Related compounds—

0.01 M Dibasic ammonium phosphate solution—Dissolve 132.1 g of dibasic ammonium phosphate in 1000 mL of water. Dilute 10.0 mL of this solution with about 990 mL of water, adjust with 2.0 M phosphoric acid to a pH of 7.0, and mix.

Diluent—Prepare a mixture of water and acetonitrile (4:1).

Solution A—Prepare a filtered and degassed mixture of *0.01 M Dibasic ammonium phosphate solution* and acetonitrile (1000:53).

Solution B—Prepare a filtered and degassed mixture of acetronitrile and *0.01 M Dibasic ammonium phosphate solution* (795:295).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution of indole and USP Dolasetron Mesylate RS in *Diluent* having known concentrations of about 0.004 mg per mL and 0.03 mg per mL, respectively.

Standard solution 1—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.03 mg per mL.

Standard solution 2—Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and USP Dolasetron Mesylate Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 6 mg per mL and 0.0072 mg per mL, respectively.

Test solution—Transfer about 150 mg of Dolasetron Mesylate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–28	100→0	→100	linear gradient
28–38	250	100	isocratic
38–40	0→100	100→0	linear gradient
40–50	100	0	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the first eluting peak, indole, and the second eluting peak, dolasetron mesylate, is not less than 1.5.

In-Process Revision

■[NOTE—If the dolasetron mesylate peak is found to elute before the indole peak, condition the column as follows. Fill up the column with *Solution A*, plug the column, and place the column in a convection oven at 105° for about 16 hours. Retest the column.]■1S (*USP27*)
Chromatograph *Standard solution 1,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution 1, Standard solution 2 ,* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of dolasetron mesylate related compound A in the portion of Dolasetron Mesylate taken by the formula:

~~(181.2/217.8)1000(r_U/r_S),~~

■2500(181.2/217.8)(C_{RC}/W)(r_U/r_S),■1S (*USP27*)

in which 181.2 and 217.8 are the molecular weights of dolasetron mesylate related compound A base and dolasetron mesylate related compound A hydrochloride, respectively;

■C_{RC} is the concentration, in mg per mL, of USP Dolasetron Mesylate Related Compound A RS in *Standard solution 2; W* is the weight, in mg, of Dolasetron Mesylate taken to prepare the *Test solution;* ■1S (*USP27*)
and r_U and r_S are the peak areas for dolasetron mesylate related compound A obtained from the *Test solution* and *Standard solution 2,* respectively: not more than 0.1% of dolasetron mesylate related compound A is found. Calculate the percentage of each impurity (other than dolasetron mesylate related compound A) in the portion of Dolasetron Mesylate taken by the formula:

~~200(r_i/r_S),~~

■2500(C/W)(r_i/r_S),■1S (*USP27*)

in which

■C is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in *Standard solution 1; W* is as defined above;■1S (*USP27*)
r_i is the peak area for each impurity obtained from the *Test solution;* and r_S is the peak area for dolasetron mesylate obtained from *Standard solution 1:* not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

Add the following:

■**Other requirements—**Where the label states that Dolasetron Mesylate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Dolasetron Mesylate Injection.* Where the label states that Dolasetron Mesylate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Dolasetron Mesylate Injection.*■2S (*USP27*)

BRIEFING

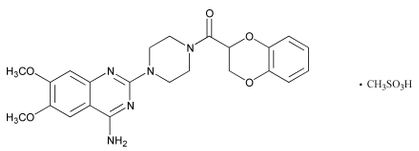
BRIEFING

Doxazosin Mesylate, page 61 of *PF* 29(1) [Jan.–Feb. 2003]. On the basis of comments received, it is proposed to revise the *Procedure* in the test for *Chromatographic purity* to change the relative standard deviation for replicate injections to 2.0% and to change the limit for any other individual impurity to 0.25%. It is also proposed to add storage conditions to the *Packaging and storage* section, according to PSD guidelines.

(PA5: A. Wilk) RTS—39699-1

Add the following:

■Doxazosin Mesylate



$C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$ ~~547.59~~ 547.58

Piperazine, 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-[(2,3-dihydro-1,4-benzodioxin-2-yl)carbonyl]-, monomethanesulfonate.

1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(1,4-benzodioxan-2-ylcarbonyl)piperazine monomethanesulfonate [*77883-43-3*].

» Doxazosin Mesylate contains not less than 98.0 percent and not more than 102.0 percent of $C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$, calculated on the ~~anhydrous~~ dried basis.

Packaging and storage—Preserve in well-closed containers and store below 30°.

USP Reference standards ⟨11⟩—*USP Doxazosin Mesylate RS. USP Terazosin Related Compound A RS. USP Terazosin Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨~~197M~~⟩⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩—Dry at 105° under vacuum for 4 hours: it loses not more than 1.0% of its weight.

~~**Water,** *Method I* ⟨921⟩: not more than 1.0%.~~

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 20 µg per g.

Chromatographic purity~~—[To come.]~~

Solution A—Dissolve 17.3 g of sodium 1-octanesulfonate and 5.4 mL of phosphoric acid in 4 liters of water. Adjust with 1 M sodium hydroxide to a pH of 2.5, and mix.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Dissolve 2.7 mL of phosphoric acid in 2 liters of water. Adjust with 1 M sodium hydroxide to a pH of 2.5, and mix.

Blank solution—Prepare a solution of dimethyl sulfoxide and *Diluent* (1 in 100).

System suitability solution—Prepare a solution containing about 1.5 µg of USP Terazosin Related Compound A RS per mL, 0.5 µg of USP Terazosin Related Compound C RS per mL, and 0.5 µg of USP Doxazosin Mesylate RS per mL in *Blank solution.*

Standard stock solution—To an accurately weighed quantity of USP Doxazosin Mesylate RS, add a volume of dimethyl sulfoxide, equivalent to about 1% of the flask volume, sonicate for one minute, and dilute quantitatively,

In-Process Revision

and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL. Sonicate, if necessary, until dissolved.

Standard solution—Quantitatively, and stepwise if necessary, dilute a volume of *Standard stock solution* with *Blank solution* to obtain a solution containing 0.5 µg of doxazosin mesylate per mL.

Test solution—Transfer about 50 mg of Doxazosin Mesylate, accurately weighed, to a 100-mL volumetric flask, add 1 mL of dimethyl sulfoxide, and sonicate for 1 minute. Dilute with *Diluent* to volume and sonicate, if necessary, until dissolved.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatographic system is equipped with a 245-nm detector and a 4.0- × 80-mm column that contains packing L7. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (min.)	*Solution A* (%)	*Solution B* (%)	Elution
0–20	75→45	25→55	linear gradient
20–35	45	55	isocratic
35–36	45→75	55→25	linear gradient
36–47	75	25	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution between terazosin related compound C and doxazosin is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections for the main peak is not more than ~~5.0%.~~ 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of each impurity in the portion of Doxazosin Mesylate taken by the formula:

~~$0.1F(C_S/C_T)(r_i/r_S)$,~~

$$100F(C_S/C_T)(r_i/r_S),$$

in which the response factor, *F,* is 0.6 for terazosin related compound A and 0.55 for terazosin related compound C; C_S is the concentration, in µg per mL, of USP Doxazosin Mesylate RS in the *Standard solution;* C_T is the concentration, in µg per mL, of doxazosin mesylate in the *Test solution;* r_i is the peak response for each individual impurity, excluding solvent peaks, obtained from the *Test solution;* and r_S is the peak response obtained from the *Standard solution:* not more than 0.3% of terazosin related compound A is found; not more than ~~0.1%~~ 0.25% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

Assay—

~~*Buffer solution*—Prepare a 0.05 M solution of monobasic potassium phosphate by disolving 0.68 g of monobasic potassium phosphate in 100 mL of water. Adjust with phosphoric acid to a pH of 3.0 ± 0.1.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, and acetonitrile (6:4:1.5). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS in methanol to obtain a solution having a known concentration of about 0.30 mg per mL. Quantitatively dilute a volume of this solution~~

In-Process Revision

~~with *Mobile phase* to obtain a solution having a known concentration of about 15.0 µg of USP Doxazosin Mesylate RS per mL.~~

~~*Assay preparation*—Transfer about 75 mg of Doxazosin Mesylate, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Quantitatively dilute a known volume of this solution with *Mobile phase* to obtain a solution having a concentration of about 15.0 µg per mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 246-nm detector and a 3.9-mm × 15.0-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, k′, is not less than 4.5; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$ in the portion of Doxazosin Mesylate taken by the formula:~~

~~$$5C(r_U/r_S),$$~~

~~in which C is the concentration, in µg per mL, of USP Doxazosin Mesylate RS in the Standard preparation; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

Buffer solution—Transfer 3.4 g of monobasic potassium phosphate into a 1-liter flask, and add 800 mL of water and 4.0 mL of triethylamine to dissolve. Adjust with phosphoric acid to a pH of 4.5, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (11:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent:—~~Dissolve 2.7 mL of phosphoric acid in 2 liters of water. Adjust with 1 M sodium hydroxide to a pH of 2.5, and mix.~~ a mixture of methanol and 0.1 N hydrochloric acid (9:1).

Standard preparation—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a final concentration of about 49 µg per mL.

Assay preparation—Transfer about 98 mg of Doxazosin Mesylate to a 200-mL volumetric flask, dissolve in and dilute with *Diluent* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 40°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′,* for doxazosin is not less than 2.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

In-Process Revision

measure the responses for the doxazosin peaks. Calculate the quantity, in mg, of $C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$ in the portion of Doxazosin Mesylate taken by the formula:

$$2C(r_U / r_S),$$

in which C is the concentration, in µg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Droperidol, *USP 26* page 674. Because of acquisition difficulty, it is proposed to remove USP 4,4′-Bis[1,2,3,6-tetrahydro-4-(2-oxo-1-benzimidazolinyl)-1-pyridyl]butyrophenone RS from the *USP Reference standards* section and to revise the limit test accordingly to include the absorptivity value of the solution under test.

BRIEFING

Ergoloid Mesylates Tablets, *USP 26* page 720 and page 626 of *PF* 29(3) [May–June 2003]. It is proposed to increase the volume of injection in the *Chromatographic system* used to quantify the dissolution samples to achieve an adequate sensitivity. Other changes are made to reflect the experimental conditions used. The column used in the experimental work is an XTerra RP 18 brand column of L1 packing.)

(PA3: S. Salado) RTS—39994-1

Change to read:

Dissolution ⟨711⟩ *(for Tablets intended to be swallowed)*—
Medium: water; 500 mL.
Apparatus 2: 50 rpm, the distance between the paddle blade and the inside bottom of the vessel being maintained at 4.5 ± 0.2 cm during the test.
Time: 30 minutes.

■Determine the amount of Ergoloid Mesylates dissolved using the following procedure.■2S (*USP27*)
Mobile phase—Prepare as directed in the *Assay.*
Standard solution—Dissolve an accurately weighed quantity of USP Ergoloid Mesylates RS in water to obtain a solution having a known concentration of about 50 µg per mL. Transfer 4 mL of this solution for every 0.5 mg of ergoloid mesylates contained in the Tablets to a 200-mL volumetric flask, add 1 mL of 0.1 N hydrochloric acid and 100 mL of water, mix, and dilute with water to volume.
Test solution—Transfer a 20-mL portion of the solution under test to a suitable container, add 100 µL of 0.1 N hydrochloric acid, and mix.
Chromatographic system—Proceed as directed in the *Assay* except that the sum of the relative standard deviation values for the four ergoloid mesylates peaks for replicate injections is not more than 3.0%.
Procedure—Separately inject equal volumes (about ~~200 µL~~ ■500 µL)■2S (*USP27*) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of ergoloid mesylates as directed in the *Assay.*
Tolerances—Not less than 75% *(Q)* of the labeled amount of ergoloid mesylates is dissolved in 30 minutes.

Change to read:

Assay—
Mobile phase—Prepare a filtered and degassed solution containing a mixture of water, acetonitrile, and triethylamine (700:300:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Internal standard solution—Transfer about 113 mg of papaverine hydrochloride to a 1-liter flask. Add a mixture of 0.01 M tartaric acid and acetonitrile (2:1) to volume, and mix.
Standard preparation—Transfer about 33 mg of USP Ergoloid Mesylates RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Internal standard solution* to volume, and mix. Use a freshly prepared solution.
Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of Ergoloid Mesylates to a 50-mL centrifuge tube. Add 15.0 mL of *Internal standard solution,* insert the stopper into the tube, and shake for about 15 minutes. Centrifuge, filter if necessary, and use the clear supernatant solution.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a ~~3.9-mm~~ ■4.6-mm■2S (*USP27*) × 15-cm column that contains packing L1.

■[NOTE—Use an L1 column capable of handling pH values greater than 11.]■2S (*USP27*)
The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined for the dihydro-β-ergocryptine mesylate peak is not less than 1000 theoretical plates; the tailing factor for dihydro-β-ergocryptine mesylate is not more than 2.0; the resolution, *R,* between the dihydro-α-ergocryptine mesylate and dihydroergocristine mesylate is not less than 2.0, the resolution, *R,* between dihydroergocristine and dihydro-β-ergocryptine is not less than 2.0; and the relative standard deviation of the ratio of the sum of the four peaks to the internal standard for replicate injections is not more than 1.5%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The order of elution is papaverine, dihydroergocornine, dihydro-α-ergocryptine, dihydroergocristine, and dihydro-β-ergocryptine. Calculate the quantity, in mg, of ergoloid mesylates in the portion of Tablets taken by the formula:

$$15C(R_U/R_S),$$

in which C is the concentration, in mg per mL, of USP Ergoloid Mesylates RS in the *Standard preparation;* and R_U and R_S are the sums of the ratios of responses of the four major peaks to the response of the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the percentage of each of the individual alkaloids taken by the formula:

$$100R_i(MW)\text{yi}/\Sigma[R_i(MW)_i],$$

where R_i is the peak response ratio of the individual alkaloid to the internal standard; $(MW)_i$ is the molecular weight of the individual alkaloid; and $\Sigma[R_i(MW)_i]$ is the summation of the products of peak response ratios and molecular weights for the four alkaloids.

USP Fenoldopam Mesylate RS. USP Fenoldopam Related Compound A RS.

Change to read:

~~**Organic volatile impurities**~~

■**Limit of residual solvents**—■2S (*USP27*)

Internal standard solution—Prepare a solution, in organic-free water, containing 10 mg of *n*-butanol per mL. Transfer 100 µL of this solution to a 10-mL volumetric flask, dilute with dimethylsulfoxide to volume, and mix.

Standard solution—Prepare a solution, in organic-free water, containing 10 mg each of *n*-propanol, isopropyl alcohol, and dimethylformamide per mL. Transfer 100 µL of this solution to a 10-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

Test solution—Transfer about 50 mg of Fenoldopam Mesylate, accurately weighed, to a 1-mL volumetric flask. Dilute with *Internal standard solution* to volume, and sonicate to dissolve completely.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica capillary column ■coated with a 1.8-µm film of stationary phase G43, and a split injection system. The carrier gas is helium, flowing at a rate of about 1 mL per minute through the column and a split ratio of about 50:1.■1S (*USP26*) The injection port and the detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed as follows. It is maintained for 12 minutes at 40°, then increased at a rate of 8° per minute to 120°, held for 0.1 minute, then increased at a rate of 25° per minute to 180°, and maintained at that temperature for 8 minutes.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution,* dimethylsulfoxide, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Identify, based on retention time, any peaks present in the chromatogram of the *Test solution.* Calculate the response factor, *F,* for each solvent in the *Standard solution* by the formula:

$$(W_R / W_I)(r_I / r_R),$$

in which W_R is the weight, in mg, of the solvent of interest; W_I is the weight, in mg, of the internal standard taken to prepare the *Internal standard solution;* and r_I and r_R are the peak responses for the internal standard and the solvent of interest, respectively, obtained from the *Standard solution.* Calculate the percentage, by weight, of each solvent found in the *Test solution* by the formula:

$$100FD(r_i / r_S)(W_I / W_D),$$

in which F is the average response factor for the solvent of interest obtained from all injections of the *Standard solution; D* is the dilution factor for the internal standard in the *Test solution* (i.e., 0.0001); r_i and r_S are the peak responses for the solvent of interest and the internal standard, respectively, obtained from the *Test solution; W_I* is the weight, in mg, of the internal standard taken to prepare the *Internal standard solution;* and W_D is the weight, in mg, of Fenoldopam Mesylate taken to prepare the *Test solution:* not more than 0.2% of total ~~organic volatile impurities~~

■residual solvents■2S (*USP27*)
is found.

Add the following:

■**Other requirements—**Where the label states that Fenoldopam Mesylate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Fenoldopam Mesylate Injection*. Where the label states that Fenoldopam Mesylate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Fenoldopam Mesylate Injection*.■2S (*USP27*)

BRIEFING

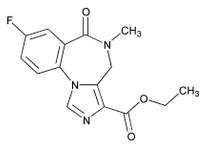
Flumazenil; Flumazenil Injection. Because there are no existing *USP* monographs for this drug substance and dosage form, new monographs, based on validation data received, are being proposed. The liquid chromtographic procedures in the *Assay* and in the *Related compounds Test 2* were validated using a Zorbax RX C-8 brand of L7 column. Typical retention times reported are about 7 minutes for flumazenil, about 2 minutes for flumazenil related compound A, and about 6 minutes for flumazenil related compound B.

(PA3: S. Salado) RTS—39640-1

In-Process Revision

Add the following:

■Flumazenil



$C_{15}H_{14}FN_3O_3$ 303.3

4*H*-Imidazo[1,5-α][1,4]benzodiazepine-3-carboxylic acid, 8-fluoro-5,6-dihydro-5-methyl-6-oxo-, ethyl ester.

Ethyl 8-fluoro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazo[1,5-α][1,4]benzodiazepine-3-carboxylate [*78755-81-4*].

» Flumazenil contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{14}FN_3O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Flumazenil RS. USP Flumazenil Related Compound A RS. USP Flumazenil Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Diluent, Adsorbent, Test solution, Standard solution 1, Application volume, and Developing solvent system—Proceed as directed for *Related compounds Test 1*.

Melting range, *Class Ia* ⟨741⟩: between 198° and 202°.

Bacterial endotoxins ⟨85⟩—It contains not more than 25.0 USP Endotoxin Units per mg of Flumazenil.

Water, *Method I* ⟨921⟩: not more than 0.5%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Related compounds—

TEST 1—

Ninhydrin solution—Dissolve 0.5 g of ninhydrin in 90 mL of alcohol, and add 10 mL of glacial acetic acid.

Diluent—Prepare a mixture of alcohol and chloroform (1:1).

Adsorbent—0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* ⟨621⟩).

Test solution—Transfer about 250 mg of Flumazenil, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Standard solution 1—Dissolve an accurately weighed portion of USP Flumazenil RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 50 mg per mL.

Standard solution 2—Prepare a solution of USP Flumazenil RS, USP Flumazenil Related Compound A RS, USP Flumazenil Related Compound B RS, and *N,N*-dimethylformamide diethyl acetal in *Diluent* having known concentrations of about 0.5 mg per mL, about 0.5 mg per mL, about 0.5 mg per mL, and about 0.6 µL per mL respectively.

Standard solution 3—Dilute 2.0 mL of *Standard solution 2* with *Diluent* to 10.0 mL.

Standard solution 4—Dilute 1.0 mL of *Standard solution 2* with *Diluent* to 10.0 mL.

Standard solution 5—Dilute 0.5 mL of *Standard solution 2* with *Diluent* to 10.0 mL.

Application volume: 10 µL.

Developing solvent system: a mixture of chloroform, glacial acetic acid, alcohol, and water (75:15:7.5:2.5).

In-Process Revision

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate for 10 minutes in a current of cold air, and view under short wavelength UV light. Spray the plate with *Ninhydrin solution,* and heat at 105° for 15 minutes. The R_F values of analytes are as follows:

Compound	R_F	Detection
Flumazenil	about 0.8	UV
Flumazenil related compound B	about 0.7	UV
Flumazenil related compound A	about 0.1	UV
N,N-Dimethylformamide diethyl acetal	about 0.04	Ninhydrin

Any spot at an R_F value corresponding to *N,N*-dimethylformamide diethyl acetal in the chromatogram obtained from the *Test solution* is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 3:* not more than 0.2% is found. Compare any unspecified spot in the chromatogram of the *Test solution* with the spot for flumazenil obtained in the chromatograms of *Standard solution 3, Standard solution 4,* and *Standard solution 5,* when viewed under UV light. Report the approximate level of each of the unknown impurities: not more than 0.2% of any unknown impurity is found; and not more than 0.5% of total unknown impurities is found. [NOTE—Use the spots for flumazenil related compound A and flumazenil related compound B in the chromatograms of *Standard solution 3, Standard solution 4,* and *Standard solution 5* as references only. They are quantified in *Test 2*.]

TEST 2—

Diluted phosphoric acid pH 2.0, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation* described in the *Assay.*

Test solution—Use the *Assay preparation* described in the *Assay.*

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Flumazenil taken by the formula:

$$(10{,}000F)(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard solution; F* is the relative response factor of the impurity according to the table below; W is the weight, in mg, of Flumazenil, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_S is the peak area for flumazenil in the *Standard solution:* the impurities meet the requirements given in the table below.

Compound name	Relative retention time	Relative Response Factor	Limit (%)
Flumazenil related compound A	about 0.23	0.9	0.2
Flumazenil related compound B	about 0.45	0.9	0.3
Flumazenil	1.0	—	—
Unknown impurities	—	1.0	0.2
Total	—	—	0.5

In-Process Revision

Limit of alcohol and methylene chloride—

Standard solution— Prepare a solution in dimethylsulfoxide containing 100 µg per mL of dehydrated alcohol and 1 µg per mL of methylene chloride. Transfer 1 mL of this solution to a 20-mL gas chromatographic headspace vial, and cap immediately.

Test solution—Transfer about 100 mg of Flumazenil, accurately weighed, to a 20-mL gas chromatographic headspace vial, add 1.0 mL of dimethyl sulfoxide, cap immediately, and swirl.

Chromatographic system (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a headspace injector and a flame-ionization detector, a 0.32-mm × 30-m fused-silica capillary column bonded with a 1.8-µm layer of phase G43, and a split injection system. The carrier gas is helium, flowing at a rate of about 1.7 mL per minute, and the total flow rate is about 40 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at about 40° for 20 minutes, then the temperature is increased at a rate of 35° per minute to 240°, and maintained at 240° for 20 minutes. The injection port temperature is maintained at about 140°, and the detector is maintained at about 260°. The *Standard solution* and the *Test solution* are maintained at about 90°, and the needle and transfer temperatures are maintained at about 140°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the elution order is alcohol and methylene chloride; the resolution, *R,* between alcohol and methylene chloride is not less than 3.0; and the relative standard deviation of consecutive injections is not more that 10.0%.

Procedure—Using a heated, gas-tight syringe, separately inject equal volumes (about 1 mL) of the headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of alcohol and methylene chloride in the portion of Flumazenil taken by the formula:

$$100(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the relevant analyte in the *Standard solution; W* is the weight, in mg, of Flumazenil taken to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding analyte obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of alcohol and not more than 0.001% of methylene chloride is found.

Assay—

Diluted phosphoric acid, pH 2.0—Adjust 800 mL of water with phosphoric acid to pH 2.0 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Diluted phosphoric acid, pH 2.0* and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

System suitability solution—Dissolve appropriate quantities of USP Flumazenil Related Compound A RS and USP Flumazenil Related Compound B RS in the *Standard preparation,* and dilute quantitatively, and stepwise if necessary, with *Standard preparation* to obtain a solution having known concentrations of each of about 0.2 µg per mL.

Assay preparation—Transfer about 10.0 mg of Flumazenil, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains packing

L7. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.23 for flumazenil related compound A, about 0.45 for flumazenil related compound B, and 1.0 for flumazenil; the resolution, *R,* between flumazenil related compound B and flumazenil is not less than 3.0; and the tailing factor is not more than 1.5 for the flumazenil peak. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area for the flumazenil peaks. Calculate the quantity, in mg, of $C_{15}H_{14}FN_3O_3$ in the portion of Flumazenil taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Flumazenil Injection—See briefing under *Flumazenil*. The *Assay* and *Related compounds* test were validated using a YMC–Pack CN brand of L10 column. The retention times are about 7 minutes for flumazenil, about 5 minutes for flumazenil related compound A, and about 6 minutes for flumazenil related compound B.

(PA3: S. Salado) RTS—39640-2

In-Process Revision

Add the following:

■Flumazenil Injection

» Flumazenil Injection is a sterile solution of Flumazenil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flumazenil ($C_{15}H_{14}FN_3O_3$).

Packaging and storage—Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Flumazenil RS. USP Flumazenil Related Compound A RS. USP Flumazenil Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩

Adsorbent—0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator.

Test solution—Dilute, if necessary, a volume of injection with water to obtain a solution containing 0.1 mg of Flumazenil per mL.

Standard solution—Prepare a solution in methanol, and dilute, step wise if necessary, with water to obtain a solution containing about 0.1 mg of USP Flumazenil RS per mL in a mixture of water and methanol (9:1).

Developing solvent system: a mixture of ethyl acetate and methanol (9:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩: not more than 25.0 USP Endotoxin Units per mg of flumazenil.

pH ⟨791⟩: between 3.4 and 4.6.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Related compounds—

Diluent, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation* as described in *Assay.*

Test solution—Use the *Assay preparation* as described in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(V/D)(F)(C/L)(r_i / r_S),$$

in which V is the volume, in mL, of the *Test Solution; C* is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard solution; L* is the dose, in mg, of Flumazenil per mL obtained in the *Assay; D* is the volume, in mL, of Injection taken to prepare the *Test solution; F* is the relative response factor as described in the table below; r_i is the peak response for each impurity in the *Test solution;* and r_S is the peak response of flumazenil obtained from the *Standard solution:* meets the requirements given in the table below.

Compound name	Relative Response Factor	Limit (%)
Flumazenil related compound A	0.9	1.0
Unknown	1.0	0.5
Total unknown	—	1.0
Total	—	2.0

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Diluent—Prepare a mixture of water, tetrahydrofuran, and methanol (75:20:5).

0.02 M Phosphate buffer—Add 0.02 M phosphoric acid to 0.02 M monobasic potassium phosphate to obtain a solution having a pH of 2.7 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *0.02 M Phosphate buffer,* tetrahydrofuran, and methanol (75:20:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve appropriate quantities of USP Flumazenil RS, USP Flumazenil Related Compound A RS, and USP Flumazenil Related Compound B RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 0.01 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Dilute a volume of Injection, if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL of flumazenil in a known volume, *V.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.71 for flumazenil related compound A, about 0.85 for flumazenil related compound B, and 1.0

In-Process Revision

for flumazenil; the resolution, *R,* between flumazenil related compound B and flumazenil is not less than 1.8; and the tailing factor for flumazenil related compound A is not more than 2.0. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of flumazenil ($C_{15}H_{14}FN_3O_3$) in the volume of Injection taken by the formula:

$$VC(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

BRIEFING

Fluoxetine Delayed-Release Capsules, page 403 of *PF* 29(2) [Mar.–Apr. 2003]. It is proposed to change the acid solution used to prepare the *Degraded fluoxetine solution* in the *Chromatographic purity* test to reflect the actual acid solution used in the method.

(PA3: S. Salado) RTS—40035-1

In-Process Revision

Add the following:

■Fluoxetine Delayed-Release Capsules

» Fluoxetine Delayed-Release Capsules contain an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine ($C_{17}H_{18}F_3NO$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Fluoxetine Hydrochloride RS. USP Fluoxetine Related Compound C RS.*

Identification, *Infrared Absorption* ⟨197F⟩—

Test specimen—Transfer the contents of 3 Capsules to a suitable container, and grind to a fine powder. Transfer ~~an accurately weighed~~ a portion of the powder, equivalent to about 40 mg of fluoxetine, to a suitable container, and dissolve in 25 mL of 0.1 N hydrochloric acid. Filter, and transfer 10 mL of the solution so obtained to a separatory funnel, add 20 mL of methylene chloride, and mix. Allow the phases to separate, and transfer the organic layer to a small glass container. Evaporate to dryness with the aid of a current of air and mild heat. Redissolve the residue with a few drops of methylene chloride, and transfer to a potassium bromide plate. Dry or evaporate to a thin film with the aid of a stream of nitrogen.

Drug release ⟨724⟩—[To come.]

Uniformity of dosage units ⟨905⟩: meet the requirements.

Chromatographic purity—

Ion-pair solution—Dissolve about 6.5 g of sodium 1-octanesulfonate and 2.9 g of anhydrous sodium acetate in 1 liter of water, and adjust with glacial acetic acid to a pH of 5.0.

Mobile phase—Prepare a filtered and degassed mixture of *Ion-pair solution* and acetonitrile (58:42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Degraded fluoxetine solution—Dissolve ~~an accurately weighed~~ a quantity of USP Fluoxetine Hydrochloride RS in ~~0.1 N hydrochloric acid~~ 1.0 N sulfuric acid to obtain a solution containing about 2.2 mg per mL. Heat to 85° for 3 hours, and cool to room temperature.

Fluoxetine related compound solution—Dissolve ~~an accurately weighed~~ a quantity of USP Fluoxetine Related Compound C RS in *Mobile phase* to obtain a solution containing about 0.5 mg per mL.

System suitability solution—Transfer ~~an accurately weighed quantity of~~ about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100-mL volumetric flask, add 2 mL of *Degraded fluoxetine solution* and 2 mL of *Fluoxetine related compound solution,* and dissolve in and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Detector sensitivity solution—Transfer 1 mL of the *System suitability solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Filter before injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L7. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Inject the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.49 for α,α,α-trifluoro-*p*-cresol, 0.70 for fluoxetine related compound C, and 1.0 for fluoxetine; the resolution, *R,* between α,α,α-trifluoro-*p*-cresol and fluoxetine related compound C is not less than 2.0, and the resolution, *R,* between fluoxetine related compound C and fluoxetine is not less than 6.0. Chromatograph the *Detector sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the fluoxetine peak is not less than 10.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram for at least three times the retention time of the fluoxetine peak, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.2% of any individual impurity is found, and not more than 0.7% of total impurities is found.

Assay—

Ion-pair solution—Dissolve about 2.9 mL of glacial acetic acid and about 7.1 g of sodium 1-pentanesulfonate in 1 liter of water. Adjust with 5 N sodium hydroxide to a pH of 5.0.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Ion-pair solution* (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve ~~accurately weighed~~ suitable quantities of USP Fluoxetine Hydrochloride RS and α,α,α-trifluoro-*p*-cresol in *Mobile phase* to obtain a solution containing about 110 µg per mL and 20 µg per mL, respectively.

In-Process Revision

Standard preparation—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.11 mg per mL.

Assay preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 500-mL volumetric flask, shake by mechanical means for about 10 minutes, and then sonicate for about 5 minutes. Cool the solution to room temperature, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 10.0-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Filter the solution before injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 7.5-cm column that contains 3.5-µm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 38°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for α,α,α-trifluoro-*p*-cresol and 1.0 for fluoxetine; the resolution, *R,* between α,α,α-trifluoro-*p*-cresol and fluoxetine is not less than 4.0; the tailing factor for the fluoxetine peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluoxetine ($C_{17}H_{18}F_3NO$) in the portion of Capsules taken by the formula:

$$1000(309.33/345.79)C(r_U/r_S),$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Flutamide, *USP 26* page 830 and page 405 of *PF* 29(2) [Mar.–Apr. 2003]; **Flutamide Capsules,** *USP 26* page 830 and page 407 of *PF* 29(2) [Mar.–Apr. 2003]. In the *Procedure* sections of the test for *Related compounds* and in the *Assay* it is proposed to add the words "area" and "response", as appropriate, to specify peak area responses. It is also proposed to make several other changes for further clarification of these test methods. In addition, minor editorial style changes have been made.

■USP Phenytoin Related Compound A RS,■2S (*USP27*) USP Phenytoin Related Compound B RS, and USP Phenytoin RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 3.0 µg per mL, 3.0 µg per mL, and 1.5 µg per mL, respectively.

Test solution—Transfer about 150 mg of Fosphenytoin Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for not less than six times the retention time of the major peak, and measure all of the peak responses. Calculate the percentage of phenytoin, phenytoin related compound B, and ~~2,2-diphenylglycine,~~

■phenytoin related compound A,■2S (*USP27*) if present, in the portion of Fosphenytoin Sodium taken by the formula:

$$100(C_S/C_U)(r_i/r_S),$$

in which C_S is the concentration, in mg per mL, of ~~USP Phenytoin RS~~

■the USP Reference Standard of the respective impurity■2S (*USP27*) in the *Standard solution;* C_U is the concentration, in mg per mL, of Fosphenytoin Sodium in the *Test solution;* and r_i and r_S are the peak responses for each impurity obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of phenytoin is found; not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

■[NOTE—Use the peak area and concentration of USP Phenytoin RS in the *Standard solution* as r_S and C_S, respectively, to calculate the percentage of the unknown impurities.]■2S (*USP27*)

In-Process Revision

BRIEFING

Fosphenytoin Sodium Injection, page 68 of *PF* 29(1) [Jan.–Feb. 2003]—It is proposed to add a *Labeling* requirement that is intended to ensure that dosages of oral Phenytoin Sodium are correctly related to the amounts of Fosphenytoin Sodium administered previously by injection. Clarity of labeling the container, which is to avoid the need to perform molecular weight-based adjustements, is expected to alleviate problems with converting between fosphenytoin sodium and phenytoin sodium doses.

The revision is proposed for publication in the *Second Supplement to USP27–NF22,* which is to become official August 1, 2004, but with February 1, 2006, designated as the official date for the *Labeling* requirement. Use of the *Labeling* requirement would be permitted as of August 1, 2004, but the *Labeling* requirement would not become mandatory until February 1, 2006. The eighteen-month postponement of the official date for the *Labeling* requirement is intended to allow for product label changes to be made and for health-care professionals and patients to become familiar with the labeling provisions.

See also the briefing under *Fosphenytoin Sodium.*

(PA3: S. Salado; NL: C. Barnstein) RTS—39907-3; 40223-1

Add the following:

■Fosphenytoin Sodium Injection

» Fosphenytoin Sodium Injection is a sterile solution of Fosphenytoin Sodium in Water for Injection. Fosphenytoin Sodium is a prodrug. Injection containing 1 mg per mL of Fosphenytoin Sodium is equivalent to 0.667 mg per mL of Phenytoin Sodium after injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fosphenytoin sodium ($C_{16}H_{13}N_2Na_2O_6P$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. ~~protected from light.~~ Store between 2° and 8°. Do not store at room temperature for more than 48 hours.

Labeling—Both the actual content of Fosphenytoin Sodium and the content of Phenytoin Sodium, expressed in terms of phenytoin sodium equivalents, are stated prominently on the label.

(Official February 1, 2006)

USP Reference standards ⟨11⟩—*USP Fosphenytoin Sodium RS. USP Phenytoin RS. USP Phenytoin Related Compound A RS. USP Phenytoin Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Transfer a 5-mL aliquot of Injection to a 100-mL beaker, add 30 mL of acetone to form a white precipitate, and stir for 20 minutes using a magnetic stirrer. Filter in vacuum, and collect the precipitate using suitable filter paper. Allow to dry in vacuum for 15 minutes.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩: not more than 14 USP Endotoxin Units per mL.

pH ⟨791⟩: between 8.3 and 9.3.

~~**Chromatographic purity—**~~

~~*Buffer solution, Mobile phase, System suitability solution,* and *Chromatographic system*—Proceed as directed in the *Assay.*~~

~~*Standard solution*—Dissolve an accurately weighed quantity quantities of USP Fosphenytoin RS, 2,2-diphenylglycine, USP Phenytoin Related Compound B RS, and USP Phenytoin RS in *Buffer solution* methanol, and dilute quantitatively, and stepwise if necessary, with *Buffer solution* to obtain a solution having a known concentrations of about 150.0, 0.3, 2.25, 750.0, 1.5, 11.25, and 0.3–1.5 µg per mL, respectively.~~

~~*Test solution*—Use the *Assay preparation.*~~

In-Process Revision

~~*Procedure*—Separately inject equal volumes (about 20 µL–40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for not less than six times the retention time of the major peak, and measure all of the peak responses. Calculate the percentage of each impurity in the volume of Injection taken by the formula:~~

~~$$100(C_S/C_U)(r_i/r_S),$$~~

~~phenytoin, phenytoin related compound B, and 2,2-diphenylglycine in the volume of Injection taken by the formula:~~

~~$$100(r_i/r_S),$$~~

~~in which C_S is the concentration, in mg per mL, of USP Phenytoin RS in the *Standard solution;* C_U is the concentration, in mg per mL, of fosphenytoin sodium in the *Test solution;* r_i and r_S are the peak responses for each impurity obtained from the *Test solution;* and r_S is the peak response for phenytoin obtained from the *Standard solution:* and the *Standard solution,* respectively: not more than 0.2% of phenytoin is found; not more than 1.5% of phenytoin related compound B is found; not more than 0.2% of 2,2-diphenylglycine is found; and not more than 2.0% of total impurities is found.~~

Related compounds—

Buffer solution, Mobile phase, Standard stock solution 1, Standard stock solution 2, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Inject a volume (about 40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentages of phenytoin, ~~2,2-diphenylglycine,~~ phenytoin related compound A, phenytoin related compound B, and unknown impurities in each mL of Injection taken by the formula:

$$200{,}000(C/VL)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of the respective impurity in the *Standard solution; V* is the volume, in mL, of the Injection taken to prepare the *Test solution; L* is the labeled amount, in mg per mL, of fosphenytoin sodium in the Injection; and r_i and r_S are the individual peak responses of the impurities in the chromatograms obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.5% of phenytoin related compound B is found; not more than 0.2% of phenytoin is found; not more than 0.2% of ~~2,2-diphenylglycine~~ phenytoin related compound A is found; not more than 0.1% of any individual unknown impurity is found; and not more than 2.0% total impurities is found. [NOTE—Use the peak area and concentration of the USP Phenytoin RS in the *Standard solution* as r_S and C, respectively, to calculate the percentage of the unknown impurities.]

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

~~*Buffer solution* and *Mobile phase*—Proceed as directed in the *Assay* under *Fosphenytoin Sodium.*~~

~~*System suitability solution*—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.15 mg per mL.~~

~~*Buffer solution*—Dissolve 8.2 g of monobasic potassium phosphate in 900 mL of water. Adjust with 6 N potassium hydroxide solution to a pH of 6.5, dilute with water to 1000 mL, and mix.~~

In-Process Revision

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, and acetonitrile (73:25:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*System suitability solution*—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in *Buffer solution,* and dilute quantitatively, and stepwise if necessary, with *Buffer solution* to obtain a solution having a known concentration of about 0.75 mg per mL *(Solution A).* Dissolve accurately weighed quantities of USP Phenytoin RS, 2,2-diphenylglycine, and USP Phenytoin Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 0.075, 0.075, and 0.015 mg per mL, respectively *(Solution B).* Transfer 10.0 mL of *Solution A* and 5.0 mL of *Solution B* to a 50-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in *Buffer solution,* and dilute quantitatively, and stepwise if necessary, with *Buffer solution* to obtain a solution having a known concentration of about 0.15 mg per mL.~~

~~*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of fosphenytoin sodium, to a 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.~~

~~*Chromatographic system*—Proceed as directed in the *Assay* under *Fosphenytoin Sodium,* except to inject the *System suitability solution.* The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L11. The flow rate is about 1.0 mL 1.25 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.3 for phenytoin related compound B, 0.5 for 2,2-diphenylglycine, 1.0 for fosphenytoin, and 3.8 for phenytoin; the resolution, *R,* between phenytoin related compound B and 2,2-diphenylglycine is not less than 4.0; the column efficiency is not less than 2250 theoretical plates determined from the fosphenytoin peak; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 1.0% determined from the fosphenytoin peak.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL 40 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fosphenytoin sodium ($C_{16}H_{12}N_2Na_2O_6P$) in each mL of the Injection taken by the formula:~~

~~$$2000(C/V)(r_U/r_S),$$~~

~~in which C is the concentration, in mg per mL, of USP Fosphenytoin Sodium RS in the *Standard preparation; V* is the volume, in mL, of Injection taken to prepare the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

Buffer solution—Dissolve about 8.2 g of monobasic potassium phosphate in 1 liter of water. Adjust with 6 N potassium hydroxide solution to a pH of 6.5 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* methanol, and acetonitrile (73:25:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution 1—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Buffer solution* to obtain a solution having a known concentration of about 0.75 mg per mL.

In-Process Revision

Standard stock solution 2—Dissolve an accurately weighed quantity of USP Phenytoin RS, ~~2,2-diphenylglycine,~~ USP Phenytoin Related Compound A RS, and USP Phenytoin Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.0075 mg per mL, 0.0075 mg per mL, and 0.015 mg per mL, respectively.

Standard preparation—Transfer 10.0 mL of *Standard stock solution 1* and 5.0 mL of *Standard stock solution 2* to a 50-mL volumetric flask. Dilute with *Buffer solution* to volume, and mix.

Assay preparation—Transfer an accurately measured volume of the Injection, equivalent to about 300 mg of fosphenytoin, to a 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask. Dilute with *Buffer solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.25 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.3 for phenytoin related compound B, about 0.5 for ~~2,2-diphenylglycine,~~ phenytoin related compound A, 1.0 for fosphenytoin, and about 3.8 for phenytoin; the resolution, *R*, between phenytoin related compound B and ~~2,2-diphenylglycine~~ phenytoin related compound A is not less than 4.0; the column efficiency is not less than 2250 theoretical plates for the fosphenytoin peak; the tailing factor is not more than 1.8 for the fosphenytoin peak; and the relative standard deviation for replicate injections is not more than 1.0% for the fosphenytoin peak and not more than 5.0% for the phenytoin related compound B, ~~2,2-diphenylglycine,~~ phenytoin related compound A, and phenytoin peaks.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the fosphenytoin peaks. Calculate the quantity, in mg, of fosphenytoin sodium ($C_{16}H_{13}N_2Na_2O_6P$) in each mL of Injection taken by the formula:

$$2000(C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Fosphenytoin Sodium RS in the *Standard preparation; V* is the volume, in mL, of the Injection taken to prepare the *Assay preparation;* and r_U and r_S are the fosphenytoin peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

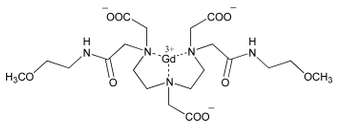
Gadoversetamide, page 410 of *PF* 29(2) [Mar.–Apr. 2003]. This proposed new monograph is being presented again with revisions recommended by the innovator firm. Also, it is proposed to add storage conditions to the *Packaging and storage* section, in accordance with PSD guidelines.

(RMI: A. Wilk) RTS—39978-1

Add the following:

■Gadoversetamide



$C_{20}H_{34}GdN_5O_{10}$ 661.76

(Gadoversetamide) ~~Gadolinium,~~ [8,11-bis(carboxymethyl)-14-[2-[(2-methoxyethyl)amino]-2-oxoethyl]-6-oxo-2-oxa-5,8,11,14-tetraazahexadecan-16-oato(3-)], gadolinium.

[*N*,*N*-Bis[2-[(carboxymethyl)[[2-methoxyethyl)carbamoyl]methyl]amino]ethyl]glycinato(3-)]gadolinium [*131069-91-5*].

In-Process Revision

» Gadoversetamide contains not less than 97.0 percent and not more than 102.0 percent of $C_{20}H_{34}GdN_5O_{10}$, calculated on an anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Gadoversetamide RS. USP Gadoversetamide Related Compound A RS. USP ~~Gadoversetamide~~ Gadodiamide Related Compound B RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

B: The lanthanide selectivity test detects gadolinium (III) in 0.1 N nitric acid with arsenazo (III). Prepare 1.5×10^{-4} M arsenazo (III) ~~acid~~ solution by dissolving 30 mg of arsenazo (III) and 160 mg of urea in 100 mL water, adding 1.6 mL of nitric acid, and diluting with water to 250 mL. Add 10 mg of Gadoversetamide to 1.0 mL of the 1.5×10^{-4} M arsenazo (III) solution, and mix. The color changes from a wine red to green-blue, indicating the presence of gadolinium.

Bacterial endotoxins ⟨85⟩: not more than 15 USP Endotoxin Units per g of gadoversetamide.

Water, *Method Ia* ⟨921⟩: not more than 10.0% (w/w), a solvent mixture of methanol and formamide (9:1) being used.

Limits of free gadolinium (III) and total chelatable material—

MES buffer—~~Transfer 97.6 g of 2-morpholinoethanesulfonic acid (MES) to a 1000-mL volumetric flask, dilute with water to volume, about 950 mL, and mix. Adjust with 20% sodium hydroxide to a pH of 6, dilute with water to volume, and mix.~~ Dissolve 97.6 g of 2-morpholinoethanesulfonic acid (MES) in about 950 mL of water, and mix. Adjust with 20% sodium hydroxide to a pH of 6, dilute with water to 1000 mL, and mix.

Edetate titrant: ~~Pipet 100 mL of 0.02 M edetate disodium VS into a 1000-mL volumetric flask, dilute with water to volume, and mix.~~ 0.002 M edetate disodium VS.

0.003 M Gadolinium (III) titrant—Transfer 0.790 g of gadolinium chloride to a 1000-mL volumetric flask, dilute with ~~0.1 N hydrochloric acid~~ water to volume, and mix.

Test solution—Transfer about 5 g of Gadoversetamide, accurately weighed, into a 250-mL flask, and add 20 mL of water and 2 mL of hydrochloric acid. Stir, and heat to boiling. Rinse the sides of the flask with water. Add 50 mL of *MES buffer* and 100 to 150 µL of xylenol orange TS to impart a light yellow color. Heat to boiling, adjust with ammonium hydroxide to a pH of ~~6.0,~~ 6, and continue boiling for 2 minutes. If the solution is yellow, proceed as directed under *Uncomplexed chelatable material.* If the color is red-violet, proceed as directed under *Free gadolinium (III).*

~~*Blank solution*—Combine 20 mL of water and 2 mL of hydrochloric acid in a 250-mL flask. Heat to boiling with stirring. Rinse the sides of the flask with water, and add 50 mL of *MES buffer* and 100 to 150 µL of xylenol orange TS to impart a slight yellow color to the blank solution. Re-heat to boiling, and adjust with ammonium hydroxide to a pH of 6.0. Continue boiling for 2 minutes, and note the color. If the solution is yellow, proceed as directed below for *Uncomplexed chelatable material.* If the color is red-violet, proceed as directed below for *Free gadolinium (III).*~~

Uncomplexed chelatable material—Continue boiling, and titrate with *0.003 M Gadolinium (III) titrant* to a red-violet endpoint that undergoes no further color change upon addition of more titrant. Record the volume of titrant used to reach the endpoint.

In-Process Revision

Free gadolinium (III)—Continue boiling and titrate with *Edetate titrant* to ~~an orange-red~~ a yellow or yellow-orange endpoint that undergoes no further color change upon addition of more titrant. Record the volume of titrant used to reach the endpoint.

Calculations—If the *Test solution* ~~and the *Blank solution* were both~~ was titrated with *Edetate titrant,* calculate the percentage of *Free gadolinium (III)* in the portion of Gadoversetamide taken by the formula:

~~$(66.16/W)(V_{EU} - V_{EB})(M_E)$,~~

$$(66.18/W)(V_{EU})(M_E),$$

in which W is the weight, in g, of Gadoversetamide taken; V_{EU} ~~and V_{EB} are the volumes,~~ is the volume, in mL, of *Edetate titrant* used to titrate the *Test solution;* ~~and the *Blank solution,* respectively;~~ and M_E is the molarity of the *Edetate titrant.* If the sample ~~and blank were both~~ was titrated with *0.003 M Gadolinium (III) titrant,* calculate the percentage of *Uncomplexed chelatable material* in the portion of Gadoversetamide taken by the formula:

~~$(66.16/W)(V_{GU} - V_{GB})(M_G)$,~~

~~$(66.18/W)(V_{GU}) - (M_G)$,~~

$$(66.18/W)(V_{GU})(M_G),$$

in which W is as defined herein; V_{GU} ~~and V_{GB} are the volumes~~ is the volume, in mL, of *0.003 M Gadolinium (III) titrant* used to titrate the *Test solution:* ~~and the *Blank solution,* respectively;~~ and M_G is the molarity of the *0.003 M Gadolinium (III) titrant.* ~~If the *Test solution* was titrated with *Edetate titrant* and the *Blank solution* titrated with *0.003 M Gadolinium (III) titrant,* calculate the percentage of free gadolinium (III) in the portion of Gadoversetamide taken by the formula:~~

~~$(66.16/W)[(V_{EU}M_E) - (V_{GB}M_G)]$,~~

~~in which W, V_{EU}, M_E, V_{GB} and M_G are as defined herein. If the *Test solution* was titrated with *0.003 M Gadolinium (III) titrant* and the *Blank solution* was titrated with *Edetate titrant,* calculate the percentage of free gadolinium (III) in the portion of Gadoversetamide taken by the formula:~~

~~$(66.16/W)[(V_{GU}M_G) - (V_{EB}M_E)]$,~~

~~in which W, V_{GU}, M_G, V_{EB}, and M_E are as defined herein.~~ Not more than 0.05% of free gadolinium III and not more than 0.1% of uncomplexed chelatable material, both calculated on the anydrous basis, are found.

Limit of 2-methoxyethylamine—

Mobile phase—~~Transfer~~ Add 2 mL of 5 M phosphoric acid to ~~a 1000-mL volumetric flask. Add~~ 550 mL of water, mix, and adjust with 10% (w/w) ammonium hydroxide to a pH of 5.0. Add 450 mL of acetonitrile, mix, filter, and degas.

0.4 M Borate buffer—~~Place~~ Add 12.4 g of boric acid ~~into a 1000-mL volumetric flask, add~~ to 300 mL of water, and swirl to suspend. Add 100 mL of 1 N potassium hydroxide, and mix. Adjust with about 60 mL of 1 N potassium hydroxide to a pH of 10.0, dilute with water to 500 mL, and mix. Test the pH, and adjust if necessary.

o-Phthalaldehyde reagent—Dissolve 25 mg of *o*-phthalaldehyde in 0.75 mL of methanol, add 25 mL of *0.4 M Borate buffer* having a pH of 10.0 and 25 µL of 2-mercaptoethanol, and mix. [NOTE—Protect from light. Discard after 3 days.]

In-Process Revision

Standard solutions—Prepare aqueous solutions of 2-methoxyethylamine having known concentrations of about 1, 20, and 50 µg per mL, respectively. Derivatize by adding an equal volume of *o-Phthalaldehyde reagent* to each solution immediately before injection.

Test solution—Transfer about 250 mg of Gadoversetamide, accurately weighed, to a 5-mL volumetric flask, and dissolve in and dilute with water to volume. Derivatize the solution by ~~adding 5 mL of *o-Phthalaldehyde reagent.*~~ combining equal volumes of *o-Phthalaldehyde reagent* and *Test solution* immediately before injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 335-nm detector and a 250-mm × 4.6-mm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solutions,* and record the chromatograms as directed for *Procedure:* the relative retention times of *o*-phthalaldehyde and 2-methoxyethylamine are about 0.6 and 1.0, respectively. Plot the concentration of 2-methoxyethylamine in each *Standard solution* versus its peak area, and perform a regression analysis to obtain a slope and an intercept. The correlation coefficient, *r,* is not less than 0.995, and the relative standard deviation for replicate injections of the 50 µg per mL *Standard solution* is not more than 5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Test solution* and the *Standard solutions* into the chromatograph, record the chromatograms, and measure the peak responses. Determine the concentration, in µg per mL, of 2-methoxyethylamine in the *Test solution* from the standard response line. Calculate the percentage of 2-methoxyethylamine by the formula:

$$0.5C/W,$$

in which C is the concentration, in µg per mL, of 2-methoxyethylamine obtained from the Standard response line; and W is the weight, in mg, of Gadoversetamide taken. Not more than 0.10% (w/w) of 2-methoxyethylamine is present, calculated on the anhydrous basis.

Limit of residual solvents—

Internal standard solution—~~Use butyl alcohol.~~ Dilute butyl alcohol with water (3:5000).

Standard solutions—~~Pipet 25, 100, 250, and 500 µL of isopropyl alcohol, each into a separate 5-mL volumetric flask. Add 1.0 µL of *Internal standard solution* to each of the four flasks, dilute with water to volume, and mix. The resulting four *Standard solutions* contain about 5, 20, 50, and 100 µg of isopropyl alcohol per mL. Pipet 25, 100, 250, and 500 µL of acetonitrile, each into a separate 5-mL volumetric flask. Add 1.0 µL of *Internal standard solution* to each of the four flasks,~~ To four separate 5-mL volumetric flasks, transfer the following designated compositions:

Flask	Isopropyl alcohol	Acetonitrile	Internal standard
1	25 µg	25 µg	1.0 mL
2	100 µg	100 µg	1.0 mL
3	250 µg	250 µg	1.0 mL
4	500 µg	500 µg	1.0 mL

Dilute each flask with water to volume, and mix. The resulting *Standard solutions* contain about 5, 20, 50, and 100 µg of isopropyl alcohol and acetonitrile per mL.

Test solution—Transfer about 500 mg of Gadoversetamide, accurately weighed, to a 5-mL volumetric flask. Add ~~1.0 µL~~ 1.0 mL of *Internal standard solution,* dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × ~~20-m~~ 30-m capillary column

In-Process Revision

with a 1.0-µm thickness of phase G35. Helium is used as the carrier gas at a flow rate of about 5 mL per minute. The column temperature is maintained at 35° for five minutes, then is increased at a rate of 15° per minute to 110°. The injection port temperature is maintained at 150°, and the detector temperature is maintained at 300°. Chromatograph the *Standard solutions,* and record the peak ~~responses~~ area ratios as directed for *Procedure:* the relative retention times are about ~~0.55~~ 0.5 for isopropyl alcohol, ~~0.77~~ 0.7 for acetonitrile, and 1.0 for butyl alcohol. Plot the concentration for each standard versus its peak area ratio, and perform a regression analysis. The correlation coefficient, *r,* is not less than 0.995 for each analyte; and the relative standard deviation for replicate injections of the 100 µg per mL *Standard solution* is not more than 5%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Test solution* and the *Standard solutions* into the chromatograph, record the chromatograms, and measure the peak ~~responses.~~ area ratios of the standard peak to the internal standard peak. Determine the concentration of isopropyl alcohol and acetonitrile from the respective standard response lines. Calculate the percentage (w/w) of each solvent in the portion of Gadoversetamide taken by the formula:

$$0.5C/W,$$

in which C is the concentration, in µg per mL, (obtained from the respective standard response line) of isopropyl alcohol and acetonitrile in the *Test solution;* and W is the weight (anhydrous), in mg, of the portion of Gadoversetamide taken: not more than 0.1% (w/w) of isopropyl alcohol is found; and not more than 0.025% (w/w) of acetonitrile is found. The total residual solvent content (sum of the %w/w isopropyl alcohol and of %w/w acetonitrile) does not exceed 0.1% w/w.

Related compounds—

Solution A—~~Transfer about~~ Dissolve 2.06 g of monobasic potassium phosphate and 18.6 mL of 20% w/w tetraethylammonium hydroxide in ~~a 1000-mL volumetric flask, and dilute with water to~~ 950 mL of water. Adjust with phosphoric acid to a pH of 7, dilute with water to ~~volume,~~ make 1000 mL, mix, filter, and degas.

Solution B: ~~acetonitrile.~~ Prepare a filtered and degassed mixture of *Solution A* and acetonitrile (475:25).

Mobile phase—~~Transfer about 2.06 g of monobasic potassium phosphate, 18.6 mL of 20% tetraethylammonium hydroxide, and 1.5 mL of acetonitrile to a 1000-mL volumetric flask, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 7, filter, and degas.~~ Use a mixture of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Stock standard solution—Transfer about 50 mg each of USP Gadoversetamide Related Compound A RS and USP ~~Gadoversetamide~~ Gadodiamide Related Compound B RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—The solution may be stored for a week.]

Standard solutions—Prepare aqueous solutions of diluted *Stock standard solution* containing about 25, 150, and 250 µg of each Reference Standard per mL.

Test solution—Transfer about 250 mg of Gadoversetamide, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a metal-free 4.6- × 150-mm column that contains 5-µm packing L1. The flow rate is 1 mL per minute. The chromatograph is programmed to pump a mixture of *Solution A* to *Solution B* ~~having a ratio of 99.85:0.15, respectively.~~ (97:3). ~~Proceed as directed in the *Assay,* except that~~ The

In-Process Revision

column is maintained at about 25°. The relative retention times are about ~~0.8~~ 0.6 for ~~gadoversetamide~~ gadodiamide related compound B and ~~1.0~~ 0.7 for gadoversetamide related compound A; the resolution, *R,* between ~~gadoversetamide~~ gadodiamide related compound B and gadoversetamide related compound A is not less than 1.0; and the relative standard deviation for replicate injections is not more than 5% for the 250 µg per mL *Standard solution.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Test solution* and the *Standard solutions* into the chromatograph. Allow 1 hour between injections to remove slow-eluting impurities. Determine the quantities, in ~~mg~~ µg per mL, of gadoversetamide related compound A and ~~gadoversetamide~~ gadodiamide related compound B from the respective Standard response lines. Calculate the percentage of gadoversetamide related compound A in the portion of Gadoversetamide taken by the formula:

$$100C/V,$$

in which C is the concentration of gadoversetamide related compound A, in µg per mL, obtained from the Standard response line; and V is the concentration of gadoversetamide, in µg per mL, in the *Test solution.* Not more than 1.0% (w/w) of gadoversetamide related compound A is found, calculated on the anhydrous basis. Calculate the percentage of ~~gadoversetamide~~ gadodiamide related compound B in the portion of Gadoversetamide taken by the following formula:

$$92.2C/V,$$

in which C is the concentration of ~~gadoversetamide~~ gadodiamide related compound B, in µg per mL, obtained from the Standard response line; and V is as described herein. Not more than 0.5% (w/w) of ~~gadoversetamide~~ gadodiamide related compound B is found, calculated on the anhydrous basis.

Assay—

Mobile phase—~~Transfer~~ Dissolve ~~15 mL of acetonitrile and~~ 1.5 g of boric acid ~~to a 1000-mL volumetric flask, dissolve in and dilute with water to volume,~~ in about 950 mL of water, and mix. Adjust with ammonium hydroxide to a pH of 6.8, add 15 mL of acetonitrile, dilute with water to ~~volume,~~ make 1000 mL, mix, filter, and degas.

Standard preparations—Prepare solutions of USP Gadoversetamide RS in *Mobile phase* having known concentrations of about 1.2, 1.0, and 0.8 mg per mL.

Assay preparation—Transfer about 100 mg of Gadoversetamide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a metal-free 4.6- × 250-mm column that contains 5-µm packing L1. The column temperature is maintained at about 50°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparations,* and record the peak responses as directed for *Procedure.* Plot the concentration of each Standard versus its peak area and perform a regression analysis to obtain a slope and intercept for the Standard response line. The correlation coefficient, *r,* is not less than 0.995; and the relative standard deviation for replicate injections of the 1.0 mg per mL *Standard preparation* is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Assay preparation* and *Standard preparations* into the chromatograph, record the chromatograms, and measure the area of the gadoversetamide peak. Determine the quantity, in mg per mL, of gadoversetamide from the Standard response line. Calculate the quantity, in % (w/w), of $C_{20}H_{34}GdN_5O_{10}$ in the portion of Gadoversetamide taken by the formula:

In-Process Revision

$$10{,}000C/W,$$

in which C is the concentration, in mg per mL, obtained from the Standard response line, and W is the weight (anhydrous), in mg, of the portion of Gadoversetamide taken to prepare the *Assay preparation.* ■2S (*USP27*)

Change to read:

Assay—

Standard preparation—Dissolve a suitable quantity of ~~USP Chorionic Gonadotropin RS~~

■USP Human Chorionic Gonadotropin RS.■2S (*USP27*) in a diluent consisting of saline TS, freshly prepared to contain 1 mg per mL of bovine serum albumin and adjusted with sodium hydroxide TS to a pH between 6.9 and 8.0, to obtain a solution having a known concentration of 10 USP Chorionic Gonadotropin Units in each mL. Using the same diluent, prepare three *Standard solutions* such that the respective concentrations of chorionic gonadotropin constitute a geometric series such as 1:1.2:1.44 or 1:2:4 and such that the activity in each mL lies within the range of 0.1 to 1.0 Unit.

Assay preparation—Following the procedure outlined for the *Standard preparation,* prepare solutions of Chorionic Gonadotropin to give three *Test solutions* corresponding to those of the standard.

The animals—Select 20- to 23-day-old female rats, but restrict the selection so that no rat is more than 30% heavier than the lightest. House the animals under uniform conditions of temperature, lighting, feeding, and watering. Mark the animals for identification, and divide them at random into groups of the same number but not less than 10 animals. Assign one group to each of the three *Standard solutions* and three *Test solutions,* respectively.

Procedure—Inject each rat subcutaneously in the dorsal area with 0.20 mL of the solution to which it was assigned, at approximately the same time on each of three consecutive days. On the afternoon of the fifth day, sacrifice the animals, and excise the uterus from each animal by cutting through the cervix, stripping off the surrounding tissue, and severing at the utero-tubal junction. Gently press out the uterine fluid on moistened absorbent paper, and weigh the uterus to the nearest 0.2 mg, using a suitable balance.

Calculation—Tabulate the observed uterine weight for each rat, designated by the symbol *y,* for each dosage group of *f* rats. Proceed as directed in the *Assay* under *Corticotropin Injection,* beginning with "If the data from one or more rats." Compute the log confidence interval *L* (see *Confidence Intervals for Individual Assay* ⟨111⟩). If the confidence interval is more than 0.1938, which corresponds at $P = 0.95$ to confidence limits of 80% and 125% of the computed potency, repeat the assay until the combined data of two or more assays, redetermined as described under *Combination of Independent Assays* ⟨111⟩, meet this limit.

Change to read:

pH, Chloride, ~~Sulfate,~~

■■2S (*USP27*)

Iron, and Reducing sugars—Dissolve 10.0 g in 20 mL of boiling water in a 100-mL volumetric flask, allow to cool, dilute with water to volume, and mix. Use the solution for the following tests.

pH ⟨791⟩—The pH of the solution is between 4.5 and 7.0.

Chloride ⟨221⟩—A 10-mL portion of the solution shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.014%).

~~*Sulfate*—To 10 mL of the solution add 1 mL of barium chloride TS: no turbidity is produced.~~

■■2S (*USP27*)

Iron—To 10 mL of the solution add 0.5 mL of hydrochloric acid and 3 drops of potassium ferrocyanide TS: the solution does not become blue within 1 minute.

Reducing sugars—To 2 mL of the solution add 5 mL of alkaline cupric tartrate TS: no reduction occurs at room temperature, and only slight reduction occurs after one minute of boiling.

Add the following:

■**Sulfate** ⟨221⟩—A 1.0 g portion shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid (0.05%). [NOTE—Inulin should be dissolved in 30 to 40 mL of water with gentle warming, prior to dilution to final volume.]■2S (*USP27*)

BRIEFING

Iohexol, *USP 26* page 996. Based on the comments received, it is proposed to rephrase the purity requirements in the *Related compounds* section.

(RMI: A. Wilk) RTS—39887-1

Change to read:

Related compounds—

Solution A: acetonitrile.

Solution B: water.

Mobile phase—Use variable mixtures of a degassed mixture of *Solution A* and *Solution B* as directed for *Chromatographic system.*

System suitability solution—Dissolve accurately weighed quantities of USP Iohexol RS, USP Iohexol Related Compound A RS, and USP Iohexol Related Compound C RS in water to obtain a solution having known concentrations of about 1.5, 0.0075, and 0.0069 mg per mL, respectively.

Test solution—Transfer 75.0 mg of Iohexol, accurately weighed, to a 50-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm stainless steel column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed to provide variable mixtures of *Solution A* and *Solution B:* the percentage of *Solution A* increases from 1% to 13% at an increase rate of 0.2% per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the retention time for the *O*-alkylated compounds is between 1.1 and 1.4 relative to 1.0 for the *exo*-isomer of iohexol; the resolution, *R,* between iohexol related compound A and iohexol related compound C is not less than 20.0; and the peak area of iohexol related compound C is 0.5% ± 0.1% by comparison to the total area of all of the peaks in the chromatogram.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of *O*-alkylated compounds

In-Process Revision

■and any other individual impurity peak, excluding peaks with a retention time between 0.84 relative to the *endo*-isomer of iohexol (first main peak) and the *endo*-isomer of iohexol,■2S (*USP27*)
in the portion of Iohexol taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the response of each impurity; and r_s is the sum of the responses of all of the peaks: not more than 0.1% of any individual impurity is found; not more than 0.6% *O*-alkylated compounds is found; and the sum of all impurities,

■other than *O*-alkylated compounds,■2S (*USP27*)
is not more than 0.3%.

Add the following:

BRIEFING

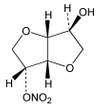
Diluted Isosorbide Mononitrate, page 829 of *PF* 29(3) [May–June 2003]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision*.

(PA5: A. Wilk) RTS—39903-1

Add the following:

■Diluted Isosorbide Mononitrate



$C_6H_9NO_6$ 191.14

D-Glucitol, 1,4:3,6-dianhydro-, 5-nitrate.

1,4:3,6-Dianhydro-D-glucitol 5-nitrate [*16051-77-7*].

» Diluted Isosorbide Mononitrate is a dry mixture of isosorbide mononitrate ($C_6H_9NO_6$) with lactose or other suitable excipients to permit safe

In-Process Revision

handling. It contains not less than 87.5 percent and not more than 92.5 percent (w/w) of isosorbide mononitrate ($C_6H_9NO_6$).

Packaging and storage—Preserve in tight containers. Store at a temperature between 20° and 30°.

USP Reference standards ⟨11⟩—*USP Diluted Isosorbide Dinitrate RS. USP Isosorbide RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

pH ⟨791⟩: between 4.8 and 6.5. To prepare the test solution, dissolve 5.6 g of Diluted Isosorbide Mononitrate in 50 mL of boiling water, sonicate for 5 minutes, and allow to cool to room temperature.

Water, *Method I* ⟨921⟩: between 0.4% and 0.8%. Proceed as directed for hygroscopic materials. To 1.0 g of sample, accurately weighed, add 5 mL of methanol, shake for 30 minutes, and centrifuge at about 2500 rpm for 5 minutes. Use 1.0 mL of the resulting supernatant.

Residue on ignition ⟨281⟩: not more than 0.1%. [*Caution—Material is explosive upon heating; digest the sample thoroughly before ignition.*]

Heavy metals, *Method I* ⟨231⟩: not more than 10 µg per g.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of absolute alcohol and toluene (8:2).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of

In-Process Revision

the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 0.5% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1:1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Isosorbide mononitrate related compound A standard solution—Prepare as directed for *Isosorbide mononitrate related compound A standard preparation* in the *Assay.*

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL.

Standard solution—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard solution* and a volume of *Isosorbide dinitrate standard stock solution,* and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of USP Isosorbide Mononitrate RS per mL, 0.005 mg of isosorbide mononitrate related compound A per mL, and 0.005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$5556(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the appropriate Reference Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution; W* is the weight, in mg, of Diluted Isosorbide Mononitrate used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding components obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(r_i/r_s),$$

in which r_i is the peak area for each other impurity obtained from the *Test solution,* and r_s is the sum of the areas of all the peaks: not more than 0.5% of total impurities is found including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than 0.5% of total impurities is found, the results for *Test 1* and *Test 2* being considered.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg per mL.

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

Resolution solution—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* 1.0 mL of *Standard preparation,* and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation—Transfer about 110 mg of Diluted Isosorbide Mononitrate, accurately weighed, to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

In-Process Revision

BRIEFING

Isosorbide Mononitrate Tablets, page 936 of *PF* 28(3) [May–June 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision* with the addition of storage instructions added to the *Packaging and storage* section similar to those in the *Diluted Isosorbide Mononitrate* monograph.

(PA5: A. Wilk) RTS—39903-2

Add the following:

■Isosorbide Mononitrate Tablets

» Isosorbide Mononitrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate ($C_6H_9NO_6$).

Packaging and storage—Preserve in tight containers. Store at a temperature between 20° and 30°.

USP Reference standards ⟨11⟩—*USP Diluted Isosorbide Dinitrate RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A RS. USP Isosorbide RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 120 mg of isosorbide mononitrate, to a suitable container, add 50.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Quantitatively dilute the supernatant (10 in 50) with absolute alcohol.

Standard solution: 0.5 mg USP Isosorbide Mononitrate RS per mL in absolute alcohol.

Application volume: 20 µL.

Developing solvent system: a mixture of chloroform and methanol (95:5).

Spray reagent: Dissolve 1 g of soluble starch in 100 mL of boiling water. Cool, add 0.5 g of potassium iodide, and mix to dissolve.

Procedure—Examine the plate under short-wave UV light, marking any observed spots. Visualize nitrates on the plate by spraying with *Spray reagent* and illuminating with short-wave UV light for about 10 minutes. Isosorbide mononitrate and other nitrates appear as a violet spot on a white to light violet background.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—[To come.]

Uniformity of dosage units ⟨905⟩: meet the requirements for *Content Uniformity.*

Related compounds—

TEST 1—

Adsorbent, Standard solution 1, Standard solution 2, Standard solution 3, Application volume, and *Developing solvent system*—Prepare as directed in *Related compounds, Test 1* under *Diluted Isosorbide Mononitrate.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in

500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 1.0% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1:1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase and *Resolution solution*—Proceed as directed in the *Assay.*

Isosorbide mononitrate related compound A standard stock solution—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg of isosorbide mononitrate related compound A per mL.

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg of isosorbide dinitrate per mL.

Standard solution—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard stock solution* and a volume of *Isosorbide dinitrate standard stock solution,* and dilute with water to volume to obtain a solution having a known concentration of about 0.1 mg of USP Isosorbide Mononitrate RS per mL, 0.0005 mg of isosorbide mononitrate related compound A per mL, and 0.0005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Compare the peak areas of the corresponding impurity obtained from the *Test solution* and the *Standard solution,* respectively. The average peak area of the impurity in the *Test solution* is less than or equal to the average peak area of the corresponding peak in the *Standard solution:* not more than 0.5% of isosorbide mononitrate related compound A is found; and not more than 0.5% of isosorbide dinitrate is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Resolution solution—Prepare a solution of USP Isosorbide Mononitrate RS and USP Isosorbide Mononitrate Related Compound A RS having a concentration of 0.0005 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of isosorbide mononitrate, to a 200-mL volumetric flask, add 100 mL of water, and sonicate for about 10 minutes. Dilute with water to volume, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Isosorbide Mononitrate Extended-Release Tablets, page 832 of *PF* 29(3) [May–June 2003]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision*.

(PA5: A. Wilk) RTS—39903-3

Add the following:

■Isosorbide Mononitrate Extended-Release Tablets

» Isosorbide Mononitrate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate ($C_6H_9NO_6$).

Packaging and storage—Preserve in tight containers. Store at a temperature between 20° and 30°.

Labeling—[To come.]

In-Process Revision

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Drug release ⟨724⟩—[To come.]

Uniformity of dosage units ⟨905⟩: meet the requirements for *Content Uniformity.* Proceed as directed in the *Assay,* except to use one Tablet in place of the portion of powdered tablets used in the *Assay preparation.*

~~**Water,** *Method I* ⟨921⟩: not more than 5.0%.~~

~~*Test solution*—Weigh and finely powder 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to one Tablet, accurately weighed, to a suitable container. Add 5.0 mL of methanol, shake for 45 minutes, and then centrifuge at about 4000 rpm for 10 minutes. Use 0.25 mL of the resulting supernatant, correcting for the blank.~~

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate to a suitable flask containing 20.0 mL of acetonitrile. Sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of toluene, ethyl acetate, and isopropyl alcohol (53:32:15).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 1% of any individual impurity is found. [NOTE—The R_F values of isosorbide and isosorbide mononitrate are about 0.2 and 0.6, respectively.] If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1:1) with acetonitrile, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

In-Process Revision

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard stock solution—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.3 mg per mL.

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.15 mg of isosorbide dinitrate per mL.

Standard stock solution—Transfer 2.0 mL of *Isosorbide mononitrate related compound A standard stock solution* and 4.0 mL of *Isosorbide dinitrate standard stock solution* to a 100-mL volumetric flask. Dilute with water to volume, and mix.

Standard solution—Transfer about 24 mg of USP Isosorbide Mononitrate RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Standard stock solution*, add 20 mL of methanol, and dilute with water to volume.

Resolution solution—Transfer 10.0 mL of *Standard stock solution* and 20 mL of methanol to a 100-mL volumetric flask. Dilute with water to volume, and mix.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 50-mL volumetric flask, add 40 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant (10 in 50) with water. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R*, between the isosorbide mononitrate related compound A and the isosorbide mononitrate is not less than 1.0. [NOTE—The relative retention times are about 0.9 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 5.6 for isosorbide dinitrate.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate in the portion of Tablets taken by the formula:

$$25(C/W)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of the appropriate Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution; W* is the weight, in mg, of isosorbide mononitrate in the sample used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding component obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the

In-Process Revision

percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Tablets taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area for each other impurity obtained from the *Test solution,* and r_s is the sum of the areas of all the peaks: not more than 0.25% of total other impurities is found and not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (8:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.15 mg per mL.

Resolution solution—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, equivalent to about 30 mg of isosorbide mononitrate, to a 250-mL volumetric flask. Dissolve in water, add 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* add 50 mL of methanol, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.12 mg of isosorbide mononitrate per mL and about 0.006 mg of isosorbide mononitrate related compound A per mL.

Standard preparation—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, add a portion of methanol equivalent to about 20% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 50 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant (10 in 50) with water. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S),$$

In-Process Revision

in which *C* is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

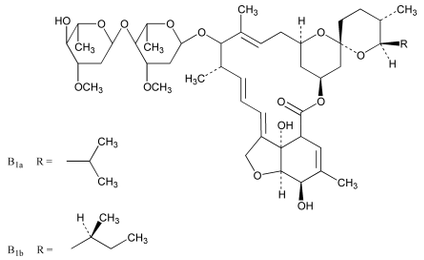
BRIEFING

Ivermectin, page 1135 of *PF* 28(4) [July–Aug. 2002]. On the basis of comments received, it is proposed to revise the specifications for *Related compounds* by giving more explicit limits for the impurities.

(VET: I. DeVeau) RTS—39719-1

Add the following:

■Ivermectin



$C_{48}H_{74}O_{14}$ (Component ~~B_{1a}~~ H_2B_{1a}) 875.10

$C_{47}H_{72}O_{14}$ (Component ~~B_{1b}~~ H_2B_{1b}) 861.07

~~Component B_{1a}: Avermectin A_{1a}, 5-*O*-22,23-dihydro-5-*O*-demethyl-22,23-dihydroavermectin A_{1a}~~ [~~*70161-11-4*~~].

~~Component B_{1b}: Avermectin A_{1b}, 5-*O*-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-5-*O*-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)avermectin A_{1b}~~ [~~*70209-81-3*~~].

~~Ivermectin~~ [~~*70288-86-7*~~].

Component H_2B_{1a}:

Avermectin A_{1a}, 5-*O*-demethyl-22,23-dihydro-.

(2a*E*,4*E*,8*E*)-(5′*S*,6*S*,6′*R*,7*S*,11*R*,13*R*,15*S*,17a*R*,20*R*,20a*R*,20b*S*)-6′-(*S*)-*sec*-Butyl-3′,4′,5′,6,6′,7,10,11,14,15,17a,20,20a,20b-tetradecahydro-20,20b-dihydroxy[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2′-[2*H*]pyran]-7-yl 2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranoside [*70161-11-4*].

Avermectin A_{1a}, 5-*O*-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-.

(2a*E*,4*E*,8*E*)-(5′*S*,6*S*,6′*R*,7*S*,11*R*,13*R*,15*S*,17a*R*,20*R*,20a*R*,20b*S*)-3′,4′,5′,6,6′,7,10,11,-oxospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2′[2*H*]pyran]-7-yl 2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranoside [*70209-81-3*].

~~» Ivermectin is a mixture of 5-*O*-demethyl-22,23-dihydroavermectin A_{1a} (component B_{1a}) and 5-*O*-demethyl-25-de(1-methylpropyl)-22, 23-dihydro-25-(1-methylethyl)avermectin A_{1b} (component B_{1b}). It contains not less than 95.0 percent of component B_{1b} plus component B_{1a}, calculated on the water-, ethanol-alcohol-, and formamide-free basis.~~

» Ivermectin is a mixture of Avermectin A_{1a}, 5-*O*-demethyl-22,23-dihydro-(component H_2B_{1a}) and Avermectin A_{1a}, 5-*O*-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-(component H_2B_{1b}). It contains not less than 90.0 percent of component H_2B_{1a}, and the

In-Process Revision

sum of component H_2B_{1a} plus component H_2B_{1b} is not less than 95.0 percent and not more than 100.5 percent, calculated on the anhydrous and alcohol- and formamide-free basis. It may contain ~~a~~ small amounts of suitable antioxidant and chelating agents.

Packaging and storage—Preserve in tight containers.

Labeling—If it is intended for veterinary use only, it is so labeled. Label it to state the name(s) and amount(s) of any added substance(s). Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards ⟨11⟩—*USP Ivermectin RS.*

Clarity of solution—Transfer 1 g to a 50-mL volumetric flask, dissolve in and dilute with toluene to volume, and mix: the solution is clear.

Color of solution—Pass a portion of the solution prepared in the test for *Clarity of solution* through a fine-porosity, sintered-glass filter. Determine the absorbance of the filtrate at 440 nm in a 1-cm cell using toluene as the blank: the absorbance is not more than $0.024(1–0.01V)$, in which V is the sum of the percentages of water, alcohol, and formamide in the Ivermectin taken.

Identification—

A: ~~The chromatogram of the *Assay preparation*, obtained as directed in the *Assay*, exhibits major peaks for component B_{1a} and component B_{1b}, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*, and the ratio of component B_{1a} to component B_{1b} is not less than 9.0:1–9.0:1.0.~~ *Infrared Absorption* ⟨197K⟩.

B: ~~*Ultraviolet Absorption* ⟨197U⟩—~~

~~*Solution:* 20 µg per mL.~~

~~*Medium:* methanol. The spectrum exhibits maxima at about 238 nm and 245 nm and a shoulder at about 253 nm, and the absorptivity at the wavelength of maximum absorption at about 245 nm is between 37.2 and 39.2, calculated on the water-, ethanol- alcohol-, and formamide-free basis.~~ The retention times of the component H_2B_{1a} peak and the component H_2B_{1b} peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

~~**Clarity and color of solution**—Dissolve 1.0 g of it in toluene to obtain 50 mL of solution: the solution is clear and its absorbance at 440 nm in a 1-cm cell is not more than 0.024, toluene being used as the blank.~~

Specific rotation ⟨781S⟩: between –17° and –20°, ~~determined at 20° and~~ calculated on the water-, ~~ethanol-~~ alcohol-, and formamide-free basis.

Test solution: ~~25~~ 5 mg per mL, in methanol.

Water, *Method I* ⟨921⟩: not more than 1.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Limit of ethanol alcohol and formamide—

~~*Standard solutions*—Transfer 3.0 mL of dehydrated alcohol to a 100 mL volumetric flask, dilute with water to volume, and mix (*Solution A*). Transfer 1.0 mL of formamide to a 100 mL volumetric flask, dilute with water to volume, and mix (*Solution B*). Transfer 3.0 mL of *Solution A* and 3.0 mL of *Solution B* to a 100 mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of ethanol alcohol and formamide of 0.0009 and 0.0003 mL per mL, respectively (*Solution C*). Transfer 8.0 mL of *Solution A* and 8.0 mL of *Solution B* to a 100 mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of ethanol alcohol and formamide of 0.0024 and 0.0008 mL per mL, respectively (*Solution D*). Transfer 4.0 mL of *Solution C* and 4.0~~

In-Process Revision

~~mL of *Solution D* to separate 15-mL centrifuge tubes, add 2.0 mL of *m*-xylene to each tube, stopper, mix, centrifuge, and discard the upper *m*-xylene layers. The retained lower layers are *Standard solutions C* and *D*.~~

~~*Test solution*—Transfer 120 mg of Ivermectin, accurately weighed, to a 15-mL centrifuge tube, and dissolve in 2.0 mL of *m*-xylene. Add 2.0 mL of water, mix, and centrifuge. Transfer the *m*-xylene layer to a 15-mL centrifuge tube, and extract again with 2.0 mL of water. Discard the *m*-xylene layer, and combine the two aqueous layers to obtain the *Test solution*.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 1.8-m × 3.2-mm column packed with 80- to 100-mesh support S2. The injection port is maintained at about 190°, and the detector is maintained at about 250°. Helium is used as the carrier gas at a flow rate of about 40 mL per minute. The column is maintained at about 150° for 12 minutes after injection, then raised at a rate of 20° per minute to 180°, and then held for 20 minutes.~~

~~*Procedure*—Separately inject equal volumes (about 2 µL) of *Standard solutions C* and *D* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ethanol-alcohol and formamide peak responses. Plot the peak responses for ethanol alcohol and formamide versus concentrations, in mL per mL, of ethanol alcohol and formamide, respectively, obtained from *Standard solutions C* and *D*. From the graphs so obtained, determine the concentrations of ethanol alcohol and formamide in the *Test solution*.[NOTE—In the event that the peak responses of the *Test solution* are significantly outside the ranges of peak responses obtained with *Standard solutions C* and *D*, prepare additional *Standard solutions*, and chromatograph them to obtain peak responses bracketing those obtained with the *Test solution*.] Calculate the percentages of ethanol alcohol and formamide in the portion of Ivermectin taken by the formula:~~

$$~~400{,}000Cd/W~~,$$

~~in which *C* is the concentration of ethanol alcohol or formamide, in mL per mL, of the *Test solution*, *d* is the density of ethanol alcohol (0.79) or formamide (1.13), and *W* is the weight, in mg, of Ivermectin taken: not more than 5.0% of ethanol alcohol (C_2H_5OH) and 3.0% of formamide are found.~~

Internal standard solution—Dilute 0.5 mL of isopropyl alcohol with water to 100 mL, and mix.

Standard solution 1—Transfer ~~3.0~~ 2.0 mL of dehydrated alcohol to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solution 2—Transfer 1.0 mL of formamide to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solution 3—Transfer 5.0 mL of *Standard solution 1* and 5.0 mL of *Standard solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of formamide and alcohol of 0.001 and ~~0.003~~ 0.002 mL per mL, respectively. Transfer 2.0 mL of this solution to a 15-mL centrifuge tube, add 2.0 mL of *m*-xylene, insert the stopper, mix, and centrifuge. Remove the upper *m*-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and mix. Each mL of this solution contains about ~~0.0012~~ 0.0008 mL of alcohol and 0.0004 mL of formamide.

Standard solution 4—Transfer 10.0 mL of *Standard solution 1* and 10.0 mL of *Standard solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of alcohol and formamide of ~~0.006~~ 0.004 and 0.002 mL per mL, respectively. Transfer

In-Process Revision

2.0 mL of this solution to a 15-mL centrifuge tube, add 2.0 mL of *m*-xylene, insert the stopper, mix, and centrifuge. Remove the upper *m*-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and mix. Each mL of this solution contains about ~~0.0024~~ 0.0016 mL of alcohol and 0.0008 mL of formamide.

Test solution—Transfer 120 mg of Ivermectin, accurately weighed, to a 15-mL centrifuge tube, and dissolve in 2.0 mL of *m*-xylene, heating in a water bath at 45 ± 5°, if necessary. Add 2.0 mL of water, mix, and centrifuge. Transfer the *m*-xylene layer to a 15-mL centrifuge tube, and extract with 2.0 mL of water. Discard the upper *m*-xylene layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused-silica analytical column coated with a 3-µm G43 stationary phase. The carrier gas is helium, with a 1:5 split ratio and a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at about 40° for 5 minutes after injection, and then increased at a rate of 20° per minute to 180°, and maintained at 180° for 2 minutes. The injection port temperature is maintained at about 140°, and the detector temperature is maintained at about 250°.

Procedure—Separately inject equal volumes (about 2 µL) of *Standard solution 3*, *Standard solution 4*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for alcohol, formamide, and isopropyl alcohol. Plot the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol versus concentrations, in mL per mL, of alcohol and formamide, respectively, obtained from *Standard solution 3* and *Standard solution 4*. From the graphs so obtained, and using the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol obtained from the chromatogram of the *Test solution*, determine the concentrations, *C*, of alcohol and formamide in the *Test solution*. [NOTE—In the event that the peak responses of the *Test solution* are significantly outside the ranges of peak responses obtained from *Standard solution 3* and *Standard solution 4*, prepare additional *Standard solutions*, and chromatograph them to obtain peak responses bracketing those obtained with the *Test solution*.] Calculate the percentages of alcohol and formamide in the portion of Ivermectin taken by the formula:

$$500{,}000CD/W,$$

in which *C* is the concentration of alcohol or formamide, as appropriate, in mL per mL, in the *Test solution; D* is the density of alcohol (0.79) or formamide (1.13); and *W* is the weight, in mg, of Ivermectin taken: not more than 5.0% of alcohol and 3.0% of formamide is found.

Related ~~substances~~ compounds~~—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of each related substance compound in the Ivermectin taken by the formula:~~

~~$100r_i/r_t$,~~

~~in which r_i is the response of each individual peak, except those of component B_{1a} and component B_{1b}, and r_t is the sum of the responses of all of the peaks in the chromatogram. Not more than 2% of any individual related substance compound is found, and the sum of all related substances is not more than 4%.~~

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard stock solution—Proceed as directed for *Standard preparation* in the *Assay.*

In-Process Revision

Standard solution 1—Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Standard solution 2—Transfer 5.0 mL of *Standard solution 1* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 20 µL) of *Standard solution 1*, *Standard solution 2*, and the *Test solution* into the chromatograph, record the chromatogram of the *Test solution* for a period of time equivalent to twice the retention time of the ~~principal~~ main peak in the chromatogram obtained from *Standard solution 1*, and measure the ~~responses for the major peaks. In the chromatogram obtained from the *Test solution*, the area of any peak with a retention time of 1.3 to 1.5 about 1.2 to 1.4, relative to the principal peak, is not greater than twice 2.5 times the area of the principal peak in the chromatogram obtained from *Standard solution 1* (2.0% 2.5%); the area of any other peak, aside from the two principal peaks, is not greater than the area of the principal peak in the chromatogram obtained from *Standard solution 1* (1.0%); and the sum of the areas of all the peaks, apart from the two principal peaks, is not greater than four times the area of the principal peak in the chromatogram obtained from *Standard solution 1* (4.0%) (4%). Disregard any peak with an area less than that of the principal peak in the chromatogram of *Standard solution 2* (0.05%).~~ peak areas. Calculate the percentage of each impurity by the formula:

$$100r_i/(r_s - r_b)$$

in which r_i is the peak area for each individual impurity in the *Test solution* chromatogram; r_s is the sum of all peaks in the *Test solution* chromatogram; and r_b is the total area of all peaks in a blank chromatogram: not more than 2.5% is found for the sum of all peaks with a relative retention time of about 1.3 to 1.4 (corresponding to H_4B_{1a} isomers and $\Delta^{2,3}$ H_2B_{1a}); not more than 1% is found for the peak with a relative retention time of about 0.7 (corresponding to 8a-oxo-H_2B_{1a}); not more than 0.7% is found for the peak with a relative retention time of about 0.5 (corresponding to Avermectin B_{1a}); not more than 0.5% is found for any other individual impurity peak; not more than 1% is found for the sum of all other individual peaks; and not more than 4% is found for the sum of the areas of all the peaks, apart from the two main peaks (H_2B_{1a} and H_2B_{1b}). Disregard any peak with an area less than that of the two main peaks (H_2B_{1a} and H_2B_{1b}) in the chromatogram of *Standard solution 2* (0.05%).

Assay—

~~*Mobile phase*—Prepare a mixture of acetonitrile, methanol, and water (530:350:120), filter through a filter having a porosity of 1 µm or less, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Ivermectin RS quantitatively in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.~~

~~*Assay preparation*—Transfer about 40 mg of Ivermectin, accurately weighed, to a 100-mL volumetric flask, dissolve in methanol, dilute with *Mobile phase* to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: component B_{1b} is eluted at a retention time of about 14 minutes, followed by component B_{1a} at a retention time of about 17 minutes. The resolution, *R*, between the peaks for component B_{1b} and~~

In-Process Revision

~~component B_{1a} is not less than 3.0, the column efficiency determined from the component B_{1a} peak is not less than 2000 theoretical plates, the tailing factor for the component B_{1a} peak is not more than 2.5, and the relative standard deviation of the peak responses for component B_{1a} for replicate injections is not more than 1.0%.~~

~~*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms over a period of time that is twice the retention time of the peak for component B_{1a}, and measure the peak responses for component B_{1a} and component B_{1b}. Calculate the percentage of component B_{1a} plus component B_{1b} in the portion of Ivermectin taken by the formula:~~

~~$$100(CP/W)(r_U/r_S),$$~~

~~in which C is the concentration, in mg per mL, of USP Ivermectin RS in the *Standard preparation*, P is the designated percentage of the sum of component B_{1a} and component B_{1b} in the USP Ivermectin RS, W is the weight, in mg, of Ivermectin taken to prepare the *Assay preparation*, and r_U and r_S are the sums of the peak responses for component B_{1a} and component B_{1b} obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

Mobile phase—Prepare a mixture of acetonitrile, methanol, and water (53:35:12), pass through a filter having a 1-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). Increasing the proportion of water increases the elution times and allows better separation of impurities.

Standard preparation—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution having a known concentration of about 0.8 mg per mL.

Assay preparation—Transfer about 80 mg of Ivermectin, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Sonicate, if necessary.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for component H_2B_{1b} and 1.0 for component H_2B_{1a}; the resolution, R, between component H_2B_{1b} and component H_2B_{1a} is not less than 3.0; the column efficiency determined from the component H_2B_{1a} peak is not less than 5000 theoretical plates; the tailing factor for component H_2B_{1a} peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.0% determined from the component H_2B_{1a} peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for component H_2B_{1a} and component H_2B_{1b}. Calculate the quantity, in mg, of component H_2B_{1a} ($C_{48}H_{74}O_{14}$) and component H_2B_{1b} ($C_{47}H_{72}O_{14}$) in the portion of Ivermectin taken by the formula:

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of component H_2B_{1a} or component H_2B_{1b} in the *Standard preparation;* and r_U and r_S are the peak responses for component H_2B_{1a} or component H_2B_{1b} obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■2S (*USP27*)

BRIEFING

Lovastatin, *USP 26* page 1099. On the basis of the comments and toxicological data received, it is proposed to change the *Limit of Lovastatin related compound A* to 0.5%. This limit is representative of marketed products. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Sixth Interim Revision Announcement* pertaining to *USP 26–NF 21,* with an official date of December 1, 2003.

(PA4: E. Gonikberg) RTS—40148-1

Change to read:

▲**Limit of Lovastatin related compound A—**

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.01 M phosphoric acid (13:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Lovastatin RS and USP Lovastatin Related Compound A RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution containing 2.0 µg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2.0 µg per mL.

Test solution—Transfer about 25 mg of Lovastatin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for lovastatin and 1.3 for lovastatin related compound A; and the resolution, *R,* between lovastatin and lovastatin related compound A is not less than 6.0. Chromato-

graph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of lovastatin related compound A in the portion of Lovastatin taken by the formula:

$$2.5F(C/W)(r_U/r_S),$$

in which F is the response factor for lovastatin related compound A and is equal to 1.6; C is the concentration, in µg per mL, of USP Lovastatin RS in the *Standard solution;* W is the weight, in mg, of Lovastatin in the *Test solution;* r_U is the peak response for lovastatin related compound A obtained from the *Test solution;* and r_S is the peak response for lovastatin obtained from the *Standard solution:* not more than ~~0.2%~~

•0.5%•6
of lovastatin related compound A is found.▲*USP26*

In-Process Revision

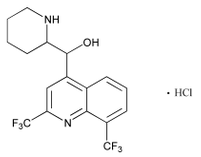
BRIEFING

Mefloquine Hydrochloride. Because there is currently no *USP* monograph for this drug substance, a new monograph is being proposed. The test for *Related compounds* is based on data obtained with a 4.0-mm × 25-cm LiChrospher 100 (Merck) column that contains 5-µm packing L1. Typical retention times are about 2 minutes for quinidine, 4 minutes for mefloquine, 15 minutes for related compound B, and 36 minutes for related compound A.

(PA7b: B. Davani) RTS—38976-1

Add the following:

■Mefloquine Hydrochloride



$C_{17}H_{16}F_6N_2O \cdot HCl$ 414.77

4-Quinolinemethanol, α-2-piperidinyl-2,8-bis(trifluoromethyl)-, monohydrochloride, (*R**,*S**)- (±)-.

DL-*erythro*-α-2-Piperidyl-2,8-bis(trifluoromethyl)-4-quinolinemethanol monohydrochloride [*51773-92-3*].

» Mefloquine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_{17}H_{16}F_6N_2O \cdot HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Mefloquine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It responds to the tests for *Chloride* ⟨191⟩.

Specific rotation ⟨781⟩: between –0.2° and +0.2°. Use a solution prepared by dissolving about 2.5 g in methanol, and dilute with methanol to 50.0 mL.

Water, *Method I* ⟨921⟩: not more than 3.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Related compounds—

Mobile phase—Dissolve 1 g of tetraheptylammonium bromide in a mixture of methanol, 1.5 g per L solution of sodium hydrogen sulfate, and acetonitrile (1:2:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 8 mg of USP Mefloquine Hydrochloride RS and 8 mg of quinidine sulfate to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 0.10 g of Mefloquine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 20-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a 4-mm × 2.5-cm precolumn, and a 4.0-mm × 25-cm column, both containing 5-µm packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5

In-Process Revision

for quinidine and 1.0 for mefloquine; the resolution, *R,* between the quinidine peak and the mefloquine peak is not less than 8.5; and the relative standard deviation for replicate injections is not more than 3%.

Procedure—Equilibrate the column with *Mobile phase* at a flow rate of about 2 mL per minute for about 30 minutes. Inject 20 µL of *Diluted test solution*. Adjust the sensitivity of the system so that the height of the major peak is at least 50% of the full scale of the recorder. Separately inject equal volumes (about 20 µL) of the *Test solution* and *Diluted test solution* into the chromatograph, record the chromatogram for a time that is 10 times the retention time of the main peak, and measure the responses of all peaks, excluding the main peak and any other peak producing a response of less than 0.2 times (0.02%) of the main peak in chromatogram of the *Diluted test solution*. The response of any peak in the *Test solution* with a relative retention time of about 0.7, with reference to the main peak, is not more than twice the area of the main peak in the chromatogram of the *Diluted test solution* (0.2%). The response of any other individual peak, other than the main peak in the chromatogram of the *Test solution,* is not greater than that of the main peak in the chromatogram of the *Diluted test solution* (0.1%), and the sum of the responses of any such peaks in the chromatogram of *Test solution* is not greater than five times the response of the main peak in the chromatogram of the *Diluted test solution* (0.5%).

Assay—Dissolve about 0.35 g, accurately weighed, in 15 mL of anhydrous formic acid, and add 40 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, and determine the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.48 mg of $C_{17}H_{16}F_6N_2O \cdot HCl$.■2S *(USP27)*

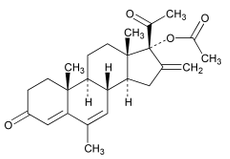
BRIEFING

Melengestrol Acetate. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The test for *Limit of residual solvents* uses gas chromatography with flame-ionization detection based on analyses performed with the Tianjing No. 2 Chemical Reagent Factory GDX-101 brand of 3-mm × 2-m stainless steel column packed with S3 porous, uncoated polymeric beads. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a Waters Symmetry Shield TM RP8 brand of 4.6-mm × 25.0-cm, 5-µm particle size L7 column. Interested parties are encouraged to validate the analytic methods using other chromatographic columns and submit comments to the USP Expert Committee on Veterinary Drugs (Standards).

(VET: I. DeVeau) RTS—39413-1; 39498-1; 39562-1

Add the following:

■Melengestrol Acetate



$C_{25}H_{32}O_4$ 396.52

Pregna-4,6-diene-3,20-dione, 17-(acetyloxy)-6-methyl-16-methylene-.

17-Hydroxy-6-methyl-16-methylenepregna-4,6-diene-3,20-dione acetate [*2919-66-6*].

» Melengestrol Acetate contains not less than 97.0 percent and not more than 103.0 percent of $C_{25}H_{32}O_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—*USP Melengestrol Acetate RS. USP Melengestrol Acetate Related Compound A RS. USP Melengestrol Acetate Related Compound B RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 10 µg per mL.

Medium: alcohol.

C: The retention time of the melengestrol acetate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Melting temperature ⟨741⟩: between 219° and 226°.

Specific rotation ⟨781S⟩: between –132.0° and –122.0°, at 20°.

Test solution: 10.0 mg per mL, in chloroform.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Heavy metals, *Method II* ⟨231⟩: not more than 0.001%.

Limit of residual solvents—

Standard solution—Separately and accurately transfer 2.5 mL of dehydrated alcohol, 5.5 mL of ethyl acetate, 0.5 mL of dichloromethane, and 0.4 mL of dioxane into a 100-mL volumetric flask. Mix, and dilute with dimethylformamide to volume. Pipet 5 mL of this solution into another 50-mL volumetric flask, mix well, and dilute with dimethylformamide to volume.

Test solution—Weigh accurately about 500 mg of Melengestrol Acetate, and transfer to a 5-mL volumetric flask, add a suitable amount of dimethylformamide, and sonicate for 5 minutes until completely dissolved. Dilute with dimethylformamide to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m stainless steel column packed with S3 porous polymeric beads, 60–80 mesh size. The temperature of the injector port, column, and detector are maintained at 200°, 155°, and 250°, respectively. The carrier gas is nitrogen, flowing at a rate of 60 mL per minute. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the elution order is alcohol, dichloromethane, ethyl acetate, dioxane, and dimethylformamide. The resolution, *R,* between each peak should be not less than 1.5, and the relative standard deviation for five replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 1.0 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for alcohol, dichloromethane, ethyl acetate, and dioxane. Calculate the concentration of the individual solvents, in ppm, in the portion of Melengestrol Acetate taken by the formula:

$$CV(r_U / r_S)/(1000W),$$

in which C is the concentration, in g per mL, of the relevant solvent in the *Standard solution; V* is the sample volume in mL; r_U and r_S are the peak areas of the relevant solvent obtained from the *Test solution* and the *Standard solution,* respectively; and W is the weight, in mg, of Melengestrol Acetate taken to prepare the *Test solution:* not more than 5000 ppm of alcohol, 5000 ppm of ethyl acetate, 600 ppm of dichloromethane, and 380 ppm of dioxane is found.

Related compounds—

Mobile phase—Prepare a mixture of acetonitrile and water (50:50).

Standard solution—Dissolve an accurately weighed quantity of USP Melengestrol Acetate RS, USP Melengestrol Acetate Related Compound A RS, and USP Melengestrol Acetate Related Compound B RS in methanol to obtain a solution having known concentrations of about 0.005 mg of each per mL.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a multiwavelength detector set at 240 and 262 nm and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* [NOTE—Melengestrol acetate and melengestrol related compound A will generate larger peak areas at 262 nm than at 240 nm; melengestrol acetate related compound B will generate a larger peak area at 240 nm than at 262 nm] the relative retention times are about 0.77, 1.0, and 1.05 for melengestrol acetate related compound A, melengestrol acetate, and melengestrol acetate related compound B, respectively; the resolution, *R,* between melengestrol acetate related compound A and melengestrol acetate related compound B is not less than 5.0; the column efficiency for the melengestrol acetate related compound A peak is greater than 1500; the tailing factor is less than 2.0; and the relative standard deviation of replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, identify the peaks, and determine which detector wavelength generates the larger peak area for each impurity. Using the larger peak area, calculate the percentage of each impurity in the portion of Melengestrol Acetate taken by the formula:

$$100(C_S / C_U)(r_I / r_S),$$

in which C_S is the concentration, in mg per mL, of either melengestrol related compound A or melengestrol related compound B in the *Standard solution* [NOTE—If using the impurity peak area generated at 262 nm, C_S is the concentration of melengestrol related compound A; if using the impurity peak area generated at 240 nm, C_S is the concentration of melengestrol related compound B]; C_U is the concentration, in mg per mL, of melengestrol acetate in the *Test solution;* r_I is the peak area of each impurity obtained from the *Test solution;* and r_S is the peak area of either melengestrol related compound A or melengestrol related compound B in the *Standard solution* [NOTE—If using the impurity peak area generated at 262 nm, r_S is the peak area of melengestrol related compound A; if using the impurity peak area generated at 240 nm, C_S is the peak area of melengestrol related compound B]: not more than 0.5% of any identified impurity is found; not more than 0.2% of any unidentified impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Mobile phase—Prepare a mixture of acetonitrile and water (50:50).

Standard preparation—Dissolve an accurately weighed quantity of USP Melengestrol Acetate RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Melengestrol Acetate, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with methanol to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 287-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the column efficiency is not less than 1500; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* in duplicate into the chromatograph, record the chromato-

In-Process Revision

grams, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{32}O_4$ in the portion of Melengestrol Acetate taken by the formula:

$$2CW(r_U / r_S),$$

in which C is the concentration, in mg per mL, of the *Standard preparation; W* is the weight, in mg, of Melengestrol Acetate used to prepare the *Assay preparation;* r_U is the average peak area of the melengestrol acetate peak obtained from the *Assay preparation;* and r_S is the average peak area of the melengestrol acetate peak obtained from the *Standard preparation.*■2S (*USP27*)

Change to read:

Assay for follicle-stimulating hormone—

Diluting solution—Using the *Diluent* under *Assay for luteinizing hormone,* dissolve an accurately weighed quantity of ~~USP Chorionic Gonadotropin RS~~

■USP Human Chorionic Gonadotropin RS■2S (*USP27*) to contain a concentration of 70 USP Chorionic Gonadotropin Units per mL, readjusting the pH, if necessary, to 7.2 ± 0.2.

Standard preparations—Dissolve an accurately weighed quantity of USP Menotropins RS in the *Diluting solution* to obtain solutions having known concentrations of about 2.5, 5.0, and 10.0 USP Follicle-Stimulating Hormone Units per mL.

Assay preparations—Following the procedure given under the *Standard preparations,* use Menotropins in place of the Reference Standard to obtain similar solutions.

Control solution—Use the *Diluting solution* as the control solution. Store all solutions at 5 ± 3° for the duration of the assay and properly dispose of any unused portions.

Test animals—Select 20- to 21-day old female rats with weights within a 10-g range of each other. Proceed as directed under *Test animals* in the *Assay for luteinizing hormone* beginning with "House the animals..."

Dose determination trial—Use the method described under the *Procedure* to determine a 3-dose range in which the lowest dose produces a definite response in some of the rats in the low-dose group (as compared with the control group) and the highest dose produces a submaximal to maximal response in the high-dose group. Doses must be established in a geometric progression. The normal dose response range will occur between 0.5 and 6.0 USP Follicle-Stimulating Hormone Units total dose per rat. Useful dose ranges will vary with the sensitivity of the rat strain selected.

Procedure—Inject each rat of each group subcutaneously in the dorsal area with 0.2 mL of the solution to which it was assigned. For *Dose determination trial* only, similarly inject each rat in the control group with 0.2 mL of the *Control solution.* Repeat these injections at approximately the same time of day after 24 hours and 48 hours. Twenty-four hours after the last injection, weigh each rat, sacrifice the animals, and carefully dissect out the ovaries of each rat, removing any fat and fibrous tissue. Thoroughly dry the ovaries by pressing against absorbent paper, avoiding damage to follicles on the ovary surface, and immediately weigh them to the nearest 0.2 mg, using a suitable balance.

Calculation—Tabulate the observed ovarian pair weight for each rat designated by the symbol *y,* for each dosage group of *f* rats. For apparently outlying ovarian weight gain, an attempt may be made to correct the organ mass relative to the mass of the rat from which it was taken. For the *y*-value in question, calculate for each of the *f* rats in the appropriate group the ratio of ovarian weight to the total body weight. Reject the *y*-value if its corresponding ratio differs from the rest of the group by more than 1.5 standard deviations. If the data from one or more rats are missing, adjust to groups of equal size by suitable means (see *Replacement of Missing Values* ⟨111⟩). Total the values of *y* in each group, and designate each total as *T,* using subscripts 1 to 3 for the three successive dosage levels and subscripts *S* and *U* for the Standard and the material under test, respectively. Test both the agreement in slope of the dosage-response lines for the Standard and for the material under test, and the lack of curvature as directed for a 3-dose balanced assay (see *Tests of Assay Validity* ⟨111⟩). If the combined discrepancy as measured by F_3 exceeds its tabular value in Table 9 (see *Combination of Independent Assays* ⟨111⟩), regard these data as preliminary, and repeat the assay.

Determine the logarithm of follicle-stimulating hormone potency of the Menotropins taken by the formula:

$$M = (4iT_a / 3T_b) + \log R,$$

in which $T_a = \Sigma(T_U - T_S)$, $T_b = \Sigma(T_3 - T_1)$, i is the interval between successive log doses of both the *Standard preparation* and *Assay preparation,* and $R = v_S/v_U$ is the ratio of the high dose of the Standard in USP Units (v_S) to the high dose of the Menotropins in mg (v_U). Compute the log confidence interval (see *Design and Analysis of Biological Assays* ⟨111⟩).

Replication—Repeat the entire determination at least once. Test the agreement among the two or more independent determinations, and compute the weights/mean log-potency M and its confidence interval, L_C (see *Confidence Intervals for Individual Assays* ⟨111⟩). If this exceeds 0.18, repeat the assay until the confidence interval of the combined results is 0.18 or less.

The potency P_* is satisfactory if P_* = antilog M is not less than 80% and not more than 125% of the labeled potency and if the log confidence interval does not exceed 0.18.

BRIEFING

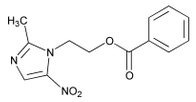
Metronidazole Benzoate, page 7747 of *PF* 25(2) [Mar.–Apr. 1999]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision*. Storage conditions have been added to the *Packaging and storage* section. Interested parties are encouraged to submit comments.

(PA7b: B. Davani) RTS—40038-1

Add the following:

■Metronidazole Benzoate



$C_{13}H_{13}N_3O_4$ 275.3

2-(2-Methyl-5-nitroimidazol-1-yl)ethyl benzoate [*13182-89-3*].

» Metronidazole Benzoate contains not less than 98.5 percent and not more than 101.0 percent of $C_{13}H_{13}N_3O_4$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Metronidazole Benzoate RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The principal spot in the chromatogram of the *Test solution* corresponds to that in the chromatogram of *Standard solution A,* as obtained in the test for *Related compounds*.

Acidity—Neutralize 40 mL of a mixture of dimethylformamide and water (1:1) with hydrochloric acid or 0.02 M sodium hydroxide, add 0.2 mL of methyl red TS and 2.0 g of Metronidazole Benzoate, mix to dissolve, and titrate with 0.02 M sodium hydroxide: not more than 0.25 mL is required to produce a color change.

Loss on drying ⟨731⟩—Dry it at 80° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Related compounds—

Adsorbent: 0.2-mm layer of chromatographic silica gel mixture.

Test solution—Transfer about 200 mg of Metronidazole Benzoate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with acetone to volume, and mix.

Standard solution A—Dissolve an accurately weighed quantity of USP Metronidazole Benzoate RS in acetone, and dilute quantitatively, and stepwise if necessary, with acetone to obtain a solution having a known concentration of about 0.1 mg per mL.

Standard solution B—Transfer 4.0 mL of *Standard solution A* to a 10-mL volumetric flask, dilute with acetone to volume, and mix.

Standard solution C—Transfer about 10 mg each of metronidazole and 2-methyl-5-nitroimidazole, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetone to volume, and mix.

Application volume: 10 µL.

Developing solvent system: ethyl acetate.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Examine the plate under short-wavelength UV light: the test is valid only if the metronidazole and 2-methyl-5-nitroimidazole spots obtained from *Standard solution C* are clearly separated; no spot obtained from the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution A* (0.5%); and not more than three spots, excluding

In-Process Revision

the principal spot, obtained from the *Test solution* are larger or more intense than the principal spot obtained from *Standard solution B* (1.0%).

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Assay—Transfer about 250 mg of Metronidazole Benzoate, accurately weighed, to a suitable container, and dissolve with stirring in 50.0 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 27.53 mg of $C_{13}H_{13}N_3O_4$·■2S (*USP27*)

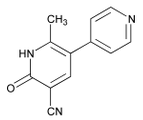
BRIEFING

Milrinone, page 2175 of *PF* 27(2) [Mar.–Apr. 2001]. It is proposed to revise the *Packaging and storage* statement to conform to specifications provided by the manufacturer and to those found in *Preservation, Packaging, Storage, and Labeling* under the *General Notices*.

(PA5: A. Wilk; PSD: C. Okeke) RTS—38978-3

Add the following:

■Milrinone



$C_{12}H_9N_3O$ 211.22

[3,4′-Bipyridine]-5-carbonitrile, 1,6-dihydro-2-methyl-6-oxo-.

1,6-Dihydro-2-methyl-6-oxo[3,4′-bipyridine]-5-carbonitrile [*78415-72-2*].

» Milrinone contains not less than 98.5 percent and not more than 101.5 percent of $C_{12}H_9N_3O$, calculated on the anhydrous basis.

Caution—Milrinone is a cardiotonic agent.

Packaging and storage—Preserve in ~~well-closed, light-resistant containers.~~ tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Milrinone RS. USP Milrinone Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the test for *Chromatographic purity.*

Water, *Method I* ⟨921⟩: not more than 2.0%.

Residue on ignition ⟨281⟩: not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Chromatographic purity—

pH 7.5 Phosphate buffer—Dissolve 2.7 g of dibasic potassium phosphate in 800 mL of water, add 2.4 mL of triethylamine, adjust with phosphoric acid to a pH of about 7.5, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *pH 7.5 Phosphate buffer* and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Milrinone RS in *Mobile phase* to obtain a solution having a known concentration of about 2 mg per mL, heat in a water bath at approximately 80°, and/or sonicate, if necessary.

In-Process Revision

Standard solution—Dilute an appropriate volume of *Standard stock solution* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of 0.006 mg per mL.

System suitability solution—Dissolve an accurately weighed quantity of USP Milrinone Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about ~~2~~ 0.2 mg per mL. Heat in a water bath at approximately 80°, and/or sonicate, if necessary, to dissolve. Transfer ~~1.0~~ 10.0 mL of this solution and 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 100 mg of Milrinone, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Heat in a water bath at approximately 80°, if necessary.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.6 for milrinone related compound A and 1.0 for milrinone; the resolution, *R,* between milrinone related compound A and milrinone is not less than 4.0; and the relative standard deviation for replicate injections of milrinone is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Milrinone taken by the formula:

$$5000(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Milrinone RS in the *Standard solution; W* is the weight, in mg, of milrinone taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response obtained from the *Standard solution:* not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities is found.

Organic volatile impurities, *Method V* ⟨467⟩: meets the requirements.

Solvent: dimethyl sulfoxide.

Assay—Transfer about 200 mg of Milrinone, accurately weighed, to a 100-mL beaker, and dissolve by stirring in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid VS is equivalent to 21.12 mg of $C_{12}H_9N_3O$.■2S (*USP27*)

BRIEFING

Nandrolone Decanoate, *USP 26* page 1269—See briefing under *Alprostadil*.

(PA1: C. Anthony) RTS—40156-16

Add the following:

■**Labeling—**Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■2S (*USP27*)

Add the following:

■**Other requirements—**Where the label states that Nandrolone Decanoate is sterile, it meets the requirements for *Sterility* under *Nandrolone Decanoate Injection*. ■2S (*USP27*)

In-Process Revision

BRIEFING

Naratriptan Tablets, page 84 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to change the particle size of the column used in the *Assay* to avoid problems with back-pressure. The new column is a Sphereclone Phenyl brand of L11 column. Typically, the retention time of naratriptan is between 4 and 7 minutes. It is proposed to change the size of the filter used for the *Assay preparation* to a size that is routinely used in laboratory work.

(PA3: S. Salado) RTS—39986-1

Add the following:

■Naratriptan Tablets

» Naratriptan Tablets contain an amount of Naratriptan Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of naratriptan ($C_{17}H_{25}N_3O_2S$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Naratriptan Hydrochloride RS. USP Naratriptan Related Compound A RS. USP Naratriptan Related Compound B RS.*

NOTE—When performing assays and tests, store all standard, system suitability, and sample solutions in a cool place, protected from light.

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Diluent—Prepare a mixture of methylene chloride and methanol (1:1).

Adsorbent: high performance thin-layer chromatographic silica gel.

Test solution—Transfer a number of Tablets, equivalent to 5 mg of naratriptan, to a 25-mL flask, add 1.0 mL of water to wet the Tablets, and gently shake to remove the Tablet film coating. Add 4.5 mL of *Diluent,* and shake for 5 minutes or until the Tablets have dispersed. Centrifuge at 3000 rpm for 10 minutes, and pass through a nylon filter having a 0.45-µm porosity.

Developing solvent system: a mixture of methylene chloride, alcohol, and triethylamine (10:2:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 1: 100 rpm.

Times: 15 minutes.

Procedure—Determine the amount of $C_{17}H_{25}N_3O_2S$ dissolved from the difference between first derivative absorbance values at the wavelengths of maximum and minimum in the range from 226 nm to 236 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Naratriptan Hydrochloride RS in the same *Medium.* [NOTE—Do not sonicate the Standard solution to effect solution. Dissolve the Reference Standard with *Dissolution Medium* at about 37°.]

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{17}H_{25}N_3O_2S$ is dissolved in 15 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Chromatographic purity—

0.05 M Ammonium phosphate buffer and *Resolution solution*—Prepare as directed in the test for *Chromatographic purity* under *Naratriptan Hydrochloride.*

Solution A—Use filtered and degassed *0.05 M Ammonium phosphate buffer.*

Solution B—Use filtered and degassed acetonitrile.

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Test solution—Transfer 5 Tablets into a suitable amber flask. Add 20.0 mL of 0.1 N sodium hydroxide, and allow to stand for 10 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add 30.0 mL of *0.05 M Ammonium phosphate buffer,* and mix well. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a ~~0.2 µm~~ 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 15-cm column that contains ~~4 µm~~ packing L1. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–35.0	97→80	3→20	linear gradient
35.0–40.0	80	20	isocratic
40.0–40.1	80→97	20→~~30~~ 3	linear gradient
40.1–50.0	97	3	re-equilibration

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.07 for naratriptan related compound B and 1.0 for naratriptan; and the resolution, *R,* between naratriptan and naratriptan related compound B is not less than 1.5.

Procedure—Inject a volume (equivalent to about 5 µg of naratriptan hydrochloride) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all of the peaks. Calculate the percentage of each impurity in the portion of ~~Naratriptan Hydrochloride~~ Tablets taken by the formula:

~~$100Fr_i/(r_N + \Sigma Fr_i)$,~~

$$100(r_i/F)/[r_N + \Sigma(r_i/F)],$$

in which F is the relative response factor (see the accompanying table for values) for each impurity; r_i is the peak response for each impurity; and r_N is the naratriptan peak response (see the accompanying table for limits).

Relative retention time	Relative response factor (F)	Limit (%)
1.07	0.6	0.2
1.26	0.6	0.2
1.33	0.4	0.3
1.44	0.6	0.2
1.62	0.5	0.2

In addition to not exceeding the limits listed in the accompanying table, not more than 0.2% of any other individual impurity is found; and not more than 1.5% of total impurities is found.

Assay—

0.01 M Triethylamine phosphate buffer, Mobile phase, and *Resolution solution*—Prepare as directed in the *Assay* under *Naratriptan Hydrochloride.*

Standard preparation—Dissolve an accurately weighed quantity of USP Naratriptan Hydrochloride RS in 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute an accurately

In-Process Revision

measured volume of this solution in *0.01 M Triethylamine phosphate buffer* to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Transfer 5 Tablets into an amber 250-mL volumetric flask, add 30 mL of 0.1 N sodium hydroxide, and shake on a wrist-action shaker for at least 30 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add about 170 mL of *0.01 M Triethylamine phosphate buffer,* and mix well. Allow to cool to room temperature, dilute with *0.01 M Triethylamine phosphate buffer* to volume, and mix. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a ~~0.2 µm~~ 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 15-cm column that contains ~~3 µm~~ 5-µm packing L11. The flow rate is about 1.3 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for naratriptan related compound A, 1.0 for naratriptan, and 1.1 for naratriptan related compound B; and the resolution, *R,* between naratriptan related compound A and naratriptan and between naratriptan related compound B and naratriptan is not less than 1.5. Chromatograph the *Standard preparation,* record the chromatogram, and measure the peak response as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject volumes (equivalent to about 1 µg of naratriptan hydrochloride) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of naratriptan ($C_{17}H_{25}N_3O_2S$) in the portion of Tablets taken by the formula:

$$(335.47/371.93)100(C/D)(r_U/r_S),$$

in which 335.47 and 371.93 are the molecular weights of naratriptan and naratriptan hydrochloride, respectively; C is the concentration, in mg per mL, of USP Naratriptan Hydrochloride RS in the *Standard preparation; D* is the concentration, in mg per mL, of naratriptan in the *Assay preparation,* based upon the labeled quantity of naratriptan in the portion of Tablets taken and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Nifedipine Extended-Release Tablets, *USP 26* page 1313, page 2986 of the *First Supplement,* and page 87 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to add the description of the sinker used in *Drug release Test 2.*

(BPC: M. Marques) RTS—40129-1

Change to read:

Drug release ⟨724⟩—

Test 1: If the product complies with this test, the labeling indicates that the product meets USP *Drug Release Test 1.*

Medium: water; 50 mL.

Apparatus 7—Do not use the reciprocating disk, but use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 ± 0.5°.

Times: 4, 12, and 24 hours.

Diluting solution 1: a mixture of methanol and acetonitrile (1:1).

Diluting solution 2: a mixture of *Diluting solution 1* and water (1:1).

In-Process Revision

Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Diluting solution 1,* dilute with water to volume, and mix to obtain a Standard stock solution. Quantitatively dilute this Standard stock solution ■with *Diluting solution 2*■1S (*USP26*) to obtain solutions having known concentrations of 0.01 mg per mL, 0.05 mg per mL, and 0.20 mg per mL that are used at 4 hours, 12 hours, and 24 hours, respectively.

Procedure—[NOTE—For the 4-hour time period, filter, determine the absorbance at 456 nm, and use this determination to correct for excipient interference at the other time periods.] Determine the amount of $C_{17}H_{18}N_2O_6$ released at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm, in 0.5-cm cells. Use test solutions that are suitably diluted, if necessary, with *Diluting solution 1* and water to obtain a final mixture of water, methanol, and acetonitrile (2:1:1) in comparison with the appropriate *Standard solution,* using *Diluting solution 2* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
4	between 5% and 17%
12	between 43% and 80%
24	not less than 80%

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Buffer concentrate—Transfer 330.9 g of dibasic sodium phosphate and 38 g of citric acid to a 1-liter volumetric flask, add water to dissolve, add 10 mL of phosphoric acid, dilute with water to volume, and mix.

Medium—Mix 125.0 mL of *Buffer concentrate* and 1 liter of 10% sodium lauryl sulfate solution, and dilute to 10 liters. Adjust if necessary to a pH of 6.8; 900 mL.

Apparatus 2: 50 rpm,

■with sinkers (see *Figure 1*).■2S (*USP27*)

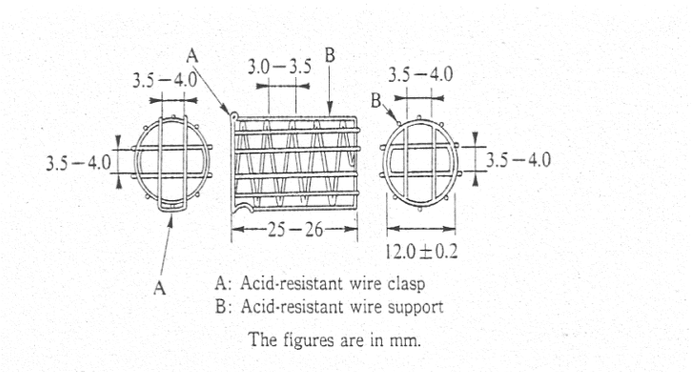


Fig. 1 (printed with permission of the Japanese Pharmacopoeia)

Times: 3, 6, and 12 hours.

Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Nifedipine RS in methanol to obtain a solution having a known concentration of about 1.11 mg per mL. Dilute quantitatively and stepwise with *Dissolution Medium* to obtain a solution having a known concentration of 0.1 mg per mL.

Chromatographic system—The liquid chromatograph is equipped with a 350-nm detector and a 4.0-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at about 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved.

Tolerances—The percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in vivo and dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
3	between 10% and 30%
6	between 40% and 65%
12	not less than 80%

■*Test 3:* If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5.

Apparatus 2: 100 rpm.

Time: 1 hour.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Dissolution Medium* for *Phase 2.*] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Dissolution Medium* as the blank.

In-Process Revision

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Dissolution Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5.

Apparatus 2: 100 rpm.

Time: 25 minutes.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Dissolution Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Dissolution Medium* as the blank.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Dissolution Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 40% and 70%
8	not less than 70%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

Test 4: If the product complies with this test, the labeling indicates that the product meets USP *Drug Release Test 4.*

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL for Tablets labeled to contain 60 mg, and of about 0.034 mg of USP Nifedipine RS per mL for Tablets labeled to contain 30 mg. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Dissolution Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released at the times specified, conform to *Acceptance Table 1.*

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 12% and 35%
4	between 44% and 67%
12	not less than 80%

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 10% and 30%
4	between 40% and 63%
12	not less than 80%

BRIEFING

Nitrofurantoin Capsules, *USP 26* page 1315. A proposal for a new monograph for *Nitrofurantoin Extended-release Capsules* was published in *PF* 24(6) [Nov.–Dec. 1998] and published again with modifications in *PF* 25(5) [Sept.–Oct. 1999]. However FDA informed USP that all *Nitrofurantoin Capsules* currently available on the market are considered by the agency as immediate-release. On the basis of these comments, the USP Expert Committee on Biopharmaceutics decided to withdraw the proposal for a new monograph for *Nitrofurantoin Extended-release Capsules*, and to add a *Dissolution Test 2* in the monograph for *Nitrofurantoin Capsules*.

(BPC: M. Marques) RTS—36856-1; 40091-1; 40101-1

Change to read:

Labeling—Capsules that contain the macrocrystalline form of Nitrofurantoin are so labeled.

■When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.■2S (*USP27*)

Change to read:

Dissolution ⟨711⟩ —

■TEST 1■2S (*USP27*)
(where labeled as containing Nitrofurantoin macrocrystals)—
Medium: pH 7.2 (±0.05) phosphate buffer; 900 mL.
Apparatus 1: 100 rpm.
Times: 1, 3, and 8 hours.
Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 375 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Nitrofurantoin RS in the same *Medium.*

Tolerances—The percentage of the labeled amount of $C_8H_6N_4O_5$ dissolved at the 1-hour time point conforms to *Acceptance Table 1* under *Drug Release* ⟨724⟩, and the percentages dissolved at the 3- and 8-hour time points conform to the criteria for the final test time in *Acceptance Table 1* under *Drug Release* ⟨724⟩.

Time (hours)	Amount dissolved
1	between 20% and 60%
3	not less than 45%
8	not less than 60%

■TEST 2 (where labeled as containing both Nitrofurantoin macrocrystalline and monohydrate forms). If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Acid medium: 0.01 N hydrochloric acid or 1 hour; 900 mL.

pH 7.5 Buffer medium—Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 liter, and mix. After 1 hour change the *Acid medium* to *pH 7.5 Buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, for an additional 6 hours.

Apparatus 2: 100 rpm, with sinkers made of teflon-coated steel wire prepared by forming a coil approximately 22 mm long from a 13-cm length of 20-gauge wire (See *Figure 1*).

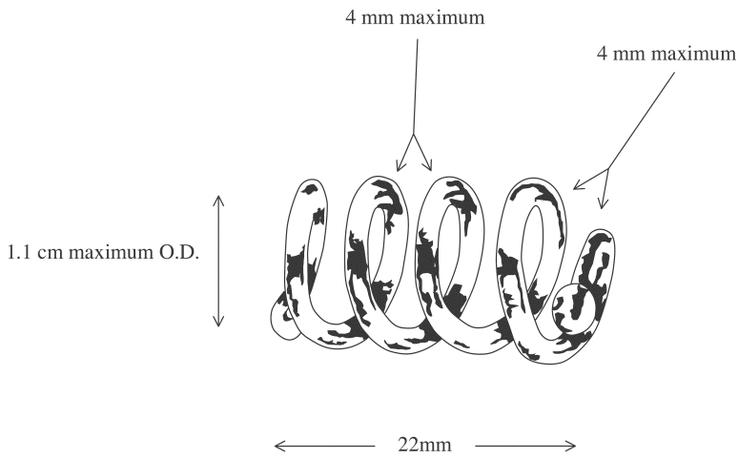

Fig. 1. Sinker.

Times: 1, 3, and 7 hours.

Acid-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *Acid medium* to obtain a solution having a known concentration of about 0.025 mg per mL.

Buffer-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *pH 7.5 Buffer medium* to obtain a solution having a known concentration of about 0.075 mg per mL.

Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved from UV absorbances at the isosbestic wavelength at about 375 nm on filtered portions of each solution under test suitability diluted, if necessary, with *Acid medium* or *pH 7.5 Buffer medium* when appropriate in comparison with the appropriate *Standard solution*.

Tolerances—The percentages of the labeled amount $C_8H_6N_40_5$ dissolved at the specified times conform to the following tables.

Time (hours)	Amount dissolved (individual)	Amount dissolved (mean)
1	between 2% and 16%	between 5% and 13%
3	between 27% and 69%	between 39% and 56%
7	not less than 68%	not less than 81%

Level	Number Tested	Criteria
L1	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are not less than the stated amount at the final test time.
L2	12	The mean percentage of dissolved label claim lies whithin the range for the means at each interval and is not less than the stated amount at the final test time. Not more than 2 of the 24 individual values, lie outside the stated ranged for individuals at each interval and not more than 2 of 24 is less than the stated amount at the final test time.

BRIEFING

Norgestrel and Ethinyl Estradiol Tablets, *USP 26* page 1338. It is proposed to replace the *Disintegration* test with a *Dissolution* test. The HPLC procedure in the *Dissolution* test was developed using a Hypersil C8 BDS brand of L7 packing. The retention times are about 4.3 minutes for norgestrel and about 3.2 minutes for ethinyl estradiol.

(BPC: M. Marques) RTS—35216-1

Delete the following:

■~~**Disintegration** ⟨701⟩: 15 minutes, the use of disks being omitted.~~■2S (*USP27*)

In-Process Revision

Add the following:

■**Dissolution** ⟨711⟩—

Medium: 0.0005% (w/v) polysorbate 80; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amount of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ dissolved by employing the following method. [NOTE—Do not use plastics during the preparation of solutions.]

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution [NOTE—A volume of alcohol not exceeding 2% of the final volume of the solution may be used to aid in dissolving the Reference Standards.]—Dissolve an accurately weighed quantity of USP Norgestrel RS and USP Ethinyl Estradiol RS in *Dissolution Medium,* and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a solution having known concentrations similar to those expected in the *Test solution*.

Test solution—Use a portion of the solution under test filtered through 0.7-µm borosilicate microfiber filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 247-nm detector (for norgestrel analysis), and a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of about 285 nm and an emission wavelength of 310 nm, and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for ethinyl estradiol and 1.0 for norgestrel; and the relative standard deviation for replicate injections is not more than 3.0% for the ethinyl estradiol and norgestrel peaks.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of norgestrel ($C_{21}H_{28}O_2$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved by the formula:

$$(500C)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ are dissolved in 60 minutes.■2S (*USP27*)

BRIEFING

Ondansetron Hydrochloride, *USP 26* page 1351 and page 92 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to modify *Method I* in the test for *Chromatographic purity* by replacing the USP Ondansetron Related Compound B RS, which is unavailable, with a new Reference Standard that contains a mixture of ondansetron, ondansetron related compound A, and ondansetron related compound B. The proposed change to the limit in the test for *Limit of ondansetron related compound D* is canceled. Other minor changes are intended to better reflect the actual approved material.

(PA3: S. Salado) RTS—39985-1

In-Process Revision

Change to read:

Limit of ondansetron related compound D—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic potassium phosphate (previously adjusted with 1 M sodium hydroxide to a pH of 5.4) and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.4 µg per mL.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.6 µg per mL and 1 µg per mL, respectively.

Test solution—Transfer about 50 mg of Ondansetron Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm × 20-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for ondansetron related compound C and 1.0 for ondansetron related compound D; and the resolution, *R,* between ondansetron related compound C and ondansetron related compound D is not less than 1.5. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 400 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the portion of Ondansetron Hydrochloride taken by the formula:

$$10(C/W)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Ondansetron Related Compound D RS in the *Standard solution; W* is the weight, in mg, of Ondansetron Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak ~~responses~~

■areas■2S (*USP27*)
obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.10% is found.

Change to read:

Chromatographic purity—

METHOD I—

Resolution solution—Dissolve ~~an accurately weighed quantity of USP Ondansetron Related Compound A RS~~

■a quantity of USP Ondansetron Resolution Mixture RS ■2S (*USP27*)
in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of ~~100 µg per mL.~~

■12.5 mg per mL.■2S (*USP27*)

~~*Identification solution*—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of 100 µg per mL.~~

■■2S (*USP27*)
Standard solutions—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in methanol, and mix to obtain a solution having a known concentration of about 0.25 mg per mL. Dilute this solution quantitatively with methanol to obtain *Standard solutions,* designated below by letter, having the following compositions:

Standard solution	Dilution	Concentration (µg RS per mL)	Percentage (%, for comparison with test specimen)
A	(1 in 5)	50	0.4
B	(1 in 10)	25	0.2
C	(1 in 20)	12.5	0.1

Test solution—Dissolve an accurately weighed quantity of Ondansetron Hydrochloride in methanol to obtain a solution containing 12.5 mg per mL.

Procedure—Separately apply 20 µL of the *Test solution,* 20 µL of each *Standard solution,* and ~~10 µL of the *Identification solution*~~

■20 µL of the *Resolution solution*■2S (*USP27*)
to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. ~~To the same plate apply 20 µL of the *Test solution* and on top of this application apply 10 µL of the *Resolution solution* and 10 µL of the *Identification solution* to make a system suitability spot.~~

■■2S (*USP27*)
Develop the chromatogram in a solvent system consisting of a mixture of chloroform, ethyl acetate, methanol, and ammonium hydroxide (90:50:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. ~~Examine the plate under short wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* complete resolution of the three components of the system suitability spot, any secondary spot from the chromatogram of the *Test solution* having an R_F value corresponding to that of the principal spot of the *Identification solution* is not larger or more intense than the principal spot obtained from the *Standard solution A* (0.4%), and no other secondary spot from the chromatogram of the *Test solution*~~

~~having an R_F value corresponding to that of the principal spot of the *Resolution solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.2%), and the sum of the intensities of the secondary spots obtained from the *Test solution* corresponds to not more than 1.0%.~~

In-Process Revision

■Examine the plate under short-wavelength UV light: complete resolution of the three components of the *Resolution solution* spot is found. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* any secondary spot from the chromatogram of the *Test solution* having an R_F value corresponding to that of the uppermost secondary spot of the *Resolution solution* is not larger or more intense than the principal spot obtained from *Standard solution A* (0.4%); and no other secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.2%).■2S (*USP27*)

METHOD II—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Proceed as directed for the *Standard preparation* in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure— ~~Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Ondansetron Hydrochloride taken by the formula:~~

~~$100(r_i / r_u)$,~~

~~in which r_i is the peak response for each impurity, and r_u is the sum of the responses of all of the peaks: not more than 0.2% of any individual impurity is found, and the total of all impurities found is not more than 0.5%.~~

■Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Ondansetron Hydrochloride taken by the formula:

$$50{,}000(C/W)(1/F)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Ondansetron Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Ondansetron Hydrochloride taken to prepare the *Test solution; F* is the relative response factor of the impurities as described in the accompanying table; r_i is the peak area for each impurity in the *Test solution;* and r_S is the peak area of ondansetron obtained from the *Standard solution:* meets the requirements given in the accompanying table.

Compound name	Relative retention time	Relative response factor	Limit (%)
Ondansetron related compound C	about 0.32	1.2	0.2
Ondansetron related compound D*	about 0.34	1.3	0.1
Imidazole	about 0.49	0.3	0.2
2-methylimidazole	about 0.54	0.4	0.2
Ondansetron	1.0	—	—

Solution: 5 µg per mL.

Medium: dehydrated alcohol.

Ratios: A_{243}/A_{251}, between 0.80 and 0.86; and ~~A_{251}/A_{261};~~ A_{261}/A_{251}, between 0.63 and 0.69.

Loss on drying (see *Thermal Analysis* ⟨891⟩)—Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument, using about 8 mg of Paricalcitol, accurately weighed. Heat at a rate of 5° per minute between ambient temperature and 150° in an atmosphere of nitrogen at a flow rate of 40 mL per minute. From the thermogram determine the accumulated loss in weight: it loses not more than 2.0% of its weight.

Chromatographic purity—

Diluent—Prepare a mixture of water and dehydrated alcohol (1:1).

Butylparaben solution—Transfer about 25 mg of butylparaben to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix

Solution A—Use filtered and degassed water.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—~~Prepare a solution of USP Paricalcitol RS~~ Dilute USP Paricalcitol Solution RS in *Diluent* ~~having~~ to a known concentration of about 0.1 µg of paricalcitol per mL.

Control standard solution—Transfer 3.0 mL of the *Standard solution* to a 10.0-mL volumetric flask, dilute with *Diluent* to volume, and mix.

In-Process Revision

Test stock solution—Transfer about 10 mg of Paricalcitol, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with dehydrated alcohol to volume, and mix.

Resolution solution—Transfer 1 mL of the *Butylparaben solution* and 1 mL of the *Test stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 1 mL of this solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Prepare a mixture of the *Test stock solution* and water (1:1).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 252-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	95	5	isocratic
10–30	95→45	5→55	linear gradient
30–40	45	55	isocratic
40–45	45→0	55→100	linear gradient
45–50	0	100	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between paricalcitol and butylparaben is not less than 12.0. Chromatograph the *Standard solution* and the *Control standard solution,* and record the peak responses as directed for *Procedure:* the area ratio for the paricalcitol peak from the *Standard solution* to that from the *Control standard solution* is between 1.8 and 4.0; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 10.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Diluent, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses, disregarding any peaks corresponding to those obtained from the *Diluent.* Calculate the percentage of each impurity in the portion of Paricalcitol taken by the formula:

$$10(C/W)(r_i / r_S),$$

in which C is the concentration, in µg per mL, of USP Paricalcitol RS in the *Standard solution; W* is the weight, in mg, of Paricalcitol taken to prepare the *Test stock solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the paricalcitol peak response obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of methanol and water (1:1).

Standard preparation—Prepare a solution of USP Paricalcitol RS in dehydrated alcohol having a known concentration of about 0.5 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 5.0 µg per mL.

Assay preparation—Transfer about 25 mg of Paricalcitol, accurately weighed, to a 50-mL low actinic volumetric flask, dissolve in and dilute with dehydrated alcohol to volume, and mix. Transfer 2.0 mL of this solution to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 252-nm detector and a 4.6-mm × 25-cm column that contains 5-µm

packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{27}H_{44}O_3$ in the portion of Paricalcitol taken by the formula:

$$5C(r_U / r_S),$$

in which C is the concentration, in µg per mL, of USP Paricalcitol RS in the *Standard preparation;* and r_U and r_S are the paricalcitol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

BRIEFING

Paricalcitol Injection, page 649 of *PF* 29(3) [May–June 2003]. It is proposed to add a resolution requirement in the test for *Related compounds* to assure that the system is suitable to quantitate related compound D. It is also proposed to correct the concentrations of the *Standard solutions* under the *Limit of aluminum* test.

(PA4: E. Gonikberg) RTS—40207-2

Add the following:

■Paricalcitol Injection

» Paricalcitol Injection is a sterile solution of Paricalcitol in a mixture of Water for Injection, Propylene Glycol, and Alcohol. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of paricalcitol ($C_{27}H_{44}O_3$). It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass. Store at controlled room temperature.

USP Reference standards ⟨11⟩— *USP Endotoxin RS. USP Paricalcitol Solution RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 10 USP Endotoxin Units per µg of paricalcitol.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Limit of aluminum ⟨206⟩—

Nitric acid diluent—Dilute 4 mL of nitric acid to 2000 mL with water.

Matrix modifier solution—Dissolve 1.5 g of magnesium nitrate in 1000 mL of water.

Standard stock solution—Proceed as directed in the chapter under *Standard Preparations,* beginning with "Treat some aluminum wire" and ending with "Cool, and transfer the solution, with the aid of water, to a 100-mL volumetric flask, dilute with water to volume, and mix." Transfer 2 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2 mL of this solution to a third 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 0.4 µg of aluminum per mL.

In-Process Revision

Standard solutions—Dilute accurately measured portions of the *Standard stock solution* with *Nitric acid diluent* to obtain solutions having known concentrations of about 2.5, 5.0, 10, 20, and 50 ~~µg~~ ng of aluminum per mL.

Test solution—Dilute 4.0 mL of Injection with 6.0 mL of *Nitric acid diluent* or use an appropriate dilution to obtain a solution having a concentration not greater than 0.02 µg of aluminum per mL.

System suitability solution—Dilute 9.5 mL of the *Test solution* with 0.5 mL of the *Standard stock solution.* If the resulting solution contains more than 0.04 µg of aluminum per mL, prepare an alternate dilution having a concentration between about 0.02 and 0.04 µg of aluminum per mL.

Procedure—Concomitantly determine the absorbances of the *Standard solutions, System suitability solution,* and *Test solution* at the aluminum emission line at 309.3 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with an aluminum hollow-cathode lamp and a flameless electrically heated furnace. Under typical conditions, the sample volume is 20 µL, the volume of the *Matrix modifier solution* is 5 µL, the injection temperature is 100°, and the oven conditions are as follows [NOTE—These conditions may be optimized for each instrument]:

Step	Temperature
Drying 1	110°
Drying 2	130°
Drying 3	200°
Pyrrolysis	1100°
Read	2300°
Clean Out	2450°

Plot the absorbances of the *Standard solutions* versus the content of aluminum, in ng per mL, drawing a straight line best fitting the five points: the correlation coefficient is not less than 0.995; the recovery for the *System suitability solution* is between 80% and 120%; and the duplicate injections must agree within 0.0024 µg per mL. From the graph so obtained, determine the quantity of aluminum, *C,* in µg, found in each mL of the *Test solution.* Calculate the quantity, in µg, of aluminum in each mL of the Injection taken by the formula:

$$CD,$$

in which C is as defined above; and D is the dilution factor used to prepare the *Test solution:* not more than 0.5 µg per mL is found.

Related compounds—

Diluent—Prepare a mixture of water and acetonitrile (1:1).

Solution A—Prepare a filtered and degassed mixture of water and acetonitrile (85:15).

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution of USP Paricalcitol Solution RS in *Diluent* having a known concentration of paricalcitol equal to about 0.5% of the labeled concentration of the Injection.

Control standard solution—Transfer 5.0 mL of the *Standard solution* to a 25.0-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Degradation stock solution—Accurately dilute about 1 mL of USP Paricalcitol Solution RS with *Diluent* to 5 mL.

Degradation solution 1—Transfer about 1 mL of the *Degradation stock solution* and 0.1 mL of 30 percent hydrogen peroxide into a 10-mL container, and let stand at room temperature for 1 hour. Dilute with *Diluent* to 10 mL, and mix.

Degradation solution 2—Place about 1 mL of the *Degradation stock solution* and 1 mL of 0.1 N hydrochloric acid in a 10-mL container. Mix, and heat at 70° for 1 hour. Cool to room temperature, dilute with *Diluent* to 10 mL, and mix.

Test solution—Use the Injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 252-nm detector, a 4.6-mm × 7.5-cm guard column that contains packing L1, and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	65→5	35→95	linear gradient
25–45	5	95	isocratic

Chromatograph the *Standard solution* and the *Control standard solution,* and record the peak responses as directed for *Procedure:* the area ratio for the paricalcitol peak from the *Standard solution* to that from the *Control standard solution* is between 4.0 and 6.0; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 5.0%.

Procedure—Chromatograph the *Degradation solution 1,* and identify the paricalcitol peak and the peaks due to the related compounds listed in *Table 1*.

Table 1.

Relative Retention Time	Name	Limit in the *Test solution,* (%)
0.63	Related compound A	1.0
0.79	Related compound B	1.0

Chromatograph the *Degradation solution 2,* and identify the paricalcitol peak and the peaks due to the related compounds listed in *Table 2*. The resolution, *R,* between the paricalcitol peak and the related compound D peak is not less than 1.0.

Table 2.

Relative Retention Time	Name	Limit in the *Test solution,* (%)
0.89	Related compound C	1.0
0.95	Related compound D	1.0
1.32	Related compound E*	1.0
1.57	Related compound F	1.0
1.66	Related compound G	1.0
1.74	Related compound H	1.0
1.79	Related compound I	1.0

* NOTE—This peak is very small (approximately 3 to 5 times the signal-to-noise ratio).

Separately inject equal volumes (about 100 to 200 µL) of the *Diluent* and the *Test solution,* in duplicate, into the chromatograph, record the chromatograms, and measure the peak responses, disregarding any peaks corresponding to those obtained from the *Diluent.* Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(C/L)(r_i/r_S),$$

in which C is the concentration, in µg per mL, of paricalcitol in the *Standard solution,* calculated on the basis of the content of paricalcitol in the USP Paricalcitol Solution RS; L is the labeled amount, in µg per mL, of paricalcitol in the Injection; r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the paricalcitol peak re-

In-Process Revision

sponse obtained from the *Standard solution:* in addition to not exceeding the limits for impurities in *Tables 1* and *2,* not more than 2.0% of total impurities is found.

Content of propylene glycol and alcohol—

Mobile phase—Prepare a filtered and degassed 0.01 N sulfuric acid solution.

Alcohol standard solution—Transfer 2.0 mL of dehydrated alcohol to a 10-mL volumetric flask, dilute with water to volume, and mix.

Propylene glycol standard solution—Transfer 3.0 mL of propylene glycol to a 10-mL volumetric flask, dilute with water to volume, and mix.

Standard solution—Transfer 5.0 mL each of *Alcohol standard solution* and *Propylene glycol standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer 5.0 mL of the Injection to a 50-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.8-mm × 30-cm column that contains packing L17. The column temperature is maintained at 60°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the elution order is propylene glycol followed by alcohol; the resolution, *R,* between propylene glycol and the alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than 2.0% for each peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatographs, and measure the responses for the major peaks. Calculate the percentage of propylene glycol and alcohol in the portion of Injection taken by the formula:

$$C(r_U / r_S),$$

in which C is the concentration, in percentage, of alcohol or propylene glycol in the *Alcohol standard solution* or *Propylene glycol standard solution,* respectively; and r_U and r_S are the corresponding peak responses obtained from the *Test solution* and *Standard solution,* respectively: between 16% and 24% of dehydrated alcohol is found; and between 26% and 34% of propylene glycol is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Diluent, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay* under *Paricalcitol.*

Standard preparation—Prepare a solution of USP Paricalcitol Solution RS in *Diluent* having a known concentration of paricalcitol similar to that of the Injection.

Assay preparation—Use the Injection.

Procedure—Separately inject equal volumes (about 100 to 200 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of paricalcitol ($C_{27}H_{44}O_3$) in each mL of the Injection taken by the formula:

$$C(r_U / r_S),$$

in which C is the concentration, in µg per mL, of paricalcitol in the *Standard preparation,* calculated on the basis of the content of paricalcitol in the USP Paricalcitol Solution RS; and r_U and r_S are the paricalcitol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

In-Process Revision

BRIEFING

Pentobarbital Sodium, *USP 26* page 1431 and page 657 of *PF* 29(3) [May–June 2003]. Because of the reported hygroscopic nature of this compound, it is proposed to indicate that the *Test solution* in the test for *Related compounds* and the *Standard preparation* in the *Assay* should be prepared at the same time as the test for *Loss on drying*. Molecular weights have been changed to reflect current atomic weight values published in *USP 26*.

(PA3: S. Salado) RTS—39792-1

Change to read:

Assay—

~~*Diluting solvent*—Use freshly prepared dilute ammonium hydroxide (1 in 200).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Pentobarbital RS in *Diluting solvent* to obtain a solution having a known concentration of about 10 µg per mL.~~

~~*Assay preparation*—Transfer about 25 mg of pentobarbital sodium, previously dried and accurately weighed, in a 50-mL volumetric flask, immediately dilute with *Diluting solvent* to volume, and mix. Pipet 2 mL of this solution into a 100-mL volumetric flask, add *Diluting solvent* to volume, and mix.~~

~~*Procedure*—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using *Diluting solvent* as the blank. Calculate the quantity, in mg, of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium taken by the formula:~~

~~$$2.5C(248.26/226.28)(A_U/A_S),$$~~

~~in which *C* is the concentration, in µg per mL, of USP Pentobarbital RS in the *Standard preparation;* 248.26 and 226.28 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.~~

■NOTE—Use the value for *Loss on drying* obtained at the same time as the preparation of the *Test solution* in the test for *Related compounds* and the *Assay preparation* in the *Assay.*■2S (*USP27*)

■*Mobile phase, Standard preparation,* and *Chromatographic system*—Proceed as described in the *Assay* under *Pentobarbital.*

Assay preparation—Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase,* and sonicate until dissolved. Dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peak. Calculate the quantity, in mg, of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium taken by the formula:

$$(248.25/226.27)1000C(r_U/r_S),$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; *C* is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP27*)

BRIEFING

Camphorated Phenol Topical Gel. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The *Assay* is based on analysis performed with a 2-mm × 1.8-m glass column with 100- to 120-mesh S1A packing, coated with 15% G44.

(PA7b: B. Davani) RTS—40196-1

In-Process Revision

Add the following:

■Camphorated Phenol Topical Gel

» Camphorated Phenol Topical Gel is a mixture of camphor and phenol in a suitable gel vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of camphor ($C_{10}H_{16}O$) and phenol (C_6H_6O).

Packaging and storage—Preserve in tight containers. Store at room temperature, avoid excessive heat and close cover after each use.

USP Reference standards ⟨11⟩—*USP Camphor RS. USP Phenol RS.*

Identification—The retention times of the camphor and phenol peaks in the chromatograms of the *Assay preparation* correspond to those of the *Standard preparation* obtained as directed in the *Assay* for camphor and phenol.

Assay—

Internal standard solution—Transfer 250 mg, accurately weighed, of *n*-dodecane to a 25-mL volumetric flask, dilute with chloroform to volume, and mix.

Standard preparation—Transfer about 96 mg of USP Phenol RS, accurately weighed, to a 10-mL volumetric flask. Add about 224 mg of USP Camphor RS, accurately weighed, to the flask. Dilute with chloroform to volume, and mix. Combine 5.0 mL of this solution with 5.0 mL of *Internal standard solution* in a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Assay preparation—Transfer about 1 g of Topical Gel, accurately weighed, to a 50-mL flask. Add 5.0 mL of *Internal standard solution,* dilute with chloroform to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector (200°) and a 2-mm × 1.8-m glass column packed with 100- to 120-mesh S1A, coated with 15% G44. The carrier gas is helium. Adjust the column temperature to about 140° so that the relative retention times are 0.3 for phenol, 0.8 for camphor, and 1.0 for the internal standard. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the camphor peak and the internal standard peak is not less than 2.0 and between the phenol peak and the camphor peak is not less than 5.0; and the relative standard deviation of the peak response ratio of the camphor peak and phenol peak to the internal standard peak for five consecutive injections of the *Standard preparation* is not more than 2.0%.

Procedure—Inject 1 to 2 µL of the *Assay preparation* and the *Standard preparation* into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of camphor (*w*/*w*) and the percentage of phenol (*w*/*w*) in the sample according to the formula:

$$(50W_R / W)(r_U / r_S),$$

in which W_R is the weight, in mg, of the appropriate USP Reference Standard in the *Standard preparation; W* is the weight of Topical Gel, in mg, taken to prepare the *Assay preparation;* and r_U and r_S are the response ratios of the corresponding analyte peaks in the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

In-Process Revision

BRIEFING

Camphorated Phenol Topical Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The *Assay* is based on analysis performed with a 2-mm × 1.8-m glass column with 100- to 120-mesh S1A packing, coated with 15% G44.

(PA7b: B. Davani) RTS—40081-1

Add the following:

■Camphorated Phenol Topical Solution

» Camphorated Phenol Topical Solution is a solution of camphor and phenol in Eucalyptus Oil and Light Mineral Oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of camphor ($C_{10}H_{16}O$) and phenol (C_6H_6O).

Packaging and storage—Preserve in tight containers. Store at room temperature, avoid excessive heat, and close cover after each use.

USP Reference standards ⟨11⟩—*USP Camphor RS. USP Phenol RS.*

Identification—The retention times of the camphor and phenol peaks in the chromatograms of the *Assay preparation* correspond to those of the *Standard preparation*, obtained as directed in the *Assay.*

Specific gravity ⟨841⟩: between 0.861 and 0.865.

Assay—

Internal standard solution—Transfer 250 mg, accurately weighed, of *n*-dodecane to a 25-mL volumetric flask, dilute with chloroform to volume, and mix.

Standard preparation—Transfer about 96 mg of USP Phenol RS, accurately weighed, to a 10-mL volumetric flask. Add about 224 mg of USP Camphor RS, accurately weighed, to the flask. Dilute with chloroform to volume, and mix. Combine 5.0 mL of this solution with 5.0 mL of *Internal standard solution* in a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Assay preparation—Transfer about 1 g of Topical Solution, accurately weighed, to a 50-mL volumetric flask. Add 5.0 mL of *Internal standard solution,* dilute with chloroform to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector (200°) and a 2-mm × 1.8-m glass column packed with 100- to 120-mesh S1A, coated with 15% G44. The carrier gas is helium. Adjust the column temperature to about 140° so that the relative retention times are 0.3 for phenol, 0.8 for camphor, and 1.0 for the internal standard. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the camphor peak and the internal standard peak is not less than 2.0 and between the phenol peak and the camphor peak not less than 5.0; and the relative standard deviation of the peak response ratio of the camphor peak and the phenol peak to the internal standard peak for five consecutive injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject 1 to 2 µL of the *Assay preparation* and the *Standard preparation* into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of camphor (*w*/*w*) and the percentage of phenol (*w*/*w*) in the portion of Topical Solution taken by the formula:

$$(50W_R/W)(R_U/R_S),$$

in which W_R is the weight, in mg, of the appropriate USP Reference Standard in the *Standard preparation; W* is the weight of Topical Solution, in mg, taken to prepare the *As-*

In-Process Revision

say preparation; and R_U and R_S are the response ratios of the corresponding analyte peaks in the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Phentolamine Mesylate, *USP 26* page 1455—See briefing under *Amifostine*.

(PA5: A. Wilk) RTS—40124-29

Change to read:

Where the label states that Phentolamine Mesylate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Phentolamine Mesylate for Injection.*■2S (*USP27*)

BRIEFING

Phenylbutazone Tablets, *USP 26* page 1458. It is proposed to change the pH of the *Medium* in the test for *Dissolution* from 6.8 to 7.5 to better reflect the test conditions as submitted in a supplement to FDA. In addition, editorial style changes have been made.

(BPC: M. Marques) RTS—36042-1

Change to read:

Dissolution ⟨711⟩—
Medium:

■pH 7.5■2S (*USP27*)
simulated intestinal fluid TS (without the enzyme); 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{19}H_{20}N_2O_2$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted, if necessary, with *Dissolution Medium,* using a suitable spectrophotometer, 1-cm cells, and *Dissolution Medium* as the blank, in comparison with a solution of known concentration of USP Phenylbutazone RS in the same *Medium*.
Tolerances—Not less than 70% *(Q)* is dissolved in 30 minutes.

BRIEFING

Potassium Chloride, *USP 26* page 1502 and page 1064 of *PF* 29(4) [July–Aug. 2003]—See briefing under *Aminophylline*.

(PA1: K. Russo) RTS—40176-21

Change to read:

Packaging and storage—Preserve in well-closed containers.~~and store at up to 25 ± 2°.~~

■Store at 25°, excursions permitted between 15° and 30°.■2S (*USP27*)

Change to read:

Labeling—Where Potassium Chloride is intended for use in hemodialysis, it is so labeled.

■Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■2S (*USP27*)

In-Process Revision

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Endotoxin RS.*■2S (*USP27*)

Change to read:

Iodide or bromide~~— Dissolve 2 g in 6 mL of water, add 1 mL of chloroform, and then add, dropwise, with constant agitation, 5 mL of a mixture of equal parts of chlorine TS and water: the chloroform is free from even a transient violet or a permanent orange color.~~

■IODIDE—

Standard stock solution—Transfer an accurately weighed quantity, about 41 mg, of potassium iodide to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Standard solution—Dilute 1.0 mL of *Standard stock solution* with water to 25 mL, and mix. Dilute 2.0 mL of this solution with water to 8 mL, and proceed as directed for *Test solution* beginning with "Add 1 mL each of chloroform".

Test solution—Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 2 drops of a chloramine T solution (0.1 in 100), and shake gently. The violet color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution:* the limit is 0.005%.

BROMIDE—

Standard solution—Transfer an accurately weighed quantity, about 32 mg, of sodium bromide to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Dilute 2.0 mL of this solution with water to 8 mL, and proceed as directed for *Test solution* beginning with "Add 1 mL each of chloroform".

Test solution—Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 5 drops of a chloramine T solution (1 in 100), and shake gently. The brown color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution:* the limit is 0.1%.■2S (*USP27*)

Add the following:

■**Other requirements—**Where the label states that Potassium Chloride is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Potassium Chloride for Injection Concentrate*. Where the label states that Potassium Chloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Potassium Chloride for Injection Concentrate.*■2S (*USP27*)

In-Process Revision

BRIEFING

Quinidine Gluconate Extended-Release Tablets, *USP 26* page 1606. Because FDA recently approved an ANDA for this drug product, it is proposed to add a new *Drug release Test 5*. The new product was approved with a *Drug release* test that differs from those currently official in the *USP* monograph because of differences in dissolution rates *in vitro*. In the absence of any adverse comment, it is proposed to implement this revision via the *First Interim Revision Announcement* pertaining to *USP 27–NF 22,* with an official date of February 1, 2004.

(BPC: M. Marques) RTS—38538-1

Change to read:

Drug release ⟨724⟩—

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1*.

Medium: pH 5.4, 0.1 M acetate buffer prepared as follows. Add 6.9 g of anhydrous sodium acetate and 0.525 mL of glacial acetic acid to 1 liter of water, and mix. Adjust with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 5.4; 900 mL.

Apparatus 2: 75 rpm.

Times: 1 hour, 2 hours, 4 hours, 8 hours.

Procedure—Determine the amount of $C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 235 nm, using filtered aliquots of the solution under test, diluted with *Dissolution Medium* if necessary, in comparison with a Standard solution having a known concentration of USP Quinidine Gluconate RS in the same medium.

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 30% and 50%
2	between 45% and 65%
4	between 60% and 85%
8	not less than 85%

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4*.

Medium: 0.1 N hydrochloric acid; 600 mL.

Apparatus 2: 75 rpm.

Times and *Procedure*—Proceed as directed for *Test 1.*

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 30% and 45%
2	between 45% and 60%
4	between 60% and 80%
8	not less than 85%

•*Test 5:* If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 5*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* using 8-mesh sinker baskets.*

Times: 1, 2, and 4 hours.

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 20% and 50%
2	between 40% and 70%
4	not less than 75%

BRIEFING

Sevoflurane, page 2577 of *PF* 27(3) [May–June 2001]. The test for *Chromatographic purity* is being replaced with a test for *Related compounds* which is more precise and robust. The gas chromatographic procedure in this test is based on analyses performed with the Rt-1000 brand of G35 column.

(AER: K. Zaidi) RTS—39471-1

Add the following:

■Sevoflurane

$C_4H_3F_7O$ ~~200.06~~ 200.05

Propane, 1,1,1,3,3,3-hexafluoro-2-(fluoromethoxy)-.

Fluoromethyl 2,2,2-trifluoro-1-(trifluoromethyl)ethyl ether [*28523-86-6*].

» Sevoflurane contains not less than ~~99.9~~ 99.97 percent and not more than ~~100.0~~ 100.00 percent of $C_4H_3F_7O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Sevoflurane RS. USP Sevoflurane Related Compound A RS. USP Sevomethyl Ether (SME) RS. USP Hexafluoroisopropanol RS.*

Identification, *Infrared Absorption—*The IR absorption spectrum of Sevoflurane, obtained using a gas cell, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Sevoflurane RS.

Refractive index ⟨831⟩: between 1.2745 and 1.2760, at 20°.

Acidity or alkalinity—Transfer 20.0 mL of Sevoflurane and 20.0 mL of carbon dioxide-free water to a separatory funnel, shake for 3 minutes, and allow the layers to separate: the aqueous layer requires not more than 0.10 mL of 0.010

In-Process Revision

N sodium hydroxide or not more than 0.60 mL of 0.010 N hydrochloric acid for neutralization, bromocresol purple TS being used as the indicator.

Water, *Method I* ⟨921⟩: ~~between 0.03% and 0.2%.~~ not more than ~~0.2%;~~ 0.1%. ~~and, when packaged in glass containers, not less than 0.03%.~~

Limit of fluoride—[NOTE—Use plastic utensils throughout this test.]

Buffer solution—Transfer 110 g of sodium chloride and 1 g of sodium citrate to a 2000-mL volumetric flask, and dissolve in 700 mL of water. Carefully add 150 g of sodium hydroxide, and shake to dissolve. Cool to room temperature, and carefully add 450 mL of glacial acetic acid while stirring. Cool, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix. [NOTE—The pH of this solution is between 5.0 and 5.5. This solution may be used for six weeks when stored at room temperature.]

Solution A—Transfer about 221 mg of sodium fluoride, previously dried at 150° for 4 hours and accurately weighed, to a 100-mL volumetric flask. Add about 20 mL of water, and mix to dissolve. Add 1.0 mL of 0.01 N sodium hydroxide, and dilute with water to volume. Each mL of this solution contains 1 mg of fluoride. Store in a tightly closed plastic container. [NOTE—This solution may be used for two weeks when stored in a refrigerator.]

Standard stock solutions—Quantitatively transfer accurately measured volumes of *Solution A* to separate 100-mL volumetric flasks, and dilute with water to obtain solutions having known concentrations of about 5, 2, 0.5, and 0.2 µg of fluoride per mL.

Standard solutions—Transfer 25.0 mL of each of the *Standard stock solutions* to separate 50-mL volumetric flasks, dilute with *Buffer solution* to volume, and mix.

Test solution—Pipet 50.0 mL of Sevoflurane and 50.0 mL of water into a separatory funnel, shake vigorously for 3 minutes, and allow the liquids to separate completely. Transfer 25.0 mL of the aqueous top layer to a 50-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.

Procedure—Concomitantly measure the potentials, in mV, of the *Standard stock solutions, Standard solutions,* and *Test solution* with a pH meter (see *pH* ⟨791⟩) capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a glass-sleeved calomel reference electrode. [NOTE—When taking measurements, transfer the solution under test to a 100-mL beaker containing a polytef-coated stirring bar, and immerse the electrodes. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained in about 2 to 3 minutes, and record the potential. Rinse the electrodes with the *Buffer solution,* and dry, taking care to avoid damaging the crystal of the specific-ion electrode. A satisfactory response is achieved if the difference between the potentials obtained with the *Standard stock solutions* having fluoride concentrations of 5 and 0.5 µg per mL is in the range between 50 and 60 mV.] Plot the logarithms of the fluoride concentrations, in µg per mL, of the *Standard solutions* versus potentials, in mV. From the graph so obtained and the measured potential of the *Test solution,* determine the concentration, in µg per mL, of fluoride in the *Test solution:* not more than 2 µg per mL is found.

Limit of nonvolatile residue—Transfer 10.0 mL of Sevoflurane to an accurately weighed evaporating dish, evaporate to dryness on a steam bath, and dry the residue at 105° for 2 hours: the weight of the residue does not exceed 1.0 mg.

In-Process Revision

Limit of peroxide—

Titanium tetrachloride solution—Separately cool 1.0 mL of 6 N hydrochloric acid and 1.0 mL of titanium tetrachloride in small beakers surrounded by crushed ice. Add titanium tetrachloride dropwise to the chilled acid. Allow to stand at ice-bath temperature until all of the yellow solid dissolves, dilute with 6 N hydrochloric acid to 100 mL, and mix.

Standard stock solution—Prepare a solution of 30 percent hydrogen peroxide in water (1 in 400).

Standard solution—Transfer 15.0 mL of the *Standard stock solution* to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of the solution so obtained and 5.0 mL of *Titanium tetrachloride solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer 50.0 mL of Sevoflurane and 5.0 mL of *Titanium tetrachloride solution* to a separatory funnel, shake vigorously, allow the layers to separate, drain, and discard the lower layer. Carefully collect the top layer in a 10-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at a wavelength of about 410 nm, with a suitable spectrophotometer, using a 1-cm cell and a mixture of *Titanium tetrachloride solution* and water (1:1) as the blank. Calculate the peroxide concentration, in µg per mL, in the portion of Sevoflurane taken by the formula:

$$0.22(A_U / A_S),$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.22 µg per mL is found.

~~**Chromatographic purity—**~~

~~*Internal standard solution*—Use dimethoxymethane.~~

~~*Standard solutions*—Prepare two solutions, proceeding for each as follows. Transfer 2.0 mL of ethylene dichloride into a screw-capped vial, immediately seal with a cap and septum, and place on a balance. Using a microsyringe, transfer about 20 µL of USP Sevoflurane RS, accurately measured, to the vial by inserting the syringe needle through the septum. Record the quantity, in mg, of USP Sevoflurane RS added. Using the same method, transfer about 20 µL of *Internal standard solution* to the vial, and record the quantity, in mg, of the *Internal standard solution* added.~~

~~*Test solution*—Transfer 20.0 mL of Sevoflurane to a vial, and insert the stopper. Using a microsyringe, add 5 µL of *Internal standard solution*, accurately measured, to the vial.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused-silica capillary column coated with a 3.0-µm film of liquid phase G19. Prior to use, condition the column overnight at a temperature of 250°. The column temperature is programmed as follows. Initially it is maintained at 40° for 10 minutes, then increased at a rate of 10° per minute to 200°, and maintained at 200° for at least 14 minutes. The injection port temperature is maintained at 200°. The detector temperature is maintained at 225°. The split ratio is 1:20. Helium is used as the carrier gas, flowing at a rate of about 1.0 mL per minute. Chromatograph one of the *Standard solutions,* and record the chromatograms as directed for *Procedure,* adjusting the recorder sensitivity to obtain the sevoflurane peak on scale: the relative retention times are 0.57 for 1,1,3,3-pentafluoroisopropenyl fluoromethyl ether, 0.62 for methyl 2,2,2-trifluoro-1-(trifluoromethyl) ethyl ether, 0.74 for sevoflurane, and 1.0 for the internal standard; the column efficiency is not less than 6000 theoretical plates; and the relative stan-~~

In-Process Revision

dard deviation for replicate injections is not more than 2.0%. Chromatograph the *Test solution,* adjusting the recorder sensitivity to obtain peak heights of at least 10% of full scale for the two impurities, and record the chromatograms as directed for *Procedure:* the resolution, *R,* between these two impurities is not less than 2.0.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the relative response factor, *F,* for each of the *Standard solutions* by the formula:

$$(W_s/W_S)R_S,$$

in which W_s is the weight, in mg, of the internal standard in the *Standard solution;* W_S is the weight, in mg, of USP Sevoflurane RS in the *Standard solution;* and R_S is the average response ratio of the sevoflurane peak to that of the internal standard obtained from the *Standard solutions:* the relative response factors for the *Standard solutions* do not differ by more than 3.0% from their average. Calculate the quantity, in µg per g, of each impurity in the portion of Sevoflurane taken by the formula:

$$250(0.859/1.525)(R_u/F),$$

in which 0.859 and 1.525 are the specific gravities of the internal standard and sevoflurane, respectively; R_u is the response ratio of the impurity peak to that of the internal standard obtained from the *Test solution;* and *F* is the average relative response factor obtained as directed above: not more than 25 µg per g of 1,1,3,3-pentafluoroisopropenyl fluoromethyl ether, not more than 50 µg per g of methyl 2,2,2-trifluoro-1-(trifluoromethyl) ethyl ether, and not more than 25 µg per g of any other individual impurity are found; and not more than 50 µg per g of total impurities, excluding the two named above, is found.

Internal standard solution—Use dimethoxymethane.

Standard solution 1—Transfer 2.0 mL of ethylene dichloride to a screw-capped vial, immediately seal with a cap and septum, and place on a balance. Inject about 20 µL of USP Sevoflurane RS and 20 µL of the *Internal standard solution,* both accurately measured, into the vial through the septum, and weigh the vial after each injection.

Standard solution 2—Transfer 2.0 mL of ethylene dichloride to a screw-capped vial, immediately seal with a cap and septum, and place on a balance. Inject about 20 µL of USP Sevoflurane Related Compound A RS and 20 µL of the *Internal standard solution,* both accurately measured, into the vial through the septum, and weigh the vial after each injection.

Test solution—Transfer 20.0 mL of Sevoflurane to a vial, and insert the stopper. Using a microsyringe, add about 5 µL of the *Internal standard solution,* accurately measured, to the vial.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 0.32-mm × 30-m fused-silica capillary column coated with a 3.0-µm film of liquid phase G43. Prior to use, condition the column overnight at a temperature of 250°. The carrier gas is helium, flowing at a rate of about 1.0 mL per minute. The chromatograph is programmed as follows. Initially the column temperature is maintained at 40° for 10 minutes, then it is increased at a rate of 10° per minute to 200°, and maintained at 200° for not less than 14 minutes. The injection port temperature is maintained at 200°, and the detector temperature is maintained at 225°. The split ratio is 1:20. Chromatograph *Standard solution 1* and *Standard solution 2,* and record the peak responses as directed for *Procedure,* adjusting the recorder sensitivity to obtain the sevoflurane peak on scale: the relative retention times are about 0.57 for sevoflurane related compound A, 0.74 for sevoflurane, and 1.0 for the internal

In-Process Revision

~~standard; the resolution, *R,* between sevoflurane and sevoflurane related compound A is not less than 2.0; the column efficiency is not less than 6000 theoretical plates; and the relative standard deviation for replicate injections, determined from the peak area ratio of sevoflurane to the internal standard, is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 2 µL) of *Standard solution 1, Standard solution 2,* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the relative response factor, *F,* for each *Standard solution* taken by the formula:~~

$$R_S(W_I/W_S),$$

~~in which R_S is the peak area ratio of sevoflurane to the internal standard obtained from the chromatogram; W_I is the weight, in mg, of the internal standard in the particular *Standard solution;* and W_S is the weight, in mg, of USP Sevoflurane RS or USP Sevoflurane Related Compound A RS in the corresponding *Standard solution.* Calculate the quantity, in µg per g, of sevoflurane related compound A in the portion of Sevoflurane taken by the formula:~~

$$250(R_U/F),$$

~~in which R_U is the peak response ratio of sevoflurane related compound A to the internal standard obtained from the *Test solution;* and *F* is the relative response factor obtained as directed above: not more than 25 µg per g of sevoflurane related compound A is found. Calculate the quantity, in µg per g, of each impurity, other than sevoflurane related compound A, in the portion of Sevoflurane taken by the formula:~~

$$250(R_U/F),$$

~~in which R_U is the peak response ratio of each impurity to the internal standard obtained from the *Test solution;* and *F* is the average relative response factor obtained as directed above: not more than 100 µg per g of any impurity, other than sevoflurane related compound A, is found; and not more than 300 µg per g of total impurities is found.~~

Related compounds—

Standard stock solution—Accurately weigh 10 mL (15 g) of USP Sevoflurane RS in a suitable vial fitted with a septum, and successively add 25 µL (~0.0375 g) each of USP Sevoflurane Related Compound A RS, USP Sevomethyl Ether (SME) RS, and USP Hexafluoroisopropanol RS. Record the weight after addition of each impurity.

Standard solution—Accurately weigh about 20 mL of USP Sevoflurane RS in a suitable vial fitted with a septum, and add 0.2 mL (~0.3 g) of the *Standard stock solution.* Record the exact weight of *Standard stock solution* added.

Test solution—The test sample is used as is.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 2.1-mm × 4-m silicosteel column packed with 5% G35 on 80- to 100-mesh support S12. The carrier gas is helium, flowing at a rate of 25 mL per minute. Initially the column temperature is maintained at 70° for 20 minutes, then it is increased at a rate of 8° per minute to 170°, and maintained at 170° for 17.5 minutes. The injection port temperature is maintained at 175°, and the detector temperature is maintained at 200°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times are 0.67 for sevoflurane related compound A, 1.0 for sevomethyl ether, and 2.88 for hexafluoroisopropanol; the resolution, *R,* between sevoflurane related compound A and sevomethyl ether is not less

In-Process Revision

than 6; and the relative standard deviation, determined from the sevomethyl ether peak, for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 2 µL) of *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of all the peaks. Record the chromatogram for at least 50 minutes. Calculate the relative response factors, *F,* of sevoflurane related compound A and hexafluoroisopropanol relative to that of sevomethyl ether taken by the formula:

$$(C_S / C_{SME\text{-}std})(r_{SME\text{-}std} / r_S),$$

in which C_S and r_S are the concentration and the peak area for either sevoflurane related compound A or hexafluoroisopropanol in the *Standard solution* and $C_{SME\text{-}std}$ and $r_{SME\text{-}std}$ are the concentration and the peak area for sevomethyl ether in the *Standard solution.* The calculated relative response factors for sevoflurane related compound A and hexafluoroisopropanol must be in the range of 1.08 to 1.31 and 2.28 to 2.79, respectively.

Calculate the percentages (w/w) of impurities present in the *Test solution,* which are also found in the *Standard solution,* by the formula:

$$C_S(r_i / r_S),$$

in which r_i and r_S are the peak responses of impurities in the *Test solution* and in the *Standard solution;* and C_S is the concentration (*w/w*) of the impurities in the *Standard solution.* The other known impurities, that are not present in the *Standard solution,* are identified by their relative retention times and their amounts present are determined using their respective relative response factors (*Table 1*) by the formula:

$$FC_{SME\text{-}std}\,(r_i / r_{SME\text{-}std}).$$

Use relative response factor of SME to calculate the unknown impurities. *F* is the relative response factor of the known impurity not present in the *Standard solution;* $C_{SME\text{-}std}$ is the concentration (w/w) of SME in the *Standard solution;* and $r_{SME\text{-}std}$ is the peak area of SME in the *Standard solution.*

Table 1.

Impurity	Relative Retention Time	Relative Response Factor
Sevomethyl ether	1	1
2-Chloropropane	0.48	0.4092
Dichloromethane	0.76	1.5141
Chlorosevo ether	2.23	1.0884
Hexafluoroisopropyl formate	1.47	1.3068
Unknown impurities		1

Not more than 0.0025% of sevoflurane related compound A is found; not more than 0.01% of any other single impurity is found; and not more than 0.03% of total impurities is found.

Assay—Using the results from the test for *Related compounds,* calculate the percentage of $C_4H_3F_7O$ in the volume of Sevoflurane taken by subtracting the sum of percentages for all impurities found from ~~100.0%.~~ 100.00%.■2S (*USP27*)

BRIEFING

Sodium Acetate, *USP 26* page 1686—See briefing under *Aminophylline.*

BRIEFING

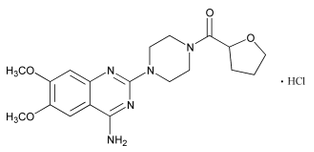
Terazosin Hydrochloride, page 121 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to revise the current *Packaging and storage* statement to conform to specifications provided by the manufacturer and to those found in *Preservation, Packaging, Storage, and Labeling* under the *General Notices and Requirements*.

(PA5: A. Wilk; PSD: CCO) RTS—40006-1

Add the following:

■Terazosin Hydrochloride



$C_{19}H_{25}N_5O_4 \cdot HCl \cdot 2H_2O$ ~~459.93~~ 459.92

Piperazine, 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-[(tetrahydro-2-furanyl)carbonyl]-, monohydrochloride, dihydrate.

1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(tetrahydro-2-furoyl)piperazine monohydrochloride dihydrate [*70024-40-7*].

Anhydrous 423.89 [*63074-08-8*].

» Terazosin Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{19}H_{25}N_5O_4 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at a temperature between 20° and 25°.

USP Reference standards ⟨11⟩—*USP Terazosin Hydrochloride RS. USP Terazosin Related Compound A RS. USP Terazosin Related Compound ~~E~~ B RS. USP Terazosin Related Compound ~~F~~ C RS.*

In-Process Revision

Color and clarity of solution—Dissolve a quantity of Terazosin Hydrochloride in methanol solution (90 in 100) to obtain a 1 in 100 solution: this solution is clear and colorless to pale yellow, when compared to methanol solution (90 in 100).

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It meets the requirements of the tests for *Chloride* ⟨191⟩, a solution prepared by dissolving 100 mg in 10 mL of methanol solution (90 in 100) being examined.

Loss on drying ⟨731⟩—Dry it in vacuum at 105° for 3 hours: it loses not more than 9.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%, determined on a 1.0-g specimen.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Limit of tetrahydro-2-furancarboxylic acid—

Blank solution—Transfer 2.0 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with acetone to volume, and mix. Mix 5.0 mL of this solution and 5.0 mL of acetone, pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone, and discard the first 1 mL of the filtrate.

Internal standard solution—Transfer about 100 mg of capric acid, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetone to volume, and mix. Transfer 10.0 mL of this solution and 2.0 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with acetone to volume, and mix.

Standard stock solution—Dissolve an accurately weighed amount of tetrahydro-2-furancarboxylic acid in acetone to obtain a solution having a known concentration of about 1.0 mg per mL. Dilute with acetone quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 100 µg per mL.

Standard solution—Transfer 5.0 mL of the *Standard stock solution* and 5.0 mL of *Internal standard solution* to a 50-mL centrifuge tube, and mix. Pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone, and discard the first 1 mL of the filtrate.

Test solution—Transfer about 100 mg of Terazosin Hydrochloride, accurately weighed, to a 50-mL centrifuge tube, add 5.0 mL of acetone and 5.0 mL of *Internal standard solution,* and shake for about 30 minutes. Centrifuge for about 10 minutes, pass through a nylon membrane filter having a 0.45-µm or finer porosity, previously washed with acetone, and discard the first 1 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 10-m fused-silica capillary column coated with a 1.2-µm film of liquid phase G25. The column temperature is maintained at about 170°. The injector is configured for splitless injection, and its temperature is maintained at about 230°. The detector temperature is maintained at about 240°. The carrier gas is helium, flowing at a rate of about 9 mL per minute. Chromatograph the *Blank solution,* and measure the peak responses as directed for *Procedure:* ensure that there are no extraneous peaks. Chromatograph the *Standard solution,* and measure the peak responses as directed for *Procedure:* the relative retention times are 1.0 for tetrahydro-2-furancarboxylic acid and 1.2 for capric acid; the resolution, *R,* between tetrahydro-2-furancarboxylic acid and capric acid is not less than 2.3; and the relative standard deviation, determined from the peak response ratios of tetrahydro-2-furancarboxylic acid to capric acid for replicate injections is not more than 6.5%.

Procedure—Separately inject equal volumes (about 0.2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of tetrahydro-2-furancarboxylic acid in the portion of Terazosin Hydrochloride taken by the formula:

$$100(C/W)(R_U/R_S),$$

in which C is the concentration, in µg per mL, of tetrahydro-2-furancarboxylic acid in the *Standard solution; W* is the weight, in mg, of Terazosin Hydrochloride taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~0.2%~~ 0.1% is found.

Limit of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine—

Derivatization solution—Dissolve about 2.0 g of 3,5-dinitrobenzoyl chloride in 250 mL of acetonitrile.

Phosphate buffer solution—Transfer about 96.3 g of dibasic potassium phosphate and 3.85 g of monobasic potassium phosphate, each accurately weighed, to a 500-mL volumetric flask. Dissolve in and dilute with water to volume. Adjust with phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100) to a pH of 8.0 ± 0.1. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. Adjust with phosphoric acid solution (10 in 100) or sodium hydroxide solution (10 in 100) to a pH of 8.0 ± 0.1.

Solution A—Use filtered and degassed water.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Blank solution—Use acetonitrile.

Standard solution—Dissolve an accurately weighed quantity of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL. Dilute quantitatively, and stepwise if necessary, with acetonitrile, to obtain a solution having a known concentration of about 5 µg per mL.

Test solution—Transfer about 125 mg of Terazosin Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with a mixture of acetonitrile and water (1:1) to volume, and mix.

Derivatization procedure—Transfer 5-mL portions of the *Blank solution,* the *Standard solution,* and the *Test solution,* each to a separate 100-mL volumetric flask, and proceed with each as follows. Add 5.0 mL of *Phosphate buffer solution,* and mix. Add 10.0 mL of *Derivatization solution* while swirling, allow to stand at room temperature for about 20 minutes, and mix. Dilute with a mixture of acetonitrile and water (1:1) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains packing L7. The flow rate is 1.5 mL per minute, except it is changed to 2.0 mL per minute during the period between 40 and 80 minutes. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–35	82	18	isocratic
35–40	82→10	18→90	linear gradient
40–75	10	90	isocratic
75–80	10→82	90→18	linear gradient
80–100	82	18	isocratic

In-Process Revision

Separately inject equal volumes (about 50 µL) of the derivatized *Blank solution* and the derivatized *Standard solution,* and measure the peak responses as directed for *Procedure,* ensuring that the peaks in the chromatogram of the derivatized *Standard solution* that correspond to those obtained from the derivatized *Blank solution* do not interfere with the determination: the retention time for 1-[(tetrahydro-2-furanyl)carbonyl]piperazine is more than 22 minutes; the column efficiency is not less than 3500 theoretical plates; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the derivatized *Standard solution* and the derivatized *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in the portion of Terazosin Hydrochloride taken by the formula:

$$2500(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of 1-[(tetrahydro-2-furanyl)carbonyl]piperazine in the *Standard solution; W* is the weight, in mg, of Terazosin Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak areas for 1-[(tetrahydro-2-furanyl)carbonyl]piperazine derivative obtained from the derivatized *Test solution* and the derivatized *Standard solution*, respectively: not more than 0.1% is found.

Related compounds—

pH 3.2 Citrate buffer, Standard stock preparation, and *Mobile phase*—Proceed as directed in the *Assay.*

Diluent 1—Dissolve 6.0 g of sodium citrate and 4.0 g of anhydrous citric acid in water, dilute with water to 1.0 liter, and mix.

Diluent 2—Prepare a mixture of water, acetonitrile, and methanol (60:30:10).

Standard stock solution 1—Dissolve an accurately weighed quantity of USP Terazosin Related Compound A RS in *Diluent 1*, and dilute with *Diluent 1* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard stock solution 2—Dissolve an accurately weighed quantity of USP Terazosin Related Compound ~~E~~ B RS in methanol, and dilute with methanol to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard stock solution 3—Dissolve an accurately weighed quantity of USP Terazosin Related Compound ~~F~~ C RS in *Diluent 2*, ~~a mixture of acetonitrile and methanol (1:1),~~ and dilute with *Diluent 2* ~~a mixture of acetonitrile and methanol (1:1)~~ to obtain a solution having a known concentration of about 0.1 mg per mL.

Standard solution—Transfer 5.0 mL of *Standard stock preparation*, 4.0 mL of *Standard stock solution 1*, 4.0 mL of *Standard stock solution 2*, and 20 mL of *Standard stock solution 3* to a 100-mL volumetric flask containing about 60 mL of *Diluent 2*. Dilute with *Diluent 2* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Use the *Assay stock preparation*.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Mobile phase*, and record the peak responses as directed for *Procedure:* ensure that there are no significant interfering peaks. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.2 for terazosin related compound A, 1.0 for terazosin, ~~1.94~~ 1.48 for terazosin related compound ~~E~~ B, and 2.57 for terazosin related compound ~~F~~ C; the resolution, R, between terazosin and terazosin related compound ~~E~~ B is not less than 9.0; the column efficiency determined from the terazosin peak is not less than 12,000 theoretical plates; the tailing factor for the terazosin related compound ~~F~~ C peak is not more

In-Process Revision

than 3.0; and the relative standard deviation for replicate injections determined from the terazosin peak is not more than 2.0%, and not more than 5.0% determined from the terazosin related compound ~~F~~ C peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 60 minutes, and measure the peak responses. Separately calculate the quantities, in mg, of terazosin related compound A and terazosin related compound ~~F~~ C in the portion of Terazosin Hydrochloride taken by the formula:

$$200C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* and r_U and r_S are the peak responses for the corresponding related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.3% of terazosin related compound A is found; and not more than 0.4% of terazosin related compound ~~F~~ C is found. Calculate the quantity, in mg, of each impurity in the portion of Terazosin Hydrochloride taken by the formula:

$$200C(r_i / r_T),$$

in which C is the concentration, in mg per mL, of USP Terazosin Hydrochloride RS in the *Standard solution;* r_i is the peak response for each impurity, other than terazosin related compound A and terazosin related compound ~~F~~ C, obtained from the *Test solution;* and r_T is the terazosin peak response obtained from the *Standard solution:* not more than 0.3% of any impurity eluting prior to the terazosin peak is found; not more than ~~0.5%~~ 0.1% of any other impurity is found; and not more than ~~1.5%~~ 0.6% of total impurities is found.

Assay—

pH 3.2 Citrate buffer—Dissolve 12.0 g of sodium citrate dihydrate and 28.5 g of anhydrous citric acid in 1.95 liters of water. Adjust with anhydrous citric acid or sodium citrate to a pH of 3.2 ± 0.1. Dilute with water to 2.0 liters, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.2 Citrate buffer* and acetonitrile (1685:315). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Terazosin Hydrochloride RS in *Mobile phase*, and dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard preparation—Transfer 10.0 mL of *Standard stock preparation* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay stock preparation—Transfer about 100 mg of Terazosin Hydrochloride, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer 10.0 mL of *Assay stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer l0.0 mL of this solution to a l00-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The column temperature is maintained at about 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Mobile phase*, and record the peak responses as directed for *Procedure:* ensure that there are no significant interfering peaks. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the col-

BRIEFING

Tiagabine Hydrochloride, *USP 26* page 1832. It is proposed to change the name of the Reference Standard USP Tiagabine Ethyl Ester Hydrochloride RS to USP Tiagabine Related Compound A RS. This editorial change is reflected in the proposed revision to the test for *Chromatographic purity.* In addition, minor editorial style changes have been made.

(PA3: S. Salado) RTS—39995-1

Change to read:

USP Reference standards ⟨11⟩— ~~*USP Tiagabine Ethyl Ester Hydrochloride RS.*~~

■*USP Tiagabine Related Compound A RS.*■2S (*USP27*)
USP Tiagabine Hydrochloride RS. USP Racemic Tiagabine Hydrochloride Mixture RS.

Change to read:

Chromatographic purity—

Solution A—Use a filtered and degassed solution of water adjusted with phosphoric acid to a pH of 2.3.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Tiagabine Hydrochloride RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Dilute a portion of the *Standard stock solution* quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.001 mg per mL.

Resolution solution—Dissolve an accurately weighed quantity of ~~USP Tiagabine Ethyl Ester Hydrochloride RS~~

■USP Tiagabine Related Compound A RS■2S (*USP27*)
in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this solution and 1.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 100 mg of Tiagabine Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	75	25	equilibration
0–30	75→45	25→55	linear gradient
30–40	45→10	55→90	linear gradient
40–45	10	90	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tiagabine hydrochloride and ~~tiagabine ethyl ester hydrochloride~~

■tiagabine related compound A■2S (*USP27*)
is not less than 9.0; chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Interference check—Inject water as the blank: no interfering peaks are observed.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Tiagabine Hydrochloride taken by the formula:

$$100F(r_i/r_s),$$

in which F is the relative response factor (see the accompanying table for values) for each impurity; r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the sum of the responses of all the peaks, excluding the solvent peaks. (See the accompanying table for limits of individual impurities.) Not more than 1.0% of total impurities is found.

Relative Response Factors

Relative retention time	*F*	Limit (%)
0.51	0.75	0.2
0.79	0.63	0.1
0.93	1.00	0.1
1.13	1.00	0.6
1.32	1.01	0.2
1.39	1.04	0.2

In-Process Revision

Change to read:

Dissolution ⟨711⟩—

Medium: 0.2 M pH 8.4 phosphate buffer, prepared by mixing 250 mL of 0.2 M monobasic potassium phosphate, 280 mL of 0.2 M potassium hydroxide, and 5 mL of 2% sodium lauryl sulfate solution. Adjust with 0.2 M potassium hydroxide to a pH of 8.4, and dilute with water to 1000 mL; 1000 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of ursodiol dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.075 M monobasic potassium phosphate (50:50). Adjust with 85% phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

■*Standard solution*—Dissolve an accurately weighed quantity of USP Ursodiol RS, and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a solution having a known concentration equivalent to that expected in the solution under test.

Test solution—Use a filtered portion of the solution under test.■2S (*USP27*)

Chromatographic system—The liquid chromatograph is equipped with a refractive index detector, a guard column that contains packing L1, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute, and the column temperature and detectors are maintained at 40°. ~~Determine the amount of $C_{24}H_{40}O_4$ dissolved.~~

■Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor of the ursodiol peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{24}H_{40}O_4$ dissolved by the formula:

$$100{,}000(r_U / r_S)(C/W),$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C is the concentration, in mg per mL, of USP Ursodiol RS in the *Standard solution;* and W is the labeled amount, in mg, of ursodiol in each capsule.■2S (*USP27*)

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{40}O_4$ is dissolved in 30 minutes.

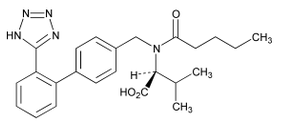
BRIEFING

Valsartan, page 673 of *PF* 29(3) [May–June 2003]. It is proposed to revise the current *Packaging and storage* statement to conform to specifications provided by the manufacturer and to those found in *Preservation, Packaging, Storage, and Labeling* under *General Notices*.

(PA5: A. Wilk; PSD: C. Okeke) RTS—39453-1

Add the following:

■Valsartan



$C_{24}H_{29}N_5O_3$ ~~435.53~~ 435.52

L-Valine, *N*-(1-oxopentyl)-*N*-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl].

N-[*p*-(*o*-1*H*-Tetrazol-5-yl-phenyl)benzyl]-*N*-valeryl-L-valine [*137862-53-4*].

» Valsartan contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{29}N_5O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at 25°; excursions are permitted between 15° and 30°. Protect from moisture and heat.

Related compounds—

TEST 1 (LIMIT OF VALSARTAN RELATED COMPOUND A)—

~~*0.07 M Phosphate buffer solution*—Dissolve 10.99 g of dibasic sodium phosphate and 3.81 g of monobasic potassium phosphate in water, dilute with water to 1000 mL, and mix.~~

Mobile phase—Prepare a ~~filtered and degassed~~ mixture of ~~*0.07 M Phosphate buffer solution* and isopropyl alcohol (98:2).~~ *n*-hexane, 2-propanol, and trifluoroacetic acid (85:15:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—~~Pipet 5.0 mL of *System suitability solution* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Dissolve an accurately weighed quantity of USP Valsartan Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.003 mg of valsartan related compound A per mL.~~ Transfer about 5 mg of USP Valsartan Related Compound A RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard solution—Transfer 1.0 mL of *Standard stock solution* into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix.

System suitability solution—~~Transfer about 30 mg of USP Valsartan Related Compound A, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume (*Solution 1*). Transfer about 15 mg of USP Valsartan RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in *Mobile phase*. Add, by pipetting, 10.0 mL of *Solution 1* to the same flask, dilute with *Mobile phase* to volume, and mix. Dissolve accurately weighed quantities of USP Valsartan RS and USP Valsartan Related Compound A RS in *Mobile phase,* serially diluting, if necessary, to obtain a solution having a known concentration of about 0.15 mg of valsartan per mL and about 0.003 mg of valsartan related compound A per mL.~~ Transfer about 1 mg of Valsartan, accurately weighed, to a ~~20-mL~~ 25-mL volumetric flask, add 10 mL of the *Standard stock solution,* and dissolve in and dilute with *Mobile phase* to volume.

Test solution—~~Transfer about 100 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Transfer about 50 mg of Valsartan, accurately weighed, to a 50-mL volumetric flask, add about 40 mL of the *Mobile phase,* and sonicate for 5 minutes. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~227-nm~~ 220-nm detector and a ~~4.0-mm × 10-cm~~ 4.6-mm × 25-cm column that contains 5-µm packing ~~L41~~ L40. The flow rate is about 0.8 mL per minute. Chromatograph the *System suit-*

In-Process Revision

ability solution, and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.60 for valsartan related compound A and 1.0 for valsartan; the ratio of the height between the baseline and the lowest point between the valsartan and valsartan related compound A peaks to the height of the valsartan related compound A peak is not more than 0.4. and~~ the resolution, *R,* between valsartan related compound A and valsartan is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan related compound A peaks, for replicate injections is not more than ~~15.0%~~ 5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ~~heights~~ areas for the major peaks. Calculate the percentage of valsartan related compound A in the portion of Valsartan taken by the formula:

~~$100(r_U/r_S)$,~~

~~in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.5% is found.~~

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Valsartan Related Compound A RS in the *Standard solution;* C_U is the concentration, in mg per mL, of valsartan in the *Test solution;* and r_U and r_S are the peak responses for valsartan related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than ~~1.5%~~ 1.0% is found.

TEST 2 (LIMIT OF VALSARTAN RELATED COMPOUND B, VALSARTAN RELATED COMPOUND C, AND OTHER RELATED COMPOUNDS)—

~~*Diluent* and~~ *Mobile phase*—Proceed as directed in the *Assay.*

~~*Standard stock solution A*—Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase* to obtain a solution having a known concentration of about 5 mg per mL.~~

~~*Standard stock solution B*—Dissolve an accurately weighed quantity of USP Valsartan Related Compound B RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.05 mg per mL.~~

~~*Standard stock solution C*—Dissolve an accurately weighed quantity of USP Valsartan Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL.~~

Resolution solution—~~Pipet 10.0 mL of *Standard stock solution A*, 5.0 mL of *Standard stock solution B*, and 2.0 mL of *Standard stock solution C* into a 100 mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Dissolve accurately weighed quantities of USP Valsartan RS, USP Valsartan Related Compound B RS, and USP Valsartan Related Compound C RS in *Mobile phase,* serially diluting if necessary, to obtain a solution having known concentrations of about ~~0.5 mg~~ 0.001 mg of valsartan per mL, ~~0.0025 mg~~ 0.001 mg of valsartan related compound B per mL, and ~~0.0005 mg~~ 0.001 mg of valsartan related compound C per mL.

Standard solution—~~Dilute an accurately measured volume of *Standard stock solution A* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.0005 mg per mL.~~ Dissolve an accurately weighed quantity of USP Val-

In-Process Revision

sartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about ~~0.0005 mg~~ 0.001 mg of valsartan per mL.

Test solution—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay,* except to use a 225-nm detector. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.73 for valsartan related compound B, 1.0 for valsartan, and 3.8 for valsartan related compound C;~~ the resolution, *R,* between valsartan related compound B and valsartan is not less than 1.8; and the relative standard deviation, determined from the valsartan related compound B peaks, for replicate injections is not more than ~~5.0%~~ 10.0%, and the relative standard deviation, determined from the valsartan peaks, for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Resolution solution,* the *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of ~~each impurity~~ valsartan related compound B and valsartan related compound C in the portion of Valsartan taken by the formula:

~~$100(Dr_i / r_u)$,~~

~~in which D is the factor due to the extent of dilution and is equal to 2.5 for valsartan related compound B, 0.5 for valsartan related compound C, and 0.05 for all other impurities; r_i is the peak response for each impurity obtained from the *Test solution;* and r_u is the peak response for valsartan related compound B or valsartan related compound C obtained from the *Resolution solution* or the valsartan peak response obtained from the *Standard solution,* as appropriate:~~

$$100(C_S / C_u)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of the appropriate USP Valsartan Related Compound RS in the *Resolution solution;* C_u is the concentration, in mg per mL, of valsartan in the *Test solution;* r_i is the peak response for the impurity obtained from the *Test solution;* and r_S is the peak response for the appropriate valsartan related compound obtained from the *Resolution solution.* Calculate the percentage of each other impurity in the portion of Valsartan taken by the formula:

$$100(C_S / C_u)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Valsartan RS in the *Standard solution;* r_S is the peak response for valsartan obtained from the *Standard solution;* and the other terms are as defined above: not more than ~~0.5%~~ 0.2% of valsartan related compound B is found; not more than 0.1% of valsartan related compound C is found; not more than 0.1% of any other individual impurity, excluding the valsartan related compound A, is found; ~~and not more than 0.5% of total impurities is found.~~ and not more than 0.3% of total impurities, excluding valsartan related compound A, is found.

Assay—

~~*Diluent*—Prepare a mixture of acetonitrile and water (1:1).~~

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (500:500:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard preparation—Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about ~~0.05 mg~~ 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. ~~Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

Chromatographic system—The liquid chromatograph is equipped with a ~~230-nm~~ 248-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{29}N_5O_3$ in the portion of Valsartan taken by the formula:

~~$1000C(r_U/r_S),$~~

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Valsartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

In-Process Revision

BRIEFING

Valsartan and Hydrochlorothiazide Tablets, page 1081 of *PF* 29(4) [July–Aug. 2003]. It is proposed to revise the current *Packaging and storage* statement to conform to specifications provided by the manufacturer and to those found in *Preservation, Packaging, Storage, and Labeling* under *General Notices*.

(PA5: A. Wilk; PSD: C. Okeke) RTS—40007-1

Add the following:

■Valsartan and Hydrochlorothiazide Tablets

» Valsartan and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at 25°; excursions are permitted between 15° and 30°. Protect from moisture and heat.

USP Reference standards ⟨11⟩—~~*USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS.*~~ *USP Benzothiadiazine Related Compound A RS. USP Hydrochlorothiazide RS. USP Valsartan RS. USP Valsartan Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—To a centrifuge tube transfer an amount of ground Tablets, equivalent in weight to a single Tablet, add 2.0 mL of acetone, sonicate for 15 minutes, and centrifuge.

Application volume: 2 µL.

Developing solvent system: a mixture of ethyl acetate, dehydrated alcohol, and a solution (25 in 100) of ammonium hydroxide (8:2:1).

Procedure—Proceed as directed in the chapter, except to develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent system* for about 15 minutes prior to use. Allow the chromatogram to develop until the solvent front has moved at least 7 cm. After removing the plate and marking the solvent front, dry the plate under a current of warm air until it is completely dry. The R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45~~ 30 minutes.

Procedure—Determine the amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing UV absorption at the wavelengths of maximum absorbance at about 250 nm for valsartan ~~(corrected for interference from hydrochlorothiazide on the basis of the absorbances of hydrochlorothiazide at 250 and 272 nm)~~ and at about 272 nm for hydrochlorothiazide on filtered portions of the solution under test, ~~suitably diluted with *Dissolution Medium,* in comparison with a Standard solution having known concentrations of USP Valsartan RS and USP Hydrochlorothiazide RS in the same *Medium*~~ diluted with *Medium* if necessary. Calculate the quantity of $C_{24}H_{29}N_5O_3$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs250}}a_{\text{H272}} - A_{\text{obs272}}a_{\text{H250}}}{a_{\text{V250}}a_{\text{H272}} - a_{\text{V272}}a_{\text{H250}}}\right),$$

in which D is the sample dilution factor if used; A_{obs250} is the observed absorbance of the sample solution at 250 nm; A_{obs272} is the observed absorbance of the sample solution at 272 nm; a_{V250} is the absorptivity of valsartan at 250 nm; a_{V272} is the absorptivity of valsartan at 272 nm; a_{H250} is the absorptivity of hydrochlorothiazide at 250 nm; and a_{H272} is the absorptivity of hydrochlorothiazide at 272 nm. The absorptivities, *a,* are determined from separate Standard solutions of USP Valsartan RS and USP Hydrochlorothiazide RS in the *Medium* having known concentration and expressed in units as defined by *Spectrophotometry and Light-Scattering* ⟨851⟩. Calculate the quantity of $C_7H_8ClN_3O_4S_2$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs272}}a_{\text{V250}} - A_{\text{obs250}}a_{\text{V272}}}{a_{\text{V250}}a_{\text{H272}} - a_{\text{V272}}a_{\text{H250}}}\right),$$

in which the terms are as defined above.

Tolerances—Not less than ~~75%~~ 80% *(Q)* of the labeled amounts of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ is dissolved in ~~45~~ 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Diluent, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation* as prepared in the *Assay.*

Test solution—Place 1 Tablet in a 200-mL volumetric flask, add 5 mL of water, and allow to stand for 5 minutes. Add about 100 mL of *Diluent,* and sonicate for 15 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at about 3000 rpm. Quantitatively dilute a volume of the clear supernatant with *Diluent* to obtain a solution having a concentration of about 0.2 mg of valsartan per mL.

In-Process Revision

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(LC_S / C_U)(r_U / r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in the Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Test solution,* based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—

Diluent, Solution A, Solution B, and *Mobile phase*—Prepare as directed in the *Assay.*

Standard stock solution—Dissolve accurately weighed quantities of ~~USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, USP Hydrochlorothiazide RS, USP Valsartan RS, and USP Valsartan Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.03 mg per mL, 0.06 mg per mL, 0.08 mg per mL, and 0.2 mg per mL, respectively.

Resolution solution—Dilute 5.0 mL of *Standard stock solution* with *Diluent* to 100.0 mL, and mix.

Standard solution—Dilute 10.0 mL of *Resolution solution* with *Diluent* to 100.0 mL, and mix.

Test solution—Use the *Assay preparation* as specified.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between valsartan related compound B and valsartan, and between ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A and hydrochlorothiazide is not less than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan and hydrochlorothiazide peaks, for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks, disregarding the peak, if any, with a retention time of about 22 minutes. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$2000C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of ~~USP Valsartan Related Compound B RS or USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, or the relevant USP Reference Standard (when determining the quantity of other impurities) in the *Standard solution;* and r_U and r_S are the corresponding peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~0.5%~~ 1.0% ~~each of valsartan related compound B and~~ of ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A is found; not more than 0.2% of any other impurity, excluding valsartan related compound A and valsartan re-

In-Process Revision

lated compound B, is found; and not more than ~~0.8%~~ 1.3% of total impurities, excluding valsartan related compound A and valsartan related compound B, is found. [NOTE—Valsartan related compound A is the enantiomer of valsartan and coelutes with valsartan in this test.]

Assay—

Diluent—Prepare a mixture of acetonitrile and water (1:1).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (90:10:0.1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and trifluoroacetic acid (90:10:0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12.5 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask. Add about 12.5*J* mg of USP Valsartan RS, accurately weighed, *J* being the ratio of the labeled amount, in mg, of valsartan to the labeled amount, in mg, of hydrochlorothiazide per Tablet. Add about 100 mL of *Diluent*, sonicate for 15 minutes, dilute with *Diluent* to volume, and mix. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Quantitatively dilute a volume of this solution with *Diluent* to obtain a solution having a known concentration of about 0.2 mg of USP Valsartan RS per mL.

Assay preparation—Transfer a number of Tablets, equivalent to about 62.5 mg of hydrochlorothiazide, to a 250-mL volumetric flask. Add 5 mL of water, and allow to stand for 5 minutes. Then add about 100 mL of *Diluent*, sonicate for 15 minutes, and shake for 30 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at 3000 rpm. Dilute 25.0 mL of the clear supernatant with *Diluent* to 200.0 mL, and mix *(Solution 1).* [NOTE—Retain a portion of *Solution 1* to use as the *Test solution* in the test for *Related compounds*.] Dilute an accurately measured volume of *Solution 1* with *Diluent* to obtain a solution containing about 0.2 mg of valsartan per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	90→10	10→90	linear gradient
25–27	10→90	90→10	linear gradient
27–40	90	10	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$(LC_S / C_U)(r_U / r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in each Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Assay preparation,* based on the labeled quantity per Tablet and the extent of dilution;

In-Process Revision

and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

MONOGRAPHS (NF)

BRIEFING

Benzyl Alcohol, *NF 21* page 2698 and page 879 of *PF* 28(3) [May–June 2002]. It is proposed to delete the requirement to ignite the sample to constant weight in the *Residue on ignition* test. This will make it clear that the sample is ignited to constant weight only if compliance with the monograph limit is not obtained first, as provided in the general test chapter *Residue on Ignition* ⟨281⟩.

(EMC: D. Bempong) RTS—40195-1

Change to read:

Residue on ignition ⟨281⟩—Evaporate 25 mL in a suitable crucible, and ignite: ~~to constant weight.~~

■■2S (*NF22*)
not more than 0.005% is found.

BRIEFING

Butylparaben, *NF 21* page 2701; **Ethylparaben,** *NF 21* page 2745; **Propylparaben,** *NF 21* page 2824; **Methylparaben,** *NF 21* page 2794. On the basis of comments received, it is proposed to change the specification range in the Definition and to revise the operating conditions in the *Assay* based on the *Assay* appearing in the harmonization draft proposals on pages 1967–1970 of *PF* 28(6) [Nov.–Dec. 2002] and page 575 of *PF* 28(2) [Mar.–Apr. 2002], respectively. In the *Assay*, it is proposed to reduce the sample weight, to change the heating process to give a specific temperature, and to omit the reflux step. Interested parties are encouraged to submit comments.

In-Process Revision

BRIEFING

Mono- and Di-glycerides, *NF 21* page 2798 and page 3024 of the *First Supplement*. On the basis of comments received that the relative retention times in the *Assay for monoglycerides* are too restrictive, it is proposed to replace the approximate relative retention times specified in the test with the order of elution of the expected components. Also, because the precision involved in *Iodine value* determination could lead to failure problems for monograph items that have low iodine values, it is proposed to revise the test to reflect a new requirement for items with a nominal iodine value less than 10.

(EMC: D. Bempong) RTS—39818-1

Change to read:

Iodine value ⟨401⟩: not less than 90.0% and not more than 110.0% of the value indicated in the labeling.

■If the value stated in the labeling is less than 10, the *Iodine value* is not more than 10.■2S (*NF22*)

Change to read:

Assay for monoglycerides—

Mobile phase—Use filtered and degassed tetrahydrofuran. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Assay preparation—Transfer about 200 mg of Mono- and Di-glycerides, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with tetrahydrofuran to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7-mm × 60-cm column that contains ■5-µm■1S (*NF21*) packing L21 ■(100 Å).■1S (*NF21*) The flow rate is about 1 mL per minute. The column and detector temperatures are maintained at 40°. Chromatograph the *Assay preparation,* and record the peak responses as directed for *Procedure*. ~~the relative retention times are about 1.0 for glycerin, 0.86 for monoglycerides, 0.81 for diglycerides, and 0.77 for triglycerides; and~~

■The order of elution is triglycerides, diglycerides, monoglycerides, and glycerin.■2S (*NF22*)

The relative standard deviation for replicate injections determined from the monoglycerides peak is not more than 1.0%.

Procedure—Inject a volume (about 40 µL) of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of monoglycerides in the portion of Mono- and Di-glycerides taken by the formula:

$$100(r_U/r_s),$$

in which r_U is the peak response for monoglycerides; and r_s is the sum of the responses of all the peaks, except the solvent peak.

BRIEFING

Propylparaben, *NF 21* page 2824 and page 1970 of *PF* 28(6) [Nov.–Dec. 2002]—See briefing under *Butylparaben.*

(EMC: C. Sheehan) RTS—40162-1

Change to read:

■Transfer about 1 g of Propylparaben, accurately weighed, to a flask fitted with a ground-glass stopper. Add 20.0 mL of 1 N sodium hydroxide VS, and heat at about 70° for 1 hour. Cool rapidly in an ice bath. Carry out the titration of the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 1 N sodium hydroxide is equivalent to 180.2 mg of $C_{10}H_{12}O_3$.■2S (*NF22*)

BRIEFING

Pregelatinized Starch, *NF 21* page 2843 and page 706 of *PF* 29(3) [May–June 2003]. This monograph is being presented again with changes to the *Packaging and storage* section and to the tests for *Identification* and *Microbial limits*. The *Packaging and storage* statement has been revised to incorporate storage specifications provided by a manufacturer. The *Identification* test has been changed to be consistent with the Adoption Stage 6 harmonization pro-

In-Process Revision

posals for the Starch monographs. It is proposed to include the requirements for total aerobic microbial count and total combined molds and yeasts count under *Microbial limits*.

(EMC: C. Sheehan; PSD: C. Okeke; AMB: D. Porter)
RTS—40158-1

Add the following:

■**Packaging and storage**—Preserve in ~~well closed~~ tight containers. Store at 25°, excursions permitted up to 40°.■2S (*NF22*)

Add the following:

■**Labeling**—Label it to indicate the botanical source from which it was derived.■2S (*NF22*)

Add the following:

■**Identification**—A water slurry of it is colored ~~reddish violet~~ orange red to deep blue by iodine TS.■2S (*NF22*)

Add the following:

■**Microbial limits** ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10^3 cfu per g, and the total combined molds and yeasts count does not exceed 10^2 cfu per g.■2S (*NF22*)

Add the following:

■**Loss on drying** ⟨731⟩—Dry it at 120° for 4 hours: it loses not more than 14.0% of its weight.■2S (*NF22*)

Add the following:

■**Residue on ignition** ⟨281⟩: not more than 0.5%, determined on a 2.0-g test specimen.■2S (*NF22*)

Change to read:

Sulfur dioxide—Mix 20 g with 200 mL of a 1 in 5 solution of anhydrous sodium sulfate, and filter. To 100 mL of the clear filtrate add 3 mL of starch TS, and titrate with ~~0.010 N iodine~~

■0.01 N iodine VS■1S (*NF22*)
to the first permanent blue color: not more than 2.7 mL is consumed (0.008%).

Delete the following:

■~~**Other requirements**—It responds to *Identification* test *B* and meets the requirements for *Packaging and storage, Labeling, Microbial limits, Loss on drying,* and *Residue on ignition* under *Starch.*~~■2S (*NF22*)

Chemical Tests and Assays

LIMIT TESTS

BRIEFING

⟨**231**⟩ **Heavy Metals,** *USP 26* page 2057 and page 1570 of *PF* 28(5) [Sept.–Oct. 2002]. On the basis of comments received, the use of a pH meter to adjust the pH in *Method I* and *Method III* is proposed. Situations in which the *Monitor Preparation* has a lighter color than the *Standard Preparation* have been reported. This problem could indicate that the pH is out of range, and external pH short-range paper indicators may not be accurate enough to detect this change. In addition to these changes, and to be consistent with *Methods I* and *II*, a formula to calculate the amount of substance to be tested is added in *Method III*.

Method II also reflects changes to the USP test appearing under the harmonization section (see page 1570 of *PF* 28(5) [Sept.–Oct 2002]). These changes are based on suggestions made in a *Stimuli* article by K. B. Blake entitled *Harmonization of the USP, EP, and JP Heavy Metals Testing Procedures* (see page 1632 of *PF* 21(6) [Nov.–Dec. 1995]). The Blake article concludes that the ashing process in *Method II* is responsible for a loss of as much as 100% of mercury content and up to 50% of the heavy metals present. Improvements in heavy metal limit determination by *Method II* are expected following the inclusion of a *Monitor Preparation,* an increase in the amount of sample, and a corresponding increase in the amount of lead in both the *Standard Preparation* and the *Monitor Preparation*. The *Monitor Preparation* is intended as a means of validating the use of *Method II,* with the instruction to proceed to *Method III* if the solution from the *Monitor Preparation* is less colored than the solution from the *Standard Preparation*.

Comments regarding this proposal are invited and should be submitted by March 15, 2004.

pH 3.5 Acetate Buffer—Prepare as directed for *Method I.*
Standard Preparation—~~Prepare as directed under *Method I.*~~

■Pipet 4 mL of the *Standard Lead Solution* into a suitable test tube, and add 10 mL of 6 N hydrocloric acid.■2S (*USP27*)

Test Preparation—Use a quantity, in g, of the substance to be tested as calculated by the formula:

~~2.0/(1000*L*),~~

■4.0/(1000*L*),■2S (*USP27*)

in which *L* is the *Heavy metals* limit, ~~in~~

■as a■2S (*USP27*)
percentage. Transfer the weighed quantity of the substance to a suitable crucible, add sufficient sulfuric acid to wet the substance, and carefully ignite at a low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off

■(no longer than 2 hours). If carbon remains, allow the residue to cool, add a few drops of sulfuric acid, evaporate, and ignite again.■2S (*USP27*)
Cool, add ~~4 mL~~

■5 mL■2S (*USP27*)
of 6 N hydrochloric acid, cover,

■and■2S (*USP27*)
digest on a steam bath for ~~15 minutes, uncover, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of hydrochloric acid, add 10 mL of hot water, and digest for 2 minutes. Add 6 N ammonium hydroxide dropwise, until the solution is just alkaline to litmus paper, dilute with water to 25 mL, and adjust with 1 N acetic acid to a pH between 3.0 and 4.0, using short-range pH indicator paper as external indicator. Filter if necessary, rinse the crucible and the filter with 10 mL of water, combine the filtrate and rinsing in a 50-mL color-comparison tube, dilute with water to 40 mL, and mix.~~

■10 minutes. Cool, and quantitatively transfer the solution to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.

Monitor Preparation—Pipet 4 mL of the *Standard Lead Solution* into a crucible identical to that used for the *Test Preparation* and containing a quantity of the substance under test that is equal to 10% of the amount required for the *Test Preparation*. Evaporate on a steam bath to dryness. Ignite at the same time, in the same muffle furnace, and under the same conditions used for the *Test Preparation*. Cool, add 5 mL of 6 N hydrochloric acid, cover, and digest on a steam bath for 10 minutes. Cool, and quantitatively transfer to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.■2S (*USP27*)

Procedure—~~To~~

■Adjust the solution in■2S (*USP27*)
each of the tubes containing the *Standard Preparation,*~~and~~ the *Test Preparation,*

■and the *Monitor Preparation* with ammonium hydroxide, added cautiously and dropwise, to a pH of 9. Cool, and adjust with glacial acetic acid, added dropwise, to a pH of 8, and then add 0.5 mL in excess. Filter, washing the filter with a few mL of water, into a 50-mL color-comparison tube, and then dilute with water to 40 mL.■2S (*USP27*)

In-Process Revision

Add 2 mL of *pH 3.5 Acetate Buffer,* then add 1.2 mL of thioacetamide-glycerin base TS, dilute with water to 50 mL, mix, allow to stand for 2 minutes, and view downward over a white surface*: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation,*

■and the color of the solution from the *Monitor Preparation* is equal to or darker than that of the solution from the *Standard Preparation*. [NOTE—If the color of the solution from the *Monitor Preparation* is lighter than that of the solution from the *Standard Preparation,* proceed as directed for *Method III* for the substance being tested.]■2S (*USP27*)

Change to read:

Method III

pH 3.5 Acetate Buffer—Prepare as directed for *Method I.*

Standard Preparation—Transfer a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to a clean, dry, 100-mL Kjeldahl flask, and add a further volume of nitric acid equal to the incremental volume of nitric acid added to the *Test Preparation.* Heat the solution to the production of dense, white fumes, cool, cautiously add 10 mL of water and, if hydrogen peroxide was used in treating the *Test Preparation,* add a volume of 30 percent hydrogen peroxide equal to that used for the substance being tested, and boil gently to the production of dense, white fumes. Again cool, cautiously add 5 mL of water, mix, and boil gently to the production of dense, white fumes and to a volume of 2 to 3 mL. Cool, dilute cautiously with a few mL of water, add 2.0 mL of *Standard Lead Solution* (20 µg of Pb), and mix. Transfer to a 50-mL color-comparison tube, rinse the flask with water, adding the rinsing to the tube until the volume is 25 mL, and mix.

Test Preparation—

■Unless otherwise indicated in the individual monograph, use a quantity, in g, of the substance to be tested as calculated by the formula:

$$2.0/(1000L),$$

in which L is the *Heavy metals* limit, as a percentage.■2S (*USP27*)

If the substance is a solid—Transfer the

■weighed■2S (*USP27*) quantity of the test substance ~~specified in the individual monograph~~

■■2S (*USP27*) to a clean, dry, 100-mL Kjeldahl flask. [NOTE—A 300-mL flask may be used if the reaction foams excessively.] Clamp the flask at an angle of 45°, and add a sufficient quantity of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to moisten the substance thoroughly. Warm gently until the reaction commences, allow the reaction to subside, and add additional portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat, and boil gently until the solution darkens. Cool, add 2 mL of nitric acid, and heat again until the solution darkens. Continue the heating, followed by addition of nitric acid until no further darkening occurs, then heat strongly to the production of dense, white fumes. Cool, cautiously add 5 mL of water, boil gently to the production of dense, white fumes, and continue heating until the volume is reduced to a few mL. Cool, cautiously add 5 mL of water, and examine the color of the solution. If the color is yellow, cautiously add 1 mL of 30 percent hydrogen peroxide, and again evaporate to the production of dense, white fumes and a volume of 2 to 3 mL. If the solution is still yellow in color, repeat the addition of 5 mL of water and the peroxide treatment. Cool, dilute cautiously with a few mL of water, and rinse into a 50-mL color-comparison tube, taking care that the combined volume does not exceed 25 mL.

If the substance is a liquid—Transfer the

■weighed■2S (*USP27*) quantity of the test substance ~~specified in the individual monograph~~

■■2S (*USP27*) to a clean, dry, 100-mL Kjeldahl flask. [NOTE—A 300-mL flask may be used if the reaction foams excessively.] Clamp the flask at an angle of 45°, and cautiously add a few mL of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid. Warm gently until the reaction commences, allow the reaction to subside, and proceed as directed for *If the substance is a solid,* beginning with "add additional portions of the same acid mixture."

Procedure—Treat the *Test Preparation* and the *Standard Preparation* as follows: ~~Adjust~~

■Using a pH meter, adjust■2S (*USP27*) the solution to a pH between 3.0 and 4.0, ~~using short range pH indicator paper as external indicator,~~

■■2S (*USP27*) with ammonium hydroxide (a dilute ammonia solution may be used, if desired, as the specified range is approached), dilute with water to 40 mL, and mix.

To each tube add 2 mL of *pH 3.5 Acetate Buffer,* then add 1.2 mL of thioacetamide-glycerin base TS, dilute with water to 50 mL, mix, allow to stand for 2 minutes, and view downward over a white surface*: the color of the *Test Preparation* is not darker than that of the *Standard Preparation.*

In-Process Revision

Physical Tests and Determinations

BRIEFING

⟨**611**⟩ **Alcohol Determination,** *USP 26* page 2124. This general chapter is revised to incorporate two new Reference Standards for *Method II—Gas-Liquid Chromatographic Method*. The use of these Reference Standards will allow a more accurate determination and decrease the number of analytical manipulations. Minor editorial style changes have also been made.

(PA4: H. Pappa) RTS—39929-1

Change to read:

METHOD II—GAS-LIQUID CHROMATOGRAPHIC METHOD

Method II is to be used where specified in the individual monograph. For a discussion of the principles upon which it is based, see *Gas Chromatography* under *Chromatography* ⟨621⟩.

■**USP Reference Standards**—*USP Alcohol Determination—Acetonitrile RS. USP Alcohol Determination—Alcohol RS.*■2S (*USP27*)

Apparatus—Under typical conditions, use a gas chromatograph equipped with a flame-ionization detector and a 1.8-m × 4-mm (ID) glass column packed with 100- to 120-mesh chromatographic column packing No. S3, using nitrogen or helium as the carrier. Prior to use, condition the column overnight at 235° with a slow flow of carrier gas. The column is maintained at 120°, and the injection port and detector are maintained at 210°. Adjust the carrier flow and temperature so that acetonitrile, the internal standard, elutes in 5 to 10 minutes.

Solutions—

~~*Standard Solution*—Dilute 5.0 mL of dehydrated alcohol with water to 250 mL.~~

~~*Internal Standard Solution*—Dilute 5.0 mL of acetonitrile with water to 250 mL.~~

■■2S (*USP27*)

Test Stock Preparation—Dilute the specimen under examination stepwise with water to obtain a solution containing approximately 2% (v/v) of alcohol.

Test Preparation—Pipet ~~10 mL each of the *Test Solution* and the *Internal Standard Solution* into a 100-mL~~

■5 mL each of the *Test Stock Preparation* and the USP Alcohol Determination—Acetonitrile RS into a 50-mL■2S (*USP27*) volumetric flask, and dilute with water to volume.

Standard Preparation—Pipet ~~10 mL each of the *Standard Solution* and the *Internal Standard Solution* into a 100-mL~~

■5 mL each of the USP Alcohol Determination—Alcohol RS and the USP Alcohol Determination—Acetonitrile RS into a 50-mL■2S (*USP27*) volumetric flask, dilute with water to volume, and mix.

Procedure—Inject about 5 µL each of *Test Preparation* and *Standard Preparation,* in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol (v/v) in the specimen under test according to the formula:

~~$2R_U D / R_S$~~,

■$CD(R_U / R_S)$,■2S (*USP27*)

in which

■C is the labeled concentration of USP Alcohol Determination—Alcohol RS;■2S (*USP27*) D is the dilution factor (the ratio of the volume of the *Test Stock Preparation* to the volume of the specimen taken); and R_U and R_S are the peak response ratios obtained for the *Test Preparation* and the *Standard Preparation,* respectively.

System Suitability Test—In a suitable chromatogram, the resolution factor, *R,* is not less than 2; the tailing factor of the alcohol peak is not greater than 1.5; and six replicate injections of the *Standard Preparation* show a relative standard deviation of not more than 2.0% in the ratio of the peak of alcohol to the peak of the internal standard.

BRIEFING

⟨**621**⟩ **Chromatography,** *USP 26* page 2126, page 3154 of the *Second Supplement,* and page 1210 of *PF* 29(4) [July–Aug. 2003]. It is proposed to add a new L designation for the column used in the *Assay* and in the *Related compounds* test in the monograph for *Clopidogrel Bisulfate,* which appears in this number of *PF.*

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

In-Process Revision

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to 10 µm in diameter.

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 10 µm in diameter.

L9—10-µm irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel 10 µm in diameter having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.[5]

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, 5 to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L31—A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate ■dextrans■1S (*USP26*) by molecular size over a range of 4,000 to ■500,000■1S (*USP26*) Da. It is spherical, silica-based, and processed to provide pH stability.■[6]■1S (*USP26*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles

■by a propyl spacer,■1S (*USP27*)
5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.[7]

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.[8]

[5] Available as ~~Fractogel TSK HW 40F and distributed by Merck and Co.~~ ■YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■1S (*USP27*)

[6] Available as TSKgel G4000 SWXL from TosoHaas (www.tosohaas.com).

[7] Available as CarboPac MA1 and distributed by Dionex Corporation.

[8] Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.

In-Process Revision

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.[9]

▲L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.[10] ▲*USP26*

▲L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.[11] ▲*USP26*

■L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column. [12] ■1S (*USP26*)

■L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter. [13] ■2S (*USP26*)

■L~~53~~ ## (Alendronic Acid Tablets, PRP-X100)—An anion-exchange resin consisting of a rigid, spherical styrene-divinylbenzene copolymer with trimethylammonium groups at a loading of about 2 mEq per g, 3 to 20 µm in diameter.[a] ■1S (*USP27*)

■L~~54~~ ## (Maltose, Aminex HPX-87N)—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about 7 to 11 µm in diameter.[b] ■1S (*USP27*)

■L~~57~~ ## (Nevirapine, Supelcosil ABZ)—Spherical, porous silica gel, 3 or 5 µm in diameter, the surface of which has been covalently modified with palmitamidopropyl groups and endcapped with acetamidopropyl groups to a ligand density of about 6 µmoles per m^2.[c] ■1S (*USP27*)

■L~~58~~ ## (Albumin Human, TSKgel G3000 SW)—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa. It is spherical (10 µm), silica-based, and processed to provide hydrophilic characteristics and pH stability.[d] ■1S (*USP27*)

▲L~~59~~ ## (Clonidine, Zorbax SB-C3)—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.[e] ▲*USP27*

▲L~~60~~ ## Bethanecol Chloride, Bethanecol Chloride Tablets, IC-Pak C M/D)—A strong cation exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.[f] ▲*USP27*

■L~~61~~ ## (Lycopene, Lycopene Preparation, YMC 30)—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter. ■1S (*USP27*)

■L## (Clopidogrel Bisulfate, Ultron ES-OVM)—A chiral-recognition protein, ovomucoid, chemically bonded to silica particles, about 5 µm in diameter, with a pore size of 120 Å. ■2S (*USP27*)

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00:0.90:0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).

In-Process Revision

G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.

G17—75% Phenyl-25% methylpolysiloxane.

G18—Polyalkylene glycol.

G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.

G20—Polyethylene glycol (av. mol. wt. of 380 to 420).

G21—Neopentyl glycol succinate.

G22—Bis(2-ethylhexyl) phthalate.

G23—Polyethylene glycol adipate.

G24—Diisodecyl phthalate.

G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.

G26—25% 2-Cyanoethyl-75% methylpolysiloxane.

G27—5% Phenyl-95% methylpolysiloxane.

G28—25% Phenyl-75% methylpolysiloxane.

G29—3,3′-Thiodipropionitrile.

G30—Tetraethylene glycol dimethyl ether.

G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.

G32—20% Phenylmethyl-80% dimethylpolysiloxane.

G33—20% Carborane-80% methylsilicone.

G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.

G36—1% Vinyl-5% phenylmethylpolysiloxane.

G37—Polyimide.

G38—Phase G1 containing a small percentage of a tailing inhibitor.[14]

G39—Polyethylene glycol (av. mol. wt. about 1500).

G40—Ethylene glycol adipate.

G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).

G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).

G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).

G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.

G45—Divinylbenzene-ethylene glycol-dimethylacrylate.

G46—14% Cyanopropylphenyl-86% methylpolysiloxane.

G47—Polyethylene glycol (av. mol. wt. of about 8000).

G48—Highly polar, partially cross-linked cyanopolysiloxane.

■G49—Proprietary derivatized phenyl groups on a polysiloxane backbone.[15] ■1S (*USP26*)

■G~~50~~ ## (Docosahexaenoic Acid)—Polyethylene glycol, cross-linked (av. mol. wt. of more than 20,000).[g] ■1S (*USP27*)

Supports

[NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.]

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane[16] to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed.[16]

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 μm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 μm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 μm.

S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 μm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.[17]

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

In-Process Revision

[14] A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc., Supelco Park, Bellefonte, PA 16823.

[15] A suitable grade is available commercially as "Optima Delta 3" from Machery-Nagel, Inc., 215 River Vale Road, River Vale, NJ 07675.

[g] A suitable grade is available commercially as Famewax from Restek.

[16] Unless otherwise specified in the individual monograph, silanized support is intended.

[17] Commercially available as SP1500 on Carbopack B from Supelco.

BRIEFING

⟨**921**⟩ **Water Determination,** *USP 26* page 2230. On the basis of comments received, it is proposed to revise the *Apparatus* section under *Method Ia* to reflect current technology. Also, it is proposed to revise the *Principle* section under *Method 1c* (*Coulometric Titration*).

(PA4: H. Pappa) RTS—40179-1

Change to read:

METHOD I (TITRIMETRIC)

Determine the water by *Method Ia,* unless otherwise specified in the individual monograph.

Method Ia (Direct Titration)

Principle—The titrimetric determination of water is based upon the quantitative reaction of water with an anhydrous solution of sulfur dioxide and iodine in the presence of a buffer that reacts with hydrogen ions.

In the original titrimetric solution, known as Karl Fischer Reagent, the sulfur dioxide and iodine are dissolved in pyridine and methanol. The test specimen may be titrated with the *Reagent* directly, or the analysis may be carried out by a residual titration procedure. The stoichiometry of the reaction is not exact, and the reproducibility of a determination depends upon such factors as the relative concentrations of the *Reagent* ingredients, the nature of the inert solvent used to dissolve the test specimen, and the technique used in the particular determination. Therefore, an empirically standardized technique is used in order to achieve the desired accuracy. Precision in the method is governed largely by the extent to which atmospheric moisture is excluded from the system. The titration of water is usually carried out with the use of anhydrous methanol as the solvent for the test specimen; however, other suitable solvents may be used for special or unusual test specimens.

Apparatus—Any apparatus may be used that provides for adequate exclusion of atmospheric moisture and determination of the endpoint. In the case of a colorless solution that is titrated directly, the endpoint may be observed visually as a change in color from canary yellow to amber. The reverse is observed in the case of a test specimen that is titrated residually. More commonly, however, the endpoint is determined electrometrically with an apparatus employing a simple electrical circuit that serves to impress about 200 mV of applied potential between a pair of platinum electrodes ~~(about 5 mm² in area and about 2.5 cm apart)~~

■■2S (*USP27*)
immersed in the solution to be titrated. At the endpoint of the titration a slight excess of the reagent increases the flow of current to between 50 and 150 microamperes for 30 seconds to 30 minutes, depending upon the solution being titrated. The time is shortest for substances that dissolve in the reagent. With some automatic titrators, the abrupt change in current or potential at the endpoint serves to close a solenoid-operated valve that controls the buret delivering the titrant. Commercially available apparatus generally comprises a closed system consisting of one or two automatic burets and a tightly covered titration vessel fitted with the necessary electrodes and a magnetic stirrer. The air in the system is kept dry with a suitable desiccant, and the titration vessel may be purged by means of a stream of dry nitrogen or current of dry air.

Reagent—Prepare the Karl Fischer Reagent as follows. Add 125 g of iodine to a solution containing 670 mL of methanol and 170 mL of pyridine, and cool. Place 100 mL of pyridine in a 250-mL graduated cylinder, and, keeping the pyridine cold in an ice bath, pass in dry sulfur dioxide until the volume reaches 200 mL. Slowly add this solution, with shaking, to the cooled iodine mixture. Shake to dissolve the iodine, transfer the solution to the apparatus, and allow the solution to stand overnight before standardizing. One mL of this solution when freshly prepared is equivalent to approximately 5 mg of water, but it deteriorates gradually; therefore, standardize it within 1 hour before use, or daily if in continuous use. Protect from light while in use. Store any bulk stock of the reagent in a suitably sealed, glass-stoppered container, fully protected from light, and under refrigeration.

A commercially available, stabilized solution of Karl Fischer type reagent may be used. Commercially available reagents containing solvents or bases other than pyridine or alcohols other than methanol may be used also. These may be single solutions or reagents formed in situ by combining the components of the reagents present in two discrete solutions. The diluted *Reagent* called for in some monographs should be diluted as directed by the manufacturer. Either methanol or other suitable solvent, such as ethylene glycol monomethyl ether, may be used as the diluent.

Test Preparation—Unless otherwise specified in the individual monograph, use an accurately weighed or measured amount of the specimen under test estimated to contain 10 to 250 mg of water.

Where the specimen under test is an aerosol with propellant, store it in a freezer for not less than 2 hours, open the container, and test 10.0 mL of the well-mixed specimen. In titrating the specimen, determine the endpoint at a temperature of 10° or higher.

Where the specimen under test is capsules, use a portion of the mixed contents of not less than 4 capsules.

Where the specimen under test is tablets, use powder from not less than 4 tablets ground to a fine powder in an atmosphere of temperature and relative humidity known not to influence the results.

Where the monograph specifies that the specimen under test is hygroscopic, use a dry syringe to inject an appropriate volume of methanol, or other suitable solvent, accurately measured, into a tared container, and shake to dissolve the specimen. Using the same syringe, remove the solution from the container and transfer it to a titration vessel prepared as directed for *Procedure.* Repeat the procedure with a second portion of methanol, or other suitable solvent, accurately measured, add this washing to the titration vessel, and immediately titrate. Determine the water content, in mg, of a portion of solvent of the same total volume as that used to dissolve the specimen and to wash the container and syringe, as directed for *Standardization of Water Solution for Residual Titrations,* and subtract this value from the water content, in mg, obtained in the titration of the specimen under test. Dry the container and its closure at 100° for 3 hours, allow to cool in a desiccator, and weigh. Determine the weight of specimen tested from the difference in weight from the initial weight of the container.

Standardization of the Reagent—Place enough methanol or other suitable solvent in the titration vessel to cover the electrodes, and add sufficient *Reagent* to give the characteristic endpoint color, or 100 ± 50 microamperes of direct current at about 200 mV of applied potential.

For determination of trace amounts of water (less than 1%), sodium tartrate may be used as a convenient water reference substance. Quickly add 150 to 350 mg of sodium tartrate ($C_4H_4Na_2O_6 \cdot 2H_2O$), accurately weighed by difference, and titrate to the endpoint. The water equivalence factor *F,* in mg of water per mL of reagent, is given by the formula:

$$2(18.02/230.08)(W/V),$$

in which 18.02 and 230.08 are the molecular weights of water and sodium tartrate dihydrate, respectively; *W* is the weight, in mg, of sodium tartrate dihydrate; and *V* is the volume, in mL, of the *Reagent* consumed in the second titration.

In-Process Revision

For the precise determination of significant amounts of water (1% or more), use *Purified Water* as the reference substance. Quickly add between 25 and 250 mg of water, accurately weighed by difference, from a weighing pipet or from a precalibrated syringe or micropipet, the amount taken being governed by the reagent strength and the buret size, as referred to under *Volumetric Apparatus* ⟨31⟩. Titrate to the endpoint. Calculate the water equivalence factor, *F,* in mg of water per mL of reagent, by the formula:

$$W/V,$$

in which W is the weight, in mg, of the water; and V is the volume, in mL, of the reagent required.

Procedure—Unless otherwise specified, transfer 35 to 40 mL of methanol or other suitable solvent to the titration vessel, and titrate with the *Reagent* to the electrometric or visual endpoint to consume any moisture that may be present. (Disregard the volume consumed, since it does not enter into the calculations.) Quickly add the *Test Preparation,* mix, and again titrate with the *Reagent* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$SF,$$

in which S is the volume, in mL, of the *Reagent* consumed in the second titration; and F is the water equivalence factor of the *Reagent.*

Method Ib (Residual Titration)

Principle—See the information given in the section *Principle* under *Method Ia.* In the residual titration, excess *Reagent* is added to the test specimen, sufficient time is allowed for the reaction to reach completion, and the unconsumed *Reagent* is titrated with a standard solution of water in a solvent such as methanol. The residual titration procedure is applicable generally and avoids the difficulties that may be encountered in the direct titration of substances from which the bound water is released slowly.

Apparatus, Reagent, and Test Preparation—Use *Method Ia.*

Standardization of Water Solution for Residual Titration—Prepare a *Water Solution* by diluting 2 mL of water with methanol or other suitable solvent to 1000 mL. Standardize this solution by titrating 25.0 mL with the *Reagent,* previously standardized as directed under *Standardization of the Reagent.* Calculate the water content, in mg per mL, of the *Water Solution* taken by the formula:

$$V'F/25,$$

in which V' is the volume of the *Reagent* consumed, and F is the water equivalence factor of the *Reagent.* Determine the water content of the *Water Solution* weekly, and standardize the *Reagent* against it periodically as needed.

Procedure—Where the individual monograph specifies that the water content is to be determined by *Method Ib,* transfer 35 to 40 mL of methanol or other suitable solvent to the titration vessel, and titrate with the *Reagent* to the electrometric or visual endpoint. Quickly add the *Test Preparation,* mix, and add an accurately measured excess of the *Reagent.* Allow sufficient time for the reaction to reach completion, and titrate the unconsumed *Reagent* with standardized *Water Solution* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$F(X' - XR),$$

in which F is the water equivalence factor of the *Reagent; X'* is the volume, in mL, of the *Reagent* added after introduction of the specimen; X is the volume, in mL, of standardized *Water Solution* required to neutralize the unconsumed *Reagent;* and R is the ratio, $V'/25$ (mL *Reagent*/mL *Water Solution*), determined from the *Standardization of Water Solution for Residual Titration.*

Method Ic (Coulometric Titration)

Principle—The Karl Fischer reaction is used in the coulometric determination of water. Iodine, however, is not added in the form of a volumetric solution but is produced in an iodide-containing solution by anodic oxidation. The reaction cell usually consists of a large anode compartment and a small cathode compartment that are separated by a diaphragm. Other suitable types of reaction cells (e.g., without diaphragms) may also be used. Each compartment has a platinum electrode that conducts current through the cell. Iodine, which is produced at the anode electrode, immediately reacts with water present in the compartment. When all the water has been consumed, an excess of iodine occurs, which usually is detected electrometrically, thus indicating the endpoint. Moisture is eliminated from the system by pre-electrolysis. Changing the Karl Fischer solution after each determination is not necessary since individual determinations can be carried out in succession in the same reagent solution. A requirement for this method is that each component of the test specimen is compatible with the other components, and no side reactions take place. Samples are usually transferred into the vessel as solutions by means of injection through a septum. Gases can be introduced into the cell by means of a suitable gas inlet tube. Precision in the method is predominantly governed by the extent to which atmospheric moisture is excluded from the system; thus, the introduction of solids into the cell is not recommended, unless elaborate precautions are taken, such as working in a glove-box in an atmosphere of dry inert gas. Control of the system may be monitored by measuring the amount of baseline drift. This method is particularly suited to chemically inert substances like hydrocarbons, alcohols, and ethers. In comparison with the volumetric Karl Fischer titration, coulometry is a micro-method. ~~The method utilizes extremely small amounts of current and is used to determine water content in the range of 100% to 0.0001%.~~

■■2S (*USP27*)

Apparatus—Any commercially available apparatus consisting of an absolutely tight system fitted with the necessary electrodes and a magnetic stirrer is appropriate. The instrument's microprocessor controls the analytical procedure and displays the results. Calibration of the instrument is not necessary, as the current consumed can be measured absolutely.

Reagent—See *Reagent* under *Method Ia.*

Test Preparation—Where the specimen is a soluble solid, dissolve an appropriate quantity, accurately weighed, in anhydrous methanol or other suitable solvents. Liquids may be used as such or as accurately prepared solutions in appropriate anhydrous solvents.

Where the specimen is an insoluble solid, the water may be extracted using a suitable anhydrous solvent from which an appropriate quantity, accurately weighed, may be injected into the anolyte solution. Alternatively an evaporation technique may be used in which water is released and evaporated by heating the specimen in a tube in a stream of dry inert gas, this gas being then passed into the cell.

Procedure—Using a dry syringe, quickly inject the *Test Preparation,* accurately measured and estimated to contain 0.5 to 5 mg of water, or as recommended by the instrument manufacturer into the anolyte, mix, and perform the coulometric titration to the electrometric endpoint. Read the water content of the *Test Preparation* directly from the instrument's display, and calculate the percentage that is present in the substance. Perform a blank determination, and make any necessary corrections.

In-Process Revision

GENERAL CHAPTERS

General Information

BRIEFING

⟨1079⟩ Good Storage and Shipping Practices. This new proposed general information chapter is intended to provide guidance to manufacturers, repackagers, distributors, shippers, and pharmacists on practices designed to maintain the integrity of pharmaceuticals during storage and shipment. The chapter was drafted based in part on storage and shipping portions of the text of the formerly proposed general chapter *Packaging, Storage, and Distribution of Pharmacopeial Articles* ⟨1141⟩, as published on page 493 of *PF* 26(2) [Mar.–Apr. 2000].

References are made in the text to the proposed general chapter *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩, published on page 476 of *PF* 28(2) [Mar.–Apr. 2002] and to *Pharmaceutical Stability* ⟨1150⟩, a renamed section of *Pharmaceutical Dosage Forms* ⟨1151⟩, a general information chapter appearing elsewhere in this number of *PF*.

Additional information from the previously proposed chapter ⟨1141⟩ related to packaging can be found in the new proposed general chapter *Good Packaging Practices* ⟨1177⟩, also appearing in this number of *PF*. Comments should be addressed to Dr. Claudia Okeke, USP Information and Standards Development.

(PSD: C. Okeke) RTS—40189-01

Add the following:

■⟨1079⟩ GOOD STORAGE AND SHIPPING PRACTICES

This general chapter is intended to provide general guidance concerning storing, distributing, and shipping of Pharmacopeial preparations. It describes procedures that should be considered to ensure that the standards for proper storage environments for individual articles are maintained. Approaches in this chapter are designed to ensure that the article's integrity is maintained until it reaches the user. It does not change any applicable requirements under good manufacturing practices, state laws governing pharmacies, the *USP General Notices and Requirements* or monographs, or provisions under approved labeling.

The section *Preservation, Packaging, Storage, and Labeling* under the *General Notices* provides definitions for storage conditions. All equipment used for recording, monitoring, and maintaining these temperatures and humidity conditions should be calibrated on a regular basis. This calibration should be traceable to national or international standards (see *Monitoring Devices—Time, Temperature, and Humidity* ⟨1118⟩).

A Pharmacopeial preparation may follow several potential routes from the original manufacturer to the patient. *Figure 1* documents these routes and the risks to the associated product. These risks include exposure to temperature excursions, humidity, light, and oxygen. For a discussion of climates, stability, and mean kinetic temperature, see *Pharmaceutical Stability* ⟨1150⟩. Temperature- or humidity-sensitive articles are to be handled in accordance with guidelines provided in the *General Notices*.

PACKAGING AND STORAGE STATEMENT IN MONOGRAPHS

Most articles have storage conditions identified by their labeling. Otherwise, it is expected that the conditions for storing the article are specified in the monograph according to definitions provided under *Storage Temperature* in the *Preservation, Packaging, Storage, and Labeling* section of the *General Notices*.

In cases where additional information on the article is desired, the packaging and storage information can be explained further in the *Packaging and storage* or the *Labeling* section of the monograph with specific handling instructions for the article.

In-Process Revision

STORAGE IN WAREHOUSES, PHARMACIES, TRUCKS, SHIPPING DOCKS, AND OTHER LOCATIONS

Pharmacopeial articles are to be stored in locations that adhere to conditions established by the manufacturer. Where conditions are not established or available, use storage conditions described in the *General Notices* or the applicable monograph.

Warehouses

Observation of the temperature variations in a warehouse should be made over a period of time to establish a meaningful temperature profile, including the temperature variations and conditions in the different parts of the warehouse. Such observations provide data and information as to where various products should and should not be stored.

ESTABLISHING TEMPERATURE PROFILES

Temperature profiles can be achieved by using a suitable number of thermometers or other temperature recording instruments or monitoring devices and placing them throughout the warehouse in divided sections, and recording the maximum and minimum temperatures achieved during a 24-hour period for a total of three consecutive 24-hour periods. With regard to temperature profiling, the following factors should be considered during the process: the size of the warehouse and conditions that give rise to predisposition to extreme temperatures such as location of space heaters, sun-facing walls, low ceilings or roofs, and regional location of the warehouse.

Temperature profiling on warehouses already in use can be done at known high external temperature times (e.g., for a period of over three hours in the daytime when ambient air temperatures are higher than 25° and when temperatures are known to be less than 15°). This exercise should be conducted in the summer and winter seasons, as these are times of extreme temperatures.

A mean kinetic temperature (MKT) of the temperature profile should be obtained and recorded for any separate areas within the warehouse; see general chapter *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩ for samples of MKT calculations. The report from the profile should provide recommendations for the use of each area and identification of any areas that are found unsuitable for storage of Pharmacopeial articles.

CONTROLLED ROOM TEMPERATURE

The *General Notices* provide a definition for controlled room temperature. A temperature profiling study should demonstrate suitability for storing Pharmacopeial articles in areas determined to be "room" or "controlled room" temperature. A suitable number of temperature and humidity recording instruments should be installed to record temperatures and provide temperature and humidity profiles. Temperature recording should be conducted to meet the recommendations for establishing mean kinetic temperature and to comply with the warehouse's written procedures. These written procedures should have a reporting mechanism in place whereby a management tree is informed in the event that predefined high or low temperatures or humidity limits have been exceeded.

Records can be reviewed as determined by the management system in accordance with established guidelines. Suitable training should be provided to persons who record temperatures, and proper quality accountability and tracking systems should be maintained.

STORAGE AT "COOL," "COLD," "REFRIGERATOR," AND "FREEZING" CONDITIONS

The *General Notices* provide definitions for ''cool,'' "cold," "refrigerator," and "freezer" temperatures. A temperature profiling study can be used to establish suitable areas for storing Pharmacopeial articles designated to be stored under these conditions. Equipment used for storing Pharmacopeial articles at these low temperatures should be validated according to written procedures provided by the management system. Recording devices can be installed within the equipment and used to enable both air and product temperatures to be recorded at regular intervals. The number and location of monitoring devices should be determined based on the result of the temperature profile. Temperature records should be examined at least once every 24 hours or as provided in the equipment protocol. Humidity-monitoring devices should be used in cases where the Pharmacopeial article is humidity-sensitive or labeled to avoid moisture. In this case, proper records must be maintained of the humidity in the area where the Pharmacopeial article is stored. Additionally, there can be installed temperature-monitoring, and where necessary, humidity-monitoring equipment that has the capability of alerting personnel in the event that temperature or humidity control is compromised. There should be protocols in place to address procedures for responding to failed temperature and humidity ranges both for normal working hours and outside normal working hours. Temperature and humidity should be reviewed at the times designated by the established protocol. The calibration and functioning of all temperature and humidity monitoring devices, including alarms and other associated equipment, should be checked on an annual or semiannual basis. Regular maintenance protocols should be in place for refrigeration equipment. There should be written agreements in place for all maintenance and evaluation procedures, and this may include an emergency situation protocol.

PERSONNEL TRAINING

Suitable training should be provided for personnel who handle Pharmacopeial articles with special storage temperature requirements. Personnel should know how to monitor temperatures and how to react to situations where adverse temperatures are identified. There should be written procedures in place such that the adverse temperatures are recorded and a report provided to the parties designated in the protocol.

VALIDATION OF "COLD" EQUIPMENT OR STORES

Only climate control equipment for which a contractor has provided documentation to assure its suitability for temperature and humidity requirements should be considered for use in cold storage. Validation procedures should be independently conducted on equipment in cold stores regularly to guarantee its suitability and proper functioning. The validation should demonstrate the temperature profile throughout the proposed equipment for both air and product temperatures both when empty and when loaded. The validation should also demonstrate the time taken for temperatures to exceed the maximum temperature in the event of a power failure. Validation should consider thermal fluctuations that occur during stock replenishment and order removal. The results of the validation should demonstrate

the ability of the equipment to maintain the required temperature range in all areas, defining any zones which should not be used for storage such as those areas in close proximity to cooling coils, cold air streams from equipment ventilation, or doors. The variability of the system should also be characterized by using the relative standard deviation. Thermal monitoring should establish that the system is rugged in that its temperature profile is consistent and reliable.

DISTRIBUTION AND SHIPMENT OF PHARMACOPEIAL ARTICLES

As indicated in *Figure 1*, a drug can take a variety of paths from the manufacturer to the patient. In the simplest form of the distribution system, the manufacturer ships directly to the customer, such as a doctor's office, clinic, or hospital. However, more often, the article leaves the manufacturer's chain of control and enters a complex system of handoffs that involve the distribution chain to the patient.

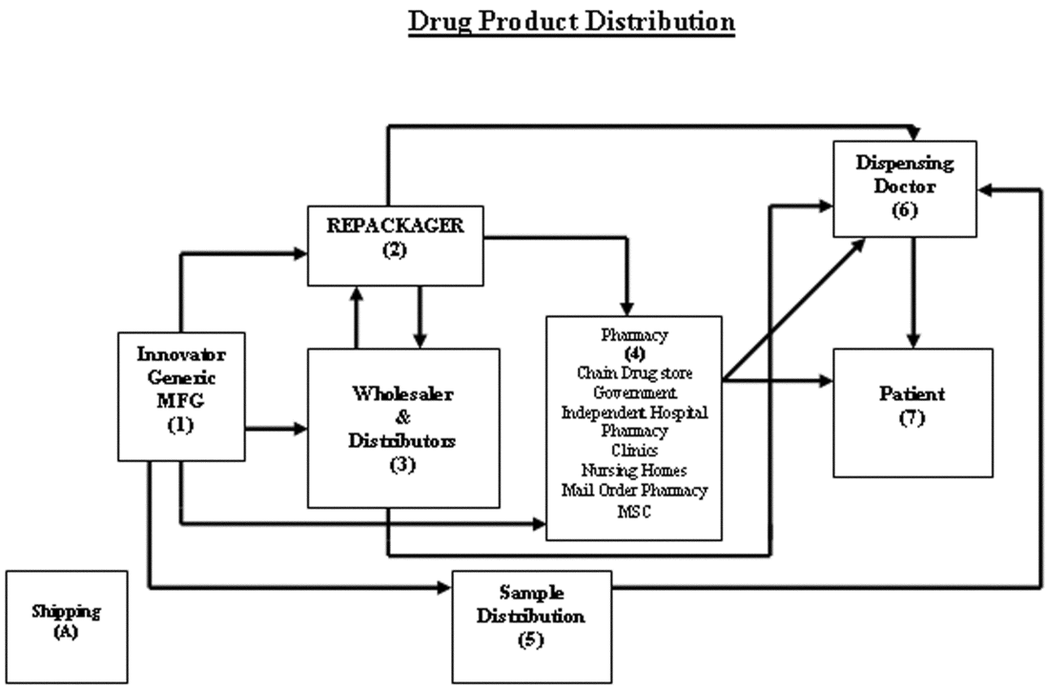

Figure 1. Drug product distribution.

Shippers and distributors are to follow the proper storage and shipping requirements as indicated by the manufacturer. For particular cases, such as shipment of vaccines or other special care products, manufacturers may require special shipping and storage conditions generally referred to as ''cold chain management''. For example, manufacturers may attach temperature-monitoring devices and/or ship under specified controlled conditions to ensure that the desired temperature is maintained during distribution. Validated, available temperature- and/or humidity-monitoring technol-

ogies can be used to monitor the overall environmental effect on compendial articles during shipment and distribution. In these cases, the shipping conditions of the package are recorded. In general, extreme temperature conditions (i.e., excessive heat, freezing) should be avoided.

Most products are sufficiently robust to withstand distribution with minimal protection from routine, well-understood physical and environmental hazards. Several standard test methods are available for evaluating package performance factors under well-documented shock, vibration, and other transit elements. The American Society for Testing and Materials document, "Standard Practice for Performance Testing of Shipping Containers and Systems" (ASTM D4169-98), and the International Safe Transit Association's (ISTA) specifications have similar methods for evaluation of shipping performance for various types of transit modes such as less-than-truckload (LTL), small package, rail car, air freight, etc. From the manufacturer's perspective, these tests are very useful in evaluating the product and package durability and fragility. The tests are usually performed on shipping carton quantities of a specific stock keeping unit (SKU) as an unbroken whole. Fragility problems can be corrected with package modifications. Some such modifications include placing cotton or rayon coilers in bottles or placing top and bottom pads in the shipping case to reduce package breakage. Not all protective packaging elements follow the SKU through the system.

Basic packaging principles are observed when separating the contents of the manufacturer's shipping container or pallet load into smaller quantities or when shipping mixed product loads. For example, glass containers are wrapped in a bubble wrap or other shock-absorbent material, and the void spaces are filled with dunnage (e.g., foam "peanuts," shredded or tightly crumpled paper, bubble wrap) to protect the contents from shifting and drop impact. Large-volume liquid containers may be bagged in plastic and kept isolated to prevent leakage to or damage of adjacent packages. "Skin packaging," a term describing a heat-shrink film that anchors the load to fiberboard and prevents load shift, can be an excellent method of protecting some products, but it may be inappropriate for heat-sensitive goods. The shipping carton should have correct Edge Crush Test (ECT) characteristics for freight being shipped according to Item 222 of the National Motor Freight Classification and Rule 41 of the Uniform Freight Classification.

Distribution systems chosen to deliver pharmaceutical products from the manufacturer to the consumer should take into account basic operational parameters, including timeliness and accountability. The manufacturer's FDA-approved storage conditions, printed in the labeling of the product, should be observed carefully at each destination of the distribution chain (see *Figure 1*). Items requiring special handling conditions will have those conditions clearly indicated in the labeling for the product. The Prescription Drug Marketing Act of 1987 and the ensuing regulations in 21 CFR Part 203, Prescription Drug Marketing, and Part 205, Guidelines for State Licensing of Wholesale Prescription Drug Distributors, provide the necessary regulations and guidance for several legs of the distribution chain for the prescription drug. The manufacturers and distributors should work together to establish proper distribution and product handling requirements for the purpose of ensuring appropriate product maintenance in transit. Pharmacists and physicians should educate patients regarding proper storage of products to ensure product integrity at the patient level.

Information that may be considered in determining the ability of pharmaceutical articles to maintain their Pharmacopeial requirements of identity, strength, quality, and purity through the distribution channel may include, but is not limited to:

- ICH stability studies,
- Temperature cycling studies,
- Stability shipping studies,
- Ongoing regulatory stability commitment studies,
- Market experience portfolio (i.e., product complaint files, historical product performance data, product development data), and
- Product labeling commitments.

Shipping of temperature-sensitive articles requiring thermally controlled packaging presents a special challenge. Unlike shock, vibration, and other physical hazards, thermal hazards tend to be unique to a given system. Except for temperature-controlled trucks, the distribution environment is widely variable and depends upon a range of factors. These factors include points of origin and destination, article and container sensitivities to cold, accidental freezing or heat, transit mode (e.g., air, truck, combination), time, weather or season, and carrier type (e.g., small package carrier or integrator, freight forwarder, U.S. Postal Service).

The shippers should know and understand the cold chain systems they use and design the protective package accordingly. Storage temperature ranges may not be indicative of the allowable tolerances during shipping. Articles labeled for special storage conditions (between 2° and 8°) vary widely in their tolerance of short-term exposure to heat and cold. Some, such as soft gelatin capsules and suppositories, carry specific upper limits on both shipping containers and SKUs. A temperature cycling study intended to identify those articles affected by multiple, short-term excursions beyond the storage temperature limits should be performed. These data provide wholesalers and distributors with clearer identification of those drug products that may require special handling during particular climate conditions.

Two commonly used types of refrigerant are dry ice (frozen carbon dioxide gas) and wet ice (frozen water), which appears as crushed ice or in various refrigerant packs containing water mixtures with specific freezing points. Phase-change materials are also available for specialized needs. Refrigerant packs should have the correct freezing point and be cooled to the proper surface temperature prior to use. Articles harmed by accidental freezing may require a barrier between the refrigerant and the product or some other special packaging.

Insulating materials commonly available include foil laminates, bubble pack, corrugated, fabricated, and molded expanded polystyrene (EPS) cartons, and fabricated or molded urethane foam cartons, with or without additional interior components. Recognized standard test methods for evaluating insulated containers are currently limited to ASTM D3103-92, "Standard Test Method for Thermal Insulation Quality of Packages" and a method under development by ISTA. Neither one fully addresses all of the issues involved, but both include useful information on testing procedures. The tests should be modified based on the specific system adopted by the shipper. The manufacturer may be able to supply helpful data on specific articles and their requirements.

Certain classes of Pharmacopeial articles may require special handling. Such articles include products classified as Dangerous Goods under the Department of Transportation (DOT), state, local, or carrier rules; or products classified as controlled substances by the Drug Enforcement Administration (DEA) or by individual states.

Receipt of Pharmacopeial Articles

Upon arrival of Pharmacopeial articles to warehouse loading docks, premises, and other arrival areas, the Pharmacopeial articles are to be transferred to their manufacturer-

designated storage environment within two hours of receipt. Limitation of the time spent in the uncontrolled environments of the loading dock is important to ensuring that the integrity of the preparation is maintained. This is particularly important for temperature-sensitive items.

The delivery document should be reviewed at receiving sites to ensure that the Pharmacopeial articles have not been subjected to any delays during shipment that could result in the article having been exposed to extremes of temperature, and that articles have not been exposed to extreme or undesirable conditions during shipment.

The receiving personnel should inspect and review the appropriate documents and verify that the container closure system used for storage, shipment, and distribution of the Pharmacopeial preparations meets the qualifications of protecting the articles from adverse storage conditions specific for the preparation such as solvent/gas permeation, light transmittance, moisture permeation, or microbial contamination as available from stability testing or in the applicable monograph(s). In addition, the receiving personnel should ensure that the ruggedness requirements in shipment have been met.

For Pharmacopeial articles requiring extreme caution, special handling, or refrigerator temperature storage conditions, those who supply the articles (e.g., wholesalers and manufacturers) and delivery contractors should provide documented evidence to show that the required temperature range has been maintained during transportation.

In the event that a deviation from the required temperature range has been observed during shipment of an article requiring such a shipping condition, the supplier or delivery contractors should document the temperature and the length of time the compendial article was not within the designated storage temperature. The pharmaceutical manufacturer may be contacted to determine the significance of unusual variances.

Distribution or Shipping Vehicles

Vehicles used for shipping or distribution of Pharmacopeial articles designated for storage at controlled room temperature should be suitably equipped to ensure that the temperature excursions encountered are within those allowed under the definition of controlled room temperature. Steps should be taken so that extremes of temperature, whether above or below the specified temperatures, should not be encountered during delivery procedures.

Vehicle Validation

Suitable monitoring devices as determined by the manufacturer and vehicle supplier should be placed in different areas of the truck to establish a temperature profile of the truck during a hot summer day and a cold winter day, and during a normal or typical day over a 24-hour period. The derived temperature of the different parts of the truck may be used to determine the location where Pharmacopeial articles are stored appropriately during shipping (see *Monitoring Devices—Time, Temperature and Humidity* ⟨1118⟩).

Pharmaceutical Delivery Staff

As part of the contractual agreement between the delivery contractors and the manufacturers, the delivery staff should receive appropriate training in order to ensure that they are aware of the correct procedures to follow in ensuring that products are maintained at the correct temperature. There may be written procedures that should be documented. In addition, the transportation personnel should have proper

In-Process Revision

knowledge of the temperature profile of the vehicle to enable proper placement of the Pharmacopeial articles in the vehicle.

Pharmacopeial articles requiring special handling (e.g., refrigeration) or environmentally sensitive preparations should be transported in a suitably equipped vehicle to ensure that the articles are maintained at the correct temperature during distribution, shipping, and delivery up to the point of receipt. Special arrangements should be made to ensure that the attention of receiving personnel, pharmacists, or other appropriate customers is drawn to the fact that the package includes articles that have special storage and handling specifications so that the article is transferred immediately to the appropriate storage location. The manufacturer, shipper, or delivery agency should provide appropriate evidence to show that the required temperature has been maintained throughout shipment and distribution.

SHIPMENT FROM MANUFACTURER TO WHOLESALER

Wholesaler

The wholesaler receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment, as directed by the manufacturer, within two hours of receipt.

The wholesaler should examine the delivery documentation to ensure that the products have not been subjected to any delays during shipping and distribution which could result in products being exposed to extreme temperatures (see also the previous section, *Pharmaceutical Delivery Staff,* for staff expectations).

The vehicles used for shipping of Pharmacopeial articles to the wholesaler, especially products requiring storage at "low" temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. The receiving wholesaler staff should be informed appropriately so that the articles are transferred to appropriate storage locations without delays.

The vehicles used for shipping of Pharmacopeial articles requiring storage at "room" or "controlled room" temperatures should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, not occur during delivery procedures. Warehouse staff may receive appropriate training in order to ensure that the correct procedures are followed to maintain required temperature conditions (see *Pharmaceutical Delivery Staff*). Where necessary, a monitoring device for temperature and/or humidity should be used during shipping and distribution.

Compromised Temperature Conditions

A procedure should be in place in the warehouse to define the action that should be taken in the event of deviation from required storage conditions. There should be maintenance of suitable records to explain the reason for deviation and the resulting action that is taken.

The product in question should then be placed in a quarantine status. Advice on the suitability of the product for use should be sought from the manufacturer or supplier of the product. The manufacturer's response should be documented prior to the issuing of the product to the customer, if that product is to be issued to the customer.

SHIPMENT FROM MANUFACTURER OR WHOLESALER TO PHARMACY

Pharmacy

The pharmacy receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment, as directed by the manufacturer, within two hours of receipt.

The pharmacy personnel should examine the delivery documentation to ensure that the products have not been subjected to any delays during shipping and distribution which could result in products being exposed to extreme temperatures (see also the section, *Pharmaceutical Delivery Staff,* for staff expectations).

The vehicles used for shipping of Pharmacopeial articles to the pharmacy, especially products requiring storage at "low" temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. Receiving pharmacy staff should be informed appropriately so that the articles are transferred to appropriate storage without delays.

The vehicles used for shipping of Pharmacopeial articles requiring storage at "room" or "controlled room" temperatures should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, do not occur during delivery procedures. Pharmacy staff may receive appropriate training in order to ensure that the correct procedures are followed to maintain required temperature conditions (see *Pharmaceutical Delivery Staff*). Where necessary, a monitoring device for temperature and/or humidity may be used during shipping and distribution.

Compromised Temperature Conditions

The pharmacy should maintain appropriate procedures to define action that should be taken in the event of deviation from the required storage conditions. There should be maintenance of suitable records to explain the reason for deviation and the resulting action taken (including whether the product is issued to the patient or customer). Advice on the suitability of the product for use as an acceptable drug article should be sought from the manufacturer or supplier of the product.

SHIPMENT FROM PHARMACY TO PATIENT OR CUSTOMER

The pharmacy should provide an appropriate label on the package sent through air or surface routes so the deliverer does not place the package in a mailbox exposed to extremes in temperature. In the event that no one is available to receive the package, the deliverer should return the package to the post office or service office and store it in a "cool" area until the patient can receive the medication. In the event that the package has not been delivered for more than two days, the package may be returned to the pharmacy. For temperature sensitive articles, it is important that proper arrangements be put in place to protect the drug from exposure to high temperatures, or in some cases, from freezing conditions. Such arrangements may include:

- Insulating packaging, or packaging with coolant included;
- Overnight shipping; and
- Pre-arranged pick-up.

The pharmacy should provide on the external package in these cases a statement of an acceptable period of delay for delivery. The patient or customer should examine the deliv-

ery documentation and ensure that the package has not been subjected to any unacceptable delays during shipping and distribution.

The patient or customer receiving the pharmaceutical articles, either by mail, delivery vehicle from the pharmacy, or directly from the physician or pharmacy should be advised that upon receipt the articles are to be transferred to appropriate storage conditions, as directed by the pharmacy, within two hours of receipt.

The vehicle used for air or surface shipping and distribution of pharmaceutical packages to the patient or customer, especially those requiring low temperatures, should contain the article suitably packaged in containers that maintain the desired storage conditions until it reaches the patient or customer.

The vehicles used for shipping and distribution of pharmaceutical articles to patient or customer, especially those requiring storage at "room" or "controlled room" temperatures should be suitably equipped during extreme temperature conditions such that the packages are not exposed to extremes of temperature either in winter or summer months. In the event that the vehicle is not adequately equipped with air conditioning or heating to protect the product, the product should not be kept in the vehicle for more than two hours. Where appropriate, a monitoring device may be used to ensure that required temperatures are maintained until the package reaches the patient or customer.

If stability studies for the Pharmacopeial preparation indicate that it is particularly sensitive to environmental insults or if appropriate shipping safeguards described in this section are not feasible, then the preparation should be shipped by a different method where such environmental control can be maintained.

Compromised Temperature Conditions

There should be appropriate procedures in the pharmacy that ships the article to the patient or customer to define the action that should be taken in the event that a patient has reported that articles, including any environmentally sensitive preparations, deviated from required storage conditions prior to the point of receipt.

Advice on the suitability of the product for use should be provided to the patient or customer after the manufacturer or supplier's advice has been sought by the pharmacy. If the patient is advised to use the article, such advice should be documented and noted appropriately by the pharmacy. Otherwise, appropriate rearrangements should be made to promptly replace the suspect article. For mail order items, replacement from local pharmacies may be necessary to ensure an uninterrupted supply of medication.

RETURNS OF PHARMACEUTICAL ARTICLES FROM PATIENTS OR CUSTOMERS

The wholesaler, manufacturer, and pharmacy personnel should evaluate the validity of the request for return and maintain an auditable account of the return receipt.

For products in unopened manufacturer's containers that have been at variance during shipment, arrangement may be made to return the products to the manufacturer, wholesaler, or pharmacy within three working days of receipt. The supplier may request records or written confirmation by the patient to show that the product was stored properly while in possession of the customer.

STORAGE OF PHYSICIAN SAMPLES HANDLED BY SALES REPRESENTATIVES IN AUTOMOBILES

Automobile trunks or passenger cabins used for the storage and distribution of physician samples should be validated to determine the temperature profile of the trunk or passenger cabin. Suitable monitoring devices as determined by the sales representative may be placed in different areas of the trunk or passenger cabin on a hot summer and a cold winter day. Measurements should also be made during typical 24-hour periods, and the derived temperature should be used for calculation of mean kinetic temperature at which the sample is stored; see general chapter *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩ for samples of MKT calculations.

If the Pharmacopeial article designated for storage requires storage at controlled room temperature, then suitable measures should be taken to maintain the sample within the allowable limits of the storage parameters.

Environmentally sensitive preparations should not be stored in automobile trunks or passenger cabins. Medications stored in automobile trunks or passenger cabins should be removed at the end of three days. Sales representatives should consider parking automobiles in shaded areas to avoid extreme heat during the summer and in garages to avoid freezing temperatures during the winter.

The use of vouchers from the manufacturer that could be presented to patients to exchange for medications at participating pharmacies is an alternative way of providing drug samples.

STORAGE OF DRUGS IN EMERGENCY MEDICAL SERVICES (EMS) VEHICLES

Ambulances and other emergency medical response vehicles that routinely carry Pharmacopeial articles should be validated to verify that temperature profiles in pharmaceutical storage cabinets are within normal limits. Suitable monitoring devices should be placed in the pharmaceutical cabinet on hot summer and cold winter days. Measurements should also be made during a typical 24-hour period, and the derived temperature should be used for calculation of mean kinetic storage temperature of the sample.

The portable carrying case in which the drugs are kept should be insulated, and when not in use, should be kept in a pharmaceutical storage cabinet.

If the Pharmacopeial article designated for storage requires storage at controlled room temperature, then suitable measures should be taken to maintain the sample within the allowable limits of the storage parameters, and monitoring devices should be in place to record weekly temperatures, and allow calculation of MKT for controlled room temperature storage.

Environmentally sensitive preparations should not be stored in emergency response vehicles unless the cabinet in which the medication is stored is climate controlled. If environmentally sensitive preparations must be kept in the EMS vehicle, then medication supplies should be rotated every three days. Ambulance personnel should consider parking in the shade in the summer or in heated garages in the winter to avoid temperature extremes.

STABILITY, STORAGE, AND LABELING

The design of stability studies of Pharmacopeial articles is based on knowledge of the behavior, properties, and stability of the drug substance and experience gained from clinical formulation studies.[1] The length of the studies and the storage conditions for a Pharmacopeial article should be sufficient to cover storage, shipment, distribution, and subsequent use of a Pharmacopeial article.

The data gathered from ICH accelerated testing or from testing at an ICH intermediate condition may be used to evaluate the effect of short-term excursions outside the label storage conditions such as might occur during shipping.

ICH recommended conditions for solid oral dosage forms are as follows:

— long-term testing: 25 ± 2°C / 60 ± 5% RH for a minimum time period at submission of 12 months.
— accelerated testing: 30° to 40 ± 2°C / 75 ± 5% RH for a minimum time period of 6 months.

Where "significant change" occurs at accelerated testing, additional testing should be performed at intermediate or 30 ± 2°C / 60 ± 5% RH for 6 months. "Significant change" is defined as:

— a 5% potency loss from initial assay value of the batch;
— a specified degradant exceeding its specification limit;
— a product exceeding its pH limits;
— a dissolution time exceeding the specification limits for 12 capsules or tablets; or
— a failure to meet specifications for appearance and physical properties, e.g., color, phase separation, resuspendability, delivery per actuation, caking, hardness, etc.

While stability studies are progressing, mass balance should be maintained to ensure that the assay value and levels of degradation products equal 100% of initial value.

For Pharmacopeial articles intended for storage in a refrigerator, the study conditions for long-term investigation are 5 ± 3° for 12 months minimum time period, and an accelerated condition of 25 ± 2° / 60 ± 5% for 6 months minimum time period. If significant changes occur at the accelerated condition between 3 and 6 months during testing, the proposed retest period should be 5 ± 3° for 12 months minimum (see also ICH Q1 A&B).

For Pharmacopeial articles intended for storage in a freezer, there is only a single long-term storage condition of –20 ± 5° at a 12-month minimum time period. Because there is no abbreviated test condition, the test must be repeated for any products requiring a retest.

For drugs at these specified storage conditions, testing at accelerated conditions may be conducted to address the effect of short-term excursions outside the proposed label storage conditions, e.g., during shipping and distribution, and handling (see ICH Q1 A&B).

[1] See International Conference on Harmonization EWG Q1 A&B; see also FDA *Guidance for Industry: Stability Testing of Drug Substances and Drug Products* (www.fda.gov).

STABILITY OF DRUG PRODUCTS AFTER RECONSTITUTION OR DILUTION

Stability testing of drug products after constitution or dilution should be performed to provide information for the labeling in the preparation, storage conditions, and in-use period of the constituted or diluted product.

- For long-term storage conditions, 25 ± 2°/ 60 ± 5% RH for a minimum time period of 12 months.
- For intermediate storage conditions, 30 ± 2°/ 60 ± 5% RH for a minimum time period of 6 months.
- For accelerated storage conditions, 40 ± 2°/ 75 ± 5% RH for 6 months minimum time period. If significant change occurs at any time during 6-month testing period at accelerated storage conditions, additional testing at the intermediate storage conditions should be conducted and evaluated against "significant change" criteria.

For drugs packaged in impermeable containers, stability studies can be conducted under any controlled or ambient humidity conditions

Drugs packaged in semipermeable containers, especially aqueous-based products, should be evaluated for water loss in addition to physical, chemical, biological, and microbiological stability. These evaluations should be done under conditions of low relative humidity to demonstrate that aqueous-based drug products and/or nonaqueous solvent-based products stored in semipermeable containers can withstand low relative humidity environments.

For both aqueous-based drug and nonaqueous drug products, stability studies include the following:

- For long-term storage conditions, 25 ± 2°/ 40 ± 5% RH for a minimum time period of 12 months.
- For intermediate storage conditions, 30 ± 2°/ 60 ± 5% RH for a minimum time period of 6 months.
- For accelerated storage conditions, 40 ± 2°/ ≤25% RH for a minimum time period of 6 months.

When there is a significant change, other than water loss, intermediate storage testing should be performed at 30 ± 2°/ 60 ± 5% RH for 6 months. For drug products intended for storage in a refrigerator: long-term storage conditions are 5 ± 3° for a 12-month minimum time period; accelerated, 25 ± 2°/ 60 ± 5% RH for 6 months minimum time period. For drug products intended for freezer storage: long-term, –20 ± 5° for 12 months minimum time period.

STATEMENTS/LABELING OF THE IMMEDIATE CONTAINERS OR PACKAGE INSERT

Storage statements should be based on the stability evaluations of the Pharmacopeial drug substances and according to national and international requirements.

Room Temperature Storage Statements—For products with a storage statement reading, "Store at controlled room temperature," the labeling should read as follows on the package insert: "Store at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C and 30°C (between 59°F and 86°F). Brief exposure to temperatures up to 40°C (104°F) may be tolerated provided the mean kinetic temperature does not exceed 25°C (77°F); however, such exposure should be minimized."

In-Process Revision

On the immediate container label, the following may read for Controlled Room Temperature (CRT): "Store at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C and 30°C (between 59°F and 86°F)."

Cool Storage Statement—The storage statement for labeling may be as follows: "Store in a cool place, 8°C to 15°C (46°F to 59°F)."

Refrigerator Storage Statement—The storage statement for labeling may be as follows: "Store in a refrigerator, 2°C to 8°C (36°F to 46°F)."

Freezer Storage Statement—The storage statement for labeling may be as follows: "Store in a freezer, –25°C to –10°C (–13°F to 14°F)."

See the *General Notices* for all other applicable storage conditions, such as *Storage Under Nonspecific Conditions* and store in a *Dry Place.* Additional cautionary statements to protect the Pharmacopeial drug product from extreme temperature and humidity conditions may be included on the container label and package insert, as the manufacturer desires.■2S (*USP27*)

BRIEFING

⟨1150⟩ Pharmaceutical Stability. It is proposed to divide the current general information chapter *Pharmaceutical Dosage Forms* ⟨1151⟩ into two chapters: (1) *Pharmaceutical Stability* ⟨1150⟩, which will consist of the section on *Stability* (including the calculation of mean kinetic temperature) that is currently in *Pharmaceutical Dosage Forms* ⟨1151⟩ and (2) *Pharmaceutical Dosage Forms* ⟨1151⟩, which will include the material in the current general information chapter ⟨1151⟩ that deals specifically with dosage forms. By dividing the current chapter into these two separate chapters, the chapter titles will more precisely reference the contents of the chapters. In addition, minor editorial style changes have been made. See also briefing under *Pharmaceutical Dosage Forms* ⟨1151⟩.

(PSD: C. Okeke) RTS—40003-1

Add the following:

■⟨1150⟩ PHARMACEUTICAL STABILITY

The term "stability," with respect to a drug dosage form, refers to the chemical and physical integrity of the dosage unit and, when appropriate, the ability of the dosage unit to maintain protection against microbiological contamination. The shelf life of the dosage form is the time lapse from initial preparation to the specified expiration date. The monograph specifications of identity, strength, quality, and purity apply throughout the shelf life of the product.

The stability parameters of a drug dosage form can be influenced by environmental conditions of storage (temperature, light, air, and humidity), as well as the package components. Pharmacopeial articles should include required storage conditions on their labeling. These are the conditions under which the expiration date shall apply. The storage requirements specified in the labeling for the article must be observed throughout the distribution of the article (i.e., beyond the time it leaves the manufacturer up to and including its handling by the dispenser or seller of the article to the consumer). Although labeling for the consumer should indicate proper storage conditions, it is recognized that control beyond the dispenser or seller is difficult. The beyond-use date shall be placed on the container label.

Stability Protocols

Stability of manufactured dosage forms must be demonstrated by the manufacturer, using methods adequate for the purpose. Monograph assays may be used for stability testing if they are stability-indicating (i.e., if they accurately differentiate between the intact drug molecules and their degradation products). Stability considerations should include not only the specific compendial requirements, but also changes in physical appearance of the product that would warn users that the product's continued integrity is questionable.

Stability studies on active substances and packaged dosage forms are conducted by means of "real-time," long-term tests at specific temperatures and relative humidities representing storage conditions experienced in the distribution chain of the climatic zone(s) of the country or region of the world concerned. Labeling of the packaged active substance or dosage form should reflect the effects of temperature, relative humidity, air, and light on its stability. Label temperature storage warnings will both reflect the results of the real-time storage tests and allow for expected seasonal excursions of temperature.

Controlled Room Temperature

Controlled room temperature (see *Storage Temperature and Humidity* in *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements*) delineates the allowable tolerance in storage circumstances at any location in the chain of distribution (e.g., pharmacies, hospitals, and warehouses). This terminology also allows patients or consumers to be counseled as to appropriate storage for the product. Products may be labeled either to store at "Controlled room temperature" or to store at temperatures "up to 25°" where labeling is supported by long-term stability studies at the designated storage condition of 25°. *Controlled room temperature* limits the permissible excursions to those consistent with the maintenance of a mean kinetic temperature calculated to be not more than 25°. See *Mean Kinetic Temperature.* The common international guideline for long-term stability studies specifies 25 ± 2° at 60 ± 5% relative humidity. Accelerated studies are specified at 40 ± 2° and at 75 ± 5% relative humidity. Accelerated studies also allow the interpretation of data and information on short-term spikes in storage conditions in addition to the excursions allowed by controlled room temperature.

The term "room temperature" is used in different ways in different countries, and for products to be shipped outside the continental U.S. it is usually preferable for product labeling to refer to a maximum storage temperature or temperature range in degrees Celsius.

Mean Kinetic Temperature

Mean Kinetic Temperature (MKT) is defined as the single calculated temperature at which the total amount of degradation over a particular period is equal to the sum of the individual degradations that would occur at various temperatures. Thus, MKT may be considered as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variation. It is not a simple arithmetic mean. MKT is calculated from temperatures in a storage facility. The temperatures for calculating MKT

can be conveniently collected using electronic devices that measure temperatures at frequent intervals (e.g., every 15 minutes). MKT can be calculated directly or the data can be downloaded to a computer for processing. For dispensing sites, such as pharmacies and hospitals, where the use of such instruments may not be feasible, devices such as high-low thermometers capable of indicating weekly high and low temperatures over a 52-week period may be employed. The arithmetic mean of the weekly high and low temperatures is then used in the calculation of MKT. MKT is calculated by the following equation (derived from the Arrhenius equation):

$$T_k = \frac{\Delta H/R}{-ln\left(\frac{e^{-\Delta H/RT_1} + e^{-\Delta H/RT_2} + \ldots + e^{-\Delta H/RT_n}}{n}\right)},$$

in which T_k is the mean kinetic temperature; ΔH is the heat of activation, 83.144 kJ · mole^{-1} (unless more accurate information is available from experimental studies); R is the universal gas constant, 8.3144 × 10^{-3} kJ · mole^{-1} · degree^{-1}; T_1 is the value for the temperature recorded during the first time period, e.g., the first week; T_2 is the value for the temperature recorded during the second time period, e.g., second week; and T_n is the value for the temperature recorded during the nth time period, e.g., nth week, n being the total number of storage temperatures recorded (minimum of 52 weekly entries) during the annual observation period. [NOTE—All temperatures, T, are absolute temperatures in degrees Kelvin (K).]

The following is an example of a typical storage and distribution temperature range in Kelvin degrees and the conversion factors used to convert this range into degrees Fahrenheit and Celsius.

Kelvin (K)	Fahrenheit (°F)	Celsius (°C)
288.1–303.1	59–86	15–30

Conversion Factors:

Fahrenheit to Kelvin = {[(°F – 32) × 5/9] + 273.1}

Celsius to Kelvin = 273.1 + °C

Fahrenheit to Celsius = [(°F – 32) × 5/9]

Climatic Zones

For convenience in planning for packaging and storage, and for stability studies, international practice identifies four climatic zones, which are described in *Table 1*. The United States, Europe, and Japan are characterized by zones I and II. The values in *Table 1* are based on observed temperatures and relative humidities, both outside and in rooms, from which mean kinetic temperatures and average humidity values are calculated.[1] Derived values are based on inspection of data from individual cities and on allowances for a margin of safety in assignment of these specified conditions.

In-Process Revision

[1] The source of the data and information in *Table 1* is the International Conference on Harmonization sponsored by the International Federation of Pharmaceutical Manufacturers Associations.

Table 1. International Climatic Zones

	Calculated Data				Derived Data		
Climatic Zone	°C*	°C MKT**	% RH	mbar***	°C	% RH	mbar
I. *Temperate* United Kingdom Northern Europe Canada Russia	20.0	20.0	42	9.9	21	45	11.2
II. *Mediterranean, Subtropical* United States Japan Southern Europe (Portugal-Greece)	21.6	22.0	52	13.5	25	60	19.0

BRIEFING

⟨1177⟩ Good Packaging Practices. The text of this new general information chapter is based on the information on packaging that was included in the formerly proposed general information chapter *Packaging, Storage, and Distribution of Pharmacopeial Articles* ⟨1141⟩ (see page 493 of *PF* 26(2) [Mar.–Apr. 2000] and page 8458 of *PF* 25(4) [July–Aug. 1999]). Information related to storage and distribution has been moved to *Good Storage and Shipping Practices* ⟨1079⟩, a new chapter proposed elsewhere in this number of *PF*. Other editorial changes have also been made.

(PSD: C. Okeke) RTS—40177-1

Add the following:

■⟨1177⟩ GOOD PACKAGING PRACTICES

This chapter provides general guidance on packaging considerations for Pharmacopeial preparations that may be stored, transported, and distributed. It describes procedures that should be considered to ensure that proper packaging practices are maintained. It does not affect any applicable requirements under good manufacturing practices, state laws governing pharmacy, the *USP General Notices and Requirements* or monographs, or provisions under approved labeling.

In-Process Revision

Definitions for storage conditions and packaging are provided in *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements*. All equipment used for recording, monitoring, and maintaining these temperatures and humidity conditions should be calibrated on a regular basis. This calibration should be traceable to national or international standards (see also the general information chapter *Monitoring Devices—Time, Temperature, and Humidity* ⟨1118⟩).

CONTAINERS

The monograph packaging and storage statement specifies that the container (primary package) should meet the requirements under *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩, which include the stipulations for determining if a container is "tight" or "well-closed." In most cases, compendial preparations are expected to be packaged in "tight" containers especially if the article is moisture sensitive. In addition, where necessary, the packaging component should protect the preparation from light, reactive gases, solvent loss, microbial contamination, etc. "Tight" and "well-closed" containers are clearly defined in *General Notices and Requirements* (see *Containers* under *Preservation, Packaging, Storage, and Labeling*), whereas testing protocol and moisture permeation limits to determine if the container meets either of these definitions can be found in *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩ for single-unit and multiple-unit containers.

A packaging system is comprised of a container system with its closure. This system may include several layers of protection for the Pharmacopeial preparation along with any sealing devices, delivery devices, labeling, and package inserts. The *General Notices* section also provides definitions for types of packaging systems that contain and protect a Pharmacopeial preparation (i.e., single-unit containers, unit-dose containers, etc.). Stability testing is conducted on the dosage forms packaged in the container–closure system proposed for marketing.

One type of permeation test for multiple-unit containers is described in *Containers—Permeation* ⟨671⟩. This test is intended for drug products being dispensed on prescription in vials with a container-closure system. The results of the test reflect the water vapor permeation through the container and through the closure. Limits have been established to define whether a container for dispensing has tight or well-closed characteristics with regard to water vapor permeation. FDA recommends that manufacturers perform this test on the container-closure system, although it is not specified in *USP*. In this particular test, the inner seal of the manufacturer's container-closure system is removed prior to testing.

Single-unit containers for capsules and tablets under *Containers—Permeation* ⟨671⟩ are measured for water vapor permeation according to the criteria for the four classes of containers (classes A–D).

The *USP* recognizes several official container materials that can be selected on the basis of their properties. Most containers are made of glass or plastic. Glass containers must be evaluated for chemical resistance and light transmission (if indicated) as described in *Containers* ⟨661⟩. In addition, injectable medication containers should be reviewed according to the section on *Packaging* under *Injections* ⟨1⟩. Elastomeric closures should be evaluated separately as described in *Elastomeric Closures for Injection* ⟨381⟩. Plastic containers should be assessed using different criteria for the three types of plastics as described in the following sections under *Container* ⟨661⟩: *Polyethylene Containers* (PE) for dry oral solid dosage forms, *Polyethylene Terephthalate Bottles and Polyethylene Terephthalate G Bottles* (PET, PETG) for liquid oral dosage forms, and *Polypropylene Containers* (PP) for dry solid and liquid oral

dosage forms. As articulated in these sections, plastics should undergo testing for light transmission (if appropriate), water vapor permeation (see also *Containers—Permeation* ⟨671⟩), extraction physiochemical testing, and biological testing (see also *Biological Reactivity Tests, In Vitro* ⟨87⟩ and *Biological Reactivity Tests, In Vivo* ⟨88⟩). For example, testing water vapor permeation for a PE container is conducted by sealing the container with heat-sealed foil laminate and measuring the water permeation in a humid atmosphere. Given that water vapor does not permeate the foil laminate, this test assesses only the properties of the container. The level of protection provided by a packaging system marketed with a heat-sealed foil laminate inner seal (prior to removal of the foil) is approximated by this test. However, in the case of a PET bottle for liquid preparations, water vapor permeation testing is done by filling containers with water and measuring the water loss rate in a dry atmosphere. Additional testing may be required for certain pharmaceutical dosage forms as well.

The container–closure system for the storage or shipment of a bulk liquid drug substance is typically plastic, stainless steel, a glass-lined metal container, or an epoxy-lined metal container with a rugged, tamper-resistant closure. Qualification of the container–closure system for these types of preparations includes evaluation for solvent and gas permeation, light transmittance, closure integrity, ruggedness in shipment, protection against microbial contamination through the closure, and compatability and safety of the packaging components as appropriate (see *Containers* ⟨661⟩).

Other information on container–closure systems may be found in FDA's *Guidance for Container Closure System for Packaging Human Drugs and Biologics,* www.fda.gov.

PACKAGING

Packaging for Pharmacopeial articles can be divided into categories according to terminology generally accepted by industry. As mentioned earlier, the *General Notices* section provides some definitions for different types of containers classified by their characteristics and uses. In addition, the ASTM Committee Dl0 on packaging publishes terminology, practices, test methods, specifications, guides, and classifications for testing and evaluating packaging (see ASTM D99695, "Standard Terminology of Packaging and Distribution Environments"). Under certain rules and guidelines (e.g., such as 49 CFR, Dangerous Goods, and others), however, alternate terminology is used for the components described below. For terminology pertaining to repackaging processes, refer to *Packaging Practice—Repackaging a Single Solid Oral Drug Product into a Unit-Dose Container* ⟨1146⟩.

Primary Container—This container is in direct contact with the Pharmacopeial preparation. The purpose of a primary container, also referred to as an immediate container, is to protect the preparation from environmental hazards during storage and handling. In some cases, the primary container is also a specialized delivery system, such as an aerosol or a metered-dose dispenser (see *Pharmaceutical Dosage Forms* ⟨1151⟩). For the majority of oral dosage forms, the primary container consists of a cap and a bottle or a blister or pouch package that can be made from many different materials, including glass, plastic, single or laminated flexible materials, and metal. All components of the primary container must meet the requirements under 21 CFR for direct food contact and, where applicable, the *USP* requirements under *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩. A full description of the primary container is included under the "Container/Closure

In-Process Revision

System'' section of the New Drug Application (NDA), Abbreviated New Drug Application (ANDA), or other classes of FDA submissions.

Critical Secondary Container—This container is not in direct contact with the article, but it provides essential product stability protection. For example, a primary container may be packed inside a critical secondary container such as a pouch to provide moisture, gas, light, or microbial protection not afforded by the primary container. A description of the critical secondary container is included under the ''Container/Closure System'' section of the NDA, ANDA, or other classes of FDA submissions.

Secondary Container—This container encloses one or more primary containers. A secondary container is not always present. If used, it is usually designed for the final market presentation. Secondary containers are often used simply to carry required labeling or to keep individual primary containers together with delivery systems or other add-on features. Secondary containers can also provide protection against damage in the handling and distribution system. The most common secondary container is the standard folding carton. Some products, such as syringes, may be placed in trays prior to packing in a carton. Secondary container materials are not included in the container and closure description and require neither stability studies nor prior approval when making a change in the materials used.

Additional Packaging—A wide variety of additional packaging, such as trays and display cartons, may be used to hold primary containers.

Unit of Sale—This may be an individual bottle, a carton containing one or more bottles, or a tray with multiple primary containers. A unit of sale may contain more than one item for individual sale. For example, a display tray may have multiples of a single article or a variety of related articles from a single manufacturer, each intended for individual sale. The individual item intended for sale is referred to as a stock-keeping-unit (SKU). SKUs are distinguished by a discrete National Drug Code (NDC). Over-the-counter (OTC) articles contain a Universal Product Code (UPC) for all SKUs. A prescription SKU may be intended for final consumer use and may not be repackaged by a pharmacy. Such packages, often called ''unit of issue'' or ''unit of use,'' require child-resistant (CR) packaging as described under 16 CFR 1700, ''Poison Prevention Packaging,'' except for packages exempted by the Consumer Product Safety Commission. The CR feature is typically incorporated by the manufacturer (see *Packaging—Unit of Use* ⟨1136⟩). OTC articles are regulated under the same rule, but only if they contain certain active ingredients above specified limits. Any regulated product shipped via the United States Postal Service (USPS) must meet the USPS rules under 39 CFR 111.

Final Exterior Package—This is typically a corrugated fiberboard box (case) or a wrapper. The shipping case label is affixed to this outermost layer and incorporates all of the bar codes required by the National Wholesale Druggists' Association (NWDA). This final package is normally shipped on pallets to distribution centers, wholesalers, and other large-volume customers. The manufacturer may or may not intend that this package enter the small-package-shipping environment as an individual unit without further protection.

Especially with fiberboard boxes, relative humidity (RH) may have a negative effect on the compression strength of the box, causing loads to shift and potentially damage the article or the outer and inner packaging. Articles stored in refrigerators or freezers, which are environments with high RH, are prone to this type of damage when stacked. The problem may be exacerbated by carton design, stacking pattern, or use of low edge-crush-test corrugated fiberboard.

Computer programs are available to determine the acceptable stack height and patterns on the basis of carton weight, style, size, and material. If problems occur, the product manufacturer should be contacted. Source materials and reference information on corrugated fiberboard boxes can be found in the "Fiber Box Handbook" published by the Fiber Box Association.

A wholesaler or other reshipper should not assume that the package received from the manufacturer is suitable for reuse. Many packages are customized for very specific routes and modes of transportation and are not suitable for other applications. Like any other shipping container, insulated cartons and inner protective packaging can be damaged during transit, thus affecting package performance and possibly allowing damage to contents if reused.

ENVIRONMENTAL ISSUES

Packaging materials are regulated by a variety of federal, state, and local rules. In general, most pharmaceutical packaging containers can be recycled within local programs. The use of recycled material in primary containers is governed by the FDA, but it is generally not allowed. Pharmaceutical manufacturers commonly follow the most current Coalition of Northeastern Governors' rules (e.g., Model Toxics in Packaging Legislation) regarding heavy metals in packaging and other environmental issues.

Certain classes of Pharmacopeial articles may require special handling. Such articles include products classified as (1) Dangerous Goods under the Department of Transportation (DOT), state, local, or carrier rules; (2) Controlled drugs under the Drug Enforcement Administration (DEA); or (3) scheduled substances under state regulations.

LABELING

The labeling of shipping containers by manufacturers must be in compliance with the pertinent sections of FDA and DOT rules.

Dangerous Goods—The labeling of shipments classified as *Dangerous Goods,* including all information on the bill of lading or airway bill, must follow the instructions provided by the DOT, the International Air Transport Association (IATA), and the carrier. The exterior package must carry all of the required standard symbols for the class of goods, and the shipping container must comply with the performance standards for the articles enclosed. The shipper of record is responsible for compliance with the Dangerous Goods requirements.

Controlled Substances—When Pharmacopeial preparations that contain DEA-scheduled controlled substances are distributed to a patient directly via the USPS, these articles must be marked and labeled in accordance with USPS Domestic Mail Manual, Regulation Article C023, Section 7.2.■2S (*USP27*)

BRIEFING

⟨**1225**⟩ **Validation of Compendial Methods,** *USP 26* page 2439. The following revisions are based on comments received from the USP Biostatistics Expert Committee.

(PA4: H. Pappa) RTS—39466-1

Change to read:

Test procedures for assessment of the quality levels of pharmaceutical products are subject to various requirements. According to Section 501 of the Federal Food, Drug, and Cosmetic Act, assays and specifications in monographs of the United States Pharmacopeia and the National Formulary constitute legal standards. The Current Good Manufacturing Practice regulations [21 CFR 211.194(a)] require that test methods, which are used for assessing compliance of pharmaceutical products with established specifications, must meet proper standards of accuracy and reliability. Also, according to these regulations [21 CFR 211.194(a)(2)], users of analytical methods described in the USP and the NF are not required to validate accuracy and reliability of these methods, but merely verify their suitability under actual conditions of use. Re-

In-Process Revision

cognizing the legal status of USP and NF standards, it is essential, therefore, that proposals for adoption of new or revised compendial analytical ~~methods~~

■procedures■2S (*USP27*)
be supported by sufficient laboratory data to document their validity.

The text of this information chapter harmonizes, to the extent possible, with the Tripartite International Conference on Harmonization (ICH) documents *Validation of Analytical Procedures* and the *Methodology* extension text, which are concerned with analytical procedures included as part of registration applications submitted within the EC, Japan, and the USA. Some aspects (dissolution, drug release), which form part of this chapter, are only dealt with in passing in the ICH documents and are to be discussed in the future. Complete harmonization has not been possible, in part because of different uses of terminology. For example, the ICH use of "procedure" presents difficulty, as this term has a specific and different use throughout the *USP–NF.*

Change to read:

SUBMISSIONS TO THE COMPENDIA

Submissions to the compendia for new or revised analytical ~~methods~~

■procedures■2S (*USP27*)
should contain sufficient information to enable members of the ~~USP Committee of Revision~~

■USP Council of Experts and its Expert Committees■2S (*USP27*)
to evaluate the relative merit of proposed procedures. In most cases, evaluations involve assessment of the clarity and completeness of the description of the analytical ~~methods.~~

■procedures,■2S (*USP27*)
determination of the need for the ~~methods.~~

■procedures,■2S (*USP27*)
and documentation that they have been appropriately validated. Information may vary depending upon the type of method involved. However, in most cases a submission will consist of the following sections.

Rationale—This section should identify the need for the ~~method~~

■procedure■2S (*USP27*)
and describe the capability of the specific ~~method~~

■procedure■2S (*USP27*)
proposed and why it is preferred over other types of determinations. For revised procedures, a comparison should be provided of limitations of the current compendial ~~method~~

■procedure■2S (*USP27*)
and advantages offered by the proposed ~~method.~~

■procedure.■2S (*USP27*)
Proposed Analytical Procedure—This section should contain a complete description of the analytical ~~method~~

■procedure■2S (*USP27*)
sufficiently detailed to enable persons "skilled in the art" to replicate it. The write-up should include all important operational parameters and specific instructions such as preparation of reagents, performance of systems suitability tests, description of blanks used, precautions, and explicit formulas for calculation of test results.

Data Elements—This section should provide thorough and complete documentation of the validation of the analytical ~~method.~~

■procedure.■2S (*USP27*)
It should include summaries of experimental data and calculations substantiating each of the applicable analytical performance characteristics. These characteristics are described in the following section.

Change to read:

VALIDATION

Validation of an analytical ~~method~~

■procedure■2S (*USP27*)
is the process by which it is established, by laboratory studies, that the performance characteristics of the ~~method~~

■procedure■2S (*USP27*)
meet the requirements for the intended analytical applications. Typical analytical performance characteristics that should be considered in the validation of the types of ~~methods~~

■procedures■2S (*USP27*)
described in this document are listed in *Table 1*. Since opinions may differ with respect to terminology and use, each of the performance characteristics is defined in the next section of this chapter along with a delineation of a typical method or methods by which it may be measured.

Table 1. Typical Analytical Characteristics Used in Method Validation.

Accuracy
Precision
Specificity
Detection Limit
Quantitation Limit
Linearity
Range
■Ruggedness■2S (*USP27*)

In the case of compendial ~~methods,~~

■procedures,■2S (*USP27*)
revalidation may be necessary in the following cases: a submission to the USP of a revised analytical ~~method;~~

■procedure;■2S (*USP27*)
or the use of an established general ~~method~~

■procedure■2S (*USP27*)
with a new product or raw material (see below under *Data Elements Required for Assay Validation*).

The ICH documents give guidance on the necessity for revalidation in the following circumstances: changes in the synthesis of the drug substance; changes in the composition of the drug product; and changes in the analytical procedure.

Analytical Performance Characteristics

ACCURACY

Definition—The accuracy of an analytical ~~method~~

■procedure■2S (*USP27*)
is the closeness of test results obtained by that ~~method~~

■procedure■2S (*USP27*)
to the true value. The accuracy of an analytical ~~method~~

■procedure■2S (*USP27*)
should be established across its range.

Determination—In the case of the assay of a drug substance, accuracy may be determined by application of the analytical ~~method~~

■procedure■2S (*USP27*)
to an analyte of known purity (e.g., a Reference Standard) or by comparison of the results of the ~~method~~

■procedure■2S (*USP27*)
with those of a second, well-characterized ~~method,~~

■procedure,■2S (*USP27*)
the accuracy of which has been stated or defined.

In the case of the assay of a drug in a formulated product, accuracy may be determined by application of the analytical ~~method~~

■procedure■2S (*USP27*)
to synthetic mixtures of the drug product components to which known amounts of analyte have been added within the range of the ~~method.~~

■procedure.■2S (*USP27*)
If it is not possible to obtain samples of all drug product components, it may be acceptable either to add known quantities of the analyte to the drug product (i.e., "to spike") or to compare results with those of a second, well-characterized ~~method,~~

■procedure,■2S (*USP27*)
the accuracy of which has been stated or defined.

In the case of quantitative analysis of impurities, accuracy should be assessed on samples (of drug substance or drug product) spiked with known amounts of impurities. Where it is not possible to obtain samples of certain impurities or degradation products, results should be compared with those obtained by an independent ~~method.~~

■procedure.■2S (*USP27*)
In the absence of other information, it may be necessary to calculate the amount of an impurity based on comparison of its response to that of the drug substance; the ratio of the responses of equal amounts of the impurity and the drug substance (response factor) should be used if known.

Accuracy is calculated as the percentage of recovery by the assay of the known added amount of analyte in the sample, or as the difference between the mean and the accepted true value, together with confidence intervals.

The ICH documents recommend that accuracy should be assessed using a minimum of nine determinations over a minimum of three concentration levels, covering the specified range (i.e., three concentrations and three replicates of each concentration).

■Assessment of accuracy can be accomplished in a variety of ways, including evaluating the recovery of the analyte (percent recovery) across the range of the assay, or evaluating the linearity of the relationship between estimated and actual concentrations. The statistically preferred criterion is that the confidence interval for the slope be contained in an interval around 1.0, or alternatively, that the slope be close to 1.0. In either case, the interval or the definition of closeness should be specified in the validation protocol. The acceptance criterion will depend on the assay and its variability and on the product. Setting an acceptance criterion based on the lack of statistical significance of the test of the null hypothesis that the slope is 1.0 is not an acceptable approach.■2S (*USP27*)

PRECISION

Definition—The precision of an analytical ~~method~~

■procedure■2S (*USP27*)
is the degree of agreement among individual test results when the ~~method~~

■procedure■2S (*USP27*)
is applied repeatedly to multiple samplings of a homogeneous sample. The precision of an analytical ~~method~~

■procedure■2S (*USP27*)
is usually expressed as the standard deviation or relative standard deviation (coefficient of variation) of a series of measurements. Precision may be a measure of either the degree of reproducibility or of repeatability of the analytical ~~method~~

■procedure■2S (*USP27*)
under normal operating conditions. In this context, reproducibility refers to the use of the analytical procedure in different laboratories, as in a collaborative study. Intermediate precision expresses within-laboratory variation, as on different days, or with different analysts or equipment within the same laboratory. Repeatability refers to the use of the analytical procedure within a laboratory over a short period of time using the same analyst with the same equipment. For most purposes, repeatability is the criterion of concern in USP analytical procedures, although reproducibility between laboratories or intermediate precision may well be considered during the standardization of a procedure before it is submitted to the Pharmacopeia.

Determination—The precision of an analytical ~~method~~

■procedure■2S (*USP27*)
is determined by assaying a sufficient number of aliquots of a homogeneous sample to be able to calculate statistically valid estimates of standard deviation or relative standard deviation (coeffi-

In-Process Revision

cient of variation). Assays in this context are independent analyses of samples that have been carried through the complete analytical procedure from sample preparation to final test result.

The ICH documents recommend that repeatability should be assessed using a minimum of nine determinations covering the specified range for the procedure (i.e., three concentrations and three replicates of each concentration or using a minimum of six determinations at 100% of the test concentration).

SPECIFICITY

Definition—The ICH documents define specificity as the ability to assess unequivocally the analyte in the presence of components that may be expected to be present, such as impurities, degradation products, and matrix components. Lack of specificity of an individual analytical procedure may be compensated by other supporting analytical procedures. [NOTE—Other reputable international authorities (IUPAC, ~~AOAC)~~

■AOAC-I)■2S (*USP27*)
have preferred the term "selectivity," reserving "specificity" for those procedures that are completely selective.] For the ~~test or assay methods~~

■tests discussed■2S (*USP27*)
below, the above definition has the following implications:

Identification Tests: ensure the identity of the analyte.

Purity Tests: ensure that all the analytical procedures performed allow an accurate statement of the content of impurities of an analyte (e.g., related substances test, heavy metals limit, organic volatile ~~impurity limit).~~

■impurities).■2S (*USP27*)

Assays: provide an exact result, which allows an accurate statement on the content or potency of the analyte in a sample.

Determination—In the case of qualitative analyses (identification tests), the ability to select between compounds of closely related structure that are likely to be present should be demonstrated. This should be confirmed by obtaining positive results (perhaps by comparison to a known reference material) from samples containing the analyte, coupled with negative results from samples that do not contain the analyte and by confirming that a positive response is not obtained from materials structurally similar to or closely related to the analyte.

In the case of analytical ~~procedure~~

■procedures■2S (*USP27*)
for impurities, specificity may be established by spiking the drug substance or product with appropriate levels of impurities and demonstrating that these impurities are determined with appropriate accuracy and precision.

In the case of the assay, demonstration of specificity requires that it can be shown that the procedure is unaffected by the presence of impurities or excipients. In practice, this can be done by spiking the drug substance or product with appropriate levels of impurities or excipients and demonstrating that the assay result is unaffected by the presence of these extraneous materials.

■For assay or impurity procedures, this can be done alternatively by demonstrating dilution parallelism between the standard and the sample over the same range used for linearity. The responses from the standard and the analyte are plotted against the respective dilutions (or after appropriate mathematical transformation, if necessary) and the two dilution curves are shown to be parallel within the limits of variation determined by the preset confidence interval for the procedure.■2S (*USP27*)

If impurity or degradation product standards are unavailable, specificity may be demonstrated by comparing the test results of samples containing impurities or degradation products to a second well-characterized procedure (e.g., a Pharmacopeial or other validated procedure). These comparisons should include samples stored under relevant stress conditions (e.g., light, heat, humidity, acid/base hydrolysis, oxidation). In the case of the assay, the results should be compared; in the case of chromatographic impurity tests, the impurity profiles should be compared.

The ICH documents state that when chromatographic procedures are used, representative chromatograms should be presented to demonstrate the degree of selectivity, and peaks should be appropriately labeled. Peak purity tests (e.g., using diode array or mass spectrometry) may be useful to show that the analyte chromatographic peak is not attributable to more than one component.

DETECTION LIMIT

Definition—The detection limit is a characteristic of limit tests. It is the lowest amount of analyte in a sample that can be detected, but not necessarily quantitated, under the stated experimental conditions. Thus, limit tests merely substantiate that the amount of analyte is above or below a certain level. The detection limit is usually expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental ~~methods,~~

■procedures,■2S (*USP27*)
the detection limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be reliably detected.

For instrumental procedures, the same ~~method~~

■approach■2S (*USP27*)
may be used as for noninstrumental

■procedures.■2S (*USP27*)
In the case of ~~methods~~

■procedures■2S (*USP27*)
submitted for consideration as official compendial ~~methods,~~

■procedures,■2S (*USP27*)
it is almost never necessary to determine the actual detection limit. Rather, the detection limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the required detection level. For example, if it is required to detect an impurity at the level of 0.1%, it should be demonstrated that the procedure will reliably detect the impurity at that level.

In the case of instrumental analytical procedures that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be detected is established. Typically acceptable signal-to-noise ratios are 2:1 or 3:1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of re-

sponses. Whatever method is used, the detection limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the detection limit.

QUANTITATION LIMIT

Definition—The quantitation limit is a characteristic of quantitative assays for low levels of compounds in sample matrices, such as impurities in bulk drug substances and degradation products in finished pharmaceuticals. It is the lowest amount of analyte in a sample that can be determined with acceptable precision and accuracy under the stated experimental conditions. The quantitation limit is expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental ~~methods,~~

■procedures,■2S (*USP27*)
the quantitation limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be determined with acceptable accuracy and precision.

For instrumental procedures, the same ~~methods~~

■approach■2S (*USP27*)
may be used as for noninstrumental

■procedures.■2S (*USP27*)
In the case of ~~methods~~

■procedures■2S (*USP27*)
submitted for consideration as official compendial ~~methods,~~

■procedures,■2S (*USP27*)
it is almost never necessary to determine the actual quantitation limit. Rather, the quantitation limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the quantitation level. For example, if it is required to assay an analyte at the level of 0.1 mg per tablet, it should be demonstrated that the ~~method~~

■procedure■2S (*USP27*)
will reliably quantitate the analyte at that level.

In the case of instrumental analytical ~~methods~~

■procedures■2S (*USP27*)
that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be quantified is established. A typically acceptable signal-to-noise ratio is 10:1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever ~~method~~

■approach■2S (*USP27*)
is used, the quantitation limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the quantitation limit.

LINEARITY AND RANGE

Definition of Linearity—The linearity of an analytical ~~method~~

■procedure■2S (*USP27*)
is its ability to elicit test results that are directly, or by a well-defined mathematical transformation, proportional to the concentration of analyte in samples within a given range.

■Thus, in this section, linearity refers to the linearity of the relationship of concentration and assay measurement. In some cases, to attain linearity, the concentration and/or the measurement may be transformed. (Note that the weighting factors used in the regression analysis may change when a transformation is applied.) Possible transformations may include log, square root, or reciprocal, although other transformations are acceptable. If linearity is not attainable, a nonlinear model may be used. The goal is to have a model, whether linear or nonlinear, that describes closely the concentration-response relationship.■2S (*USP27*)

Definition of Range—The range of an analytical ~~method~~

■procedure■2S (*USP27*)
is the interval between the upper and lower levels of analyte (including these levels) that have been demonstrated to be determined with a suitable level of precision, accuracy, and linearity using the ~~method~~

■procedure■2S (*USP27*)
as written. The range is normally expressed in the same units as test results (e.g., percent, parts per million) obtained by the analytical ~~method.~~

■procedure.■2S (*USP27*)

Determination of Linearity and Range—Linearity should be established across the range of the analytical procedure. It should be established initially by visual examination of a plot of signals as a function of analyte concentration of content. If there appears to be a linear relationship, test results should be established by appropriate statistical methods (e.g., by calculation of a regression line by the method of least squares). ~~In some cases, to obtain linearity between the response of an analyte and its concentration, the test data may have to be subjected to a mathematical transformation.~~

■■2S (*USP27*)
Data from the regression line itself may be helpful to provide mathematical estimates of the degree of linearity. The correlation coefficient, y-intercept, slope of the regression line, and residual sum of squares should be submitted.

The range of the ~~method~~

■procedure■2S (*USP27*)
is validated by verifying that the analytical ~~method~~

■procedure■2S (*USP27*)
provides acceptable precision, accuracy, and linearity when applied to samples containing analyte at the extremes of the range as well as within the range.

In-Process Revision

ICH recommends that, for the establishment of linearity, a minimum of five concentrations normally be used. It is also recommended that the following minimum specified ranges should be considered:

Assay of a Drug Substance (or a finished product): from 80% to 120% of the test concentration.

Determination of an Impurity: from 50% to 120% of the ~~specification.~~

■acceptance criterion.■2S (*USP27*)

For Content Uniformity: a minimum of 70% to 130% of the test concentration, unless a wider or more appropriate range, based on the nature of the dosage form (e.g., metered-dose inhalers) is justified.

For Dissolution Testing: ±20% over the specified range (e.g., if the ~~specifications~~

■acceptance criteria■2S (*USP27*)
for a controlled-release product cover a region from 20%, after 1 hour, and up to 90%, after 24 hours, the validated range would be 0% to 110% of the label claim).

RUGGEDNESS

Definition—The ruggedness of an analytical ~~method is the degree of reproducibility of test results obtained by the analysis of the same samples under a variety of conditions, such as different laboratories, different analysts, different instruments, different lots of reagents, different elapsed assay times, different assay temperatures, different days, etc. Ruggedness is normally expressed as the lack of influence on test results of operational and environmental variables of the analytical method. Ruggedness is a measure of reproducibility of test results under the variation in conditions normally expected from laboratory to laboratory and from analyst to analyst.~~

■procedure is the lack of influence on test results obtained by the analysis of the same samples under a variety of conditions, such as different analysts, different instruments, different lots of reagents, different elapsed assay times, different days, and other operational and environmental variables external to the analytical procedure documentation.■2S (*USP27*)

Determination—The ruggedness of an analytical ~~method~~

■procedure■2S (*USP27*)
is determined by analysis of aliquots from homogeneous lots ~~in different laboratories,~~

■■2S (*USP27*)
by different analysts, using operational and environmental conditions that may differ but are still within the specified parameters of the assay. The degree of reproducibility of test results is then determined as a function of the assay variables. This reproducibility may be compared to the precision of the assay under normal conditions to obtain a measure of the ruggedness of the analytical ~~method.~~

■procedure.■2S (*USP27*)

ROBUSTNESS

Definition—The robustness of an analytical ~~method~~

■procedure■2S (*USP27*)
is a measure of its capacity to remain unaffected by small but deliberate variations in ~~method parameters and provides an indication of its reliability~~

■procedural parameters listed in the procedure documentation and provides an indication of its suitability■2S (*USP27*)
during normal usage.

SYSTEM SUITABILITY

If measurements are susceptible to variations in analytical conditions, these should be suitably controlled, or a precautionary statement should be included in the ~~method.~~

■procedure.■2S (*USP27*)
One consequence of the evaluation of robustness and ruggedness should be that a series of system suitability parameters is established to ensure that the validity of the analytical ~~method~~

■procedure■2S (*USP27*)
is maintained whenever used. Typical variations are the stability of analytical solutions, different equipment, and different analysts. In the case of liquid chromatography, typical variations are the pH of the mobile phase, the mobile phase composition, different lots or suppliers of columns, the temperature, and the flow rate. In the case of gas chromatography, typical variations are different lots or suppliers of columns, the temperature, and the flow rate.

System suitability tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such. System suitability test parameters to be established for a particular ~~method~~

■procedure■2S (*USP27*)
depend on the type of ~~method~~

■procedure■2S (*USP27*)
being evaluated. They are especially important in the case of chromatographic ~~methods, and submissions~~

■procedures. Submissions■2S (*USP27*)

In-Process Revision

BRIEFING

⟨1231⟩ Water for Pharmaceutical Purposes, *USP 26* page 2445. This chapter has been recognized as an authoritative resource for the pharmaceutical water treatment and analysis industry. It is the only USP source of recommendations for the microbial testing of pharmaceutical waters applied in the regulatory arena. At the USP Open Conference on Microbiological Compendial Issues in 1996, attendees recommended that this chapter provide more information on water chemistry. Also, since the establishment of the chapter, it became evident that additional definitions, clarifications, water treatment methodologies, etc., would be useful. During the past two years, a Committee member developed this extensive revision proposal and, after a formal review by the Committee, it was approved for *PF* publication. This is a general information chapter; however, its applications give it special status. The Committee, therefore, encourages public comment. Please direct all communications to Mr. Frank Barletta, USP Information and Standards Development.

(PW: F. Barletta) RTS—39138-2

Change to read:

⟨1231⟩ WATER FOR PHARMACEUTICAL PURPOSES

~~Water is the most widely used substance, raw material, or ingredient in the production, processing, and formulation of compendial articles. Control of the microbiological quality of these waters is important because proliferation of microorganisms ubiquitous to water may occur during the purification, storage, and distribution of this substance. If water is used in the final product, these microorganisms or their metabolic products may eventually cause adverse consequences.~~

~~Water that is used in the early stages of the production of drug substances and that is the source or feed water for the preparation of the various types of purified waters must meet the requirements of the National Primary Drinking Water Regulations (NPDWR) (40 CFR 141) issued by the Environmental Protection Agency (EPA). Comparable regulations for drinking water of the European Union or Japan are acceptable. These requirements ensure the absence of coliforms, which, if determined to be of fecal origin, may portend or indicate the presence of other microorganisms of fecal origin, including viruses that may be pathogenic for humans. On the other hand, meeting these National Drinking Water Regulations would not rule out the presence of other microorganisms, which, while not considered a major public health concern, could, if present, constitute a hazard or be considered undesirable in a drug substance or formulated product. For this reason, there are many different grades of pharmaceutical waters.~~

~~TYPES OF WATER~~

~~**Drinking Water**— Drinking Water is not covered by a compendial monograph but must comply with the quality attributes of the EPA NPDWR or comparable regulations of the European Union or Japan. It may be derived from a variety of sources including a public water utility, a private water supply (e.g., a well), or a combination of more than one of these sources. Drinking Water may be used in the early stages of chemical synthesis and in the early stages of the cleaning of pharmaceutical manufacturing equipment. It is the prescribed source feed water for the production of pharmaceutical waters. As seasonal variations in the quality attributes of the drinking water supply can occur, processing steps in the production of pharmaceutical waters must be designed for this characteristic.~~

~~**Purified Water**— Purified Water (see *USP* monograph) is used as an excipient in the production of official preparations, in pharmaceutical applications, such as cleaning of certain equipment, and in the preparation of some bulk pharmaceutical chemicals. Purified Water must meet the requirements for ionic and organic chemical purity and must be protected from microbial proliferation. It is prepared using Drinking Water as a feed water and is purified using unit operations that include deionization, distillation, ion exchange, reverse osmosis, filtration, or other suitable procedures. Purified Water systems must be validated.~~

~~Purified Water systems that produce, store, and circulate water under ambient conditions are susceptible to the establishment of tenacious biofilms of microorganisms, which can be the source of undesirable levels of viable microorganisms or endotoxins in the effluent water. These systems require frequent sanitization and microbiological monitoring to ensure water of appropriate microbiological quality at the points of use.~~

~~**Sterile Purified Water**— Sterile Purified Water [*USP* monograph to come] is *Purified Water* that is packaged and rendered sterile. It is used in the preparation of nonparenteral compendial dosage forms where a sterile form of *Purified Water* is required.~~

~~**Water for Injection**— Water for Injection (see *USP* monograph) is an excipient in the production of injections and for use in pharmaceutical applications, such as cleaning of certain equipment, and in the preparation of some bulk pharmaceutical chemicals. The source or feed water for this article is Drinking Water, which may have been preliminarily purified but which is finally subjected to distillation or reverse osmosis. It must meet all of the chemical requirements for *Purified Water* and in addition the requirements under *Bacterial Endotoxins Test* 85. It also must be protected from microbial contamination. The system used to produce, store, and distribute Water for Injection must be designed to prevent microbial contamination and the formation of microbial endotoxins, and it must be validated.~~

~~**Sterile Water for Injection**— Sterile Water for Injection (see *USP* monograph) is *Water for Injection* that is packaged and rendered sterile. Sterile Water for Injection is intended for extemporaneous prescription compounding and is distributed in sterile units. It is used as a diluent for parenteral products. It is packaged in single dose containers not larger than 1 liter in size.~~

~~**Bacteriostatic Water for Injection**— Bacteriostatic Water for Injection (see *USP* monograph) is sterile *Water for Injection* to which has been added one or more suitable antimicrobial preservatives. It is intended to be used as a diluent in the preparation of parenteral products. It may be packaged in single dose or multiple dose containers not larger than 30 mL.~~

~~**Sterile Water for Irrigation**— Sterile Water for Irrigation (see *USP* monograph) is *Water for Injection,* packaged in single dose containers of larger than 1 liter in size, that is intended to be delivered rapidly and is rendered sterile. It need not meet the requirement under small volume injections in the chapter *Particulate Matter* 788.~~

~~**Sterile Water for Inhalation**— Sterile Water for Inhalation (see *USP* monograph) is *Water for Injection* that is packaged and rendered sterile and is intended for use in inhalators and in the preparation of inhalation solutions.~~

~~VALIDATION AND QUALIFICATION OF WATER PURIFICATION, STORAGE, AND DISTRIBUTION SYSTEMS~~

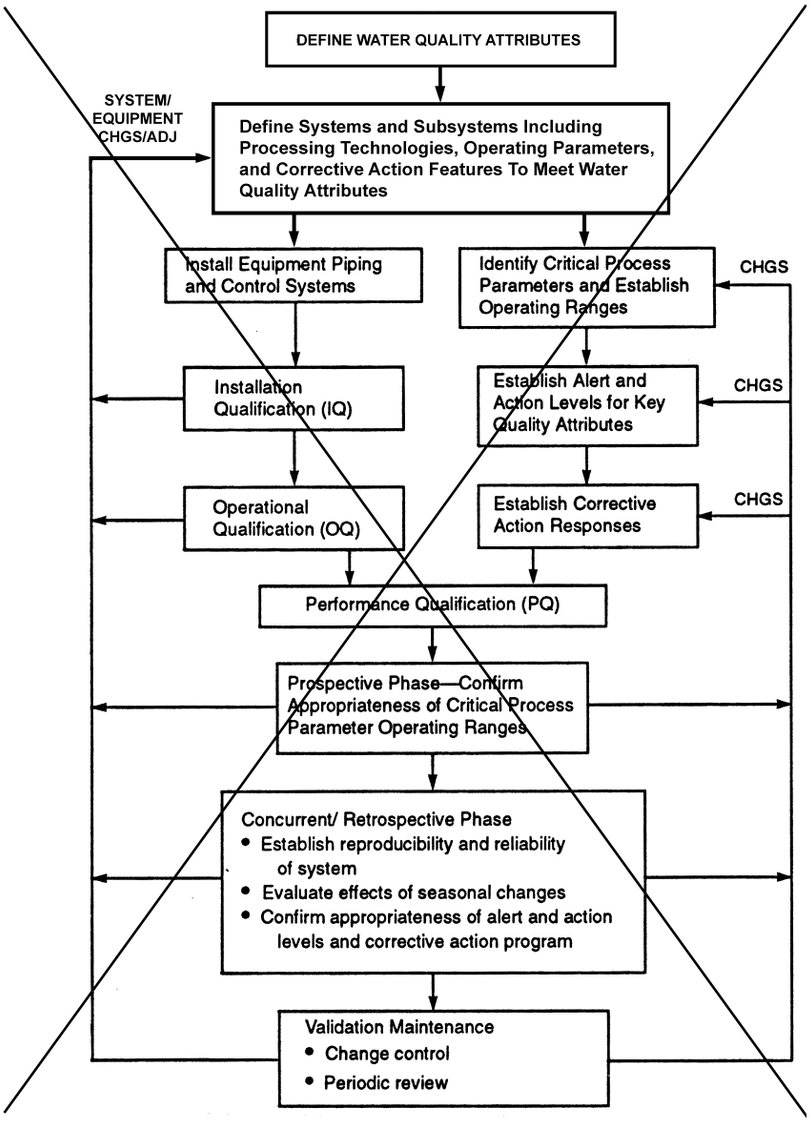
~~Establishing the dependability of pharmaceutical water purification, storage, and distribution systems requires an appropriate period of monitoring and observation. Ordinarily, few problems are~~

In-Process Revision

~~encountered in maintaining the chemical purity of *Purified Water* and *Water for Injection*. However, it is more difficult to meet established microbiological quality criteria consistently. A typical program involves intensive daily sampling and testing of major process points for at least one month after operational criteria have been established for each sampling point.~~

~~Validation is the procedure whereby substantiation to a high level of assurance that a specific process will consistently produce a product conforming to an established set of quality attributes is acquired and documented. The validation defines the critical process parameters and their operating ranges. A validation program qualifies the design, installation, operation, and performance of equipment. It begins when the system is defined and moves through several stages: qualification of the installation (IQ), operational qualification (OQ), and performance qualification (PQ). A graphical representation of a typical water system validation life cycle is shown in *Figure 1*. A validation plan for a water system typically includes the following steps:~~

~~(1) Establishing standards for quality attributes and operating parameters.~~



~~Fig. 1. Water system validation life cycle.~~

~~(2) Defining systems and subsystems suitable to produce the desired quality attributes from the available source water.~~

~~(3) Selecting equipment, controls, and monitoring technologies.~~

~~(4) Developing an IQ stage consisting of instrument calibrations, inspections to verify that the drawings accurately depict the as built configuration of the water system and, where necessary, special tests to verify that the installation meets the design requirements.~~

~~(5) Developing an OQ stage consisting of tests and inspections to verify that the equipment, system alerts, and controls are operating reliably and that appropriate Alert and Action Levels~~

In-Process Revision

are established. This phase of qualification may overlap with aspects of the next step.

(6) Developing an OQ stage consisting of tests and inspections to vDeveloping a prospective PQ stage to confirm the appropriateness of critical process parameter operating ranges. A concurrent or retrospective PQ is performed to demonstrate system reproducibility over an appropriate time period. During this phase of validation, Alert and Action Levels for key quality attributes and operating parameters are verified.

(7) Developing an OQ stage consisting of tests and inspections to vSupplementing a validation maintenance program (also called continuous validation life cycle) that includes a mechanism to control changes to the water system and establishes and carries out scheduled preventive maintenance including recalibration of instruments. In addition, validation maintenance includes a monitoring program for critical process parameters and a corrective action program.

(8) Instituting a schedule for periodic review of the system performance and requalification.

(9) Completing protocols and documenting Steps 1–8.

PHARMACEUTICAL WATER SYSTEMS

The quality attributes of water for a particular application are dictated by the requirements of its usage. Sequential processing steps that are used for treating water for different pharmaceutical purposes are shown in *Figure 2*. A typical evaluation process to select an appropriate water quality for a particular pharmaceutical purpose is shown in the decision tree in *Figure 3*. These diagrams may be used to assist in defining requirements for specific water uses and in the selection of unit operations.

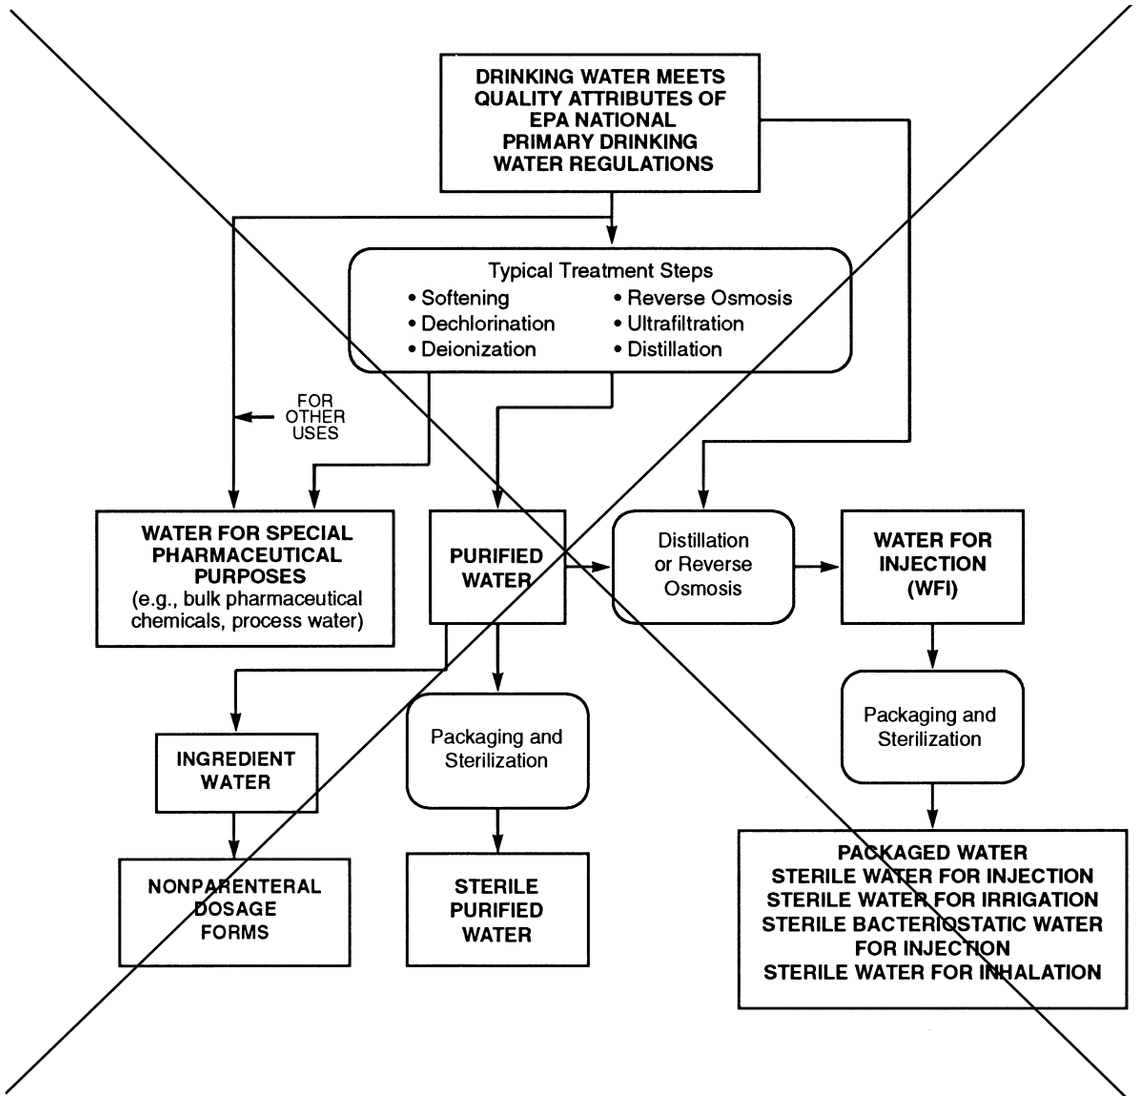


Fig. 2 Water for pharmaceutical purposes.

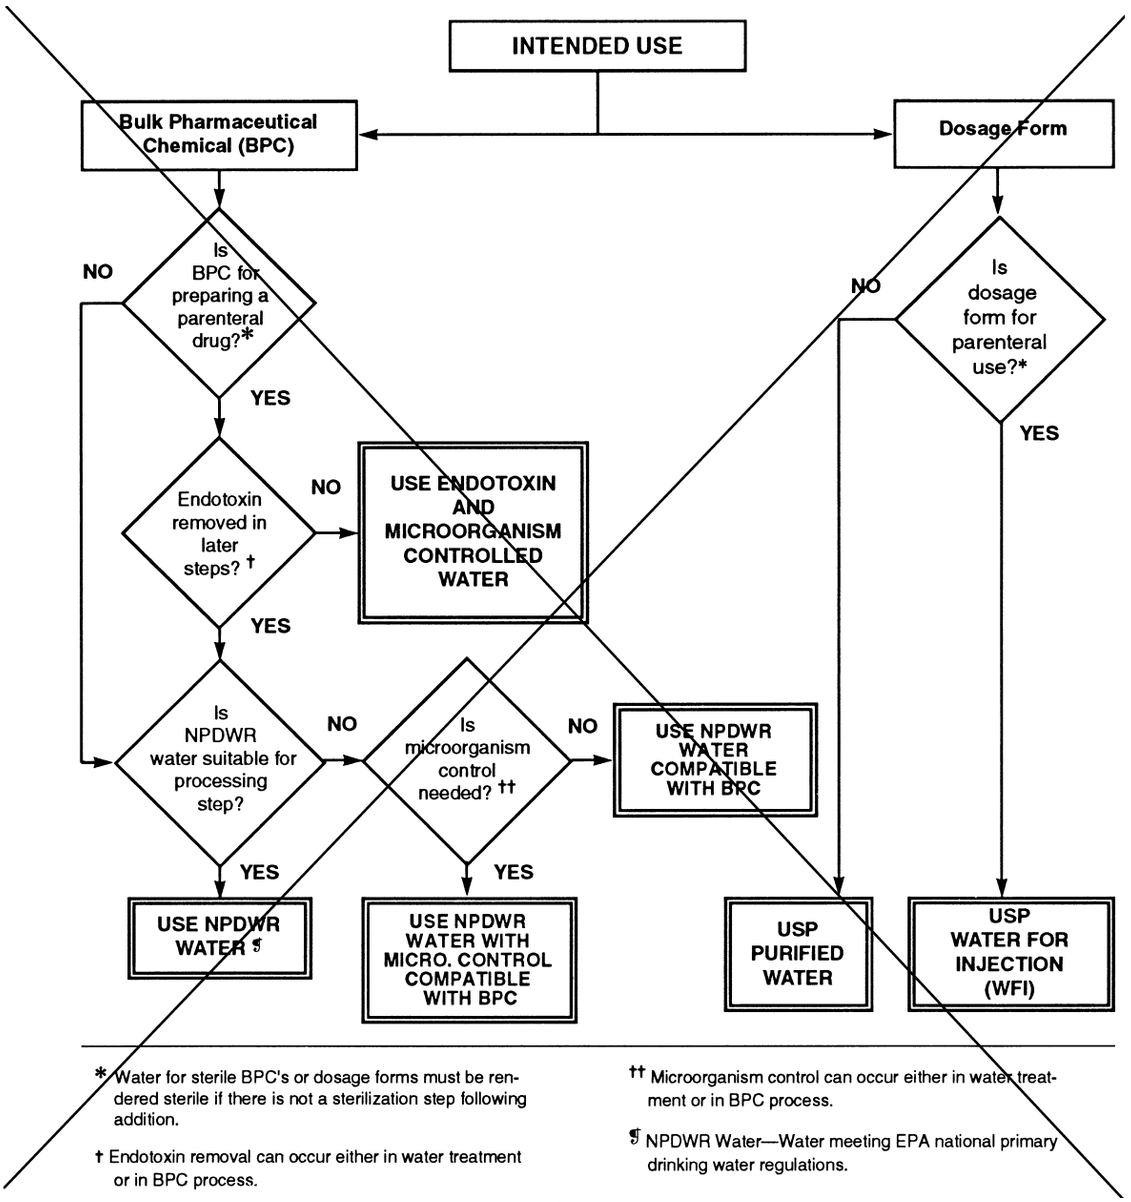

~~Fig. 3. Selection of water for pharmaceutical purposes.~~

~~PURIFIED WATER AND WATER FOR INJECTION SYSTEMS~~

~~The design, installation, and operation of systems to produce *Purified Water* and *Water for Injection* include similar components, control techniques, and procedures. The quality attributes of both waters differ only in the presence of a bacterial endotoxin requirement for *Water for Injection* and in their methods of preparation, at least at the last stage of preparation. The similarities in the quality attributes provide considerable common ground in the design of water systems to meet either requirement. The critical difference is the degree of control of the system and the final purification steps needed to ensure bacterial and bacterial endotoxin removal.~~

~~Production of pharmaceutical water employs sequential unit operations (processing steps) that address specific water quality attributes and protect the operation of subsequent treatment steps. The final unit operations used to produce *Water for Injection* have been limited to distillation and reverse osmosis. Distillation has a long history of reliable performance and can be validated as a unit operation for the production of *Water for Injection*. Other technologies such as ultrafiltration may be suitable in the production of *Water for Injection*, but at this time experience with this process is not widespread.~~

~~The validation plan should be designed to establish the suitability of the system and to provide a thorough understanding of the purification mechanism, range of operating conditions, required~~

In-Process Revision

pretreatment, and the most likely mode of failure. It is also necessary to demonstrate the effectiveness of the monitoring scheme and to establish the requirements for validation maintenance.

Trials conducted in a pilot installation can be valuable in defining the operating parameters and the expected water quality and in identifying failure modes. However, qualification of the specific unit operation can only be performed as part of the validation of the installed operational system.

The selection of specific unit operations and design characteristics for a water system should take into consideration the quality of the feed water, the technology chosen for subsequent processing steps, the extent and complexity of the water distribution system, and the appropriate compendial requirements. For example, in the design of a system for *Water for Injection,* the final process (distillation or reverse osmosis) must have effective bacterial endotoxin reduction capability and must be validated.

The following is a brief description of selected unit operations and the operation and validation concerns associated with them. This review is not comprehensive in that not all unit operations are discussed, nor are all potential problems addressed. The purpose is to highlight issues that focus on the design, installation, operation, maintenance, and monitoring parameters that facilitate water system validation.

Filtration technology plays an important role in water systems, and filtration units are available in a wide range of designs and for various applications. Removal efficiencies differ significantly from coarse filters, such as granular anthracite, quartz, or sand for larger water systems and depth cartridges for smaller water systems, to membrane filters for very small particle control. Unit and system configurations vary widely in type of filtering media and location in the process. (Use of membrane filters is discussed in a later paragraph.)

Granular or cartridge filters are used for prefiltration. They remove solid contaminants from the water supply and protect downstream system components from contamination that can inhibit equipment performance and shorten their effective life. Design and operational issues that may impact performance of depth filters include channeling of the filtering media, blockage from silt, microbial growth, and filtering media loss. Control measures include pressure and flow monitoring, backwashing, sanitizing, and replacing filtering media. An important design concern is sizing of the filter to prevent channeling or media loss resulting from inappropriate water flow rates.

Activated carbon beds adsorb low molecular weight organic material and oxidizing additives, such as chlorine compounds, and remove them from the water. They are used to achieve certain quality attributes and to protect against reaction with downstream stainless steel surfaces, resins, and membranes. The chief operating concerns regarding activated carbon beds include the propensity to support bacteria growth, the potential for hydraulic channeling, the inability to be regenerated *in situ,* and the shedding of bacteria, endotoxins, organic chemicals, and fine carbon particles. Control measures include appropriate high water flow rates, sanitization with hot water or steam, backwashing, testing for adsorption capacity, and frequent replacement of the carbon bed. Alternative technologies such as chemical additives and regenerable organic scavenging devices can be used in place of activated carbon beds.

Chemical additives are used in water systems to control microorganisms by use of chlorine compounds and ozone, to enhance the removal of suspended solids by use of flocculating agents, to remove chlorine compounds, to adjust pH, and to remove carbonate compounds. Subsequent processing steps are required to remove the added chemicals. Control of additives and subsequent monitoring to ensure removal of additives and of any of their reaction products should be designed into the system and included in the monitoring program.

Organic scavenging devices use macroreticular anion exchange resins capable of removing organic material and endotoxins from the water. They can be regenerated with appropriate biocidal caustic solutions. Operating concerns are associated with scavenging capacity and shedding of resin fragments. Control measures include testing of effluent, monitoring performance, and using downstream filters to remove resin fines.

Water softeners remove cations such as calcium and magnesium that interfere with the performance of downstream processing equipment such as reverse osmosis membranes, deionization columns, and distillation units. Water softener resin beds are regenerated with sodium chloride solution (brine). Concerns include microorganism proliferation, channeling due to inappropriate water flow rates, organic fouling of resin, fracture of the resin beads, and contamination from the brine solution used for regeneration. Control measures include recirculation of water during periods of low water use, periodic sanitization of the resin and brine system, use of microbial control devices (e.g., UV and chlorine), appropriate regeneration frequency, effluent monitoring (hardness), and downstream filtration to remove resin fines.

Deionization (DI), electrodeionization (EDI) and Electrodialysis (EDR) are effective methods of improving the chemical quality attributes of water by removing cations and anions.

DI systems have charged resins that require periodic regeneration with an acid and base. Typically, cationic resins are regenerated with either hydrochloric or sulfuric acid, which replace the captured positive ions with hydrogen ions. Anionic resins are regenerated with sodium or potassium hydroxide, which replace captured negative ions with hydroxide ions. Both regenerant chemicals are biocidal and offer a measure of microbial control. The system can be designed so that the cation and anion resins are separated or that they form a mixed bed. Rechargeable resin canisters can also be used for this purpose.

The EDI system uses a combination of mixed resin, selectively permeable membranes, and an electric charge to provide continuous flow (product and waste concentrate) and continuous regeneration. Water enters both the resin section and the waste (concentrate) section. As it passes through the resin, it is deionized to become product water. The resin acts as a conductor enabling the electrical potential to drive the captured cations and anions through the resin and appropriate membranes for concentration and removal in the waste water stream. The electrical potential also separates the water in the resin (product) section into hydrogen and hydroxide ions. This permits continuous regeneration of the resin without the need for regenerant additives.

Electrodialysis (EDR) is a similar process that uses only electricity and selectively permeable membranes to separate, concentrate, and flush the removed ions from the water stream. It, however, is less efficient than EDI because it contains no resin to enhance ion removal and current flow. Also, EDR units require periodic polarity reversal and flushing to maintain operating performance.

Concerns for all forms of deionization units include microbial and endotoxin control, chemical additive impact on resins and membranes, and loss, degradation, and fouling of resin. Issues of concern specific to DI units include regeneration frequency, channeling, complete resin separation for mixed bed regeneration, and mixing air contamination (mixed beds). Control measures vary but typically include recirculation loops, microbial control by UV light, conductivity monitoring, resin testing, microporous filtration of mixing air, microbial monitoring, frequent regeneration to minimize and control microorganism growth, sizing the equipment for suitable water flow, and use of elevated temperatures. Regeneration piping for mixed bed units should be configured to ensure that regeneration chemicals contact all internal surfaces and resins. Rechargeable canisters can be the source of contamination and should be carefully monitored. Full knowledge of previous resin use, minimum storage time between regeneration and use, and appropriate sanitizing procedures are critical factors ensuring proper performance.

Reverse osmosis (RO) units employ a semipermeable membrane and a substantial pressure differential to drive water through the membrane to achieve chemical, microbial, and endotoxin quality improvement. The process streams consist of supply water, product water (permeate), and waste water (reject). Pretreatment and system configuration variations may be necessary depending on

In-Process Revision

source water to achieve desired performance and reliability. Concerns associated with the design and operation of RO units include membrane material sensitivity to bacteria and sanitizing agents, membrane fouling, membrane integrity, seal integrity, and the volume of waste water. Failure of membrane or seal integrity will result in product water contamination. Methods of control consist of suitable pretreatment of the water stream, appropriate membrane material selection, integrity challenges, membrane design such as spiral wound to promote flushing action, periodic sanitization, monitoring of differential pressures, conductivity, microbial levels, and total organic carbon. The configuration of the RO unit offers control opportunities by expanding the single pass scheme to parallel staged, reject staged, two pass, and combination designs. An example would be the use of a two pass design to improve reliability, quality, and efficiency. RO units can be used alone or in combination with DI and EDI units for operational and quality enhancements.

Ultrafiltration is another technology that uses a permeable membrane, but unlike RO it works by mechanical separation rather than osmosis. Due to the filtration ability of the membrane, macromolecular and microbial impurities, such as endotoxins, are reduced. This technology may be appropriate as an intermediate or final purification step. Similar to RO, successful performance is dependent upon other system unit operations and system configuration.

Issues of concern include compatibility of membrane material with sanitizing agents, membrane integrity, fouling by particles and microorganisms, cartridge contaminant retention, and seal integrity. Control measures include sanitization, designs capable of flushing the membrane surface, integrity challenges, regular cartridge changes, elevated feed water temperature, and monitoring total organic carbon and differential pressure. Additional flexibility in operation is possible based on the way units are arranged such as in a parallel or series configuration. Care should be taken to avoid stagnant water conditions that could promote microorganism growth in back up or standby units.

Microbial retentive filters (membrane filters) prevent the passage of microorganisms and very small particles. They are used in tank air and inert gas vents and for filtration of compressed air gases used in the regeneration of mixed bed deionization units. Areas of concern are blockage of tank vents by condensed water vapor, which can cause mechanical damage to the tank, and concentration of microorganisms on the surface of the membrane filter, creating the potential for contamination of the tank or deionizer contents. Control measures include the use of hydrophobic filters and heat tracing vent filter housings to prevent vapor condensation. Sterilization of the unit prior to initial use and periodically thereafter or regular filter changes are also recommended control methods. Microbial retentive filters are sometimes incorporated into purification systems or in water distribution piping. This application should be carefully controlled because as noted above, these units can become a source for microbial contamination. The potential exists for the release of microorganisms should the membrane filter rupture or as a result of microbial grow through. Other means of controlling microorganisms and fine particles can be employed in place of membrane filters in the purification and distribution section of water systems. Filters that are intended to be microretentive should be sanitized and integrity tested prior to initial use and at appropriate intervals thereafter.

Positively charged filter media reduce endotoxin levels by electrostatic attraction and adsorption. Application may be unit operation or distribution system related depending upon the microbial control requirements. Filter media that are microbial retentive require the same concerns and controls as indicated in the previous paragraph. Concerns include flow rate, membrane and seal integrity, and retention capacity, which can be affected by the development of a finite charge potential on the filter. Control measures include monitoring differential pressure and endotoxin levels, proper sizing, testing membrane integrity, and configuring units in series to control break through.

Distillation units provide chemical and microbial purification via thermal vaporization, mist elimination, and condensing. A variety of designs are available including single effect, multiple effect, and vapor compression. The latter two configurations are normally used in larger systems because of their generating capacity and efficiency. Distilled water systems may require less rigorous control of feed water quality than do membrane systems. Areas of concern include carry over of impurities, evaporator flooding, stagnant water, pump and compressor seal design, and conductivity (quality) variations during start up and operation. Methods of control consist of reliable mist elimination, visual or automated high water level indication, use of sanitary pumps and compressors, proper drainage, blow down control, and use of on line conductivity sensing with automated diversion of unacceptable quality water to the waste stream.

Storage tanks are included in water distribution systems to optimize processing equipment capacity. Storage also allows for routine maintenance while maintaining continuous supply to meet manufacturing needs. Design and operation considerations are needed to prevent the development of biofilm, to minimize corrosion, to aid in the use of chemical sanitization of the tanks, and to safeguard mechanical integrity. These considerations may include using closed tanks with smooth interiors and the ability to spray the tank head space. This minimizes corrosion and biofilm development and aids in sanitizing thermally or chemically.

Storage tanks require venting to compensate for the dynamics of changing water levels. This can be accomplished with a hydrophobic microbial retentive membrane filter fitted onto an atmospheric vent. Alternatively, an automatic membrane filtered compressed gas pressurization and venting system may be used. Rupture disks equipped with a rupture alarm device serve as a further safeguard for the mechanical integrity of the tank.

Distribution configuration should allow for the continuous flow of water in the piping by means of recirculation or should provide for the periodic flushing of the system. Experience has shown that continuously recirculated systems are easier to maintain.

Pumps should be designed to deliver fully turbulent flow conditions to retard the development of biofilms. Components and distribution lines should be sloped and fitted with drain points so that the system can be completely drained. In distribution systems, where the water is circulated at a high temperature, dead legs and low flow conditions should be avoided, and valved tie in points should have length to diameter ratios of 6 or less. In ambient temperature distribution systems, particular care should be exercised to avoid pocket areas and provide for complete drainage. Water exiting from a loop should not be returned to the system. Distribution design should include the placement of sampling valves in the storage tank and at other locations such as in the return line of the recirculating water system. The primary sampling site for water should be the valves that deliver water to the point of use. Direct connections to processes or auxiliary equipment should be designed to prevent reverse flow into the controlled water system. The distribution system should permit sanitization for microorganism control. The system may be continuously operated at sanitizing conditions or sanitized periodically.

INSTALLATION AND MATERIALS OF CONSTRUCTION AND COMPONENT SELECTION

Installation techniques are important because they can affect the mechanical, corrosive, and sanitary integrity of the system. Valve installation attitude should promote gravity drainage. Pipe supports should provide appropriate slopes for drainage and should be designed to support the piping adequately under worst case thermal conditions. Methods of connecting system components including units of operation, tanks, and distribution piping require careful attention to preclude potential problems.

In-Process Revision

Stainless steel welds should provide reliable joints that are internally smooth and corrosion free. Low carbon stainless steel, compatible wire filler, where necessary, inert gas, automatic welding machines, and regular inspection and documentation help to ensure acceptable weld quality. Follow up cleaning and passivation are important for removing contamination and corrosion products and to reestablish the passive corrosion resistant surface. Plastic materials can be fused (welded) in some cases and also require smooth, uniform internal surfaces. Adhesives should be avoided due to the potential for voids and chemical reactions. Mechanical methods of joining, such as flange fittings, require care to avoid the creation of offsets, gaps, penetrations, and voids. Control measures include good alignment, properly sized gaskets, appropriate spacing, uniform sealing force, and the avoidance of threaded fittings.

Materials of construction should be selected to be compatible with control measures such as sanitizing, cleaning, and passivating. Temperature rating is a critical factor in choosing appropriate materials because surfaces may be required to handle elevated operating and sanitization temperatures. Should chemicals or additives be used to clean, control, or sanitize the system, materials resistant to these chemicals or additives must be utilized.

Materials should be capable of handling turbulent flow and elevated velocities without wear on the corrosive barrier impact, such as the passivation related chromium oxide surface of stainless steel. The finish on metallic materials such as stainless steel, whether it be a refined mill finish, polished to a specific grit, or an electropolished treatment, should complement system design and provide satisfactory corrosion and microbial activity resistance. Auxiliary equipment and fittings that require seals, gaskets, diaphragms, filter media, and membranes should exclude materials that permit the possibility of extractables, shedding, and microbial activity.

Insulating materials exposed to stainless steel surfaces should be free of chlorides to avoid the phenomenon of stress corrosion cracking that can lead to system contamination and the destruction of tanks and critical system components.

Specifications are important to ensure proper selection of materials and to serve as a reference for system qualification and maintenance. Information such as mill reports for stainless steel and reports of composition, ratings, and material handling capabilities for nonmetallic substances should be reviewed for suitability and retained for reference.

Component (auxiliary equipment) selection should be made with assurance that it does not create a source for contamination intrusion. Heat exchangers should be double tube sheet or concentric tube design. They should include differential pressure monitoring or utilize heat transfer medium of equal or better quality to avoid problems should leaks develop. Pumps should be of sanitary design with seals that prevent contamination of the water. Valves should have smooth internal surfaces with the seat and closing device exposed to the flushing action of water, such as occurs in diaphragm valves. Valves with pocket areas or closing devices (e.g., ball, plug, gate, globe) that move into and out of a flow area should be avoided.

SANITIZATION

Microbial control in water systems is achieved primarily through sanitization practices. Systems can be sanitized using either thermal or chemical means. In-line UV light at a wavelength of 254 nm can also be used to "sanitize" water in the system continuously.

Thermal approaches to system sanitization include periodic or continuously circulating hot water and the use of steam. These techniques are limited to systems that are compatible with the higher temperatures needed to achieve sanitization, such as stainless steel and some polymer formulations. Although thermal methods control biofilm development, they are not effective in removing established biofilms.

Chemical methods, where compatible, can be used on a wider variety of construction materials. These methods typically employ oxidizing agents such as halogenated compounds, hydrogen peroxide, ozone, or peracetic acid. Halogenated compounds are effective sanitizers but are difficult to flush from the system and tend to leave biofilms intact. Compounds such as hydrogen peroxide, ozone, and peracetic acid oxidize bacteria and biofilms by forming reactive peroxides and free radicals (notably hydroxyl radicals). The short half-life of these compounds, particularly ozone, may require that it be added continuously during the sanitization process. Hydrogen peroxide and ozone rapidly degrade to water and oxygen; peracetic acid degrades to acetic acid in the presence of UV light.

UV light impacts on the development of biofilms by reducing the rate of new microbial colonization in the system; however, it is only partially effective against planktonic microorganisms. Alone, UV light is not an effective tool because it does not eliminate existing biofilm. However, when coupled with conventional thermal or chemical sanitization technologies, it is most effective and can prolong the interval between system sanitizations. The use of UV light also facilitates the degradation of hydrogen peroxide and ozone.

Sanitization steps require validation to demonstrate the capability of reducing and holding microbial contamination at acceptable levels. Validation of thermal methods should include a heat distribution study to demonstrate that sanitization temperatures are achieved throughout the system. Validation of chemical methods require a demonstration of adequate chemical concentrations throughout the system. In addition, when the sanitization process is completed, effective removal of chemical residues must be demonstrated.

The frequency of sanitization is generally dictated by the results of system monitoring. Conclusions derived from the trend analysis of the microbiological data should be used as the alert mechanism for maintenance. The frequency of sanitization should be established such that the system operates in a state of microbiological control and does not exceed Alert Levels.

OPERATION, MAINTENANCE, AND CONTROL

A preventive maintenance program should be established to ensure that the water system remains in a state of control. The program should include (1) procedures for operating the system, (2) monitoring programs for critical quality attributes and operating conditions including calibration of critical instruments, (3) schedule for periodic sanitization, (4) preventive maintenance of components, and (5) control of changes to the mechanical system and to operating conditions.

Operating Procedures—Procedures for operating the water system and performing routine maintenance and corrective action should be written, and they should also define the point when action is required. The procedures should be well documented, detail the function of each job, assign who is responsible for performing the work, and describe how the job is to be conducted.

Monitoring Program—Critical quality attributes and operating parameters should be documented and monitored. The program may include a combination of in-line sensors or recorders (e.g., a conductivity meter and recorder), manual documentation of operational parameters (such as carbon filter pressure drop) and laboratory tests (e.g., total microbial counts). The frequency of sampling, the requirement for evaluating test results, and the necessity for initiating corrective action should be included.

Sanitization—Depending on system design and the selected units of operation, routine periodic sanitization may be necessary to maintain the system in a state of microbial control. Technologies for sanitization are described above.

In-Process Revision

Preventive Maintenance—A preventive maintenance program should be in effect. The program should establish what preventive maintenance is to be performed, the frequency of maintenance work, and how the work should be documented.

Change Control—The mechanical configuration and operating conditions must be controlled. Proposed changes should be evaluated for their impact on the whole system. The need to requalify the system after changes are made should be determined. Following a decision to modify a water system, the affected drawings, manuals, and procedures should be revised.

SAMPLING CONSIDERATIONS

Water systems should be monitored at a frequency that is sufficient to ensure that the system is in control and continues to produce water of acceptable quality. Samples should be taken from representative locations within the processing and distribution system. Established sampling frequencies should be based on system validation data and should cover critical areas. Unit operation sites might be sampled less frequently than point of use sites. The sampling plan should take into consideration the desired attributes of the water being sampled. For example, systems for *Water for Injection,* because of their more critical microbiological requirements, may require a more rigorous sampling frequency.

When sampling water systems, special care should be taken to ensure that the sample is representative. Sampling ports should be sanitized and thoroughly flushed before a sample is taken. Samples containing chemical sanitizing agents require neutralization prior to microbiological analysis. Samples for microbiological analysis should be tested immediately or suitably protected to preserve the sample until analysis can begin.

Samples of flowing water are only indicative of the concentration of planktonic (free floating) microorganisms present in the system. Benthic (attached) microorganisms present as biofilms are generally present in greater numbers and are the source of the planktonic population. Microorganisms in biofilms represent a continuous source of contamination and are difficult to sample and quantify. Consequently, the planktonic population is used as an indicator of system contamination levels and is the basis for system Alert Levels. The consistent appearance of elevated planktonic levels is usually an indication of advanced biofilm development in need of remedial control. System control and sanitization are key in controlling biofilm formation and the consequent planktonic population.

MICROBIAL CONSIDERATIONS

The major exogenous source of microbial contamination is source or feed water. Feed water quality must, at a minimum, meet the quality attributes of drinking water for which the level of coliforms are regulated. A wide variety of other microorganisms, chiefly Gram-negative bacteria, may be present. These microorganisms may compromise subsequent purification steps.

Examples of other potential exogenous sources of microbial contamination include unprotected vents, faulty air filters, backflow from contaminated outlets, drain air breaks, and replacement activated carbon and deionizer resins. Sufficient care should be given to system design and maintenance in order to minimize microbial contamination from these sources.

Unit operations can be a major source of endogenous microbial contamination. Microorganisms present in feed water may adsorb to carbon beds, deionizer resins, filter membranes, and other unit operation surfaces and initiate the formation of a biofilm. Biofilm is an adaptive response by certain microorganisms to survive in a low nutrient environment. Microorganisms in a biofilm are protected from the action of many biocides. Downstream colonization can occur when microorganisms are sloughed off and carried in other areas of the water system. Microorganisms may also attach to suspended particles such as carbon bed fines and serve as a source of contamination to subsequent purification equipment and distribution systems.

Another source of endogenous microbial contamination is the distribution system. Microorganisms can colonize pipe surfaces, valves, and other areas. There they proliferate, forming a biofilm, which then provides a continuous source of microbial contamination.

Endotoxins are lipopolysaccharides from the cell envelope that is external to the cell wall of Gram-negative bacteria. Gram-negative bacteria readily form biofilms that can become a source of endotoxins. Endotoxins may either be associated with living microorganisms or fragments of dead microorganisms, or they may be free molecules. The free form of endotoxins may be released from cell surfaces or biofilms that colonize the water system, or they may enter the water system via the feed water. Endotoxin levels may be minimized by controlling the introduction of microorganisms and microbial proliferation in the system. This may be accomplished through the normal exclusion or removal action afforded by various unit operations within the treatment system as well as through system sanitization. Other control methods include the use of ultrafilters or charge-modified filters, either in line or at the point of use. The presence of endotoxins may be monitored as described in the chapter *Bacterial Endotoxins Test* 85.

METHODOLOGICAL CONSIDERATIONS*

The objective of a water system microbiological monitoring program is to provide sufficient information to control the microbiological quality of the water produced. Product quality requirements should dictate water quality needs. An appropriate level of control may be maintained by using data trending techniques and limiting specific contraindicated microorganisms. Consequently, it may not be necessary to detect all of the microorganisms present. The monitoring program and methodology should indicate adverse trends and detect microorganisms that are potentially harmful to the finished product or consumer.

Final selection of method variables should be based on the individual requirements of the system being monitored. It should be recognized that there is no single method that is capable of detecting all of the potential microbial contaminants of a water system. Methods selected should be capable of isolating the numbers and types of organisms that have been deemed significant relative to system control and product impact for each individual system.

Several criteria should be considered when selecting a method to monitor the microbial content of a pharmaceutical water system. These include method sensitivity, range of organisms recovered, sample throughput, incubation period, cost, and technical complexity. An additional consideration is the use of the classical "culture" approaches vs. a sophisticated instrument approach.

THE CLASSICAL CULTURE APPROACH

Classical culture approaches for microbial testing of water include but are not limited to pour plates, spread plates, membrane filtration, and most probable number (MPN) tests. These methods are generally easy to perform, are less expensive, and provide excellent sample processing throughput. Method sensitivity can be increased via the use of larger sample sizes. This strategy is used in the membrane filtration method.

Culture approaches are further defined by the type of medium used in combination with the incubation temperature and duration. This combination should be selected according to the monitoring

* For additional guidance concerning microbial water testing methodology, consult *Standard Methods for the Examination of Water and Wastewater,* 18th Edition, American Public Health Association, Washington DC, 20005.

In-Process Revision

needs presented by a specific water system as well as its ability to recover microorganisms that could have a detrimental effect on the product or process.

There are two basic forms of media available for traditional microbiological analysis: "high" nutrient and "low" nutrient. High-nutrient media are intended as general media for the isolation and enumeration of heterotrophic bacteria. Low-nutrient media are beneficial for isolating slow-growing bacteria and bacteria that have been injured by previous exposure to disinfectants and sanitizers such as chlorine. Low-nutrient media may be compared to high-nutrient media, especially during the validation of a water system, in order to determine if any additional numbers or types of bacteria are present so that their impact on the end use may be assessed. Additionally, the efficacy of system controls and sanitization on these slower-growing or impaired bacteria can also be assessed.

Duration and temperature of incubation are also critical aspects of a microbiological test method. Classical methodologies using high-nutrient media have required incubation at 30°C to 35°C for 48 to 72 hours. In certain water systems incubation at lower temperatures (e.g., 20°C to 25°C) and longer periods (e.g., 5 to 7 days) can produce higher counts when compared to classical methods. Whether or not a particular system needs to be monitored using lower incubation temperatures or longer incubation times should be determined during system validation.

The decision to use longer incubation periods should be made after considering the need for timely information and the type of corrective actions required when an Alert or Action Level is exceeded. The advantages gained by incubating for longer times, namely recovery of injured microorganisms, slow growers, or more fastidious microorganisms, should be balanced against the need to have a timely investigation and to take corrective action, as well as the ability of these microorganisms to detrimentally affect products or processes.

"INSTRUMENT" APPROACH

Examples of instrument approaches include microscopic direct counting techniques (e.g., epifluorescence and immunofluorescence), radiometric, impedometric, and biochemically based methodologies. These methods all possess a variety of advantages and disadvantages.

One advantage is their precision and accuracy. In general, instrument approaches often have a shorter lead time for obtaining results, which facilitates timely system control. This advantage, however, is often counterbalanced by limited sample processing throughput due to labor-intensive sample processing or other instrument limitations. In addition, instrumental approaches are destructive in that further isolate manipulation for characterization purposes are precluded. Generally, some form of microbial isolate characterization may be a required element of water system monitoring. Consequently, culturing approaches have traditionally been preferred over instrumental approaches because they offer a balance of desirable test attributes and post-test capabilities.

RECOMMENDED METHODOLOGIES

The following general methods obtained from *Standard Methods for the Examination of Water and Wastewater*, 18th Edition, American Public Health Association, Washington, DC 20005, are considered appropriate for establishing trends in the number of colony-forming units observed in the routine microbiological monitoring of ingredient water. It is recognized, however, that other combinations of media, time, and temperature of incubation may occasionally or even consistently result in higher numbers of colony-forming units being observed. The extended incubation periods that are usually required by some of the alternative methods available offer disadvantages that may outweigh the higher counts obtained. The somewhat higher baseline counts would not necessarily have greater utility in detecting an excursion or a trend.

Methodologies that can be recommended as generally satisfactory for monitoring pharmaceutical water systems are as follows:

Drinking Water:	POUR PLATE METHOD Minimum sample—1.0 mL Plate count agar Plate count agar 42 to 72 hours incubation at 30°C to 35°C
Purified Water:	POUR PLATE METHOD Minimum sample—1.0 mL Plate count agar 48 to 72 hours incubation at 30°C to 35°C
Water for Injection:	MEMBRANE FILTRATION METHOD Minimum sample—100 mL Plate count agar 48 to 72 hours incubation at 30°C to 35°C

Identification of Microorganisms

Identifying the isolates recovered from water monitoring methods may be important in instances where specific waterborne microorganisms may be detrimental to the products or processes in which the water is used. Microorganism information such as this may also be useful when identifying the source of microbial contamination in a product or process.

Often a limited group of microorganisms are continuously recovered from a water system. After repeated characterization, an experienced microbiologist may become proficient at their identification based on only a few traits such as colonial morphology and staining characteristics. This level of characterization is adequate for most situations.

Alert and Action Levels

The individual monographs for *Purified Water* and *Water for Injection* do not include specific microbial limits. These were purposefully omitted since most current microbiological techniques available require at least 48 hours to obtain definitive results. By that time, the water from which the sample was taken has already been employed in the production process. Failure to meet a compendial specification would require rejecting the product lot involved, and this is not the intent of an alert or action guideline. The establishment of quantitative microbiological guidelines for water for pharmaceutical purposes is in order because such guidelines will establish procedures that are to be implemented in the event that significant excursions beyond these limits occur.

Water systems should be microbiologically monitored to confirm that they continue to operate within their design specifications and produce water of acceptable quality. Monitoring data may be compared to established process parameters or product specifications. A refinement to the use of process parameters and product specifications is the establishment of Alert and Action Levels, which signal a shift in process performance. Alert and Action Levels are distinct from process parameters and product specifications in that they are used for monitoring and control rather than accept or reject decisions.

In-Process Revision

~~**Alert Levels** are levels or ranges that, when exceeded, indicate that a process may have drifted from its normal operating condition. Alert Levels constitute a warning and do not necessarily require a corrective action.~~

~~**Action Levels** are levels or ranges that, when exceeded, indicate that a process has drifted from its normal operating range. Exceeding an Action Level indicates that corrective action should be taken to bring the process back into its normal operating range.~~

~~Alert and Action Levels are established within process and product specification tolerances and are based on a combination of technical and product related considerations. Consequently, exceeding an Alert or Action Level does not imply that product quality has been compromised.~~

~~Technical considerations used to establish Alert and Action Levels should include a review of equipment design specifications to ensure that the purification equipment is capable of achieving the required level of purity. In addition, samples should be collected and analyzed over a period of time to develop data reflecting normal water quality trends. Historical or statistically based levels can be established using the above data. Levels established in this way measure process performance and are independent of product concerns.~~

~~Product related Alert and Action Levels should represent both product quality concerns and the ability to effectively manage the purification process. These levels are typically based on a review of process data and an assessment of product sensitivity to chemical and microbiological contamination. The assessment of product susceptibility might include preservative efficacy, water activity, pH, etc. The levels should be set such that, when exceeded, product quality is not compromised.~~

~~Monitoring data should be analyzed on an ongoing basis to ensure that the process continues to perform within acceptable limits. An analysis of data trends is often used to evaluate process performance. This information can be used to predict departures from established operating parameters, thereby signaling the need for appropriate preventative maintenance.~~

~~It should be recognized that the microbial Alert and Action Levels established for any pharmaceutical water system are necessarily linked to the monitoring method chosen. Using the recommended methodologies, generally considered appropriate Action Levels are 500 colony forming units (cfu) per mL for *Drinking Water,* 100 cfu per mL for *Purified Water* and 10 cfu per 100 mL for *Water for Injection*.~~

~~It should be emphasized that the above action guidelines are not intended to be totally inclusive for every situation where ingredient waters are employed. For example, Gram negative microorganisms are not excluded from ingredient waters, nor is the presence of Gram negative microorganisms prohibited in *Drinking Water* in the Federal Regulations. The reason for this is that these microorganisms are ubiquitous to the aqueous environment and their exclusion would likely require a sterilization process that would not be appropriate or feasible in many manufacturing scenarios. However, there are situations where they might not be tolerated: in topical products and in some oral dosage forms. It is, therefore, incumbent upon the manufacturer to supplement the general action guidelines to fit each particular manufacturing situation.~~

■Water is widely used as a raw material, ingredient, and solvent in the processing, formulation, and manufacture of pharmaceutical substances and compendial articles. Its broad use makes it an important substance whose quality requires carefully established specifications to render it suitable for the majority of its uses. Because these varied uses each require tailored specifications, a number of compendial monographs have been created.

Control of the chemical purity of these waters is important and is the main purpose of the monographs in this compendium. Unlike other official articles, the bulk water monographs (*Purified Water* and *Water for Injection*) also limit how the article can be produced because of the belief that the nature and robustness of the purification process is directly related to the resulting purity. The chemical attributes listed in these monographs should be considered as a set of minimum specifications. More stringent specifications may be needed for some applications to ensure suitability for particular uses. Basic guidance on the appropriate applications of these waters is found in the monographs and is further explained in this chapter.

Control of the microbiological quality of water is important for many but not all of its uses. All packaged forms of water are required to be sterile either because their uses require this attribute or because potential contaminating microorganisms, if not removed or killed prior to packaging, could continue to grow unchecked to extremely high levels after packaging, rendering the water potentially unsuitable for many of its other nonsterile uses. USP has determined

that a microbial specification for the bulk monographed waters is inappropriate for several reasons. These waters can be used in a variety of applications, some requiring extreme microbiological control and others requiring none. Unlike for packaged waters, the needed microbial specification for a given bulk water depends upon its use. A single specification for this difficult-to-control attribute would unnecessarily burden some water users with irrelevant specifications and testing. However, other applications may require even more careful microbial control to avoid the proliferation of microorganisms ubiquitous to water during the purification, storage, and distribution of this substance. Another reason such a microbial specification would be inappropriate is related to the ''utility'' or continuous supply nature of this raw material. Microbial specifications are typically assessed by test methods that take at least 48 to 72 hours to generate results. Since pharmaceutical waters are generally produced by continuous processes and used in products and manufacturing processes soon after generation, the water is likely to have been used well before definitive test results are available. Failure to meet a compendial specification, whether relevant to that particular use or not, would require rejecting all product lots between the previous sampling's acceptable test result and a subsequent sampling's acceptable test result. However, the establishment of quantitative microbiological guidelines for specific pharmaceutical water uses is not totally inappropriate for especially critical uses. In these situations, manufacturing at risk (using the water in a continuous mode prior to availability of test results) may be contraindicated. Instead, action and alert levels should be used as in-process controls to keep the microbial quality of the water within levels that reflect a state of control of the water system with microbial counts well under any specification established for a specific critical use.

SOURCE/FEED WATER CONSIDERATIONS

To ensure adherence to certain minimal chemical and microbiological quality standards, water used in the production of drug substances or as source or feed water for the preparation of the various types of purified waters must meet the requirements of the National Primary Drinking Water Regulations (NPDWR) (40 CFR 141) issued by the U.S. Environmental Protection Agency (EPA) or comparable regulations for drinking water of the European Union or Japan. Limits on the types and quantities of certain organic and inorganic contaminants ensure that the water will contain only small quantities of potentially objectionable chemical species. Therefore, water pretreatment systems will only be challenged to remove small quantities of these potentially difficult-to-remove chemicals. Also, control of objectionable chemical contaminants at the source-water stage eliminates the need to specifically test for some of them (e.g., trihalomethanes and heavy metals) after the water has been further purified.

Microbiological requirements ensure the absence of coliforms, which, if determined to be of fecal origin, may indicate the potential presence of other potentially pathogenic microorganisms and viruses of fecal origin.

On the other hand, meeting these regulations does not rule out the presence of other microorganisms, which, while not considered a major public health concern could, if present, constitute a hazard or be considered undesirable in a drug substance or formulated product.

To accomplish microbial control, Municipal Water Authorities add to drinking water, among other things, disinfectants. Chlorine-containing and other oxidizing substances have been used for many decades for this purpose and have generally been considered, in and of themselves, to be relatively innocuous to humans. However, these oxidants can interact with naturally occurring organic matter to produce disinfection by-products (DBPs) such as trihalomethanes (THMs, including chloroform, bromodichloromethane, and dibromochloromethane) and haloacetic acids (HAAs, including dichloroacetic acid and trichloroacetic acid). The levels of DBPs produced vary with, among other things, the level and type of disinfectant used and the levels and types of organic materials found in the water. These may vary seasonally or even hourly.

High levels of DBPs are considered a health hazard, so control of their levels is mandated by Drinking Water Regulations intended to reduce exposure to these substances to nonhazardous levels. However, depending on the unit operations used for further water purification, a small fraction of the DBPs in the starting water may carry over to the finished water. Therefore, the importance of having minimal levels of DBPs in the starting water while achieving effective disinfection is important.

DBP levels in drinking water can be minimized by using disinfectants such as ozone, chloramines, or chlorine dioxide. Like chlorine, their oxidative properties are sufficient to damage some pretreatment unit operations and must be removed early in the pretreatment process. The complete removal of some of these disinfectants can be challenging. For example, chloramines may degrade during the disinfection process or during pretreatment removal, thereby releasing ammonia, which in turn can carry over to the finished water. Pretreatment unit operations must be designed and operated to adequately remove the disinfectant, drinking water DBPs, and objectionable disinfectant degradants. A serious problem can occur if unit operations designed to remove chlorine were, without warning, challenged with chloramine-containing drinking water from a municipality that had been mandated to cease use of chlorine disinfection to comply with ever tightening EPA Drinking Water THM specifications. Not only might the dechlorination process incompletely remove the chloramine (which could irreparably damage downstream unit operations), but the release of ammonia during this process might carry through pretreatment and prevent the finished water from passing compendial conductivity specifications. The purification process must be reassessed if the drinking water disinfectant is changed, emphasizing the need for a good working relationship and open communications between the pharmaceutical water manufacturer and the drinking water provider.

TYPES OF WATER

There are many different grades of water used for pharmaceutical purposes. Several of these water grades are described in *USP* monographs that specify uses, acceptable methods of preparation, and quality attributes. These waters

can be divided into two general types, bulk waters, which are typically produced on site where they are used, and packaged waters, which are produced, packaged, and sterilized to preserve microbial quality throughout their packaged shelf life. There are several specialized types of packaged waters, differing in their designated applications, packaging limitations, and other quality attributes.

There are also other types of water for which there are no monographs. These are all bulk waters, with names given for descriptive purposes only. Most of these waters are used in specific analytical methods. The associated text, created during an era predating USP's replacement of the archaic bulk water wet chemistry tests with tests for *Conductivity* and *Total Organic Carbon,* may or may not specify or imply certain quality attributes or modes of preparation. It is not the intent of USP that these nonmonographed waters necessarily adhere strictly to the stated or implied modes of preparation or attributes. Waters produced by other means or controlled by other test attributes may equally satisfy the intended uses for these waters. It is the user's responsibility to ensure that such waters, even if produced and controlled exactly as stated, be suitable for their intended use. Wherever the term "water" is used within this compendium without other descriptive adjectives or clauses, the intent is that water of no less purity than *Purified Water* be used.

What follows is a brief description of the various types of pharmaceutical waters and their significant uses or attributes. *Figure 1* may also be helpful in understanding some of the various types of waters.

BULK MONOGRAPHED WATERS

The following waters are typically produced in large volume by a multiple-unit operation water system and distributed by a piping system for use at the same site. These particular pharmaceutical waters must meet the quality attributes as specified in the related monographs, but the following discussion gives further insight as to their uses and requirements.

Purified Water—*Purified Water* (see *USP* monograph) is used as an excipient in the production of nonparenteral preparations and in other pharmaceutical applications, such as cleaning of certain equipment and nonparenteral product-contact components. Unless otherwise specified, *Purified Water* is also to be used for all tests and assays for which water is indicated (see *General Notices and Requirements*). *Purified Water* must meet the requirements for ionic and organic chemical purity and must be protected from microbial contamination. The minimal quality of source or feed water for the production of *Purified Water* is *Drinking Water.* This source water may be purified using unit operations that include deionization, distillation, ion exchange, reverse osmosis, filtration, or other suitable purification procedures. Purified water systems must be validated to reliably and consistently produce and distribute water of acceptable chemical and microbiological quality. Purified water systems that function under ambient conditions are particularly susceptible to the establishment of tenacious biofilms of microorganisms, which can be the source of undesirable levels of viable microorganisms or endotoxins in the effluent water. These systems require frequent sanitization and microbiological monitoring to ensure water of appropriate microbiological quality at the points of use.

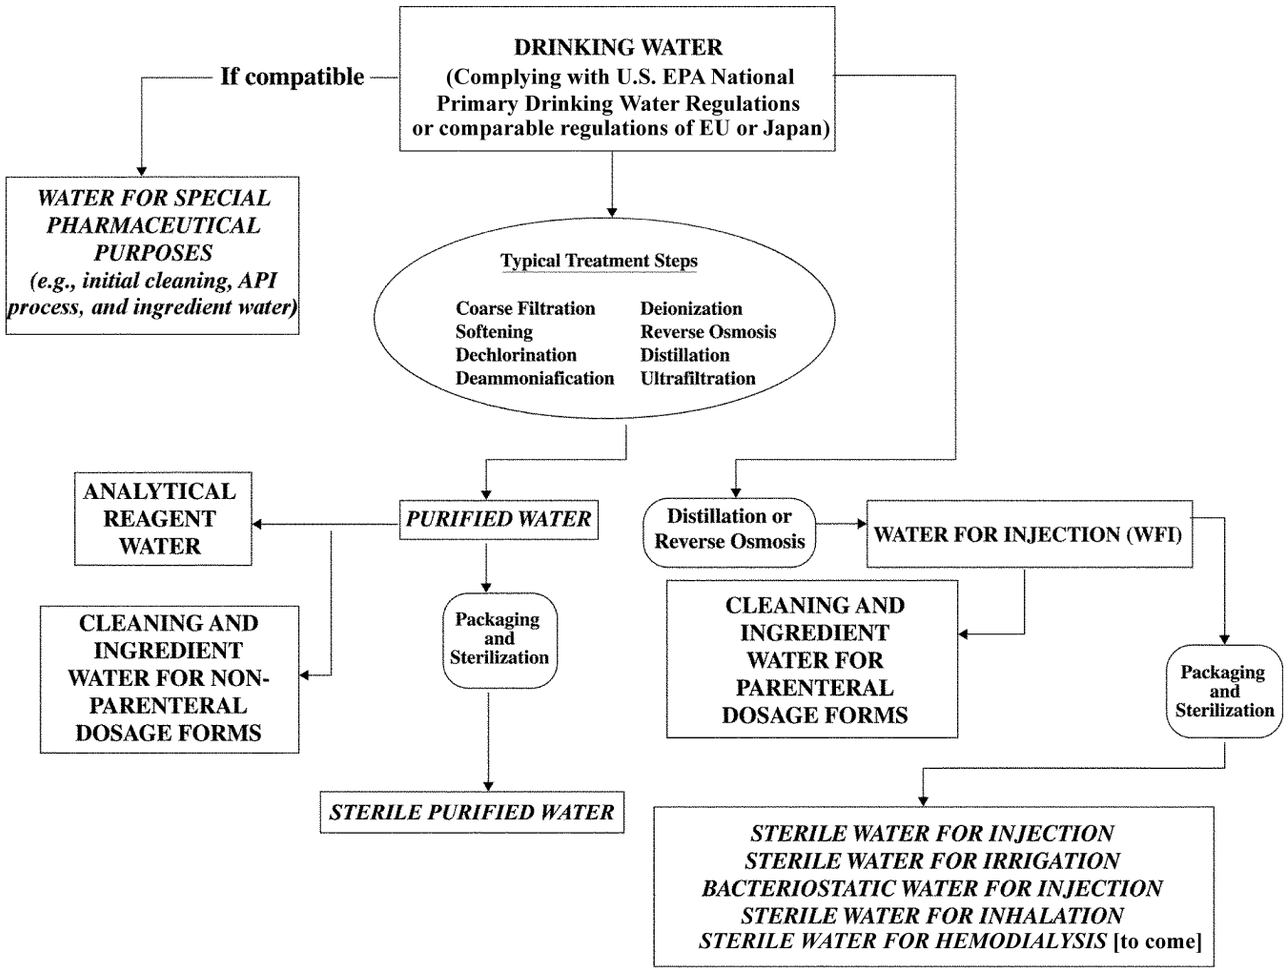

Fig. 1. Water for pharmaceutical purposes.

In-Process Revision

Water for Injection—*Water for Injection* (see *USP* monograph) is used as an excipient in the production of parenteral and other preparations where product endotoxin content must be controlled, and in other pharmaceutical applications, such as cleaning of certain equipment and parenteral product-contact components. The minimum quality of source or feed water for the generation of *Water for Injection* is *Drinking Water*. This source water may be preliminarily purified to render it suitable for subsequent distillation (or whatever other validated process is used according to the monograph). The resulting water must meet all of the chemical requirements for *Purified Water* as well as an additional bacterial endotoxin specification. Since endotoxins are produced by the kinds of microorganisms that are prone to inhabit water, the equipment and procedures used by the system to purify, store, and distribute *Water for Injection* must be designed to minimize or prevent microbial contamination as well as remove incoming endotoxin from the starting water. Water for injection systems must be validated to reliably and consistently produce and distribute this quality of water.

PACKAGED MONOGRAPHED WATERS

The following waters are packaged forms of either bulk *Purified Water* or bulk *Water for Injection* which have been sterilized to preserve their microbiological properties. These waters may have specific intended uses as indicated by their names and may also have restrictions on packaging configurations related to those uses. In general, these waters may be used in lieu of the bulk form of water from which they were derived. However, the user should take into consideration that the packaging and sterilization processes used for the articles may leach materials from the packaging material into the water over its shelf life, rendering it less pure than the original water placed into the package. The chemical attributes of these waters are still defined primarily by the wet chemistry methods and specifications similar to those formerly used for the bulk pharmaceutical waters prior to their replacement with conductivity and total organic carbon. It is the user's responsibility to ensure fitness for use of this article when used in manufacturing, clinical, or analytical applications where the purer bulk form of the water is indicated.

Sterile Purified Water—*Sterile Purified Water* (see *USP* monograph) is *Purified Water*, packaged and rendered sterile. It is used in the preparation of nonparenteral compendial dosage forms or in analytical applications requiring *Purified Water* where access to a validated *Purified Water* system is not practical, where only a relatively small quantity is needed, or where microbiologically controlled or sterile *Purified Water* is required.

Sterile Water for Injection—*Sterile Water for Injection* (see *USP* monograph) is *Water for Injection* packaged and rendered sterile. It is used for extemporaneous prescription compounding and as a sterile diluent for parenteral products. It may also be used for other applications where bulk *Water for Injection* or *Purified Water* is indicated but where assess to a validated water system is either not practical or only a relatively small quantity is needed. *Sterile Water for Injection* is packaged in single-dose containers not larger than 1 liter in size.

Bacteriostatic Water for Injection—*Bacteriostatic Water for Injection* (see *USP* monograph) is sterile *Water for Injection* to which has been added one or more suitable antimicrobial preservatives. It is intended to be used as a diluent in the preparation of parenteral products. It may be packaged in single-dose or multiple-dose containers not larger than 30 mL.

Sterile Water for Irrigation—*Sterile Water for Irrigation* (see *USP* monograph) is *Water for Injection* packaged and sterilized in single-dose containers of larger than 1 liter in size and intended to be delivered rapidly. It need not meet the requirement under small-volume injections in the general test chapter *Particulate Matter in Injections* ⟨788⟩. It may also be used in other applications where bulk *Water for Injection* or *Purified Water* is indicated but where access to a validated water system is not practical or where somewhat larger quantities than are provided as *Sterile Water for Injection* are needed.

Sterile Water for Inhalation—*Sterile Water for Inhalation* (see *USP* monograph) is *Water for Injection* that is packaged and rendered sterile and is intended for use in inhalators and in the preparation of inhalation solutions. It carries a less stringent specification for bacterial endotoxins than *Sterile Water for Injection*, so it is not suitable for parenteral applications.

Sterile Water for Hemodialysis—*Sterile Water for Hemodialysis* [*USP* monograph to come] is *Water for Injection* which has additional attributes for certain chemicals which have been shown to be problematic during hemodialysis. It is used for the dilution of hemodialysis concentrate and other hemodialysis applications.

NONMONOGRAPHED WATERS AND STEAM

Pharmaceutical Water—Cited in this chapter, this is a broad term referring to any water used in the preparation of active pharmaceutical ingredients, excipients, and finished products as well as any related process such as pharmaceutical equipment cleaning or product testing. The term covers a broad range of water purities, starting with the least pure allowed in any process for *USP* substances, *Drinking Water*, and extending to the highest purity reasonably achievable. The water's purity must be suitable for its intended use, but no less pure than the *USP* and cGMP requirements.

Drinking Water—Cited in *General Notices and Requirements*, the general test chapters, and the dietary supplement chapters, this water must comply with the quality attributes of the U.S. Environmental Protection Agency's National Primary Drinking Water Regulations (NPDWR) or comparable regulations of the European Union or Japan. It may be derived from a variety of sources including a public water utility, a private water supply (e.g., a well), or a combination of more than one of these sources. *Drinking Water* may be used in the early stages of cleaning pharmaceutical manufacturing equipment and product-contact components. *Drinking Water* is also the minimum quality of water which should be used for the preparation of official substances and other bulk pharmaceutical ingredients. Where required by the processing of the materials to achieve their required final purity, higher qualities of water may be needed, perhaps even as pure as *Water for Injection* or *Purified Water* Such higher purity waters might, however, receive only selected attributes to be of higher purity than *Drinking Water* (see *Water for Special Pharmaceutical Purposes* and *Endotoxin- and Microorganism-Controlled Water* below). *Drinking Water* is the prescribed source feed water for the production of pharmaceutical waters. As seasonal variations in the quality attributes of the *Drinking Water* supply can occur, due consideration to its synthetic and cleaning uses must be given. In addition, the processing steps in the production of pharmaceutical waters must be designed to accommodate this variability.

Potable Water—Cited in the *General Notices and Requirements*, the general test chapters, and the dietary supplement chapters, this is an older synonym for *Drinking Water* (derived from the French adjective *potable,* meaning drinkable).

NPDWR Water—Cited in this chapter, this water must comply with the U.S. Environmental Protection Agency's National Primary Drinking Water Regulations, the drinking water mandated for use in the United States. The specifications for this water, found in 40 CFR Part 141, include maximum contaminant levels for a large number of inorganic, organic, microbiological, and radioactive contaminants.

Water for Special Pharmaceutical Purposes—Cited in this chapter, this broad term is used to describe any type of water that does not have a monograph but has special purity requirements suited for its intended purposes.

Endotoxin- and Microorganism-Controlled Water—Cited in this chapter, this type of water has been subjected to conditions that control its microbial and endotoxin concentrations at a level suitable for its intended use. It may also have undergone some level of chemical purification.

LAL Reagent Water—Cited in the *USP* monographs as well as the general chapters, this is a water, usually *Water for Injection* which may have been sterilized and is free from a level of endotoxin that would yield any detectable reaction or interference with the Limulus Amebocyte Lysate reagent used in the *Bacterial Endotoxins Test* ⟨85⟩.

Endotoxin-Free Water—Cited in one *USP* monograph, this water is a synonymous with LAL Reagent Water.

Carbon Dioxide-Free Water—Cited in numerous *USP* monographs, general test chapters, and *NF* monographs, this is *Purified Water* or *Water for Injection* that has been prepared to remove dissolved carbon dioxide and bicarbonate during its purification and then either protected from carbon dioxide reabsorption during its preparation and storage or treated to drive off the dissolved carbon dioxide just prior to use, such as by sparging with an inert gas or by boiling. The *Reagents* section of *USP* describes its preparation as *Purified Water* that has been boiled for 5 minutes, cooled, and protected from atmospheric carbon dioxide adsorption. Practically speaking, it is extremely difficult to remove all carbon dioxide from the water by boiling or sparging, and if exposed to air at all, such as during cooling or when transferring a quantity of water to a working container for use in a test, readsorption is inevitable. Deionization by a mixed bed deionizer is an effective initial carbon dioxide removal approach. Distillation and reverse osmosis are less effective. Reintrusion of carbon dioxide is possible if the water is not properly protected after production. The usual uses of this type of water are for analyses requiring highly purified water or where the test is related to pH, acidity, or alkalinity and the concern is that the carbon dioxide in the water could affect the test result. The efficacy of the carbon dioxide limitation process should be evaluated for its impact on the tests in which the water is used. Normally, the small amount absorbed during reasonably rapid, open-to-the-air handling of truly carbon dioxide-free water will not affect the testing where *Carbon Dioxide-Free Water* is indicated.

Ammonia-Free Water—Cited in only one *USP* monograph, this is *Purified Water* or *Water for Injection* that has been produced in such a way as to prevent the carryover of ammonia from the source water. Ammonia is typically only a problem in regions where chloramines are used as the *Drinking Water* disinfectant. Deionization by a mixed bed deionizer is very effective at removing ammonia, but distillation and reverse osmosis are less effective. In order for distillation and reverse osmosis to produce *Ammonia-Free Water* in chloramine-using regions, the ammonia must be removed by earlier unit operations prior to entering the distillation or reverse osmosis units. The use of this water is for a test related to pH and the concern, like with carbon dioxide, is that the pH of the water may affect the test result. In most laboratory settings, there is insufficient atmospheric ammonia to create a need for ammonia reintrusion protection, unlike the analogous protection that would be needed for *Carbon Dioxide-Free Water.*

High Purity Water—Cited in one *USP* monograph and one general chapter, this water is well characterized in the general test chapter *Containers* ⟨661⟩ . In essence, it is water that is prepared by several sequential steps, an interim one of which is distillation, that renders it extremely pure relative to on-line conductivity, particulates, and copper content. This water is used for many of the reagents and tests for containers in ⟨661⟩ where less pure waters would not perform acceptably, as well as for the reagents employed where cited for the *USP* monograph tests.

Distilled Water—Cited in several *USP* monographs and general test chapters, this water is, as the name suggests, produced by vaporizing liquid water and condensing it in a purer state. This water is used primarily for reagent preparation in the *USP* monographs where pure water is needed and in the general test chapter primarily for cleaning purposes where the leaving of no water impurity residuals is important. It is also cited as the starting water used for making *High Purity Water.*

Freshly Distilled Water—Cited in only one *USP* monograph, this water is prepared in a similar fashion to *Distilled Water,* though as the name suggests, immediately before use. It is used for preparing standards and control solutions

for injection into test animals. Because of this use and the term "freshly", the implied attributes are its chemical purity as well as its low endotoxin and bioburden (though no reference to these microbial attributes or specific protection from recontamination is mentioned). Due to the nature of the testing, *Water for Injection* could be a reasonable substitute, though as for any test, the suitability of the water must be verified for this use.

Deionized Water—Cited in numerous *USP* monographs, general test chapters, and dietary supplement monographs, this water is produced by an ion exchange process in which the contaminating ions are replaced with either H^+ or OH^- ions. In the *USP* monographs and general test chapters, this water is indicated for cleaning and reagent preparation purposes. In one general test chapter, it is listed as a suitable substitute for *Purified Water* In the dietary supplement monographs, it is listed as the water to be used wherever "water" is mentioned, which includes reagent and article preparations as well as for cleaning. Due to the nature of the testing, *Purified Water* could be a reasonable substitute, though as for any test, the suitability of the water must be verified for these uses.

Freshly Deionized Water—Cited in only two related *USP* monographs, this water is prepared in a similar fashion to *Deionized Water,* though as the name suggests, immediately before it is to be used. This implies the need to avoid any adventitious contamination from the air or container leachables, which in turn implies a reasonably high degree of purity. This water is indicated for use wherever "water" is mentioned, which includes reagent and article preparations as well as for cleaning. Due to the nature of the testing, *Purified Water* could be a reasonable substitute for most of the applications mentioned, though as for any test, the suitability of the water must be verified for these uses, particularly for its indicated use in preparing mobile phase solutions where highly deionized water is needed.

Deionized Distilled Water—Cited in only two *USP* monographs, this water is produced by deionizing (see *Deionized Water* above) *Distilled Water* (also see above). This water is used as a reagent in a chromatography test that requires a high purity. Because of the importance of this high purity, water that barely meets the requirements for *Purified Water* would not be acceptable.

Deaerated Water—Cited in two *USP* monographs and two general information chapters, this water is *Purified Water* that has been treated to reduce the content of dissolved air by any suitable means such as by reducing the headspace air pressure in a closed container, boiling for at least five minutes, or sonication. The *Reagents* section of *USP* also describes its preparation. *Deaerated Water* is primarily indicated for use in dissolution testing where the presence of high levels of dissolved gases could outgas during the test and interfere with the test results or accurate volumetric withdrawals.

Clean Steam—Clean Steam (also commonly known as Pure Steam or Additive-Free Steam) is not specifically cited in *USP,* but is commonly used throughout the pharmaceutical industry. Its quality is sometimes confusingly identified in various references by either the quality of the water from which it is produced or by the quality of the condensate formed from it, both of which make reference to a *USP* monographed bulk water. Though these various preparation and end-quality definitions may serve their respective purposes in isolation, their inconsistently assigned descriptive names create confusion when taken out of context. Therefore, the purpose of this discussion is to clarify the term "Clean Steam," its production, uses, and quality. Clean Steam may be prepared analogously to either *Purified Water*

or *Water for Injection* but vaporized and distributed in such a fashion as to render its condensate equivalent in quality to that of *Water for Injection* It is used where its condensate directly contacts product or product contact surfaces such as during cleaning or sterilization of products, product components, and other product contact surfaces and where there is no subsequent processing step to remove any codeposited impurity residues. The primary intent of using this quality of steam is to ensure that articles or product contact surfaces exposed to it are not contaminated by residues that may be deposited by the steam. The source of this contamination could originate from entrained source water, steam additives, or the steam production and distribution system itself. Depending on its use in sterilization, such as for porous autoclave loads and SIP systems, the presence of even small quantities of noncondensable gases or an unsaturated or dry state, such as would exist in a superheated condition, could compromise the steam's sterilizing properties. Therefore, control of these attributes may also be necessary.

VALIDATION AND QUALIFICATION OF WATER PURIFICATION, STORAGE, AND DISTRIBUTION SYSTEMS

Establishing the dependability of pharmaceutical water purification, storage, and distribution systems requires an appropriate period of monitoring and observation. Ordinarily, few problems are encountered in maintaining the chemical purity of *Purified Water* and *Water for Injection* Nevertheless, the advent of using conductivity and TOC to define chemical purity has allowed the user to more quantitatively assess the water's chemical purity and its variability as a function of routine pretreatment system maintenance, regeneration, etc. Even the presence of such unit operations as heat exchangers and use point hoses can compromise the chemical quality in an otherwise well-controlled water system. Therefore, an assessment of the consistency of the water's chemical purity over time must be part of the validation program. However, even with the most well controlled chemical quality, it is often more difficult to consistently meet established microbiological quality criteria owing to phenomena occurring during and after chemical purification. A typical program involves intensive daily sampling and testing of major process points for at least one month after operational criteria have been established for each unit operation, point of use, and sampling point.

Validation is the process whereby substantiation to a high level of assurance that a specific process will consistently produce a product conforming to an established set of quality attributes is acquired and documented. Prior to and during the very early stages of validation, the critical process parameters and their operating ranges are established. A validation program qualifies the design, installation, operation, and performance of equipment. It begins when the system is defined and moves through several stages, installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ). A graphical representation of a typical water system validation life cycle is shown in *Figure 2.*

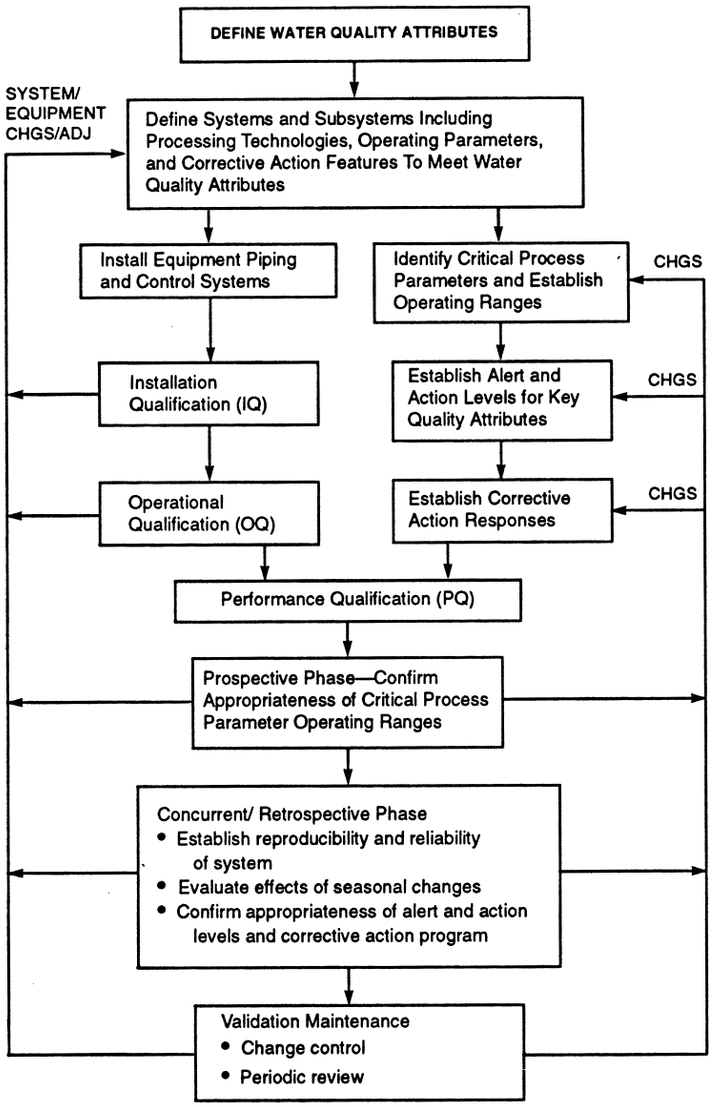

Fig. 2. Water system validation life cycle.

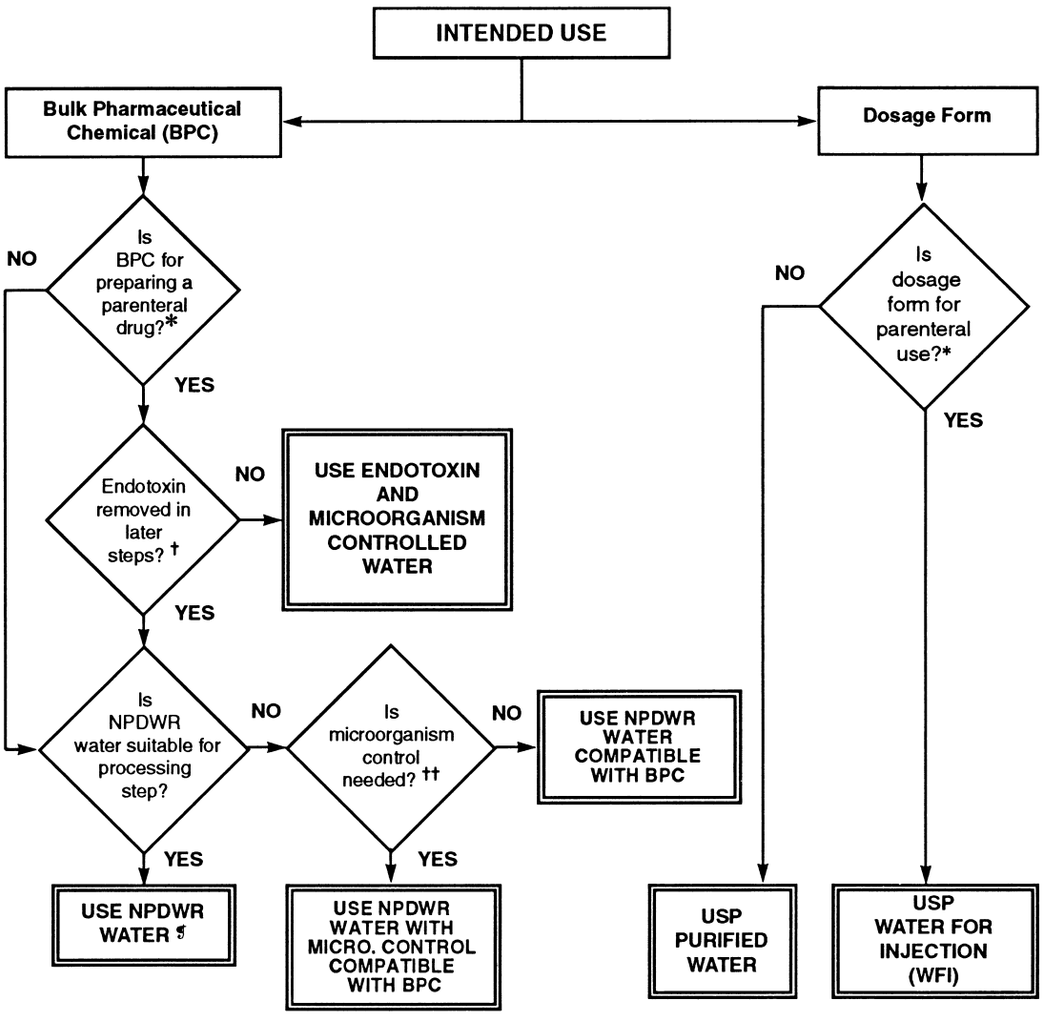
A validation plan for a water system typically includes the following steps: (1) establishing standards for quality attributes and operating parameters; (2) defining systems and suitable subsystems to produce the desired quality attributes from the available source water; (3) selecting equipment, controls, and monitoring technologies; (4) developing an IQ stage consisting of instrument calibrations, inspections to verify that the drawings accurately depict the as-built configuration of the water system and, where necessary, special tests to verify that the installation meets the design requirements; (5) developing an OQ stage consisting of tests and inspections to verify that the equipment, system alerts, and controls are operating reliably and that appropriate Alert and Action Levels are established (this phase of qualification may overlap with aspects of the next step); and (6) developing a prospective PQ stage to confirm the appropriateness of critical process parameter operating

ranges (During this phase of validation, *alert and action levels* for key quality attributes and operating parameters are verified.); (7) supplementing a validation maintenance program (also called continuous validation life cycle) that includes a mechanism to control changes to the water system and establishes and carries out scheduled preventive maintenance including recalibration of instruments (In addition, validation maintenance includes a monitoring program for critical process parameters and a corrective action program.); (8) instituting a schedule for periodic review of the system performance and requalification; and (9) completing protocols and documenting Steps 1 through 8.

PURIFIED WATER AND WATER FOR INJECTION SYSTEMS

The design, installation, and operation of systems to produce *Purified Water* and *Water for Injection* include similar components, control techniques, and procedures. The quality attributes of both waters differ only in the presence of a bacterial endotoxin requirement for *Water for Injection* and in their methods of preparation, at least at the last stage of preparation. The similarities in the quality attributes provide considerable common ground in the design of water systems to meet either requirement. The critical difference is the degree of control of the system and the final purification steps needed to ensure bacterial and bacterial endotoxin removal. Production of pharmaceutical water employs sequential unit operations (processing steps) that address specific water quality attributes and protect the operation of subsequent treatment steps as shown in *Figure 2*. A typical evaluation process to select an appropriate water quality for a particular pharmaceutical purpose is shown in the decision tree in *Figure 3.* These diagrams may be used to assist in defining requirements for specific water uses and in the selection of unit operations. The final unit operations used to produce *Water for Injection* have been limited to distillation and reverse osmosis. Distillation has a long history of reliable performance and can be validated as a unit operation for the production of *Water for Injection.* Other technologies such as ultrafiltration may be suitable in the production of *Water for Injection* but at this time experience with this process is not widespread.



* Water for sterile BPC's or dosage forms must be rendered sterile if there is not a sterilization step following addition.

† Endotoxin removal can occur either in water treatment or in BPC process.

†† Microorganism control can occur either in water treatment or in BPC process.

¶ NPDWR Water—Water meeting EPA national primary drinking water regulations.

Fig. 3. Selection of water for pharmaceutical purposes.

The validation plan should be designed to establish the suitability of the system and to provide a thorough understanding of the purification mechanism, range of operating conditions, required pretreatment, and the most likely modes of failure. It is also necessary to demonstrate the effectiveness of the monitoring scheme and to establish the requirements for validation maintenance. Trials conducted in a pilot installation can be valuable in defining the operating parameters and the expected water quality and in identifying failure modes. However, qualification of the specific unit operation can only be performed as part of the validation of the installed operational system. The selection of specific unit operations and design characteristics for a

water system should take into account the quality of the feed water, the technology chosen for subsequent processing steps, the extent and complexity of the water distribution system, and the appropriate compendial requirements. For example, in the design of a system for *Water for Injection*, the final process (distillation or reverse osmosis) must have effective bacterial endotoxin reduction capability and must be validated.

UNIT OPERATIONS CONCERNS

The following is a brief description of selected unit operations and the operation and validation concerns associated with them. This review is not comprehensive in that not all unit operations are discussed, nor are all potential problems addressed. The purpose is to highlight issues that focus on the design, installation, operation, maintenance, and monitoring parameters that facilitate water system validation.

Prefiltration

Filtration technology plays an important role in water systems, and filtration units are available in a wide range of designs and for various applications. Removal efficiencies differ significantly from coarse filters, such as multimedia or sand for larger water systems and depth cartridges for smaller water systems, to membrane filters for very small particle control. Unit and system configurations vary widely in type of filtering media and location in the process. (The use of membrane filters is discussed in a later paragraph.) Granular or cartridge filters are used for prefiltration and are often situated at or near the head of the water pretreatment system prior to unit operations designed to remove the source water disinfectants. This location, however, does not preclude the need for periodic microbial control since biofilm can still proliferate in the presence of source water disinfectants, albeit slower than in their absence. These prefilters remove solid contaminants down to a size of 7 to 10 μm from the water supply and protect downstream system components from particulates that can inhibit equipment performance and shorten their effective life. Design and operational issues that may impact performance of depth filters include channeling of the filtering media, blockage from silt, microbial growth, and filtering-media loss during improper backwashing. Control measures include pressure and flow monitoring during use and backwashing, sanitizing, and replacing filtering media. An important design concern is sizing of the filter to prevent channeling or media loss resulting from inappropriate water flow rates as well as proper sizing to minimize excessive frequent or infrequent backwashing or cartridge filter replacement.

Activated Carbon

Activated carbon beds adsorb low molecular weight organic material and oxidizing additives, such as chlorine and chloramine compounds, removing them from the water. They are used to achieve certain quality attributes and to protect against reaction with downstream stainless steel surfaces, resins, and membranes. The chief operating concerns regarding activated carbon beds include the propensity to support bacteria growth, the potential for hydraulic channeling, the inability to be regenerated in situ, and the shedding of bacteria, endotoxins, organic chemicals, and fine carbon particles. Control measures include appropriate high water flow rates, sanitization with hot water or steam, backwashing, testing for adsorption capacity, and frequent replacement of the carbon bed. It is important to note that the use of steam for carbon bed sanitization is often incompletely effective due to channeling rather than even permeation through the bed. This phenomenon can usually be avoided by using hot water sanitization. Alternative technologies to

activated carbon beds can be used in order to avoid their microbial problems, such as disinfectant-neutralizing chemical additives and regenerable organic scavenging devices. However, these alternatives do not function by the same mechanisms as activated carbon, may not be as effective at removing some organics, and have a different set of operating concerns and control measures that may be nearly as troublesome as activated carbon beds.

Additives

Chemical additives are used in water systems (a) to control microorganisms by use of sanitants such as chlorine compounds and ozone, (b) to enhance the removal of suspended solids by use of flocculating agents, (c) to remove chlorine compounds, (d) to avoid scaling on reverse osmosis membranes, and (e) to adjust pH for more effective removal of carbonate and ammonia compounds by reverse osmosis. These additives do not constitute ''added substances'' so long as they are either removed by subsequent processing steps or they naturally and completely autodegrade or equilibrate to ions and molecules native to the water such as hydrogen and hydroxide ions, oxygen, or water itself. Control of additives to ensure a continuously effective concentration and subsequent monitoring to ensure their removal as well as their non-native reaction/degradation products should be designed into the system and included in the monitoring program.

Organic Scavengers

Organic scavenging devices use macroreticular weakly basic anion-exchange resins capable of removing organic material and endotoxins from the water. They can be regenerated with appropriate biocidal caustic brine solutions. Operating concerns are associated with organic scavenging capacity, particulate, chemical and microbiological fouling of the reactive resin surface, flow rate, regeneration frequency, and shedding of resin fragments. Control measures include testing of effluent, backwashing, monitoring hydraulic performance, and using downstream filters to remove resin fines.

Softeners

Water softeners may be located either upstream or downstream of disinfectant removal units. They utilize sodium-based cation exchange resins to remove water-hardness ions, such as calcium and magnesium, that could foul or interfere with the performance of downstream processing equipment such as reverse osmosis membranes, deionization devices, and distillation units. Water softeners can also be used to remove other lower affinity cations, such as the ammonium ion, that may be released from chloramine disinfectants commonly used in drinking water and which might otherwise carryover through other downstream unit operations. If ammonium removal is one of its purposes, the softener must be located downstream of the disinfectant removal operation, which itself may liberate ammonium from neutralized chloramine disinfectants. Water softener resin beds are regenerated with concentrated sodium chloride solution (brine). Concerns include microorganism proliferation, channeling, appropriate water flow rates and contact time, ion-exchange capacity, organic and particulate resin fouling, fracture of the resin beads, resin degradation by excessively chlorinated water, and contamination from the brine solution used for regeneration. Control measures include recirculation of water during periods of low water use, periodic sanitization of the resin and brine system, use of microbial control devices (e.g., ultraviolet and chlorine), locating the unit upstream of the disinfectant removal step (if used only for softening), appropriate regeneration frequency, effluent chemical monitoring (e.g., hardness ions

and possibly ammonium), and downstream filtration to remove resin fines. If a softener is used for ammonium removal from chloramine-containing source water, then capacity, contact time, resin surface fouling, pH, and regeneration frequency are very important.

Deionization

Deionization (DI), electrodeionization (EDI), and continuous deionization (CDI) are effective methods of improving the chemical quality attributes of water by removing cations and anions. DI systems have charged resins that require periodic regeneration with an acid and base. Typically, cationic resins are regenerated with either hydrochloric or sulfuric acid, which replace the captured positive ions with hydrogen ions. Anionic resins are regenerated with sodium or potassium hydroxide, which replace captured negative ions with hydroxide ions. Both regenerant chemicals are biocidal and offer a measure of microbial control. The system can be designed so that the cation and anion resins are in separate or ''twin'' beds or they can be mixed together to form a mixed bed. Twin beds are easily regenerated but deionize water less efficiently than mixed beds, which have a considerably more complex regeneration process. Rechargeable resin canisters can also be used for this purpose.

The EDI and CDI systems use a combination of mixed resin, selectively permeable membranes, and an electric charge, providing continuous flow (product and waste concentrate) and continuous regeneration. Water enters both the resin section and the waste (concentrate) section. As it passes through the resin, it is deionized to become product water. The resin acts as a conductor enabling the electrical potential to drive the captured cations and anions through the resin and appropriate membranes for concentration and removal in the waste water stream. The electrical potential also separates the water in the resin (product) section into hydrogen and hydroxide ions. This permits continuous regeneration of the resin without the need for regenerant additives. However, unlike conventional deionization, EDI and CDI units must start with water that is already pretreated to be fairly pure because they cannot handle the heavier ion load of unpurified source water.

Concerns for all forms of deionization units include microbial and endotoxin control, chemical additive impact on resins and membranes, and loss, degradation, and fouling of resin. Issues of concern specific to DI units include regeneration frequency, channeling, organic leaching from new resins, complete resin separation for mixed bed regeneration, and mixing air contamination (mixed beds). Control measures vary but typically include recirculation loops, effluent microbial control by ultraviolet light, conductivity monitoring, resin testing, microporous filtration of mixing air, microbial monitoring, frequent regeneration to minimize and control microorganism growth, sizing the equipment for suitable water flow and contact time, and use of elevated temperatures. Internal distributor and regeneration piping for mixed bed units should be configured to ensure that regeneration chemicals contact all internal bed and piping surfaces and resins. Rechargeable canisters can be the source of contamination and should be carefully monitored. Full knowledge of previous resin use, minimum storage time between regeneration and use, and appropriate sanitizing procedures are critical factors ensuring proper performance.

Reverse Osmosis

Reverse osmosis (RO) units employ a semipermeable membrane and a substantial pressure differential to drive water through the membrane to achieve chemical, microbial, and endotoxin quality improvement. The process streams consist of supply water, product water (permeate), and wastewater (reject). Pretreatment and system configuration

variations and chemical additives may be necessary depending on source water to achieve desired performance and reliability. Concerns associated with the design and operation of RO units include membrane materials that are extremely sensitive to sanitizing agents; to particulate, chemical, and microbial membrane fouling; to membrane and seal integrity; to the passage of dissolved gases, such as carbon dioxide and ammonia; and to the volume of wastewater. Failure of membrane or seal integrity will result in product water contamination. Methods of control consist of suitable pretreatment of the water stream, appropriate membrane material selection, integrity challenges, membrane design and heat tolerance, periodic sanitization, and monitoring of differential pressures, conductivity, microbial levels, and total organic carbon. The configuration of the RO unit offers control opportunities by expanding the single pass scheme to parallel staged, reject staged, two-pass, and combination designs. An example would be the use of a two-pass design to improve reliability, quality, and efficiency. The development of RO units that can tolerate sanitizing water temperatures as well as operate efficiently at elevated temperatures has added greatly to their microbial control and to the avoidance of biofouling. RO units can be used alone or in combination with DI and EDI units for operational and quality enhancements.

Ultrafiltration

Ultrafiltration is another technology that uses a permeable membrane, but unlike RO, it works by mechanical separation rather than osmosis. Due to the ability of the membrane to sieve out macromolecules (typically greater than about 20 K daltons) depending on pore size and other factors, macromolecular and microbial impurities, such as endotoxins, can be retained by these membranes, effectively removing them from the effluent. This technology may be appropriate as an intermediate or final purification step. Similar to RO, successful performance is dependent upon pretreatment of the water by upstream unit operations. Issues of concern include compatibility of membrane material with heat and sanitizing agents, membrane integrity, fouling by particles and microorganisms, and seal integrity. Control measures include filtration medium selection, sanitization, tangential flow designs capable of flushing the membrane surface, integrity challenges, regular cartridge changes, elevated feed water temperature, and monitoring total organic carbon and differential pressure. Additional flexibility in operation is possible based on the way units are arranged such as in a parallel or series configuration. Care should be taken to avoid stagnant water conditions that could promote microorganism growth in back-up or standby units.

Microporous/Microbial Retentive Filtration

Microbial retentive membrane filters have a larger effective pore size than ultrafilters and are used to prevent the passage of microorganisms and similarly sized particles. Filters are rated by their manufacturer for the theoretical smallest size of bacterial cell they are capable of retaining. The generally accepted rating considered to retain all bacteria from a gas stream is 0.2 or 0.22 µm (absolute, not nominal rating). When used on air or gas vents for tanks and other unit operations, as well as for compressed air gases used in the regeneration of mixed bed deionization units, the membrane surface is typically hydrophobic (nonwettable by water). Areas of concern are blockage of tank vents by condensed water vapor or trapped particulate matter, which can cause mechanical damage to the tank, and concentration of microorganisms on the surface of the membrane filter, creating the potential for contamination of the tank or deionizer contents. Control measures include heat tracing and proper orientation of vent filter housings to prevent accumu-

lation of vapor condensate. Sterilization of the unit prior to initial use, and periodically thereafter, as well as regular filter changes are recommended control methods.

Microbial retentive filters are also sometimes used for water filtration in the purification systems or in distribution piping. Though microbial retentive filters, treated to be hydrophilic and having an absolute filter rating of 0.2 or 0.22 µm, are considered to be sterilizing filters for process streams and product formulations, their use in water systems should either be avoided or very carefully controlled because these units can become a source for microbial contamination. The potential exists for the release of microorganisms should the membrane filter rupture or as a result of microbial grow-through. There is also evidence that the kinds of microorganisms that proliferate in ambient water systems are of a size and possess cell surface properties that could allow their passage through these filters. Filters of smaller retention ratings (e.g., 0.1 µm) may be necessary to more definitively retain these aquatic microorganisms.

Filters that are intended to be microretentive should be sanitized and integrity tested prior to initial use and at appropriate intervals thereafter. It may also be necessary to frequently replace these filters to avoid grow-through as well as release of endotoxin from the accumulated bioburden on the upstream side of the filters. As an added measure of protection, in-line ultraviolet lamps, appropriately sized for the flow rate, may be used just upstream of microretentive filters to inactivate microorganisms prior to their capture by the filter to avoid or greatly delay filter grow-through.

Microretentive filters may be used downstream of unit operations that tend to release microorganisms or upstream of unit operations that are sensitive to microorganisms. Microretentive filters may also be used to filter water feeding the distribution system. Concerns include flow rate, membrane and seal integrity, retention capacity, and service duration. Control measures include monitoring differential pressure and endotoxin levels, proper sizing, membrane integrity testing, placing ultraviolet lamps immediately upstream, and configuring units in series to control break-through.

These hydrophilic filters can also be treated to have a positive charge on the surface of the filter media. Such charged filters can additionally be used to reduce endotoxin levels in the fluids passing through them by electrostatic attraction and adsorption. However, such applications are difficult to validate for endotoxin retention because their endotoxin retention capacity for "natural" endotoxin is difficult to gauge from purified endotoxin retention and because the amount of endotoxin in the water, or pyroburden, can be quite variable. These factors make usage duration difficult to validate.

Ultraviolet Light

The use of ultraviolet (UV) light for microbial control is discussed under the *Sanitization* heading, but its applications to chemical purification are also emerging. At wavelengths of 185 nm, UV light has demonstrated utility in the destruction of the chlorine containing disinfectants used in source water as well as for interim stages of water pretreatment. This wavelength of UV light has also been used to reduce TOC levels in recirculating distribution systems. Areas of concern include adequate UV intensity and residence time, unforeseen hyperchlorination of the source water overwhelming the photodegradation capability, release of ammonia from the photodegradation of chloramines, and unapparent UV bulb failure.

Distillation

Distillation units provide chemical and microbial purification via thermal vaporization, mist elimination, and water vapor condensation. A variety of designs are available in-

cluding single effect, multiple effect, and vapor compression. The latter two configurations are normally used in larger systems because of their generating capacity and efficiency. Distilled water systems may require less rigorous control of feed water quality than do membrane systems. Areas of concern include carry-over of gaseous impurities such as ammonia and carbon dioxide, faulty mist elimination, evaporator flooding, inadequate blowdown, stagnant water in condensers and evaporators, pump and compressor seal design, pinhole evaporator and condenser leaks, and conductivity (quality) variations during start-up and operation.

Methods of control consist of preliminary decarbonation steps, reliable mist elimination, visual or automated high water level indication, use of sanitary pumps and compressors, proper drainage during inactive periods, blow down control, on-line conductivity sensing with automated diversion of unacceptable quality water to the waste stream, and periodic integrity testing for pinhole leaks.

Storage Tanks

Storage tanks are included in water distribution systems to optimize processing equipment capacity. Storage also allows for routine maintenance while maintaining continuous supply to meet manufacturing needs. Design and operation considerations are needed to prevent or minimize the development of biofilm, to minimize corrosion, to aid in the use of chemical sanitization of the tanks, and to safeguard mechanical integrity. These considerations may include using closed tanks with smooth interiors and the ability to spray the tank headspace. This minimizes corrosion and biofilm development and aids in thermal and chemical sanitization. Storage tanks require venting to compensate for the dynamics of changing water levels. This can be accomplished with a hydrophobic microbial retentive membrane filter fitted onto an atmospheric vent. Alternatively, an automatic membrane-filtered compressed gas pressurization and venting system may be used. In both cases, rupture disks equipped with a rupture alarm device should be used as a further safeguard for the mechanical integrity of the tank. Areas of concern include microbial growth or corrosion due to nonuniform sanitization and microbial contamination from unapparent nonalarmed rupture disk failures that are caused by condensate occlusion of hydrophobic vent filters.

Distribution Systems

Distribution system configuration should allow for either the continuous flow of water in the piping by means of recirculation or should provide for the periodic flushing of nonrecirculating, dead-end, or one-way systems. Experience has shown that continuously recirculated systems are easier to maintain. Pumps should be designed to deliver fully turbulent flow conditions to facilitate thorough heat distribution (for hot water sanitized systems) as well as thorough chemical sanitant distribution. Pumps also appear to either retard the development of biofilms or force its development to be less susceptible to shearing into the water.

Components and distribution lines should be sloped and fitted with drain points so that the system can be completely drained. In stainless steel distribution systems where the water is circulated at a high temperature, dead legs and low-flow conditions should be avoided, and valved tie-in points should have length-to-diameter ratios of 6 or less. If constructed of heat tolerant plastic, this ratio should be even less to avoid cool points where biofilm development could occur. In ambient temperature distribution systems, particular care should be exercised to avoid or minimize dead legs of any length and provide for complete drainage. If the system is intended to be steam sanitized, careful sloping and low-point drainage is crucial to sanitization success.

If system drainage is intended as a microbial control strategy, it should also be configured to be dried by passage of dry compressed air or nitrogen throughout the system because drained moist piping will also support microbial proliferation. Water exiting from the distribution system should not be returned to the system.

The distribution design should include the placement of sampling valves in the storage tank and at other locations, such as in the return line of the recirculating water system. Where feasible, the primary sampling sites for water should be the valves that deliver water to the points of use. Direct connections to processes or auxiliary equipment should be designed to prevent reverse flow into the controlled water system. Hoses and heat exchangers that are attached to points of use in order to deliver water for a particular use must not degrade the water quality chemically or microbiologically. The distribution system should permit sanitization for microorganism control. The system may be continuously operated at sanitizing conditions or sanitized periodically.

INSTALLATION, MATERIALS OF CONSTRUCTION, AND COMPONENT SELECTION

Installation techniques are important because they can affect the mechanical, corrosive, and sanitary integrity of the system. Valve installation attitude should promote gravity drainage. Pipe supports should provide appropriate slopes for drainage and should be designed to support the piping adequately under worst-case thermal conditions. The methods of connecting system components including units of operation, tanks, and distribution piping require careful attention to preclude potential problems. Stainless steel welds should provide reliable joints that are internally smooth and corrosion-free. Low carbon stainless steel, compatible wire filler, where necessary, inert gas, automatic welding machines, and regular inspection and documentation help to ensure acceptable weld quality. Follow-up cleaning and passivation are important for removing contamination and corrosion products and to re-establish the passive corrosion resistant surface. Plastic materials can be fused (welded) in some cases and also require smooth, uniform internal surfaces. Adhesives should be avoided due to the potential for voids and chemical reactions. Mechanical methods of joining, such as flange fittings, require care to avoid the creation of offsets, gaps, penetrations, and voids. Control measures include good alignment, properly sized gaskets, appropriate spacing, uniform sealing force, and the avoidance of threaded fittings.

Materials of construction should be selected to be compatible with control measures such as sanitizing, cleaning, and passivating. Temperature rating is a critical factor in choosing appropriate materials because surfaces may be required to handle elevated operating and sanitization temperatures. Should chemicals or additives be used to clean, control, or sanitize the system, materials resistant to these chemicals or additives must be utilized. Materials should be capable of handling turbulent flow and elevated velocities without wear of the corrosion-resistant film such as the passive chromium oxide surface of stainless steel. The finish on metallic materials such as stainless steel, whether it is a refined mill finish, polished to a specific grit, or an electropolished treatment, should complement system design and provide satisfactory corrosion and microbial activity resistance as well as chemical sanitizability. Auxiliary equipment and fittings that require seals, gaskets, diaphragms, filter media, and membranes should exclude materials that permit the possibility of extractables, shedding, and microbial activity. Insulating materials exposed to stainless steel surfaces should be free of chlorides to avoid the phenomenon of stress corrosion cracking that can lead to system contamination and the destruction of tanks and critical system components.

Specifications are important to ensure proper selection of materials and to serve as a reference for system qualification and maintenance. Information such as mill reports for stainless steel and reports of composition, ratings, and material handling capabilities for nonmetallic substances should be reviewed for suitability and retained for reference. Component (auxiliary equipment) selection should be made with assurance that it does not create a source of contamination intrusion. Heat exchangers should be double tube sheet or concentric tube design. They should include differential pressure monitoring or utilize heat transfer medium of equal or better quality to avoid problems should leaks develop. Pumps should be of sanitary design with seals that prevent contamination of the water. Valves should have smooth internal surfaces with the seat and closing device exposed to the flushing action of water, such as occurs in diaphragm valves. Valves with pocket areas or closing devices (e.g., ball, plug, gate, globe) that move into and out of the flow area should be avoided.

SANITIZATION

Microbial control in water systems is achieved primarily through sanitization practices. Systems can be sanitized using either thermal or chemical means. Thermal approaches to system sanitization include periodic or continuously circulating hot water and the use of steam. These techniques are limited to systems that are compatible with the higher temperatures needed to achieve sanitization, such as stainless steel and some polymer formulations. Although thermal methods control biofilm development, they are not effective in removing established biofilms that could become a nutrient source for rapid biofilm regrowth after the sanitizing conditions are removed or halted. Chemical methods, where compatible, can be used on a wider variety of construction materials. These methods typically employ oxidizing agents such as halogenated compounds, hydrogen peroxide, ozone, peracetic acid, or combinations thereof. Halogenated compounds are effective sanitizers but are difficult to flush from the system and may leave biofilms intact. Compounds such as hydrogen peroxide, ozone, and peracetic acid oxidize bacteria and biofilms by forming reactive peroxides and free radicals (notably hydroxyl radicals). The short half-life of these compounds, particularly ozone, may require that it be added continuously during the sanitization process. Hydrogen peroxide and ozone rapidly degrade to water and oxygen; peracetic acid degrades to acetic acid in the presence of ultraviolet light. It is important to note that microorganisms in a biofilm can be extremely difficult to kill, even by aggressive oxidizing biocides. The less developed the biofilm, the more effective the biocidal action. Therefore, optimal biocide control is achieved by frequent biocide use that does not allow significant biofilm development between treatments.

In-line ultraviolet light at a wavelength of 254 nm can also be used to "sanitize" water in the system continuously, but these devices must be properly sized for the water flow. Such devices inactivate a high percentage of microorganisms that flow through the device but cannot be used to directly control existing biofilm upstream or downstream of the device. However, when coupled with conventional thermal or chemical sanitization technologies or located immediately upstream of a microbially retentive filter, it is most effective and can prolong the interval between system sanitizations. The use of ultraviolet light of the proper wavelength also facilitates the degradation of hydrogen peroxide and ozone, peracetic acid, and chlorinated water disinfectants.

Sanitization steps require validation to demonstrate the capability of reducing and holding microbial contamination at acceptable levels. Validation of thermal methods should include a heat distribution study to demonstrate that saniti-

zation temperatures are achieved throughout the system. Validation of chemical methods require demonstrating adequate chemical concentrations throughout the system. In addition, when the sanitization process is completed, effective removal of chemical residues must be demonstrated. The frequency of sanitization is generally dictated by the results of system monitoring. Conclusions derived from trend analysis of the microbiological data should be used as the alert mechanism for maintenance. The frequency of sanitization should be established in such a way that the system operates in a state of microbiological control and does not routinely exceed Alert Levels.

OPERATION, MAINTENANCE, AND CONTROL

A preventive maintenance program should be established to ensure that the water system remains in a state of control. The program should include (1) procedures for operating the system, (2) monitoring programs for critical quality attributes and operating conditions including calibration of critical instruments, (3) schedule for periodic sanitization, (4) preventive maintenance of components, and (5) control of changes to the mechanical system and to operating conditions.

Operating Procedures—Procedures for operating the water system and performing routine maintenance and corrective action should be written, and they should also define the point when action is required. The procedures should be well documented, detail the function of each job, assign who is responsible for performing the work, and describe how the job is to be conducted.

Monitoring Program—Critical quality attributes and operating parameters should be documented and monitored. The program may include a combination of in-line sensors or automated instruments (e.g., for TOC, conductivity, hardness, chlorine, etc.), automated or manual documentation of operational parameters (such as flow rates or pressure drop across a carbon bed, filter, or RO unit), and laboratory tests (e.g., total microbial counts). The frequency of sampling, the requirement for evaluating test results, and the necessity for initiating corrective action should be included.

Sanitization—Depending on system design and the selected units of operation, routine periodic sanitization may be necessary to maintain the system in a state of microbial control. Technologies for sanitization are described above.

Preventive Maintenance—A preventive maintenance program should be in effect. The program should establish what preventive maintenance is to be performed, the frequency of maintenance work, and how the work should be documented.

Change Control—The mechanical configuration and operating conditions must be controlled. Proposed changes should be evaluated for their impact on the whole system. The need to requalify the system after changes are made should be determined. Following a decision to modify a water system, the affected drawings, manuals, and procedures should be revised.

SAMPLING CONSIDERATIONS

Water systems should be monitored at a frequency that is sufficient to ensure that the system is in control and continues to produce water of acceptable quality. Samples should be taken from representative locations within the processing and distribution system. Established sampling frequencies should be based on system validation data and should cover critical areas including unit operation sites. The sampling plan should take into consideration the desired attributes of the water being sampled. For example, systems for *Water for Injection* because of their more critical microbiological requirements, may require a more rigorous sampling frequency.

Where possible, samples should be collected from use points using the same delivery devices, such as hoses, and procedures, such as preliminary hose or outlet flushing, as are employed for normal water use from those use points. Where use-points samples are not practical, special sampling ports may be used, but in both cases, consideration must be given to sample collection so that it accurately represents the quality attributes of the water delivered by the system. This may include sampling port or use-point sanitization and thorough flushing before a sample is taken if such practices are employed during routine water use or delivery from the system.

Samples containing chemical sanitizing agents require neutralization prior to microbiological analysis. Samples for microbiological analysis should be tested immediately or suitably protected to preserve the original microbial attributes until analysis can begin. Samples of flowing water are only indicative of the concentration of planktonic (free floating) microorganisms present in the system. Biofilm microorganisms (those attached to water system surfaces) are usually present in greater numbers and are the source of the planktonic population recovered from grab samples. Microorganisms in biofilms represent a continuous source of contamination and are difficult to directly sample and quantify. Consequently, the planktonic population is usually used as an indicator of system contamination levels and is the basis for system *Alert* and *Action Levels*. The consistent appearance of elevated planktonic levels is usually an indication of advanced biofilm development in need of remedial control. System control and sanitization are key in controlling biofilm formation and the consequent planktonic population.

CHEMICAL CONSIDERATIONS

The chemical attributes of *USP* waters prior to 1997 were specified by a series of chemistry tests for various specific and nonspecific attributes with the intent of detecting chemical species indicative of incomplete or inadequate purification. Many tests dated back to the 19th century, were nonquantitative, and represented long since outmoded analytical technologies. While these methods could have been considered barely adequate to control the quality of these waters, they nevertheless stood the test of time. This was partly because the operation of water systems was, and still is, based on on-line conductivity measurements and specifications generally thought to correlate with, or at least preclude, the failure of these archaic chemistry attribute tests.

In 1997, USP initiated a movement away from these chemical attribute tests to contemporary analytical technologies for the bulk waters *Purified Water* and *Water for Injection* The intent was to upgrade the analytical technologies without necessarily tightening the quality requirements. The two contemporary analytical technologies employed were total organic carbon (TOC) and conductivity. The TOC test replaced the test for *Oxidizable Substances* that primarily targeted organic contaminants. A multistaged *Conductivity* test which detects ionic (mostly inorganic) contaminants replaced, with the exception of the test for *Heavy Metals,* all of the inorganic chemical tests (i.e., *Ammonia, Calcium, Carbon Dioxide, Chloride, Sulfate*).

Replacing the heavy metals attribute was considered unnecessary because (a) the source water specifications (found in the NPDWR) for individual heavy metals were tighter than the empirically determined limit found in the *USP XXII Water for Injection* and *Purified Water* monograph tests (approximately 0.1 ppm), (b) contemporary water system construction materials do not leach heavy metal contaminants, and (c) test results for this attribute have uniformly been

negative—there has not been a confirmed occurrence of a singular test failure (failure of only the *Heavy Metals* test with all other attributes passing) since the current heavy metal drinking water standards have been in place. Nevertheless, since the presence of heavy metals in *Purified Water* or *Water for Injection*, however unlikely, could have dire consequences, its absence should at least be documented during new water system commissioning, validation, or through pre-1997 test results records.

The only remaining original ''inorganic'' tests not covered by the conductivity specifications were *Total Solids* and *pH. Total Solids* was considered largely redundant with the nonselective tests of conductivity and TOC for most chemical species other than silica, which could remain undetected in its colloidal form. Fortunately, colloidal silica in *Purified Water* and *Water for Injection* is easily removed by most water pretreatment steps and even if present in the water, constitutes no medical or functional hazard except under extreme and rare situations. In such extreme situations, other attribute extremes are also likely to be detected. Nevertheless, it is the user's responsibility to ensure fitness for use, so if silica is a significant component in the source water and the purification unit operations could be operated or fail in such a way as to selectively allow silica to be released into the finished water (in the absence of co-contaminants detectable by a significant conductivity response), then either silica-specific or a total solids type testing should be utilized by those few affected users to monitor and control this rather rare problem.

The *pH* attribute was eventually recognized to be redundant to the conductivity test (which included *pH* as an aspect of the test and specification), so *pH* was dropped as a separate attribute test.

The rationale used by USP to establish its conductivity specification took into consideration the conductivity contributed by the two least conductive former attributes of *Chloride* and *Ammonia,* thereby precluding their failure had those wet chemistry tests been performed. In essence, the Stage 3 conductivity specifications (see *Water Conductivity* ⟨645⟩) were established from the sum of the conductivities of contributing ions as a function of pH of chloride (from pH 5.0 to 6.2) or ammonia (from pH 6.3 to 7.0), plus the unavoidable contribution from water ions (H^+ and OH^-), dissolved atmospheric CO_2 (as HCO_3^-), and an electro-balancing quantity of either Na^+ of Cl^-, depending on the pH-induced ionic imbalance (see *Table 1*). The Stage 2 conductivity specification is the lowest value on this table, 2.1 µS/cm. The Stage 1 specifications, designed primarily for on-line measurements, were derived from summing the lowest values in each column for a series of tables similar to *Table 1*, but created for each 5° increment between 0° and 100°. For example purposes, the italicized values in *Table 1*, the conductivity data table for 25°, were summed to yield a conservative value of 1.3 µS/cm, the Stage 1 specification for a nontemperature compensated, nonatmosphere equilibrated water sample that actual had a measured temperature of 25° to 29°. Each 5° increment table was similarly treated to yield the individual values listed in the table of Stage 1 specifications (see *Water Conductivity* ⟨645⟩).

Table 1. Contributing Ion Conductivities of the Chloride–Ammonia Model as a Function of pH (in atmosphere-equilibrated water at 25°)

	Conductivity (μS/cm)						Combined	Stage 3
pH	H^+	OH^-	HCO_3^-	Cl^-	Na^+	NH_4^+	Conductivities	Limit

6.9	0.04	0.02	1.56	0	0.93	1.22	3.77	3.8
7.0	0.03	0.02	1.97	0	1.39	1.22	4.63	4.6

As mentioned above, this rather radical change to a conductivity attribute as well as the inclusion of a TOC attribute allowed on-line measurements, if desired. This was a major philosophical change for USP and allowed major savings to be realized by laboratories. The TOC and conductivity tests can also be performed "off-line" in the laboratories using collected samples, though sample collection tends to introduce opportunities for adventitious contamination that can cause false high readings. The collection of on-line data is not, however, without challenges. The essentially continuous readings tend to create voluminous amounts of data where before only a single data point was available. Contin-

uous data is excellent for understanding how a water system performs during all of its various usage and maintenance events in real time, but it tends to overwhelm quality control data systems that are designed for far less data. In such situations, the user must decide how to limit the data to be used for routine quality control purposes. Examples of acceptable approaches include using highest values for a given period, highest time-weighted average for a given period (from fixed or rolling subperiods), or values at a fixed daily time. Each approach has advantages and disadvantages relative to calculation complexity and reflection of continuous quality, so the user must decide which approach is most suitable or justifiable.

Packaged waters have presented a particular dilemma relative to the attributes of conductivity and TOC. The package itself is the source of chemicals (inorganics and organics) that leach over time into the water and can be easily detected. The irony of organic leaching from plastic packaging is that prior to the 1997 attribute changes for bulk monographed waters, when the *Oxidizable Substances* test was the only "organic contaminant" for both bulk and packaged waters, that test's insensitivity to those organic leachables rendered their presence in packaged water at high concentrations (many times the TOC specification for bulk water) virtually undetectable. Similarly, glass containers can also leach inorganics, such as sodium, which are easily detected by conductivity, but are virtually undetected by the specific wet chemistry tests, other than *pH* or *Total Solids,* included in the water monographs of that day. Fortunately, time has proven most of these leachables to be harmless at the rather significant concentrations present. Nevertheless, they effectively degrade the quality of the high-purity waters placed into these packaging system. Some packaging materials contain more leachables than others and may not be as suitable for holding water and maintaining its purity. In essence, the attributes of conductivity and TOC tend to reveal more about the packaging leachables than they do about the water's original purity. These "allowed" leachables may render the packaged versions of originally equivalent bulk water essentially unsuitable for many uses where the bulk waters are perfectly adequate.

MICROBIAL CONSIDERATIONS

The major exogenous source of microbial contamination of bulk pharmaceutical water is source or feed water. Feed water quality must, at a minimum, meet the quality attributes of *Drinking Water* for which the level of coliforms are regulated. A wide variety of other microorganisms, chiefly Gram-negative bacteria, may be present. These microorganisms may compromise subsequent purification steps. Examples of other potential exogenous sources of microbial contamination include unprotected vents, faulty air filters, backflow from contaminated outlets, drain airbreaks, and replacement activated carbon, deionizer resins, and regenerant chemicals. Sufficient care should be given to system design and maintenance in order to minimize microbial contamination from these exogenous sources.

Unit operations can be a major source of endogenous microbial contamination. Microorganisms present in feed water may adsorb to carbon beds, deionizer resins, filter membranes, and other unit operation surfaces and initiate the formation of a biofilm. In a high-purity water system, biofilm is an adaptive response by certain microorganisms to survive in this low nutrient environment. Downstream colonization can occur when microorganisms are sloughed off existing biofilm colonized surfaces and carried to other areas of the water system. Microorganisms may also attach to suspended particles such as carbon bed fines or fractured resin particles. When they become planktonic, they serve as

a source of contamination to subsequent purification equipment (compromising its functionality) and to distribution systems.

Another source of endogenous microbial contamination is the distribution system itself. Microorganisms can colonize pipe surfaces, valves, and other areas where they proliferate, forming a biofilm and becoming a continuous source of microbial contamination.

Endotoxins are lipopolysaccharides from the cell envelope that is external to the cell wall of Gram-negative bacteria. Gram-negative bacteria that form biofilms can become a source of endotoxins in pharmaceutical waters. Endotoxins may either be associated with living microorganisms or fragments of dead microorganisms, or they may be free molecules. The free form of endotoxins may be released from cell surfaces or biofilms that colonize the water system, or they may enter the water system via the feed water.

Endotoxin levels may be minimized by controlling the introduction of free endotoxins and microorganisms in the feed water and minimizing microbial proliferation in the system. This may be accomplished through the normal exclusion or removal action afforded by various unit operations within the treatment system as well as through system sanitization. Other control methods include the use of ultrafilters or charge-modified filters, either in-line or at the point of use. The presence of endotoxins may be monitored as described in the general test chapter *Bacterial Endotoxins Test* ⟨85⟩.

ENUMERATION CONSIDERATIONS

The objective of a water system microbiological monitoring program is to provide sufficient information to control and assess the microbiological quality of the water produced. Product quality requirements should dictate water quality needs. An appropriate level of control may be maintained by using data trending techniques and, if necessary, limiting specific contraindicated microorganisms. Consequently, it may not be necessary to detect all of the microorganisms present in a given sample. The monitoring program and methodology should indicate adverse trends and detect microorganisms that are potentially harmful to the finished product, process, or consumer. Final selection of method variables should be based on the individual requirements of the system being monitored.

It should be recognized that there is no single method that is capable of detecting all of the potential microbial contaminants of a water system. The methods used for microbial monitoring should be capable of isolating the numbers and types of organisms that have been deemed significant relative to system control and product impact for each individual system. Several criteria should be considered when selecting a method to monitor the microbial content of a pharmaceutical water system. These include method sensitivity, range of organisms recovered, sample throughput, incubation period, cost, and technical complexity. An alternative consideration to the use of the classical "culture" approaches is a sophisticated instrumental or hybrid approach that may yield more timely results. However, care must be exercised in selecting such an alternative approach to ensure that it has both sensitivity and correlation to classical culture approaches, which are generally considered to be the "gold standard" of microbial enumeration.

The Classical Culture Approach

Classical culture approaches for microbial testing of water include but are not limited to pour plates, spread plates, membrane filtration, and most probable number (MPN) tests. These methods are generally easy to perform, are less expensive, and provide excellent sample processing throughput. Method sensitivity can be increased via the use of larger sample sizes. This strategy is used in the mem-

brane filtration method. Culture approaches are further defined by the type of medium used in combination with the incubation temperature and duration. This combination should be selected according to the monitoring needs presented by a specific water system as well as its ability to recover microorganisms that could have a detrimental effect on the product or process.

There are two basic forms of media available for traditional microbiological analysis: ''high'' nutrient and ''low'' nutrient. High-nutrient media are intended as general media for the isolation and enumeration of heterotrophic or ''copiotrophic'' bacteria. Low-nutrient media may be beneficial for isolating slow growing ''oligotrophic'' bacteria and bacteria that require lower levels of nutrients to grow optimally. Low-nutrient and high-nutrient cultural approaches may be concurrently used, especially during the validation of a water system, as well as periodically thereafter, in order to determine if any additional numbers or types of bacteria are present so that their impact on the end use may be assessed. Additionally, the efficacy of system controls and sanitization on these slower growing bacteria can also be assessed.

Duration and temperature of incubation are also critical aspects of a microbiological test method. Classical methodologies using high nutrient media are typically incubated at 30° to 35° for 48 to 72 hours. Because of the flora in certain water systems, incubation at lower temperatures (e.g., 20° to 25°) for longer periods (e.g., 5 to 7 days) can recover higher microbial counts when compared to classical methods. Low-nutrient media are designed for these lower temperature and longer incubation conditions (sometimes as long as 14 days to maximize recovery of very slow growing oligotrophs or sanitant injured microorganisms), but even high-nutrient media can sometimes increase their recovery with these longer and cooler incubation conditions. Whether or not a particular system needs to be monitored using high- or low-nutrient media with higher or lower incubation temperatures or shorter or longer incubation times should be determined during or prior to system validation and periodically reassessed as the microbial flora of a new water system gradually establish a steady state relative to its routine maintenance and sanitization procedures. The establishment of a ''steady state'' can take months or even years and can be perturbed by a change in use patterns, a change in routine and preventative maintenance or sanitization procedures, and frequencies or any type of system intrusion, such as for component replacement, removal, or addition. The decision to use longer incubation periods should be made after considering the need for timely information and the type of corrective actions required when an *Alert* or *Action Level* is exceeded.

The advantages gained by incubating for longer times, namely recovery of injured microorganisms, slow growers, or more fastidious microorganisms, should be balanced against the need to have a timely investigation and to take corrective action, as well as the ability of these microorganisms to detrimentally affect products or processes. In no case, however, should incubation at 30° to 35° be less than 48 hours or less than 96 hours at 20° to 25°.

"Instrumental" Approaches

Examples of instrumental approaches include microscopic visual counting techniques (e.g., epifluorescence and immunofluorescence) and similar automated laser scanning approaches and radiometric, impedometric, and biochemically based methodologies. These methods all possess a variety of advantages and disadvantages. One advantage is their precision and accuracy. In general, instrument approaches often have a shorter lead time for obtaining results, which facilitates timely system control. This advantage, however, is often counterbalanced by limited sample processing throughput due to extended sample collection time, costly and labor-intensive sample processing, or other instrument and sensitivity limitations.

Instrumental approaches are typically destructive because further isolate manipulation for characterization purposes is precluded. Generally, some form of microbial isolate characterization may be a required element of water system monitoring. Consequently, culturing approaches have traditionally been preferred over instrumental approaches because they offer a balance of desirable test attributes and post-test capabilities.

Suggested Methodologies

The following general methods were originally derived from *Standard Methods for the Examination of Water and Wastewater,* 17th Edition, American Public Health Association, Washington, DC 20005. Even though this publication has undergone several revisions since its first citation in this *USP* chapter, the methods are still considered appropriate for establishing trends in the number of colony-forming units observed in the routine microbiological monitoring of pharmaceutical waters. It is recognized, however, that other combinations of media and incubation time and temperature may occasionally or even consistently result in higher numbers of colony-forming units being observed.

The extended incubation periods that are usually required by some of the alternative methods available offer disadvantages that may outweigh the advantages of the higher counts that may be obtained. The somewhat higher baseline counts that might be observed using alternate cultural conditions would not necessarily have greater utility in detecting an excursion or a trend. In addition, some alternate cultural conditions using low-nutrient media tend to lead to the development of microbial colonies that are much less differentiated in colonial appearance, an attribute that microbiologists rely on when selecting representative microbial types for further characterization. It is also ironical that the nature of some of the slow growers and the extended incubation times needed for their development into visible colonies may also lead to those colonies being largely nonviable, which limits their further characterization and precludes their subculture and identification.

Methodologies that can be suggested as generally satisfactory for monitoring pharmaceutical water systems are as follows. However, it must be noted that these are not referee methods nor are they necessarily optimal for recovering microorganisms from all water systems. The users must decide which methodologies are best for monitoring their water systems and recovering certain contraindicated species they may have specified.

Drinking Water:	POUR PLATE METHOD OR MEMBRANE FILTRATION METHOD[1]
	Sample Volume—1.0 mL minimum[2]
	Growth Medium—Plate Count Agar[3]
	Incubation Time—48 to 72 hours minimum
	Incubation Temperature—30° to 35°
Purified Water:	POUR PLATE OR MEMBRANE FILTRATION METHOD[1]
	Sample Volume—1.0 mL minimum[2]
	Growth Medium—Plate Count Agar[3]
	Incubation Time—48 to 72 hours minimum
	Incubation Temperature—30° to 35°
Water for Injection:	MEMBRANE FILTRATION METHOD[1]
	Sample Volume—100 mL minimum[2]
	Growth Medium—Plate Count Agar[3]
	Incubation Time—48 to 72 hours minimum
	Incubation Temperature—30°C to 35°C

[1] A membrane filter with an absolute rating of 0.45 µm is generally considered preferable even though the cellular width of some of the bacteria in the sample may be narrower than this. The efficiency of the filtration process still allows the retention of a very high percentage of these smaller cells and is adequate for this application. Filters with smaller porosity ratings may be used if desired, but for a variety of reasons the ability of the retained cells to develop into visible colonies may be compromised, so count accuracy must be verified by a reference approach.

[2] When colony counts are low to undetectable using the indicated minimum sample volume, it is generally recognized that a larger sample volume should be tested in order to gain better assurance that the resulting colony count is more statistically representative. The sample volume to consider testing is dependent on the user's need to know (which is related to the established *Alert* and *Action Levels* and the water system's microbial control capabilities) and the statistical reliability of the resulting colony count. In order to test a larger sample volume, it may be necessary to change testing techniques, e.g., changing from a Pour Plate to a Membrane Filtration approach. Nevertheless, in a very low to nil count scenario, a maximum sample volume of around 250 to 300 mL is usually considered a reasonable balance of sample collecting and processing ease and increased statistical reliability. However, when sample volumes larger than about 2 mL are needed, they can only be processed using the Membrane Filtration method.

[3] Also known as Standard Methods Agar, Standard Methods Plate Count Agar, or TGYA, this medium contains Tryptone (pancreatic digest of casein), Glucose and Yeast Extract.

IDENTIFICATION OF MICROORGANISMS

Identifying the isolates recovered from water monitoring methods may be important in instances where specific waterborne microorganisms may be detrimental to the products or processes in which the water is used. Microorganism information such as this may also be useful when identifying the source of microbial contamination in a product or process. Often a limited group of microorganisms are routinely recovered from a water system. After repeated recovery and characterization, an experienced microbiologist may become proficient at their identification based on only a few traits such as colonial morphology and staining characteristics. This level of characterization may be adequate for most situations.

ALERT AND ACTION LEVELS

Water systems should be microbiologically monitored to confirm that they continue to operate within their design specifications and produce water of acceptable quality. Monitoring data may be compared to established process parameters or product specifications.

A refinement to the use of process parameters and product specifications is the establishment of *Alert* and *Action Levels,* which signal a shift in process performance. *Alert* and *Action Levels* are distinct from process parameters and product specifications in that they are used for monitoring and control rather than accept or reject decisions. *Alert Levels* are levels, events, or ranges that, when exceeded, indicate that a process may have drifted from its normal operating condition. *Alert Levels* constitute a warning and do not necessarily require a corrective action. *Action Levels* are levels, events, or ranges that, when exceeded, indicate that a process has drifted from its normal operating range. Exceeding an *Action Level* indicates that corrective action should be taken to bring the process back into its normal operating range. *Alert* and *Action Levels* are established within process and product specification tolerances and are based on a combination of technical and product related considerations. Consequently, exceeding an *Alert* or *Action Level* does not imply that product quality has been compromised.

Technical considerations used to establish *Alert* and *Action Levels* should include a review of equipment design specifications to ensure that the purification equipment is capable of achieving the required level of purity. In addition, samples should be collected and analyzed over a period of time to develop data reflecting normal water quality trends. Historical or statistically based levels can be established using the above data. Levels established in this way measure process performance and are independent of product concerns.

Product-related *Alert* and *Action Levels* should represent both product quality concerns and the ability to effectively manage the purification process. These levels are typically based on a review of process data and an assessment of pro-

duct sensitivity to chemical and microbiological contamination. The assessment of product susceptibility might include preservative efficacy, water activity, pH, etc. The levels should be set such that, when exceeded, product quality is not compromised. Monitoring data should be analyzed on an ongoing basis to ensure that the process continues to perform within acceptable limits. An analysis of data trends is often used to evaluate process performance. This information can be used to predict departures from established operating parameters, thereby signaling the need for appropriate preventative maintenance.

It should be recognized that the microbial *Alert* and *Action Levels* established for any pharmaceutical water system are necessarily linked to the monitoring method chosen. Using the suggested methodologies above, generally considered maximum *Action Levels* are 500 colony-forming units (cfu) per mL for *Drinking Water,* 100 cfu per mL for *Purified Water* and 10 cfu per 100 mL for *Water for Injection.* However, if a given water system controls microorganisms much more tightly than these levels, appropriate *Alert* and *Action Levels* should be lower to truly indicate when water systems may be starting to trend out of control. It is appropriate that, where possible, these in-process control parameters should be established well below microbial levels that could be problematic for products and processes where used.

It should be emphasized that these in-process control guidelines are not intended to be totally inclusive for every situation where ingredient waters are employed. For example, Gram-negative microorganisms are not excluded from ingredient waters, nor is the presence of Gram-negative microorganisms prohibited in *Drinking Water* in the Federal Regulations. The reason for this is that these microorganisms are ubiquitous to the aqueous environment and their exclusion would likely require a sterilization process that would not be appropriate or feasible in many manufacturing scenarios. However, there are situations where they might not be tolerated in certain products, such as some topical products intended for use on broken skin or in some oral dosage forms. It is, therefore, incumbent upon the manufacturer to supplement the general in-process control guidelines to fit each particular manufacturing and product use situation.■2S (*USP27*)

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

***N,N*-Dimethylformamide Diethyl Acetal.** This new reagent is used in *Standard solution 2* of *Test 1* in the *Related compounds* test under *Flumazenil*, which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—39640-3

Add the following:

■***N,N*-Dimethylformamide Diethyl Acetal—147.22** [*1188-33-6*]—Use a suitable grade.[10] ■2S (*USP27*)

BRIEFING

Methyl Yellow. It is proposed to add this new reagent, which is used to prepare the *Methyl Yellow TS* employed in the *Assay* test in the monograph for *Cetylpyridinium Chloride Lozenges*.

(HDQ: M. Marques) RTS—40011-1

Add the following:

■**Methyl Yellow** *(p-Dimethylaminoazobenzene),* $C_{14}H_{15}N_3$—**225.3** [*60-11-7*]—Use a suitable grade. ■2S (*USP27*)

BRIEFING

Sodium Hydrogen Sulfate (*Sodium Bisulfate*)**.** This new reagent is used as a component of the *Mobile phase* in the test for *Related compounds* in the proposed monograph for *Mefloquine Hydrochloride*, which appears elsewhere in this number of *PF*.

(HDQ: M. Marques) RTS—38976-1

Add the following:

■**Sodium Hydrogen Sulfate** (*Sodium Bisulfate*), $NaHSO_4$—**120.06** [*7681-38-1*]—Freely soluble in water; very soluble in boiling water. It decomposes in alcohol into sodium sulfate and free sulfuric acid. Use a suitable reagent grade.

Melting point ⟨741⟩: about 315°. ■2S (*USP27*)

BRIEFING

Tuberculin, Purified Protein Derivative. This new reagent is used as a component of the *Tuberculin solution* in the test for *Tuberculin sensitivity* in the proposed monograph *BCG Live*, which appears elsewhere in this number of *PF*.

(VVI: L. Bhattacharyya) RTS—40080-1

Add the following:

■**Tuberculin, Purified Protein Derivative** *(Tuberculin PPD)*—Derived from the human strain of *Mycobacterium tuberculosis*, and available either as a solution or as a lyophilized powder. For lyophilized powder, reconstitute according to the manufacturer's instructions using the diluent provided by the manufacturer. Solutions may contain a stabilizer and a preservative. One Tuberculin Unit (TU) is equivalent to 0.02 µg of Tuberculin PPD. ■2S (*USP27*)

Test Solutions

BRIEFING

Methyl Yellow TS, *USP 26* page 2529 and page 3012 of the *First Supplement*. It is proposed to update the preparation of this solution employed in the *Assay* test in the monograph for *Cetylpyridinium Chloride Lozenges*.

(HDQ: M. Marques) RTS—40011-1

Change to read:

Methyl Yellow TS~~— Dilute with alcohol a commercially available stock solution of methyl yellow in alcohol[S6] to obtain a solution having a concentration of 0.10 mg per mL.~~

■Prepare a solution containing 0.10 mg per mL in alcohol. ■2S (*USP27*)

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 26* page 2540, page 3179 of the *Second Supplement*, and page 1262 of *PF* 29(4) [Mar.–Apr. 2003].

(HDQ) RTS—39903-2; 39903-3

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Change to read:	
Acepromazine Maleate Tablets	~~W~~ ■T, ■1S (*USP27*) LR
Change to read:	
Acetaminophen, Aspirin, and Caffeine Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Acetazolamide Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Acetohexamide Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Albuterol Tablets	~~W~~ ■T, ■1S (*USP27*) LR
Add the following:	
■Alendronate Sodium Tablets	T ■1S (*USP27*)
Change to read:	
Allopurinol Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Alumina and Magnesia Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Alumina, Magnesia, and Calcium Carbonate Tablets	~~W~~ ■T ■1S (*USP27*)
Change to read:	
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets	~~W~~ ■T ■1S (*USP27*)
Add the following:	
■Benazepril Tablets	W ■1S (*USP27*)
Add the following:	
■Bisoprolol Fumarate and Hydrochlorothiazide Tablets	W ■1S (*USP27*)
Add the following:	
■Black Cohosh Tablets	T, LR ■1S (*USP27*)
Add the following:	
■Desogestrel and Ethinyl Estradiol Tablets	W ■1S (*USP27*)
Add the following:	
■Fluoxetine Capsules, Delayed-Release	T ■1S (*USP27*)
Add the following:	
■Gabapentin Capsules	W ■1S (*USP27*)
Add the following:	
■Ginkgo Capsules	T, LR ■1S (*USP27*)
Add the following:	
■Ginkgo Tablets	T, LR ■1S (*USP27*)

Monograph Title	*Container Specification*
Add the following:	
■Irbesartan Tablets	W■1S (*USP27*)
Add the following:	
■Irbesartan and Hydrochlorothiazide Tablets	W■1S (*USP27*)
Add the following:	
■Isosorbide Mononitrate Tablets	T■2S (*USP27*)
Add the following:	
■Isosorbide Mononitrate Tablets, Extended-Release	T■2S (*USP27*)
Add the following:	
■Isradipine Capsules	T■1S (*USP27*)
Add the following:	
■Kava Capsules	T, LR■1S (*USP27*)
Add the following:	
■Kava Tablets	T, LR■1S (*USP27*)
Add the following:	
■Loratadine Tablets	T■1S (*USP27*)
Add the following:	
■Misoprostol Tablets	T■1S (*USP27*)
Add the following:	
■Naratriptan Tablets	T■1S (*USP27*)
Add the following:	
■Norgestimate and Ethinyl Estradiol Tablets	W■1S (*USP27*)
Add the following:	
Oxaprozin Tablets	T, LR
Add the following:	
■Paroxetine Hydrochloride Tablets	W■1S (*USP27*)
Add the following:	
■Quinapril Tablets	W■1S (*USP27*)
Add the following:	
■Valsartan Capsules	T, LR■1S (*USP27*)
Add the following:	
■Valsartan and Hydrochlorothiazide Tablets	W■1S (*USP27*)

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 26* page 2546, page 3179 of the *Second Supplement*, page 5310 of *PF* 23(6) [Nov.–Dec. 1997], page 7017 of *PF* 24(5) [Sept.–Oct. 1998], page 8282 of *PF* 25(3) [May–June 1999], page 8589 of *PF* 25(4) [July–Aug. 1999], page 8917 of *PF* 25(5) [Sept.–Oct. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 504 of *PF* 26(2) [Mar.–Apr. 2000], page 837 of *PF* 26(3) [May–June 2000], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1385 of *PF* 26(5) [Sept.–Oct. 2000], page 1907 of *PF* 27(1) [Jan.–Feb. 2001], page 2281 of *PF* 27(2) [Mar.–Apr. 2001], page 2839 of *PF* 27(4) [July–Aug. 2001], page 3374 of *PF* 27(6) [Nov.–Dec. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 853 of *PF* 28(3) [May–June 2002], page 1236 of *PF* 28(4) [July–Aug. 2002], page 1542 of *PF* 28(5) [Sept.–Oct. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 509 of *PF* 29(2) [Mar.–Apr. 2003], page 812 of *PF* 29(3) [May–June 2003], and page 1262 of *PF* 29(4) [July–Aug. 2003].

(HDQ) RTS—37377-1; 38976-1; 39640-5; 40038-1; 40048-1; 40196-1

Add the following:

■**Calcitriol:** White or almost white crystals. Freely soluble in alcohol; soluble in ether and in fatty oils; practically insoluble in water. It is sensitive to air, heat, and light.■2S (*USP27*)

Add the following:

■**Camphorated Phenol Topical Gel:** Clear, colorless, oily gel.■2S (*USP27*)

Add the following:

■**Clopidogrel Bisulfate:** White to off-white powder. Freely soluble in water and in methanol; practically insoluble in ether.■2S (*USP27*)

In-Process Revision

Add the following:

■**Flumazenil:** White to off-white powder. Slightly soluble in acidic aqueous solutions; practically insoluble in water.■2S (*USP27*)

Add the following:

■**Mefloquine Hydrochloride:** White or slightly yellow, crystalline powder. Freely soluble in methanol; soluble in alcohol; very slightly soluble in water.■2S (*USP27*)

Add the following:

■**Metronidazole Benzoate:** White to slightly yellow, crystalline powder. Freely soluble in methylene chloride; soluble in acetone; slightly soluble in alcohol; very slightly soluble in ethyl ether; practically insoluble in water.■2S (*USP27*)

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

Ketamine Hydrochloride—See PF Vol. 29 No. 4, page 1039.
Lamivudine—See PF Vol. 29 No. 2, page 419.
Leuprolide Acetate—See PF Vol. 28 No. 5, page 1412.
Leuprolide Acetate Injection—See PF Vol. 25 No. 5, page 8722.
Levocarnitine—See PF Vol. 28 No. 1, page 71.
Levodopa Capsules—See PF Vol. 29 No. 3, page 633.
Levothyroxine Sodium Tablets—See PF Vol. 29 No. 3, page 634.
Lindane—See PF Vol. 29 No. 3, page 635.
Lindane Cream—See PF Vol. 29 No. 3, page 635.
Lindane Lotion—See PF Vol. 29 No. 3, page 635.
Lindane Shampoo—See PF Vol. 29 No. 3, page 636.
Lipid Injectable Emulsion—See PF Vol. 29 No. 2, page 421.
Loratadine—See PF Vol. 29 No. 4, page 1041.
Loratadine Oral Solution—See PF Vol. 29 No. 4, page 1043.
Loratadine Tablets—See PF Vol. 29 No. 4, page 1045.
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution—See PF Vol. 26 No. 4, page 1050.
Magnesium Oxide—See PF Vol. 29 No. 4, page 1047.
Mangafodipir Trisodium—See PF Vol. 29 No. 4, page 1047.
Mangafodipir Trisodium Injection—See PF Vol. 29 No. 4, page 1048.
Manganese Gluconate—See PF Vol. 29 No. 3, page 636.
Mannitol—See PF Vol. 27 No. 5, page 3017.
Mannitol Injection—See PF Vol. 28 No. 1, page 73.
Mecamylamine Hydrochloride—See PF Vol. 28 No. 6, page 1817.
Mecamylamine Hydrochloride Tablets—See PF Vol. 28 No. 2, page 322.
Mechlorethamine Hydrochloride—See PF Vol. 29 No. 3, page 636.
Megestrol Acetate Oral Suspension—See PF Vol. 29 No. 1, page 80.
Melphalan Tablets—See PF Vol. 29 No. 3, page 637.
Mephobarbital Tablets—See PF Vol. 26 No. 1, page 178.
Mercaptopurine Tablets—See PF Vol. 29 No. 4, page 1049.
Methamphetamine Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1050.
Methenamine Hippurate Tablets—See PF Vol. 29 No. 4, page 1050.
Metronidazole Benzoate—See PF Vol. 25 No. 2, page 7747.
Mexiletine Hydrochloride Capsules—See PF Vol. 29 No. 3, page 638.
Miconazole Nitrate Cream—See PF Vol. 29 No. 4, page 1051.
Milrinone—See PF Vol. 27 No. 2, page 2175.
Misoprostol—See PF Vol. 26 No. 5, page 1304.
Misoprostol Dispersion—See PF Vol. 28 No. 3, page 772.
Misoprostol Tablets—See PF Vol. 26 No. 5, page 1310.
Mitomycin—See PF Vol. 29 No. 4, page 1052.
Mitomycin for Injection—See PF Vol. 29 No. 4, page 1053.
Molindone Hydrochloride Tablets—See PF Vol. 24 No. 1, page 5461.
Morphine Sulfate Extended-Release Capsules—See PF Vol. 28 No. 6, page 1822.
Nabumetone Tablets—See PF Vol. 29 No. 1, page 82.
Naltrexone Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1053.
Naratriptan Hydrochloride—See PF Vol. 29 No. 3, page 638.
Naratriptan Tablets—See PF Vol. 29 No. 1, page 84.
Nevirapine—See PF Vol. 29 No. 4, page 1054.
Niacin—See PF Vol. 29 No. 4, page 1056.
Nimodipine—See PF Vol. 29 No. 4, page 1057.
Ammonia N 13 Injection—See PF Vol. 29 No. 3, page 641.
Norgestimate—See PF Vol. 29 No. 2, page 423.
Norgestimate and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 1, page 87.
Nystatin—See PF Vol. 28 No. 4, page 1271.
Nystatin Cream—See PF Vol. 28 No. 1, page 134.
Nystatin Lozenges—See PF Vol. 28 No. 1, page 135.
Nystatin Ointment—See PF Vol. 28 No. 1, page 136.
Nystatin Topical Powder—See PF Vol. 28 No. 1, page 136.
Nystatin Oral Suspension—See PF Vol. 28 No. 1, page 136.
Nystatin Tablets—See PF Vol. 28 No. 1, page 137.
Nystatin Vaginal Inserts—See PF Vol. 29 No. 3, page 641.
Nystatin Vaginal Tablets—See PF Vol. 29 No. 3, page 642.
Nystatin and Triamcinolone Acetonide Cream—See PF Vol. 28 No. 1, page 137.
Nystatin and Triamcinolone Acetonide Ointment—See PF Vol. 28 No. 1, page 138.
Octinoxate—See PF Vol. 29 No. 3, page 642.
Omeprazole Delayed-Release Capsules—See PF Vol. 29 No. 2, page 424.
Ondansetron Oral Solution—See PF Vol. 26 No. 1, page 34.
Orphenadrine Citrate—See PF Vol. 29 No. 1, page 94.
Orphenadrine Citrate Injection—See PF Vol. 29 No. 1, page 95.
Oxandrolone—See PF Vol. 28 No. 6, page 1835.
Oxaprozin—See PF Vol. 29 No. 4, page 1059.
Oxaprozin Tablets—See PF Vol. 29 No. 4, page 1061.
Oxybutynin Chloride—See PF Vol. 29 No. 3, page 642.
Oxycodone and Acetaminophen Capsules—See PF Vol. 29 No. 3, page 645.
Oxycodone and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 645.
Oxycodone Terephthalate—See PF Vol. 29 No. 3, page 645.
Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Inserts—See PF Vol. 29 No. 3, page 646.
Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Tablets—See PF Vol. 29 No. 3, page 646.
Water O 15 Injection—See PF Vol. 27 No. 2, page 2182.
Paricalcitol—See PF Vol. 29 No. 3, page 647.
Paricalcitol Injection—See PF Vol. 29 No. 3, page 649.
Paroxetine Hydrochloride—See PF Vol. 29 No. 1, page 100.
Paroxetine Tablets—See PF Vol. 29 No. 3, page 653.
Pentazocine and Acetaminophen Tablets—See PF Vol. 28 No. 6, page 1838.
Pentobarbital—See PF Vol. 29 No. 3, page 655.
Pentobarbital Sodium—See PF Vol. 29 No. 3, page 657.
Petrolatum—See PF Vol. 28 No. 2, page 569.
White Petrolatum—See PF Vol. 28 No. 2, page 570.
Phenindamine Tartrate—See PF Vol. 25 No. 3, page 8063.
Phenyltoloxamine Dihydrogen Citrate—See PF Vol. 29 No. 4, page 1062.
Poloxalene—See PF Vol. 29 No. 2, page 429.
Potassium Chloride—See PF Vol. 29 No. 4, page 1064.
Potassium Chloride Extended-Release Capsules—See PF Vol. 22 No. 6, page 3043.
Povidone—See PF Vol. 29 No. 4, page 1064.
Procainamide Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 1, page 109.
Propafenone Hydrochloride—See PF Vol. 29 No. 3, page 659.
Propantheline Bromide—See PF Vol. 29 No. 2, page 430.
Propantheline Bromide Tablets—See PF Vol. 29 No. 2, page 431.
Propofol—See PF Vol. 28 No. 6, page 1854.
Propoxyphene Hydrochloride—See PF Vol. 29 No. 3, page 660.
Propoxyphene Napsylate—See PF Vol. 29 No. 3, page 662.

Propoxyphene Napsylate and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 663.
Protamine Sulfate Injection—See PF Vol. 29 No. 4, page 1065.
Pseudoephedrine Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 4, page 1065.
Quinapril Hydrochloride—See PF Vol. 29 No. 4, page 1068.
Quinapril Tablets—See PF Vol. 29 No. 4, page 1071.
Ranitidine Oral Solution—See PF Vol. 28 No. 2, page 360.
Reserpine Tablets—See PF Vol. 29 No. 4, page 1074.
Rifampin and Isoniazid Capsules—See PF Vol. 28 No. 6, page 1862.
Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets—See PF Vol. 29 No. 1, page 112.
Rimantadine Hydrochloride—See PF Vol. 29 No. 4, page 1074.
Rimantadine Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1076.
Saquinavir Capsules—See PF Vol. 27 No. 2, page 2197.
Sevoflurane—See PF Vol. 27 No. 3, page 2577.
Shark Liver Oil—See PF Vol. 26 No. 6, page 1643.
Sildenafil Citrate—See PF Vol. 24 No. 6, page 7182.
Sildenafil Tablets—See PF Vol. 24 No. 6, page 7184.
Simethicone—See PF Vol. 29 No. 4, page 1078.
Simvastatin Tablets—See PF Vol. 29 No. 2, page 437.
Sodium Bicarbonate—See PF Vol. 28 No. 5, page 1446.
Sodium Chloride—See PF Vol. 20 No. 5, page 7991.
Monobasic Sodium Phosphate—See PF Vol. 29 No. 4, page 1078.
Sorbitol Solution—See PF Vol. 29 No. 4, page 1078.
Sotalol Hydrochloride—See PF Vol. 29 No. 3, page 663.
Sotalol Hydrochloride Tablets—See PF Vol. 29 No. 3, page 666.
Spironolactone—See PF Vol. 29 No. 3, page 668.
Spironolactone Tablets—See PF Vol. 29 No. 4, page 1080.
Spironolactone Oral Suspension—See PF Vol. 24 No. 2, page 5813.
Spironolactone and Hydrochlorothiazide Oral Suspension—See PF Vol. 24 No. 2, page 5814.
Spironolactone and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 669.
Topical Starch—See PF Vol. 29 No. 3, page 669.
Sterile, Single-Use Plastic Large-Volume Containers for Human Blood and Blood Components—See PF Vol. 23 No. 5, page 4651.
Triple Sulfa Vaginal Inserts—See PF Vol. 29 No. 3, page 669.
Triple Sulfa Vaginal Tablets—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Injection—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Oral Suspension—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Tablets—See PF Vol. 29 No. 3, page 670.
Sulfasalazine Delayed-Release Tablets—See PF Vol. 29 No. 3, page 670.
Sumatriptan—See PF Vol. 29 No. 1, page 116.
Sumatriptan Nasal Spray—See PF Vol. 29 No. 1, page 119.
Sumatriptan Succinate—See PF Vol. 27 No. 5, page 3157.
Terazosin Hydrochloride—See PF Vol. 29 No. 1, page 121.
Terbutaline Sulfate Inhalation Aerosol—See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection—See PF Vol. 26 No. 3, page 756.
Theophylline Syrup—See PF Vol. 27 No. 1, page 1819.
Thiacetarsamide—See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection—See PF Vol. 29 No. 1, page 127.
Tobramycin Inhalation Solution—See PF Vol. 29 No. 2, page 438.
Triamterene Capsules—See PF Vol. 29 No. 3, page 671.
Triamterene and Hydrochlorothiazide Capsules—See PF Vol. 29 No. 3, page 672.
Triamterene and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 672.
Trichlorfon—See PF Vol. 26 No. 6, page 1576.
Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 3, page 672.
Trimethoprim—See PF Vol. 29 No. 4, page 1080.
Unithiol—See PF Vol. 25 No. 2, page 7752.
Urea C for Oral Solution—See PF Vol. 29 No. 2, page 441.
Urofollitropin—See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection—See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate—See PF Vol. 24 No. 3, page 6180.
Ursodiol—See PF Vol. 29 No. 1, page 128.
Valproic Acid—See PF Vol. 29 No. 3, page 673.
Valproic Acid Injection—See PF Vol. 26 No. 4, page 939.
Valsartan—See PF Vol. 29 No. 3, page 673.
Valsartan Capsules—See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 4, page 1081.
Vecuronium Bromide—See PF Vol. 28 No. 6, page 1886.
Vecuronium Bromide for Injection—See PF Vol. 25 No. 4, page 8449.
Verteporfin for Injection—See PF Vol. 29 No. 3, page 677.
Vitamin E—See PF Vol. 27 No. 5, page 3159.
Water for Hemodialysis—See PF Vol. 29 No. 3, page 680.
Water for Injection—See PF Vol. 29 No. 3, page 679.
Bacteriostatic Water for Injection—See PF Vol. 29 No. 4, page 1084.
Sterile Water for Inhalation—See PF Vol. 29 No. 4, page 1085.
Sterile Water for Injection—See PF Vol. 29 No. 4, page 1086.
Sterile Water for Irrigation—See PF Vol. 29 No. 4, page 1087.
Purified Water—See PF Vol. 29 No. 3, page 680.
Sterile Purified Water—See PF Vol. 29 No. 4, page 1088.
Yttrium 90 Ibritumomab Tiuxetan Injection—See PF Vol. 29 No. 3, page 681.
Zileuton—See PF Vol. 29 No. 2, page 447.
Zinc Gluconate—See PF Vol. 29 No. 3, page 683.

EXCIPIENTS

Excipients, USP and NF Excipients, Listed by Category—See PF Vol. 21 No. 5, page 1258; PF Vol. 25 No. 5, page 8887; PF Vol. 28 No. 3, page 796; PF Vol. 28 No. 4, page 1206 and 1273; PF Vol. 28 No. 6, page 1891; PF Vol. 29 No. 1, page 135; PF Vol. 29 No. 2, page 450; PF Vol. 29 No. 3, page 684; PF Vol. 29 No. 4, page 1088.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨1⟩ Injections—See PF Vol. 29 No. 3, page 707.
⟨11⟩ USP Reference Standards—See PF Vol. 23 No. 6, page 5180; PF Vol. 24 No. 5, page 6925; PF Vol. 25 No. 4, page 8561; PF Vol. 25 No. 5, page 8893; PF Vol. 26 No. 1, page 218; PF Vol. 26 No. 2, page 471; PF Vol. 26 No. 3, page 793; PF Vol. 26 No. 4, page 1101; PF Vol. 26 No. 5, page 1369; PF Vol. 27 No. 1, page 1832; PF Vol. 27 No. 2, page 2268; PF Vol. 27 No. 4, page 2806; PF Vol. 27 No. 5, page 3071; PF Vol. 27 No. 6, page 3348; PF Vol. 28 No. 2, page 433; PF Vol. 28 No. 3, page 839; PF Vol. 28 No. 4, page 1224; PF Vol. 28 No. 5, page 1468; PF Vol. 28 No. 6, page 1913; PF Vol. 29 No. 1, page 163; PF Vol. 29 No. 2, page 483; PF Vol. 29 No. 3, page 710; PF Vol. 29 No. 4, page 1137.

Chemical Tests and Assays

IDENTIFICATION TESTS

⟨197⟩ Spectrophotometric Identification Test—See PF Vol. 29 No. 3, page 711.

In-Process Revision

LIMIT TESTS

⟨231⟩ Heavy Metals—See PF Vol. 27 No. 3, page 2619.
⟨267⟩ Porosimetry by Mercury Intrusion—See PF Vol. 29 No. 3, page 712.

OTHER TESTS AND ASSAYS

⟨311⟩ Alginates Assay—See PF Vol. 29 No. 4, page 1138.
⟨341⟩ Antimicrobial Agents—Content—See PF Vol. 29 No. 4, page 1141.
⟨381⟩ Elastomeric Closures for Injections—See PF Vol. 29 No. 1, page 164.
⟨386⟩ Environmentally Sensitive Preparations—See PF Vol. 29 No. 4, page 1143.
⟨401⟩ Fats and Fixed Oils—See PF Vol. 29 No. 4, page 1145.
⟨429⟩ Light Diffraction Measurement of Particle Size—See PF Vol. 29 No. 4, page 1146.
⟨467⟩ Organic Volatile Impurities—See PF Vol. 29 No. 4, page 1153.
⟨518⟩ Solution Calorimetry—See PF Vol. 28 No. 4, page 1299.

Physical Tests and Determinations

⟨601⟩ Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers—See PF Vol. 29 No. 4, page 1176.
⟨621⟩ Chromatography—See PF Vol. 29 No. 4, page 1210.
⟨625⟩ Clarity and Degree of Opalescence of Liquids—See PF Vol. 26 No. 6, page 1616.
⟨627⟩ Degree of Color of Liquids—See PF Vol. 26 No. 6, page 1617.
⟨661⟩ Containers—See PF Vol. 29 No. 2, page 490.
⟨696⟩ Crystallinity Determination by Solution Calorimetry—See PF Vol. 29 No. 1, page 175.
⟨699⟩ Density of Solids—See PF Vol. 28 No. 2, page 603.
⟨724⟩ Drug Release—See PF Vol. 29 No. 3, page 715.
⟨730⟩ Inductively Coupled Plasma (ICP)—See PF Vol. 28 No. 6, page 1922.
⟨789⟩ Particulate Matter in Ophthalmic Solutions—See PF Vol. 28 No. 5, page 1496.
⟨795⟩ Pharmaceutical Compounding—Nonsterile Preparations—See PF Vol. 29 No. 1, page 179.
⟨811⟩ Powder Fineness—See PF Vol. 28 No. 2, page 611.
⟨823⟩ Radiopharmaceuticals for Positron Emission Tomography—Compounding—See PF Vol. 29 No. 2, page 494.
⟨846⟩ Specific Surface Area—See PF Vol. 28 No. 2, page 612.
⟨851⟩ Spectrophotometry and Light-Scattering—See PF Vol. 29 No. 3, page 722.

General Information

⟨1010⟩ Analytical Data—Interpretation and Treatment—See PF Vol. 29 No. 1, page 187.
⟨1072⟩ Disinfectants and Antiseptics—See PF Vol. 29 No. 3, page 726.
⟨1075⟩ Good Compounding Practices—See PF Vol. 29 No. 2, page 497.
⟨1078⟩ Good Manufacturing Practices for Bulk Pharmaceutical Excipients—See PF Vol. 28 No. 5, page 1504.
⟨1080⟩ Bulk Pharmaceutical Excipients—Certificate of Analysis—See PF Vol. 28 No. 5, page 1650.

Dietary Supplements

⟨2021⟩ Microbial Limit Testsã Nutritional Supplements—See PF Vol. 29 No. 1, page 268.
⟨2022⟩ Microbiological Procedures for Absence of Objectionable Microorganisms in Nutritional and Dietary Articles—See PF Vol. 29 No. 1, page 287.
⟨2023⟩ Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements—See PF Vol. 29 No. 1, page 296.
⟨2040⟩ Disintegration and Dissolution of Nutritional Supplements—See PF Vol. 29 No. 2, page 513.
⟨2091⟩ Uniformity of Dietary Supplement Intake Units—See PF Vol. 28 No. 5, page 1549.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

Acetaldehyde—See PF Vol. 29 No. 4, page 1227.
2-Acetamidophenol—See PF Vol. 25 No. 6, page 9107.
Acetyl Chloride—See PF Vol. 29 No. 4, page 1228.
Agarose—See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard—See PF Vol. 28 No. 4, page 1234.
Albumin Bovine Serum—See PF Vol. 29 No. 4, page 1228.
Alum—See PF Vol. 29 No. 4, page 1228.
Alumina, Activated—See PF Vol. 29 No. 4, page 1229.
4-Amino-3-hydroxy-1-naphthalenesulfonic Acid—See PF Vol. 29 No. 4, page 1229.
Ammonia Detector Tube—See PF Vol. 29 No. 4, page 1229.
Ammonia Water, Stronger—See PF Vol. 29 No. 4, page 1229.
Ammonium Hydroxide—See PF Vol. 29 No. 4, page 1229.
Ammonium Pyrrolidinedithiocarbamate—See PF Vol. 27 No. 5, page 3115.
Anti-A Blood Grouping Reagent, Anti-B Blood Grouping Reagent, and Anti-A,B Blood Grouping Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D (Rh_o) Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D Reagent—See PF Vol. 29 No. 2, page 506.
Antihuman Globulin Reagent—See PF Vol. 29 No. 2, page 506.

In-Process Revision

Antithrombin III for Amidolytic Test—See PF Vol. 29 No. 1, page 264.
Arsenic Trioxide—See PF Vol. 29 No. 4, page 1230.
Bacterial Alkaline Protease Preparation—See PF Vol. 28 No. 2, page 552.
Barbituric Acid—See PF Vol. 29 No. 1, page 265.
Benzil—See PF Vol. 28 No. 4, page 1305.
Benzoic Acid—See PF Vol. 29 No. 4, page 1230.
Blood Group A_1 and Blood Group B Red Blood Cells—See PF Vol. 29 No. 2, page 506.
7 Percent Bovine Serum Albumin Certified Standard—See PF Vol. 29 No. 4, page 1230.
Bromelain—See PF Vol. 28 No. 2, page 552.
Bromobimane—See PF Vol 25 No. 2, page 7804.
Branched Polymeric Sucrose—See PF Vol. 27 No. 6, page 3363.
1,4-Butanediol—See PF Vol 25 No. 5, page 8747.
Butyl Acetate, Normal—See PF Vol. 29 No. 4, page 1230.
Butyl Alcohol—See PF Vol. 29 No. 4, page 1230.
Butyl Alcohol, Tertiary—See PF Vol. 29 No. 4, page 1230.
n-Butylboronic Acid—See PF Vol. 29 No. 4, page 1231.
Butyrolactone—See PF Vol. 22 No. 6, page 3248.
Calcium Acetate—See PF Vol. 29 No. 4, page 1231.
Calcium Carbonate—See PF Vol. 29 No. 4, page 1231.
Calcium Chloride, Anhydrous—See PF Vol. 29 No. 4, page 1231.
dl-Camphene—See PF Vol. 28 No. 6, page 1951.
Capric Acid—See PF Vol 25 No. 5, page 8749.
Carbon Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1232.
Carbon Monoxide Detector Tube—See PF Vol. 29 No. 4, page 1232.
Casein—See PF Vol. 29 No. 4, page 1232.
Cation-Exchange Resin, Styrene-Divinylbenzene, Strongly Acidic—See PF Vol. 29 No. 4, page 1232.
Ceric Ammonium Sulfate—See PF Vol. 29 No. 4, page 1233.
Chloramine T—See PF Vol. 29 No. 4, page 1233.
Chlorine Detector Tube—See PF Vol. 29 No. 4, page 1233.
p-Chloroaniline—See PF Vol. 29 No. 4, page 1234.
Chlorobenzene—See PF Vol. 29 No. 4, page 1234.
Chloroform, Alcohol-free—See PF Vol. 29 No. 4, page 1234.
4-Chloro-1-naphthol—See PF Vol. 29 No. 4, page 1234.
Chromatograhic Reagents—See PF Vol. 29 No. 4, page 1234.
Chromotropic Acid—See PF Vol. 29 No. 4, page 1235.
Cobaltous Acetate—See PF Vol. 29 No. 4, page 1235.
Compactin—See PF Vol. 29 No. 4, page 1235.
Coomassie Blue G-250 C—See PF Vol. 29 No. 4, page 1235.
Cupric Chloride—See PF Vol. 29 No. 4, page 1236.
Cyclohexylmethanol—See PF Vol. 28 No. 3, page 849.
DEAE-Agarose—See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase—See PF Vol. 27 No. 6, page 3365.
Deoxythymidine Triphosphate—See PF Vol. 27 No. 6, page 3365.
Dextran, High Molecular Weight—See PF Vol. 29 No. 4, page 1236.
Dibutylammonium Phosphate—See PF Vol. 26 No. 4, page 1132.
Dichloroacetic Acid—See PF Vol. 29 No. 4, page 1236.
Dicyclohexyl—See PF Vol. 28 No. 3, page 849.
Dicyclohexyl Phthalate—See PF Vol. 26 No. 2, page 504.
Diethylamine—See PF Vol. 29 No. 4, page 1236.
Diethylpyrocarbonate—See PF Vol. 27 No. 6, page 3365.
Diisobutylene—See PF Vol. 28 No. 4, page 1305.
N,N-Dimethyldodecylamine-*N*-oxide—See PF Vol. 27 No. 4, page 2837.
1,3-Dimethyl-2-imidazolidinone—See PF Vol. 29 No. 4, page 1237.
Dimethyl Sulfoxide, Spectrophotometric Grade—See PF Vol. 29 No. 4, page 1237.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bromide—See PF Vol. 27 No. 6, page 3365.
2,4-Dinitrofluorobenzene—See PF Vol. 29 No. 4, page 1237.
Dioleoylglycerol—See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol—See PF Vol. 28 No. 3, page 849.
Disodium Arsenate—See PF Vol. 28 No. 4, page 1305.
Disodium Chromotropate—See PF Vol. 29 No. 4, page 1237.
1-Dodecanol—See PF Vol. 29 No. 4, page 1238.
Dodecyl Lithium Sulfate—See PF Vol. 29 No. 4, page 1238.
Drabkin's Reagent—See PF Vol. 29 No. 2, page 507.
Eosin Y (Eosin Yellowish Y)—See PF Vol. 29 No. 4, page 1238.
Escin—See PF Vol. 27 No. 4, page 2837.
Ethidium Bromide—See PF Vol. 27 No. 6, page 3366.
Ethylbenzene—See PF Vol. 28 No. 3, page 850.
9-Fluorenylmethyl Chloroformate—See PF Vol. 25 No. 5, page 8916.
Formamide, Anhydrous—See PF Vol. 27 No. 5, page 3115.
β-Galactosidase Suspension—See PF Vol. 29 No. 4, page 1238.
Glucose—See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid—See PF Vol. 27 No. 6, page 3366.
L-Glutamine—See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate—See PF Vol. 27 No. 6, page 3366.
1-Heptadecanol—See PF Vol. 29 No. 4, page 1238.
Hexadecane—See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide—See PF Vol. 29 No. 1, page 265.
Hexamethylenetetramine—See PF Vol. 28 No. 3, page 850.
Hexokinase and Glucose-6-phosphate Dehydrogenase Suspension—See PF Vol. 29 No. 4, page 1239.
L-Histidine Hydrochloride Monohydrate—See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide—See PF Vol. 28 No. 4, page 1305.
Horseradish Peroxidase Conjugated to Goat Anti-Mouse IgG—See PF Vol. 29 No. 4, page 1239.
Hydriotic Acid—See PF Vol. 29 No. 4, page 1239.
Hydrocodone Diol—See PF Vol. 28 No. 4, page 1306.
Hydrogen Sulfide Detector Tube—See PF Vol. 29 No. 4, page 1239.
4-Hydroxybenzoic Acid Isopropyl Ester—See PF Vol. 29 No. 4, page 1239.
IgG-Coated Red Cells—See PF Vol. 29 No. 2, page 507.
Imidazole—See PF Vol. 29 No. 4, page 1240.
Iodoethane—See PF Vol. 24 No. 6, page 7327.
Iron Wire—See PF Vol. 29 No. 4, page 1240.
4-Isobutylacetophenone—See PF Vol. 29 No. 4, page 1240.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isoflupredone Acetate—See PF Vol. 29 No. 4, page 1240.
Lactose—See PF Vol. 29 No. 4, page 1240.
Lanthanum Chloride—See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide—See PF Vol. 28 No. 3, page 851.
Lead Acetate Paper—See PF Vol. 29 No. 1, page 265.
Lead Perchlorate—See PF Vol. 29 No. 4, page 1241.
Linoleic Acid—See PF Vol. 27 No. 6, page 3367.
α-Lipoic Acid—See PF Vol. 27 No. 6, page 3367.
Lithium Chloride—See PF Vol. 29 No. 4, page 1241.
Lithium Hydroxide—See PF Vol. 29 No. 4, page 1241.
Lithium Perchlorate—See PF Vol. 29 No. 4, page 1242.
Mercuric Nitrate—See PF Vol. 29 No. 4, page 1242.
Mercuric Sulfate—See PF Vol. 29 No. 4, page 1242.
Methenamine—See PF Vol. 29 No. 4, page 1243.
Methoxyethanol—See PF Vol. 29 No. 4, page 1243.
2-Methoxyethanol—See PF Vol. 29 No. 4, page 1243.
p-Methylaminophenol Sulfate—See PF Vol. 29 No. 4, page 1243.
Methyl Behenate—See PF Vol. 29 No. 4, page 1244.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride—See PF Vol. 25 No. 3, page 8280.
Methyl Chloroform—See PF Vol. 29 No. 4, page 1244.
Methyl Ethyl Ketone—See PF Vol. 29 No. 4, page 1244.
2-Methyl-5-nitroimidazole—See PF Vol. 25 No. 2, page 7804.
N-Methylpyrrolidine—See PF Vol. 29 No. 4, page 1245.
Monochloroacetic Acid—See PF Vol. 29 No. 4, page 1245.
Monoethanolamine—See PF Vol. 29 No. 4, page 1245.
Monooleoylglycerol—See PF Vol. 26 No. 6, page 1622.
2-Naphthyl Chloroformate—See PF Vol. 29 No. 4, page 1245.

Nickel(II) Sulfate Heptahydrate—See PF Vol. 27 No. 5, page 3116.
Nitric Oxide–Nitrogen Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1246.
Nitromethane—See PF Vol. 29 No. 4, page 1246.
Nonylphenol Polyoxyethylene Ether—See PF Vol. 27 No. 6, page 3368.
Olefin Detector Tube—See PF Vol. 29 No. 4, page 1246.
Oligo-deoxythymidine—See PF Vol. 27 No. 6, page 3368.
Osmium Tetroxide—See PF Vol. 29 No. 4, page 1246.
Pentadecanoic Acid Methyl Ester—See PF Vol. 26 No. 6, page 1622.
Periodic Acid—See PF Vol. 29 No. 4, page 1247.
o-Phenanthroline Monohydrochloride Monohydrate—See PF Vol. 27 No. 1, page 1904.
Phenol Red, Sodium—See PF Vol. 27 No. 6, page 3368.
3-Phenoxybenzoic Acid—See PF Vol. 29 No. 4, page 1247.
2-Phenylacetamide—See PF Vol. 29 No. 4, page 1247.
Phenylglycine—See PF Vol. 29 No. 4, page 1247.
Phthalic Acid—See PF Vol. 29 No. 4, page 1248.
Polyoxyethylene (23) Lauryl Ether—See PF Vol. 29 No. 2, page 507.
Polyoxyethylene (20) Sorbitan Monolaurate—See PF Vol. 27 No. 6, page 3368.
Potassium Dichromate—See PF Vol. 29 No. 4, page 1248.
Potassium Phosphate, Monobasic—See PF Vol. 29 No. 4, page 1248.
Potassium Phosphate, Tribasic—See PF Vol. 29 No. 4, page 1248.
n-Propyl Alcohol—See PF Vol. 29 No. 4, page 1248.
Protein Molecular Weight Standard—See PF Vol. 29 No. 4, page 1249.
Putrescine Dihydrochloride—See PF Vol. 27 No. 6, page 3369.
Red-Cell Lysing Agent—See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase—See PF Vol. 27 No. 6, page 3369.
Ribonuclease Inhibitor—See PF Vol. 27 No. 6, page 3369.
Sodium 1-Decanesulfonate—See PF Vol. 29 No. 4, page 1249.
Sodium Acetate—See PF Vol. 29 No. 4, page 1249.
Sodium Acetate, Anhydrous—See PF Vol. 29 No. 4, page 1249.
Sodium Arsenite, Twentieth-Molar (0.05 M)—See PF Vol. 29 No. 4, page 1250.
Sodium Borate—See PF Vol. 29 No. 4, page 1250.
Sodium Bromide—See PF Vol. 29 No. 4, page 1250.
Sodium Dichromate—See PF Vol. 29 No. 4, page 1251.
Sodium Iodate—See PF Vol. 27 No. 6, page 3369.
Sodium Oxalate—See PF Vol. 29 No. 4, page 1251.
Sodium Perchlorate—See PF Vol. 29 No. 4, page 1251.
Sodium Pyrophosphate—See PF Vol. 29 No. 4, page 1251.
Sodium Sulfate—See PF Vol. 29 No. 4, page 1252.
Sodium Tetraphenylborate—See PF Vol. 29 No. 4, page 1252.
Starch, Soluble, Purified—See PF Vol. 29 No. 4, page 1252.
Succinic Acid—See PF Vol. 29 No. 4, page 1253.
Sulfamic Acid—See PF Vol. 29 No. 4, page 1253.
Sulfur Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1253.
Tannic Acid—See PF Vol. 29 No. 4, page 1253.
2′,4′,5′,7′-Tetrabromofluorescein—See PF Vol. 29 No. 4, page 1254.
Tetrabutylammonium Bromide—See PF Vol. 29 No. 4, page 1254.
1,1,2,2-Tetrachloroethane—See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran—See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran, Stabilizer-Free—See PF Vol. 29 No. 4, page 1254.
Tetrahydro-2-furancarboxylic Acid—See PF Vol. 25 No. 5, page 8748.
N-(2-Tetrahydrofuroyl)piperazine—See PF Vol. 25 No. 5, page 8748.
Tetramethylammonium Bromide—See PF Vol. 29 No. 4, page 1255.
1,1,4,4-Tetraphenyl-1,3-butadiene—See PF Vol. 26 No. 6, page 1623.
Thiourea—See PF Vol. 29 No. 4, page 1255.
Thymidine—See PF Vol. 27 No. 6, page 3369.
p-Toluenesulfonic Acid—See PF Vol. 29 No. 4, page 1255.
Trichlorotrifluoroethane—See PF Vol. 29 No. 4, page 1255.
Trioleoylglycerol—See PF Vol. 26 No. 6, page 1623.
Tropine—See PF Vol. 28 No. 4, page 1306.
L-Tyrosine Disodium—See PF Vol. 27 No. 6, page 3370.
Vinyl Acetate—See PF Vol. 21 No. 2, page 466.
2-Vinylpyridine—See PF Vol. 26 No. 2, page 504.
1-Vinyl-2-pyrrolidone—See PF Vol. 22 No. 6, page 3249.
Water Vapor Detector Tube—See PF Vol. 29 No. 4, page 1256.
m-Xylene—See PF Vol. 28 No. 6, page 1952.
Zinc Acetate—See PF Vol. 29 No. 4, page 1256.
Zinc Sulfate Heptahydrate—See PF Vol. 26 No. 2, page 504.

Indicator Test Papers

Methyl Green—See PF Vol. 28 No. 4, page 1306.
Methyl Green—Iodomercurate Paper—See PF Vol. 28 No. 4, page 1306.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.

In-Process Revision

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Alcohol, *USP 26* page 59 and page 2507 of *PF* 27(3) [May–June 2001]. The European Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of compendial standards for the *Alcohol* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION Stage 6** document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia.

Differences between the **ADOPTION Stage 6** document and the current *USP* monograph include the following:

(1) Definition—No change.
(2) *Packaging and storage*—Storage conditions to protect from light are added.
(3) *USP Reference standards*—A reference standard for Alcohol is added for use in the *Identification* test.
(4) *Identification*—Tests *A* and *B* are replaced with a more definitive infrared absorption test, and the test for specific gravity is moved under *Identification*.
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Specific gravity*—No change.
(8) *Acidity*—This test is replaced by a test for *Acidity or alkalinity* to comply with EP standards.
(9) *Limit of nonvolatile residue*—The sample size in increased from 40 to 100 mL.
(10) *Water-insoluble substances*—This test is deleted. Because the monograph contains tests for *Nonvolatile residue* and *Volatile impurities,* this test is no longer needed.
(11) *Aldehydes and other foreign organic substances*—This test is replaced with a *Volatile impurities* test.
(12) *Amyl alcohol and nonvolatile, carbonizable substances*—This test is replaced with a *Volatile impurities* test.
(13) *Ultraviolet absorbance*—This test is added to comply with EP standards.
(14) *Limit of acetone and isopropyl alcohol*—This test is replaced with a *Volatile impurities* test.
(15) *Methanol*—This test is replaced with a *Volatile impurities* test.
(16) *Volatile impurities*—This chromatographic test is added to limit a wide array of volatile impurities within a single test method.

(EMC: J. Lane) RTS—40109-1

Add the following:

Alcohol

C_2H_6O 46.07

Ethanol.

Ethyl alcohol [*64-17-5*].

» Alcohol contains not less than 92.3 percent and not more than 93.8 percent, by weight, corresponding to not less than 94.9 percent and not more than 96.0 percent, by volume, at 15.56°, of C_2H_5OH.

Packaging and storage—Preserve in tight containers, protected from light, and remote from heat, sparks, or open flames.

USP Reference standards ⟨11⟩**—***USP Alcohol RS.*

Clarity of solution—[NOTE—The *Test solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution A—The substance to be examined.

Test solution B—Dilute 1.0 to 20 mL with water, and allow to stand for 5 minutes before testing.

Procedure—Transfer a sufficient portion of *Test solution A* and *Test solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* and water to separate matching test tubes. Compare *Test solution A, Test solution B, Reference suspension A, Reference suspension B,* and water in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] *Test solution A* and *Test solution B* show the same clarity as that of water or their opalescence is not more pronounced than that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—The substance to be examined.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution* and water to separate, matching test tubes. Compare the *Test solution, Standard solution,* and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or is not more intensely colored than the *Standard solution.*

Identification—

A: It complies with the test for *Specific gravity.*

B: *Infrared Absorption* ⟨197F⟩ or ⟨197S⟩ neat.

Specific gravity ⟨841⟩**:** between 0.812 and 0.816 at 15.56°, indicating between 92.3% and 93.8%, by weight, or between 94.9% and 96.0%, by volume, of C_2H_5OH.

Acidity or alkalinity—

Phenolphthalein solution—Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

Procedure—To 20 mL of alcohol, add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution*. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide. The solution is pink (30 ppm, expressed as acetic acid).

Ultraviolet absorption—Record the UV absorption spectrum of the test material from 200 to 400 nm in a 1-cm cell: maximum absorbance 0.40 at 240 nm, 0.30 between 250 and 260 nm, and 0.10 between 270 and 340 nm. Examine between 235 and 340 nm, in a 5-cm cell, using water as the compensation liquid. The absorption curve is smooth.

Volatile impurities—

Test solution A—The substance to be examined.

Test solution B—Add 150 µL of 4-methylpentan-2-o1 to 500.0 mL of the substance to be examined.

Standard solution A—Dilute 100 µL of methanol to 50.0 mL with the substance to be examined. Dilute 5.0 mL of the solution to 50.0 mL with the substance to be examined.

Standard solution B—Dilute 50 µL of methanol and 50 µL of acetaldehyde to 50.0 mL with the substance to be examined. Dilute 100 µL of the solution to 10.0 mL with the substance to be examined.

Standard solution C—Dilute 150 µL of acetal to 50.0 mL with the substance to be examined. Dilute 100 µL of the solution to 10.0 mL with the substance to be examined.

Standard solution D—Dilute 100 µL of benzene to 100.0 mL with the substance to be examined. Dilute 100 µL of the solution to 50.0 mL with the substance to be examined.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, maintained at about 280°, and a 0.32-mm × 30-m fused silica capillary column bonded with a 1.8-µm layer of phase G43. The carrier gas is helium with a linear velocity of about 35 cm per second and a split ratio of 1:20. The column is maintained at 40° for the first 12 minutes after an injection is made and is increased from 40° to 240° from 12 to 32 minutes after injection. During the period of 32 to 42 minutes after an injection is made the column is maintained at 240°. The injector port is maintained at 200°.

Procedure—Inject about 1.0 µL of *Standard solution B* into a suitable gas chromatograph, and record the chromatogram. The resolution, *R,* between the first major peak (acetaldehyde) and the second major peak (methanol) is not less than 1.5. Separately inject equal volumes (1.0 µL) of *Test solution A* and *Test solution B* into the chromatograph, record the chromatograms, and measure the major peaks. Calculate the concentration of methanol in *Test solution A:* not more than half the area of the corresponding peak in the chromatogram obtained with *Standard solution A* (200 ppm).

Calculate the sum of the contents of acetaldehyde and acetal, expressed as acetaldehyde, using the following expression:

$$[(10 \times A_E)/(A_T - A_E)] + [(30 \times C_E)/(C_T - C_E)],$$

where A_E is the area of the acetaldehyde peak in the chromatogram obtained with the *Test solution A;* A_T is the area of the acetaldehyde peak in the chromatogram obtained with *Standard solution B;* C_E is the area of the acetal peak in the chromatogram obtained with *Test solution A;* and C_T is the area of the acetal peak in the chromatogram obtained with *Standard solution C:* not more than 10 ppm, expressed as acetaldehyde.

Calculate the content of benzene using the following expression:

$$(2B_E)/(B_T - B_E),$$

where B_E is the area of the benzene peak in the chromatogram obtained with *Test solution A;* and B_T is the area of the benzene peak in the chromatogram obtained with *Standard*

solution D: not more than 2 ppm. If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

The total of all other impurities in the chromatogram obtained with *Test solution B:* not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with *Test solution B* (300 ppm).

Disregard any peaks that are 0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with *Test solution B* (9 ppm).

Limit of nonvolatile residue—Evaporate 100 mL in a tared dish on a water bath, and dry at 100° to 105° for 1 hour: the weight of the residue does not exceed 2.5 mg.

BRIEFING

Dehydrated Alcohol, *USP 26* page 60. The European Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of compendial standards for the *Dehydrated Alcohol* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION Stage 6** document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia. Differences between the **ADOPTION Stage 6** document and the current *USP* monograph include the following:

(1) Definition—No change.
(2) *Packaging and storage*—Storage conditions to protect from light are added.
(3) *USP Reference standards*—A reference standard for Alcohol is added for the *Identification* test.
(4) *Identification*—Tests A and B are replaced with a more definitive *Infrared absorption* test, and the test for *Specific gravity* is moved under *Identification*.
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Specific gravity*—No change.
(8) *Acidity*—This test is replaced by a test for *Acidity or alkalinity* to comply with EP standards.
(9) *Limit of nonvolatile residue*—The sample size is increased from 40 to 100 mL.
(10) *Water-insoluble substances*—This test is deleted. Because the monograph contains tests for *Nonvolatile residue* and *Volatile impurities,* this test is no longer needed.
(11) *Aldehydes and other foreign organic substances*—This test is replaced with a *Volatile impurities* test.
(12) *Amyl alcohol and nonvolatile, carbonizable substances*—This test is replaced with a *Volatile impurities* test.
(13) *Ultraviolet absorbance*—The standards have been modified to comply with EP standards.
(14) *Limit of acetone and isopropyl alcohol*—This test is replaced with a *Volatile impurities* test.
(15) *Methanol*—This test is replaced with a *Volatile impurities* test.
(16) *Volatile impurities*—This chromatographic test is added to limit a wide array of volatile impurities within a single test method.

(EMC: J. Lane) RTS—40108-1

Add the following:

Dehydrated Alcohol

C_2H_6O 46.07

Ethanol.

Ethyl alcohol [*64-17-5*].

» Dehydrated Alcohol contains not less than 99.2 percent, by weight, corresponding to not less that 99.5 percent, by volume, at 15.56°, of C_2H_5OH.

Packaging and storage—Preserve in tight containers, protected from light, remote from fire.

USP Reference standards ⟨11⟩—*USP Dehydrated Alcohol RS.*

Clarity of solution—[NOTE—*Test solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Harmonization

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent* suspension to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution A—The substance to be examined.

Test solution B—Dilute 1.0 to 20 mL with water and allow to stand for 5 minutes before testing.

Procedure—Transfer a sufficient portion of *Test solution A* and *Test solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* and water to separate, matching test tubes. Compare *Test solution A, Test solution B, Reference suspension A, Reference suspension B,* and water in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and *Reference suspension B* can readily be distinguished from *Reference suspension A.*] *Test solution A* and *Test solution B* show the same clarity as that of water, or their opalescence is not more pronounced than that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL ferric chloride CS, 3.0 mL cobaltous chloride CS, 2.4 mL cupric sulfate CS, and 1.6 mL dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—The substance to be examined.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution* and water to separate matching test tubes. Compare the *Test solution, Standard solution,* and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or is not more intensely colored than the *Standard solution.*

Identification—

A: It complies with the test for *Specific gravity.*

B: *Infrared Absorption* ⟨197F⟩ or ⟨197S⟩ neat.

Specific gravity ⟨841⟩:not more than 0.7962 at 15.56°, indicating not less than 99.2% of C_2H_5OH, by weight.

Acidity or alkalinity—To 20 mL of alcohol, add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution.* The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide. The solution is pink (30 ppm, expressed as acetic acid).

Phenolphthalein solution—Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol and dilute to 100 mL with water.

Ultraviolet absorption—Record the UV absorption spectrum of the test material from 200 to 400 nm in a 1-cm cell: maximum absorbance 0.40 at 240 nm, 0.30 between 250 and 260 nm, and 0.10 between 270 and 340 nm. Examine between 235 and 340 nm, in a 5-cm cell, using water as the compensation liquid. The absorption curve is smooth.

Volatile impurities—

Test solution A—The substance to be examined.

Test solution B—Add 150 µL of 4-methylpentan-2-ol to 500.0 mL of the substance to be examined.

Standard solution A—Dilute 100 µL of methanol to 50.0 mL with the substance to be examined. Dilute 5.0 mL of the solution to 50.0 mL with the substance to be examined.

Standard solution B—Dilute 50 µL of methanol and 50 µL of acetaldehyde to 50.0 ml with the substance to be examined. Dilute 100 µL of the solution to 10.0 mL with the substance to be examined.

Standard solution C—Dilute 150 µL of acetal to 50.0 mL with the substance to be examined. Dilute 100 µL of the solution to 10.0 mL with the substance to be examined.

Standard solution D—Dilute 100 µL of benzene to 100.0 mL with the substance to be examined. Dilute 100 µL of the solution to 50.0 mL with the substance to be examined.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame ionization detector, maintained at about 280°, and a 0.32-mm × 30-m fused silica capillary column bonded with a 1.8 µm layer of phase G43. The carrier gas is helium with a linear velocity of about 35 cm per second and a split ratio of 1:20. The column is maintained at 40° for the first 12 minutes after an injection is made and is increased from 40° to 240° from 12 to 32 minutes after injection. During the period of 32 to 42 minutes after an injection is made the column is maintained at 240°. The injector port is maintained at 200°.

Procedure—Inject about 1.0 µL of *Standard solution B* into a suitable gas chromatograph, and record the chromatogram. The resolution, *R*, between the first major peak (acetaldehyde) and the second major peak (methanol) is not less than 1.5. Separately inject equal volumes (1.0 µL) of *Test solution A* and *Test solution B* into the chromatograph, record the chromatograms, and measure the major peaks. Calculate the concentration of methanol in *Test solution A:* not more than half the area of the corresponding peak in the chromatogram obtained with *Standard solution A* (200 ppm).

Calculate the sum of the contents of acetaldehyde and acetal, expressed as acetaldehyde, using the following expression:

$$[(10 \times A_E)/(A_T - A_E)] + [(30 \times C_E)/(C_T - C_E)],$$

where A_E is the area of the acetaldehyde peak in the chromatogram obtained with the *Test solution,* A_T is the area of the acetaldehyde peak in the chromatogram obtained with *Standard solution B,* C_E is the area of the acetal peak in the chromatogram obtained with *Test solution A,* and C_T is the area of the acetal peak in the chromatogram obtained with *Standard solution C:* not more than 10 ppm, expressed as acetaldehyde.

Calculate the content of benzene using the following expression:

$$(2B_E)/(B_T - B_E),$$

where B_E is the area of the benzene peak in the chromatogram obtained with *Test solution A,* and B_T is the area of the benzene peak in the chromatogram obtained with *Standard*

solution D: not more than 2 ppm. If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

The total of all other impurities in the chromatogram obtained with *Test solution B:* not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with *Test solution B* (300 ppm).

Disregard any peaks that are 0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with *Test solution B* (9 ppm).

Limit of nonvolatile residue—Evaporate 100 mL in a tared dish on a water bath, and dry at 100° to 105° for 1 hour: the weight of the residue does not exceed 2.5 mg.

BRIEFING

Saccharin Calcium, *USP 26* page 1656. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin Calcium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **Adoption Stage 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

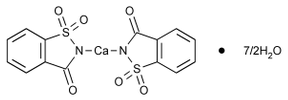
Differences between the Adoption Stage 6 document and the current USP monograph include the following:

(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions are added.
(3) *Labeling*—No change.
(4) *USP Reference standards*—A reference standard for Saccharin Calcium is added for use in *Identification* test *A.*
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Identification—Identification* tests *A, B,* and *D* are replaced with a more definitive IR absorption test. *Identification* test *C* is retained, but separated into 2 tests (*B* and *C*).
(8) *Water*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Selenium*—This test is deleted because it is unnecessary for this compound.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method.
(12) *Heavy metals*—No change.
(13) *Limit of benzoate and salicylate*—No change.
(14) *Organic volatile impurities*—No change.
(15) *Assay*—No change.

(EMC: J. Lane) RTS—40107-1

Add the following:

Saccharin Calcium



$C_{14}H_8CaN_2O_6S_2 \cdot 3½H_2O$ 467.49

1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide, calcium salt, hydrate (2:7)

1,2-Benzisothiazolin-3-one 1,1-dioxide calcium salt hydrate (2:7) [*6381-91-5*]

Anhydrous 404.44 [*6485-34-3*].

» Saccharin Calcium contains not less than 99.0 percent and not more than 101.0 percent of $C_{14}H_8CaN_2O_6S_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

Labeling—Where the quantity of saccharin calcium is indicated in the labeling of any preparation containing Saccharin Calcium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).

USP Reference standards ⟨11⟩**—***USP Saccharin Calcium RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*

Clarity of solution—[NOTE—*Test solution* is to be compared to the *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution—Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with water to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* water and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced that that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution,* a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The

Test solution has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Dry the specimen at 105° for 2 hours before use.

B: To a solution (1 in 10) add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid, dropwise, until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. This precipitate is insoluble in 6 N acetic acid but dissolves in hydrochloric acid.

C: Calcium salts moistened with hydrochloric acid impart a transient yellowish red color to a nonluminous flame.

Water, *Method I* ⟨921⟩: not more than 15.0%.

Readily carbonizable substances ⟨271⟩**—**Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Heavy metals, *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit if 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 1 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to pH 7 to 8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The instrument is equipped with a flame-ionization detector and contains a fused silica column 10 m long and 0.53 mm in internal diameter, coated with G3 phase (film thickness 2 μm). The injector port, column, and detector are maintained at temperatures of about 250°, 180°, and 250°, respectively, and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1:2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, *Method I* ⟨467⟩: meets the requirements.

Assay—Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Calcium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.22 mg of $C_{14}H_8CaN_2O_6S_2$.

BRIEFING

Saccharin Sodium, *USP 26* page 1657. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin Sodium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **Adoption Stage 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

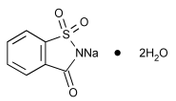
Differences between the Adoption Stage 6 document and the current USP monograph include the following:

(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions are added.
(3) *Labeling*—No change.
(4) *USP Reference standards*—A reference standard for Saccharin Sodium is added for use in *Identification A* test.
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Identification—Identification* tests *A, B,* and *D* are replaced with a more definitive IR test. *Identification* test *C* is retained, but separated into 2 tests (*B* and *C*).
(8) *Water*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Selenium*—This test is deleted because it is unnecessary for this compound.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method.
(12) *Heavy metals*—No change.
(13) *Limit of benzoate and salicylate*—No change.
(14) *Organic volatile impurities*—No change.
(15) *Assay*—No change.

(EMC: J. Lane) RTS—40105-1

Add the following:

Saccharin Sodium



$C_7H_4NNaO_3S \cdot 2H_2O$ 241.20

1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide, sodium salt, dihydrate.

1,2-Benzisothiazolin-3-one 1,1-dioxide sodium salt dihydrate [*6155-57-3*].

Anhydrous 205.17 [*128-44-9*].

Harmonization

» Saccharin Sodium contains not less than 99.0 percent and not more than 101.0 percent of $C_7H_4NNaO_3S \cdot 2H_2O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

Labeling—Where the quantity of saccharin sodium is indicated in the labeling of any preparation containing Saccharin Sodium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).

Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Dry the specimen at 105° for 2 hours before use.

B: To a solution (1 in 10) add 2 mL of 15% potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of potassium pyroantimonate TS, and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

C: Sodium salts impart an intense yellow color to a nonluminous flame.

Acidity or alkalinity—To a solution of 1.0 g in 10 mL of carbon dioxide-free water add 1 drop of phenolphthalein TS: no pink color is produced. Then add 1 drop of 0.1 N sodium hydroxide: a pink color is produced.

Water, *Method I* ⟨921⟩: not more than 15.0%.

Readily carbonizable substances ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Heavy metals, *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit is 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 1 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to pH 7 to 8 and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue

into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The instrument is equipped with a flame-ionization detector and contains a fused silica column 10 m long and 0.53 mm in internal diameter, coated with G3 phase (film thickness 2 µm). The injector port, column, and detector are maintained at temperatures of about 250°, 180°, and 250°, respectively, and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1:2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to o-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the test solution, the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, *Method I* ⟨467⟩: meets the requirements.

Assay—Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Sodium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.

MONOGRAPHS (NF)

BRIEFING

Saccharin, *NF 21* page 2825. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **Adoption Stage 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Differences between the Adoption Stage 6 document and the current *NF* monograph include the following:

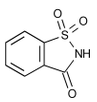
(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions are added.
(3) *USP Reference standards*—A reference standard for Saccharin is added for use in the *Identification* test.
(4) *Clarity of solution*—This test is added to comply with EP standards.
(5) *Color of solution*—This test is added to comply with EP standards.
(6) *Identification—Identification* tests *A* and *B* are replaced with a more definitive IR absorption test.
(7) *Melting range*—No change.

(8) *Loss on drying*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Residue on ignition*—No change.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method.
(12) *Selenium*—This test is deleted because it is unnecessary for this compound.
(13) *Heavy metals*—No change.
(14) *Limit of benzoate and salicylate*—No change.
(15) *Organic volatile impurities*—No change.
(16) *Assay*—No change.

(EMC: J. Lane) RTS—40106-1

Add the following:

Saccharin



$C_7H_5NO_3S$ 183.19

1,2-Benzisothiazol-3(*2H*)-one, 1,1-dioxide.

1,2-Benzisothiazolin-3-one 1,1-dioxide [*81-07-2*].

» Saccharin contains not less than 99.0 percent and not more than 101.0 percent of $C_7H_5NO_3S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

USP Reference standards ⟨11⟩**—***USP Saccharin RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*

Clarity of solution—[NOTE—The *Test solution* is to be compared to the *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution—Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with water to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* water and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspen-*

sion A can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced that that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution*, a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification, *Infrared Absorption* ⟨197K⟩.

Melting range ⟨741⟩**:** between 226° and 230°.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

Readily carbonizable substances ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Residue on ignition ⟨281⟩: not more than 0.2%. Ignition temperature: 600 ± 50°.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute to 100 mL with the same solvent.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a current of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 1 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to pH 7 to 8, and dilute to 50 mL with water. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10 mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The instrument is equipped with a flame-ionization detector and contains a fused silica column 10 m long and 0.53 mm in internal diameter, coated with G3 phase (film thickness 2 µm). The injector port, column, and detector are maintained at temperatures of about 250°, 180°, and 250°, respectively, and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1:2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide, and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide, and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a hot, saturated solution of it add ferric chloride TS, dropwise: no precipitate or violet color appears in the liquid.

Organic volatile impurities, *Method V* ⟨467⟩: meets the requirements.

Solvent—Use dimethyl sulfoxide as the solvent.

Assay—Accurately weigh about 500 mg of Saccharin, dissolve in 40 mL of alcohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N sodium hydroxide is equivalent to 18.32 mg of $C_7H_5NO_3S$.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

⟨**61**⟩ **Microbial Limit Tests,** *USP 26* page 2006. The proposed revision to this chapter, which includes a name change and which previously appeared as a Pharmacopeial Discussion Group (PDG) Stage 4 OFFICIAL INQUIRY (see page 2299 of *PF* 27(2) [Mar.–Apr. 2001]), has undergone extensive changes. Therefore the previous Stage 4 document is hereby canceled and replaced by this new PDG **Stage 4 OFFICIAL INQUIRY**. The following changes were based upon comments received in response to the previous Stage 4 document and upon discussions held by experts from the EP, JP, and USP:

(1) References to method "validation" have been replaced by the more appropriate terminology "verification of suitability of the method".
(2) The section describing preparation of test strains has been modified in order to allow more flexibility (e.g., use of commercial strains instead of freshly prepared strains; use of solid as well as liquid agar to grow bacterial strains; use of Sabouraud-Dextrose Medium for *Candida albicans;* use of Potato Dextrose Agar Medium for growth of *Aspergillus niger;* use of stable spore suspensions; and storage of the test organism suspension for up to 24 hours.)
(3) The sections on growth promotion have been significantly expanded (e.g., indications of which microorganism grows on which medium, incubation conditions). Criteria for liquid media have been added. In the tests for specified microorganisms, a new section for verification of the selectivity of the

media has been introduced; the verification of the suitability of the medium is carried out with separate microorganism suspensions.
(4) More detailed instructions on how to cope with products containing antimicrobial agents have been added throughout the texts. In particular, growth is considered inhibited if there is a reduction by a factor of 2 (0.3 log).
(5) Confidence limits for the most-probable-number (MPN) method have been added.
(6) Regarding interpretation of the results, clarification has been made with regard to the counting of colonies.

Other changes of lesser significance have been made throughout the text. Comments regarding this Stage 4 proposal are invited and should be submitted by **31 October 2003**.

(AMB: D. Porter) RTS—40088-1

Add the following:

⟨61⟩ MICROBIOLOGICAL EXAMINATION OF NONSTERILE PRODUCTS: MICROBIAL ENUMERATION TESTS

INTRODUCTION

The tests described hereafter will allow quantitative enumeration of mesophilic bacteria and fungi that may grow under aerobic conditions. [NOTE—See *Buffer Solutions and Media* in the general test chapter *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩ for preparation of the solutions and media used in this chapter.]

The tests are designed primarily to determine whether a substance or preparation complies with an established specification for microbiological quality. When used for such purposes, follow the instructions given below, including the number of samples to be taken, and interpret the results as stated below.

The methods are not applicable to products containing viable microorganisms as active ingredients.

Alternative microbiological procedures, including automated methods, may be used, provided that their equivalence to the Pharmacopeial method has been demonstrated.

GENERAL PROCEDURES

Carry out the determination under conditions designed to avoid extrinsic contamination of the product to be examined. The precautions taken to avoid contamination must be such that they do not affect any microorganisms that are to be revealed in the test.

If the product to be examined has antimicrobial activity, this is, insofar as possible, removed or neutralized. If inactivators are used for this purpose, their efficacy and their absence of toxicity for microorganisms must be demonstrated.

If surface-active substances are used for sample preparation, their absence of toxicity for microorganisms and their compatibility with any inactivators used must be demonstrated.

ENUMERATION METHODS

Use the *Membrane Filtration Method* or the one of the *Plate-Count Methods*, as directed below. The *Most-Probable-Number (MPN) Method* is generally the least accurate method for microbial counts; however, for certain product groups with very low bioburden, it may be the most appropriate method.

The choice of a method is based on factors such as the nature of the product and the required limit of microorganisms. The method chosen must allow testing of a sufficient sample size to judge compliance with the specification, and the suitability of the chosen method must be established.

GROWTH PROMOTION TEST AND SUITABILITY OF THE COUNTING METHOD

General Considerations

The ability of the test to detect microorganisms in the presence of product must be established.

Suitability must be confirmed if a change in testing performance or in the product, which may affect the outcome of the test, is introduced.

Preparation of Test Strains

Use standardized stable suspensions, or prepare as stated below. Seed-lot culture maintenance techniques (seed-lot systems) are used so that the viable microorganisms used for inoculation are not more than five passages removed from the original master seed-lot. Grow the bacterial test strains separately in containers containing *Soybean–Casein Digest Medium* or *Soybean–Casein Digest Agar Medium* for 18 to 24 hours between 30° and 35°. Grow the fungal test strains separately on *Sabouraud Dextrose Agar Medium* for both fungi or *Potato Dextrose Agar Medium* for *Aspergillus niger* and *Sabouraud Dextrose Medium* for *Candida albicans* for 2 to 3 days between 20° and 25° and for 5 to 7 days between 20° and 25° for *Aspergillus niger.*

Staphylococcus aureus	such as ATCC 6538, NCIMB 9518, CIP 4.83, or NBRC 13276
*Pseudomonas aeruginos*a	such as ATCC 9027, NCIMB 8626, CIP 82.118, or NBRC 13275
Bacillus subtilis	such as ATCC 6633, NCIMB 8054, CIP 52.62, or NBRC 3134
Candida albicans	such as ATCC 10231, NCPF 3179, IP 48.72, or NBRC 1594
Aspergillus niger	such as ATCC 16404, IMI 149007, IP 1431.83, or NBRC 9455

Use *pH 7.0 Buffered Sodium Chloride–Peptone Solution* or *pH 7.2 Phosphate Buffer* to make suitable test suspensions; to suspend *A. niger* spores, 0.05% of polysorbate 80 may be added to the buffer. Use the suspensions within 2 hours, or within 24 hours if stored between 2° and 8°. As an alternative to preparing and then diluting a fresh suspension of vegetative cells of *A. niger* or *B. subtilis,* a stable spore suspension is prepared and then an appropriate volume of the spore suspension is used for test inoculation. The stable spore suspension may be maintained at 2° to 8° for a validated period of time.

Negative Control

To verify the absence of contamination in media a portion of each batch is incubated. To verify testing conditions, a negative control is performed using the chosen diluent as the test preparation for each batch of diluent. There must be no growth of microorganisms.

Growth Promotion of the Media

Test each batch of ready-prepared medium and each batch of medium prepared either from dehydrated medium or from ingredients (see *Buffer Solutions and Media* under *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩. In appropriate cases, periodic testing of the different batches prepared from the same lot of dehydrated medium is acceptable.

Inoculate portions of *Soybean–Casein Digest Medium* and *Soybean–Casein Digest Agar Medium* with a small number (not more than 100 cfu) of the following microorganisms, using a separate portion or plate of medium for each: *Bacillus subtilis, Pseudomonas aeruginosa, Staphylococcus aureus, Aspergillus niger* (agar medium only), *Candida albicans* (agar medium only). Inoculate plates of *Sabouraud Dextrose Agar Medium* with a small number

(not more than 100 cfu) of *Aspergillus niger* and *Candida albicans,* using a separate plate of medium for each. Incubate at the specified temperature for not more than 3 days in the case of bacteria and not more than 5 days in the case of fungi.

For solid media, growth obtained must not differ by a factor greater than 2 (0.3 log) from the calculated value for the inoculum determined on a previously used batch of medium and must show growth characteristics comparable to a previously used batch of medium. Liquid media are suitable if clearly visible growth of the microorganisms occurs comparable to a previously used batch of medium.

Suitability of the Counting Method

PREPARATION OF THE SAMPLE

The method for sample preparation depends on the physical characteristics of the product to be tested. If none of the procedures described below can be demonstrated to be satisfactory, a suitable alternative procedure must be developed.

Water-Soluble Products—Dissolve or dilute (usually a 1 in 10 dilution is prepared) the product to be examined in *pH 7.0 Buffered Sodium Chloride–Peptone Solution, pH 7.2 Phosphate Buffer,* or *Soybean–Casein Digest Medium*. If necessary adjust to a pH of 6 to 8. Further dilutions, where necessary, are prepared with the same diluent.

Nonfatty Products Insoluble in Water—Suspend the product to be examined (usually a 1 in 10 dilution is prepared) in *pH 7.0 Buffered Sodium Chloride–Peptone Solution , pH 7.2 Phosphate Buffer,* or *Soybean–Casein Digest Medium*. A suitable surface-active agent such as 1 g per L of polysorbate 80 may be added to assist the suspension of poorly wettable substances. If necessary, adjust to a pH of 6 to 8. Further dilutions, where necessary, are prepared with the same diluent.

Fatty Products—Dissolve in isopropyl myristate sterilized by filtration, or homogenize the product to be examined with the minimum necessary quantity of sterile polysorbate 80 or another suitable sterile surface-active reagent, heated if necessary to not more than 40°—or in exceptional cases to not more than 45°. Mix carefully, and if necessary maintain the temperature in a water bath. Add a sufficient amount of the prewarmed chosen diluent to make a 1 in 10 dilution of the original product. Mix carefully while maintaining the temperature for the shortest time necessary until an emulsion is formed. Further serial 10-fold dilutions may be prepared using the chosen diluent containing a suitable concentration of sterile polysorbate 80 or another suitable sterile surface-active reagent.

Fluids or Solids in Aerosol Form—Aseptically transfer the product into a membrane filter apparatus, or a suitable sterile container, for further sampling. Use either the total contents or a defined number of metered doses from each of the containers tested.

Transdermal Patches—Remove the protective cover sheets (''release liners'') of the transdermal patches and place them, adhesive side upwards, on sterile glass or plastic trays. Cover the adhesive surface with a suitable sterile porous material to prevent the patches from sticking together, and transfer the patches to a suitable volume of the chosen diluent containing suitable inactivators such as polysorbate 80 or lecithin. Shake the preparation vigorously for at least 30 minutes.

INOCULATION AND DILUTION

Add to the sample, prepared as directed for *Preparation of the Sample,* a sufficient volume of the microbial suspension to obtain a final level of less than 100 cfu per mL. If inhibi-

tion of growth by the sample cannot otherwise be avoided, the aliquot of the microbial suspension may be added after neutralization, dilution, or filtration.

To demonstrate suitable microbial recovery from the product, the first possible dilution must be tested. Where this is not possible due to antimicrobial activity or poor solubility, further appropriate protocols must be developed.

NEUTRALIZATION AND REMOVAL OF ANTIMICROBIAL ACTIVITY

The number of microorganisms recovered from the incubated sample preparation is compared to the number of microorganisms recovered from the control preparation (no test material included). If growth is inhibited (reduction by a factor of 2, or 0.3 log or greater), then modify the procedure for the particular enumeration test to ensure the validity of the results. Modification of the procedure may include the following:

(1) an increase in the volume of the diluent,
(2) incorporation of suitable specific or general neutralizing agents into the diluent,
(3) membrane filtration, or
(4) a combination of the above measures.

Where neutralizers are used specifically to neutralize or to remove antimicrobial substances in a sample, the absence of toxicity for microorganisms of the neutralizer or inactivator, and any by-products of neutralization or inactivation, is demonstrated by carrying out a blank with neutralizer and without product.

Neutralizing Agents—Neutralizing agents may be used to neutralize the activity of antimicrobial agents (see *Table 1*). They may be added to the chosen diluent or to the medium, preferably before sterilization. If used, their efficacy and their absence of toxicity for microorganisms must be demonstrated.

Table 1. Common Neutralizing Agents for Interfering Substances

Interfering Substances	Potential Neutralizing Agent
Glutaraldehyde, mercurials	Bisulfate
Phenolics, alcohol, aldehydes, sorbate	Dilution
Aldehydes	Glycine
Quaternary ammonium compounds (QACs), Parahydroxy-benzoates (parabens), bis-biguanides	Lecithin
QAC, iodine, parabens	Polysorbate
Mercurials	Thioglycolate
Mercurials, halogens, aldehydes	Thiosulfate
EDTA (edetate)	Mg^{+2} or Ca^{+2} ions

If in spite of the incorporation of suitable inactivating agents and a substantial increase in the volume of diluent, it is still not possible to recover the viable cultures described above and if the article is not suitable for employment of membrane filtration, it can be assumed that the failure to isolate the inoculated organism is attributable to the bactericidal activity of the product. This information serves to indicate that the article is not likely to be contaminated with the given species of the microorganism. However, it is possible that the product inhibits some of the microorganisms specified herein but does not inhibit others not included among the test strains or for which the latter are not representative. Therefore, perform the test with the lowest possible dilution that gives acceptable recovery of the test microorganisms.

EXAMINATION OF THE SAMPLE

For each of the microorganisms listed, separate tests are performed.

Membrane Filtration—Use membrane filters having a nominal pore size not greater than 0.45 µm. The type of filter material is chosen in such a way that the bacteria-retaining efficiency is not affected by the components of the sample to be investigated. For each of the microorganisms listed, one membrane filter is used.

Transfer a suitable quantity of the sample prepared as described for *Inoculation and Dilution* and *Neutralization and Removal of Antimicrobial Activity* under *Preparation of the Sample,* preferably representing 1 g of the product—or less if large numbers of cfu are expected—to the membrane filter, filter immediately, and rinse the membrane filter with an appropriate volume of diluent.

For the determination of total aerobic microbial count (TAMC), transfer the membrane filter to the surface of the *Soybean–Casein Digest Agar Medium*. For the determination of total combined yeasts and molds count (TYMC), transfer the membrane to the surface of the *Sabouraud Dextrose Agar Medium.* Incubate the plate of *Soybean–Casein Digest Agar Medium* for not more than 3 days between 30° and 35° and the plate of *Sabouraud Dextrose Agar Medium* for not more than 5 days between 20° and 25°. Perform the counting.

Plate-Count Methods—Perform Plate-Count Methods at least in duplicate for each medium.

Pour-Plate Method—For Petri dishes 9 cm in diameter, add to the dish 1 mL of the sample prepared as described for *Inoculation and Dilution* and *Neutralization and Removal of Antimicrobial Activity* under *Preparation of the Sample* and 15 to 20 mL of *Soybean–Casein Digest Agar Medium*, or 15 to 20 mL of *Sabouraud Dextrose Agar Medium,* both media maintained at not more than 45°. If larger Petri dishes are used, the amount of agar medium is increased accordingly. For each of the microorganisms listed, at least two Petri dishes are used.

Incubate the plates of *Soybean–Casein Digest Agar Medium* for not more than 3 days between 30° and 35° and the plates of *Sabouraud Dextrose Agar Medium* for not more than 5 days between 20° and 25°. Take the arithmetic mean of the counts per medium, and calculate the number of cfu in the original inoculum.

Surface-Spread Method—For Petri dishes 9 cm in diameter, add 15 to 20 mL of *Soybean–Casein Digest Agar Medium* or *Sabouraud Dextrose Agar Medium* at about 45° to each Petri dish, and allow to solidify. If larger Petri dishes are used, the volume of the agar is increased accordingly. Dry the plates, for example, in a laminar-air-flow cabinet or in an incubator. For each of the microorganisms listed, at least two Petri dishes are used. Spread a measured volume of not less than 0.1 mL of the sample, prepared as directed for *Inoculation and Dilution* and *Neutralization and Removal of Antimicrobial Activity* under *Preparation of the Sample*, over the surface of the medium. Incubate, and count as directed for *Pour-Plate Method*.

Most-Probable-Number (MPN) Method—The precision and accuracy of the MPN Method is less than that of the *Membrane Filtration Method* or the *Plate-Count Method*. Unreliable results are obtained particularly for the enumeration of molds. For these reasons the MPN Method is reserved for the enumeration of microorganisms in situations where no other method is available. If the use of the method is justified, proceed as follows.

Prepare a series of at least three serial 10-fold dilutions of the product as described for *Inoculation and Dilution* and *Neutralization and Removal of Antimicrobial Activity* under *Preparation of the Sample*. From each level of dilution, three aliquots of 1 g or 1 mL are used to inoculate three

tubes with 9 to 10 mL of *Soybean–Casein Digest Medium*. If necessary, a surface-active agent such as polysorbate 80, or an inactivator of antimicrobial agents, may be added to the medium. Thus, if 3 levels of dilution are prepared, 9 tubes are inoculated.

Incubate all tubes for not more than 3 days between 30° and 35°. If reading of the results is difficult or uncertain owing to the nature of the product to be examined, subculture in the same broth or in *Soybean–Casein Digest Agar Medium* for 1 to 2 days at the same temperature, and use these results. Determine the MPN of microorganisms per g or mL of the product to be examined from *Table 2*.

Table 2. Most-Probable Number Values of Bacteria

Observed Combinations of Numbers of Tubes Showing Growth in Each Set			MPN per g or per mL of Product	95% Confidence Limits
Number of g or mL of Product per Tube				
0.1	0.01	0.001		
3	3	3	more than 1100	—
3	3	2	1100	300–4800
3	3	1	500	200–2400
3	3	0	200	100–1400
3	2	2	210	80–640
3	2	1	150	50–510
3	2	0	90	30–390
3	1	1	70	20–280
3	1	0	40	20–210
3	0	1	40	10–180
3	0	0	23	7–129
2	2	0	21	8–63
2	1	1		
20	8–61			
2	1	0	15	5–50
2	0	1	14	5–48
2	0	0	9	2–38
1	2	0	11	4–35
1	1	0	7	2–28
1	0	0	4	1–21
0	1	0	3	<1–17
0	0	0	<3	—

RESULTS AND INTERPRETATION

When verifying the suitability of the *Membrane Filtration Method* or the *Plate-Count Method*, a count of any of the test organisms differing by not more than a factor of 2 (0.3 log) from the value of the control in the absence of the product must be obtained.

When verifying the suitability of the *MPN Method,* the calculated value from the inoculum must be within 95% confidence limits of the results obtained.

TESTING OF PRODUCTS

Sample Size

Unless otherwise directed, use sample(s) of 10 g or 10 mL of the product to be examined taken with the precautions referred to above. For fluids or solids in aerosol form, sample 10 containers. For transdermal patches, sample 10 patches.

The amount of sample tested may be reduced for active substances that will be formulated under the following conditions: the amount per dosage unit (e.g., tablet, capsule) is less than or equal to 1 mg, or the amount per g or mL (for preparations not presented in dose units) is less than 1 mg. In these cases, the amount of sample tested is not less than the amount present in 10 dosage units or 10 g or 10 mL of the product.

For materials used as bulk active substances where sample quantity is limited or batch size is extremely small (i.e., less than 1000 mL or 1000 g), test 1% of the batch.

For products where the total number of entities in a batch is less than 200 (e.g., samples used in clinical trials), the sample size may be reduced to 2 units, or 1 unit if the size is less than 100.

Select the sample(s) at random from the bulk material or from the available containers of the preparation. To obtain the required quantity, mix the contents of a sufficient number of containers to provide the sample.

Examination of the Product Sample

MEMBRANE FILTRATION

Use a filtration apparatus designed to allow the transfer of the filter to the medium. Prepare the sample using a method that has been shown to be suitable (see *Growth Promotion Test and Suitability of the Counting Method*), transfer the appropriate quantity to each of two membrane filters, and filter immediately. Wash each filter following the procedure shown to be suitable.

For the determination of TAMC, transfer one of the membrane filters to the surface of *Soybean–Casein Digest Agar Medium*. For the determination of TYMC, transfer the other membrane to the surface of *Sabouraud Dextrose Agar Medium*. Incubate the plate of *Soybean–Casein Digest Agar Medium* for 3 to 5 days between 30° and 35° and the plate of *Sabouraud Dextrose Agar Medium* for 5 to 7 days between 20° and 25°. Calculate the number of cfu per g or per mL of product.

When examining transdermal patches, separately filter 10% of the volume of the preparation as directed for *Preparation of the Sample* through each of two sterile filter membranes. Transfer one membrane to *Soybean–Casein Digest Agar Medium* for TAMC and the other membrane to *Sabouraud Dextrose Agar Medium* for TYMC.

PLATE-COUNT METHODS

Pour-Plate Method—Prepare the sample using a method that has been shown to be suitable (see *Growth Promotion Test and Suitability of the Counting Method*). Prepare for each medium at least two Petri dishes for each level of dilution. Incubate the plates of *Soybean–Casein Digest Agar Medium* for 3 to 5 days between 30° and 35° and the plates of *Sabouraud Dextrose Agar Medium* for 5 to 7 days between 20° and 25°. Select the plates corresponding to a given dilution and showing the highest number of colonies less than 250 for TAMC and less than 50 for TYMC. Take the arithmetic mean per culture medium of the counts, and calculate the number of cfu per g or per mL of product.

Surface-Spread Method—Prepare the sample using a method that has been shown to be suitable (see *Growth Promotion Test and Suitability of the Counting Method*). Prepare at least two Petri dishes for each medium and each level of dilution. For incubation and calculation of the number of cfu, proceed as directed for the *Pour-Plate Method.*

MPN METHOD

Prepare and dilute the sample using a method that has been shown to be suitable (see *Growth Promotion Test and Suitability of the Counting Method*). Incubate all tubes for 3 to 5 days between 30° and 35°. Subculture if necessary, using the procedure shown to be suitable. For each level of dilution, record the number of tubes showing microbial growth. Determine the MPN of bacteria per g or mL of the product to be examined from *Table 2*.

Interpretation of Results

The TAMC is considered to be equal to the number of cfu found on *Soybean–Casein Digest Agar Medium*. If colonies of fungi are detected on this medium, they are counted as part of the TAMC. The total combined yeasts and mould count (TYMC) is considered to be equal to the number of cfu found on *Sabouraud Dextrose Agar Medium.* If colonies of bacteria are detected on this medium, they are counted as part of the TYMC. If the count is carried out by the *MPN Method*, the calculated value is the TAMC.

When a criterion for microbiological quality is prescribed, it is interpreted as follows:

- 10^1 cfu: maximum acceptable count is 20;
- 10^2 cfu: maximum acceptable count is 200;
- 10^3 cfu: maximum acceptable count is 2000; and so forth.

BRIEFING

⟨62⟩ Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms. This proposed new chapter, which previously appeared as a Pharmacopeial Discussion Group (PDG) Stage 4 OFFICIAL INQUIRY (see 2313 of *PF* 27(2) [Mar.–Apr. 2001]), has undergone extensive changes, and therefore the previous Stage 4 document is hereby cancelled and replaced by this new PDG **Stage 4 OFFICIAL INQUIRY**. The following changes were based upon comments received in response to the previous Stage 4 document and upon discussion held by experts from the EP, JP, and USP:

(1) Incubation temperature for *Escherichia coli* has been raised to between 42° and 44°. This provides better selectivity.
(2) Sample size was decreased to 1 g.
(3) Regarding selective agars for the detection of *Salmonella* species, *Pseudomonas aeruginosa,* and *Staphylococcus aureus,* only one medium was retained in each case.
(4) The method for growing *Candida albicans* has been replaced by the method used for the determination of TCYM.
(5) Specific instructions for the sterilization of media have been removed.

Other changes of lesser significance have been made throughout the text. Comments regarding this Stage 4 proposal are invited and should be submitted by **31 October 2003**.

(AMB: D.A. Porter) RTS—40089-1

Add the following:

⟨62⟩ MICROBIOLOGICAL EXAMINATION OF NONSTERILE PRODUCTS: TESTS FOR SPECIFIED MICROORGANISMS

INTRODUCTION

The tests described hereafter will allow determination of the absence of or limited occurrence of specified microorganisms that may be detected under the conditions described.

The tests are designed primarily to determine whether a substance or preparation complies with an established specification for microbiological quality. When used for such purposes, follow the instructions given below, including the number of samples taken, and interpret the results as directed below.

Alternative microbiological procedures, including automated methods, may be used, provided that their equivalence to the Pharmacopeial method has been demonstrated.

GENERAL PROCEDURES

The preparation of samples is carried out as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩.

If the product to be examined has antimicrobial activity, this is, insofar as possible, removed or neutralized (see *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩).

If surface-active substances are used for sample preparation, their absence of toxicity for microorganisms and their compatibility with any inactivators used must be demonstrated as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩.

NUTRITIVE AND SELECTIVE PROPERTIES OF THE MEDIA AND SUITABILITY OF THE TEST

The ability of the test to detect microorganisms in the presence of product must be established. Suitability must be confirmed if a change in testing performance or in the product, which may affect the outcome of the test, is introduced.

Preparation of Test Strains

Use standardized stable suspensions or prepare as stated below. Seed lot culture maintenance techniques (seed-lot systems) are used so that the viable microorganisms used for inoculation are not more than five passages removed from the original master seed-lot.

AEROBIC MICROORGANISMS

Grow the bacterial test strains separately in containers containing *Soybean–Casein Digest Medium* or *Soybean–Casein Digest Agar Medium* between 30° and 35° for 18 to 24 hours. Grow the test strain for *Candida albicans* separately on *Sabouraud Dextrose Agar Medium* or *Sabouraud Dextrose Medium* between 20° and 25° for 2 to 3 days.

Staphylococcus aureus	such as ATCC 6538, NCIMB 9518, CIP 4.83, or NBRC 13276
Pseudomonas aeruginosa	such as ATCC 9027, NCIMB 8626, CIP 82.118, or NBRC 13275
Escherichia coli	such as ATCC 8739, NCIMB 8545, CIP 53.126, or NBRC 3972
Salmonella enterica ssp. typhimurium	such as ATCC 14028
or as an alternative *Salmonella enterica ssp. abony*	such as NCTC 6017 or CIP 80.39
Candida albicans	such as ATCC 10231, NCPF 3179, IP 48.72, or NBRC 1594

CLOSTRIDIA

Use *Clostridium sporogenes* such as ATCC 11437 or ATCC 19404 (NCTC 532 or CIP 79.03). Grow the clostridial test strain under anaerobic conditions in *Reinforced Medium for Clostridia* between 30° and 35° for 24 to 48 hours. As an alternative to preparing and then diluting down a fresh suspension of vegetative cells of *C. sporogenes* when verifying the suitability of the test method, a stable spore suspension can be used for test inoculation. The stable spore suspension is maintained between 2° and 8° for a validated period.

Negative Control

To verify the absence of contamination in media a portion of each batch is incubated. To verify testing conditions a negative control is performed using the chosen diluent as the test preparation for each batch of diluent. There must be no growth of microorganisms.

Growth Promotion of the Media

Test each batch of ready-prepared medium and each batch of medium prepared either from dehydrated medium or from ingredients (see *Buffer Solutions and Culture Media*). In appropriate cases, periodic testing of different batches prepared from the same lot of dehydrated medium is acceptable. Verify suitable properties of relevant media as described in *Table 1*.

Table 1. Nutritive, Selective, and Indicative Properties of Media

Medium	Property	Test Strains
Test for bile-tolerant Gram-negative bacteria		
Mossel Enterobacteriaceae Enrichment Broth	Nutritive	*E. coli*
		P. aeruginosa
	Selective	*S. aureus*
Violet Red Bile Glucose Agar Medium	Nutritive + Indicative	*E. coli*
		P. aeruginosa
Test for Escherichia coli		
MacConkey Medium	Nutritive	*E. coli*
	Selective	*S. aureus*
MacConkey Agar Medium	Nutritive + Indicative	*E. coli*
Test for Salmonella		
Rappaport Vassiliadis Salmonella Enrichment Broth	Nutritive	*Salmonella enterica ssp. typhimurium* or *Salmonella enterica ssp. abony*
	Selective	*S. aureus*
Xylose, Lysine, Deoxycholate, Agar Medium	Nutritive + Indicative	*Salmonella enterica ssp. typhimurium* or *Salmonella enterica ssp. abony* *E. coli*

Table 1. Nutritive, Selective, and Indicative Properties of Media (*continued*)

Medium	Property	Test Strains
Test for Pseudomonas aeruginosa		
Cetrimide Agar Medium	Nutritive	*P. aeruginosa*
	Selective	*E. coli*
Test for Staphylococcus aureus		
Mannitol Salt Agar Medium	Nutritive	*S. aureus*
	Selective	*E. coli*
Test for Clostridia		
Reinforced Medium for Clostridia	Nutritive	*C. sporogenes*
Columbia Agar Medium	Nutritive	*C. sporogenes*
Test for Candida albicans		
Sabouraud Dextrose Medium	Nutritive	*C. albicans*
Sabouraud Dextrose Agar Medium	Nutritive + Indicative	*C. albicans*

TEST FOR NUTRITIVE PROPERTIES

Liquid Media—Inoculate a portion of the appropriate medium with a small number (not more than 100 cfu) of the appropriate microorganism. Incubate at the specified temperature for not more than the shortest period of time specified in the test. Clearly visible growth of the microorganism comparable to a previously used batch of medium occurs.

Solid Media—Perform *Surface-Spread Method* (see *Pour-Plate Methods* under *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩), inoculating each plate with a small number (not more than 100 cfu) of the appropriate microorganism. Incubate at the specified temperature for not more than the shortest period of time specified in the test. Colonies are comparable in number and size to a previously used batch of medium.

TEST FOR SELECTIVE PROPERTIES FOR LIQUID OR SOLID MEDIA

Inoculate the appropriate medium with at least 100 cfu of the appropriate microorganism. Incubate at the specified temperature for not less than the longest period of time specified in the test. No growth of the test microorganism occurs.

TEST FOR INDICATIVE PROPERTIES

Perform *Surface-Spread Method* (see *Pour-Plate Methods* under *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩), inoculating each plate with a small number (not more than 100 cfu) of the appropriate microorganism. Incubate at the specified temperature for a period of time within the range specified in the test. Colonies are comparable in appearance and indication reactions to a previously used batch of medium.

Suitability of the Test Method

For each new product to be tested perform sample preparation as directed under *Testing of Products*. Add test strains at the time of homogenization in *Soybean–Casein Digest Medium*. Inoculate the test strains individually. Use a number of microorganisms equivalent to not more than 100 cfu in the final test preparation. Perform the test as directed under *Testing of Products*.

Table 2. Suitability of the Test Method for Each Product

Test Microorganism	Required Outcome
Test for bile-tolerant Gram-negative bacteria:	
E. coli	Growth as described
S. aureus	No growth
Test for Escherichia coli:	
E. coli	Growth as described
S. aureus	No growth
Test for Salmonella:	
Salmonella enterica ssp. typhimurium or *Salmonella enterica ssp. abony*	Growth as described
S. aureus	No growth
Test for Pseudomonas aeruginosa:	
P. aeruginosa	Growth as described
E. coli	No growth
Test for Staphylococcus aureus:	
S. aureus	Growth as described
E. coli	No growth

Any antimicrobial activity of the product necessitates a modification of the test procedure (see *Neutralization and Removal of Antimicrobial Activity* under *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩).

TESTING OF PRODUCTS

Bile-Tolerant Gram-Negative Bacteria

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare a sample using a 1 in 10 dilution of not less than 1 g of the product to be examined as described under *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, but using *Soybean–Casein Digest Medium* as the chosen diluent. Homogenize, and incubate between 20° and 25° for a time sufficient to resuscitate the bacteria but not sufficient to encourage multiplication of the organisms (usually 2 hours but not more than 5 hours).

TEST FOR ABSENCE

Use the volume corresponding to the limit required (see *Sample Preparation and Pre-Incubation*) to inoculate a suitable amount (as determined under *Suitability of the Test Method*), of *Mossel Enterobacteriaceae Enrichment Broth*. When testing transdermal patches, filter the volume of sample corresponding to one patch (see *Transdermal Patches* under *Preparation of the Sample* in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩) through a sterile filter membrane, and place in 100 mL of *Mossel Enterobacteriaceae Enrichment Broth*. Incubate between 30° and 35° for 24 to 48 hours. Subculture on plates of *Violet Red Bile Glucose Agar Medium*. Incubate between 30° and 35° for 18 to 24 hours. The product complies with the test if there is no growth of red colonies surrounded by a reddish precipitate.

QUANTITATIVE TEST

Selection and Subculture—Inoculate suitable quantities of *Mossel Enterobacteriaceae Enrichment Broth* with the preparation as directed under *Sample Preparation and Pre-Incubation* and/or dilutions of it containing respectively

0.1 g, 0.01 g, and 0.001 g (or 0.1 mL, 0.01 mL, and 0.001 mL) of the product to be examined. Incubate between 30° and 35° for 24 to 48 hours. Subculture each of the cultures on a plate of *Violet Red Bile Glucose Agar Medium*. Incubate between 30° and 35° for 18 to 24 hours.

Interpretation—Growth of red colonies, surrounded by a reddish precipitate, constitutes a positive result. Note the smallest quantity of the product that gives a positive result and the largest quantity that gives a negative result. Determine from *Table 3* the probable number of bacteria.

Table 3.

Results for Each Quantity of Product			Probable Number of Bacteria per g of Product
0.1 g or 0.1 mL	0.01 g or 0.01 mL	0.001 g or 0.001 mL	
+	+	+	more than 10^3
+	+	–	less than 10^3 and more than 10^2
+	–	–	less than 10^2 and more than 10
–	–	–	less than 10

Escherichia coli

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare a sample using a 1 in 10 dilution of not less than 1 g of the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩ and use 10 mL, or the quantity corresponding to 1 g or 1 mL, to inoculate a suitable amount (as determined under *Suitability of the Test Method*) of *Soybean–Casein Digest Medium*. Homogenize, and incubate between 30° and 35° for 18 to 24 hours.

SELECTION AND SUBCULTURE

Shake the container, transfer 1 mL of *Soybean–Casein Digest Medium* to 100 mL of *MacConkey Medium*, and incubate between 42° and 44° for 24 to 48 hours. Subculture on a plate of *MacConkey Agar Medium* between 30° and 35° for 18 to 72 hours.

INTERPRETATION

Growth of colonies indicates the possible presence of *E. coli*. This is confirmed by suitable identification tests. The product complies with the test if no colonies are present or if the identification tests are negative.

Salmonella

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, and use the quantity corresponding to 1 g or 1 mL to inoculate a suitable amount (as determined under *Suitability of the Test Method*) of *Soybean–Casein Digest Medium*. Homogenize, and incubate between 30° and 35° for 18 to 24 hours.

SELECTION AND SUBCULTURE

Transfer 1 mL of *Soybean–Casein Digest Medium* to 10 mL of R*appaport Vassiliadis Salmonella Enrichment Broth*, and incubate between 30° and 35° for 18 to 24 hours. Subculture on plates of *Xylose, Lysine, Deoxycholate Agar Medium*. Incubate between 30° and 35° for 18 to 48 hours.

INTERPRETATION

The possible presence of *Salmonella* is indicated by the growth of well-developed, red colonies, with or without black centers. This is confirmed by suitable identification tests. The product complies with the test if colonies of the types described are not present or if the confirmatory identification tests are negative.

Pseudomonas aeruginosa

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare a sample using a 1 in 10 dilution of not less than 1 g of the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, and use 10 mL or the quantity corresponding to 1 g or 1 mL to inoculate a suitable amount (as determined under *Suitability of the Test Method*) of *Soybean–Casein Digest Medium*, and homogenize. When testing transdermal patches, filter the volume of sample corresponding to one patch of the preparation (see *Transdermal Patches* under *Preparation of the Sample* in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩) through a sterile filter membrane, and place in 100 mL of *Soybean–Casein Digest Medium*. Incubate between 30° and 35° for 18 to 24 hours.

SELECTION AND SUBCULTURE

Subculture on a plate of *Cetrimide Agar Medium*, and incubate between 30° and 35° for 18 to 72 hours.

INTERPRETATION

Growth of colonies indicates the possible presence of *P. aeruginosa*. This is confirmed by suitable identification tests. The product complies with the test if colonies are not present or if the confirmatory identification tests are negative.

Staphylococcus aureus

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare a sample using a 1 in 10 dilution of not less than 1 g of the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, and use 10 mL or the quantity corresponding to 1 g or 1 mL to inoculate a suitable amount (as determined under *Suitability of the Test Method*) of *Soybean–Casein Digest Medium*, and homogenize. When testing transdermal patches, filter the volume of sample corresponding to one patch of the preparation (see *Transdermal Patches* under *Preparation of the Sample* in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩) through a sterile filter membrane, and place in 100 mL of *Soybean–Casein Digest Medium*. Incubate between 30° and 35° for 18 to 24 hours.

SELECTION AND SUBCULTURE

Subculture on a plate of *Mannitol Salt Agar Medium*, and incubate between 30° and 35° for 18 to 72 hours.

INTERPRETATION

The possible presence of *S. aureus* is indicated by the growth of yellow or white colonies surrounded by a yellow zone. This is confirmed by suitable identification tests. The product complies with the test if colonies of the types described are not present or if the confirmatory identification tests are negative.

Clostridia

SAMPLE PREPARATION AND HEAT TREATMENT

Prepare the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩. Take two equal portions corresponding to 1 g or 1 mL of the product to be examined. Heat one portion at 80° for 10 minutes, and cool rapidly. Do not heat the other portion.

SELECTION AND SUBCULTURE

Transfer 10 mL of each of the homogenized portions to two containers (38 × 200 mm), or other suitable containers, containing 100 mL of *Reinforced Medium for Clostridia*. Incubate under anaerobic conditions between 30° and 35° for 48 hours. After incubation, make subcultures from each tube on *Columbia Agar Medium*, and incubate under anaerobic conditions between 30° and 35° for 48 hours.

INTERPRETATION

The occurrence of anaerobic growth of rods (with or without endospores) giving a negative catalase reaction indicates the presence of *Clostridia*. If no anaerobic growth of microorganisms is detected on *Columbia Agar Medium* or the catalase test is positive, the product complies with the test.

Candida albicans

SAMPLE PREPARATION AND PRE-INCUBATION

Prepare the product to be examined as described in *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, and use 10 mL, or the quantity corresponding to 1 g or 1 mL, to inoculate 100 mL of *Sabouraud Dextrose Medium*, and homogenize. Incubate between 20° and 25° for 5 to 7 days.

SELECTION AND SUBCULTURE

Subculture on a plate of *Sabouraud Dextrose Agar Medium*, and incubate between 20° and 25° for 2 days.

INTERPRETATION

Growth of white colonies may indicate the presence of *C. albicans*. This is confirmed by suitable identification tests. The product complies with the test if spores are not present or if the confirmatory identification tests are negative.

BUFFER SOLUTIONS AND CULTURE MEDIA

The following solutions and culture media have been found satisfactory for the purposes for which they are prescribed in the test for microbial contamination in the Pharmacopeia.

pH 7.2 Phosphate Buffer

Stock Buffer Solution—Transfer 34 g of potassium hydrogen phosphate to a 1000-mL volumetric flask, dissolve in 500 mL of *Purified Water*, adjust with about 175 mL of sodium hydroxide to a pH of 7.2 ± 0.2, add *Purified Water* to volume, and mix. Dispense in containers, and sterilize. Store at a temperature between 2° to 8°.

Prepare a mixture of *Purified Water* and *Stock Buffer Solution* (800:1), and sterilize.

pH 7.0 Buffered Sodium Chloride-Peptone Solution

Monobasic Potassium Phosphate	3.6 g
Dibasic Sodium Phosphate, Dihydrate (equivalent to 0.067 M phosphate)	7.2 g
Sodium Chloride	4.3 g
Peptone (meat or casein)	1.0 g
Purified Water	1000 mL

Sterilize in an autoclave using a validated cycle.

Soybean–Casein Digest Medium

Pancreatic Digest of Casein	17.0 g
Papaic Digest of Soybean Meal	3.0 g
Sodium Chloride	5.0 g
Dibasic Potassium Phosphate	2.5 g
Dextrose ($C_6H_{12}O_6 .H_2O$)/($C_6H_{12}O_6$)	2.5/2.3 g
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 7.3 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Soybean–Casein Digest Agar Medium

Pancreatic Digest of Casein	15.0 g
Papaic Digest of Soybean Meal	5.0 g
Sodium Chloride	5.0 g
Agar	15.0 g
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 7.3 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Sabouraud Dextrose Agar Medium

Dextrose	40.0 g
Mixture of Peptic Digest of Animal Tissue and Pancreatic Digest of Casein (1:1)	10.0 g
Agar	15.0 g
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 5.6 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Potato Dextrose Agar Medium

Infusion from potatoes	200 g
Dextrose	20.0 g
Agar	15.0 g
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 5.6 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Sabouraud Dextrose Medium

Dextrose	20.0 g
Mixture of Peptic Digest of Animal Tissue and Pancreatic Digest of Casein (1:1)	10.0 g
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 5.6 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Mossel Enterobacteriaceae Enrichment Broth	
Pancreatic Digest of Gelatin	10.0 g
Glucose Monohydrate	5.0 g
Dehydrated Ox Bile	20.0 g
Monobasic Potassium Phosphate	3.0 g
Dibasic Sodium Phosphate, Dihydrate	8.0 g
Brilliant Green	15 mg
Purified Water	1000 mL

Adjust the pH so that after heating it is 7.2 ± 0.2 at 25°. Heat at 100° for 30 minutes, and cool immediately.

Violet Red Bile Glucose Agar Medium	
Yeast Extract	3.0 g
Pancreatic Digest of Gelatin	7.0 g
Bile Salts	1.5 g
Sodium Chloride	5.0 g
Glucose Monohydrate	10.0 g
Agar	15.0 g
Neutral Red	30 mg
Crystal Violet	2 mg
Purified Water	1000 mL

Adjust the pH so that after heating it is 7.4 ± 0.2 at 25°. Heat to boiling; do not heat in an autoclave.

MacConkey Medium	
Pancreatic Digest of Gelatin	20.0 g
Lactose Monohydrate	10.0 g
Dehydrated Ox Bile	5.0 g
Bromocresol Purple	10 g
Purified Water	1000 mL

Adjust the pH so that after sterilzation it is 7.3 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

MacConkey Agar Medium	
Pancreatic Digest of Gelatin	17.0 g
Peptones (meat and casein)	3.0 g
Lactose Monohydrate	10.0 g
Sodium Chloride	5.0 g
Bile Salts	1.5 g
Agar	13.5 g
Neutral Red	30.0 mg
Crystal Violet	1 mg
Purified Water	1000 mL

Adjust the pH so that after sterilization it is 7.1 ± 0.2 at 25°. Boil for 1 minute with constant shaking, then sterilize in an autoclave using a validated cycle.

Rappaport Vassiliadis Salmonella Enrichment Broth	
Soya Peptone	4.5 g
Magnesium Chloride Hexahydrate	29.0 g
Sodium Chloride	8.0 g
Dipotassium Phosphate	0.4 g
Potassium Dihydrogen Phosphate	0.6 g
Malachite Green	0.036 g
Purified Water	1000 mL

Dissolve, warming slightly. Sterilize in an autoclave using a validated cycle, at a temperature not exceeding 115°. The pH is to be 5.2 ± 0.2 at 25° after heating and autoclaving.

Xylose, Lysine, Deoxycholate Agar Medium	
Xylose	3.5 g
L-Lysine	5.0 g
Lactose Monohydrate	7.5 g
Sucrose	7.5 g
Sodium Chloride	5.0 g
Yeast Extract	3.0 g
Phenol Red	80 mg
Agar	13.5 g
Sodium Deoxycholate	2.5 g
Sodium Thiosulphate	6.8 g
Ferric Ammonium Citrate	0.8 g
Purified Water	1000 mL

Adjust the pH so that after heating it is 7.4 ± 0.2 at 25°. Heat to boiling, cool to 50°, and pour into Petri dishes. Do not heat in an autoclave.

Cetrimide Agar Medium	
Pancreatic Digest of Gelatin	20.0 g
Magnesium Chloride	1.4 g
Dipotassium Sulphate	10.0 g
Cetrimide	0.3 g
Agar	13.6 g
Purified Water	1000 mL
Glycerol	10.0 mL

Heat to boiling for 1 minute with shaking. Adjust the pH so that after sterilization it is 7.2 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Mannitol Salt Agar	
Pancreatic Digest of Casein	5.0 g
Peptic Digest of Animal Tissue	5.0 g
Beef Extract	1.0 g
D-Mannitol	10.0 g
Sodium Chloride	75.0 g
Agar	15.0 g
Phenol Red	0.025 g
Purified Water	1000 mL

Heat to boiling for 1 minute with shaking. Adjust the pH so that after sterilization it is 7.4 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle.

Reinforced Medium for Clostridia	
Beef Extract	10.0 g
Peptone	10.0 g
Yeast Extract	3.0 g
Soluble Starch	1.0 g
Glucose Monohydrate	5.0 g
Cysteine Hydrochloride	0.5 g
Sodium Chloride	5.0 g
Sodium Acetate	3.0 g
Agar	0.5 g
Purified Water	1000 mL

Hydrate the agar, and dissolve by heating to boiling with continuous stirring. If necessary, adjust the pH so that after sterilization it is about 6.8 at 25°. Sterilize in an autoclave using a validated cycle.

Columbia Agar Medium	
Pancreatic Digest of Casein	10.0 g
Meat Peptic Digest	5.0 g
Heart Pancreatic Digest	3.0 g
Yeast Extract	5.0 g
Maize Starch	1.0 g
Sodium Chloride	5.0 g
Agar, according to gelling power	10.0–15.0 g
Purified Water	1000 mL

Hydrate the agar, and dissolve by heating to boiling with continuous stirring. If necessary, adjust the pH so that after sterilization it is 7.3 ± 0.2 at 25°. Sterilize in an autoclave using a validated cycle. Allow to cool to between 45° and 50°; add, if necessary, gentamicin sulfate corresponding to 20 mg of gentamicin base and pour into Petri dishes.

GENERAL CHAPTERS

General Information

BRIEFING

⟨1111⟩ Microbiological Quality of Nonsterile Pharmaceutical Products, *USP 26* page 2380 and page 916 of *PF* 28(3) [May–June 2002]. This proposed revision, which previously appeared as a Pharmacopeial Discussion Group (PDG) PROPOSAL STAGE 3 document, is now forwarded to PDG as **OFFICIAL INQUIRY Stage 4**. The following changes were based on comments received in response to the Stage 3 document and discussions held by experts from the EP, JP, and USP:

1. The term "objectionable" has been deleted.
2. The decision tree (*Figure 1*) for selection of objectionable microorganisms present on selective media has been deleted, because it has caused confusion and the guidance it provided did not prove to be useful.
3. The term "Microbial Enumeration Targets" has been replaced by the term "Criteria for Microbiological Quality".
4. Criteria for total combined yeasts and molds count (TCYM) have been added for preparations for oromucosal, gingival, cutaneous, nasal, auricular, vaginal, and inhalation uses, and for transdermal patches.
5. Preparations for oral use have been split into two categories (liquid and solid), because different acceptance criteria are applied in view of the different potential for contamination.
6. Herbal drugs have been excluded from the scope of International Harmonization, because they are dealt with differently from region to region.
7. Nonsterile substances for pharmaceutical use have been included into the scope of International Harmonization, to give general guidance on microbiological quality; specific monographs will continue to give mandatory requirements where appropriate.

Other changes of lesser significance have been made throughout the text.

Deadline for comments: **31 October 2003**.

(AMB: D. Porter) RTS—40090-1

Change to read:

■⟨1111⟩ MICROBIOLOGICAL QUALITY OF NONSTERILE PHARMACEUTICAL PRODUCTS

The presence of certain specific microorganisms in nonsterile preparations may have the potential to reduce or even inactivate the therapeutic activity of the product and has a potential to adversely affect the health of the patient. Manufacturers therefore, have to ensure a low bioburden of finished dosage forms by implementing current guidelines on Good Manufacturing Practice during the manufacture, storage, and distribution of pharmaceutical preparations.

Microbial examination of nonsterile products is performed according to the methods given in the texts on *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩ and *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganism* ⟨62⟩. Acceptable criteria for nonsterile dosage forms based upon the total aerobic microbial count (TAMC)

and the total combined yeasts and molds count (TYMC) are given in *Tables 1* and *2*. Criteria are based on individual results or on the average of replicate counts when replicate counts are performed (e.g., direct plating methods). *Table 1* includes a listing of specified microorganisms for which criteria are set.

Table 1. Criteria for Microbiological Quality Nonsterile Dosage Forms

Route of Administration	Total Aerobic Microbial Count (cfu/g or cfu/mL)	Total Combined Yeasts/Molds Count (cfu/g or cfu/mL)	Specified Microorganism(s)
Solid preparations for oral use*	10^3	10^2	Absence of *Escherichia coli* (1 g or 1 mL)
Liquid preparations for oral use*	10^2	10^1	Absence of *Escherichia coli* (1 g or 1 mL)
Rectal use	10^3	10^2	—
Oromucosal use Gingival use Cutaneous use Nasal use Auricular use	10^2	10^1	Absence of *Staphylococcus aureus* (1 g or 1 mL) Absence of *Pseudomonasaeruginosa* (1 g or 1 mL)
Vaginal use	10^2	10^1	Absence of *Staphylococcus aureus* (1 g or 1 mL) Absence of *Escherichia coli* (1 g or 1 mL) Absence of *Candida albicans* (1 g or 1 mL)
Transdermal patches (limits for one patch including adhesive layer and backing)	10^2	10^1	Absence of *Staphylococcus aureus* (1 patch) Absence of *Pseudomonas aeruginosa* (1 patch)

Table 1. Criteria for Microbiological Quality Nonsterile Dosage Forms (*continued*)

Route of Administration	Total Aerobic Microbial Count (cfu/g or cfu/mL)	Total Combined Yeasts/Molds Count (cfu/g or cfu/mL)	Specified Microorganism(s)
Inhalation use (except for nebulizer solutions, which must be sterile)	10^2	10^1	Absence of *Staphylococcus aureus* (1 g or 1 mL) Absence of *Pseudomonas aeruginosa* (1 g or 1 mL) Absence of bile-tolerant Gram-negative bacteria (1 g or 1 mL)

* For oral dosage forms, other than those covered by *Table 2*, containing raw materials of natural (animal, vegetable, or mineral) origin for which antimicrobial pretreatment is not feasible and for which the competent authority accepts microbial contamination of the raw material exceeding 10^3 viable microorganisms per g or per mL, the enumeration targets are the following: TAMC, 10^4 cfu per g or per mL; TYMC, 10^2 cfu per g or per mL. Tests for specified microorganisms show not more than 10^2 enterobacteria and certain other Gram-negative bacteria per g or per mL, absence of *Salmonella* (10 g or 10 mL), absence of *E. coli* (1 g or 1 mL) and absence of *Staphylococcus aureus* (1 g or 1 mL).

Table 2. Criteria for Microbiological Quality of Nonsterile Substances for Pharmaceutical Use

Route of Administration	Total Aerobic Microbial Count (cfu/g or cfu/mL)	Total Combined Yeasts/Molds Count (cfu/g or cfu/mL)
Substances for pharmaceutical use	10^3	10^2

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 29(5) [Sept.–Oct. 2003]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Development of a Compendial Taxonomy and Glossary for Pharmaceutical Dosage Forms

Keith Marshall, *Chair, USP Pharmaceutical Dosage Forms Expert Committee*; Thomas S. Foster, *Chair, USP Biopharmaceutics Expert Committee*; Herbert S. Carlin, *Chair, USP Nomenclature and Labeling Expert Committee*; and Roger L. Williams, *EVP & CEO, United States Pharmacopeia*

ABSTRACT Members of the Pharmaceutical Dosage Forms Expert Committee (PDF EC) began development of this pharmaceutical dosage form taxonomy scheme and related glossary more than a year ago. In November 2002, an Ad Hoc Committee composed of members with expertise in pharmaceutical dosage forms, biopharmaceutics, and nomenclature was formed to work with the PDF EC in this endeavor.

The Stimuli article presented here represents the combined effort of this Ad Hoc Committee and the PDF EC. Portions of the PDF EC–approved taxonomy charts and glossary were subsequently revised by members of the Ad Hoc Committee for clarity and to address nomenclature issues. This article is the first step in the public review and comment process. Further modifications to the taxonomy scheme and glossary are anticipated.

Readers are invited and encouraged to submit comments and suggestions regarding the completeness, clarity, and utility of this taxonomy scheme and glossary. Receipt of such comments will facilitate revision of the taxonomy chart and glossary and their advancement in the revision review/adoption process.

INTRODUCTION

As part of its assignment to revise General Chapter <1151> *Pharmaceutical Dosage Forms*, the Pharmaceutical Dosage Forms Expert Committee (PDF EC) undertook during 2002 the development of a taxonomic scheme for the categorization of pharmaceutical dosage forms. The intent is that this scheme will clarify the content of *USP–NF* and make it more user-friendly. The taxonomy and its associated glossary provide the following benefits to users of the compendia:

- a uniform way of categorizing pharmaceutical dosage forms;
- a tool for finding information and linking specific dosage form monographs and general chapters;
- a rational linkage between dosage forms and their compendial specifications; and
- a linkage between dosage form drug substance(s) and therapeutic use.

In particular, if individual dosage forms can be more easily linked with their specifications or performance tests, both the manufacturer and the regulator will have a much clearer knowledge of the specifications generally needed to demonstrate compliance. Development of this taxonomy is also seen by USP as a mechanism for linking the endeavors of other USP Expert Committees, the Food and Drug Administration (FDA), Health Level 7 (HL7) (*1*), and the International Conference on Harmonization (ICH) in this field. It has been reported that FDA has a goal to standardize the established names of dosage forms to facilitate electronic transactions within the Agency.

In an effort to standardize names, FDA is also looking at nomenclature use in other countries. FDA and the USP Expert Committee on Nomenclature and Labeling work together on USP nomenclature for new products for which there are no USP dosage form descriptors. Many of the FDA and USP terms match or are close—but many of them do not match. The CDER Data Standards Manual has many dosage forms that USP does not have.

TAXONOMY

The currently suggested taxonomy chart was developed by the PDF EC with assistance from members of the Biopharmaceutics Expert Committee and the Nomenclature and Labeling Expert Committee. This chart is based on the *tier* concept, with the first tier delineating dosage forms according to the route of administration by which the drug substance is delivered.

The second tier is based on the general type of dosage form involved and its physical properties, i.e., solid, semisolid, liquid, gas, or aerosol. Each one of these groupings contains its own subsections listing the specific presentation of the dosage form, e.g., tablet, cream, insert, etc. This second tier facilitates downward expansion into the third tier, which is based on the type of release pattern of the drug substance and performance characteristics of the dosage form.

With such a scheme, any dosage form for any drug substance can be unambiguously identified by a combination of taxonomic terms from each tier, taking the form:

[drug substance] [route of administration] [physical state] [release pattern].

GLOSSARY

The glossary contains an introductory statement indicating that the definitions are for information only and for use in understanding the pharmaceutical dosage forms taxonomy. In the interest of the ongoing harmonization efforts,

the terms used in the taxonomy and glossary generally correspond with those definitions used by FDA, EP, and JP. Dosage form listings in the glossary follow the convention used in USP monograph titles.

The glossary has two parts. Except where indicated, the first part includes definitions associated with those dosage forms that appear in USP monograph titles, i.e., that appear in the taxonomy scheme, plus certain terms that have been agreed upon by USP and FDA but are not yet used in USP monograph titles.

The second part of the glossary includes definitions of some nonpreferred and/or outdated terms that are included only for completeness and electronic searching but with a notation directing the user to the preferred terms in Part 1. It also includes definitions of other terms that are not acceptable for use in *USP–NF* but are deemed to be helpful to the reader because they provide information about dosage form terminology used in other regions.

The general information chapter ⟨1151⟩ *Pharmaceutical Dosage Forms* will not contain subheadings for, or disquisitions on, the dosage form terms contained in Part 2 of the glossary.

CONCLUSION

In developing this taxonomy and glossary, every effort was made to keep them as simple as possible and to avoid duplication. This is viewed by USP as a positive move that may make *USP–NF* more user-friendly. Specifically, it will facilitate electronic searches in a manner that is not currently possible.

It should also be obvious that the taxonomic convention will facilitate the identification of clear associations between related groups of dosage forms and logical standards that should be uniformly applied. Consequently, in accordance with the tests and general chapters (or lack thereof), USP Expert Committees could be assigned or Advisory Panels could be formed to develop and revise the needed tests and general chapters, e.g., an Advisory Panel on Topicals or one on Performance Tests.

In the future it likely will be necessary to expand the number of categories in this taxonomy and glossary to accommodate entirely new types of dosage forms as required by the novel sources of drug substances now beginning to emerge. Likewise, there is Expert Committee agreement that this taxonomy should not limit new naming conventions. It is vital that new dosage form names be published in *USP–NF* to publicly announce the establishment of new dosage forms because FDA uses *USP–NF* as an information source for dosage-form nomenclature. There are also global implications associated with this nomenclature process, e.g., harmonization via ICH and HL7.

PUBLIC COMMENTS ABOUT THE TAXONOMY

Reader comments regarding the suggested taxonomy and glossary are invited. These comments should be submitted to Dr. W. Larry Paul at USP Headquarters, 12601 Twinbrook Parkway, Rockville, MD 20852-1790, by 28 November 2003.

REFERENCE

1. Founded in 1987, Health Level Seven, Inc. (http://www.HL7.org) is a not-for-profit, ANSI-accredited standards developing organization whose mission is to provide a comprehensive framework and related standards for the exchange, integration, sharing, and retrieval of electronic health information that supports clinical practice and the management, delivery, and evaluation of health services. Its 2200 members represent more than 500 corporate members, including 90 percent of the largest information systems vendors serving health care. HL7 has the specific goal to create flexible, cost-effective standards, guidelines, and methodologies to enable health care information system interoperability and sharing of electronic health records. The HL7 data interchange standards have been recommended by the National Committee on Vital and Health Statistics (NCVHS) for national adoption within the United States.

   HL7 has created ANSI standards for the transmission of drug orders, drug dispensing, and patient drug administration transactions. In this context, it is essential that the codes used for drugs be accurate, readily available, easy to use, and stable. Drug codes that meet these qualifications can be used for detecting drug–drug interactions, dosing errors, and drug allergies, as well as efficient reporting of adverse drug events. By means of these capabilities, accurate drug codes ultimately lead to decreased costs and improved patient safety.

USP Expert Committee on Pharmaceutical Dosage Forms

Categories of Pharmaceutical Dosage Forms
A Taxonomic Proposal

The taxonomic charts given here incorporate only dosage forms that are actually named in USP–NF monographs.

FIRST TIER

Delineated by the region of the body to which the drug substance is first delivered by the dosage form.

SECOND TIER

The criterion for this grouping is based on the general type of dosage form involved.

THIRD TIER

Individual dosage forms grouped depending on the release pattern of the drug substance.

NOTE: For some dosage forms it may be advisable to preface titles with a descriptor, e.g., "topical cream," "vaginal insert," or "otic solution."

GLOSSARY

PART 1

AEROSOL
A product that is packaged under pressure and contains active ingredients that are released upon activation of an appropriate valve system.

CAPSULE
A solid dosage form in which the active, with or without other ingredients, is filled into either a hard or soft shell. Most capsule shells are composed mainly of gelatin.

CHEWABLE
Term applied to a dosage form that is intended to be chewed in the mouth before swallowing.

COLLODION
Liquid preparation composed of pyroxilin dissolved in a solvent mixture of alcohol and ether and applied externally.

CONCENTRATE
A dosage form that is intended to be diluted with a vehicle before use. This term is being phased out of USP titles.

CREAM
A dosage form comprising a viscous semisolid emulsion.

DELAYED RELEASE
Release pattern of the active from the dosage form is deliberately modified to delay release of the active for some period of time after initial administration.

DENTAL
Term applied to a dosage form that is applied to the teeth and/or gums for localized action.

EFFERVESCENT
Term applied to a dosage form, frequently tablets, containing ingredients that, when in contact with water, rapidly release carbon dioxide. The dosage form is dissolved or dispersed in water before administration.

EMULSION
A two-phase system in which one liquid is dispersed throughout another liquid in the form of small droplets. When an aqueous solution is the continuous phase, the system is designated an oil-in-water emulsion. Conversely, when oil is the continuous phase, the system is designated a water-in-oil emulsion.

EXTENDED RELEASE
Release pattern of the active from the dosage form is deliberately modified to slow down the rate of release compared to that of a conventional (immediate-release) form of the same active. The term is synonymous with *PROLONGED RELEASE*.

FOAM
An emulsion packaged in pressurized aerosol containers; when dispensed it has a fluffy, semisolid consistency.

GEL
A dispersion of small inorganic particles or a solution of large organic molecules rendered jellylike in consistency.

GUM
A dosage form in which the base consists of a plastically deforming material that, when chewed, releases the active into the oral cavity.

IMMEDIATE RELEASE
Synonymous with *CONVENTIONAL RELEASE* (see Part 2), i.e., the release pattern of active from a dosage form in which no deliberate effort has been made to modify the rate. In the case of capsules and tablets, the inclusion or exclusion of a disintegrating agent is not interpreted as a modification. *IMMEDIATE RELEASE* is the preferred term.

INHALATION
A dosage form designed to be dispersed in a current of air and drawn into the airways when the patient breathes in.

INJECTION (INJECTABLE)
A sterile dosage form injected into a body cavity, fluid, or tissue.

INSERT
A solid dosage form which is inserted into a body cavity, such as the urethra or vagina. See also *SUPPOSITORY*, a term used to describe inserts into the rectal region.

IRRIGATION
A sterile solution intended to bathe or flush open wounds or body cavities.

INTRAOCULAR
A sterile liquid dosage form for administration within the eye.

JELLY
Term synonymous with *GEL*.

LOZENGE
A solid dosage form intended to disintegrate or dissolve slowly in the mouth and usually prepared by compaction in a manner similar to that of tablets or by a molding process.

MODIFIED RELEASE
Release pattern of the active from the dosage form has been deliberately changed from that of a conventional (immediate-release) form of the same active.

NASAL
Term applied to a dosage form administered to the nasal cavity for local or systemic effect.

OCULAR
See *INTRAOCULAR*.

OIL
A liquid or liquefiable-on-warming solid that is insoluble in water but soluble in ether.

OINTMENT
A viscous oleaginous or polymeric semisolid dosage form.

OPHTHALMIC
A sterile dosage form administered to the external parts of the eye.

ORAL
Term applied to dosage forms that are to be delivered into the mouth and are often swallowed.

ORALLY DISINTEGRATING
A solid oral dosage form that disintegrates rapidly in the mouth.

OTIC
Term for dosage forms to be administered to, or by way of, the ear. Sometimes referred to as AURAL (see Part 2).

PASTE
A semisolid preparation with a stiff consistency containing a relatively high concentration of solids.

PELLET
A solid dosage form of a granular or regular shape.

PLASTER
A solid or semisolid mass supplied on a backing material and intended to provide prolonged contact with the skin.

POWDER
A solid, or mixture of solids, that has been reduced to a finely divided state.

RECTAL
Term applied to dosage forms that are to be delivered into the rectal region to provide local or systemic effect.

RINSE
A solution used to cleanse by flushing.

SHAMPOO
A solution or suspension used to clean the hair and scalp.

SOAP
The alkali salt(s) of a fatty acid or mixture of fatty acids.

SOLUTION
A liquid preparation that contains one or more chemical substances dissolved, i.e., molecularly dispersed, in a suitable solvent or mixture of mutually miscible solvents.

SUBLINGUAL
A term applied to a dosage form that is intended to be placed underneath the tongue and to release the active for absorption in that region.

SUPPOSITORY
A solid dosage form in which one or more actives is dispersed in a suitable base and molded or otherwise formed into a suitable shape for insertion into the rectal area to provide local or systemic effect.

SUSPENSION
A liquid preparation that consists of solid particles dispersed throughout a liquid phase in which the particles are not soluble.

TABLET
A solid dosage form prepared from a powder or mixture of powders by compaction, by molding, or by means of lyophilization.

TINCTURE
An alcoholic or hydroalcoholic solution prepared from vegetable materials or from chemical substances.

TOPICAL
Term applied to dosage forms that are intended to be applied to the outer surface of the body.

VAGINAL
Term applied to solid dosage forms administered to the vagina, typically to obtain local effect.

PART 2

AROMATIC WATER
A clear, saturated aqueous solution of volatile oils or other aromatic or volatile substances.

AURAL (Auricular)
An unofficial alternative to *OTIC* (see Part 1) for administration to, or by way of, the ear.

BEAD
A solid dosage form in the shape of a small sphere. In most products a unit dose would consist of multiple beads. (See also *PELLETS*.)

COATED
Term applied to a solid dosage form that is covered by deposition of an outer solid that is different in composition from the core material.

CONVENTIONAL RELEASE
Release pattern of active from a dosage form in which no deliberate effort has been made to modify the rate. In the case of capsules and tablets, the inclusion, or exclusion, of a disintegrating agent is not interpreted as a modification. *IMMEDIATE RELEASE* (see Part 1) is synonymous with this term.

ELIXIR
A clear, pleasantly flavored, sweetened hydroalcoholic liquid containing dissolved actives intended for oral use. The term is no longer used in *USP–NF* (see Part 1 [ORAL][SOLUTION] or [ORAL][SUSPENSION]).

EMOLLIENT
A bland, fatty, or oleaginous substance applied locally to the skin to increase the tissue moisture content.

EXCIPIENT
An ingredient of a dosage form other than an active.

GRANULES
Preparations composed of dry aggregates of powder particles that may contain one or more actives, with or without other ingredients. They may be swallowed as such, or dispersed or dissolved in water. Granules are frequently compacted into tablets, with or without additional ingredients.

HARD-SHELL CAPSULE
A solid dosage form in which one or more actives, with or without other ingredients, is filled into a two-piece shell. Most hard-shell capsules are composed mainly of gelatin and are fabricated prior to the filling operation (see *CAPSULES* in Part 1).

LOTION
A fluid suspension or emulsion applied to the outer surface of the body. The term is no longer used in *USP–NF* (see Part 1 [TOPICAL][EMULSION] or [TOPICAL][SUSPENSION] or [TOPICAL][SOLUTION]).

MOLDED TABLET
A tablet that has been formed by dampening the ingredients and pressing them into a mold, then removing and drying the resulting solid mass.

MOUTHWASH
Term applied to an aqueous solution used to rinse the oral cavity.

ORO-PHARYNGEAL
Term applied to dosage forms in which the active is released into the buccal cavity and/or pharyngeal region to exert a local or systemic effect.

PILL
A solid spherical pharmaceutical dosage form, usually prepared by a wet massing technique. The use of the term *PILL* to describe tablets or capsules is discouraged.

SPIRIT
A liquid dosage form comprised of an alcoholic or hydroalcoholic solution of volatile substances.

STRIP
A dosage form or device in the shape of a long, narrow, thin solid material.

SYRUP
A solution containing high concentrations of sucrose or other sugars. The term is no longer used in *USP–NF (*see Part 1 [ORAL][SOLUTION] or [ORAL][SUSPENSION]).

TAPE
A dosage form or device in the shape of a long, narrow, solid material, frequently constructed of plastic or fabric.

TROCHE
A solid dosage form intended to disintegrate or dissolve slowly in the mouth and usually prepared by compaction in a manner similar to that of tablets. Also frequently referred to as *LOZENGE* (see Part 1).

URETHRAL
A term applied to a dosage form intended for insertion into the urethra to provide a local effect of the contained active.

A New Technique for Amino Acid Analysis in Pharmaceutical Samples

Petr Jandik, Jun Cheng, and Nebojsa Avdalovic*

ABSTRACT In this report, we discuss principles and applications of a new technique for amino acid analysis. The technique utilizes anion-exchange chromatography in combination with integrated pulsed amperometric detection (IPAD) using a gold electrode. All organic anions carrying primary and secondary amino groups and hydroxyl groups are detected. The technique does not require any form of derivatization for making the analytes detectable. The detection limits are comparable to those obtained by fluorescence detection of amino acid derivatives.

The new method is effective for monitoring the level of nutrients in cell cultures, and it also has been applied to different types of protein and peptide hydrolysates. Additionally, this report provides suggestions for method validation following regulatory guidelines.

INTRODUCTION

Until very recently, all analytical techniques for amino acid analysis utilized either a cation-exchange separation with postcolumn derivatization followed by optical detection or prechromatographic sample derivatization with reversed-phase separation and one form or another of optical detection *(1)*. The new technique discussed here is distinctly different from other methods of amino acid analysis because it combines anion exchange with an entirely new detection technique, integrated pulsed amperometric detection (IPAD) *(2)*.

Anion-exchange separations of amino acids are carried out under relatively highly alkaline conditions (pH >12). Along with the amino acids, several other classes of compounds that are capable of forming anions at high pH are also separated, for example, mono-, di-, and oligosaccharides and amino sugars. The elution sequence is essentially a reversal of that obtained by cation exchange and is also markedly different from elution orders of derivatized amino acids on reversed-phase columns.

IPAD is carried out in a three-electrode detection cell. The detection potentials are applied between the gold surface and glass/silver–silver chloride combination electrode. Electrons that are transferred to the gold surface during the oxidation of analytes give rise to an electric current between the gold electrode and counter electrode. The use of two additional separate electrodes instead of a single reference electrode (reference and counter electrode) helps minimize the flow of electric current through the reference electrode and keeps the reference potential stable over a long period of time. If the main portion of the current is allowed to pass through the reference electrode, it causes the silver chloride to dissolve from the surface of the silver wire and, consequently, causes the potential of the reference electrode to vary. The current resulting from analyte oxidation at the gold electrode is measured by integration over a time period. The units of the detection signal are nanocoulombs (coulomb = ampere · second) rather than amperes.

The method does not require any derivatization of amino acids and achieves sensitivities (signal intensity at a given concentration) that are comparable to those obtained by fluorescence detection of various amino acid and carbohydrate derivatives.

It is important to note that routine use of a new detection technique engenders a new set of requirements. Some of these may be unfamiliar to even experienced users of derivatization-based detection techniques for amino acids. In addition to a general description of the new technique, this report provides guidelines for successful startup, routine operation, and validation of anion-exchange/IPAD systems.

EXPERIMENTAL

Anion Exchange of Amino Acids

All separations are achieved by ternary gradients employing three eluents (A: water, B: 0.25 M NaOH, and C: 1.0 M Na-acetate). A typical gradient program used for analyzing cell culture samples is shown in *Table 1a*.

75	94	6	0		

The high pH–stable anion-exchange columns are typically used as a combination of a guard (2 mm internal diameter × 50 mm length) and an analytical column (2 mm internal diameter × 250 mm length). The columns are packed with 9-µm-diameter microporous resin beads consisting of ethylvinylbenzene crosslinked with 55% divinylbenzene. The latex layer agglomerated on the surface of the 9-µm-diameter beads consists of 200-nm vinylbenzylchloride-based spherical particles functionalized with a mix of quaternary/tertiary ammonium groups. This mix of functionalized groups has a controlled ratio to give required selectivity for the separation of amino acids. The small particle size of the anion-exchange resin beads exhibits adequate mass transfer characteristics to enable good chromatographic peak efficiency. The highly cross-linked core of the packing permits the use of organic solvents to facilitate column cleanup.

Integrated Pulsed Amperometric Detection

The rapidly cycled sequence of potentials (IPAD waveform) applied to the three-electrode, low dead volume chromatographic detection cell is shown in *Table 1b*. The detection current is measured by integration over a time period also indicated in *Table 1b*.

Table 1b: IPAD Waveform

Time (s)	Potential vs pH	Integration
0.00	+0.13	
0.04	+0.13	
0.05	+0.28	
0.11	+0.28	Begin
0.12	+0.55	
0.41	+0.55

0.57	–1.67	
0.58	–1.67	
0.59	+0.93	
0.60	+0.13	

Indicator electrode: gold 1-mm diameter
Reference electrode: pH/Ag/AgCl
Counter electrode: titanium

Amino Acid Analysis System

A typical system fulfilling all of the requirements for anion-exchange/IPAD analysis of amino acids includes an autosampler, a column thermostat (the separation temperature has to be controlled within ±1 °C; for the majority of existing methods the prescribed temperature is 30 °C), microbore version of a gradient pump, and a suitable electrochemical detector for pulsed electrochemical detection. The detector should include a microbore-compatible three-electrode cell comprising a working electrode (gold), a reference electrode (pH), and a counter electrode. For automatic operation, a PC with appropriate system and data acquisition software should also be included.

Eluents and Standards

Use sterile vacuum filtration units with 0.2-µm Nylon filters for the filtration of all eluents. Blanket all eluents with inert gas at all times during preparation and use.

Eluent E1: Deionized Water

Filter the pure deionized water through 0.2-µm Nylon filters; then transfer into an eluent bottle. Seal the filtered water immediately. Minimize the contact time of the water surface with the atmosphere.

Eluent E2: 250 mM Sodium Hydroxide

The first step in the preparation of sodium hydroxide eluent is degassing and filtration of water (typically 1.0 L). Using a pipette, add an aliquot of 50% (w/w) sodium hydroxide (13.1 mL/L of water). Seal the container immediately after the sodium hydroxide transfer is complete. Minimize the carbon dioxide absorption during the transfer into the system eluent container, and apply inert gas immediately after transfer.

Eluent E3: 1.0 M Sodium Acetate

Dissolve 82.04 g of anhydrous sodium acetate in approximately 750 mL water. Seal the container during the dissolution step. Make up to 1.0 L with water, and filter through a 0.2-µm Nylon filter. Transfer the filtered sodium acetate eluent into the system eluent container.

Diluent Solutions Containing Sodium Azide

Prepare 1 L of a solution containing 20 mg/L of NaN_3. Use the solution without norleucine if the presence of an internal standard is not required. Store the pure azide solution in a closed container at room temperature.

Amino Acid Standards

Dissolve suitable amino acid standards and dilute with the diluent to obtain a solution that contains 5 µM or 10 µM of each amino acid. The standard solutions thus prepared remain stable for weeks if stored in a refrigerator. Sodium azide introduced with the diluent stabilizes diluted standards for up to 48 hours at room temperature. Suitable standard solutions of mono- and disaccharides may be added to the amino acid analysis standard solution, if and as necessary.

APPLICATIONS

Cell culture monitoring is perhaps one of the most important applications for the new amino acid analysis technique. In many cases, the technique makes possible a simultaneous quantitative determination not only of amino acids but also of sugars present in the medium *(3–4)*.

A typical chromatogram is shown in *Figure 1a*. The figure shows an overlay of chromatograms of a 1:50 diluted cell culture sample and of a mixture of amino acid standards to which glucose and sucrose were added in approximately the same concentration as the amino acids. The molar concentrations of the two sugars in the cell culture sample are about 100-fold higher than those of the amino acids. The chromatogram in *Figure 1a* represents roughly the highest possible excess of carbohydrates for such samples at which it is still possible to obtain quantitative results for the two carbohydrates and the full range of amino acids present.

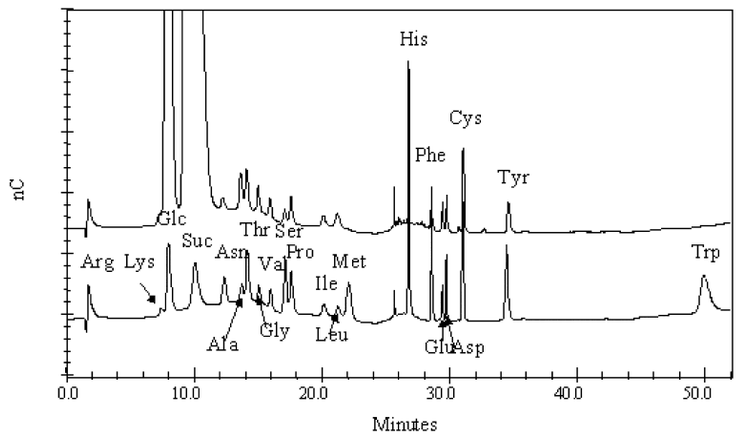

Fig. 1a: Overlay of a 1:50 diluted cell culture sample and amino acid standard (NIST SRM 2389, 321.5-fold diluted and containing glucose and sucrose at 8 M each) chromatograms. Injection volume: 25 µL. Gradient conditions: *Table 1a*. Detection waveform: *Table 1b.* Column temperature 30 °C. See Experimental for further details.

The resolution between the carbohydrates and the nearest peaks of amino acids can be optimized with the help of retention maps such as the one shown in *Figure 1b*. The "Initial NaOH Concentration" is the mobile phase composition during the first two minutes of the gradient of *Table 1a*. The resolution under the exact conditions of the *Table 1a* gradient is thus represented in *Figure 1b* by the data points at 15 mM of NaOH. As the initial mobile phase composition is decreased from 25 to 10 mM, the retention times of the nearest amino acids diverge, while the retention times of carbohydrates converge. Such a converging pattern for the retention times is observed for virtually all carbohydrates.

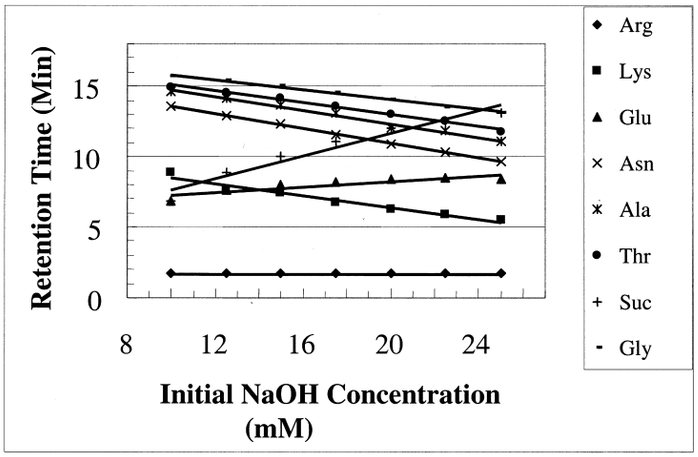

Fig. 1b: The Retention Map of two sugars and the nearest peaks of amino acids. Initial (0–2 min) concentration of sodium hydroxide of *Table 1a* is being changed between 25 and 10 mM. The timing and compositions of all other steps remain unchanged. The retention times of the peaks in the second half of the separation (His to Trp) are not affected. Also not changed is the total run time of 75 min (includes re-equilibration to initial gradient conditions).

At the initial concentration of 10 mM, the gap between the peaks of lysine and arginine becomes sufficiently wide that a full simultaneous separation of fucose, galactosamine, glucosamine, galactose, glucose, and mannose becomes possible (data not shown). Further developments of simultaneous carbohydrate and amino acid separations have been published *(5)*. Samples containing higher than approximately 100-fold molar excess of carbohydrates over amino acids require sample preparation that involves reducing the carbohydrate content prior to amino acid separation. A method describing an automated removal of carbohydrates from carbohydrate-rich amino acid samples has been re-

ported *(6)*, and the corresponding accessory consisting of an additional pump, valve, and cation-exchange cartridge is commercially available.

Another area of application of the anion-exchange/IPAD method is the analysis of hydrolysates of peptides and proteins. The method has been evaluated for different types of protein and peptide hydrolysates that are currently in use (HCl, MSA, MSA with performic acid oxidation, NaOH, propionic acid/HCl, etc.). The corresponding experimental protocols have been made available in a chapter of a recently published book *(7)*. A new validation protocol for protein hydrolysates analyzed by anion-exchange/IPAD is reported in a chapter of another book *(8)*.

An overlay of the amino acid standard and the peptide hydrolysate chromatograms is shown in *Figure 2*. As with many other amino acid analysis techniques, norleucine is used as an internal standard. Cysteic acid was added to the standard mixture to indicate the position of the peak in hydrolysate samples oxidized by performic acid. Occasionally, the arginine peak may co-elute closely with unretained "IPAD-positive" compounds such as non-anionic amines, e.g., tris(hydroxymethyl)-aminomethane, etc., as simulated by the addition of tris(hydroxymethyl)-aminomethane (TRIS) to the standard mixture in *Figure 2*. In those cases when reliable quantitation of arginine is impossible, users have the option to adjust the arginine retention and with it the resolution of the corresponding peak from the matrix. Complete separation of arginine is accomplished by adjusting the acidity during the reconstitution of hydrolysate samples following the evaporative centrifugation step after acid hydrolysis or by timed insertion of an acidic segment during the chromatographic separation *(9)*.

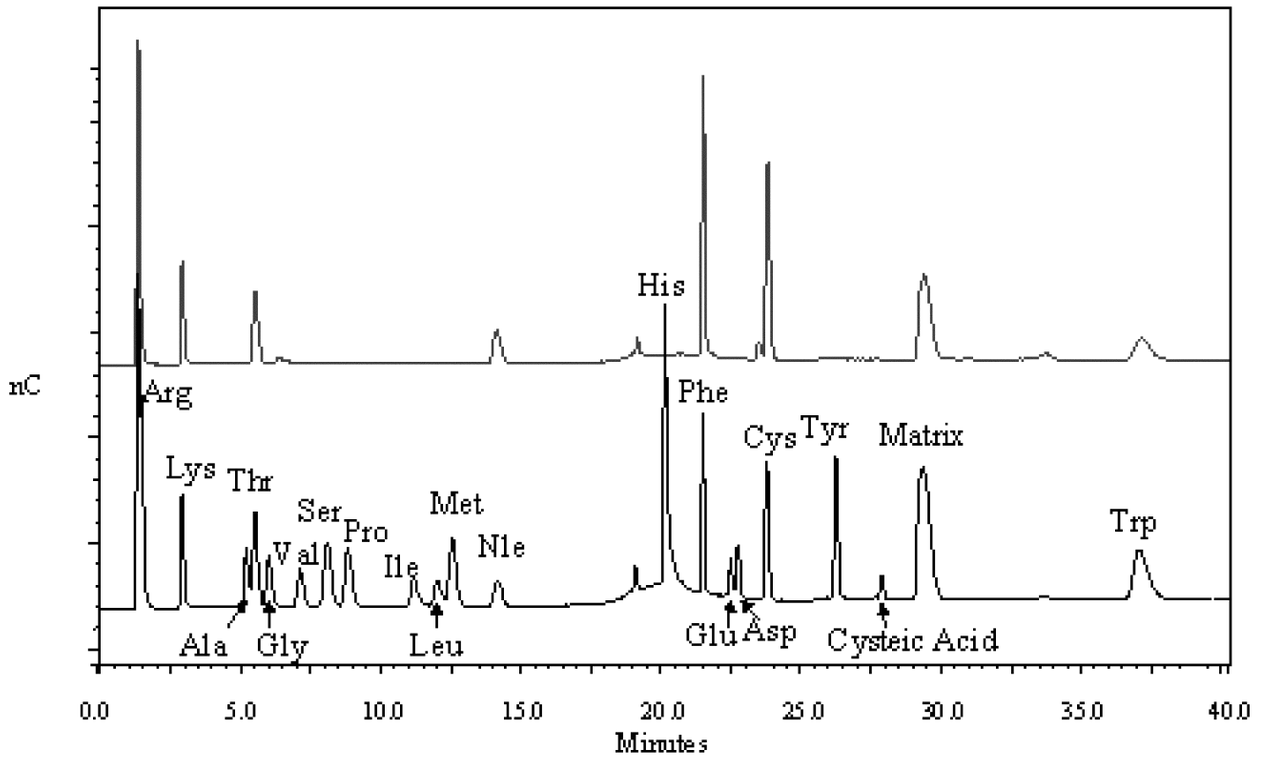

Fig. 2: Chromatograms of an NIST SRM 2389 (312.5-fold diluted) standard and peptide hydrolysate sample. Injection volume: 25 µL. Gradient conditions were the same as in *Table 1a*, except for the initial concentration of sodium hydroxide that was set at 60 mM between 0 and 2 minutes. The detection waveform and all other chromatographic conditions were the same as in *Fig. 1a*. The total amount of the original peptide used to generate the chromatogram was 0.754 µg. The hydrolysis was carried out in constant boiling HCl at 130 °C for 16 h.

The list of other useful examples of application of the anion-exchange/IPAD-based technique for amino acid analysis includes pharmaceutical excipient solutions, plant and soil extracts, food analysis, etc.

EXPERIMENTAL CONSIDERATIONS

Certain significant requirements of this new technique and the analyzer may not be immediately obvious even to experienced users of other types of amino acid analyzers. First is the requirement for sterility of eluents. Even small traces of bacterial contamination in eluents, eluent containers, eluent tubing, or glassware for eluent preparation may cause elevated detection backgrounds, interfering peaks, and excessive baseline rise during gradients. Bacterial contamination introduced, for example, by accidental skin contact, shared glassware, and eluents that were not passed through a 0.2-µm Nylon filter requires cleaning of the entire system by 2 N sodium hydroxide. Experienced users often add a low concentration of sodium hydroxide (10–25 mM) to the two non-hydroxide eluents (water and sodium acetate). This minimizes the effect of bacterial contamination and has been shown to eliminate the need for an occasional hydroxide cleanup.

The second of the requirements arises from the sensitivity of the detection methods for hydroxylic compounds. Accidental contamination of eluents by sugars or some organic solvents may affect the long-term stability of detector response and may require a thorough system cleanup with 6 N nitric acid. Incorrect eluent filtration materials such as cellulose acetate or inadvertent introduction of alcohols from the autosampler rinsing fluid that contains 50% methanol have been identified as the two most frequent causes of system contamination by hydroxylic compounds.

The third of the unusual requirements is that of the absence of even traces of thiolic impurities in the eluents. Because of their affinity to gold, thiols can accumulate on the surface of the working electrode, causing a gradual decrease of the detection signal. The authors recommend frequent testing of detection response by injections of a single component standard such as histidine. Investigations show that thiol impurities are being introduced exclusively from contaminated lots of sodium acetate used in the preparation of eluents. Thus, using a thiol-free sodium acetate is absolutely critical for the new amino acid analysis technique.

The required system clean-up after accidental use of contaminated acetate consists of thorough rinsing of eluent tubing and column with a thiol-free, acetate-containing mobile phase. The working electrode has to be either replaced or reconditioned by polishing.

Because of these unique requirements, the use of a dedicated system for amino acid analysis is recommended. Any changeover between two or more chromatographic methods may require long and laborious cleanups. One possible exception is using the same system for carbohydrate analysis and amino acid analysis. Because the system requirements are very similar for both techniques (both use anion-exchange/IPAD), a changeover between columns optimized for carbohydrate and amino acid analyses is very easy.

METHOD VALIDATION

In this section we provide recommendations for method validation following the relevant regulatory guidelines *(10–11)*.

Accuracy

For accuracy testing with culture samples, the authors recommend spiking samples with an amino acid or sugar normally not present in that particular type of cell culture media. Norleucine, asparagine, fucose, galactose, and fructose are examples of possible test compounds for accuracy evaluation. Most cell culture samples have to be diluted at least 50-fold prior to analysis by the anion-exchange/IPAD method, and the spiking compound can be added with the diluent solution. Assay accuracy can thus be monitored with each injection. Also, as recommended in the ICH Guidelines *(11)*, accuracy can be inferred from precision, linearity, and specificity evaluation results. Additional data on the accuracy of this technique have been reported in Table 2 of Reference 2.

Precision

The specified precision (relative standard deviation, RSD) of the discussed method is 2 to 5% RSD within one day. An RSD of <10% is achievable over a period of several weeks. Sample stability, proper functioning of the autosampler, column performance within specifications, correct peak identification, and integration are the most important requirements for achieving satisfactory precision in amino acid analysis by the anion-exchange/IPAD method.

Sample stability

A solution of 20 mg/L of sodium azide is recommended as a matrix for all standards and samples. If bacterial contamination is minimized (e.g., gloves, sterile containers, azide diluent), standard solutions containing micromolar and picomolar amounts of amino acids have been found to be stable within the specified measurement error (2–5% RSD) for 3 days at room temperature. Over a longer period of time, for example 5–7 days, some of the less stable amino acids such as, e.g., arginine, may exhibit 5–10% decrease in concentration. The majority of the standard amino acids, however, are stable over 5–7 days even at room temperature.

Autosampler functioning

One should neither under- nor over-fill the autosampler vials. Operators should re-prime the sample syringe if they observe air bubbles inside the rinse line or in the sample syringe, and they should tighten up connections leading to the sample syringe valves if they observe air bubbles inside the Teflon tubing leading from the syringe to the injection port. The authors recommend using 20 mg/L sodium azide as an autosampler rinse solution.

Column performance

Deteriorating column performance may degrade the resolution of several peak pairs. The affected peaks can be frequently misidentified or incorrectly (and irreproducibly) integrated in the automatic mode. In the majority of cases, separation performance can be restored by replacing the guard column, modifying the gradient method, correcting the setting of the column thermostat, or adjusting the sample matrix. The most important critical pairs to watch are alanine/threonine in the alanine-threonine-glycine triplet, leucine/methionine in the isoleucine-leucine-methionine triplet, and glutamate/aspartate in the glutamate-aspartate doublet.

The alanine/threonine peak pair is the one most affected by a deteriorated guard column. It is not unusual to replace the guard column several times during a lifetime of an analytical column (6–24 months). A lower degree of resolution between alanine and threonine is frequently observed with gradients optimized for simultaneous carbohydrate-amino acid separations *(Figure 1a)*. If necessary, users have an option to apply on-line carbohydrate removal *(6)* in connection with one of the gradient methods optimized for the separations of carbohydrate-free amino acid mixtures. This approach always improves the resolution of the alanine/threonine peak pair. Poor resolution of the leucine/methionine pair usually indicates incorrect column thermostat temperature. Only a slight deviation from the prescribed column temperature of 30 °C affects the resolution of these two peaks while the resolution of all other amino acid peaks remains unaffected. The effect of column temperature on the resolution of amino acids, particularly of the leucine/methionine pair, and techniques to improve leucine/methionine resolution have been discussed *(12)*.

A decrease in glutamate/aspartate resolution is observed if the matrix of the injected samples is too acidic or if the ionic strength is too high. Consequently, the authors recommended not exceeding ~0.1 M concentration of mineral acids or salts in the analyzed samples.

Correct peak identification and integration

Incorrect integration can cause high RSD even if all the modules are functioning perfectly. Such a situation is easily diagnosed by creating an overlay of several injections of the same standard. If the overlay of five or more peaks has the appearance of seemingly merging into a single chromatogram and the RSD is still higher than 5%, incorrect integration is the most likely cause of the problem.

Analysts can review the position of baseline and integration markers in each chromatogram and reposition the peak delimiters, if necessary. Should the high value of RSD result from peak misidentification, one can readjust the retention time intervals for the affected peaks using the chromatographic software.

Specificity

This method for amino acid analysis relies on the combined use of ion-exchange separation and electrochemical detection, both of which are known as highly selective methods. Their combined use further enhances the achievable specificity. Following are examples of compounds that can be reliably handled by the method:

Compounds that are neither retained nor detected

All inorganic and organic cations (including ammonium, quaternary and tertiary ammonium, and transition metals); all organic molecules that are non-ionized and lack primary or secondary amine groups.

Compounds that are retained but not detected

All inorganic and organic anions (including phosphates, all alcohols, and carboxylates such as citric acid or EDTA).

Compounds that are not retained but detected

Sugar alcohols and ethanolamines (including TRIS). The nonretained "IPAD-positive" compounds, such as for example TRIS or myoinositol, can on occasions make the quantitation of arginine difficult or impossible. For such cases, the literature describes a modified protocol for achieving improved resolution of arginine *(9)*.

Compounds that are retained, detected, and separated depending on the ratio of molar concentrations

Sugars and amino sugars. Depending on molar concentration ratios and the specific pair of chromatographic peaks, sugars up to ~100-fold molar excess can be separated from the nearest co-eluting amino acid peak. An example of such a separation of excessive sugar concentrations from amino acids is illustrated in *Figure 1a*. For samples containing even higher molar ratios of sugar concentrations, an automated sugar-removal technique should be used *(6)*.

Impurity Testing

The IPAD detection technique for amino acid analysis offers a unique approach to verifying peak purity and detecting unresolved impurities co-eluting with peaks of interest. The method is described in *(4)*. IPAD detection makes it possible to generate peak area ratios obtained with different modes of electrode current integration. These ratios are compound specific. The unexpected values of peak ratios indicate the presence of an impurity or impurities.

Detection and Quantitation Limits

Table 2 documents detection limits calculated as 3:1 signal-to-noise ratios that are typical for the performance of the anion-exchange/IPAD technique (see column 2). Limit of quantitation data can be calculated as 10:1 signal-to-noise ratios from the same data.

Table 2: Summary of typical validation results

Amino Acid	Limit of Detection (pmol)	Linear Range (pmol)	R^2	RSD (%) 20 Runs
Arginine	0.11	2.5–500	0.9990	1.97
Lysine	0.22	2.5–500	0.9999	1.67
Alanine	0.39	2.5–500	0.9990	0.71
Threonine	0.19	2.5–2000	0.9993	0.67
Glycine	0.44	2.5–500	0.9997	1.34
Valine	0.44	2.5–1000	0.9993	0.73
Serine	0.28	2.5–2000	0.9993	0.84
Proline	0.29	2.5–1000	0.9996	1.38
Isoleucine	0.58	2.5–2000	1.0000	0.82
Leucine	0.67	2.5–2000	1.0000	1.10
Methionine	0.36	2.5–500	0.9999	0.75
Histidine	0.043	2.5–250	0.9909	0.88
Phenylalnine	0.10	2.5–500	0.9980	0.57
Glutamate	0.41	2.5–500	0.9995	1.51
Aspartate	0.22	2.5–500	0.9994	1.65
Cystine	0.050	2.5–500	0.9979	0.91
Tyrosine	0.093	2.5–500	0.9995	1.20

Linearity

The calibration plots for most amino acids are linear from their respective detection limits to 1 nmol (amount injected). The basic amino acids (Arg, His, Lys) represent an exception. Their calibration plots are linear up to several hundred pmol (amount injected).

A possibility exists for expanding the linear range for all amino acids at the cost of increasing the detection limits and decreasing sensitivity. This can be done by decreasing the waveform potential values at 0.12 and 0.42 sec (*Table 1b*) to a value between 0.5 to 0.28 V vs pH. The same potential value has to be selected for both time points of the waveform.

A representative example of linearity evaluation is shown in the third and fourth columns of *Table 2*. An in-depth discussion of aspects that influence the linearity of IPAD is presented in *(2)*, which also provides a detailed discussion about detection waveform optimization.

Range

Upper Limit

For the purpose of determining and documenting the upper limit of the (linearity) range, amino acids can be divided into three classes:

- aliphatic amino acids such as glycine, alanine, valine, isoleucine, and leucine
- basic amino acids such as arginine, lysine, and histidine
- hydroxy amino acids and sugars such as serine and threonine.

Aliphatic amino acids exhibit the broadest range of linearity, frequently exceeding 1 nmol injected. Their upper limits of detection are usually slightly higher than those of the other two groups. The upper limits of detection of basic amino acids are usually less than those of the other two groups.

The upper limit of linearity of the hydroxy amino acids and sugars may be slightly lower than that of the aliphatic amino acids. The ranges of amino acids carrying mercapto or thioether groups are similar to those of the hydroxy amino acids.

Lower Limit

The lower limit of the range is dictated by the relative position of a peak in the gradient separation. The peaks eluting at the final section of the acetate gradient tend to have lower detection limits than those eluting in isocratic regions or parts of the chromatogram eluted by hydroxide gradient. The peak position is a much more important factor in determining the lower detection limit than is the actual result of electrode response for the same peak. See, for example, the much higher response for histidine than for lysine. A similar comparison can also be made for leucine and alanine.

To make the documentation less confusing and to simplify the evaluation, it is thus possible to validate the amino acid analysis using the anion-exchange/IPAD method only for a group of well-selected amino acids. The worst-case scenario can be defined by selecting the data of, for example, lysine and leucine for the upper and lower limits of the range, respectively. All other results would either conform to or exceed such a specification. Alternatively, it is also possible to define a span from worst to best possible values for the upper and lower limits of the range. The selection of experimental values of leucine and threonine or histidine and threonine for the lower and upper limits, respectively, would seem appropriate.

Robustness

The effects of different compositions of gradients are illustrated in Tables 2, 3, and 4 and Figures 4, 5, 6, and 7 of Reference 12. The influence of temperature variations on the separation of 17 amino acids is shown in Figure 10 of Reference 12. Figure 16 of Reference 12 shows the effects of different autosampler injection modes on the quality and appearance of the chromatograms.

CONCLUSION

Anion-exchange/IPAD is a new technique for the analysis of un-derivatized amino acids and also of carbohydrates. Frequently, amino acids and sugars can be analyzed simultaneously if they are present in the same sample. The selectivity of separations can be modified to a very large degree by optimization of gradient-elution programs. The selectivity, linearity, and sensitivity of the detection response can be adjusted by choosing different detection potentials of the detection waveform. The evaluation results show anion-exchange/IPAD to be a useful technique for the analysis of cell culture media, protein hydrolysates, pharmaceutical excipients, and many other types of amino-acid–containing samples.

Stimuli to the Revision Process

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

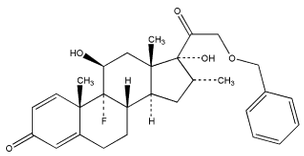
USP Dictionary of USAN and International Drug Names
2003 USP DICTIONARY SUPPLEMENT 3

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2003 edition of the USP Dictionary (USPD) up to date. The cumulative contents of the supplements to the current (2003) edition will be included in the next complete edition of the Dictionary.

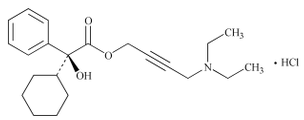
New United States Adopted Names (USAN)

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

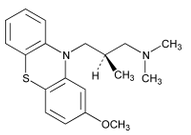
Dexamethasone Beloxil [*2003*] (dex a meth′ a sone bel ox′ il). $C_{29}H_{35}F_5$. 482.60. (1) (11β,16α)-9-Fluoro-3,17-dihydroxy-16-methyl-21-(phenylmethoxy)-pregna-1,4-diene-3,20-dione; (2) 21-(Benzyloxy)-9-fluoro-11β,17-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione; (3) 21-*O*-Benzyldexamethasone. *CAS-150587-07-8*. *Anti-inflammatory used in the treatment of uveitis, iritis, keratitis, postsurgical inflammation, vernal keratoconjunctivitis, and giant papillary conjunctivitis.* (Alcon)



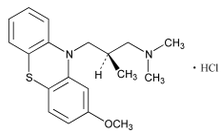
Esoxybutynin Chloride [*2003*] (es ox i bue′ ti nin). $C_{22}H_{31}NO_3$.HCl. 393.95. (1) Benzeneacetic acid, α-cyclohexyl-α-hydroxy-, 4-(diethylamino)-2-butynyl ester, hydrochloride, (α*S*)-; (2) 4-(Diethylamino)but-2-ynyl (2*S*)-cyclohexylhydroxyphenylacetate hydrochloride. *CAS-230949-16-3*. *Treats overactive bladder symptoms of urgency, frequency and urinary incontinence* (*antispasmodic/anticholinergic*). (Sepracor)



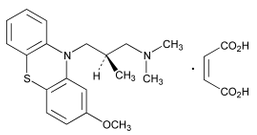
Levomepromazine [*2003*] (lee″ voe me proe′ ma zeen). $C_{19}H_{24}N_2OS$. 328.47. (1) 10*H*-Phenothiazine-10-propanamine, 2-methoxy-*N*,*N*,β-trimethyl-, (β*R*)-; (2) (–)-(2*R*)-3-(2-Methoxy-10*H*-phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine. *CAS-60-99-1*. INN; BAN; DCF. *Analgesic* (*central nervous system depressant*). Nozinan (Aventis); (Orgasynth) ✧*RP-7044; XP03*



Levomepromazine Hydrochloride [*2003*]. $C_{19}H_{24}N_2OS$.HCl. 364.93. (1) 10*H*-Phenothiazine-10-propanamine, 2-methoxy-*N*,*N*,β-trimethyl-, monohydrochloride, (β*R*)-; (2) (2*R*)-3-(2-Methoxy-10*H*-phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine hydrochloride. *CAS-1236-99-3*. JAN. *Analgesic* (*central nervous system depressant*) . Nozinan (Aventis); (Orgasynth)

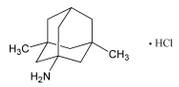


Levomepromazine Maleate [*2003*]. $C_{19}H_{24}N_2OS.C_4H_4O_4$. 444.54. (1) 10*H*-Phenothiazine-10-propanamine, 2-methoxy-*N*,*N*,β-trimethyl-, (β*R*)-, (2*Z*)-2-butenedioate (1:1); (2) (2*R*)-3-(2-Methoxy-10*H*-phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine hydrogen (2*Z*)-but-2-enedioate. *CAS-7104-38-3*. JAN. *Analgesic* (*central nervous system depressant*). Nozinan (Aventis); (Orgasynth); Tisercin (Elan)

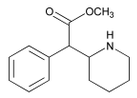


Lucinactant [*2003*] (loo sin ak′ tant). Lucinactant. A surfactant formulation containing a mixture of synthetic phospholipids, fatty acid, and synthetic peptide. Lucinactant is comprised of sinapultide, colfosceril palmitate (dipalmitoylphosphatidylcholine [DPPC]), palmitoyloleaylphosphatidyl glycerol, sodium salt (POPG), and palmitic acid.*Treatment of respiratory distress syndrome* (*RDS*) *in adults; treatment and prevention of RDS in infants.* (Acute Therapeutics) ✧*KL_4-surfactant; ATI 02*

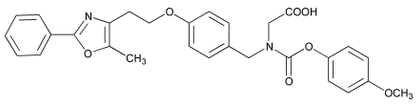
Memantine Hydrochloride [*2003*] (me man′ teen). $C_{12}H_{21}N.HCl$. 215.76. (1) Tricyclo[3.3.1.1^{3,7}]decan-1-amine, 3,5-dimethyl-, hydrochloride; (2) 3,5-Dimethyltricyclo[3.3.1.1^{3,7}]decan-1-amine hydrochloride; (3) 3,5-Dimethyl-1-adamantanamine hydrochloride; (4) 1-Amino-3,5-dimethyladamantane hydrochloride. *CAS-41100-52-1. Treatment of Alzheimer's disease.* Ebixa (Cambrex Profarmaco, Belgium); Axura (Cambrex Profarmaco, Belgium)



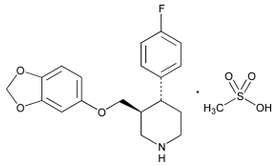
Methylphenidate [*2003*] (meth il fen′ i date). $C_{14}H_{19}NO_2$. 233.31. (1) 2-Piperidineacetic acid, α-phenyl-, methyl ester; (2) α-Phenyl-2-piperidineacetic acid methyl ester. *CAS-113-45-1*. INN; BAN. *Stimulant* (*CNS*). (Mallinckrodt)



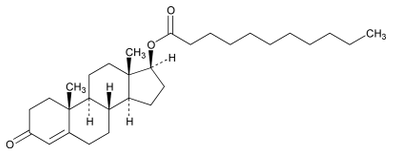
Muraglitazar [*2003*] (myoo ra gli′ ta zar). $C_{29}H_{28}N_2O_7$. 516.54. (1) Glycine,*N*-[(4-methoxyphenoxy)carbonyl]-*N*-[[4-[2-(5-methyl-2-phenyl-4-oxazolyl)ethoxy]phenyl]methyl]-; (2) [[(4-Methoxyphenoxy)carbonyl][4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]benzyl]amino]acetic acid. *CAS-331741-94-7* [free acid]. *Treatment of type-2 diabetes mellitus, mixed dyslipidemia, atherosclerosis, and metabolic syndrome* (*dual* (*alpha and gamma*) *peroxime proliferator activated* (*PPAR*) *agonist*). (Bristol-Myers Squibb) ✧*BMS-298585*



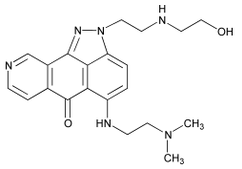
Paroxetine Mesylate [*2003*] (pa rox′ e teen). $C_{19}H_{20}FNO_3.CH_4O_4S$. 441.47. (1) Piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)-, (3*S*,4*R*)-, methanesulfonate; (2) (–)-*trans*-4*R*-(4′-Fluorophenyl)-3*S*-[(3′,4′-methylenedioxyphenoxy)methyl]piperidine, mesylate. *CAS-217797-14-3*. *Treatment of major depressive disorder, obsessive compulsive disorder, and panic disorder* (*selective serotonin reuptake inhibitor*). Asimia (Heumann Pharma GmbH, Germany) ✧*POT.mes*



Testosterone Undecanoate [*2003*] (tes tos′ ter own un dek′ a noe′ ate). $C_{30}H_{48}O_3$. 456.70. (1) 3-Oxoandrost-4-en-17β-yl undecanoate; (2) Androst-4-en-3-one, 17-[(1-oxoundecyl)oxy]-(17β). *CAS-5949-44-0. In males: testosterone replacement therapy for primary or secondary hypogonadal disorders. In female-to-male transsexuals: masculinization. Moreover, in men, testosterone therapy may be indicated in osteoporosis caused by androgen deficiency.* Andriol (Diosynth B.V., Netherlands); Andriol (Organon) ✧*Org 538*



Topixantrone [*2003*] (toe pix′ an trone). $C_{21}H_{26}N_6O_2$. 394.47. (1) Indazolo[4,3-*gh*]isoquinolin-6(2*H*)-one, 5-[[2-(dimethylamino)ethyl]amino]-2-[2-[(2-hydroxyethyl)amino]ethyl]-; (2) 5-[[2-(Dimethylamino)ethyl]amino]-2-[2-[(2-hydroxyethyl)amino]ethyl]indazolo[4,3-*gh*]isoquinolin-6(2*H*)-one. *CAS-156090-18-5*. INN; BAN. *Anti-neoplastic.* (Novuspharma SpA) ✧*BBR 3576* (*dihydrochloride*)



Yttrium Y 90 Epratuzumab [*2003*] (it′ ree um e pra too′ zoo mab). (1) Immunoglobulin G1, anti-(human CD22 (antigen)) (human-mouse monoclonal hLL2 γ-chain), disulfide with human-mouse monoclonal hLL2 κ-chain, dimer, yttrium-90Y chelate; (2) Immunoglobulin G1 (human-mouse monoclonal hLL2 γ-chain anti-human antigen CD22), disulfide with human-mouse monoclonal hLL2 κ-chain, dimmer, yttrium-90Y chelate. Molecular weight is approximately 150,000 daltons. *CAS-501423-23-0. Radioimmunotherapy* (*RAIT*) *for non-Hodgkin's B-cell lymphoma patients* (*monoclonal antibody*). LymphoCide (Immunomedics) ✧^{90}*Y-hLL2*

Yttrium Y 90 Labetuzumab [*2003*] (it′ ree um la be too zoo′ mab). (1) Immunoglobulin G1, anti-(human carcinoembryonic antigen) (human-mouse monoclonal hMN-14 γ-chain), disulfide with human-mouse monoclonal hMN-14 κ-chain, dimer, yttrium-90Y chelate; (2) Immunoglobulin G1 (human-mouse monoclonal hMN-14 γ-chain anti-human carcinoembryonic antigen), disulfide with human-mouse monoclonal hMN-14 κ-chain, dimer, yttrium-90Y chelate. Molecular weight is approximately 150,000 daltons. *CAS-501423-27-4. Radioimmunotherapy* (*RAIT*) *of CEA-expressing tumors for use in the treatment of colorectal cancer* (*monoclonal antibody*). CEA-Cide (Immunomedics) ✧^{90}*Y-hMN-14*

Nomenclature

Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

Aminosalicylic Acid

Delete the following:

[4-aminosalicylic acid]

Ceftazidime

Change the CAS number to read:

CAS-78439-06-2; CAS-72558-82-8 [anhydrous]

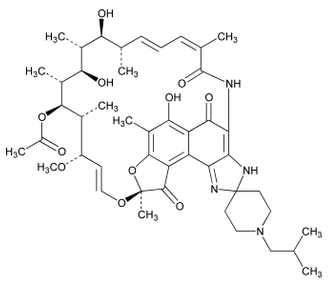
Meradimate

Change the second chemical name to read:

(2) Anthranilic acid, *p*-menth-3-yl ester

Rifabutin

Change the chemical structure to read:



Zinc Carbonate

Change the CAS number to read:

CAS-3486-35-9

Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Helath Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Proposed International Nonproprietary Names

The following 43 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol 17, No. 1, 2003.

Any comments or formal objections to the proposed names should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Alvocidib	*Antineoplastic*
Anatibant	*Bradykinin B2 receptor antagonist*
Ardenermin	*Immunostimulant*
Arimoclomol	*Symptomatic antidiabetic agent*
Arundic Acid	*Neuroprotective agent*
Aselizumab	*Immunomodulator*
Asoprisnil Ecamate	*Progesterone receptor modulator*
Ataciguat	*Vasodilator*
Atazanavir	*Antiviral*
Atocalcitol	*Vitamin D analogue*
Barixibat	*Bile acid absorption inhibitor*
Barusiban	*Oxytocin antagonist*
Bertilimumab	*Immunomodulator*
Bortizomib	*Antineoplastic*
Cinacalcet	*Calcimimetic*
Darunavir	*Antiviral*
Dexmethylphenidate	*Sympathomimetic*
Disufenton Sodium	*Neuroprotective agent*
Dofequidar	*Antineoplastic*
Doramapimod	*Immunomodulator*
Etiprednol Dicloacetate	*Corticosteroid; anti-inflammatory*
Etavirine	*Antiviral*
Etriciguat	*Vasodilator*
Fipamezole	*Antiparkinsonian; α_2-adrenoreceptor antagonist*
Gemcabene	*Antihyperlipidaemic*
Ibrolipim	*Antiatherogenic*
Iclaprim	*Antibacterial*
Iosimenol	*Contrast medium*
Latidectin	*Antiparasitic*
Lurasidone	*Antipsychotic*
Mantabegron	*β_3-Adrenoreceptor agonist (veterinary drug)*
Matuzumab	*Immunomodulator*
Mitratapid	*Microsomal triglyceride transfer protein (MTP) inhibitor (veterinary drug)*
Oxeglitazar	*Antidiabetic*
Posizolid	*Antibacterial*
Rafabegron	*β_3-Adrenoreceptor agonist*
Rupintrivir	*Antiviral*
Salcaprozic Acid	*Absorption promotor*
Sorafenib	*Antineoplastic*
Squalamine	*Antineoplastic*
Tacedinaline	*Antineoplastic*
Telbivudine	*Antiviral*
Tolevamer	*Antidiarrheal*

Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary.* A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* ("Recommended International Nonproprietary Names"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Nomenclature

Suggested INN	Category
Acrilovirine Axiovirine Triptavirine	*HIV1 non-nucleoside reverse transcriptase inhibitor (NNRTI)*
Adaglen Jaocebrin Resazenil Resevinadine	*Cognitive enhancer*
Adecatumumab Epcatumumab	*Monoclonal antibody*
Adorestat Dorestat Ranarestat	*Treatment of diabetic complications by reducing sorbitol accumulation*
Antithrombin Alfa Antithrombin Alfa (human) Antithrombin Alfa (recombinant)	*Anticoagulant*
Arformoterol Tartrate	*Antiasthmatic*
Armodafinil	*Wake promoting agent*
Artofisopam Dextrofisopam	*Treatment of irritable bowel syndrome, Crohn's disease*
Atlizumab Tocilizumab	*Monoclonal antibody*
Batabulin Sodium	*Antineoplastic*
Cariporide Caripormide	*Reduction of death and nonfatal myocardial infarction in patients undergoing CABG surgery*
Celatopurone Emazenil Emitobran Marcerion	*Antianxiety/antidepressant*
Certolizumab Pegol	*Treatment of rheumatoid arthritis and inflammatory bowel disease; Crohn's disease*
Ciclesonide	*Treatment of asthma as prophylactic therapy in adults and adolescents*
Ciluprevir Ciluprovir	*Treatment of Hepatitis C infection*
Clofarabine	*Treatment of primary refractory or relapsed acute myelogenous leukemia (AML) and acute lymphoblastic leukemia (ALL)*
Dablusagon Dabluzagon Dabuzalgron Zoyanagon	*Treatment of urinary incontinence*
Doranidazole	*Hypoxic cell radiosensitizer*
Dorizem Resizem Salizem	*Treatment of systemic hypertension, stable angina, and supraventicular arrhythmias*
Ecocipladib Ecopladib	*Treatment of pain and symptomatic management of arthritis*
Ecteinibin Ecteinoturbein Trabectedin Trantiblectein Turbinectein	*Antineoplastic*
Emglumegad Eglumetad	*Antianxiety; Smoking cessation*
Enzastaurin	*Antineoplastic*
Etagoloxan Etagolukib	*Antineoplastic*

Suggested INN	Category
Etomilast Tiamilast Tietomilast	*Phosphodiesterase IV inhibitor*
Fluorestrelone Fluorestrenol Fluorestrenolone	*Contraceptive*
Lumiliximab	*Treatment of allergic asthma, allergic rhinitis, chronic lymphocytic leukemia*
Maraglitazar Muraglitazar	*Treatment of Type 2 diabetes*
Maropitant	*Antiemetic*
Maropitant Citrate Marpitant Citrate	*Antiemetic*
Melitrexol Pelitrexol	*Antineoplastic*
Miglustat Miglutrastat	*Treatment of lipid storage diseases*
Mubritinib	*Antineoplastic*
Navaglitazar	*Treatment of Type II Diabetes and associated cardiovascular indications*
Nebantan Nobentan	*Antineoplastic*
Obasermin	*Hormone replacement used in the treatment of diabetes*
Paclitaxel Poliglumex Paclitaxel Poliglutamex	*Antineoplastic*
Parathyroid Hormone	*Treatment of osteoporosis*
Ramelreon Ramelteon	*Treatment of sleep disorders*
Razaxaban	*Anticoagulant; antithrombotic inhibitor of coagulant factor Xa*
Revaprazan	*Acid pump antagonist*
Solabegron	β-*3 Adrenergic receptor agonist intended for use as an antidiabetic*
Sonaglitazar Sonaglitazone	*Antidiabetic; Antidyslipidemic*
Tanprogecet Tanproget	*Oral contraceptive*
Technetium (99m Tc) Diglutide Technetium (99m Tc) Glintrotide Technetium (99m Tc) Protreotide	*To visualize venous thromboemboli, particularly pulmonary embolism*
Teduglutide Tegludutide	*Treatment of intestinal diseases*
Tetrastarch	*Therapy and prophylaxis of hypovolemia*
Tiplactinin Tiplastinin	*Treatment of fibrinolytic impairment diseases*

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Table of Contents*

PHARMACOPEIAL FORUM VOL. 29 NO. 6 NOV.–DEC. 2003

* The *USP–NF* (*USP27–NF22*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

Table of Contents*

PHARMACOPEIAL FORUM VOL. 29 NO. 6 NOV.–DEC. 2003

* The *USP–NF* (*USP27–NF22*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

Moving?

Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

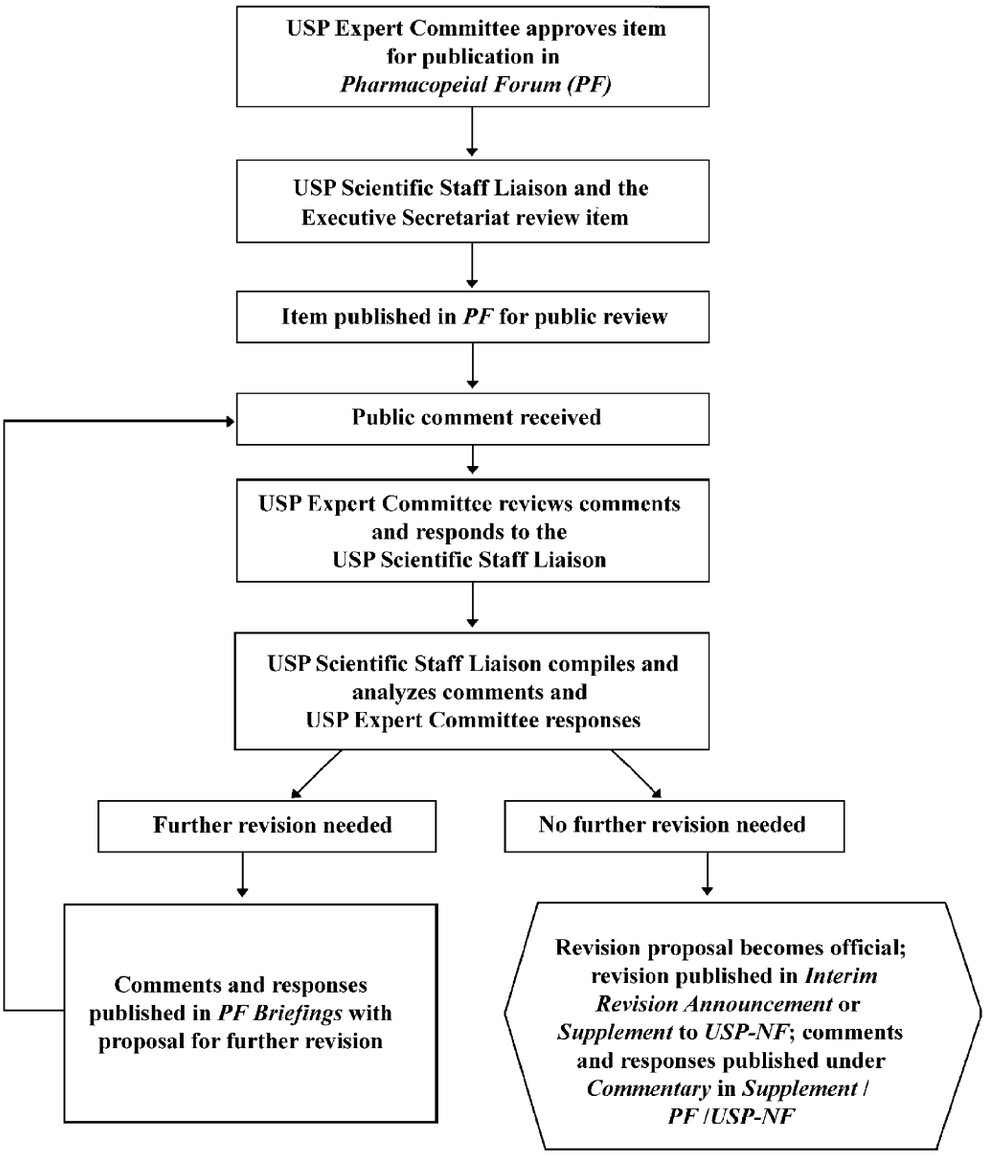
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■■ or ●● or ▲▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision*, both separate sections of *Harmonization.* •For *In-Process Revision*, new or revised text is marked with symbols (■■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 29(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content†
ESC	Excipients—Substances and Characterization†
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7—Antibiotics
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

* **HDQ** Indicates USP Headquarters items.
† The Expert Committee has been renamed. The old name, Excipients—Substances and Characterization (ESC) has been changed to Excipient Monograph Content (EMC).

STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Senior Scientific Associate	cma@usp.org	(301) 816-8139	Pharmaceutical Analysis 1 (PA1)

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

NEW DIRECTOR NAMED FOR NON-COMPLEX ACTIVES AND EXCIPIENTS.
USP is pleased to announce that Lokesh Bhattacharyya, Ph.D., has been named as the new Director, ISD for Non-Complex Actives and Excipients. As part of his duties, he will be responsible for the development of monographs and general chapters for non-complex drug substances and products as well as excipients. In addition, he will also be involved in the PDG efforts toward harmonization.

Most recently, Dr. Bhattacharyya was the USP Senior Scientist responsible for the Blood and Blood Products Expert Committee as well as the Vaccines, Virology, and Immunology Expert Committee. Prior to joining USP, he gained significant industrial experience in the pharmaceutical and biotechnology research and development arena.

Dr. Bhattacharyya may be reached by telephone at 301-816-8201, and his email address is lb@usp.org.

USP CONFERENCE ON BIOLOGICAL AND BIOTECHNOLOGICAL DRUG SUBSTANCES AND PRODUCTS, NOVEMBER 19–21, 2003.

This conference will be held in the Marriot Crystal City Gateway in Crystal City, Virginia. It is intended for those responsible for the development and maintenance of quality standards in this field. There are several objectives for this meeting:

- To involve industry and regulatory agencies in the development of quality standards for these products
- To promote the utility of standards for these products as necessary from regulatory and quality perspectives
- To involve stakeholders in the development of the future USP blueprint in these areas
- To promote the utility of USP as a neutral body bridging industry and the regulatory agencies for the benefit of public health.

This conference will consist of formal presentations and workshops led by nationally and internationally recognized experts in different areas of interest to the biological and biotechnological industry. Conference topics will include the following:

- Equivalence of biological and biotechnological drug substances and products
- Biotechnology-derived products
- Blood-derived products
- Vaccines
- Cell and gene therapy, and tissue engineering
- Bioassay
- Ancillary products.

For program information, contact Lokesh Bhattacharyya at 301-816-8201 or lb@usp.org. For conference registration information, call 301-816-8226, or register online at www.usp.org/conferences.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF.* We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF*. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Barbara B. Hubert, Director, Pharmacopeial Education, BBH@usp.org, 301-816-8333, or Diana Lenahan, Program Associate, DPL@usp.org, 301-816-8530.

Calendar of Pharmacopeial Education Courses, 2003

Date	Name of course	Location
November 17 and 18	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 8	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 9	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
December 15 and 16	Fundamentals of Dissolution	USP Headquarters, Rockville, MD

Calendar of Pharmacopeial Education Courses, 2004

Date	Name of course	Location
January 12 and 13	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
January 14	Analytical Method Validation	USP Headquarters, Rockville, MD
February 4 and 5	Fundamentals of Titrations	USP Headquarters, Rockville, MD
February 9	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
February 10	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
March 22 and 23	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
March 24	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
April 1	Analytical Method Validation	USP Headquarters, Rockville, MD
April 21 and 22	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
May 19	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
May 20	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
June 10	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
July 19 and 20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
August 10	Analytical Method Validation	USP Headquarters, Rockville, MD
August 11	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 12	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
October 14	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
October 18 and 19	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
November 11	Analytical Method Validation	USP Headquarters, Rockville, MD
November 11	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD

Calendar of Pharmacopeial Education Courses, 2004 (*continued*)

Date	Name of course	Location
November 12	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
November 12	Fundamentals of Dissolution (Lecture)	USP Headquarters, Rockville, MD
December 2	Analytical Method Validation	USP Headquarters, Rockville, MD
December 8	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 9	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD

Call 301-816-8530 to get information on customized courses offered at USP or at your site.

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

***USP–NF* AVAILABLE IN THREE ELECTRONIC FORMATS.** The trusted reference for official pharmaceutical standards is available in three convenient electronic formats—CD, intranet, and online. The CD is ideal for single users who prefer to have *USP–NF* on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official *USP–NF* content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

***CHROMATOGRAPHIC REAGENTS* NOW AVAILABLE.** *Chromatographic Reagents* lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in *Pharmacopeial Forum* (*PF*) since 1980. *Chromatographic Reagents* also helps to track which column reagents were used to validate methods that have become official and are included in *USP–NF*. The branded column reagents list is updated bimonthly through *Pharmacopeial Forum*. *Chromatographic Reagents* can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for *USP 27–NF 22* is as follows:

	Comment Deadline	**Publication Date**	**Official Date**
Main Book	May 15, 2003	November 2003	January 2004
Supplement One	October 15, 2003	February 2004	April 2004
Supplement Two	February 17, 2004	June 2004	August 2004

The publication and comment schedule for *USP 28–NF 23* is as follows:

	Comment Deadline	**Publication Date**	**Official Date**
Main Book	May 15, 2004	November 2004	January 2005
Supplement One	October 15, 2004	February 2005	April 2005
Supplement Two	February 17, 2005	June 2005	August 2005

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements*, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2003	Apr. 1, 2003
PF 29(2) [Mar.–Apr. 2003]	Mar. 2003	Not Applicable
2nd IRA [published in *PF* 29(2)]	Mar. 2003	Apr. 1, 2003
PF 29(3) [May–June 2003]	May 2003	Not Applicable
3rd IRA [published in *PF* 29(3)]	May 2003	June 1, 2003
2nd Supplement	June 2003	Aug. 1, 2003
PF 29(4) [July–Aug. 2003]	July 2003	Not Applicable
4th IRA [published in *PF* 29(4)]	July 2003	Aug. 1, 2003
PF 29(5) [Sept.–Oct. 2003]	Sept. 2003	Not Applicable
5th IRA [published in *PF* 29(5)]	Sept. 2003	Oct. 1, 2003
PF 29(6) [Nov.–Dec. 2003]	Nov. 2003	Not Applicable
6th IRA [published in *PF* 29(6)]	Nov. 2003	Dec. 1, 2003

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP 26*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 26*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 26–NF 21*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

SIXTH INTERIM REVISION ANNOUNCEMENT to *USP 26* and to *NF 21*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official December 1, 2003. **Released November 3, 2003.**

All inquiries and comments regarding *USP 26* text and *NF 21* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 26* or *NF 21* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Acesulfame Potassium RS (January 1, 2004)
USP Alendronate Sodium RS (November 1, 2003)
USP Allantoin RS (March 1, 2004)
USP Amifostine Disulfide RS (March 1, 2004)
USP Amitraz RS (November 1, 2003)
USP Ammonium Chloride RS (March 1, 2004)
USP Aspartame Acesulfame RS (March 1, 2004)
USP Benazepril Related Compound A RS (May 1, 2004)
USP Benazepril Related Compound B RS (May 1, 2004)
USP Betahistine Hydrochloride RS (January 1, 2004)
USP Brinzolamide RS (November 1, 2003)
USP Brinzolamide Related Compound A RS (November 1, 2003)
USP Brinzolamide Related Compound B RS (November 1, 2003)
USP Bupropion Hydrochloride RS (March 1, 2004)
USP Cefipime Hydrochloride RS (January 1, 2004)
USP Cefipime Hydrochloride System Suitability RS (January 1, 2004)
USP Cetyl Palmitate RS (November 1, 2003)
USP Choline Bitartrate RS (January 1, 2004)
USP Choline Chloride RS (March 1, 2004)
USP Clozapine RS (November 1, 2003)
USP Copovidone RS (March 1, 2004)
USP Desflurane RS (May 1, 2004)
USP Desflurane Related Compound A RS (March 1, 2004)
USP Dextran 40 RS (May 1, 2004)
USP Dextran 70 RS (May 1, 2004)
USP Dextran 4 Calibration RS (November 1, 2003)
USP Dextran 10 Calibration RS (November 1, 2003)
USP Dextran 40 Calibration RS (November 1, 2003)
USP Dextran 70 Calibration RS (November 1, 2003)
USP Dextran 250 Calibration RS (November 1, 2003)
USP Diloxanide Furoate RS (November 1, 2003)
USP Dinoprostone RS (November 1, 2003)
USP Dorzolamide RS (November 1, 2003)
USP Dorzolamide Hydrochloride Related Compound A RS (January 1, 2004)
USP Doxazosin Mesylate RS (March 1, 2004)
USP Emedastine Difumarate RS (November 1, 2003)
USP Ethinyl Estradiol Related Compound A RS (November 1, 2003)
USP Fenoldopam Mesylate RS (March 1, 2004)
USP Fenoldopam Related Compound A RS (January 1, 2004)
USP Fenoldopam Related Compound B RS (January 1, 2004)
USP Flumazenil RS (May 1, 2004)
USP Formononetin RS (March 1, 2004)
USP Fosphenytoin Sodium RS (March 1, 2004)
USP Gadoversetamide RS (March 1, 2004)
USP Gadoversetamide Related Compound A RS (March 1, 2004)
USP Ganciclovir RS (May 1, 2004)
USP Gemfibrozil Related Compound A RS (January 1, 2004)
USP Glutamic Acid RS (November 1, 2003)
USP Glycyrrhizic Acid RS (November 1, 2003)
USP Hydrocodone Bitartrate Related Compound A CII RS (March 1, 2004)
USP Isoflupredone Acetate RS (January 1, 2004)
USP Powdered Kava Extract RS (March 1, 2004)
USP Kawain RS (March 1, 2004)
USP Ketamine Related Compound A RS (January 1, 2004)
USP Lansoprazole RS (November 1, 2003)
USP Lansoprazole Related Compound A RS (November 1, 2003)
USP Meropenem RS (March 1, 2004)
USP Metformin Hydrochloride RS (March 1, 2004)
USP Metformin Related Compound A RS (March 1, 2004)
USP Powdered Milk Thistle Extract RS (November 1, 2003)
USP Milrinone RS (November 1, 2003)
USP Milrinone Related Compound A RS (November 1, 2003)
USP Nabumetone RS (January 1, 2004)
USP Norgestimate RS (January 1, 2004)
USP Ondansetron Hydrochloride RS (March 1, 2004)
USP Ondansetron Related Compound A RS (March 1, 2004)
USP Ondansetron Related Compound C RS (March 1, 2004)
USP Ondansetron Related Compound D RS (March 1, 2004)
USP Oxaprozin RS (January 1, 2004)
USP Oxfendazole RS (March 1, 2004)
USP Paclitaxel RS (March 1, 2004)
USP Paclitaxel Related Compound A RS (March 1, 2004)
USP Paclitaxel Related Compound B RS (March 1, 2004)
USP Paroxetine Related Compound D RS (May 1, 2004)
USP Phenytoin Related Compound A RS (March 1, 2004)
USP Poloxalene RS (November 1, 2003)
USP Quinapril Related Compound A RS (January 1, 2004)
USP Quinapril Related Compound B RS (January 1, 2004)
USP Quinine Hydrochloride Dihydrate RS (March 1, 2004)
USP Ramipril RS (January 1, 2004)
USP Ramipril Related Compound A RS (January 1, 2004)
USP Powdered Red Clover Extract RS (May 1, 2004)
USP Sevoflurane RS (May 1, 2004)
USP Sevoflurane Related Compound A RS (May 1, 2004)
USP Sodium Starch Glycolate RS (January 1, 2004)
USP Sotalol Related Compound A RS (May 1, 2004)
USP Sotalol Related Compound B RS (May 1, 2004)
USP Sotalol Related Compound C RS (May 1, 2004)
USP Stearoyl Polyoxyglycerides RS (May 1, 2004)
USP Sumatriptan RS (March 1, 2004)
USP Sumatriptan Succinate RS (March 1, 2004)
USP Sumatriptan Succinate Related Compound A RS (March 1, 2004)
USP Sumatriptan Succinate Related Compound C RS (March 1, 2004)
USP Tacrine Hydrochloride RS (January 1, 2004)
USP Taurine RS (January 1, 2004)
USP Terazosin Hydrochloride RS (March 1, 2004)
USP Terazosin Related Compound A RS (March 1, 2004)
USP Terazosin Related Compound B RS (March 1, 2004)
USP Terazosin Related Compound C RS (March 1, 2004)
USP Tiletamine Hydrochloride RS (November 1, 2003)
USP Tinidazole RS (January 1, 2004)
USP Tinidazole Related Compound A RS (January 1, 2004)
USP Thalidomide RS (January 1, 2004)
USP Tylosin RS (November 1, 2003)
USP Urea C13 RS (January 1, 2004)
USP Valsartan Related Compound A RS (March 1, 2004)
USP Valsartan Related Compound C RS (March 1, 2004)
USP Verteporfin RS (March 1, 2004)
USP Verteporfin Related Compound A RS (March 1, 2004)
USP Vinorelbin Related Compound A RS (March 1, 2004)
USP Vinorelbine Tartrate RS (May 1, 2004)
USP Vitexin RS (March 1, 2004)
USP Zileuton RS (January 1, 2004)
USP Zileuton Related Compound A RS (November 1, 2003)
USP Zileuton Related Compound B RS (November 1, 2003)
USP Zileuton Related Compound C RS (November 1, 2003)

The official dates of any *USP 26* or *NF 21* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

USP Alteplase RS
USP Amiloxate RS
USP Positive Bioreaction RS
USP Cefpiramide RS
USP Cinoxate RS
USP Clonazepam Related Compound C RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Enalapril Related Compound B RS
USP Enzacamene RS
USP Fludeoxyglucose RS
USP Ginseng Extract RS
USP Gonadorelin Hydrochloride RS
USP Hypericin RS
USP Lactase RS
USP Medroxyprogesterone Acetate Related Compound A RS
USP Menotropins RS
USP Methyldopa–Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Ondansetron Related Compound B RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Sargramostim RS
USP Sulisobenzone RS
USP Δ^8-tetrahydrocannabinol RS
USP Δ^9-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS
USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

USP 26 MONOGRAPHS

Cefuroxime Axetil Tablets

Change to read:

Labeling—The labeling indicates whether the Tablets contain amorphous or crystalline Cefuroxime Axetil. If Tablets contain a mixture of amorphous and crystalline Cefuroxime Axetil, label to indicate the percentage of each contained therein. •When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•6

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•6

Medium: 0.07 N hydrochloric acid; 900 mL.

Apparatus 2: 55 rpm.

Times: 15 and 45 minutes.

Procedure—Determine the amount of cefuroxime ($C_{16}H_{16}N_4O_8S$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Cefuroxime Axetil RS, equivalent to about 0.01 to 0.02 mg of cefuroxime ($C_{16}H_{16}N_4O_8S$) per mL, in the same *Medium.*

Tolerances—Not less than 60% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 75% (*Q*) is dissolved in 45 minutes; except that where Tablets are labeled to contain the equivalent of 500 mg of cefuroxime, not less than 50% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 70% (*Q*) is dissolved in 45 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Apparatus 2: 100 rpm.

Medium, Times, and *Procedure*—Proceed as directed under *Test 1.*

Tolerances—Not less than 60% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 75% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 45 minutes.•6

Ciclopirox Olamine Cream

Change to read:

Identification—••6Dilute 4 mL of the *Assay preparation* obtained as directed in the *Assay* with a mixture of methanol and 6.25 N sodium hydroxide (123:2) to make 100 mL: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution prepared from the *Standard preparation* obtained as directed in the *Assay*, concomitantly measured.

••6

Pseudoephedrine Hydrochloride Extended-Release Tablets

Add the following:

•**Labeling—**When more than one *Drug Release* test is given, the labeling states the *Drug Release* test used only if *Test 1* is not used.•6

Add the following:

•**Drug release** ⟨724⟩—

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm

Times: 1, 3, and 6 hours.

Standard solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.13 mg per mL.

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the procedure set forth in the *Assay*. Separately inject equal volumes (about 50 µL) of the *Standard solution* and the filtered solution under test. Calculate the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved per Tablet.

Times and Tolerances:

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 50% and 75%
6	not less than 75%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*

Medium, Apparatus, and *Times*—Proceed as directed for *Test 1.*

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 214 nm on portions of the solution under test, filtered through a 0.45-µm filter and suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Pseudoephedrine Hydrochloride RS in the same *Medium*.

Times and Tolerances:

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 60% and 80%
6	not less than 80%

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Medium: 0.9% sodium chloride in water; 50 mL.

Apparatus 7: 30 cycles per minute; 2–3 cm amplitude. To prepare the sample, see Figure 1 below that illustrates the following steps:

1. Place one Tablet on a 5- × 5-cm nylon netting.
2. Fold netting over the Tablet. Continue folding until the Tablet is enclosed in netting.
3. Fold netting so that the two open ends meet. The Tablet should be enveloped in the center of the netting.
4. Insert rod (see *Figure 7c* under *Drug Release* ⟨724⟩) through netting to secure the Tablet.
5. Secure netting with HPLC plastic ferrules or other appropriate device. Trim the excess netting. Attach each sample holder to the vertically reciprocating sample holder.

Interim Revision Announcement

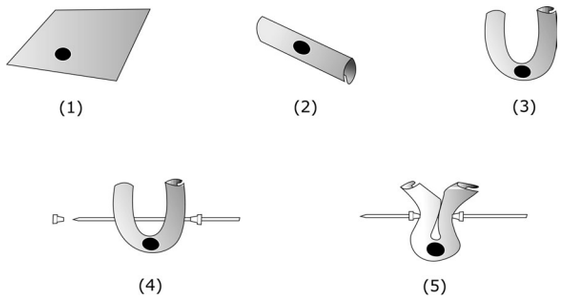

Fig. 1

Times: 2, 8, 14, and 24 hours.

Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the following method.

0.05 M Phosphate buffer, pH 6.8—Transfer 200 mL of water to a 1000-mL volumetric flask. Add 3.4 mL of phosphoric acid and 5 mL of triethylamine. Add water to almost 900 mL. Adjust with 1 N sodium hydroxide to a pH of about 6.8, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Phosphate buffer, pH 6.8* and methanol (9:1).

System suitability solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.4 mg per mL.

Standard solutions—Prepare solutions in water having accurately known concentrations of USP Pseudoephedrine Hydrochloride RS in a range around the expected concentration of the solution under test at each time interval.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solutions* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peak. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions*. Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at each time interval from a linear regression analysis of the calibration curve.

Times and Tolerances:

Time (hours)	Amount dissolved
2	between 20% and 35%
8	between 40% and 65%
14	between 60% and 90%
24	not less than 85% ●6

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions; (2) proposed revisions placed directly under *In-Process Revision*; or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, thus:

•new text•

if slated for an *Interim Revision Announcement to USP 26–NF 21* (*IRA*), thus:

▲new text▲*USP27*

if slated for *USP 27–NF 22*, and thus:

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, and ■2S (*USP 27*) indicates that the proposed revision is slated for the *Second Supplement to USP 27*, and ▲*USP27* and ▲*NF22* indicate that the revisions are proposed for *USP 27* and *NF 22*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

General Notices and Requirements, *USP 26* page 3, page 3076 of the *Second Supplement*, and page 983 of *PF* 29(4) [July–Aug. 2003]. The proposed revisions in the section *General Chapters* are intended to clarify the intent and character of this section. This change indicates that those chapters numbered over 1000 are intended to be interpretive.

(EC: T. Cecil) RTS—40437-1

Change to read:

"OFFICIAL" AND "OFFICIAL ARTICLES"

The word "official," as used in this Pharmacopeia or with reference hereto, is synonymous with "Pharmacopeial," with "USP," and with "compendial."

The designation "USP" in conjunction with the official title or elsewhere on the label of an article ~~means that the article~~

▲indicates that a monograph is included in the *USP* and that

the article▲*USP27*
purports to comply with

▲all applicable▲*USP27*
USP standards.
~~Any language modifying or limiting this representation shall be accompanied by a statement that the article is "not USP", such specific~~

▲The▲*USP27*
designation

▲"USP"▲*USP27*
on the label

▲may not and▲*USP27*
does not constitute a representation, endorsement, or incorporation by the manufacturer's labeling of the informational material contained in the USP monograph, nor does it constitute assurance by USP that the article is known to comply with USP standards. An article may only purport to comply with a USP standard

▲or other requirements▲*USP27*
when the article is recognized in the *USP*. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, whether or not the added designation "USP" is used. Names considered to be synonyms of the official titles may not be used for official titles.

Although both compendia, the *United States Pharmacopeia* and the *National Formulary*, currently are published under one cover, they remain separate compendia. The designation *USP–NF* or similar combination may be used on the label of an article, provided the label also bears a statement such as, "Meets *NF* standards as published by the USP," indicating the particular compendium to which the article purports to apply.

Where an article differs from the standards of strength, quality, and purity, as determined by the application of the assays and tests set forth for it in the Pharmacopeia, its difference shall be plainly stated on its label. Where an article fails to comply in identity with the identity prescribed in the *USP*, or contains an added substance that interferes with the prescribed assays and tests, such article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in the Pharmacopeia.

Articles listed herein are official and the standards set forth in the monographs apply to them only when the articles are intended or labeled for use as drugs, as nutritional or dietary supplements, or as medical devices and when bought, sold, or dispensed for these purposes or when labeled as conforming to this Pharmacopeia.

An article is deemed to be recognized in this Pharmacopeia when a monograph for the article is published in it, including its supplements, addenda, or other interim revisions, and an official date is generally or specifically assigned to it.

The following terminology is used for distinguishing the articles for which monographs are provided: an *official substance* is an active drug entity, a recognized nutrient, a dietary supplement ingredient, or a pharmaceutic ingredient (see also *NF 21*) or a component of a finished device for which the monograph title includes no indication of the nature of the finished form; an *official preparation* is a *drug product*, a *nutritional supplement*, a *dietary supplement* or a *finished device*. It is the finished or partially finished (e.g., as in the case of a sterile solid to be constituted into a solution for administration) preparation or product of one or more official substances formulated for use on or for the patient or consumer; an *article* is an item for which a monograph is provided, whether an official substance or an official preparation.

▲*Designating Conformance with Official Standards*—When the letters "USP" or "NF" or "USP–NF" are utilized on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article or when appropriate, with the ingredients contained therein. The letters are not to be enclosed in any symbol such as a circle, square, etc., and must appear in block capital letters.

If a dietary supplement purports to be or is represented as an official product and such claim is determined by USP not to be made in good faith, it is the policy of the USP to seek appropriate legal redress.▲*USP27*

Products Not Marketed in the United States—Interest in the USP outside the United States has always existed. From time to time, monographs may be adopted for articles not legally marketed in the United States as a service to authorities in other countries where USP standards are recognized and applied. Appearance of any such monograph does not grant any marketing rights whatsoever, and the status of the article in the United States must be checked with the U.S. Food and Drug Administration in the event of any question.

Nutritional and Other Dietary Supplements—The designation of an official preparation containing one or more recognized nutrients or dietary supplement ingredients as "USP" or the use of the designation "USP" in conjunction with the title of such nutritional or dietary supplement preparation may be made only if the preparation meets

▲all▲*USP27*
the applicable requirements contained in the individual monograph and general chapters.

▲Any language modifying or limiting this representation shall be accompanied by a statement indicating that the article is "not USP", and indicating how the article differs from the standards of strength, quality, or purity as determined by the application of the tests and assays set forth in the compendia.▲*USP27*
Any additional ingredient in such article that is not recognized in the Pharmacopeia and for which nutritional value is claimed shall not be represented nor imply that such ingredient is of USP quality or recognized by USP. If a preparation does not comply with ▲all▲*USP27*
applicable requirements but contains nutrients or dietary supplement ingredients that are recognized in the *USP*, the article may not designate the individual nutrients or ingredients as complying with USP standards or being of USP quality without designating on the label that the article itself does not comply with USP standards.

Change to read:

SIGNIFICANT FIGURES AND TOLERANCES

Where limits are expressed numerically herein, the upper and lower limits of a range include the two values themselves and all intermediate values, but no values outside the limits. The limits expressed in monograph definitions and tests, regardless of whether the values are expressed as percentages or as absolute numbers, are considered significant to the last digit shown.

Equivalence Statements in Titrimetric Procedures—The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, it is to be understood that the number of significant figures in the concentration of the titrant corresponds to the number of significant figures in the weight of the analyte. Blank corrections are to be made for all titrimetric assays where appropriate (see *Titrimetry* ⟨541⟩).

Tolerances—The limits specified in the monographs for Pharmacopeial articles are established with a view to the use of these articles as drugs, nutritional or dietary supplements, or devices, except where it is indicated otherwise. The use of the molecular formula for the active ingredient(s) named in defining the required strength of a Pharmacopeial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

A dosage form shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label.
■■2S (*USP26*)
The tolerances and limits stated in the definitions in the monographs for Pharmacopeial articles allow ■■2S (*USP26*) for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. Where the minimum amount of a substance present in a nutritional or dietary supplement is required to be higher than the lower tolerance limit allowed for in the monograph because of applicable legal requirements, then the upper tolerance limit contained in the monograph shall be increased by a corresponding amount.

The specified tolerances are based upon such attributes of quality as might be expected to characterize an article produced from suitable raw materials under recognized principles of good manufacturing practice.

The existence of compendial limits or tolerances does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" the Pharmacopeial quality. Similarly, the fact that an article has been prepared to closer tolerances than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the Pharmacopeial requirements.

Interpretation of Requirements—Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated limits to determine whether there is conformance with compendial assay or test requirements. The observed or calculated values usually will contain more significant figures than there are in the stated limit, and ~~an observed or calculated~~

■a reportable■1S (*USP27*)
result is to be rounded off to the number of places that is in agreement with the limit expression by the following procedure. ~~[NOTE—Limits, which are fixed numbers, are not rounded off.]~~

■Intermediate calculations (e.g., slope for linearity in *Validation of Compendial Methods* ⟨1225⟩) may be rounded for reporting purposes, but the original value (not rounded) should be used for any additional required calculations. Rounding off should not be done until the final calculations for the reportable value have been completed. [NOTE—Limits, which are fixed numbers, are not rounded off.]

A reportable value is often a summary value for several individual determinations. It is the end result of a completed measurement method, as documented. It is the value compared with the acceptance criterion. In most cases, the reportable value is used as documentation for internal or external users.■1S (*USP27*)

When rounding off is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is greater than 5, it is eliminated and the preceding digit is increased by one. If this digit equals 5, the 5 is eliminated and the preceding digit is increased by one.

Illustration of Rounding Numerical Values for Comparison with Requirements

Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit ≥98.0%	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit ≤101.5%	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes
Limit test ≤0.02%	0.025%	0.03%	No
	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test ≤3 ppm	0.00035%	0.0004%	No
	0.00025%	0.0003%	Yes
	0.00028%	0.0003%	Yes

In-Process Revision

GENERAL CHAPTERS

Each general chapter is assigned a number that appears in brackets adjacent to the chapter name (e.g., ⟨621⟩ *Chromatography*). ~~General chapters that include general *requirements* for tests and assays are numbered from ⟨1⟩ to ⟨999⟩, chapters that are *informational* are numbered from ⟨1000⟩ to ⟨1999⟩, and chapters pertaining to *nutritional supplements* are numbered above ⟨2000⟩.~~

■Articles recognized in this compendia must comply with the official standards and tests and assays in the General Notices, relevant monographs, and General Chapters numbered below 1000. General Chapters numbered above 1000 are considered to be interpretive and are intended to provide information on, give definition to, or describe a particular subject. They contain no official standards, tests, assays, or other mandatory requirements applicable to any pharmacopeial article unless specifically referenced in a monograph or elsewhere in the pharmacopeia.■2S (*USP27*)

The use of the general chapter numbers is encouraged for the identification and rapid access to general tests and information. It is especially helpful where monograph section headings and chapter names are not the same (e.g., *Ultraviolet Absorption* ⟨197U⟩ in a monograph refers to method ⟨197U⟩ under general tests chapter ⟨197⟩ *Spectrophotometric Identification Tests*; *Specific rotation* ⟨781S⟩ in a monograph refers to method ⟨781S⟩ under general tests chapter ⟨781⟩ *Optical Rotation;* and *Calcium* ⟨191⟩ in a monograph refers to the tests for *Calcium* under general tests chapter ⟨191⟩ *Identification Tests—General*).

Change to read:

INGREDIENTS AND PROCESSES

Official drug products and finished devices are prepared from ingredients that meet the requirements of the compendial monographs for those individual ingredients for which monographs are provided (see also *NF 21*). Generally, nutritional and dietary supplements are prepared from ingredients that meet requirements of the compendial monographs for those ingredients for which monographs are provided, except that substances of acceptable food grade quality may be utilized in the event of a difference.

Official substances are prepared according to recognized principles of good manufacturing practice and from ingredients complying with specifications designed to assure that the resultant substances meet the requirements of the compendial monographs (see also *Foreign Substances and Impurities* under *Tests and Assays*).

Preparations for which a complete composition is given in this Pharmacopeia, unless specifically exempted herein or in the individual monograph, are to contain only the ingredients named in the formulas. However, there may be deviation from the specified processes or methods of compounding, though not from the ingredients or proportions thereof, provided the finished preparation conforms to the relevant standards laid down herein and to preparations produced by following the specified process.

The tolerances specified in individual monographs and in the general chapters for compounded preparations are based on those attributes of quality as might be expected to characterize an article compounded from suitable bulk drug substances and ingredients in accordance with the procedures provided or under recognized principles of good pharmaceutical practice as described in this Pharmacopeia (see ■~~*Pharmacy Compounding* ⟨795⟩~~■2S (*USP26*)

▲*Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩)▲*USP27* and elsewhere.

Monographs for preparations intended to be compounded pursuant to prescription may contain assay methods. ■Assay methods■1S (*USP26*) are not intended for evaluating a compounded preparation prior to dispensing. ■Assay■1S (*USP26*) methods are intended to serve as the official test methods in the event of a question or dispute as to whether or not the compounded preparation complies with official standards.

Where a monograph on a preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried prior to use if due allowance is made for the water or other volatile substances present in the quantity taken.

Unless specifically exempted elsewhere in this Pharmacopeia, the identity, strength, quality, and purity of an official article are determined by the definition, physical properties, tests, assays, and other specifications relating to the article, whether incorporated in the monograph itself, in the *General Notices*, or in the section *General Chapters*.

Water—Water used as an ingredient of official preparations meets the requirements for *Purified Water*, for *Water for Injection*, or for one of the sterile forms of water covered by a monograph in this Pharmacopeia.

Potable water meeting the requirements for drinking water as set forth in the regulations of the U.S. Environmental Protection Agency may be used in the preparation of official substances.

Alcohol—All statements of percentages of alcohol, such as under the heading *Alcohol content* refer to percentage, by volume, of C_2H_5OH at 15.56°. Where reference is made to "C_2H_5OH," the chemical entity possessing absolute (100 percent) strength is intended.

Alcohol—Where "alcohol" is called for in formulas, tests, and assays, the monograph article *Alcohol* is to be used.

Dehydrated Alcohol—Where "dehydrated alcohol" (absolute alcohol) is called for in tests and assays, the monograph article *Dehydrated Alcohol* is to be used.

Denatured Alcohol—Specially denatured alcohol formulas are available for use in accordance with federal statutes and regulations of the Internal Revenue Service. A suitable formula of specially denatured alcohol may be substituted for Alcohol in the manufacture of Pharmacopeial preparations intended for internal or topical use, provided that the denaturant is volatile and does not remain in the finished product. A finished product that is intended for topical application to the skin may contain specially denatured alcohol, provided that the denaturant is either a normal ingredient or a permissible added substance; in either case the denaturant must be identified on the label of the topical preparation. Where a process is given in the individual monograph, the preparation so made must be identical with that prepared by the given process.

Added Substances—An official substance, as distinguished from an official preparation, contains no added substances except where specifically permitted in the individual monograph. Where such addition is permitted, the label indicates the name(s) and amount(s) of any added substance(s).

Unless otherwise specified in the individual monograph, or elsewhere in the *General Notices*, suitable substances such as antimicrobial agents, bases, carriers, coatings, colors, flavors, preservatives, stabilizers, and vehicles may be added to an official preparation to enhance its stability, usefulness, or elegance or to facilitate its preparation. Such substances are regarded as unsuitable and are prohibited unless (a) they are harmless in the amounts

used, (b) they do not exceed the minimum quantity required to provide their intended effect, (c) their presence does not impair the bioavailability or the therapeutic efficacy or safety of the official preparation, and (d) they do not interfere with the assays and tests prescribed for determining compliance with the Pharmacopeial standards.

Nutritional and Dietary Supplements—Unless otherwise specified in the individual monograph, or elsewhere in the *General Notices*, consistent with applicable regulatory requirements, suitable added substances such as bases, carriers, coatings, colors, flavors, preservatives, and stabilizers may be added to a nutritional supplement preparation to enhance its stability, usefulness, or elegance, or to facilitate its preparation. Such added substances shall be regarded as suitable and shall be permitted unless they interfere with the assays and tests prescribed for determining compliance with Pharmacopeial standards.

Additional Ingredients—Additional ingredients, including excipients, may be added to nutritional supplement preparations containing recognized nutrients, consistent with applicable regulatory requirements, provided that they do not interfere with the assays and tests prescribed for determining compliance with Pharmacopeial standards.

Inert Headspace Gases—The air in a container of an article for parenteral use may be evacuated or be replaced by carbon dioxide, helium, or nitrogen, or by a mixture of these gases, which fact need not be declared in the labeling.

Colors—Added substances employed solely to impart color may be incorporated into official preparations, except those intended for parenteral or ophthalmic use, in accordance with the regulations pertaining to the use of colors issued by the FDA provided such added substances are otherwise appropriate in all respects. (See also *Added Substances* under *Injections* ⟨1⟩.)

Ointments and Suppositories—In the preparation of ointments and suppositories, the proportions of the substances constituting the base may be varied to maintain a suitable consistency under different climatic conditions, provided the concentrations of active ingredients are not varied and the bioavailability, therapeutic efficacy or safety of the preparation is not impaired.

Change to read:

TESTS AND ASSAYS

Apparatus—A specification for a definite size or type of container or apparatus in a test or assay is given solely as a recommendation. Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed. (See also *Thermometers* ⟨21⟩, *Volumetric Apparatus* ⟨31⟩, and *Weights and Balances* ⟨41⟩.) Where low-actinic or light-resistant containers are specified, clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

Where an instrument for physical measurement, such as a spectrophotometer, is specified in a test or assay by its distinctive name, another instrument of equivalent or greater sensitivity and accuracy may be used. In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used, solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure.

Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification. Items capable of equal or better performance may be used if these characteristics have been validated.

Where the use of a centrifuge is indicated, unless otherwise specified, the directions are predicated upon the use of apparatus having an effective radius of about 20 cm (8 inches) and driven at a speed sufficient to clarify the supernatant layer within 15 minutes.

Unless otherwise specified, for chromatographic tubes and columns the diameter specified refers to internal diameter (ID); for other types of tubes and tubing the diameter specified refers to outside diameter (OD).

Steam Bath—Where the use of a steam bath is directed, exposure to actively flowing steam or to another form of regulated heat, corresponding in temperature to that of flowing steam, may be used.

Water Bath—Where the use of a water bath is directed without qualification with respect to temperature, a bath of vigorously boiling water is intended.

Foreign Substances and Impurities—Tests for the presence of foreign substances and impurities are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Official Articles* ⟨1086⟩).

While one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity, strength, quality, and purity, it is manifestly impossible to include in each monograph a test for every impurity, contaminant, or adulterant that might be present, including microbial contamination. These may arise from a change in the source of material or from a change in the processing, or may be introduced from extraneous sources. Tests suitable for detecting such occurrences, the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice, should be employed in addition to the tests provided in the individual monograph.

Other Impurities—Official substances may be obtained from more than one process, and thus may contain impurities not considered during preparation of monograph assays or tests. Wherever a monograph includes a chromatographic assay or purity test based on chromatography, other than a test for ~~organic volatile impurities,~~

■residual solvents■1S (*USP27*)

and that monograph does not detect such an impurity, solvents excepted, the impurity shall have its amount and identity, where both are known, stated under the heading *Other Impurity*(*ies*) by the labeling (certificate of analysis) of the official substance.

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is 0.1% or greater. Tests suitable for detection and quantitating unlabeled impurities, when present as the result of process change or other identifiable, consistent occurrence, shall be submitted to the USP for inclusion in the individual monograph. Otherwise, the impurity shall be identified, preferably by name, and the amount listed under the heading *Other Impurity*(*ies*) in the labeling (certificate of analysis) of the official substance. The sum of all *Other Impurities* combined with the monograph-detected impurities does not exceed 2.0% (see *Ordinary Impurities* ⟨466⟩), unless otherwise stated in the monograph.

Categories of drug substances excluded from *Other Impurities* requirements are fermentation products and semi-synthetics derived therefrom, radiopharmaceuticals, biologics, biotechnology-derived products, peptides, herbals, and crude products of animal or plant origin. Any substance known to be toxic must not be listed under *Other Impurities*.

■**Residual Solvents**—The requirements are stated in *Organic Volatile Impurities* ⟨467⟩ together with information in *Impurities in Official Articles* ⟨1086⟩. Thus all drug substances, excipients, and products are subject to relevant control of residual solvents, even when no test is specified in the

In-Process Revision

individual monograph. The requirements have been aligned with the ICH guideline on this topic. If solvents are used during production, they are of suitable quality. In addition, the toxicity and residual level of each solvent are taken into consideration, and the solvents are limited according to the principles defined and the requirements specified in *Organic Volatile Impurities* ⟨467⟩, using the general methods presented therein or other suitable methods.■1S (*USP27*)

Procedures—Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the utilization of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures utilized. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all of the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for assuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing *process validation* studies and from *in-process controls* may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not less than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.

Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not less than a given number, usually 20, of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the *Assay* procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on drying*, or *Water*, or *Loss on ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for *Loss on drying* or *Water*, the expression "previously dried" without qualification signifies that the substance is to be dried as directed under *Loss on drying* or *Water* (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter *USP Reference Standards* ⟨11⟩, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within 10% of the specified weight or volume. However, the weight or volume taken is accurately determined and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under *Volumetric Apparatus* ⟨31⟩, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under *Volumetric Apparatus* ⟨31⟩ , may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as "25.0 mL" and "25.0 mg," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under *Volumetric Apparatus* ⟨31⟩ or under *Weights and Balances* ⟨41⟩.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession. See also *Use of Reference Standards* under *Spectrophotometry and Light-Scattering* ⟨851⟩.

Blank Determination—Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator—The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution—Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see *Volumetric Apparatus* ⟨31⟩).

Drying to Constant Weight—The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration—Where it is directed to "filter," without further qualification, the intent is that the liquid be filtered through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests—The Pharmacopeial tests headed *Identification* are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight—The specification "ignite to constant weight" means that the ignition shall be continued, at 800 ± 25° unless otherwise indicated, until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators—Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL, or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms—Logarithms used in the assays are to the base 10.

Microbial Strains—Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible—This term indicates a quantity not exceeding 0.50 mg.

Odor—Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, of either a freshly opened package of the article (for packages containing not more than 25 g) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about 100-mL capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements—The term "mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions—Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with *Purified Water*.

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid is to be diluted with, or 1 part *by weight* of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts *by volume*.

An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions*, and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity—Unless otherwise stated, the specific gravity basis is 25°/25°, i.e., the ratio of the weight of a substance in air at 25° to the weight of an equal volume of water at the same temperature.

Temperatures—Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at 25°. Where moderate heat is specified, any temperature not higher than 45° (113°F) is indicated. See *Storage Temperature* under *Preservation, Packaging, Storage, and Labeling* for other definitions.

Time Limit—In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum—The term "in vacuum" denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water—Where water is called for in tests and assays, Purified Water is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide–free water," see the introduction to the section *Reagents, Indicators, and Solutions*. For *High-purity Water* see *Containers* ⟨661⟩.

Water and Loss on Drying—Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading *Water*. Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading *Loss on drying*. However, *Loss on drying* is most often given as the heading where the loss in weight is known to represent residual volatile constituents including organic solvents as well as water.

Test Results, Statistics, and Standards—Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compliance with good manufacturing practices generally, are developed and followed to assure that the article will indeed comply with

In-Process Revision

compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for *Dissolution* and *Uniformity of dosage units*, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.

■Where the *Content Uniformity* determinations have been made using the same ~~method~~ procedure specified in the *Assay*, the average of all of the individual *Content Uniformity* determinations may be used as the *Assay* value.■1S (*USP27*)

Description—Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table *Description and Relative Solubility of USP and NF Articles* in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility—The statements concerning solubilities given in the reference table *Description and Relative Solubility of USP and NF Articles* for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table. Soluble Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1000
Very slightly soluble	From 1000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

▲**Interchangeable Methods**—Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method from one of these pharmacopeias, it should comply with the requirements of the *United States Pharmacopeia*. However, where a difference appears, or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.▲*USP26*

Change to read:

PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers—The *container* is that which holds the article and is or may be in direct contact with the article. The *immediate container* is that which is in direct contact with the article at all times. The *closure* is a part of the container.

Prior to its being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The Pharmacopeial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

■*Tamper-Evident*■2S (*USP26*) *Packaging*—The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the ■tamper-evident■2S (*USP26*) packaging and labeling requirements of the FDA where applicable.

Preferably, the immediate container and/or the outer container or protective packaging utilized by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

Light-Resistant Container (see *Light Transmission* under *Containers* ⟨661⟩)—A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to "protect from light" in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering prior to dispensing.

Well-Closed Container—A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container—A tight container protects the contents from contamination by extraneous liquids, solids, or vapors, from loss of the article, and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution, and is capable of tight reclosure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

NOTE—Where packaging and storage in a *tight container* or a *well-closed container* is specified in the individual monograph, the container utilized for an article when dispensed on prescription meets the requirements under *Containers—Permeation* ⟨671⟩.

Hermetic Container—A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Unit Container—A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

Single-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A single-dose container is a single-unit container for articles intended for parenteral administration only. A single-dose container is labeled as such. Examples of single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Unit-Dose Container—A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

Unit-of-Use Container—A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

Multiple-Unit Container—A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Multiple-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

Storage Temperature and Humidity—Specific directions are stated in some monographs with respect to the temperatures and humidity at which Pharmacopeial articles shall be stored and distributed (including the shipment of articles to the consumer) when stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply (see also *Stability* under *Pharmaceutical Dosage Forms* ⟨1151⟩.) The conditions are defined by the following terms.

Freezer—A place in which the temperature is maintained thermostatically between –25° and –10° (–13° and 14 °F).

Cold—Any temperature not exceeding 8° (46 °F). A *refrigerator* is a cold place in which the temperature is maintained thermostatically between 2° and 8° (36° and 46 °F).

Cool—Any temperature between 8° and 15° (46° and 59 °F). An article for which storage in a *cool place* is directed may, alternatively, be stored and distributed in a *refrigerator*, unless otherwise specified by the individual monograph.

Room Temperature—The temperature prevailing in a working area.

Controlled Room Temperature—A temperature maintained thermostatically that encompasses the usual and customary working environment of 20° to 25° (68° to 77 °F); that results in a mean kinetic temperature calculated to be not more than 25°; and that allows for excursions between 15° and 30° (59° and 86 °F) that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to 40° are permitted as long as they do not exceed 24 hours. Spikes above 40° may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to 25°", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variations. (See also *Stability* under *Pharmaceutical Dosage Forms* ⟨1151⟩.)

An article for which storage at *Controlled room temperature* is directed may, alternatively, be stored and distributed in a *cool place*, unless otherwise specified in the individual monograph or on the label.

Warm—Any temperature between 30° and 40° (86° and 104 °F).

Excessive Heat—Any temperature above 40° (104 °F).

Protection from Freezing—Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Dry Place—The term "dry place" denotes a place that does not exceed 40% average relative humidity at *Controlled Room Temperature* or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value is 40% relative humidity.

Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.

Storage under Nonspecific Conditions—~~For articles, regardless of quantity, where no specific storage directions or limitations are provided in the individual monograph, it is to be understood that conditions of storage and distribution include protection from moisture, freezing, and excessive heat.~~

▲Where no specific directions or limitations are provided in the packaging and storage section of individual monographs or in the article's labeling, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Articles shall be protected from moisture, freezing, and excessive heat, and, where necessary, from light during shipping and distribution. Active pharmaceutical ingredients are exempt from this requirement.▲*USP27*

■**Repackaging Instructions—**Except where a drug product is packaged in a container intended to be dispensed directly to the patient, such as a unit-of-use or unit-dose container, the labeling shall contain directions specifying the types of containers suitable for repackaging the drug product so as to maintain its identity, strength, quality, and

In-Process Revision

purity. Such directions shall be sufficient to allow a repackager or dispenser to select an adequate container and shall include a description of the composition of the container(s), e.g., glass, polyethylene, polyvinyl chloride, and any moisture vapor transmission rate characteristics required. The labeling shall also indicate whether or not the container is to afford light protection, and shall include any storage or shipping temperature restrictions to which the drug as repackaged shall be limited (see 21 CFR 201.100).■1S (*USP27*)

Labeling—The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in this Pharmacopeia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the Pharmacopeial requirements set forth for the articles.

Amount of Ingredient per Dosage Unit—The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Pharmacopeial articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in *Deliverable Volume* ⟨698⟩. Pharmacopeial drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see *Percentage Measurements*), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each 5-mL portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units (see also *Units of Potency* in these *General Notices*).

Use of Leading and Terminal Zeros—In order to help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg]). The quantity of active ingredient when expressed as a decimal number smaller than one shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg]).

Labeling of Salts of Drugs—It is an established principle that Pharmacopeial articles shall have only one official name. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids; but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

Labeling Vitamin-Containing Products—The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.

Labeling Parenteral and Topical Preparations—The label of a preparation intended for parenteral or topical use states the names of all added substances (see *Added Substances* in these *General Notices and Requirements*, and see *Labeling* under *Injections* ⟨1⟩), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

Labeling Electrolytes—The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

Labeling Alcohol—The content of alcohol in a liquid preparation shall be stated on the label as a percentage (v/v) of C_2H_5OH.

Special Capsules and Tablets—The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used.

Expiration Date and Beyond-Use Date—The label of an official drug product, nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/89," "Exp. June 89," or "Expires 6/89"). [NOTE—For additional information and guidance, refer to the Nonprescription Drug Manufacturers Association's *Voluntary Codes and Guidelines of the OTC Medicines Industry.*]

The monographs for some preparations state how the expiration date that shall appear on the label is to be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the Pharmacopeial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article must not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the

General Notices and Requirements of this Pharmacopeia. The beyond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution prior to use, a suitable beyond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) one year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be one year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturers container, whichever is earlier, unless stability data or the manufacturers labeling indicates otherwise.

The dispenser must maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than 25°. The plastic material used in packaging the dosage forms must afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records must be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

Pharmaceutical Compounding—The label on the container or package of an official compounded preparation shall bear a beyond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, is to be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see *Stability Criteria and Beyond-Use Dating* under *Stability of Compounded Preparations* in the general tests chapter ■~~*Pharmacy Compounding* ⟨795⟩~~:■2S (*USP26*)

MONOGRAPHS (USP)

BRIEFING

Acepromazine Maleate, *USP 26* page 14; **Alteplase,** *USP 26* page 69; **Aminopentamide Sulfate,** *USP 26* page 123; **Azaperone,** *USP 26* page 195; **Desoxycorticosterone Pivalate,** *USP 26* page 557; **Flunixin Meglumine,** *USP 26* page 799; **Glucagon,** *USP 26* page 861; **Indigotindisulfonate Sodium,** *USP 26* page 961; **Indocyanine Green,** *USP 26* page 966; **Insulin,** *USP 26* page 973 and page 2969 of the *First Supplement;* **Insulin Human,** *USP 26* page 976; **Ketamine Hydrochloride,** *USP 26* page 1045; **Manganese Sulfate,** *USP 26* page 1125; **Menotropins,** *USP 26* page 1148; **Oxytocin,** *USP 26* page 1385; **Phenylbutazone Injection,** *USP 26* page 1457; **Vasopressin,** *USP 26* page 1923; **Xylazine,** *USP 26* page 1942 and page 3002 of the *First Supplement;* **Xylazine Hydrochloride,** *USP 26* page1944; **Yohimbine Hydrochloride,** *USP 26* page 1947 and page 3003 of the *First Supplement.* Revisions are proposed to establish consistency with the system of *Labeling* established in 1993 by the USP Drug Nomenclature Committee (page 5618 of *PF* 19(4) [July–Aug. 1993]). Specifically, it is now proposed to include in each monograph of drug substances (active pharmaceutical ingredients) intended for use in preparing injectable dosage forms, a statement that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed stating that where the label states that it is sterile it must meet the requirements under *Sterility Test* ⟨71⟩ and *Bacterial Endotoxins* ⟨85⟩. In addition, where the label states that it must be subjected to further processing during the preparation of injectable dosage forms, it must meet the requirements under *Bacterial Endotoxins* ⟨85⟩. In some monographs it is proposed to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

BRIEFING

Adenosine, *USP 26* page 51 and page 2940 of the *First Supplement;* **Diatrizoate Meglumine,** *USP 26* page 582; **Diatrizoate Sodium,** *USP 26* page 585; **Diatrizoic Acid,** *USP 26* page 586; **Gadodiamide,** *USP 26* page 839; **Gadoteridol,** *USP 26* page 843; **Inulin,** *USP 26* page 980; **Iodipamide,** *USP 26* page 990; **Iodixanol,** *USP 26* page 991; **Iohexol,** *USP 26* page 996; **Iopamidol,** *USP 26* page 998; **Iophendylate,** *USP 26* page 1000; **Iothalamic Acid,** *USP 26* page 1005; **Ioversol,** *USP 26* page 1006; **Ioxaglic Acid,** *USP 26* page 1008; **Ioxalin,** *USP 26* page 1008; **Mangafodipir Trisodium,** *USP 26* page 1121; **Mebrofenin,** *USP 26* page 1133; **Propyliodone,** *USP 26* page 1584. Revisions are proposed to establish consistency with the system of *Labeling* established in 1993 by the USP Drug Nomenclature Committee (see page 5618 of *PF* 19(4) [July–Aug. 1993]). Specifically, it is now proposed to include in each monograph of drug substances (active pharmaceutical ingredients) intended for use in preparing injectable dosage forms, a statement that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed stating that where the label states that it is sterile, it must meet the requirements of the *Sterility Tests* ⟨71⟩ and of the test for *Bacterial Endotoxins* ⟨85⟩. In addition where the label states that it must be subjected to further processing during the preparation of injectable dosage forms, it must meet the requirements of the test for *Bacterial Endotoxins* ⟨85⟩. In some monographs it is proposed to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

BRIEFING

Alumina, Magnesia, and Calcium Carbonate Tablets, *USP 26,* page 76 and page 2515 of *PF* 27(3) [May–June 2001]. Revisions are proposed by the Expert Committee on Nomenclature and Labeling to change the titles of nine USP monographs for tablets that must be chewed before being swallowed. The revisions are those that are proposed to change the current titles that are in the general form [DRUG(S)] Tablets to the general form [DRUG(S)] Chewable Tablets. The Expert Committee on Nomenclature and Labeling considers that the term "Chewable" appearing prominently in a product name will represent a significant improvement in that the consumer will be provided with the assurance that, along with the labeling statement directing that "tablets must be chewed before being swallowed," the product will be used properly to achieve the benefit of the medication.

This proposed nomenclature revision is not intended for tablets that may (not must) be chewed before being swallowed or that may be swallowed intact.

The revisions are proposed for publication in the *Second Supplement to USP 27–NF 22,* which is to become official August 1, 2004, but with February 1, 2007 designated as the official date for the name changes. Use of the revised names would be permitted as of the August 1, 2004 official date of the *Second Supplement to USP 27–NF 22,* but use of the revised names would not become mandatory until February 1, 2007. The thirty-month postponement of the official date for the name changes is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the revised terminology.

BRIEFING

Alumina, Magnesia, and Calcium Carbonate Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul; PSD: C. Okeke) RTS—40424-1

Add the following:

■Alumina, Magnesia, and Calcium Carbonate Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Alumina, Magnesia, and Calcium Carbonate Tablets)

» Alumina, Magnesia, and Calcium Carbonate Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [$Al(OH)_3$], magnesium hydroxide [$Mg(OH)_2$], and calcium carbonate ($CaCO_3$).

Packaging and storage—Preserve in ~~well closed~~ tight containers, and store at controlled room temperature.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Chewable Tablets prepared with the use of *Dried Aluminum Hydroxide* may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of $Al(OH)_3$.

Identification—To a 3-g portion of finely powdered Chewable Tablets add 25 mL of water and 25 mL of 2 N sulfuric acid, stir, and heat on a steam bath for 10 minutes. Cool, add 50 mL of alcohol, and stir: the mixture so obtained responds to *Identification* tests *A*, *B*, and *C* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*, beginning under *Identification* test *A* with "place in an ice bath for 30 minutes."

Disintegration ⟨701⟩: 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to alumina, to magnesia, and to calcium carbonate.

Acid-neutralizing capacity ⟨301⟩—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M) + 0.9(0.02C),$$

in which 0.0385, 0.0343, and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of $Al(OH)_3$, $Mg(OH)_2$, and $CaCO_3$, respectively, and *A*, *M*, and *C* are the respective quantities, in mg, of $Al(OH)_3$, $Mg(OH)_2$, and $CaCO_3$ in the specimen tested, based on the labeled quantities.

Assay for aluminum hydroxide—

Edetate disodium titrant—Prepare as directed in the *Assay for aluminum hydroxide* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*.

Assay preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay for aluminum hydroxide* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of $Al(OH)_3$.

In-Process Revision

Assay for magnesium hydroxide—

Edetate disodium titrant and *Assay preparation*—Prepare as directed in the *Assay for aluminum hydroxide*.

Procedure—Proceed as directed for *Procedure* in the *Assay for magnesium hydroxide* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.916 mg of $Mg(OH)_2$.

Assay for calcium carbonate—

Edetate disodium titrant and *Assay preparation*—Prepare as directed in the *Assay for aluminum hydroxide*.

Procedure—Proceed as directed for *Procedure* in the *Assay for calcium carbonate* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 5.004 mg of $CaCO_3$. ■2S (*USP27*)

(Official February 1, 2007)

BRIEFING

Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets, *USP 26* page 76 and page 2516 of *PF* 27(3) [May–June 2001]. It is proposed to change the title of this monograph to *Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; L. Paul; PSD: C. Okeke) RTS—40425-1

Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets

(Current title—not to change until February 1, 2007)

BRIEFING

Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; L. Paul; PSD: C. Okeke) RTS—40425-1

Add the following:

■Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets)

» Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [$Al(OH)_3$], magnesium hydroxide [$Mg(OH)_2$], and calcium carbonate ($CaCO_3$), and an amount of polydimethylsiloxane ([$–(CH_3)_2SiO–]_n$) that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

In-Process Revision

Labeling—The labeling indicates that the Chewable Tablets are to be chewed before swallowing. Label the Chewable Tablets to state the sodium content, if it is greater than 5 mg per Chewable Tablet.

USP Reference standards ⟨11⟩—*USP Polydimethylsiloxane RS.*

Identification—

A: Cut a Chewable Tablet into pieces, add 50 mL of 1 N sulfuric acid, stir until the pieces disintegrate, and heat on a steam bath for 10 minutes. Cool, add 50 mL of alcohol, and stir. The mixture so obtained responds to *Identification* tests *A*, *B*, and *C* under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension,* beginning under *Identification* test *A* with "place in an ice bath for 30 minutes."

B: *Infrared Absorption* ⟨197S⟩—

Cell: 0.5 mm.

Solution: prepared as directed in the *Assay for polydimethylsiloxane.*

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 200 per g, the total combined molds and yeasts count does not exceed 200 per g, and the Chewable Tablets meet the requirements of the test for the absence of *Salmonella* species and *Escherichia coli.*

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to aluminum hydroxide, to magnesium hydroxide, and to calcium carbonate.

Acid-neutralizing capacity ⟨301⟩—Dissolve an accurately counted number of Chewable Tablets, equivalent to about 120 mEq of acid-neutralizing capacity, in about 400 mL of water. Transfer the mixture to a 500-mL volumetric flask, dilute with water to volume, and mix. Use 75.0 mL of this solution as the *Test preparation*. Proceed as directed in the section *Procedure for Powders, Effervescent Solids, Suspensions and Other Liquids, Nonchewable Tablets, Chewable Tablets, and Capsules.* The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M) + 0.9(0.02C),$$

in which 0.0385, 0.0343, and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of $Al(OH)_3$, $Mg(OH)_2$, and $CaCO_3$, respectively, and *A*, *M*, and *C* are the quantities, in mg, of $Al(OH)_3$, $Mg(OH)_2$, and $CaCO_3$ in the specimen tested, based on the labeled quantities.

Defoaming activity—

Foaming solution—Dissolve 1 g of octoxynol 9 in 100 mL of 0.3 N hydrochloric acid.

Procedure—[NOTE—For each test, use a clean 250-mL cylindrical glass jar.] Weigh not fewer than 10 Chewable Tablets, cut them into small pieces, and mix. Transfer a portion of mixed Tablet pieces, equivalent to about 20 mg of simethicone, to a clean 250-mL cylindrical glass jar, fitted with a 50-mm cap, containing 100 mL of *Foaming solution* that has been warmed to 37°. After effervescence ceases, proceed as directed for *Procedure* in the *Defoaming activity* test under *Simethicone,* beginning with "Cap the jar." The defoaming activity time does not exceed 45 seconds.

Sodium content—

Potassium chloride solution—Dissolve 3 g of potassium chloride in water in a 100-mL volumetric flask, dilute with water to volume, and mix.

Dilute hydrochloric acid—Prepare by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

Standard solution—Transfer 2.5420 g of sodium chloride, previously dried at 105° for 2 hours, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. To three

In-Process Revision

separate 100-mL volumetric flasks, each containing 10.0 mL of *Potassium chloride solution* and 3.0 mL of *Dilute hydrochloric acid,* add, respectively, 10.0, 20.0, and 30.0 mL of this solution. These solutions contain 1.0, 2.0, and 3.0 µg of sodium (Na) per mL, respectively.

Test solution—Accurately weigh 10 Chewable Tablets, and determine the average weight, *A,* in mg. Cut 4 Chewable Tablets into pieces, combine the pieces, and weigh them. Transfer the combined pieces to a 500-mL volumetric flask, add 150 mL of *Dilute hydrochloric acid,* and swirl gently to disintegrate the pieces. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Potassium chloride solution,* dilute with water to volume, and mix.

Blank solution—Transfer 3.0 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a sodium hollow-cathode lamp and an air–acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in µg per mL, of sodium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C,* in µg per mL, of sodium in the *Test solution.* Calculate the mg of sodium (Na) in each Chewable Tablet taken by the formula:

$$5C(A/W),$$

in which *A* is the average weight, in mg, of each Chewable Tablet and *W* is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Test solution.* Tablets contain not more than 5 mg of sodium per Chewable Tablet, except when labeled as containing more than 5 mg of sodium per Chewable Tablet, they contain not more than 110% of the labeled amount.

Assay for aluminum hydroxide—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum.*

Assay preparation—Transfer an accurately counted number of Chewable Tablets, equivalent to about 665 mg of aluminum hydroxide, to a suitable beaker. Add 15 mL of hydrochloric acid, and swirl to dissolve the Tablets. Add 80 mL of water, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

Procedure—Pipet 20 mL of *Assay preparation* into a 250-mL beaker, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the *Assay preparation,* and making any necessary correction. Each mL of *0.05 M Edetate disodium titrant* consumed is equivalent to 3.900 mg of $Al(OH)_3$.

Assay for magnesium hydroxide—

Lanthanum chloride solution—Transfer 17.6 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

Dilute hydrochloric acid—Prepare by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

Potassium chloride solution—Dissolve 3 g of potassium chloride in water in a 100-mL volumetric flask, dilute with water to volume, and mix.

Magnesium stock solution—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water, slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains 20 µg of magnesium (Mg) per mL.

Standard preparations—To three separate 100-mL volumetric flasks each containing 5.0 mL of *Lanthanum chloride solution,* add 1.0, 2.0, and 3.0 mL, respectively, of the *Magnesium stock solution.* Dilute each with water to volume, and mix. These solutions contain 0.1, 0.2, and 0.3 µg of magnesium (Mg) per mL, respectively.

Assay preparation—Transfer an accurately counted number of Chewable Tablets, equivalent to about 250 mg of magnesium hydroxide (100 mg of magnesium), to a 1000-mL volumetric flask. Add 500 mL of *Dilute hydrochloric acid,* and swirl to disintegrate the Tablets. Add 100.0 mL of *Potassium chloride solution,* dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution,* dilute with water to volume, and mix.

Blank—Add 50 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a third 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution,* dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a magnesium hollow-cathode lamp and an air–acetylene flame, using the *Blank* to set the instrument. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg per mL, of magnesium in the *Assay preparation.* Calculate the quantity, in mg, of magnesium hydroxide [$Mg(OH)_2$] in each Chewable Tablet taken by the formula:

$$(58.34/24.305)(500C/N),$$

in which 58.34 is the molecular weight of magnesium hydroxide; 24.305 is the atomic weight of magnesium; and *N* is the number of Chewable Tablets taken to prepare the *Assay preparation.*

Assay for calcium carbonate—

Assay preparation—Prepare as directed in the *Assay for aluminum hydroxide.*

Procedure—Pipet a volume of the *Assay preparation,* equivalent to about 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, a volume of sodium hydroxide solution (1 in 2) equivalent to the volume of the *Assay preparation* taken, and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M edetate disodium VS until the solution is distinctly blue. Perform a blank determination, substituting a volume of water equivalent to the volume of the *Assay preparation* taken, and make any necessary correction. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of $CaCO_3$.

In-Process Revision

Assay for polydimethylsiloxane—

Dilute hydrochloric acid—Prepare by mixing 400 mL of hydrochloric acid with sufficient water to make 1000 mL.

Standard preparation—Transfer about 60 mg of USP Polydimethylsiloxane RS, accurately weighed, to a separator, add 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid*, shake for 30 seconds, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained (*Standard preparation*).

Assay preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of simethicone, to a suitable screw-capped bottle, add 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid*, and allow to stand, with frequent shaking, until the Chewable Tablets are dissolved. Transfer the contents of the bottle to a separator, shake, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained (*Assay preparation*).

Blank—Place 30.0 mL of chloroform and 60 mL of *Dilute hydrochloric acid* in a separator, shake for 30 seconds, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained (*Blank*).

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9 µm, with a suitable IR spectrophotometer, using the *Blank* to set the instrument. Calculate the quantity, in mg, of $[–(CH_3)_2SiO–]_n$ in each Chewable Tablet taken by the formula:

$$(W/N)(A_U / A_S),$$

in which W is the weight, in mg, of USP Polydimethylsiloxane RS used in preparing the *Standard preparation; N* is the number of Chewable Tablets taken to prepare the *Assay preparation;* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

(Official February 1, 2007)

BRIEFING

Alumina, Magnesia, and Simethicone Tablets, *USP 26* page 79. It is proposed to change the title of this monograph to *Alumina, Magnesia, and Simethicone Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40426-1

Alumina, Magnesia, and Simethicone Tablets

(Current title—not to change until February 1, 2007)
Monograph title change—to become official February 1, 2007
(see Official Title Changes on the first page of In-Process Revision):

In-Process Revision

BRIEFING

Alumina, Magnesia, and Simethicone Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40426-1

Add the following:

■Alumina, Magnesia, and Simethicone Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Alumina, Magnesia, and Simethicone Tablets)

» Alumina, Magnesia, and Simethicone Chewable Tablets contain the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of aluminum hydroxide [$Al(OH)_3$] and magnesium hydroxide [$Mg(OH)_2$], and an amount of polydimethylsiloxane [$–(CH_3)_2SiO–]_n$ that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Label the Chewable Tablets to state the sodium content if it is greater than 5 mg per Tablet. The Chewable Tablets may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of $Al(OH)_3$.

USP Reference standards ⟨11⟩—*USP Polydimethylsiloxane RS.*

Identification—

A: *Infrared Absorption* ⟨197S⟩—

Cell: 0.5 mm.

Solution: prepared as directed in the *Assay for polydimethylsiloxane.*

B: To a portion of finely powdered Chewable Tablets, equivalent to about 600 mg of magnesium hydroxide, add 25 mL of 3 N hydrochloric acid and 25 mL of water, and mix. Boil gently for 2 minutes. Allow to cool, and filter. Add 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution just turns to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate so obtained responds to the tests for *Magnesium* ⟨191⟩.

C: Wash the precipitate obtained in *Identification* test *B* with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution so obtained responds to *Identification* test *C* under *Alumina, Magnesia, and Simethicone Oral Suspension.*

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium hydroxide.

Acid-neutralizing capacity ⟨301⟩—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M),$$

in which 0.0385 and 0.0343 are the theoretical acid-neutralizing capacities, in mEq, of $Al(OH)_3$ and $Mg(OH)_2$, respectively, and A and M are the quantities, in mg, of $Al(OH)_3$ and $Mg(OH)_2$ in the specimen tested, based on the labeled quantities.

In-Process Revision

Defoaming activity—

Foaming solution—Dissolve 500 µg of FD&C Blue No. 1 and 1 g of octoxynol 9 in 100 mL of 0.1 N hydrochloric acid.

Procedure—[NOTE—For each test, employ a clean, unused, 250-mL glass jar.] Transfer a quantity of finely powdered Chewable Tablets, passed completely through an 80-mesh sieve, equivalent to 20 mg of simethicone, to a clean, unused, cylindrical 250-mL glass jar, fitted with a 50-mm cap, containing 100 mL of *Foaming solution* that has been warmed to 37°. Proceed as directed for *Procedure* in the test for *Defoaming activity* under *Simethicone,* beginning with "Cap the jar." The defoaming activity time does not exceed 45 seconds.

Sodium content—

Potassium chloride solution, Sodium chloride stock solution, and *Standard preparations*—Prepare as directed in the test for *Sodium content* under *Alumina, Magnesia, and Simethicone Oral Suspension.*

Test preparation—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to the average weight of 1 Chewable Tablet, to a 100-mL volumetric flask. Add 50 mL of 1 N hydrochloric acid, boil for 15 minutes, cool to room temperature, dilute with water to volume, and mix. Filter, discarding the first few mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask containing 10.0 mL of *Potassium chloride solution,* dilute with water to volume, and mix.

Procedure—Proceed as directed in the test for *Sodium content* under *Alumina, Magnesia, and Simethicone Oral Suspension.* Calculate the quantity, in mg, of sodium per Chewable Tablet taken by the formula:

$$2C.$$

Assay for aluminum hydroxide—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum.*

Assay preparation—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 800 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool to room temperature, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay for aluminum hydroxide* under *Alumina, Magnesia, and Simethicone Oral Suspension.*

Assay for magnesium hydroxide—

Assay preparation—Prepare as directed in the *Assay for aluminum hydroxide*.

Procedure—Proceed as directed for *Procedure* in the *Assay for magnesium hydroxide* under *Alumina, Magnesia, and Simethicone Oral Suspension.*

Assay for polydimethylsiloxane—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 33 mg of simethicone, to a suitable round, narrow-mouth, screw-capped, 120-mL bottle, add 40 mL of 0.1 N sodium hydroxide, and swirl to disperse. Add 20.0 mL of toluene, close the bottle securely with a cap having an inert liner, and shake for 30 minutes, accurately timed, on a reciprocating shaker (e.g., about 200 oscillations per minute and a stroke of 38 ± 2 mm). Transfer the mixture to a 125-mL separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing about 2 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant (*Assay preparation*) is

obtained. Similarly prepare a *Standard preparation*, using about 33 mg of USP Polydimethylsiloxane RS, accurately weighed. Prepare a blank by mixing 10 mL of toluene with about 1 g of anhydrous sodium sulfate and centrifuging to obtain a clear supernatant. Concomitantly determine the absorbances of the solutions in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9 µm (1265.8 cm^{-1}), with a suitable IR spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of $[–(CH_3)_2SiO–]_n$ in the portion of Chewable Tablets taken by the formula:

$$(W)(A_U / A_S),$$

in which W is the weight, in mg, of USP Polydimethylsiloxane RS used to prepare the *Standard preparation,* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

(Official February 1, 2007)

Change to read:

USP Reference standards ⟨11⟩—*USP Aminopentamide Sulfate RS*.

■*USP Endotoxin RS.*■2S (*USP27*)

Add the following:

■**Other requirements—**Where the label states that Aminopentamide Sulfate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Aminopentamide Sulfate Injection*. Where the label states that Aminopentamide Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Aminopentamide Sulfate Injection*.■2S (*USP27*)

Change to read:

Assay—Dissolve about 500 mg of Aminopentamide Sulfate, accurately weighed, in 100 mL of dimethylformamide in a suitable container. Add 5 drops of thymol blue TS, and titrate with 0.1 N lithium methoxide VS

■in benzene■2S (*USP27*)
to a deep blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 19.72 mg of $C_{19}H_{24}N_2O \cdot H_2SO_4$.

BRIEFING

Aminopentamide Sulfate, *USP 26* page 123 and page 1414 of *PF* 29(5) [Sept.–Oct. 2003]—See briefing under *Acepromazine Maleate*.

1354 and page 94 of *PF* 29(1) [Jan.–Feb. 2003]; **Pentobarbital,** *USP 26* page 1429 and page 655 of *PF* 29(3) [May–June 2003]; **Pentobarbital Sodium,** *USP 26* page 1431and page 1558 of *PF* 29(5) [Sept.–Oct. 2003]; **Perphenazine,** *USP 26* page 1438; **Phenobarbital,** *USP 26* page 1448; **Phenobarbital Sodium,** *USP 26* page 1449; **Phenytoin Sodium,** *USP 26* page 1467; **Physostigmine Salicylate,** *USP 26* page 1473; **Pyridostigmine Bromide,** *USP 26* page 1597; **Secobarbital Sodium,** *USP 26* page 1671; **Thiothixene Hydrochloride,** *USP 26* page 1828; **Trifluoperazine Hydrochloride,** *USP 26* page 1880; **Triflupromazine Hydrochloride,** *USP 26* page 1884; **Tubocurarine Chloride,** *USP 26* page 1907. Revisions are proposed to establish consistency with the system of Labeling established in 1993 by the USP Drug Nomenclature Committee (see *PF* 19(4) [July-Aug. 1993] page 5618). Specifically, it is now proposed to include in each monograph of drug substances (active pharmaceutical ingredients) intended for use in preparing injectable dosage forms a statement that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed stating that where the label states that it is sterile it must meet the requirements of the *Sterility Tests* ⟨71⟩ and of the test for *Bacterial endotoxins* ⟨85⟩. In addition, where the label states that it must be subjected to further processing during the preparation of injectable dosage forms, it must meet the requirements of the test for *Bacterial endotoxins* ⟨85⟩. In some monographs it is proposed to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

Add the following:

▲**Related compounds—**

Buffer solution—Transfer about 0.48 g of methanesulfonic acid to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg of USP Bethanechol Chloride RS per mL.

Test solution—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

System suitability solution—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatography system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector and a 3.9- × 150-mm column containing packing L60. The flow rate is about 1.0 mL per minute. The detector and column temperature are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention time is about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol; the resolution, *R,* between 2-hydroxypropyltrimethyl ammonium chloride and bethanechol is not less than 1.5. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0% for bethanechol chloride.

Procedure—Separately inject equal volumes (about 50 µL) of the *Mobile phase, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for all the peaks. Calculate the percentage of each impurity in the portion of Bethanechol Chloride taken by the formula:

$$2500C(F/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard solution; F* is the relative response factor and is equal to 0.79 for 2-hydroxypropyltrimethyl ammonium and 1.0 for any other impurity; r_i is the peak response for any impurity in the *Test solution;* r_S is the peak response of USP Bethanechol Chloride RS in the *Standard solution;* and W is the weight, in mg, of Bethanechol Chloride taken to prepare the *Test solution.* Not more than 1.0% of 2-hydroxypropyltrimethyl ammonium is found, not more than 0.1% of any other impurity is found, and the sum of all the impurities is not more than 1.5%.▲*USP27*

Add the following:

■**Other requirements—**Where the label states that Bethanechol Chloride is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Bethanechol Chloride*

In-Process Revision

Injection. Where the label states that Bethanechol Chloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Bethanechol Chloride Injection.* ■2S (*USP27*)

Change to read:

Assay— ~~Dissolve about 500 mg of Bethanechol Chloride, accurately weighed, in a mixture of 10 mL of glacial acetic acid and 10 mL of mercuric acetate TS. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.67 mg of $C_7H_{17}ClN_2O_2$.~~

▲*Buffer solution*—Transfer about 29 mg of edetate disodium to a 1000-mL volumetric flask, and dissolve in 500 mL of water. Add 300 µL of nitric acid to the volumetric flask, and dilute with water to volume. Filter through 0.45-µm nylon membrane filter.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg of USP Bethanechol Chloride RS per mL.

Assay preparation—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector and a 3.9- × 150-mm column containing packing L60. The flow rate is about 1.0 mL per minute. The detector and column temperature are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol, and the resolution, *R,* between 2-hydroxypropyltrimethyl ammonium chloride and Bethanechol is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 3.5; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of $C_7H_{17}ClN_2O_2$ in the portion of Bethanechol Chloride taken by the formula:

$$250C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard preparation;* and r_U and r_S are the bethanechol chloride peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP27*

BRIEFING

Calcium Carbonate and Magnesia Tablets, *USP 26* page 302. It is proposed to change the title of this monograph to *Calcium Carbonate and Magnesia Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40427-1

Calcium Carbonate and Magnesia Tablets

(Current title—not to change until February 1, 2007)
Monograph title change—to become official February 1, 2007
(see Official Title Changes on the first page of In-Process Revision):
***See* Calcium Carbonate and Magnesia Chewable Tablets**

BRIEFING

Calcium Carbonate and Magnesia Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40427-1

Add the following:

■Calcium Carbonate and Magnesia Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Calcium Carbonate and Magnesia Tablets)

» Calcium Carbonate and Magnesia Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of calcium carbonate ($CaCO_3$) and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of magnesium hydroxide [$Mg(OH)_2$].

In-Process Revision

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed.

Identification—

A: The addition of 3 N hydrochloric acid to the Chewable Tablets produces effervescence, and the resulting solution, after being boiled to expel carbon dioxide and neutralized with 6 N ammonium hydroxide, meets the requirements of the tests for *Calcium* ⟨191⟩.

B: Heat 2 Chewable Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 minutes. Filter this solution, and add 2 mL of 1 N hydrochloric acid to the filtrate: this solution meets the requirements of the tests for *Magnesium* ⟨191⟩.

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesia.

Acid-neutralizing capacity ⟨301⟩—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.0343M) + 0.9(0.02C),$$

in which 0.0343 and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of $Mg(OH)_2$ and $CaCO_3$, respectively; and M and C are the respective quantities, in mg, of $Mg(OH)_2$ and $CaCO_3$ in the specimen tested, based on the labeled quantities.

Assay for calcium carbonate—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 400 mg of calcium carbonate, to a beaker with 25 mL of water, and add 40 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 minutes, allow to cool, transfer to a 100-mL volumetric flask with the aid of water, dilute with water to volume, mix, and filter. Transfer 20.0 mL of the filtrate to a suitable container, dilute with water to 100 mL, add 30 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS until the solution is deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of calcium carbonate ($CaCO_3$).

Assay for magnesium hydroxide—Transfer an accurately measured portion of the filtrate remaining from the *Assay for calcium carbonate,* equivalent to about 120 mg of calcium carbonate and magnesium hydroxide combined, to a suitable container, dilute with water to 100 mL, add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. The volume, in mL, of 0.05 M edetate disodium consumed, less the volume of 0.05 M edetate disodium corresponding to the content of calcium carbonate in the volume, in mL, of the filtrate taken, represents the volume, in mL, of 0.05 M edetate disodium equivalent to the quantity of magnesium hydroxide present. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of $Mg(OH)_2$. ■2S (*USP27*)

(Official February 1, 2007)

BRIEFING

Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40428-1

Add the following:

■Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Calcium Carbonate, Magnesia, and Simethicone Tablets)

» Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of calcium carbonate ($CaCO_3$) and magnesium hydroxide [$Mg(OH)_2$], and an amount of polydimethylsiloxane [$–(CH_3)_2SiO–]_n$ that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate that the Chewable Tablets are to be chewed before swallowing. Label the Chewable Tablets to state the sodium content, in mg per Chewable Tablet, if it is greater than 5 mg per Chewable Tablet.

USP Reference standards ⟨11⟩—*USP Polydimethylsiloxane RS.*

Identification—

A: *Infrared Absorption* ⟨197S⟩—

Solution—Using Chewable Tablets, proceed to obtain IR absorption spectra as directed in the *Assay for polydimethylsiloxane* under *Alumina, Magnesia, and Simethicone Chewable Tablets.*

B: The addition of 1 N hydrochloric acid to a Chewable Tablet produces effervescence, and the resulting solution, after having been filtered, responds to the tests for *Calcium* ⟨191⟩.

C: Heat 2 Chewable Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 minutes. Filter this solution, and to the filtrate add 2 mL of 1 N hydrochloric acid: this solution responds to the tests for *Magnesium* ⟨191⟩.

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesium hydroxide.

Acid-neutralizing capacity ⟨301⟩—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

Defoaming activity—

Foaming solution—Dissolve 500 µg of FD&C Blue No. 1 and 1 g of octoxynol 9 in 100 mL of 0.1 N hydrochloric acid.

Procedure—[NOTE—For each test, use a clean, unused, 250-mL cylindrical glass jar.] Transfer a quantity of finely powdered Chewable Tablets, which has completely passed though an 80-mesh sieve, equivalent to 20 mg of simethi-

In-Process Revision

cone, to a clean 250-mL cylindrical glass jar, fitted with a 50-mm cap, containing 100 mL of *Foaming solution* that has been warmed to 37°. Proceed as directed for *Procedure* in the test for *Defoaming activity* under *Simethicone,* beginning with "Cap the jar." The defoaming activity time does not exceed 45 seconds.

Sodium content (if so labeled)—

Lanthanum chloride solution—Prepare as directed in the *Assay for calcium carbonate and magnesium hydroxide.*

Dilute hydrochloric acid—Prepare as directed in the *Assay for polydimethylsiloxane.*

Standard solution—Transfer 2.542 g of sodium chloride, previously dried at 105° for 2 hours, to a 1000-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 4.0 mL of this solution to a second 100-mL volumetric flask containing 6.0 mL of *Dilute hydrochloric acid* and 2.0 mL of *Lanthanum chloride solution,* dilute with water to volume, and mix. This solution contains 2.0 µg of sodium (Na) per mL.

Test preparation—Transfer 3.0 mL of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* to a 50-mL volumetric flask containing 1.0 mL of *Lanthanum chloride solution,* dilute with water to volume, and mix.

Blank solution—Transfer 15.0 mL of *Dilute hydrochloric acid* and 5.0 mL of *Lanthanum chloride solution* to a 250-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard solution* and the *Test preparation* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Calculate the mg of sodium (Na) in each Chewable Tablet taken by the formula:

$$(5C/6)(A/W)(A_U/A_S),$$

in which C is the concentration, in µg per mL, of sodium in the *Standard preparation, A* is the average weight, in mg, of each Chewable Tablet, W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation* in the *Assay for polydimethylsiloxane,* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively. Each Chewable Tablet contains not more than the number of mg of sodium stated on the label.

Assay for polydimethylsiloxane—

Saccharin solution—Prepare a solution of saccharin in 4-methyl-2-pentanone containing 12.5 mg per mL.

Dilute hydrochloric acid—Mix 200 mL of hydrochloric acid with sufficient water to make 1000 mL.

Standard preparation—Dissolve a suitable quantity of USP Polydimethylsiloxane RS in 4-methyl-2-pentanone to obtain a stock solution having a known concentration of about 1 mg per mL. On the day of use, transfer 20.0 mL of this solution and 5.0 mL of *Saccharin solution* to a 250-mL volumetric flask, dilute with 4-methyl-2-pentanone to volume, and mix. This solution contains about 0.08 mg of USP Polydimethylsiloxane RS per mL.

Assay preparation—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of polydimethylsiloxane, to a 125-mL separator. Cautiously add 50.0 mL of *Dilute hydrochloric acid,* and swirl until the reaction subsides. Insert the stopper, and mix. Carefully release the pressure, add 50.0 mL of 4-methyl-2-pentanone, and mix for 10 minutes. Allow the layers to separate, and drain the aqueous layer into a suitable stoppered container. [NOTE—

Retain this aqueous layer for use in preparing the *Assay preparation* in the *Assay for calcium carbonate and magnesium hydroxide* and for the preparation of the *Test preparation* in the test for *Sodium content.*] Filter the organic layer through a filter containing 50 g of anhydrous sodium sulfate. Transfer 10.0 mL of the filtrate to a 50-mL volumetric flask, add 1.0 mL of *Saccharin solution,* dilute with methyl isobutyl ketone to volume, and mix.

Blank solution—Transfer 1.0 mL of *Saccharin solution* to a 50-mL volumetric flask, dilute with 4-methyl-2-pentanone to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the silicon emission line at 251.6 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a silicon hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Calculate the quantity, in mg, of polydimethylsiloxane in each Tablet taken by the formula:

$$250C(A/W)(A_U/A_S),$$

in which C is the concentration, in mg per mL, of USP Polydimethylsiloxane RS in the *Standard preparation, A* is the average weight, in mg, of each Chewable Tablet, W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation,* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.

Assay for calcium carbonate and magnesium hydroxide—

Lanthanum chloride solution—Transfer 26.8 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

Dilute hydrochloric acid—Prepare as directed in the *Assay for polydimethylsiloxane.*

Calcium stock standard solution—Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of *Dilute hydrochloric acid,* and swirl to dissolve the calcium carbonate. Dilute with water to volume, and mix. This solution contains 1000 µg of calcium (Ca) per mL.

Magnesium stock standard solution—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water, slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with water to volume, and mix. This solution contains 1000 µg of magnesium (Mg) per mL.

Calcium and magnesium standard preparation—To a 250-mL volumetric flask add 10.0 mL of *Calcium stock standard solution* and 5.0 mL of *Magnesium stock standard solution,* dilute with water to volume, and mix. This solution contains 40 µg of calcium (Ca) and 20 µg of magnesium (Mg) per mL. On the day of use, transfer 4.0 mL of this solution to a 100-mL volumetric flask containing 2.0 mL of *Lanthanum chloride solution,* dilute with water to volume, and mix. This solution contains 1.6 µg of calcium (Ca) and 0.8 µg of magnesium (Mg) per mL.

Assay preparation—Transfer an accurately measured volume of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane,* equivalent to about 28 mg of calcium carbonate, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 2.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

Blank solution—Transfer 5.0 mL of *Lanthanum chloride solution* to a 250-mL volumetric flask, dilute with water to volume, and mix.

In-Process Revision

Procedure for calcium carbonate—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the calcium emission line at 422.7 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a calcium hollow-cathode lamp and an nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Calculate the quantity, in mg, of calcium carbonate ($CaCO_3$) in each Tablet taken by the formula:

$$(100.09/40.08)(1000C/3V)(A/W)(A_U/A_S),$$

in which 100.09 is the molecular weight of calcium carbonate, 40.08 is the atomic weight of calcium, C is the concentration, in µg per mL, of calcium in the *Standard preparation, V* is the volume, in mL, of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* used to prepare the *Assay preparation, A* is the average weight, in mg, of each Chewable Tablet, W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation* in the *Assay for polydimethylsiloxane,* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.

Procedure for magnesium hydroxide—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a magnesium hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Calculate the quantity, in mg, of magnesium hydroxide [$Mg(OH)_2$] in each Chewable Tablet taken by the formula:

$$(58.34/24.305)(1000C/3V)(A_U/A_S),$$

in which 58.34 is the molecular weight of magnesium hydroxide, 24.305 is the atomic weight of magnesium, C is the concentration, in µg per mL, of magnesium in the *Standard preparation, V* is the volume, in mL, of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* used to prepare the *Assay preparation, A* is the average weight, in mg, of each Chewable Tablet taken, W is the weight, in mg, of the portion of Tablets taken to prepare the *Assay preparation* in the *Assay for polydimethylsiloxane,* and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

(Official February 1, 2007)

BRIEFING

Carbamazepine Oral Suspension, *USP 26* page 324; **Doxepin Hydrochloride Oral Solution,** *USP 26* page 664; **Ergoloid Mesylates Oral Solution,** *USP 26* page 720; **Fluoxetine Oral Solution,** *USP 26* page 816; **Fluphenazine Hydrochloride Elixir,** *USP 26* page 822; **Haloperidol Oral Solution,** *USP 26* page 894; **Hydroxyzine Hydrochloride Oral Solution,** *USP 26* page 936; **Hydroxyzine Hydrochloride Syrup,** *USP 26* page 937; **Hydroxyzine Pamoate Oral Suspension,** *USP 26* page 939; **Meprobamate Oral Suspension,** *USP 26* page 1157; **Mesoridazine Besylate Oral Solution,** *USP 26* page 1167; **Nortriptyline Hydrochloride Oral Solution,** *USP 26* page 1339; **Perphenazine Oral Solution,** *USP 26* page 1438; **Perphenazine Syrup,** *USP 26* page 1439; **Phenytoin Oral Suspension,** *USP 26* page 1466; **Primidone Oral Suspension,** *USP 26* page 1539; **Thioridazine Oral Suspension,** *USP 26* page 1823; **Thiothixene Hydrochloride Oral Solution,** *USP 26* page 1829; **Trifluprom azine Oral Suspension,** *USP 26* page 1883. It is proposed to improve the standards in a number of oral solution, oral suspension, elixir, and syrup monographs by adding requirements for *Uniformity of dosage units* ⟨905⟩ for single-unit containers and requirements for *Deliverable volume* ⟨698⟩ for multiple-unit containers.

(PA3: S. Salado) RTS—40408-1

In-Process Revision

Add the following:

■**Uniformity of dosage units** ⟨905⟩—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.■2S *(USP27)*

Add the following:

■**Deliverable volume** ⟨698⟩—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.■2S *(USP27)*

BRIEFING

Cefaclor Tablets. Because there is no existing monograph for this dosage form, a new monograph based on validated methods of analysis is being proposed. The monograph includes standards of quality for chewable Tablets. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the 5-µm Hypersil ODS brand of L1 column. The typical retention time for cefaclor is about 9 minutes.

(PA7a: W. Wright; PSD: C. Okeke) RTS—39774-1

Add the following:

■Cefaclor Tablets

» Cefaclor Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Packaging and storage—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label chewable Tablets to include the word "chewable" in juxtaposition to the official name. The labeling indicates that chewable Tablets are to be chewed before being swallowed.

USP Reference standards ⟨11⟩—*USP Cefaclor RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—[To come]

Uniformity of dosage units ⟨905⟩: meet the requirements.

Water, *Method I* ⟨921⟩: not more than 5.0%.

Related compounds—

Solvent, Blank solution, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, and *Chromatographic system*—Proceed as directed for *Related compounds* under *Cefaclor.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the composite, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Solvent,* using brief sonication, if necessary, to achieve dissolution. Avoid heating. Dilute with *Solvent* to volume, mix, and filter. Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the mg of each related compound in the portion of Tablets taken by the formula:

$$0.01CP(r_i / r_S),$$

in which the terms are as defined for *Related compounds* under *Cefaclor.* Not more than 1.0% of any individual cefaclor related compound is found; and the sum of all cefaclor related compounds found is not more than 3.0%, not including the contribution of any peak that gives a result of less than 0.1%.

In-Process Revision

Assay—

Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Cefaclor.*

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of cefaclor, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate, if necessary, to dissolve the cefaclor. Filter to obtain a clear solution.

Procedure—Proceed as directed in the *Assay* under *Cefaclor*. Calculate the quantity, in mg, of cefaclor ($C_{15}H_{14}ClN_3O_4S$) in the portion of Tablets taken by the formula:

$$5W_S(P/1000)(r_U/r_S),$$

in which the terms are as defined therein.■2S (*USP27*)

BRIEFING

Chlordiazepoxide Hydrochloride, *USP 26* page 417—See briefing under *Amitriptyline Hydrochloride.*

BRIEFING

Clarithromycin Extended-Release Tablets. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the 5-µm Nucleosil and the 5-µm Inertsil brands of L1 column. Typical retention times are about 4 and 6 minutes for clarithromycin and clarithromycin related compound A, respectively.

(PA7: W. Wright; PSD: C. Okeke) RTS—39803-1

Add the following:

■Clarithromycin Extended-Release Tablets

» Clarithromycin Extended-Release Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$).

Packaging and storage—Preserve in well-closed containers, protected from light. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Clarithromycin RS. USP Clarithromycin Related Compound A RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

Drug release ⟨724⟩—[To come].

Loss on drying ⟨731⟩—Dry a portion of powdered Tablets in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Clarithromycin*.

Standard preparation—Prepare as directed for *Standard preparation* in the *Assay* under *Clarithromycin*, except to dilute an accurately measured volume of the stock solution quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 400 µg of clarithromycin ($C_{38}H_{69}NO_{13}$) per mL.

Assay preparation—Finely powder an accurately counted number of Clarithromycin Extended-Release Tablets, equivalent to about 2000 mg of clarithromycin. With the aid of methanol quantitatively transfer the powder to a 500-mL volumetric flask, add about 350 mL of methanol, and shake by mechanical means for 30 minutes. Dilute with methanol to volume, mix, and allow any insoluble matter to settle. Transfer 3.0 mL of the supernatant to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5 µm or finer, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Clarithromycin*. Calculate the quantity, in mg, of clarithromycin ($C_{38}H_{69}NO_{13}$) in each Extended-Release Tablet taken by the formula:

$$(50/3)(C/N)(r_U / r_S),$$

in which N is the number of Tablets taken, and the other terms are as defined therein.■2S (*USP27*)

BRIEFING

Cyanocobalamin Co 57 Oral Solution, *USP 26* page 502 and page 398 of *PF* 29(2) [Mar.–Apr. 2003]—See briefing under *Ferric Ammonium Citrate for Oral Solution*.

(RMI: A. Wilk) RTS—40369-2

Change to read:

» Cyanocobalamin Co 57 Oral Solution is a solution suitable for oral administration, containing Cyanocobalamin in which a portion of the molecules contain radioactive cobalt (^{57}Co) in the molecular structure. Cyanocobalamin Co 57 Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{57}Co as cyanocobalamin expressed in megabecquerels (microcuries) per mL at the time indicated in the labeling. The cyanocobalamin content is not less than 90.0 percent and not more than

In-Process Revision

110.0 percent of the labeled amount. ~~The specific activity is not less than 0.02 megabecquerel (0.5 microcurie) per µg of cyanocobalamin.~~

▲▲*USP27*
Cyanocobalamin Co 57 Oral Solution contains a suitable antimicrobial agent.

Add the following:

▲**Specific activity:** not less than 0.02 MBq (0.5 µCi) per µg of cyanocobalamin.▲*USP27*

Change to read:

Packaging and storage—Preserve in tight containers, protected from light,

▲and store in a cold place.▲*USP27*

Add the following:

■**Uniformity of dosage units** ⟨905⟩—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

Add the following:

■**Deliverable volume** ⟨698⟩ —

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

Change to read:

Radiochemical purity— ~~[NOTE—Solutions of cyanocobalamin are light sensitive. Prepare the strips in diffuse light, and perform the development and drying steps in the absence of light.] Place 0.01 mL of a solution containing 1 mg of cyanocobalamin per mL about 45 mm from one end of a 25 mm × 300 mm strip of chromatographic paper (see *Chromatography* ⟨621⟩), and allow to dry. To the same area add a measured volume, such that it provides a count rate of not less than 20,000 counts per minute, of appropriately diluted Cyanocobalamin Co 57 Oral Solution, and allow to dry. Develop the chromatogram over a period of about 24 hours by descending chromatography, using a freshly prepared, homogeneous solution prepared by mixing 1 liter of secondary butyl alcohol, 1 mL of ammonium hydroxide, 20 mL of sodium cyanide solution (3.5 in 1000), and 300 mL of water (if phases separate, add 10 mL increments of secondary butyl alcohol, and shake until the mixture becomes homogeneous). Remove the paper strip from the apparatus when the cyanocobalamin spot has moved at least 75 mm from the point of application. Dry the chromatogram in air, and determine the radioactivity distribution by scanning with a suitable collimated radiation detector, or divide the strip horizontally into sections not exceeding 65 mm in width, and determine the radioactivity of the individual sections. The radioactivity of the cyanocobalamin band is not less than 95.0% of the total radioactivity.~~

▲*Mobile phase*—Prepare a solution of 10.0 g of dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 3.5. Prepare a mixture of this solution and methanol (73.5:26.5), mix, and degas. Use within 2 days.

Test solution—Use the Oral Solution.

Standard solution—Transfer about 10 mg of cyanocobalamin, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 361-nm detector, a gamma detector adjusted for ^{57}Co and a 4.6-mm × 25-cm stainless steel column that contains 5-µm packing L7. The flow rate is about 1 mL per minute.

Procedure—Inject about 100 µL of the *Standard solution* into the chromatograph, record the chromatogram for 30 minutes, and note the retention time of the cyanocobalamin peak. Inject 100 µL of the *Test solution* into the chromatograph, and record the chromatogram for three times the retention time of cyanocobalamin. Measure the peak areas using the gamma detector, and calculate the percentage of cyanocobalamin present as cyanocobalamin Co 57 using the formula:

$$100(r_U / r_T),$$

in which r_U is the cyanocobalamin Co 57 peak response obtained from the *Test solution,* and r_T is the total of all the peak area responses in the radiochromatogram obtained from the *Test solution.* Not less than 90% of the total radioactivity is found as cyanocobalamin Co 57.▲*USP27*

In-Process Revision

Add the following:

▲**Radionuclidic purity**—Using a suitable calibrated instrument (see *Radioactivity* ⟨821⟩) and standardized solutions of ^{58}Co, ^{57}Co, and ^{60}Co, record the gamma spectrum of the Oral Solution. The spectrum does not differ significantly from that of the standardized ^{57}Co solution. Determine the relative amounts of ^{58}Co, ^{57}Co, and ^{60}Co present. Cobalt 58 has a half-life of 70.9 days, and its presence is shown by 0.511- MeV and 0.811-MeV gamma photons. Cobalt 60 has a half-life of 5.27 years, and its presence is shown by 1.173-MeV and 1.333-MeV gamma photons. Not more than 1% of the total radioactivity is due to ^{60}Co; and not more than 2% of the total radioactivity is due to ^{58}Co, ^{60}Co, and other radionuclidic impurities.▲*USP27*

USP Reference standards ⟨11⟩—*USP Dextran 40 RS.* ~~*USP Dextran Calibration RS.*~~

▲*USP Dextran 4 Calibration RS. USP Dextran 10 Calibration RS. USP Dextran 40 Calibration RS. USP Dextran 70 Calibration RS. USP Dextran 250 Calibration RS.*▲*USP27* *USP Dextran V_o Marker RS. USP Dextran 40 System Suitability RS. USP Endotoxin RS.*

Change to read:

Molecular weight distribution and weight and number average molecular weights—

Mobile phase—Prepare a suitable degassed and filtered solution containing 7.1 g of anhydrous sodium sulfate per liter in water.

Calibration solutions— ~~Separately dissolve each of the five USP Dextran Calibration RS in *Mobile phase* to obtain solutions containing 20 mg per mL.~~

▲Separately dissolve USP Dextran 4 Calibration RS, USP Dextran 10 Calibration RS, USP Dextran 40 Calibration RS, USP Dextran 70 Calibration RS, and USP Dextran 250 Calibration RS in *Mobile phase* to obtain solutions each containing 20 mg per mL.▲*USP27*

Marker solution—Prepare a solution in *Mobile phase* containing 3 mg of dextrose and 3 mg of USP Dextran V_o Marker RS per mL.

System suitability preparation—Prepare a solution of USP Dextran 40 System Suitability RS in *Mobile phase* containing 20 mg per mL.

Test preparation—Prepare a solution of Dextran 40 in *Mobile phase* containing 20 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and three 7.5-mm × 30-cm columns containing packing L38, and maintained at a constant temperature. Chromatograph the *Marker solution,* and record the peak responses as directed for *Procedure:* the elution profile shows two peaks, the first due to the V_o marker, the second due to dextrose. Determine the void volume, V_o, of the system as the inflection point of the ascending part of the first peak. Determine the total volume, V_T, of the system as the maximum of the second peak; the tailing factor, *t,* of the dextrose peak is not more than 1.3; and the relative standard deviation of the ratio V_o/V_T is not more than 1%. ~~Chromatograph the *Calibration solutions,* and record the peak responses as directed for *Procedure.*~~

▲Chromatograph each of the *Calibration solutions* separately, and record the peak responses as directed for *Procedure.*▲*USP27*

Divide each profile into at least 60 vertical sections of equal volume increments. (The actual number of sections is represented by the variable a in the equations below). Record y_i, the height above the baseline, corresponding to each value of v_i, the volume eluted at that section. For each value of v_i, calculate the distribution coefficient, K_i, by the formula:

$$(v_i - V_o)/(V_T - V_o).$$

Find appropriate values of b_1, b_2, b_3, b_4, and b_5, using a suitable method,* that, when substituted in the equation:

$$M_i = b_5 + e^{(b_4 + b_1K_i + b_2K_i^2 + b_3K_i^3)},$$

and the resulting values of M_i substituted, along with their corresponding values of y_i, in the equation:

* The Gauss-Newton method, modified by Hartley [see D. Hartley *Technometrics,* **3** (1961)] and the G. Nilsson and K. Nilsson method [see G. Nilsson and K. Nilsson *J. Chromat,* **101,** 137 (1974)] is a suitable method. A curve-fitting program capable of nonlinear regression may be used.

$$\overline{M}_w = \sum_{i=1}^{a} (y_i M_i) \Big/ \sum_{i=1}^{a} y_i,$$

give values of weight average molecular weight, $\overline{M}_w$, within 5% of the labeled values for each of the *Calibration solutions* and 180 ± 2 for dextrose. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure.* Calculate $\overline{M}_w$ of the total molecular weight distribution using the same method as directed for the *Calibration solutions,* but inserting the now known values of b_1, b_2, b_3, b_4, and b_5. It is between 39,000 and 46,000.

Similarly, calculate $\overline{M}_w$ of the high-fraction dextran eluted through section *n* by the formula:

$$\sum_{i=1}^{n} (y_i M_i) \Big/ \sum_{i=1}^{n} y_i,$$

in which *n* is defined by the relations:

$$\sum_{i=1}^{n} y_i \leq 0.1\left(\sum_{i=1}^{a} y_i\right), \text{ and}$$

$$\sum_{i=1}^{n+1} y_i > 0.1\left(\sum_{i=1}^{a} y_i\right).$$

It is between 111,000 and 135,000.

Similarly, calculate $\overline{M}_w$ of the low-fraction dextran eluted in and after section *m* by the formula:

$$\sum_{i=m}^{a} (y_i M_i) \Big/ \sum_{i=m}^{a} y_i,$$

in which *m* is defined by:

$$\sum_{i=m}^{a} y_i \leq 0.1\left(\sum_{i=1}^{a} y_i\right), \text{ and}$$

$$\sum_{i=m-1}^{a} y_i > 0.1\left(\sum_{i=1}^{a} y_i\right).$$

It is between 6,000 and 9,000.

Procedure—Chromatograph a 50-µL volume of the *Test preparation,* and record the peak responses. Calculate values of the weight average molecular weight, $\overline{M}_w$, of the total molecular weight distribution of the high-fraction dextran, and of the low-fraction dextran as directed for *System Suitability* under *Chromatography* ⟨621⟩ the values are between 35,000 and 45,000, not more than 120,000, and not less than 5,000, respectively. With the values of b_1, b_2, b_3, b_4, and b_5, obtained with the *Calibration solutions* under *Chromatographic system,* calculate the number average molecular weight, $\overline{M}_n$, of the total molecular weight distribution of the *Test preparation* by substituting the corresponding values of M_i, along with their corresponding values of y_i, in the equation:

$$\overline{M}_n = \sum_{i=1}^{a} y_i \Big/ \sum_{i=1}^{a} (y_i / M_i),$$

The number average molecular weight, $\overline{M}_n$, is between 16,000 and 30,000. Where Dextran 40 is labeled as intended for use in the preparation of injectables, the ratio $\overline{M}_w/\overline{M}_n$ is in the 1.4 to 1.9 range.

Add the following:

■**Other requirements**—Where the label states that Dextran 40 is sterile, it meets the requirements under *Sterility Tests* ⟨71⟩.■2S (*USP27*)

Identification—
A: *Infrared Absorption* ⟨197K⟩.
B: *Ultraviolet Absorption* ⟨197U⟩—
Solution: 50 µg per mL.
Medium: 70% alcohol. Absorptivities at 280 nm, calculated on the dried basis, do not differ by more than 3.0%.
C: ~~The principal spot from the *Test preparation* found in the test for *Related alkaloids* corresponds in R_f value to that obtained from the *Standard preparation.*~~

■The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*■2S (*USP27*)

Delete the following:

■~~**Related alkaloids—**~~
~~*Solvent mixture*—Mix 10 volumes of chloroform, 10 volumes of methanol, and 1 volume of ammonium hydroxide.~~
~~*Test preparation*—Prepare a solution of Dihydroergotamine Mesylate in *Solvent mixture* to contain 20 mg per mL.~~
~~*Standard preparation* and *Standard dilutions*—Prepare a solution of USP Dihydroergotamine Mesylate RS in *Solvent mixture* to contain 20 mg per mL *(Standard preparation).* Prepare a series of dilutions of *Standard preparation* in *Solvent mixture* to contain 0.40 mg, 0.20 mg, and 0.10 mg per mL *(Standard dilutions).*~~

In-Process Revision

~~*Procedure*—In a suitable chromatographic chamber arranged for thin-layer chromatography place a volume of a solvent system consisting of a mixture of chloroform and alcohol (9:1) sufficient to develop the chromatogram, cover, and allow to equilibrate for 30 minutes. Apply 5-µL portions of *Test preparation, Standard preparation,* and each of the three *Standard dilutions* to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a solution prepared by dissolving 800 mg of *p*-dimethylaminobenzaldehyde in a cooled mixture of 80 g of alcohol and 20 g of sulfuric acid. The R_f value of the principal spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation.* Estimate the concentration of any other spots observed in the lane for the *Test preparation* by comparison with the *Standard dilutions.* The spots from the 0.40-, 0.20-, and 0.10-mg-per-mL dilutions are equivalent to 2.0%, 1.0%, and 0.50% of impurities, respectively. The sum of the impurities is not greater than 2.0%.~~ ■2S (*USP27*)

Add the following:

■Chromatographic purity—

Diluent 1, Diluent 2, Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution 1— Use the *Standard preparation* prepared as directed in the *Assay.*

Standard solution 2—Dilute a known volume of *Standard solution 1* with *Diluent 2* and stepwise if necessary with *Diluent 2* to obtain a solution containing about 0.3 µg per mL.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	60	40	equilibration
0–12	60–50	40–50	linear gradient
12–20	50–15	50–85	linear gradient
20–25	15	85	isocratic
24–25	15–60	85–40	linear gradient
25–31	60	40	re-equilibration

Chromatograph 10 µL of *Standard solution 1,* and record the peak areas as directed for *Procedure:* the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Standard solution 2,* and record the peak areas as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution 2* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the analyte peaks. Calculate the percentage of each impurity in the portion of Dihydroergotamine Mesylate taken by the formula:

$$5000\ (C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard solution 2; W* is the weight, in mg, of Dihydroergotamine Mesylate taken to prepare the *Test solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_S is the peak area of dihydroergotamine mesylate obtained from the *Standard solution 2:* not more than 0.5% of one individual impurity is found; not more than 1.0% of total impurities is found. ■2S (*USP27*)

Add the following:

■Other requirements—Where the label states that Dihydroergotamine Mesylate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Dihydroergotamine Mesylate Injection.* Where the label states that Dihydroergotamine Mesylate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Dihydroergotamine Mesylate Injection.* ■2S (*USP27*)

In-Process Revision

Change to read:

Assay—

~~*Standard preparation*—Transfer about 10 mg of USP Dihydroergotamine Mesylate RS, accurately weighed, to a 200-mL volumetric flask, add 2 mL of methanol, dilute with tartaric acid solution (1 in 100) to volume, and mix.~~

~~*Assay preparation*—Using about 10 mg of Dihydroergotamine Mesylate, accurately weighed, prepare as directed for *Standard preparation.*~~

~~*Procedure*—Transfer 3.0 mL each of the *Standard preparation,* the *Assay preparation,* and tartaric acid solution (1 in 100) to provide the blank, to separate conical flasks. Add 6.0 mL of *p*-dimethylaminobenzaldehyde TS to each, shake, and allow to stand for 20 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 585 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ in the portion of Dihydroergotamine Mesylate taken by the formula:~~

~~$$0.2C(A_U/A_S),$$~~

~~in which C is the concentration, in µg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard preparation,* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.~~

■*Diluent 1*—Prepare a solution of 0.1 mL of phosphoric acid in 1000 mL of water.

Diluent 2—Prepare a mixture of *Diluent 1* and acetonitrile (60:40).

Solution A—Prepare a filtered and degassed mixture of water, 25 percent ammonia water, and 98% formic acid (1000:10:5). Adjust the pH to 8.50.

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Solution A* (80:20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Dihydroergotamine Mesylate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Diluent 1* to obtain a solution having a known concentration of about 0.6 mg per mL. [NOTE—The final ratio of acetonitrile and *Diluent 1* should be similar to the final ratio obtained in the *Assay preparation.*]

Assay preparation—Transfer about 30 mg of Dihydroergotamine Mesylate, accurately weighed, to a 50-mL volumetric flask, dissolve with 20 mL of acetonitrile, dilute with *Diluent* 1 to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	60	40	equilibration
0–12	60–50	40–50	linear gradient
12–20	50–15	50–85	linear gradient
20–25	15	85	isocratic
24–25	15–60	85–40	linear gradient
25–31	60	40	re-equilibration

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the analyte peaks. Calculate the quantity, in mg, of $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ in the portion of Dihydroergotamine Mesylate taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

Dihydrotachysterol Oral Solution, *USP 26* page 621; **Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution,** *USP 26* page 640; **Hyoscyamine Sulfate Oral Solution,** *USP 26* page 943; **Loperamide Hydrochloride Oral Solution,** page 3101 of the *Second Supplement* to *USP 26;* **Metoclopramide Oral Solution,** *USP 26* page 1218; **Prochlorperazine Oral Solution,** *USP 26* page 1550. It is proposed to improve the standards in monographs for a number of *Oral Solutions*. It is proposed to add requirements for *Uniformity of dosage units* ⟨905⟩ to apply to single-unit containers, and *Deliverable volume* ⟨698⟩ to apply to multiple-unit containers.

(PA4: E. Gonikberg) RTS—40419-1

Add the following:

■**Uniformity of dosage units** ⟨905⟩—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

Add the following:

■**Deliverable volume** ⟨698⟩—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

BRIEFING

Dihydroxyaluminum Sodium Carbonate Tablets, *USP 26* page 624. It is proposed to change the title of this monograph to *Dihydroxyaluminum Sodium Carbonate Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40429-1

Dihydroxyaluminum Sodium Carbonate Tablets

(Current title—not to change until February 1, 2007)
Monograph title change—to become official February 1, 2007
(see Official Title Changes on the first page of In-Process Revision):
***See* Dihydroxyaluminum Sodium Carbonate Chewable Tablets**

BRIEFING

Dihydroxyaluminum Sodium Carbonate Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40429-1

Add the following:

■Dihydroxyaluminum Sodium Carbonate Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Dihydroxyaluminum Sodium Carbonate Tablets)

» Dihydroxyaluminum Sodium Carbonate Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of CH_2AlNaO_5.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before swallowing.

Identification—A 1 in 10 suspension of powdered Chewable Tablets in 3 N hydrochloric acid responds to the tests for *Aluminum* ⟨191⟩ and for *Sodium* ⟨191⟩.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Acid-neutralizing capacity ⟨301⟩—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.0278D),$$

in which 0.0278 is the theoretical acid-neutralizing capacity, in mEq, of CH_2AlNaO_5; and D is the quantity, in mg, of

In-Process Revision

CH_2AlNaO_5 in the specimen tested, based on the labeled quantity.

Assay—

Edetate disodium titrant—Dissolve 18.6 g of edetate disodium in water to make 500 mL, and standardize as directed in the *Assay* under *Ammonium Alum*.

Procedure—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg of dihydroxyaluminum sodium carbonate, to a 250-mL beaker, and proceed as directed in the *Assay* under *Dihydroxyaluminum Sodium Carbonate,* beginning with "add 10 mL of 2 N sulfuric acid." Each mL of 0.1 *M Edetate disodium titrant* is equivalent to 14.40 mg of CH_2AlNaO_5.■2S (*USP27*)

BRIEFING

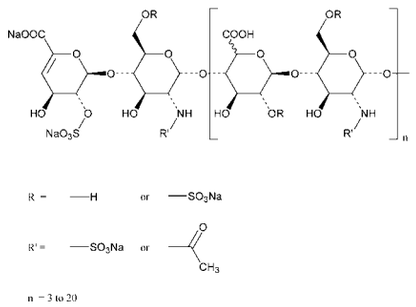
Enoxaparin Sodium. Because there is no existing *USP* monograph for this article, a new monograph is being proposed.

(BBP: L. Bhattacharyya) RTS—39330-1; 40150-1

Add the following:

■Enoxaparin Sodium



[*9041-08-1*].

» Enoxaparin Sodium is the sodium salt of a depolymerized heparin. It is obtained by alkaline depolymerization of heparin benzyl ester. The starting material, heparin, is obtained exclusively from porcine intestinal mucosa. The majority of the components have a 4-enopyranose uronate structure at the nonreducing end of their chain. About 20 percent of the materials contain a 1,6-anhydro derivative on the reducing end of the chain, the range being between 15 and 25 percent. The weight-average molecular weight of Enoxaparin Sodium is 4,500 Da, the range being between 3,800 and 5,000 Da; about 16 percent has a molecular weight of less than 2,000 Da, the range being between 12.0 and 20.0 percent; about 74 percent has a molecular weight between 2,000

In-Process Revision

and 8,000 Da, the range being between 68.0 and 82.0 percent. Not more than 18.0 percent has a molecular weight higher than 8,000 Da. The degree of sulfation is not less than 1.8 per disaccharide unit. It has a potency of not less than 90.0 and not more than 125.0 Anti-Factor X_a International Units per mg, and not less than 20.0 and not more than 35.0 Anti-Factor II_a International Units per mg, calculated on the dried basis. The ratio of anti-factor X_a activity to anti-factor II_a activity is between 3.3 to 5.3.

Packaging and storage—Preserve in tight containers, and store below 40°, preferably at room temperature.

USP Reference standards ⟨11⟩—*USP Benzyl Alcohol RS. USP Endotoxin RS. USP Enoxaparin Sodium RS. USP Enoxaparin Sodium Solution for Bioassays RS. USP Low-Molecular-Weight Heparin Molecular Weight RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 500 µg per mL.

Medium: 0.01 N hydrochloric acid. The spectra exhibit maxima at 231 ± 2 nm.

B: *^{13}C NMR spectrum* (see *Nuclear Magnetic Resonance* ⟨761⟩)—

Standard solution—Dissolve 200 mg of USP Enoxaparin Sodium RS in a mixture of 0.2 mL of deuterium oxide and 0.8 mL of water. Add 1 drop of deuterated methanol to serve as an internal reference.

Test solution—Dissolve 200 mg of Enoxaparin Sodium in a mixture of 0.2 mL of deuterium oxide and 0.8 mL of water. Add 1 drop of deuterated methanol.

Procedure—Transfer the *Standard solution* and the *Test solution* to NMR tubes of 5-mm diameter. Using a pulsed (Fourier transform) NMR spectrometer operating at not less than 75 MHz for ^{13}C, record the ^{13}C NMR spectra of the *Standard solution* and the *Test solution* at 40°. The spectra are similar.

C: The ratio of the numerical value of the anti-factor X_a activity, in Anti-Factor X_a International Units per mg, to the numerical value of the anti-factor II_a activity, in Anti-Factor II_a International Units per mg, as determined by the *Assay (anti-factor X_a activity)* and the *Anti-factor II_a activity,* respectively, is not less than 3.3 and not more than 5.3.

D: *Molecular weight distribution and weight-average molecular weight—*

Mobile phase—Prepare a 0.5 M lithium nitrate solution. Pass through a membrane filter having a porosity of 0.45 µm or less, and degas with helium.

Calibration solutions—Prepare two calibration solutions, *A* and *B*, by dissolving about 2 mg each of USP Low-Molecular-Weight Heparin Molecular Weight RS in 1 mL of the *Mobile phase*. Distribute the Reference Standards in alternating order of magnitude between solutions *A* and *B*.

Standard solution—Dissolve an accurately weighed quantity of about 10 mg of USP Enoxaparin Sodium RS in 1 mL of *Mobile phase*.

Test solution—Dissolve an accurately weighed quantity of about 10 mg of Enoxaparin Sodium in 1 mL of *Mobile phase*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The high performance size exclusion chromatograph is equipped with a differential refractive index detector, a 6- × 40-mm guard column and two 7.8- × 300-mm analytical columns in series, both analytical and guard columns prepacked with L20 packing, and used at room temperature. The flow rate is about 0.6 mL per minute maintained constant to ±0.1%.

In-Process Revision

Procedure—Separately inject 20 µL of *Calibration solutions A* and *B*, record the chromatograms, and measure the retention times. Inject in duplicate, 20 µL of each of the *Standard solution* and the *Test solution,* and record the chromatograms for a length of time to ensure complete elution, including salt and solvent peaks. Calculate the total area under each of the *Standard solution* and *Test solution* chromatograms, excluding salt and solvent peaks at the end.

Calibration curve—Plot the retention times on the y-axis against the peak molecular weights on the x-axis for the peaks in the chromatograms of *Calibration solutions A* and *B,* and fit the data to a third-order polynomial using a suitable gel permeation chromatography (GPC) software.

Calculations—Compute the data, using the same GPC software, to determine the weight-average molecular weight, M_W, for each of the duplicate chromatograms of the *Standard solution* and the *Test solution,* and take the average for each solution. Correct the mean value of M_W to the nearest 50. The *Chromatographic system* is suitable if M_W of USP Enoxaparin Sodium RS is within 150 Da of the labeled M_W value. The M_W for the *Test solution* is between 3,800 and 5,000 Da. Using the same software determine for each of the duplicate *Test solution* chromatograms the percentage of Enoxaparin Sodium chains with molecular weights lower than 2000 Da, M_{2000}, the percentage of Enoxaparin Sodium chains with molecular weights in the range 2000 and 8000 Da, $M_{2000–8000}$, and the percentage of Enoxaparin Sodium chains with molecular weights greater than 8000 Da, M_{8000}. Average the duplicate values and express to the nearest 0.5 %. M_{2000} is between 12.0% and 20.0%, $M_{2000–8000}$ is between 68.0% and 82.0%, and M_{8000} is not more than 18.0%.

E: It responds to the test for *Sodium* ⟨191⟩.

Appearance of solution (see *Clarity and Degree of Opalescence of Liquids* ⟨625⟩ and *Degree of Color of Liquids, Method I* ⟨627⟩)—

Test solution—Dissolve 1.0 g of Enoxaparin Sodium in 10 mL of water.

Procedure—The solution is clear and not more intensely colored than degree 6 of the range of *Reference Solutions* of the most appropriate color and not more opalescent than *Reference Suspension I.*

Specific absorbance (see *Spectrophotometry and Light-Scattering* ⟨851⟩)—

Test solution—Dissolve 50.0 mg of Enoxaparin Sodium in 100 mL of 0.01 N hydrochloric acid.

Procedure—Obtain the UV spectra of the *Standard solution* and the *Test solution* between 200 nm and 300 nm against 0.01 N hydrochloric acid blank. Calculate the specific absorbance at the wavelength of maximum absorbance at 231 ± 2 nm, with reference to the dried substance, using the following formula:

$$A \times 100 \times 1000 / [M \times 1 \times (100 - E)],$$

in which A is the absorbance at the wavelength of maximum absorbance; l is the pathlength (typically l = 1 cm); M is the weight, in mg, of Enoxaparin Sodium in the *Test solution;* and E is the loss on drying, in percent. The specific absorbance is between 14.0 and 20.0, calculated on the dried basis.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.01 USP Endotoxin Unit per USP Unit of anti-factor X_a activity.

pH ⟨791⟩: between 6.2 and 7.7 in a 10.0% solution in water.

Loss on drying ⟨731⟩—Dry 1 g in a vacuum at 70° for 6 hours: it loses not more than 10.0% of its weight.

Nitrogen content, *Method II* ⟨461⟩: between 1.8% and 2.5%, calculated on the dried basis.

In-Process Revision

Heavy metals, *Method I* ⟨231⟩—Prepare a 5% solution in water: the limit is not more than 0.0030%.

Sodium content (see *Spectrophotometry and Light-Scattering* ⟨851⟩)—

Cesium chloride solution—Prepare a solution of cesium chloride in 0.1 N hydrochloric acid containing 1.27 mg per mL.

Standard solutions—Dissolve an accurately weighed quantity of sodium chloride in *Cesium chloride solution* to obtain a solution having a known concentration of about 0.2% sodium. Dilute accurately measured volumes of this solution with *Cesium chloride solution* having known concentrations of 0.0025%, 0.0050%, and 0.0075% of sodium.

Test solution—Transfer an accurately weighed quantity of about 50.0 mg of Enoxaparin Sodium to a 100-mL volumetric flask, and dissolve in and dilute with *Cesium chloride solution* to volume.

Procedure—Concomitantly determine the absorbances of the *Cesium chloride solution* (blank), *Test solution*, and *Standard solutions* at 330.3 nm using a sodium hollow-cathode lamp and an air–acetylene flame. Using the absorbances of *Standard solutions,* determine the sodium content in the *Test solution* after appropriate blank correction. The sodium content, calculated on the dried basis, is between 11.3% and 13.5%.

Molar ratio of sulfate to carboxylate—

Mobile phase: carbon dioxide-free water.

Test solution—Dissolve an accurately weighed quantity of about 50 mg of Enoxaparin Sodium in 10 mL of carbon dioxide-free water.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph consists of two peristaltic pumps, a six-port injection valve, an ion detector, and two columns—one 1.5- × 2.5-cm column packed with an anion-exchange resin L## packing and one 1.5- × 7.5-cm column packed with a cation-exchange resin L## packing (see *Chromatography* ⟨621⟩). The outlet of the anion-exchange column is connected to the inlet of the cation-exchange column. The flow rate is about 1 mL per minute.

Procedure—[NOTE—Regenerate the anion-exchange column and the cation-exchange column with 1 N sodium hydroxide and 1 N hydrochloric acid, respectively, between two injections.] Inject the *Test solution* into the anion-exchange column, and collect the eluate from the cation-exchange column in a beaker at the outlet until the ion detector reading returns to the baseline value. Quantitatively transfer the eluate to a titration vessel containing a magnetic stirring bar, and dilute with carbon dioxide-free water to about 60 mL. Position the titration vessel on a magnetic stirrer and immerse the electrodes. Note the initial conductivity reading and titrate with approximately 0.1 N sodium hydroxide added in 100-µL portions. [NOTE—Prepare the sodium hydroxide solution in carbon dioxide-free water.] Record the burette reading and the conductivity meter reading after each addition of the sodium hydroxide solution.

Calculations—Plot the conductivity measurements on the y-axis against the volumes of sodium hydroxide added on the x-axis. The graph will have three linear sections—an initial downwards slope, a middle slight rise, and a final rise. For each of these sections draw the best-fit straight lines using linear regression analysis. At the points where the first and second straight lines intersect and where the second and third lines intersect, draw perpendiculars to the x-axis to determine the volumes of sodium hydroxide taken up by the sample at those points. The point where the first and second lines intersect corresponds to the volume of sodium hydroxide taken up by the sulfate groups (V_S). The point where the second and third lines intersect corresponds to the volume of

sodium hydroxide consumed by the sulfate and the carboxylate groups together (V_T). Calculate the molar ratio of sulfate to carboxylate by the formula:

$$V_S/(V_T - V_S).$$

The molar ratio of sulfate to carboxylate is not less than 1.8.

Benzyl alcohol content—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (15:5:80 v/v).

Standard solution—Dissolve 100 mg of USP Benzyl Alcohol RS in 200 mL of water. Transfer 10 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. Transfer 5 mL of this solution to a 20-mL volumetric flask, and dilute with water to volume.

Test solution—Weigh 0.5 g of Enoxaparin Sodium into a 10-mL volumetric flask, and dissolve in 5.0 mL of 1 N sodium hydroxide. Allow to stand at room temperature for about 1 hour. Add 1.0 mL of glacial acetic acid, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 256-nm detector and a 4.6-mm × 15-cm stainless steel column that contains L7 packing. The flow rate is about 1.0 mL per minute maintained constant to ±10%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution,* record the chromatograms, and measure the peak responses.

Calculation—Calculate the percentage of benzyl alcohol in Enoxaparin Sodium taken by the formula,

$$(A_T \times C_S)/(A_S \times C_T),$$

in which C_T is the concentration, in mg per mL, of Enoxaparin Sodium; A_T is the benzyl alcohol peak area in the *Test solution;* C_S is the concentration, in mg per mL, of benzyl alcohol; and A_S is the area of the benzyl alcohol peak in the *Standard solution*. The percentage of benzyl alcohol is not more than 0.1%.

Anti-factor II_a activity—

Acetic acid solution, pH 7.4 Polyethylene glycol 6000 buffer, pH 7.4 buffer, pH 8.4 buffer, and *Antithrombin III solution*—Proceed as directed under *Assay (anti-factor X_a activity),* except that the concentration of the *Antithrombin III solution* is 0.5 Antithrombin III Unit per mL.

Thrombin human solution—Reconstitute thrombin human (see *Reagent Specifications* in the section *Reagents, Indicators and Solutions*) in water, and dilute in *pH 7.4 Polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 5 Thrombin Units per mL.

Chromogenic substrate solution—Prepare a solution of a suitable chromogenic substrate for an amidolytic test (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) for thrombin in water to obtain a concentration of about 3 mM. Immediately before use, dilute with *pH 8.4 buffer* to 0.5 mM.

Standard solutions—Dilute USP Enoxaparin Sodium Solution for Bioassays RS with *pH 7.4 buffer* to obtain four dilutions having concentrations in the range between 0.015 and 0.075 USP Anti-Factor II_a Activity Unit per mL.

Test solutions—Proceed as directed under *Standard solutions* to obtain concentrations of Enoxaparin Sodium similar to those obtained for the *Standard solutions*.

Procedure—Proceed as directed under *Assay (anti-factor X_a activity),* except to use *Thrombin human solution* instead of *Factor X_a solution* and to use the *Antithrombin III solution* as described above.

Calculations—For each series, calculate the regression of the absorbance against log concentrations of the *Test solutions* and of the *Standard solutions,* and calculate the potency of the enoxaparin sodium in IU of anti-factor II_a

In-Process Revision

activity per mg using statistical methods for parallel-line assays. The four independent relative potency estimates are then combined to obtain the final weighted mean, balanced by the adequate factor. Then calculate the confidence limits. Express the anti-factor II_a activity of Enoxaparin Sodium per mg, calculated on the dried basis.

Assay (anti-factor X_a activity)—

Acetic acid solution—Transfer 42 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

pH 7.4 Polyethylene glycol 6000 buffer—Dissolve 6.08 g of tris(hydroxymethyl) aminomethane and 8.77 g of sodium chloride in 500 mL of water. Add 1.0 g of polyethylene glycol 6000, adjust with hydrochloric acid to a pH of 7.4., and dilute with water to 1000 mL.

pH 7.4 buffer—Dissolve 6.08 g of tris(hydroxymethyl)-aminomethane and 8.77 g of sodium chloride in 500 mL of water. Adjust with hydrochloric acid to a pH of 7.4, and dilute with water to 1000 mL.

pH 8.4 buffer—Dissolve 3.03 g of tris(hydroxymethyl)-aminomethane, 5.12 g of sodium chloride and 1.40 g of edetate sodium in 250 mL of water. Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 500 mL.

Antithrombin III solution—Reconstitute a vial of antithrombin III (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water to obtain a solution containing 5 Antithrombin III Units per mL. Dilute this solution with *pH 7.4 Polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 1.0 Antithrombin III Unit per mL.

Factor X_a solution—Reconstitute an accurately weighed quantity of bovine factor X_a (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in *pH 7.4 Polyethylene glycol 6000 buffer* to obtain a solution that gives an increase in absorbance value at 405 nm of not more than 0.20 absorbance units per minute when assayed as described below but using as an appropriate volume (*V,* in µL) of *pH 7.4 buffer* instead of *V* µL of the enoxaparin solution.

Chromogenic substrate solution—Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) for factor X_a in water to obtain a concentration of about 3 mM. Dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 0.5 mM.

Standard preparations—Dilute USP Enoxaparin Sodium Solution for Bioassays RS with *pH 7.4 buffer* to obtain four dilutions in the concentration range between 0.025 and 0.2 USP Anti-Factor X_a Units per mL.

Assay preparations—Proceed as directed for *Standard preparations* to obtain concentrations of Enoxaparin Sodium similar to those obtained for the *Standard preparations*.

Procedure—Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the *Assay preparations;* and S1, S2, S3, and S4 each in duplicate for the dilutions of the *Standard preparations*. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, *V,* (20 to 50 µL) of *Antithrombin III solution* and an equal volume, *V,* of either the blank, *pH 7.4 buffer,* or an appropriate dilution of the *Assay preparations* or the *Standard preparations*. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 minute. Add to each tube volume 2*V* (40 to100 µL) of *Factor X_a solution,* and incubate for 1.0 minute. Add 5*V* (100 to 250 µL) volume of *Chromogenic substrate solution*. Stop the reaction after 4.0 minutes with 5*V* (100 to 250 µL) volume of *Acetic acid solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry*

In-Process Revision

and Light-Scattering ⟨851⟩) against the blank B1. The reading of the blank B2 is not more than ±0.01 absorbance units.

Calculations—For each series, calculate the regression of the absorbance against log concentrations of the *Assay preparations* and of the *Standard preparations,* and calculate the potency of the enoxaparin sodium in IU of anti-factor II_a activity per mL using statistical methods for parallel-line assays. The four independent relative potency estimates are then combined to obtain the final weighted mean, balanced by the adequate factor. Its confidence limits are calculated. Express the anti-factor X_a activity of Enoxaparin Sodium per mg, calculated on the dried basis.■2S (*USP27*)

BRIEFING

Enoxaparin Sodium Injection. Because there is no existing *USP* monograph for this product, a new monograph is being proposed.

(BBP: L. Bhattacharyya) RTS—39330-2

Add the following:

■Enoxaparin Sodium Injection

» Enoxaparin Sodium Injection is a sterile solution of Enoxaparin Sodium in Water for Injection. Its potency value is not less than 90.0 percent and not more than 110.0 percent of the potency stated on the label in terms of USP Anti-factor X_a Units. It may contain, in multiple-dose containers, a suitable antimicrobial preservative, such as benzyl alcohol.

Packaging and storage—Preserve in single-dose or multiple-dose containers in Type I glass. Store between 20° and 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate the amount (milligrams) of Enoxaparin Sodium in the total volume of contents. The label states also that the Enoxaparin Sodium starting material is porcine derived.

USP Reference standards ⟨11⟩—*USP Benzyl Alcohol RS. USP Endotoxin RS. USP Enoxaparin Sodium RS. USP Enoxaparin Sodium Solution for Bioassays RS.*

Identification—

A: Add 2 mL of water to the total content of a single-dose container or to 0.4 mL from a multiple-dose container and 1 mL of 2% w/v protamine sulfate solution in a glass test tube, and mix. A creamy white precipitate is formed.

B: *Ultraviolet Absorption* ⟨197U⟩—

Standard solution: 500 µg per mL.

Medium: 0.01 N hydrochloric acid. The spectra exhibit maxima at 231 ± 2 nm.

Test solution—Transfer the total content of a single-dose container or 0.4 mL from a multiple-dose container to a 100-mL volumetric flask. Dilute with *Medium* to volume.

C: It meets the requirements of the test for *Sodium* ⟨191⟩.

Clarity (see *Clarity and Degree of Opalescence of Liquids* ⟨625⟩)—The clarity of the solution does not exceed that of suspension I.

Color (see *Degree of Color of Liquids, Method I* ⟨627⟩)—The color of the solution is not more than degree 4 of the range of reference solution of the most appropriate color for a solution containing 100 mg of enoxaparin sodium per mL.

pH ⟨791⟩: between 5.5 and 7.5.

In-Process Revision

Benzyl alcohol content *(if present)*—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (1:1).

Standard solution—Transfer about 200 mg, accurately weighed, of USP Benzyl Alcohol RS to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solutions—Transfer 5.0 mL of the Injection to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 258-nm detector and a 4.0-mm × 25-cm stainless steel column that contains packing L1[1]. The flow rate is about 1.0 mL per minute maintained constant to ±10%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution,* record the chromatograms, and measure the peak responses. Calculate the percentage of benzyl alcohol in the portion of enoxaparin sodium solution taken by the formula:

$$(A_T \times M)/(A_S \times 20),$$

in which, A_T and A_S are areas of the benzyl alcohol peaks in the chromatograms of the *Test solution* and the *Standard solution,* respectively; and M is the mass of the benzyl alcohol dissolved to prepare the *Standard solution*. The percentage (w/v) of benzyl alcohol in the Injection is not less than 1.35% and not more than 1.65%.

Bacterial endotoxins ⟨85⟩—It contains less than 0.01 USP Endotoxin Units per unit of anti-factor X_a activity in USP Anti-factor X_a Units.

Free sulfate content—

Mobile phase—Prepare a 3.0 mM sodium carbonate solution. Make adjustments if necessary.

Standard sulfate stock solution—Prepare a solution of sodium sulfate in the *Mobile phase* in a suitable sulfate-free container such that the concentration of sulfate is accurately known at about 1 g per L. Transfer about 5 g, accurately weighed, of the solution to a similar container, and add *Mobile phase* to obtain about 25 g of solution.

Standard solutions—Prepare standard solutions at concentrations of 0.1, 0.5, 1, 2, 4, and 5 µg per g by appropriate dilution of the *Standard sulfate stock solution* in the *Mobile phase*.

System suitability solution—Prepare a solution containing 3 µg per mL of sulfate anion and 5 µg per mL of oxalate anion.

Test solutions—Transfer about 200 mg of a 100 mg per mL Enoxaparin Sodium Injection, accurately weighed, to a suitable previously tared sulfate-free vial. Add *Mobile phase* to obtain a total mass, M_S, of about 20 g.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a conductivity detector and a 4-mm × 5-cm anion-exchange guard column, a 4-mm × 25-cm anion-exchange analytical column, prepacked with L## and L## packings (see *Chromatography* ⟨621⟩), respectively, and a micromembrane anion autosuppressor[2] or a suitable chemical suppression system. The flow rate is about 2.0 mL per minute.

Procedure—Chromatograph about 25 µL of the *System suitability solution*. The resolution between the sulfate and oxalate peaks is greater than 1. Separately inject 25 µL of the *Standard solutions* and the *Test solution* into the chromatograph and plot the standard curve of sulfate peak height as a function of sulfate concentration (in µg per g) in the *Standard solutions*. From the sulfate peak height in the chromatogram determine the concentration of sulfate, *T,* in µg

In-Process Revision

[1] Available as Lichrospher 100 RP 18, Pore size 100 Å, Particle size 5 µm.

[2] Available as Anion Self-Regenerating Suppressor (ASRS) from Dionex Inc.

per g, in the *Test solution* using the standard curve. Calculate the percentage of free sulfate content (w/v) in the Injection taken using the formula:

$$T \times M_S / 10m,$$

in which m is the mass, in mg, of Enoxaparin Sodium Injection aliquoted to prepare the *Test solution*. The percentage of free sulfate is not more than 0.12%.

Anti-factor II_a activity—Proceed as directed for *Anti-factor II_a activity* under *Enoxaparin Sodium*.

Anti-factor X_a to anti-factor II_a ratio—The ratio of the numerical value of the anti-factor X_a activity in USP Anti-Factor X_a Units per mg to the numerical value of the anti-factor II_a activity in USP Anti-Factor II_a Units per mg, as determined by the *Assay (anti-factor X_a activity)* and the *Anti-factor II_a activity,* respectively, is not less than 3.3 and not more than 5.3.

Other requirements—It meets the requirements under *Injections* ⟨1⟩, *Particulate Matter in Injections* ⟨788⟩, and *Sterility Tests* ⟨71⟩.

Assay (anti-factor X_a activity)—Proceed as directed for *Assay (anti-factor X_a activity)* under *Enoxaparin Sodium*.■2S (*USP27*)

BRIEFING

Gemfibrozil, *USP 26* page 849 and page 3100 of the *Second Supplement.* It is proposed to correct the calculations under the *Related compounds* test. In the absence of any adverse comment, it is proposed to implement this revision via the *First Interim Revision Announcement*, pertaining to *USP 27–NF 22,* with an official date of February 2, 2004.

(PA4:E. Gonikberg) RTS—40303-1

Change to read:

■**Related compounds—**■2S (*USP26*)
Mobile phase—Add 10 mL of glacial acetic acid to 750 mL of methanol in a 1000-mL volumetric flask, dilute with water to volume, mix, and pass through a membrane filter.

■*System suitability solution*—Dissolve accurately weighed quantities of USP Gemfibrozil RS, USP Gemfibrozil Related Compound A RS, and 2,5-dimethylphenol in *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL, 0.05 mg per mL, and 0.05 mg per mL, respectively.

In-Process Revision

Standard solution—Transfer 10 mg each of USP Gemfibrozil RS and USP Gemfibrozil Related Compound A RS, both accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.■2S (*USP26*)

Test solution—Transfer about 100 mg of Gemfibrozil, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
■■2S (*USP26*)

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 276-nm detector and a ■4.0-mm × 25-cm■2S (*USP26*) column that contains packing L1. The flow rate is about 1 mL per minute. ■Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.35 for 2,5-dimethylphenol, 1.0 for gemfibrozil, and 2.1 for gemfibrozil related compound A; and the relative standard deviation for replicate injection is not more than 3.0%.■2S (*USP26*)

Procedure—■Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least three times the retention time of gemfibrozil, and measure the areas for the major peaks. Calculate the percentage of gemfibrozil related compound A in the portion of Gemfibrozil taken by the formula:

~~$10C(r_U/r_S),$~~

$$\bullet 1000(C/W)(r_U/r_S),\bullet 1$$

in which C is the concentration, in mg per mL, of USP Gemfibrozil Related Compound A RS in the *Standard solution;*

•W is the weight, in mg, of Gemfibrozil taken to prepare the *Test solution;*•1
and r_U and r_S are the peak areas for gemfibrozil related compound A obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of gemfibrozil related compound A is found. Calculate the percentage of any other impurity in the portion of Gemfibrozil taken by the formula:

~~$100(r_i/r_u),$~~

$$\bullet 1000(C_G/W)(r_i/r_G),\bullet 1$$

in which

•C_G is the concentration, in mg per mL, of USP Gemfibrozil RS in the *Standard solution;*•1
r_i is the peak area of each individual impurity obtained from the *Test solution;* ~~and r_u is the sum of all of the peak areas obtained from the *Test solution.*~~

•r_G is the gemfibrozil peak area obtained from the *Standard solution;* and W is as defined above:•1
not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.■2S (*USP26*)

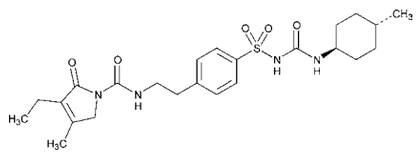
BRIEFING

Glimepiride. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for *Related compounds* and in the *Assay* is based on analyses performed with the Superspher 100 RP18 brand of L1 column. The typical retention time for glimepiride is about 17 minutes. The liquid chromatographic procedure in the test for *Limit of cis-isomer* is based on analyses performed with the Lichrosorb Diol brand of L20 column. The typical retention times for glimepiride and glimepiride *cis*-isomer are about 16 minutes and 14 minutes, respectively. The gas chromatographic procedure in the test for *Water* is based on analyses performed with the Optima 624 brand of G43 column. The approximate retention times for air, water, and dimethylformamide are about 1.6, 1.8, and 5.5 minutes, respectively.

(PA4: E. Gonikberg) RTS—40086-1

Add the following:

■Glimepiride



$C_{24}H_{34}N_4O_5S$ 490.62

1*H*-Pyrrole-1-carboxamide, 3-ethyl-2,5-dihydro-4-methyl-*N*-[2-[4-[[[[(4-methylcyclohexyl)amino]carbonyl]amino]sulfonyl]phenyl]ethyl]-2-oxo-, *trans*-.

1-[[4-[2-(3-Ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxamido)ethyl]phenyl]sulfonyl]-3-(*trans*-4-methylcyclohexyl)urea [*93479-97-1*].

» Glimepiride contains not less than 97.0 and not more than 102.0 percent of $C_{24}H_{34}N_4O_5S$, calculated on the anhydrous basis.

Packaging and storage—Store in well-closed containers, at a temperature not exceeding 25°.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Glimepiride RS. USP Glimepiride Related Compound A RS. USP Glimepiride Related Compound B RS. USP Glimepiride Related Compound C RS. USP Glimepiride Related Compound D RS.*

Identification, *Infrared Absorption* ⟨197K⟩.

Water—

Diluent—Use dimethylformamide dried over a molecular sieve (2 mm; pore size: 0.4 nm).

Standard solution—Transfer about 100.0 mg of water, accurately weighed, into a 100-mL volumetric flask containing the *Diluent,* dilute with *Diluent* to volume, and mix.

Blank solution—Use the *Diluent.*

Test solution—Dissolve about 50 mg of Glimepiride, accurately weighed, in 1.0 ml of *Diluent.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a thermal conductivity detector, a 0.32-mm × 30-m fused silica column containing bonded phase G43 in a 1.8-µm film thickness, and a splitless injection system. The carrier gas is helium flowing at a rate of about 2.2 mL per minute. The temperature of the column is maintained at 80°, the injection port temperature is maintained at 200°, and the detector is maintained at 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the water peak and the air peak is not less than 2.0; and the relative standard deviation for replicate injections is not more than 10%. [NOTE—The approximate retention times for air, water, and dimethylformamide are about 1.6, 1.8, and 5.5 minutes, respectively.]

Procedure—Separately inject equal volumes (about 1 µL) of the *Blank solution,* the *Standard solution,* and the *Test solution* into the gas chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of water in the portion of Glimepiride taken by the formula:

$$(r_T - r_B)/(r_S - r_B)(W_S / W_U),$$

in which r_B, r_T, and r_S are the peak responses obtained from the *Blank solution,* the *Test solution,* and the *Standard solution,* respectively; W_S is the weight, in mg, of water taken to prepare the *Standard solution;* and W_U is the weight, in mg, of Glimepiride taken to prepare the *Test solution*. The water content is not more than 0.5%.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of *cis*-isomer (glimepiride related compound A)—

Mobile phase—Transfer 100 mL of isopropyl alcohol into a 1-L volumetric flask, add 1 mL of glacial acetic acid, dilute with hexane to volume, filter, and degas.

System suitability stock solution—Dissolve about 1 mg of USP Glimepiride Related Compound A RS in 1 mL of methylene chloride. Add 3 mL of *Mobile phase,* and mix.

System suitability solution—Transfer about 10 mg of USP Glimepiride RS to a 20-mL volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with *Mobile phase* to volume, and mix. Transfer 5 mL of this solution to a separate flask, add 50 µL of the *System suitability stock solution,* and mix.

Test solution—Transfer about 10 mg of Glimepiride to a 20-mL volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 228-nm detector and a 3-mm × 15-cm column containing 5-µm packing L20. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention

In-Process Revision

times are 1.0 for glimepiride and not more than 0.9 for the glimepiride *cis*-isomer; and the signal-to-noise ratio of the glimepiride *cis*-isomer peak is not less than 15.

Procedure—Inject about 10 µL of the *Test solution* into the chromatograph, and measure the peak areas for the glimepiride cis-isomer and glimepiride. Calculate the percentage of glimepiride *cis*-isomer in the portion of Glimepiride taken by the formula:

$$100r_{cis} / (r_{cis} + r_G),$$

in which r_{cis} and r_G are the peak areas for the glimepiride *cis*-isomer and glimepiride, respectively: not more than 0.8% of the glimepiride *cis*-isomer is found.

Related compounds—

Mobile phase, Diluent, System suitability solution, and Chromatographic system—Prepare as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Diluted test solution 1—Dilute 5.0 mL of the *Test solution* with *Diluent* to 100.0 mL. Dilute 5.0 mL of the solution obtained with *Diluent* to 50.0 mL. This solution contains about 0.001 mg of glimepiride per mL.

Diluted test solution 2—Dilute 1.0 mL of *Diluted test solution 1* with *Diluent* to 10.0 mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and *Diluted test solutions 1* and *2* into the chromatograph, record the chromatograms, and measure the peak response for glimepiride obtained from *Diluted test solution 1* and the responses for all other peaks, other than the glimepiride peak, obtained from the *Test solution*. Disregard any peak with an area less than that of the glimepiride peak in the chromatogram obtained from *Diluted test solution 2.* Continue the elution for 2.5 times the retention time of the glimepiride peak. Calculate the percentage of each related compound (see *Table 1*) and any unknown impurity in the portion of Glimepiride taken by the formula:

$$100(C_S / C_T)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of glimepiride in *Diluted test solution 1;* C_T is the concentration, in mg per mL, of glimepiride in the *Test solution;* r_i is the peak response for each individual peak obtained from the *Test solution;* and r_S is the glimepiride peak obtained from *Diluted test solution 1.*

Table 1.

Relative Retention Time	Name	Limit (%)
0.2	Glimepiride related compound B[1]	0.4
0.3	Glimepiride related compound C[2]	0.1
1.1	Glimepiride related compound D[3]	0.2

[1] Glimepiride–sulfonamide
[2] Glimepiride–urethane
[3] Glimepiride-3-isomer

In addition to not exceeding the limits for each impurity in *Table 1*, not more than 0.1% of any other individual impurity is found; and not more than 0.5% of total impurities excluding glimepiride related compound B is found.

Assay—

Mobile phase—Dissolve 0.5 g of monobasic sodium phosphate in a mixture of 500 mL of water and 500 mL of acetonitrile. Adjust with phosphoric acid to a pH of 2.5 to 3.5.

Diluent—Prepare a mixture of acetonitrile and water (4:1).

Standard preparation —Dissolve an accurately weighed quantity of USP Glimepiride RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

System suitability solution—Prepare a solution in *Diluent* containing 0.1 mg each of USP Glimepiride Related Compound B RS, USP Glimepiride Related Compound C RS, and USP Glimepiride Related Compound D RS per mL. Dilute 1 mL of this solution with the *Standard preparation* to 50 mL.

Assay preparation—Transfer about 20.0 mg of Glimepiride, accurately weighted, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. [NOTE—Keep the *Assay preparation* at a temperature not exceeding 12°, and store it no longer than 15 hours].

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 228-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and identify the glimepiride peak and the peaks due to the related compounds listed in *Table 1*. Record the peak responses as directed for *Procedure:* the resolution, *R,* between glimepiride related compound B and glimepiride related compound C is not less than 4.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of $C_{24}H_{34}N_4O_5S$ in the portion of Glimepiride taken by the formula:

$$10{,}000\ (C/W)[100/(100 - L)](r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Glimepiride RS in the *Standard preparation; W* is the weight, in mg, of Glimepiride taken to prepare the *Assay preparation; L* is the percentage of water as determined in the test for *Water;* and r_U and r_S are the peak responses for the glimepiride obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Gonadorelin Hydrochloride, *USP 26* page 872 and page 2552 of *PF* 27(3) [May–June 2001]. USP has had the opportunity to review the previously proposed revision, based on data submitted and published in *PF* 27(3), to increase the water content in this monograph. The data indicate that gonadorelin hydrochloride is stable when it is stored containing 7.0% water; therefore the proposal is being resubmitted by the USP Expert Committee on Biotechnology and Natural Therapeutics to allow for additional comments.

(BNT: I. DeVeau) RTS—39939-1

Change to read:

Water—[NOTE—Dry all glassware used in the following procedure at 105° for a minimum of 1 hour, and cool in a desiccator at room temperature. Store in a desiccator. Perform as many operations as possible in a low-humidity glove box.]

Anhydrous methanol—Wash about 150 g of 8- to 17-mesh type 3A molecular sieve with several 100-mL portions of methanol to remove the fine particles. Place the washed molecular sieve in a shallow glass dish, heat in an oven at 350° for 2 hours, and cool in a desiccator. Transfer the dry molecular sieve to a 1-liter glass container, add about 700 mL of methanol, insert a stopper, mix, and allow to stand in a desiccator for not less than 48 hours before using.

Standard solutions—Prepare solutions in *Anhydrous methanol* containing 0.4, 0.8, and 1.2 mg of distilled water per mL.

Test solution—[NOTE—Prepare immediately prior to use.] Transfer about 20 mg of Gonadorelin Hydrochloride, accurately weighed, to a vial, place a cap on the vial, add 800 µL of *Anhydrous methanol* by means of a 1000-µL gas-tight syringe, and swirl to mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a thermal conductivity detector and a 2-mm × 180-cm glass column packed with 80- to 100-mesh support S3. The column temperature is maintained at about 100°, and the injection port and detector temperatures are maintained at 130°. Helium is used as the carrier gas at a flow rate of about 30 mL per minute. Chromatograph the *Standard solution* containing 1.2 mg per mL, record the chromatograms, and measure the peak responses as directed for *Procedure:* the elution order is water, followed by a broad methanol peak; the retention time of the water peak is between 0.5 and 3 minutes; and the relative standard deviation for not less than three replicate injections is not more than 2.5%.

Procedure—Separately inject equal volumes (1 to 3 µL) of each of the *Standard solutions, Test solution,* and *Anhydrous methanol* into the chromatograph, and measure the responses for the first (water) and second (methanol) major peaks, correcting the peak areas obtained from the *Test solution* and the *Standard solutions* against the *Anhydrous methanol* blank. Plot the responses of the water peaks versus concentration, in mg per mL, of water in each of the *Standard solutions,* and determine the regression line using the least-squares method. The coefficient of variation from the regression line is not more than 3.0%. From the graph so obtained, determine the concentration, *C,* in mg per mL, of water in the *Test* solution. Calculate the percentage of water in the portion of Gonadorelin Hydrochloride taken by the formula:

$$80C/W,$$

in which *W* is the weight, in mg, of Gonadorelin Hydrochloride in the *Test solution:* not more than ~~3.0%~~

Change to read:

Assay—

Standard preparations—Dissolve a suitable quantity of ~~USP Chorionic Gonadotropin RS~~

■USP Human Chorionic Gonadotropin RS.■2S (*USP27*)
in a diluent consisting of saline TS, freshly prepared to contain 1 mg per mL of bovine serum albumin and adjusted with sodium hydroxide TS to a pH between 6.9 and 8.0, to obtain a solution having a known concentration of 10 USP Chorionic Gonadotropin Units in each mL. Using the same diluent, prepare three *Standard preparations* such that the respective concentrations of chorionic gonadotropin constitute a geometric series such as 1:1.2:1.44 or 1:2:4 and such that the activity in each mL lies within the range of 0.1 to 1.0 Unit.

In-Process Revision

Assay preparations—Following the procedure outlined for the *Standard preparations,* prepare solutions of Chorionic Gonadotropin to obtain three *Assay preparations* corresponding to those of the Standard.

The animals—Select 20- to 23-day-old female rats, but restrict the selection so that no rat is more than 30% heavier than the lightest. House the animals under uniform conditions of temperature, lighting, feeding, and watering. Mark the animals for identification, and divide them at random into groups of the same number but not less than 10 animals. Assign one group to each of the three *Standard preparations* and three *Assay preparations,* respectively.

Procedure—Inject each rat subcutaneously in the dorsal area with 0.20 mL of the solution to which it was assigned, at approximately the same time on each of three consecutive days. On the afternoon of the fifth day, sacrifice the animals, and excise the uterus from each animal by cutting through the cervix, stripping off the surrounding tissue, and severing at the utero-tubal junction. Gently press out the uterine fluid on moistened absorbent paper, and weigh the uterus to the nearest 0.2 mg, using a suitable balance.

Calculation—Tabulate the observed uterine weight for each rat, designated by the symbol *y,* for each dosage group of *f* rats. Proceed as directed in the *Assay* under *Corticotropin Injection,* beginning with "If the data from one or more rats." Compute the log confidence interval *L* (see *Confidence Intervals for Individual Assays* ⟨111⟩). If the confidence interval is more than 0.1938, which corresponds at $P = 0.95$ to confidence limits of 80% and 125% of the computed potency, repeat the assay until the combined data of two or more assays, redetermined as described under *Combination of Independent Assays* ⟨111⟩, meet this limit.

Anti-factor X_a activity—

~~*pH 8.4 buffer*—Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.~~

~~*Blank solution*—Use *pH 8.4 buffer*.~~

~~*Antithrombin III solution*—Reconstitute an accurately weighed quantity of antithrombin III for amidolytic test (see *Reagents Specifications* in the section *Reagents, Indicators, and Solutions*) in *pH 8.4 buffer* to obtain a solution having a concentration of 1.0 Antithrombin III Unit per mL.~~

~~*Factor X_a solution*—Reconstitute an accurately weighed quantity of factor X_a for anti-factor X_a test (see *Reagents Specifications* in the section *Reagents, Indicators, and Solutions*) in water to obtain a solution containing about 20 Factor X_a Units per mL. Factor X_a Units are equivalent to nanokatalytic units (nkats). [NOTE—Whether employing Factor X_a Units or equivalent nkats, reconstitute as directed by the manufacturer of the reagent. Because of lot-to-lot differences due to variations among manufacturers in measuring anti-factor X_a activity, different quantities of factor X_a may be required. Different quantities of factor X_a may also be required because the absorbance value of factor X_a varies according to the chromogenic substrate used. This solution, when used in the reaction mixture containing the *Blank solution*, gives an absorbance rate change of 0.650 to 0.700 per minute, determined as directed for *Procedure*. Adjustments in potency are made, if necessary.]~~

~~*Chromogenic substrate solution*—Prepare a solution of chromogenic substrate for amidolytic test (see *Reagents Specifications* in the section *Reagents, Indicators, and Solutions*) in water to obtain a concentration of 2.5 mM or more.~~

~~*Standard solutions*—Dilute an accurately measured volume of USP Heparin Sodium RS with *pH 8.4 buffer*, and dilute accurately measured volumes of this solution with the same buffer to obtain a series of separate solutions having known concentrations of about 0.25, 0.188, 0.125, 0.0625, and 0.0312 USP Heparin Unit per mL.~~

~~*Test solutions*—Dissolve or dilute an accurately measured quantity of Heparin Sodium in *pH 8.4 buffer*, and dilute with *pH 8.4 buffer* to obtain separate solutions in a corresponding series of activities approximately equivalent to those of the *Standard solutions*.~~

~~*Procedure*—[NOTE—Each *Standard solution* and *Test solution* is made in duplicate. Two blank readings are made, one before the start of the test and another at the end. The two readings are similar to each other.] Add 600 µL of *pH 8.4 buffer*, 100 µL of *Antithrombin III solution*, and 100 µL of *Test solution* to a cuvette, mix, and incubate at 37° for 120 seconds. Add 100 µL of *Factor X_a solution*, mix immediately, and incubate at 37° for 120 seconds. Add 100 µL of *Chromogenic substrate solution*, mix immediately, and record the change in absorbance per minute at 405 nm and 37° in a spectrophotometer, or by reading the change in absorbance between 0 to 60 seconds. Repeat the procedure for each *Standard solution* and *Test solution*, and record the results.~~

~~*Calculations*—Convert to logarithms the absorbance values of the *Standard solutions*, and plot the log changes in absorbance on the *y* axis and the heparin concentrations on the *x* axis. Construct a straight line of best fit, using a least-squares linear regression analysis. Similarly treat the absorbance values of the *Test solutions*, and construct the *Test solutions* line. The regression lines for the *Test solutions* and the *Standard solutions* have a common intercept on the *y* axis at dose 0. Determine the slope for each regression line. Calculate the potency of Heparin Sodium taken by the formula:~~

~~$$P(s_u/s_s),$$~~

~~in which P is the potency of the *Standard solutions*, and s_u and s_s are the slopes of the lines from the *Test solutions* and the *Standard solutions*, respectively. Express the Anti-factor X_a potency of the *Test solution* as a percentage of the heparin concentration determined in the *Assay*. Calculate the percent anti-factor X_a activity against anticoagulant activity by the formula:~~

~~100(anti-factor X_a potency / anticoagulant potency).~~

~~Not less than 80% and not more than 120% is found.~~

▲*pH 8.4 Buffer*—Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

In-Process Revision

Antithrombin III solution—Reconstitute an accurately weighed quantity of antithrombin III (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) in *pH 8.4 buffer* to obtain a solution having a concentration of 1.0 Antithrombin III Unit per mL.

Factor X_a solution—Reconstitute an accurately weighed quantity of bovine factor X_a (see Factor X_a in *Reagent Specifications* under *Reagents, Indicators, and Solutions*) in *pH 8.4 Buffer* to obtain a solution that gives an absorbance value between 0.65 and 1.25 at 405 nm when assayed as described below but using 30 µL of *pH 8.4 Buffer* instead of the 30 µL of *Standard solutions* or *Test solutions.* [NOTE—*Factor X_a solution* contains about 3 nanokatalytic units per mL, but can vary depending upon the manufacturer of factor X_a or the substrate used.]

Chromogenic substrate solution—Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) specific for factor X_a in water to obtain a concentration of about 1 mM.

Stopping solution—Prepare a 20% (v/v) solution of acetic acid in water.

Standard solutions—Dilute an accurately measured volume of USP Heparin Sodium RS with *pH 8.4 Buffer* to obtain at least 5 (out of 7 below) solutions having known activities of about 0.375, 0.3125, 0.25, 0.188, 0.125, 0.0625, and 0.0313 USP Heparin Unit per mL.

Test solutions—Dissolve or dilute an accurately measured quantity of Heparin Sodium in *pH 8.4 Buffer,* and dilute with the same buffer to obtain solutions having activities approximately equal to those of the *Standard solutions.*

Procedure—[NOTE—Perform the test with each *Standard solution* and *Test solution* in duplicate.] To each of a series of suitable plastic tubes placed in a water bath set at 37°, transfer 120 µL of *pH 8.4 Buffer.* Then separately transfer 30 µL of the different dilutions of *Standard solutions* or *Test solutions* to the tubes. Add 150 µL of *Antithrombin III solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for 2 minutes. Add 300 µL of *Factor X_a solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for 2 minutes. Add 300 µL of *Chromogenic substrate solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for exactly 2 minutes. Add 150 µL of *Stopping solution* to each tube, and mix. Prepare a blank for zeroing the spectrophotometer by adding the reagents in reverse order, starting with the *Stopping solution* and ending with the addition of 150 µL of *pH 8.4 Buffer,* and excluding *Standard solutions* or *Test solutions.* Record the absorbance at 405 nm against the blank.

Calculations—Plot the log of the absorbance values of the *Standard solutions* and *Test solutions* versus heparin concentrations in USP Units. Construct separate straight lines of best fit using least-squares linear regression analyses for the *Standard solutions* and *Test solutions,* and determine the slope for each regression line. Calculate the potency of Heparin Sodium by the formula:

$$P(S_T / S_S),$$

in which P is the potency of USP Heparin Sodium RS; and S_T and S_S are the slopes of the lines from the *Test solutions* and *Standard solutions,* respectively. Express the Anti-factor X_a potency of the *Test solution* as a percentage of the heparin concentration determined in the *Assay.* Calculate the percent anti-factor X_a activity against anticoagulant activity by the formula:

100(anti-factor X_a potency / anticoagulant potency).

Not less than 80% and not more than 120% is found. ▲*USP27*

BRIEFING

Hydroxyurea, *USP 26* page 934; **Hydroxyurea Capsules,** *USP 26* page 935. It has been reported that the current *Assay* procedure results in poor reproducibility and peak shape in the chromatogram of the *Resolution solution*. On the basis of these comments, it is proposed to replace the *Assay* with one that utilizes a buffer–methanol solution as the *Mobile phase*.

(PA6: L. Evans) RTS—40112-1; 40112-3

Change to read:

Assay—

~~*Mobile phase*—Use degassed water.~~

~~*Internal standard solution*—Dissolve uracil in water to obtain a solution having a concentration of about 0.12 mg per mL.~~

~~*Standard preparation*—Transfer about 50 mg of USP Hydroxyurea RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of *Internal standard solution,* dilute with water to volume, and mix.~~

~~*Resolution solution*—Dissolve suitable quantities of USP Hydroxyurea RS and hydroxylamine hydrochloride in water to obtain a solution containing about 1 mg and 4 mg per mL, respectively.~~

~~*Assay preparation*—Transfer about 50 mg of Hydroxyurea, accurately weighed, to a 50-mL volumetric flask, add 10 mL of *Internal standard solution,* dilute with water to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed under *Procedure*: the resolution, *R*, between the hydroxylamine and hydroxyurea peaks is not less than 1.0. Chromatograph the *Standard preparation,* and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for hydroxyurea and 1.0 for uracil. Calculate the quantity, in mg, of $CH_4N_2O_2$ in the portion of Hydroxyurea taken by the formula:~~

$$50C(R_U/R_S),$$

~~in which *C* is the concentration, in mg per mL, of USP Hydroxyurea RS in the *Standard preparation,* and R_U and R_S are the response ratios of the hydroxyurea peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

■*Solution A*—Dissolve 1.7 g of tetrabutylammonium hydrogen sulfate and 1.74 g of dibasic potassium phosphate, anhydrous, in 1000 mL of water, and adjust with 1 N sodium hydroxide or 85% phosphoric acid to a pH of 5.0.

Solution B: methanol.

In-Process Revision

Mobile phase—Prepare a solution of filtered, degassed *Solution A* and *Solution B* (8.5:1.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Hydroxyurea RS and hydroxylamine hydrochloride in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL of each.

Standard preparation—Dissolve an accurately weighed quantity of USP Hydroxyurea RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer about 200 mg of Hydroxyurea, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the hydroxylamine and hydroxyurea peaks is not less than 1.5; for the hydroxyurea peak, the column efficiency is not less than 5000; and the tailing factor is not more than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $CH_4N_2O_2$ in the portion of Hydroxyurea taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Hydroxyurea RS in the *Standard preparation;* and r_U and r_S are the peak responses of the hydroxyurea peaks obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

Dissolution ⟨711⟩—

~~*Medium:* water; 800 mL.~~

~~*Apparatus*—Proceed as directed for *Uncoated Tablets* under *Disintegration* ⟨701⟩ beginning with "Place 1 Tablet in each of the six tubes of the basket", with these exceptions: (a) the disks are not used; (b) the apparatus is adjusted so that the bottom of the basket rack assembly descends to 1.0 ± 0.1 cm from the inside bottom surface of the vessel on the downward stroke; (c) the 10-mesh, stainless steel cloth in the basket rack is replaced with 40-mesh, stainless steel cloth; and (d) 40-mesh, stainless steel cloth is fitted to the top of the basket rack assembly if necessary to prevent any dosage unit from floating out of the tubes of the assembly.~~

~~*Time:* 45 minutes.~~

~~*Procedure*—Determine the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Hydroxyzine Hydrochloride RS in the same *Medium.* Calculate the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved in each Tablet.~~

~~*Tolerances*—Not less than 75% of the labeled amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ is dissolved in 45 minutes.~~

■TEST 1—

Medium: water, 250 mL.

Apparatus 3 (see *Drug Release* ⟨724⟩): 30 dips per minute.

Time: 45 minutes.

Procedure—Determine the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of

In-Process Revision

USP Hydroxyzine Hydrochloride RS in the same *Medium.* Calculate the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved per Tablet.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water, 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Hydroxyzine Hydrochloride RS in the same *Medium.* Calculate the amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ dissolved per Tablet.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ is dissolved in 45 minutes.■2S (*USP27*)

USP Iodixanol Related Compound C RS. USP Iodixanol Related Compound D RS. USP Iodixanol Related Compound E RS.

Change to read:

Limit of free aromatic amine—

N-(1-Naphthyl)ethylenediamine dihydrochloride solution—Prepare a fresh solution of *N*-(1-naphthyl)ethylenediamine dihydrochloride (3 in 1000) in a mixture of propylene glycol and water (70:30).

Blank solution—Add 15 mL of water to a 25-mL volumetric flask.

Standard stock solution—Dissolve an accurately weighed quantity of ~~USP Iodixanol Related Compound A RS,~~

▲USP Iohexol Related Compound B RS,▲*USP27*
and quantitatively dilute with water to obtain a solution having a known concentration of about 10 µg per mL.

Standard solution—Transfer 10.0 mL of the *Standard stock solution* and 5 mL of water to a 25-mL volumetric flask.

Test solution—Transfer about 200 mg of Iodixanol, accurately weighed, to a 25-mL volumetric flask, add 15 mL of water, and mix.

Procedure—Treat the *Standard solution,* the *Test solution,* and the *Blank solution* as follows. Place the flask in an ice bath for 5 minutes. Add 1.5 mL of 6 N hydrochloric acid, mix by swirling, add 1.0 mL of sodium nitrite solution (2 in 100), mix, and allow to stand in the ice bath for 4 minutes. Remove the flask from the ice bath, add 1.0 mL of 4% sulfamic acid solution, and swirl gently until gas evolution ceases. Add 1.0 mL of *N-(1-Naphthyl)ethylenediamine dihydrochloride solution,* mix, dilute with water to volume, mix, and allow to stand for 5 minutes. Transfer the solution obtained from the *Test solution* and the solution obtained from the Standard solution to separate color-comparison tubes. The solution obtained from the *Test solution* is lighter than the solution obtained from the *Standard solution:* not more than 0.05% is found. If the solution obtained from the *Test solution* is about the same color or darker than the solution obtained from the *Standard solution,* proceed as follows. Concomitantly determine the absorbances of the solution obtained from the *Test solution,* the solution obtained from the *Standard solution,* and the solution obtained from the *Blank solution* in 5-cm cells, at the wavelength of maximum absorbance at about 495 nm, using the solution obtained from the *Blank solution* to zero the spectrophotometer. Calculate the percentage of free aromatic amine in the portion of Iodixanol taken by the formula:

$$(C/W)[(A_U - A_B)/(A_S - A_B)],$$

in which C is the concentration, in µg per mL, of ~~USP Iodixanol Related Compound A RS~~

▲USP Iohexol Related Compound B RS▲*USP27*
in the *Standard solution; W* is the weight, in mg, of Iodixanol taken to prepare the *Test solution;* and A_U, A_B, and A_S are the absorbances of the final solutions obtained from the *Test solution, Blank solution,* and *Standard solution,* respectively: not more than 0.05% is found.

Add the following:

■**Other requirements—**Where the label states that Iodixanol is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Iodixanol Injection*. Internal standard solution—Transfer about 1 g of normal butyl acetate, accurately weighed, to a 100-mL volumetric flask, dilute with Isoflurane to volume, and mix.

Standard solution—To 95 mL of Isoflurane in a 100-mL volumetric flask, add 10.0 µL of ▲USP Isoflurane Related Compound A RS,▲*USP26* 7.0 µL of ▲USP Isoflurane Related Compound B RS,▲*USP26* 10.0 µL of acetone, and 250 µL of *Internal standard solution,* dilute with Isoflurane to volume, and mix. It contains 0.01% of ▲isoflurane related compound A,▲*USP26* 0.007% of ▲isoflurane related compound B,▲*USP26* and 0.01% of acetone.

Test solution—To 20.0 mL of Isoflurane add 50.0 µL of *Internal standard solution,* and mix. It contains about 0.0025% (w/v) of normal butyl acetate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2.4-mm × 3.7-m nickel or stainless steel column packed with 10% phase G31 and 15% phase G18 on 60- to 80-mesh sodium hydroxide-washed support S1C. The carrier gas is helium, flowing at a rate of about 25 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 65° for 7 minutes, and then the temperature is increased at a rate of 4° per minute to 110°. The injection port temperature is maintained at about 150°, and the detector is maintained at about 200°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the normal butyl acetate peak is not more than 1.5; and the relative standard deviation for replicate injections of the ratio of the response of the acetone peak to the response of the normal butyl acetate peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 40 minutes, and measure the responses for all the peaks. Separately calculate the percentages of acetone, ▲isoflurane related compound A,▲*USP26* and ▲isoflurane related compound B▲*USP26* in the portion of Isoflurane taken by the formula:

$$P[R_U/(R_S - R_U)],$$

in which P is the percentage of the relevant analyte in the *Standard solution;* and R_U and R_S are the peak response ratios obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.01% of acetone, not more than 0.01% of ▲isoflurane related compound A,▲*USP26* and not more than 0.007% of ▲isoflurane related compound B▲*USP26* are found. Calculate the percentage of any other individual impurity by the formula:

$$P[R_i/(R_S - R_i)],$$

in which P is the percentage of ▲isoflurane related compound B▲*USP26* in the *Standard solution;* R_i is the peak response ratio of any individual impurity to the internal standard obtained from the *Test solution;* and R_S is the peak response ratio of ▲isoflurane related compound B▲*USP26* to the internal standard obtained from the *Standard solution:* not more than 0.003% of any other individual impurity is found.

USP Ketamine Hydrochloride RS. USP Ketamine Related Compound A RS.

Change to read:

Related compounds—

~~*Buffer, Mobile phase,* and *System suitability solution*—Proceed as directed in the *Assay*.~~

~~*Standard solution*—Transfer 4.0 mL of the *System suitability solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having known concentrations of about 0.002 mg each of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS per mL.~~

~~*Test solution*—Transfer about 100 mg of Ketamine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of *Mobile phase,* and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.~~

~~*Chromatographic system*—Proceed as directed in the *Assay*. To evaluate the system suitability requirements, use the *System suitability solution* and the *Standard preparation,* as prepared in the *Assay*.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of ketamine related compound A in the portion of Ketamine Hydrochloride taken by the formula:~~

$$5000(C/W)(r_U/r_S),$$

~~in which *C* is the concentration, in mg per mL, of USP Ketamine Related Compound A RS in the *Standard solution; W* is the weight, in mg, of Ketamine Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses for ketamine related compound A obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of ketamine related compound A is found. In the chromatogram of the *Test solution,* the response of no other, unknown, impurity is greater than 0.3% of the ketamine peak response; and the sum of the responses of all unknown impurity peaks is not greater than 1.0% of the ketamine peak response.~~

■*Mobile phase*—Dissolve 0.95 g of sodium 1-hexanesulfonate in 1 liter of a solution consisting of a mixture of water and acetonitrile (3:1). Add 4 mL of acetic acid, and mix.

In-Process Revision

~~*Ketamine hydrochloride standard stock solution*—Dissolve an accurately weighed quantity of USP Ketamine Hydrochloride RS in *Mobile phase,* sonicating if necessary, to obtain a solution having a concentration of 1 mg per mL.~~

~~*Resolution solution*—Dissolve an accurately weighed quantity of USP Ketamine Related Compound A RS in *Mobile phase,* sonicating if necessary, to obtain a solution having a concentration of 0.5 mg per mL. To 1 mL of this solution, add 0.5 mL of *Ketamine hydrochloride standard stock solution,* and dilute with *Mobile phase* to 100 mL. [NOTE—Prepare immediately before use.]~~

Standard solution—Dissolve accurately weighed quantities of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS in *Mobile phase* (sonicate if necessary) to prepare a solution containing about 0.005 mg per mL of each compound. Prepare immediately before use.

Test solution—Transfer an accurately weighed quantity of about 50.0 mg of Ketamine Hydrochloride to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, sonicating if necessary. ~~Dilute 1.0 mL of the solution so obtained to 10.0 mL with *Mobile phase.* Dilute 1.0 mL of the resulting solution to 20.0 mL with *Mobile phase.*~~

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.0-mm × 4.0-mm guard column with a 4.0-mm × 12.5-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the ~~*Resolution solution,*~~ *Standard solution,* and record the peak responses as directed for *Procedure:* the order of elution is ketamine hydrochloride followed by ketamine related compound A; the retention time of ketamine hydrochloride is between 3.0 and 4.5 minutes (if necessary, adjust the concentration of water and acetonitrile); the resolution, *R,* between ketamine hydrochloride and ketamine related compound A is not less than 2.0; and the tailing factor is not greater than 1.5.

Procedure—Separately inject equal volumes (about 20 µL) of the ~~*Resolution solution,*~~ *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, identify the ketamine hydrochloride and ketamine related compound A peaks, and measure the areas of the major peaks. Calculate the area percentage of each impurity, relative to ketamine hydrochloride, taken by the formula:

~~$100(r_i/r_u)$,~~

~~in which r_i and r_u are the peak areas of the impurity and ketamine hydrochloride, respectively, in the *Test solution.*~~

$$5000(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Ketamine Hydrochloride taken to prepare the *Test solution;* r_i is the peak area of each individual impurity peak in the *Test solution;* and r_S is the response of the ketamine hydrochloride peak obtained from the *Standard solution.* Not more than 0.1% of ketamine related compound A is found; the response of no other unknown impurity is greater than 0.3% of the ketamine peak area; and the sum of the responses of all unknown impurity peaks is not greater than 1.0% of the ketamine peak response. ■1S (*USP27*)

Add the following:

■**Other requirements**—Where the label states that Ketamine Hydrochloride is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Ketamine Hydrochloride Injection*. Where the label states that Ketamine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Ketamine Hydrochloride Injection.* ■2S (*USP27*)

Assay—

Buffer—Dissolve 5.75 g of monobasic ammonium phosphate in 1000 mL of water. Add 6 mL of triethylamine, and adjust with phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 12.5 mg each, of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS, both accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase* with the aid of sonification if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer about 10 mg of USP Ketamine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add about 20 mL of *Mobile phase,* and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 20 mg of Ketamine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add about 35 mL of *Mobile phase,* and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the order of elution is ketamine followed by ketamine related compound A; the resolution, *R,* between ketamine and ketamine related compound A is not less than ~~9.4;~~

■2.0;■1S (*USP27*)
the column efficiency determined from the ketamine peak is not less than 9400 theoretical plates; and the tailing factor determined from the ketamine peak is not more than 1.6. Chromatograph the *Standard preparation,* and record the ketamine peak response as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 0.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{16}ClNO \cdot HCl$ in the portion of Ketamine Hydrochloride taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the ketamine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

USP Labetalol Hydrochloride RS.

Change to read:

Diastereoisomer ratio—

1-Butaneboronic acid solution—Dissolve 1-butaneboronic acid in pyridine, previously dried over a suitable molecular sieve, and mix to obtain a solution having a known concentration of 20 mg per mL.

System suitability solution—Dissolve an accurately weighed quantity of USP Labetalol Hydrochloride RS in *1-Butaneboronic acid solution,* and dilute quantitatively and stepwise with *1-Butaneboronic acid solution* to obtain a solution having a known concentration of about 1.4 mg of USP Labetalol Hydrochloride RS per mL. Allow the solution to stand at room temperature for 20 minutes before using.

Test solution—Transfer about 1 mg of Labetalol Hydrochloride to a 1-mL reaction vial, add 0.7 mL of *1-Butaneboronic acid solution,* and mix until the labetalol hydrochloride is completely dissolved. Allow the solution to stand at room temperature for 20 minutes before using.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with 10% phase G3 on 100- to 120-mesh support S1AB. The column is maintained at about 320°, and the injection port and the detector block are maintained at about 340°. Nitrogen is used as the carrier gas at the flow rate of about 30 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for the diastereoisomer B 1-butaneboronate derivative and 1.0 for the diastereoisomer A 1-butaneboronate derivative; the resolution, *R,* between the diastereoisomer A 1-butaneboronate derivative and diastereoisomer B 1-butaneboronate derivative peaks is not less than 1.5; and the relative standard deviation ■of the ratios of the peak areas of the diastereoisomers■2S (*USP27*) for replicate injections is not more than 2.0%.

Procedure—Inject about 2 µL of the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the diastereoisomer A content, in percentage, taken by the formula:

$$100 r_A / (r_A + r_B),$$

in which r_A is the peak area of the diastereoisomer A 1-butaneboronate derivative peak and r_B is the peak area of the diastereoisomer B 1-butaneboronate derivative peak. The diastereoisomer A content is not less than 45.0% and not more than 55.0%.

Add the following:

BRIEFING

Lithium Carbonate Extended-Release Tablets, *USP 26* page 1089. It is proposed to add *Drug release Test 4* to this monograph because FDA recently approved a new generic version of this product that is bioequivalent to the Reference Listed Drug, but, due to differences in the formulation, requires a new drug release test. In the absence of any adverse comments, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 27–NF 22,* with an official date of April 1, 2004.

(BPC: M. Marques) RTS—40213-1; 40168-1

Change to read:

Drug release ⟨724⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1.*

Medium: dilute hydrochloric acid (7 in 1000); 800 mL.

Apparatus 1: 100 rpm.

Times: 15, 45, 90, and 120 minutes.

Procedure—At each *Time,* withdraw 8.0 mL of the solution under test, and pass through a filter having a 35-µm or finer porosity. Using the filtrate as the *Assay preparation,* suitably diluted with *Dissolution Medium* if necessary, and using *Dissolution Medium* to prepare the *Standard preparation,* determine the amount of Li_2CO_3 dissolved by employing a flame photometer, as directed in the *Assay.*

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 1.*

Time (minutes)	Amount dissolved
15	between 2% and 16%
45	between 25% and 45%
90	between 60% and 85%
120	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Apparatus and *Procedure*—Proceed as directed for *Test 1.*

Medium: water; 900 mL.

Times: 1, 3, and 7 hours.

Tolerances—The percentages of the labeled amount of Li_2Co_3 dissolved at the specified times conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	not more than 40%
3	between 45% and 75%
7	not less than 70%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*

Medium: water; 250 mL.

Apparatus 3: 6 dips per minute, 20-mesh top screen and 100-mesh bottom screen.

Procedure—Proceed as directed for *Test 1.*

Times and *Tolerances*—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 10% and 45%
2	between 25% and 75%
6	not less than 70%

•TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4.*

Medium, Apparatus, Times, and *Procedure*—Proceed as directed for *Test 1.*

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 1.*

Time (minutes)	Amount dissolved
15	between 2% and 16%
45	between 25% and 45%
90	between 60% and 85%
120	not less than 80% •2

BRIEFING

Magaldrate and Simethicone Tablets, *USP 26* page 1108. It is proposed to change the title of this monograph to *Magaldrate and Simethicone Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40430-1

Magaldrate and Simethicone Tablets

(Current title—not to change until February 1, 2007)
Monograph title change—to become official February 1, 2007
(see Official Title Changes on the first page of In-Process Revision):
***See* Magaldrate and Simethicone Chewable Tablets**

In-Process Revision

BRIEFING

Magaldrate and Simethicone Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40430-1

Add the following:

■Magaldrate and Simethicone Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Magaldrate and Simethicone Tablets)

» Magaldrate and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magaldrate [$Al_5Mg_{10}(OH)_{31}(SO_4)_2$], and an amount of polydimethylsiloxane [$-(CH_3)_2SiO-]_n$ that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed.

USP Reference standards ⟨11⟩—*USP Magaldrate RS*. *USP Polydimethylsiloxane RS*.

Identification—

A: Transfer a quantity of powdered Chewable Tablets, equivalent to about 2 g of magaldrate, to a 100-mL centrifuge tube. Add about 60 mL of water, cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant. Repeat the washing with three more 60-mL portions of water. Transfer the residue to a 250-mL beaker, and heat on a steam bath to dryness: the residue so obtained meets the requirements of the *Identification* tests under *Magaldrate*.

B: The IR absorption spectrum, in the 7- to 11-μm region, determined in a 0.5-mm cell, of the *Assay preparation* prepared as directed in the *Assay for polydimethylsiloxane,* exhibits maxima only at the same wavelengths as that of the *Standard preparation* containing about 2 mg of USP Polydimethylsiloxane RS per mL prepared as directed in the *Assay for polydimethylsiloxane.*

Microbial limits ⟨61⟩—Chewable Tablets meet the requirements of the test for absence of *Escherichia coli*.

Uniformity of dosage units ⟨905⟩: meet the requirements for *Weight Variation* with respect to magaldrate.

Acid-neutralizing capacity—Proceed as directed under *Acid-neutralizing Capacity* ⟨301⟩. The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.8(0.0282M),$$

in which 0.0282 is the theoretical acid-neutralizing capacity, in mEq per mg, of magaldrate, and M is the quantity, in mg, of the labeled amount of magaldrate.

Defoaming activity—

Foaming solution and *System suitability tests*—Proceed as directed in the test for *Defoaming activity* under *Magaldrate and Simethicone Oral Suspension*.

Procedure—[NOTE—For each test use a clean 250-mL cylindrical jar (50-mm internal diameter × 110-mm internal height) with a 50-mm opening fitted with a tight cap with an inert liner.] Transfer a quantity of finely powdered Chewable Tablets, equivalent to 20 mg of simethicone, to a 250-mL cylindrical jar containing 50 mL of 0.6 N hydrochloric acid that has been warmed to 37°, and proceed as directed in the test for *Defoaming activity* under *Magaldrate and Simethicone Oral Suspension,* beginning with ‘‘Cap the jar.’’ Record the time, in seconds, for the foam to collapse

In-Process Revision

to the extent that its thickness, measured from the surface of the liquid, is 1.0 cm. The defoaming activity time does not exceed 45 seconds.

Magnesium hydroxide content—

Test preparation—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 g of magaldrate, to a 100-mL volumetric flask, add 30 mL of dilute hydrochloric acid (1 in 10), shake for 15 minutes, dilute with water to volume, and mix.

Procedure—Transfer 10.0 mL of *Test preparation* to a 400-mL beaker, and proceed as directed in the test for *Magnesium hydroxide content* under *Magaldrate,* beginning with "and dilute with water to about 200 mL." Not less than 492 mg and not more than 666 mg of magnesium hydroxide [$Mg(OH)_2$] per g of the labeled amount of magaldrate is found.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Test preparation—Prepare as directed in the test for *Magnesium hydroxide content*.

Procedure—Transfer 10.0 mL of *Test preparation* and 20 mL of water to a 250-mL beaker, and proceed as directed for *Procedure* in the test for *Aluminum hydroxide content* under *Magaldrate*, beginning with "Add, with stirring, 25.0 mL of *Edetate disodium*." Not less than 321 mg and not more than 459 mg of aluminum hydroxide [$Al(OH)_3$] per g of the labeled amount of magaldrate is found.

Assay for magaldrate—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 g of magaldrate, to a 200-mL volumetric flask. Add 100.0 mL of 2 N hydrochloric acid VS, and swirl by mechanical means for 30 minutes. Dilute with water to volume, mix, and filter. Transfer 100.0 mL of the filtrate to a beaker. Titrate the excess acid with 1 N sodium hydroxide VS to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 2 N hydrochloric acid is equivalent to 70.80 mg of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Assay for polydimethylsiloxane—Weigh and finely powder not less than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of simethicone, to a 60-mL separator. Add 10.0 mL of hexanes and 25 mL of 6 N hydrochloric acid, cap the separator, and shake by mechanical means for not less than 2 hours. Allow to stand for about 10 minutes, and drain off as much of the lower, aqueous layer as possible without removing any of the unseparated interphase. Add 25 mL of 4 N sodium hydroxide to the separator, cap it, and shake by mechanical means for 1 hour. Transfer the mixture from the separator to a 50-mL centrifuge tube, cap, and centrifuge to obtain clear layers. Transfer not less than 5 mL of the clear upper hexanes layer to a test tube containing about 0.5 g of anhydrous sodium sulfate. Cap the tube, shake vigorously, and allow to stand to obtain a clear supernatant (*Assay preparation*). Prepare three *Standard preparations* in hexanes having known concentrations of about 1.6, 2.0, and 2.4 mg of USP Polydimethylsiloxane RS per mL, respectively. Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparations* in a 0.5-mm cell at the wavelength of maximum absorbance at about 1260 cm^{-1} with an IR spectrophotometer, using hexanes as the blank. [NOTE—Between each measurement, rinse the cell with heptane, empty, and dry it.] Plot the absorbances for the *Standard preparations* versus concentration, in mg per mL, of USP Polydimethylsiloxane RS, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C,*

In-Process Revision

in mg per mL, of polydimethylsiloxane in the *Assay preparation.* Calculate the quantity, in mg, of $[-(CH_3)_2SiO-]_n$ in the portion of Chewable Tablets taken by multiplying *C* by 10.■2S (*USP27*)

(Official February 1, 2007)

BRIEFING

Magnesium Sulfate, *USP 26* page 1118—See briefing under *Amitriptyline Hydrochloride*.

Related compounds—

Ascorbic acid solution—Dissolve 0.4 g of ascorbic acid in 100 mL of water.

Phosphate buffer—Prepare as directed in the *Assay.*

Mobile phase—Prepare as directed in the *Assay.* [NOTE—Increasing the proportion of acetonitrile will decrease the retention times.]

System suitability stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

System suitability solution 1—Prepare a solution of USP Mangafodipir Trisodium RS having a known concentration of about 4.0 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *System suitability stock solution,* 5.0 mL of *Phosphate buffer,* and 5.0 mL of *Ascorbic acid solution.* Dilute with nitrogen-purged water to volume, and mix to obtain a solution having a concentration of about 0.4 mg of USP Mangafodipir Trisodium RS, and about 0.01 mg each of USP Mangafodipir Related Compound A RS and USP Mangafodipir Related Compound B RS per mL. [NOTE—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

System suitability solution 2—Transfer about 10 mg of USP Mangafodipir Related Compound C RS to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and add 5.0 mL of *Phosphate buffer.*

Test solution—Transfer an accurately weighed quantity of Mangafodipir Trisodium, equivalent to about 100 mg of mangafodipir trisodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 50-mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [NOTE—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph *System suitability solution 2,* and record the peak responses as directed for *Procedure:* note the elution time to identify the mangafodipir related compound C peak, if present, in the chromatogram of *System suitability solution 1.* Chromatograph *System suitability solution 1,* and record the peak responses as directed for *Procedure:* the reten-

In-Process Revision

tion time for mangafodipir is between 18 and 30 minutes. The peak area for mangafodipir related compound C is less than 0.1%. [NOTE—If the peak area is more than 0.1% of the total of all peak areas, prepare fresh quantities of *Ascorbic acid solution* and *System suitability solution 1,* and repeat the test. If the peak area of mangafodipir related compound C is still greater than 0.1%, repeat the test using another column. A contaminated column can result in oxidation of Mn(II) to Mn(III), forming related compound C.] The tailing factor for the mangafodipir peak is not more than 2.3; the column efficiency is not less than 1000 theoretical plates; the resolution, *R,* between mangafodipir related compound B and mangafodipir is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10% for each peak. [NOTE—If the resolution is less than 1.5, adjust the *Mobile phase* by increasing the concentration of tetrabutylammonium hydrogen sulfate.]

Procedure—Inject about 10 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all of the major peaks. The relative retention times for ascorbic acid, mangafodipir related compound A, Mn(II)-5-methyl dipyridoxal monophosphate (Mn(II)-5-methyl DPMP) if present, mangafodipir related compound C, mangafodipir related compound B, and mangafodipir are about 0.1, 0.3, 0.4, 0.6, 0.8, and 1.0, respectively. Calculate the percentages of mangafodipir related compound A, mangafodipir related compound B, mangafodipir related compound C, and Mn(II)-5-methyl DPMP in the portion of Mangafodipir Trisodium taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area of each impurity; and r_s is the sum of the areas of all of the peaks: not more than 0.5% each of mangafodipir related compound A and mangafodipir related compound B is found; not more than 0.6% of mangafodipir related compound C is found; not more than 0.3% of Mn(II)-5-methyl DPMP is found; not more than ~~0.1%~~

■0.3%■1S (*USP27*)
of any other impurity is found; ~~and~~

■■1S (*USP27*)
not more than a total of 0.5% of other impurities is found;

■and not more than 2.0% of total impurities is found.■1S (*USP27*)

Add the following:

Assay for follicle-stimulating hormone—

Diluting solution—Using the *Diluent* under *Assay for luteinizing hormone,* dissolve an accurately weighed quantity of ~~USP Chorionic Gonadotropin RS~~

■USP Human Chorionic Gonadotropin RS■2S (*USP27*) to obtain a solution having a concentration of 70 USP Chorionic Gonadotropin Units per mL, readjusting the pH, if necessary, to 7.2 ± 0.2.

Standard preparations—Dissolve an accurately weighed quantity of USP Menotropins RS in the *Diluting solution* to obtain solutions having known concentrations of about 2.5, 5.0, and 10.0 USP Follicle-Stimulating Hormone Units per mL.

Assay preparations—Following the procedure given under the *Standard preparations,* use Menotropins in place of the Reference Standard to obtain similar solutions.

Control solution—Use the *Diluting solution* as the control solution. Store all solutions at 5 ± 3° for the duration of the assay, and properly dispose of any unused portions.

Test animals—Select 20- to 21-day old female rats with weights within a 10-g range of each other. Proceed as directed under *Test animals* in the *Assay for luteinizing hormone* beginning with "House the animals."

Dose determination trial—Use the method described under *Procedure* to determine a 3-dose range in which the lowest dose produces a definite response in some of the rats in the low-dose group (as compared with the control group) and the highest dose produces a submaximal to maximal response in the high-dose group. Doses must be established in a geometric progression. The normal dose response range will occur between 0.5 and 6.0 USP Follicle-Stimulating Hormone Units total dose per rat. Useful dose ranges will vary with the sensitivity of the rat strain selected.

Procedure—Inject each rat of each group subcutaneously in the dorsal area with 0.2 mL of the solution to which it was assigned. For *Dose determination trial* only, similarly inject each rat in the control group with 0.2 mL of the *Control solution.* Repeat these injections at approximately the same time of day after 24 hours and 48 hours. Twenty-four hours after the last injection, weigh each rat, sacrifice the animals, and carefully dissect out the ovaries of each rat, removing any fat and fibrous tissue. Thoroughly dry the ovaries by pressing against absorbent paper, avoiding damage to follicles on the ovary surface, and immediately weigh them to the nearest 0.2 mg, using a suitable balance.

Calculation—Tabulate the observed ovarian pair weight for each rat designated by the symbol *y*, for each dosage group of *f* rats. For apparently outlying ovarian weight gain, an attempt may be made to correct the organ mass relative to the mass of the rat from which it was taken. For the *y*-value in question, calculate for each of the *f* rats in the appropriate group the ratio of ovarian weight to the total body weight. Reject the *y*-value if its corresponding ratio differs from the rest of the group by more than 1.5 standard deviations. If the data from one or more rats are missing, adjust to groups of equal size by suitable means (see *Replacement of Missing Values* under *Design and Analysis of Biological Assays* ⟨111⟩). Total the values of *y* in each group, and designate each total as *T,* using subscripts 1 to 3 for the three successive dosage levels and subscripts *S* and *U* for the Standard and the material under test, respectively. Test both the agreement in slope of the dosage-response lines for the Standard and for the material under test, and the lack of curvature as directed for a 3-dose balanced assay (see *Tests of Assay Validity* under general chapter ⟨111⟩). If the combined discrepancy as measured by F_3 exceeds its tabular value in *Table 9* (see *Combination of Independent Assays* under general chapter ⟨111⟩), regard these data as preliminary, and repeat the assay.

Determine the logarithm of follicle-stimulating hormone potency of the Menotropins taken by the formula:

$$M = (4iT_a / 3T_b) + \log R,$$

in which $T_a = \Sigma(T_U - T_S)$; $T_b = \Sigma(T_3 - T_1)$; *i* is the interval between successive log doses of both the *Standard preparation* and *Assay preparation;* and $R = v_S / v_U$ is the ratio of the high dose of the Standard in USP Units (v_S) to the high dose of the Menotropins in mg (v_U). Compute the log confidence interval (see *Design and Analysis of Biological Assays* ⟨111⟩).

Replication—Repeat the entire determination at least once. Test the agreement among the two or more independent determinations, and compute the weights/mean log-potency *M* and its confidence interval, L_C (see *Confidence Intervals for Individual Assays* under general chapter ⟨111⟩). If this exceeds 0.18, repeat the assay until the confidence interval of the combined results is 0.18 or less.

The potency P_* is satisfactory if P_* = antilog *M* is not less than 80% and not more than 125% of the labeled potency and if the log confidence interval does not exceed 0.18.

BRIEFING

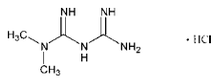
Metformin Hydrochloride; Metformin Hydrochloride Tablets. Because there are no existing *USP* monographs for this drug substance, new monographs are being proposed. The liquid chromatographic procedure in the test for *Related compounds* is based on analyses performed with the Partisil SCX brand of L9 column. The typical retention times at a flow rate of 1.7 mL per minute are about 2 minutes for metformin related compound A, about 3 minutes for melamine, and about 10 to 12 minutes for metformin.

(PA4: E. Gonikberg) RTS—34256-1

Add the following:

■Metformin Hydrochloride



$C_4H_{11}N_5 \cdot HCl$ 165.62

Imidodicarbonimidic diamide, *N,N*-dimethyl-, monohydrochloride.

1,1-Dimethylbiguanide monohydrochloride [*1115-70-4*].

» Metformin Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of $C_4H_{11}N_5 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Metformin Hydrochloride RS. USP Metformin Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements of the tests for *Chloride* ⟨191⟩.

Loss on drying ⟨731⟩—Dry it at 105° for 5 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩: 0.001%.

Related compounds—

Mobile phase—Prepare a solution in water, containing 17 g of monobasic ammonium phosphate per L, adjust with phosphoric acid to a pH of 3.0, and mix.

Standard solution—Prepare a solution of USP Metformin Related Compound A RS in water having a known concentration of about 0.2 mg per mL. Transfer 1.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Metformin related compound A is 1-cyanoguanidine.]

Test solution—Transfer about 500 mg of Metformin Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution solution—Transfer about 10 mg of melamine to a 100-mL volumetric flask, and dissolve in about 90 mL of water. Add 5.0 mL of the *Test solution,* dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 25-cm column containing packing L9. The flow rate is about 1.0 to 1.7 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between melamine and metformin is not less than 10.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution,* the *Standard solution,* and the *Diluted test solution* into the chromatograph, record the chromatograms for not less than twice the retention time of metformin, and measure the peak areas. The area of a peak corresponding to metformin related compound A in the chromatogram of the *Test solution* is not greater than the

In-Process Revision

area of the corresponding peak in the chromatogram of the *Standard solution:* not more than 0.02% of metformin related compound A is found.

The area of any other secondary peak in the chromatogram of the *Test solution* is not greater than the area of the major peak in the chromatogram of the *Diluted test solution;* and the sum of the areas of all secondary peaks in the chromatogram of the *Test solution* is not greater than five times the area of the major peak in the chromatogram of the *Diluted test solution:* not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

Assay—[NOTE—To avoid overheating of the reaction medium, mix thoroughly throughout the titration, and stop the titration immediately after the endpoint has been reached.] Dissolve about 60 mg of Metformin Hydrochloride, accurately weighed, in 4 mL of anhydrous formic acid. Add 50 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 8.28 mg of $C_4H_{11}N_5 \cdot HCl$.■2S (*USP27*)

BRIEFING

Metformin Hydrochloride Tablets—See briefing under *Metformin Hydrochloride*. It is proposed to have two different *Dissolution* tests: *Test 1* for all approved ANDA and *Test 2* for the Reference Listed Drug.

(PA4: E. Gonikberg; BPC: M. Marques) RTS—34256-2; 40422-2

Add the following:

■Metformin Hydrochloride Tablets

» Metformin Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

Labeling—When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Metformin Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

Test specimen—Transfer a quantity of powdered Tablets, equivalent to about 20 mg of metformin hydrochloride, to a suitable flask, add 20 mL of dehydrated alcohol, and shake. Filter, evaporate the filtrate on a water bath to dryness, and dry the residue at 105° for 1 hour.

B: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. To 5 mL of the filtrate add 1.5 mL of 5 N sodium hydroxide solution and 1 mL of a 1-napthol solution, prepared by dissolving 1 g of 1-naphthol in a solution containing 6 g of sodium hydroxide and 16 g of anhydrous sodium carbonate in 100 mL of water. Add 0.5 mL of sodium hypochlorite TS, dropwise, and with shaking: an orange-red color is produced that darkens on standing.

C: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. The filtrate meets the requirements of the tests for *Chloride* ⟨191⟩.

In-Process Revision

Dissolution ⟨711⟩—

TEST 1 —

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 233 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium.*

Tolerances—Not less than 70% (*Q*) of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

For products labeled to contain 500 mg of Metformin—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Proceed as directed under *Test 1.*

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 30 minutes.

For products labeled to contain 850 mg or 1000 mg of Metformin—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Procedure—Proceed as directed under *Test 1.*

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Related compounds—

Mobile phase, Resolution solution, Diluted test solution, and *Chromatographic system*—Proceed as directed in the test for *Related compounds* under *Metformin Hydrochloride*.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 500 mg of metformin hydrochloride, to a 100-mL volumetric flask, dissolve in *Mobile phase,* with shaking, dilute with *Mobile phase* to volume, and mix. Filter, and use the filtrate.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Diluted test solution* into the chromatograph, record the chromatograms for not less than twice the retention time of metformin, and measure the peak areas.

The area of any secondary peak in the chromatogram of the *Test solution* is not greater than the area of the major peak in the chromatogram of the *Diluted test solution;* and the sum of the areas of all secondary peaks in the chromatogram of the *Test solution* is not greater than five times the area of the major peak in the chromatogram of the *Diluted test solution:* not more than 0.1% of any impurity is found; and not more than 0.5% of total impurities is found.

Assay—

Standard preparation—Prepare a solution of USP Metformin Hydrochloride RS in water having a known concentration of about 10 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of metformin hydrochloride, to a 100-mL volumetric flask. Add 70 mL of water, shake by mechanical means for 15 minutes, dilute with water to volume, and filter, discarding the first 20 mL

In-Process Revision

of the filtrate. Dilute 10.0 mL of the filtrate with water to 100.0 mL, and dilute 10.0 mL of the resulting solution with water to 100.0 mL.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation,* in 1-cm cells, at the wavelength of maximum absorbance at about 232 nm, with a suitable spectrophotometer, using water as a blank. Calculate the quantity, in mg, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) in the portion of Tablets taken by the formula:

$$10C(A_U / A_S),$$

in which C is the concentration, in µg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation;* and A_U and A_S are the absorbances obtained from the *Standard preparation* and the *Assay preparation,* respectively.■2S (*USP27*)

BRIEFING

Metolazone Tablets, *USP 26* page 1220. On the basis of data received, it is proposed to change the procedure in the *Assay* from a spectrophotometric measurement to HPLC. The proposed method was validated using the Waters, Symmetry C-18 brand of L1 packing. The typical retention time for metolazone is 10.3 minutes. It is also proposed to revise the *Packaging and storage* section.

(PA5: A. Wilk) RTS—39659-1

Change to read:

Packaging and storage—Preserve in tight, light-resistant containers,

■and store below 30°.■2S (*USP27*)

Change to read:

Assay—[NOTE—Use low-actinic glassware throughout the *Assay.*]
~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Metolazone RS in alcohol to obtain a solution having a known concentration of about 40 µg per mL.~~
~~*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of metolazone, to a 250-mL volumetric~~

In-Process Revision

~~flask, add 150 mL of alcohol, sonicate for 2 minutes, dilute with alcohol to volume, and filter. Pipet 25 mL of the filtrate into a 100-mL volumetric flask, dilute with alcohol to volume, and mix.~~

~~*Procedure*—Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 343 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{16}H_{16}ClN_3O_3S$ in the portion of Tablets taken by the formula:~~

~~$$C(A_U/A_S),$$~~

~~in which *C* is the concentration, in µg per mL, of USP Metolazone RS in the *Standard preparation*, and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.~~

■*Mobile phase*—Dissolve 1.38 g of monobasic potassium phosphate monohydrate in about 900 mL of water, adjust with phosphoric acid to a pH of 3.0, and dilute with water to 1000 mL. Prepare a filtered and degassed mixture of this buffer solution, methanol, and acetonitrile (65:28:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Metolazone RS in methanol to obtain a solution having a known concentration of about 5 µg per mL.

Assay preparation—Transfer 10 Tablets to a 200-mL volumetric flask, add 3 mL of water and about 100 mL of methanol. Sonicate for 30 minutes. If disintegration is not complete, sonicate for an additional 30 minutes. Shake by mechanical means for about 30 minutes. Dilute with methanol to volume, and mix. Transfer an accurately measured volume of this stock solution, equivalent to about 0.25 mg of metolazone, to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not less than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the metolazone peak. Calculate the quantity, in mg, of $C_{16}H_{16}ClN_3O_3S$ in the portion of Metolazone Tablets taken by the formula:

$$50C(r_U/r_S),$$

in which *C* is the concentration, in mg per mL, of USP Metolazone RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

In-Process Revision

BRIEFING

Nalidixic Acid Oral Suspension, *USP 26* page 1265. It is proposed to correct a typographical error in the volume of methanol added in the preparation of the *Mobile phase* in the *Assay.* In addition, minor editorial style changes have been made. In the absence of any significant adverse comments, it is proposed to implement the revision in the *Assay* via the *Second Interim Revision Announcement* pertaining to *USP 27–NF 22,* with an official date of April 1, 2004. See also the briefing under *Acyclovir Oral Suspension*.

(PA7b: B. Davani) RTS—40283-1; 40399-1

Add the following:

■**Uniformity of dosage units** ⟨905⟩—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

Add the following:

■**Deliverable volume** ⟨698⟩—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.■2S (*USP27*)

Change to read:

Assay—

Mobile phase—Prepare a solution of 784 mg of dibasic potassium phosphate in 325 mL of water. To this solution add a solution of 2.62 g of hexadecyltrimethylammonium bromide in 350 mL of methanol. To the combined solution add ~~25 mL~~ •325 mL•2 of methanol, mix, filter, and degas. This solution has an apparent pH of about 10. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Prepare a solution of sulfanilic acid in *Mobile phase* containing about 0.8 mg per mL.

Standard preparation—Prepare a solution having a known concentration of about 0.18 mg per mL of USP Nalidixic Acid RS in methanol. Transfer 5.0 mL of this solution and 1.0 mL of *Internal standard solution* to a 25-mL volumetric flask, dilute with methanol to volume, and mix.

Assay preparation—Transfer an accurately measured volume of freshly mixed Oral Suspension, equivalent to about 150 mg of nalidixic acid, to a 500-mL volumetric flask, add about 400 mL of methanol, and sonicate for about 30 minutes. Shake by mechanical means for about 30 minutes, sonicate again for about 30 minutes, dilute with methanol to volume, mix, and filter. Transfer 3.0 mL of the clear filtrate and 1.0 mL of *Internal standard solution* to a 25-mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for sulfanilic acid and 1.0 for nalidixic acid; the resolution, *R,* between sulfanilic acid and nalidixic acid is not less than 1; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure— Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{12}N_2O_3$ in each mL of the Oral Suspension taken by the formula:

$$(12{,}500/3)(C/V)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of USP Nalidixic Acid RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation;* and R_U and R_S are the ratios of the peak areas for nalidixic acid and sulfanilic acid in the chromatograms obtained from the *Assay preparation* and the *Standard preparation,* respectively.

In-Process Revision

BRIEFING

Niacin, *USP 26* page 1304 and page 1056 of *PF* 29(4) [July–Aug. 2003]. It is proposed to delete the *Test preparation* in the test for *Organic volatile impurities* to eliminate inconsistency with the preparation of the *Standard Solution* as specified in the general test chapter under *Method IV.*

(DSN: L. Evans) RTS—40363-1

Change to read:

Identification—
A: *Infrared Absorption* ⟨197M⟩.
B: *Ultraviolet Absorption* ⟨197U⟩—
Solution: 20 µg per mL.
Medium: ~~water.~~

■Use the *Buffer solution,* prepared as directed in the *Assay.*■1S (*USP27*)
Ratio: A_{237}/A_{262}, between ~~0.35 and 0.39.~~

■0.46 and 0.50.■1S (*USP27*)

Change to read:

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.
~~*Test preparation*—Transfer 100 mg of Niacin to a vial, add 5 mL water, seal the vial, and heat to 80° for 60 minutes.~~

■■2S (*USP27*)

Change to read:

Assay—~~Transfer about 200 mg of Niacin, accurately weighed, to a 500-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and a solution of USP Niacin RS in the same medium, at a concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 262 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_6H_5NO_2$ in the Niacin taken by the formula:~~

~~$10C(A_U/A_S)$,~~

~~in which C is the concentration, in µg per mL, of USP Niacin RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Niacin and the Standard solution, respectively.~~

■*Buffer solution*—Dissolve 6.8 g of monobasic potassium phosphate in 1 L of water. Adjust with 50% sodium hydroxide solution to a pH of 7.0.

Assay preparation—Transfer about 200 mg of Niacin, accurately weighed, to a 500-mL volumetric flask, add the *Buffer solution* to dissolve, dilute with the *Buffer solution* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with the *Buffer solution* to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Assay preparation* and a solution of USP Niacin RS in the same medium *(Standard preparation),* at a concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 262 nm, with a suitable spectrophotometer, using the *Buffer solution* as the blank. Calculate the quantity, in mg, of $C_6H_5NO_2$ in the portion of Niacin taken by the formula:

$$10C(A_U/A_S),$$

in which C is the concentration, in µg per mL, of USP Niacin RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solution of the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP27*)

Specific rotation ⟨781S⟩: between +40° and +46°.

Test solution: 10 mg per mL, in chloroform. ~~[NOTE—Use within 10 minutes of preparation.]~~

▲ ▲*USP27*

Change to read:

Limit of residual solvents—

Internal standard solution—Prepare a solution of isobutyl alcohol in dimethylformamide containing 2 µL of isobutyl alcohol per 100 mL of solution.

Standard solution—Prepare a solution in *Internal standard solution* containing 5 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

System suitability solution—Dilute a portion of the *Standard solution* with *Internal standard solution* to obtain a solution containing 0.05 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

Test solution—Transfer about 40 mg of Norgestimate and 2 mL of *Internal standard solution* to a 5-mL volumetric flask or a suitable vial, and shake well to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica capillary column bonded with a 1-µm layer of phase G16, and a split injection system. The detector temperature is about 250°, and the injection port temperature is about 180°. The column temperature is programmed as follows. It is maintained at about 65° for 2.5 minutes, increased at a rate of 35° per minute to 100°, maintained for 2 minutes, then at a rate of 30° per minute increased to 160°, and maintained for 2.5 minutes. The carrier gas is helium, flowing at a rate of about 6 mL per minute, and the split flow rate is about 16 mL per minute. Chromatograph the *Internal standard solution,* the *Standard solution,* and the *System suitability solution,* and record the peak responses as directed for *Procedure:* there are no interfering peaks due to dimethylformamide; the retention time of isobutyl alcohol in the chromatogram of the *Internal standard solution* is between 4 and 5 minutes; the signal-to-noise ratio for alcohol obtained from the *System suitability solution* is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard solution,* determined from the peak response ratios of each solvent to the internal standard, is not more than 3.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each solvent in the portion of Norgestimate taken by the formula:

$$200(CD/W)(R_U/R_S),$$

in which C is the concentration, in mL per mL, of each solvent in the *Standard solution; D* is the density, in mg per mL, of each solvent; W is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios of the appropriate analyte to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 0.05% each of ~~acetone and diisopropyl ether is found; not more than 0.08% of alcohol is found; not more than 0.1% of chloroform is found; and not more than 0.2% of methanol is found.~~

■acetone, diisopropyl ether, and alcohol is found; not more than 0.006% of chloroform is found; and not more than 0.3% of methanol is found.■2S (*USP27*)

In-Process Revision

Chromatographic purity—

TEST 1—

Diluent, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation*, prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation*, prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Norgestimate taken by the formula:

$$5000(CP/W)(r_i/Fr_S),$$

in which C is the concentration, in mg per mL, of USP Norgestimate RS in the *Standard solution; P* is the fraction of (*E*)-norgestimate in USP Norgestimate RS; *W* is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* r_i is the peak area for each impurity obtained from the *Test solution; F* is the relative response factor and it is equal to 0.83 for any peak having a relative retention time of 0.50, 1.13 for any peak having a relative retention time of 0.56, 0.85 for any peak having a relative retention time of 0.72, and 1.0 for any other peak; and r_S is the peak area of (*E*)-norgestimate obtained from the *Standard solution.* Not more than 0.3% of total impurities having relative retention times of 0.50 and 0.56 is found; not more than 0.3% of the impurity having a relative retention time of 0.72 is found; and not more than 0.1% of any other impurity is found.

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of cyclohexane and

▲absolute▲*USP27*
alcohol (50:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Norgestimate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

System suitability solution—Dilute a portion of *Standard solution* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 µg per mL.

Test solution—Transfer about 10 mg of Norgestimate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains a 5-µm packing L20. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for (*E*)-norgestimate is not less than 3.0. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the retention time is about 18.6 minutes for (*E*)-norgestimate; the relative retention times are about 1.0 for (*E*)-norgestimate and 1.1 for (*Z*)-norgestimate; the tailing factor is not more than 1.5; the resolution, *R,* between (*Z*)-norgestimate and (*E*)-norgestimate is not less than 1.5; and the relative standard deviation for replicate injections, determined from the peak area of (*Z*)-norgestimate to (*E*)-norgestimate, is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Norgestimate taken by the formula:

$$1000(CP/W)(r_i/Fr_S),$$

in which C is the concentration, in mg per mL, of USP Norgestimate RS in the *Standard solution; P* is the fraction of (*E*)-norgestimate in USP Norgestimate RS; *W* is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* r_i is the peak area for each impurity obtained from the *Test solution; F* is the relative response factor and it is equal to 1.4 for any peak having a relative retention time of 0.74, 1.5 for any peak having a relative retention time of 0.78, and 1.2 for any peak having a relative retention time of 0.91; and r_S is the peak area of (*E*)-norgestimate obtained from the *Standard solution.* Not more than 0.2% of the impurity having a relative retention time of 0.74 is found; and not more than 0.1% each of the impurities having relative retention times of 0.78 and 0.91. Not more than 1.0% of total impurities is found, the results for *Test 1* and *Test 2* being added.

Delete the following:

■~~**Chromatographic purity—**~~

~~*Mobile phase*—Dissolve 27.2 g of monobasic potassium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 2.4, and mix. Prepare a filtered and degassed mixture of this solution and acetonitrile (90:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*System suitability standard solution*—Dissolve an accurately weighed quantity of USP Ofloxacin RS in methanol to obtain a solution having a known concentration of about 1.0 µg per mL.~~

~~*Test solution*—Quantitatively dissolve an accurately weighed quantity of Ofloxacin in methanol to obtain a solution containing about 1.0 mg per mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 294 nm detector and a 4.6 mm × 10 cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency, determined from the ofloxacin peak, is not less than 1400 theoretical plates when calculated by the formula:~~

$$5.545(t_R/W_{h/2})^2,$$

~~and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram for a period of time that is 2.5 times the retention time of the main ofloxacin peak, and measure the areas for all the peaks, except to disregard the solvent peak. Calculate the percentage of desfluoroofloxacin in the portion of Ofloxacin taken by the formula:~~

$$100(1.13r_u/r_t),$$

~~in which 1.13 is the response factor of desfluoroofloxacin relative to that of ofloxacin; r_u is the area for the desfluoroofloxacin peak, if present, at a retention time of about 0.56 relative to that of ofloxacin; and r_t is the total area of the peaks, except for the solvent peak: not more than 0.2% is found. Calculate the percentage of each other impurity with an area greater than that of the ofloxacin peak in the chromatogram of the *System suitability standard solution* obtained under *Chromatographic system,* by the formula:~~

$$100(r_i/r_t),$$

~~in which r_i is the peak area for an individual impurity; and r_t is the total area of the peaks in the chromatogram obtained from the *Test solution,* except for the solvent peak: not more than 0.3% of any individual impurity is found; and the sum of all impurities found is not more than 0.5%.~~■2S (*USP27*)

Add the following:

■**Related compounds—**

Mobile phase—Dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchlorate in 1300 mL of water, adjust with phosphoric acid to a pH of 2.2, and mix. Prepare a filtered and degassed mixture of this solution and 240 mL of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer 10.0 mg of USP Ofloxacin Related Compound A RS and 10.0 mg of USP Ofloxacin RS to a 100-mL volumetric flask, dissolve in and dilute with a mixture of acetonitrile and water (1:6) to volume, and mix. Dilute 10.0 mL of this solution to 50.0 mL

In-Process Revision

with a mixture of acetonitrile and water (1:6). Dilute 1.0 mL of this solution to 50.0 mL with a mixture of acetonitrile and water (1:6).

Standard solution—Quantitatively dissolve an accurately weighed quantity of USP Ofloxacin RS in a mixture of acetonitrile and water (1:6) to obtain a solution that contains 0.0004 mg per mL ofloxacin.

Test solution—Quantitatively dissolve an accurately weighed quantity of Ofloxacin in a mixture of acetonitrile and water (1:6) to obtain a solution containing about 0.2 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 294-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution between ofloxacin and ofloxacin related compound A is not less than 2.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Inject equal volumes (about 10 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatogram for a period of time that is about 2.5 times the retention time of the ofloxacin peak, and measure the areas for all peaks, except the solvent peak. Calculate the percentage of each impurity with an area greater than 0.1 times the average area of the ofloxacin peak obtained from the *Standard solution* by the formula:

$$100(C/C_T)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Ofloxacin RS in the *Standard solution;* C_T is the concentration, in mg per mL, of the *Test solution;* r_i is the peak area for an individual impurity; and r_S is the average area of the ofloxacin peak obtained from the *Standard solution:* not more than 0.3% of any individual impurity is found; and the sum of all impurities found is not more than 0.5%.■2S (*USP27*)

Related compounds—

TEST 1 *(for material labeled as isolated from natural sources)*—If the material complies with this test, the labeling indicates that it meets *USP Related compounds Test 1.*

Diluent—Prepare as directed in the *Assay.*

Solution A—Prepare filtered and degassed acetonitrile.

Solution B—Prepare filtered and degassed water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel Related Compound A RS and USP Paclitaxel Related Compound B RS in methanol to obtain a solution having known concentrations of about 10 µg of each per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Paclitaxel RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 5 µg per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L43. The flow rate is about 2.6 mL per minute. The column temperature is maintained at 30°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–35	35	65	isocratic
35–60	35→80	65→20	linear gradient
60–70	80→35	20→65	linear gradient
70–80	35	65	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.78 for paclitaxel related compound A and 0.86 for paclitaxel related compound B (relative to the retention time for paclitaxel obtained from the *Test solution*); and the resolution, *R,* between paclitaxel related compound A and paclitaxel related compound B is not less than 1.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 15 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(Fr_i / r_U),$$

in which F is the relative response factor for each impurity peak (see *Table 1* for values); r_i is the peak area for each individual impurity; and r_U is the peak area for paclitaxel.

Table 1

Relative Retention Time	Relative Response Factor *(F)*	Name	Limit (%)
0.24	1.29	Baccatin III	0.2
0.53	1.00	10-Deacetylpaclitaxel	0.5
0.57	1.00	7-Xylosylpaclitaxel	0.2
0.78	1.26	Cephalomannine (paclitaxel related compound A)	a_1[1]
0.78	1.26	2″,3″-Dihydrocephalomannine	a_2[1]
0.86	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	0.5
1.10	1.00	Benzyl analog[3]	b_1[2]
1.10	1.00	3″,4″-Dehydropaclitaxel C	b_2[2]
1.40	1.00	7-Epicephalomannine	0.3
1.85	1.00	7-Epipaclitaxel	0.5

[1] Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of a_1 and a_2 is not more than ~~0.5%.~~

■0.8%.■2S (*USP27*)

[2] Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of b_1 and b_2 is not more than 0.5%.

[3] The following chemical name is assigned to the related compound, benzyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(2-phenylacetylamino)propanoic acid.

In-Process Revision

In addition to not exceeding the limits for paclitaxel related impurities in *Table 1*, not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

TEST 2 *(for material labeled as produced by a semisynthetic process)*—If the material complies with this test, the labeling indicates that it meets *USP Related compounds Test 2.*

Diluent—Use acetonitrile.

Solution A—Use a filtered and degassed mixture of water and acetonitrile (3:2).

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel RS and USP Paclitaxel Related Compound B RS in *Diluent,* using shaking and sonication if necessary, to obtain a solution having known concentrations of about 0.96 mg per mL and 0.008 mg per mL, respectively.

Test solution—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, using shaking and sonication if necessary, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–20	100	0	isocratic
20–60	100→10	0→90	linear gradient
60–62	10→100	90→0	linear gradient
62–70	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for paclitaxel related compound B and 1.0 for paclitaxel; the resolution, *R,* between paclitaxel related compound B and paclitaxel is not less than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Diluent* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all of the peaks. Disregard any peaks due to the *Diluent.* Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(Fr_i / r_s),$$

in which F is the relative response factor for each impurity (see *Table 2* for values); r_i is the peak area for each impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks obtained from the *Test solution.* In addition to not exceeding the limits for paclitaxel related impurities in *Table 2,* not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

Table 2

Relative Retention Time	Relative Response factor (*F*)	Name	Limit (%)
0.11	1.24	10-Deacetylbaccatin III	0.1
0.20	1.29	Baccatin III	■0.2■2S (*USP26*)
0.42	1.39	Photodegradant[2]	0.1
0.47	1.00	10-Deacetylpaclitaxel	0.5
0.80	1.00	2-Debenzoylpaclitaxel-2-pentenoate	0.7
0.92[1]	1.00	Oxetane ring opened, acetyl and benzoyl[2]	x_1
0.92[1]	1.00	10-Acetoacetylpaclitaxel	x_2
0.94[1]	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	x_3
1.37	1.00	7-Epipaclitaxel	0.4
1.45	1.00	10,13-Bissidechainpaclitaxel[2]	0.5

[1] Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of x_1, x_2, and x_3 is not more than 0.4%.

[2] The following chemical names are assigned to the related compounds Photodegradant, Oxetane ring opened, acetyl and benzoyl, and 10,13-Bissidechainpaclitaxel:

Photodegradant
(1*R*,2*R*,4*S*,5*S*,7*R*,10*S*,11*R*,12*S*,13*S*,15*S*,16*S*)-2,10-diacetyloxy-5,13-dihydroxy-4,16,17,17-tetramethyl-8-oxa-3-oxo-12-phenylcarbonyloxypentacyclo[11.3.1.$0^{1,11}$.$0^{4,11}$.$0^{7,10}$]heptadec-15-yl(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate

Oxetane ring opened, acetyl and benzoyl(1*S*,2*S*,3*R*,4*S*,5*S*,7*S*,8*S*,10*R*,13*S*)-5,10-diacetyloxy-1,2,4,7-tetrahydroxy-8,12,15,15-tetramethyl-9-oxo-4-(phenylcarbonyloxymethyl)tricyclo[9.3.1.$0^{3,8}$]pentadec-11-en-13-yl(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate

10,13-Bisside-chainpaclitaxel Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid, 10-ester with (2*S*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid

BRIEFING

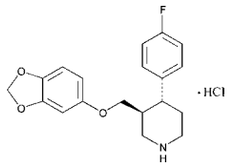
Paroxetine Hydrochloride, page 100 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to revise the *Packaging and storage* section to add the storage temperature. It is also proposed not to include the melting range test for this product. One of the limits for the impurities in the *Procedure* under *Chromatographic purity Test 1* is proposed to be modified because two possible impurities elute at the relative retention time of paroxetine related compound B. Other minor editorial revisions have also been made.

(PA3: S. Salado) RTS—39464-1; 39620-1; 39480-1

In-Process Revision

Add the following:

■Paroxetine Hydrochloride



$C_{19}H_{20}FNO_3 \cdot HCl$ 365.83

Piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)-, hydrochloride, (3*S*-*trans*)-.

(–)-(3*S*,4*R*)-4-(*p*-Fluorophenyl)-3-[(3,4-methylenedioxy)-phenoxy]methyl]piperidine hydrochloride [*78246-49-8*].

Hemihydrate 374.83 ~~[*CAS to come*].~~

» Paroxetine Hydrochloride is anhydrous or contains one-half molecule of water of hydration. It contains not less than 98.5 percent and not more than 102.0 percent of $C_{19}H_{20}FNO_3 \cdot HCl$, calculated on the anhydrous and solvent-free basis.

Packaging and storage—Preserve the anhydrous form in tight containers. Preserve the hemihydrate form in well-closed containers. Store between 15° and 30°.

Labeling—Label it to indicate whether it is the anhydrous or the hemihydrate form. Label it to indicate with which impurity tests the article complies.

USP Reference standards ⟨11⟩—*USP Paroxetine Hydrochloride RS. USP Paroxetine Related Compound A RS. USP Paroxetine Related Compound B RS. Identification—

A: *Infrared Absorption* ⟨197M⟩—

Test specimen—Dissolve a suitable portion of Paroxetine Hydrochloride in a solution of water in isopropyl alcohol (1 in 10), heat to 70° to dissolve, recrystallize, ~~and use the residue.~~ and dry the residue under vacuum at 50° for 3 hours.

Standard specimen: a similar preparation of USP Paroxetine Hydrochloride RS.

B: A solution (1 in 100) in a mixture of methanol and water (1:1) meets the requirements of the test for *Chloride* ⟨191⟩.

~~**Melting range,** *Class I* ⟨741⟩: between 115° and 126° for the anhydrous form; [To come for the anhydrous form] between 141° and 145° for the hemihydrate form.~~

Water, *Method I* ⟨921⟩: not more than ~~1.5%~~ 1.0% for the anhydrous form and between ~~2.0%~~ 2.2% and ~~3.0%~~ 2.8% for the hemihydrate form.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

~~**Limit of stereoisomers**~~ **Limit of related compound C**—

~~*Mobile phase*—Prepare a filtered and degassed mixture of 0.5 M sodium chloride and methanol (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*0.05 M Phosphate buffer solution*—Dissolve 8.7 g of dibasic potassium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *0.05 M Phosphate buffer solution* and acetonitrile (92:8). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

In-Process Revision

System suitability solution—Transfer about 5 mg of USP Paroxetine Hydrochloride Related Compound C RS and about 5 mg of USP Paroxetine Hydrochloride RS, accurately weighed, to a 10 mL volumetric flask. Dissolve in 1 mL of methanol, dilute with *Mobile phase* to volume, and mix.

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Related Compound C RS and USP Paroxetine Hydrochloride RS in methanol, the volume of the solvent not exceeding 20% of the final solution volume, and dilute quantitatively with 0.5 M sodium chloride to obtain a solution having a known concentration of about 0.01 mg of each USP Reference Standard per mL. If stepwise dilution is necessary, dilute with *Mobile phase* instead.

Test solution—Transfer about 100 mg of Paroxetine Hydrochloride, accurately weighed, to a 100 mL volumetric flask, dissolve in 20 mL of methanol, dilute with 0.5 M sodium chloride to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295 nm detector and a 4 mm × 10 cm column that contains packing L41. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.56 for paroxetine related compound C and 1.0 for paroxetine; the resolution, *R,* between paroxetine related compound C and paroxetine is not less than 1.8; the column efficiency determined from the related compound C peak is not less than 230 theoretical plates; the tailing factor for the paroxetine related compound C peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes Inject a volume (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of paroxetine related compound C in the portion of Paroxetine Hydrochloride taken by the formula:

$$10(C/W)(r_C/r_S),$$

or

$$100(r_C/r_T),$$

in which C is the concentration, in µg per mL, of USP Paroxetine Related Compound C RS in the *Standard solution;* W is the quantity, in mg, of Paroxetine Hydrochloride in the *Test solution;* and r_C and r_S are the peak responses for paroxetine related compound C obtained from the *Test solution* and the *Standard solution,* respectively; in which r_C is the peak response for paroxetine related compound C, and r_T is the sum of the responses of all of the peaks: not more than 0.1% is found.

LIMIT OF RELATED COMPOUND D—

Phosphate buffer—Prepare a 0.05 M monobasic sodium phosphate solution in water, adjust with phosphoric acid to a pH of 3.0, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Paroxetine Related Compound D RS and USP Paroxetine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 and 1.0 mg per mL, respectively.

Test solution—Transfer about 100 mg of Paroxetine Hydrochloride, accurately weighed, to a 50 mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295 nm detector and a 4.6 mm × 25 cm column that contains packing

In-Process Revision

~~L13. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.2 for paroxetine related compound D and 1.0 for paroxetine; the resolution, *R,* between paroxetine related compound D and paroxetine is not less than 2.2; the column efficiency determined from the paroxetine related compound D peak is not less than 4000 theoretical plates; the tailing factor for the related compound D peak is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.5%.~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound D in the portion of Paroxetine Hydrochloride taken by the formula:~~

~~$5(C/W)(r_u/r_s)$,~~

~~in which *C* is the concentration, in µg per mL, of USP Paroxetine Related Compound D RS in the *Standard solution; W* is the quantity, in mg, of Paroxetine Hydrochloride in the *Test solution;* and r_u and r_s are the peak responses for paroxetine related compound D obtained from the *Test solution* and the *Standard solution,* respectively: the sum of the percentages found in the *Limit of related compound C* and the *Limit of related compound D* tests is not more than 0.1%.~~

Mobile phase—Prepare a mixture of *n*-hexane, alcohol, water, and trifluoroacetic acid (900:100:2:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of alcohol and *n*-hexane (1:1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Related Compound C RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.

Test solution—Transfer about 125 mg of Paroxetine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

System suitability solution—Dilute known volumes of the *Test solution* and the *Standard solution* with *Diluent* to obtain a solution having known concentrations of about 0.1 mg per mL of each of ~~USP~~ Paroxetine Hydrochloride ~~RS~~ and of USP Paroxetine Related Compound C RS.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295-nm detector and a 4.6-mm × 25-cm column that contains packing ~~L49.~~ L51. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at 30°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times for paroxetine and paroxetine related compound C is 1.0 and about 0.6, respectively; the resolution, *R,* between paroxetine and paroxetine related compound C is not less than 2.0; and the tailing factor for paroxetine related compound C is not greater than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0% for the paroxetine related compound C.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the re-

In-Process Revision

sponses for the major peaks. Calculate the percentage of paroxetine related compound C in the portion of Paroxetine Hydrochloride taken by the formula:

~~$10{,}000(C/W)(r_i/r_s)$,~~

$$2500(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Related Compound C RS in the *Standard solution;* W is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for paroxetine related compound C in the *Test solution* and the *Standard solution,* respectively: not more than of 0.1% of paroxetine related compound C is found.

Limit of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine—

Solution A—Prepare a filtered and degassed mixture of acetonitrile and trifluoroacetic acid (1000:1).

Solution B—Prepare a filtered and degassed mixture of water and trifluoroacetic acid (1000:1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Related Compound E RS in a mixture of *Solution B* and *Solution A* (7:3), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine of about ~~0.2~~ 100 ng per mL.

Test solution—Transfer about 20 mg of Paroxetine Hydrochloride, accurately weighed, to a suitable flask, add 1.0 mL of a mixture of *Solution B* and *Solution A* (7:3), and shake to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a tandem mass spectrophotometric detector, monitoring the mass-to-charge ratio of 44 arising from the fragmentation of mass-to-charge ratio of 192, and a 2.0-mm × 25-cm column that contains base-deactivated packing L1. The flow rate is about 0.15 mL per minute. The collision-induced disassociation sector is filled with sufficient argon gas to produce –20 eV collisions. Adjust the argon gas pressure as necessary. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	30	70	equilibration
0–10	30	70	isocratic
10–10.5	30→90	70→10	linear gradient
10.5–20	90	10	isocratic
20–20.5	90→30	10→70	linear gradient
20.5–30	30	70	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the analyte response at a mass-to-charge ratio of 44 is not less than 5; and the relative standard deviation for replicate injections is not more than 5.0%. [NOTE—A large peak due to paroxetine is observed at about 10 minutes in this system. Divert the flow of eluate from the mass spectrometer at about 10 minutes after injection.]

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

In-Process Revision

responses for the major peaks. Calculate the amount, in ~~pg~~ ng, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$CI(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Related Compound E RS in the *Standard solution; I* is the amount, in ng, ~~per g,~~ of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in each mg of USP Paroxetine Related Compound E RS in the *Standard solution;* and r_U and r_S are the peak responses for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~200 pg 100 ng~~ 20 ng is found (0.0001%).

Chromatographic purity—[NOTE—Perform ~~both~~ all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to their material.]

TEST 1—

Solution A—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180:20:1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180:20:1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of water and tetrahydrofuran (9:1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

System suitability solution—Dissolve, by sonication if necessary, suitable quantities of USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS in ~~a mixture of water and tetrahydrofuran (9:1)~~ *Diluent* to obtain a solution having known concentrations of about 0.01 mg of each USP Reference Standard per mL.

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in 20 mL of ~~a mixture of water and tetrahydrofuran (9:1),~~ *Diluent,* sonicate, dilute with ~~a mixture of water and tetrahydrofuran (9:1)~~ *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector ~~capable of monitoring at 263 and 295 nm~~ and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–30	80	20	isocratic
30–50	80→20	20→80	linear gradient
50–60	20	80	isocratic
60–70	20→80	80→20	linear gradient

~~Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between paroxetine related compound A and paroxetine related compound B is not less than 1.5; the column efficiency determined from the paroxetine related compound A peak is not less than 10,000 theoretical plates; the tailing factor for the paroxetine related compound A peak is not more than 1.2; and the relative standard deviation for replicate injections is not more than 1.0%.~~

In-Process Revision

~~*Procedure*—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses at both 263 and 295 nm. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:~~

~~$100(r_i/r_s)$,~~

~~in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all of the peaks: not more than 0.1% of any individual impurity is found, and not more than 0.5% of total impurities is found.~~

~~Time (minutes)~~	~~*Solution A* (%)~~	~~*Solution B* (%)~~	~~Elution~~
~~0~~	~~80~~	~~20~~	~~equilibration (for 10 minutes)~~
~~0–30~~	~~80~~	~~20~~	~~isocratic~~
~~30–50~~	~~80→20~~	~~20→80~~	~~linear gradient~~
~~50–end~~	~~20~~	~~80~~	~~isocratic~~

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.1 for paroxetine related compound B, and 1.0 for paroxetine related compound A; the resolution, *R,* between paroxetine related compound A and paroxetine related compound B is not less than 2.0; the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0; ~~Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:*~~ and the relative standard deviation for replicate injections is not more than 2.0% for paroxetine related compound A.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution, Test solution,* and *Diluent* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$2500(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_U is the peak area of each impurity in the *Test solution,* excluding the peaks obtained in the chromatogram of the *Diluent;* and r_S is the peak area of paroxetine obtained in the *Standard solution:* not more than of ~~0.5%~~ 0.3% of any peak at a retention time of paroxetine related compound B is found; not more that 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

TEST 2—

Phosphate buffer—Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 liter of water.

Solution A—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (98:2).

Solution B—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (6:4).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of *Phosphate buffer* and acetonitrile (9:1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent,* and dilute quantitatively, and stepwise if

In-Process Revision

necessary, with *Diluent* to obtain a solution having known concentrations of about 4 µg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Identification solution—Dissolve an accurately weighed quantity of Paroxetine Hydrochloride, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–70	100→40	0→60	linear gradient
70–90	40→0	60→100	linear gradient
90–95	0	100	isocratic
95–95.1	0→100	100→0	linear gradient
95.1–110	100	0	re-equilibration

Chromatograph the *Identification solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.91 for paroxetine related compound B, about 0.96 for paroxetine related compound F, 1.0 for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0% for the paroxetine related compound B, paroxetine related compound F, paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B, paroxetine related compound F, and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for the corresponding impurity in the *Test solution* and the *Standard solution,* respectively: not more than of 0.5% of paroxetine related compound B is found; not more than 0.2% of paroxetine related compound F is found; and not more than 0.2% of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of the USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any unknown impurity in the *Test solution;* and r_S is the peak area of paroxetine in the *Standard solution:* not more than of 0.1 % of any single unknown impurity is found, and not more than 1.0% of total impurities is found.

In-Process Revision

Organic volatile impurities, *Method V* ⟨467⟩: meets the requirements.

Assay—

Acetate buffer—Prepare a 0.05 M solution of ammonium acetate in water, adjust with glacial acetic acid to a pH of 4.5, mix, and filter.

Mobile phase—Prepare a filtered and degassed mixture of *Acetate buffer,* acetonitrile, and triethylamine (60:40:1). Adjust with glacial acetic acid to a pH of 5.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve suitable quantities of USP Paroxetine Related Compound B RS and USP Paroxetine Hydrochloride RS in water to obtain a solution having known concentrations of about 0.5 mg of each USP Reference Standard per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Paroxetine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295-nm detector and a 4.6-mm × 25-cm column that contains packing L13. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for paroxetine related compound B and 1.0 for paroxetine; the resolution, *R,* between paroxetine related compound B and paroxetine is not less than 2.0; the column efficiency determined from the paroxetine peak is not less than 3000 theoretical plates; the tailing factor for the paroxetine peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{20}FNO_3 \cdot HCl$ in the portion of Paroxetine Hydrochloride taken by the formula:

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

Change to read:

USP Reference standards ⟨11⟩—

■*USP Endotoxin RS.*■2S (*USP27*)
USP Pentobarbital RS.

Change to read:

Identification—

A: ~~The UV absorption spectrum of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay.*~~

■*Ultraviolet Absorption* ⟨197U⟩—

Solution: 10 µg per mL.

Medium: dilute ammonium hydroxide (1 in 200).■1S (*USP27*)

B: ■The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: ■1S (*USP27*) Ignite about 200 mg: the residue effervesces with acids, and meets the requirements of the tests for *Sodium* ⟨191⟩.

Add the following:

■**Related compounds—**

Mobile phase—Prepare as described in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Pentobarbital RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.001 mg per mL.

Test solution—Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase,* and sonicate until dissolved. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm

packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′,* is not less than 2.5; the column efficiency is not less than 15,000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 15.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Pentobarbital Sodium taken by the formula:

$$(248.25/226.27)(10{,}000/F)(C/W)(r_i/r_S),$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; C is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard solution; F* is the relative response factor of the impurity according to the table below; W is the weight, in mg, of Pentobarbital Sodium, on the dried basis, used to prepare the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_S is the peak area for Pentobarbital in the *Standard solution:* the impurities meet the requirements given in the table below:

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
6-Imino-5-ethyl-5-(1-methylbutyl)barbituric acid	about 0.39	1.5	0.2
Pentobarbital	1.0	—	—
5-Ethyl-5-(1,3-dimethylbutyl) barbituric acid	about 1.5	0.9	0.3
Unknown impurities	—	1.0	0.1
Total	—	—	0.5

■1S (*USP27*)

Add the following:

■**Other requirements**—Where the label states that Pentobarbital Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Pentobarbital Sodium Injection*. Where the label states that Pentobarbital Sodium must be subjected fo further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Pentobarbital Sodium Injection.*■2S (*USP27*)

Change to read:

Assay—

~~*Diluting solvent*—Use freshly prepared dilute ammonium hydroxide (1 in 200).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Pentobarbital RS in *Diluting solvent* to obtain a solution having a known concentration of about 10 µg per mL.~~

~~*Assay preparation*—Transfer about 25 mg of pentobarbital sodium, previously dried and accurately weighed, in a 50-mL volumetric flask, immediately dilute with *Diluting solvent* to volume, and mix. Pipet 2 mL of this solution into a 100-mL volumetric flask, add *Diluting solvent* to volume, and mix.~~

In-Process Revision

~~*Procedure*—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using *Diluting solvent* as the blank. Calculate the quantity, in mg, of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium taken by the formula:~~

~~$$2.5C(248.26/226.28)(A_U/A_S),$$~~

~~in which *C* is the concentration, in µg per mL, of USP Pentobarbital RS in the *Standard preparation;* 248.26 and 226.28 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.~~

■NOTE—Use the value for *Loss on drying* obtained at the same time as the preparation of the *Test solution* in the test for *Related compounds* and the *Assay preparation* in the *Assay.*■2S (*USP27*)

■*Mobile phase, Standard preparation,* and *Chromatographic system*—Proceed as described in the *Assay* under *Pentobarbital.*

Assay preparation—Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase,* and sonicate until dissolved. Dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peak. Calculate the quantity, in mg, of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium taken by the formula:

$$(248.25/226.27)1000C(r_U/r_S),$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; *C* is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP27*)

BRIEFING

Pentoxifylline Extended-Release Tablets, page 3112 of the *Second Supplement*. In the table under *Tolerances* in *Drug release Test 2,* it is proposed to correct the 10-hour time point in accordance with the original documentation for this monograph.

■**Drug release** ⟨724⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1.*
Medium: water; 900 mL or 1000 mL.
Apparatus 2: 100 rpm.
Times: 1, 4, 8, and 12 hours.
Procedure—Determine the amount of $C_{13}H_{18}N_4O_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Pentoxifylline RS in the same *Medium.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Times: 1, 6, 10, and 20 hours.
Procedure—Proceed as directed under *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 8% and 30%
6	between 35% and 60%
10	between 53% and ~~80%~~ ■78%■2S (*USP27*)
20	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Times: 2, 8, 12, and 20 hours.
Procedure—Proceed as directed under *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
2	between 15% and 35%
8	between 55% and 75%
12	between 75% and 95%
20	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4.*
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 8, and 24 hours.
Procedure—Proceed as directed for *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 0% and 20%
8	between 35% and 60%
24	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 5*.
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Times: 1, 2, 4, 6, and 20 hours.
Procedure—Proceed as directed for *Test 1,* except to use the wavelength of maximum absorbance at about 264 nm instead of 274 nm.
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 5% and 25%
2	between 10% and 35%
4	between 20% and 50%
6	between 30% and 60%
20	not less than 80%

TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 6.*
Medium: simulated gastric fluid (without enzymes); 900 mL.
Apparatus 2: 50 rpm.
Times: 2, 8, 12, and 24 hours.
Procedure—Proceed as directed for *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
2	between 10% and 30%
8	between 40% and 60%
12	between 55% and 75%
24	not less than 85%

TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 7.*
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 3, 8, and 18 hours.
Procedure—Proceed as directed for *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	not more than 25%
3	between 25% and 45%
8	between 55% and 75%
18	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 8.*
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Times: 1, 2, 4, 10, and 16 hours.
Procedure—Proceed as directed for *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 10% and 20%
2	between 15% and 35%
4	between 25% and 45%
10	between 55% and 75%
16	not less than 80%

TEST 9—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 9.*
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 3, 6, 12, and 18 hours.
Procedure—Proceed as directed for *Test 1,* except to use the wavelength of maximum absorbance at about 230 nm instead of 274 nm.
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 0% and 20%
3	between 20% and 40%
6	between 30% and 60%
12	between 50% and 80%
18	not less than 80%

TEST 10—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 10.*
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Times: 1, 6, 12, and 20 hours.
Procedure—Proceed as directed for *Test 1.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	not more than 20%
6	between 35% and 65%
12	between 60% and 90%
20	not less than 80% ■2S (*USP26*)

BRIEFING

Phenytoin Tablets, *USP 26* page 1467. It is proposed to change the title of this monograph to *Phenytoin Chewable Tablets.* See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40431-1

Phenytoin Tablets

(Current title—not to change until February 1, 2007)
Monograph title change—to become official February 1, 2007
(see Official Title Changes on the first page of In-Process Revision):
***See* Phenytoin Chewable Tablets**

BRIEFING

Phenytoin Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40431-1

Add the following:

■Phenytoin Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Phenytoin Tablets)

» Phenytoin Chewable Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{12}N_2O_2$.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed.

USP Reference standards ⟨11⟩—*USP Phenytoin RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

0.05 M Tris buffer—Dissolve 60.5 g of tris(hydroxymethyl)aminomethane in 6 liters of water. Dilute with water to 10 liters, and adjust with phosphoric acid to a pH of 9.0 ± 0.05. Dissolve 100 g of sodium dodecyl sulfate in about 6 liters of the prepared buffer, transfer this solution to the remaining buffer solution, and mix.

Medium: 0.05 M Tris buffer; 900 mL.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Determine the amount of $C_{15}H_{12}N_2O_2$ dissolved by employing the following method.

In-Process Revision

Triethylamine solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Phenytoin RS in methanol to obtain a solution having a known concentration of 3.0 mg per mL. Transfer a portion of this solution to a suitable container, and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a concentration of 0.06 mg per mL. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Withdraw a portion of the solution under test, and filter, discarding the first 3 mL of the filtrate. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses. Determine the amount of $C_{15}H_{12}N_2O_2$ dissolved by comparison of the peak responses obtained from the *Standard solution* and the *Test solution*.

Tolerances—Not less than 70% (*Q*) of the labeled amount of $C_{15}H_{12}N_2O_2$ is dissolved in 120 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—

Triethylamine solution—Transfer 1 mL of triethylamine to a 100-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, acetonitrile, *Triethylamine solution*, and acetic acid (500:270:230:5:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Phenytoin RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of phenytoin, to a 500-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 6500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{15}H_{12}N_2O_2$ in the portion of Chewable Tablets taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Phenytoin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Povidone, *USP 26* page 1519 and page 1064 of *PF* 29(4) [July–Aug. 2003]. On the basis of comments received, it is proposed to reduce the current acceptable levels of Vinylpyrrolidinone in the test for *Vinylpyrrolidinone* from 2000 ppm to 10 ppm or less in order to minimize the safety risks associated with higher levels of the monomer. Also, it is proposed to replace the current titrimetric test for *Vinylpyrrolidinone* with an HPLC test published in the international harmonization Stage 5A draft proposal monograph. The proposed limit complies with both the harmonization Stage 5A draft proposal and the limit published in the European Pharmacopoeia. Interested parties are encouraged to comment.

(EMC: C. Sheehan) RTS—40407-1

Change to read:

» Povidone is a synthetic polymer consisting essentially of linear 1-vinyl-2-pyrrolidinone groups, the degree of polymerization of which results in polymers of various molecular weights. ~~It is characterized by its viscosity in aqueous solution, relative to that of water, expressed as a K-value, ranging from 10 to 120. The K-value of Povidone having a nominal K-value of 15 or less is not less than 85.0 percent and not more than 115.0 percent of the nominal K-value, and K-value of Povidone having a nominal K-value or nominal K-value range with an average of more than 15 is not less than 90.0 percent and not more than 108.0 percent of the nominal K-value or average of the nominal K-value range.~~

■The different types of Povidone are characterized by their viscosity in aqueous solution, relative to that of water, expressed as a K-value. (See the section on *K-value* below.) The K-value of Povidone having a stated (nominal) K-value of 15 or less is not less than 85.0 percent and not more than 115.0 percent of the stated values. The K-value of Povidone having a stated K-value or a stated K-value range with an average of more than 15 is not less than 90.0 percent and not more than 108.0 percent of the stated value or of the average of the stated range.■1S (*USP27*)

Limit of aldehydes—

Phosphate buffer—Transfer ~~50.0 g~~ ■8.3 g■1S (*USP27*) of potassium pyrophosphate to a 500-mL volumetric flask, and dissolve in 400 mL of water. Adjust, if necessary, with 1 N hydrochloric acid to a pH of 9.0, dilute with water to volume, and mix.

Aldehyde dehydrogenase solution—Transfer a quantity of lyophilized aldehyde dehydrogenase equivalent to 70 units to a glass vial, dissolve in 10.0 mL of water, and mix. [NOTE—This solution is stable for 8 hours at 4°.]

NAD solution—Transfer 40 mg of nicotinamide adenine dinucleotide to a glass vial, dissolve in 10.0 mL of *Phosphate buffer*, and mix. [NOTE—This solution is stable for 4 weeks at 4°.]

Standard preparation—Add about 2 mL of water to a glass weighing bottle, and weigh accurately. Add about 100 mg (about 0.13 mL) of freshly distilled acetaldehyde, and weigh accurately. Transfer this solution to a 100-mL volumetric flask. Rinse the weighing bottle with several portions of water, transferring each rinsing to the 100-mL volumetric flask. Dilute the solution in the 100-mL volumetric flask with water to volume, and mix. Store at 4° for about 20 hours. Pipet 1 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

Test preparation—Transfer about 2 g of Povidone, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Phosphate buffer,* dilute with *Phosphate buffer* to volume, and mix. Insert a stopper into the flask, heat at 60° for 1 hour, and cool to room temperature.

Procedure—Pipet 0.5 mL each of the *Standard preparation,* the *Test preparation,* and water to provide the reagent blank into separate 1-cm cells. Add 2.5 mL of *Phosphate buffer* and 0.2 mL of *NAD solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 2 to 3 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm, using water as the reference. Add 0.05 mL of *Aldehyde dehydrogenase solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 5 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm, using water as the reference. Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Povidone taken by the formula:

$$10(C/W)\left[\frac{(A_{U2}-A_{U1})-(A_{B2}-A_{B1})}{(A_{S2}-A_{S1})-(A_{B2}-A_{B1})}\right],$$

in which C is the concentration, in mg per mL, of acetaldehyde in the *Standard preparation; W* is the weight, in g, of Povidone taken; A_{U1}, A_{S1}, and A_{B1} are the absorbances of the solutions obtained from the *Test preparation,* the *Standard preparation,* and the water reagent blank, respectively, before addition of the *Aldehyde dehydrogenase solution;* and A_{U2}, A_{S2}, and A_{B2} are the absorbances of the solutions obtained from the *Test preparation,* the *Standard prepa-*

In-Process Revision

ration, and the water reagent blank, respectively, after addition of the *Aldehyde dehydrogenase solution:* not more than 0.05% is found.

Change to read:

Vinylpyrrolidinone—~~Dissolve 10.0 g of Povidone in 80 mL of water, add 1.0 g of sodium acetate, and titrate with 0.10 N iodine until the color of iodine no longer fades. Add an additional 3.0 mL of 0.10 N iodine, allow to stand for 10 minutes, and titrate the excess iodine with 0.10 N sodium thiosulfate, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩), using the same total volume of 0.10 N iodine, accurately measured, as was used for titrating the specimen: not more than 3.6 mL of 0.10 N iodine is consumed, corresponding to not more than 0.2% of vinylpyrrolidinone.~~

■*Mobile phase*—Prepare a mixture of methanol and water (20:80).

System suitability solution—Transfer 10 mg of vinylpyrrolidinone and 500 mg of vinyl acetate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer an accurately weighed quantity of 50 mg of vinylpyrrolidinone to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 1.0-mL of this solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test preparation—Transfer an accurately weighed quantity of about 250 mg of Povidone to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector, a 4.0-mm × 2.5-cm guard column containing packing L7, and a 4.0-mm × 25-cm analytical column containing 5-µm packing L7. The column temperature is maintained at about 40°. Adjust the flow rate so that the retention time of vinylpyrrolidinone is about 10 minutes. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between vinylpyrrolidinone and vinyl acetate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separetely inject equal volumes (about 50 µL) each of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinylpyrrolidinone peak. [NOTE—If necessary, after each injection of the *Test preparation,* wash the polymeric material of Povidone from the guard column by passing the *Mobile phase* through the column backwards for about 30 minutes at the same flow rate.] Calculate the percentage of vinylpyrrolidinone in the sample taken by the formula:

$$1000\ (C/W)\ (r_U / r_S),$$

in which C is the concentration, in mg per mL , of vinylpyrrolidinone in the *Standard preparation; W* is the weight , in mg, of Povidone taken to prepare the *Test preparation;* and r_U and r_S are the peak responses for vinylpyrrolidinone obtained from the *Test preparation* and *Standard preparation,* respectively: not more than 0.001 % is found.■2S (*USP27*)

BRIEFING

Propofol, page 1854 of *PF* 28(6) [Nov.–Dec. 2002]. On the basis of comments received, the following revisions are proposed, and, where possible, procedures are harmonized to the *EP* monograph for Propofol:

- A revision is proposed to the *Packaging and storage* statement to specify packaging in light-resistant containers under inert gas; the recommended storage temperature is specified in accordance with the USP Packaging, Storage, and Distribution (PSD) Expert Committee.
- Two reference standards, USP Propofol for System Suitability RS and USP Propofol Related Compound B RS, are added to support proposed analytical procedures, and it is proposed to designate 3,3′,5,5′-Tetraisopropyldiphenol as USP Propofol Related Compound A RS.
- A narrower specification is proposed for the test for *Refractive index;* the range is in agreement with that in the *EP* monograph.
- Purification by distillation renders the tests for *Water, Residue on ignition, Heavy metals,* and *Content of chloride* unnecessary; the deletion of these tests is proposed, again, in accordance with the *EP* monograph.
- Deletion is proposed for the test for *Bacterial endotoxins* because the finished product specification will control the amount of endotoxins.
- In order to accommodate detection and quantitation of propofol and impurities resulting from different synthetic processes, the *Chromatographic purity* test is being renamed to *Related compounds* and an additional test, *Test 2,* is added; the *Limit of 3,3′-5,5′-tetraisopropyldiphenol* is renamed to *Limit of propofol related compound A;* the *Limit of 2,6-diisopropylbenzoquinone* is renamed to *Limit of propofol related compound B* with the addition of another test, *Test 2;* and in the *Assay,* another test is added. These proposed normal phase HPLC procedures are based on those in the *EP* monograph for Propofol; use of a Partisil column is recommended, and propofol elutes at about 3 minutes.
- It is proposed to revise the *Labeling* statement to indicate which *Related compounds* procedure is used.
- A revision is proposed to the *Limit of propofol related compound A* procedure to eliminate the use of propofol and change the solvent to methanol.
- A new procedure is proposed for *Test 1* in the *Assay,* replacing the current method that uses a G49 column. Advantages of the proposed procedure include the following: (1) increased laboratory efficiency because it uses the same column (G16) and carrier gas (helium) as in *Related compounds Test 1;* (2) elimination of methylene chloride as the solvent in favor of methanol; and (3) increased precision because the procedure does not use a split-flow technique. The validation was performed using an AT-Wax brand of G16 column; propofol elutes between 14 and 16 minutes on this system.
- Minor editorial changes are also proposed.

~~*System suitability solution* and *Chromatographic system*—Proceed as directed in the *Assay.*~~

~~*Test solution*—Use the *Assay preparation.*~~

~~*Procedure*—Inject equal volumes (about 0.5 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Propofol taken by the formula:~~

~~$100(r_i/r_s)$,~~

~~in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the peak response for propofol obtained from the *System suitability solution:* not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities is found.~~

~~*System suitability solution*—Prepare a solution in dichloromethane containing 4 µg of 2-isopropylphenol and 4 mg of USP Propofol RS per mL.~~

~~*Test solution*—Dissolve 400 mg of Propofol in 100 mL of dichloromethane, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.25-mm × 30-m column coated with a 0.15-mm phase G3, and a 0.53-mm × 5-m deactivated fused-silica guard column. The carrier gas is helium, flowing at a rate of about 1.7 mL per minute and maintained at about 20 psi. The detector temperature is maintained at 270°. The injector~~

In-Process Revision

~~temperature is maintained at 38°; immediately after the injection it is increased at a rate of 125° per minute to 270°; and then it is maintained at 270° for 28 minutes. Initially the temperature of the column is equilibrated at 35° for 3 minutes; upon injection it is increased at a rate of 20° per minute to 80°; it is increased again at a rate of 6° per minute to 150°; it is increased again at a rate of 20° per minute to 270°; and then it is maintained at 270° for 7 minutes. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for 2-isopropylphenol and 1.0 for propofol; the tailing factor for the 2-isopropylphenol peak is not more than 2; the peak area for 2-isopropylphenol is not less than 0.085% and not more than 0.125% relative to propofol; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*— Separately inject equal volumes (about 5 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Propofol taken by the formula:~~

~~$100(r_i/r_u)$,~~

~~in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_u is the sum of the responses for all the peaks, excluding that of the solvent peak: not more than 0.1% of any individual peak is found; and not more than 0.3% of total impurities is found.~~

TEST 1—

Resolution solution— ~~Dissolve about 1000 mg of USP Propofol Resolution RS in 10.0 mL of methanol.~~Dissolve an accurately weighed quantity of USP Propofol ~~Resolution~~ RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 100 mg per mL.

Standard solution— ~~Dissolve 50 mg of USP Propofol RS in 50.0 mL of methanol, and mix. Further dilute 5.0 mL of this solution with methanol to 50.0 mL.~~Dissolve an accurately weighed quantity of USP Propofol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 0.1 mg per mL.

Test solution— ~~Dissolve 1000 mg of Propofol in 10.0 mL of methanol.~~Transfer about 1000 mg of Propofol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— ~~The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 1.2-µm phase G16. The carrier gas is helium, flowing at a rate of about 8 mL per minute. The injection port and the detector temperatures are maintained at 250° and 300°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is maintained at 145° for 20 minutes; the temperature is increased at a rate of 5° per minute to 200° and maintained at 200° for 5 minutes. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:*~~ Proceed as directed under *Assay Test 1,* except to chromatograph the *Standard solution* six times and chromatograph the *Resolution solution:* the relative retention time is about 0.18 for 2,6-diisopropylphenyl isopropylether, 1.0 for propofol, and about 1.1 for 2-isopropyl-6-*n*-propylphenol; the resolution, *R,* between propofol and 2-isopropyl-6-*n*-propylphenol is not less than 2. Chromatograph the *Standard solution* six times, and record the peak responses as directed for *Procedure:* the column efficiency determined from the propofol peak is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than 3.5%.

In-Process Revision

Procedure—Separately inject equal volumes (about 1.0 µL) of the *Resolution solution, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Propofol taken by the formula:

$$0.1(r_i / r_S),$$

in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for propofol obtained from the *Standard solution:* not more than 0.1% of 2,6-diisopropylphenyl isopropylether is found; not more than 0.1% of each other individual impurity is found; and not more than 0.3% of total impurities is found.

TEST 2—

Mobile phase—Prepare as directed in *Assay Test 2.*

System suitability solution 1—Transfer 5 µL of USP Propofol RS and 15 µL of USP Propofol Related Compound B RS to a 50-mL volumetric flask, dissolve in and dilute with hexane to volume, and mix

System suitability solution 2—Dissolve 1 mL of USP Propofol for System Suitability RS with hexane to make 10 mL.

Test solution—Transfer about 1000 mg of Propofol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with hexane to volume, and mix.

Reference solution—Dilute 1 mL of the *Test solution* with hexane to 100 mL, and mix. Dilute 1 mL of this solution with hexane to 10 mL, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in *Assay Test 2.* Chromatograph *System suitability solution 1* and *System suitability solution 2,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for propofol related compound B from *System suitability solution 1,* and 0.5 for 2-(1-methylethoxy)-1,3-bis(1-methylethylbenzene), 1.0 for propofol, and 5.0 for propofol related compound A from *System suitability solution 2;* the resolution, *R,* between propofol related compound B and propofol is at least 4.0.

Procedure—Separately inject a volume (about 10 µL) of the *Test solution* and *Reference solution* into the chromatograph, record the chromatogram, and measure all peak responses. Calculate the percentage of each impurity in the portion of Propofol taken by the formula:

$$0.1(r_i / r_S)(1/F),$$

in which r_i is the peak response for each impurity obtained from the *Test solution;* r_S is the peak response for propofol obtained from the *Reference solution;* and F is the response factor. F is 0.2 for 2,6-diisopropylphenylisopropyl ether and 4.0 for propofol related compound A: not more than 0.2% of 2-(1-methylethoxy)-1,3-bis(1-methylethylbenzene) is found; not more than 0.2% of 2,6-diisopropylphenylisopropyl ether is found; not more than 0.01% of propofol related compound A is found; not more than 0.05% of each other individual impurity is found; and not more than 0.3% of total impurities is found.

Limit of ~~3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A—[NOTE—This is to be performed in conjunction with *Related compounds Test 1.*]

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and methanol (50:40:10).

Standard solution—Prepare a solution in ~~*Mobile phase*~~ methanol containing ~~2~~ 20 µg per mL ~~each~~ of ~~USP Propofol RS and USP 3,3′-5,5′-Tetraisopropyldiphenol RS.~~ USP Propofol Related Compound A RS.

Test solution—~~Dissolve 500 mg of Propofol in 25.0 mL of *Mobile phase.*~~ Transfer about 500 mg of Propofol, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with ~~*Mobile phase*~~ methanol to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 270-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution* six times, and record the peak responses as directed for *Procedure:* the column efficiency, based on the ~~propofol~~ propofol related compound A peak, is not less than 6000 theoretical plates; and the relative standard deviation for replicate injections for ~~propofol and 3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A peaks is not more than 15%.

Procedure—Separately inject equal volumes (about 20 mL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for ~~3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A. Calculate the percentage of ~~3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A in the portion of Propofol taken by the formula:

$$~~0.01(r_U/r_S),~~$$

$$0.01(r_U/r_S),$$

in which ~~r_U~~ r_U and r_S are the peak responses for ~~3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of ~~3,3′-5,5′-tetraisopropyldiphenol~~ propofol related compound A is found.

Limit of ~~2,6-diisopropylbenzoquinone~~ propofol related compound B—

TEST 1—[NOTE—This is to be performed in conjunction with *Related compounds Test 1.*]

Sample solution: neat.

Procedure—Examine the portion of Propofol taken at 330 nm using air as the blank (see *Ultraviolet Absorption* ⟨197U⟩. The absorbance of the *Sample solution* is not more than 0.4 absorbance units (0.1%).

TEST 2—[NOTE—This is to be performed in conjunction with *Related compounds Test 2.*]

Mobile phase—Prepare as directed under *Assay Test 2.*

Stock standard solution—Dissolve about 5 mg of USP Propofol Related Compound B RS in hexane, and dilute with hexane to 50 mL.

Standard solution—Dilute 5 mL of the *Stock standard solution* with hexane to 100 mL.

Test solution—Dissolve about 0.5 g of Propofol in hexane, and dilute with hexane to 10 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed under *Assay Test 2* except that the liquid chromatograph is equipped with a detector at 254 nm. Chromatograph the *Standard solution* and the *Test solution,* and record the peak responses as directed for *Procedure:* the relative retention time for propofol related compound B is about 0.8 and 1.0 for propofol.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of propofol related compound B in the portion of Propofol taken by the formula:

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of the *Standard solution;* C_U is the concentration, in mg per mL, of propofol in the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.05% of propofol related compound B is found.

~~**Content of chloride** ⟨221⟩—Dissolve about 3 g of Propofol, accurately weighed, in 60 mL of methanol, add 10 mL of water and 20 mL of 2 N nitric acid, and titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometri-~~

In-Process Revision

~~cally (see *Titrimetry* ⟨541⟩). Each mL of 0.01 N silver nitrate is equivalent to 35.45 0.3545 mg of chloride: not more than 0.01% of chloride is found.~~

Assay—

~~*System suitability solution*—Dissolve about 100 mg of USP Propofol RS and 10 mg of triethylamine in 5.0 mL of dichloromethane, and mix.~~

~~*Standard preparation*—Dissolve 100 mg of USP Propofol RS in 5.0 mL of dichloromethane, and mix.~~

~~*Assay preparation*—Dissolve 100 mg of Propofol in 5.0 mL of dichloromethane, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m column coated with a 0.25-µm phase G49. The carrier gas is hydrogen, flowing at a rate of about 2 mL per minute and maintained at 10 psi; and the split flow rate is about 10 mL per minute with a split flow ratio of 5:4. The injection port and the detector temperatures are maintained at 250° and 300°, respectively. The chromatograph is programmed as follows. Initially the column temperature is equilibrated at 60° for 2 minutes; upon injection the temperature is increased at a rate of 10° per minute to 150°; the temperature is increased again at a rate of 30° per minute to 270°; and is maintained at 270° for 5 minutes. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.15 for triethylamine and 1.0 for propofol; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 0.5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{18}O$, in the portion of Propofol taken by the formula:~~

$$5C(r_U/r_S),$$

~~in which *C* is the concentration, in mg per mL, of USP Propofol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

TEST 1—[NOTE—This is to be performed in conjunction with *Related compounds Test 1.*]

Standard preparation—Dissolve an accurately weighed quantity of USP Propofol ~~System Suitability~~ Resolution RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 10 mg per mL.

Assay preparation—Transfer about 250 mg of Propofol, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with methanol to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 1.2-µm phase G16. The carrier gas is helium, flowing at a rate of about 8 mL per minute. The injection port and the detector temperatures are maintained at 250° and 300°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is maintained at 145° for 20 minutes; the temperature is increased at a rate of 5° per minute to 200° and maintained at 200° for 5 minutes. Chromatograph the *Standard preparation* five times, and record the peak responses as directed for *Procedure:* the column efficiency determined from the propofol peak is not less than 5000 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%.

In-Process Revision

Procedure—Separately inject equal volumes (about 1.0 µL) of the *Standard preparation* and *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the percentage of $C_{12}H_{18}O$ in the portion of Propofol taken by the formula:

$$100(C_S / C_U)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Propofol RS in the *Standard preparation;* C_U is the concentration, in mg per mL, of propofol in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

TEST 2—[NOTE—This is to be performed in conjunction with *Related compounds Test 2.*]

Mobile phase—Prepare a filtered and degassed mixture of hexane, acetonitrile, and ethanol (990:7.5:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Propofol RS in hexane, and dilute quantitatively, and stepwise if necessary, with hexane to obtain a solution having a concentration of about 2.4 mg per mL

Assay preparation—Transfer about 240 mg of Propofol, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with hexane to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and ~~4.9~~ 4.6-mm × 20-cm column that contains 5-µm packing L3. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the propofol peaks. Calculate the quantity, in mg, of $C_{12}H_{18}O$ in the portion of Propofol taken by formula:

$$100(C_S / C_U)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Propofol RS in the *Standard preparation;* C_U is the concentration, in mg per mL, of propofol in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Somatropin; Somatropin for Injection. Since the publication of the proposed monograph of Somatropin in *PF* 25(4), many comments were received from manufacturers of the product; therefore, the original proposal is canceled and a new monograph is proposed on the basis of those comments. The revisions and the justifications are summarized below.

1. **Identification test C:** *Electrophoretic Test*
   The test has been deleted because (a) it is difficult to reproduce and (b) the results are not consistent from manufacturer to manufacturer. In addition, several problems with the details of the procedure were reported. Furthermore, the need for this test was questioned because there were two other identification tests included in the proposed monograph—a chromatographic identity test and a test for peptide mapping.
2. **Limit of high molecular weight of proteins**
   The procedure for this test is the same as that of the procedure for the *Assay*, except for the injection volume. A suggestion was made to change the injection volume to 20 µL to make it consistent with the *Assay* procedure.
3. **Chromatographic purity**
   - The requirement for a limit for any individual impurity is deleted. In the proposed monograph published in *PF* 25(4), the acceptance criteria of this test were not more than 2.0% of any individual impurity and not more than 6.0% of total impurities. It was suggested that the requirement of the individual impurity should be removed because of lack of appropriate resolution of the desamido peak from its adjacent peak and because multiple desamido peaks overlap with other impurities. Deleting the requirement for any individual impurity also is consistent with the somatropin monograph in the *European Pharmacopeia* (*EP*).
   - The system suitability requirement in terms of an absolute retention time of the somatropin peak is deleted. In the proposed monograph published in *PF* 25(4), a retention time for the somatropin peak between 30.0 and 36.6 minutes was suggested as part of the system suitability requirement. However, because the absolute retention time can vary significantly from column to column, an absolute retention time is inappropriate as a system suitability requirement. An evaluation in the USP laboratory supports this observation. It was shown that when L26 columns from different manufacturers were used, there

was a significant variation in the retention time, with values extending beyond the limits specified in the proposed monograph (30.0–36.6 minutes). However, it is desirable that the system suitability should include acceptance criteria in terms of a relative retention time of the somatropin peak either with respect to an internal or an external standard. The manufacturers are encouraged to submit proposals for such a revision.

4. **Cell proliferation bioactivity test**
The *Cell proliferation* test is deleted.
   - The proposed monograph published in *PF* 25(4) included the cell proliferation test as one of the bioactivity tests, which requires the use of cells that were specially made for the test by genetic engineering . To obtain those cells, the manufacturers would have to sign a restricted-use agreement with USP. The company that developed the cells for this assay for USP required USP to set the condition that USP would make the cells available only to those manufacturers who would sign such an agreement. Many manufacturers of somatropin informed USP that signing such an agreement is inappropriate and might be detrimental to their business interest. Accordingly, USP proposed to withdraw the *Cell proliferation* test as one of the bioactivity tests.
   - On the basis of the results of an international collaborative study (European Pharmacopoeia Commission. *Pharmeuropa,* Vol. 3, Special Issue, March 1991), in 1993, the bioassays were deleted from the *EP* somatropin monograph. The study showed that the bioassay could be removed from the monograph without compromising the safety and quality of the product. The study concluded, "the in-vivo bioassay remains essential during product development and validation of the manufacturing process. However, once a manufacturing process and its product have been validated and shown to be consistent, then on-going batch testing and product monitoring to ensure safety and efficacy can be undertaken using a battery of physicochemical tests sufficient to guarantee identity, purity, and amount (vial content) within set specification limits." Such physicochemical procedures "include reverse-phase liquid chromatography and size-exclusion chromatography", and are included in the current revision.

5. **Rat weight-gain test**
In the Somatropin monograph published in *PF* 25(4), the rat weight-gain test was included as a bioactivity test. In the current proposal the test is proposed as a test for *Bioidentity.*
   - The data obtained from manufacturers indicate that the rat weight-gain test has significantly large variability. Thus, the test is not suitable as a bioactivity test. However, the test would be suitable as a bioidentity test.
   - Several manufacturers questioned the need for this test as a bioidentity test because it involves a significant amount of effort, not generally warranted for a bioidentity test. Unfortunately, at present, there is no good bioassay available for somatropin that can be used by everyone "without strings attached." Furthermore, the USP Biotechnology and Natural Therapeutics and Diagnostics Expert Committee determined that it would be inappropriate to have a growth hormone protein monograph without any test to ensure that it is biologically active. However, the manufacturers are not required to perform the test on every lot, provided that lot-to-lot consistency has been demonstrated through adequate historical data and through process validation (see *General Notices*).

6. **USP Reference standards**
The requirement of USP F1 Cells for Cell Proliferation Test RS is deleted because this Reference Standard was related to the test for *Cell proliferation*, which is no longer in the new proposal.

7. **Assay**
   - The system suitability requirement in terms of an absolute retention time of the somatropin peak is deleted. The proposed monograph published in *PF* 25(4) suggested a retention time for the somatropin peak between 12 and 17 minutes as part of the system suitability requirement. This requirement is deleted for reasons similar to those described above under *Chromatographic purity* test.
   - The word "potency" is changed to "quantity". The assay procedure is physicochemical, i.e., it measures the "quantity" of somatropin in mg, not its bioactivity. On the other hand, "potency" is related to bioactivity and is measured in USP Somatropin Units (or in IU of Somatropin). However, as mentioned above under the *Cell proliferation bioactivity test,* the *Assay* correlates to the bioactivity, that is, potency, of somatropin.

» Somatropin is a protein hormone consisting of 191 amino acid residues, and its structure corresponds to the major component of the growth hormone extracted from human pituitary glands. It is produced by methods based on recombinant DNA technology. When prepared as a lyophilized powder, it contains not less than 910 µg of somatropin per mg, calculated on the anhydrous basis. When prepared as a bulk solution, it contains not less than 910 µg of somatropin per mg of total protein. The presence of host-cell DNA and host-cell protein impurities in Somatropin is process specific—the limits of these impurities are determined by validated methods. Manufacturers must exhibit a

correlation between the *Assay* and a validated and approved growth-promotion based bioassay. It may contain excipients. [NOTE—One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

Packaging and storage—Preserve in tight containers, and store between –10° and –25°.

Labeling—The labeling states that the material is of recombinant DNA origin.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Somatropin RS.*

Identification—

A: Proceed as directed in the test for *Chromatographic purity,* except to prepare a *Standard solution* by reconstituting a vial of USP Somatropin RS with the *Diluent* to obtain a solution having a known concentration of about 2.0 mg per mL. Chromatograph the *Standard solution* and the *Test solution* as directed for *Procedure:* the retention time of the somatropin peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*.

B: *Peptide Mapping* (see *Biotechnology-Derived Articles—Tests* ⟨1047⟩)—

Solution A—Prepare a filtered and degassed solution of trifluoroacetic acid in water (1 in 1000, v/v).

Solution B—Transfer 100 mL of water to a 1000-mL volumetric flask, add 1 mL of trifluoroacetic acid, dilute with acetonitrile to volume, and mix.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Tris buffer—Prepare a 0.05 M solution of tris(hydroxymethyl)aminomethane (Tris), and adjust with hydrochloric acid to a pH of 7.5.

Trypsin solution—Prepare a solution containing 1 mg of trypsin per mL of *Tris buffer,* and mix. Store in a freezer, if necessary.

Standard solution—Prepare a solution containing 2.0 mg of USP Somatropin RS per mL of the *Tris buffer,* and mix. Add 1 mL of this solution to a suitable tube, and add 30 µL of *Trypsin solution*. Cap the tube, and place it in a water bath at 37° for 4 hours. [NOTE—If this solution is not injected immediately, store it in a freezer.]

Test solution—Prepare a solution containing 2.0 mg of Somatropin per mL of *Tris buffer,* and mix. Add 1 mL of this solution to a suitable tube, and add 30 µL of *Trypsin solution.* Cap the tube, and place it in a water bath at 37° for 4 hours. [NOTE—If this solution is not injected immediately, store it in a freezer.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is 1 mL per minute and the column temperature is maintained at 30°. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0→20	100→80	0→20	Linear gradient
20→40	80→75	20→25	Linear gradient
40→65	75→50	25→50	Linear gradient
65→70	50→20	50→80	Linear gradient
70→71	20→100	80→0	Linear gradient
71→86	100	0	Isocratic, re-equilibration

In-Process Revision

Procedure—[NOTE—Condition the chromatographic system by running a blank gradient program prior to injecting the digests.] Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution,* and record the chromatograms: the chromatographic profile of the *Test solution* is similar to that of the *Standard solution*.

Bioidentity—

Buffer solution—Prepare a solution of 0.1 M ammonium bicarbonate, and adjust with sodium hydroxide to a pH of 8.0.

Standard solutions—Transfer accurately weighed quantities of USP Somatropin RS, and dissolve in and dilute quantitatively with *Buffer solution* to obtain solutions having known concentrations between 10 and 100 µg per mL.

Test solutions—Transfer accurately weighed amounts of Somatropin, and dissolve in and dilute quantitatively with *Buffer solution* to obtain solutions with concentrations similar to those of the *Standard solutions*. [NOTE—Do not agitate while mixing; swirl gently.]

Control solution—Use the *Buffer solution*.

Test animals—Select an appropriate number of only female or only male Sprague Dawley rats hypophysectomized at 25 to 30 days of age. After hypophysectomization, feed the rats on rat chow and 5% sucrose water for at least 72 hours. After 72 hours, feed the rats on rat chow and filtered and deionized water adjusted with 1 N hydrochloric acid to a pH of 3.0 ± 0.25. Weigh the rats when they are 37 to 44 days old, and retain only healthy rats. Reweigh the remaining rats 7 days later, and use only those rats that are in good health and have not gained or lost more than 10% of their body weight in the previous 7-day period.

Procedure— Randomly divide the rats into Control, Standard, and Test groups, each group containing approximately 10 rats. Each day for 10 days inject subcutaneously 0.1 mL of the *Control solution, Standard solutions,* and *Test solutions* to the Control, Standard, and Test groups, respectively. Record the body weight of each animal at the start of the test and at approximately 18 hours following the 10th injection. Determine the change in body weight for each rat during the 10-day period, and compute the potency of the *Test solution* relative to that of the *Standard solution* using appropriate statistical analysis. Calculate the mean potency in USP Somatropin Units per mg: not less than 2 USP Somatropin Units per mg is found. Using appropriate statistical methods, calculate the width, *L,* of a 95% confidence interval for the estimated logarithm of the relative potency: *L* is not more than 0.40, which corresponds to confidence limits between 63% and 158% of the calculated potency. If *L* is more than 0.40, repeat the test until the results from two or more tests, combined by appropriate statistical methods, meet this criterion.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 300 per g, the test being performed on about 0.2 to 0.3 g of powder, accurately weighed.

Bacterial endotoxins ⟨85⟩—It contains not more than 10 USP Endotoxin Units per mg.

Water, *Method Ic* ⟨921⟩: not more than 10%, when prepared as a lyophilized powder.

Chromatographic purity—

Diluent—Prepare a solution of 0.05 M Tris in water, and adjust with hydrochloric acid to a pH of 7.5.

Mobile phase—Degas the *Diluent,* mix with *n*-propyl alcohol (71:29, v/v), and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution of 2.0 mg of Somatropin per mL of the *Diluent,* pass through a filter to sterilize or add sodium azide to a final concentration of 0.01%, and allow to stand at room temperature for 24 hours. [NOTE—Use within 48 hours after preparation, or store the solution in a refrigerator until ready to use.]

In-Process Revision

Test solution—Prepare a solution of 2.0 mg of Somatropin per mL of the *Diluent* immediately before use.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L26 and is maintained at 45°. The flow rate is about 0.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the tailing factor of the somatropin peak (major peak) is between 0.9 and 1.8; and the resolution, *R,* between the somatropin peak and its adjacent peak is not less than 1.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution,* record the chromatograms, and measure the area of the major peak. Calculate the percentage of impurities in Somatropin by the formula:

$$100A_I/(A_I + A_S),$$

in which A_I is the sum total of the responses of all peaks, other than the somatropin peak (major peak) and disregarding any peak due to the solvent; and A_S is the response of the somatropin peak: not more than 6.0% of total impurities is found.

Limit of high molecular weight proteins—

Phosphate buffer, Mobile phase, Diluent, Resolution solution, Test solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Procedure—Inject about 20 µL of the *Test solution*. Record the chromatogram, and measure the areas of the main peak and of the peaks eluting prior to the main peak, excluding the solvent peaks. Calculate the percentage of high molecular weight proteins in the portion of Somatropin taken by the formula:

$$100A_H/(A_H + A_M),$$

in which A_H is the sum total of the areas of the high molecular weight peaks, and A_M is the area of the monomer peak in the chromatogram of the *Test solution:* not more than 4% of high molecular weight proteins is found.

Total protein (see *Spectrophotometry and Light-Scattering* ⟨851⟩)—

Phosphate buffer—Prepare a 0.025 M solution of monobasic potassium phosphate in water, and adjust with sodium hydroxide to a pH of 7.0.

Test solution—Dissolve an accurately weighed quantity of Somatropin in *Phosphate buffer* to obtain a solution having an absorbance value between 0.5 and 1.0 at the wavelength of maximum absorbance at about 280 nm.

Procedure—Determine the absorbance of the *Test solution* using a spectrophotometric cell of path length 1-cm, at the wavelength of maximum absorbance at around 280 nm and at 320 nm, using *Phosphate buffer* as the blank. Calculate the protein content, in mg, in the portion of Somatropin taken by the formula:

$$V(A_{max} - A_{320})/0.82,$$

in which V is the volume of the *Test solution;* and A_{max} and A_{320} are the absorbance values of the *Test solution* at the wavelength of maximum absorbance and at 320 nm, respectively.

Assay—

Phosphate buffer—Prepare a 0.063 M solution of monobasic potassium phosphate in water, and adjust with sodium hydroxide to a pH of 7.0.

Mobile phase—Prepare a filtered and degassed mixture of the *Phosphate buffer* and isopropyl alcohol (97:3, v/v). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a 0.025 M solution by dissolving monobasic potassium phosphate in water and adjusting with sodium hydroxide to a pH of 7.0.

In-Process Revision

Resolution solution—Place one vial of USP Somatropin RS in an oven at 50° for 12 to 24 hours. Remove from the oven, and dissolve the contents of the vial in *Diluent* to obtain a solution of known concentration of about 1 mg per mL and the content of the dimer between 1% and 2%.

Standard preparation—Reconstitute a vial of USP Somatropin RS with the *Diluent* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Somatropin in *Diluent* to obtain a solution having a concentration of about 1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 7.8-mm × 30-cm column that contains packing L33 and is maintained at ambient temperature. The flow rate is 0.6 mL per minute. Chromatograph the *Resolution solution* as directed for *Procedure:* the tailing factor of the monomer peak (major peak) is not more than 1.7; and the resolution, *R* (determined as the ratio of the valley height, between the dimer and the monomer, and the dimer peak height) is not more than 0.4.

Procedure—Separately inject equal volumes (about 20 µL) of the the *Standard preparation* and the *Assay preparation*, record the chromatograms for not less than twice the retention time of somatropin monomer peak (major peak), and measure the peak responses for the monomer. Calculate the quantity of somatropin, in µg per mg, of total protein, by the formula:

$$P(C_S / C_U)(r_U / r_S),$$

in which P is the quantity of somatropin, in µg per mg, of USP Somatropin RS; C_S and C_U are the total protein concentrations, in mg per mL, of the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses of the monomer in the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Somatropin for Injection—See briefing under *Somatropin*. The proposed monograph is revised on the basis of the comments received in response to the previously published monograph (now canceled). The revisions and justifications are summarized below.

1. **Chromatographic purity**
   The requirement for a limit for any individual impurity is deleted. In the proposed monograph published in *PF* 25(4), the acceptance criteria of this test were not more than 2.0% of any individual impurity and not more than 6.0% of total impurities. It was suggested that the requirement of the individual impurity should be removed because of lack of appropriate resolution of the desamido peak from its adjacent peak and because multiple desamido peaks overlap with other impurities. Deleting the requirement for any individual impurity also is consistent with the somatropin monograph in the *European Pharmacopeia* (*EP*).
2. **Bioactivity test**
   Both Bioactivity tests (the *Cell proliferation* test and the *Rat weight-gain* test) are deleted. However, whereas the rat weight-gain test is included in the *Somatropin* monograph as a *Bioidentity* test, it is considered unnecessary for the Injection because it is not necessary to repeat an identity test for a product derived from the same drug substance.
3. **USP Reference standards**
   The requirement of USP F1 Cells for Cell Proliferation Test RS is deleted because this Reference Standard was related to the test for *Cell proliferation*, which is no longer in the new proposal.
4. **Assay**
   The word "potency" is changed to "quantity". The assay procedure is physicochemical, which measures the "quantity" of somatropin, in mg, not its bioactivity. On the other hand, the "potency" is related to its bioactivity and is measured in USP Somatropin Units (or in IU of Somatropin). However, as mentioned in the *Cell proliferation bioactivity* test under *Somatropin* the *Assay* correlates to the bioactivity, that is, potency, of somatropin.

(BNT: L. Bhattacharyya) RTS—40030-1

Add the following:

■Somatropin for Injection

» Somatropin for Injection is a sterile, lyophilized mixture of Somatropin with one or more suitable buffering and stabilizing agents. It contains not less than 89.0 percent and not more than 110.0 percent of the amount of somatropin stated on the label.

In-Process Revision

NOTE—One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.

Packaging and storage—Preserve in tight containers, and store between 2° and 8°.

Labeling—The labeling states that the material is of recombinant DNA origin.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Somatropin RS.*

Identification—It meets the requirements for *Identification* test *A* under *Somatropin*.

Bacterial endotoxins ⟨85⟩—It contains not more than 20 USP Endotoxin Units per mg of somatropin.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

Chromatographic purity—Proceed as directed in the *Chromatographic purity* test under *Somatropin:* not more than 12% of total impurities is found.

Limit of high molecular weight proteins—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Somatropin,* except to use the *Assay preparation* as the *Test solution:* not more than 6% of high molecular weight proteins is found.

Assay—

Phosphate buffer, Mobile phase, Diluent, Resolution solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Somatropin*.

Assay preparation—Dissolve a suitable number of vials in *Diluent* to obtain a concentration of 1 mg of somatropin per mL.

Procedure—Proceed as directed under *Somatropin*. Calculate the quantity of Somatropin, in mg, of somatropin per vial by the formula:

$$(PC_S / 1000)(V/N)(r_U / r_S),$$

in which P is the quantity of somatropin, in µg per mg, of USP Somatropin RS; C_S is the concentration, in mg per mL, of the *Standard preparation; V* is the total volume of the *Assay preparation; N* is the number of vials used to obtain the *Assay preparation;* and r_U and r_S are the peak responses of the monomer in the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Succinylcholine Chloride, *USP 26* page 1716 and page 1580 of *PF* 29(5) [Sept.–Oct. 2003]. It is proposed to replace the current test for *Chromatographic purity* with two HPLC procedures: *Test 1* uses reverse phase HPLC for the quantitation of succinylmonocholine, succinic acid, and unspecified impurities; *Test 2* uses ion chromatography for the quantitation of choline and unspecified impurities. These HPLC procedures are quantitative and selective, and provide a more accurate determination of impurities than that provided by the current thin-layer chromatographic procedure. The validation data for *Test 1* and *Test 2* were obtained using Alltima C18 and Waters X-terra MS C18 brands of L1 column, respectively. The retention times for succinylcholine chloride are about 22 minutes for *Test 1* and about 8 minutes for *Test 2*. To support *Test 2,* it is proposed to revise the *Reference standards* section to add USP Choline Chloride RS. A minor change to the note in the *Assay* is also proposed, indicating that rinsing the system with water is advisable. In addition, minor editorial style changes have been made.

In-Process Revision

USP Endotoxin RS. USP Succinylcholine Chloride RS. USP Succinylmonocholine Chloride RS.

Change to read:

Chromatographic purity—

~~*Standard solution*—Transfer 18.75 mg each of choline chloride and USP Succinylmonocholine Chloride RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 40 mL of methanol, dilute with methanol to volume, and mix.~~

~~*Diluted standard solution*—Transfer 4.0 mL of *Standard solution* to a 10-mL volumetric flask, dilute with methanol to volume, and mix.~~

~~*Test solution*—Prepare, immediately prior to use, a solution of Succinylcholine Chloride in methanol having a known concentration of about 50 mg per mL.~~

~~*Procedure*—Separately apply 2 µL of the *Test solution, Standard solution, and Diluted standard solution* to a suitable high-performance 10- × 10-cm thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.10-mm layer of chromatographic cellulose. Allow the spots to dry, and immediately place the plate, its coated surface toward the nearer wall, in the dry trough of a twin-trough chromatographic chamber whose other trough contains a solvent system consisting of the upper layer of a mixture of butyl alcohol, water, and 96% formic acid (65:35:15) that has been shaken and allowed to stand for 24 hours until the phases have separated. Equilibrate the chromatographic chamber for 30 minutes, and tilt the chamber to introduce the developing solvent into the trough containing the plate. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate, remove the plate from the developing chamber, quickly and thoroughly evaporate the solvent with the aid of a current of air, and dry at 105° for 15 minutes. [NOTE—During the drying, support the plate in such a manner that only the upper and lower edges of the plate, outside the chromatographic zone, are in direct contact with any heated surface.] Spray the plate with potassium iodoplatinate TS, dry at 105° for about 2 minutes, and allow to cool to room temperature: any spots from the *Test solution* are not greater in size or intensity than the spots, occurring at the respective R_f values (approximately 0.4 for succinylmonocholine chloride, and 0.3 for choline chloride), produced by 2 µL of the *Standard solution,* corresponding to 0.75% of each compound. Estimate the size and intensities of any other spots detected by comparison with the spots produced by succinylmonocholine chloride in the *Standard solution* and in the *Diluted standard solution.* The total of any such spots detected is not more than 1.5%.~~

■TEST 1—

Buffer solution—Prepare a solution in water containing 3.85 g per liter of 1-pentanesulfonic acid, 2.9 g per liter of sodium chloride, and 1% (v/v) of 1 N sulfuric acid.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (5:95).

System suitability solution—Dissolve accurately weighed quantities of citric acid and succinic acid in *Mobile phase* to obtain a solution containing about 0.5 mg of each per mL .

Standard solution—Dissolve an accurately weighed quantity of USP Succinylmonocholine Chloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Test solution—Transfer about 100 mg of Succinylcholine Chloride, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Samples are maintained at a temperature of about 4° during the analysis. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.22 for succinic acid, 0.32 for the doublet of peaks quantitated as a single component, 0.49 for succinylmonocholine chloride, and 1.0 for succinylcholine chloride; the resolution, *R,* between citric acid and succinic acid is not less than 2.9; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Begin integration after the edetate disodium peak (retention time is about 3.5 minutes). Calculate the percentage of each impurity in the portion of Succinylcholine Chloride taken by the formula:

$$10C(r_i / r_S)F,$$

in which C is the concentration, in mg per mL, of USP Succinylcholine Chloride RS in the *Standard solution;* r_i is the peak area for each impurity obtained from the *Test solution;* r_S is the succinylmonocholine chloride peak area obtained from the *Standard solution;* and F is the response factor (0.63 for succinic acid): not more than 0.1% of succinic acid

In-Process Revision

is found; not more than 0.4% of the doublet of peaks quantitated as a single component is found; not more than 0.4% of succinylmonocholine chloride is found; and not more than 0.2% of any other individual impurity is found.

TEST 2 (LIMIT OF CHOLINE)—

Solution A—Prepare a solution in water containing 5% (v/v) of acetonitrile and 5% (w/v) of 0.1 M 1-hexanesulfonic acid.

Solution B—Prepare a solution of acetonitrile and water (1:1).

Mobile phase—Use variable amounts of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS and sodium chloride in water and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.05 mg per mL and 0.5 mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.5 mg per mL.

Standard solution—Dilute 1 mL of the *Standard stock solution* with water to 50 mL.

Test solution—Transfer an accurately weighed quantity of Succinylcholine Chloride, about 50 mg, to a 25-mL flask. Dissolve in and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a cation self-regenerating suppressor, a conductivity detector at 30 µS and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The eluant flow is about 1 mL per minute and the regenerant flow is about 10 mL per minute at 50 mA output. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–16	100→0	0→100	linear gradient
16–25	0	100	isocratic
25–27	0→100	100→0	linear gradient
27–40	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the sodium and choline peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of choline in the portion of Succinylcholine Chloride taken by the formula:

$$37.5C(r_C / r_S),$$

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* and r_C and r_S are the choline peak areas obtained from the *Test solution* and *Standard solution,* respectively: not more than 0.3% of choline is found. Calculate the percentage of any other impurity present by the formula:

$$50C(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_S is the choline peak area obtained from the *Standard solution:* not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being added.■2S (*USP27*)

In-Process Revision

Change to read:

Assay—[NOTE—Since the *Mobile phase* employed in this procedure has a fairly high concentration of chloride ion and a low pH, it ~~may be~~

■is■2S (*USP27*)
advisable to rinse the entire system with water following the use of this *Mobile phase.*]

Mobile phase—Prepare a 1 in 10 solution of 1 N aqueous tetramethylammonium chloride in methanol. Filter this solution through a 0.45-µm membrane filter, and adjust with hydrochloric acid to a pH of about 3.0.

Standard preparation—Transfer about 88 mg of USP Succinylcholine Chloride RS, accurately weighed, to a 10-mL volumetric flask, add 4.0 mL of water, and dilute with *Mobile phase* to volume while mixing. Prepare the *Standard preparation* concurrently with the *Assay preparation.*

Assay preparation—Transfer about 88 mg of Succinylcholine Chloride, accurately weighed, to a 10-mL volumetric flask, add 4.0 mL of water, and dilute with *Mobile phase* to volume while mixing.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4-mm × 25-cm column that contains packing L3. The flow rate is about 0.75 mL per minute. Chromatograph five replicate injections of the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not greater than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{14}H_{30}Cl_2N_2O_4$ in the Succinylcholine Chloride taken by the formula:

$$10C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of anhydrous succinylcholine chloride in the *Standard preparation,* as determined from the concentration of USP Succinylcholine Chloride RS corrected for moisture content by a titrimetric water determination; r_U is the peak response obtained from the *Assay preparation;* and r_S is the average peak response obtained from the *Standard preparation.*

BRIEFING

Succinylcholine Chloride for Injection, *USP 26* page 1718. It is proposed to revise the test for *Chromatographic purity* to incorporate the thin-layer chromatographic procedure from the monograph for *Succinylcholine Chloride*. The current cross-reference is obsolete due to a pending revision to the *Succinylcholine Chloride* monograph.

(PA1: K. Russo) RTS—40374-1

***See* Thiabendazole Chewable Tablets**

BRIEFING

Thiabendazole Chewable Tablets—See briefing under *Alumina, Magnesia, and Calcium Carbonate Tablets.*

(NL: C. Barnstein; W. Paul) RTS—40432-1

Add the following:

■Thiabendazole Chewable Tablets

(Monograph under this new title—to become official February 1, 2007)
(Current monograph title is Thiabendazole Tablets)

» Thiabendazole Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{10}H_7N_3S$.

Packaging and storage—Preserve in tight containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before swallowing.

USP Reference standards ⟨11⟩—*USP Thiabendazole RS.*

Identification—

A: Triturate a quantity of powdered Chewable Tablets, equivalent to about 0.5 g of thiabendazole, with about 20 mL of water, and filter. Wash the residue with 20 mL of water, discard the washing, dissolve the residue in 30 mL of 0.1 N hydrochloric acid, and filter. Collect the filtrate in a separator, render it alkaline with 1 N sodium hydroxide, and extract with 10 mL of carbon disulfide. Filter the carbon disulfide layer through a dry filter, collecting the filtrate in an evaporating dish. Evaporate the solvent with the aid of gentle heat and a stream of nitrogen. [*Caution—Do not overheat the residue*.] The residue so obtained responds to *Identification* test *A* under *Thiabendazole*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Standard preparation—Dissolve an accurately weighed quantity of USP Thiabendazole RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 5 µg per mL.

Test preparation—Transfer 1 Chewable Tablet to a 1000-mL volumetric flask, add about 75 mL of 0.1 N hydrochloric acid, and heat on a steam bath for about 1 hour. Cool to room temperature, dilute with 0.1 N hydrochloric acid to volume, mix, and filter a portion of the solution, discarding the first 20 mL of the filtrate. Pipet 5 mL of the filtrate into a 500-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Test preparation* at the wavelength of maximum absorbance at about 302 nm, with

a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{10}H_7N_3S$ in the Chewable Tablet taken by the formula:

$$(TC/D)(A_U/A_S),$$

in which T is the labeled quantity, in mg, of thiabendazole in the Chewable Tablet; C is the concentration, in µg per mL, of USP Thiabendazole RS in the *Standard preparation; D* is the concentration, in µg per mL, of thiabendazole in the *Test preparation,* based upon the labeled quantity per Chewable Tablet and the extent of dilution; and A_U and A_S are the absorbances of the *Test preparation* and the *Standard preparation,* respectively.

Assay—

Standard preparation and *Chromatographic system*—Prepare as directed in the *Assay* under *Thiabendazole Oral Suspension*.

pH 3.5 Phosphate buffer—Dissolve 13.8 g of monobasic sodium phosphate in water to obtain 2000 mL of solution. Adjust this solution with phosphoric acid to a pH of 3.5 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.5 Phosphate buffer* and methanol (54:46). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Assay preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of thiabendazole, to a 1000-mL volumetric flask, add 100 mL of 0.1 N hydrochloric acid, mix, and warm the solution for a minimum of 30 minutes. Allow to cool to room temperature, dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Thiabendazole Oral Suspension*. Calculate the quantity, in mg, of $C_{10}H_7N_3S$ in the portion of Chewable Tablets taken by the formula:

$$1000C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Thiabendazole RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

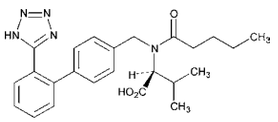
Valsartan, page 1590 of *PF* 29(5) [Sept.–Oct., 2003]. This new monograph is presented again with additional changes. Detector wavelengths are changed in *Related compounds Test 1* and in the *Assay.* The *Standard solution* in *Test 1* is also corrected.

(PA5: A. Wilk) RTS—40405-1

Add the following:

■Valsartan



$C_{24}H_{29}N_5O_3$ ~~435.53~~ 435.52

L-Valine, *N*-(1-oxopentyl)-*N*-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl].

N-[*p*-(*o*-1*H*-Tetrazol-5-yl-phenyl)benzyl]-*N*-valeryl-L-valine [*137862-53-4*].

» Valsartan contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{29}N_5O_3$, calculated on the anhydrous basis.

In-Process Revision

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at 25°; excursions are permitted between 15° and 30°. Protect from moisture and heat.

USP Reference standards ⟨11⟩—*USP Valsartan RS. USP Valsartan Related Compound A RS. USP Valsartan Related Compound B RS. USP Valsartan Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Absorbance: not more than ~~0.070~~ 0.07, determined at 420 nm, in a 4-cm cell, on a solution prepared by dissolving 1 g in 20 mL of methanol.

~~**Specific rotation** ⟨781S⟩: between −64° and −69° at 20°.~~

~~*Test solution:* 10 mg per mL, in methanol.~~

Water, *Method I* ⟨921⟩: not more than 2.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Related compounds—

TEST 1 (LIMIT OF VALSARTAN RELATED COMPOUND A)—

~~*0.07 M Phosphate buffer solution*—Dissolve 10.99 g of dibasic sodium phosphate and 3.81 g of monobasic potassium phosphate in water, dilute with water to 1000 mL, and mix.~~

Mobile phase—Prepare a ~~filtered and degassed~~ mixture of ~~*0.07 M Phosphate buffer solution* and isopropyl alcohol (98:2).~~ *n*-hexane, 2-propanol, and trifluoroacetic acid (85:15:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—~~Pipet 5.0 mL of *System suitability solution* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Dissolve an accurately weighed quantity of USP Valsartan Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.003 mg of valsartan related compound A per mL.~~ Transfer about 5 mg of USP Valsartan Related Compound A RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard solution—Transfer 1.0 mL of *Standard stock solution* into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix. ~~Transfer 1.0 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix.~~

System suitability solution—~~Transfer about 30 mg of USP Valsartan Related Compound A, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume (*Solution 1*). Transfer about 15 mg of USP Valsartan RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in *Mobile phase*. Add, by pipetting, 10.0 mL of *Solution 1* to the same flask, dilute with *Mobile phase* to volume, and mix. Dissolve accurately weighed quantities of USP Valsartan RS and USP Valsartan Related Compound A RS in *Mobile phase,* serially diluting, if necessary, to obtain a solution having a known concentration of about 0.15 mg of valsartan per mL and about 0.003 mg of valsartan related compound A per mL.~~ Transfer about 1 mg of Valsartan, accurately weighed, to a ~~20-mL~~ 25-mL volumetric flask, add 10 mL of the *Standard stock solution,* and dissolve in and dilute with *Mobile phase* to volume.

Test solution—~~Transfer about 100 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Transfer about 50

In-Process Revision

mg of Valsartan, accurately weighed, to a 50-mL volumetric flask, add about 40 mL of *Mobile phase,* and sonicate for 5 minutes. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~227-nm 220-nm~~ 230-nm detector and a ~~4.0-mm × 10-cm~~ 4.6-mm × 25-cm column that contains 5-µm packing ~~L41~~ L40. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.60 for valsartan related compound A and 1.0 for valsartan; the ratio of the height between the baseline and the lowest point between the valsartan and valsartan related compound A peaks to the height of the valsartan related compound A peak is not more than 0.4. and~~ the resolution, *R,* between valsartan related compound A and valsartan is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan related compound A peaks, for replicate injections is not more than ~~15.0%~~ 5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ~~heights~~ areas for the major peaks. Calculate the percentage of valsartan related compound A in the portion of Valsartan taken by the formula:

~~$100(r_U/r_S),$~~

~~in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.5% is found.~~

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Valsartan Related Compound A RS in the *Standard solution;* C_U is the concentration, in mg per mL, of valsartan in the *Test solution;* and r_U and r_S are the peak responses for valsartan related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than ~~1.5%~~ 1.0% is found.

TEST 2 (LIMIT OF VALSARTAN RELATED COMPOUND B, VALSARTAN RELATED COMPOUND C, AND OTHER RELATED COMPOUNDS)—

~~*Diluent* and~~ *Mobile phase*—Proceed as directed in the *Assay.*

~~*Standard stock solution A*—Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase* to obtain a solution having a known concentration of about 5 mg per mL.~~

~~*Standard stock solution B*—Dissolve an accurately weighed quantity of USP Valsartan Related Compound B RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.05 mg per mL.~~

~~*Standard stock solution C*—Dissolve an accurately weighed quantity of USP Valsartan Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL.~~

Resolution solution—~~Pipet 10.0 mL of *Standard stock solution A,* 5.0 mL of *Standard stock solution B,* and 2.0 mL of *Standard stock solution C* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Dissolve accurately weighed quantities of USP Valsartan RS, USP Valsartan Related Compound B RS, and USP Valsartan Related Compound C RS in *Mobile phase,* serially diluting if necessary, to obtain a solution having known concentrations of about ~~0.5 mg~~ 0.001 mg of valsartan per mL, ~~0.0025 mg~~ 0.001 mg of valsartan related compound B per mL, and ~~0.0005 mg~~ 0.001 mg of valsartan related compound C per mL.

In-Process Revision

Standard solution—~~Dilute an accurately measured volume of *Standard stock solution A* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.0005 mg per mL.~~ Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about ~~0.0005 mg~~ 0.001 mg of valsartan per mL.

Test solution—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay,* except to use a 225-nm detector. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.73 for valsartan related compound B, 1.0 for valsartan, and 3.8 for valsartan related compound C;~~ the resolution, *R,* between valsartan related compound B and valsartan is not less than 1.8; and the relative standard deviation, determined from the valsartan related compound B peaks, for replicate injections is not more than ~~5.0%~~ 10.0%, and the relative standard deviation, determined from the valsartan peaks, for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Resolution solution, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of ~~each impurity~~ valsartan related compound B and valsartan related compound C in the portion of Valsartan taken by the formula:

~~$100(Dr_i/r_u)$,~~

~~in which *D* is the factor due to the extent of dilution and is equal to 2.5 for valsartan related compound B, 0.5 for valsartan related compound C, and 0.05 for all other impurities; r_i is the peak response for each impurity obtained from the *Test solution;* and r_u is the peak response for valsartan related compound B or valsartan related compound C obtained from the *Resolution solution* or the valsartan peak response obtained from the *Standard solution,* as appropriate:~~

$$100(C_S/C_u)(r_i/r_S),$$

in which C_S is the concentration, in mg per mL, of the appropriate USP Valsartan Related Compound RS in the *Resolution solution;* C_u is the concentration, in mg per mL, of valsartan in the *Test solution;* r_i is the peak response for the impurity obtained from the *Test solution;* and r_S is the peak response for the appropriate valsartan related compound obtained from the *Resolution solution.* Calculate the percentage of each other impurity in the portion of Valsartan taken by the formula:

$$100(C_S/C_u)(r_i/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Valsartan RS in the *Standard solution;* r_S is the peak response for valsartan obtained from the *Standard solution;* and the other terms are as defined above: not more than ~~0.5%~~ 0.2% of valsartan related compound B is found; not more than 0.1% of valsartan related compound C is found; not more than 0.1% of any other individual impurity, excluding the valsartan related compound A, is found; ~~and not more than 0.5% of total impurities is found.~~ and not more than 0.3% of total impurities, excluding valsartan related compound A, is found.

Assay—

~~*Diluent*—Prepare a mixture of acetonitrile and water (1:1).~~

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (500:500:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about ~~0.05 mg~~ 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system—The liquid chromatograph is equipped with a ~~230-nm 248-nm~~ 273-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the tailing factor is between 0.8 and 1.5; and~~ the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{29}N_5O_3$ in the portion of Valsartan taken by the formula:

~~$1000C(r_U/r_S)$,~~

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Valsartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP27*)

BRIEFING

Valsartan and Hydrochlorothiazide Tablets, page 1954 of *PF* 29(5) [Sept.–Oct. 2003]. This monograph is presented again with additional changes. It is proposed to revise the test for *Related compounds* to remove valsartan related compound B from the impurity limit exclusion.

(PA5: A. Wilk) RTS—40406-1

Add the following:

■Valsartan and Hydrochlorothiazide Tablets

» Valsartan and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at 25°; excursions are permitted between 15° and 30°. Protect from moisture and heat.

USP Reference standards ⟨11⟩—~~*USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS.*~~ *USP Benzothiadiazine Related Compound A RS. USP Hydrochlorothiazide RS. USP Valsartan RS. USP Valsartan Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—To a centrifuge tube transfer an amount of ground Tablets, equivalent in weight to a single Tablet, add 2.0 mL of acetone, sonicate for 15 minutes, and centrifuge.

Application volume: 2 µL.

Developing solvent system: a mixture of ethyl acetate, dehydrated alcohol, and a solution (25 in 100) of ammonium hydroxide (8:2:1).

In-Process Revision

Procedure—Proceed as directed in the chapter, except to develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent system* for about 15 minutes prior to use. Allow the chromatogram to develop until the solvent front has moved at least 7 cm. After removing the plate and marking the solvent front, dry the plate under a current of warm air until it is completely dry. The R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45~~ 30 minutes.

Procedure—Determine the amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing UV absorption at the wavelengths of maximum absorbance at about 250 nm for valsartan ~~(corrected for interference from hydrochlorothiazide on the basis of the absorbances of hydrochlorothiazide at 250 and 272 nm)~~ and at about 272 nm for hydrochlorothiazide on filtered portions of the solution under test, ~~suitably diluted with *Dissolution Medium,* in comparison with a Standard solution having known concentrations of USP Valsartan RS and USP Hydrochlorothiazide RS in the same *Medium*~~ diluted with *Medium* if necessary. Calculate the quantity of $C_{24}H_{29}N_5O_3$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs}250}a_{\text{H}272}-A_{\text{obs}272}a_{\text{H}250}}{a_{\text{V}250}a_{\text{H}272}-a_{\text{V}272}a_{\text{H}250}}\right),$$

in which D is the sample dilution factor if used; $A_{\text{obs}250}$ is the observed absorbance of the sample solution at 250 nm; $A_{\text{obs}272}$ is the observed absorbance of the sample solution at 272 nm; $a_{\text{V}250}$ is the absorptivity of valsartan at 250 nm; $a_{\text{V}272}$ is the absorptivity of valsartan at 272 nm; $a_{\text{H}250}$ is the absorptivity of hydrochlorothiazide at 250 nm; and $a_{\text{H}272}$ is the absorptivity of hydrochlorothiazide at 272 nm. The absorptivities, *a,* are determined from separate Standard solutions of USP Valsartan RS and USP Hydrochlorothiazide RS in the *Medium* having known concentration and expressed in units as defined by *Spectrophotometry and Light-Scattering* ⟨851⟩. Calculate the quantity of $C_7H_8ClN_3O_4S_2$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs}272}a_{\text{V}250}-A_{\text{obs}250}a_{\text{V}272}}{a_{\text{V}250}a_{\text{H}272}-a_{\text{V}272}a_{\text{H}250}}\right),$$

in which the terms are as defined above.

Tolerances—Not less than ~~75%~~ 80% (Q) of the labeled amounts of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ is dissolved in ~~45~~ 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Diluent, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation* as prepared in the *Assay.*

In-Process Revision

Test solution—Place 1 Tablet in a 200-mL volumetric flask, add 5 mL of water, and allow to stand for 5 minutes. Add about 100 mL of *Diluent,* and sonicate for 15 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at about 3000 rpm. Quantitatively dilute a volume of the clear supernatant with *Diluent* to obtain a solution having a concentration of about 0.2 mg of valsartan per mL.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(LC_S / C_U)(r_U / r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in the Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Test solution,* based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—

Diluent, Solution A, Solution B, and *Mobile phase*—Prepare as directed in the *Assay.*

Standard stock solution—Dissolve accurately weighed quantities of ~~USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, USP Hydrochlorothiazide RS, USP Valsartan RS, and USP Valsartan Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.03 mg per mL, 0.06 mg per mL, 0.08 mg per mL, and 0.2 mg per mL, respectively.

Resolution solution—Dilute 5.0 mL of *Standard stock solution* with *Diluent* to 100.0 mL, and mix.

Standard solution—Dilute 10.0 mL of *Resolution solution* with *Diluent* to 100.0 mL, and mix.

Test solution—Use the *Assay preparation* as specified.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between valsartan related compound B and valsartan, and between ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A and hydrochlorothiazide is not less than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan and hydrochlorothiazide peaks, for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks, disregarding the peak, if any, with a retention time of about 22 minutes. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$2000C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of ~~USP Valsartan Related Compound B RS or USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, or the relevant USP Reference Standard (when determining the quantity of other impurities) in the *Standard solution;* and r_U and r_S are the corresponding peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~0.5%~~ 1.0% ~~each of valsartan related compound B and~~ of ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A is found; not more than 0.2% of any other impurity,

In-Process Revision

excluding valsartan related compound A ~~and valsartan related compound B~~, is found; and not more than ~~0.8%~~ 1.3% of total impurities, excluding valsartan related compound A ~~and valsartan related compound B~~, is found. [NOTE—Valsartan related compound A is the enantiomer of valsartan and coelutes with valsartan in this test.]

Assay—

Diluent—Prepare a mixture of acetonitrile and water (1:1).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (90:10:0.1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and trifluoroacetic acid (90:10:0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12.5 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask. Add about 12.5*J* mg of USP Valsartan RS, accurately weighed, *J* being the ratio of the labeled amount, in mg, of valsartan to the labeled amount, in mg, of hydrochlorothiazide per Tablet. Add about 100 mL of *Diluent,* sonicate for 15 minutes, dilute with *Diluent* to volume, and mix. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Quantitatively dilute a volume of this solution with *Diluent* to obtain a solution having a known concentration of about 0.2 mg of USP Valsartan RS per mL.

Assay preparation—Transfer a number of Tablets, equivalent to about 62.5 mg of hydrochlorothiazide, to a 250-mL volumetric flask. Add 5 mL of water, and allow to stand for 5 minutes. Then add about 100 mL of *Diluent,* sonicate for 15 minutes, and shake for 30 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at 3000 rpm. Dilute 25.0 mL of the clear supernatant with *Diluent* to 200.0 mL, and mix *(Solution 1).* [NOTE—Retain a portion of *Solution 1* to use as the *Test solution* in the test for *Related compounds*.] Dilute an accurately measured volume of *Solution 1* with *Diluent* to obtain a solution containing about 0.2 mg of valsartan per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	90→10	10→90	linear gradient
25–27	10→90	90→10	linear gradient
27–40	90	10	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$(LC_S / C_U)(r_U / r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in each Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Assay preparation,* based on the labeled quantity per Tablet and the extent of dilution;

In-Process Revision

and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Vasopressin, *USP 26* page 1923—See briefing under *Acepromazine Maleate*.

(BNT: I. DeVeau) RTS—40270-17

Add the following:

■**Labeling—**Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■2S (*USP27*)

USP Reference standards ⟨11⟩—

■*USP Endotoxin RS.*■2S (*USP27*)
USP Vasopressin RS.

Add the following:

■**Other requirements—**Where the label states that Vasopressin is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Vasopressin Injection*. Where the label states that Vasopressin must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Vasopressin Injection*.■2S (*USP27*)

BRIEFING

Vitamin A, *USP 26* page 1933. Because USP Vitamin A RS is now available in ampuls rather than soft gel capsules, it is proposed to replace the word "capsule" with "ampul" in the *Thin-Layer Chromatographic Identification Test*. In addition, the *Identification* test has been restyled to conform to current USP editorial style. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 27–NF 22,* with an official date of April 1, 2004.

(DSN: L. Evans) RTS—40298-1

Change to read:

Identification—

A: To 1 mL of a chloroform solution of it containing the equivalent of approximately 6 µg of retinol, add 10 mL of antimony trichloride TS: a transient blue color appears at once.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—*Test solution*—

FOR LIQUID FORM OF VITAMIN A—Dissolve a volume equivalent to about 15,000 USP Units in chloroform to obtain 10 mL of solution.

FOR SOLID FORM OF VITAMIN A—Weigh a quantity equivalent to about 15,000 USP Units, place in a separator, add 75 mL of water, shake vigorously for 1 minute, extract with 10 mL of chloroform by shaking for 1 minute, and centrifuge to clarify the chloroform extract.

Standard solution—Dissolve the contents of 1 ~~capsule~~ •ampul•2 of USP Vitamin A RS in chloroform to obtain 25.0 mL.

Developing solvent system: a mixture of cyclohexane and ether (4:1).

Procedure—Apply at the starting point of the chromatogram 0.015 mL of the *Standard solution* and 0.01 mL of the *Test solution,* and proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Allow the solvent front to move a distance of 10 cm, remove the plate, and air dry. Spray with phosphomolybdic acid TS: the blue-green spot formed is indicative of the presence of retinol. The approximate R_F values of the predominant spots, corresponding to the different forms of retinol, are 0.1 for the alcohol form, 0.45 for the acetate, and 0.7 for the palmitate.

BRIEFING

BRIEFING

Zileuton, page 3003 of the *First Supplement* and page 447 of *PF* 29(2) [Mar.–Apr. 2003]. It is proposed to add a *Note* to the procedures in the test for *Chromatographic purity* and in the *Assay* specifying that immediately after preparation and during analysis, solutions containing Zileuton should be stored at or below 5°. It is known that Zileuton degrades in solution at room temperature; refrigeration of solutions is necessary to ensure the accurate determination of impurity levels.

(PA1: K. Russo) RTS—39706-1

In-Process Revision

Change to read:

Packaging and storage—Preserve in tight, light-resistant containers,

▲and store at room temperature.▲*USP27*

Change to read:

Chromatographic purity—

■NOTE—For *Test 1* and *Test 2* the *System suitability solution, Standard solution,* and *Test solution* are to be refrigerated at or below 5° immediately after preparation and during analysis using a refrigerated autosampler. The solutions are stable at or below 5° for about 36 hours.■2S (*USP27*)

TEST 1—

Buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (82:18). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Zileuton RS and USP Zileuton Related Compound A RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 5 µg of each USP Reference Standard per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Zileuton RS in acetonitrile to obtain a solution having a known concentration of about 10 µg per mL.

Test solution—Transfer about 125 mg of Zileuton, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system—Prepare as directed in the *Assay,* except to use a flow rate of 2.2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between zileuton and zileuton related compound A is not less than 1.5; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Zileuton taken by the formula:

$$100F(C_S / C_U)(r_i / r_S),$$

in which F is the relative response factor for each impurity, which is 1.0 for any peak with a relative retention time of 0.5, 0.7, 1.2, 1.6, 3.2, or 3.4, and is 1.2, 1.4, and 1.7 for peaks with relative retention times of 0.8, 2.1, and 2.8, respectively; C_S is the concentration, in mg per mL, of USP Zileuton RS in the *Standard solution;* C_U is the concentration, in mg per mL, of zileuton in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for zileuton obtained from the *Standard solution:* not more than 0.1% of any individual impurity with a relative retention time of 0.7, 0.8, 1.6, 2.1, 3.2, or 3.4 is found; not more than 0.2% of any individual impurity with a relative retention time of 0.5 or 1.2 is found; and not more than 0.3% of any individual impurity with a relative retention time of 2.8 is found.

TEST 2—

Perchloric acid solution—Dissolve 5.0 mL of perchloric acid in 1000 mL of water.

Mobile phase—Prepare a filtered and degassed mixture of *Perchloric acid solution* and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Zileuton Related Compound B RS in acetonitrile to obtain a solution having a known concentration of about 0.25 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix.

System suitability solution—Dissolve an accurately weighed quantity of USP Zileuton Related Compound C RS in acetonitrile to obtain a solution having a known concentration of about 10 µg per mL. Transfer 5.0 mL of this solution and 5.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix.

Standard solution—Transfer 5.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix.

Test solution—Proceed as directed for *Test solution* under *Test 1.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between zileuton related compound B and zileuton related compound C is not less than 20. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Zileuton taken by the formula:

$$100(C_S / C_U)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Zileuton Related Compound B RS in the *Standard solution;* C_U is the concentration, in mg per mL, of zileuton in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for zileuton related compound B obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.7% of total impurities is found, the results for *Test 1* and *Test 2* being added.

Change to read:

Assay—

■NOTE—The *Standard preparation* and the *Assay preparation* are to be refrigerated at or below 5° immediately after preparation and during analysis using a refrigerated autosampler. The solutions are stable at or below 5° for about 36 hours.■2S (*USP27*)

Buffer solution—Dissolve 7.7 g of ammonium acetate and 0.25 g of acetohydroxamic acid in about 900 mL of water in a 1000-mL volumetric flask, adjust with perchloric acid to a pH of 2.0, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (72:28). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard preparation—Transfer about 30 mg of methylparaben, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Zileuton RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL.

Standard preparation—Transfer 5.0 mL of the *Standard stock preparation* and 4.0 mL of the *Internal standard preparation* to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix.

In-Process Revision

Assay preparation—Transfer about 100 mg of Zileuton, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution and 4.0 mL of the *Internal standard preparation* to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between zileuton and methylparaben is not less than 5.0; the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 0.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the quantity, in mg, of $C_{11}H_{12}N_2O_2S$ in the portion of Zileuton taken by the formula:

$$1000C(R_U / R_S),$$

in which C is the concentration, in mg per mL, of USP Zileuton RS in the *Standard preparation;* and R_U and R_S are the peak area ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 21* page 2679 and page 1088 of *PF* 29(4)) [July–Aug. 2003]. The proposed revisions complement the proposed new monographs *Carbomer Homopolymer* and *Ammonio Methacrylate Copolymer Dispersion,* which appear elsewhere in this number of *PF.*

MONOGRAPHS (NF)

BRIEFING

Ammonio Methacrylate Copolymer Dispersion, page 628 of *PF* 28(2) [Mar.–Apr. 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process* Revision. On the basis of comments received, the following changes have been included in the proposed monograph. A statement to include the use of antimicrobial preservatives and alkalizing agents is added to the Definition statement. A corresponding change is also made to the *Labeling* section. In the *Assay,* the following additional information is included for clarification: the initial temperature of the glacial acetic acid and the use of glacial acetic acid as the solvent to prepare the 0.6% cupric acetate solution.

(EMC: C. Sheehan; PSD: C. Okeke; NL: WL. Paul) RTS—37702-1

Add the following:

■Ammonio Methacrylate Copolymer Dispersion

» Ammonio Methacrylate Copolymer Dispersion is an aqueous dispersion of Ammonio Methacrylate Copolymer Type A or B in water. ~~It may contain surface-active agents.~~ It may contain suitable antimicrobial preservatives and alkalizing agents. The assay requirements differ for the two types, as set forth in the accompanying table.

	Ammonio methacrylate units, dried basis (%)	
Type	Min	Max
A	10.18	13.73
B	6.11	8.26

Packaging and storage—Preserve in tight containers, at a temperature not exceeding 25° for Type A, and not exceeding 30° for Type B. Protect from freezing.

Labeling—Label it to state whether it is Type A or Type B. Label it to indicate the name and quantity of any added antimicrobial preservative or alkalizing agent.

USP Reference standards ⟨11⟩—*USP Ammonio Methacrylate Copolymer Type A RS*. *USP Ammonio Methacrylate Copolymer Type B RS*.

Identification—

A: *Infrared Absorption* ⟨197K⟩—Proceed as directed, except to use the residue obtained in the test for *Loss on drying* as the test specimen.

B: It meets the requirements of the test for *Viscosity* and the *Assay.*

Viscosity ⟨911⟩—Use a viscosimeter equipped with a spindle having a cylinder 1.88 cm in diameter and 6.51 cm high attached to a shaft 0.32 cm in diameter. The distance from the top of the cylinder to the lower tip of the shaft is 0.75 cm, and the immersion depth is 8.15 cm. Adjust the temperature to 20 ± 0.10°. With the spindle rotating at 30 rpm, immediately record the scale reading. Multiply the scale reading by the constant for the viscosimeter spindle and speed employed, to obtain the viscosity in centipoises. The viscosity is not more than 100 centipoises.

Loss on drying ⟨731⟩—Dry it at 110° for 6 hours: it loses between 68.5% and 71.5% of its weight.

Residue on ignition ⟨281⟩—Using mild heating conditions (e.g., steam bath, sand bath, etc.) to avoid loss of material, evaporate the dispersion to dryness prior to ignition: not more than 0.5% of residue is obtained, calculated on the undried dispersion basis.

Limit of monomers—Proceed as directed in the test for *Limit of monomers* under *Ammonio Methacrylate Copolymer:* not more than 0.002% of methyl methacrylate and not more than 0.008% of ethyl acrylate are found.

Coagulum content—Accurately weigh a stainless steel sieve having 125-µm openings, and filter 100 g of Dispersion through it. Wash the sieve with distilled water until a clear filtrate is obtained, and dry the sieve to constant weight at 105°: the weight of the residue does not exceed 1000 mg (1%).

Assay—Dry under vacuum 2 g of Ammonio Methacrylate Copolymer Dispersion Type A, or 4 g of Ammonio Methacrylate Copolymer Dispersion Type B at 90° for 30 minutes. Dissolve in 75 mL of glacial acetic acid at about 50°, within about 30 minutes of drying. After the solution has cooled down, add 25 mL of 0.6% cupric acetate solution in glacial

In-Process Revision

acetic acid, and titrate with 0.1 N perchloric acid VS, determining the end point potentiometrically. Perform a blank titration, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.772 mg of ammonio methacrylate ($C_9H_{18}ClNO_2$) units.■2S (*NF22*)

BRIEFING

Carbomer 910, *NF 21* page 2704. It is proposed to delete this monograph because this product has been discontinued. See also the briefing under *Carbomer Homopolymer*.

(EMC: E. Gonikberg) RTS—39641-3

Delete the following:

■~~Carbomer 910~~

~~» Carbomer 910 is a high molecular weight polymer of acrylic acid cross-linked with allyl ethers of pentaerythritol. Carbomer 910, previously dried in vacuum at 80° for 1 hour, contains not less than 56.0 percent and not more than 68.0 percent of carboxylic acid (–COOH) groups. The viscosity of a neutralized 1.0 percent aqueous dispersion of Carbomer 910 is between 3000 and 7000 centipoises.~~

~~**Packaging and storage**—Preserve in tight containers.~~
~~**Labeling**—Label it to indicate that it is not intended for internal use.~~
~~**Viscosity**—Proceed as directed in the test for *Viscosity* under *Carbomer 934P*, except to perform the test on a 1.0% aqueous dispersion (prepared by using 5.00 g instead of 2.50 g) and to use a spindle having a disk 1.3 cm in diameter and 0.2 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the disk to the lower tip of the shaft being 2.4 cm and the immersion depth being 5 cm (No. 3 spindle). The viscosity is between 3000 and 7000 centipoises.~~
~~**Limit of benzene**—Proceed as directed in the test for *Limit of benzene* under *Carbomer 934P*, except to use about 20 mg of Carbomer 910, accurately weighed, instead of about 1 g of Carbomer 934P, to prepare the *Test solution*. Calculate the percentage of benzene in the portion of Carbomer 910 taken by the formula:~~

$$10(C/W)(r_U/r_S),$$

~~in which *C* is the concentration, in µg per mL, of benzene in the *Standard solution*, *W* is the weight, in mg, of Carbomer 910 taken to prepare the *Test solution*, and r_U and r_S are the benzene peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% is found.~~

~~**Other requirements**—It meets the requirements for *Identification*, *Loss on drying*, *Heavy metals*, and *Assay for carboxylic acid content* under *Carbomer 934P*.~~■2S (*NF22*)

BRIEFING

Carbomer Homopolymer, page 1276 of *PF* 28(4) [July–Aug. 2002]. This new monograph, which previously appeared in *Pharmacopeal Previews,* is now being forwarded to *In-Process Revision*. On the basis of comments received, it is proposed to change the scope of this new monograph to cover only Carbomer Homopolymers manufactured without the use of benzene. It is proposed to delete the test for *Limit of benzene* which is no longer applicable and to make changes in the *Definition, Labeling,* and *Viscosity* sections that are consistent with the new scope. It is also proposed to make changes in the *Identification* section. The currently official monographs for *Carbomers 934, 934P, 940,* and *941,* manufactured using benzene, will not be replaced by this new monograph as previously proposed. It is also proposed to delete the *Carbomer 910* monograph because this product is discontinued.

(EMC: E. Gonikberg; NL: C. Barnstein) RTS—39641-2

Add the following:

■Carbomer Homopolymer

» Carbomer Homopolymer is a high molecular weight polymer of acrylic acid cross-linked with polyalkenyl ethers of polyalcohols. Carbomer Homopolymer, previously dried, contains not less than 56.0 percent and not more than 68.0 percent of carboxylic acid (–COOH) groups.

NOTE—Carbomer Homopolymer is manufactured without the use of benzene. Specifically, ethyl acetate or a mixture of ethyl acetate and cyclohexane is used. Carbomer Homopolymer obtained from different manufacturers or produced in different solvents with different manufacturing

In-Process Revision

processes may not have identical properties with respect to its use for specific pharmaceutical purposes, e.g., as tablet controlled-release agents, bioadhesives, topical gellants, etc. Therefore, types of Carbomer Homopolymer should not be interchanged unless performance equivalency has been ascertained.

Packaging and storage—Preserve in tight containers, at a temperature not exceeding 45°.

~~**USP Reference standards** ⟨11⟩ —*USP Carbomer Homopolymer RS.*~~

Labeling~~—The label states the nominal viscosity range of a defined neutralized dispersion; the solvent used in the polymerization process and residual level; and, where applicable, that the Carbomer Homopolymer has been slightly preneutralized.~~ Label it to indicate whether it is Type A, B, or C; and also to state the measured viscosity, the solvent or solvents used in the polymerization process, and the nominal and residual solvent levels for each solvent.

Identification—

~~**A:** *Infrared Absorption* ⟨197K⟩.~~

~~**B:** The viscosity test result complies with the viscosity range indicated on the label.~~

A: *Infrared Absorption* ⟨197K⟩—The IR spectrum exhibits main bands at or near (±5) wave numbers (cm^{-1}) 1710, 1454, 1414, 1245, 1172, 1115, and 801, with the strongest band at 1710.

~~**C:**~~ **B:** Adjust a 1 in 100 dispersion of it with 1 N sodium hydroxide to a pH of about 7.5: a viscous gel is produced.

~~**D:**~~ **C:** Add 2 mL of a 1 in 10 aqueous solution of calcium chloride, while stirring, to 10 mL of the gel obtained from *Identification* test ~~*C*~~ *B* a white precipitate is immediately produced.

~~**E:**~~ **D:** Prepare a 1 in 100 dispersion of it. Add 0.5 mL of thymol blue TS to 10 mL of the dispersion: an orange color is produced. To another 10 mL of the dispersion add 0.5 mL of cresol red TS: a yellow color is produced.

Viscosity ⟨911⟩—Carefully add 2.50 g of the resin, which has been previously dried, to 500 mL of water in a 800-mL beaker, while stirring continuously at 1000 ± 50 rpm. The stirrer shaft is set at an angle of 60° and positioned at one side of the beaker, and the propeller is positioned near the bottom of the beaker. The stirrer used should be a three-blade, 2-inch marine impeller. Add Carbomer Homopolymer at a uniform rate over a period of 45 to 60 seconds, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 50 rpm for 15 minutes. [NOTE—Proper dispersion of the Carbomer Homopolymer resin is imperative for accurate viscosity readings.] Remove the stirrer, and let the beaker containing the dispersion stand at controlled room temperature for 30 minutes. Insert a paddle stirrer to a depth necessary to ensure that the air is not drawn into the dispersion, and while stirring at 300 ± 25 rpm, titrate potentiometrically (see *Titrimetry* ⟨541⟩) with sodium hydroxide solution (18 in 100) to the pH indicated on the label. (For example, if the pH is 7.3, then the total volume of sodium hydroxide would be about 5.4 mL.) After adding the sodium hydroxide solution, stir with a paddle mixer at 300 ± 25 rpm for 2 to 3 minutes. [NOTE—After neutralization, care must be taken to avoid excessively high shearing, as aggressive mixing will break the polymer chains and reduce the viscosity reading.] Take the final pH reading with a pH meter. If the final pH exceeds that indicated on the label, discard the mucilage, and prepare another using a smaller amount of sodium hydroxide for titration. Place the neutralized mucilage into a water bath maintained at 25 ± 2° for 1 hour, then perform the viscosity determination without delay.

In-Process Revision

Equip a suitable rotational viscometer (i.e., a Brookfield RVT or RVF viscometer) with a suitable spindle, as defined in the chart below. For spindle dimensions, consult the table under *Carbomer Copolymer*.

Expected Viscosity (cP)	Spindle Number	Multiplier
100–400	1	5
400–1600	2	20
1000–4000	3	50
2000–8000	4	100
4000–16,000	5	200
10,000–40,000	6	500
40,000–160,000	7	2000

With the spindle rotating at 20 rpm, observe and record the scale reading. Calculate the viscosity, in centipoise, by multiplying the scale reading by the multiplier defined in the table above for the spindle used at 20 rpm. ~~Viscosity results for the type of Carbomer Homopolymer falls within the range specified in the label when measured at 25 ± 2° and 20 rpm.~~ The viscosity values, determined by the conditions specified herein, are within the limits specified in the accompanying table.

Carbomer Homopolymer	Viscosity Specified (cP)
A	4,000–11,000
B	25,000–45,000
C	40,000–60,000

Loss on drying ⟨731⟩—Dry it in vacuum at 80° for 1 hour: it loses not more than 3.0% of its weight.

Residue on ignition ⟨231⟩: not more than 4.0%, determined on 1.0 g.

Heavy metals, *Method II* ⟨231⟩: not more than 0.002%.

Limit of ethyl acetate and cyclohexane—[NOTE—This test is required only for those Carbomer Homopolymers whose labeling indicates that ethyl acetate or a mixture of ethyl acetate and cyclohexane was used in the polymerization process.]

Standard stock solution—Transfer 5.0 mL of methanol to a 10-mL serum vial, insert a rubber septum, and seal with a metal cap. Add an accurately weighed quantity of about 25.0 µL of ethyl acetate and 20.0 µL of cyclohexane through the septum into the vial, and mix.

Standard solution—Transfer 20.0 mL of methanol to a 30-mL serum vial, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone (internal standard) and 50.0 µL of the *Standard stock solution*, and mix.

Test solution—Transfer about 50 mg of Carbomer Homopolymer, accurately weighed, to a 30-mL serum vial, add 20 mL of methanol, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed under *Carbomer Copolymer*.

Procedure—Proceed as directed under *Carbomer Copolymer*, except to calculate the percentages of ethyl acetate and cyclohexane in the portion of Carbomer Homopolymer taken by the formula:

$$100(W_S / W_T)(R_U / R_S),$$

in which W_S is the weight, in mg, of ethyl acetate or cyclohexane, as appropriate, in the *Standard solution*; W_T is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and R_U and R_S are the peak area ratios of the relevant analyte peak to the methyl ethyl ketone peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% of ethyl acetate and not more than 0.3% of cyclohexane is found.

In-Process Revision

Limit of benzene—[NOTE—This test is required only for those Carbomer Homopolymers whose labeling indicates that benzene was used in the polymerization process.]

Standard solution—Quantitatively dissolve an accurately weighed quantity of benzene in methanol to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute this solution quantitatively with organic-free water (see *Organic Volatile Impurities* ⟨467⟩) to obtain a solution having a known concentration of about 1.0 µg per mL.

Test solution—Transfer an accurately weighed quantity of about 100 mg of Carbomer Homopolymer to a 100-mL volumetric flask. Add about 75 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (about 30 minutes). Dilute with sodium chloride solution (2 in 100) to volume, and mix until homogeneous (1 minute or less). [NOTE—This preparation must be analyzed within 3 hours of preparation.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused silica analytical column coated with a 3.0-µm G43 stationary phase, a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane, and a splitless injection system. The carrier gas is helium flowing at a linear velocity of about 35 cm per second. The injection port and detector are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps: it is held at 40° for 20 minutes after injection, then increased at 50° per minute to 260°, and held at 260° for 20 minutes. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 15%.

Procedure—Separately inject equal volumes (about 4 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the benzene peaks. Calculate the percentage of benzene in the portion of Carbomer Homopolymer taken by the formula:

$$10(C/W)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of benzene in the *Standard solution*; W is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution*; and r_U and r_S are the benzene peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

Limit of acrylic acid—

0.01 M Phosphate buffer—Dissolve 1.361 g of monobasic potassium phosphate in 100 mL of water, and mix.

Solution A—Use *0.01 M Phosphate buffer*.

Solution B— Prepare a filtered and degassed mixture of *0.01 M Phosphate buffer* and acetonitrile (1:1, v/v).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solvent—Dissolve 25 g of potassium alum in 1000 mL of water, and mix.

Standard solution—Dissolve an accurately weighed quantity of acrylic acid in the *Solvent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 12.5 µg per mL.

Test solution—Mix about 100 mg of Carbomer Homopolymer, accurately weighed, with *Solvent*, and add *Solvent* to obtain 20.0 mL of suspension. Heat the suspension at 50° for 20 minutes with occasional shaking. Then shake the suspension continuously at room temperature for 60 minutes. Centrifuge and use the clear supernatant.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 12-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–8	100	0	isocratic
8–9	100→0	0→100	linear gradient
9–20	0	100	isocratic
20–21	0→100	100→0	linear gradient
21–30	100	0	isocratic

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for the acrylic acid peaks. Calculate the percentage of free acrylic acid in the portion of Carbomer Homopolymer taken by the formula:

$$(C/W)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of acrylic acid in the *Standard solution;* W is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and r_U and r_S are the acrylic acid responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% is found.

Content of carboxylic acid—Slowly add about 400 mg of Carbomer Homopolymer, previously dried in vacuum at 80° for 1 hour and accurately weighed, to 400 mL of water in a 800-mL beaker, while stirring continuously at about 1000 rpm. The stirrer shaft is set at an angle of 60° and positioned at one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 minutes. Reduce the stirring speed, and, using a calomel-glass electrode, titrate potentiometrically with 0.25 N sodium hydroxide VS to a pH of 10.0 (see *Titrimetry* ⟨541⟩). Allow 1 minute for mixing, after each addition of 0.25 N sodium hydroxide VS, before recording the pH. Calculate the percentage of carboxylic acid in the portion of Carbomer Homopolymer taken by the formula:

$$100(45.02VN/W),$$

in which V is the volume, in mL, of sodium hydroxide solution consumed; N is the normality of the sodium hydroxide solution; W is the weight, in mg, of Carbomer Homopolymer taken; and 45.02 is the molecular weight of the carboxylic acid (–COOH) group.■2S (*NF22*)

BRIEFING

Guar Gum, *NF 21* page 2770; **Xanthan Gum,** *NF 21* page 2861. It is proposed to correct an invalid reference in the test for *Lead*.

(EMC: D. Bempong) RTS—40418-1

Change to read:

Lead ⟨251⟩—Prepare a *Test Preparation* as directed ~~for organic compounds,~~

■in the chapter■2S (*NF22*)
and use 10 mL of *Diluted Standard Lead Solution* (10 µg of Pb) for the test: the limit is 0.001%.

In-Process Revision

BRIEFING

Magnesium Stearate, *NF 21* page 2787 and page 474 of *PF* 29(2) [Mar.–Apr. 2003]. On the basis of comments received, it is proposed to revise the test for *Specific surface area* to allow for plot deviations from linearity for P/P_0 values from 0.05 to 0.15.

(EMC: C. Sheehan) RTS—40327-1

Change to read:

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 10^3 ~~per g~~

■cfu per g,■2S (*NF22*)
the total combined molds and yeasts count does not exceed ~~500 per g~~

■10^2 cfu per g,■2S (*NF22*)
and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*

Change to read:

Specific surface area ⟨846⟩—[NOTE—In cases where there are no functionality-related concerns regarding the specific surface area of this article, this test may be omitted.] Where the labeling states the specific surface area, determine the specific surface area value as directed in the chapter in the P/P_0 range of 0.05 to 0.15, and using outgassing conditions of 2 hours at 40°.

■If the plot deviates from linearity for P/P_0 values of 0.05 to 0.15, then a suitable range of P/P_0 values should be validated for linearity. In this case, it is necessary to state the range of validated P/P_0 values, the increment of the P/P_0 values, and the outgassing conditions employed.■2S (*NF22*)

BRIEFING

Methacrylic Acid Copolymer Dispersion, *NF 21* page 2792. It is proposed to revise the sample volume in the test for *Viscosity* to 16 mL because comments were received that commercially available low-viscosity adapters cannot hold the 20-mL sample. The dimensions of the viscosimeter are also provided.

(EMC: D. Bempong) RTS—40250-1

Change to read:

Viscosity ⟨911⟩—~~Use a rotational viscosimeter equipped with a low-viscosity adapter. Mix the Dispersion, and pipet 20 mL of it into the low-viscosity small sample adapter. Adjust the temperature to 20 ± 0.1°. With the spindle rotating at 30 rpm, immediately~~ observe and record the scale reading. Multiply the scale reading by the constant for the adapter and spindle speed employed to obtain the viscosity in centipoises. The viscosity is not more than 15 centipoises.

■Equip a suitable rotational viscosimeter with an adapter system consisting of a measuring cylinder and a spindle. The measuring cylinder has an internal diameter of 2.762 cm and a depth of 13.50 cm; the spindle is 2.515 cm in diameter and 9.074 cm in height, and has a shaft that is 0.40 cm in diameter. Mix the Dispersion, pipet 16 mL of it into the measuring cylinder, and adjust the temperature of the dispersion and the adapter to 20 ± 0.1°. With the spindle rotating at 30 rpm, immediately observe and record the scale reading. Convert the scale reading to centipoises by multiplying the reading by the constant for the viscosimeter, the adapter system, and the speed employed. The viscosity is not more than 15 centipoises.■2S (*NF22*)

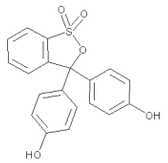
BRIEFING

Phenolsulfonphthalein, page 1899 of *PF* 28(6) [Nov.–Dec. 2002]. On the basis of comments received, it is proposed to revise the *Labeling* and *Bacterial endotoxins* sections to reflect usage of this excipient in parenteral articles. It is also proposed to add storage conditions to the *Packaging and storage* section. In addition, editorial style changes have been made.

(EMC: E. Gonikberg; VVI: L. Bhattacharyya) RTS—40020-3

Add the following:

■Phenolsulfonphthalein



$C_{19}H_{14}O_5S$ 354.38

In-Process Revision

Phenol, 4,4′-(3*H*-2,l-benzoxathiol-3-ylidene)bis-,(*S*,*S*-dioxide).

3,3-bis(4-hydroxyphenyl)-3*H*-2,l-benzoxathiole 1,1-dioxide [*143-74-8*].

» Phenolsulfonphthalein contains not less than 98.0 percent and not more than 102.0 percent of $C_{19}H_{14}O_5S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Where it is intended for use in ~~vaccines administered either intramuscularly or subcutaneously,~~ articles administered parenterally, it is so labeled.

USP Reference standards ⟨11⟩—*USP Endotoxin RS.*

Identification—

A: Transfer 5 mg of Phenolsulfonphthalein to a 100-mL volumetric flask, dissolve in and dilute with sodium carbonate solution (1 in 100) to volume, and mix. Dilute 5.0 mL of the solution so obtained to 100.0 mL with sodium carbonate solution (1 in 100). Examined between 400 and 630 nm, the solution exhibits an absorption maximum at 558 nm. The specific absorbance at the maximum is between 1900 and 2100.

B: Dissolve about 10 mg of Phenolsulfonphthalein in 2 mL of 1 N sodium hydroxide, and add 8 mL of water. To 5 mL of the solution so obtained add 1 mL of 0.1 N potassium bromide-bromate and 1 mL of diluted hydrochloric acid, shake, and allow to stand for 15 minutes. Render the solution alkaline with 1 N sodium hydroxide: an intense violet-blue color is produced.

Visual transition interval—Dissolve 1.0 g of potassium chloride in 100 mL of water, and adjust with 0.01 N hydrochloric acid or sodium hydroxide to a pH of 6.8. Dissolve 0.1 g of Phenolsulfonphthalein in 100 mL of alcohol, and add 0.15 mL of this solution to the potassium chloride solution. The color of the resulting solution is yellow, with not more than a faint trace of green color. Titrate the solution with 0.01 N sodium hydroxide to a pH of 7.0: the color of the solution becomes orange. Continue the titration to pH 8.2: the color of the solution becomes red. Not more than 0.20 mL of 0.01 N sodium hydroxide is consumed in the entire titration.

Microbial limit ⟨61⟩—The total aerobic microbial count does not exceed 10^3 microorganisms per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Bacterial endotoxins ⟨85⟩—Where it is intended for use in ~~vaccines administered either intramuscularly or subcutaneously,~~ articles administered parenterally, it contains not more than 600 USP Endotoxin Units per mg.

Loss on drying ⟨731⟩—Dry 1 g of the powdered Phenolsulfonphthalein at 105° to constant weight: it loses not more than 1.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%, determined on a 0.5-g portion.

Insoluble substances—To about 1 g of the finely powdered Phenolsulfonphthalein, accurately weighed, add a solution of 0.50 g of sodium bicarbonate in 12 mL of water. Allow to stand for 1 hour, shaking frequently. Dilute with sufficient water to make 100 mL, and allow to stand for 15 hours. Centrifuge at 2000 to 3000 *g* for 30 minutes, and decant the supernatant. Wash the residue first with 25 mL of sodium bicarbonate solution (1 in 100), then with 25 mL of

water, and dry at 105°: the weight of the insoluble residue does not exceed 0.5% of the weight of Phenolsulfonphthalein taken.

Chromatographic purity—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Application volume: l0 µL

Developing solvent system: a mixture of *tert*-amyl alcohol, glacial acetic acid, and water (100:25:25).

Test solution—Transfer about 100 mg of Phenolsulfonphthalein to a 5-mL volumetric flask, dissolve in and dilute with 0.1 N sodium hydroxide to volume, and mix.

Diluted test solution—Transfer 0.5 mL of the *Test solution* to a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Allow the plate to air-dry until the solvent has evaporated, and expose the plate to ammonia vapor. Examine the plate under short-wavelength UV light. Not more than one spot, apart from the principal spot, appears in the chromatogram obtained from the *Test solution.* This spot is not more intense than the spot in the chromatogram obtained from the *Diluted test solution:* not more than 0.5% is found.

Assay—Transfer about 0.9 g of Phenolsulfonphthalein, accurately weighed, to a 250-mL volumetric flask, dissolve in 15 mL of 1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 10.0 mL of the solution so obtained to a glass-stoppered flask, add 25 mL of glacial acetic acid, 20.0 mL of 0.1 N potassium bromate VS, 5 mL of potassium bromide solution (1 in 10), and 5 mL of hydrochloric acid, and immediately insert the stopper into the flask. Allow to stand protected from light for 15 minutes. Quickly add 10 mL of potassium iodide solution (1 in 10), taking care to avoid the escape of bromine vapor, immediately insert the stopper in the flask, and shake vigorously. Rinse the stopper and the neck of the flask with a small quantity of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩), and note the difference in volumes required. Each mL of the difference in volumes of 0.1 N sodium thiosulfate is equivalent to 4.43 mg of $C_{19}H_{14}O_5S$.■2S (*NF22*)

BRIEFING

Poloxamer, *NF 21* page 2809. On the basis of comments received, it is proposed to revise the preparation of the *Phthalic anhydride–pyridine solution* in the *Average molecular weight* determination because the desired concentration of phthalic anhydride is not obtained using the current procedure. Instead of adding 144 g of phthalic anhydride to 1000 mL of pyridine, it is proposed to dissolve the phthalic anhydride sample in pyridine, and then dilute this solution with pyridine to 1000 mL.

(EMC: D. Bempong) RTS—40381-1

Change to read:

Average molecular weight—

Phthalic anhydride–pyridine solution— ~~Add 144 g of phthalic anhydride to 1000 mL of freshly opened or freshly distilled pyridine containing less than 0.1% of water. Protect from light. Shake vigorously until completely dissolved, and allow to stand overnight.~~

■Dissolve 144 g of phthalic anhydride in freshly opened or freshly distilled pyridine containing less than 0.1% of water, and dilute with pyridine to 1000 mL. Protect from light, and allow to stand overnight.■2S (*NF22*)

In-Process Revision

To verify that the *Phthalic anhydride–pyridine solution* has adequate strength, pipet 10 mL into a 250-mL conical flask, add 25 mL of pyridine and 50 mL of water, and after about 15 minutes add 0.5 mL of a solution of phenolphthalein in pyridine (1 in 100), then titrate with 0.5 N sodium hydroxide VS: it consumes between 37.6 mL and 40.0 mL of 0.5 N sodium hydroxide.

Procedure—Accurately weigh a suitable quantity, not exceeding 15 g, of Poloxamer, calculated by multiplying the average molecular weight by 0.004, into a glass-stoppered, 250-mL boiling flask. Carefully pipet 25 mL of *Phthalic anhydride–pyridine solution* into the flask, touching the tip of the drained pipet to the protrusion in the flask. Add a few glass beads, and swirl to dissolve the specimen. Pipet 25 mL of *Phthalic anhydride–pyridine solution* into a second, glass-stoppered, conical flask, add a few glass beads, and use as the reagent blank. (An additional 25-mL portion of pyridine may be added to both the test specimen and reagent blank, prior to refluxing, if necessary to ensure fluidity.) Heat both flasks, fitted with suitable reflux condensers, and allow to reflux for 1 hour. Allow to cool, and pour two 10-mL portions of pyridine through each condenser. Remove the flasks from the condensers, add 10 mL of water to each, insert the stoppers, swirl, and allow to stand for 10 minutes. To each flask add 50.0 mL of 0.66 N sodium hydroxide and 0.5 mL of a 1 in 100 solution of phenolphthalein in pyridine. Titrate with 0.5 N sodium hydroxide VS to a light pink endpoint that persists for not less than 15 seconds, recording the volume, in mL, consumed by the residual acid in the test solution as *S,* and that consumed by the blank as *B*. Calculate the average molecular weight taken by the formula:

$$2000W/[(B - S)(N)],$$

in which W is the weight, in g, of the test specimen taken; and N is the exact normality of the 0.5 N sodium hydroxide VS.

BRIEFING

Stearyl Alcohol, *NF 21* page 2844. On the basis of comments received, it is proposed to revise the *System suitability solution* in the *Assay* to use dehydrated alcohol instead of alcohol to be consistent with the use of dehydrated alcohol in the *Assay preparation.*

(EMC: C. Sheehan) RTS—40338-01

Change to read:

Assay—

System suitability solution—Dissolve accurately weighed quantities of USP Stearyl Alcohol RS and USP Cetyl Alcohol RS in

■dehydrated■2S (*NF22*)
alcohol to obtain a solution containing about 9 mg per mL and 1 mg per mL, respectively.

Assay preparation—Dissolve 100 mg of Stearyl Alcohol in 10.0 mL of dehydrated alcohol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m column packed with 10% liquid phase G2 on support S1A. The carrier gas is helium. The temperature of the column is maintained at about 205°, the injection port temperature is maintained at about 275°, and the detector is maintained at about 250°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Inject about 2 µL of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of $C_{18}H_{38}O$ in the portion of Stearyl Alcohol taken by the formula:

$$100(r_U/r_s),$$

in which r_U is the peak area for stearyl alcohol obtained from the *Assay preparation;* and r_s is the sum of the areas of all the peaks except the solvent peak.

BRIEFING

Xanthan Gum, *NF 21* page 2861—See briefing under *Guar Gum*.

(EMC: D. Bempong) RTS—40417-1

Change to read:

Lead ⟨251⟩—Prepare a *Test Preparation* as directed ~~for organic compounds,~~

■in the chapter■2S (*NF22*)
and use 5 mL of *Diluted Standard Lead Solution* (5 µg of Pb) for the test: the limit is 5 µg per g.

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to 10 µm in diameter.

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 10 µm in diameter.

L9—10-µm irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel 10 µm in diameter having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.[5]

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, 5 to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

[5] Available as ~~Fractogel TSK HW 40F and distributed by Merck and Co.~~ ■YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■1S (*USP27*)

In-Process Revision

L31—A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate ■dextrans■1S (*USP26*) by molecular size over a range of 4,000 to ■500,000■1S (*USP26*) Da. It is spherical, silica-based, and processed to provide pH stability.■[6] ■1S (*USP26*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles

■by a propyl spacer,■1S (*USP27*)
5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.[7]

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.[8]

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.[9]

▲L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.[10] ▲*USP26*

▲L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.[11] ▲*USP26*

■L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column.[12] ■1S (*USP26*)

■L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.[13] ■2S (*USP26*)

▲L55—A strong cation-exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.[14] ▲*USP27*

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00:0.90:0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17—75% Phenyl-25% methylpolysiloxane.
G18—Polyalkylene glycol.
G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.
G20—Polyethylene glycol (av. mol. wt. of 380 to 420).
G21—Neopentyl glycol succinate.
G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.
G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.
G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.
G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36—1% Vinyl-5% phenylmethylpolysiloxane.
G37—Polyimide.
G38—Phase G1 containing a small percentage of a tailing inhibitor.[14]
G39—Polyethylene glycol (av. mol. wt. about 1500).
G40—Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).
G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).
G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).
G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.
G45—Divinylbenzene-ethylene glycol-dimethylacrylate.
G46—14% Cyanopropylphenyl-86% methylpolysiloxane.
G47—Polyethylene glycol (av. mol. wt. of about 8000).
G48—Highly polar, partially cross-linked cyanopolysiloxane.
~~G49—Proprietary derivatized phenyl groups on a polysiloxane backbone.[15]~~

■G~~50~~ ## (Docosahexaenoic Acid)—Polyethylene glycol, cross-linked (av. mol. wt. of more than 20,000).[g] ■1S (*USP27*)

Supports

[NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.]

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane[16] to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed.[16]

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 μm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 μm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 μm.

S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 μm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.[17]

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

BRIEFING

⟨**643**⟩ **Total Organic Carbon,** *USP 26* page 2139 and page 3156 of the *Second Supplement.* On the basis of comments received, the Pharmaceutical Waters Expert Committee has decided to cancel the previously proposed revisions (see page 1232 of *PF* 28(4) [July–Aug. 2002]) and is presenting this new proposal, which incorporates two methods that can be used to arrive at the TOC content: *Method 1* is the current qualitative pass/fail test, and *Method 2* is a quantitative test. Both analytical approaches provide equal assurance that the TOC limit is not exceeded. The Expert Committee encourages the submission of comments pertaining to this new proposal, which should be addressed to Frank Barletta, the liaison to the PW Expert Committee.

(PW: F. Barletta) RTS—39721-1

Change to read:

INTRODUCTION

Total organic carbon (TOC) is an indirect measure of organic molecules present in pharmaceutical waters measured as carbon. Organic molecules are introduced into the water from the source water, from purification and distribution system materials, and from biofilm growing in the system. TOC can also be used as a process control attribute to monitor the performance of unit operations comprising the purification and distribution system.

A number of acceptable methods exist for analyzing TOC. This chapter does not limit or prevent alternative technologies from being used, but provides guidance on how to qualify these analytical technologies for use as well as guidance on how to interpret instrument results for use as a limit test. The *Standard Solution* is a theoretically easy-to-oxidize solution that gives an instrument response at the attribute limit. The analytical technology is qualified by challenging the capability of the instrument using a theoretically difficult to oxidize solution in the system suitability portion of the method.

Analytical technologies utilized to measure TOC share the objective of completely oxidizing the organic molecules in an aliquot of sample water to carbon dioxide (CO_2), measuring the resultant CO_2 ~~levels,~~

■concentration,■2S (*USP27*)
and expressing this response as carbon concentration. All technologies must discriminate between the inorganic carbon, which may be present in the water from sources such as dissolved CO_2 and bicarbonate, and the CO_2 generated from the oxidation of organic molecules in the sample.

Two general approaches are used to measure TOC. One approach determines TOC by subtracting the measured inorganic carbon (IC) from the measured total carbon (TC), which is the sum of organic carbon and inorganic carbon:

$$TOC = TC - IC.$$

The other approach first purges the IC from the sample before any carbon measurement is performed. However, this IC purging step also purges some of the organic molecules, which can be retrapped, oxidized to CO_2, and quantitated as purgeable organic carbon (POC). The remaining organic matter in the sample is also oxidized to CO_2 and quantitated as nonpurgeable organic carbon (NPOC). In this approach, TOC is the sum of POC and NPOC:

$$TOC = POC + NPOC.$$

In pharmaceutical waters, the amount of POC is negligible,

■compared to the limit,■2S (*USP27*)
and can be discounted. Therefore, for the purpose of this methodology, NPOC is equivalent to TOC.

[16] Unless otherwise specified in the individual monograph, silanized support is intended.

[17] Commercially available as SP1500 on Carbopack B from Supelco.

Delete the following:

■~~SYSTEM SUITABILITY~~

~~Test the *Reagent Water Control* in the apparatus, and record the response, r_w. Repeat the test using the *Standard Solution,* and record the response, r_s. Calculate the corrected *Standard Solution* response, which is also the limit response, by subtracting the *Reagent Water Control* response from the response of the *Standard Solution.* The theoretical limit of 0.50 mg of carbon per liter is equal to the corrected *Standard Solution* response, $r_s - r_w$. Test the *System Suitability Solution* in the apparatus, and record the response, r_{ss}. Calculate the corrected *System Suitability Solution* response by subtracting the *Reagent Water Control* response from the response of the *System Suitability Solution*, $r_{ss} - r_w$. Calculate the response efficiency for the *System Suitability Solution* by the formula:~~

$$100[(r_{ss} - r_w)/(r_s - r_w)].$$

~~The system is suitable if the response efficiency is not less than 85% and not more than 115% of the theoretical response.~~■2S (*USP27*)

Delete the following:

■~~PROCEDURE~~

~~Perform the test on the *Test Solution,* and record the response, r_t. The *Test Solution* meets the requirements if r_t is not more than the limit response, $r_s - r_w$. This method also can be performed alternatively using on-line instrumentation that has been appropriately calibrated, standardized, and has demonstrated acceptable system suitability. The acceptability of such on-line instrumentation for quality attribute testing is dependent on its location(s) in the water system. These instrument location(s) and responses must reflect the quality of the water used.~~■2S (*USP27*)

In-Process Revision

Add the following:

▪METHOD SELECTION

Proceed using either *Method 1* or *Method 2,* as directed by the monograph. *Method 1* is a limit test that is designed for use as a test for the TOC attribute specifically for *Purified Water* and *Water for Injection*. *Method 2* is designed to be a more general test that could be used for many types of pharmaceutical waters, including *Purified Water* and *Water for Injection*. This method also accounts for small differences between the target solution concentrations and the actual solution concentrations in the system suitability testing. [NOTE—These methods can be performed using off-line or on-line instrumentation that has been appropriately calibrated and standardized, and that has demonstrated acceptable system suitability. The acceptability of such on-line instrumentation for quality attribute testing is dependent on its location(s) in the water system. These instrument location(s) and responses must reflect the quality of the water used.]

Method 1

System Suitability—At appropriate intervals based upon established instrument performance, test the *Reagent Water Control* in the apparatus, and record the response, r_W. Repeat the test using the *Standard Solution,* and record the response, r_S. Test the *System Suitability Solution* in the apparatus, and record the response, r_{SS}. Calculate the response efficiency for the *System Suitability Solution,* corrected for the reagent water, by the formula:

$$100[(r_{SS} - r_W)/(r_S - r_W)].$$

The system is suitable if the response efficiency is not less than 85% and not more than 115% of the theoretical response.

Procedure—Perform the test on the *Test Solution,* and record the response, r_U. The *Test Solution* meets the requirements if r_U is not more than the limit response, $r_S - r_W$.

Method 2

System Suitability—At appropriate intervals based upon established instrument performance, test the *Reagent Water Control* in the apparatus, and record the response, r_W. Repeat the test using the *Standard Solution,* and record the response, r_S. Test the *System Suitability Solution* in the apparatus, and record the response, r_{SS}. Calculate the response efficiency for the *System Suitability Solution,* corrected for the reagent water, by the formula:

$$63C_S(r_{SS} - r_W) / [C_{SS}(r_S - r_W)],$$

where C_S and C_{SS} are the concentrations of sucrose and 1,4-benzoquinone in the *Standard Solution* and *System Suitability Solution* (in mg per L), respectively. The system is suitable if the response efficiency is not less than 85% and not more 115%.

Procedure—Perform the test on the *Test Solution,* and record the response, r_U. Calculate the carbon concentration, C_C, of the *Test Solution* by the formula:

$$C_C = 0.42C_S r_U / (r_S - r_W),$$

where C_S is the concentration of sucrose in the *Standard Solution.* The *Test Solution* meets the requirements if C_C is not more than 0.50 mg per liter of carbon (500 ppb), unless otherwise directed in the monograph.▪2S (*USP27*)

BRIEFING

⟨**698**⟩ **Deliverable Volume,** *USP 26* page 2152. On the basis of comments received, it is proposed to revise this chapter in order to clarify the acceptance criteria. Decision schemes for multiple-unit containers and for single-unit containers are also added. Other editorial changes are included.

(PDF: H. Pappa) RTS—39877-1

Change to read:

The following tests are designed to provide assurance that oral ~~solutions and suspensions~~

■liquids■2S (*USP27*)
will, when transferred from the original container, deliver the volume of dosage form that is declared on the label of the article. These tests are applicable to products labeled to contain not more than 250 mL, whether supplied as liquid preparations or liquid preparations that are constituted from solids upon the addition of a designated volume of a specific diluent. They are not required for an article packaged in single-unit containers when the monograph includes the *Uniformity of Dosage Units* ⟨905⟩ test.

~~For the determination of deliverable volume, select not fewer than 30 containers, and proceed as follows for the dosage form designated.~~

~~ORAL SOLUTIONS, ORAL SUSPENSIONS, AND SYRUPS—Mix the contents of 10 containers individually.~~

~~POWDERS THAT ARE LABELED TO STATE THE VOLUME OF ORAL SOLUTION OR ORAL SUSPENSION THAT RESULTS WHEN THE POWDER IS CONSTITUTED WITH THE VOLUME OF DILUENT STATED IN THE LABELING—Constitute 10 containers with the volume of diluent stated in the labeling, accurately measured, and mix.~~

■■2S (*USP27*)

Add the following:

■TEST PREPARATIONS

For the determination of deliverable volume, select not fewer than 30 containers, and proceed as follows for the dosage form designated.

Oral Solutions, Oral Suspensions, and Other Oral Liquid Dosage Forms—Shake the contents of 10 containers individually.

Powders that are Labeled to State the Volume of Oral Liquid that Results when the Powder is Constituted with the Volume of Diluent Stated in the Labeling—Constitute 10 containers with the volume of diluent stated in the labeling, accurately measured, and shake individually.■2S (*USP27*)

separate dry graduated cylinders of a rated capacity not exceeding two and a half times the volume to be measured, and calibrated "to

In-Process Revision

contain". ~~being careful to avoid the formation of bubbles and allowing them~~

■Allow each container■2S (*USP27*) to drain for a period not to exceed 30 minutes, for multiple-unit containers and 5 seconds for single-unit containers, unless otherwise specified in the monograph. When free from air bubbles, measure the volume of each mixture. Alternatively, in the case of products of low volume packaged in single-unit containers, the volume can be computed ~~by discharging into a suitable tared container (allowing drainage for not more than 5 seconds), by determining the weight by difference and by computing the volume after determining the apparent density. The average volume of solution, suspension, or syrup obtained from the 10 containers is not less than 100%, and the volume of no container is less than 95%, and in the case of products packaged in single-unit containers, more than 110% of the volume declared in the labeling. If *A,* the average volume is less than 100% of that declared in the labeling, but the volume of no container is less than 95% of the labeled amount, or *B,* the volume of not more than 1 container is less than 95%, but is not less than 90% of the labeled volume, perform the test on 20 additional containers. The average volume of solution, suspension, or syrup obtained from the 30 containers is not less than 100% of the volume declared in the labeling; and the volume of solution, suspension, or syrup obtained from not more than 1 of the 30 containers is less than 95%, but not less than 90% of that declared in the labeling; and in the case of products packaged in single-unit containers, is more than 110%, but not more than 115% of that declared on the labeling.~~

■as follows: (1) discharge the container contents into a suitable tared container (allowing drainage for not more than 5 seconds); (2) determine the weight of the contents; and (3) compute the volume after determining the density.■2S (*USP27*)

Add the following:

■ACCEPTANCE CRITERIA

Use the following criteria to determine compliance with this test.

For Multiple-Unit Containers (see Figure 1)—The average volume of liquid obtained from the 10 containers is not less than 100%, and the volume of no container is less than 95% of the volume declared in the labeling. If *A,* the average volume is less than 100% of that declared in the labeling, but the volume of no container is less than 95% of the labeled amount, or *B,* the average volume is not less than 100% and the volume of not more than 1 container is less than 95%, but is not less than 90% of the labeled volume, perform the test on 20 additional containers. The average volume of liquid obtained from the 30 containers is not less than 100% of the volume declared in the labeling; and the volume of liquid obtained from not more than 1 of the 30 containers is less than 95%, but not less than 90% of that declared in the labeling.

In-Process Revision

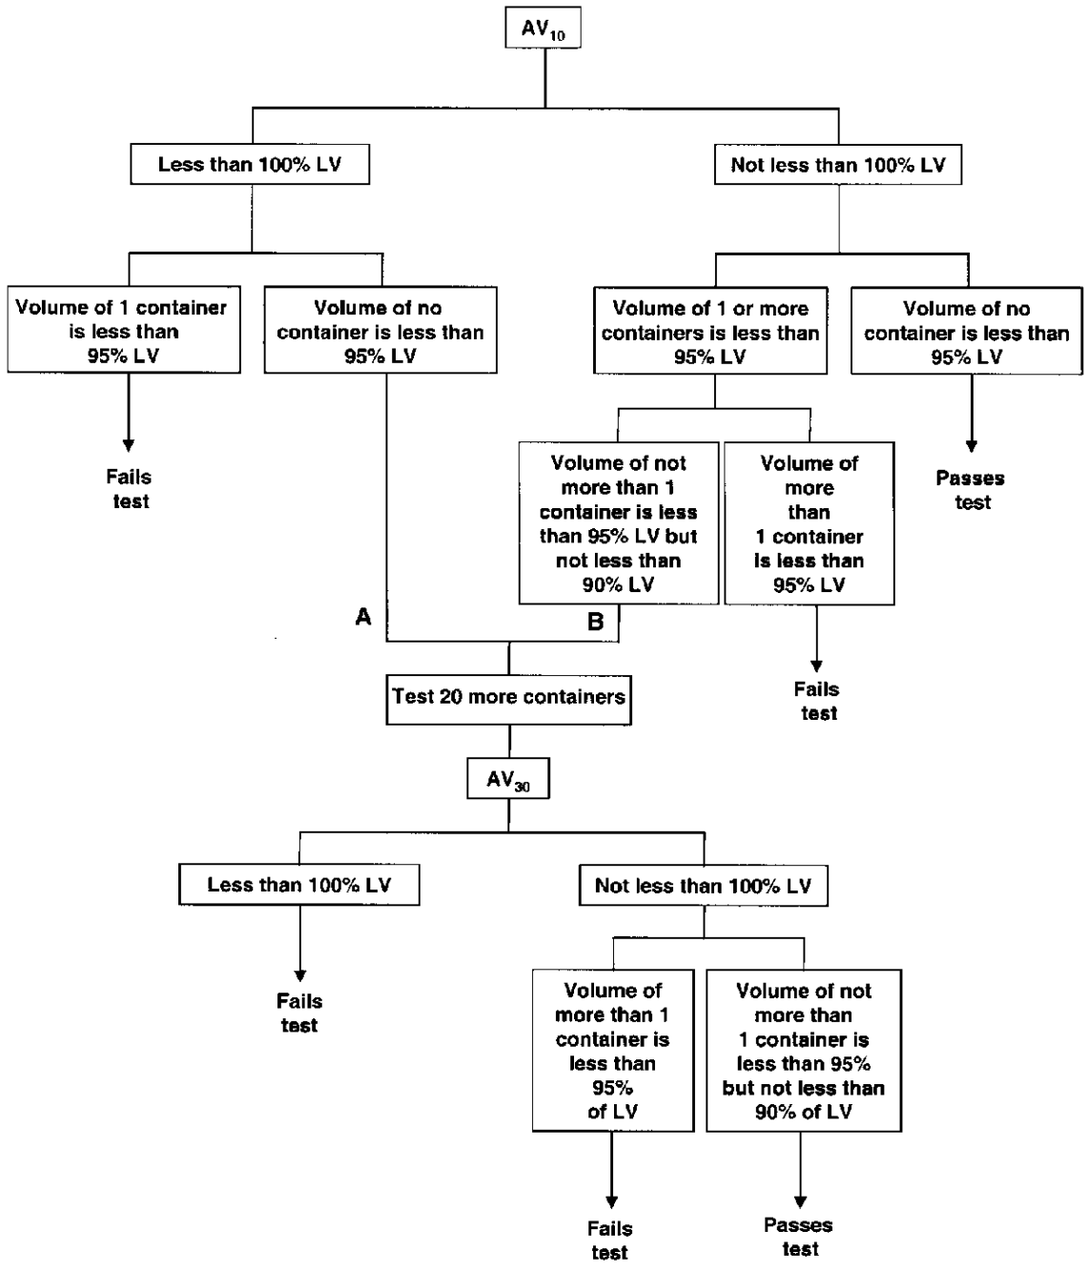

Figure 1. Decision scheme for multiple-unit containers. (AV = Average volume. LV = Labeled volume)

For Single-Unit Containers (see Figure 2)—The average volume of liquid obtained from the 10 containers is not less than 100%, and the volume of each of the 10 containers lies within the range of 95% to 110% of the volume declared in the labeling. If *A,* the average volume is less than 100% of that declared in the labeling, but the volume of no container is outside the range of 95% to 110%, or if *B,* the average volume is not less than 100% and the volume of not more than 1 container is outside the range of 95% to 110%, but within the range of 90% to 115%, perform the test on 20 additional containers. The average volume of liquid ob-

tained from the 30 containers is not less than 100% of the volume declared in the labeling; and the volume obtained from not more than 1 of the 30 containers is outside the range of 95% to 110%, but within the range of 90% to 115% of the volume declared on the labeling.

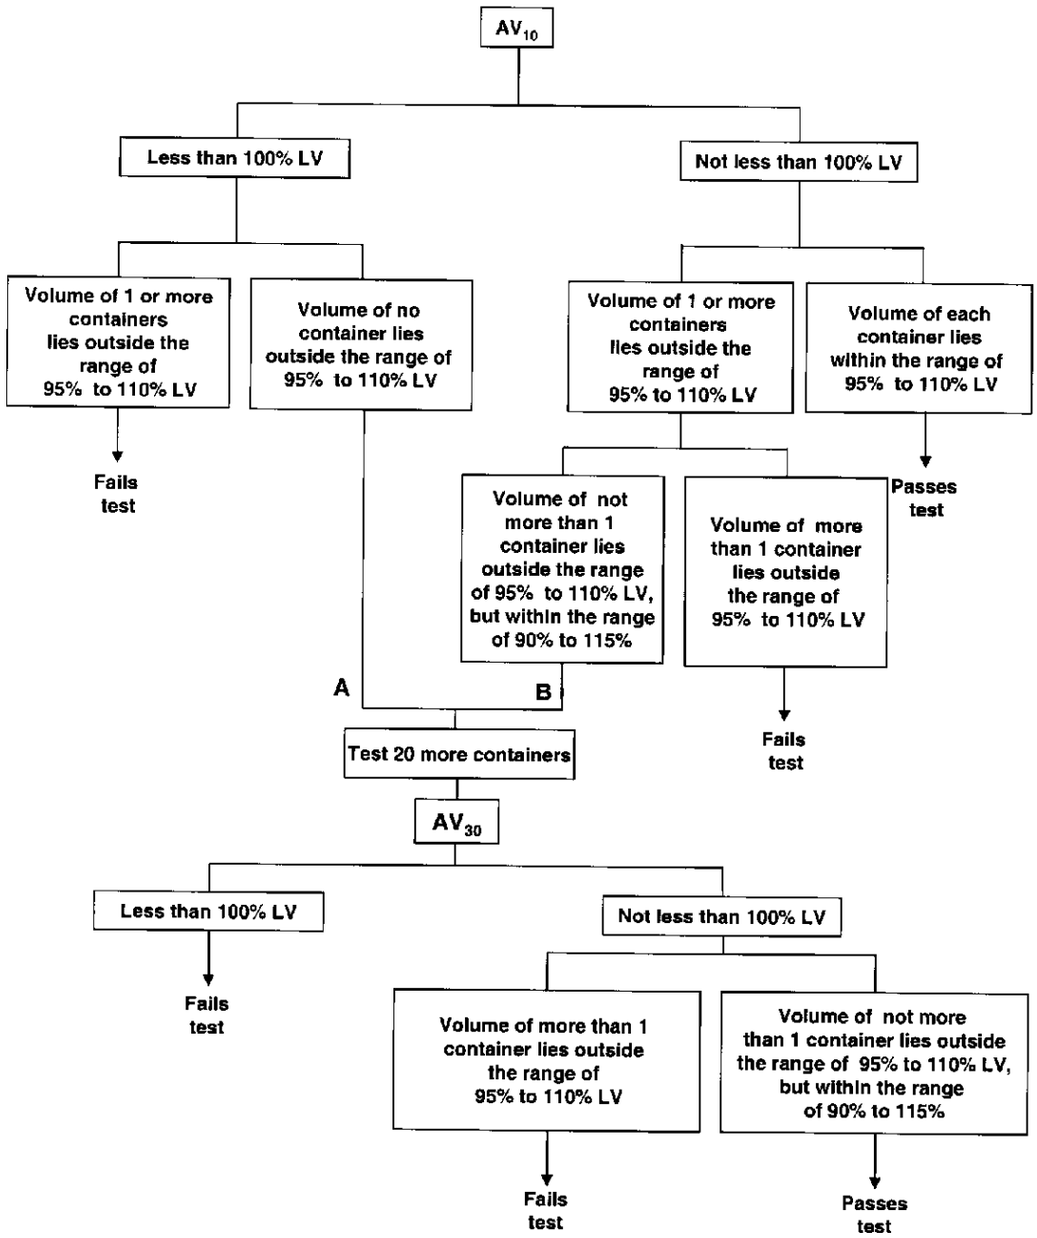

Figure 2. Decision scheme for single-unit containers. (AV = Average volume. LV = Labeled volume)

■2S (*USP27*)

In-Process Revision

BRIEFING

⟨**785**⟩ **Osmolarity,** *USP 26* page 2187. Several comments have been received regarding this chapter. The following proposal reflects those comments. A discussion evaluating the impact of this revision on monographs and general chapters that reference this chapter follows.

The official monographs of *Alcohol in Dextrose Injection* (*USP 26–NF 21,* p. 61) and *Iron Sucrose Injection* (*USP 26–NF 21,* pp. 1016–1017) require the label to state "the total osmolarity of the solution expressed in mOsmol per liter". There is no impact of the proposed chapter revision on these monographs because the proposed revision indicates that the osmolarity is expressed in mOsmol per liter unit.

The official monographs of *Ferumoxsil Oral Suspension* (*USP 26–NF 21,* p. 790), *Gadodiamide Injection* (*USP 26–NF 21,* pp.841–842), and *Iodixanol Injection* (*USP 26–NF 21,* pp. 994–995), and the proposed *In-Process Revision* of the monographs *Mangafodipir Trisodium Injection* (*PF* 29(4), pp. 1048–1049) and *Tobramycin Inhalation Solution* (*PF* 29(2), pp. 438–441) have a test for *Osmolarity* that refers to the general test chapter ⟨785⟩, but these monographs express the acceptance criteria for the test in mOsmol per kg unit, which is in fact the osmolality unit. In its present form, ⟨785⟩ may present the following problem for manufacturers. Because osmolarity cannot be measured experimentally, manufacturers may be measuring the osmolality of their products. However, there is no *USP* chapter that refers to osmolality, which means that manufacturers have no option but to call the test "osmolarity". The proposed revision will make it possible to state the test in terms of osmolality, thus eliminating the problem.

The monographs of *Manganese Chloride for Oral Solution* (*USP 26–NF 21,* p. 1124) and *PEG 3350 and Electrolytes for Oral Solution* (*USP 26–NF 21,* pp. 1493–1495) include a test for *Osmolarity* that refers to ⟨785⟩, but the acceptance criteria are expressed in mOsmol (without specifying "per liter" or "per kg").

The *Ferumoxides Injection* (*USP 26–NF 21,* pp. 788–790) monograph includes a test for *Osmolality,* with the acceptance criteria expressed in mOsmol per kg, but *Osmolarity* ⟨785⟩ is referenced.

The monographs *Aztreonam Injection* (*USP 26–NF 21,* p. 202) and *Cefoperazone Injection* (*USP 26–NF 21,* p. 367) mention "a suitable osmolality adjusting substance . . ." in the Definition sections. Because ⟨785⟩ does not include osmolality, the proposed revision in this *PF* will provide correct perspectives to the Definitions in these monographs.

In addition, appropriate revisions should be made to all of the above monographs, as necessary, to make the wording consistent with the Expert Committee's proposal in this *PF.*

The terms osmolarity and osmolality are also mentioned in USP chapters. The general test chapter *Radiopharmaceuticals for Positron Emission Tomography—Compounding* ⟨823⟩ (*USP 26–NF 21,* pp. 2213–2216) uses the term osmolality. Under *Background Information, for Ophthalmic Exposure* in the general information chapter *Excipient Biological Safety Evaluation Guidelines* ⟨1074⟩ (*USP 26–NF 21,* pp. 2320–2322) is the statement "define pH and osmolarity of topical ocular dose form". Also *Sterile Drug Products for Home Use* ⟨1206⟩ (*USP 26–NF 21,* pp. 2417–2429) mentions, " . . . and the critical product formulation parameters (pH, viscosity, ionic strength, and osmolarity) used to generate the supplied data . . .". However, none of the above chapters refer to ⟨785⟩. The proposed general test chapter *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ [*PF* 28(2)] mentions osmolarity as a "critical product formulation parameter" but also does not refer to ⟨785⟩. On the other hand, the proposed general information chapter *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩ [*PF* 29(1) p. 224–242] mentions osmolarity as a topic closely related to osmotic properties of solutions and does make reference to ⟨785⟩ as "see *Osmolarity* ⟨785⟩" and "See USP general chapters . . . *Osmolarity* ⟨785⟩". Clearly, the proposed revisions in this *PF* for *Osmolarity* ⟨785⟩ do not impact the above general chapters, except that in the proposed ⟨1160⟩ a revision will be necessary to change the title of the cross-reference from *Osmolarity* ⟨785⟩ to *Osmolality and Osmolarity* ⟨785⟩.

⟨785⟩

■OSMOLALITY AND■2S (*USP27*)
OSMOLARITY

~~Osmotic pressure is fundamentally related to all biological processes that involve diffusion of solutes or transfer of fluids through membranes. Thus, knowledge of the osmolar concentrations of parenteral fluids is essential. The labels of Pharmacopeial solutions that provide intravenous replenishment of fluid, nutrient(s), or electrolyte(s), as well as of the osmotic diuretic Mannitol Injection, are required to state the osmolar concentration.~~

~~The declaration of osmolar concentration on the label of a parenteral solution serves primarily to inform the practitioner whether the solution is hypo-osmotic, iso-osmotic, or hyper-osmotic. A quantitative statement facilitates calculation of the dilution required to render a hyper-osmotic solution iso-osmotic. It also simplifies many calculations involved in peritoneal dialysis and hemodialysis procedures. The osmolar concentration of an extemporaneously compounded intravenous solution prepared in the pharmacy (e.g., a hyperalimentation solution) from osmolar labeled solutions also can be obtained simply by summing the osmoles contributed by each constituent.~~

~~The units of osmolar concentration are usually expressed as milliosmoles (abbreviation: mOsmol) of solute per liter of solution. In general terms, the weight of an osmole is the gram molecular weight of a substance divided by the number of ions or chemical species *(n)* formed upon dissolution. In ideal solutions, for example, n = 1 for glucose, n = 2 for sodium chloride or magnesium sulfate, n = 3 for calcium chloride, and n = 4 for sodium citrate.~~

~~The ideal osmolar concentration may be determined according to the formula:~~

~~osmolar concentration (mOsmol / liter) = mOsM~~

$$= \frac{\text{wt. of substance (g/liter)}}{\text{mol. wt. (g)}} \times \text{number of species} \times 1000.$$

~~As the concentration of the solute increases, interaction among solute particles increases, and actual osmolar values decrease when compared to ideal values. Deviation from ideal conditions is usually slight in solutions within the physiologic range and for more dilute solutions, but for highly concentrated solutions the actual osmolarities may be appreciably lower than ideal values. For example, the ideal osmolarity of 0.9% Sodium Chloride Injection is 9/58.4 × 2 × 1000 = 308 milliosmoles per liter. In fact, however, n is slightly less than 2 for solutions of sodium chloride at this concentration, and the actual measured osmolarity of 0.9% Sodium Chloride Injection is about 286 milliosmoles per liter.~~

~~The theoretical osmolarity of a complex mixture, such as Protein Hydrolysate Injection, cannot be readily calculated. In such instances, actual values of osmolar concentration are to be used to meet the labeling requirement set forth in the individual mono-~~

In-Process Revision

~~graph. They are determined by calculating the osmolarity from measured values of osmolal concentration and water content. Each osmole of solute added to 1 kg of water lowers the freezing point approximately 1.86° and lowers the vapor pressure approximately 0.3 mm of mercury (at 25°). These physical changes are measurable, and they permit accurate estimations of osmolal concentrations.~~

~~Where osmometers that measure the freezing point depression are employed, a measured volume of solution (usually 2 mL) is placed in a glass tube immersed in a temperature-controlled bath. A thermistor and a vibrator are lowered into the mixture, and the temperature of the bath is decreased until the mixture is supercooled. The vibrator is activated to induce crystallization of the water in the test solution, and the released heat of fusion raises the temperature of the mixture to its freezing point. By means of a Wheatstone bridge, the recorded freezing point is converted to a measurement in terms of milliosmolality, or its near equivalent for dilute solutions, milliosmolarity. The instrument is calibrated by using two standard solutions of sodium chloride that span the expected range of osmolarities.~~

~~Osmometers that measure the vapor pressures of solutions are less frequently employed. They require a smaller volume of specimen (generally about 5 µL), but the accuracy and precision of the resulting osmolality determination are comparable to those obtained by the use of osmometers that depend upon the observed freezing points of solutions.~~

~~**Labeling**—Where an osmolarity declaration is required in the individual monograph, the label states the total osmolar concentration in milliosmoles per liter. Where the contents are less than 100 mL, or where the label states that the article is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in milliosmoles per milliliter.~~

▪INTRODUCTION

Osmotic pressure plays a critical role in all biological processes that involve diffusion of solutes or transfer of fluids through membranes. Osmosis occurs when solvent but not solute molecules cross a semipermeable membrane from regions of lower to higher concentrations to produce equilibrium. The knowledge of osmotic pressures is important for practitioners in determining whether a parenteral solution is hypo-osmotic, iso-osmotic, or hyperosmotic. A quantitative measure of osmotic pressure facilitates the dilution required to render a solution iso-osmotic relative to whole blood.

OSMOTIC PRESSURE

The osmotic pressure of a solution depends on the number of particles in solution, and is therefore referred to as a colligative property. A particle can be a molecule or an ion or an aggregated species (e.g., a dimer) that can exist discretely in solution. A solution exhibits ideal behavior when no interaction occurs between solutes and solvent, except where solvent molecules are bound to solutes by hydrogen bonding or coordinate covalency. For such a solution containing a nondissociating solute, the osmotic pressure (π) is directly proportional to its molality (number of moles of solute per kilogram of the solvent):

$$\pi = (\rho RT/1000)m,$$

where ρ is the density of the solvent at the temperature T (in the absolute scale); R is the universal gas constant; and m is the molality of the solution. For a real solution containing more than one solute, the osmotic pressure is given by the formula:

$$\pi = (\rho RT/1000)\Sigma\nu_i m_i \Phi_{m,i},$$

where ν_i is the number of particles formed by the dissociation of one molecule of the i^{th} solute, $\nu_i = 1$ for nonionic (nondissociating) solutes, m_i is the molality of the i^{th} solute, and $\Phi_{m,i}$ is the molal osmotic coefficient of the i^{th} solute. The molal osmotic coefficient takes into account the deviation of a solution from ideal behavior. Its value depends upon the concentration of the solute(s) in solution, its chemical properties, and ionic characteristics. The value of the molal osmotic coefficient of a solute can be determined experimentally by measuring the freezing point depression

In-Process Revision

at different molal concentrations. At concentrations of pharmaceutical interest, the value of the molal osmotic coefficient is less than one. The molal osmotic coefficient decreases with the increase in concentration of the solute (*Table 1*).

OSMOLALITY

The osmolality of a solution ξ_m is given by

$$\xi_m = \Sigma \nu_i m_i \Phi_{m,i},$$

The osmolality of a real solution corresponds to the molality of an ideal solution containing nondissociating solutes and is expressed in osmoles or milliosmoles per kilogram of solvent (Osm per kg or mOsm per kg, respectively), a unit that is similar to the molality of the solution. Thus, osmolality is a measure of the osmotic pressure exerted by a real solution across a semipermeable membrane. Like osmotic pressure, other colligative properties of a solution, such as vapor pressure lowering, boiling point elevation, and freezing point depression, are also directly related to the osmolality of the solution. Indeed, the osmolality of a solution is typically determined most accurately and conveniently by measuring freezing point depression (ΔT_f):

$$\Delta T_f = k_f \xi_m,$$

where, k_f is the molal cryoscopic constant, which is a property of the solvent. For water, the value of k_f is 1.860° per osmole. That is, 1 osmole of a solute added to 1 kg of water lowers the freezing point by 1.860°.

OSMOLARITY

Osmolarity of a solution is a theoretical quantity expressed in osmoles per liter of a solution and is widely used in clinical practice because it expresses osmoles as a function of volume. Osmolarity cannot be measured but is calculated theoretically from the experimentally measured value of osmolality.

Sometimes, osmolarity (ξ_c) is calculated theoretically from the molar concentrations:

$$\xi_c = \Sigma \nu_i c_i,$$

where ν_i is as defined above, and c_i is the molar concentration of the i^{th} solute in solution. For example, the osmolarity of a solution prepared by dissolving 1 g of vancomycin in 100 mL of 0.9% sodium chloride solution can be calculated as follows:

[3 × 10 g/L/1468 (mol. wt. of vancomycin) + 2 × 9 g/L/58.5 (mol. wt. of sodium chloride)] × 1000 = 328mOsm/L.

The results suggest that the solution is slightly hyperosmotic since the osmolaltiy of blood ranges between 285 and 310 mOsm per kg. However, the solution is found to be hypo-osmotic and has an experimentally determined osmolality of 255 mOsm per kg.[1] The example illustrates that osmolarity values calculated theoretically from the concentration of a solution should be interpreted cautiously and may not represent the osmotic properties of infusion solutions.

The discrepancy between theoretical (osmolarity) and experimental (osmolality) results is, in part, due to the fact that osmotic pressure is related to osmolality and not osmolarity. More significantly, the discrepancy between experimental results and the theoretical calculation is due to the fact that the osmotic pressure of a real solution is less than that of an ideal solution because of interactions between solute molecules or between solute and solvent molecules in a solution. Such interactions reduce the pressure exerted by solute molecules on a semipermeable membrane, reducing experimental values of osmolality compared to theoretical

[1] Kastango, E.S. and Hadaway, L. (2001) *International Journal of Pharmaceutical Compounding 5,* 465-469.

values. This difference is related to the molal osmotic coefficient ($\Phi_{m,i}$). The example also illustrates the importance of determining the osmolality of a solution experimentally, rather than calculating the value theoretically.

MEASUREMENT OF OSMOLALITY

The osmolality of a solution is commonly determined by the measurement of the freezing point depression of the solution.

Apparatus—The apparatus, an osmometer for freezing point depression measurement, consists of the following: a means of cooling the container used for the measurement; a resistor sensitive to temperature (thermistor), with an appropriate current- or potential-difference measurement device that may be graduated in temperature change or in osmolality; and a means of mixing the sample.

Standard Solutions—Prepare *Standard Solutions* as specified in *Table 1*, as necessary.

Table 1. Standard Solutions for Osmometer Calibration[2]

Standard Solutions (Weight in g of sodium chloride per kg of water)	Osmolality (mOsm/kg) (ξ_m)	Molal Osmotic Coefficient ($\Phi_{m,\ NaCl}$)	Freezing Point Depression (°) ΔT_f
3.087	100	0.9463	0.186
6.260	200	0.9337	0.372
9.463	300	0.9264	0.558
12.684	400	0.9215	0.744
15.916	500	0.9180	0.930
19.147	600	0.9157	1.116
22.380	700	0.9140	1.302

[2] Adapted from the *European Pharmacopoeia,* 4th Edition, 2002, p. 50.

Test Solution—For a solid for injection, constitute with the appropriate diluent as specified in the instructions on the labeling. For solutions, use the sample as is. [NOTE—A solution can be diluted to bring it within the range of measurement of the osmometer, if necessary, but the results must be expressed as that of the diluted solution and must NOT be multiplied by a dilution factor to calculate the osmolality of the original solution. The molal osmotic coefficient is a function of concentration. Therefore, it changes with dilution.]

Procedure—Set the zero of the apparatus using water. To calibrate the apparatus, choose at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution.* Introduce an appropriate volume of each *Standard Solution* into the measurement cell as per the manufacturer's instructions, and start the cooling system. Usually, the mixing device is programmed to operate at a temperature below the lowest temperature expected from the freezing point depression. The apparatus indicates when the equilibrium is attained. Calibrate the osmometer using an appropriate

adjustment device such that the reading corresponds to either the osmolality or freezing point depression value of the *Standard Solution* shown in *Table 1.* [NOTE—Some instruments indicate osmolality and some others show freezing point depression.] Before each measurement, rinse the measurement cell at least twice with the solution to be tested. Repeat the procedure with each *Test Solution.* Read the osmolality of the *Test Solution* directly, or calculate it from the measured freezing point depression.

Assuming that the value of the osmotic coefficient is essentially the same whether the concentration is expressed in molality or molarity, the experimentally determined osmolality of a solution can be converted to osmolarity in the same manner in which the concentration of a solution is converted from molality to molarity. Unless a solution is very concentrated, the osmolarity of a solution (ξ_c) can be calculated from its experimentally determined osmolality (ξ_m):

$$\xi_c = 1000\xi_m / (1000 / \rho + \Sigma w_i \nu_i),$$

where w_i, is the weight in g; and ν_i is the partial specific volume, in mL per g, of the i^{th} solute. The partial specific volume of a solute is the change in volume of a solution when an additional 1 g of solute is dissolved in the solution. This volume can be determined by the measurement of densities of the solution before and after the addition of the solute. The partial specific volumes of salts are generally very small, around 0.1 mL per g. However, those of other solutes are generally higher. For example, the partial specific volumes of amino acids are in the range of 0.6–0.9 mL per g.■2S (*USP27*)

BRIEFING

⟨**791**⟩ **pH,** *USP 26* page 2196. It is proposed to revise under *Buffer Solutions for Standardization of the pH Meter* the type of storage containers used and the accuracy for standardization solutions with a pH of 4 or lower. Editorial style changes are also made.

(PA4: H. Pappa) RTS—38500-1

Change to read:

For compendial purposes, pH is defined as the value given by a suitable, properly standardized, potentiometric instrument (pH meter) capable of reproducing pH values to 0.02 pH unit using an indicator electrode sensitive to hydrogen-ion activity, the glass electrode, and a suitable reference electrode. The instrument should be capable of sensing the potential across the electrode pair and, for pH standardization purposes, applying an adjustable potential to the circuit by manipulation of "standardization," "zero," "asymmetry," or "calibration" control, and should be able to control the change in millivolts per unit change in pH reading through a "temperature" and/or "slope" control. Measurements are made at 25 ± 2°, unless otherwise specified in the individual monograph or herein.

The pH scale is defined by the equation:

$$\text{pH} = \text{pHs} + (E - E_S) / k,$$

in which E and E_S are the measured potentials where the galvanic cell contains the solution under test, represented by pH, and the appropriate *Buffer Solution for Standardization,* represented by pHs, respectively. The value of k is the change in potential per unit change in pH and is theoretically $[0.05916 + 0.000198(t - 25°)]$ volts at any temperature t. ~~This operational pH scale is established by assigning rounded pH values to the *Buffer Solutions for Standardization* from the corresponding National Institute of Standards and Technology *molal* solutions.~~

■■2S (*USP27*)
It should be emphasized that the definitions of pH, the pH scale, and the values assigned to the *Buffer Solutions for Standardization* are for the purpose of establishing a practical, operational system so that results may be compared between laboratories. The pH values thus measured do not correspond exactly to those obtained by the definition, $\text{pH} = -\log a_{H^+}$. So long as the solution being measured is sufficiently similar in composition to the buffer used for standardization, the operational pH corresponds fairly closely to the theoretical pH. Although no claim is made with respect to the suitability of the system for measuring hydrogen-ion activity or concentration, the values obtained are closely related to the activity of the hydrogen ion in aqueous solutions.

Where a pH meter is standardized by use of an aqueous buffer and then used to measure the "pH" of a nonaqueous solution or suspension, the ionization constant of the acid or base, the dielectric constant of the medium, the liquid-junction potential (which may give rise to errors of approximately 1 pH unit), and the hydrogen-ion response of the glass electrode are all changed. For these reasons, the values so obtained with solutions that are only partially aqueous in character can be regarded only as apparent pH values.

Change to read:

BUFFER SOLUTIONS FOR STANDARDIZATION OF THE PH METER

Buffer Solutions for Standardization are to be prepared as directed in the *accompanying table*.* Buffer salts of requisite purity can be obtained from the National Institute of Science and Technology. Solutions may be stored in ~~chemically resistant, tight containers, such as Type I glass bottles. Fresh solutions should be prepared at intervals not to exceed 3 months.~~ ■hard glass or polyethylene bottles fitted with a tight closure or carbon dioxide-absorbing tube (soda lime). Fresh solutions should be prepared at intervals not to exceed 3 months using carbon dioxide-free water.■2S (*USP27*)

The table indicates the pH of the buffer solutions as a function of temperature. The instructions presented here are for the preparation of solutions having the designated molal *(m)* concentrations. For convenience, and to facilitate their preparation, however, instructions are given in terms of dilution to a 1000-mL volume rather than specifying the use of 1000 g of solvent, which is the basis of the molality system of solution concentration. The indicated quantities cannot be computed simply without additional information.

pH Values of Buffer Solutions for Standardization

Temperature, °C	Potassium Tetraoxalate, 0.05 *m*	Potassium Biphthalate, 0.05 *m*	Equimolal Phosphate, 0.05 *m*	Sodium Tetraborate, 0.01 *m*	Calcium Hydroxide, Saturated at 25°
10	1.67	4.00	6.92	9.33	13.00
15	1.67	4.00	6.90	9.28	12.81
20	1.68	4.00	6.88	9.23	12.63
25	1.68	4.01	6.86	9.18	12.45
30	1.68	4.02	6.85	9.14	12.29
35	1.69	4.02	6.84	9.10	12.13
40	1.69	4.04	6.84	9.07	11.98
45	1.70	4.05	6.83	9.04	11.84
50	1.71	4.06	6.83	9.01	11.71
55	1.72	4.08	6.83	8.99	11.57
60	1.72	4.09	6.84	8.96	11.45

Potassium Tetraoxalate, 0.05 m—Dissolve 12.61 g of $KH_3(C_2O_4)_2 \cdot 2H_2O$ in water to make 1000 mL.

Potassium Biphthalate, 0.05 m—Dissolve 10.12 g of $KHC_8H_4O_4$, previously dried at 110° for 1 hour, in water to make 1000 mL.

Equimolal Phosphate, 0.05 m—Dissolve 3.53 g of Na_2HPO_4 and 3.39 g of KH_2PO_4, each previously dried at 120° for 2 hours, in water to make 1000 mL.

Sodium Tetraborate, 0.01 m—Dissolve 3.80 g of $Na_2B_4O_7 \cdot 10H_2O$ in water to make 1000 mL. Protect from absorption of carbon dioxide.

Calcium Hydroxide, saturated at 25°—Shake an excess of calcium hydroxide with water, and decant at 25° before use. Protect from absorption of carbon dioxide.

Because of variations in the nature and operation of the available pH meters, it is not practicable to give universally applicable directions for the potentiometric determinations of pH. The general principles to be followed in carrying out the instructions provided for each instrument by its manufacturer are set forth in the following paragraphs. Examine the electrodes and, if present, the salt bridge prior to use. If necessary, replenish the salt bridge solution, and observe other precautions indicated by the instrument or electrode manufacturer.

To standardize the pH meter, select two *Buffer Solutions for Standardization* whose difference in pH does not exceed 4 units and such that the expected pH of the material under test falls between them. Fill the cell with one of the *Buffer Solutions for Standardization* at the temperature at which the test material is to be measured. Set the "temperature" control at the temperature of the solution, and adjust the calibration control to make the observed pH value identical with that tabulated. Rinse the electrodes and cell with several portions of the second *Buffer Solution for Standardization,* then fill the cell with it, at the same temperature as the material to be measured. The pH of the second buffer solution is within ±0.07 pH unit of the tabulated value. If a larger deviation is noted, examine the electrodes and, if they are faulty, replace them. Adjust the "slope" or "temperature" control to make the observed pH value identical with that tabulated. Repeat the standardization until both *Buffer Solutions for Standardization* give observed pH values within 0.02 pH unit of the tabulated value without further adjustment of the controls. When the system is functioning satisfactorily, rinse the electrodes and cell several times with a few portions of the test material, fill the cell with the test material, and read the pH value. Use carbon dioxide-free water (see *Water* in the section *Reagents, Indicators, and Solutions*) for solution or dilution of test material in pH determinations. In all pH measurements, allow a sufficient time for stabilization.

Where approximate pH values suffice, indicators and test papers (see *Indicators and Indicator Test Papers,* in the section *Reagents, Indicators, and Solutions*) may be suitable.

For a discussion of buffers, and for the composition of standard buffer solutions called for in compendial tests and assays, see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions.*

* Commercially available buffer solutions for pH meter standardization, standardized by methods traceable to the National Institute of Standards and Technology (NIST), labeled with a pH value accurate to 0.01 pH unit may be used.

■For standardization solutions having a pH lower than 4, a labeled accuracy of 0.02 is acceptable.■2S (*USP27*)

Solutions prepared from ACS reagent grade materials or other suitable materials, in the stated quantities, may be used provided the pH of the resultant solution is the same as that of the solution prepared from the NIST certified material.

INTRODUCTION

~~Near-IR (NIR) spectroscopy is a specialized branch of spectroscopy and shares many of the attributes of other spectroscopic measurements discussed in *Spectrophotometry and Light-Scattering* ⟨851⟩. The NIR spectral region includes two subranges, each requiring a specific detector. For the short-wavelength IR, or Herschel range, that extends from 700 to 1100 nm, silicon-based photodetectors are suitable for measurements. Lower energies and longer wavelengths between 1100 and 2500 nm comprise the NIR subregion in which lead sulfide (PbS) or indium-gallium-arsenide (InGaAs) detectors are used. [NOTE—See the final section of this chapter, *Definition of Terms and Symbols*, for the terms and symbols referred to in this chapter and commonly employed in NIR spectroscopy.]~~

~~NIR spectroscopy is advantageous because quick and accurate measurements can often be made without destroying the sample. Molecular spectra in this region are dominated by overtones and combinations of fundamental vibrational modes, which are much weaker than the fundamental vibrations encountered in the mid-IR region. Because there is much less light absorption in the NIR range, radiation typically penetrates several millimeters into materials, including solids. Furthermore, many materials such as glass are relatively transparent in this region, so the optics in NIR spectrometers are comparatively robust and inexpensive. Fiber optic technology is readily implemented in the NIR range, which allows remote monitoring of processes in challenging environments.~~

~~Transmittance and Reflectance~~

~~Two different measurements commonly performed in the NIR spectral range are transmittance and reflectance.~~

~~TRANSMITTANCE, or direct sample absorption, measures the decrease in radiation intensity as a function of wavelength when radiation is passed through the sample. The sample, which must be relatively transparent to the radiation, is placed in the optical beam path between the source and the detector. This arrangement is analogous to that in many conventional spectrophotometers, and the results can be presented directly in terms of absorbance (see *Definition of Terms and Symbols*). Because tungsten filament lamp sources can be highly stabilized, many NIR instruments have the single-beam design. The intensity of the source radiation, I_o, is scanned and stored. Samples are then scanned, and their absorbances are calculated with the aid of the stored data. A variation of this technique called transflectance places a reflector behind the sample to double the path length. This configuration can be adapted to share the same instrument geometry with reflectance or fiber-optic probe systems where the source and the detector are on the same side of the sample.~~

~~REFLECTANCE, or diffuse reflectance, r, measures the ratio of the intensity of light reflected from the sample, I, to that reflected from a background or reference reflective surface, I_o (see *Definition of Terms and Symbols*). For these measurements, I_o, determined from a standard reflector, is an approximation of the energy incident on the sample surface. NIR radiation penetrates a substantial distance (1 to 3 mm) into the sample, where it can be absorbed by the vibrational combinations and overtones from the analyte species present in the sample. Unabsorbed radiation is reflected back from the sample. A plot of reflectance, as a function of wavelength in the NIR region, exhibits bands of low reflectance where light absorption has occurred. In many instances, these spectral bands adhere to Beer's law with respect to concentration of components in the mixture. [NOTE—Beer's law may not hold for all solid mixtures in NIR~~

In-Process Revision

reflectance. However, if calibration curves are established, quantitative work can be performed.] NIR reflectance spectra are typically treated in the same way as conventional absorption spectra, by calculating and plotting $\log(1/r)$ versus wavelength. In analogy to conventional transmittance spectrophotometry, this logarithmic form is commonly called "absorbance". However, the background spectrum (see *Definition of Terms and Symbols*) may differ substantially from the sample spectrum. Thus, artifacts, such as nonlinear bands, negative absorbances, or areas where the absorbance exceeds the dynamic range of the instrument, may appear.

Most NIR reflectance spectra are collected from samples such as powders or compressed heterogeneous solids such as whole tablets. Solids typically exhibit a broad upward slope in absorbance toward longer wavelengths. Variations in particle size, shape, compaction, and other physical differences between samples can cause shifts in spectral baselines and hence interfere with quantitation. Mathematical techniques are available to reduce or eliminate particle size dependence, if deemed necessary. The most common procedure is to take the first or second derivative of the spectrum. Derivatives are practical in the NIR region because of the low noise and high photometric precision. Where data are available on large numbers of nearly identical samples, multiplicative scatter correction (MSC) is an alternative to taking derivatives. The corrected absorbance spectra may then be used directly for quantitation. In pharmaceutical analysis, particle size information may be pertinent to the safety and effectiveness of the product. Thus, techniques aimed at eliminating particle size effects in NIR reflectance are applied on a case-by-case basis.

Other Factors Affecting Quantitation

Sample Temperature— This parameter is most important for solutions, especially aqueous solutions, where a difference of a few degrees can result in substantial changes. It appears to be less critical for solids in NIR reflectance but may need to be considered for accurate work. If sample temperature cannot be controlled, then it should be measured and recorded. These data can then be used to determine whether sample temperature affects the results, and if it does, then sample temperature data provide a basis upon which a suitable correction for temperature effects can be formulated. Various methods exist to calculate the appropriate temperature correction.

Moisture and Residual Solvents— Adsorbed moisture, which is nonchemically bound, and water of hydration contribute to bands in the NIR region. NIR methods for moisture determination have been developed. It is important to maintain consistent room humidity for samples affected by humidity variations. This problem may be avoided if samples are kept in, and measured directly through, sealed containers. Other residual solvents may also contribute to the spectrum.

Sample Thickness— Because NIR radiation is absorbed much less than mid-IR radiation, the light can penetrate several millimeters into the sample. It is important to use methods that ensure a consistent light path. To achieve this, the sample must be "infinitely" thick, or thinner samples of constant thickness must have a stable, diffusely reflecting backing material of constant, and preferably high, reflectivity. In measurements of reflectance, it is desirable to use samples that are optically infinitely thick at all wavelengths. That is, measurements of samples of various depths should demonstrate that their spectra do not change for sample depths greater than the chosen measurement depth. Where transmittance or transflectance of intact samples is possible, steps are taken to ensure that all method calibration standards and analytical samples are of the same optical thickness or reflected path length. For liquid samples, the same or a matching cell is used for backgrounds, references, and samples.

Sample Optical Properties— In solids, both surface and bulk scattering properties of calibration standards and analytical samples must be taken into account. Spectra of physically, chemically, or optically heterogeneous samples may require sample averaging by increasing the beam size or examining multiple samples. Certain factors, such as the differing degrees of sample compaction in powdered materials, can cause significant spectral differences. Glossiness of the surface finish of samples (e.g., coated tablets) may add a specular reflectance component to the observed NIR reflectance. Specular reflectance can distort the diffuse reflectance absorption peaks and may thereby interfere with quantitation.

Polymorphism— Because NIR reflectance can be measured directly for solid crystalline substances, variations in crystalline structure (polymorphism) influence the spectra. Hence, polymorphs as well as the amorphous solids may be distinguished from one another on the basis of their NIR spectra. Where multiple polymorphs can coexist in an otherwise chemically pure bulk drug substance, care must be taken to ensure that the calibration standards have a distribution of polymorphs matching that of the test specimen.

Age of Samples— Some samples may change their chemical, physical, or optical properties over time. Care must be taken to ensure that samples for NIR analysis are representative of those used for calibration. If samples of different age are to be analyzed, potential differences in properties must be accounted for in the calibration sample set.

■Near-infrared (NIR) spectroscopy is a branch of spectroscopy that shares many of the principles that apply to other spectroscopic measurements discussed in *Spectrophotometry and Light-Scattering* ⟨851⟩. The NIR spectral region includes two subranges. The short-wavelength or Herschel range extends from approximately 780 750 to 1100 nm, (~12,800–9000 cm^{-1}), (~13,333–9000 cm^{-1}), while longer wavelengths between 1100–2500 nm (~9,000–4000 cm^{-1}) comprise the traditional NIR region. In common with other spectrophotometric measurements, NIR is used for both qualitative and quantitative assessment of the chemical composition of samples. It may also be sensitive to physical properties of the sample. Measurements can be made directly on in-situ samples, in addition to standard sampling and testing procedures. Typical applications of NIR spectra utilize both wavelength and wavenumber units.

Vibrational spectroscopy in the NIR region is dominated by overtones and combinations that are much weaker than the fundamental mid-IR vibrations from which they originate. Because molar absorptivities in the NIR range are low, radiation typically penetrates several millimeters into materials, including solids. Furthermore, many materials

In-Process Revision

such as glass are relatively transparent in this region. Fiber-optic technology is readily implemented in the NIR range, which allows monitoring of processes in inaccessible, remote, and challenging environments.

The tests and criteria given in this chapter may not be appropriate for all instrument configurations, particularly on-line process analytical technology measurements. In such cases, alternative instrument qualification and performance checks should be scientifically justified.

Transmittance and Reflectance

Two different measurements commonly performed in the NIR spectral range are transmittance and reflectance.

TRANSMITTANCE, *T*, measures the decrease in radiation intensity as a function of wavelength when radiation is passed through the sample. The sample is placed in the optical beam between the source and the detector. This arrangement is ~~analogous to that in~~ similar to many conventional spectrophotometers, and the results can be presented directly in terms of absorbance. A variation of this technique, transflectance, places a reflector behind the sample so as to double the path length. This configuration can be adapted to share the same instrument geometry with reflectance or fiber-optic probe systems where the source and the detector are on the same side of the sample.

REFLECTANCE, *R*, measures the ratio of the intensity of light reflected from the sample, *I*, to that reflected from a background or reference reflective surface, I_r, NIR radiation can penetrate a substantial distance into the sample, where it can be absorbed by the vibrational combinations and overtones of the analyte species present in the sample. Nonabsorbed radiation is reflected back from the sample to the detector. NIR reflectance spectra are accessed by calculating and plotting $\log(1/R)$ versus wavelength. This logarithmic form is commonly called absorbance.

Factors Affecting Quantitation

The following list, although not exhaustive, includes many of the major factors affecting spectral response.

Sample Temperature—This parameter is most important for aqueous solutions, where a difference of a few degrees can result in ~~substantial~~ significant spectral changes. Temperature is also an important parameter for solids and powders containing water. Various methods exist to calculate the appropriate temperature correction.

Moisture and Residual Solvents—Moisture present in the sample and analytical system will contribute to bands in the NIR region. Other residual solvents may also contribute to the spectrum.

Sample Thickness—Sample thickness is a known source of spectral variability and must be understood and/or controlled. For example, in reflectance, the sample must be "infinitely" thick, or thinner samples of constant thickness must have a stable, diffusely reflecting backing material of constant, and preferably high, reflectivity.

Sample Optical Properties—In solids, both surface and bulk scattering properties of calibration standards and analytical samples must be taken into account. Spectra of physically, chemically, or optically heterogeneous samples may require sample averaging by increasing the beam size or examining multiple samples. Certain factors, such as differing degree of compaction or particle size in powdered materials and surface finish of samples, can cause significant spectral differences.

Polymorphism—Because NIR reflectance can be measured directly for solid crystalline substances, variations in crystalline structure (polymorphism) influence the spectra. Hence, polymorphs, as well as the amorphous form of a solid, may be distinguished from one another on the basis of their NIR spectra. Where multiple polymorphs can coexist in an otherwise chemically pure bulk drug substance, care

must be taken to ensure that the calibration standards have a distribution of polymorphs relevant to the intended application.

Age of Samples—Samples may exhibit changes in their chemical, physical, or optical properties over time. Care must be taken to ensure that samples for NIR analysis are representative of those used for calibration. If samples of different age are to be analyzed, potential differences in properties must be accounted for in the calibration sample set.■2S (*USP27*)

■~~**NEAR-INFRARED REFLECTANCE REFERENCES**~~

~~NIR reflectance relies on a background spectrum for the calculation of absorbance. The references (for instance, powders such as barium sulfate or polytetrafluoroethylene and solids such as ceramic or sintered polytef plate) perform essentially the same function in the reflectance measurements as do the solvent blanks in the transmittance measurements. Most NIR measurements are performed in single-beam instruments: the reflectance of a background reference is scanned to obtain a baseline, and then the reflectance of one or more analytical samples is measured. An important property of a reflectance background reference is its uniform reflectance response as a function of wavelength across the spectral range of the instrument. If the background reflectance is not uniform with wavelength, a correction must be calculated. Another important property of the reference is its stability over time. Only spectra measured against the same background reference can be compared with one another. In order to minimize positioning effects, the diameter of the reference sample is at least 125% that of the beam. From measurements in which the background is used as a reference and a sample, a spectrum of the inherent instrument noise as a function of wavelength can be obtained. [NOTE—Instruments based on an integrating sphere geometry can use a sample of the sphere material for the noise measurement.]~~■2S (*USP27*)

Delete the following:

■~~**APPARATUS**~~

~~All NIR measurements are based on passing light radiation through, or into, a sample and measuring the attenuation of the emerging (transmitted or reflected) beam. There is a variety of spectrophotometers and spectrometers based on different operating principles. Dispersive devices include double-beam extended-range UV-visible spectrophotometers, single-beam grating-based rapid-scanning spectrometers, and diode-array spectrometers. Filter technology is employed in fixed- or multiple-wavelength instruments as well as acousto-optical tunable filter (AOTF) spectrometers. Extended range Fourier-transform IR (FTIR) spectrometers are also available. Silicon, lead sulfide, or indium gallium arsenide are the most commonly used detector materials. Conventional cuvette sample holders, fiber-optic probes, transmission dip cells, and spinning or traversing sample holders are some of the more common sampling arrangements.~~

~~Many NIR instruments are designed with easy-to-use or automatic, built-in calibration procedures. Therefore, theoretically, it is only necessary to require that such calibrations be done and to specify how often they are to be performed to maintain quality control. In most cases, the autocalibration setup utilizes special internal parts incorporated into the instrument design for this purpose. Because the optical configuration used in the built-in calibration may differ physically from that used in the specific analytical measurement, this configuration is not necessarily applicable to analytical measurements. Also, the commonly employed internal polystyrene film reference calibrator may be subject to aging and attack by solvents and vapors in the laboratory environment. Methods for internal instrument calibration may vary depending on instrument manufacturer, instrument model, or software version. Therefore, detailed functional validation employing external reference standards is required to demonstrate instrument suitability. The use of external reference standards does not imply the omission of the usual internal quality control procedures; rather, it provides independent documentation of the ability of the instrument to perform the specific analysis.~~■2S (*USP27*)

Add the following:

■**INSTRUMENTATION**

Apparatus

All NIR measurements are based on passing light radiation through or into a sample and measuring the attenuation of the emerging (transmitted, scattered, or reflected) beam. There are a variety of spectrophotometers available based on different operating principles.

Some examples of currently available spectrophotometers are the following: filter and grating-based dispersive, acousto-optical tunable filter (AOTF), ~~and~~ Fourier-transform (FT-NIR), and liquid crystal tunable filters (LCTF) systems. Silicon, lead sulfide, indium gallium arsenide and deuterated triglycine sulphate are commonly used detector materials. Conventional cuvette sample holders, fiber-optic probes, transmission dip cells, and spinning or traversing sample holders are some of the more common sampling arrangements.

The selection of the equipment should be based on the intended application, with particular attention being paid to the suitability of the sampling device for the type of sample to be analyzed.

In-Process Revision

Near-Infrared Reflectance References

NIR references, by providing a known stable measurement against which other measurements can be compared, are used to eliminate instrumental variations that would affect the measurements.

Transmittance Mode—The measurement of transmittance is dependent on a background transmittance spectrum for its calculation. A transmittance reference can be air, an empty cell, a solvent blank, or in special cases, a reference sample.

Reflectance Mode—The measurement of reflectance is dependent on a background reflectance spectrum for its calculation. Most measurements are performed in single-beam instruments; the reflectance of a background reference is scanned to obtain a baseline, and then the reflectance of one or more analytical samples is measured. Common reflectance references are ceramic, perfluorinated polymers and gold; other suitable materials may be used. Only spectra measured against a background possessing the same optical properties can be directly compared with one another.

Qualification of NIR Instruments

Elements of Qualification—The qualification of an NIR instrument can be divided into three elements:

- Installation Qualification (IQ)
- Operational Qualification (OQ)
- Performance Qualification (PQ)

Installation Qualification—The IQ requirements help ensure that the hardware and software are installed according to vendor and safety specifications at the desired location.

Operational Qualification—In operational qualification, the instrument's performance is controlled with respect to external certified standards to verify that the system operates within target specifications. The purpose of operational qualification is to ensure that an instrument is suitable for its intended application. Because there are so many different approaches to measuring NIR spectra, operational qualification ~~employs traceable external standards that can be used on any instrument.~~ with traceable external standards that can be used on any instrument is desired. The most important property of a reference material is its stability. For example, the commonly employed internal polystyrene-film reference may be subject to aging and attack by solvents and vapors in the laboratory environment. The use of external traceable reference standards does not imply the omission of the instrument's internal quality control procedures. Similiar to any spectrophotometric device, NIR instruments need to be qualified for both wavelength and photometric scale. Maximum and reduced light-flux noise tests are also included.

Performance Qualification—In performance qualification, a quality of fit to an initial scan or group of scans included in the operational qualification is employed. In such an analysis, it is assumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best ones available. Comparisons of spectra taken over time on the identical reference standards form the basis for evaluating the long-term stability of an

NIR measurement system. The objective is to ensure that no wavelength calibration shift or change in sensitivity occurs during ongoing analysis.

Previous operational qualification has shown that the equipment is acceptable for use; therefore, a single performance ~~verification~~ qualification standard can be used to re-verify performance on a continuing basis. The user may have a method-specific reference sample to perform this kind of control, providing the sample is stable.

Test Details—The specific tests and how frequently they are performed for each level of qualification is dependent on the instrument and intended application.

Wavelength Uncertainty—Potential problems with internal calibration schemes are avoided by specifying appropriate independent external wavelength standards. For the reflectance mode, NIST SRM 1920a[1] and NIST SRM 2035[2] used in the transflectance mode are available. The nature and type of background reference standard must be specified. In transmittance measurements, NIST SRM 2035 rare earth oxide in glass standard, or Holmium oxide solution NIST SRM 2034[3] are available. ~~These standards can be substituted by other traceable wavelength standards.~~ Alternative standards may be used with appropriate justification.

Take one spectrum (with the same spectral resolution used to obtain the certified value) and measure the position of at least three peaks to cover the entire available range. The acceptance limits for SRM 1920a are reported in *Table 1*.

[1] A mixture of dysprosium, holmium, and erbium, NIST SRM 1920a may be obtained from NIST, Gaithersburg, MD 20899: "A Wavelength Standard for the Near-Infrared Based on the Reflectance of Rare Earth Oxides," *J. Res. Natl. Bur. Stds.* **1986,** *91*(5), 243–253. This reference material exhibits useful calibration peaks in the 700- to 2500-nm range. Because there is no available calibration peak above 2000 nm in SRM 1920a, an instrument cannot be considered wavelength-qualified in the 2000- to 2500-nm range.

[2] A rare earth oxide in glass transmission wavelength standard, SRM 2035, has been certified recently by NIST. "Production and Verification of SRM 2035. Near Infrared Transmission Wavelength Standard", *NIST Special Publication* **1999**, 260-102 (in preparation). This standard may be used in transflectance mode, but it is not currently certified for such use.

[3] Holmium oxide solution, NIST SRM 2034, (wavelength standard from 240 to 650 nm) may be used currently in the 650- to 1100-nm region although bands are not certified in this region. "Holmium Oxide Solution wavelength Standard from 240 to 640 nm-SRM 2034", *NBS Special Publication* **1986**, 260-102; "Spectral Transmittance Characteristics of Holmium Oxide in Perchloric Acid", *J. Res. Natl. Bur. Stds*., **1985**. *90*(2), 115–125.

Table 1. Recommended Near-IR Instrument Specifications[a]

Wavelength Uncertainty	SRM 1920a peaks[b] occur at 1261, 1681, and 1935 nm	
Tolerances	±1 nm at 1200 nm	or ±8 cm^{-1} at 8300 cm^{-1}
	±1 nm at 1600 nm	or ±4 cm^{-1} at 6250 cm^{-1}
	±1.5 nm at 2000 nm	or ±4 cm^{-1} at 5000 cm^{-1}
Photometric Linearity	A_{OBS} vs A_{REF} at 1200, 1600, and 2000 nm;[c]	
	slope = 1.0 ± 0.05; intercept = 0.0 ± 0.05	
Spectrophotometric Noise	measured for 100-nm (300 cm^{-1}) segments between 1200 and 2200 nm (8300 and 4500 cm^{-1})	
Average RMS for measurements at high-light flux	less than 0.3×10^{-3}; no RMS noise greater than 0.8×10^{-3}	
Average RMS for measurements at low-light flux	less than 1×10^{-3}; no RMS noise greater than 2.0×10^{-3}	

[a] A maximum nominal instrument bandwidth of 10 nm at 2500 nm or 16 cm^{-1} at 4000 cm^{-1} is appropriate for most applications.

[b] The nominal 1935-nm peak is sensitive to instrument bandwidth. Use the wavelength value supplied with SRM 1920a at the appropriate instrument bandwidth to determine wavelength uncertainty.

[c] A_{OBS} is the observed absorbance, and A_{REF} is the tabulated absorbance of the reference reflectors at each of the three specified wavelengths.

Photometric Linearity—Verification of photometric linearity is demonstrated with a set of transmission standards of known relative transmittance or reflectance standards of known relative reflectance, usually expressed as percent transmittance or reflectance. For reflectance measurements, traceable carbon-doped polymer standards are available. Spectra obtained from reflectance standards are subject to variability as a result of the difference between the experimental conditions under which they were factory-calibrated and those under which they are subsequently put to use. Hence, the percent reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an "absolute" calibration for a given instrument. Provided that (1) the standards do not change chemically or physically, (2) the same reference background is used as was used to obtain the certified values, and (3) the instrument measures each standard under identical conditions (including precise sample positioning), the reproducibility of the photometric scale will be established over the range of standards used. Subsequent measurements on the identical set of standards give information on long-term stability. Use at least four reference standards in the range 10% to 90%. [NOTE—A typical set of four reflectance references might be 10%, 20%, 40%, and 80% with 1.0, 0.7, 0.4, and 0.1 as their respective absorbances.] If the system is used for analytes with absorbances higher than 1.0, add a 2% or a 5% standard, or both, to the set. The specifications are reported in *Table 1*.

Spectrophotometric Noise—NIR instrument software may include built-in procedures to automatically determine system noise and to provide a statistical report of noise or signal-to-noise ratio over its operating range. As previously

discussed, it is desirable to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. If the qualification procedures in the NIR software do not comply with the contents of this chapter, it is recommended to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. The method involves measuring spectra of high- and low-reflectance traceable reference materials. For transmittance modules there are no standards for the low-flux noise test at this time, so it is only possible to perform the high-flux noise test.

HIGH-FLUX NOISE—The instrument noise is evaluated at high-light flux by measuring reflectance or transmittance of the reference standard, with the reference material (e.g., 99%, reflectance standard) acting as both the sample and the background reference. The analysis is performed by tabulating RMS noise levels in successive nominal 100-nm (300 cm^{-1}) spectral segments across the instruments range. The limits are reported in *Table 1*.

LOW-FLUX NOISE—The same procedure may be used with a lower-reflectivity reference material (e.g., 10% reflectance standard) to determine system noise at reduced light flux. The source, optics, detector, and electronics make significant contributions to the noise under these conditions. The limits are reported in *Table 1*.■2S (*USP27*)

Delete the following:

■~~QUALIFICATION AND VERIFICATION OF NEAR INFRARED INSTRUMENTS~~

~~The suitability of a specific instrument for use in a given method is ensured by both the routine, periodic instrument operational qualifications and the more frequent performance verifications (see *Definition of Terms and Symbols*). The purpose of instrument qualification is to ensure that an instrument is suitable for its intended application and, when requalified periodically, continues to function properly over extended time periods. When the device is used for a specific qualitative or quantitative analysis, regular performance verifications are made. Because there are many different approaches to measuring NIR spectra, instrument operational qualification and performance verification employ external standards that can be used on any instrument. As with any spectrophotometric device, an NIR instrument needs to be qualified for both wavelength accuracy and absorbance- or reflectance-scale photometric precision. Maximum and reduced light flux noise tests are also included.~~

~~In performance verification, a quality of fit to an initial scan or group of scans included in the instrument qualification is employed. In such analysis, it is assumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best available. Comparisons of spectra taken over time on the identical reference standards form the basis for evaluating the long-term stability of an NIR measurement system.~~

~~NOTE—Some instrument software may impose smoothing (see *Definition of Terms and Symbols* and *Spectrophotometric Noise*) to remove noise effects. Smoothing is to be set at a minimum or made to match the required operating conditions for the analysis. The number of scans averaged matches that used in regular operation.~~

~~Frequency of Testing~~

~~Instrument qualification is performed at designated intervals or following a repair or optical reconfiguration, such as lamp replacement or substitution of a tablet analyzer accessory by a fiber optic probe. Tests include wavelength uncertainty, absorbance scale linearity, and high- and low-light flux noise tests. Instrument qualification tests require that specific tolerances be met. If the normal reference standards cannot be used with the operating instrument configuration, then a suitable alternate standard is run in that configuration for use in the performance verification.~~

In-Process Revision

Performance verification is carried out on the instrument configured for measurements and is done more frequently than instrument qualification. Performance verification includes wavelength uncertainty, absorbance scale linearity, and high light level noise tests. Wavelength uncertainty and absorbance scale linearity tests may be needed prior to any data collection on a given day. Performance is verified by matching the current spectra to those collected during the previous instrument qualification.

Instrument Operational Qualification

Wavelength uncertainty, photometric linearity, and spectrophotometric noise level specifications recommended for many pharmaceutical analysis applications are shown in *Table 1*. Validation of an analytical method requires establishment of the suitability through testing of each of these specifications. [NOTE—Specifications in *Table 1* are based on the results of a collaborative study. The same principles apply outside of the range covered in this discussion.]

Table 1. Recommended Near-IR Instrument Specifications[a]

Wavelength Uncertainty Tolerances	SRM 1920a peaks[b] occur at 1261, 1681, and 1935 nm	
	±1 nm at 1200 nm	or ±8 cm^{-1} at 8300 cm^{-1}
	±1 nm at 1600 nm	or ±4 cm^{-1} at 6250 cm^{-1}
	±1.5 nm at 2000 nm	or ±4 cm^{-1} at 5000 cm^{-1}
Photometric Linearity	A_{OBS} vs A_{REF} at 1200, 1600, and 2000 nm;[c] slope = 1.0 ± 0.05; intercept = 0.0 ± 0.05	
Spectrophotometric Noise	measured for 100 nm (300 cm^{-1}) segments between 1200 and 2200 nm (8300 and 4500 cm^{-1})	
Average RMS for measurements—at high light flux	less than 0.3×10^{-3}; no RMS noise greater than 0.8×10^{-3}	
Average RMS for measurements—at low light flux	less than 1×10^{-3}; no RMS noise greater than 2.0×10^{-3}	

[a] A maximum nominal instrument bandwidth of 10 nm at 2500 nm or 16 cm^{-1} at 4000 cm^{-1} is appropriate for most applications.
[b] The nominal 1935-nm peak is sensitive to instrument bandwidth. Use the wavelength value supplied with SRM 1920a at the appropriate instrument bandwidth to determine wavelength uncertainty.
[c] A_{OBS} is the observed absorbance, and A_{REF} is the tabulated absorbance of the reference reflectors at each of the three specified wavelengths.

Wavelength Uncertainty—[NOTE—The method used in developing wavelength uncertainty values is based on the NIST Center of Gravity algorithm.] Potential problems with internal calibration schemes are avoided by specifying appropriate independent external wavelength standards. For the reflectance mode, the NIST SRM 1920a reflectance standard is preferred.[1] Standards containing dysprosium or holmium oxide are available. The nature and type of background reference standard must also be specified. In transmittance measurements, the corresponding rare earth solution[2] or glass standards can be used. Solid or sealed standards can be maintained similarly to a set of calibration weights to provide information on long-term stability.[3]

Photometric Linearity—Photometric qualification is based on a set of transmission or reflectance standards of known relative transmittance, or reflectance, usually expressed as percent transmittance or reflectance. Spectra obtained from reflectance standards are subject to variability due to the difference between the experimental conditions under which they are factory calibrated and those under which they are subsequently used. Hence, the percent reflectance values supplied with a set of calibration standards may not be useful to establish an "absolute" calibration for a given instrument. However, as long as the standards have the same physical description, the same reference background is used, and the target instrument measures each under identical settings, the reproducibility of the photometric scale will be established over the range of standards used. Subsequent measurements on the identical set of standards give information on long-term stability. For analytes with absorbances below 1.0, use at least four reference standards in the range 10% to 90%. [NOTE—Lead sulfide or indium gallium arsenide detectors have nearly linear response to absorbances below 2.0, but the instrument design can affect the overall response linearity; hence, a need for multipoint calibrations arises.] For analytes with absorbances that exceed 1.0, add a 2% or a 5% standard, or both, to the regular set.

Spectrophotometric Noise—NIR instrument software may include built in procedures to automatically determine system noise and to provide a statistical report of noise or signal-to-noise ratio over its operating range. Significant changes in the tabulated noise level could signal the need for service. As previously discussed, it is desirable to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. The method involves measuring spectra of high- and low-reflectance reference materials. The root-mean-square or peak-to-peak noise values (see *Definition of Terms and Symbols*) in the resulting spectra can then be compared to baseline values established for the instrument on the same reference standard used during the last instrument qualification cycle. Peak-to-peak noise comparison can be carried out by visual inspection of overlaid plots. Preferably, a more thorough analysis is performed by tabulating the root-mean-square (RMS) noise level in successive 100-nm (300-cm^{-1}) spectral segments across the instrument's range (see *Definition of Terms and Symbols*). Calculate the RMS noise in the range from 1200 to 2200 nm by selecting a nominal wavelength every 100 nm and by combining all data points in the range ±50 nm from the nominal wavelength; for example, at 1200 nm use all the points collected from 1150 to 1250 nm (see *Table 1*). Find the mean signal strength over the range, and then calculate the root-mean-square deviations from this mean. Use of deviations from the mean value in a range reduces the effect imparted by differences between the two scans.

The instrument noise is evaluated at high light flux by measuring reflectance of the reference standard, the reference standard acting as the sample and the background reference. This gives the

[1] A mixture of dysprosium, holmium, and erbium, NIST SRM 1920 may be obtained from NIST, Gaithersburg, MD 20899: "A Wavelength Standard for the Near-IR Based on the Reflectance of Rare Earth Oxides," *J Res Natl Bur Stand* **1986,** *91(5)*:243–253. This reference material exhibits useful calibration peaks in both the 700- to 1100-nm and 1100- to 2500-nm ranges. Because there is no available calibration peak above 2000 nm in SRM 1920, an instrument cannot be considered wavelength qualified in the 2000- to 2500-nm range.

[2] Holmium oxide solution, NIST SRM 2034, (wavelength standard from 240 to 650 nm) may be used currently in the 650- to 1100-nm region although bands are not certified in this region.

[3] A rare earth oxide in glass transmission wavelength standard, SRM 2035, has been certified recently by NIST. This standard may be used in transflectance mode, but it is not currently certified for such use.

~~inherent noise as a function of wavelength at high light flux. Because this measurement can be done whenever a new reference background is collected, very frequent noise checks can be made easily.~~

~~In a similar procedure, noise measurements using a lower reflectivity reference material, a 10% or less reflectance standard being recommended, are obtained to determine system output at reduced light flux. This occurs when a highly absorbing or very low reflectance sample is measured. The source, optics, detector, and electronics make significant contributions to the noise under these conditions.~~

~~Performance Verification~~

~~The objective is to ensure that no sudden wavelength calibration shift or change in sensitivity occurs during the analysis. Once an instrument has been set up for a specific analytical measurement, it may no longer be possible or desirable to measure the wavelength and photometric qualification reference standards as described above. Provided instrument operational qualification has shown that the equipment is acceptable for use, a single external performance verification standard can be used to reverify function on a continuing basis. The performance verification standard matches the format of the samples in the current analysis as closely as possible and uses the same background spectrum. For example, for tablet samples use a performance verification tablet of approximately the same size and shape and allow scanning conditions to remain identical.[4] Quantitative measurement of this external performance verification standard spectrum checks both the wavelength calibration and the photometric accuracy. Favorable comparison of a series of performance verification spectra demonstrates proper continued operation of the instrument.~~ ■2S (*USP27*)

Add the following:

▪METHOD VALIDATION

Introduction

The objective of the validation of an NIR method, as in the case with the validation of any analytical procedure, is to demonstrate that it is suitable for its intended purpose. Quantitation by NIR is performed by reference to data obtained from a primary method or a calibration set of samples having known composition.

Although NIR is somewhat different from conventional analytical techniques such that validation is generally achieved through the assessment of specialized chemometric parameters, these parameters can still be related to the fundamental validation characteristics required for any analytical method.

Data pretreatment is often a vital step in the chemometric analysis of NIR spectral data. It can be defined as the mathematical transformation of the NIR spectral data to enhance spectral features and/or remove or reduce unwanted sources of variation prior to the development of the calibration model. Calibration is the process of constructing a mathematical model to relate the response from an analytical instrument to the properties of samples. Many suitable chemometric algorithms for data pretreatment and calibration exist; the selection should be based on suitability for the intended use. Any available data transform or algorithm that can be clearly defined in an exact mathematical expression and gives suitable results can be used.

Validation Parameters

Analytical performance characteristics that should be considered for demonstrating the validation of NIR methods are similar to those required for any analytical procedure. A discussion of the general principles that apply is found in *Validation of Compendial Methods* ⟨1225⟩. These principles should be considered typical for NIR procedures, but exceptions should be dealt with on a case-by-case basis. For qualitative NIR methods, refer to *Analytical Performance Characteristics for Category IV* assays under *Validation of Compendial Methods* ⟨1225⟩; quantitative NIR methods will correspond to the *Analytical Performance Characteristics* for *Category I* and *Category II* assays in the chapter. Specific acceptance criteria for each validation parameter must be consistent with the intended use of the method. The samples used for validation should be independent of the calibration set.

[4] ~~USP has two materials suitable for performance verification. For powder work, Calcium Ascorbate is available as a reference calibrator. For most tablets, Acetaminophen Tablets can be supplied as a reference material.~~

In-Process Revision

Specificity—The extent of specificity testing is dependent on the intended application. Lack of specificity of the NIR method can be compensated by other supporting analytical procedures.

Demonstration of specificity in NIR methods may be accomplished by using the following approaches:

Qualitative

- Potential challenges should be presented to the spectral reference library. These can be materials received on site that are similar to library members in visual appearance, chemical structure, or by name. These challenges must fail identification. Independent samples of materials represented in the library, but not used to create it (i.e., different batches, blends), must give positive identifications when analyzed.

Quantitative

- Wavelengths used in the calibration model can be compared to the known bands of the analyte of interest and those of the matrix to verify that the bands of the analyte of interest are being used in the calibration.
- Wavelengths used for the calibration (e.g., for multiple linear regression models (MLR) or the loadings for the factors used (e.g., for partial least squares [PLS] or principal component regression [PCR] models) can be examined to ~~check if they are using the actual spectroscopic information~~ verify that the actual spectroscopic information results from the analyte of interest.
- For PLS and PCR calibrations, the coefficients can be plotted and the regions of large coefficients compared with the spectrum of the analyte.
- ~~Quantitative measurements may be demonstrated in the presence of variations in the matrix, within the specified method range.~~ Variations in the sample matrix may be shown to have no significant effect on quantitation of the analyte within the specified method range.

Linearity—The validation of NIR linearity involves the demonstration of correlated NIR response to samples distributed throughout the defined range of the calibration model.

Demonstration of linearity in NIR methods may be accomplished using the following approaches:

- The slope and y-intercept (bias) for the predicted validation set can be used together with a plot of the data. Many statistical methods are available for evaluation of the significance of the slope and bias. Other applicable statistics may be used as appropriate.
- Statistical tests such as Durbin–Watson are available for the determination of linearity. Other applicable statistics may be used as appropriate.

The correlation coefficient, ~~r^2~~; r; is not a true measure of linearity, but is rather a measure of the fraction of variation in the data that is adequately modeled by the equation. It is dependent on the standard error of the calibration equation (and hence the reference method) and on the range of the calibration data.

Range—The range of analyte reference values in the validation set defines the range of the NIR method. The range of analyte reference values also effectively defines the quantitation limits for an NIR method. Controls must be in place to ensure that results outside the validated range are not accepted. In certain circumstances, it may not be possible or desirable to extend the validated range to cover the specifications or expected process variability for the entire life cycle of the process. Examples of situations in which only a limited sample range may be available are samples from a controlled manufacturing process and in-process samples. A limited sample set does not preclude the use of an NIR method.

The validation procedure for a quantitative NIR method should generate an outlier result when a sample containing analyte outside of the calibration range is measured. This

outlier result does not necessarily indicate an out-of-specification result. An outlier result from the NIR measurement indicates that further testing of the sample is required. If subsequent testing of the sample by an appropriate method indicates that the analyte content is within specifications, then the sample should be considered to have met those specifications. Thus, measurement of a sample by NIR may generate an outlier result and the sample may still meet specifications for the analyte of interest. For qualitative methods, a batch of material may be outside the space of the original calibration data and fail the identification specification. Acceptable identification of the material must then be established by other appropriate methods.

Accuracy—Accuracy for NIR methods is demonstrated by correlation of NIR results with analytical reference data.

Demonstration of accuracy in NIR methods may be accomplished using the following approaches:

- Accuracy can be indicated by how close the standard error of prediction (SEP) is to the standard error of the reference method used for validation. The error of the reference method may be known on the basis of historical data or a determination of standard error of the laboratory (SEL) may be carried out.
- Several statistical comparison methods can be applied to the predicted validation set and reference values to determine if there is any statistical difference between the results of each method at a specified confidence limit (e.g., paired t-test, bias evaluation).

Precision—Precision of an NIR method expresses the closeness of agreement between a series of measurements under the prescribed conditions. There are two levels of precision that may be considered: repeatability and intermediate precision. The precision of an NIR method is typically expressed as the relative standard deviation of a series of predictions and should be equivalent or better than the precision of the reference method used for validation.

Demonstration of precision in NIR methods may be accomplished using the following approaches:

Repeatability

- Statistical evaluation of a number of replicate measurements of the same sample without variation in sample position.
- Statistical evaluation of multiple sample positionings or aliquots, as appropriate.

Intermediate Precision

- Statistical evaluation of a number of replicate measurements by different analysts on different days.

Robustness—The challenges performed in this category will vary depending on the application and sampling technique. Some of the challenges may be covered as part of the development of the method.

Typical challenges are the following:

- Effect of environmental conditions (e.g., temperature, humidity)
- Effect of sample temperature
- Sample handling (e.g., probe depth, compression of material, sample depth/thickness, sample position)
- Influence of instrument changes (e.g., lamp change, warm up time)

Ongoing Model Evaluation

NIR models validated for use should be the subject of ongoing performance evaluation, which may include the monitoring of accuracy, precision, or other suitable parameters. If unacceptable performance is indicated, corrective action will be necessary. This will involve initial investigations into the cause of the discrepancy and may indicate that the calibration model is not performing satisfactorily. Main-

tenance of the model will then be required and may involve revalidation of the model. The degree of revalidation required depends on the nature of the changes. Appropriate change controls should be established to cover these procedures.

Revalidation of a qualitative model may be necessary as a result of the following:

- Addition of a new material to the spectral reference library
- Changes in the physical properties of the material
- Changes in the source of supply
- Coverage of a wider range of characteristics of a material

Revalidation of a quantitative model may be necessary as a result of the following:

- Changes in the composition of the finished product
- Changes in the manufacturing process
- Changes in the sources or grades of raw materials
- Changes in the reference analytical method
- Major changes to the instrument hardware

Model Transfer

The model for an NIR method is developed, stored and applied in electronic form as part of an appropriate instrument/software package. When a model is transferred to another instrument, procedures and criteria must be applied to demonstrate that the model remains valid on the second instrument. In general, electronic model transfer is only recommended for another instrument of the same type and configuration. A number of model transfer procedures exist and can be applied as appropriate. Procedures involve the use of various chemometric (mathematical and statistical) approaches with appropriate validation.■2S (*USP27*)

Delete the following:

■~~DEFINITION OF TERMS AND SYMBOLS~~

~~ABSORBANCE, *A*, is represented by the equation:~~

~~$$A = -\log(I/I_o) \text{ or } A = -\log T = \log(1/r),$$~~

~~in which, in transmittance measurements, I_o is the intensity of the radiant energy from the source, and includes losses due to solvent absorption, refraction, and scattering when the sample is not present; or in reflectance measurements, I_o is the intensity of radiation indirectly reflected from the background reference material, and also incorporates any losses independent of the sample; I is the intensity of the radiation, at the same wavelength, passing through or reflected from the sample; and T and r are the transmittance and the reflectance, respectively.~~

~~ABSORBANCE SPECTRUM is a display or plot of absorbance as a function of wavelength, in nm, or energy, in cm^{-1}.~~

~~BACKGROUND SPECTRUM is also referred to as a reference spectrum, background reference, or, for reflectance, a white standard. This is a spectrum of transmitted or reflected light intensity as a function of wavelength that does not contain any spectral features due to the analyte. In reflectance measurements, a highly reflective standard reference material is used. A ratio of this spectrum to that of the sample radiation intensities produces a transmittance or reflectance spectrum.~~

~~DATA RESOLUTION is the spacing, in nm or cm^{-1}, between the data points collected in a spectrum.~~

~~DIFFUSE REFLECTANCE is that portion of radiated light penetrating the sample surface, interacting with the analyte material, and being reflected back to the detector. This is the component of the overall reflectance that produces the absorbance spectrum of the sample.~~

~~FIBER OPTIC PROBES generally used in NIR reflectance comprise two components: an optic fiber, which may vary in length and in the number of fibers, and a terminus, which contains specially designed optics for examination of the sample matrix.~~

~~FIBER OPTIC PROBE CONFIGURATION is an instrument setup that incorporates the use of a fiber optic probe. Small lengths of fiber used as components of sampling interfaces are not included in this configuration.~~

~~INSTRUMENT BANDWIDTH—See *Spectral Resolution*.~~

~~INSTRUMENT OPERATIONAL QUALIFICATION, also referred to as instrument qualification, is the process of providing documented evidence that the instrument performs according to its specifications, and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, major repair, and so forth.~~

~~INSTRUMENT VERIFICATION—See *Performance Verification*.~~

~~METHOD VALIDATION is the process of establishing and documenting that a developed method of analysis is suitable for its intended application.~~

~~MULTIPLICATIVE SCATTER CORRECTION (MSC) is the spectral preprocessing technique for samples with similar profiles used to minimize spectral differences arising from the discrepancies in characteristics such as particle size, shape, and packing. Other algorithms are also available.~~

~~NOISE SPECTRUM—See *Spectrophotometric Noise*.~~

~~PEAK-TO-PEAK NOISE is the difference between the maximum and the minimum values of absorbance defined within a restricted wavelength or energy range of a noise spectrum.~~

~~PERFORMANCE VERIFICATION, also known as instrument verification, is the process of using one or more well-characterized and stable reference materials to verify that instrument response is equivalent to that previously characterized. Verification may employ the same or different standards for different performance characteristics.~~

In-Process Revision

PERFORMANCE VERIFICATION STANDARD is a reference material used to establish consistent instrument performance with respect to wavelength and absorbance scale precision.

PHOTOMETRIC PERFORMANCE VERIFICATION, also referred to as the absorbance scale performance verification, is the process of verifying the response of the photometric scale of an instrument. This requires a minimum of four transmittance or reflectance standards spanning the range from 10% to 90%. [NOTE—A typical set of four reflectance references might be 10%, 20%, 40%, and 80% with 1.0, 0.7, 0.4, and 0.1 as their respective absorbances.] Transmittance standards are not currently available.

POLYMORPHISM is the property of crystallizing in two or more crystalline forms. Such solids, called polymorphs, have the same chemical composition (empirical formula) and molecular structure but differ in the arrangement or conformation of the molecules in the crystal lattice.

REFERENCE SPECTRUM—See *Background Spectrum*.

REFLECTANCE is described by the equation:

$$r = I/I_0;$$

in which I is the intensity of radiation reflected from the surface of the sample; and I_0 is the intensity of radiation reflected from a background reference material and incorporates losses due to solvent absorption, refraction, and scattering.

ROOT MEAN SQUARE (RMS) NOISE is reported for the mid-point of the selected spectral range, and it is calculated by the equation:

$$RMS\ Noise = \sqrt{\frac{1}{N}\sum_{i}^{Segment}(A_i - \bar{A})^2},$$

in which A_i is the absorbance for each data point; and $\bar{A}$ is the mean absorbance over the spectral segment, typically 100-nm segment, of N data points.

SMOOTHING is the process of averaging or otherwise fitting neighboring data points in a spectrum to achieve noise suppression.

SPECTRAL RESOLUTION, also called instrument bandwidth, is a measure of the ability of a spectrometer to separate adjacent narrow spectral lines. Spectral resolution of an instrument is affected by all optical elements in the system, namely, the source geometry, apertures, lenses, mirrors, detector elements, diffraction grating, etc. The line width at half intensity of a narrow-band laser source or a very sharp absorption peak can be used to measure resolution.

SPECTROPHOTOMETRIC NOISE is also referred to as noise spectrum. High flux and low flux determinations exist. In high flux transmittance measurements, the baseline absorbance spectrum is obtained in the absence of the sample. For high flux reflectance measurements, the absorbance spectrum of the 100%r standard reference material is obtained using the same 100%r standard as the reference and the sample. Low flux transmittance spectrum employs a 10%T neutral density reference filter. [NOTE—In single-beam transmittance, the 10%T filter may be used as the reference spectrum.] For low flux reflectance measurement, the absorbance spectrum of a 10%r standard material is obtained by using the same 10%r standard as the reference spectrum.

SPECULAR REFLECTANCE, also known as mirror reflection, is that portion of the radiation not interacting with the sample but simply reflecting back from the sample surface layer (sample-air interface).

TRANSFLECTANCE is a transmittance measurement technique where the radiation traverses the sample twice, the second time after being reflected from a surface behind the sample.

TRANSMITTANCE is represented by the equation:

$$T = I/I_0 \text{ or } T = 10^{-A};$$

in which I is the intensity of the radiation transmitted through the sample; I_0 is the intensity of the radiant energy incident on the sample and includes losses due to solvent absorption, refraction, and scattering; and A is the absorbance.

WAVELENGTH CALIBRATION is the process by which an internal standard material, such as polystyrene, is used to correct the wavelength scale applied to the sensor responses. This process is typically predefined in the software and hardware configuration of the instrument.

WAVELENGTH VERIFICATION is the process of using a wavelength verification standard (e.g., SRM 1920a) to verify the wavelength uncertainty of an instrument. ■2S (*USP27*)

Add the following:

▪GLOSSARY

ABSORBANCE, A, is represented by the equation:

$$A = -\log T = \log (1/T) \text{ or } A = \log (I/R)$$

in which T and R are the transmittance and the reflectance, respectively.

BACKGROUND SPECTRUM is also referred to as a reference spectrum or background reference. A ratio of this spectrum to that of the sample radiation intensities produces a transmittance or reflectance spectrum. For example, in reflectance measurements, a highly reflective standard reference material is used.

CALIBRATION MODEL is a mathematical expression to relate the response from an analytical instrument to the properties of samples.

DIFFUSE REFLECTANCE is that portion of radiated light penetrating the sample surface, interacting with the analyte material, and being reflected back to the detector. This is the component of the overall reflectance that produces the absorbance spectrum of the sample.

DURBIN–WATSON is a method of testing the linearity of a calibration by comparing the sum of squares of successive calibration residuals to the sum of squares of the calibration

In-Process Revision

residuals around their mean. The expected value of the Durbin–Watson statistic for random, independent, normally distributed residuals is two.

FIBER-OPTIC PROBES consist of two components: optical fibers, which may vary in length and in the number of fibers, and a terminus, which contains specially designed optics for examination of the sample matrix.

INSTRUMENT BANDWIDTH—is a measure of the ability of a spectrometer to separate radiation of similar wavelengths.

MULTIPLE LINEAR REGRESSION is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. The distinguishing feature of this algorithm is the use of a limited number of independent variables. Linear-least-squares calculations are performed to establish a relationship between these independent variables and the properties of the samples.

OPERATIONAL QUALIFICATION is the process by which it is demonstrated and documented that the instrument performs according to specifications, and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, major repair, etc.

PARTIAL LEAST SQUARES (PLS) is a calibration algorithm used to relate instrument responses to the properties of samples. The distinguishing feature of this algorithm is that, while similar to PCR, this algorithm includes data concerning the properties of the samples used for calibration in the calculation of the factors used to describe the instrument responses.

PERFORMANCE QUALIFICATION, ~~also known as performance verification,~~ is the process of using one or more well-characterized and stable reference materials to verify consistent instrument performance. Qualification may employ the same or different standards for different performance characteristics.

PHOTOMETRIC LINEARITY, also referred to as photometric verification, is the process of verifying the response of the photometric scale of an instrument.

PRINCIPAL COMPONENT REGRESSION (PCR) is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. This algorithm, which expresses a set of independent variables as a linear combination of factors, is a method of relating those factors to the properties of the samples for which the independent variables were obtained.

REFERENCE SPECTRUM—See *Background Spectrum.*

REFLECTANCE is described by the equation:

$$R = I/I_r,$$

in which I is the intensity of radiation reflected from the surface of the sample; and I_r is the intensity of radiation reflected from a background reference material and its incorporated losses due to solvent absorption, refraction, and scattering.

ROOT-MEAN-SQUARE (RMS) NOISE is calculated by the equation:

$$RMS = \sqrt{\frac{\sum_{i=1}^{N}(A_{1i} - A_{2i})^2}{N}}$$

$$RMS = \sqrt{\frac{1}{N} \times \sum_{i}^{N}\left(A_i - \overline{A}\right)^2},$$

~~in which A_{ik} (with $k = 1,2$) is the value for each data point;~~ in which A_i is the absorbance for each data point; $\overline{A}$ is the mean absorbance over the spectral segment; and N is the number of points per segment.

In-Process Revision

SPECTRAL REFERENCE LIBRARY is a collection of spectra of known materials used for the purpose of comparison with unknown materials. The term is commonly used in connection with qualitative methods of spectral analysis (e.g., identification of materials).

STANDARD ERROR OF THE LABORATORY (SEL) is a calculation based on repeated readings of one or more samples to estimate the precision and/or accuracy of the reference laboratory method, depending on how the data was collected.

STANDARD ERROR OF PREDICTION (SEP) is a measure of accuracy of an analytical method based on applying a given calibration model to the spectral data from a set of samples different from but similar to those used to calculate the calibration model. The SEP is the standard deviation of the residuals obtained from comparing the values from the reference laboratory to those from the method under test, for the specified samples. The SEP provides a measure of the accuracy expected when measuring future samples.

SURFACE REFLECTANCE, also known as specular reflection, is that portion of the radiation not interacting with the sample but simply reflecting back from the sample surface layer (sample-air interface).

TRANSFLECTANCE is a transmittance measurement technique in which the radiation traverses the sample twice, the second time after being reflected from a surface behind the sample.

TRANSMITTANCE is represented by the equation:

$$T = I/I_0 \text{ or } T = 10^{-A},$$

in which I is the intensity of the radiation transmitted through the sample; I_0 is the intensity of the radiant energy incident on the sample and includes losses due to solvent absorption, refraction, and scattering; and A is the absorbance.■2S (*USP27*)

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Cesium Chloride. This new reagent is specified in the test for *Sodium content* under *Enoxaparin Sodium* appearing elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—40322-1

Add the following:

■**Cesium Chloride**—**168.4** [*7647-17-8*]—White fine crystals. Use a suitable grade.■2S (*USP27*)

BRIEFING

Deuterated Methanol. This new reagent is used in *Identification B* under *Enoxaparin Sodium,* appearing elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—40321-1

Add the following:

■**Deuterated Methanol** *(Methanol-^{12}C-d_4, Methyl-^{12}C-d_3 alcohol-d_1)*—**36.1** [*811-98-3*] The degree of deuteration is not less than 99.8%. Is a clear colorless liquid miscible with water, with alcohol, and with methylene chloride; density at 20°: 0.888 g/mL, refractive index at 20° (D-line): 1.326; boiling point 65.4° (760 mm Hg).■2S (*USP27*)

In-Process Revision

BRIEFING

Melamine. This new reagent is used to prepare the *Resolution solution* in the test for *Related compounds* under *Metformin Hydrochloride* and *Metformin Hydrochloride Tablets,* which appear elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—34256-1

Add the following:

■**Melamine** *(2,4,6-Triamino-1,3,5-triazine)*, $C_3H_6N_6$—**126.1** [*108-78-1*]—Use a suitable grade.■2S (*USP27*)

BRIEFING

Pyridoxal 5-Phosphate, *USP 26* page 2505. It is proposed to revise the quality requirements of this reagent to reflect the material that is currently available on the market.

(HDQ: M. Marques) RTS—40271-1

Change to read:

Pyridoxal 5-Phosphate, 4-$CHOC_5HN$-2-CH_3, 3-OH, 5-$CH_2PO_4H_2 \cdot H_2O$—**265.16**—Light yellow powder.

~~*Assay*—Transfer about 500 mg, accurately weighed, to a suitable flask. Add 20.0 mL of 0.5 *N* sodium hydroxide VS and 130 mL of water and heat under reflux for 1 hour. Cool, transfer the solution to a 250-mL beaker, rinse the flask with about 30 mL of water and add the rinsing to the beaker. Titrate the solution with 0.5 *N* hydrochloric acid VS, determining the first endpoint potentiometrically. Perform a blank determination and make any necessary correction. Each mL of 0.1 *N* sodium hydroxide consumed is equivalent to 8.839 mg of $C_8H_{10}NO_6P \cdot H_2O$. not less than 95% is found.~~

~~*Melting range* ⟨741⟩: between 140° and 143°, with decomposition.~~

~~*Water, Method I* ⟨921⟩: between 8.5% and 9.5%.~~

■Use a suitable grade.■2S (*USP27*)

BRIEFING

Thrombin Human *(Factor II_a)*. This new reagent is used in the test for *Anti-factor II_a activity content* under *Enoxaparin Sodium* and *Enoxaparin Sodium Injection* appearing elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—40323-1

Add the following:

■**Thrombin Human** *(Factor II_a)*—**~33,600 [***9002-04-4***]**—A preparation of a serine protease (enzyme) that converts human fibrinogen into fibrin. It is obtained from human plasma and may be prepared by precipitation with suitable salts and organic solvents under controlled conditions of pH, ionic strength, and temperature. A yellowish-white powder, freely soluble in a 9 g per L solution of sodium chloride, which forms a cloudy, pale yellow solution. Store in a sealed, sterile container under nitrogen, protected from light, at a temperature below 0°. One unit corresponds to the amount of enzyme that hydrolyzes 1 µmol of Tos-Gly-Pro-Arg-4-nitroaniline acetate per minute at a pH of 8.4 and at a temperature of 37°.■2S (*USP27*)

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 26* page 2540, and page 1683 of *PF* 29(5) [Sept.–Oct. 2003].

(HDQ) RTS—34256-1; 39659-1; 39774-1; 39803-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 26* page 2546, page 3179 of the *Second Supplement*, page 5310 of *PF* 23(6) [Nov.–Dec. 1997], page 7017 of *PF* 24(5) [Sept.–Oct. 1998], page 8282 of *PF* 25(3) [May–June 1999], page 8589 of *PF* 25(4) [July–Aug. 1999], page 8917 of *PF* 25(5) [Sept.–Oct. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 504 of *PF* 26(2) [Mar.–Apr. 2000], page 837 of *PF* 26(3) [May–June 2000], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1385 of *PF* 26(5) [Sept.–Oct. 2000], page 1907 of *PF* 27(1) [Jan.–Feb. 2001], page 2281 of *PF* 27(2) [Mar.–Apr. 2001], page 2839 of *PF* 27(4) [July–Aug. 2001], page 3374 of *PF* 27(6) [Nov.–Dec. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 853 of *PF* 28(3) [May–June 2002], page 1236 of *PF* 28(4) [July–Aug. 2002], page 1542 of *PF* 28(5) [Sept.–Oct. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 509 of *PF* 29(2) [Mar.–Apr. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], and page 1684 of *PF* 29(5) [Sept.–Oct. 2003].

(HDQ) RTS—34256-1; 37702-1; 39641-2; 40086-1

Add the following:

■**Ammonio Methacrylate Copolymer Dispersion:** Milky-white liquids of low viscosity with a faint characteristic odor. Miscible with water in any proportion, the milky-white appearance being retained. A clear or slightly cloudy solution is obtained on mixing one part with five parts of acetone, alcohol, or isopropyl alcohol. When mixed with methanol in a ratio of 1:5, Ammonio Methacrylate Copolymer Dispersion Type A dissolves completely, and Ammonio Methacrylate Copolymer Dispersion Type B dissolves only partially. *NF category:* Coating agent.■2S (*USP27*)

Add the following:

■**Carbomer Homopolymer:** White, fluffy hydroscopic powder, having a slight, characteristic odor. The pH of a 1 in 100 dispersion in water is about 3. When neutralized with alkali hydroxides or with amines, it swells giving the appearance of dissolving in water; when neutralized with lower amines and alkanolamines, it swells giving the appearance of dissolving in methanol or glycerin; when neutralized with ethoxylated long-chain (C_{14}–C_{18}) amines, it

swells giving the appearance of dissolving in ethanol. *NF category:* Tablet binder; suspending and/or viscosity-increasing agent.■2S (*USP27*)

Add the following:

■**Glimepiride:** White to almost white powder. Soluble in dimethylformamide; slightly soluble in methanol; sparingly soluble in methylene chloride; practically insoluble in water. It also dissolves in dilute alkali hydroxides and dilute acids.■2S (*USP27*)

Add the following:

■**Metformin Hydrochloride:** White, crystalline powder. Freely soluble in water; slightly soluble in alcohol; practically insoluble in acetone and in methylene chloride.■2S (*USP27*)

Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets—See PF Vol. 27 No. 3, page 2499.
Acetaminophen and Pseudoephedrine Hydrochloride Tablets—See PF Vol. 27 No. 3, page 2500.
Acetazolamide—See PF Vol. 27 No. 3, page 2500.
Acetazolamide for Injection—See PF Vol. 27 No. 3, page 2500.
Acetazolamide Tablets—See PF Vol. 27 No. 3, page 2501.
Glacial Acetic Acid—See PF Vol. 27 No. 3, page 2501.
Acetic Acid Irrigation—See PF Vol. 27 No. 3, page 2501.
Acetic Acid Otic Solution—See PF Vol. 27 No. 3, page 2501.
Acetohexamide—See PF Vol. 27 No. 3, page 2501.
Acetohexamide Tablets—See PF Vol. 27 No. 3, page 2501.
Acetohydroxamic Acid Tablets—See PF Vol. 27 No. 3, page 2503.
Acetylcholine Chloride—See PF Vol. 27 No. 3, page 2502.
Acetylcholine Chloride for Ophthalmic Solution—See PF Vol. 27 No. 3, page 2502.
Acetylcysteine—See PF Vol. 27 No. 3, page 2503.
Acetylcysteine Solution—See PF Vol. 27 No. 3, page 2503.
Acetylcysteine and Isoproterenol Hydrochloride Inhalation Solution—See PF Vol. 27 No. 3, page 2503.
Acyclovir Capsules—See PF Vol. 29 No. 3, page 602.
Acyclovir for Injection—See PF Vol. 29 No. 3, page 602.
Acyclovir Ointment—See PF Vol. 29 No. 3, page 604.
Acyclovir Oral Suspension—See PF Vol. 29 No. 3, page 604.
Acyclovir Tablets—See PF Vol. 29 No. 3, page 604.
Adenine—See PF Vol. 27 No. 3, page 2504.
Albendazole—See PF Vol. 27 No. 3, page 2505.
Albendazole Oral Suspension—See PF Vol. 29 No. 4, page 991.
Albendazole Tablets—See PF Vol. 27 No. 3, page 2505.
Albumin Human—See PF Vol. 29 No. 4, page 992.
Albuterol—See PF Vol. 27 No. 3, page 2505.
Albuterol Sulfate—See PF Vol. 27 No. 3, page 2506.
Albuterol Tablets—See PF Vol. 27 No. 3, page 2506.
Alclometasone Dipropionate—See PF Vol. 27 No. 3, page 2506.
Alclometasone Dipropionate Cream—See PF Vol. 27 No. 3, page 2507.
Alclometasone Dipropionate Ointment—See PF Vol. 27 No. 3, page 2507.
Alcohol—See PF Vol. 27 No. 3, page 2507.
Dehydrated Alcohol—See PF Vol. 27 No. 3, page 2507.
Dehydrated Alcohol Injection—See PF Vol. 27 No. 3, page 2507.
Rubbing Alcohol—See PF Vol. 27 No. 3, page 2507.
Alcohol in Dextrose Injection—See PF Vol. 27 No. 3, page 2508.
Alendronate Sodium—See PF Vol. 28 No. 3, page 737.
Alendronate Sodium Tablets—See PF Vol. 28 No. 3, page 740.
Alendronic Acid Tablets—See PF Vol. 29 No. 4, page 997.
Allopurinol—See PF Vol. 28 No. 5, page 1387.
Allopurinol Oral Solution—See PF Vol. 29 No. 4, page 1000.
Allopurinol Tablets—See PF Vol. 29 No. 3, page 604.
Allyl Isothiocyanate—See PF Vol. 27 No. 3, page 2509.
Alprostadil—See PF Vol. 29 No. 5, page 1412.
Altretamine—See PF Vol. 27 No. 3, page 2514.
Altretamine Capsules—See PF Vol. 27 No. 3, page 2514.
Potassium Alum—See PF Vol. 27 No. 3, page 2515.
Alumina and Magnesia Oral Suspension—See PF Vol. 27 No. 3, page 2515.
Alumina and Magnesia Tablets—See PF Vol. 27 No. 3, page 2515.
Alumina, Magnesia, and Calcium Carbonate Oral Suspension—See PF Vol. 27 No. 6, page 3241.
Alumina, Magnesia, and Calcium Carbonate Tablets—See PF Vol. 27 No. 3, page 2515.
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—See PF Vol. 27 No. 6, page 3241.
Amifostine—See PF Vol. 29 No. 5, page 1413.
Amiloride Hydrochloride and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 605.
Aminocaproic Acid—See PF Vol. 29 No. 5, page 1414.
Aminopentamide Sulfate—See PF Vol. 29 No. 5, page 1414.
Aminophylline—See PF Vol. 29 No. 5, page 1414.
Ammonium Chloride—See PF Vol. 29 No. 5, page 1415.
Ammonium Molybdate—See PF Vol. 29 No. 5, page 1416.
Amoxicillin Tablets—See PF Vol. 29 No. 1, page 48.
Amoxicillin and Clavulanate Potassium for Oral Suspension—See PF Vol. 29 No. 3, page 605.
Amoxicillin and Clavulanate Potassium Tablets—See PF Vol. 29 No. 3, page 605.
Ampicillin—See PF Vol. 28 No. 6, page 1766.
Amprolium Oral Solution—See PF Vol. 29 No. 3, page 606.

Anthrax Vaccine Adsorbed—See PF Vol. 29 No. 4, page 1002.
L-Asparagine—See PF Vol. 29 No. 3, page 687.
Aspirin and Codeine Phosphate Tablets—See PF Vol. 29 No. 3, page 606.
Atenolol—See PF Vol. 29 No. 5, page 1416.
Atenolol Oral Solution—See PF Vol. 29 No. 4, page 1001.
Atenolol Tablets—See PF Vol. 29 No. 1, page 49.
Atenolol and Chlorthalidone Tablets—See PF Vol. 29 No. 3, page 606.
Atracurium Besylate Injection—See PF Vol. 29 No. 4, page 1008.
Azithromycin—See PF Vol. 29 No. 5, page 1417.
Azithromycin Capsules—See PF Vol. 27 No. 6, page 3394.
Barium Sulfate Paste—See PF Vol. 25 No. 4, page 8479.
BCG Live—See PF Vol. 29 No. 5, page 1419.
Benazepril Hydrochloride—See PF Vol. 29 No. 5, page 1422.
Benazepril Hydrochloride Tablets—See PF Vol. 29 No. 3, page 606.
Benzethonium Chloride Concentrate—See PF Vol. 29 No. 3, page 608.
Betahistine Hydrochloride—See PF Vol. 29 No. 4, page 1008.
Betamethasone—See PF Vol. 29 No. 5, page 1427.
Betamethasone Oral Solution—See PF Vol. 29 No. 4, page 1009.
Betamethasone Syrup—See PF Vol. 29 No. 4, page 1010.
Betamethasone Tablets—See PF Vol. 29 No. 4, page 1011.
Betamethasone Acetate—See PF Vol. 29 No. 5, page 1427.
Betamethasone Benzoate—See PF Vol. 29 No. 5, page 1427.
Betamethasone Benzoate Gel—See PF Vol. 29 No. 5, page 1428.
Betamethasone Dipropionate—See PF Vol. 29 No. 5, page 1428.
Betamethasone Dipropionate Cream—See PF Vol. 29 No. 5, page 1429.
Betamethasone Dipropionate Lotion—See PF Vol. 29 No. 5, page 1430.
Betamethasone Dipropionate Ointment—See PF Vol. 29 No. 5, page 1430.
Betamethasone Dipropionate Topical Aerosol—See PF Vol. 29 No. 5, page 1428.
Bethanechol Chloride—See PF Vol. 29 No. 1, page 52.
Bethanechol Chloride Tablets—See PF Vol. 29 No. 1, page 54.
Bismuth Subsalicylate Oral Suspension—See PF Vol. 28 No. 2, page 627.
Bismuth Subsalicylate Tablets—See PF Vol. 28 No. 5, page 1603.
Bisoprolol Fumarate—See PF Vol. 29 No. 3, page 609.
Bisoprolol Fumarate Tablets—See PF Vol. 29 No. 3, page 610.
Bisoprolol Fumarate and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 612.
Bleomycin for Injection—See PF Vol. 29 No. 4, page 1011.
Whole Blood—See PF Vol. 29 No. 2, page 445.
Red Blood Cells—See PF Vol. 29 No. 2, page 431.
Bretylium Tosylate—See PF Vol. 29 No. 5, page 1431.
Bromodiphenhydramine Hydrochloride and Codeine Phosphate Syrup—See PF Vol. 27 No. 5, page 2980.
Brompheniramine Maleate—See PF Vol. 29 No. 5, page 1431.
Bumetanide—See PF Vol. 29 No. 5, page 1432.
Bupivacaine Hydrochloride—See PF Vol. 29 No. 5, page 1432.
Bupropion Hydrochloride—See PF Vol. 29 No. 4, page 1011.
Bupropion Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 4, page 1012.
Butalbital, Acetaminophen, and Caffeine Tablets—See PF Vol. 29 No. 3, page 615.
Calcitriol—See PF Vol. 29 No. 5, page 1433.
Calcitriol Injection—See PF Vol. 29 No. 5, page 1434.
Calcium Chloride—See PF Vol. 29 No. 5, page 1436.
Dibasic Calcium Phosphate—See PF Vol. 22 No. 6, page 3029.
Anhydrous Dibasic Calcium Phosphate—See PF Vol. 22 No. 6, page 2011.
Carbidopa and Levodopa Tablets—See PF Vol. 29 No. 3, page 615.
Carboprost Tromethamine—See PF Vol. 29 No. 5, page 1436.
Cefaclor Capsules—See PF Vol. 29 No. 1, page 56.
Cefadroxil—See PF Vol. 29 No. 5, page 1436.
Cefazolin Ophthalmic Solution—See PF Vol. 28 No. 2, page 261.
Cefepime Hydrochloride—See PF Vol. 29 No. 5, page 1437.
Cefixime—See PF Vol. 29 No. 3, page 616.
Ceftazidime for Injection—See PF Vol. 29 No. 3, page 617.
Cefuroxime Axetil for Oral Suspension—See PF Vol. 29 No. 5, page 1438.
Cefuroxime Axetil Tablets—See PF Vol. 29 No. 4, page 1014.
Chloroprocaine Hydrochloride—See PF Vol. 29 No. 5, page 1438.
Chlorothiazide—See PF Vol. 29 No. 5, page 1439.
Chlorpheniramine Maleate—See PF Vol. 29 No. 5, page 1439.
Chromic Chloride—See PF Vol. 29 No. 5, page 1440.
Ciclopirox—See PF Vol. 29 No. 2, page 393.
Ciclopirox Olamine—See PF Vol. 29 No. 4, page 1015.
Cimetidine—See PF Vol. 29 No. 5, page 1440.
Cimetidine Tablets—See PF Vol. 28 No. 1, page 52.
Ciprofloxacin—See PF Vol. 29 No. 4, page 1017.
Ciprofloxacin Tablets—See PF Vol. 29 No. 4, page 1018.
Clavulanate Potassium—See PF Vol. 29 No. 3, page 617.
Clindamycin Phosphate—See PF Vol. 29 No. 1, page 57.
Clindamycin Phosphate Vaginal Inserts—See PF Vol. 29 No. 3, page 620.
Clonazepam Tablets—See PF Vol. 29 No. 3, page 621.
Clonidine—See PF Vol. 29 No. 1, page 58.
Clonidine Hydrochloride—See PF Vol. 29 No. 5, page 1440.
Clonidine Hydrochloride Injection—See PF Vol. 26 No. 2, page 351.
Clonidine Transdermal System—See PF Vol. 29 No. 5, page 1441.
Clopidogrel Bisulfate—See PF Vol. 29 No. 5, page 1445.
Clotrimazole Vaginal Inserts—See PF Vol. 29 No. 3, page 622.
Clotrimazole Vaginal Tablets—See PF Vol. 29 No. 3, page 623.
Clotrimazole and Betamethasone Dipropionate Cream—See PF Vol. 29 No. 3, page 623.
Clozapine—See PF Vol. 29 No. 3, page 623.
Cortisone Acetate—See PF Vol. 29 No. 5, page 1447.
Cupric Sulfate—See PF Vol. 29 No. 5, page 1447.
Cyanocobalamin Co 57 Capsules—See PF Vol. 29 No. 2, page 397.
Cyanocobalamin Co 57 Oral Solution—See PF Vol. 29 No. 2, page 398.
Cyclandelate—See PF Vol. 29 No. 4, page 1023.
Cyclobenzaprine Hydrochloride—See PF Vol. 29 No. 4, page 1024.
Cyclosporine Capsules—See PF Vol. 27 No. 4, page 2721.
Deferoxamine Mesylate—See PF Vol. 29 No. 5, page 1448.
Demeclocycline Hydrochloride Capsules—See PF Vol. 29 No. 3, page 625.
Demeclocycline Hydrochloride Tablets—See PF Vol. 29 No. 3, page 625.
Deslanoside—See PF Vol. 29 No. 5, page 1448.
Desmopressin Acetate—See PF Vol. 24 No. 2, page 5773.
Desmopressin Injection—See PF Vol. 24 No. 2, page 5778.
Desmopressin Nasal Spray Solution—See PF Vol. 24 No. 2, page 5779.
Desogestrel—See PF Vol. 28 No. 6, page 1785.
Desogestrel and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 5, page 1448.
Desoxycorticosterone Acetate—See PF Vol. 29 No. 5, page 1456.
Dexamethasone Acetate—See PF Vol. 29 No. 5, page 1457.
Dextran 40—See PF Vol. 29 No. 2, page 399.
Dextran 70—See PF Vol. 29 No. 2, page 401.
Dextrose—See PF Vol. 29 No. 5, page 1457.
Diazoxide—See PF Vol. 29 No. 5, page 1458.
Dibucaine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Dichlorphenamide—See PF Vol. 29 No. 4, page 1025.
Dicyclomine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Dicyclomine Hydrochloride Capsules—See PF Vol. 29 No. 5, page 1459.
Dicyclomine Hydrochloride Injection—See PF Vol. 29 No. 5, page 1460.
Dicyclomine Hydrochloride Oral Solution—See PF Vol. 29 No. 5, page 1461.

Dicyclomine Hydrochloride Syrup—See PF Vol. 29 No. 5, page 1462.
Dicyclomine Hydrochloride Tablets—See PF Vol. 29 No. 5, page 1462.
Diethylstilbestrol—See PF Vol. 29 No. 5, page 1463.
Diethylstilbestrol Diphosphate Tablets—See PF Vol. 23 No. 1, page 3385.
Dihydroergotamine Mesylate—See PF Vol. 29 No. 5, page 1463.
Dihydroergotamine Mesylate Nasal Solution—See PF Vol. 25 No. 6, page 9078.
Dimenhydrinate—See PF Vol. 29 No. 5, page 1466.
Dimercaprol—See PF Vol. 29 No. 5, page 1466.
Diphenhydramine Hydrochloride—See PF Vol. 29 No. 5, page 1466.
Dipyridamole—See PF Vol. 29 No. 5, page 1467.
Divalproex Sodium Delayed-Release Tablets—See PF Vol. 29 No. 3, page 625.
Dobutamine Hydrochloride—See PF Vol. 29 No. 5, page 1467.
Dolasetron Mesylate—See PF Vol. 29 No. 5, page 1468.
Dolasetron Mesylate Injection—See PF Vol. 29 No. 1, page 60.
Dopamine Hydrochloride—See PF Vol. 29 No. 5, page 1469.
Doxazosin Mesylate—See PF Vol. 29 No. 5, page 1470.
Doxazosin Tablets—See PF Vol. 29 No. 1, page 64.
Doxorubicin Hydrochloride—See PF Vol. 29 No. 1, page 66.
Droperidol—See PF Vol. 29 No. 5, page 1473.
Dyphylline—See PF Vol. 29 No. 5, page 1473.
Edetate Calcium Disodium—See PF Vol. 29 No. 5, page 1474.
Edetate Disodium—See PF Vol. 29 No. 5, page 1474.
Edrophonium Chloride—See PF Vol. 29 No. 5, page 1475.
Egg Phospholipids—See PF Vol. 29 No. 2, page 401.
Enalapril Maleate—See PF Vol. 29 No. 5, page 1475.
Ephedrine Sulfate—See PF Vol. 29 No. 5, page 1476.
Epinephrine—See PF Vol. 29 No. 5, page 1476.
Ergoloid Mesylates Tablets—See PF Vol. 29 No. 5, page 1477.
Ergonovine Maleate—See PF Vol. 29 No. 5, page 1478.
Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension—See PF Vol. 29 No. 3, page 626.
Estradiol—See PF Vol. 29 No. 5, page 1478.
Estradiol Transdermal System—See PF Vol. 25 No. 6, page 9080.
Conjugated Estrogens—See PF Vol. 29 No. 5, page 1478.
Estrone—See PF Vol. 29 No. 5, page 1479.
Ethacrynic Acid—See PF Vol. 29 No. 5, page 1479.
Ethotoin—See PF Vol. 29 No. 1, page 66.
Famotidine Tablets—See PF Vol. 29 No. 3, page 627.
Fenoldapam Mesylate—See PF Vol. 29 No. 5, page 1479.
Ferrous Fumarate—See PF Vol. 29 No. 3, page 629.
Ferrous Fumarate and Docusate Sodium Extended-Release Tablets—See PF Vol. 29 No. 4, page 1026.
Ferrous Gluconate—See PF Vol. 29 No. 3, page 630.
Ferumoxides Injection—See PF Vol. 28 No. 3, page 758.
Fexofenadine Hydrochloride—See PF Vol. 28 No. 6, page 1790.
Fexofenadine Hydrochloride Capsules—See PF Vol. 29 No. 4, page 1027.
Finasteride Tablets—See PF Vol. 29 No. 2, page 403.
Flumazenil—See PF Vol. 29 No. 5, page 1480.
Flumazenil Injection—See PF Vol. 29 No. 5, page 1484.
Fluoxetine Delayed-Release Capsules—See PF Vol. 29 No. 5, page 1486.
Flutamide—See PF Vol. 29 No. 5, page 1488.
Flutamide Capsules—See PF Vol. 29 No. 5, page 1490.
Fluvastatin Capsules—See PF Vol. 25 No. 4, page 8423.
Folic Acid Tablets—See PF Vol. 29 No. 2, page 409.
Fosphenytoin Sodium—See PF Vol. 29 No. 5, page 1492.
Fosphenytoin Sodium Injection—See PF Vol. 29 No. 5, page 1493.
Fructose—See PF Vol. 29 No. 5, page 1496.
Furosemide—See PF Vol. 29 No. 5, page 1497.
Gabapentin—See PF Vol. 29 No. 1, page 72.
Gabapentin Capsules—See PF Vol. 28 No. 2, page 298.
Gadoversetamide—See PF Vol. 29 No. 5, page 1497.
Gadoversetamide Injection—See PF Vol. 29 No. 2, page 415.
Gallamine Triethiodide—See PF Vol. 29 No. 5, page 1503.
Ganciclovir for Injection—See PF Vol. 29 No. 3, page 630.
Gemcitabine Hydrochloride—See PF Vol. 29 No. 4, page 1029.
Gemcitabine for Injection—See PF Vol. 29 No. 4, page 1032.
Glipizide—See PF Vol. 29 No. 2, page 417.
Glyburide Tablets—See PF Vol. 29 No. 2, page 418.
Glycerin Injection—See PF Vol. 27 No. 5, page 3143.
Glycopyrrolate—See PF Vol. 29 No. 5, page 1503.
Gonadorelin Hydrochloride—See PF Vol. 27 No. 3, page 2552.
Chorionic Gonadotropin—See PF Vol. 29 No. 5, page 1504.
Chorionic Gonadotropin for Injection—See PF Vol. 29 No. 5, page 1504.
Graftskin—See PF Vol. 28 No. 6, page 1804.
Haloperidol—See PF Vol. 29 No. 5, page 1504.
Heparin Sodium—See PF Vol. 29 No. 1, page 75.
Histamine Phosphate—See PF Vol. 29 No. 5, page 1504.
Hyaluronidase Injection—See PF Vol. 29 No. 5, page 1505.
Hyaluronidase for Injection—See PF Vol. 29 No. 5, page 1505.
Hydralazine Hydrochloride—See PF Vol. 29 No. 5, page 1505.
0.1 Normal Hydrochloric Acid Intravenous Injection—See PF Vol. 27 No. 5, page 3144.
Hydrocodone Bitartrate—See PF Vol. 29 No. 3, page 630.
Hydrocodone Bitartrate and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 633.
Hydrocodone Bitartate and Homatropine Methylbromide Tablets—See PF Vol. 28 No. 4, page 1267.
Hydrocortisone—See PF Vol. 29 No. 5, page 1506.
Hydroxyprogesterone Caproate—See PF Vol. 29 No. 5, page 1506.
Hyoscyamine Sulfate—See PF Vol. 29 No. 5, page 1507.
Ibuprofen Capsules—See PF Vol. 26 No. 2, page 360.
Idoxuridine—See PF Vol. 29 No. 4, page 1033.
Inamrinone—See PF Vol. 29 No. 5, page 1507.

Lidocaine Hydrochloride—See PF Vol. 29 No. 5, page 1525.
Lindane—See PF Vol. 29 No. 3, page 635.
Lindane Cream—See PF Vol. 29 No. 3, page 635.
Lindane Lotion—See PF Vol. 29 No. 3, page 635.
Lindane Shampoo—See PF Vol. 29 No. 3, page 636.
Lipid Injectable Emulsion—See PF Vol. 29 No. 2, page 421.
Loratadine—See PF Vol. 29 No. 4, page 1041.
Loratadine Oral Solution—See PF Vol. 29 No. 4, page 1043.
Loratadine Tablets—See PF Vol. 29 No. 4, page 1045.
Lovastatin—See PF Vol. 29 No. 5, page 1525.

Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution—See PF Vol. 26 No. 4, page 1050.
Magnesium Oxide—See PF Vol. 29 No. 4, page 1047.
Mangafodipir Trisodium—See PF Vol. 29 No. 4, page 1047.
Mangafodipir Trisodium Injection—See PF Vol. 29 No. 4, page 1048.
Manganese Chloride—See PF Vol. 29 No. 5, page 1526.
Manganese Gluconate—See PF Vol. 29 No. 3, page 636.
Mannitol—See PF Vol. 27 No. 5, page 3017.
Mannitol Injection—See PF Vol. 28 No. 1, page 73.
Mecamylamine Hydrochloride—See PF Vol. 28 No. 6, page 1817.
Mecamylamine Hydrochloride Tablets—See PF Vol. 28 No. 2, page 322.
Mechlorethamine Hydrochloride—See PF Vol. 29 No. 3, page 636.
Medroxyprogesterone Acetate—See PF Vol. 29 No. 5, page 1526.
Mefloquine Hydrochloride—See PF Vol. 29 No. 5, page 1527.
Megestrol Acetate Oral Suspension—See PF Vol. 29 No. 1, page 80.
Melengestrol Acetate—See PF Vol. 29 No. 5, page 1528.
Melphalan Tablets—See PF Vol. 29 No. 3, page 637.
Menadiol Sodium Diphosphate—See PF Vol. 29 No. 5, page 1531.
Menadione—See PF Vol. 29 No. 5, page 1531.
Menotropins—See PF Vol. 29 No. 5, page 1532.
Menotropins for Injection—See PF Vol. 29 No. 5, page 1532.
Mephobarbital Tablets—See PF Vol. 26 No. 1, page 178.
Mepivacaine Hydrochloride—See PF Vol. 29 No. 5, page 1533.
Mercaptopurine Tablets—See PF Vol. 29 No. 4, page 1049.
Metaramenol Bitartrate—See PF Vol. 29 No. 5, page 1533.
Methamphetamine Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1050.
Methenamine Hippurate Tablets—See PF Vol. 29 No. 4, page 1050.
Methohexital—See PF Vol. 29 No. 5, page 1534.
Methyldopate Hydrochloride—See PF Vol. 29 No. 5, page 1534.
Methylene Blue—See PF Vol. 29 No. 5, page 1534.
Methylergonovine Maleate—See PF Vol. 29 No. 5, page 1535.
Methylprednisolone Acetate—See PF Vol. 29 No. 5, page 1535.
Metoclopramide Hydrochloride—See PF Vol. 29 No. 5, page 1536.
Metoprolol Tartrate—See PF Vol. 29 No. 5, page 1536.
Metronidazole Benzoate—See PF Vol. 29 No. 5, page 1537.
Mexiletine Hydrochloride Capsules—See PF Vol. 29 No. 3, page 638.
Miconazole Nitrate Cream—See PF Vol. 29 No. 4, page 1051.
Milrinone—See PF Vol. 29 No. 5, page 1538.
Misoprostol—See PF Vol. 26 No. 5, page 1304.
Misoprostol Dispersion—See PF Vol. 28 No. 3, page 772.
Misoprostol Tablets—See PF Vol. 26 No. 5, page 1310.
Mitomycin—See PF Vol. 29 No. 4, page 1052.
Mitomycin for Injection—See PF Vol. 29 No. 4, page 1053.
Molindone Hydrochloride Tablets—See PF Vol. 24 No. 1, page 5461.
Morphine Sulfate Extended-Release Capsules—See PF Vol. 28 No. 6, page 1822.
Nabumetone Tablets—See PF Vol. 29 No. 1, page 82.
Naltrexone Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1053.
Nandrolone Decanoate—See PF Vol. 29 No. 5, page 1539.
Naratriptan Hydrochloride—See PF Vol. 29 No. 3, page 638.
Naratriptan Tablets—See PF Vol. 29 No. 5, page 1540.
Nevirapine—See PF Vol. 29 No. 4, page 1054.
Niacin—See PF Vol. 29 No. 4, page 1056.
Nifedipine Extended-Release Tablets—See PF Vol. 29 No. 5, page 1542.
Nimodipine—See PF Vol. 29 No. 4, page 1057.
Nitrofurantoin Capsules—See PF Vol. 29 No. 5, page 1545.
Ammonia N 13 Injection—See PF Vol. 29 No. 3, page 641.
Diluted Nitroglycerin—See PF Vol. 29 No. 5, page 1547.
Norepinephrine Bitartrate—See PF Vol. 29 No. 5, page 1547.
Norgestimate—See PF Vol. 29 No. 2, page 423.
Norgestimate and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 1, page 87.
Norgestrel and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 5, page 1547.
Nystatin—See PF Vol. 28 No. 4, page 1271.
Nystatin Cream—See PF Vol. 28 No. 1, page 134.
Nystatin Lozenges—See PF Vol. 28 No. 1, page 135.
Nystatin Ointment—See PF Vol. 28 No. 1, page 136.
Nystatin Topical Powder—See PF Vol. 28 No. 1, page 136.
Nystatin Oral Suspension—See PF Vol. 28 No. 1, page 136.
Nystatin Tablets—See PF Vol. 28 No. 1, page 137.
Nystatin Vaginal Inserts—See PF Vol. 29 No. 3, page 641.
Nystatin Vaginal Tablets—See PF Vol. 29 No. 3, page 642.
Nystatin and Triamcinolone Acetonide Cream—See PF Vol. 28 No. 1, page 137.
Nystatin and Triamcinolone Acetonide Ointment—See PF Vol. 28 No. 1, page 138.
Octinoxate—See PF Vol. 29 No. 3, page 642.
Omeprazole Delayed-Release Capsules—See PF Vol. 29 No. 2, page 424.
Ondansetron Oral Solution—See PF Vol. 26 No. 1, page 34.
Ondansetron Hydrochloride—See PF Vol. 29 No. 5, page 1548.
Orphenadrine Citrate—See PF Vol. 29 No. 1, page 94.
Orphenadrine Citrate Injection—See PF Vol. 29 No. 1, page 95.
Oxandrolone—See PF Vol. 28 No. 6, page 1835.
Oxaprozin—See PF Vol. 29 No. 4, page 1059.
Oxaprozin Tablets—See PF Vol. 29 No. 4, page 1061.
Oxybutynin Chloride—See PF Vol. 29 No. 3, page 642.
Oxycodone and Acetaminophen Capsules—See PF Vol. 29 No. 3, page 645.
Oxycodone and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 645.
Oxycodone Terephthalate—See PF Vol. 29 No. 3, page 645.
Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Inserts—See PF Vol. 29 No. 3, page 646.
Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Tablets—See PF Vol. 29 No. 3, page 646.
Water O 15 Injection—See PF Vol. 27 No. 2, page 2182.
Papaverine Hydrochloride—See PF Vol. 29 No. 5, page 1551.
Paricalcitol—See PF Vol. 29 No. 5, page 1552.
Paricalcitol Injection—See PF Vol. 29 No. 5, page 1554.
Paroxetine Hydrochloride—See PF Vol. 29 No. 1, page 100.
Paroxetine Tablets—See PF Vol. 29 No. 3, page 653.
Pentazocine and Acetaminophen Tablets—See PF Vol. 28 No. 6, page 1838.
Pentobarbital—See PF Vol. 29 No. 3, page 655.
Pentobarbital Sodium—See PF Vol. 29 No. 5, page 1558.
Petrolatum—See PF Vol. 28 No. 2, page 569.
White Petrolatum—See PF Vol. 28 No. 2, page 570.
Phenindamine Tartrate—See PF Vol. 25 No. 3, page 8063.
Camphorated Phenol Topical Gel—See PF Vol. 29 No. 5, page 1559.
Camphorated Phenol Topical Solution—See PF Vol. 29 No. 5, page 1561.
Phentolamine Mesylate—See PF Vol. 29 No. 5, page 1562.
Phenylbutazone Tablets—See PF Vol. 29 No. 5, page 1562.
Phenyltoloxamine Dihydrogen Citrate—See PF Vol. 29 No. 4, page 1062.
Poloxalene—See PF Vol. 29 No. 2, page 429.
Potassium Chloride—See PF Vol. 29 No. 5, page 1562.
Potassium Chloride Extended-Release Capsules—See PF Vol. 22 No. 6, page 3043.
Dibasic Potassium Phosphate—See PF Vol. 29 No. 5, page 1563.
Povidone—See PF Vol. 29 No. 4, page 1064.
Povidone-Iodine—See PF Vol. 29 No. 5, page 1564.
Pralidoxine Chloride—See PF Vol. 29 No. 5, page 1564.
Prednisolone Acetate—See PF Vol. 29 No. 5, page 1564.
Prilocaine Hydrochloride—See PF Vol. 29 No. 5, page 1564.
Procainamide Hydrochloride—See PF Vol. 29 No. 5, page 1565.
Procainamide Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 1, page 109.

Procaine Hydrochloride—See PF Vol. 29 No. 5, page 1565.
Prochlorperazine Edisylate—See PF Vol. 29 No. 5, page 1565.
Progesterone—See PF Vol. 29 No. 5, page 1566.
Promazine Hydrochloride—See PF Vol. 29 No. 5, page 1566.
Promethazine Hydrochloride—See PF Vol. 29 No. 5, page 1567.
Propafenone Hydrochloride—See PF Vol. 29 No. 3, page 659.
Propantheline Bromide—See PF Vol. 29 No. 2, page 430.
Propantheline Bromide Tablets—See PF Vol. 29 No. 2, page 431.
Propofol—See PF Vol. 28 No. 6, page 1854.
Propoxycaine Hydrochloride—See PF Vol. 29 No. 5, page 1567.
Propoxyphene Hydrochloride—See PF Vol. 29 No. 3, page 660.
Propoxyphene Napsylate—See PF Vol. 29 No. 3, page 662.
Propoxyphene Napsylate and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 663.
Propranolol Hydrochloride—See PF Vol. 29 No. 5, page 1568.
Protamine Sulfate Injection—See PF Vol. 29 No. 4, page 1065.
Pseudoephedrine Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 4, page 1065.
Quinapril Hydrochloride—See PF Vol. 29 No. 4, page 1068.
Quinapril Tablets—See PF Vol. 29 No. 4, page 1071.
Quinidine Gluconate—See PF Vol. 29 No. 5, page 1568.
Quinidine Gluconate Extended-Release Tablets—See PF Vol. 29 No. 5, page 1569.
Ranitidine Oral Solution—See PF Vol. 28 No. 2, page 360.
Ranitidine Hydrochloride—See PF Vol. 29 No. 5, page 1569.
Reserpine—See PF Vol. 29 No. 5, page 1570.
Reserpine Tablets—See PF Vol. 29 No. 4, page 1074.
Rifampin and Isoniazid Capsules—See PF Vol. 28 No. 6, page 1862.
Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets—See PF Vol. 29 No. 1, page 112.
Rimantadine Hydrochloride—See PF Vol. 29 No. 4, page 1074.
Rimantadine Hydrochloride Tablets—See PF Vol. 29 No. 4, page 1076.
Ritodrine Hydrochloride—See PF Vol. 29 No. 5, page 1570.
Saquinavir Capsules—See PF Vol. 27 No. 2, page 2197.
Selenious Acid—See PF Vol. 29 No. 5, page 1571.
Sevoflurane—See PF Vol. 29 No. 5, page 1571.
Shark Liver Oil—See PF Vol. 26 No. 6, page 1643.
Sildenafil Citrate—See PF Vol. 24 No. 6, page 7182.
Sildenafil Tablets—See PF Vol. 24 No. 6, page 7184.
Simethicone—See PF Vol. 29 No. 4, page 1078.
Simvastatin Tablets—See PF Vol. 29 No. 2, page 437.
Sodium Acetate—See PF Vol. 29 No. 5, page 1576.
Sodium Bicarbonate—See PF Vol. 29 No. 5, page 1577.
Sodium Chloride—See PF Vol. 28 No. 4, page 1249.
Sodium Nitrite—See PF Vol. 29 No. 5, page 1577.
Sodium Nitroprusside—See PF Vol. 29 No. 5, page 1578.
Dibasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1578.
Monobasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1579.
Sodium Sulfate—See PF Vol. 29 No. 5, page 1579.
Sodium Thiosulfate—See PF Vol. 29 No. 5, page 1579.
Sorbitol Solution—See PF Vol. 29 No. 4, page 1078.
Sotalol Hydrochloride—See PF Vol. 29 No. 3, page 663.
Sotalol Hydrochloride Tablets—See PF Vol. 29 No. 3, page 666.
Spironolactone—See PF Vol. 29 No. 3, page 668.
Spironolactone Tablets—See PF Vol. 29 No. 4, page 1080.
Spironolactone Oral Suspension—See PF Vol. 24 No. 2, page 5813.
Spironolactone and Hydrochlorothiazide Oral Suspension—See PF Vol. 24 No. 2, page 5814.
Spironolactone and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 669.
Topical Starch—See PF Vol. 29 No. 3, page 669.
Sterile, Single-Use Plastic Large-Volume Containers for Human Blood and Blood Components—See PF Vol. 23 No. 5, page 4651.
Succinylcholine Chloride—See PF Vol. 29 No. 5, page 1580.
Triple Sulfa Vaginal Inserts—See PF Vol. 29 No. 3, page 669.
Triple Sulfa Vaginal Tablets—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Injection—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Oral Suspension—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Tablets—See PF Vol. 29 No. 3, page 670.
Sulfasalazine Delayed-Release Tablets—See PF Vol. 29 No. 3, page 670.
Sumatriptan—See PF Vol. 29 No. 1, page 116.
Sumatriptan Nasal Spray—See PF Vol. 29 No. 1, page 119.
Sumatriptan Succinate—See PF Vol. 27 No. 5, page 3157.
Terazosin Hydrochloride—See PF Vol. 29 No. 5, page 1580.
Terbutaline Sulfate—See PF Vol. 29 No. 5, page 1585.
Terbutaline Sulfate Inhalation Aerosol—See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection—See PF Vol. 26 No. 3, page 756.
Testosterone—See PF Vol. 29 No. 5, page 1585.
Tetracaine Hydrochloride—See PF Vol. 29 No. 5, page 1586.
Theophylline—See PF Vol. 29 No. 5, page 1586.
Theophylline Syrup—See PF Vol. 27 No. 1, page 1819.
Thiacetarsamide—See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection—See PF Vol. 29 No. 1, page 127.
Thiopental Sodium—See PF Vol. 29 No. 5, page 1586.
Tiagabine Hydrochloride—See PF Vol. 29 No. 5, page 1587.
Tobramycin Inhalation Solution—See PF Vol. 29 No. 2, page 438.
Tolazoline Hydrochloride—See PF Vol. 29 No. 5, page 1588.
Tolbutamide—See PF Vol. 29 No. 5, page 1588.
Triamcinolone Acetonide—See PF Vol. 29 No. 5, page 1588.
Triamterene Capsules—See PF Vol. 29 No. 3, page 671.
Triamterene and Hydrochlorothiazide Capsules—See PF Vol. 29 No. 3, page 672.
Triamterene and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 672.
Trichlorfon—See PF Vol. 26 No. 6, page 1576.
Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 5, page 1589.
Trimethoprim—See PF Vol. 29 No. 4, page 1080.
Unithiol—See PF Vol. 25 No. 2, page 7752.
Urea—See PF Vol. 29 No. 5, page 1589.
Urea C for Oral Solution—See PF Vol. 29 No. 2, page 441.
Urofollitropin—See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection—See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate—See PF Vol. 24 No. 3, page 6180.
Ursodiol—See PF Vol. 29 No. 1, page 128.
Ursodiol Capsules—See PF Vol. 29 No. 5, page 1589.
Valproic Acid—See PF Vol. 29 No. 3, page 673.
Valproic Acid Injection—See PF Vol. 26 No. 4, page 939.
Valsartan—See PF Vol. 29 No. 5, page 1590.
Valsartan Capsules—See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 5, page 1594.
Vecuronium Bromide—See PF Vol. 28 No. 6, page 1886.
Vecuronium Bromide for Injection—See PF Vol. 25 No. 4, page 8449.
Verapamil Hydrochloride—See PF Vol. 29 No. 5, page 1598.
Verteporfin for Injection—See PF Vol. 29 No. 3, page 677.
Vitamin E—See PF Vol. 27 No. 5, page 3159.
Water for Hemodialysis—See PF Vol. 29 No. 3, page 680.
Water for Injection—See PF Vol. 29 No. 3, page 679.
Bacteriostatic Water for Injection—See PF Vol. 29 No. 4, page 1084.
Sterile Water for Inhalation—See PF Vol. 29 No. 4, page 1085.
Sterile Water for Injection—See PF Vol. 29 No. 4, page 1086.
Sterile Water for Irrigation—See PF Vol. 29 No. 4, page 1087.
Purified Water—See PF Vol. 29 No. 3, page 680.
Sterile Purified Water—See PF Vol. 29 No. 4, page 1088.
Yttrium 90 Ibritumomab Tiuxetan Injection—See PF Vol. 29 No. 3, page 681.
Zileuton—See PF Vol. 29 No. 2, page 447.
Zinc Gluconate—See PF Vol. 29 No. 3, page 683.

EXCIPIENTS

Excipients, USP and NF Excipients, Listed by Category—See PF Vol. 21 No. 5, page 1258; PF Vol. 25 No. 5, page 8887; PF Vol. 28 No. 3, page 796; PF Vol. 28 No. 4, page 1206 and 1273; PF Vol. 28 No. 6, page 1891; PF Vol. 29 No. 1, page 135; PF Vol. 29 No. 2, page 450; PF Vol. 29 No. 3, page 684; PF Vol. 29 No. 4, page 1088.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨1⟩ Injections—See PF Vol. 29 No. 3, page 707.
⟨11⟩ USP Reference Standards—See PF Vol. 23 No. 6, page 5180; PF Vol. 24 No. 5, page 6925; PF Vol. 25 No. 4, page 8561; PF Vol. 25 No. 5, page 8893; PF Vol. 26 No. 1, page 218; PF Vol. 26 No. 2, page 471; PF Vol. 26 No. 3, page 793; PF Vol. 26 No. 4, page 1101; PF Vol. 26 No. 5, page 1369; PF Vol. 27 No. 1, page 1832; PF Vol. 27 No. 2, page 2268; PF Vol. 27 No. 4, page 2806; PF Vol. 27 No. 5, page 3071; PF Vol. 27 No. 6, page 3348; PF Vol. 28 No. 2, page 433; PF Vol. 28 No. 3, page 839; PF Vol. 28 No. 4, page 1224; PF Vol. 28 No. 5, page 1468; PF Vol. 28 No. 6, page 1913; PF Vol. 29 No. 1, page 163; PF Vol. 29 No. 2, page 483; PF Vol. 29 No. 3, page 710; PF Vol. 29 No. 4, page 1137; PF Vol. 29 No. 5, page 1601.

Chemical Tests and Assays

IDENTIFICATION TESTS

⟨197⟩ Spectrophotometric Identification Test—See PF Vol. 29 No. 3, page 711.

LIMIT TESTS

⟨231⟩ Heavy Metals—See PF Vol. 29 No. 5, page 1603.
⟨267⟩ Porosimetry by Mercury Intrusion—See PF Vol. 29 No. 3, page 712.

OTHER TESTS AND ASSAYS

⟨311⟩ Alginates Assay—See PF Vol. 29 No. 4, page 1138.
⟨341⟩ Antimicrobial Agents—Content—See PF Vol. 29 No. 4, page 1141.
⟨381⟩ Elastomeric Closures for Injections—See PF Vol. 29 No. 1, page 164.
⟨386⟩ Environmentally Sensitive Preparations—See PF Vol. 29 No. 4, page 1143.
⟨401⟩ Fats and Fixed Oils—See PF Vol. 29 No. 4, page 1145.
⟨429⟩ Light Diffraction Measurement of Particle Size—See PF Vol. 29 No. 4, page 1146.
⟨467⟩ Organic Volatile Impurities—See PF Vol. 29 No. 4, page 1153.
⟨518⟩ Solution Calorimetry—See PF Vol. 28 No. 4, page 1299.

Physical Tests and Determinations

⟨601⟩ Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers—See PF Vol. 29 No. 4, page 1176.
⟨611⟩ Alcohol Determination—See PF Vol. 29 No. 5, page 1606.
⟨621⟩ Chromatography—See PF Vol. 29 No. 5, page 1606.
⟨625⟩ Clarity and Degree of Opalescence of Liquids—See PF Vol. 26 No. 6, page 1616.
⟨627⟩ Degree of Color of Liquids—See PF Vol. 26 No. 6, page 1617.
⟨661⟩ Containers—See PF Vol. 29 No. 2, page 490.
⟨696⟩ Crystallinity Determination by Solution Calorimetry—See PF Vol. 29 No. 1, page 175.
⟨699⟩ Density of Solids—See PF Vol. 28 No. 2, page 603.
⟨724⟩ Drug Release—See PF Vol. 29 No. 3, page 715.
⟨730⟩ Inductively Coupled Plasma (ICP)—See PF Vol. 28 No. 6, page 1922.
⟨789⟩ Particulate Matter in Ophthalmic Solutions—See PF Vol. 28 No. 5, page 1496.
⟨795⟩ Pharmaceutical Compounding—Nonsterile Preparations—See PF Vol. 29 No. 1, page 179.
⟨811⟩ Powder Fineness—See PF Vol. 28 No. 2, page 611.
⟨823⟩ Radiopharmaceuticals for Positron Emission Tomography—Compounding—See PF Vol. 29 No. 2, page 494.
⟨846⟩ Specific Surface Area—See PF Vol. 28 No. 2, page 612.
⟨921⟩ Water Determination—See PF Vol. 29 No. 5, page 1610.

General Information

⟨1010⟩ Analytical Data—Interpretation and Treatment—See PF Vol. 29 No. 1, page 187.
⟨1072⟩ Disinfectants and Antiseptics—See PF Vol. 29 No. 3, page 726.
⟨1075⟩ Good Compounding Practices—See PF Vol. 29 No. 2, page 497.
⟨1078⟩ Good Manufacturing Practices for Bulk Pharmaceutical Excipients—See PF Vol. 28 No. 5, page 1504.
⟨1079⟩ Good Storage and Shipping Practices—See PF Vol. 29 No. 5, page 1612.
⟨1080⟩ Bulk Pharmaceutical Excipients—Certificate of Analysis—See PF Vol. 28 No. 5, page 1650.
⟨1086⟩ Impurities in Official Articles—See PF Vol. 29 No. 4, page 1214.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

Acetaldehyde—See PF Vol. 29 No. 4, page 1227.
2-Acetamidophenol—See PF Vol. 25 No. 6, page 9107.
Acetyl Chloride—See PF Vol. 29 No. 4, page 1228.
Agarose—See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard—See PF Vol. 28 No. 4, page 1234.
Albumin Bovine Serum—See PF Vol. 29 No. 4, page 1228.
Alum—See PF Vol. 29 No. 4, page 1228.
Alumina, Activated—See PF Vol. 29 No. 4, page 1229.
4-Amino-3-hydroxy-1-naphthalenesulfonic Acid—See PF Vol. 29 No. 4, page 1229.
Ammonia Detector Tube—See PF Vol. 29 No. 4, page 1229.
Ammonia Water, Stronger—See PF Vol. 29 No. 4, page 1229.
Ammonium Hydroxide—See PF Vol. 29 No. 4, page 1229.
Ammonium Pyrrolidinedithiocarbamate—See PF Vol. 27 No. 5, page 3115.
Anti-A Blood Grouping Reagent, Anti-B Blood Grouping Reagent, and Anti-A,B Blood Grouping Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D (Rh_o) Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D Reagent—See PF Vol. 29 No. 2, page 506.
Antihuman Globulin Reagent—See PF Vol. 29 No. 2, page 506.
Antithrombin III for Amidolytic Test—See PF Vol. 29 No. 1, page 264.
Arsenic Trioxide—See PF Vol. 29 No. 4, page 1230.
Bacterial Alkaline Protease Preparation—See PF Vol. 28 No. 2, page 552.
Barbituric Acid—See PF Vol. 29 No. 1, page 265.
Benzil—See PF Vol. 28 No. 4, page 1305.
Benzoic Acid—See PF Vol. 29 No. 4, page 1230.
Blood Group A_1 and Blood Group B Red Blood Cells—See PF Vol. 29 No. 2, page 506.
7 Percent Bovine Serum Albumin Certified Standard—See PF Vol. 29 No. 4, page 1230.
Bromelain—See PF Vol. 28 No. 2, page 552.
Bromobimane—See PF Vol 25 No. 2, page 7804.
Branched Polymeric Sucrose—See PF Vol. 27 No. 6, page 3363.
1,4-Butanediol—See PF Vol 25 No. 5, page 8747.
Butyl Acetate, Normal—See PF Vol. 29 No. 4, page 1230.
Butyl Alcohol—See PF Vol. 29 No. 4, page 1230.
Butyl Alcohol, Tertiary—See PF Vol. 29 No. 4, page 1230.
n-Butylboronic Acid—See PF Vol. 29 No. 4, page 1231.
Butyrolactone—See PF Vol. 22 No. 6, page 3248.
Calcium Acetate—See PF Vol. 29 No. 4, page 1231.
Calcium Carbonate—See PF Vol. 29 No. 4, page 1231.
Calcium Chloride, Anhydrous—See PF Vol. 29 No. 4, page 1231.
dl-Camphene—See PF Vol. 28 No. 6, page 1951.
Capric Acid—See PF Vol 25 No. 5, page 8749.
Carbon Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1232.
Carbon Monoxide Detector Tube—See PF Vol. 29 No. 4, page 1232.
Casein—See PF Vol. 29 No. 4, page 1232.
Cation-Exchange Resin, Styrene-Divinylbenzene, Strongly Acidic—See PF Vol. 29 No. 4, page 1232.
Ceric Ammonium Sulfate—See PF Vol. 29 No. 4, page 1233.
Chloramine T—See PF Vol. 29 No. 4, page 1233.
Chlorine Detector Tube—See PF Vol. 29 No. 4, page 1233.
p-Chloroaniline—See PF Vol. 29 No. 4, page 1234.
Chlorobenzene—See PF Vol. 29 No. 4, page 1234.
Chloroform, Alcohol-free—See PF Vol. 29 No. 4, page 1234.
4-Chloro-1-naphthol—See PF Vol. 29 No. 4, page 1234.
Chromatograhic Reagents—See PF Vol. 29 No. 4, page 1234.
Chromotropic Acid—See PF Vol. 29 No. 4, page 1235.
Cobaltous Acetate—See PF Vol. 29 No. 4, page 1235.
Compactin—See PF Vol. 29 No. 4, page 1235.
Coomassie Blue G-250 C—See PF Vol. 29 No. 4, page 1235.
Cupric Chloride—See PF Vol. 29 No. 4, page 1236.
Cyclohexylmethanol—See PF Vol. 28 No. 3, page 849.
DEAE-Agarose—See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase—See PF Vol. 27 No. 6, page 3365.
Deoxythymidine Triphosphate—See PF Vol. 27 No. 6, page 3365.
Dextran, High Molecular Weight—See PF Vol. 29 No. 4, page 1236.
Dibutylammonium Phosphate—See PF Vol. 26 No. 4, page 1132.
Dichloroacetic Acid—See PF Vol. 29 No. 4, page 1236.
Dicyclohexyl—See PF Vol. 28 No. 3, page 849.
Dicyclohexyl Phthalate—See PF Vol. 26 No. 2, page 504.
Diethylamine—See PF Vol. 29 No. 4, page 1236.
Diethylpyrocarbonate—See PF Vol. 27 No. 6, page 3365.
Diisobutylene—See PF Vol. 28 No. 4, page 1305.
N,N-Dimethylformamide Diethyl Acetal—See PF Vol. 29 No. 5, page 1681.
N,N-Dimethyldodecylamine-*N*-oxide—See PF Vol. 27 No. 4, page 2837.
1,3-Dimethyl-2-imidazolidinone—See PF Vol. 29 No. 4, page 1237.
Dimethyl Sulfoxide, Spectrophotometric Grade—See PF Vol. 29 No. 4, page 1237.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bromide—See PF Vol. 27 No. 6, page 3365.
2,4-Dinitrofluorobenzene—See PF Vol. 29 No. 4, page 1237.
Dioleoylglycerol—See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol—See PF Vol. 28 No. 3, page 849.
Disodium Arsenate—See PF Vol. 28 No. 4, page 1305.
Disodium Chromotropate—See PF Vol. 29 No. 4, page 1237.
1-Dodecanol—See PF Vol. 29 No. 4, page 1238.
Dodecyl Lithium Sulfate—See PF Vol. 29 No. 4, page 1238.
Drabkin's Reagent—See PF Vol. 29 No. 2, page 507.
Eosin Y (Eosin Yellowish Y)—See PF Vol. 29 No. 4, page 1238.
Escin—See PF Vol. 27 No. 4, page 2837.
Ethidium Bromide—See PF Vol. 27 No. 6, page 3366.
Ethylbenzene—See PF Vol. 28 No. 3, page 850.
9-Fluorenylmethyl Chloroformate—See PF Vol. 25 No. 5, page 8916.
Formamide, Anhydrous—See PF Vol. 27 No. 5, page 3115.
β-Galactosidase Suspension—See PF Vol. 29 No. 4, page 1238.
Glucose—See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid—See PF Vol. 27 No. 6, page 3366.
L-Glutamine—See PF Vol. 27 No. 6, page 3366.

In-Process Revision

Guanidine Isothiocyanate—See PF Vol. 27 No. 6, page 3366.
1-Heptadecanol—See PF Vol. 29 No. 4, page 1238.
Hexadecane—See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide—See PF Vol. 29 No. 1, page 265.
Hexokinase and Glucose-6-phosphate Dehydrogenase Suspension—See PF Vol. 29 No. 4, page 1239.
L-Histidine Hydrochloride Monohydrate—See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide—See PF Vol. 28 No. 4, page 1305.
Horseradish Peroxidase Conjugated to Goat Anti-Mouse IgG—See PF Vol. 29 No. 4, page 1239.
Hydriotic Acid—See PF Vol. 29 No. 4, page 1239.
Hydrocodone Diol—See PF Vol. 28 No. 4, page 1306.
Hydrogen Sulfide Detector Tube—See PF Vol. 29 No. 4, page 1239.
4-Hydroxybenzoic Acid Isopropyl Ester—See PF Vol. 29 No. 4, page 1239.
IgG-Coated Red Cells—See PF Vol. 29 No. 2, page 507.
Imidazole—See PF Vol. 29 No. 4, page 1240.
Iodoethane—See PF Vol. 24 No. 6, page 7327.
Iron Wire—See PF Vol. 29 No. 4, page 1240.
4-Isobutylacetophenone—See PF Vol. 29 No. 4, page 1240.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isoflupredone Acetate—See PF Vol. 29 No. 4, page 1240.
Lactose—See PF Vol. 29 No. 4, page 1240.
Lanthanum Chloride—See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide—See PF Vol. 28 No. 3, page 851.
Lead Acetate Paper—See PF Vol. 29 No. 1, page 265.
Lead Perchlorate—See PF Vol. 29 No. 4, page 1241.
Linoleic Acid—See PF Vol. 27 No. 6, page 3367.
α-Lipoic Acid—See PF Vol. 27 No. 6, page 3367.
Lithium Chloride—See PF Vol. 29 No. 4, page 1241.
Lithium Hydroxide—See PF Vol. 29 No. 4, page 1241.
Lithium Perchlorate—See PF Vol. 29 No. 4, page 1242.
Mercuric Nitrate—See PF Vol. 29 No. 4, page 1242.
Mercuric Sulfate—See PF Vol. 29 No. 4, page 1242.
Methenamine—See PF Vol. 29 No. 4, page 1243.
Methoxyethanol—See PF Vol. 29 No. 4, page 1243.
2-Methoxyethanol—See PF Vol. 29 No. 4, page 1243.
p-Methylaminophenol Sulfate—See PF Vol. 29 No. 4, page 1243.
Methyl Behenate—See PF Vol. 29 No. 4, page 1244.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride—See PF Vol. 25 No. 3, page 8280.
Methyl Chloroform—See PF Vol. 29 No. 4, page 1244.
Methyl Ethyl Ketone—See PF Vol. 29 No. 4, page 1244.
2-Methyl-5-nitroimidazole—See PF Vol. 25 No. 2, page 7804.
N-Methylpyrrolidine—See PF Vol. 29 No. 4, page 1245.
Methyl Yellow—See PF Vol. 29 No. 5, page 1682.
Monochloroacetic Acid—See PF Vol. 29 No. 4, page 1245.
Monoethanolamine—See PF Vol. 29 No. 4, page 1245.
Monooleoylglycerol—See PF Vol. 26 No. 6, page 1622.
2-Naphthyl Chloroformate—See PF Vol. 29 No. 4, page 1245.
Nickel(II) Sulfate Heptahydrate—See PF Vol. 27 No. 5, page 3116.
Nitric Oxide–Nitrogen Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1246.
Nitromethane—See PF Vol. 29 No. 4, page 1246.
Nonylphenol Polyoxyethylene Ether—See PF Vol. 27 No. 6, page 3368.
Olefin Detector Tube—See PF Vol. 29 No. 4, page 1246.
Oligo-deoxythymidine—See PF Vol. 27 No. 6, page 3368.
Osmium Tetroxide—See PF Vol. 29 No. 4, page 1246.
Pentadecanoic Acid Methyl Ester—See PF Vol. 26 No. 6, page 1622.
Periodic Acid—See PF Vol. 29 No. 4, page 1247.
o-Phenanthroline Monohydrochloride Monohydrate—See PF Vol. 27 No. 1, page 1904.
Phenol Red, Sodium—See PF Vol. 27 No. 6, page 3368.
3-Phenoxybenzoic Acid—See PF Vol. 29 No. 4, page 1247.
2-Phenylacetamide—See PF Vol. 29 No. 4, page 1247.
Phenylglycine—See PF Vol. 29 No. 4, page 1247.
Phthalic Acid—See PF Vol. 29 No. 4, page 1248.
Polyoxyethylene (23) Lauryl Ether—See PF Vol. 29 No. 2, page 507.
Polyoxyethylene (20) Sorbitan Monolaurate—See PF Vol. 27 No. 6, page 3368.
Potassium Dichromate—See PF Vol. 29 No. 4, page 1248.
Potassium Phosphate, Monobasic—See PF Vol. 29 No. 4, page 1248.
Potassium Phosphate, Tribasic—See PF Vol. 29 No. 4, page 1248.
n-Propyl Alcohol—See PF Vol. 29 No. 4, page 1248.
Protein Molecular Weight Standard—See PF Vol. 29 No. 4, page 1249.
Putrescine Dihydrochloride—See PF Vol. 27 No. 6, page 3369.
Red-Cell Lysing Agent—See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase—See PF Vol. 27 No. 6, page 3369.
Ribonuclease Inhibitor—See PF Vol. 27 No. 6, page 3369.
Sodium 1-Decanesulfonate—See PF Vol. 29 No. 4, page 1249.
Sodium Acetate—See PF Vol. 29 No. 4, page 1249.
Sodium Acetate, Anhydrous—See PF Vol. 29 No. 4, page 1249.
Sodium Arsenite, Twentieth-Molar (0.05 M)—See PF Vol. 29 No. 4, page 1250.
Sodium Borate—See PF Vol. 29 No. 4, page 1250.
Sodium Bromide—See PF Vol. 29 No. 4, page 1250.
Sodium Dichromate—See PF Vol. 29 No. 4, page 1251.
Sodium Hydrogen Sulfate—See PF Vol. 29 No. 5, page 1682.
Sodium Iodate—See PF Vol. 27 No. 6, page 3369.
Sodium Oxalate—See PF Vol. 29 No. 4, page 1251.
Sodium Perchlorate—See PF Vol. 29 No. 4, page 1251.
Sodium Pyrophosphate—See PF Vol. 29 No. 4, page 1251.
Sodium Sulfate—See PF Vol. 29 No. 4, page 1252.
Sodium Tetraphenylborate—See PF Vol. 29 No. 4, page 1252.
Starch, Soluble, Purified—See PF Vol. 29 No. 4, page 1252.
Succinic Acid—See PF Vol. 29 No. 4, page 1253.
Sulfamic Acid—See PF Vol. 29 No. 4, page 1253.
Sulfur Dioxide Detector Tube—See PF Vol. 29 No. 4, page 1253.
Tannic Acid—See PF Vol. 29 No. 4, page 1253.
2′,4′,5′,7′-Tetrabromofluorescein—See PF Vol. 29 No. 4, page 1254.
Tetrabutylammonium Bromide—See PF Vol. 29 No. 4, page 1254.
1,1,2,2-Tetrachloroethane—See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran—See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran, Stabilizer-Free—See PF Vol. 29 No. 4, page 1254.
Tetrahydro-2-furancarboxylic Acid—See PF Vol. 25 No. 5, page 8748.
N-(2-Tetrahydrofuroyl)piperazine—See PF Vol. 25 No. 5, page 8748.
Tetramethylammonium Bromide—See PF Vol. 29 No. 4, page 1255.
1,1,4,4-Tetraphenyl-1,3-butadiene—See PF Vol. 26 No. 6, page 1623.
Thiourea—See PF Vol. 29 No. 4, page 1255.
Thymidine—See PF Vol. 27 No. 6, page 3369.
p-Toluenesulfonic Acid—See PF Vol. 29 No. 4, page 1255.
Trichlorotrifluoroethane—See PF Vol. 29 No. 4, page 1255.
Trioleoylglycerol—See PF Vol. 26 No. 6, page 1623.
Tropine—See PF Vol. 28 No. 4, page 1306.
L-Tyrosine Disodium—See PF Vol. 27 No. 6, page 3370.
Tuberculin, Purified Protein Derivative (Tuberculin PPD)—See PF Vol. 29 No. 5, page 1682.
Vinyl Acetate—See PF Vol. 21 No. 2, page 466.
2-Vinylpyridine—See PF Vol. 26 No. 2, page 504.
1-Vinyl-2-pyrrolidone—See PF Vol. 22 No. 6, page 3249.
Water Vapor Detector Tube—See PF Vol. 29 No. 4, page 1256.
m-Xylene—See PF Vol. 28 No. 6, page 1952.
Zinc Acetate—See PF Vol. 29 No. 4, page 1256.
Zinc Sulfate Heptahydrate—See PF Vol. 26 No. 2, page 504.

In-Process Revision

Indicator Test Papers

Methyl Green—See PF Vol. 28 No. 4, page 1306.
Methyl Green—Iodomercurate Paper—See PF Vol. 28 No. 4, page 1306.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.
Ninhydrin TS—See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

Test Solutions

Cupric Citrate TS—See PF Vol. 27 No. 5, page 3117.
Ferroin TS—See PF Vol. 27 No. 1, page 1905.
Methyl Yellow TS—See PF Vol. 29 No. 5, page 1682.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

Volumetric Solutions

Hydrochloric Acid, Alcoholic, Tenth-Molar (0.1 M)—See PF Vol. 28 No. 4, page 1235.
0.01 N Iodine VS—See PF Vol. 29 No. 3, page 812.
Lead Nitrate, Hundredth-Molar (0.01 M)—See PF Vol. 29 No. 4, page 1256.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 28 No. 4, page 1235.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N—See PF Vol. 29 No. 2, page 508.

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

DIETARY SUPPLEMENTS—MONOGRAPHS

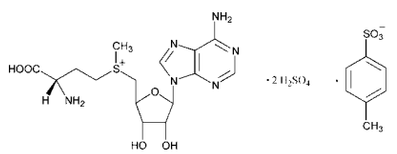
BRIEFING

***S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate.** Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being previewed. The liquid chromatographic procedures in the *Assay, Content of p-toluene sulfonic acid,* and *Related compounds* test are based on analyses performed using a Supelco Supelcosil LC-SCX brand of L9 column. The retention time of the *S*-adenosyl-L-methionine ion is about 4.7 minutes. The liquid chromatographic procedures in the *Isomeric ratio* determination are based on analyses performed using a YMC C18 brand of L1 column. The retention times of the *R,S*- and *S,S*-isomers are about 17.4 and 18.5 minutes, respectively. The liquid chromatographic procedures in the *Content of sulfate* determination are based on analyses performed using a Dionex Ion Pac AS14A brand of L46 column. The retention time of sulfate is about 12.7 minutes. The name of this monograph has been assigned as a temporary working title. The Expert Committee on Nomenclature and Labeling will be considering establishing a shorter, useful name to be used as the official title for this monograph. Suggestions from reviewers of *PF* will be welcomed in that regard.

(DSN: L. Evans) RTS—40057-1; 40057-2; 40057-3; 40057-4; 40057-5; 40057-6; 40057-7

Add the following:

S-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate



$C_{22}H_{34}N_6O_{16}S_4$ 766.56

S-(Adenosyl)-L-methionine disulfate *p*-toluene sulfonate.

(3*S*)-5′-[(3-Amino-3-carboxypropyl)methylsulfonio]-5′-deoxyadenosine hydroxide, disulphate-methylbenesulfonate.

(3*S*)-5′-[(3-Amino-3-carboxypropyl)methylsulfonio]-5′-deoxyadenosine inner salt [*29908-08-0*].

» *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate contains not less than 49.5 percent and not more than 53.0 percent of *S*-adenosyl-L-methionine ($C_{15}H_{23}N_6O_5S^+$), not less than 21.0 percent and not more than 24.0 percent of *p*-toluene sulfonate as *p*-toluene sulfonic acid ($C_7H_7N_6O_3S$) and not less than 23.5 percent and not more than 26.5 percent of sulfate and the sum of *S*-adenosyl-L-methionine, *p*-toluene sulfonate, and sulfate is not less than 95.0 percent on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a refrigerator.

USP Reference standards ⟨11⟩—*USP S-Adenosyl-L-Methionine Disulfate p-Toluene Sulfonate RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩: between 1.0 and 2.0 , in an aqueous solution (1 in 20).

Water, *Method Ia* ⟨921⟩: not more than 2.0%.

Heavy metals, *Method I* ⟨231⟩: not more than 0.002%.

Organic volatile impurities, *Method V* ⟨467⟩: not more than 0.001%.

Isomeric ratio—

Buffer A—Transfer 4.2 g of citric acid monohydrate, 2.03 g sodium dihydrogen phosphate dihydrate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Transfer 4.0 g of sodium dodecyl sulfate and 440 mL of acetonitrile to a 1-L volumetric flask, dilute with *Buffer A* to volume, and mix.

Standard solution and *Test solution*—Use the *Standard preparation* and the *Assay preparation,* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak response as directed for *Procedure:* the resolution, *R,* between *S,S*-isomer and *R,S*-isomer is not less than 1.0; and the relative retention times are about 0.94 and 1.0 for *S,S*-isomer and *R,S*-isomer, respectively.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Identify the peaks of *S,S*- and *R,S*-isomers in the chromatogram of the *Test solution* by comparison with the chromatogram of the *Standard solution,* and calculate the percentage of *S,S*-isomer by the formula:

$$100[r_{SS} / (r_{SS} + r_{RS})],$$

in which r_{SS} and r_{RS} are the areas of the peaks corresponding to the *S,S*-isomer and *R,S*-isomer, respectively, in the *Test solution*. Not less than 75% of *S,S*-isomer is found.

Related compounds—

Mobile phase—Prepare as directed under *Assay.*

Test solution—Use the *Assay preparations* under *Assay.*

Chromatographic system —Prepare as directed under *Assay.* Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of adenosine, *S*-adenosyl-L-homocysteine, methylthioadenosine, and any other impurity in the portion of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluenesulfonate taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area for each individual impurity; r_s is the sum of the peak areas of all the peaks.

Name	Relative Retention Time	Limit (%)
Adenosine	about 0.86	1.0
S-Adenosyl-L-homocysteine	about 0.90	1.0
Methylthioadenosine	about 2.06	1.5
Other individual impurities	—	0.1
Total impurities	—	3.5

Content of sulfate—

Mobile phase—Prepare a solution of 8.0 mM sodium carbonate and 1.0 mM sodium bicarbonate in water.

Standard solution—Dissolve an accurately weighed quantity of potassium sulfate in water, to obtain a solution having a known sulfate concentration of about 0.18 mg per mL.

Test solution—Transfer about 50 mg of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an ion detector with suppressed conductivity, a 4.0-mm × 25-cm column that contains 7-µm packing L46. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency

Pharmacopeial Forum
Vol. 29(6) [Nov.–Dec. 2003]

is not less than 8200 theoretical plates; the tailing factor is not more than 1.1; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the sulfate peak. Calculate the percentage of sulfate in the portion of the *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate taken by the formula:

$$10{,}000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the *Standard solution; W* is the weight, in mg, of *S*-adenosyl-L-methionine disulfate *p*-toluene sulfonate taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained for sulfate in the chromatograms of the *Test solution* and the *Standard solution,* respectively.

Content of *p*-toluene sulfonic acid—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of *p*-toluene sulfonic acid monohydrate in water, to obtain a solution having a known concentration of about 0.5 mg per mL.

Test solution—Transfer about 100 mg of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the *p*-toluene sulfonic acid peak. Calculate the percentage of *p*-toluene sulfonic acid in the portion of the *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate taken by the formula:

$$10{,}000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the *Standard solution; W* is the weight, in mg, of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained for *p*-toluene sulfonic acid in the chromatograms of the *Test solution* and the *Standard solution,* respectively.

Assay—

Mobile phase—Prepare a filtered and degassed solution of 0.5 M ammonium formate in water, and adjust with formic acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate RS in water, to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 100 mg of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L9. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak response as directed for *Procedure:* the column efficiency is not less than 3950 theoretical plates; the tailing factor is not more than 1.7; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

measure the area of the major peak. Calculate the quantity, in mg, of $C_{15}H_{23}N_6O_5S$ in the portion of the *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate taken by the formula:

$$(399.28/766.56)100C(r_U/r_S),$$

in which 399.28 and 766.8 are the molecular weights of *S*-adenosyl-L-methionine and *S*-adenosyl-L-methionine disulfate *p*-toluene sulfonate, respectively; *C* is the concentration, in mg per mL, of USP *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained for *S*-adenosyl-L-methionine in the chromatograms of the *Assay preparation* and the *Standard preparation,* respectively.

⟨11⟩ **USP Reference Standards**

Add the following:

USP *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate RS—Do not dry; determine the water content titrimetrically at time of use. Keep container tightly closed. Protect from light, and store in a refrigerator.

Description and Solubility

Add the following:

***S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate:** White powder. Freely soluble in water.

STIMULI TO THE REVISION PROCESS

This section may contain the following:
- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 29(6) [Nov.–Dec. 2003]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Applications of Ion Chromatography in Pharmaceutical and Drug Analysis

Shreekant Karmarkar* and Dennis Jenke

ABSTRACT Since its introduction in 1975, ion chromatography (IC) has developed and matured into an important analytical methodology in a number of diverse applications and industries. This article briefly describes IC principles and instruments and also provides a review of IC applications developed and validated for the determination of active and inactive ingredients, excipients, degradation products, and impurities relevant to pharmaceutical analyses. Although at present IC-based procedures are cited only in a handful of USP monographs, this article shows that many more IC methods have been successfully developed and validated for pharmaceutical and drug analysis.

INTRODUCTION

Since its introduction in 1975 (*1*), ion chromatography (IC) has developed and matured into an important analytical methodology in a number of diverse applications and industries. The technique, a type of high-performance liquid chromatography (HPLC), has gained popularity in laboratories for the analysis of inorganic anions and cations, organic acids, carbohydrates, sugar alcohols, aminoglycosides, amino acids, proteins, and glycoproteins in environmental, agricultural, pharmaceutical, biotechnology, metal plating, power generation, semiconductor fabrication, and industrial samples. Several books and chapters on IC furnish a detailed review of IC principles and instruments (*2–4*). This article briefly describes IC principles and instruments and also provides a review of IC applications for the determinations of active and inactive ingredients, excipients, degradation products, and impurities relevant to pharmaceutical and drug analyses. Although not reviewed in the present article, IC is extensively used in the biotechnology industry for the determinations of amino acids, peptides, proteins, glycoproteins, carbohydrates, etc. [For the application of IC in amino acid analysis, see *Pharmacopeial Forum* 29(5), "A New Technique for Amino Acid Analysis in Pharmaceutical Samples."]

The IC instrument closely resembles conventional HPLC instrumentation. Typical components of an IC system (*Figure 1*) include an optional autosampler, a high-pressure pump, an injection valve with a sample loop of suitable size (typically 10 to 250 µL), a guard column, an analytical column, a suppressor or other form of postcolumn reaction system, a flow-through detector, and a data system ranging in complexity from a chart recorder to a computerized data system. Typically all of the components in contact with the eluent and sample are made from inert materials such as PEEK (polyetheretherketone), although a conventional HPLC system also may be used provided the materials are compatible with the mobile phase used and injected samples. Following suitable sample preparation, the sample is introduced to the IC via the injection valve. The ions are separated based on various modes such as ion exchange, ion exclusion, or ion pair. After optional chemical suppression or other postcolumn reaction on the column effluent, the ions are detected using conductivity, pulsed amperometry, or other detection modes. The IC setup, therefore, is very similar to that of HPLC. A comparison of IC and HPLC is presented in *Table 1,* which shows that IC differs from HPLC in several regards: First, ions are separated in IC with partial impact of hydrophobic characters of the ionic analytes. Second, due to the nature of the separation, ionic mobile phases are used that are not transparent to typical conductometric detection. Third, the ionic mobile phases quite often necessitate use of a suppressor prior to conductometric detection, although nonsuppressed conductometric detection, pulsed amperometric detection, direct or indirect UV detection, or other forms of detection have been successfully used in pharmaceutical analysis.

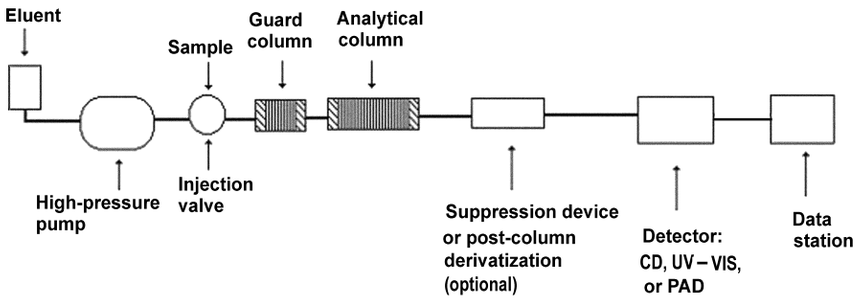

Fig. 1. Components of a typical IC system illustrated schematically. CD, conductivity; PAD, pulsed amperometric detection.

IC is a complementary technique to the more commonly used reversed-phase and normal-phase HPLC and to atomic absorption (AA) and inductively-coupled plasma (ICP) techniques in pharmaceutical analysis. At present IC-based procedures are cited only in a handful of USP monographs (*Table 2*), although many more IC methods have been successfully developed and validated (*Tables 6–10*).

EXPERIMENTAL PROCEDURES

Stationary and Mobile Phases

A survey of IC columns is presented in *Tables 3* and *4*. As IC has developed and matured, the number of ion-exchange materials developed for IC has increased tremendously, facilitated by the understanding of the processes taking place at the surface of the stationary phase. In contrast to the silica-based column packing prevalent in classical HPLC, organic polymers are predominantly used as support materials for IC. Such materials have a higher stability with respect to extremes in pH and in many cases are fully compatible with organic solvents.

The stationary phases used in IC differ in terms of both the support material used and in terms of the different pore sizes and ion-exchange capacities. Although ion exchangers with relatively high exchange capacities are used in cation applications, stationary phases used in anion applications typically have low ion-exchange capacities, thereby facilitating conductivity detection.

Recently, Weiss and Jensen have published a compilation of stationary phases used in modern IC (*6*). Information in this reference is summarized and augmented in *Tables 3* and *4*. A scheme of the selection criteria for separation and detection of ions is presented on page 9 of the book on IC by Weiss (*2*). Column selection guides are also available from several companies, e.g., Alltech, Dionex, Hamilton, Shodex, and Transgenomic.

Because the dominant separation mechanism in IC is ion exchange, the mobile phase consists of mono- or divalent ionic species to accomplish the separation. In ion-exclusion methods, particularly of organic acids, the mobile phase consists of mineral acids in order to maintain organic acids in their undissociated forms. Often, the detection mode to be used dictates the mobile phase employed for the separation of ionic species, and as such the typical mobile phases used in IC are described in the section on IC detection.

IC with Suppressed or Nonsuppressed Conductivity Detection

As a universal method for the detection of ionic species, conductivity detection is, by far, the most commonly employed mode of detection in IC. In the early 1970s, the crucial milestones accomplished by scientists at Dow Chemicals (*1*) in their original IC development work included development of low-capacity ion-exchange resins for efficient chromatographic separation and conductometric detection of ions in chemically suppressed mobile phase.

In suppressed IC, the background conductance of the ionic mobile phase is significantly reduced as it flows through the suppression device. For example, dilute NaOH, ~10–50 mM used as mobile phase in IC of anions is converted to H_2O when the column effluent containing NaOH flows through a suppressor device present in H^+ form. The analyte ionic species in the column effluent, on the other hand, are converted from their Na form to highly conducting acid forms. The reduced background conductance and the enhanced signal of the ionic species result in increased sensitivity for the conductometric detection of ions in suppressed IC. Further details of chemical suppression in IC can be found in various books and chapters on IC (*2–4*). The chemical suppression devices in common use today essentially fall into two broad categories: In the first type the reactions occur across an ion-exchange membrane (*7*). In the second

type the suppression reactions occur in a packed bed of high-exchange-capacity resin material (*8, 9*). In a third type, although not commonly used, the suppression reactions occur as the eluent stream mixes with the flowing stream of high-capacity resin material (*10*). The suppressed conductometric detection is employed in environmental methods, regulated by US EPA and other agencies, and for detection of trace ions in high-purity waters. The commonly used mobile phases in IC of anions include mixtures of bicarbonate, carbonate, and hydroxide, and in IC of cations methane sulfonic acid is typically used.

Soon after the introduction of IC technology, Gjerde et al. in 1979 developed IC without chemical suppression, in which the analytical column effluent flows directly to a conductivity detector (*11*). The typical eluents used in nonsuppressed IC are phthalic acid and *p*-hydroxybenzoic acid for the determination of anions, and methanesulfonic acid for the determination of cations. The equivalent conductance values of chloride, sulfate, and other common anions are significantly greater than those of the eluent anions, and hence positive peaks are detected as the anions are carried through the detector. The equivalent conductance values of sodium, potassium, and other common cations are appreciably smaller than those of the eluent cations, and hence negative peaks are detected as the cations are carried through the detector.

Nonsuppressed IC is easier to operate, and it is a useful technique for determining ions of weak acids such as cyanide and sulfide that do not conduct after chemical suppression. Pharmaceutical analyses can be performed in nonsuppressed mode because the quantitation limits are usually in upper mg/L to low percentage levels. Although suppressor-based methodologies often must be implemented on instrument systems specifically designed for this purpose, it is possible to perform IC without the suppressor on existing HPLC instrumentation. A consideration of the ability to perform IC analyses on various commercially available HPLC systems (e.g., systems from Agilent, Waters, and Shimadzu) is presented in *Table 5*. As this table indicates, it is possible to perform IC analysis on such HPLC instruments because the commonly used eluents in IC include dilute concentrations of bases and acids that are compatible for use on the existing HPLC instruments. It is, however, prudent to consult the instrument manufacturer regarding applicability of the instrument for the IC analysis.

Other Detectors

Other detectors commonly used in IC include pulsed amperometry, direct UV detection, or postcolumn derivatization followed by UV–VIS detection.

Pulsed amperometric detection (PAD) is commonly used for the detection of electroactive ions, e.g., organic compounds such as carbohydrates, sugar alcohols, amino acids, and organic sulfur species. In PAD, organic molecules are detected by an oxidative desorption process at the surface of an electrode located in the column effluent stream. Following the detection process, a series of potentials are applied for fixed time periods to clean the electrode surface. Compared with conventional amperometry, a rapidly repeating sequence of different working potentials in PAD, referred to as a waveform, helps in removal of oxidizable and reducible species from the electrode surface. A review of the waveforms employed for detection and electrode cleaning is presented in Dionex's technical note 21 (*79*).

Several inorganic and organic ions possess a UV chromophore. Direct UV detection is used for such ions, e.g., organic acids, bromide, iodide, nitrate, nitrite, thiosulfate, and cyanometalic complexes. Analogous to the inverse conductometric detection of cations, UV detection may also be performed indirectly. This method is called indirect photometric chromatography (IPC). Examples of IPC for inorganic and organic ions are listed in *Table 7*.

In photometric detection, column effluent is derivatized with a color-forming reagent prior to detection in VIS wavelength. A classic example is the detection of metal ions (*Table 6*) in which the column effluent is derivatized with 4-(2-pyridylazo)-resorcinol and detection is performed at 510–530 nm.

Sample Preparation

Typically, sample preparation in IC includes only dilution or filtering through a 0.45-µm filter or both. Certain samples may require removal of undesirable species by pushing the sample through solid-phase extraction (SPE) cartridges containing, depending on the application, different packing materials. For example, a highly alkaline sample can be neutralized by pushing it through an SPE cartridge packed with cation-exchange material in H^+ form. Further details on SPE procedures can be found in reference 2.

APPLICATIONS OF IC IN PHARMACEUTICAL AND DRUG ANALYSIS

As dictated by the nature of the analyte, IC has been applied to all aspects of the manufacturing and disposition of pharmaceutical products, including the characterization of drug substances and active ingredients, excipients, and other so-called inert product components, degradation products, and/or impurities and process streams. The following sample types are analyzed: raw materials, intermediates (including media and culture broths), bulk active ingredients, diluents, formulated products, production equipment cleaning solutions, and waste streams. The method is especially valuable in the pharmaceutical industry for ionic analytes (in products containing non-ionic components) that have little or no native UV absorbance. *Figure 2* shows a chromatogram for the determination of inorganic cations in electrolyte solution with a runtime of less than 10 minutes. However, the ability to couple the ion-exchange separation with numerous detection strategies, e.g., PAD, expands IC applications to instances were analyte-specific detection strategies can provide the required degree of sensitivity and/or specificity. High-performance anion-exchange

Pharmacopeial Forum
Vol. 29(6) [Nov.–Dec. 2003]

chromatography, coupled with PAD, is illustrated in *Figure 3* for the determinations of carbohydrates, alditols, alcohols, and glycols (*78*). Utilization of such strategies allows IC applications to be implemented on appropriately configured HPLC systems. Additionally, ion-exclusion separations expand the range of application of IC to aliphatic organic acids (*Figure 4*) as well as to non-ionic analytes of significant pharmaceutical interest, including alcohols and carbohydrates. The wide dynamic range of the methodology makes it applicable for the quantitation of trace contaminants as well as major product components.

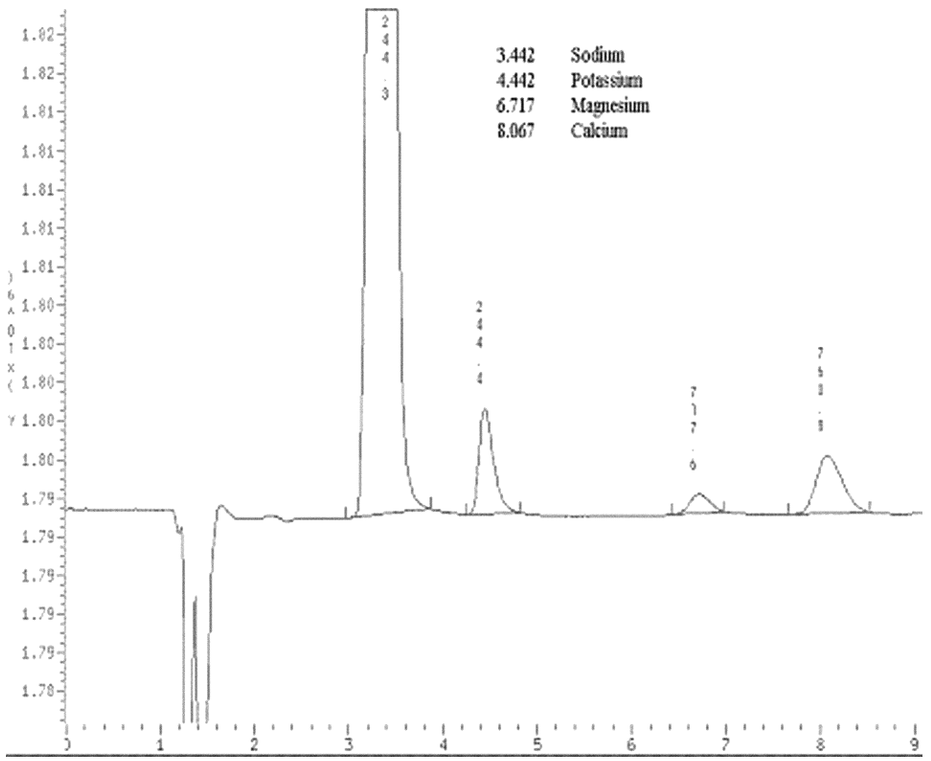

Fig. 2. Chromatogram illustrating separation of cations in electrolyte solution. IC conditions: WATERS IC Pak CM/D column, 3.9 × 150 mm at 30 °C, 4.0 mM HNO_3 eluent at 1.0 mL/min, 20 µL injection, ALLTECH conductivity detector at 35 °C with 100 µS sensitivity, and inverse polarity.

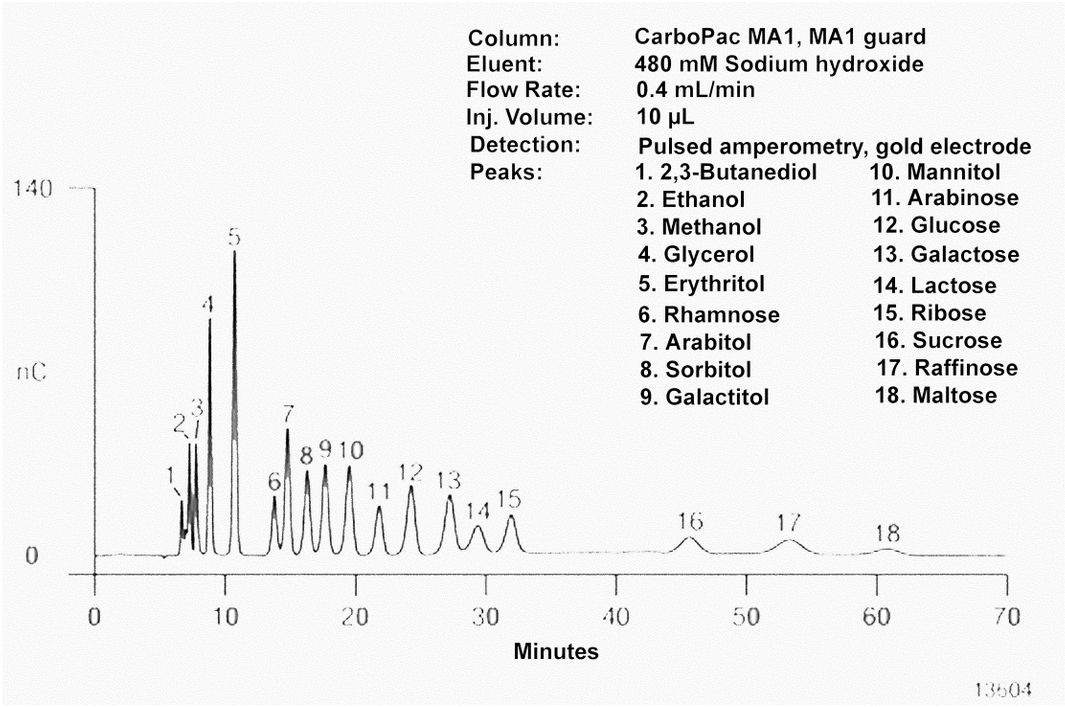

Fig. 3. Chromatogram demonstrating separation of carbohydrates, alditols, alcohols, and glycols on DIONEX CARBOPAC MA1 column followed by pulsed amperometric detection.

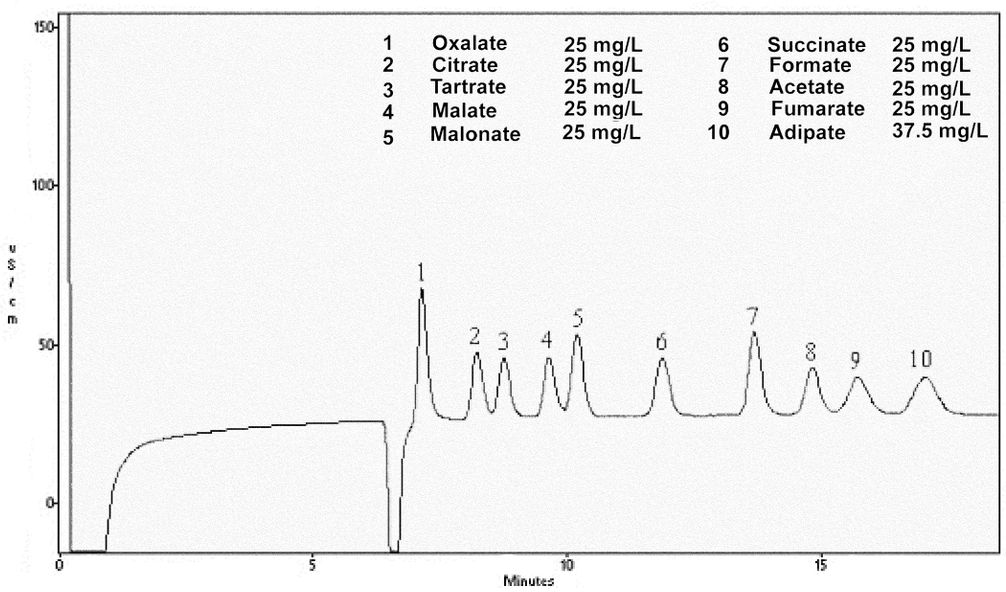

Fig. 4. Determination of organic acids by ion-exclusion separation followed by suppressed conductometric detection. Guard column (3.0 × 10 mm), analytical column (7.5 × 300 mm), eluent, 7.5 mM H_2SO_4 at the rate of 0.6 mL/min, MicroSuppressor (4.6 × 20 mm) regenerated with 0.6 M TMAOH, sample loop, 50 µL, conductometric detection.

Examples of the application of IC to pharmaceutical analysis are provided in *Tables 6–9*. Although these tables do not exhaustively capture the entire database of pharmaceutical applications of IC, they do provide relevant examples of the types of separation and detection strategies that are used in this field.

METHOD VALIDATION

Because IC is a liquid chromatographic method, guidelines for the validation of IC applications in the pharmaceutical industry are readily available (*70–72*), and most of the applications cited in this manuscript contain some degree of assay validation information. Comprehensive validation information, specifically with respect to the common validation parameters (e.g., accuracy, linearity, precision, specificity, sensitivity, and ruggedness), is summarized in *Table 10* for the various pharmaceutical applications of IC. Consistent with the nature of the application (trace analysis versus content/potency), the operating characteristics are similar to those that are routinely obtainable in more classical applications of liquid chromatography (e.g., HPLC).

Ion chromatography is extensively employed in the environmental and food industries. Because the requirements for quality in these disciplines are similar to those in the pharmaceutical industry, applications in these fields have been extensively validated, including the utilization of interlaboratory collaborative assessments (*61–68*).

Table 1. Comparison of IC and HPLC

Item	IC	HPLC
1. Separation modes	Ion exchange, ion exclusion, and ion pair	Reversed phase, normal phase, size exclusion, affinity, and chiral
2. Band broadening	Typically follows Knox equation	Typically follows Knox equation
3. Mobile phase	Ionic mobile phases are commonly used. Solvents are sometimes added to enhance separation	Various solvents with or without buffers for pH adjustment
4. Suppressor for enhancing signal/noise ratio	Most commonly used for conductometric detection of anions and cations. Direct conductometric detection is suitable when detection at ppb levels is not necessary.	None
5. Detection	Conductivity, UV detection, postcolumn reaction followed by VIS detection, and pulsed amperometry	UV, diode-array, MS, RI, fluorescence, and postcolumn reaction followed by VIS detection
6. Instrumental setup	Resembles HPLC setup. Due to ionic mobile phases, system components preferably are made of inert materials.	Most of the system components are made of passivated 316 stainless steel, other metals, or plastic material.
7. Computer-based software	Very similar to that for HPLC	

Table 2. IC in USP monographs[1]

Title	Test	Separation	Detection[2]
Amikacin	Assay	Column: Anion Exchange, 8 µm, L47 packing, available as DIONEX's CarboPac MA1; Eluent: 0.115 N NaOH	PAD
Bethanecol chloride injection	Assay and limit of 2-hydroxypropyl trimethyl ammonium chloride	Column: Weak cation Exchange, 3–15 µm, L53 packing, available as DIONEX's CS14; Eluent: 20 mM methanesulfonic acid	NS, CD
Erythromycin ointment	Erythromycin assay	Column: Cation Exchange, 5–10 µm, L47 packing, available as TSK IC SW cation from TosoHaas; Eluent: mixture of ACN, NaOH, and water	PAD
Fludeoxyglucose F18 injection	Limit of 2-chloro-2-deoxy-D-glucose	Column: Anion Exchange, 10 µm, L46 packing; Eluent: 0.8% NaOH	PAD
Fenoldopam mesylate	Limit of iodide	Column: Anion Exchange, packing not specified; Eluent: 2.8 mM $NaHCO_3$ + 2.2 mM Na_2CO_3 + 0.8 mM 4-cyanophenol + 2% acetonitrile	S, CD
Ferumoxides Injection	Assay for citrate	Column: Anion Exchange, 15 µm, L48 packing, available as DIONEX's IonPac AS5; Eluent: 37.5 mM NaOH	S, CD
Kanamycin sulfate	Assay	Column: Anion Exchange, 8 µm, L47 packing, available as DIONEX's CarboPac MA1; Eluent: 0.115 N NaOH	PAD
Oil- and water-soluble vitamins with minerals oral solution	Assay for fluoride	Column: Ion Exclusion, 7–11 µm, L17 packing; Eluent: 10% (v/v) Ethanol + 2 mN H_2SO_4	CD
Oil- and water-soluble vitamins with minerals tablets	Assay for fluoride	Column: Ion Exclusion, 7–11 µm, L17 packing; Eluent: 10% (v/v) Ethanol + 2 mN H_2SO_4	CD
PEG 3350 and electrolyte oral solution	Assay of sodium and potassium	Column: Strong Cation Exchange, about 10 µm, L22 packing; Eluent: 1.9 mM HNO_3 eluent	NS, CD
	Assay of chloride and sulfate	Column: Weak Anion Exchange, about 10 µm, L23 packing; Eluent: Mixture of borate, gluconate, glycerine, and acetonitrile	NS, CD
Potassium Perchlorate	Assay of perchlorate	Column: Weak Anion Exchange, about 10 µm, L23 packing; Eluent: 10 mM phthalic acid + 10% methanol, pH 4.5	CD
Sodium fluoride F18 injection	Radiochemical purity (Purity of $N^{18}F$)	Column: Ion Exclusion, 7–11 µm, L17 packing; Eluent: 3 mN H_2SO_4	Gamma ray detector in series with CD
Streptomycin sulfate	Assay	Column: Anion Exchange, 15 µm, L48 packing, available as DIONEX's CarboPac PA1; Eluent: 70 mM NaOH	PAD

Table 2. IC in USP monographs[1] *(Continued)*

Title	Test	Separation	Detection[2]
Enoxaparin Sodium Injection (proposed)	Free sulfate content	Column: Strong Anion Exchange, 8 µm, L31 packing, available as DIONEX's IonPac AS11; Eluent: 3.0 mM Na_2CO_3	S, CD
Mg-carbonate, citric acid, and K-citrate for oral solution (proposed)	Assay for citrate	Column: Ion Exclusion, 7–11 µm, L17 packing; Eluent: 2 mM HNO_3	CD

[1] Information revised from reference 5.
[2] Detection: PAD, pulsed amperometric; NS, CD, nonsuppressed conductometric; CD, direct conductometric; S, CD, suppressed conductometric.

Table 3. Survey of stationary phases used in anion separations by ion chromatography[1]

Phase	Vendor	Functionality	Characteristics			
			Particle Size (µm)	Capacity (mequiv/g)	pH Range	Solvent Use (%)
A. Based on surface functionalized ethylenevinylbenzene/divinylbenzene copolymers						
PRP-X100	Hamilton	Aminated with triethylamine	10	0.2	1–13	100
PRP-X110	Hamilton	Quaternary ammonium	7	—[2]	0–14	100

Table 5. Compatibility of conventional HPLC equipment for performing IC

Equipment	Composition of various components in the HPLC system that come in contact with the mobile phase	Recommended Solvents	Solvents to Avoid
Agilent 1100[1]	SST, gold, sapphire, ceramic, ruby, PTFE, FEP, PEEK, Quartz, Kapton, fused silica, vespel	- Various solvents. - Other details not available.	- Alkaline solutions with UV detection because they can attack quartz. - Alkali halides and their respective acids. - High concentration of inorganic acids, e.g., H_2SO_4 and HNO_3 at higher temperatures. - Halogenated solvents or mixtures that form radicals or acids. - Ether-containing peroxides: filter through Al_2O_3 to remove peroxides. - Solvents containing strong complexing agents, e.g., EDTA. - Mixtures of CCl_4 with 2-propanol or THF.
Waters 2695 Separations Module[2]	SST 316, zirconia ceramic, UHMWPE, sapphire, ruby, TEFZEL® (ETFE), TEFLON® (FEP and PTFE), TEFLON AF, FLUOROLY G, FLUORO-POLY-08R	- Various acids, e.g., methanesulfonic acid, 6 N HNO_3, and 0.2 M H_2SO_4, bases, e.g., NaOH, KOH, and 3 M NH_4OH, buffers, e.g., $NaHCO_3$, Na_2CO_3, and phosphate, and 100% solvents can be used.	- Perfluorosolvents: Attack or dissolve the TEFLON AF tubing in the degasser. - Halide salts: Avoid long-term exposure because they will cause pitting or corrosion of SS parts.
Waters 2795 Separations Module[3]	SST 316, UHMWPE, sapphire, ruby, Tefzel® (ETFE), TEFLON® (FEP and PTFE), PEEK, FLUOROLY G, FLUOROPOLY-08R	- Various acids, e.g., methanesulfonic acid, 6 N HNO_3, and 0.2 M H_2SO_4, bases, e.g., NaOH, KOH, and 3 M NH_4OH, buffers, e.g., $NaHCO_3$, Na_2CO_3, and phosphate, and 100% solvents can be used.	- Perfluorosolvents: Attack or dissolve the TEFLON AF tubing in the degasser. - Halide salts: Avoid long-term exposure because they will cause pitting or corrosion of SS parts.
Shimadzu, LC-2010 and VP series[4]	All the details not available	- Solvents. - Other details not available.	- Buffers or acids containing halogen (especially chloride) ions, because they cause pitting in the metal. - For PEEK in the flow path: Avoid THF, concentrated sulfuric acid, concentrated nitric acid, dichloromethane (also known as methylene chloride, MeCl, or DCM), dimethylsulfoxide (DMSO,) chloroform, or acetone because they will physically weaken the material.

Table 6. Pharmaceutical applications of ion chromatography, active ingredients

Analyte	Column	Eluent	Detection	Other	Ref.
Disodium clodronate tetrahydrate	DIONEX IonPac AS7, 250 × 4 mm, 10 µm particles	40 mM HNO_3 at 0.5 mL/min	UV at 300 nm after post-column derivatization with acidic iron (III)	Stability-indicating versus degradation products with some validation data provided	12
1-(Butylamino)-1-deoxy-D-glucitol[1]	DIONEX IonPac CS3, 250 × 4 mm, 10 µm particles	10 mM HCl with 0.01 mM DL-2,3-diaminopropionic acid, 2 mL/min	Suppressed conductivity, 0.1 M TBAOH[2] regenerant	Stability-indicating versus common impurities with some validation data provided.	13
Alendronate[3]	WATERS IC-PAK HR (75 × 4.6 mm, 6 µm particles) or a Dionex OmniPac PAX-100 (250 × 4 mm, 8 µm particles)	1.6 mM HNO_3 or 1.76 mM HNO_3 with 20% acetonitrile at 0.5 mL/min	Direct conductivity	Analysis in intravenous solution, validation data provided	14
Aredia[4]	ALLTECH Universal Anion	5 mM potassium nitrate, pH 3.5, 1.2 mL/min	Refractive index	Quantitation in dosage forms, stability-indicating versus formulation components, impurities and degradation products	15
Alendronate sodium,[3] etidronate disodium,[5] clodronate disodium[6]	WATERS IC-PAK HR anion (75 × 4.6 mm, 6 µm particles) and others[7]	Nitric acid or nitric acid–potassium nitrate mixtures, 0.5–1.0 mL/min	Indirect UV at 235–245 nm	Validation of method for drug analysis in tablets and i.v. formulations	16
Alprenolol,[8] atenolol,[9] acebutolol,[10] metopropolol,[11] oxprenolol,[12] propranolol[13]	WATERS IC-PAK CM/D (5 µm particles)	50 mM HNO_3 in 4% acetonitrile, 1 mL/min	UV at 270 nm	Validation of method for drug analysis in tablets and i.v. formulations	17
Alendronate, clodronate, etidronate	HAMILTON PRP-X100, 250 × 4.1 mm, 10 µm particles	1 mM trimesic acid, pH 5.5 at 1 mL/min	Indirect UV at 254 nm	Stability-indicating versus thermal degradation products, influence of mobile phase composition explored	18
Sodium salicylate, ampicillin sodium, potassium guaiacolsulfonate, benzylpencillin potassium	BIO TECH RESEARCH Carbon B1-01, 100 × 4.6 mm	0.1 M Pyrocatechol Violet–2 mM HNO_3 at 0.8 mL/min	Suppressed conductivity with TBAOH as regenerant	Indirect drug quantitation via the counterions (Na, K). Some validation data provided.	19
Caffeine, theobromine, theophylline[14]	DIONEX HPIC-CS3 (cation, 2 columns in series) DIONEX OMNIPAC PAX-100 (anion)	100 mM HCl at 1 mL/min (cation) 15 mM KOH in 1% acetonitrile at 1 mL/min (anion)	Direct UV at 274 nm	Quantitation in injections and tablets, some method optimization and validation data provided.	20
Paracetamol[15]	WATERS IC-PAK A HR (10 cm, 6 µm particles)	5 mM LiOH in 5% acetonitrile at 1 mL/min	Direct UV at 300 nm	Quantitation in solid dosage forms.	21
Oxytetracycline, tetracycline, chlortetracycline, doxycycline	DIONEX OMNIPAC PCX-100 (250 × 4 mm)	0.2 M HCl in ≈ 28% acetonitrile at 1 mL/min	Direct UV at 300 nm	Method developed primarily for residuals testing	22

Table 6. Pharmaceutical applications of ion chromatography, active ingredients *(Continued)*

Analyte	Column	Eluent	Detection	Other	Ref.
Benzethonium chloride, cetylpyridium chloride, chlorhexidine digluconate, cetrimonium bromide, domiphen bromide	SHIM-PACK IC-A1 (100 × 4.6 mm, 10 µm)	0.94 mM sodium carbonate + 0.31 mM sodium bicarbonate or 0.25 mM phthalic acid + 2.4 mM tris(hydroxymethyl)aminoethane, pH 4.31, both at 1.5 mL/min	Direct conductivity	Sample combusted and analyzed via the liberated anion (Cl or Br). Analytical recoveries reported.	23
Copper, manganese, zinc	DIONEX HPICE-CS5	0.05 M oxalic acid (pH 5.24) at 1 mL/min	UV-VIS at 520 nm after postcolumn reaction with PAR	Used to characterize multivitamin supplements.	69
Chloride, bromide	DIONEX IONPAC AS4A	0.75 mmol/dm^3 sodium bicarbonate, 2.2 mmol/dm^3 sodium carbonate at 1 mL/min	Suppressed conductivity with 25 mmol/dm^3 sulfuric acid as regenerant	Used to assess batch-to-batch variation in an ion-exchange bile acid sequestrant	60

Notes:
[1] A polyhydroxy aliphatic amine synthetic reaction intermediate.
[2] TBAOH = tetrabutylammonium hydroxide.
[3] Monosodium monohydrate salt of 4-amino-1-hydroxybutane-1,1-bis-phosphonic acid.
[4] Disodium-3-amino-1-hydroxy-propylidene-1,1-biphosphonate pentahydrate.
[5] 1-Hydroxyethane-1,1-bisphosphonic acid disodium salt.
[6] 1,1-Dichloromethane-1,1-bisphosphonic acid, disodium tetrahydrate salt.
[7] Other columns include DIONEX AS7 and AS4A and METACHEM HEMA 1000Q.
[8] 1-(*o*-Allylphenoxy)-3-isopropylamino-2-propanol.
[9] 1,4-(2′-Hydroxy-3′-isopropylamino-propoxy)phenylacetamide.
[10] N-3-Acetyl-4-(2-hydroxy-3-(isopropylamino)-propoxy)-phenylbutanamide.
[11] 1-Isopropylamiono-3-(*p*-(β-methyloxyethyl)phenoxy)-2-propanol.
[12] 1-(2-(Allyloxy)-phenoxy)-3-isopropylamino-2-propanol.
[13] 1-Isopropylamino-3-(1-napththyoxy)-2-propanol.
[14] Separations as anions and cations reported.
[15] Acetominophen, N-acetyl-*p*-aminophenol.

Table 7. Pharmaceutical applications of ion chromatography, excipients and inactive formulation components

Analyte	Column	Eluent	Detection	Other	Ref.
Acetate, lactate, chloride, phosphate citrate, sulfate	HAMILTON PRPX-100, 250 × 4.1 mm; WATERS IC PAK A, 50 × 4.6 mm, VYDAC 300 IC, 50 × 4.1 mm	Various potassium hydrogen phthalate solutions (some with acetonitrile at 1.3–2.0 mL/min	Indirect UV at 254 nm	Used to measure these anions in i.v. solutions	24
Oxalate	DIONEX AS-1	1 mM potassium hydrogen phthalate, 2 mM sodium borate, pH 9.1 at 2–4 mL/min	Indirect UV at 250 nm	Recovery data provided from a generalized pharmaceutical LVP solution.	25
Lactic acid and lactic acid lactate	DIONEX HPICE-AS1 (ion exclusion)	1 mM sodium octanesulfonate	Suppressed conductivity	Used to characterize Amrinone Lactate Injection	26
Sodium, potassium, cesium, magnesium, calcium	ZORBAX SCX-300, 250 × 4.6 mm	2.5 mM copper sulfate at 1.2 mL/min	Indirect UV at 230 nm	Used for the analysis of a cardioplegic solution, some validation data	27
Sodium lauryl sulfate	DIONEX OMNIPAC PAX-500, 250 × 4 mm	Gradient used[1] at 1 mL/min	Suppressed conductivity, 12.5 mM sulfuric acid as regenerant	Characterization of tablet dosage form	28
Chloride, sulfate, phosphate, citrate	DIONEX OMNIPAC PAX-500, 250 × 4 mm	40 mM NaOH in 5% methanol at 1 mL/min	Suppressed conductivity, 12.5 mM sulfuric acid as regenerant	Characterization of a liquid veterinary drug	28
Citrate	HAMILTON PRP-X100, 150 × 4.1 mm, 10 µm particles	0.875 mM trimesic acid, pH 10.0 at 1.5 mL/min	Indirect UV at 280 nm	Used to characterize a number of commercial pharmaceutical products, validation data provided	29
Methane through octane sulfonic acids	DIONEX PAX-500	Gradient used[2] at 1 mL/min	Suppressed conductivity with 12.5 mM sulfuric acid regenerant	Validation data provided	30
Methanesulfonic acid, fumaric, maleic, succinic, tartaric acids	DUPONT ZORBAX NH_2, 250 × 4.6 mm, 5 µM particles	20 mM sodium dihydrogen phosphate, 0.13 mM phosphoric acid (pH 4.2) in 5% acetonitrile	Direct conductivity	Method development data provided.	31
Chloride, bromide, sulfate	BIO TECH RESEARCH Carbon BI-01, 100 × 4.6 mm	2 mM sodium carbonate, 1 mM tetrabutylammonium-hydroxide, 5% acetonitrile at 0.8 mL/min	Suppressed conductivity, 12.5 mM sulfuric acid regenerant	In D&C color additives. Sample analysis by direct injection or after oxygen flask combustion.	32
Oxalate, citrate	DIONEX AS-1	10 mM TRIS, 30 mM sulfate, pH 6.5 at 1 mL/min	Direct UV at 210–220 nm	Accuracy documented in a number of i.v. products.	33
Acetic, malic, lactic acids	BIO-RAD Aminex HPX-87H, 300 × 7.8 mm	0.15% sulfuric acid or 0.005% phosphoric acid at 0.8 mL/min	Direct UV at 210 nm	Ion exclusion method. Assay validation data provided for use in TPN solutions.	34
Malic, citric, and tartaric acids	SHIMPACK IC-A1, 100 × 4.6 mm, 12.5 µm particles	1.5 mM phthalic acid at pH 4.0 at 1.2 mL/min	Series bulk acoustic wave detector	Reported to be 5X more sensitive than direct conductivity. Used to characterize a homeopathic drug.	35

Table 7. Pharmaceutical applications of ion chromatography, excipients and inactive formulation components *(Continued)*

Analyte	Column	Eluent	Detection	Other	Ref.
Phosphate, phosphite, hydrophosphite	WATERS IC-PAK A HR, 6 µm particles	Gluconate/borate buffer containing acetonitrile and *n*-butanol at 1 mL/min	Direct conductivity	Used to characterize several tablet and syrup products.	36
Sulfite	WESCAN Anion Exclusion H/S, 250 × 4.6 mm	20 mM sulfuric acid at 0.75 mL/min	Direct conductivity	Used to characterize several herbal medicines.	37
Additives in foods and pharmaceutical preparations[3]	SHIMADZU SHIM-PACK IC-A3, 150 × 4.6 mm, 5-µm particles	5 mM sodium phosphate monobasic (pH 8.2) with 4% acetonitrile at 1 mL/min	Direct UV, switched between 205 and 227 nm	Some assay validation and performance data provided (tablet dosage form).	38
Acetic and lactic acids	ALLTECH Anion Exclusion, 300 × 7.8 mm	2 mM sulfuric acid at 0.7 mL/min	Direct conductivity	Validation of an ion-exclusion method for use in characterizing LVP products.	39
Silicic acid, calcium, magnesium, aluminum	TOSOH TSK gel IC-Anion-PW (50 × 4.6 mm, 10-µm particles)	1 mM NaOH with 10% methanol at 1.2 mL/min	Conductivity	Cations separated as their EDTA complexes. Validation data provided.	40

Notes:
[1] This separation utilized a 60-minute gradient formed with four eluents including water, acetonitrile/water (90/10), 200 mM NaOH, and methanol/water (45/55).
[2] A = 5 mM sodium borate, 5% acetonitrile; B = 20 mM sodium borate, 40% acetonitrile. Time = 0 min, 100% A. Time = 10 min, 100% B. Time = 15 min, 100% B.
[3] Analytes included saccharin, aspartame, acesulfame-K, benzoic acid, sorbic acid, caffeine, theobromine, and theophylline.

Table 8. Pharmaceutical applications of ion chromatography, degradation products and impurities

Analyte	Column	Eluent	Detection	Other	Ref.
5-hydroxymethylfurfural (5-HMF)	WESCAN Anion Exclusion HS, 100 × 4.6 mm	10 mM sulfuric acid at 0.8 mL/min	UV detection at 285 nm	Performance contrasted favorably with reversed-phase HPLC method.	41
Aluminum	WATERS Protein-Pak SP-5PW, 75 × 7.5 mm	0.01 M potassium sulfate, pH 3.0 at 1 mL/min	Fluorescence (395 nm excitation, 500 nm emission) with postcolumn reaction	Used for the quantitation of trace levels of Al in pharmaceutical diluents.	42
Cyanamide[1]	DIONEX ION-PAC AS-10	50 mM NaOH in 1% acetonitrile	PAD	Validation information provided.	43
Common anions[2]	DIONEX IONPAC AS4A	1.75 mM sodium bicarbonate, 2.5 mM sodium carbonate at 1 mL/min	Suppressed conductivity	Characterization of high-purity water for sub-ppb trace ionic contaminants with preconcentration.	44
Common cations[3]	DIONEX IONPAC CS12	20 mM methanesulfonic acid at 1 mL/min	Suppressed conductivity	Characterization of high-purity water for sub-ppb trace ionic contaminants with preconcentration.	44
Sulfamate, sulphate	HAMILTON PRP-X100 (150 × 4.6 mm, 10-µm particles)	5.8 mM *p*-hydroxybenzoic acid, 2.5% methanol at pH 9.4, 1.5 mL/min	Indirect UV at 310 nm	Degradation products of Topiramate.	45
Methansulfonic acid	HAMILTON PRP-X100 (150 × 4.1 mm, 10-µm particles)	Acetonitrile/60 mM NaOH (20/80) at 2 mL/min	Suppressed conductivity with 50 mN sulfuric acid as regenerant.	Measured this drug synthesis intermediate in drug raw materials; some validation data provided.	46
Citric, malic, ascorbic acid	SHIM-PACK IC-A1 (100 × 4.6 mm)	20 mM potassium hydrogen phthalate at 1 mL/min	Direct conductivity and quartz crystal detector	Used to determine these components in a Chinese herbal medicine.	47
Amylamine, *tert*-butylamine	DIONEX CS-14 (250 × 4 mm, 5-µm particles)	Acetonitrile/50 mM methanesulfonic acid (5/95) at 1 mL/min	Suppressed conductivity with 100 mM tetrabutyl ammonium hydroxide as regenerant.	Amylamine is a synthetic residual and *t*-butylamine is the active's counterion (measured for purity assessment).	48
Nitrite, nitrate	EXSIL SAX (125 × 4.6 mm)	22 mmol/dL potassium dihydrogen phosphate, 3 mmole/dL phosphoric acid with 20% acetonitrile at 1.6 mL/min	Direct UV at 214 nm, or electrochemical	Used to study the oxidative denitrification of hydroxyguanidines.	49
Carbonate	DIONEX IONPAC ACE-AS1 (ion exclusion)	Water at 1 mL/min	Conductivity	Used to study the oxidative decarboxylation of aromatic carboxylic acids	49
Sulfate	DIONEX AS4-SC	1.8 mmol/dL sodium carbonate, 1.7 mmol/dL sodium bicarbonate at 1.5 mL/min	Direct UV at 214 nm or suppressed conductivity	Used to study the generation of sulfate from perthiol drugs.	49

Table 8. Pharmaceutical applications of ion chromatography, degradation products and impurities *(Continued)*

Analyte	Column	Eluent	Detection	Other	Ref.
Methanesulfonic acid	DIONEX IONPAC AS4A-SC	0.015% sodium hydrogen carbonate at 2 mL/min	Suppressed conductivity with 0.075% sulfuric acid as regenerant	Hydrolysis of busulfan tablets; validation data provided.	50
Oxalic acid, oxamic acid, and oxamide	DIONEX IONPAC ICE-AS1 (250 × 9 mm, 7.5-µm particles)	5/95 acetonitrile/0.1% sulfuric acid at 0.8 mL/min	UV at 205 nm	Impurity products in synthetic processes; some validation data provided.	51
Sulfate and sulfamate	DIONEX IONPAC AS5A-5µ (150 × 4 mm)	Gradient with mobile phase A being water and mobile phase B being 50 mM NaOH at 1 mL/min	Suppressed conductivity	Assay used to measure these analytes as degradation products of Topiramate. Extensive validation information provided.	59

Notes:
[1] Synthetic residue.
[2] Including chloride, nitrite, bromide, nitrate, orthophosphate, and sulfate.
[3] Including lithium, sodium, ammonium, potassium, magnesium, and calcium.

Table 9. Pharmaceutical applications of ion chromatography, process streams

Analyte	Column	Eluent	Detection	Other	Ref.
Carbohydrates (galactose, glucose, ribose, fructose)	DIONEX CARBOPAC PA1 (250 × 4 mm)	150 mM NaOH at 1 mL/min[1]	PAD (Au electrode)	Methods used to quantitate substrates and metabolites in fermentation broth	52
Inorganic cations (calcium, magnesium, ammonium, potassium, sodium)	DIONEX IONPAC CS10 (250 × 4 mm)	20 mM HCl, 4 mM *d,l*-2,3-diaminopropionic acid at 1 mL/min	Suppressed conductivity with 0.1 M tetrabutylammonium hydroxide as regenerant		
Sugar alcohols (glycerol, inositol, mannitol, sorbitol)	DIONEX HPICE-AS1 (250 × 4 mm, ion exclusion	100 mM perchloric acid at 0.8 mL/min	PAD (Pt electrode)		
Sodium, ammonium, potassium, magnesium, calcium	DIONEX IONPAC CS12 (250 × 4 mm)	4 mM methanesulfonic acid at 1 mL/min	Suppressed conductivity	Used to optimize culture media composition.	53
Chloride, nitrate, sulfate	Ion exclusion: BIORAD Organic Acids column HPAH (100 × 7.8 mm, 9-µm particles) Ion exchange: Dionex AS4A	Ion Exclusion: 1 mM octanesulfonic acid with 2% isopropyl alcohol Ion Exchange: 2.8 mM sodium carbonate, 1.7 mM sodium bicarbonate, both at 2 mL/min	Suppressed conductivity with suppression for both the ICE and IC separations	Coupled ion exclusion (online sample preparation) with ion exchange (analytical separation) to analyze these analytes in fermentation broth containing high levels of organic acids.	54
Dimethylbenzenesulfonate	DIONEX OMNIPACK PAX-100	5 mM sodium chloride, 0.2 mM sodium hydroxide, 32% acetonitrile at 1 mL/min	Direct UV at 220 nm	Used to perform residuals testing during cleaning validation.	55
Magnesium	SHIM-PACK IC-C1 (150 × 5 mm, 10-µm particles)	4 mM tartaric acid, 2 mM ethylenediamine at 1.5 mL/min	Double cell bulk acoustic wave detector	Used to follow decrease in magnesium levels in cell culture media.	56
Hydroxylamine	DIONEX CS14 (250 × 4 mm)	11 mM sulfuric acid at 1 mL/min	PAD, Au working electrode	Analyte is a mutagenic active ingredient raw material, levels of which were monitored in final waste streams before disposal.	57
Chloride, nitrate, sulfate	DIONEX AS4A-SC	1.8 mM sodium carbonate, 1.7 mM sodium bicarbonate at 2 mL/min	Suppressed conductivity	Validated as the EP method for characterizing Purified Water.	58
Ammonium, magnesium, calcium	DIONEX CS 12	20 mM methanesulfonic acid at 1 mL/min	Suppressed conductivity	Validated as the EP method for characterizing Purified Water.	58

Note:
[1] A gradient separation for the carbohydrates is also reported.

Table 10. Examples of validation data for quantitative ion chromatography methods

Application	Performance Parameters						Ref.
	Accuracy	Precision	Linearity	Specificity	LOQ/LOD	Ruggedness	
A. Active ingredient analysis							
Alendronate in i.v. and tablet formulation by suppressed conductivity detection	Spiked drug into placebo at 80, 90, 100, 110, and 120% of formulation level. Mean recovery, 100.2%. Demonstrated equivalence versus an HPLC/fluorescence method.	Injection, $n = 10$ at 0.05 mg/mL, 1% RSD by peak height. Total method, $n = 10$ at 2.5 mg/mL 1.1% RSD or less.	Coefficients of determinations of 0.999 or greater for range of 40–160% of assay level. Non-zero intercepts observed.	Tested against formulation placebo and known thermal decomposition products.	Not evaluated.	Evaluated by performing testing on four analytical systems.	14
Biphosphonate drugs with indirect UV detection	Spiked drug into placebo at 50, 75, 100, 125, and 150% of formulation level. Mean recovery for three drugs, 100± 1% at sample level of 0.05 mg/mL.	Injection to injection, $n = 10$ at 0.05 mg/mL (25 µL injection) or 0.4 mg/mL (50 µL injection). %RSD less than 1%. Total method, 1–2% RSD for $n = 10$.	Coefficients of determinations of 0.999 or greater for range of 20–200% of formulation level. Areas better than heights; non-zero intercepts observed.	Tested against formulation placebo and known thermal decomposition products.	LOD of 0.001 mg/mL at S/N of 4 for all analytes	Evaluated via two analysts/two system testing, testing using five columns, and examining performance on one column after at least 500 injections.	16
Disodium clodronate in bulk materials pharmaceuticals by UV with postcolumn derivatization	Spiked drug into placebo capsules and tablets at 80, 100, and 120% of nominal formulation level (300–1000 mg). Mean recovery = 99.5–100.7%.	Six samples of bulk material and pharmaceuticals assayed. %RSD from 0.8% to 1.3% for 60–820 mg of drug.	50–175% of nominal analyte conc. (0.02–0.07 mg/mL), $r^2 = 0.9999$ ($n = 6$ at each level).	Tested against formulations degraded by acid, base, peroxide, heat, UV light) and against mixture of known impurities.	Not evaluated.	Stability of sample solutions = 60 hours at RT. Tested two columns with system suitability tests.	12
SPE removal of nonpolar compounds, ion-exclusion separation, and UV detection of citrate and acetate in medical fluids	Recovery, compared with non-SPE treated, ranged from 99.9 to 100.3% for 80 to 120% concentration.	%RSD ranging from 0.0 to 0.3%.	r^2 0.999, with % y-intercept ≤0.6.	The SPE treatment did not introduce citrate or acetate.	Not evaluated.	Two analysts on separate systems. Pooled data, 99.9 to 100.2% recovery, and %RSD ≤0.3.	73
B. Excipients and inactive ingredients							
Methane sulfonic acid in intermediates and drug substances by direct conductivity	Determined by mass-balance calculations in batch-release applications.	Injection precision, 1–2% RSD. Method precision, 1–3% RSD.	$r^2 = 0.9997$ over the range of 0.1–5 mg/mL.	Extensive investigation of elution characteristics.	Not evaluated.	Not evaluated.	31

Table 10. Examples of validation data for quantitative ion chromatography methods *(Continued)*

Application	Performance Parameters						Ref.
	Accuracy	Precision	Linearity	Specificity	LOQ/ LOD	Ruggedness	
Alkyl sulfonic acids (for example, methansulfonic acid, MSA) by suppressed conductivity, total method performance (sample extraction)	Spiked samples at 6 levels between 80 and 120% of allowable limit, mean recovery (n = 6) = 102.9%.	Injection precision (n = 5) at the specification limit was 5% RSD.	r^2 = 0.9999 over application range.	Resolution demonstrated versus other sulfonic acids and chloride.	LOQ of 40 ppm (µg/g) in sample for MSA.	Stock solutions of analytes stable for 1 week at RT. Analyzed 4 samples across 2 days, two columns, and fresh mobile phase preparations. %RSD = 7.5%.	30
Acetic and lactic acids in LVP i.v. solutions by ion exclusion with direct conductivity	Autoclaved formulation blanks spiked with 80, 100, or 120% of product specification levels. Acetate recovery 99–101%, 1500–7900 mg/L. Lactate, 99–103%, 680–3800 mg/L.	For 5 preparations in 4 formulations, 0.35–1.2% RSD at levels from 840 to 6600 mg/L.	Examined at 50 to 150% of sample dilution target with 5 standards, triplicate injections each (150–450 mg/L for sodium acetate trihydrate, 50 to 150 mg/L for sodium lactate). r^2 = 0.9997; other data provided.	Autoclaved formulation blanks examined. Examined a test sample cocktail containing 13 dextrose impurities, related substances, ''foreign sugars,'' and decomposition products.	LOQ = 9.9 mg/L for sodium acetate trihydrate and 3.6 mg/L for sodium lactate.	Performed accuracy assessment with two runs (different analysts and columns). No difference in performance noted. Also examined robustness and response stability.	39
C. Impurities and/or degradation products							
Cyanamide as a synthesis residual via PAD	Bulk drug substance spiked with 3 to 25 ppm additional analyte, % recovery from 89 to 106%.	Ten injections of sample at 5.4 ppm, %RSD = 4.6%. Method precision tested with 8 preparations of one lot, %RSD = 6.4%.	Assessed over the range of 15–150 ng/mL (7 levels, duplicate injections per level), r^2 = 0.9982.	Absence of response noted in degraded bulk drug substance.	Minimum quantifiable limit = 3 ppm.	Sample solutions stable for 53 hours at RT.	43
Methanesulfonic acid as a synthesis impurity with suppressed conductivity	Batch of drug spiked with MSA levels of 0.1–2.0% (by weight), duplicate injections at 7 levels, % recovery 98–107%.	Six preparations of bulk drug, %RSD = 0.51%. Day-to-day reproducibility of 2.9–4.0% RSD.	Assessed over a range of 1–20 ppm, r^2 > 0.999 (n = 10)	Absence of response noted in formulation placebos.	LOD = 0.3 ppm.	Assessed as day-to-day reproducibility.	46
Oxalic acid, oxamic acid, and oxamide as synthetic impurities by ion exclusion with UV detection	Examined by comparing calibration curves obtained in water matrix versus API. Less than 5% difference in slope, water versus API.	For six replicate preparations, %RSD = 9.3% at 2 ppm for oxalic acid; 4.1% at 1 ppm for oxamic acid; and 3.4% at 0.6 ppm for oxamide.	r^2 = 0.9999 over range of 0.4–24 ppm for oxalic and oxalic acids; 0.1 to 6.2 ppm for oxamide. Six concentrations, replicate injections.	Blank API matrix repetitively injected with no interfering peaks.	LOQ of 0.2 to 0.6 ppm.	Standards and samples stable for 24 hours at RT. Method tested in two different laboratories with new and aged columns.	51

Table 10. Examples of validation data for quantitative ion chromatography methods *(Continued)*

Application	Performance Parameters						Ref.
	Accuracy	Precision	Linearity	Specificity	LOQ/ LOD	Ruggedness	
Sulfate and sulfamate, decomposition products of topiramate, by suppressed conductivity	Examined by analyzing tablets spiked with the analytes over the range of 0.24–1.0 mol%. Mean recovery of 103%.	1.1% RSD (10 injections) for sulfamate and 1.5% RSD for sulfate at 0.5 mol%.	0.04 to 27 mol% for sulfamate, 0.1 to 30 mol% for sulfate, $r^2 > 0.999$ but systematic skew in calibration curve noted.	Formulation placebo (degraded and fresh) examined for absence of interfering peaks.	LOQ = 0.05 mol% for sulfamide, 0.1 mol% for sulfate.	Samples and standards stable for at least 6 days at RT. Performed robustness assessment.	59
D. Process streams							
Inorganic cations in culture media by suppressed conductivity	Spike recoveries determined in chemically defined and complex media formulations.	Interday ($n = 6$) and intraday ($n = 12$) precision assessed at concentrations ranging from 0.5 to 50 ppm. At > 1 ppm, interday %RSD < 1%, intraday < 2%.	$r^2 > 0.9999$ using polynomial model, 0.5 to 25 ppm for Na and K, 1 to 50 ppm for ammonium, Ca, Mg.	Specificity considered from a theoretical perspective based on the separation and detection methods.	LOD 0.5 to 1 ppm.	Assessed via intraday precision.	53
Hydroxylamine in waste streams by PAD	Mean recoveries of analyte spiked into waste water of 69.4% at 0.05 ppm and 93.3% at 0.5 ppm.	Triplicate injections at 0.05 ppm and 0.5 ppm had %RSD of 2.8% and 1.5%.	$r^2 = 0.999$ over range of 0.01 to 2.0 ppm.	Examined versus a mixture of *n*-methylhydroxyamine analogs at 1 ppm.	LOQ = 0.015 ppm.	Standards stable for 12 hours at RT.	57

Table 10. Examples of validation data for quantitative ion chromatography methods *(Continued)*

Application	Performance Parameters						Ref.
	Accuracy	Precision	Linearity	Specificity	LOQ/ LOD	Ruggedness	
Chloride, nitrate, sulfate in pharmacopeial grades of water with suppressed conductivity	Recovery in solutions at 75%, 100%, and 125% of nominal standard concentration. Mean accuracy = 105.1% for Cl; 104.5% for nitrate; 105.3% for sulfate.	Method repeatability assessed by six injections on one day at the specification limit. %RSD = 5.0% for Cl, 3.3% for nitrate, 0.7% for sulfate. Method reproducibility assessed by duplicate injections on six different days by different analysts. %RSD for Cl = 12.4%, 7.8% for nitrate, 4.0% for sulfate.	Duplicate injections for 5 standards over range of 25–150% of the pharmacopeial limit (0.1 ppm Cl, 0.2 ppm nitrate, 1 ppm sulfate); $r^2 >$ 0.99.	Tested against other common inorganic anions.	LOQ = 0.05 ppm, Cl; 0.004 ppm, nitrate; 0.04 ppm sulfate.	Standards and samples stable for > 7 days at RT. See method reproducibility.	58
Ammonium, magnesium, calcium in pharmacopeial grades of water with suppressed conductivity	Recovery in solutions at 75%, 100%, and 125% of nominal standard concentration. Mean accuracy = 97.9%% for ammonium; 98.5% for magnesium; 98.4% for sulfate.	Method repeatability assessed by six injections on one day at the specification limit. %RSD = 2.7% for ammonium, 1.7% for magnesium, 0.4% for calcium. Method reproducibility assessed by duplicate injections on six different days by different analysts. %RSD for ammonium = 5.4%, 1.7% for magnesium, 2.6% for calcium.	Duplicate injections for 5 standards over range of 25–150% of the pharmacopeial limit (0.2 ppm ammonium, 1.0 ppm magnesium, 2 ppm calcium); $r^2 >$ 0.99.	Tested against other common inorganic cations.	LOQ = 0.02 ppm, ammonium; 0.25 ppm, magnesium; 0.35 ppm calcium.	Standards and samples stable for > 7 days at RT. See method reproducibility.	58

The Role of Rapid Microbiological Methods within the Process Analytical Technology Initiative

Donald C. Singer and Anthony M. Cundell, PhD, USP Analytical Microbiology Expert Committee*

ABSTRACT This article discusses the role of rapid microbiological methods for in-process and finished-product testing within the context of the FDA Process Analytical Technology Initiative. The disadvantage of the extended incubation time required by growth-based microbiological methods is emphasized in this stimuli article. The authors briefly review candidate technologies for rapid microbiological testing. Using risk assessment tools, the authors identify critical microbial tests where these rapid microbiological methods could be applied.

In November 2001 Janet Woodcock, MD, Director, Center for Drug Evaluation and Research (CDER), U.S. Food and Drug Administration, outlined the agency's Process Analytical Technology (PAT) Initiative to promote innovation in manufacturing process research and development to achieve drug quality improvements in the U.S. pharmaceutical industry (*1*). The PAT subcommittee of the Advisory Committee for Pharmaceutical Science was established and chaired by Ajaz Hussein, PhD, Deputy Director, CDER, Office of Pharmaceutical Sciences. This initiative is designed to address manufacturing-related quality problems within the industry by encouraging process innovation in a regulatory risk-adverse industry.

PAT has been defined as systems for analysis and control of manufacturing processes based on timely measurements during processing, and control of critical quality parameters and performance attributes of raw and in-process materials and processes to ensure acceptable end-product quality at the completion of the process.

At the 23 October 2002 PAT subcommittee meeting presentations (*2*) were made on the PDA Technical Report No. 33, The Evaluation, Validation, and Implementation of New Microbiological Testing Methods (Jeanne Moldenhauer (Vetech Pharmaceutical Consultants, Inc.) and the role of rapid microbiological methods in PAT (Dr. Robert Johnson and colleagues, GlaxoSmithKline). Also there was an afternoon breakout session moderated by Dr. Peter Cooney to discuss the role of Rapid Microbiological Methods (RMM) within the PAT Initiative. Drs. Michael Korcynzski and Scott Sutton, members of the USP Analytical Microbiology Expert Committee, participated in the breakout session. When Dr. Korcynzki summarized feedback from the breakout sessions, he emphasized that the overriding concerns were the acceptance of rapid methods by regulatory agencies and the complexity of the validation of new microbiological testing methods.

In the pharmaceutical and biotechnology industries, microbial testing may be divided into two areas: first, in-process monitoring and second, product release testing. Examples of in-process monitoring are incoming pharmaceutical ingredient testing, water for pharmaceutical purposes monitoring, intermediate monitoring, and microbial monitoring of personnel and the manufacturing environment. Product release testing includes microbial limit testing of nonsterile drug products, sterility testing of finished product, microbial assay of vitamins and antibiotics, and microbial identification. Typically, because of the extended testing cycle time for classical microbial tests, the results of both the in-process monitoring and product release testing are reviewed as part of the product release and do not immediately influence the manufacturing process.

Classical microbial tests require extended cycle times because they rely on the growth of microorganisms on microbiological culture media. Classical microbial detection is based on the development of turbidity or other indicators of microbial growth in liquid media and of colonies on solid media. The cultivation of microorganisms includes a pregrowth phase that includes the germination of bacterial and fungal spores and the resuscitation of stressed vegetative bacterial and fungal cells, a lag phase for the biochemical and physiological acclimatization of the cells to the media, and a logarithmic phase during which the cells are actively dividing. Rapidly growing bacterial cells may have a generation time of the order of 20 minutes, and most microorganisms isolated from pharmaceutical ingredients, intermediates, and products are stressed. Thus, the lag phase may be extended, and the time for microbial detection and/or enumeration typically ranges from 2 to14 days of incubation. *Table 1* summarizes the classical microbial tests and their incubation times.

* Correspondence should be addressed to David A. Porter, PhD, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; e-mail dap@usp.org. David A. Porter is the staff liaison to the Expert Committee on Analytical Microbiology.

Table 1. Examples of in-process microbial monitoring and product release tests and their incubation times

Type of Microbial Test	Microbial Test	Incubation Time
In-process Monitoring	Pharmaceutical ingredient bioburden	48–72 hours (Total Aerobic Microbial Count) or 5–7 days (Total Combined Yeast & Mold Count)
	In-process intermediate bioburden testing	As above
	Environmental monitoring	As above
	Water monitoring	2–5 days (Total Aerobic Microbial Count)
	Cleaning validation or verification	As above
Product Testing	Sterility testing	14 days
	Microbial limits testing	48–72 hours (Total Aerobic Microbial Count) or 5–7 days (Total Combined Yeast & Mold Count)
	Bacterial endotoxin test	90 minutes
	Microbial assay of vitamins and antibiotics	18–24 hours
	Microbial identification	3–14 days

Clearly the extended incubation times of the current microbial tests preclude them from being applied to PAT. Furthermore, optimization of the manufacturing process and the substitution of in-process chemical and physical monitoring to reduce the product manufacturing and release cycle will not be possible when the in-process and product release microbial testing are the most lengthy parts of the cycle. For example, the bulk solution preparation, sterile filtration, and aseptic filling of sterile pharmaceutical product may take 1–2 days, while the sterility test has an incubation time of 14 days. The advent of RMMs that are less reliant on microbial growth represent a major opportunity to reduce the risk of microbial contamination and shorten the product release cycle time.

The PDA Task Force conveniently classified microbiological testing methods as 1) growth-based, 2) viability-based, 3) cellular component– or artifact-based, and 4) nucleic acid–based methods (*3*). Growth-based methods rely on the measurement of biochemical, physiological, or physical parameters that reflect the growth of the microorganisms; hence they will never be real-time methods. Conventional examples of growth-based microbial testing technologies are plate count, most probable number multiple-tube, and membrane filtration methods. Rapid microbiology examples of growth-based microbial testing technologies are ATP bioluminescence, impedance, and colorimetric or radiometric CO_2 detection methods. The commercialization of highly sensitive image analyzers has made it possible to count microbial colonies on plates before they develop into visual colonies, eliminating lengthy incubation time (updating Frost's Little Plate Count Method.)

Some examples of viability-based methods are:

- Direct epifluoroscence microscopy; the microbial cells are detected on a membrane filter using vital staining and epifluorescence microscopy
- Solid-phase laser scanning fluorescence microscopy; microbial cells that are collected on a membrane filter transport a fluorogenic substrate into their cells and enzymatically cleave the nonfluorescent substrate. A fluorochrome is released and accumulates within the cells and is detected by laser-induced fluorescence
- Flow fluorescence cytometry that employs similar chemistry in a highly sensitive flow cytometer.

Some examples of artifact-based methods are:

- Fatty acid profile analysis using gas chromatography for microbial identification
- Charged molecular weight profiles from intact microbial cells using MALDI-TOF mass spectrometry for microbial identification
- Fluorescence antibody techniques for specific microbial cell detection and enumeration
- The Bacterial Endotoxin—*Limulus* Amebocyte Lysate Test.

Nucleic acid–based methods that are most closely associated with microbial identification include DNA hybridization, ribotyping, and 16S rRNA sequencing techniques. Recent advances in Polymerase Chain Reaction (PCR) technology make it possible to use rapid cyclers and specific primers to amplify and use fluorescence-tagged probes to detect microbial nucleic acids in real time. It is possible to achieve up to 48 amplification cycles within 20 minutes—the same time required for a single generation for a dividing microbial cell. It is technically possible to semi-quantify specific microorganisms within a test sample using this

technology. For example, the log magnitude of Gram-negative bacteria within a water sample can be determined using PCR technology based on the number of amplification cycles to reach a predetermined quantity of nucleic acid.

The challenge for a microbiologist within the PAT initiative will be identify critical processing steps in a manufacturing process for a particular pharmaceutical dosage form and to apply an RMM to monitor the bioburden within the product intermediate to control the process and lessen the risk of microbial contamination. Several risk assessment programs could be applied, including: Hazard Analysis and Critical Control Points (HACCP) from the food industry, and Failure Mode and Effects Analysis (FMEA), an engineering program. The system developed by the food industry has general applicability to microbial contamination in the pharmaceutical industry. In the 1960s, the Pillsbury Company, the U.S. Army, and NASA introduced a system for ensuring pathogen-free foods for the space program. This system, HACCP, focuses on critical food safety areas as part of total quality programs and has been implemented by FDA to prevent microbial contamination of foodstuffs at risk to cause food-borne microbial illness (*4*). It involves a critical examination of the entire food manufacturing process to determine every step at which there is a possibility of physical, chemical, or microbiological contamination of the food, which would render it unsafe or unacceptable for human consumption. These identified points are the critical control points (CCP).

There are seven principles to HACCP:

1. analyze hazards
2. determine CCPs
3. establish critical limits
4. establish monitoring procedures
5. establish deviation procedures
6. establish verification procedures
7. establish record-keeping procedures.

Process steps for the manufacture of a sterile injectable pharmaceutical drug are:

1. Procurement of pharmaceutical ingredients
2. Warehousing pharmaceutical ingredients
3. Incoming microbial testing of pharmaceutical ingredients
4. Batching of the pharmaceutical ingredients
5. Preparation of Water for Injection
6. Bulk solution equipment cleaning
7. Bulk solution preparation and release
8. Container and closure preparation, depyogenation, and sterilization
9. Aseptic filling equipment cleaning and sterilization
10. Clean room cleaning and sanitization
11. Personnel gowning and entry
12. Sterile filtration
13. Aseptic filling, capping, and sealing
14. Air, personnel, and facilities microbial monitoring
15. Product inspection
16. Quality attributes testing
17. Batch record review and deviation investigation
18. Product release.

From a microbiological testing aspect the five critical process steps are a) incoming microbial testing of pharmaceutical ingredients (Step 3), b) preparation of Water for Injection (Step 5), c) bulk solution preparation and sterile filtration (Step 7), d) air, personnel, and facilities microbial monitoring (Step 14), and e) quality attributes testing (Step 16).

An example of the application of FMEA to the pharmaceutical industry may be found in a case study of risk associated with the routine use of sterility testing isolators (*5*). A numerical approach was employed based on 1) severity, i.e., the consequence of failure, 2) occurrence, i.e., the likelihood of failure based on past experience, and 3) detection, i.e., the monitoring system in place and likelihood that the monitoring system will detect a failure. The critical areas investigated were the room surrounding the isolator, the decontamination cycle, the frequency of decontamination, isolator integrity, transfer of material from the transfer isolator to the testing isolator, incomplete sample and equipment decontamination, and isolator operating parameter failure. The risk assessment identified glove leaks, loss of isolator integrity, and incomplete decontamination as the greatest risks, in descending order.

Because the formal application of risk assessment techniques to pharmaceutical processes is a new activity, the reader is cautioned to avoid the uncritical transfer of techniques from other industries to the pharmaceutical industry. The authors hope that unique intellectual frames for risk assessment in the pharmaceutical industry are developed and incorporate the specific requirements of pharmaceutical manufacturing and testing processes.

The question may be asked, if RMMs were available could they be beneficially deployed for process monitoring to establish CCPs? Clearly RMMs may be employed for the incoming microbial testing of pharmaceutical ingredients, for product release testing to reduce the manufacturing and release cycle time and control inventories, and to prevent product backorders. Because in-line conductivity and total organic carbon measurements are being employed for real-time monitoring of water for pharmaceutical purposes, it would be attractive to add in-line microbial monitoring as a control for these important pharmaceutical ingredients. Fluorescence flow cytometry may be a potential candidate for this function. The presterile filtration bioburden is a critical parameter for the maintenance of a high level of sterility assurance of aseptically filled pharmaceutical products. A real-time measurement of the number and size of bacteria within the bulk solution could control the bacterial challenge to the sterilizing filter. However, first an appropriate bioburden level for a specified bulk solution volume and sterilizing filter surface area should be determined. It is assumed that the alert and action levels would be related to the recommended microbial count for bulk Water for Injection and the sterilizing filter rating of the retention of 10^7 colony-forming units of the challenge organism, *Brevundimonas diminuta,* per square cm of filter surface (*6*). An RMM that can produce microbial counts within 1–3 hours could be employed as a process control

providing information prior to starting the sterile filtration process. An RMM could be employed as a cleaning verification step for critical equipment and facilities. In response to bioterrorism threats, research organizations and commercial companies are working on optical laser microbial detection systems that could conceivably be used for real-time monitoring of air and surfaces in aseptic processing areas. Time will tell whether these technologies will have utility in the pharmaceutical industry.

Performing routine microbial monitoring to demonstrate a satisfactory level of process control and identify adverse trends during sterile product manufacturing takes considerable effort. Much of this effort is wasted because of the delay in obtaining microbial testing results and our inability to analyze the data and recognize adverse trends in a timely manner. Major benefits would arise from combining information technology and instrumentation for microbial detection, enumeration, and identification. These would include electronic data capture and the ability to analyze the data in real time to quickly identify adverse trends. Most microbial tests are limit tests. Examples of limit tests are: an absence of *E. coli* in 10 g of a pharmaceutical ingredient, less than 10 colony-forming units in 100 mL of Water for Injection, or less than 1 colony-forming unit in 10 cubic feet of air in a Grade A aseptic processing area. Unlike chemical assays for potency in which simple control charts can identify changes in the manufacturing process, the vast preponderance of microbial test results are below the sensitivity of the test. This makes the real-time capture and analysis of the test results more important with the employment of trend rules that are not immediately obvious on inspection of the data. Examples of these rules may be the frequency of out-of-limit results within an extended time period or the mean time between occurrences of rare events.

Given the potential benefits of RMMs in PAT what are the major obstacles to their development, validation, and implementation?

Obstacles include:

- New microbial testing technologies that do not deliver on their promise in terms of standardized testing methods
- The inability of pharmaceutical microbiologists to evaluate and select methods appropriate for a particular application
- The lack of consensus on how to validate RMMs and demonstrate their equivalency to compendial test methods
- Disagreement about the acceptability of defaulting from the alternative RMM to the compendial tests when an out-of-specification result is obtained
- Pharmaceutical companies' being regulatory-risk adverse
- Higher capital and unit testing costs
- Lack of serious commitment to RMM by the pharmaceutical industry, and
- Past lack of leadership regarding the PAT initiative from regulatory agencies.

How are these obstacles to be met? Companies developing RMMs must work closely with opinion leaders in the pharmaceutical industry to develop applications that can be implemented. Microbiologists need to revisit the concepts contained in the PDA Technical Report No. 33 The Evaluation, Validation, and Implementation of New Microbiological Testing Methods (*3*) and the USP In-Process Revision Validation of Alternative Microbial Methods (*7*) as they may be too confined to *USP–NF* ⟨1225⟩ *Validation of Compendial Methods* (*8*). The acceptance criterion of same or better recoveries than the compendial method may be too rigid. RMMs will differ in their selectivity in the recovery of a microbial population and thus will have a high bias with respect to microbiological growth–based methods. RMMs that have different units of measurement should be evaluated to determine if new control criteria (for pass/fail or alert/action levels) are warranted. An example is the difference between classic culture methods reported as colony-forming units and viable but not culturable microbial cells with solid phase laser scanning fluorescence microscopy. The results obtained by different enumeration methods should be compared to the existing requirements and evaluated against microbial risk for a particular pharmaceutical dosage form. For example, water microbiological standards are based on microbiological culture methods. The health impact of a potable water system would not change if higher microbial counts were obtained using a microbial enumeration method that counted microorganisms that do not grow on microbiological media unless there was compelling epidemiological evidence that higher microbial counts obtained by an RMM had public health consequences. The same argument can be made for water for pharmaceutical purposes.

Appropriate planning and detail can begin to develop an approach that is scientifically sound. One approach, using comparability (FDA Guidance, February 2003, Comparability Protocols—Chemistry, Manufacturing, and Controls Information) may be an acceptable way to justify changing test methodology from a classical method to an RMM. Key details that could be included in the comparability protocol are: instrument validation (design qualification, installation qualification, and operational qualification), tests to perform and criteria to meet to indicate equivalency within the capability of the two methods compared, and plans for periodic reporting to regulatory authorities if changes occur after implementation of the RMM.

Microbiologists need to convince their companies that an investment in RMMs will result in inventory reductions, fewer product failures, faster resolution of laboratory and manufacturing investigations, and better product quality.

There are now movements within industry and the regulatory agencies to collaborate and to develop acceptance criteria and to open avenues for changing to RMMs in an environment where technology can enhance analytical measurement in real time, providing increased assurance of product quality.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2003 USP DICTIONARY SUPPLEMENT 4

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2003 edition of the USP Dictionary (USPD) up to date. The cumulative contents of the supplements to the current (2003) edition will be included in the next complete edition of the Dictionary.

New United States Adopted Names (USAN)

No newly established United States Adopted Names (USAN) are available for publication at this time. See preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

Antimony Trisulfide Colloid

Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Recommended International Nonproprietary Names

The following 57 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol 17, No. 2, 2003.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Albaconazole	Ertiprotafib	Naminidil	Soraprazan
Alvimopan	Eszopiclone	Nemifitide	Tapentadol
Apaziquone	Fandosentan	Nortopixantrone	Tecadenoson
Apolizumab	Fontolizumab	Oblimersen	Tecalcet
Asenapine	Garenoxacin	Ortataxel	Teneliximab
Axomadol	Inecalcitol	Osemozotan	Topixantrone
Bifeprunox	Iroxanadine	Pascolizumab	Toralizumab
Canertinib	Lidorestat	Pegaptanib	Torcetrapib
Cefovecin	Liraglutide	Pegsunercept	Torcitabine
Cethromycin	Lubiprostone	Perflubrodec	Treprostinil
Dabigatran Etexilate	Lumiracoxib	Picoplatin	Triplatin Tetranitrate
Ecromeximab	Merimepodib	Plevitrexed	Tulathromycin
Eculizumab	Mozavaptan	Pumosetrag	Vapaliximab
Elzasonan	Nalfurafine	Siplizumab	Varespladib
Enecadin			

Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary.* A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Ranticicra	
Ranticicrant	
Ranticirpant	
Rantirafiv	
Viracirin	
Zeptacirin	
Anretinib	*Antineoplastic*
Arcutinib	
Palrotinib	
Panretinib	
Pelritinib	
Ramotinib	
Recetinib	
Apoptaxel	*Antineoplastic*
Azetaxel	
Milataxel	
Aquifocon A	*Hydrophobic contact lens material*
Aquilafocon A	
Aquilfocon A	
Aquilofocon A	
Arblurbifenil	*Treatment of Alzheimer's disease*
Arflurbifenil	
Arflurbifenpro	
Arflurbinifen	
Arflurbiprofen	
Flurbifenil	
Artagoxoforb	*Antineoplastic*
Bariloxoforb	
Barilubant	
Eitagoxoforb	
Etagolokib	
Etagoloxan	
Etagolubant	
Etagolukib	
Etalokib	
Etalubloxan	
Igolubant	
Tagolubant	
Asterbulin	*Chemotherapeutic agent for solid tumors; tubulin inhibitor*
Atrobulin	
Mivobulin	
Taltobulin	
Tubulastin	
Xenobulin	
Atamcimod Acetate	*Treatment of chemotherapy-induced diarrhea (CID)*
Binamcimod Acetate	
Delamcimod Acetate	
Delamgatide Acetate	

Suggested USAN	Category
Atilizumab	*Monoclonal antibody*
Atlizumab	
Nealizumab	
Nelizumab	
Noralizumab	
Tocilizumab

Zelacurium Chloride	
Barfusakinra	*Treatment of rheumatoid arthritis*
Benfusakinra	
Binakinra	
Kinakinra	
Setfunakinra	
Setfusakinra	
Beclabucol	*Reduction of signs and symptoms and inhibition of progressive structural damage in patients with mild to severe rheumatoid arthritis*
Cetabucol	
Glibucolide	
Glidobucol	
Glybucolide	
Becorotan Hydrochloride	*Treatment of Alzheimer's disease*
Becorotane Hydrochloride	
Lecorotan Hydrochloride	
Lecorotane Hydrochloride	
Lecozotan Hydrochloride	
Lecozotane Hydrochloride	
Bectapitant Mesylate	*Antiemetic*
Vestipitant Mesylate	
Vintapitant Mesylate	
Bepisermin	*Antidiabetic*
Cobasermin	
Derasermin	
Mecasermin Infabate	
Mecasermin Rinfabate	
Obasermin	
Bioctadekin	*Treatment of disseminated solid tumors*
Idoctadekin	
Immunoctadekin	
Munoctadekin	
Bisurex	*Contraceptive; anti-infective*
Cebemirex	
Cebemirside	
Cemisurex	
Cetamox	
Pamiceb	
Bitafosol Tetrasodium	*Treatment of rhinitis, URI and lung disease, including cystic fibrosis; also retinal detachment and edema*
Denufosol Tetrasodium	
Dinufosol Tetrasodium	
Dipirafosol Tetrasodium	
Dipirfosol Tetrasodium	

Suggested USAN	Category
Cadenoson	*Management of atrial fibrillation and atrial flutter*
Redenoson	
Selodenoson	
Calimumab	*Anti-inflammatory*
Relimumab	
Rolimumab	
Zolimumab	
Zylimumab	
Capaprovir	*Treatment of Hepatitis C infection*
Cepaprovir	
Cepaprovirate	
Ciclocivirate	
Cicloprovirate	
Ciluprevir	
Ciluprovir	
Catelavancin Hydrochloride	*Antibacterial agent*
Catellavancin Hydrochloride	
Selavancin Hydrochloride	
Stenavancin Hydrochloride	
Stenzenvancin Hydrochloride	
Telavancin Hydrochloride	
Cenalidomide	*Antineoplastic*
Centroxidomide	
Cenzoxamide	
Cetroxidomide	
Enazalidomide

Yttrium Y90 Lecratuzumab Yttrium Y90 Tacatuzumab Yttrium Y90 Tactuzumab Yttrium Y90 Vintuzumab	*Tumor eradication via selective targeting of APF-positive cancers by radiolabeled hAPF-31*

Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Nomenclature

Suggested INN	Category
Accravir Inccravir Kinokemavir Kinovir Noccravir Zenokinovir	*Antiviral*
Alglucosidase Alfa	*Enzyme replacement therapy for the treatment of Pompe's disease*
Alopilone Fantopilone Syopilone	*Treatment of advanced solid tumors*
Amipridadine Eonadine Imipridadine	*Antihistamine*
Amustaline	*Nucleic acid alkylator used in the ex vivo blood bank process for inactivation of virusis, bacteria, parasites, and leukocytes in red blood cells*
Ancripentoc	*Antiviral; immunomodulator*
Apritapix Apritrotapix Pitatroban Tapitroban	*Treatment of myocardial infarction*
Atlizumab Tocilizumab	*Monoclonal antibody*
Besitomab Granulomab Mitrilomab	*Monoclonal antibody*
Biofact Biofactant Folprofact	*Treatment of acute lung injury/acute respiratory distress syndrome*
Botadopa Botagolide Protaline Protiamine Protioline Retadopa Rotigotine	*Antiparkinsonian*
Canglustratide	*Antineoplastic agent*
Cetalistat	*Lipase inhibitor*
Ciluprevir Ciluprovir	*Treatment of Hepatitis C infection*
Cindolamide Indibulin Indobulin Indoxobulin	*Antineoplastic agent*
Dablusagon Dabluzagon Dabuzalgron Zoyanagon	*Treatment of urinary incontinence*
Daprexermin	*Treatment of obesity*
Diphentrone Disphenitrone Disufenton Phenitrone	*Neuroprotectant agent used to treat ischemic stroke*
Disramide Ditocemide Ditopamide Dixibamide Valgabamide Valgabite Valproate Oxedamine Valrocemide	*Antiepileptic; anticonvulsant*

Suggested INN	Category
Ecteinibin Ecteinoturbein Trabectedin Trantiblectein Turbinectein	*Antineoplastic*
Emglumegad Eglumetad	*Antianxiety; Smoking cessation*
Epicallantide	*60 Amino acid protein that has been genetically engineered to inhibit human plasma kallikrein with high affinity and specificity*
Imiglatazar Oxiglitazar	*Antidiabetic*
Indanterol Quindanterol Quinoterol	*Bronchodilator*
Lemuxaporfin	*Photosensitivity agent with applications of photodynamic therapy*
Levtofisopam	*Anxiolytic, autonomic instability*
Mecasermin Obasermin	*Hormone replacement used in the treatment of diabetes*
Micafungin	*Antifungal*
Milataxel	*Antineoplastic agent*
Nesbuvir	*Treatment of Hepatitis C*
Netoglitazone	*Antidiabetic*
Nexfuvirtide Tifuvirtide Zanfuvirtide	*HIV inhibitor for the treatment of HIV infection*
Paliperidone	*Treatment of schizophrenia*
Pelritinib	*Antineoplastic*
Perflisoban Perflisotan Perfluban Perfluroban Perflutan	*Ultrasound contrast agent/diagnostic aid*
Psyllium hemicellulose	*Laxation; cholesterol lowering*
Selodenoson	*Management of atrial fibrillation and atrial flutter*
Sonaglitazar Sonaglitazone	*Antidiabetic; Antidyslipidemic*
Taltobulin	*Treatment of solid tumors*

New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here 's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

Cat.No.	Description	Curr. Lot	Price
1002505	Acesulfame Potassium (200 mg)	F0C136	$250
1012780	Alendronate Sodium (200 mg)	F0B315	$150
1012939	Allantoin (200 mg)	F0C169	$150
1019417	Amifostine Disulfide (25 mg)	F0C152	$468
1025908	Aminopentamide Sulfate (200 mg)	F0B273	$150
1028000	Amitraz (200 mg)	F0C042	$150
1029953	Ammonium Chloride (200 mg)	F0C134	$150
1043750	Aspartame Acesulfame (200 mg)	F0C137	$150
*1048620	Benazapril Related Compound A (15 mg)	F0C252	$468
*1048630	Benazapril Related Compound B (15 mg)	F0C256	$468
1065618	Betahistine Hydrochloride (200 mg)	F0C105	$150
1076363	Brinzolamide (200 mg)	F0C034	$150
1076374	Brinzolamide Related Compound A (50 mg)	F0C033	$468
1076385	Brinzolamide Related Compound B (50 mg)	F0C035	$468
1078733	Bupropion (200 mg)	F0C123	$200
1097636	Cefepime Hydrochloride (500 mg)	F0C063	$150
1097647	Cefepime Hydrochloride System Suitability (25 mg)	F0C095	$150
1103105	Cetyl Palmitate (50 mg)	F0B241	$150
1133536	Choline Bitartrate (200 mg)	F0C057	$150
1133547	Choline Chloride (200 mg)	F0C058	$150
1133570	Chondroitin Sulfate Sodium (300 mg)	F0B256	$150
1140247	Clomipramine Hydrochloride (200 mg)	F0C075	$150
1142107	Clozapine (100 mg)	F0C032	$250
1148500	Copovidone (100 mg)	F0C194	$150
*1171900	Desflurane (0.5 mL)	F0C187	$150
1171910	Desflurane Related Compound A (0.1 mL)	F0C031	$468
1173235	Desogestrel (50 mg)	F0B282	$150
1173246	Desogestrel Related Compound A (15 mg)	F0B279	$468
1173257	Desogestrel Related Compound B (15 mg)	F0B284	$468
1173268	Desogestrel Related Compound C (25 mg)	F0B281	$468
*1179708	Dextran 40 (50 mg)	F0C247	$150
*1179741	Dextran 70 (50 mg)	F0C260	$150
1179854	Dextran 4 Calibration (100 mg)	F0C002	$150
1179865	Dextran 10 Calibration (100 mg)	F0C010	$150
1179876	Dextran 40 Calibration (100 mg)	F0C011	$150
1179887	Dextran 70 Calibration (100 mg)	F0C013	$150
1179898	Dextran 250 Calibration (100 mg)	F0C039	$150
1179800	Dextran Vo Marker (100 mg)	F0B242	$150
1204805	Diloxanide Furoate (200 mg)	F0C026	$150
1213103	Dinoprostone (50 mg)	F0C030	$1,466
1225281	Dorzolamide Hydrochloride (500 mg)	F0C040	$150
1225292	Dorzolamide Hydrochloride Related Compound A (20 mg)	F0C068	$468
1225419	Doxazosin Mesylate (200 mg)	F0C079	$150
1234806	Emedastine Difumarate (100 mg)	F0C059	$150
1260012	Ethinyl Estradiol Related Compound A (20 mg)	F0B252	$468
1269458	Fenoldopam Mesylate (200 mg)	F0C125	$150
1269469	Fenoldopam Related Compound A (20 mg)	F0C124	$468
1269470	Fenoldopam Related Compound B (20 mg)	F0C126	$468
*1273808	Flumazenil (200 mg)	F0C305	$750
1286060	Formononetin (50 mg)	F0C196	$500
1286366	Fosphenytoin Sodium (250 mg)	F0C156	$150
1287675	Gadoversetamide (200 mg)	F0C172	$150
1287686	Gadoversetamide Related Compound A (200 mg)	F0C173	$468
*1288306	Ganciclovir (200 mg)	F0C287	$350
1288510	Gemfibrozil Related Compound A (20 mg)	F0C101	$468
1291708	Powdered Asian Ginseng Extract (1.5 g)	F0B289	$500
1294976	Glutamic Acid (200 mg)	F0C069	$150
1294808	Glutamine (100 mg)	F0B244	$150
1295888	Glycyrrhizic Acid (25 mg)	F0C006	$468
1315012	Hydrocodone Bitartrate Related Compound A **CII** (70 mg)	F0C214	$493
1329709	Hydroxypropyl Betadex (200 mg)	F0B295	$150
1343517	Iodixanol (200 mg)	F0B240	$150
1343540	Iodixanol Related Compound C (25 mg)	F0B236	$468
1343550	Iodixanol Related Compound D (50 mg)	F0B231	$468
1343561	Iodixanol Related Compound E (25 mg)	F0B229	$468
1348907	Isoflupredone Acetate (200 mg)	F0C109	$150
1355709	Powdered Kava Extract (1 g)	F0C161	$250
1355753	Kawain (200 mg)	F0C160	$200
1356020	Ketamine Related Compound A (50 mg)	F0C118	$468
1356916	Lansoprazole (200 mg)	F0B310	$150
1356927	Lansoprazole Related Compound A (25 mg)	F0B311	$468
1370611	Lovastatin Related Compound A (20 mg)	F0B235	$468
1370906	Lynestrenol (20 mg)	F0B314	$195
1443850	Powdered Milk Thistle Extract (250 mg)	F0B321	$250
1392454	Meropenem (300 mg)	F0C201	$175
1396309	Metformin Hydrochloride (200 mg)	F0C209	$175
1396310	Metformin Related Compound A (50 mg)	F0C210	$468
1443908	Milrinone (500 mg)	F0C050	$250
1443919	Milrinone Related Compound A (50 mg)	F0C051	$468
1445481	Monensin Sodium (200 mg)	F0B293	$150
1449518	Nabumetone (200 mg)	F0C072	$150
1471914	Norgestimate (200 mg)	F0C086	$150
1478582	Ondansetron Hydrochloride (300 mg)	F0C222	$200

17 completely NEW Reference Standards this month! (Look for items marked *)

NOTICE TO THE EXECUTIVE SECRETARIAT OF INTENT TO COMMENT

Date _____

Mail to: Executive Secretariat, USP–NF
12601 Twinbrook Parkway
Rockville, MD 20852

Title(s)	With Reference to the Proposal(s) in *Pharmacopeial Forum:* Vol.	No.	Page(s)	Estimated Date of Sending Comments*

I am unable to comment at present, but please be informed of my intent to comment later, as indicated above.

Name _____
(Please type or print)

Company _____

Address _____

_____

_____

Telephone No. ( ) _____
(area code)

*NOTE—Specifying date(s) when you expect to submit comments to the Executive Secretariat will not necessarily result in a deferment of the implementation of the proposal(s) referred to.

[*Please fold before mailing.*]

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP–NF* and *Pharmacopeial Forum*

November–December 2003

EXOSAPARIN SODIUM DSD Mgh #29290

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L# #	Dowex 1X8	Molar ratio of sulfate to carboxylate	1.5 cm x 2.5 cm, 200 – 400 mesh, Fluka catalog number 44339.
29(6)	L# #	Dowex 50W2	Molar ratio of sulfate to carboxylate	1.5 cm x 7.5 cm, 100 – 200 mesh, Fluka catalog number 44462.
29(6)	L# #	Dowex 1X8	Mol wt distrib, Ave mol wt	1.5 cm x 2.5 cm, 200 – 400 mesh, Fluka catalog number 44339.

ENOXAPARIN SODIUM INJECTION DSD Mgh #29295

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L# #	IonPac AS11	Free	Free Sulfate content. Analytical column. 4 mm x 25 cm, manufacturer Dionex.
29(6)	L# #	IonPac AS11	Free	Free Sulfate content. Guard column. 4 mm x 5 cm, manufacturer Dionex.

GLIMPEPIRIDE DSD Mgh #35020

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	G43	Optima 624	Water	0.32 mm x 30 m, 1.8 :m film thickness, manufacturer Macherey-Nagel
29(6)	L20	LiChrosorb Diol	Limit of	Limit of cis isomer. 3 mm x 15 cm, 3 :m, manufacturer Merck KGaA.
29(6)	L1	Superspher 100 RP-18	Assay and Related Compounds	4 mm x 25 cm, 4 :m, manufacturer Merck KGaA.

METFORMIN HYDROCHLORIDE DSD Mgh #49795

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L9	Partisil 10 SCX	Related compounds	4.6 mm x 25 cm, 10 :m, manufacturer Whatman, Inc.

METFORMIN HYDROCHLORIDE TABLETS DSD Mgh #49800

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L9	Partisil 10 SCX	Related compounds	4.6 mm x 25 cm, 10 :m, manufacturer Whatman, Inc.

METOLAZONE TABLETS DSD Mgh #53470

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L1	Symmetry C-18	Assay	3.9 mm x 15 cm, 5 :m, manufacturer Waters.

S-(ADENOSYL)-L-METHIONINE DISULFATE P-TOLUEN SULFONATE BULK SPRY DRIED POWDER DSD Mgh #704

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L46	Ion Pac AS14A	Content of	Content of sulfate. 4 mm x 5 cm, :m, manufacturer Dionex.
29(6)	L1	YMC 18 ODS-A	Isomeric ratio	4.6 mm x 25 cm, 5 :m, manufacturer YMC Co., Ltd.
29(6)	L9	Supelcosil SCX	Assay, Related compounds, and Content of	Content of p-toluene sulfonic acid. 4.6 mm x 25 cm, 5 :m, manufacturer Supelco.

SUCCINYLCHOLINE CHLORIDE DSD Mgh #78520

PF	LGS#	Reagent Brand	Type of Test	Comments
29(6)	L1	XTerra MS C18	Limit of	Limit of choline. 4.6 mm x 25 cm, 5 :m, manufacturer Waters.
29(6)	L1	Alltima C-18	Chromatographic purity	4.6 mm x 25 cm, 5 :m, manufacturer Alltech.
29(6)	L1	Xterra MS C18	Chromatographic purity	Test 2. 4.6 mm x 25 cm, 5 :m, manufacturer Waters.
29(6)	L1	Alltima C-18	Chromatographic purity	Test 1. 4.6 mm x 25 cm, 5 :m, manufacturer Alltech.
