Table of Contents*

PHARMACOPEIAL FORUM VOL. 29 NO. 4 **JULY–AUG. 2003**

* The *USP–NF* (*USP26–NF21*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

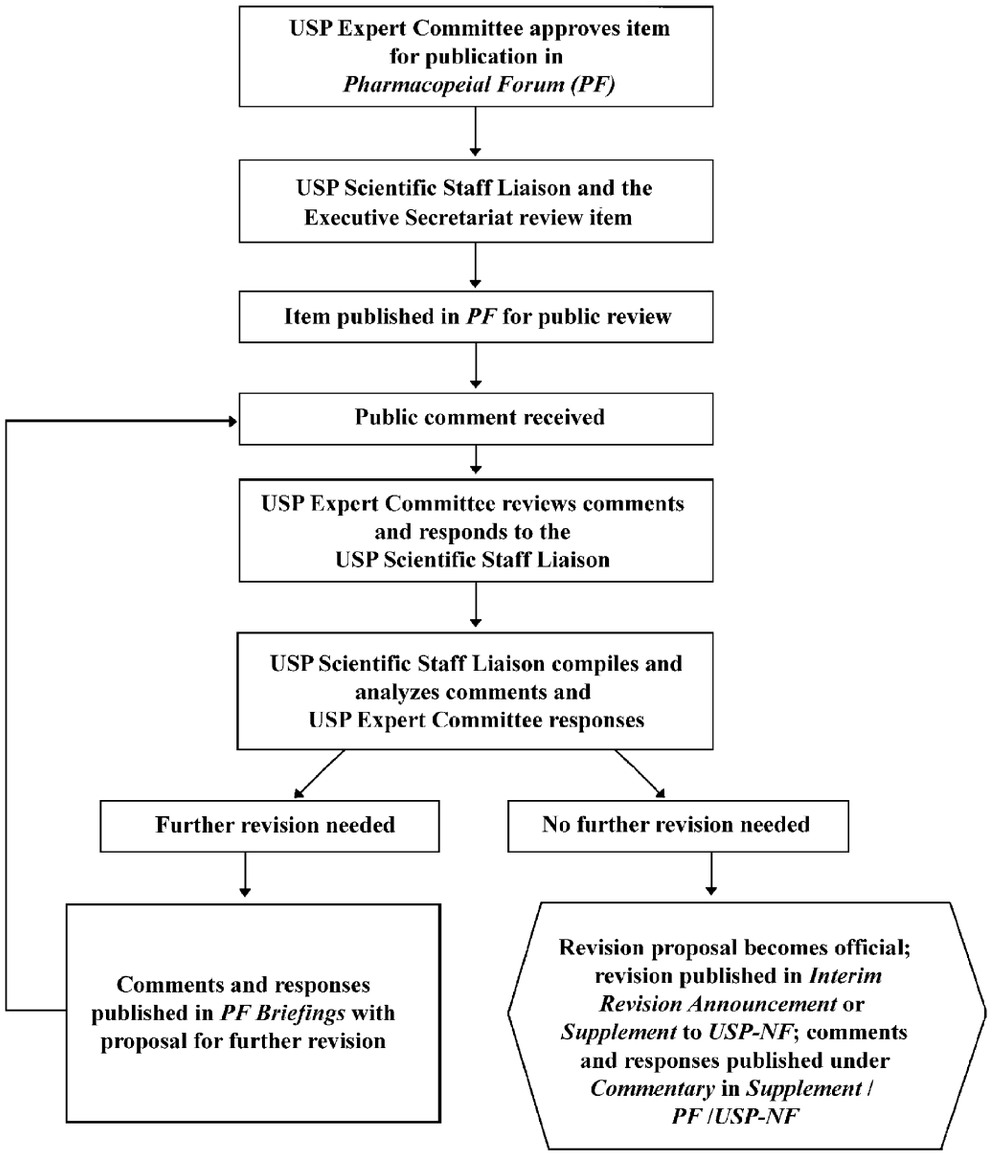
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section.

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed method and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed method and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■▪ or ●▪ or ▲▪) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision*, both separate sections of *Harmonization.* •For *In-Process Revision*, new or revised text is marked with symbols (■▪) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●▪.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 29(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content†
ESC	Excipients—Substances and Characterization†
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7—Antibiotics
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

* **HDQ** Indicates USP Headquarters items.
† The Expert Committee has been renamed. The old name, Excipients—Substances and Characterization (ESC) has been changed to Excipient Monograph Content (EMC).

STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Senior Scientific Associate	cma@usp.org	(301) 816-8139	Pharmaceutical Analysis 1 (PA1)

Kahkashan Zaidi, Scientist	kxz@usp.org	(301) 816-8269	Aerosols (AER)

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

USP CONFERENCE ON BIOLOGICAL AND BIOTECHNOLOGICAL DRUG SUBSTANCES AND PRODUCTS, NOVEMBER 18–23, 2003

This conference will be held in the Marriot Crystal City Gateway in Crystal City, Virginia. It is intended for those responsible for the development and maintenance of quality standards in this field. There are several objectives for this meeting:

- To involve industry and regulatory agencies in the development of quality standards for these products
- To promote the utility of standards for these products as necessary from regulatory and quality perspectives
- To involve stakeholders in the development of the future USP blueprint these areas
- To promote the utility of USP as a neutral body bridging industry and the regulatory agencies for the benefit of public health.

This conference will consist of formal presentations and workshops led by nationally and internationally recognized experts in different areas of interest to the biological and biotechnological industry. Conference topics will include the following:

- Equivalence of biological and biotechnological drug substances and products
- Biotechnology-derived products
- Blood-derived products
- Vaccines
- Cell and gene therapy, and tissue engineering
- Bioassay
- Ancillary products.

For program information, contact Lokesh Bhattacharyya at 301-816-8201 or lb@usp.org. For conference registration information, call 301-816-8226, or register online at www.usp.org/conferences.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF.* We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF*. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Non-Prescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

NEW *DIETARY SUPPLEMENTS* SECTION OF THE *USP.* As previously noted in earlier Announcements, beginning with *USP 27–NF 22*, all dietary supplement monographs will appear in the new *Dietary Supplements* section of the *USP*. Also, the section of *Pharmacopeial Forum* that was formerly entitled *Nutritional Supplements* is being changed to *Dietary Supplements*. Monographs that formerly appeared in the *Nutritional Supplements* will subsequently appear in the new *Dietary Supplements* section of the *USP* when they become official. Therefore, in addition to retaining the monographs that are in the current *Nutritional Supplements* section, the new section will include the following dietary supplement monographs that will be moved from the *NF*:

Chamomille
Choline Bitartrate
Choline Chloride
Chondroitin Sulfate Sodium
Chondroitin Sulfate Sodium Tablets
Chromium Picolinate
Cranberry Liquid Preparation
Echinacea angustifolia
Echinacea angustifolia, Powdered
Echinacea angustifolia, Powdered Extract
Echinacea pallida
Echinacea pallida, Powdered
Echinacea pallida, Powdered Extract
Echinacea purpurea Root
Echinacea purpurea Root, Powdered Extract
Echinacea purpurea, Powdered
Eleuthero
Eleuthero, Powdered
Eleuthero, Powdered Extract
Feverfew

Feverfew, Powdered
Garlic
Garlic Delayed-Release Tablets
Garlic Fluidextract
Garlic, Powdered
Garlic, Powdered Extract
Ginger
Ginger Tincture
Ginger, Powdered
Ginkgo
Ginseng, American
Ginseng, American, Powdered
Ginseng, American, Powdered Extract
Ginseng, Asian
Ginseng, Asian Tablets
Ginseng, Asian Powdered
Ginseng, Asian, Powdered Extract
Glucosamine and Chondroitin Sulfate Sodium Tablets
Glucosamine Hydrochloride
Glucosamine Sulfate Potassium Chloride
Glucosamine Sulfate Sodium Chloride
Glucosamine Tablets
Goldenseal
Goldenseal, Powdered
Goldenseal, Powdered Extract
Hawthorn Leaf with Flower
Hawthorn Leaf with Flower, Powdered
Horse Chestnut
Horse Chestnut, Powdered
Horse Chestnut, Powdered Extract
Licorice
Licorice, Powdered
Licorice, Powdered Extract
Lipoic Acid, Alpha
Lipoic Acid, Alpha Capsules
Lipoic Acid, Alpha Tablets
Milk Thistle
Milk Thistle Capsules
Milk Thistle Tablets
Milk Thistle, Powdered
Milk Thistle, Powdered Extract
Red Clover
Red Clover Tablets
Red Clover, Powdered
Red Clover, Powdered Extract
St. John's Wort
St. John's Wort, Powdered
St. John's Wort, Powdered Extract
Saw Palmetto
Saw Palmetto Capsules
Saw Palmetto Extract
Saw Palmetto, Powdered
Selenomethionine
Valerian
Valerian Tablets
Valerian, Powdered
Valerian, Powdered Extract

CORRESPONDENCE ADDRESS CORRECTION

In order to respond to the Stimuli article "Review of the Media Selection and Incubation Conditions for the Compendial Sterility and Microbial Limit Tests," published in *Pharmacopeial Forum*, Vol. 28(6) [Nov.–Dec. 2002], page 2034, correspondence should be addressed to David A. Porter, 12601 Twinbrook Parkway, Rockville, MD 20852; email: DAP@usp.org. David A. Porter is Staff Liaison to the Expert Committee on Analytical Microbiology. Correspondence should not be sent to Anthony M. Cundell, Ph.D. at Wyeth-Ayerst Pharmaceuticals, as we originally published.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Barbara B. Hubert, Director, Pharmacopeial Education, BBH@usp.org, 301-816-8333, or Diana Lenahan, Program Associate, DPL@usp.org, 301-816-8530. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2003

Date	Name of course	Location
July 14 and 15	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
July 23	Analytical Method Validation	USP Headquarters, Rockville, MD
August 11 and 12	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
August 20	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 21	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
September 15 and 16	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
September 18	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
September 24	Fundamentals of Titration	USP Headquarters, Rockville, MD
October 8	Analytical Method Validation	USP Headquarters, Rockville, MD
October 20 and 21	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
November 17 and 18	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 8	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 9	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
December 15 and 16	Fundamentals of Dissolution	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

***USP–NF* AVAILABLE IN THREE ELECTRONIC FORMATS**. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats—CD, intranet, and online. The CD is ideal for single users who prefer to have *USP–NF* on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official *USP–NF* content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

***CHROMATOGRAPHIC REAGENTS* NOW AVAILABLE**. *Chromatographic Reagents* lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that have been published in *Pharmacopeial Forum* (*PF*) since 1980. *Chromatographic Reagents* also helps to track which column reagents were used to validate methods that have become official and are included in *USP–NF*. The branded column reagents list is updated bimonthly through *Pharmacopeial Forum*. *Chromatographic Reagents* can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for *USP 27–NF 22* is as follows:

	Comment Deadline	**Publication Date**	**Official Date**
Main Book	May 15, 2003	November 2003	January 2004
Supplement One	October 15, 2003	February 2004	April 2004
Supplement Two	February 17, 2004	June 2004	August 2004

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements*, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2003	Apr. 1, 2003
PF 29(2) [Mar.–Apr. 2003]	Mar. 2003	Not Applicable
2nd IRA [published in *PF* 29(2)]	Mar. 2003	Apr. 1, 2003
PF 29(3) [May–June 2003]	May 2003	Not Applicable
3rd IRA [published in *PF* 29(3)]	May 2003	June 1, 2003
2nd Supplement	June 2003*	Aug. 1, 2003*
PF 29(4) [July–Aug. 2003]	July 2003*	Not Applicable
4th IRA [published in *PF* 29(4)]	July 2003*	Aug. 1, 2003*
PF 29(5) [Sept.–Oct. 2003]	Sept. 2003*	Not Applicable
5th IRA [published in *PF* 29(5)]	Sept. 2003*	Oct. 1, 2003*
PF 29(6) [Nov.–Dec. 2003]	Nov. 2003*	Not Applicable
6th IRA [published in *PF* 29(6)]	Nov. 2003*	Dec. 1, 2003*

* Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP 26*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 26*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 26–NF 21*. The page number indicates where the item is found in *USP 26–NF 21*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available annual edition or *Supplement*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FOURTH INTERIM REVISION ANNOUNCEMENT to *USP 26* and to *NF 21*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President* and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official August 1, 2003. **Released July 1, 2003.**

All inquiries and comments regarding *USP 26* text and *NF 21* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 26* or *NF 21* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Acesulfame Potassium RS (January 1, 2004)
USP Alendronate Sodium RS (November 1, 2003)
USP Aminopentamide Sulfate RS (September 1, 2003)
USP Amitraz RS (November 1, 2003)
USP Powdered Asian Ginsing Extract RS (September 1, 2003)
USP Betahistine Hydrochloride RS (January 1, 2004)
USP Brinzolamide RS (November 1, 2003)
USP Brinzolamide Related Compound A RS (November 1, 2003)
USP Brinzolamide Related Compound B RS (November 1, 2003)
USP Cefipime Hydrochloride RS (January 1, 2004)

NOTICE OF POSTPONEMENT

The following revision to the Prednisolone monograph, published in the *First Supplement* to *USP 26-NF 21* and originally scheduled to become official on April 1, 2003, has been postponed indefinitely. The revision was to have added a *Chromatographic purity* test and have deleted the *Ordinary impurities* test for Prednisolone. This postponement is to accommodate approved products on the market that cannot meet the requirement and is intended to provide sufficient time to evaluate a different proposal via the regular revision process.

The Expert Committee is reviewing a new proposal to reflect the approved products. The USP intends to publish this revised acceptance criteria in a future number of *Pharmacopeial Forum* for public review and comment.

Prednisolone

Add the following:

•**Chromatographic purity**—

Solution A—Prepare a filtered and degassed mixture of chloroform, methanol, and water (967.9:30:2.1).

Solution B—Prepare a filtered and degassed mixture of chloroform, methanol, and water (947.9:50:2.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Test solution—Dissolve a suitable quantity of Prednisolone in *Solution A*, with the aid of sonication and shaking, to obtain a solution having a concentration of about 2.5 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L3. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–20	100	0	equilibration
20–30	100→0	0→100	linear gradient
30–50	0	100	isocratic
50–51	0→100	100→0	linear gradient
51–100	100	0	isocratic

Chromatograph the *Test solution*, and record the peak areas as directed for *Procedure:* the resolution, *R*, between prednisolone and any impurity is not less than 1.5; and the column efficiency is not less than 6000 theoretical plates.

Procedure—Inject a volume (about 5 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Prednisolone taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity; and r_s is the sum of the areas of all the peaks: not more than 0.6% of any individual impurity is found, and not more than 2.0% of total impurities is found.•4

•(Postponed Indefinitely)•4

Delete the following:

•**Ordinary impurities** ⟨466⟩—

Solvent: a mixture of alcohol and water (1:1).

Eluant: a mixture of toluene and isopropyl alcohol (70:30), in a nonequilibrated chamber.

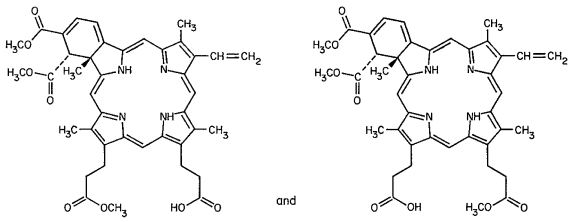
Visualization: technique 1.•4

•(Postponed Indefinitely)•4

USP 26 MONOGRAPHS

Add the following:

•Verteporfin



$C_{41}H_{42}N_4O_8$ 718.79

23*H*,25*H*-Benzo[*b*]porphine-9,13-dipropanoic acid, 18-ethenyl-4,4a-dihydro-3,4-bis(methoxycarbonyl)-4a,8,14,19-tetramethyl-, monomethyl ester, *trans*.

(±)-*trans*-3,4-Dicarboxy-4,4a-dihydro-4a,8,14,19-tetramethyl-18-vinyl-23*H*,25*H*-benzo[*b*]porphine-9,13-dipropanoic acid, 3,4,9-trimethyl ester mixture with (±)-*trans*-3,4-dicarboxy-4,4a-dihydro-4a,8,14,19-tetramethyl-18-vinyl-23*H*,25*H*-benzo[*b*]porphine-9,13-dipropionic acid, 3,4,13-trimethyl ester [*129497-78-5*].

» Verteporfin contains not less than 94.0 percent and not more than 102.0 percent of $C_{41}H_{42}N_4O_8$, calculated on the anhydrous basis.

Caution—Verteporfin is a light-activated drug used in photodynamic therapy. Care should be taken to avoid contact with eyes and skin.

Packaging and storage—Preserve in tight containers, and store in a freezer.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Verteporfin RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention times of the two major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 100 cfu per g.

Bacterial endotoxins ⟨85⟩: not more than 0.5 USP Endotoxin Unit per mg of verteporfin.

Water, *Method Ic* ⟨921⟩: not more than 1.4%.

Residue on ignition ⟨281⟩: not more than 0.2%.

Heavy metals, *Method I* ⟨231⟩: not more than 0.002%.

Related compounds—

Solution A, *Solution B*, and *Mobile phase*—Proceed as directed in the *Assay.*

Test solution—Prepare as directed for *Assay preparation* in the *Assay.*

Chromatographic system—Proceed as directed in the *Assay.* To evaluate the system suitability requirements, use the *Standard preparation* prepared as directed in the *Assay.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound in the portion of Verteporfin taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the individual peak response of each related compound; and r_s is the sum of the responses of all of the peaks. Not more than 0.6% of the peak having a retention time of about 0.56 relative to that of the first verteporfin isomer peak is found, not more than 0.8% of any other individual related compound is found, and the sum of all impurities is not more than 4.0%.

Limit of methylene chloride—Use the procedure for *Method 1* under *Organic Volatile Impurities* ⟨467⟩, with the following exceptions:

Standard solution: 50 µg of methylene chloride per mL in dimethylformamide.

Test solution: 10 mg of Verteporfin per mL in dimethylformamide.

Limit: not more than 5,000 µg per g of Verteporfin (0.5%).

Assay—

Solution A—Prepare a filtered and degassed mixture of 1% (w/v) aqueous ammonium sulfate, acetonitrile, glacial acetic acid, and 3.6 M sulfuric acid (10:10:1:0.027).

Solution B—Prepare a filtered and degassed mixture of 1% (w/v) aqueous ammonium sulfate, tetrahydrofuran, glacial acetic acid, and 3.6 M sulfuric acid (10:10:1:0.034).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—To a suitable volumetric flask, transfer an accurately weighed quantity of USP Verteporfin RS sufficient to make a 0.25 mg per mL solution. Add a volume of a mixture of acetonitrile and tetrahydrofuran (1:1) equivalent to 60% of the flask volume, and dissolve. Dilute with water to volume, and mix. [NOTE—Protect the solution from light.]

Assay preparation—Transfer about 25 mg of Verteporfin, accurately weighed, to a 100-mL volumetric flask. Add 60 mL of a mixture of acetonitrile and tetrahydrofuran (1:1), and dissolve. Dilute with water to volume, and mix. [NOTE—Protect the solution from light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 410-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is 1.5 mL per minute. The column temperature is maintained at 30°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–60	80	20	isocratic
60–90	80→60	20→40	linear gradient
90–91	60	40	isocratic
91–120	60→30	40→70	linear gradient
120–121	30	70	isocratic
121–125	30→0	70→100	linear gradient
125–137	0	100	isocratic
137–140	0→80	100→20	linear gradient
140–150	80	20	isocratic

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the two verteporfin peaks is not less than 2.5; the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 2.0%.

Interim Revision Announcement

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the verteporfin peaks. Calculate the quantity, in mg, of $C_{41}H_{42}N_4O_8$ in the portion of Verteporfin taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Verteporfin RS in the *Standard preparation;* and r_U and r_S are the sums of the peak responses of the two verteporfin regioisomer peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the ratio of the peak responses for the two peaks assigned to verteporfin: not less than 0.9 and not more than 1.1.●4

NF 21 MONOGRAPHS

Red Clover

Change to read:

Content of isoflavones—

Solvent: a mixture of alcohol and water (1:1).

Solution A—Prepare a filtered and degassed mixture of water and acetonitrile (75:25) containing 0.05% trifluoroacetic acid.

Solution B—Use filtered and degassed acetonitrile containing 0.05% trifluoroacetic acid.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution 1—Dissolve an accurately weighed quantity of USP Powdered Red Clover Extract RS in 2 N hydrochloric acid (0.5 mL per each mg of Extract) with shaking for 1 minute and heating in a water bath for 30 minutes. Dilute with *Solvent* to obtain a solution having a known concentration of about 0.5 mg per mL. Filter through a membrane having a 0.45-µm or finer porosity.

Standard solution 2—Dissolve an accurately weighed quantity of USP Formononetin RS in a mixture of n-propanol and water (1:1) with sonication. Dilute quantitatively, and stepwise if necessary, with the mixture of n-propanol and water (1:1) to obtain a solution having a known concentration of about 0.1 mg per mL. Filter through a membrane having a 0.45-µm or finer porosity.

Test solution—Accurately weigh approximately 2500 mg of ground plant material, and place in a 120-mL flask with a stopper. Add exactly 100 mL of *Solvent*, close the flask, and shake on an orbital or wrist-action shaker for not less than 12 hours. Transfer 50.0 mL of this solution to a round-bottom flask, and evaporate to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 minutes. Quantitatively transfer this solution with the aid of about 15 mL of alcohol, to a 50-mL volumetric flask, and dilute with *Solvent* to volume. Filter through a membrane having a 0.45-µm or finer porosity, discarding the first 4 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains end-packed 5-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 45°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–2	100	0	isocratic
2–2.5	100→87	0→13	linear gradient
2.5–7.5	87→80	13→20	linear gradient
7.5–7.8	80→73	20→27	linear gradient
7.8–8.0	73→55	27→45	linear gradient
8.0–11.0	55→50	45→50	linear gradient
11.0–13.0	50→40	50→60	linear gradient
13.0–15.0	40→26	60→74	linear gradient
15.0–16.0	26→0	74→100	linear gradient
16.0–18.1	0→100	100→0	linear gradient
18.1–23.0	100	0	isocratic

Chromatograph *Standard solution 1*, and record the peak responses as directed for *Procedure:* the chromatograms obtained are similar to the Reference Chromatogram provided with the USP Powdered Red Clover Extract RS; the tailing factor for formononetin is not more than 2.0; and the relative standard deviation for replicate injections of *Standard solution 1* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of *Standard solution 1*, *Standard solution 2*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to daidzein, genistein, formononetin, and biochanin A by comparison of the chromatogram of *Standard solution 1* with that obtained from the Reference Chromatogram. Separately calculate the percentages of daidzein, genistein, formononetin, and biochanin A in the portion of Red Clover taken by the formula:

$$50F(C/W)(r_U / r_S),$$

in which F is the conversion factor for each analyte (0.97 for daidzein, 1.13 for genistein, 1.00 for formononetin, and 1.05 for bioachanin A); C is the concentration, in mg per mL, of USP Formononetin RS in *Standard solution 2; W* is the weight, in g, of Red Clover taken to prepare the *Test solution;* ●r_U is the peak response for each relevant isoflavon obtained from the *Test solution;* and r_S is the peak response for formononetin obtained from *Standard solution 2*.●4

⟨71⟩ STERILITY TESTS

•◆Portions of this general chapter have been harmonized with the corresponding texts of the European Pharmacopeia and/or the Japanese Pharmacopeia. Those portions that are not harmonized are marked with symbols (◆ ◆) to specify this fact.◆

The following procedures are applicable for determining whether a Pharmacopeial article purporting to be sterile complies with the requirements set forth in the individual monograph with respect to the test for sterility. Pharmacopeial articles are to be tested by the *Membrane Filtration* method under *Test for Sterility of the Product to be Examined* where the nature of the product permits. If the membrane filtration technique is unsuitable, use the *Direct Inoculation of the Culture Medium* method under *Test for Sterility of the Product to be Examined*. All devices, with the exception of *Devices with Pathways Labeled Sterile*, are tested using the *Direct Inoculation of the Culture Medium* method. Provisions for retesting are included under *Observation and Interpretation of Results*.

Because sterility testing is a very exacting procedure, where asepsis of the procedure must be ensured for a correct interpretation of results, it is important that personnel be properly trained and qualified. The test for sterility is carried out under aseptic conditions. In order to achieve such conditions, the test environment has to be adapted to the way in which the sterility test is performed. The precautions taken to avoid contamination are such that they do not affect any microorganisms that are to be revealed in the test. The working conditions in which the tests are performed are monitored regularly by appropriate sampling of the working area and by carrying out appropriate controls.

These Pharmacopeial procedures are not by themselves designed to ensure that a batch of product is sterile or has been sterilized. This is accomplished primarily by validation of the sterilization process or of the aseptic processing procedures.

When evidence of microbial contamination in the article is obtained by the appropriate Pharmacopeial method, the result so obtained is conclusive evidence of failure of the article to meet the requirements of the test for sterility, even if a different result is obtained by an alternative procedure. For additional information on sterility testing, see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩.•4

MEDIA

Prepare media for the tests as described below, or dehydrated formulations may be used provided that, when reconstituted as directed by the manufacturer or distributor, they meet the requirements of the *Growth Promotion Test of Aerobes, Anaerobes, and Fungi*. Media are sterilized using a validated process.

The following culture media have been found to be suitable for the test for sterility. *Fluid Thioglycollate Medium* is primarily intended for the culture of anaerobic bacteria. However, it will also detect aerobic bacteria. *Soybean–Casein Digest Medium* is suitable for the culture of both fungi and aerobic bacteria.

Fluid Thioglycollate Medium

L-Cystine	0.5 g
Sodium Chloride	2.5 g
Dextrose ($C_6H_{12}O_6 \cdot H_2O$)	5.5/5.0 g
Agar, granulated (moisture content not exceeding 15%)	0.75 g
Yeast Extract (water-soluble)	5.0 g
Pancreatic Digest of Casein	15.0 g
Sodium Thioglycollate	0.5 g
or Thioglycolic Acid	0.3 mL
Resazurin Sodium Solution (1 in 1000), freshly prepared	1.0 mL
Purified Water	1000 mL

Mix the L-cystine, sodium chloride, dextrose, yeast extract, and pancreatic digest of casein with the purified water, and heat until solution is effected. Dissolve the sodium thioglycollate or thioglycolic acid in the solution and, if necessary, add 1 N sodium hydroxide so that, after sterilization, the solution will have a pH of 7.1 ± 0.2. If filtration is necessary, heat the solution again without boiling, and filter while hot through moistened filter paper. Add the resazurin sodium solution, mix, and place the medium in suitable vessels that provide a ratio of surface to depth of medium such that not more than the upper half of the medium has undergone a color change indicative of oxygen uptake at the end of the incubation period. Sterilize using a validated process. If the medium is stored, store at a temperature between 2° and 25° in a sterile, airtight container. If more than the upper one-third of the medium has acquired a pink color, the medium may be restored once by heating the containers in a water-bath or in free-flowing steam until the pink color disappears and by cooling quickly, taking care to prevent the introduction of nonsterile air into the container.

Fluid Thioglycollate Medium is to be incubated at 32.5 ± 2.5°.

◆Alternative Thioglycollate Medium

Prepare a mixture having the same composition as that of the *Fluid Thioglycollate Medium*, but omitting the agar and the resazurin sodium solution, sterilize as directed above, and allow to cool prior to use. The pH after sterilization is 7.1 ± 0.2. Incubate under anaerobic conditions for the duration of the incubation period.

Alternative Fluid Thioglycollate Medium is to be incubated at 32.5 ± 2.5°.◆

Soybean–Casein Digest Medium

Pancreatic Digest of Casein	17.0 g
Papaic Digest of Soybean Meal	3.0 g
Sodium Chloride	5.0 g
Dibasic Potassium Phosphate	2.5 g
Dextrose ($C_6H_{12}O_6 \cdot H_2O$)	2.5/2.3 g
Purified Water	1000 mL

Dissolve the solids in the purified water, heating slightly to effect a solution. Cool the solution to room temperature, and adjust the pH with 1 N sodium hydroxide so that, after sterilization, it will have a pH of 7.3 ± 0.2. Filter, if necessary to clarify, dispense into suitable containers, and sterilize using a validated filtration process. Store at a temperature between 2° and 25° in a sterile well-closed container, unless it is intended for immediate use.

Soybean–Casein Digest Medium is to be incubated at 22.5 ± 2.5°.

◆Media for Penicillins or Cephalosporins

Where sterility test media are to be used in the *Direct Inoculation of the Culture Medium* method under *Test for Sterility of the Product to be Examined*, modify the preparation of *Fluid Thioglycollate Medium* and the *Soybean–Casein Digest Medium* as follows. To the containers of each medium, transfer aseptically a quantity of β-lactamase sufficient to inactivate the amount of antibiotic in the specimen under test. Determine the quantity of β-lactamase required to inactivate the antibiotic by using a β-lactamase preparation that has been assayed previously for its penicillin- or cephalosporin-inactivating power. [NOTE—Supplemented β-lactamase media can also be used in the membrane filtration test.]

Alternatively (in an area completely separate from that used for sterility testing), confirm that an appropriate amount of β-lactamase is incorporated into the medium, following either method under *Validation Test*, using less than 100 colony-forming units (cfu) of *Staphylococcus aureus* (see *Table 1*) as the challenge. Typical microbial growth of the inoculated culture must be observed as a confirmation that the β-lactamase concentration is appropriate.◆

Suitability Tests

The media used comply with the following tests, carried out before, or in parallel, with the test on the product to be examined.

STERILITY

Confirm the sterility of each sterilized batch of medium by incubating a portion of the media at the specified incubation temperature for 14 days. No growth of microorganisms occurs.

GROWTH PROMOTION TEST OF AEROBES, ANAEROBES, AND FUNGI

Test each lot of of ready-prepared medium and each batch of medium prepared either from dehydrated medium or from ingredients◆[1]◆. Suitable strains of microorganisms are indicated in *Table 1*.

Inoculate portions of *Fluid Thioglycollate Medium* with a small number (not more than 100 cfu) of the following microorganisms, using a separate portion of medium for each of the following species of microorganism: *Clostridium sporogenes*, *Pseudomonas aeruginosa*, and *Staphylococcus aureus*. Inoculate portions of *Alternative Fluid Thioglycollate Medium* with a small number (not more than 100 cfu) of *Clostridium sporogenes*. Inoculate portions of *Soybean–Casein Digest Medium* with a small number (not more than 100 cfu) of the following microorganisms, using a separate portion of medium for each of the following species of microorganism: *Aspergillus niger*, *Bacillus subtilis*, and *Candida albicans*. Incubate for not more than 3 days in the case of bacteria and not more than 5 days in the case of fungi.

The media are suitable if a clearly visible growth of the microorganisms occurs.

◆STORAGE

If prepared media are stored in unsealed containers, they can be used for 1 month, provided that they are tested for growth promotion within 2 weeks of the time of use and that color indicator requirements are met. If stored in tight containers, the media can be used for 1 year, provided that they are tested for growth promotion within 3 months of the time of use and that the color indicator requirements are met.◆

◆[1] In appropriate cases, periodic testing of the different batches prepared from the same lot of dehydrated medium is acceptable.◆

Table 1. Strains of the Test Microorganisms Suitable for Use in the Growth Promotion Test and the Validation Test

Aerobic bacteria	
Staphylococcus aureus◆[1]◆	ATCC 6538, CIP 4.83, NCTC 10788, NCIMB 9518
Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB 8054
Pseudomonas aeruginosa◆[2]◆	ATCC 9027, NCIMB 8626, CIP 82.118
Anaerobic bacterium	
Clostridium sporogenes◆[3]◆	ATCC 19404, CIP 79.3, NCTC 532 or ATCC 11437
Fungi	
Candida albicans	ATCC 10231, IP 48.72, NCPF 3179
Aspergillus niger	ATCC 16404, IP 1431.83, IMI 149007

◆[1] An alternative to *Staphylococcus aureus* is *Bacillus subtilis* (ATCC 6633).◆

◆[2] An alternative microorganism is *Micrococcus luteus* (*Kocuria rhizophila*), ATCC 9341.◆

◆[3] An alternative to *Clostridium sporogenes*, when a nonspore-forming microorganism is desired, is *Bacteroides vulgatus* (ATCC 8482).◆

[NOTE—Seed-lot culture maintenance techniques (seed-lot systems) are used so that the viable microorganisms used for inoculation are not more than five passages removed from the original master seed lot.]

◆DILUTING AND RINSING FLUIDS FOR MEMBRANE FILTRATION

Fluid A

PREPARATION

Dissolve 1 g of peptic digest of animal tissue in water to make 1 liter, filter or centrifuge to clarify, if necessary, and adjust to a pH of 7.1 ± 0.2. Dispense into containers, and sterilize using a validated process.

PREPARATION FOR PENICILLINS OR CEPHALOSPORINS

Aseptically add to the above *Preparation*, if necessary, a quantity of sterile β-lactamase sufficient to inactivate any residual antibiotic activity on the membranes after the solution of the test specimen has been filtered (see *Media for Penicillins or Cephalosporins*).

Fluid D

To each liter of *Fluid A* add 1 mL of polysorbate 80, adjust to a pH of 7.1 ± 0.2, dispense into containers, and sterilize using a validated process. Use this fluid for articles containing lecithin or oil, or for devices labeled as "sterile pathway."

Fluid K

Dissolve 5.0 g of peptic digest of animal tissue, 3.0 g of beef extract, and 10.0 g of polysorbate 80 in water to make 1 liter. Adjust the pH to obtain, after sterilization, a pH of 6.9 ± 0.2. Dispense into containers, and sterilize using a validated process.◆

VALIDATION TEST

Carry out a test as described below under *Test for Sterility of the Product to be Examined* using exactly the same methods, except for the following modifications.

Membrane Filtration

After transferring the content of the container or containers to be tested to the membrane, add an inoculum of a small number of viable microorganisms (not more than 100 cfu) to the final portion of sterile diluent used to rinse the filter.

Direct Inoculation

After transferring the contents of the container or containers to be tested (for catgut and other surgical sutures for veterinary use: strands) to the culture medium, add an inoculum of a small number of viable microorganisms (not more than 100 cfu) to the medium.

In both cases use the same microorganisms as those described above under *Growth Promotion Test of Aerobes, Anaerobes, and Fungi*. Perform a growth promotion test as a positive control. Incubate all the containers containing medium for not more than 5 days.

If clearly visible growth of microorganisms is obtained after the incubation, visually comparable to that in the control vessel without product, either the product possesses no antimicrobial activity under the conditions of the test or such activity has been satisfactorily eliminated. The test for sterility may then be carried out without further modification.

If clearly visible growth is not obtained in the presence of the product to be tested, visually comparable to that in the control vessels without product, the product possesses antimicrobial activity that has not been satisfactorily eliminated under the conditions of the test. Modify the conditions in order to eliminate the antimicrobial activity, and repeat the validation test.

This validation is performed (a) when the test for sterility has to be carried out on a new product; and (b) whenever there is a change in the experimental conditions of the test. The validation may be performed simultaneously with the *Test for Sterility of the Product to be Examined*.

TEST FOR STERILITY OF THE PRODUCT TO BE EXAMINED

◆Number of Articles to Be Tested

Unless otherwise specified elsewhere in this chapter or in the individual monograph, test the number of articles specified in *Table 3*. If the contents of each article are of sufficient quantity (see *Table 2*), they may be divided so that equal appropriate portions are added to each of the specified media. [NOTE—Perform sterility testing employing two or more of the specified media.] If each article does not contain sufficient quantities for each medium, use twice the number of articles indicated in *Table 3*.◆

Table 2. Minimum Quantity to be Used for Each Medium

Quantity per Container	Minimum Quantity to be Used (unless otherwise justified and authorized)
Liquids (other than anitbiotics)	
Less than 1 mL	The whole contents of each container
1–40 mL	Half the contents of each container, but not less than 1 mL
Greater than 40 mL, and not greater than 100 mL	20 mL
Greater than 100 mL	10% of the contents of the container, but not less than 20 mL
Antibiotic liquids	1 mL
Other preparations soluble in water or in isopropyl myristate	The whole contents of each container to provide not less than 200 mg
Insoluble preparations, creams, and ointments to be suspended or emulsified	Use the contents of each container to provide not less than 200 mg
Solids	
Less than 50 mg	The whole contents of each container
50 mg or more, but less than 300 mg	Half the contents of each container, but not less than 50 mg
300 mg–5 g	150 mg
Greater than 5 g	500 mg
Devices	
Catgut and other surgical sutures for veterinary use	3 sections of a strand (each 30-cm long)
◆Surgical dressing/cotton/gauze (in packages)	100 mg per package
Sutures and other individually packaged single-use material	The whole device
Other medical devices	The whole device, cut into pieces or disassembled◆

Interim Revision Announcement

Table 3. Minimum Number of Articles to be Tested in Relation to the Number of Articles in the Batch

Number of Items in the Batch	Minimum Number of Items to be Tested for Each Medium (unless otherwise justified and authorized)*
Parenteral preparations	
Not more than 100 containers	10% or 4 containers, whichever is the greater
More than 100 but not more than 500 containers	10 containers
More than 500 containers	2% or 20 containers, whichever is less
◆*For large-volume parenterals*	2% or 10 containers, whichever is less
Antibiotic solids	
Pharmacy bulk packages (<5 g)	20 containers
Pharmacy bulk packages (≥5 g)	6 containers
Bulks and blends	See *Bulk solid products*◆
Ophthalmic and other noninjectable preparations	
Not more than 200 containers	5% or 2 containers, whichever is the greater
More than 200 containers	10 containers
If the product is presented in the form of single-dose containers, apply the scheme shown above for preparations for parenteral use.	
Devices	
Catgut and other surgical sutures for veterinary use	2 % or 5 packages, whichever is the greater, up to a maximum total of 20 packages
◆Not more than 100 articles	10% or 4 articles, whichever is greater
More than 100, but not more than 500 articles	10 articles
More than 500 articles	2% or 20 articles, whichever is less◆
Bulk solid products	
Up to 4 containers	Each container
More than 4 containers, but not more than 50 containers	20% or 4 containers, whichever is greater
More than 50 containers	2% or 10 containers, whichever is greater

* If the contents of one container are enough to inoculate the two media, this column gives the number of containers needed for both the media together.

The test may be carried out using the technique of *Membrane Filtration* or by *Direct Inoculation of the Culture Medium* with the product to be examined. Appropriate negative controls are included. The technique of membrane filtration is used whenever the nature of the product permits; that is, for filterable aqueous preparations, for alcoholic or oily preparations, and for preparations miscible with, or soluble in, aqueous or oily solvents, provided these solvents do not have an antimicrobial effect in the conditions of the test.

Membrane Filtration

Use membrane filters having a nominal pore size not greater than 0.45 µm whose effectiveness to retain microorganisms has been established. Cellulose nitrate filters, for example, are used for aqueous, oily, and weakly alcoholic solutions; and cellulose acetate filters, for example, are used for strongly alcoholic solutions. Specially adapted filters may be needed for certain products, e.g. for antibiotics.

The technique described below assumes that membranes about 50 mm in diameter will be used. If filters of a different diameter are used, the volumes of the dilutions and the washings should be adjusted accordingly. The filtration apparatus and membrane are sterilized by appropriate means. The apparatus is designed so that the solution to be examined can be introduced and filtered under aseptic conditions: it permits the aseptic removal of the membrane for transfer to the medium, or it is suitable for carrying out the incubation after adding the medium to the apparatus itself.

AQUEOUS SOLUTIONS

If appropriate, transfer a small quantity of a suitable, sterile diluent such as ◆*Fluid A* (see *Diluting and Rinsing Fluids for Membrane Filtration*)◆ onto the membrane in the apparatus and filter. The diluent may contain suitable neutralizing substances and/or appropriate inactivating substances, for example, in the case of antibiotics.

Transfer the contents of the container or containers to be tested to the membrane or membranes, if necessary, after diluting to the volume used in the *Validation Test* with the chosen sterile diluent, but using not less than the quantities of the product to be examined prescribed in *Tables 2* and *3*. Filter immediately. If the product has antimicrobial properties, wash the membrane not less than three times by filtering through it each time the volume of the chosen sterile diluent used in the *Validation Test*. Do not exceed a washing cycle of 5 times 200 mL, even if during validation it has been demonstrated that such a cycle does not fully eliminate the antimicrobial activity. Transfer the whole membrane to the culture medium or cut it aseptically into two equal parts, and transfer one half to each of two suitable media. Use the same volume of each medium as in the *Validation Test*. Alternatively, transfer the medium onto the membrane in the apparatus. Incubate the media for not less than 14 days.

SOLUBLE SOLIDS (OTHER THAN ANTIBIOTICS)

Use for each medium not less than the quantity prescribed in *Tables 2* and *3* of the product dissolved in a suitable solvent, such as ◆*Fluid A* (*Diluting and Rinsing Fluids for Membrane Filtration*),◆ and proceed with the test as described above for *Aqueous Solutions* using a membrane appropriate to the chosen solvent.

OILS AND OILY SOLUTIONS

Use for each medium not less than the quantity of the product prescribed in *Tables 2* and *3*. Oils and oily solutions of sufficiently low viscosity may be filtered without dilution through a dry membrane. Viscous oils may be diluted as necessary with a suitable sterile diluent such as isopropyl myristate shown not to have antimicrobial activity in the conditions of the test. Allow the oil to penetrate the membrane by its own weight, and then filter, applying the pressure or suction gradually. Wash the membrane at least three times by filtering through it each time about 100 mL of a suitable sterile solution such as ◆*Fluid A* (see *Diluting and Rinsing Fluids for Membrane Filtration*)◆ containing a suitable emulsifying agent at a concentration shown to be appropriate in the validation of the test, for example polysorbate 80 at a concentration of 10 g per liter ◆(*Fluid K*)◆. Transfer the membrane or membranes to the culture medium or media, or vice versa, as described above for *Aqueous Solutions*, and incubate at the same temperatures and for the same times.

OINTMENTS AND CREAMS

Use for each medium not less than the quantities of the product prescribed in *Tables 2* and *3*. Ointments in a fatty base and emulsions of the water-in-oil type may be diluted to 1% in isopropyl myristate as described above, by heating, if necessary, to not more than 40°. In exceptional cases it may be necessary to heat to not more than 44°. Filter as rapidly as possible and proceed as described above for *Oils and Oily Solutions*.

◆PREFILLED SYRINGES

For prefilled syringes without attached sterile needles, expel the contents of each syringe into one or two separate membrane filter funnels or into separate pooling vessels prior to transfer. If a separate sterile needle is attached, directly expel the syringe contents as indicated above, and proceed as directed for *Aqueous Solutions*. Test the sterility of the needle, using *Direct Inoculation* under *Validation Test*.

SOLIDS FOR INJECTION OTHER THAN ANTIBIOTICS

Constitute the test articles as directed on the label, and proceed as directed for *Aqueous Solutions* or *Oils and Oily Solutions*, whichever applies. [NOTE—If necessary, excess diluent can be added to aid in the constitution and filtration of the constituted test article.]

ANTIBIOTIC SOLIDS FOR INJECTION

Pharmacy Bulk Packages, < 5 g—From each of 20 containers, aseptically transfer about 300 mg of solids, into a sterile 500-mL conical flask, dissolve in about 200 mL of *Fluid A* (see *Diluting and Rinsing Fluids for Membrane Filtration*), and mix; or constitute, as directed in the labeling, each of 20 containers and transfer a quantity of liquid or suspension, equivalent to about 300 mg of solids, into a sterile 500-mL conical flask, dissolve in about 200 mL of *Fluid A*, and mix. Proceed as directed for *Aqueous Solutions* or *Oils and Oily Solutions*, whichever applies.

Pharmacy Bulk Packages, ≥5 g—From each of 6 containers, aseptically transfer about 1 g of solids into a sterile 500-mL conical flask, dissolve in about 200 mL of *Fluid A*, and mix; or constitute, as directed in the labeling, each of 6 containers and transfer a quantity of liquid, equivalent to about 1 g of solids, into a sterile 500-mL conical flask, dissolve in about 200 mL of *Fluid A*, and mix. Proceed as directed for *Aqueous Solutions*.

ANTIBIOTIC SOLIDS, BULKS, AND BLENDS

Aseptically remove a sufficient quantity of solids from the appropriate amount of containers (see *Table 2*), mix to obtain a composite, equivalent to about 6 g of solids, and transfer to a sterile 500-mL conical flask. Dissolve in about 200 mL of *Fluid A*, and mix. Proceed as directed for *Aqueous Solutions*.

STERILE AEROSOL PRODUCTS

For fluid products in pressurized aerosol form, freeze the containers in an alcohol-dry ice mixture at least at –20° for about 1 hour. If feasible, allow the propellant to escape before aseptically opening the container, and transfer the contents to a sterile pooling vessel. Add 100 mL of *Fluid D* to the pooling vessel, and mix gently. Proceed as directed for *Aqueous Solutions* or *Oils and Oily Solutions*, whichever applies.

DEVICES WITH PATHWAYS LABELED STERILE

Aseptically pass not less than 10 pathway volumes of *Fluid D* through each device tested. Collect the fluids in an appropriate sterile vessel, and proceed as directed for *Aqueous Solutions* or *Oils and Oily Solutions*, whichever applies.

In the case of sterile, empty syringes, draw sterile diluent into the barrel through the sterile needle, if attached, or through a sterile needle attached for the purpose of the test, and express the contents into a sterile pooling vessel. Proceed as directed above.◆

Direct Inoculation of the Culture Medium

Transfer the quantity of the preparation to be examined prescribed in *Tables 2* and *3* directly into the culture medium so that the volume of the product is not more than 10% of the volume of the medium, unless otherwise prescribed.

Interim Revision Announcement

If the product to be examined has antimicrobial activity, carry out the test after neutralizing this with a suitable neutralizing substance or by dilution in a sufficient quantity of culture medium. When it is necessary to use a large volume of the product, it may be preferable to use a concentrated culture medium prepared in such a way that it takes into account the subsequent dilution. Where appropriate, the concentrated medium may be added directly to the product in its container.

OILY LIQUIDS

Use media to which have been added a suitable emulsifying agent at a concentration shown to be appropriate in the validation of the test, for example polysorbate 80 at a concentration of 10 g per liter.

OINTMENTS AND CREAMS

Prepare by diluting to about 1 in 10 by emulsifying with the chosen emulsifying agent in a suitable sterile diluent such as ◆*Fluid A* (see *Diluting and Rinsing Fluids for Membrane Filtration*).◆ Transfer the diluted product to a medium not containing an emulsifying agent.

Incubate the inoculated media for not less than 14 days. Observe the cultures several times during the incubation period. Shake cultures containing oily products gently each day. However, when thioglycollate medium or other similar medium is used for the detection of anaerobic microorganisms, keep shaking or mixing to a minimum in order to maintain anaerobic conditions.

CATGUT AND OTHER SURGICAL SUTURES FOR VETERINARIAN USE

Use for each medium not less than the quantities of the product prescribed in *Tables 2* and *3*. Open the sealed package using aseptic precautions, and remove three sections of the strand for each culture medium. Carry out the test on three sections, each 30-cm long, which have been cut off from the beginning, the center, and the end of the strand. Use whole strands from freshly opened cassette packs. Transfer each section of the strand to the selected medium. Use sufficient medium to cover adequately the material to be tested (20 mL to 150 mL).

◆SOLIDS

Transfer a quantity of the product in the form of a dry solid (or prepare a suspension of the product by adding sterile diluent to the immediate container), corresponding to not less than the quantity indicated in *Tables 2* and *3*. Transfer the material so obtained to 200 mL of *Fluid Thioglycollate Medium*, and mix. Similarly, transfer the same quantity to 200 mL of *Soybean–Casein Digest Medium*, and mix. Proceed as directed above.

PURIFIED COTTON, GAUZE, SURGICAL DRESSINGS, AND RELATED ARTICLES

From each package of cotton, rolled gauze bandage, or large surgical dressings being tested, aseptically remove two or more portions of 100- to 500-mg each from the innermost part of the sample. From individually packaged, single-use materials, aseptically remove the entire article. Immerse the portions or article in each medium, and proceed as directed above.

STERILE DEVICES

Articles can be immersed intact or disassembled. To ensure that device pathways are also in contact with the media, immerse the appropriate number of units per medium in a volume of medium sufficient to immerse the device completely, and proceed as directed above. For extremely large devices, immerse those portions of the device that are to come into contact with the patient in a volume of medium sufficient to achieve complete immersion of those portions.

For catheters where the inside lumen and outside are required to be sterile, either cut them into pieces such that the medium is in contact with the entire lumen or fill the lumen with medium, and then immerse the intact unit.◆

OBSERVATION AND INTERPRETATION OF RESULTS

At intervals during the incubation period and at its conclusion, examine the media for macroscopic evidence of microbial growth. If the material being tested renders the medium turbid so that the presence or absence of microbial growth cannot be readily determined by visual examination, 14 days after the beginning of incubation transfer portions (each not less than 1 mL) of the medium to fresh vessels of the same medium, and then incubate the original and transfer vessels for not less than 4 days.

If no evidence of microbial growth is found, the product to be examined complies with the test for sterility. If evidence of microbial growth is found, the product to be examined does not comply with the test for sterility, unless it can be clearly demonstrated that the test was invalid for causes unrelated to the product to be examined. The test may be considered invalid only if one or more of the following conditions are fulfilled:

a. The data of the microbiological monitoring of the sterility testing facility show a fault.
b. A review of the testing procedure used during the test in question reveals a fault.
c. Microbial growth is found in the negative controls.
d. After determination of the identity of the microorganisms isolated from the test, the growth of this species (or these species) may be ascribed unequivocally to faults with respect to the material and or the technique used in conducting the sterility test procedure.

If the test is declared to be invalid, it is repeated with the same number of units as in the original test. If no evidence of microbial growth is found in the repeat test, the product examined complies with the test for sterility. If microbial growth is found in the repeat test, the product examined does not comply with the test for sterility.

APPLICATION OF THE TEST TO PARENTERAL PREPARATIONS, OPHTHALMIC, AND OTHER NONINJECTABLE PREPARATIONS REQUIRED TO COMPLY WITH THE TEST FOR STERILITY

When using the technique of membrane filtration, use, whenever possible, the whole contents of the container, but not less than the quantities indicated in *Tables 2* and *3*, diluting where necessary to about 100 mL with a suitable sterile solution, such as ◆*Fluid A* (see *Diluting and Rinsing Fluids for Membrane Filtration*).◆

When using the technique of direct inoculation of media, use the quantities shown in *Tables 2* and *3*, unless otherwise justified and authorized. The tests for bacterial and fungal sterility are carried out on the same sample of the product to be examined. When the volume or the quantity in a single container is insufficient to carry out the tests, the contents of two or more containers are used to inoculate the different media.

(Official January 1, 2004)●4

●⟨797⟩ PHARMACEUTICAL COMPOUNDING—STERILE PREPARATIONS●4

Change to read:

•INTRODUCTION

This chapter provides procedures and requirements for compounding sterile preparations. Sterile compounding differs from nonsterile compounding (see *Pharmaceutical Compounding — Nonsterile Preparations* ⟨795⟩ and *Good Compounding Practices* ⟨1075⟩) primarily by requiring a test for sterility. Sterile compounding also requires cleaner facilities; specific training and testing of personnel in principles and practices of aseptic manipulations; air quality evaluation and maintenance; and sound knowledge of sterilization and solution stability principles and practices. Greater care is required for aqueous injections that are compounded sterile preparations (CSPs)—the most common CSPs used in therapy. Aqueous injections for administration into the vascular and central nervous systems pose the greatest risk of harm to patients if there are issues of nonsterility and large errors in ingredients.

The intent of this chapter is to prevent harm and fatality to patients that could result from microbial contamination (nonsterility), excessive bacterial endotoxins, large content errors in the strength of correct ingredients, and incorrect ingredients in CSPs. The quality control and testing for CSPs in this chapter are appropriate and necessary. The content of this chapter applies to health care institutions, pharmacies, physician practice facilities, and other facilities in which CSPs are prepared, stored, and dispensed. For the purposes of this chapter, CSPs include any of the following:

a. Preparations prepared according to the maufacturer's labeled instructions and other manipulations when manufacturing sterile products that expose the original contents to potential contamination.
b. Preparations containing nonsterile ingredients or employing nonsterile components and devices that must be sterilized before administration.
c. Biologics, diagnostics, drugs, nutrients, and radiopharmaceuticals that possess either of the above two characteristics, and which include, but are not limited to, baths and soaks for live organs and tissues, implants, inhalations, injections, powders for injection, irrigations, metered sprays, and ophthalmic and otic preparations.

The sections in this chapter are organized to facilitate practitioners' understanding of the fundamental accuracy and quality practices of CSPs. They provide a foundation for the development and implementation of essential procedures for the safe preparation of CSP's in the three risk levels, which are classified according to the potential for microbial, chemical, and physical contamination. The chapter is divided into the following main sections:

- Responsibilities of all compounding personnel
- The basis for the classification of a CSP into a low-, medium-, and high-risk level, with examples of CSPs and their quality assurance practices in each of these risk levels
- Verification of compounding accuracy and sterilization
- Personnel training and evaluation in aseptic manipulation skills, including representative sterile microbial culture medium transfer and fill challenges
- Environmental quality and control during the processing of CSPs
- Equipment used in the preparation of CSPs
- Verification of automated compounding devices for parenteral nutrition compounding
- Finished preparation release checks and tests
- Storage and beyond-use dating
- Maintaining product quality and control after CSPs leave the compounding facility, including education and training of personnel
- Packing, handling, storage, and transport of CSPs
- Patient or caregiver training
- Patient monitoring and adverse events reporting
- A quality assurance program for CSPs

It is the ultimate responsibility of all personnel who prepare CSPs to understand these fundamental practices and precautions, to develop and implement appropriate procedures, and to continually evaluate these procedures and the quality of final CSPs to prevent harm and fatality to patients who are treated with CSPs.●4

Delete the following:

•RESPONSIBILITY OF THE DISPENSING PHARMACIST

A pharmacist dispensing any SP is responsible for ensuring that the product has been prepared, labeled, controlled, stored, dispensed, and distributed properly. This includes the responsibility for ensuring that the SP is kept under appropriate controlled conditions at the location of use and that it is administered properly through adequate labeling and verbal or written instructions. The dispensing pharmacist is also responsible for ensuring that the SP retains its quality attributes within acceptable limits through a written quality assurance program. This program should ensure that for the entire labeled life of the product, or until manipulated by the clinician, patient, or caregiver, the potency, pH, sterility, freedom from pyrogens, particulate limits, container integrity, appearance, and other qualities or characteristics that the SP is expected to have do exist. The quality assurance program should encompass every SP under the pharmacy's control and includes all phases of its preparation, distribution, storage, administration, and use. The dispensing pharmacy should employ proper analytical testing, where appropriate, to ensure the microbiological, chemical, and physical quality of all SPs. These responsibilities apply equally to commercially available injectable drug products that are dispensed to patients without compounding or other manipulation and to SPs that

have been repackaged, reconstituted, diluted, admixed, blended, or otherwise manipulated (collectively referred to as ''Compounded'') in any way prior to dispensing. The pharmacist is responsible for ensuring that quality is built into the preparation of products, with key factors including at least the following general principles:

(1) Personnel are capable and qualified to perform their assigned duties.
(2) Ingredients usedin compounding have their expected identity, quality, and purity.
(3) Critical processes are validated to ensure that procedures, when used, will consistently result in the expected qualities in the finished product.
(4) The production environment is suitable for its intended purpose (addressing such matters as environmental cleanliness, control, monitoring, and the setting of action limits, as appropriate).
(5) Appropriate release checks or testing procedures are performed to ensure that finished products have their expected potency, purity, quality, and characteristics at the time of release.
(6) Appropriate stability evaluation is performed or determined from the literature for establishing reliable beyond-use dating to ensure that finished products have their expected potency, purity, quality, and characteristics at least until the labeled beyond-use date.
(7) There is assurance that processes are always carried out as intended or specified and are under control.
(8) Preparation conditions and procedures are adequate for preventing mixups.
(9) There are adequate procedures and records for investigating and correcting failures or problems in preparation, testing, or in the product itself.
(10) There is adequate separation of quality control functions and decisions from those of production.

Emphasis in this chapter is placed upon the quality and the control of the processes utilized, personnel performance, and the environmental conditions under which the processes are performed. Other factors, such as testing and stability, are addressed to the extent necessary for the limited quantities of products with relatively short beyond-use dating periods normally associated with home care pharmacy practice. This chapter is not intended to address issues concerning the manufacture of sterile drug products.●4

Add the following:

•RESPONSIBILITY OF COMPOUNDING PERSONNEL

Compounding personnel are responsible for ensuring that CSPs are accurately identified, measured, diluted, and mixed; and are correctly purified, sterilized, packaged, sealed, labeled, stored, dispensed, and distributed. These performance responsibilities include maintaining appropriate cleanliness conditions and providing labeling and supplementary instructions for the proper clinical administration of CSPs.

Compounding supervisors shall ensure through either direct measurement or appropriate information sources that specific CSPs maintain their labeled strength within monograph limits for USP articles, or within 10% if not specified, until their beyond-use dates. All CSPs are prepared in a manner that maintains sterility and minimizes the introduction of particulate matter.

A written quality assurance procedure includes the following in-process checks that are applied, as is appropriate, to specific CSPs: accuracy and precision of measuring and weighing; the requirement for sterility; methods of sterilization and purification; safe limits and ranges for strength of ingredients, bacterial endotoxins, particulate matter, and pH; labeling accuracy and completeness; beyond-use date assignment; and packaging and storage requirements. The dispenser shall, when appropriate and practicable, obtain and evaluate results of testing for identity, strength, purity, and sterility before a CSP is dispensed. Qualified licensed health care professionals who supervise compounding and dispensing of CSPs shall ensure that the following objectives are achieved.

1. Compounding personnel are adequately skilled, educated, instructed, and trained to correctly perform and document the following activities in their sterile compounding duties:
   a. Perform antiseptic hand cleansing and disinfection of nonsterile compounding surfaces;
   b. Select and appropriately don protective gloves, goggles, gowns, masks, and hair and shoe covers;
   c. Use laminar flow clean-air hoods, barrier isolators, and other contamination control devices that are appropriate for the risk level;
   d. Identify, weigh, and measure ingredients; and
   e. Manipulate sterile products aseptically, sterilize high-risk level CSPs, and label and quality inspect CSPs.
2. Ingredients have their correct identity, quality, and purity.
3. Opened or partially used packages of ingredients for subsequent use in CSPs are properly stored under restricted access conditions in the compounding facility. Such packages cannot be used when visual inspection detects unauthorized breaks in the container, closure, and seal; when the contents do not possess the expected appearance, aroma, and texture; when the contents do not pass identification tests specified by the compounding facility; and when either the beyond-use or expiration date has been exceeded.
4. To minimize the generation of bacterial endotoxins, water-containing CSPs that are nonsterile during any phase of the compounding procedure are sterilized within 6 hours after completing the preparation.
5. Sterilization methods achieve sterility of CSPs while maintaining the labeled strength of active ingredients and the physical integrity of packaging.
6. Measuring, mixing, sterilizing, and purifying devices are clean, appropriately accurate, and effective for their intended uses.
7. Potential harm from added substances and differences in rate and extent of bioavailability of active ingredients for other than oral route of administration are carefully evaluated before such CSPs are dispensed and administered.
8. Packaging selected for CSPs is appropriate to preserve the sterility and strength until the beyond-use date.
9. While being used, the compounding environment maintains the sterility or the presterilization purity, whichever is appropriate, of the CSP.
10. Labels on CSPs list the names and amounts or concentrations of all ingredients. Before being dispensed, and or administered, the clarity of solutions are visually confirmed; also the identity and amounts of ingredients, procedures to prepare and sterilize CSPs, and specific release criteria are reviewed to assure their accuracy and completeness.
11. Beyond-use dates are assigned based on direct testing or extrapolation from reliable literature sources and other documentation (see *Stability Criteria* and *Beyond-Use Dating* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).
12. Procedures for measuring, mixing, dilution, purification, sterilization, packaging, and labeling conform to the correct sequence and quality established for the specified CSP.
13. Deficiencies in compounding, labeling, packaging, and quality testing and inspection can be rapidly identified and corrected.
14. When time and personnel availability so permit, compounding manipulations and procedures are separated from post-compounding quality inspection and review before CSPs are dispensed and administered.

This chapter emphasizes the need to maintain high standards for the quality and control of processes, components, and environments; and for the skill and knowledge of personnel who prepare CSPs. The rigor of in-process quality-control checks and of post-compounding quality inspection and testing increases corresponding to the potential hazard of the route of administration. For example, nonsterility, excessive bacterial endotoxin contamination, large errors in strength of correct ingredients, and incorrect ingredients in CSPs are potentially more dangerous to patients when the CSPs are administered into the vascular and central nervous systems than when administered by most other routes.●4

•RISK LEVELS

With reference to the microbiological quality (i.e., sterility) of the finished drug product, an SP, in general, is compounded under either relatively *low-risk* or *high-risk* conditions, as determined by the potential for the introduction of microbial contamination. This contamination may result from the use of nonsterile components; novel, complex, or prolonged aseptic processes; or open exposure of the drug product or product containment devices to the atmosphere. In addition, long storage time between compounding and initiation of administration may affect the microbiological quality of the finished drug product.

The characteristics itemized below to distinguish between the high-risk and low-risk levels are intended to provide conceptual guidance and are not intended to be prescriptive. The pharmacist is expected to exercise professional judgment on a case-by-case basis when determining the risk level that would be appropriate for a particular process.

Low-Risk

An SP is considered to be aseptically processed under low-risk conditions when all of the following conditions prevail:

(1) The finished product is compounded with commercially available, sterile drug products.
(2) Compounding involves only basic, and relatively few, aseptic manipulations that are promptly executed.
(3) ''Closed system'' transfers are used: the container-closure system remains essentially intact throughout the aseptic process, compromised only by the penetration of a sterile, pyrogen-free needle or cannula through the designated stopper or port to affect transfer, withdrawal, or delivery in accordance with the labeled instructions for the pertinent, commercially available devices. Opened ampuls should be regarded as if they are closed systems for purposes of this chapter.

Examples of low-risk processes include the following:

(1) Transferring sterile drug products from vials or ampuls into sterile final containers using a sterile needle and syringe.
(2) Transferring sterile drug products into sterile elastomeric infusion containers with the aid of a mechanical pump and an appropriate sterile transfer tubing device, with or without the subsequent addition of sterile drug products to the infusion container with a sterile needle and syringe.
(3) Compounding sterile nutritional solutions by combining *Dextrose Injection* and *Amino Acids Injection* via gravity transfer into sterile empty containers, with or without the subsequent addition of sterile drug products to the final container with a sterile needle and syringe.

High-Risk

Category I—A high-risk SP may fall into either of two subclassifications. High-risk SPs in *Category I* are those prepared from commercially available, sterile components where one or more of the following conditions prevail:

(1) Compounding involves the intermediate closed system pooling of sterile drug products. Pooling of additives is defined as a higher risk process than performing multiple single additives because contamination of the pool could result in contamination of units filled from the pool, thus potentially causing epidemic infection.
(2) Compounding includes complex and/or numerous aseptic manipulations executed over a prolonged period.
(3) An individual finished product is administered as a multi-day infusion via a portable pump or reservoir.

Examples of high-risk category I processes include the following:

(1) Compounding sterile nutritional solutions using an automated compounding device involving repeated attachment of fluid containers to proximal openings of the compounder tubing set and of empty final containers to the distal opening. The process concludes with the transfer of additives into the filled final container from individual drug product containers or from a pooled additive solution.
(2) Preparing ambulatory pump reservoirs by adding more than one drug product with the evacuation of air from the reservoir prior to dispensing.
(3) Preparing ambulatory pump reservoirs for multi-day (i.e., ambient temperature) administration.

Category II—High-risk SPs in *Category II* are those involving either of the following:

(1) A nonsterile drug substance or an injectable drug product prepared in-house from a nonsterile substance is used to compound the SP.
(2) ''Open systems'' are used, for example, when combining ingredients in a nonsealed reservoir before filling or when fluid passes through the atmosphere during a fill-seal operation.

Examples of high-risk category II processes include the following:

(1) Compounding injectable morphine solutions from nonsterile morphine substance and suitable vehicles.
(2) Compounding sterile nutritional solutions from nonsterile ingredients with initial mixing in a nonsealed or nonsterile reservoir.●4

Add the following:

•CSP MICROBIAL CONTAMINATION RISK LEVELS

The appropriate risk level—low, medium, or high—is assigned according to the corresponding probability of contaminating a CSP with (1) microbial contamination (microbial organisms, spores, and endotoxins) and (2) chemical and physical contamination (foreign chemicals and physical matter). Potential sources of contamination include, but are not limited to, solid and liquid matter from compounding personnel and objects; nonsterile components employed and incorporated before terminal sterilization; inappropriate conditions within the restricted compounding environment; prolonged presterilization procedures with aqueous preparations; and nonsterile dosage forms used to compound CSPs.

The characteristics described below for low-risk, medium-risk, and high-risk CSPs are intended as a guide to the breadth and depth of care necessary in compounding, but they are neither exhaustive nor prescriptive. The licensed health care professionals who super-

Interim Revision Announcement

vise compounding are responsible for determining the procedural and environmental quality practices and attributes that are necessary for the risk level they assign to specific CSPs.

These risk levels apply to the quality of CSPs immediately after the final aseptic mixing or filling or immediately after the final sterilization, unless precluded by the specific characteristics of the preparation, such as lipid-based emulsions where administration must be completed within 12 hours of preparation. Upon subsequent storage and shipping of freshly finished CSPs, an increase in the risks of chemical degradation of ingredients, contamination from physical damage to packaging, and permeability of plastic and elastomeric packaging is expected. In such cases, compounding personnel consider the potential additional risks to the integrity of CSPs when assigning beyond-use dates. The pre-administration exposure duration and temperature limits specified in the following low-risk, medium-risk, and high-risk level sections apply in the absence of direct testing results or appropriate information sources that justify different limits for specific CSPs. For a summary of the criteria according to risk levels, please see the *Appendix*.

Low-Risk Level CSPs

CSPs compounded under all of the following conditions are at a low risk of contamination.

Low-Risk Conditions—

1. The CSPs are compounded with aseptic manipulations entirely within ISO Class 5 (see *Table 1*) or better air quality using only sterile ingredients, products, components, and devices.
2. The compounding involves only transfer, measuring, and mixing manipulations with closed or sealed packaging systems that are performed promptly and attentively.
3. Manipulations are limited to aseptically opening ampuls, penetrating sterile stoppers on vials with sterile needles and syringes, and transferring sterile liquids in sterile syringes to sterile administration devices and packages of other sterile products.
4. For a low-risk preparation, in the absence of passing a sterility test, the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 48 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 14 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.

Examples of Low-Risk Compounding—

1. Single transfers of sterile dosage forms from ampuls, bottles, bags, and vials using sterile syringes with sterile needles, other administration devices, and other sterile containers. The contents of ampuls require sterile filtration to remove any glass particles.
2. Manually measuring and mixing no more than three manufactured products to compound drug admixtures and nutritional solutions.

Quality Assurance—

Quality assurance practices include, but are not limited to, the following:

1. Routine disinfection and air quality testing of the direct compounding environment to minimize microbial surface contamination and maintain ISO Class 5 air quality (see *Table 1*).
2. Visual confirmation that compounding personnel are properly donning and wearing appropriate items and types of protective garments and goggles.
3. Review of all orders and packages of ingredients to assure the correct identity and amounts of ingredients were compounded.
4. Visual inspection of CSPs to ensure the absence of particulate matter in solutions, the absence of leakage from vials and bags, and the accuracy and thoroughness of labeling.

Example of a Media-Fill Test Procedure—This, or an equivalent test, is performed at least annually by each person authorized to compound in a low-risk level under conditions that closely simulate the most challenging or stressful conditions encountered during compounding of low-risk level CSPs. Once begun, this test is completed without interruption. Within an ISO Class 5 air quality environment, (see *Table 1*) three sets of four 5-mL aliquots of sterile Soybean–Casein Digest Medium are transferred with the same sterile 10-mL syringe and vented needle combination into separate sealed empty sterile 30-mL clear vials (i.e., four 5-mL aliquots into each of three 30-mL vials). Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.

Medium-Risk Level CSPs

When CSPs are compounded aseptically under *Low-Risk Conditions*, and one or more of the following conditions exists, such CSPs are at a medium risk of contamination.

Medium-Risk Conditions—

1. Multiple individual or small doses of sterile products are combined or pooled to prepare a CSP that will be administered either to multiple patients or to one patient on multiple occasions.
2. The compounding process includes complex aseptic manipulations other than the single-volume transfer.
3. The compounding process requires unusually long duration, such as that required to complete dissolution or homogeneous mixing.
4. The sterile CSPs do not contain broad-spectrum bacteriostatic substances, and they are administered over several days (e.g., an externally worn or implanted infusion device).
5. For a medium-risk preparation, in the absence of passing a sterility test, the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 30 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 7 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.

Examples of Medium-Risk Compounding—

1. Compounding of total parenteral nutrition fluids using manual or automated devices during which there are multiple injections, detachments, and attachments of nutrient source products to the device or machine to deliver all nutritional components to a final sterile container.
2. Filling of reservoirs of injection and infusion devices with multiple sterile drug products and evacuation of air from those reservoirs before the filled device is dispensed.
3. Filling of reservoirs of injection and infusion devices with volumes of sterile drug solutions that will be administered over several days at ambient temperatures between 25° and 40°.
4. Transfer of volumes from multiple ampuls or vials into a single, final sterile container or product.

Quality Assurance—Quality assurance procedures for medium-risk level CSPs include all those for low-risk level CSPs, as well as a more challenging media-fill test passed annually, or more frequently.

Example of a Media-Fill Test Procedure—This, or an equivalent test, is performed under conditions that closely simulate the most challenging or stressful conditions encountered during compounding. This test is completed without interruption within an ISO Class 5 air quality environment (see *Table 1*). Six 100-mL aliquots of sterile Soybean–Casein Digest Medium are aseptically transferred by gravity through separate tubing sets into separate evacuated sterile containers. The six containers are then arranged as three pairs, and a sterile 10-mL syringe and 18-gauge needle combination is used to exchange two 5-mL aliquots of medium from one container to the other container in the pair. For example, after a 5-mL aliquot from the first container is added to the second container in the pair, the second container is agitated for 10 seconds, then a 5-mL aliquot is removed and returned to the first container in the pair. The first container is then agitated for 10 seconds, and the next 5-mL aliquot is transferred from it back to the second container in the pair. Following the two 5-mL aliquot exchanges in each pair of containers, a 5-mL aliquot of medium from each container is aseptically injected into a sealed empty sterile 10-mL clear vial using a sterile 10-mL syringe and vented needle. Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.

High-Risk Level CSPs

CSPs compounded under any of the following conditions are either contaminated or at a high risk to become contaminated with infectious microorganisms.

High-Risk Conditions—

1. Nonsterile ingredients, including manufactured products for routes of administration—other than those listed under *c.* in the *Introduction*—are incorporated or a nonsterile device is employed before terminal sterilization.
2. Sterile ingredients, components, devices, and mixtures are exposed to air quality inferior to ISO Class 5 (see *Table 1*). This includes storage in environments inferior to ISO Class 5 of opened or partially used packages of manufactured sterile products that lack antimicrobial preservatives.
3. Nonsterile preparations are exposed for at least 6 hours before being sterilized.
4. It is assumed, and not verified by examination of labeling and documentation from suppliers or by direct determination, that the chemical purity and content strength of ingredients meet their original or compendial specifications in unopened or in opened packages of bulk ingredients (see *Ingredient Selection* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).
5. For a high-risk preparation, in the absence of passing a sterility test, the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 24 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 3 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.

All nonsterile measuring, mixing, and purifying devices are rinsed thoroughly with sterile, pyrogen-free water, and then thoroughly drained or dried immediately before use for high-risk compounding. All high-risk CSP solutions subjected to terminal steam sterilization are passed through a filter with a nominal porosity not larger than 1.2 µm preceding or during filling into their final containers. Sterilization of high-risk level CSPs by filtration is conducted entirely with an ISO Class 5 or superior air quality environment (see *Table 1*).

Examples of High-Risk Compounding—

1. Dissolving nonsterile bulk drug and nutrient powders to make solutions, which will be terminally sterilized.
2. Sterile ingredients, components, devices, and mixtures are exposed to air quality inferior to ISO Class 5 (see *Table 1*). This includes storage in environments inferior to ISO Class 5 of opened or partially used packages of manufactured sterile products that lack antimicrobial preservatives.
3. Measuring and mixing sterile ingredients in nonsterile devices before sterilization is performed.
4. Assuming, without appropriate evidence or direct determination, that packages of bulk ingredients contain at least 95% by weight of their active chemical moiety and have not been contaminated or adulterated between uses.

Quality Assurance—Quality assurance procedures for high-risk level CSPs include all those for low-risk level CSPs. In addition, a media-fill test that represents high-risk level compounding is performed semi-annually by each person authorized to compound high-risk level CSPs.

Example of a Media-Fill Test Procedure—This, or an equivalent test, is performed under conditions that closely simulate the most challenging or stressful conditions encountered when compounding high-risk level CSPs. This test is completed without interruption in the following sequence:

1. Dissolve 3 g of nonsterile commercially available Soybean–Casein Digest Medium in 100 mL of nonbacteriostatic water to make a 3% solution.
2. Draw 25 mL of the medium into each of three 30-mL sterile syringes. Transfer 5 mL from each syringe into separate sterile 10-mL vials. These vials are the controls, and they generate exponential microbial growth, indicated by visible turbidity upon incubation.
3. Under aseptic conditions and using aseptic techniques, affix a sterile 0.2-µm porosity filter unit and a 20-gauge needle to each syringe. Inject the next 10 mL from each syringe into three separate 10-mL sterile vials. Repeat the process into three more vials. Label all vials, affix sterile adhesive seals to the closure of the nine vials, and incubate them at 25° to 35°. Inspect for microbial growth over 14 days as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.•4

Delete the following:

•VALIDATION

The sterilization or aseptic processing of an SP should be in accordance with properly designed and validated written procedures. The act of validation of a sterilization or aseptic process involves planned testing designed to demonstrate that microorganisms will be effectively destroyed, removed, or prevented from inadvertently being introduced by personnel or by process-related activities.

Sterilization Processes

A high-risk SP prepared from nonsterile ingredients or components should be sterilized using an appropriate sterilization process, such as filtration or heat sterilization. In general, each sterilization process should be validated to demonstrate suitability for its intended purpose and specific manner of intended uses.

Interim Revision Announcement

STERILIZATION BY FILTRATION

A sterilizing filtration process should be capable of removing microorganisms from the liquid SP. Commercially available presterilized filtration devices should be certified to be appropriate for human use in sterile pharmaceutical applications, have a pore size of 0.2 µm or smaller (generally recognized as a sterilizing filter), and have been lot tested for retention of *Pseudomonas diminuta* at a minimum concentration of 10^7 organisms per cm^2 under specified operating parameters. The individual devices should be tested for membrane and housing integrity, nonpyrogenicity, and extractables by the manufacturer. Such devices should be capable of sterilizing an SP (see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). Before using such devices, the pharmacist should thoroughly evaluate their suitability for the intended SP and conditions of use.

The size and configuration of filtration devices should accommodate the volume being filtered to permit complete filtration within a reasonable period of time and without clogging to the point where mid-process filter changes would be required.

Filters and associated devices and apparatus (housing, gaskets, etc.) should be physically and chemically compatible with the product to be filtered and should be capable of withstanding the temperatures, pressures, and hydrostatic stresses imposed on the system. These capabilities are to be established through appropriate product-specific testing. To establish compatibility, the pharmacy may rely on vendor certification or on definitive evidence, specific to product and filter, obtained from a critical review of the literature or from reliable unpublished research.

Validation should be established experimentally for all filtration apparatus involving assembly in the pharmacy of the membrane (filtration medium) into its housing or holder. The pharmacy may rely on vendor certification of validation for commercially available presterilized ready-to-use filter devices or for pharmacy-assembled apparatus. (The sterilization process used for pharmacy-assembled apparatus must be properly validated.) When initially selecting a commercially available, sterile, pre-assembled filter device, the pharmacist should ensure that the vendor has validated the filter for the intended conditions of use and that an adequate challenge was used (minimum concentration of 10^7 organisms *Pseudomonas diminuta* per cm^2 of filter surface). Validation should encompass the filtration apparatus and configuration, duration of filtration, filtration operating conditions (filtration rate and temperature), and the critical product formulation parameters (pH, viscosity, ionic strength, and osmolarity) used to generate the supplied data are representative of the pharmacy's product, apparatus, specified operating parameters, etc., in regard to the factors that might physically or chemically alter filter integrity, affect microbial capture mechanisms, or shrink the microorganism during filtration.

Each filter device used for product sterilization should be checked for integrity at the time of use. Integrity testing of commercially available, sterile, self-contained filter devices requiring no preuse assembly may be performed at the conclusion of the filtration process. Filter integrity test kits suitable for pharmacy use (for example, those consisting of a small gauge and a three-way stopcock assembly) are commercially available for testing the bubble point of small disk-type filters. For pharmacy-assembled apparatus, as defined above, prefiltration integrity testing is recommended in addition to postfiltration testing. Quantitative integrity testing, such as the bubble-point or forward flow tests (see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩) should be used, as appropriate for larger filtration devices or when *Category II* high-risk SPs are sterilized.

Filtration should be performed in accordance with written procedures that list those filters determined to be acceptable for the various SPs to be filtered in the pharmacy or in accordance with master batch formulas that include definitive filter specifications. Filtration procedures and master batch formulas should also describe acceptable techniques for using and for checking the integrity of all listed filters. Fluid-filter compatibility must be established prior to the filtration of any SP not included in the procedure.

HEAT STERILIZATION

Terminal sterilization should be used when sterilizing *Category II* high-risk SPs. Sterilization may be accomplished in the final sealed container as a validated, controlled moist heat process (see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). In the absence of heat sterilization capabilities, or where heat labile drug products or container-closure systems preclude heat sterilization, an SP may be sterilized by filtration and aseptically processed and controlled in accordance with the standards set forth in this chapter.

Heat sterilization processes should be validated to ensure that the likelihood of survival of the most resistant microorganisms likely to constitute product bioburden is no greater than 10^{-6} under the specified operating conditions and parameters, such as sterilization time and temperature, size and nature of load, and chamber loading configuration. The validation and monitoring of heat sterilization processes should be in writing with all critical parameters specified, should be followed each time of use, and should be supervised by a pharmacist knowledgeable of the technology involved in the sterilization of drug products. Monitoring datashould be recorded properly to ensure, retrospectively, that the processes were carried out as specified and that all critical parameters were within specified limits during processing.[1] •4

Add the following:

•VERIFICATION OF COMPOUNDING ACCURACY AND STERILIZATION

The compounding procedures and sterilization methods for CSPs correspond to correctly designed and verified written documentation in the compounding facility. Verification requires planned testing designed to demonstrate effectiveness of all procedures critical to the accuracy and purity of finished CSPs. For example, sterility testing (see *Test Procedures* under *Sterility Tests* ⟨71⟩) may be applied to specimens of low- and medium-risk CSPs, and standard nonpathogenic bacterial cultures may be added to nondispensable specimens of high-risk CSPs before terminal sterilization for subsequent evaluation by sterility testing. Packaged and labeled CSPs are visually inspected for physical integrity and expected appearance, including final fill amount. To ensure that the identities and concentrations of ingredients are accurate, and in the absence of reliable observations and data to confirm and extrapolate those parameters, samples of CSPs are assayed.

Sterilization Methods

The licensed health care professionals who supervise compounding are responsible for determining that the selected sterilization method (see *Methods of Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩) both sterilizes and maintains the strength, purity, quality, and packaging integrity of CSPs. The selected sterilization process is expected from experience and appropriate information sources—and, preferably, veri-

[1] PDA Technical Monograph No. 1, Validation of Steam Sterilization Cycles, 1978.

fied wherever possible—to achieve sterility in the particular CSPs. General guidelines for matching CSPs and components to appropriate sterilization methods include the following:

1. CSPs have been ascertained to remain physically and chemically stable when subjected to the selected sterilization method.
2. Glass and metal devices may be covered tightly with aluminum foil, then exposed to dry heat in an oven at a mean temperature of 250° for 2 hours to achieve sterility and depyrogenation (see *Dry-Heat Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). Such items are either used immediately or stored until use in an environment suitable for compounding low- and medium-risk CSPs.
3. Personnel ascertain from appropriate information sources that the sterile microporous membrane filter used to sterilize CSP solutions, either during compounding or administration, is chemically and physically compatible with the CSP.

STERILIZATION BY FILTRATION

Commercially available sterile filters must be approved for human-use applications in sterilizing pharmaceutical fluids. Both filters that must be sterilized before processing CSPs and those filters that are commercially available, disposable, sterile, and pyrogen-free have a nominal porosity of 0.2 µm, which includes 0.22-µm porosity. They should be certified by the manufacturer to retain at least 10^7 microorganisms of a strain of *Brevundimonas* (*Pseudomonas*) *diminuta* on each cm^2 of upstream filter surface under conditions similar to those in which the CSPs will be sterilized. In emergency situations when sterile 0.2-µm porosity membranes are not available, filters of the same composition and 0.45-µm nominal porosity may be used. Sterilizing filters with 0.2-µm and 0.45-µm nominal porosities will not remove bacterial endotoxins and viruses by physical retention.

The supervising health care professional must ensure, directly or from appropriate documentation, that the filters are chemically and physically stable at the pressure and temperature conditions to be used, and that the filters will achieve sterility and maintain prefiltration pharmaceutical quality of the specific CSP. The filter dimensions and material must permit the sterilization process to be completed rapidly without the replacement of the filter during the process. When CSPs are known to contain excessive particulate matter, a prefilter or larger porosity membrane is placed upstream from the sterilizing filter to remove gross particulate contaminants in order to maximize the efficiency of the sterilizing filter.

When filter devices are assembled from separate nonsterile components by compounding personnel, such devices shall be identified to be sterile and ascertained to be effective under relevant conditions before they are used to sterilize CSPs. For example, sterility can be identified using biological indicators (see *Biological Indicators* ⟨1035⟩). Filter units used to sterilize CSPs can also be subjected to the manufacturer's recommended integrity test, such as the bubble point test.

When commercially available sterile disposable filter devices are used, the compounding personnel may accept the written certification from suppliers that the filters retain at least 10^7 cfu, of *Brevundimonas* (*Pseudomonas*) *diminuta* on each cm^2 of filter surface. Compounding personnel must ascertain that selected filters will achieve sterilization of the particular CSPs being sterilized. Large deviations from usual or expected chemical and physical properties of CSPs may cause undetectable damage to filter integrity and shrinkage of microorganisms to sizes smaller than filter porosity.

Sterile, commercially available sterilizing filter devices for use on handheld syringes may be checked by feeling for greater resistance on the plunger when filtering air after an aqueous fluid has been filtered.

STEAM STERILIZATION

The process of thermal sterilization employing saturated steam under pressure, or autoclaving, is the preferred method to terminally sterilize aqueous preparations that have been verified to maintain their full chemical and physical stability under the conditions employed (see *Steam Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). To achieve sterility, it is necessary that all materials be exposed to steam at 121°, under a pressure of about one atmosphere or 15 psi, for the duration verified by testing to achieve sterility of the items, which is usually 20 to 60 minutes for CSPs. An allowance must be made for the time required for the material to reach 121° before the sterilization exposure duration is timed.

Items that are not directly exposed to pressurized steam may result in survival of microbial organisms and spores. Before their sterilization, plastic, glass, and metal devices are tightly wrapped in low particle shedding paper or fabrics, or sealed in envelopes that prevent poststerilization microbial penetration. Immediately before filling ampuls and vials that will be steam sterilized, solutions are passed through a filter having a porosity not larger than 1.2 µm for removal of particulate matter. Sealed containers must be able to generate steam internally; thus, stoppered and crimped empty vials must contain a small amount of moisture to generate steam.

The description of steam sterilization conditions and duration for specific CSPs is included in written documentation in the compounding facility. The effectiveness of steam sterilization is verified using appropriate biological indicators (see *Biological Indicators* ⟨1035⟩) or other confirmation methods (see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩ or *Sterility Tests* ⟨71⟩).•4

Delete the following:

•ASEPTIC PROCESSING

All aseptic processing operations and configurations should be adequately established by media-fill validation.[2] Media fills should simulate as closely as possible actual aseptic operations. All manipulations, handling, environmental conditions, and other factors likely to influence the risk of process-associated contamination should be represented by the media-fill simulations. The intensity of such challenges should represent the greatest risk that would be expected during normal production. Media-fill validations should be repeated with sufficient frequency to ensure the ongoing capability of performing properly each aseptic processing operation used in the authorized facility. The frequency and results of media-fill runs should be documented.

The culture medium selected should be capable of supporting the growth of a broad spectrum of microorganisms likely to be production-associated contaminants in the authorized facility. Commercially available media can be obtained that, when reconstituted as directed by the manufacturer, are certified to have growth-promoting properties. Soybean–Casein Digest Medium is acceptable (see *Sterility Tests* ⟨71⟩). Incubation of medium-filled

[2] FDA Guideline on Sterile Drug Products Produced by Aseptic Processing, June 1987, pp. 20-27; PDA Technical Monograph No. 2, Validation of Aseptic Filling for Solution Drug Products, 1980.

Interim Revision Announcement

units should take at least 14 days and may be at room temperature for 14 days or may be at room temperature for the first 7 days, with the final 1 to 7 days at 30° to 35°. Alternate suitable incubation schedules may be used as determined by the pharmacy to ensure enough growth of any potential contaminating microorganisms to be visually detectable. Microorganisms in all medium-filled units showing visible evidence of microbial growth should be promptly identified, and if this growth exceeds the action limits, an immediate investigation should be made with prompt correction of any identifiable causes of the failure. Review of environmental monitoring data obtained during the media fill should be included in the investigation, aswell as a review of the cleaning, sanitizing, disinfection, production procedures, aseptic technique, personnel practices, and other factors as appropriate. Revalidation should occur after all media-fill failures (see *Table 1*).

Table 1. Media-Fill Validation of Aseptic Processing

Validation Purpose	Minimum Validation Requirements: Low- and Medium-Risk CSPs	Minimum Validation Requirements: High Risk CSPs*
General	Personnel validation	Process validation
Initial	3 consecutive media-fill runs without contamination	3 consecutive media-fill runs without contamination
Revalidation	1 media-fill run quarterly without contamination	annual media-fill run without contamination
Failure Revalidation	3 consecutive media-fill runs without contamination	3 consecutive media-fill runs without contamination

* NOTE—Personnel should have first passed low- and medium-risk validation. ●4

Delete the following:

•LOW-RISK OPERATIONS

A quality assurance program should include a system that incorporates validation and monitoring processes that ensure a compounded sterile preparation meets predetermined, specific criteria of quality. The primary objective of the validation of aseptic processing involving low-risk operations is to ensure that personnel are capable of using effective aseptic technique to compound an SP successfully under the most rigorous conditions encountered during normal work assignments. The validation program should include a system of proofs that show that processes and operators are appropriate for achieving predefined product-quality conditions and personnel have skills to perform those compounding activities reproducibly and repeatedly. The validation of the process includes media fills consisting of a planned repetitive sequence of compounded or repackaged units. The number of manipulations of each unit and the number of units in each media fill should reflect the most complex and prolonged aseptic manipulations likely to be encountered by an operator as a normal workload requirement. The number of units per media-fill run should be enough to ensure that the operator is capable of replicating acceptable aseptic procedures. A sampling plan and validation requirements are defined in written procedures. Media transfers could be used to represent procedures such as syringe transfers, use of automated compounding devices, multiple additive procedures, and various aseptic assemblies and connections. An example of a validation procedure for low-risk operations is as follows.

Scenario—A pharmacy prepares antibiotics, hydration solutions, and parenteral nutrition solutions. Low-risk CSP processing would include the reconstitution and preparation of antibiotics for administration of single units at set intervals. Many of these products are prepared in batches and stored in anticipation of future use. Operators should be trained and their techniques validated using a sterile culture medium to simulate the syringe transfer of diluent to reconstitute lyophilized antibiotics, the transfer of that product to an empty sterile bag, bottle, or syringe; and any other manipulations that may be routine in the admixture processes.

Example of a Validation Procedure—Six 25-mL aliquots of sterile Soy–Casein Digest Medium are aseptically transferred to separate, empty 30-mL sterile vials. Ten milliliters of sterile Soy–Casein Digest Medium is removed from one of the vials and added to a vial of sterile, lyophilized Polyethylene Glycol. Four 2.5-mL aliquots of the resulting solution are added to 30-mL vials already containing 25-mL sterile Soy–Casein Digest Medium, and the vials are labeled. The six 30-mL vials are incubated at room temperature for a total of 14 days, with frequent checks for growth.

Media fills should be representative of peak periods of fatigue, stress, and pacing demands. For example, media fills could be scheduled immediately after normal production activity has ended. Media fills should not be performed during normal production.

Operators should pass an initial validation, performing three media fills with no contamination, before they are allowed to compound CSPs for patients. Subsequently, each operator should perform at least one media fill involving low-risk operations quarterly. If one contaminated unit results from a media fill, the operator should be retrained and then perform three consecutive media fills with no evidence of contamination before resuming preparation of CSPs for patients. Operators should also be revalidated if the nature of their aseptic compounding assignments changes to the extent that their previous media fills are not representative of their revised assignments.

Quality assurance programs for low-risk CSPs also include a system that employs routine methods to ensure that the finished products are reviewed for compounding accuracy and potential hazards, such as particulate matter, microorganisms, pyrogens, allergens, and cross-contamination from other drugs that may have been introduced into the compounding environment. Final products are inspected for particulate matter and leakage before release. A predetermined percentage of compounded products could be sequestered for routine sterility and pyrogen testing. Allergens and cross-contamination are best controlled through the strict adherence to proper procedures, which limit or eliminate the introduction of the allergens, and to frequent cleaning to reduce the potential of lingering drug residues in the work area. Personnel are trained in the proper methods of eliminating allergens and cleaning and disinfecting the workstation. That training is reviewed periodically.●4

Delete the following:

•HIGH-RISK OPERATIONS

In the case of high-risk operations, the focus of validation is on the process as well as personnel capability. Thus, the primary objective of the validation of aseptic processing for high-risk CSP operations is to ensure that the aseptic process is capable of being carried out consistently under control by any qualified operator, before the process is utilized for production of units intended for administration to patients. Accordingly, each type of high-risk operation is validated independently, rather than having operators perform representative sets of aseptic activities, as is the case with low-risk and medium-risk aseptic operations.

Personnel assigned to high-risk aseptic operations should be validated for low-risk and medium-risk operations as described above. In addition, this personnel should participate, at least annually, in the validation of each high-risk aseptic operation to which they are assigned.

For example, for high-risk operations involving nonsterile components, the media-fill run should simulate as closely as possible the most intensive conditions likely to be encountered during the normal production activities. The number of units in a media-fill run should be no less than the largest number of units encountered during production involving the process being validated. However, the fill volume of media-fill units need not equal the fill volume of finished product units.

A media-fill run should be performed at least annually for each unique high-risk batch processing procedure and configuration. A media-fill failure for most operations (less than 1000 units) is one or more contaminated units after incubation. For batches equal to or greater than 1000 units, a media-fill failure is greater than one contaminated unit. When a media-fill failure occurs, three consecutive successful media fills should occur before the process failing the media fill may be used for the preparation of a CSP for patients. An example of a validation procedure for a high-risk operation is as follows:

Scenario—A pharmacy prepares individual cassettes of morphine for epidural use from morphine powder. The nonsterile powder is weighed, and then placed in the barrel of a 60-mL syringe. After replacing the syringe plunger, sterile 5% dextrose solution is drawn into the syringe to make a total volume of 50 mL. After shaking to dissolve the powder, a 0.22-µm disk filter is placed on the syringe, and the solution is pushed through the filter into a drug reservoir cassette for an ambulatory infusion pump. Typically, the pharmacy prepares a week's supply of two to three cassettes at one time.

Example of a Validation Procedure—A small quantity of an inert powder (for example, lactose or sugar) is placed in the barrel of a 60-mL syringe. After replacing the syringe plunger, sterile 5% dextrose solution is withdrawn into the syringe to make a total volume of 50 mL. A sterile 0.22-µm filter is connected to the syringe tip. After shaking to dissolve the powder, the solution is pushed through the filter: the first 5 mL are aseptically introduced into a test tube containing 10 mL of sterile Soybean–Casein Digest Medium; the next 40 mL are discarded in a sterile container; and the last 5 mL are aseptically introduced into another tube containing 10 mL of sterile Soybean–Casein Digest Medium. At least three syringes should be evaluated in this manner. The inoculated tubes of Medium should be incubated at 20° to 25° for 14 days, with frequent visual observations made for growth of microorganisms.●4

Add the following:

•PERSONNEL TRAINING AND EVALUATION IN ASEPTIC MANIPULATION SKILLS

Personnel who prepare CSPs must be provided with appropriate training from expert personnel, audio–video instructional sources, and professional publications in the theoretical principles and practical skills of aseptic manipulations before they begin to prepare CSPs. Compounding personnel shall perform didactic review, and pass written and media-fill testing of aseptic manipulative skills initially; at least annually thereafter for low- and medium-risk level compounding; and semi-anually for high-risk level compounding. Compounding personnel who fail written tests, or whose media-fill test vials result in gross microbial colonization, must be immediately re-instructed and re-evaluated by expert compounding personnel to assure correction of all aseptic practice deficiencies.

Media-Fill Challenge Testing—The skill of personnel to aseptically prepare CSPs may be evaluated using sterile fluid bacterial culture media-fill validation,[1] (i.e., sterile bacterial culture medium transfer via a sterile syringe and needle). Media-fill testing is used to assess the quality of the aseptic skill of compounding personnel. Media-fill tests represent the most challenging or stressful conditions actually encountered by the personnel being evaluated when they prepare particular risk level CSPs and when sterilizing high-risk level CSPs.

Commercially available sterile fluid culture media, such as Soybean–Casein Digest Medium (see *Sterility Tests* ⟨71⟩), shall be able to promote exponential colonization of bacteria that are most likely to be transmitted to CSPs from the compounding personnel and environment. Media-filled vials are incubated at 25° to 35° for 14 days. Failure is indicated by visible turbidity in the medium on or before 14 days.

Example of a Media-Fill Test Procedure—Perform the test as directed in the section *Quality Assurance of Low-Risk Level CSPs*.●4

Change to read:

ENVIRONMENTAL QUALITY AND CONTROL

Achieving and maintaining sterility and overall freedom from contamination of a pharmaceutical product is dependent upon the quality status of the components incorporated, the process utilized, personnel performance, and the environmental conditions under which the process is performed. The standards required for the environmental conditions depend upon the amount of exposure of the CSP to the immediate environment anticipated during processing. The quality and control of environmental conditions for •each risk level of operation●4 is explained in this section. In addition, operations using nonsterile components require the use of a method of preparation designed to produce a sterile product.

Critical Site Exposure

The degree of exposure of the product during processing will be affected by the length of time of exposure, the size of the critical site exposed, and the nature of the critical site.

A critical site is any opening providing a direct pathway between a sterile product and the environment or any surface coming in direct contact with the product and the environment. The risk of such a site picking up contamination from the environment increases with time of exposure. Therefore, the processing plan and the intent of the operator should give due consideration to organization, efficiency, and speed in order to keep such exposure time to a minimum. For example, an ampul should not be opened unnecessarily in advance of use.

The size of the critical site affects the risk of contamination entering the product: the greater the exposed area, the greater the risk. An open vial or bottle exposes to contamination a critical site of much larger area than the tip of a 26-gauge needle. Therefore, the risk of contamination when entering an open vial or bottle is much greater than during the momentary exposure of a needle tip.

The nature of a critical site also affects the risk of contamination. The relatively rough, permeable surface of •an elastomeric●4 closure retains microorganisms and other contaminants, after swabbing with an alcohol pad, more readily than does the smooth glass surface of the neck of an ampul. Therefore, the surface dis-

[1] FDA Guideline on Sterile Drug Products Produced by Aseptic Processing, June 1987, pp. 20-27; PDA Technical Monograph No. 2, Validation of Aseptic Filling for Solution Drug Products, 1980.

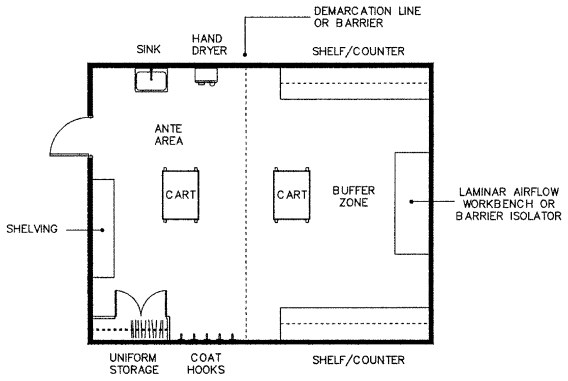
infection can be expected to be more effective for an ampul.• Once the ampul is open, the critical site of exposure is greatly increased, creating a pathway with the potential for introduction of glass, fiber, and dust into the fluid contained in the ampul.•[4]

The prevention or elimination of airborne particles must be given high priority. •[4] Airborne contaminants are much more likely to reach critical sites than contaminants that are adhering to the floor or other surfaces below the work level. Further, particles that are relatively large or of high density settle from the airspace more quickly and thus can be removed from the vicinity of critical sites.

•Clean Rooms and Barrier Isolators

In general, sterile product preparation facilities utilize laminar airflow workbenches (LAFWs) to provide an adequate critical site environment. A discussion of the necessary facilities and proper procedures for preparing sterile products using LAFWs in clean rooms is presented below. The use of alternative systems in clean rooms that have been verified to achieve the same or better level of environmental quality as that achieved by properly operated LAFWs may also be utilized. An emerging alternative technology utilizes barrier isolator systems to minimize the extent of personnel contact and interaction, to separate the external environment from the critical site, and to provide an ISO Class 5 environment (see *Table 1*) for preparing CSPs. A well-designed positive pressure barrier isolator, supported by adequate procedures for its maintenance, monitoring, and control, may offer an acceptable alternative to the use of conventional LAFWs in clean rooms for aseptic processing. An example of the arrangement of a clean-room floor plan for low- and medium-risk level CSPs is illustrated in the first drawing in *Figure 1*. The second drawing in *Figure 1* depicts an appropriate multicompartment clean-room floor plan for high-risk level CSPs.

EXAMPLE OF CLEAN ROOM FLOOR PLAN SUITABLE FOR LOW AND MEDIUM RISK-LEVEL CSPs



EXAMPLE OF CLEAN ROOM FLOOR PLAN SUITABLE FOR HIGH RISK-LEVEL CSPs

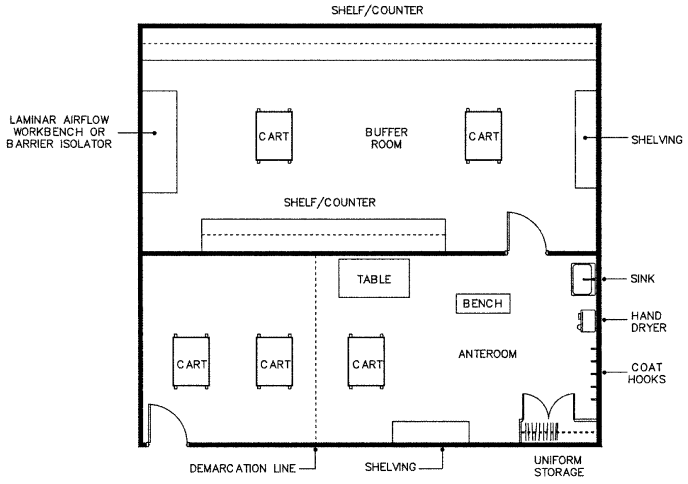


Fig. 1

Environmental Controls

Engineering controls reduce the potential for airborne contamination in workspaces by limiting the amount and size of contaminants in the CSP processing environment. Primary engineering controls are used and generally include horizontal flow clean benches, vertical flow clean benches, biological safety cabinets, and barrier isolators. Primary environmental control must provide at least ISO Class 5 quality of air (see *Table 1*) to which sterile ingredients and components of CSPs are directly exposed. Secondary engineering controls generally provide a buffer zone or buffer room as a core for the location of the workbenches or isolators.

Table 1. International Organization of Standardization (ISO) Classification of Particulate Matter in Room Air [Limits are in particles 0.5 μm and larger per cubic meter (current ISO) and cubic feet (former Federal Standard No. 209E, FS209E).]*

Class Name		Particle Size	
ISO Class	U.S. FS 209E	ISO, m^3	FS 209E, $ft.^3$
3	Class 1	35.2	1
4	Class 10	352	10
5	Class 100	3520	100

Class Name		Particle Size	
ISO Class	U.S. FS 209E	ISO, m^3	FS 209E, $ft.^3$
6	Class 1000	35,200	1000
7	Class 10,000	352,000	10,000
8	Class 100,000	3,520,000	100,000

* Adapted from the Federal Standard No. 209E, General Services Administration, Washington, DC, 20407 (September 11, 1992) and ISO [4644-1:1999 Clean rooms and associated controlled environments—Part 1: Classification of air cleanliness. For example, 3520 particles of 0.5 µm per m_3 or larger (ISO Class 5) is equivalent to 100 particles per ft_3 (Class 100) (1 m_3 = 34.314 $ft._3$).

Airflow through high-efficiency particulate air (HEPA) filters is unidirectional or columnar, and because of the pore size of the filter the "first air" at the face of the filter is, for the purposes of aseptic compounding, free from airborne particulate contamination. Barrier isolators provide a suitable environment by restricting any ambient air from the work chamber. These systems are not as sensitive to external environments as the HEPA-filtered unidirectional airflow units.

Several aspects of barrier isolation and filtered unidirectional airflow in work environment must be understood and practiced in the compounding process. Policies and procedures for maintaining and working in the prescribed conditions for aseptic processing must be prepared, updated, maintained, and implemented and are determined by the scope and risk levels of the activities undertaken in the SP compounding operation.

In general, the CSP work environment is designed to have the cleanest work surfaces (horizontal or vertical clean benches, biological safety cabinets, or isolators) located in a buffer area, which is preceded by an anteroom that provides a clean area for donning personnel barriers, such as hair covers, gloves, gowns, or full clean-room attire. The class limit of the buffer or core room has to be demonstrably better than that of ambient air to reduce the risk of contaminants being blown, dragged, or otherwise introduced into the filtered unidirectional airflow environment. For example, strong air currents from opened doors, personnel traffic, or air streams from the heating, ventilating, and air-conditioning systems can easily disrupt the unidirectional, columnar airflow in the open-faced workbenches. The operators may also introduce disruptions in flow by their own movements and by the placement of objects onto the work surface.

Buffer or clean-room areas in which LAFWs are located are to provide at least ISO Class 8 air quality (see Table 1). Measuring, weighing, mixing, and other manipulations of nonsterile in-process CSPs are also performed in air quality of at least ISO Class 8 (see *Table 1*). Appropriate air conditioning and humidity controls must be in place for the buffer area.●4

Tasks carried out within the buffer area should be limited to those for which a controlled environment is necessary. Only the furniture, equipment, supplies, and other goods required for the tasks to be performed may be brought into this room, and they should be nonpermeable, nonshedding, and resistant to disinfectants. Whenever such items are brought into the room, they should first be cleaned and sanitized. Whenever possible, equipment and other items used in the buffer area should not be taken from the room except for calibration, servicing, or other activity associated with the proper maintenance of the item.

The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in the buffer area should be smooth, impervious, free from cracks and crevices, and nonshedding, thereby promoting cleanability and minimizing spaces in which microorganisms and other contaminants may accumulate. The surfaces should be resistant to damage by sanitizing agents. Junctures of ceilings to walls should be coved or caulked to avoid cracks and crevices where dirt can accumulate. If ceilings consist of inlaid panels, the panels should be impregnated with a polymer to render them impervious and hydrophobic, and they should be caulked around each perimeter to seal them to the support frame. Walls may be of panels locked together and sealed or of epoxy-coated gypsum board. Preferably, floors are overlaid with wide sheet vinyl flooring with heat-welded seams and coving to the sidewall. Dust-collecting overhangs, such as ceiling utility pipes, or ledges, such as windowsills, should be avoided. The exterior lens surface of ceiling lighting fixtures should be smooth, mounted flush, and sealed. Any other penetrations through the ceiling or walls should be sealed.

The buffer area should contain no sinks or floor drains. Work surfaces should be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they are readily cleanable and sanitizable. Carts should be of stainless steel wire or sheet metal construction with good quality, cleanable casters to promote mobility. Storage shelving, counters, and cabinets should be smooth, impervious, free from cracks and crevices, nonshedding, cleanable, and sanitizable. Their number, design, and manner of installation should promote effective cleaning and sanitizing.

•CSP Environment

The contamination reduction conditions and procedures in this section include LAFWs being located within buffer or clean-room areas that maintain at least an ISO Class 8 (see *Table 1*). It is preferred, but not necessary, to locate barrier isolators within such a buffer air quality area. The frequency and amount of personnel access to buffer air quality areas is restricted to minimize contaminants, while allowing delivery of essential materials for CSPs. Food, drinks, and materials exposed in patient care and treatment areas must never be introduced into areas where components and ingredients for CSPs are present.

In an area near, but physically isolated from the buffer room area—the anteroom area—supplies, such as needles, syringes, ampuls, bags, vials of parenteral fluids, and packages of transfer tubing sets for large-volume fluids are uncartoned and disinfected.

Hand sanitizing and gowning activities also occur in the anteroom area adjacent to the buffer area. Faucet handles are designed to be hands-free. Before processing CSPs, hands are resanitized after donning all appropriate garb, except for gloves. A demarcation line or barrier identifies the separation of the buffer area from the anteroom area. Compounding personnel must be capable of accessing the buffer area without use of their hands. Anteroom areas adjacent to buffer areas are intended to minimize the introduction of contaminants into buffer areas.●4

Cleaning and Sanitizing the Workspaces

The cleaning, sanitizing, and organizing of the •direct and contiguous compounding areas (DCCA) is●4 the responsibility of trained operators (pharmacists and technicians) following written procedures and •is●4 performed at the beginning of each shift. •Before compounding is performed, all items are●4 removed from the •DCCA and all surfaces are cleaned of loose material and residue

from spills, followed by an application of a residue-free sanitizing agent[2] that is left on for a time sufficient to exert its antimicrobial effect.

Work surfaces near the DCCA in the buffer or clean area are cleaned in a similar manner, including counter tops and supply carts. Storage shelving is emptied of all supplies and then cleaned and sanitized at least weekly, using approved agents.

Floors in the buffer or clean area are cleaned by mopping once daily when no aseptic operations are in progress. Mopping may be performed by trained and supervised custodial personnel using approved agents described in the written procedures. Only approved cleaning and sanitizing agents are used with careful consideration of compatibilities, effectiveness, and inappropriate or toxic residues. Their schedules of use and methods of application are in accord with written procedures. All cleaning tools, such as wipers, sponges, and mops, are nonshedding and dedicated to use in the buffer or clean area. Floor mops may be used in both the buffer or clean area and anteroom area, but only in that order. Most wipers are discarded after one use. If cleaning tools are reused, their cleanliness is maintained by thorough rinsing and sanitization after use and by storing in a clean environment between uses. Trash is collected in suitable plastic bags and removed with minimal agitation.

In the anteroom area, supplies and equipment removed from shipping cartons are wiped with a sanitizing agent, such as sterile 70% isopropyl alcohol (IPA)[3] , which is checked periodically for contamination. Alternatively, if supplies are planned to be received in sealed pouches, the pouches can be removed as the supplies are introduced into the buffer or clean area without the need to sanitize the individual supply items. No shipping or other external cartons may be taken into the buffer or clean area. Cleaning and sanitizing of the anteroom area is performed at least weekly by trained and supervised custodial personnel, in accordance with written procedures. However, floors are cleaned and sanitized daily, always proceeding from the buffer or clean area to the anteroom area. Storage shelving is emptied of all supplies and cleaned and sanitized at planned intervals, preferably monthly.

These cleaning and sanitizing procedures apply to both low-risk and high-risk operations.

Personnel Cleansing and Gowning

Personnel are critical keys to the maintenance of asepsis when carrying out their assigned responsibilities. They must be thoroughly trained in aseptic techniques and be highly motivated to maintain these standards each time they prepare a sterile product.

Prior to entering the buffer or clean area, operators should remove outer lab jackets or the like, makeup, and jewelry and should thoroughly scrub hands and arms to the elbow. After drying hands and arms they should properly don clean, nonshedding uniform components, including hair covers, shoe covers, knee-length coats or coveralls, and appropriate protective gloves, in that order. The coats should fit snugly at the wrists and be zipped or snapped closed in the front. Shoe covers should be donned so that feet then touch the floor only on the clean side of the bench or other demarcation. Face masks should be donned just before beginning activities in the DCCA to minimize airborne contaminants from coughing, sneezing, and talking. When preparing CSPs in a vertical flow LAFW with a transparent shield between the face of the operator and sterile components, or when using an isolator, wearing a face mask is optional, but head and facial hair must be covered.

Appropriate powder-free protective gloves are sterile or, if nonsterile, are sanitized with an appropriate antimicrobial cleaner such as 70% alcohol before use. Protective gloves are put on as the last uniform component. When nonsterile gloves, chosen for their chemically protective composition, are used, they are disinfected with sterile 70% isopropyl alcohol or an antimicrobial agent that is allowed to evaporate before beginning compounding procedures. Sterile and sanitized gloves do not remain sterile and clean during compounding activities because they come in contact with nonsterile surfaces and air. Therefore, compounding personnel must be trained to avoid touching sterile surfaces of packages, transfer devices, and components within ISO Class 5 or superior environments (see *Table 1*). During protracted compounding activities, personnel should intermittently resanitize their gloves with sterile 70% isopropyl alcohol.

Proper scrubbing and gowning immediately prior to entry into the buffer or clean area is required of all personnel, without exception. Should the operator find it necessary to leave the room, the coat may be carefully removed at the entrance and hung inside out for redonning upon re-entry, but only during the same shift. However, hair covers, masks, shoe covers, and gloves should be discarded and new ones donned prior to re-entry.

For high-risk operations, it is especially critical to minimize the risk of contamination on lab coats, coveralls, and other garb to be worn in the buffer or clean area. Preferably, fresh clean garb should be donned upon each entry into the buffer or clean area to avoid liberating contaminants from previously worn garb. Alternatively, garb that has been worn may be removed with the intention of regarbing for re-entry into the buffer or clean area and stored during the interim under proper control and protection in the anteroom area. Garb worn or taken outside the confines of the anteroom area cannot be worn in the buffer or clean area.

Dispersion of particles from body surfaces, such as from skin rashes, sunburn, or cosmetics, increases the risk of contamination of critical sites and must be appropriately controlled or minimized. If severe, the operator must be excluded from the buffer or clean area until the condition is remedied, especially for high-risk operations.

Suggested Standard Operating Procedures

The pharmacy should have written, properly approved standard operating procedures (SOPs) designed to ensure the quality of the environment in which a CSP is prepared. The following procedures are recommended:

(1) Access to the buffer or clean area is restricted to qualified personnel with specific responsibilities or assigned tasks in the area.

(2) All cartoned supplies are decontaminated in the anteroom area by removing them from shipping cartons and wiping or spraying with a disinfecting agent, such as sterile IPA, while being transferred to a clean, sanitized cart or other conveyance for introduction into the buffer or clean area. Individual pouched supplies need not be wiped because the pouches can be removed as these supplies are introduced into the buffer or clean area.

(3) Supplies required frequently or otherwise needed close at hand but not necessarily needed for the scheduled operations of the shift are decontaminated and stored on the shelving in the anteroom area.

(4) Carts used to bring supplies from the storeroom cannot be rolled beyond the demarcation line in the anteroom area, and carts used in the buffer or clean area cannot be rolled outward beyond the demarcation line unless cleaned and sanitized before returning.

(5) Generally, supplies required for the scheduled operations of the shift are prepared and brought into the buffer or clean area, preferably on one or more movable carts. Supplies that

[2] Approved by the pharmacist in charge.

[3] NOTE—70% isopropyl alcohol (IPA) may harbor resistant microbial spores. Therefore, IPA used in aseptic areas should always be filtered through a 0.2-µm hydrophobic filter to render it sterile.

Interim Revision Announcement

are required for back-up or general support of operations may be stored on the designated shelving in the •buffer or clean area,•4 but •avoid•4 excessive accumulation of supplies. •4

(6) Objects that shed particles •cannot•4 be brought into the •buffer or clean area,•4 including pencils, cardboard cartons, paper towels, and cotton items. •Only nonshedding paper-related products (boxes, work records, and so forth) can be brought into the buffer or clean area.•4

(7) Traffic flow in and out of the •buffer or clean area must be•4 minimized.

(8) Personnel preparing to enter the •buffer or clean area must•4 remove all jewelry from hands and arms.

(9) Personnel entering the •buffer or clean area must•4 first scrub hands and arms with soap, including using a scrub brush on the fingers and nails. An air dryer or disposable nonshedding towels •are•4 used to dry hands and arms after washing.

(10) Personnel entering the •buffer or clean area,•4 after scrubbing, should don attire as described under •*Personnel Cleansing and Gowning*.•4

(11) No chewing gum, candy, or food items may be brought into the •buffer or clean area or anteroom area.•4

(12) •At the beginning of each compounding activity session, and after liquids are spilled, the surfaces of the direct compounding environment are first cleaned with *Purified Water* to remove water soluble residues. Immediately thereafter, the same surfaces are sanitized with sterile 70% isopropyl alcohol, or other effective antimicrobial agents, using a nonlinting wipe.•4

(13) •When LAFWs or barrier isolators are used as the ISO Class 5 air quality environment (see Table 1), their blowers must be operated continuously during compounding activity, including during interruptions of less than 8 hours. When the blower is turned off and before other personnel enter to perform compounding activities, only one person can enter the contiguous buffer area for the purposes of turning on the blower (for at least 30 minutes) and of sanitizing the work surfaces.•4

(14) Traffic in the area of the •DCCA is•4 minimized and controlled. The •DCCA is•4 shielded from all less clean air currents that are of higher velocity than the clean laminar airflow.

(15) Supplies to be utilized in the •DCCA•4 for the planned procedures •are•4 accumulated and then decontaminated by wiping •or spraying•4 the outer surface with IPA or removing the outer wrap at the edge of the •DCCA•4 as the item is introduced into the aseptic work area.

(16) After proper introduction into the •DCCA•4 of supply items required for and limited to the assigned operations, they •are•4 so arranged that a clear, uninterrupted path of HEPA-filtered air will bathe all critical sites at all times during the planned procedures. That is, no objects may be placed behind an exposed critical site in a horizontal position or above in the vertical laminar flow workbench.

(17) All supply items •are arranged in the DCCA so as•4 to reduce clutter and to provide maximum efficiency and order for the flow of work.

(18) All procedures •are•4 performed in a manner designed to minimize the risk of touch contamination. Gloves •are•4 sanitized with adequate frequency •with an approved disinfectant.•4

(19) All rubber stoppers of vials and bottles and the neck of ampuls •are•4 sanitized with IPA prior to the introduction of a needle or spike for the removal of product.

(20) After the preparation of every admixture, the contents of the container •are•4 thoroughly mixed and then inspected for the presence of particulate matter, evidence of incompatibility, or other defects.

(21) After procedures are completed, used syringes, bottles, vials, and other supplies •are•4 removed, but with a minimum of exit and re-entry into the •DCCA•4 to minimize the risk of introducing contamination into the aseptic workspace.

•Environmental Monitoring

In addition to the evaluation and verification of personnel aseptic techniques and of the adequacy of compounding processes and procedures (see *Personnel Training and Evaluation in the Aseptic Manipulation Skills* section), assessment and verification of the adequacy of the sterile compounding environment is essential, especially for preparing high-risk preparations. Evaluation of environmental quality is performed by measuring both the total number of particles and the number of viable microorganisms in the controlled air environments of the compounding area.

Certification that each LAFW and barrier isolator is functioning properly and meets the air quality requirement of ISO Class 5 (refer to *Clean Rooms and Barrier Isolators* and Table 1 in the *Environmental Quality and Control* section) is performed by a qualified operator(s) using current, state-of-the-art electronic air sampling at least every six months and whenever the LAFW or barrier isolator is relocated. Similarly, the air quality of the buffer or clean area and anteroom area is evaluated by a qualified operator(s) for conformance to ISO Class 7 and ISO Class 8 requirements, as appropriate, at least every six months and when renovations occur. These records are maintained and reviewed by the supervising pharmacist or other designated employee.

Evaluation of airborne microorganisms in the controlled air environments (LAFW, barrier isolators, buffer or clean area, and anteroom area) is performed by properly trained individuals using suitable electric air samplers or by exposing sterile nutrient agar plates for a suitable time frame. For either approach, the air sampling is performed at locations judged by compounding personnel to be the most prone to contamination during compounding activities: this includes zones of air backwash turbulence within LAFWs and other areas where air backwash turbulence may enter the compounding area. Such evaluations are performed as a regular and ongoing process at least monthly for sterile compounding areas used for low- and medium-risk preparations and at least weekly for areas used for high-risk preparations.

For electric air samplers that actively collect volumes of air for evaluation, the instructions for verification and use of these devices must be followed. When using the passive exposure of sterile nutrient agar settling plates, the covers are removed and the media is exposed for a period usually lasting 1 hour or longer to collect viable microorganisms as they fall from the environment. At the end of the designated exposure period, the plates are recovered and incubated at a temperature and for a time period conducive to multiplication of microorganisms on the nutrient agar—usually at 30° to 35° for a minimum of 48 hours. The number of discrete colonies of microorganisms are then counted and reported as colony forming units (cfu). This provides a measurement of the level of microbial contamination in the air within the tested environment.

The greatest value of viable microorganism monitored in the air of the compounding environment is realized when normal baseline cfu counts are determined over a period of time. Determining the baseline cfu counts permits identification of a trend toward increasing microbial cfu counts. A sufficiently increasing trend in cfu counts over time must prompt a re-evaluation of the adequacy of cleaning procedures, operational procedures, and air filtration efficiency within the sterile compounding location. Action may be warranted when an increasing trend to 50% above the baseline for areas used for high- and medium- risk preparations or to 100% above baseline for areas used for low-risk preparations is found.

A written plan and schedule for the environmental monitoring procedures for airborne microorganisms must be established and followed. The plan must be adequate to evaluate the various controlled air environment areas (LAFW, barrier isolator, buffer or clean area, and anteroom area) of the sterile compounding facility. All compounding personnel are trained in and educated about the importance of this environmental monitoring process. For sterile compounding areas used for low- and medium-risk preparations,

a minimum of monthly evaluation is appropriate. For sterile compounding areas used for high-risk preparations, at least weekly evaluation is appropriate.•4

Change to read:

PROCESSING

•A written description of specific training and performance evaluation program for individuals involved in the use of aseptic techniques for the preparation of sterile products must be developed for each site. This program equips the personnel with the appropriate knowledge and trains them in the required skills necessary to perform the assigned tasks. Each person assigned to the aseptic area in the preparation of sterile products must successfully complete specialized training in aseptic techniques and aseptic area practices prior to preparing CSPs (see the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section).

Aseptic Technique

Critical operations are carried out by appropriately trained and qualified personnel in a DCCA using proper aseptic techniques described in a written procedure (see *Suggested Standard Operating Procedures*). Aseptic technique is equally applicable to the preparation of sterile sensitizing and chemotoxic agents. However, it is essential to recognize that additional precautions must be utilized to protect the personnel and the compounding environment from the potential adverse effects of these chemotoxic products. The minimum requirements for this process include the following: working and verified vertical laminar airflow work bench, barrier isolator, or other environmental containment and control device with biohazard control capabilities; the protective capabilities of gowns, masks, bouffants, and gloves; sprayback and spill control techniques and equipment; the use specialized compounding devices and equipment; and proper disposal.•4

Components

•Compounding personnel ascertain that ingredients for CSPs are of the correct identity and appropriate quality using the following information: vendors' labels, labeling, certificates of analysis, direct chemical analysis, and knowledge of compounding facility storage conditions.•4

STERILE •INGREDIENTS AND•4 COMPONENTS

Commercially available sterile drug products, sterile ready-to-use containers and devices are examples of sterile components. A written procedure for unit-by-unit physical inspection preparatory to use •is•4 followed to ensure that these components are sterile, free from defects, and otherwise suitable for their intended use.

NONSTERILE •INGREDIENTS AND•4 COMPONENTS

•If any nonsterile components, including containers, devices, and ingredients are used to make a CSP, such CSPs must be compounded at a high-risk level. Nonsterile active ingredients and added substances, or excipients, for CSPs should preferably be official *USP* or *NF* articles. When nonofficial ingredients are used, they must be accompanied by certificates of analysis from their suppliers to aid compounding personnel in judging the identity, quality, and purity in relation to the intended use in a particular CSP. Physical inspection of a package of ingredients is necessary in order to detect breaks in the container, looseness in the cap or closure, and deviation from the expected appearance, aroma, and texture of the contents.

Bulk, or unformulated, drug substances and added substances, or excipients, must be stored in tightly closed containers under temperature, humidity, and lighting conditions that are either indicated in official monographs or approved by suppliers; also the date of receipt in the compounding facility must be clearly and indelibly marked on each package of ingredient. After receipt by the compounding facility, packages of ingredients that lack a supplier's expiration date cannot be used after one year, unless either appropriate inspection or testing indicates that the ingredient has retained its purity and quality for use in CSPs.

Careful consideration and evaluation of nonsterile ingredient sources is especially warranted when the CSP will be administered into the vascular, central nervous system, and eyes.

Upon receipt of each lot of the bulk drug substance or excipient used for CSPs, the individual compounding the preparation performs a visual inspection of the lot for evidence of deterioration, other types of unacceptable quality, and wrong identification. The bulkdrug substance or excipient visual inspection is performed on a routine basis as described in the written protocol.•4

Equipment

•It is necessary that equipment, apparatus, and devices used to compound a CSP are consistently capable of operating properly and within acceptable tolerance limits. Written procedures outlining required equipment calibration, annual maintenance, monitoring for proper function, controlled procedures for use of the equipment and specified time frames for these activities are established and followed. Routine maintenance and time intervals are also outlined in these written procedures. Results from the equipment calibration, annual maintenance reports, and routine maintenance are kept on file for the lifetime of the equipment. Personnel is prepared through an appropriate combination of specific training and experience to operate or manipulate any piece of equipment, apparatus, or device they may use when preparing CSPs. Training includes gaining the ability to determine whether any item of equipment is operating properly or is malfunctioning.•4

Add the following:

•VERIFICATION OF AUTOMATED COMPOUNDING DEVICES FOR PARENTERAL NUTRITION COMPOUNDING

Automated compounding devices (ACDs) for the preparation of parenteral nutrition admixtures are widely used by pharmacists in hospitals and other health care settings. They are designed to streamline the labor-intensive processes involved in the compounding of these multiple-component formulations by automatically delivering the individual nutritional components in a predetermined sequence under computerized control. Parenteral nutrition admixtures often contain 20 or more individual additives representing as many as 50 or more individual components (e.g., 15 to 20 crystalline amino acids, dextrose monohydrate, and lipids; 10 to 12 electrolyte salts; 5 to 7 trace minerals; and 12 vitamins). Thus, the ACDs can improve the accuracy and precision of the

Interim Revision Announcement

compounding process compared to the traditional, manual compounding methods. Pharmacists should consult the general information chapter *Validation of Compendial Methods* ⟨1225⟩ for verification parameters to be considered when evaluating an ACD.

Accuracy

The accuracy of an ACD can be determined in various ways to ensure that the correct quantities of nutrients, electrolytes, or other nutritional components are delivered to the final infusion container. Initially, the ACD is tested for its volume and weight accuracy. For volume accuracy, a suitable volume of *Sterile Water for Injection*, which represents a typical additive volume (e.g., 40 mL for small-volume range of 1 to 100 mL; or 300 mL for large-volume range of 100 to 1000 mL), is programmed into the ACD and delivered to the appropriate volumetric container. The pharmacist then consults *Volumetric Apparatus* ⟨31⟩ for appropriate parameters to assess the volumetric performance of the ACD. For gravimetric accuracy, the balance used in conjunction with the ACD is tested using various weight sizes that represent the amounts typically used to deliver the various additives. The pharmacist consults *Weights and Balances* ⟨41⟩ for acceptable tolerances of the weights used. In addition, the same volume of *Sterile Water for Injection* used to assess volumetric accuracy is then weighed on the balance used in conjunction with the ACD. For example, if 40 mL of water was used in the volumetric assessment, its corresponding weight should be about 40 g (assuming the relative density of water is 1.0). In addition, during the use of the ACD, certain additives, such as potassium chloride (corrected for density differences) can also be tested in the same manner as an in-process test.

Finally, additional tests of accuracy may be employed that determine the content of certain ingredients in the final volume of the parenteral nutrition admixture. Generally, pharmacy departments do not have the capability to routinely perform chemical analyses such as analyses of dextrose or electrolyte concentrations. Consequently, hospital or institutional laboratories may be called upon to perform these quality assurance tests. However, the methods in such laboratories are often designed for biological, not pharmaceutical, systems. Thus, their testing procedures must be verified to meet the *USP* requirements stated in the individual monograph for the component being tested. For example, under *Dextrose Injection*, the following is stated: It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_6H_{12}O_6 \cdot H_2O$. The hospital or institutional chemistry laboratories have to validate their methods to apply to this range and correct for their typical measurement of anhydrous dextrose versus dextrose monohydrate. Similar ranges and issues exist, for example, for injections of calcium gluconate, magnesium sulfate, potassium chloride, and so forth. The critical point is the use of *USP* references and possible laboratory procedural differences.

Precision

The intermediate precision of the ACD can be determined on the basis of the day-to-day variations in performance of the accuracy measures. Thus, the pharmacist must keep a daily record of the above-described accuracy assessments and review the results over time. This review must occur at least at weekly intervals to avoid potentially clinically significant cumulative errors over time. This is especially true for additives with a narrow therapeutic index, such as potassium chloride.●4

Change to read:

FINISHED •PREPARATION ●4 RELEASE CHECKS AND TESTS

All •high-risk level CSPs for administration by injection into the vascular and central nervous systems that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, and vials), or in multiple dose vials for administration to multiple patients, or are exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized are tested to ensure that they are sterile (see *Sterility Tests* ⟨71⟩) and do not contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* ⟨85⟩). All CSPs that are intended to be solutions must be visually examined for the presence of particulate matter and not administered or dispensed when such matter is observed. The prescription orders, written compounding procedure, preparation records, and expended materials used to make CSPs in all contamination risk levels are inspected for accuracy of correct identities and amounts of ingredients, aseptic mixing and sterilization, packaging, labeling, and expected physical appearance before they are administered or dispensed.●4

Physical Inspection

•Finished CSPs are individually inspected in accordance with written procedures after compounding. If not distributed promptly, these products are individually inspected just prior to leaving the storage area. Those products that are not immediately distributed are stored in an appropriate location as described in the written procedures.●4 Immediately after compounding and as a condition of release, each product unit, where possible, should be inspected against lighted white •or black background or both●4 for evidence of visible particulates or other foreign matter. Pre-release inspection •also includes●4 container–closure integrity and any other apparent visual defect. Products with observed defects should be immediately discarded or marked and segregated from acceptable products in a manner that prevents their administration. When products are not distributed promptly after preparation, a predistribution inspection •is●4 conducted to ensure that a CSP with defects, such as precipitation, cloudiness, and leakage, which may develop between the time of release and the time of distribution, is not released.

Compounding Accuracy Checks

Written procedures for double-checking compounding accuracy •must be followed for every CSP during preparation and immediately●4 prior to release. The double check system should meet state regulations and include label accuracy and accuracy of the addition of all drug products or ingredients used to prepare the finished product and their volumes or quantities. The used additive containers and, for those additives for which the entire container was not expended, the syringes used to measure the additive, should be quarantined with the final products until the final product check is completed. •Compounding personnel must visually confirm that ingredients measured in syringes match the written order being compounded. Preferably, a person other than the compounder can verify that correct volumes of correct ingredients were measured to make each CSP. For example, compounding personnel would pull the syringe plunger back to the volume measured

When practical, confirm accuracy of measurements by weighing a volume of the measured fluid, then calculating that volume by dividing the weight by the accurate value of the density, or specific gravity, of the measured fluid. Correct density or specific gravity values programmed in automated compounding devices, which measure by weight using the quotient of the programmed volume divided by the density or specific gravity, must be confirmed to be

accurate before and after delivering volumes of the liquids assigned to each channel or port. These volume accuracy checks and the following additional safety and accuracy checks in this section must be included in the standard operating procedures manual of the CSP facility.●4

Sterility Testing

•All high-risk level CSPs for administration by injection into the vascular and central nervous systems that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, vials), or in multiple dose vials for administration to multiple patients, or exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized must be tested to ensure that they are sterile (see *Sterility Tests* ⟨71⟩) before they are dispensed or administered. The *Membrane Filtration* method is the method of choice where feasible (e.g., components are compatible with the membrane). A method not described in the USP may be used if verification results demonstrate that the alternative is at least as effective and reliable as the USP *Membrane Filtration* method or the USP *Direct Inoculation of the Culture Medium* method where the membrane filtration method is not feasible.

In such a case, a written procedure requiring daily observation of the media and requiring an immediate recall if there is any evidence of microbial growth must be available. In addition, the patient and the physician of the patient to whom a potentially contaminated CSP was administered is notified of the potential risk. Positive sterility test results should prompt a rapid and systematic investigation of aseptic technique, environmental control, and other sterility assurance controls to identify sources of contamination and correct problems in the methods or processes.●4

•Bacterial Endotoxin (Pyrogen) Testing●4

•All high-risk level CSPs for administration by injection into the vascular and central nervous systems that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, vials), or in multiple dose vials for administration to multiple patients, or exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized must be tested to ensure that they do not contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* ⟨85⟩). In the absence of a bacterial endotoxins limit in the official monograph or other CSP formula source, the CSP must not exceed the amount of USP Endotoxin Units (EU per hour per kg of body weight or m^2 of body surface area) specified in the above chapter for the appropriate route of administration.●4

•Identity and Strength Verification of Ingredients

Compounding facilities must have at least the following written procedures for verifying the correct identity and quality of CSPs before they are dispensed and administered:

1. That labels of CSPs bear correct names and amounts or concentrations of ingredients; the total volume; the beyond-use date; the appropriate route(s) of administration; the storage conditions; and other informationfor safe use.
2. That there are correct identities, purities, and amounts of ingredients by comparing the original written order to the written compounding record for the CSP.
3. That correct fill volumes in CSPs and correct quantities of filled units of the CSPs were obtained. When the strength of finished CSPs cannot be confirmed to be accurate, based on the above three inspections, the CSPs must be assayed by methods that are specific for the active ingredients.

To inhibit microbial growth from undetected contamination, finished CSPs that will not be immediately dispensed and administered must be refrigerated at 2° to 8°, unless their chemical and physical stability are known to be adversely affected by cold temperatures. When CSPs are filled into patient-worn infusion devices that are likely to attain temperatures exceeding 30° for more than 24 hours, the chemical and physical stability at such temperatures and durations must be confirmed from either appropriate literature sources or direct testing.●4

Change to read:

STORAGE AND BEYOND-USE DATING

•Beyond-use dates for compounded preparations are usually assigned based on professional experience, which should include careful interpretation of appropriate information sources for the same or similar formulations (see *Stability Criteria and Beyond-Use Dating* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩). Beyond-use dates for CSPs are rarely based on preparation-specific chemical assay results, which are used with the Arrhenius equation to determine expiration dates (see *General Notices and Requirements*) for manufactured products. The majority of CSPs are aqueous solutions in which hydrolysis of dissolved ingredients is the most common chemical degradation reaction. The extent of hydrolysis and other heat-catalyzed degradation reactions at any particular time point in the life of a CSP represents the thermodynamic sum of exposure temperatures and durations. Such lifetime stability exposure is represented in the mean kinetic temperature calculation (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩). Drug hydrolysis rates increase exponentially with arithmetic temperature increase; thus, exposure of a beta-lactam antibiotic solution for one day at controlled room temperature (see *General Notices and Requirements*) will have an equivalent effect on the extent of hydrolysis of approximately 3 to 5 days in cold temperatures (see *General Notices and Requirements*).

Personnel who prepare, dispense, and administer CSPs must store them strictly in accordance with the conditions stated on the label of ingredient products and finished CSPs. When CSPs are known to have been exposed to temperatures warmer than the warmest labeled limit, but not exceeding 40° (see *General Notices and Requirements*) for more than 4 hours, such CSPs should be discarded, unless appropriate documentation or direct assay data confirms their continued stability.●4

Determining Beyond-Use Dates

•When CSPs deviate from conditions in the approved labeling of manufactured products contained in CSPs, compounding personnel may consult the manufacturer of particular products for advice on assigning beyond-use dates based on chemical and physical stability parameters. Beyond-use dates for CSPs that are prepared strictly in accordance with manufacturers' product labeling must be those specified in that labeling, or from appropriate literature sources or direct testing. Beyond-use dates for CSPs that lack justification from either appropriate literature sources or by direct testing evidence must be assigned as described in the section *Stability Criteria and Beyond-Use Dating* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.

Interim Revision Announcement

In addition, the pharmacist may refer to applicable publications to obtain relevant stability, compatibility, and degradation information regarding the drug or its congeners. When assigning a beyond-use date, pharmacists should consult and apply drug-specific and general stability documentation and literature where available, and they should consider the nature of drug and its degradation mechanism, the container in which it is packaged, the expected storage conditions, and the intended duration of therapy (see *Expiration Date and Beyond-Use Date* under *Labeling* in the *General Notices and Requirements*). Stability information must be carefully interpreted in relation to the actual compounded formulation and conditions for storage and use. Predictions based on other evidence, such as publications, charts, tables, and so forth would result in theoretical beyond-use dates. Theoretically predicted beyond-use dating introduces varying degrees of assumptions, and hence a likelihood of error or at least inaccuracy. The degree of error or inaccuracy would be dependent on the extent of differences between the CSP's characteristics (such as composition, concentration of ingredients, fill volume, or container type and material) and the characteristics of the products from which stability data or information are to be extrapolated. The greater the doubt of the accuracy of theoretically predicted beyond-use dating, the greater the need to determine dating periods experimentally. Theoretically predicted beyond-use dating periods should be carefully considered for CSPs prepared from nonsterile bulk active ingredients having therapeutic activity, especially where these CSPs are expected to be compounded routinely. When CSPs will be distributed to and administered in residential locations other than health care facilities, the effect of potentially uncontrolled and unmonitored temperature conditions must be considered when assigning beyond-use dates. It must be ascertained that CSPs will not be exposed to warm temperatures (see *General Notices and Requirements*) unless the compounding facility has evidence to justify stability of CSPs during such exposure.

It should be recognized that the truly valid evidence of stability for predicting beyond-use dating can be obtained only through product-specific experimental studies. Semi-quantitative procedures, such as thin-layer chromatography (TLC), may be acceptable for many CSPs. However, quantitative stability-indicating assays, such as high performance liquid chromatographic (HPLC) assays, would be more appropriate for certain CSPs. Examples include CSPs with a narrow therapeutic index, where close monitoring or dose titration is required to ensure therapeutic effectiveness and to avoid toxicity; where a theoretically established beyond-use dating period is supported by only marginal evidence; or where a significant margin of safety cannot be verified for the proposed beyond-use dating period. In short, because beyond-use dating periods established from product-specific data acquired from the appropriate instrumental analyses are clearly more reliable than those predicted theoretically, the former approach is strongly urged to support dating periods exceeding 30 days.

To ensure consistent practices in determining and assigning beyond-use dates, the pharmacy should have written policies and procedures governing the determination of the beyond-use dates for all compounded products. When attempting to predict a theoretical beyond-use date, a compounded or an admixed product should be considered as a unique system that has physical and chemical properties and stability characteristics that differ from its components. For example, antioxidant, buffering, or antimicrobial properties of a sterile vial for injection (SVI) might be lost upon its dilution, with the potential of seriously compromising the chemical stability of the SVIs active ingredient or the physical or microbiological stability of the SVI formulation in general. Thus, the properties stabilized in the SVI formulation usually cannot be expected to be carried over to the compounded or admixed product. Product-specific, experimentally determined stability data evaluation protocols are preferable to published stability information. Pharmacists should consult the general information chapter *Stability* under *Pharmaceutical Dosage Forms* ⟨1151⟩ for the appropriate stability parameters to be considered when initiating or evaluating a product-specific stability study.

Compounding personnel who assign beyond-use dates to CSPs when lacking direct chemical assay results must critically interpret and evaluate the most appropriate available information sources to decide a conservative and safe beyond-use date. The standard operating procedures manual of the compounding facility and each specific CSP formula record must describe the general basis used to assign the beyond-use date and storage conditions.

If multiple-dose parenteral medication vials (MDVs) are used, refrigerate the MDVs after they are opened unless otherwise specified by the manufacturer. Discard the MDVs when empty, when suspected or visible contamination occurs, or when the manufacturer's stated expiration date is reached, provided the manufacturers storage conditions have been adhered to. Expiration dating not specifically referenced in the package insert should not exceed 30 days once the vial has been opened.•4

Monitoring Controlled Storage Areas

To ensure that product potency is retained through the manufacturer's labeled expiration date, pharmacists must monitor the drug storage areas within the pharmacy. Controlled temperature storage areas in the pharmacy (refrigerators, 2° to 8°; freezers, –20° to –10°; and incubators, 30° to 35°; etc.) should be monitored at least once daily and the results documented on a temperature log. Additionally, pharmacy personnel should note the storage temperature when placing the product into or removing the product from the storage unit in order to monitor any temperature aberrations. Suitable temperature recording devices may include a calibrated continuous recording device or an NBS calibrated thermometer that has adequate accuracy and sensitivity for the intended purpose and should be properly calibrated at suitable intervals. If the pharmacy uses a continuous temperature recording device, pharmacy personnel should verify at least once daily that the recording device itself is functioning properly.

The temperature sensing mechanisms should be suitably placed in the controlled temperature storage space to reflect accurately its true temperature. In addition, the pharmacy should adhere to appropriate procedures of all controlled storage spaces to ensure that such spaces are not subject to significantly prolonged temperature fluctuations as may occur, for example, by leaving a refrigerator door open too long.

Change to read:

MAINTAINING PRODUCT QUALITY AND CONTROL AFTER •THE CSP•4 LEAVES THE PHARMACY

•Sterile Preparations for Institutional Use

This section pertains to the responsibilities of the pharmacy for maintaining product quality and control after the CSP leaves the pharmacy for distribution and use within the organized health care system to which the pharmacy belongs. The pharmacy is responsible for the quality of all CSPs prepared by or dispensed from the pharmacy, throughout the life cycle of the CSP, regardless of where the CSP exists physically within the organized health care system. In fulfilling this general responsibility, the pharmacy is responsible for the proper packaging, handling, transport, and storage of CSPs prepared by or dispensed from it, including the appropriate education, training, and supervision of pharmacy personnel assigned to these functions. The pharmacy should assist in the education and training of nonpharmacy personnel responsible for carrying out any aspect of these functions.

Establishing, maintaining, and assuring compliance with comprehensive written policies and procedures encompassing these responsibilities is a further responsibility of the pharmacy. Where nonpharmacy personnel are assigned tasks involving any of these responsibilities, the policies and procedures encompassing those tasks should be developed by the pharmacy in consultation with other institutional departments as appropriate. Activities or concerns that should be addressed as the pharmacy fulfills these responsibilities are as follows.

PACKAGING, HANDLING, AND TRANSPORT

Inappropriate processes or techniques involved with packaging, handling, and transport can adversely affect product quality and package integrity. While pharmacy personnel routinely perform many of the tasks associated with these functions, some tasks, such as transport, handling, and placement into storage, may be fulfilled by nonpharmacy personnel who are not under the direct administrative control of the pharmacy. Under these circumstances, appropriate written policies and procedures are established by the pharmacy with the involvement of other departments or services whose personnel are responsible for carrying out those CSP-related functions for which the pharmacy has a direct interest. The performance of the nonpharmacy personnel is monitored for compliance to established policies and procedures.

The critical requirements that are unique to CSPs and that are necessary to ensure product quality and packaging integrity must be addressed in written procedures. For example, techniques should be specified to prevent the depression of syringe plungers or dislodging of syringe tips during handling and transport. Additionally, disconnection of system components (for example, where CSPs are dispensed with administration sets attached to them) must be prevented throughout the life cycle of the product. Foam padding or inserts are particularly useful where CSPs are transported by pneumatic tube systems. Regardless of the methods used, the pharmacy has to evaluate their effectiveness and the reliability of the intended protection. Evaluation should be continuous, for example, through a surveillance system, including a system of problem reporting to the pharmacy.

Inappropriate transport and handling can adversely affect the quality of certain CSPs having unique stability concerns. For example, the physical shaking that might occur during pneumatic tube transport, or undue exposure to heat or light, have to be addressed on a product-specific basis. Alternate transport modes or special packaging measures might be needed for the proper assurance of quality of these CSPs. The use of tamper-proof closures and seals on CSP ports can add an additional measure of security to ensure product integrity regardless of transport method used.

Chemotoxic and other hazardous CSPs require safeguards to maintain the integrity of the CSP and to minimize the exposure potential of these products to the environment and to personnel who may come in contact with them. Special requirements associated with the packaging, transport, and handling of these agents include the prevention of accidental exposures or spills and the training of personnel in the event of an exposure or spill. Examples of special requirements of these agents also include exposure-reducing strategies such as the use of Luer lock syringes and connections, syringe caps, the capping of container ports, sealed plastic bags, impact-resistant containers, and cautionary labeling. Appropriate cushioning for pneumatic tube transport should be selected and evaluated to ensure that the products so conveyed can withstand the stresses induced by the system. Pneumatic transport of nonevaluated packaging alternatives should be avoided. Additional references should be consulted as necessary for further information on handling chemotoxic and other hazardous drugs.

USE AND STORAGE

The pharmacy is responsible for ensuring that CSPs in the patient-care setting maintain their quality until administered. The immediate labeling of the CSP container will display prominently and understandably the requirements for proper storage and expiration dating. Delivery and patient-care-setting personnel must be properly trained to deliver the CSP to the appropriate storage location. Outdated and unused CSPs must be returned to the pharmacy for disposal or possible reuse.

Written procedures have to exist to ensure that storage conditions in the patient-care setting are suitable for the CSP-specific storage requirements. Procedures include daily monitoring and documentation of drug storage refrigerators to ensure temperatures between 2° and 8° and the monthly inspection of all drug storage locations by pharmacy personnel. Inspections must confirm compliance with appropriate storage conditions, separation of drugs and food, proper use of multiple-dose containers, and the avoidance of using single-dose products as multiple-dose containers. CSPs, as well as all other drug products, must be stored in the patient-care area in such a way as to secure them from unauthorized personnel, visitors, and patients.

ADMINISTRATION

Procedures essential for generally ensuring product quality, especially sterility assurance, when readying a CSP for its subsequent administration include proper hand-washing, aseptic technique, site care, and change of administration sets. Additional procedures may also be essential for certain products, devices, or techniques. Examples where such special procedures are needed include in-line filtration, the operation of automated infusion control devices, and the replenishment of drug products into the reservoirs of implantable or portable infusion pumps.

REDISPENSED CSPS

The pharmacy must have the sole authority for determining whether a CSP not administered as originally intended can be used for an alternate patient or under alternate conditions. All CSPs that are not used as originally intended must be returned to the pharmacy for appropriate disposition, which may include redispensing, but only if adequate continuing quality can be fully ensured. The following may provide such assurance: the CSP was maintained under continuous refrigeration and protected from light, if required; no evidence of tampering or any readying for use outside the pharmacy exists; and there is sufficient time remaining until the originally assigned beyond-use time and date will be reached. Thus, initial preparation and thaw times should be documented and reliable measures should have been taken to prevent and detect tampering. Compliance with all procedures associated with maintaining product quality is essential. The CSP must not be redispensed if there is not adequate assurance that product quality and packaging integrity (including the connections of devices, where applicable) were continuously maintained between the time the CSP left and the time that it was returned to the pharmacy. Additionally, CSPs must not be redispensed if redispensing cannot be supported by the originally assigned beyond-use time.

EDUCATION AND TRAINING

The assurance of CSP quality and packaging integrity is highly dependent upon the proper adherence of all personnel to the pertinent written procedures. The pharmacy must design, implement, and maintain a formal education, training, and competency assessment program that encompasses all the functions and tasks addressed in the foregoing sections and all personnel to whom such functions and tasks are assigned. This program includes the assessment and documentation of procedural breaches, administration mishaps, side effects, allergic reactions, and complications associated with dosage or administration, such as extravasation. This program should be coordinated with the institution's adverse-event and incident reporting programs.●4

•Packing and Transporting CSPs

The following sections on *Packing CSPs for Transit* and *Transit of CSPs* describe how to maintain sterility and stability of CSPs until they are delivered to patient care locations for administration.

PACKING CSPS FOR TRANSIT

When CSPs are distributed to locations outside the premises in which they are compounded, compounding personnel select packing containers and materials that are expected to maintain physical integrity, sterility, and stability of CSPs during transit. Packing is selected that simultaneously protects CSPs from damage, leakage, contamination, and degradation; and protects personnel who transport packed CSPs from harm. The standard operating procedures manual of the compounding facility specifically describes appropriate packing containers and insulating and stuffing materials, based on information from product specifications, vendors, and experience of compounding personnel. Written instructions that clearly explain how to safely open containers of packed CSPs are provided to patients and other recipients.

TRANSIT OF CSPS

Compounding facilities that ship CSPs to locations outside their own premises must select modes of transport that are expected to deliver properly packed CSPs in undamaged, sterile, and stable condition to recipients.

Compounding personnel should ascertain that temperatures of CSPs during transit by the selected mode will not exceed the warmest temperature specified on the storage temperature range on CSPs labels. It is recommended that compounding personnel communicate directly with the couriers to learn shipping durations and exposure conditions that CSPs may encounter.

Compounding personnel must include specific handling and exposure instructions on the exteriors of containers packed with CSPs to be transported and obtain reasonable assurance of compliance therewith from transporters. Compounding personnel must periodically review the delivery performance of couriers to ascertain that CSPs are being efficiently and properly transported.

STORAGE IN LOCATIONS OUTSIDE CSP FACILITIES

Compounding facilities that ship CSPs to patients and other recipients outside their own premises must ascertain or provide, whichever is the appropriate case, the following assurances:

1. Labels and accessory labeling for CSPs include clearly readable beyond-use dates, storage instructions, and disposal instructions for out-of-date units.
2. Each patient or other recipient is able to store the CSPs properly, including the use of a properly functioning refrigerator and freezer if CSPs are labeled for such storage.●4

Change to read:

PATIENT OR CAREGIVER TRAINING

A formal training program •is●4 provided as a means to ensure understanding and compliance with the many special and complex responsibilities placed upon the patient or caregiver for the storage, handling, and administration of •CSPs.●4 The instructional objectives for the training program •includes●4 all home care responsibilities expected of the patient or caregiver and •is●4 specified in terms of patient or caregiver competencies.

Upon the conclusion of the training program, the patient or caregiver should, correctly and consistently, be able to do the following:

(1) Describe the therapy involved, including the disease or condition for which the •CSP●4 is prescribed, goals of therapy, expected therapeutic outcome, and potential side effects of the •CSP.●4
(2) Inspect all drug products, devices, equipment, and supplies on receipt to ensure that proper temperatures were maintained during transport and that goods received show no evidence of deterioration or defects.
(3) Handle, store, and monitor all drug products and related supplies and equipment in the home, including all special requirements related to same.
(4) Visually inspect all drug products, devices, and other items the patient or caregiver is required to use immediately prior to administration in a manner to ensure that all items are acceptable for use. For example, •CSPs must●4 be free from leakage, container cracks, particulates, precipitate, haziness, discoloration, or other deviations from the normal expected appearance, and the immediate packages of sterile devices •must be●4 completely sealed with no evidence of loss of package integrity.
(5) Check labels immediately prior to administration to ensure the right drug, dose, patient, and time of administration.
(6) Clean the in-home preparation area, scrub hands, use proper aseptic technique, and manipulate all containers, equipment, apparatus, devices, and supplies used in conjunction with administration.
(7) Employ all techniques and precautions associated with •CSP●4 administration, for example, preparing supplies and equipment, handling of devices, priming the tubing, and discontinuing an infusion.
(8) Care for catheters, change dressings, and maintain site patency as indicated.
(9) Monitor for and detect occurrences of therapeutic complications such as infection, phlebitis, electrolyte imbalance, and catheter misplacement.
(10) Respond immediately to emergency or critical situations such as catheter breakage or displacement, tubing disconnection, clot formation, flow blockage, and equipment malfunction.

(11) Know when to seek and how to obtain professional emergency services or professional advice.
(12) Handle, contain, and dispose of wastes, such as needles, syringes, devices, biohazardous spills or residuals, and infectious substances.

Training programs •include a•4 hands-on demonstration and practice with actual items that the patient or caregiver is expected to use, such as •CSP•4 containers, devices, and equipment. The patient or caregiver •practices•4 aseptic and injection technique under the direct observation of a health professional.

The pharmacy, in conjunction with nursing or medical personnel, is responsible for ensuring initially and on an ongoing basis that the patient or caregiver understands, has mastered, and is capable of and willing to comply with all of these home care responsibilities. This •is•4 achieved through a formal, written assessment program. All specified competencies in the patient or caregiver's training program •are•4 formally assessed. The patient or caregiver •is•4 expected to demonstrate to appropriate health care personnel their mastery of their assigned activities before being allowed to administer •CSPs•4 unsupervised by a health professional.

Printed material such as checklists or instructions provided during training may serve as continuing post-training reinforcement of learning or as reminders of specific patient or caregiver responsibilities. Post-training verbal counseling •can•4 also be used periodically, as appropriate, to reinforce training and to ensure continuing correct and complete fulfillment of responsibilities.

Delete the following:

•PATIENT MONITORING AND COMPLAINT SYSTEM

The pharmacy must have written policies and procedures describing the monitoring of patients using CSPs and the handling of reports of adverse events.

Outcome Monitoring

The pharmacy is responsible for developing a patient monitoring plan, which includes written outcome measures and systems for routine patient assessment. The outcome monitoring system should provide information suitable for the evaluation of the quality of patient care and of pharmaceutical services. Examples of assessment parameters include infection rates, rehospitalization rates, incidence of adverse drug reactions, catheter complications, and other variables that may serve as meaningful indicators of the effectiveness and suitability of the home use of CSPs. In selecting suitable outcome measures, the focus should be on high-risk, high-volume, or problem-prone factors.

Reports

The pharmacy should have policies and procedures for the receipt, documentation, handling, and disposition of reports of patient problems, complaints, adverse drug reactions, drug product or device defects, and other adverse events reported by patients, caregivers, family members, pharmacists, or other health professionals. The pharmacy should have a procedure to ensure that the patient receives prompt and appropriate medical attention as necessary in response to all adverse incidents from CSPs or devices. When a complaint or problem prompts a suspicion that a CSP or a device may be defective, the pharmacy should also be able to identify and recall the potentially defective item to the patient level whenever appropriate.

Procedures should also include a mechanism for periodic review of reports received to determine any need for correction of underlying systems problems. All reports received should be maintained for a reasonable period of time in a log, file, or binder dedicated for this purpose and readily retrievable as needed for subsequent analysis, legal or regulatory inquiry, or quality assurance audit. Standardized forms or formats for the reporting and recording of incidents, complaints, and so forth should be used. Reports should be completed and signed by the individual receiving it or by the individual involved in the situation. Procedures should depict the classification, documentation, investigation, and resolution of all reports and should provide a mechanism for participation in various federal and state reporting programs such as USP or FDA programs for reporting reaction problems, or defects with drug products or medical devices.•4

Add the following:

•PATIENT MONITORING AND ADVERSE EVENTS REPORTING

Compounding facilities must clinically monitor patients treated with CSPs according to the regulations and guidelines of their respective state health care practitioner licensure boards or of accepted standards of practice. Compounding facilities must provide patients and other recipients of CSPs with a way to address their questions and report any concerns that they may have with CSPs and their administration devices.

The standard operating procedures manuals of compounding facilities must describe specific instructions for receiving, acknowledging, and dating receipts; and for recording, or filing, and evaluating reports of adverse events and of the quality of preparation claimed to be associated with CSPs. Reports of adverse events with CSPs must be reviewed promptly and thoroughly by compounding supervisors to correct and prevent future occurrences. Compounding personnel are encouraged to participate in adverse event reporting and product defects programs of the Food and Drug Administration (FDA) and United States Pharmacopeia (USP).•4

Change to read:

THE QUALITY ASSURANCE PROGRAM

A provider of •CSPs must•4 have in place a formal Quality Assurance (QA) Program[4] intended to provide a mechanism for monitoring, evaluating, correcting, and improving the activities and processes described in this chapter. Emphasis in the QA Program is•4 placed on maintaining and improving the quality of systems and the provision of patient care. In addition, the QA program ensures•4 that any plan aimed at correcting identified problems also includes appropriate follow-up to make certain that effective corrective actions were performed.[5]

Characteristics of a QA plan include the following:

(1) Formalization in writing;
(2) Consideration of all aspects of the preparation and dispensing of products as described in this chapter, including environmental testing, validation results, etc.;
(3) Description of specific monitoring and evaluation activities;
(4) Specification of how results are to be reported and evaluated;
(5) Identification of appropriate follow-up mechanisms when action limits or thresholds are exceeded;and
(6) Delineation of the individuals responsible for each aspect of the QA program.

In developing a specific plan, focus •is•4 on establishing objective, measurable indicators for monitoring activities and processes that are deemed high-risk, high-volume, or problem-prone. Appropriate evaluation of environmental monitoring might include, for example, the trending of an indicator such as settling plate counts. In general, the selection of indicators and the effectiveness of the overall QA plan •is•4 reassessed on an annual basis.

[4] Other accepted terms that describe activities aimed at assessing and improving the quality of care rendered include Continuous Quality Improvement, Quality Assessment and Improvement, and Total Quality Management.

[5] The use of additional resources, such as the Accreditation Manual for Home Care from the Joint Commission on Accreditation of Healthcare Organizations, may prove helpful in the development of a QA plan.

•APPENDIX

CRITERIA	LOW-RISK LEVEL	MEDIUM-RISK LEVEL	HIGH-RISK LEVEL
Compounding Conditions	• Compounded entirely under ISO Class 5 (Class 100) conditions • Compounding involves only transfer, measuring, and mixing manipulations with closed or sealed packaging systems that are performed promptly and attentively • Manipulations are limited to aseptically opening ampuls, penetrating sterile stoppers on vials with sterile needles and syringes and transferring sterile liquids in sterile syringes to sterile administration devices and packages of other sterile products	• All conditions listed under low-risk level • Multiple individual or small doses of sterile products are combined or pooled to prepare a CSP that will be administered either to multiple patients or to one patient on multiple conditions • Compounding process includes complex aseptic manipulations other than the single-volume transfer • Compounding process requires unusually long duration • The sterile CSPs do not contain broad-spectrum bacteriostatic agents, and are administered over several days	• Nonsterile ingredients are incorporated or a nonsterile device is employed before terminal sterilization • Sterile ingredients, components, devices and mixtures are exposed to air quality inferior to ISO Class 5 (Class 100) • Nonsterile preparations are exposed for not more than 6 hours before being sterilized • Nonsterile preparations are terminally sterilized but are not tested for bacterial endotoxins • It is assumed that the chemical purity and content strength of ingredients meet their original or compendial specifications in unopened or in opened packages of bulk ingredients
QA Program	• Formalized in writing • Describes specific monitoring and evaluation activities • Reporting and evaluation of results • Identification of follow-up activities when thresholds are exceeded • Delineation of individual responsibilities for each aspect of the program	See low-risk level.	See low-risk level.
QA Practices	• Routine disinfection and quality testing of direct compounding environment • Visual confirmation of personnel processes regarding gowning, etc. • Review of orders and packages of ingredients to assure correct identity and amounts of ingredients • Visual inspection of CSP • Media-fill test procedure performed at least annually for each person	See low-risk level. (Official January 1, 2004)●4

Add the following:

•⟨1196⟩ PHARMACOPEIAL HARMONIZATION

This general information chapter provides information about the concept of harmonization by the Pharmacopeial Discussion Group (PDG). The chapter provides: (1) the *PDG Policy Statement*; (2) the *PDG Working Procedures*; (3) a discussion; (4) a status report; and (5) a glossary.

HARMONIZATION POLICY

The following policy statement was concluded by the PDG at its September 2002 meeting.

General Information

In 1989, the PDG was formed with representatives from the European Directorate for the Quality of Medicines in the Council of Europe, the United States Pharmacopeial Convention, Inc., and the Japanese Pharmacopoeia in the Ministry of Health and Welfare—now the Ministry of Health, Labor, and Welfare (MHLW). Since that time, the PDG generally meets twice a year to work on pharmacopeial harmonization topics. In May 2001, the PDG welcomed the World Health Organization as an observer. While not part of the International Conference on Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH), the PDG usually meets in conjunction with the ICH and provides the ICH Steering Committee with reports of its progress. To facilitate harmonization of some ICH Quality guidelines and the Quality section of the Common Technical Document, the PDG representatives sometimes attend ICH expert working group discussions as observers.

Purpose

A pharmacopeial monograph for an active ingredient or excipient, preparation, or other substance used in the manufacture or compounding of a medicinal product generally provides a name, definition, description, and sometimes packaging, labeling, and storage statements. Thereafter, the monograph provides tests, procedures, and acceptance criteria that constitute the specification. For frequently cited procedures, a monograph may refer to a general chapter for editorial convenience. The PDG works to harmonize excipient monographs and general chapters. This will reduce manufacturers' burden of performing analytical procedures in different ways, using different acceptance criteria. At all times, the PDG works to maintain an optimal level of science consistent with protection of the public health.

Definition of Harmonization

The PDG has defined harmonization of a pharmacopeial monograph or general chapter as follows:

"A pharmacopeial general chapter or other pharmacopeial document is harmonized when a pharmaceutical substance or product tested by the document's harmonized procedure yields the same results and the same accept/reject decision is reached."

When using a fully harmonized pharmacopeial monograph or general chapter, an analyst will perform the same procedures and reach the same accept/reject decisions irrespective of which PDG pharmacopeia is referenced. This approach is called interchangeability, and each pharmacopeia will identify, in an appropriate manner, such a monograph or general chapter.

When full harmonization of a pharmacopeial monograph or general chapter is not possible, the PDG works to harmonize it using an approach termed harmonization by attribute. According to this approach, some elements of a monograph or general chapter may be harmonized, but others may not. When a monograph is harmonized by attribute, a combination of approaches is needed. For nonharmonized elements, reliance on the individual PDG pharmacopeia is needed.

Process

Harmonization of pharmacopeial documents in the PDG occurs based upon decisions of the expert bodies of each pharmacopeia. The PDG works transparently in many ways, including, principally through the public notice and comment procedures of each pharmacopeia. The details are described below under *PDG Working Procedures*.

Implementation

The implementation of a harmonized document varies in the three PDG regions, depending upon their legal requirements, need of translation, and publication schedules. Each pharmacopeia generally allows some period of time after publication to implement official harmonized texts to allow manufacturers and other users to achieve conformity. Harmonization is not achieved until the text becomes official in all three pharmacopeias.

Revision of Harmonized Monographs

The pharmacopeias participating in the PDG have agreed not to revise unilaterally any harmonized document after publication. Should revisions be necessary for any appropriate reasons, the initiating pharmacopeia notifies the PDG, and revision proceeds according to the *PDG Working Procedures*.

Change to read:

PDG WORKING PROCEDURES

General

Harmonization may be carried out retrospectively for existing monographs or chapters or prospectively for new monographs or chapters.

The three pharmacopeias have a commitment to respect the agreed working procedures and the associated time deadlines as an essential part of the harmonization procedure.

Harmonization of pharmacopeial documents in the PDG occurs based on decisions of the expert bodies of each pharmacopeia. The PDG works transparently in many ways, including principally through the public notice and comment procedures of each pharmacopeia.

Where necessary, meetings of experts are held to identify potential solutions to resolve difficult problems.

The specific stages of the PDG process involved in harmonization are described below.

Stage 1: Identification

Based on inquiry among its users, the PDG identifies subjects to be harmonized among PDG pharmacopeias and nominates a coordinating pharmacopeia for each subject.

The PDG distributes the work by consensus among the three pharmacopeias and strives for a balance in the distribution of coordinating pharmacopeia assignments.

Stage 2: Investigation

For a subject to be harmonized retrospectively, the coordinating pharmacopeia collects the information on the existing specifications in the three pharmacopeias, on the grades of products marketed, and on the potential analytical procedures.

The coordinating pharmacopeia prepares a draft monograph or chapter, accompanied by a report giving the rationale for the proposal with validation data.

Stage 2 ends with the proposal draft, which is mentioned in this procedure as a Stage 3 draft. The Stage 3 draft, accompanied by supporting comments or data that explain the reasons for each test procedure or limit proposed, is sent by the coordinating pharmacopeia to the secretariats of the other two PDG pharmacopeias.

Stage 3: Proposal for Expert Committee Review

The three pharmacopeias forward the Stage 3 draft to their expert committee (through meetings or consultation by correspondence).

Comments by the experts resulting from this preliminary survey are sent to their respective pharmacopeial secretariat, preferably within 2 months. However, the comment period should not exceed 4 months. Within 2 months of receipt of the comments, the pharmacopeial secretariat should consolidate the comments and forward them to the coordinating pharmacopeia.

The coordinating pharmacopeia reviews the comments received and prepares a harmonized document (Stage 4 draft) accompanied by a commentary discussing comments received regarding the previous text and providing reasons for action taken in response to those comments.

The Stage 4 draft, as far as possible written in global style—a style easily understood by a variety of readers—together with the commentary, are sent to the secretariats of the other pharmacopeias (end of Stage 3).

Stage 4: Official Inquiry

The Stage 4 draft and the commentary are published in the revision document of each pharmacopeia in a section entitled International Harmonization. The draft is published in its entirety.

The corresponding secretariats may have to add information essential to the understanding of the implementation of the texts (e.g., the addition of the description of an analytical procedure or of reagents that do not exist in the pharmacopeia) and a translation is added by the European and Japanese Pharmacopoeias. The style may be adapted to that of the pharmacopeia concerned or global style may be used. The three pharmacopeias endeavor to publish the drafts simultaneously or as closely as possible.

Comments regarding this draft are sent by readers of the revision document to their respective pharmacopeial secretariat, preferably within 4 months, and at most within 6 months of its publication.

Each pharmacopeia analyzes the comments received and submits its consolidated comments to the coordinating pharmacopeia within 2 months of the end of the review/comment period.

The coordinating pharmacopeia reviews the comments received and prepares a draft harmonized document (Stage 5A draft), accompanied by a commentary discussing comments received regarding the previous text and providing reasons for action taken in response to those comments.

The Stage 5A draft together with the commentary is sent to the secretariats of the other two PDG pharmacopeias.

Stage 5. Consensus

5A. PROVISIONAL

The Stage 5A draft is reviewed and commented on by the other two PDG pharmacopeias within 4 months of receipt. The three pharmacopeias shall do their utmost to reach full agreement at this stage to obtain a final consensus document.

If a consensus has not been reached, the coordinating pharmacopeia prepares a revised version (Stage 5A/2), taking relevant, substantiated comments on the Stage 5A document from the two other pharmacopeias into consideration. The revised document (Stage 5A/2), together with the commentary, are sent to the secretariats of the other two PDG pharmacopeias. The revised document is reviewed and commented on by the other two PDG pharmacopeias, preferably within 2 months of receipt. This review/comment and revision process of the 5A document are repeated (Stage 5A/n) until the three PDG pharmacopeias reach a consensus or until the coordinating pharmacopeia considers that harmonization by attribute should be applied.

If the coordinating pharmacopeia considers certain attributes in the monograph or provisions in a general chapter (especially for retroactive harmonization) are such that it will not be possible to harmonize within a reasonable time period, harmonization by attribute will be applied. If harmonization by attribute is applied, a special cover page (see the table in the *Appendix*) indicating harmonization is included with the draft. The text contains only harmonized attributes/provisions; nonharmonized and local attributes are not included. The table is prepared as follows: if three pharmacopeias agree on the attribute, there will be a (+) in all columns; if two pharmacopeias agree that the attribute should be included and have agreed on the method and limit, there will be a (+) in the column for those two pharmacopeias, and a (–) in the column for the pharmacopeia that will not stipulate the test.

For nonharmonized or local requirements, if three pharmacopeias agree that the attribute should be included, but have not come to agreement on the method and/or limit: state attribute under "nonharmonized attributes." If only one pharmacopeia will include an attribute: state under "local requirement."

If the Stage 5A draft is substantially different from the Stage 4 draft, the PDG may decide that it should be published again in the revision documents; the draft then reverts technically to Stage 4, revised.

5B. DRAFT SIGN-OFF

When full agreement is reached, the 5B draft is sent by the coordinating pharmacopeia to the other pharmacopeias no later than 4 weeks before a PDG meeting for final confirmation. The document is then presented for sign-off at the PDG meeting.

NOTE—The last two stages of the implementation of the "harmonized" chapters and monographs take place individually according to the procedures established by each pharmacopeial organization.

Stage 6: Adoption

The document is submitted for adoption to the organization responsible for each pharmacopeia. Each pharmacopeia incorporates the harmonized draft according to its own procedures.

Adopted texts are published by the three pharmacopeias in their supplements, or where applicable, in a new edition.

If necessary, the Stage 5B draft may be adopted with some amendments (local requirements) corresponding to a general policy in the national or regional (European) area. If a pharmacopeia includes a local attribute after the sign-off of a text, it will inform the PDG.

Users of the pharmacopeias are appropriately informed of the harmonization status of monographs and general chapters. In the *European Pharmacopoeia* (*EP*) and *USP-NF*, for general chapters, this is done via a preliminary paragraph. For the *Japanese Pharmacopoeia* (*JP*), a notification is made by MHLW, and information is given in a general chapter.

Stage 7: Implementation

The pharmacopeias will inform each other of the date of implementation in their particular region.

The date of implementation of a harmonized document varies in the three PDG regions depending on their legal requirements, need of translation, and publication schedules. Each pharmacopeia generally allows some period of time after publication for implementation to allow manufacturers and other users to achieve conformity. Harmonization is not achieved until the text becomes official in all three pharmacopeias.

Revision

Following is the procedure for the revision of harmonized monographs and chapters:

The pharmacopeias participating in the PDG have agreed not to revise unilaterally any harmonized document (monograph or chapter) after sign-off or after publication.

A pharmacopeia requesting the revision of a monograph or chapter shall apply the following criteria for justification of the revision:

- Public health and safety reasons.
- Insufficient supply of pharmacopeial-quality product on the market.
- Specified analytical reagents or equipment are not available.
- New methods of preparation of products or reagents are not covered by the current monograph.
- Analytical procedures can be replaced by more appropriate, accurate, or precise procedures.

The PDG as a whole has to agree to initiate the revision. A coordinating pharmacopeia will be nominated. The coordinating pharmacopeia will prepare a Stage 3 draft, based on the validation of data provided by the pharmacopeia requesting the revision.

The *PDG Working Procedures* will then be followed. The revisions of a sign-off document prepared for this or other reasons are indicated as revision 1, 2, 3, etc.

In case of health and safety issues, and whenever agreed to by the PDG, an accelerated procedure shall be applied (shortening and/or eliminating stages).

Discussion

Harmonization of general chapters and monographs benefits manufacturers of pharmaceutical products intended for human use, regulatory agencies, and ultimately, practitioners and patients. Benefits are derived from (1) reduced development effort; (2) simplification of regulatory filings; and (3) reduced release testing.

Pharmacopeial harmonization amplifies the work of the ICH, particularly for Quality topics. While the PDG is not part of the ICH, the PDG periodically provides updates to the ICH Steering Committee, and in the past participated in a joint task force. This task force focused on harmonization of general chapters considered important to the ICH harmonized document *Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances (Q6A)*. USP also participates in the International Cooperation on Harmonization of Technical Requirements for Registration of Veterinary Products (VICH). As with the ICH, some of the quality guidelines developed in VICH depend upon harmonization of pharmacopeial general chapters. A major difference between the PDG and ICH/VICHs is that the ICH/VICH guidelines generally are applicable only to ingredients and drug products not previously registered in an ICH/VICH region or nation, whereas the PDG harmonization applies to all marketed products in the applicable region or nation.

In the case of harmonization by attribute, nonharmonization or divergence will be indicated in *USP–NF* and *EP* by the symbol ◆. For these nonharmonized attributes, reliance upon the individual pharmacopeia is required. A monograph or general chapter in one PDG pharmacopeia may unilaterally include additional local or national attributes that are not included in the corresponding text of the other pharmacopeias. Such text is not considered by the PDG to be a divergence from the PDG harmonized text.

As with other *USP–NF* revisions, draft harmonization texts are published for comment in *Pharmacopeial Forum*. Final harmonized official text in *USP–NF* is presented in the latest edition, *Supplement*, or *Interim Revision Announcement.* The current status of all harmonization projects appears in Table 1and Table 2. These status tables will be updated in subsequent editions of *USP–NF* and its *Supplements*.

In the U.S., cases of noncompliance and/or dispute are resolved through performance of the official procedure in *USP* or *NF*. If the procedure and its acceptance criteria are harmonized in the PDG, then a manufacturer may follow the relevant compendial instructions in *USP–NF*, *EP*, or *JP*.

•Harmonized Monographs and Chapters

HARMONIZED CHAPTERS

⟨85⟩ **Bacterial Endotoxins Test**—This chapter has been harmonized by PDG and published in the *European Pharmacopoeia* and in the *Japanese Pharmacopoeia*. Portions of the chapter that are not harmonized with the other two pharmacopeias are marked by the symbol ◆. Footnotes 1, 2, and 4 are in *USP* while they are not in *EP* or *JP*. These footnotes give additional information, such as the calculation of endotoxin limits for different classes of products (Footnote 4) or reference USP chapters (Footnote 2).

The USP Endotoxin Reference Standard is harmonized with the International Reference Standard for Endotoxin and the EP Endotoxin Reference Standard and indirectly harmonized with the JP Endotoxin Reference Standard that is indexed to the International Reference Standard. The result is that 1 USP Endotoxin Unit = 1 International Endotoxin Unit = 1 EP Endotoxin Unit.•4

GLOSSARY

Harmonized monograph or general chapter—Text that has reached Stage 5B and that has been countersigned by the three PDG pharmacopeias.

Total harmonization—A monograph or a general chapter that is identical in the three PDG pharmacopeias in terms of identical tests, test procedures, and acceptance criteria.

Harmonization by attributes—A monograph or a general chapter that contains a combination of harmonized and nonharmonized tests or sections.

Interchangeability—A test or a section of a monograph or a general chapter that is not the same among the PDG pharmacopeias, but the accept/reject decision is the same regardless of which one of the tests or sections of the PDG pharmacopeia is used.

Local or national divergence—A monograph or a general chapter in one of the PDG pharmacopeias contains specific attributes of local or national origin in addition to the PDG harmonized/nonharmonized attributes.

Nonharmonized attributes—Attributes that could not be agreed upon by the three PDG pharmacopeias due to regional differences, regulatory differences, nonavailability of reagents, etc.

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 26–NF 21*. The page number indicates where the item is found in *USP 26–NF 21*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available annual edition or *Supplement*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
1	*General Notices and Requirements*	*Ingredients and Processes*	Line 7 of the 4th paragraph: Change "*Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩" to: *Pharmacy Compounding* ⟨795⟩
		Preservation, Packaging, Storage, and Labeling	Last line under *Pharmaceutical compounding* under *Labeling:* Change "*Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩" to: *Pharmacy Compounding* ⟨795⟩
93	*Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution*	*Assay for calcium acetate*	Line 8: Change "1.742 mg" to: 1.762 mg
221	*Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Aerosol*	*Assay*	Line 4 under *Assay preparation:* Change "125 mm of mercury" to: 600 mm of mercury
389	*Cefuroxime Axetil Tablets*	*Assay*	Line 4 under *Procedure:* Change "$(V/12{,}500N)(P_S W_S)(R_U/R_S)$," to: $(V/12{,}500N)(P_S W_S/100)(100-K)(R_U/R_S)$,
895	*Helium*	*Carbon monoxide*	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
1136	*Meclizine Hydrochloride Tablets*	*Dissolution*	Lines 2 and 3 under *Chromatographic system:* Change "4.6-mm × 4-cm precolumn" to: 4.6-mm × 25-cm precolumn
1159	*Mercaptopurine Tablets*	*Assay*	Line 20: Change "170.20" to: 170.19
1322	*Nitrous Oxide*	*Limit of nitric oxide*	Line 1: Change "550 ± 50 mL," to: 500 ± 50 mL,
		Carbon monoxide	Line 1: Change "1050 ± 50 mL," to: 1000 ± 50 mL,
		Halogens	Line 1: Change "1050 ± 50 mL," to: 1000 ± 50 mL,
		Carbon dioxide	Line 1: Change "1050 ± 50 mL," to: 1000 ± 50 mL,
1372	*Oxygen*	*Carbon dioxide*	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
		Carbon monoxide	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
1373	*Oxygen 93 Percent*	*Carbon dioxide*	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
		Carbon monoxide	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
1433	*Perflubron*	*Specific gravity*	Line 1: Change "1.916 and 1.919." to: 1.922 and 1.925.
1720	*Sufentanil Citrate Injection*	*Definition*	Line 5: Change "sufentanil ($C_{22}H_{30}N_2O_2S$), as the citrate." to: sufentanil citrate ($C_{22}H_{30}N_2O_2S \cdot C_6H_8O_7$).
1932	*Vinorelbine Tartrate*	*Assay*	Line 2: Change "40.0 mL of acetic acid." to: 40.0 mL of glacial acetic acid.
2092	⟨563⟩ *Identification of Articles of Botanical Origin*		This new chapter should display ***Add the following:*** before the title, and ▲ at its beginning and end.
2125	⟨616⟩ *Bulk Density and Tapped Density*	*Bulk Density*	Line 14 under *Procedure* in *Method I—Measurement in a Graduated Cylinder*: Change "$(M)/(V_f)$." to: $(M)/(V_o)$.
		Tapped Density	Line 28 under *Method I*: Change "$(M)/(V_o)$." to: $(M)/(V_f)$.
2189	⟨788⟩ *Particulate Matter in Injections*	*Microscopic Particle Count Test*	Table 2 under *Interpretation*: Microscopic Method Particle Count is missing 2 column headers. Change to:

Table 2. Microscopic Method Particle Count

	≥10 µm	≥25 µm
Small-Volume Injections	3000	300 per container
Large-Volume Injections	12	2 per mL

Interim Revision Announcement

Page	Title	Section	Description
2471	*Reagents Specifications*	*4-(Butylamino)benzoic Acid*	Line 2: Change footnote "[104]" to: [96]
2598	*Reference Tables*	*Alcoholometric Table*	Adjust column widths and headers, thereby correcting alignment of column heads. Reprinted on the following pages for clarity.
2686	*Acetyltributyl Citrate*	*Assay*	Lines 1–11 under *Chromatographic system*, ending with "about 2.3 mL per minute." Revert to the official text as published in *NF 20,* page 2503. Reprinted on the following pages for clarity. Line 2 under *Procedure:* Change "about 1.0 µL" to: 1 µL; Line 7 under *Procedure:* Change "100*A*/*B*," to: 100(*A*/*B*),
2687	*Acetyltriethyl Citrate*	*Assay*	Lines 1–11 under *Chromatographic system*, ending with "about 2.3 mL per minute." Revert to the official text as published in *NF 20,* page 2504. Reprinted on the following pages for clarity. Line 2 under *Procedure:* Change "about 1.0 µL" to: 1 µL; Line 7 under *Procedure:* Change "100*A*/*B*," to: 100(*A*/*B*),
2800	*Nitrogen*	*Carbon monoxide*	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
2801	*Nitrogen 97 Percent*	*Carbon dioxide*	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
		Carbon monoxide	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
		Sulfur dioxide	Line 1: Change "1050 ± 50 mL" to: 1000 ± 50 mL
		Limit of nitric oxide and nitrogen dioxide	Line 1: Change "550 ± 50 mL" to: 500 ± 50 mL
2810	*Polyethylene Glycol*	*Limit of ethylene glycol and diethylene glycol*	Revert to the official text as published on page 2920 of the *Second Supplement* to *NF 20*, reprinted on the following page for clarity.
2851	*Tributyl Citrate*	*Assay*	Lines 1–11 under *Chromatographic system*, ending with "about 2.3 mL per minute." Revert to the official text as published in *NF 20,* page 2635. Reprinted on the following pages for clarity. Line 1 under *Procedure:* reinsert NOTE—Use peak areas where peak responses are indicated.; Line 1 under *Procedure:* Change "about 1.0 µL" to: 1 µL; Line 7 under *Procedure:* Change "100*A*/*B*," to: 100(*A*/*B*),
2852	*Triethyl Citrate*	*Assay*	Lines 1–11 under *Chromatographic system*, ending with "about 2.3 mL per minute." Revert to the official text as published in *NF 20,* page 2635. Reprinted on the following pages for clarity. Line 1 under *Procedure:* reinsert NOTE—Use peak areas where peak responses are indicated.; Line 1 under *Procedure:* Change "a volume (about 1.0 µL)" to: 1 µL
Supplement 1			
2942	*Amoxicillin Tablets for Oral Suspension*	*Definition*	Line 3: Change "$C_{12}H_{15}N_3O_2S$" to: $C_{16}H_{19}N_3O_5S$
		Dissolution	Line 2 of paragraph after *Time:* Change "$C_{12}H_{15}N_3O_2S$" to: $C_{16}H_{19}N_3O_5S$; Line 2 under *Tolerances:* Change "$C_{12}H_{15}N_3O_2S$" to: $C_{16}H_{19}N_3O_5S$
		Assay	Line 3 under *Procedure:* Change "$C_{12}H_{15}N_3O_2S$" to: $C_{16}H_{19}N_3O_5S$
2968	*Hydrochlorothiazide Tablets*	*Related compounds*	Line 5 under *Procedure:* Change "in the portion of Hydrochlorothiazide" to: in the portion of Tablets

Interim Revision Announcement

ALCOHOLOMETRIC TABLE

Based on data appearing in the National Bureau of Standards Bulletin, vol. 9, pp. 424–425 (publication of the National Institute of Standards and Technology).

Acetyltributyl Citrate

Assay—

Chromatographic system (see *Chromatography* 621)—The gas chromatograph is equipped with an on-column, temperature-programmable injector, a flame-ionization detector maintained at about 275°, and a 0.32-mm × 30-m column bonded with a 0.5-µm layer of phase G42. The column temperature is programmed to be maintained at about 80° for 0.5 minute, then to increase to about 220° at a rate of 20° per minute, and to hold at about 220° for 10 minutes. The injection port temperature is programmed to be maintained at about 85° for 0.5 minute, then to increase to about 225° at a rate of 20° per minute, and to hold at about 225° for 10 minutes. Heilum is used as the carrier gas at a flow rate of about 2.3 mL per minutes. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for tributyl citrate and 1.0 for acetyltributyl citrate; the resolution, *R*, between tributyl citrate and acetyltributyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the tributyl citrate and acetyltributyl citrate peaks, based on area percent calculation.

Acetyltriethyl Citrate

Assay—

Chromatographic system (see *Chromatography* 621)—The gas chromatograph is equipped with an on-column, temperature-programmable injector, a flame-ionization detector maintained at about 275°, and a 0.32-mm × 30-m column bonded with a 0.5-µm layer of phase G42. The column temperature is programmed to be maintained at about 80° for 0.5 minute, then to increase to about 220° at a rate of 20° per minute, and to hold at about 220° for 10 minutes. The injection port temperature is programmed to be maintained at about 85° for 0.5 minute, then to increase to about 225° at a rate of 20° per minute, and to hold at about 225° for 10 minutes. Helium is used as the carrier gas at a flow rate of about 2.3

mL per minutes. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for triethyl citrate and 1.0 for acetyltriethyl citrate; the resolution, *R*, between triethyl citrate and acetyltriethyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the triethyl citrate and acetyltriethyl citrate peaks, based on area percent calculation.

Polyethylene Glycol

Limit of ethylene glycol and diethylene glycol (for Polyethylene Glycol having a nominal molecular weight less than 450)—

Standard preparation—Prepare an aqueous solution containing 500 µg each of ethylene glycol and of diethylene glycol per mL.

Test preparation—Transfer about 4 g of Polyethylene Glycol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* 621)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 1.5-m stainless steel column packed with 12% G13 on support S1NS. The carrier gas is nitrogen or another suitable inert gas, flowing at a rate of 50 mL per minute. The column temperature is maintained at about 140°, the injection port temperature is maintained at about 250°, and the flame-ionization detector temperature is maintained at 280°.

Procedure—Inject a volume (about 2.0 µL) of the *Standard preparation* into the chromatograph, and record the chromatogram, adjusting the operational conditions to obtain peaks not less than 10 cm in height. Measure the heights of the first (ethylene glycol) and second (diethylene glycol) peaks, and record the values as P_1 and P_2, respectively. Inject a volume (about 2.0 µL) of the *Test preparation* into the chromatograph, and record the chromatogram under the same conditions as those employed for the *Standard preparation*. Measure the heights of the first (ethylene glycol) and second (diethylene glycol) peaks, and record the values as $p_1$and p_2, respectively. Calculate the percentage of ethylene glycol in the portion of Polyethylene Glycol taken by the formula:

$$(C_1 p_1)/(P_1 W),$$

in which C_1 is the concentration, in µg per mL, of ethylene glycol in the *Standard preparation;* and W is the weight, in mg, of Polyethylene Glycol taken. Calculate the percentage of diethylene glycol in the portion of Polyethylene Glycol taken by the formula:

$$(C_2 p_2)/(P_2 W),$$

in which C_2 is the concentration, in µg per mL, of diethylene glycol in the *Standard preparation:* not more than 0.25% of the sum of ethylene glycol and diethylene glycol is found.

Tributyl Citrate

Assay—

Chromatographic system (see *Chromatography* 621)—The gas chromatograph is equipped with an on-column, temperature-programmable injector, a flame-ionization detector maintained at about 275°, and a 0.32-mm × 30-m column bonded with a 0.5-µm layer of phase G42. The column temperature is programmed to be maintained at about 80° for 0.5 minute, then to increase to about 220° at a rate of 20° per minute, and to hold at about 220° for 10 minutes. The injector port temperature is programmed to be maintained at about 85° for 0.5 minute, then to increase to about 225° at a rate of 20° per minute, and to hold at about 225° for 10 minutes. Helium is used as the carrier gas at a flow rate of about 2.3 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for tributyl citrate and 1.0 for acetyltributyl citrate; the resolution, *R*, between tributyl citrate and acetyltributyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the tributyl citrate and acetyltributyl citrate peaks, based on area percent calculation.

Triethyl Citrate

Assay—

Chromatographic system (see *Chromatography* 621)—The gas chromatograph is equipped with an on-column, temperature-programmable injector, a flame-ionization detector maintained at about 275°, and a 0.32-mm × 30-m column bonded with a 0.5-µm layer of phase G42. The column temperature is programmed to be maintained at about 80° for 0.5 minute, then to increase to about 220° at a rate of 20° per minute, and to hold at about 220° for 10 minutes. The injector port temperature is programmed to be maintained at about 85° for 0.5 minute, then to increase to about 225° at a rate of 20° per minute, and to hold at about 225° for 10 minutes. Helium is used as the carrier gas at a flow rate of about 2.3 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for triethyl citrate and 1.0 for acetyltriethyl citrate; the resolution, *R*, between triethyl citrate and acetyltriethyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the triethyl citrate and acetyltriethyl citrate peaks, based on area percent calculation.

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions; (2) proposed revisions placed directly under *In-Process Revision*; or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, thus:

•new text•

if slated for an *Interim Revision Announcement to USP 26–NF 21* (*IRA*), thus:

▲new text▲*USP27*

if slated for *USP 27–NF 22*, and thus:

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, and ■2S (*USP 27*) indicates that the proposed revision is slated for the *Second Supplement to USP 27*, and ▲*USP27* and ▲*NF22* indicate that the revisions are proposed for *USP 27* and *NF 22*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

In-Process Revision

In-Process Revision

BRIEFING

General Notices and Requirements, *USP 26* page 3, page 2938 of the *First Supplement*, and page 1757 of *PF* 28(6) [Nov.–Dec. 2002]. The proposed revisions in the section *Significant Figures and Tolerances* are intended to clarify and provide consistency regarding the use of rounded or unrounded numbers in the calculation of analytical results. The term "reportable result" is also introduced and discussed.

In addition, it is proposed to add a subsection on *Residual Solvents* in the section *Foreign Substances and Impurities* under *Tests and Assays*, to provide consistency with revisions to general chapters *Organic Volatile Impurities* ⟨467⟩ and *Impurities in Official Articles* ⟨1086⟩. (See briefing under *Organic Volatile Impurities* ⟨467⟩, appearing elsewhere in this number of *PF*.)

Several favorable comments were received on the proposal that appeared in *PF* 28(5) to revise the section on *Test Results*, *Statistics*, *and Standards* under *Tests and Assays* to allow the use of the average of results of the *Content Uniformity* determinations to be used as the *Assay* value. This provision requires that the determination of *Content Uniformity* must be performed using the same method specified in the *Assay* in the individual monograph. Other comments raised several issues:

1. There was a question as to whether the "same" method meant the "identical" method specified in the *Assay*. It is recognized in the general chapter *Uniformity of Dosage Units* ⟨905⟩, that in performing the test for *Content Uniformity* in order to assay individual dosage units, different volumes of diluent may be required. Other than that, the procedure is identical. Therefore, it is proposed to change the words "same method" to "same procedure" specified in the *Assay*.
2. One comment noted that the proposal stated that the average of the *Content Uniformity* determinations "may be used" as the *Assay* value. There was a question as to how to resolve any dispute if differences occur between results of the average of the *Content Uniformity* determinations and results in the *Assay*. The Committee agreed that in view of the fact that the *Content Uniformity* determinations are made using the same procedure as is specified in the *Assay*, no significant differences are likely. This option allows flexibility in laboratory operations.
3. A question was raised as to which of the possible *Content Uniformity* determinations should be averaged, that is, the initial 10 units, the next 20 units, or the total of 30 units. It is proposed to state that "the average of *all* of the individual *Content Uniformity* determination is used as the *Assay* value."

Finally, in the section *Preservative*, *Packaging*, *Storage*, *and Labeling*, it is proposed to add *Repackaging Instructions* to provide information, supporting the current statement in 21 CFR 201 · 100 and to clarify the repackaging process.

(BST: W. Paul; PSD: C. Okeke; PA2: W. Paul; PA7a: W. Wright) RTS—39444-1; 39905-1; 39967; 39711-1

"OFFICIAL" AND "OFFICIAL ARTICLES"

The word "official," as used in this Pharmacopeia or with reference hereto, is synonymous with "Pharmacopeial," with "USP," and with "compendial."

The designation "USP" in conjunction with the official title or elsewhere on the label of an article ~~means that the article~~

▲indicates that a monograph is included in the *USP* and that

the article▲*USP27*
purports to comply with

▲all applicable▲*USP27*
USP standards.
~~Any language modifying or limiting this representation shall be accompanied by a statement that the article is "not USP".such specific~~

▲The▲*USP27*
designation

▲"USP"▲*USP27*
on the label

▲may not and▲*USP27*
does not constitute a representation, endorsement, or incorporation by the manufacturer's labeling of the informational material contained in the USP monograph, nor does it constitute assurance by USP that the article is known to comply with USP standards. An article may only purport to comply with a USP standard

▲or other requirements▲*USP27*
when the article is recognized in the *USP*. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, whether or not the added designation "USP" is used. Names considered to be synonyms of the official titles may not be used for official titles.

Although both compendia, the *United States Pharmacopeia* and the *National Formulary*, currently are published under one cover, they remain separate compendia. The designation *USP–NF* or similar combination may be used on the label of an article, provided the label also bears a statement such as, "Meets *NF* standards as published by the USP," indicating the particular compendium to which the article purports to apply.

Where an article differs from the standards of strength, quality, and purity, as determined by the application of the assays and tests set forth for it in the Pharmacopeia, its difference shall be plainly stated on its label. Where an article fails to comply in identity with the identity prescribed in the *USP*, or contains an added substance that interferes with the prescribed assays and tests, such article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in the Pharmacopeia.

Articles listed herein are official and the standards set forth in the monographs apply to them only when the articles are intended or labeled for use as drugs, as nutritional or dietary supplements, or as medical devices and when bought, sold, or dispensed for these purposes or when labeled as conforming to this Pharmacopeia.

An article is deemed to be recognized in this Pharmacopeia when a monograph for the article is published in it, including its supplements, addenda, or other interim revisions, and an official date is generally or specifically assigned to it.

The following terminology is used for distinguishing the articles for which monographs are provided: an *official substance* is an active drug entity, a recognized nutrient, a dietary supplement ingredient, or a pharmaceutic ingredient (see also *NF 21*) or a component of a finished device for which the monograph title includes no indication of the nature of the finished form; an *official preparation* is a *drug product*, a *nutritional supplement*, a *dietary supplement* or a *finished device*. It is the finished or partially finished (e.g., as in the case of a sterile solid to be constituted into a solution for administration) preparation or product of one or more

official substances formulated for use on or for the patient or consumer; an *article* is an item for which a monograph is provided, whether an official substance or an official preparation.

▲*Designating Conformance with Official Standards*—When the letters "USP" or "NF" or "USP–NF" are utilized on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article or when appropriate, with the ingredients contained therein. The letters are not to be enclosed in any symbol such as a circle, square, etc., and must appear in block capital letters.

If a dietary supplement purports to be or is represented as an official product and such claim is determined by USP not to be made in good faith, it is the policy of the USP to seek appropriate legal redress.▲*USP27*

Products Not Marketed in the United States—Interest in the USP outside the United States has always existed. From time to time, monographs may be adopted for articles not legally marketed in the United States as a service to authorities in other countries where USP standards are recognized and applied. Appearance of any such monograph does not grant any marketing rights whatsoever, and the status of the article in the United States must be checked with the U.S. Food and Drug Administration in the event of any question.

Nutritional and Other Dietary Supplements—The designation of an official preparation containing one or more recognized nutrients or dietary supplement ingredients as "USP" or the use of the designation "USP" in conjunction with the title of such nutritional or dietary supplement preparation may be made only if the preparation meets

▲all▲*USP27*
the applicable requirements contained in the individual monograph and general chapters.

▲Any language modifying or limiting this representation shall be accompanied by a statement indicating that the article is "not USP", and indicating how the article differs from the standards of strength, quality, or purity as determined by the application of the tests and assays set forth in the compendia.▲*USP27*
Any additional ingredient in such article that is not recognized in the Pharmacopeia and for which nutritional value is claimed shall not be represented nor imply that such ingredient is of USP quality or recognized by USP. If a preparation does not comply with

▲all▲*USP27*
applicable requirements but contains nutrients or dietary supplement ingredients that are recognized in the *USP*, the article may not designate the individual nutrients or ingredients as complying with USP standards or being of USP quality without designating on the label that the article itself does not comply with USP standards.

Change to read:

SIGNIFICANT FIGURES AND TOLERANCES

Where limits are expressed numerically herein, the upper and lower limits of a range include the two values themselves and all intermediate values, but no values outside the limits. The limits expressed in monograph definitions and tests, regardless of whether the values are expressed as percentages or as absolute numbers, are considered significant to the last digit shown.

Equivalence Statements in Titrimetric Procedures—The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, it is to be understood that the number of significant figures in the concentration of the titrant corresponds to the number of significant figures in the weight of the analyte. Blank corrections are to be made for all titrimetric assays where appropriate (see *Titrimetry* ⟨541⟩).

Tolerances—The limits specified in the monographs for Pharmacopeial articles are established with a view to the use of these articles as drugs, nutritional or dietary supplements, or devices, except where it is indicated otherwise. The use of the molecular formula for the active ingredient(s) named in defining the required strength of a Pharmacopeial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

A dosage form shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. ~~Where the content of an ingredient is known to decrease with time, an amount in excess of that declared on the label may be introduced into the dosage form at the time of manufacture to assure compliance with the content requirements of the monograph throughout the expiration period.~~

■■2S (*USP26*)
The tolerances and limits stated in the definitions in the monographs for Pharmacopeial articles allow ~~for such overages and~~

■■2S (*USP26*)
for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. Where the minimum amount of a substance present in a nutritional or dietary supplement is required to be higher than the lower tolerance limit allowed for in the monograph because of applicable legal requirements, then the upper tolerance limit contained in the monograph shall be increased by a corresponding amount.

The specified tolerances are based upon such attributes of quality as might be expected to characterize an article produced from suitable raw materials under recognized principles of good manufacturing practice.

The existence of compendial limits or tolerances does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" the Pharmacopeial quality. Similarly, the fact that an article has been prepared to closer tolerances than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the Pharmacopeial requirements.

Interpretation of Requirements—Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated limits to determine whether there is conformance with compendial assay or test requirements. The observed or calculated values usually will contain more significant figures than there are in the stated limit, and ~~an observed or calculated~~

■a reportable■1S (*USP27*)

In-Process Revision

result is to be rounded off to the number of places that is in agreement with the limit expression by the following procedure. ~~[NOTE—Limits, which are fixed numbers, are not rounded off.]~~

■Intermediate calculations (e.g., slope for linearity in *Validation of Compendial Methods* ⟨1225⟩) may be rounded for reporting purposes, but the original value (not rounded) should be used for any additional required calculations. Rounding off should not be done until the final calculations for the reportable value have been completed. [NOTE—Limits, which are fixed numbers, are not rounded off.]

A reportable value is often a summary value for several individual determinations. It is the end result of a completed measurement method, as documented. It is the value compared with the acceptance criterion. In most cases, the reportable value is used as documentation for internal or external users.■1S (*USP27*)

When rounding off is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is greater than 5, it is eliminated and the preceding digit is increased by one. If this digit equals 5, the 5 is eliminated and the preceding digit is increased by one.

Illustration of Rounding Numerical Values for Comparison with Requirements

Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit ≥98.0%	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit ≤101.5%	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes
Limit test ≤0.02%	0.025%	0.03%	No
	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test ≤3 ppm	0.00035%	0.0004%	No
	0.00025%	0.0003%	Yes
	0.00028%	0.0003%	Yes

Change to read:

TESTS AND ASSAYS

Apparatus—A specification for a definite size or type of container or apparatus in a test or assay is given solely as a recommendation. Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed. (See also *Thermometers* ⟨21⟩, *Volumetric Apparatus* ⟨31⟩, and *Weights and Balances* ⟨41⟩.) Where low-actinic or light-resistant containers are specified, clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

Where an instrument for physical measurement, such as a spectrophotometer, is specified in a test or assay by its distinctive name, another instrument of equivalent or greater sensitivity and accuracy may be used. In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used, solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure.

Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification. Items capable of equal or better performance may be used if these characteristics have been validated.

Where the use of a centrifuge is indicated, unless otherwise specified, the directions are predicated upon the use of apparatus having an effective radius of about 20 cm (8 inches) and driven at a speed sufficient to clarify the supernatant layer within 15 minutes.

Unless otherwise specified, for chromatographic tubes and columns the diameter specified refers to internal diameter (ID); for other types of tubes and tubing the diameter specified refers to outside diameter (OD).

Steam Bath—Where the use of a steam bath is directed, exposure to actively flowing steam or to another form of regulated heat, corresponding in temperature to that of flowing steam, may be used.

Water Bath—Where the use of a water bath is directed without qualification with respect to temperature, a bath of vigorously boiling water is intended.

Foreign Substances and Impurities—Tests for the presence of foreign substances and impurities are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Official Articles* ⟨1086⟩).

While one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity, strength, quality, and purity, it is manifestly impossible to include in each monograph a test for every impurity, contaminant, or adulterant that might be present, including microbial contamination. These may arise from a change in the source of material or from a change in the processing, or may be introduced from extraneous sources. Tests suitable for detecting such occurrences, the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice, should be employed in addition to the tests provided in the individual monograph.

Other Impurities—Official substances may be obtained from more than one process, and thus may contain impurities not considered during preparation of monograph assays or tests. Wherever a monograph includes a chromatographic assay or purity test based on chromatography, other than a test for ~~organic volatile impurities,~~

■residual solvents■1S (*USP27*)

and that monograph does not detect such an impurity, solvents excepted, the impurity shall have its amount and identity, where both are known, stated under the heading *Other Impurity*(*ies*) by the labeling (certificate of analysis) of the official substance.

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is 0.1% or greater. Tests suitable for detection and quantitating unlabeled impurities, when present as the result of process change or other identifiable, consistent occurrence, shall be submitted to the USP for inclusion in the individual monograph. Otherwise, the impurity shall be identified, preferably by name, and the amount listed under the heading *Other Impurity*(*ies*) in the labeling (certificate of analysis) of the official substance. The sum of all *Other Impurities* combined with the monograph-detected impurities does not exceed 2.0% (see *Ordinary Impurities* ⟨466⟩), unless otherwise stated in the monograph.

Categories of drug substances excluded from *Other Impurities* requirements are fermentation products and semi-synthetics derived therefrom, radiopharmaceuticals, biologics, biotechnology-derived products, peptides, herbals, and crude products of animal or plant origin. Any substance known to be toxic must not be listed under *Other Impurities*.

■**Residual Solvents**—The requirements are stated in *Organic Volatile Impurities* ⟨467⟩ together with information in *Impurities in Official Articles* ⟨1086⟩. Thus all drug substances, excipients, and products are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. The requirements have been aligned with the ICH guideline on this topic. If solvents are used during production, they are of suitable quality. In addition, the toxicity and residual level of each solvent are taken into consideration, and the solvents are limited according to the principles defined and the requirements specified in *Organic Volatile Impurities* ⟨467⟩, using the general methods presented therein or other suitable methods.■1S (*USP27*)

Procedures—Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the utilization of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures utilized. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all of the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for assuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing *process validation* studies and from *in-process controls* may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not less than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.

Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not less than a given number, usually 20, of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the *Assay* procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on drying*, or *Water*, or *Loss on ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for *Loss on drying* or *Water*, the expression "previously dried" without qualification signifies that the substance is to be dried as directed under *Loss on drying* or *Water* (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter *USP Reference Standards* ⟨11⟩, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within 10% of the specified weight or volume. However, the weight or volume taken is accurately determined and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under *Volumetric Apparatus* ⟨31⟩, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under *Volumetric Apparatus* ⟨31⟩ , may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as "25.0 mL" and "25.0 mg," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under *Volumetric Apparatus* ⟨31⟩ or under *Weights and Balances* ⟨41⟩.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession. See also *Use of Reference Standards* under *Spectrophotometry and Light-Scattering* ⟨851⟩.

Blank Determination—Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator—The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution—Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see *Volumetric Apparatus* ⟨31⟩).

Drying to Constant Weight—The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration—Where it is directed to "filter," without further qualification, the intent is that the liquid be filtered through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests—The Pharmacopeial tests headed *Identification* are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight—The specification "ignite to constant weight" means that the ignition shall be continued, at 800 ± 25° unless otherwise indicated, until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators—Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL, or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms—Logarithms used in the assays are to the base 10.

Microbial Strains—Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible—This term indicates a quantity not exceeding 0.50 mg.

Odor—Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, of either a freshly opened package of the article (for packages containing not more than 25 g) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about 100-mL capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements—The term "mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions—Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with *Purified Water*.

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid is to be diluted with, or 1 part *by weight* of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts *by volume*.

An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions*, and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity—Unless otherwise stated, the specific gravity basis is 25°/25°, i.e., the ratio of the weight of a substance in air at 25° to the weight of an equal volume of water at the same temperature.

Temperatures—Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at 25°. Where moderate heat is specified, any temperature not higher than 45° (113°F) is indicated. See *Storage Temperature* under *Preservation, Packaging, Storage, and Labeling* for other definitions.

Time Limit—In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum—The term "in vacuum" denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water—Where water is called for in tests and assays, Purified Water is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide–free water," see the introduction to the section *Reagents, Indicators, and Solutions*. For *High-purity Water* see *Containers* ⟨661⟩.

Water and Loss on Drying—Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading *Water*. Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading *Loss on drying*. However, *Loss on*

drying is most often given as the heading where the loss in weight is known to represent residual volatile constituents including organic solvents as well as water.

Test Results, Statistics, and Standards—Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compliance with good manufacturing practices generally, are developed and followed to assure that the article will indeed comply with compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for *Dissolution* and *Uniformity of dosage units*, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.

▲Where the *Content Uniformity* determinations have been made using the same ~~method~~ procedure specified in the *Assay*, the average of all of the individual *Content Uniformity* determinations may be used as the *Assay* value.▲*USP27*

Description—Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table *Description and Relative Solubility of USP and NF Articles* in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility—The statements concerning solubilities given in the reference table *Description and Relative Solubility of USP and NF Articles* for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table.

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1000
Very slightly soluble	From 1000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

Soluble Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

▲**Interchangeable Methods**—Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method from one of these pharmacopeias, it should comply with the requirements of the *United States Pharmacopeia*. However, where a difference appears, or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.▲*USP26*

Change to read:

PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers—The *container* is that which holds the article and is or may be in direct contact with the article. The *immediate container* is that which is in direct contact with the article at all times. The *closure* is a part of the container.

Prior to its being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The Pharmacopeial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

~~*Tamper-Resistant*~~

■*Tamper-Evident*■2S (*USP26*)

Packaging—The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the ~~tamper-resistant~~

■tamper-evident■2S (*USP26*)
packaging and labeling requirements of the FDA where applicable.

In-Process Revision

Preferably, the immediate container and/or the outer container or protective packaging utilized by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

Light-Resistant Container (see *Light Transmission* under *Containers* ⟨661⟩)—A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to ''protect from light'' in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering prior to dispensing.

Well-Closed Container—A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container—A tight container protects the contents from contamination by extraneous liquids, solids, or vapors, from loss of the article, and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution, and is capable of tight reclosure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

NOTE—Where packaging and storage in a *tight container* or a *well-closed container* is specified in the individual monograph, the container utilized for an article when dispensed on prescription meets the requirements under *Containers—Permeation* ⟨671⟩.

Hermetic Container—A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Unit Container—A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

Single-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A single-dose container is a single-unit container for articles intended for parenteral administration only. A single-dose container is labeled as such. Examples of single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Unit-Dose Container—A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

Unit-of-Use Container—A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

Multiple-Unit Container—A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Multiple-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

Storage Temperature and Humidity—Specific directions are stated in some monographs with respect to the temperatures and humidity at which Pharmacopeial articles shall be stored and distributed (including the shipment of articles to the consumer) when stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply (see also *Stability* under *Pharmaceutical Dosage Forms* ⟨1151⟩.) The conditions are defined by the following terms.

Freezer—A place in which the temperature is maintained thermostatically between –25° and –10° (–13° and 14 °F).

Cold—Any temperature not exceeding 8° (46 °F). A *refrigerator* is a cold place in which the temperature is maintained thermostatically between 2° and 8° (36° and 46 °F).

Cool—Any temperature between 8° and 15° (46° and 59 °F). An article for which storage in a *cool place* is directed may, alternatively, be stored and distributed in a *refrigerator*, unless otherwise specified by the individual monograph.

Room Temperature—The temperature prevailing in a working area.

Controlled Room Temperature—A temperature maintained thermostatically that encompasses the usual and customary working environment of 20° to 25° (68° to 77 °F); that results in a mean kinetic temperature calculated to be not more than 25°; and that allows for excursions between 15° and 30° (59° and 86 °F) that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to 40° are permitted as long as they do not exceed 24 hours. Spikes above 40° may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to 25°", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variations. (See also *Stability* under *Pharmaceutical Dosage Forms* ⟨1151⟩.)

An article for which storage at *Controlled room temperature* is directed may, alternatively, be stored and distributed in a *cool place*, unless otherwise specified in the individual monograph or on the label.

Warm—Any temperature between 30° and 40° (86° and 104 °F).

Excessive Heat—Any temperature above 40° (104 °F).

Protection from Freezing—Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Dry Place—The term "dry place" denotes a place that does not exceed 40% average relative humidity at *Controlled Room Temperature* or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value is 40% relative humidity.

Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.

Storage under Nonspecific Conditions—~~For articles, regardless of quantity, where no specific storage directions or limitations are provided in the individual monograph, it is to be understood that conditions of storage and distribution include protection from moisture, freezing, and excessive heat.~~

▲Where no specific directions or limitations are provided in the packaging and storage section of individual monographs or in the article's labeling, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Articles shall be protected from moisture, freezing, and excessive heat, and, where necessary, from light during shipping and distribution. Active pharmaceutical ingredients are exempt from this requirement.▲*USP27*

■**Repackaging Instructions**—Except where a drug product is packaged in a container intended to be dispensed directly to the patient, such as a unit-of-use or unit-dose container, the labeling shall contain directions specifying the types of containers suitable for repackaging the drug product so as to maintain its identity, strength, quality, and purity. Such directions shall be sufficient to allow a repackager or dispenser to select an adequate container and shall include a description of the composition of the container(s), e.g., glass, polyethylene, polyvinyl chloride, and any moisture vapor transmission rate characteristics required. The labeling shall also indicate whether or not the container is to afford light protection, and shall include any storage or shipping temperature restrictions to which the drug as repackaged shall be limited (see 21 CFR 201.100).■1S (*USP27*)

Labeling—The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in this Pharmacopeia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the Pharmacopeial requirements set forth for the articles.

Amount of Ingredient per Dosage Unit—The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Pharmacopeial articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in *Deliverable Volume* ⟨698⟩. Pharmacopeial drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see *Percentage Measurements*), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each 5-mL portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units (see also *Units of Potency* in these *General Notices*).

Use of Leading and Terminal Zeros—In order to help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg]). The quantity of active ingredient when expressed as a decimal number smaller than one shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg]).

Labeling of Salts of Drugs—It is an established principle that Pharmacopeial articles shall have only one official name. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids; but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

Labeling Vitamin-Containing Products—The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.

Labeling Parenteral and Topical Preparations—The label of a preparation intended for parenteral or topical use states the names of all added substances (see *Added Substances* in these *General Notices and Requirements*, and see *Labeling* under *Injections* ⟨1⟩), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

Labeling Electrolytes—The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

Labeling Alcohol—The content of alcohol in a liquid preparation shall be stated on the label as a percentage (v/v) of C_2H_5OH.

Special Capsules and Tablets—The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used.

Expiration Date and Beyond-Use Date—The label of an official drug product, nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary con-

In-Process Revision

ditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/89," "Exp. June 89," or "Expires 6/89"). [NOTE—For additional information and guidance, refer to the Nonprescription Drug Manufacturers Association's *Voluntary Codes and Guidelines of the OTC Medicines Industry.*]

The monographs for some preparations state how the expiration date that shall appear on the label is to be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the Pharmacopeial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article must not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the *General Notices and Requirements* of this Pharmacopeia. The beyond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution prior to use, a suitable beyond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) one year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be one year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturers container, whichever is earlier, unless stability data or the manufacturers labeling indicates otherwise.

The dispenser must maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than 25°. The plastic material used in packaging the dosage forms must afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records must be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

Pharmaceutical Compounding—The label on the container or package of an official compounded preparation shall bear a beyond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, is to be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see *Stability Criteria and Beyond-Use Dating* under *Stability of Compounded Preparations* in the general tests chapter

■*Pharmacy Compounding* ⟨795⟩).■2S (*USP26*)

MONOGRAPHS (USP)

BRIEFING

Albendazole Oral Suspension, *USP 26* page 54 and page 2505 of *PF* 27(3) [May–June 2001]. USP acknowledges that *Albendazole Oral Suspension* is approved in several countries for human use. It is proposed to change the specified labeling requirements so that manufacturers can use the USP *Albendazole Oral Suspension* monograph for these drug products.

Change to read:

~~» Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.80 to 640.86) (see *Biologics* ⟨1041⟩). It is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen.~~

■» Albumin Human is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen, hepatitis C, and HIV by antibody and nucleic acid assay, and other disease-causative agents that are not destroyed or removed by the processing method, as determined by the medical history of the donor, and from such physical examination and approved clinical tests as may appear necessary for each donor at the time the blood was obtained.■1S (*USP27*)
It is made by a process that yields a product that is safe for intravenous use. Not less than 96 percent of its total protein is albumin

■, as determined by an approved and validated method.■1S (*USP27*)
It is a solution containing, in each 100 mL, either 25 g of serum albumin osmotically equivalent to 500 mL of normal human plasma, or 20 g equivalent to 400 mL, or 5 g equivalent to 100 mL, or 4 g equivalent to 80 mL thereof, and contains not less than 93.75 percent and not more than 106.25 percent of the labeled amount in the case of the solution containing 4 g in each 100 mL, and not less than 94.0 percent and not more than 106.0 percent of the labeled amount in the other cases. It contains no added antimicrobial agent, but may contain sodium acetyltryptophanate with or without sodium caprylate as a stabilizing agent. ~~It has a sodium content of not less than 130 mEq per liter and not more than 160 mEq per liter. It has a heme content such that the absorbance of a solution, diluted to contain 1 percent of protein, in a 1-cm holding cell, measured at a wavelength of 403 nm, is not more than 0.25. It meets the requirements of the tests for heat stability and for pH.~~

■■1S (*USP27*)

Change to read:

Packaging and storage—Preserve in tight containers, and store at the temperature ~~recommended by the manufacturer~~

■■1S (*USP27*)
indicated on the label.

Change to read:

Expiration date—The expiration date is not later than 5 years after issue from manufacturer's cold storage ~~(5°, 3 years)~~

■(at 5° for not more than 3 years)■1S (*USP27*)
if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage ~~(5°, 3 years)~~

■■1S (*USP27*)
if labeling recommends storage at temperatures not higher than 37°; and not later than 10 years after date of manufacture if in a hermetically sealed metal container and labeling recommends storage between 2° and 10°.

Change to read:

Labeling— ~~Label it to state that it is not to be used if it is turbid and that it is to be used within 4 hours after the container is entered. Label it also to state the osmotic equivalent in terms of plasma, the sodium content, and the type of source material (venous plasma, placental plasma, or both) from which it was prepared. Label it also to indicate that additional fluids are needed when the 20 g per 100 mL or 25 g per 100 mL product is administered to a markedly dehydrated patient.~~

■Label it to state (1) the osmotic equivalent in terms of plasma, and the sodium content in terms of a value or a range in mEq per liter, (2) the need for additional fluids when 20% or 25% albumin is administered to a patient with marked dehydration, and (3) the protein content, expressed as a 4%, 5%, 20%, or 25% solution. Include on the label in a prominent position the following cautionary statements: "Do Not Use if Turbid. Do Not Begin Administration More Than 4 Hours After the Container Has Been Entered." Indicate on either the container or package label, or in the package insert, the type of source material, expressed as venous plasma, pla-

In-Process Revision

cental plasma, or both, used to manufacture the final product. Label it to indicate the volume of the preparation, storage conditions, the expiration date, and the name and concentration of any added substance (for example, stabilizer). Where applicable, the label indicates that the preparation is suitable for administration to patients undergoing dialysis and to premature infants.■1S (*USP27*)

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Albumin Human RS. USP Endotoxin RS.*■1S (*USP27*)

Add the following:

■**Identification**—

A: *Immunodiffusion*—

pH 8.0 buffer—Dissolve 1.98 g of barbituric acid, 1.03 g of sodium barbital, and 8.7 g of sodium chloride in 900 mL of water. Adjust with a sodium hydroxide solution to a pH of 8.0, dilute with water to make up to 1 L, and mix.

Procedure—Prepare agar-gel immunodiffusion plates each containing one central well and 5 or 6 outer wells concentric with the central well using 1.9 g of agar in 150 mL *pH 8.0 buffer*. Place 5 µL of Albumin Human in the central well of one plate and 5 µL of USP Albumin Human RS in the central well of another plate. Add 5 µL of an antiserum specific to human plasma proteins from a suitable commercial source in one of the appropriately marked outer wells of each plate. Place 5 µL each of antisera specific to plasma proteins of animals commonly used in the preparation of materials of biological origin in other appropriately marked outer wells of each plate. [NOTE—At the minimum, antisera against plasma proteins of bovine, porcine, and ovine must be used.] Incubate the plates at 2° to 8° for at least 24 hours. The plate containing Albumin Human observed in a bright white light shows a sharp white arc between the central well and the well containing antiserum specific to human plasma proteins, and no arc between the central well and the wells containing antisera specific to plasma proteins of other animals. The test is valid if the plate containing USP Albumin Human RS shows an arc between the central well and the well containing antiserum specific to human plasma proteins, and no arc between the central well and the wells containing antisera specific to plasma proteins of other animals.

B: *Immunoelectrophoresis*—

Electrophoretic buffer—Dissolve 2.5 g of barbituric acid, 16.7 g of sodium barbital, 1.0 g of sodium chloride, and 0.7 g of edetate disodium in about 1.9 L of water, and adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.6. Dilute with water to obtain a final volume of 2 L, and mix.

Reference solution—Dilute normal human serum from a suitable commercial source with *Electrophoretic buffer* to obtain a total protein concentration of about 10 mg per mL.

Test solution—Dilute Albumin Human with *Electrophoretic buffer* to obtain a total protein concentration of about 10 mg per mL.

Procedure—Mount a suitable immunoelectrophoresis microslide strip containing 1% agar gel between the two buffer reservoirs of a suitable microelectrophoresis apparatus. Place suitable volumes of *Electrophoretic buffer* in the buffer reservoirs. Cut two pieces of blotting paper of suitable lengths such that the widths are approximately equal to that of the agar gel, and soak them in *Electrophoretic buffer*. Place the pieces such that one end of each dips into the *Electrophoretic buffer* while the other ends of the pieces are placed on the two ends of the agar-gel strip such that they extend for about 1 cm at both ends. Using a suitable commercial device dig two wells about 1.5 cm apart near one end of the agar-gel strip such that they are about 0.5 cm away from the nearest blotting paper and at the same level perpendicular to the direction of the electrophoresis, and dig a central slot of suitable length between the two wells, and

equidistant from them, along the direction of electrophoresis. Place 1 µL of *Reference solution* into one well and an equal volume of *Test solution* into the other. Electrophorese the samples for about 35 minutes applying 90 volts across the agar-gel strip. Remove the blotting papers, and place in the central slot about 25 µL of the same antiserum specific to human plasma proteins as is used in *Identification* test *A*. Incubate the microslide at 2° to 8° for at least 24 hours. Observed in a bright white light, the microslide shows an arc for *Test solution* that corresponds to the major arc obtained with the *Reference solution*. The test is not valid if *Identification* test *A* is not valid.■1S (*USP27*)

Add the following:

■**Bacterial endotoxins** ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.■1S (*USP27*)

Add the following:

■**Safety**—It meets the requirements when tested as directed for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩■1S (*USP27*)

Add the following:

■**Sterility**⟨71⟩: It meets the requirements.■1S (*USP27*)

Add the following:

■**pH** ⟨791⟩: between 6.4 and 7.4 when diluted with 0.15 M sodium chloride to obtain a solution containing 1% protein.■1S (*USP27*)

Add the following:

■**Molecular size distribution**—

Mobile phase—Prepare a suitable degassed and filtered solution containing 7.337 g of dibasic sodium phosphate heptahydrate, 1.741 g of monobasic sodium phosphate monohydrate, and 11.688 g of sodium chloride per liter in water.

Reference solution—Dilute a solution of USP Albumin Human RS in *Mobile phase* to obtain a solution having a concentration of about 10 mg per mL of protein, and mix.

Test solution—Dilute a solution of Albumin Human in *Mobile phase* to obtain a solution having about the same concentration of protein as the *Reference solution*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a UV/visible detector set at 280 nm, a 7.5- × 600-mm analytical column, a 7.5- × 75-mm guard column, both containing ~~L58~~ L## (see *Chromatography* ⟨621⟩) packing, and maintained at ambient temperature. The flow rate is constant and is maintained at 0.5 mL per minute ± 1%.

Procedure—Separately inject 25 µL of the *Reference solution* and the *Test solution*, and record the chromatograms. The area of the major peak is not less than 85% of the total peak area in the chromatogram. The test is not valid unless the value obtained for USP Albumin Human RS is within the value stated in the USP Albumin Human RS Data Sheet.■1S (*USP27*)

Add the following:

■**Heat stability**—A final container sample of Albumin Human shall remain unchanged, as determined by visual inspection, after heating at 57° for 50 hours, when compared to its control consisting of a sample, from the same lot, which has not undergone the heat treatment.■1S (*USP27*)

Add the following:

■**Prekallikrein activator**—

Buffer A—Dissolve 6.1 g of tris(hydroxymethyl)aminomethane, 1.2 g of sodium chloride, 50 mg of hexadimethrine bromide, and 0.1 g of sodium azide in 800 mL water. Adjust with 2 M hydrochloric acid at 20° to 25° to a pH of 7.8, and dilute with water to 1000 mL.

Buffer B—Dissolve 6.1 g of tris(hydroxymethyl)aminomethane and 0.7 g of sodium chloride in 800 mL of water. Adjust with 2 M hydrochloric acid at 20° to 25° to a pH of 7.8, and dilute with water to 1000 mL.

Chromogenic substrate solution A—Prepare a solution of a suitable *Chromogenic Substrate for Amidolytic Test* (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) specific for kallikrein in water to obtain a solution having a concentration of about 6 mM.

Chromogenic substrate solution B—Dilute 1 volume of *Chromogenic substrate solution A* with 9 volumes of *Buffer B*.

Prekallikrein substrate—[NOTE—To avoid coagulation activation, blood or plasma used for the preparation of *Prekallikrein substrate* must only come into contact with plastic or silicone-treated glass surfaces.] Draw 9 volumes of human blood into 1 volume of a suitable anticoagulant solution containing 1 mg per mL of hexadimethrine bromide. Centrifuge the mixture at 3600 *g* for 5 minutes. Centrifuge the plasma fraction again at 6000 *g* for 20 minutes to sediment platelets. Dialyze the platelet-reduced plasma against 10 volumes of *Buffer A* for 20 hours. Apply the dialyzed plasma to a DEAE-agarose column equilibrated in *Buffer A*, such that the volume of DEAE-agarose is twice the volume of the plasma. Elute from the column with *Buffer A* at 20 mL per cm^2 per hour. Collect the eluate in fractions, and record the absorbance at 280 nm. Pool the fractions containing the first protein peak so that the volume of the pool is about 1.2 times the volume of the platelet-reduced plasma. Add solid sodium chloride to the pooled solution, and dissolve such that the final concentration of sodium chloride is 7.0 mg per mL. Filter the solution using a membrane filter having a 0.45-µm porosity, freeze the filtrate in portions, and store at –70°; the substrate is stable at –70° for 1 year. [NOTE—Carry out all steps from the beginning of the chromatography to freezing in portions during a single working day.] Test the substrate pool for absence of kallikrein activity by mixing 1 part with 20 parts of the *Chromogenic substrate solution B* prewarmed at 37°, and incubate at 37° for 2 minutes. The substrate is suitable if the increase in absorbance is less than 0.001 per minute.

Standard solutions—Dilute USP Albumin Human RS with *Buffer B* to prepare four solutions corresponding to a suitable range of prekallikrein activator concentration in IU per mL.

Test solution—Dilute Albumin Human with an equal volume of *Buffer B*.

Procedure—To suitably capped tubes transfer 25 µL each of *Buffer B* (to be used as the blank), four *Standard solutions*, and the *Test solution*. To each tube add 100 µL of *Prekallikrein substrate*, and incubate at 37° for 45 minutes. Transfer 25 µL of each solution to a suitable cuvette (1-cm path length) containing 1000 µL of *Chromogenic substrate solution B* and prewarmed and maintained at 37°. Mix, and measure the change of absorbance (ΔA) for 10 minutes spectrophotometrically at 405-nm wavelength at 37°. Subtract ΔA per minute for the blank from ΔA per minute for each of the *Standard solutions*, and the *Test solution*. Plot the corrected ΔA per minute for each of the *Standard solutions* versus its respective prekallikrein activator concentration. Calculate the prekallikrein activator concentration of the *Test solution* from the standard curve, and multiply the value by 2. The prekallikrein activator concentration of Albumin Human is not more than 35 IU per mL.■1S (*USP27*)

Add the following:

■**Protein content**—

Sodium molybdate solution—Dissolve 9.0 g of disodium molybdate dihydrate in 115 mL of water in a suitable container. Add 4 mL of sulfuric acid, and mix.

Test solution—Dilute Albumin Human with 0.15 M sodium chloride to obtain a solution containing about 7.5 mg of protein per mL of the solution.

In-Process Revision

Blank: 0.15 M sodium chloride used to make the *Test solution*.

Procedure—To 2.0 mL of the *Test solution* and the *Blank* in suitable centrifuge tubes, add 2.0 mL of *Sodium molybdate solution*. Mix, allow to stand for about 10 minutes, centrifuge for 5 minutes, and decant the supernatant. Resuspend the precipitates in 2.0 mL of *Sodium molybdate solution*, centrifuge for 5 minutes, decant the supernatant, and hold the tubes inverted to drain on a filter paper. Transfer the residues quantitatively with a minimum quantity of water to a micro-Kjeldahl flask, and determine the nitrogen in the residues using *Method II* under *Nitrogen Determination* ⟨461⟩. Multiply the result, corrected for the *Blank*, by 6.25 to calculate the quantity of protein.■1S (*USP27*)

Add the following:

■**Heme content**—Dilute Albumin Human using 0.15 M sodium chloride to obtain a solution having a concentration of 10 mg per mL of protein. The absorbance (see *Spectrophotometry and Light-Scattering* ⟨851⟩) of the solution measured at 403 nm using 0.15 M sodium chloride as the blank, is not greater than 0.25.■1S (*USP27*)

Add the following:

■**Potassium content**—

Standard solutions 1, *2*, *3*, and *4*—Prepare four standard solutions containing 0, 1.0, 2.0, and 3.0 mg of potassium, in the form of the chloride, per L, respectively, in 0.1 N hydrochloric acid and 25 mEq of sodium (1.46 g of sodium chloride) per L.

Test solution—Transfer 3.5 mL of Albumin Human, 5.0 mL of 0.15 M sodium chloride, and 5.0 mL of 1 N hydrochloric acid to a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Set a suitable flame photometer to a wavelength of 766 nm. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of *Standard solutions 2* and *3*. Plot the observed transmittance of *Standard solutions 2, 3,* and *4* versus their respective potassium concentrations. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of the *Test solution*, and from the standard curve calculate the potassium content in mg per liter of the *Test solution*. Multiply the value by 0.365 (multiplication by the dilution factor and division by the equivalent weight of potassium, 39.1) to obtain the potassium concentration in mEq per L in the sample. Albumin Human contains between 0 and 1 mEq of potassium per L of sample.■1S (*USP27*)

Add the following:

■**Sodium content**—

Standard solutions 1, *2*, *3*, and *4*—Prepare four standard solutions containing 0, 2.0, 3.0, and 4.0 mg of sodium, in the form of the chloride, per L, respectively, in 0.1 N hydrochloric acid and 6.0 mEq of potassium (447.6 mg of potassium chloride) per L.

Test solution—Transfer 75 µL of Albumin Human, 4.0 mL of 0.15 M potassium chloride, and 10.0 mL of 1 N hydrochloric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Set a suitable flame photometer to a wavelength of 589 nm. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of *Standard solutions 2* and *3*. Plot the observed transmittance of *Standard solutions 2, 3,* and *4* versus their respective sodium concentrations. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of the *Test solution*, and from the standard curve calculate the sodium content in mg per liter in the *Test solution*. Multiply the value by 57.97 (multiplication by the di-

lution factor and division by the equivalent weight of sodium, 23.0) to obtain the sodium concentration in mEq per L. Albumin Human contains between 130 and 160 mEq of sodium per L of sample.■1S (*USP27*)

BRIEFING

Alendronic Acid Tablets, page 740 of *PF* 28(3) [May–June 2002]—See briefing under *Chromatography* ⟨621⟩).

(HDQ: M. Marques) RTS—39943-1

Add the following:

■~~Alendronate Sodium Tablets~~ Alendronic Acid Tablets

» ~~Alendronate Sodium Tablets contain~~ Alendronic Acid Tablets contain an amount of Alendronate Sodium, equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ~~alendronate sodium ($C_4H_{12}NNaO_7P_2 \cdot 3H_2O$).~~ alendronic acid ($C_4H_{13}NO_7P_2$).

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—*USP Alendronate Sodium RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: ~~30~~ 15 minutes.

~~Determine the amount of $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ dissolved by employing the following method.~~

~~*Buffer solution* and *Mobile phase*—Prepare as directed in the *Assay.*~~

~~*0.05% 9-Fluorenylmethyl chloroformate solution*—Transfer 100 mg of 9-fluorenylmethyl chloroformate to a 200-mL volumetric flask, dilute with acetonitrile to volume, and mix. This solution must be freshly prepared.~~

~~*Borate solution*—Transfer 38.1 g of sodium borate to a 1-liter volumetric flask, dissolve in and dilute with water to volume, and mix.~~

~~*Borate buffer*—Dissolve 6.2 g of boric acid in approximately 950 mL of water, adjust with 1 N sodium hydroxide to a pH of 9.0, and dilute with water to 1 liter.~~

~~*Diluent*—Transfer 176.4 g of sodium citrate dihydrate to a 1000-mL volumetric flask, dissolve in and dilute with *Dissolution Medium* to volume, and mix.~~

~~*Standard stock solution*—Dissolve an accurately weighed quantity of USP Alendronate Sodium RS in *Dissolution Medium*, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration corresponding to the concentration that would be obtained by dissolving one Tablet in 900 mL of the same *Medium.*~~

~~*Standard solution*—Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Borate solution buffer*, and mix for about 3 minutes. Add 3.0 mL of *0.05% 9-Fluorenylmethyl chloroformate solution*, and agitate for about 30 seconds. Allow the solution to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 10 minutes. Use a portion of the clear upper aqueous layer.~~

In-Process Revision

~~*Reagent blank*—Using 5 mL of water, proceed as directed for *Standard solution*, beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."~~

~~*Test solution*—After 30 minutes, withdraw a portion of the solution under test, and filter immediately. Using 5.0 mL of the filtrate, proceed as directed for *Standard solution*, beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the capacity factor, *k′*, is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard solution*, the *Test solution*, and the *Reagent blank* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alendronate sodium ($C_4H_{12}NNaO_7P_2 \cdot 3H_2O$) dissolved by the formula:~~

~~$$0.9C(r_u/r_s),$$~~

~~in which C is the concentration, in µg per mL, of USP Alendronate Sodium RS in the *Standard stock solution;* and r_u and r_s are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively.~~

Procedure—Determine the amount of $C_4H_{13}NO_7P_2$ dissolved, by employing the procedure set forth in the *Assay*, except to make any necessary volumetric adjustment and to use 200-µL injection volumes.

Tolerances—Not less than 80% (Q) of the labeled amount of ~~$C_4H_{12}NNaO_7P_2 \cdot 3H_2O$~~ alendronic acid ($C_4H_{13}NO_7P_2$) is dissolved in ~~30 minutes~~ 15 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Limit of phosphate—

Mobile phase, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of alendronic acid, to a 50-mL volumetric flask, dissolve in HPLC grade water, sonicate for 30 minutes, and shake for 10 minutes. Dilute with HPLC grade water to volume, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Procedure—Inject a volume (about 100 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of phosphate in the portion of Tablets taken by the formula:

$$100(r_i/r_s),$$

in which r_i is the phosphate peak response, and r_s is the sum of the responses of all the peaks: not more than 0.1% is found.

Assay—

~~*Diluent*—Transfer 29.4 g of sodium citrate dihydrate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

~~*Buffer solution*—Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0, dilute with water to volume, and mix.~~

~~*0.1% 9-Fluorenylmethyl chloroformate solution*—Transfer 250 mg of 9-fluorenylmethyl chloroformate to a 250-mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare this solution fresh just prior to use.~~

In-Process Revision

~~*Borate solution*—Transfer 38.1 g of sodium borate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Prepare a 0.1 M sodium borate solution.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, acetonitrile, and methanol (75:20:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard stock preparation*—Transfer about 25 mg of USP Alendronate Sodium RS, accurately weighed, to a 1000-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.~~

~~*Standard preparation*—Transfer 5.0 mL of the *Standard stock preparation* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Borate solution*, and mix for about 3 minutes. Add 4 mL of *0.1% 9-Fluorenylmethyl chloroformate solution*, and agitate for about 30 seconds. Allow the solution to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 10 minutes. Use the clear upper aqueous layer.~~

~~*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of alendronate sodium, to a 1000-mL volumetric flask, dilute with *Diluent* to volume, and mix. Stir with the aid of a magnetic stirrer for 30 minutes. Centrifuge a portion of this solution for about 20 minutes. Using 5.0 mL of the solution so obtained, proceed as directed for *Standard preparation*, beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."~~

~~*Reagent blank*—Using 5 mL of *Diluent*, proceed as directed for *Standard preparation*, beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 266-nm detector and a 4.1-mm × 25-cm column that contains 10-µm packing L21. The column is maintained at a constant temperature of about 35°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, k', is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation*, *Assay preparation*, and the *Reagent blank* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alendronate sodium ($C_4H_{12}NNaO_7P_2 \cdot 3H_2O$), in the portion of Tablets taken by the formula:~~

$$W(r_U/r_S),$$

~~in which W is the weight, in mg, of USP Alendronate Sodium RS taken to prepare the *Standard stock preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

Mobile phase—Prepare a 7.2 mM solution of nitric acid in HPLC grade water.

System suitability solution—Prepare a solution of USP Alendronate Sodium RS and sodium biphosphate in HPLC grade water containing 0.2 mg per mL and 0.1 mg per mL, respectively.

Standard preparation—Prepare a solution of USP Alendronate Sodium RS in HPLC grade water having a known concentration of about 0.52 mg of alendronate sodium trihydrate per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of alendronic acid, to a 250-mL volumetric flask, dissolve in HPLC grade

In-Process Revision

water, sonicate for 30 minutes, and shake for 10 minutes. Dilute with HPLC grade water to volume, and mix. Pass a portion of this solution through a filter having a 0.45-mm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.1-mm × 25-cm column that contains packing ~~L53.~~ L## (see *Chromatography* ⟨621⟩). The flow rate is about 1.6 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between alendronate and phosphate is not less than 2.0; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alendronic acid ($C_4H_{13}NO_7P_2$) in the portion of Tablets taken by the formula:

$$250(249.10/325.12)C(r_U/r_S),$$

in which 249.10 and 325.12 are the molecular weights of alendronic acid and alendronate sodium trihydrate, respectively; *C* is the concentration, in mg per mL, of alendronate sodium trihydrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Allopurinol Oral Solution, page 1991 of *PF* 28(6) [Nov.–Dec. 2002]; **Atenolol Oral Solution,** page 1991 of *PF* 28(6) [Nov.–Dec. 2002]. These two new monographs, which previously appeared in *Pharmacopeial Previews*, are now recommended to be published as four monographs, with changes, in *In-Process Revision* for inclusion in *USP*. The Expert Committee on Nomenclature and Labeling voted to approve the separate titles in the general form [DRUG] Oral Solution and [DRUG] Oral Suspension to alleviate confusion if a preparation called "Oral Solution" could in fact be a suspension with "shake well" instructions where tablets formulated with insoluble excipients provide the prescribed amount of the therapeutically active ingredient.

The revised titles "Vehicle for Oral Solution" and "Vehicle for Oral Suspension" are indicated in the compounding directions, and control of pH is recommended similarly as for the monographs on the vehicles.

(CRX: C. Okeke; NL: C. Barnstein) RTS—39822-1

Add the following:

■Allopurinol Oral ~~Solution~~ Suspension

» Allopurinol Oral ~~Solution~~ Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of allopurinol ($C_5H_4N_4O$). Prepare Allopurinol Oral ~~Solution~~ Suspension at a 2% concentration, for example, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Allopurinol	2 g
Glycerin	5 mL
~~Oral Suspension Vehicle~~ Vehicle for Oral Suspension	45 mL
~~Oral Solution Vehicle,~~ Vehicle for Oral Solution, a sufficient quantity to make	100 mL

~~Calculate~~ Select the number of Tablets that contain the specified amount of Allopurinol and calculate the quantity of each ingredient required for the total amount to be prepared. Accurately count/weigh/measure each ingredient.~~, or obtain~~

In-Process Revision

~~the required number of Tablets.~~ Thoroughly pulverize the tablets.~~, if used.~~ Mix the ~~Allopurinol~~ powdered Allopurinol Tablets and Glycerin to form a smooth paste, incorporate the ~~Oral Suspension Vehicle,~~ Vehicle for Oral Suspension, add sufficient ~~Oral Solution Vehicle~~ Vehicle for Oral Solution to volume, and mix well. Adjust the pH, if necessary. Package, and label.

Packaging and storage—Package in a tight container, and store at controlled room temperature.

Labeling—Label it to state that it is to be shaken well before use and that it is to be discarded after 60 days. Label it to state that it is to be kept out of the reach of children. Label it to indicate the nominal content of Allopurinol ~~Oral Solution.~~ in the Oral Suspension.

pH ⟨791⟩: an apparent pH between 6.5 and 7.5.

Beyond-use date: not more than 60 days after preparation.■1S (*USP27*)

BRIEFING

Atenolol Oral Solution, page 1991 of *PF* 28(6) [Nov.–Dec. 2002]—See briefing under *Allopurinol Oral Solution*.

(CRX: C. Okeke; NL: C. Barnstein) RTS—39822-2

Add the following:

■Atenolol Oral Solution

» Atenolol Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of atenolol ($C_{14}H_{22}N_2O_3$).

Prepare Atenolol Oral Solution at a 0.2% concentration, for example, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Atenolol	200 mg
Glycerin	5 mL
~~Oral Suspension Vehicle~~ Vehicle for Oral Suspension	45 mL
~~Oral Solution Vehicle Sugar Free~~ Vehicle for Oral Solution, Sugar Free, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total volume and atenolol strength to be prepared. Accurately weigh/measure each ingredient. ~~Atenolol Oral Solution (0.2%) may be prepared from Atenolol powder or pulverized tablets or Atenolol Tablets.~~ Mix the Atenolol, previously pulverized, and Glycerin to form a smooth paste. Incorporate the ~~Oral Suspension Vehicle if Atenolol Tablets are used to prepare the Oral Solution. The Oral Suspension Vehicle may be omitted if Atenolol is dissolved to prepare the Oral Solution.~~ Vehicle for Oral Suspension or an equal volume of Vehicle for Oral Solution, Sugar Free. [NOTE—The Vehicle for Oral Suspension may be omitted.] Incorporate sufficient ~~Oral Solution Vehicle~~ Vehicle for Oral Solution, Sugar Free in increments to

In-Process Revision

bring to volume, and mix well. Adjust the pH, if necessary. [NOTE—Do not use a sucrose-containing vehicle for oral solution.] Package, and label.

Packaging and storage—Package in amber, tight containers, and store at controlled room temperature.

Labeling—Label it to state that it is to be shaken well before use, and discarded after 60 days. Label it to state that it is to be kept out of reach of children. Label it to indicate the nominal atenolol concentration.

Beyond-use date: not more than 60 days after preparation.■IS (*USP27*)

BRIEFING

Anthrax Vaccine Adsorbed. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The approved U.S. Reference Anthrax Vaccine to be used in the test for *Relative potency*, included in the proposed monograph, is available from the Center for Biologics Evaluation and Research, Food and Drug Administration.

(VVI: L. Bhattacharyya) RTS—37388-1; 39647-1; 39509-1; 39972-1

Add the following:

■Anthrax Vaccine Adsorbed

» Anthrax Vaccine Adsorbed is a sterile, milky-white suspension made from cell-free filtrates of microaerophilic cultures of an avirulent, non-encapsulated strain of *Bacillus anthracis*. The final product contains no dead or live bacteria. The production cultures are grown in a chemically defined protein-free medium containing amino acids, vitamins, inorganic salts, and sugars. The sterile filtrate is adsorbed on sterile aluminum hydroxide, concentrated 10-fold, and resuspended in sterile physiological saline containing formaldehyde with benzethonium chloride as a preservative. Sublots may be combined to produce final lots. The product meets potency requirements when tested against the U.S. Reference Standard Anthrax Vaccine, in accordance with approved procedures (guinea pig intracutaneous challenge models).

Packaging and storage—Preserve in multiple-dose tight Type I glass containers, and store at a temperature between 2° and 8°. Do not freeze.

Expiration date—The expiration date is 18 months from the date of manufacture.

Labeling—Label it to state that it is to be well shaken before use and that it is not to be frozen. Label it to state that it is "Rx only" and not to be used after the expiration date given on the package.

FILTRATE—

Identification—

Trichloroacetic acid solution—Prepare a solution of trichloroacetic acid (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water containing 100 g trichloroacetic acid per 100 mL of the solution.

Sample buffer—Prepare a solution containing 141 mM tris(hydroxymethyl)aminomethane, 106 mM tris(hydroxymethyl)aminomethane hydrochloride, 0.51 mM edetate disodium, 2% (w/v) dodecyl lithium sulfate, 10% (v/v) glycerol, 0.22 mM Coomassie blue G-250, and 0.175 mM phenolsulfonphthalein. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

Running buffer—Prepare a solution containing 25 mM tris(hydroxymethyl)aminomethane, 192 mM glycine, and 0.1% (w/v) dodecyl sodium sulfate (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

Transblotting buffer—Prepare a solution containing 12.5 mM tris(hydroxymethyl)aminomethane, 96 mM glycine, and 10% (v/v) methanol. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.0.

Blocking buffer—Prepare a solution containing 10 mM monobasic sodium phosphate, 150 mM sodium chloride, 5% (w/v) nonfat dry milk, and 0.05% (w/v) Polysorbate 20. Adjust with sodium hydroxide to a pH of 7.4.

Primary antibody solutions—Prepare suitable monoclonal antibodies raised against the Protective Antigen (PA), the Lethal Factor (LF), and the Edema Factor (EF), respectively, of *Bacillus anthracis* in murine ascites cells, harvested, and used without further purification. Immediately before use, dilute each of the murine ascites fluids containing the monoclonal antibodies 1:1000 (v/v) with the *Blocking buffer.*

Secondary antibody solution—Immediately before use, dissolve according to the manufacturer's instructions, if necessary, and dilute the stock horseradish peroxidase conjugated to goat anti-mouse IgG solution 1:1000 with *Blocking buffer.*

Chromogenic visualization solution—Prepare a 150 mg per mL solution of 4-chloro-1-naphthol in water.

Test solution—Use Anthrax Vaccine Filtrate as is.

Procedure—In a suitable centrifuge tube transfer 30/*c* mL of the *Test solution*, where *c* is the total protein concentration, in µg per mL, of the solution as determined in the test for *Total protein*. Add 16.5/*c* mL of *Trichloroacetic acid solution*, and incubate for at least 10 minutes. Centrifuge at 9,000*g* for about 10 minutes, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in about 60 µL of *Sample buffer*, and transfer the solution to a polypropylene microfuge tube that has a lid. Close the lid tightly, secure with a lid-lock, and heat at 100° for 5 minutes. Allow the solution to cool to room temperature, and centrifuge at 10,000*g* for 15 seconds to collect the liquids. In a suitable device for polyacrylamide-gel electrophoresis (see *Electrophoresis* ⟨726⟩ and the section *Polyacrylamide Gel Electrophoresis* under *Biotechnology-Derived Articles—Tests* ⟨1047⟩) add appropriate volumes of the *Running buffer* in the upper and the lower buffer chambers. Attach a 4%–20% gradient tris-glycine polyacrylamide slab gel sandwiched between two glass plates, such that the wells for sample application are exposed to the *Running buffer* in the upper buffer chamber. Apply about 20-µL aliquots of the treated *Test solution* in three alternate lanes. [NOTE—Do not apply any solution in the outside lanes.] Connect the lower buffer chamber electrode to the positive terminal and the upper buffer chamber electrode to the negative terminal of a suitable power supply unit, and carry out the electrophoresis at a constant current of about 40 mA. When the dye-front is about 1 cm from the bottom of the gel (about 40 minutes), stop the current, and remove the gel from the gel assembly. [NOTE—Do not touch the gel with bare hand. Use gloves.]

Place 3–4 filter papers (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*), cut to the size of the gel and soaked in the *Transblotting buffer*, on the anode plate of a suitable semidry electroblotter. Cut a nitrocellulose membrane to the same size as the gel plus 1–2 mm on each side, and "wet" the membrane by immersing it into the *Transblotting buffer* for about 15 seconds, such that there is no air-bubble between the buffer and the membrane. Place the "wet" membrane immediately on the stack of filter papers, and remove all air bubbles between the membrane and

filter paper by rolling a pipet, or equivalent, gently over the surface of the membrane. Place a few drops of the *Transblotting buffer* on the membrane, and then carefully place the gel on it. Gently roll a pipet, or equivalent, over the surface of the gel to ensure intimate contact between the gel and the membrane, making sure that there are no air bubbles in between. Place a filter paper cut to the size of the gel and soaked in the *Transblotting buffer*, such that there is no air-bubble between the filter paper and the gel. Place 2–3 additional filter papers, prepared in a similar manner, on the top, and complete the transfer stack by placing the cathode plate on the top. Apply a current of about 250 mA, and continue transfer for 90 minutes.

Remove the membrane, and wash it quickly by immersing into water for 15 seconds. [NOTE—Do not touch the membrane with bare hand. Use gloves.] Cut the membrane into three strips such that each strip contains a lane containing the *Test solution*, and mark the strips as PA, LF, and EF at the top. Place each strip in a heat-sealable bag, add 5 mL of *Blocking buffer*, and seal the bag. Incubate for 30 minutes with constant agitation. Open each bag, and pour out the *Blocking buffer*. Add 9 mL of the diluted *Primary antibody solution* against PA to the bag containing the strip marked PA. Similarly, add 9 mL of the diluted *Primary antibody solution* against LF and EF to the bags containing strips labeled LF and EF, respectively. Seal the bags, and incubate under agitation for 2 hours at room temperature or overnight at 2° to 8°. Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 minutes at room temperature with two changes of *Blocking buffer*. Remove the strips, and place each strip in a new heat-sealable plastic bag. Add 9 mL of the *Secondary antibody solution* to each plastic bag. Seal the bags, and incubate for 1 hour at room temperature under agitation. Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 minutes at room temperature with two changes of the *Blocking buffer*. Transfer each strip into a new heat-sealable plastic bag, add 9 mL *Chromogenic visualization solution*, 10 µL of 30% (v/v) hydrogen peroxide, and seal the bags. Incubate for about 30 minutes under agitation. Transfer the strips into separate plastic boxes, and remove the excess 4-chloro-1-naphthol by incubating with water under agitation for 10 minutes. Visual observation indicates a strong positive band on the strip labeled PA (Protective Antigen), a faintly detectable band on the strip labeled LF (Lethal Factor), and no detectable band on the strip labeled EF (Edema Factor).

83 kDa protein—

Trichloroacetic acid solution, Sample buffer, Running buffer, and *Test solution*—Prepare as directed under *Identification*.

Staining solution—Prepare a solution of Coomassie blue G-250 having a concentration of 1.25 g per L in a mixture of water, methanol, and acetic acid (5:4:1, v/v).

Protein molecular weight standard solution—Reconstitute a vial of protein molecular weight standard mixture containing proteins of molecular weights at least in the range of 14 to 200 kDa, according to manufacturer's instruction. Dilute the solution with *Sample buffer* such that the concentration of each protein in the solution is about 0.5 µg per µL.

Procedure—In a suitable centrifuge tube transfer 10/*c* mL of the *Test solution*, where *c* is the total protein concentration, in µg per mL, of the solution as determined by the test for *Total protein* (see below). Add 5.5/*c* mL of *Trichloroacetic acid solution*, and incubate for at least 10 minutes. Centrifuge at 9,000*g* for about 10 minutes, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in 20 µL of *Sample buffer*, and

In-Process Revision

transfer the solution to a polypropylene microfuge tube with a lid. Transfer 20 µL of *Protein molecular weight standard solution* to another polypropylene microfuge tube with a lid. Close the lids tightly, secure with lid-locks, and heat both solutions at 100° for 5 minutes. Allow the solutions to cool to room temperature, and centrifuge at 10,000*g* for 15 seconds to collect the liquids. Apply the solutions to two consecutive lanes of a 4%–20% gradient tris-glycine polyacrylamide slab gel [NOTE—Do not apply any solution in the outside lanes.], and electrophorese as directed under *Identification* (see *Electrophoresis* ⟨726⟩ and the section *Polyacrylamide Gel Electrophoresis* under *Biotechnology-Derived Articles—Tests* ⟨1047⟩). When the dye-front is about 1 cm from the bottom of the gel (about 40 minutes), stop the current, and remove the gel from the gel assembly. Soak the gel in a suitable volume of the *Staining solution* for at least 1 hour, such that the gel is completely immersed in the *Staining solution* during staining. [NOTE—Do not touch the gel with bare hand. Use disposable gloves.] Destain the gel with a large volume of water under constant agitation with repeated changes of water until the background of the gel is completely color free. Using the molecular weights of the proteins in *Protein molecular weight standard solution*, identify the band corresponding to the Protective Antigen (MW about 83 kDa) in the *Test solution* lane. [NOTE—This band is also the single most predominant band in the lane of the *Test solution*.] Scan the gel, and determine the relative amount (by peak area) of the 83-kDa band by densitometry in the lane of the *Test solution*. The content of 83 kDa band is not less than 35% of the total peak area.

Total protein—

Standard solution A—Prepare a solution of albumin bovine serum (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water to obtain a known concentration of about 2.0 mg per mL.

Standard solutions B, C, D, and *E*—Dilute *Standard solution A* with water to obtain solutions having protein concentrations of 4, 8, 16, and 24 µg per mL, respectively.

Test solution—Use Anthrax Vaccine Filtrate as is.

Procedure (See *Biotechnology-Derived Articles—Tests* ⟨1047⟩, Total Protein Assay, Method 3)—To a series of test tubes transfer 800 µL each of *Standard solutions B, C, D,* and *E* and the *Test solution*. Also transfer 800 µL of water to be used as the blank. Add 200 µL of Coomassie blue G-250 dye solution (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) to each tube, and mix without foaming. Determine absorbances of the solutions at 595 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the blank to set the instrument to zero. [NOTE—Do not use quartz (silica) spectrophotometer cells; the dye binds to silica.] Construct a standard curve by plotting the absorbances versus protein concentrations, in µg per mL, of *Standard solutions B, C, D,* and *E* and by drawing a best-fit straight line using the linear regression method. From the standard curve, determine the total protein concentration of the *Test solution* using the absorbance value. The protein concentration is between 5 and 20 µg per mL.

FINAL PRODUCT—

Aluminum—

Standard solutions—Prepare as directed for *Standard Preparations* under *Aluminum* ⟨206⟩, except to prepare solutions containing 10, 20, 30, 40, and 50 µg per mL of aluminum.

Test solution—Mix Anthrax Vaccine Adsorbed, Final Product well, and transfer 0.2 mL to a 10-mL volumetric flask. Add 0.5 mL of concentrated sulfuric acid and 0.5 mL of concentrated nitric acid, and mix gently. Incubate at room temperature for 30 minutes or until the solution becomes essentially clear. Dilute with water to volume.

Procedure—Proceed as directed for *Procedure* under *Aluminum* ⟨206⟩. Plot the absorbances versus the content of aluminum, in µg per mL, for the *Standard solutions*, and draw a best-fit straight line through the points using a linear regression model. Calculate the amount of aluminum in Anthrax Vaccine Adsorbed, in mg per mL. The aluminum concentration is between 0.8 and 1.5 mg per mL.

Safety—It meets the requirements when tested as directed in the section *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* method under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩: between 7.5 and 8.5.

Sodium chloride—

Standard solutions A and *B*—Prepare two solutions of sodium chloride in water having concentrations of 0.2 mM and 2.0 mM, respectively.

Test solution—Transfer 0.5 mL of Anthrax Vaccine Adsorbed, Final Product to a 50-mL volumetric flask. Dilute with water to volume.

Procedure—Determine the voltage readings of *Standard solutions A* and *B* and the *Test solution* using an ion-specific electrode specific for the chloride ion electrically coupled with a standard silver–silver chloride reference electrode. Plot the voltage readings versus concentration of chloride, in mg per mL, for *Standard solutions A* and *B*, and draw a straight line joining the points. Calculate the concentration of chloride ion in the *Test solution* from the voltage reading. Assuming that the chloride ion comes entirely from sodium chloride, calculate the concentrations of sodium chloride in the *Test solution*. The concentration of sodium chloride in Anthrax Vaccine Adsorbed is between 0.75% and 0.95% (w/v).

Formaldehyde—

Potassium ferricyanide solution—Dissolve 2.5 g of potassium ferricyanide in about 100 mL of water, and mix.

Phenylhydrazine hydrochloride solution—Dissolve 4 g of phenylhydrazine hydrochloride in 100 mL of absolute alcohol, add 2 mL of water, and mix.

Standard stock solution—To prepare a stock solution, proceed as directed in the *Assay* under *Formaldehyde Solution* to determine the concentration of formaldehyde in percent (w/v).

Standard solutions—Dilute the *Standard stock solution* in water to obtain solutions having concentrations of 0.005%, 0.01%, and 0.02% (w/v).

Test solution—Use Anthrax Vaccine Adsorbed, Final Product as is.

Procedure—To suitable glass centrifuge tubes transfer 1.0 mL each of water, the *Standard solutions*, and the *Test solution*. To each tube add 1.0 mL of *Potassium ferricyanide solution*, 4.0 mL of 18% (w/v) hydrochloric acid and 2.0 mL of *Phenylhydrazine hydrochloride solution*. Mix after each addition. Incubate for 50 to 60 minutes at room temperature. Centrifuge the solutions at 10,000*g* for at least 10 minutes, and measure absorbances of the supernatants at 540 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). Plot the absorbances versus concentrations of formaldehyde, in mg per mL, in the *Standard solutions*, and draw the best-fit straight line through the points. Calculate the amount of formaldehyde in the sample in percent (w/v). The concentration of formaldehyde in Anthrax Vaccine Adsorbed is less than 0.02% (w/v).

Benzethonium chloride—

Citrate buffer—Dissolve 25 g of citric acid monohydrate in about 60 mL of water, and adjust with a solution of sodium hydroxide to a pH of 4.5. Transfer the solution to a 100-mL volumetric flask. Dilute with water to volume, and mix.

Dye solution—Dissolve 50 mg of 2′,4′,5′,7′-tetrabromofluorescein in about 100 mL water, and mix. Dilute 1 mL of this solution to 100 mL with water.

Docusate sodium solution—Dissolve 50 mg of docusate sodium in 1 L of water.

Standard solution A—Transfer about 0.5 g, accurately weighed, of benzethonium chloride to a 100-mL volumetric flask, dissolve in about 60 mL water, dilute with water to volume, and mix.

Standard solutions B, C, D, and *E*—Dilute *Standard solution A* with water to obtain solutions having concentrations of 0.001%, 0.002%, 0.003%, and 0.004% (w/v), respectively.

Test solution—Use Anthrax Vaccine Adsorbed, Final Product as is.

Procedure—Transfer 4.0 mL each of *Standard solutions B, C, D,* and *E* and the *Test solution* to suitable glass centrifuge tubes. Add 1.0 mL *Citrate buffer* and 0.4 mL of the *Dye solution* to each tube, and mix. Add 4.0 mL of 1,1,2,2-tetrachloroethane to each tube, and vigorously mix on a vortex mixer for 1 minute. Centrifuge at about 1,000*g* for at least 15 minutes to separate the organic layer from the aqueous layer. Transfer 2.0 mL of the organic layer from the tubes to another set of glass tubes. Add 4.0 mL of water and 0.5 mL of *Citrate buffer* to each tube, and mix on a vortex mixer for approximately 1 minute. Titrate the benzethonium chloride-dye complex in each tube with the *Docusate sodium solution* (see *Titrimetry* ⟨541⟩) to the colorimetric endpoint indicated by the disappearance of the pink color of the organic layer. [NOTE—Vigorously mix the solution on a vortex mixer after each addition of the *Docusate sodium solution*.] Plot the volumes of *Docusate sodium solution* required versus the concentrations of benzethonium chloride in *Standard solutions B, C, D,* and *E*, and draw a best-fit straight line through the points. Determine the concentration of benzethonium chloride in the *Test solution* from the volume of *Docusate sodium solution* required to titrate the *Test solution*. The concentration of benzethonium chloride in Anthrax Vaccine Adsorbed is between 0.0015% and 0.0030% (w/v).

Relative potency—

Standard solutions—Dilute approved U.S. Reference Standard Anthrax Vaccine 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

Test solutions—Dilute Anthrax Vaccine Adsorbed, Final Product 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

Procedure—Assign each dilution to a set of 12 randomly selected guinea pigs, strain Mdh:S(RA), 6 males and 6 females, each weighing 315 to 385 g on the day of vaccination. Inject the animals subcutaneously in the ventral abdomen with 0.5 mL of the assigned dilutions. On the 14th day post-vaccination, challenge the animals with approximately 1000 spores of *Bacillus anthracis* Vollum 1B, and record the deaths daily for a 10-day observation period. Record the numbers of surviving animals for each of the *Standard solutions* and the *Test solutions* at the end of the test. Perform calculations by estimating best-fit lines for the *Standard solutions* and the *Test solutions* using a logistic regression model that utilizes the number of animals that survived at the end of the test and the time to death for the animals that died. Evaluate statistically the lines corresponding to the *Standard solutions* and the *Test solutions* for parallelism. Determine the common slope, and draw the parallel lines using the common slope. The relative potency

of Anthrax Vaccine Adsorbed with respect to the corresponding Approved U.S. Reference Standard Anthrax Vaccine is the antilog of the horizontal distance between the two parallel lines. The relative potency of Anthrax Vaccine Adsorbed is acceptable if it is between 0.53 and 1.79, both values inclusive.■1S (*USP27*)

BRIEFING

Atracurium Besylate Injection, page 2943 of the *First Supplement* and page 593 of the *Third Interim Revision Announcement* to *USP 26* and *NF 21* of *PF* 29(3) [May–June 2003].The limit for other known impurities in the test for *Related compounds* is proposed to be modified to reflect the levels found in approved products.

(PA3: S. Salado) RTS—39720-1

Change to read:

Related compounds—

Buffer solution, *Solution A*, *Solution B*, *Mobile phase*, and *Standard preparation*—Proceed as directed in the *Assay* under *Atracurium Besylate.*

System suitability solution—Heat a portion of the *Standard preparation* at 90° for 30 minutes, and chill immediately to about 5°.

Diluted standard preparation—Dilute a portion of the *Standard preparation* quantitatively, and stepwise if necessary, with *Solution A* to obtain a solution having a known concentration of about 0.02 mg per mL.

Test preparation—Use the *Assay preparation*.

Chromatographic system—Prepare as directed for *Chromatographic system* in the *Assay.* Chromatograph the *System suitability solution* and the *Diluted standard preparation*, record the chromatograms, and measure the responses for the degradation products by comparing the peak responses of the *System suitability solution* to those of the *Diluted standard preparation* as directed for *Procedure:* the retention times relative to the atracurium besylate *cis-cis*-isomer are about 0.22 for the acidic compound, 0.29 for laudanosine, 0.44 and 0.50 for the *trans*- and *cis*-isomers, respectively, of the hydroxy compound, and about 1.28 and 1.33 for the *trans*- and *cis*-isomers, respectively, of the monoacrylate.

Procedure—Separately inject equal volumes (about 20 µL) of the *Diluted standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the peak responses, except the peak due to benzenesulfonic acid occurring at a retention time of about 0.08 relative to the atracurium besylate *cis-cis*-isomer. Calculate the percentage of each impurity in the portion of *Test preparation* taken by the formula:

$$100(C/M)(r_i / r_s),$$

in which C is the concentration, in mg per mL, of USP Atracurium Besylate RS in the *Diluted standard preparation; M* is the concentration of atracurium besylate, in mg per mL, in the *Test preparation; r_i* is the peak response for each impurity obtained from the *Test preparation;* and r_s is the sum of the responses of all the peaks obtained from the *Diluted standard preparation:* not more than 6.0% of the acidic compound, not more than 6.0% of the combined *cis*- and *trans*-isomers of the hydroxy compound, not more than 3.0% of laudanosine, and not more than 3.0% of the combined *cis*- and *trans*-isomers of the monoacrylate, ●~~and not more than 0.5% of other known impurities~~●,

■and not more than 2.0% of other known impurities■1S (*USP27*)
is found; not more than 0.1% of any other impurity is found; and not more than 15.0% of total impurities is found.

●~~(Postponed Indefinitely)~~●.

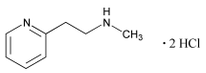
BRIEFING

Betahistine Hydrochloride, page 1401 of *PF* 26(5) [Sept.–Oct. 2000]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision* with editorial changes. Based on the comments received it is proposed to replace alcohol with absolute alcohol as a *Diluent* in *Related compounds* section.

(PA5: A. Wilk) RTS—39859-1

Add the following:

■Betahistine Hydrochloride



$C_8H_{12}N_2 \cdot 2HCl$ 209.12

2-Pyridineethanamine, *N*-methyl-, dihydrochloride.

2-[2-(Methylamino)ethyl]pyridine dihydrochloride [*5579-84-0*].

» Betahistine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_8H_{12}N_2 \cdot 2HCl$, calculated on the dried basis.

In-Process Revision

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Betahistine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The R_F value and intensity of the principal spot in the chromatogram of *Test solution 2* correspond to those in the chromatogram of *Standard solution 1*, obtained as directed in the test for *Related compounds.*

pH ⟨791⟩: between 2.0 and 3.0, in a solution (1 in 10).

Loss on drying ⟨731⟩—Dry it between 100° and 105° to constant weight: it loses not more than ~~0.5%~~ 1.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Related compounds—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Diluent—Prepare a mixture of alcohol and water (3:1).

Test solution 1—Dissolve about 250 mg of Betahistine Hydrochloride, accurately weighed, in 5.0 mL of *Diluent.*

Test solution 2—Dilute 1.0 mL of *Test solution 1* with *Diluent* to 25.0 mL, and mix.

Resolution solution—Pepare a solution of USP Betahistine Hydrochloride RS and 2-vinylpyridine in *Diluent* containing 1.0 mg of each per mL.

Standard solution 1—Prepare a solution of USP Betahistine Hydrochloride RS in *Diluent* containing 2.0 mg per mL.

Standard solution 2—Dilute 1.0 mL of *Standard solution 1* with *Diluent* to 20.0 mL. Dilute 1.0 mL of this solution with *Diluent* to 20.0 mL, and mix.

~~*Standard solution 3*—Dilute 5.0 mL of *Standard solution 2* with *Diluent* to 5.0 mL, and mix.~~

Application volume: 5 µL.

Developing solvent system: a mixture of toluene, absolute alcohol, and ammonium hydroxide (10:5:1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩, except to ~~develop~~ dry the plate under a current of warm air, in a hood, ~~and then dry~~ followed by heating for 10 minutes at 110°. Examine the plate under short-wavelength UV light using a quantitative scanner. The resolution, *R*, between the peaks due to 2-vinylpyridine and betahistine in the scan of the chromatogram of the *Resolution solution* is not less than 3.0. The area obtained for any individual impurity is not greater than that obtained for the major peak in the chromatogram of *Standard solution 2:* not more than 0.25% of any individual impurity is found. The total amount of impurities found is not greater than twice the area of the major peak in the same solution: not more than 0.5% of total impurities is found.

Assay—Dissolve about 80 mg of Betahistine Hydrochloride, accurately weighed, in 60 mL of a mixture of glacial acetic acid and acetic anhydride (5:1). Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using suitable electrodes (see *Titrimetry* ⟨541⟩). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 10.455 mg of $C_8H_{12}N_2 \cdot 2HCl$.■1S (*USP27*)

BRIEFING

BRIEFING

Bleomycin for Injection, *USP 26* page 258. It is proposed to replace the *Loss on drying* test with a *Water* determination using *Method Ic* (coulometric titration). The hygroscopic nature of Bleomycin Sulfate causes considerable variation, as well as a high bias, in *Loss on drying* values. In addition, the lyophilized product is electrostatic and the powder is difficult to handle in sample preparation. It is therefore proposed to use a *Water* determination in which the sample is prepared by adding anhydrous methanol through the stopper of the container, and then titrating the constituted solution by *Method Ic.* USP has received data showing that this *Water* determination yielded less variable results than the *Loss on drying* procedure. The *Water* determination also yielded lower results. The results were in good agreement with water values obtained by thermal gravimetric analysis.

(PA7: W. Wright) RTS—39784-1

Delete the following:

■~~**Loss on drying** ⟨731⟩— Dry the total contents of 2 containers in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.~~■1S (*USP27*)

Add the following:

■**Water,** *Method Ic* ⟨921⟩: not more than 6.0%. Prepare the specimen for test as follows. Use a dry syringe to inject 4 mL of anhydrous methanol through the stoppers of two tared containers, respectively, and shake to dissolve. Using the same syringe, aspirate the contents of the two containers, transfer to the titration vessel, and titrate. Perform a blank determination on 8 mL of the anhydrous methanol. Determine the weights of the empty containers, and calculate the percentage of water.■1S (*USP27*)

BRIEFING

Bupropion Hydrochloride, *USP 26* page 279. In the *Chromatography purity Test 1*, it is proposed to specify the wavelength for the densitometer used to scan the plates.

(PA3: S. Salado) RTS—39777-2

Change to read:

Chromatographic purity—

TEST 1—

Adsorbent: a 0.25-mm layer of high-performance silica gel, previously washed with methanol.

Test solution—Prepare a solution of Bupropion Hydrochloride in methanol having a concentration of about 100.0 mg per mL.

In-Process Revision

Standard solutions—Prepare a solution of *m*-chlorobenzoic acid in methanol containing about 0.5 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with methanol to obtain solutions having known concentrations of about 0.3, 0.2, and 0.1 mg per mL.

Application volume: 2 µL.

Developing solvent system: a mixture of toluene, cyclohexane, and glacial acetic acid (47:47:6).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Locate and quantitate the spots obtained by scanning the entire plate with a suitable densitometer

■at 254 nm.■1S (*USP27*)
Plot a standard curve of area versus concentrations of the *Standard solutions.* From the standard curve, determine the percentages of *m*-chlorobenzoic acid and any other impurity present: not more than 0.2% of *m*-chlorobenzoic acid is found; and not more than 0.1% of any other individual impurity is found.

TEST 2—

Procedure—Using the chromatograms obtained in the *Assay*, calculate the percentage of each impurity in the portion of Bupropion Hydrochloride taken by the formula:

$$100F(r_i/r_S),$$

in which F is the relative response factor for each impurity (see the accompanying table for values); r_i is the peak response for each impurity obtained from the *Assay preparation;* and r_S is the peak response for bupropion hydrochloride obtained from the *Standard preparation*. The limits of impurities are specified in the accompanying table: not more than 0.3% of total unidentified impurities is found; and not more than 1.0% of total impurities is found, the results of *Test 1* and *Test 2* being added.

Relative retention time	Relative response factor (*F*)	Limit (%)
0.38	0.68	0.5
0.58	0.96	0.2
0.71	2.22	0.1
0.78	0.82	0.1
0.92	0.73	0.2
1.14	n/a	0.2[a]
1.63	1.13	0.1
2.30	0.91	0.2
2.74	1.45	0.2
all other peaks[b]	1.00	0.1

[a] The percentage is determined by direct comparison to the area of the peak for bupropion hydrochloride related compound B obtained from the *System suitability solution.*

[b] Except the peaks with relative retention time of 1.14.

BRIEFING

Bupropion Hydrochloride Extended-Release Tablets, *USP 26* page 280 and page 1074 of *PF* 28(4) [July–Aug. 2002]. In the *Assay*, it is proposed to revise the concentration of bupropion hydrochloride specified for making up the *Assay preparation.*

(PA3: S. Salado) RTS—39777-1

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Crush 1 Tablet using a mortar and pestle. Prepare an approximate 1% w/w dispersion of the sample in potassium bromide:

■the *Test specimen* shows strong bands at about 1690, 1560, and 1240 cm^{-1} and a weaker band at about 790 cm^{-1} similar to the reference preparation.■1S (*USP27*)

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Change to read:

Related compounds—

Solution A, *Solution B*, *Mobile phase*,

■*System suitability solution 1*, and *System suitability solution 2*■1S (*USP27*)
—Proceed as directed in the *Assay.*

~~*System suitability solution*—Prepare separate solutions containing accurately weighed amounts of USP Bupropion Hydrochloride Related Compound C RS and USP Bupropion Hydrochloride Related Compound F RS in methanol to obtain solutions having concentrations of about 0.20 mg per mL. Transfer accurately measured volumes of these solutions to a suitable flask, and dilute with a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having a concentration of about 0.0018 mg of USP Bupropion Hydrochloride Related Compound C RS per mL and 0.018 mg of USP Bupropion Hydrochloride Related Compound F RS per mL.~~

~~*Wavelength check solution*—Prepare a solution containing an accurately weighed amount of *m*-chlorobenzoic acid in methanol to obtain a solution having a concentration of about 0.09 mg per mL. Dilute an accurately measured volume of this solution with a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having a concentration of about 0.0018 mg of *m*-chlorobenzoic acid per mL.~~

■■1S (*USP27*)

In-Process Revision

Standard solution—Dissolve accurately weighed quantities of USP Bupropion Hydrochloride RS and USP Bupropion Hydrochloride Related Compound E RS in a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having known concentrations of about 0.6 mg per mL and 0.0024 mg per mL, respectively.

Test solution—Use the *Assay preparation.*

Chromatographic system—~~Prepare~~

■Proceed■1S (*USP27*) as directed in the *Assay*, ~~Chromatograph the *System suitability solution*, the *Wavelength check solution*, and the *Standard solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between bupropion hydrochloride related compound C and bupropion hydrochloride related compound F is not less than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%. The relative response factor obtained for the *Wavelength check solution* is between 0.22 and 0.26.~~

■except to use the *Standard solution* instead of the *Standard preparation*.■1S (*USP27*)

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of bupropion hydrochloride related compound E in the portion of Tablets taken by the formula:

$$100(C/D)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Bupropion Hydrochloride Related Compound E RS in the *Standard solution;* D is the concentration, in mg per mL, of bupropion hydrochloride in the *Test solution*, based on the number of Tablets taken, the labeled quantity per Tablet, and the extent of dilution; and r_U and r_S are the peak responses for bupropion hydrochloride related compound E obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.4% of bupropion hydrochloride related compound E is found. Calculate the percentage of each additional impurity in the portion of Tablets taken by the formula:

$$100F(r_i/r_S),$$

in which F is the relative response factor for each impurity (see the accompanying table for values); r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for bupropion hydrochloride obtained from the *Standard solution*. See the accompanying table for limits of individual impurities based upon Tablet strength.

Compound	Relative Retention Time	*F*	Limit (%) 100 mg or less	Limit (%) 150 mg or greater
Specified impurity 1	0.38	0.80	0.3	0.3
Specified impurity 2	0.56	0.86	1.0	1.0
Specified impurity 3	0.78	0.88	0.5	0.4

Assay—

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (90:10:0.04).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and trifluoroacetic acid (95:5:0.03).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

■*System suitability solution 1*—Prepare separate solutions containing accurately weighed quantities of USP Bupropion Hydrochloride Related Compound C RS and USP Bupropion Hydrochloride Related Compound F RS in methanol to obtain solutions having concentrations of about 0.20 mg per mL. Transfer accurately measured volumes of these solutions to a suitable flask, and dilute with a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having a concentration of about 0.0018 mg of USP Bupropion Hydrochloride Related Compound C RS per mL and 0.018 mg of USP Bupropion Hydrochloride Related Compound F RS per mL.

System suitability solution 2—Prepare a solution containing an accurately weighed quantity of *m*-chlorobenzoic acid to obtain a solution having a concentration of about 0.09 mg per mL. Dilute an accurately measured volume of this solution with a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having a concentration of about 0.0018 mg of *m*-chlorobenzoic acid per mL.■1S (*USP27*)

Standard preparation—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in a mixture of 0.001 N hydrochloric acid and methanol (80:20) to obtain a solution having a known concentration of about 0.6 mg of bupropion hydrochloride per mL.

Assay preparation—Transfer a number of Tablets to a suitable homogenizer vessel containing an accurately measured volume of methanol to obtain a concentration of about ~~0.3 mg~~

In-Process Revision

■3.0 mg■1S (*USP27*) of bupropion hydrochloride per mL. Immediately homogenize the sample for 30 seconds at 20,000 rpm. Allow to extract for 3 minutes, and follow by two additional 10-second pulses, each at 20,000 rpm, pausing 3 minutes between these pulses to ensure complete extraction. Pass a portion of the solution through a nylon filter having a 0.45-µm porosity, discarding the first 2 to 4 mL of the filtrate. Pipet 10.0 mL of the filtrate into a 50-mL volumetric flask, and add about 25 mL of 0.001 N hydrochloric acid. Allow to cool to room temperature, and dilute with 0.001 N hydrochloric acid to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 226-nm detector and a 4.6-mm × 10-cm column that contains 3.5-µm packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	90	10	equilibration
0–3.4	90→87	10→13	linear gradient
3.4–10.0	87→15	13→85	linear gradient
10.0–10.1	15→0	85→100	linear gradient
10.1–13.0	0	100	isocratic
13.0–13.2	0→90	100→10	linear gradient
13.2–19.0	90	10	isocratic

~~Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.~~

■Chromatograph *System suitability solution 1*, *System suitability solution 2*, and the *Standard preparation*, and record the peak areas as directed for *Procedure:* the resolution, *R*, between bupropion hydrochloride related compound C and bupropion hydrochloride related compound F is not less than 1.5; the relative response factor for *System suitability solution 2* is between 0.22 and 0.26 when calculated using the peak obtained in the *Standard preparation*; the tailing factor is not more than 1.9; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.5%.■1S (*USP27*)

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount, in mg, of buproprion hydrochloride ($C_{13}H_{18}ClNO \cdot HCl$) in the portion of Tablets taken by the formula:

$$(TC/D)(r_U/r_S),$$

in which T is the labeled quantity, in mg, of bupropion hydrochloride in the Tablet; *C* is the concentration, in mg per mL, of USP Bupropion Hydrochloride RS in the *Standard preparation; D* is the concentration, in mg per mL, of bupropion hydrochloride in the *Assay preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses for bupropion hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

BRIEFING

Cefuroxime Axetil Tablets, *USP 26* page 389. The proposal on page 2128 of *PF* 27(2) [Mar.–Apr. 2001] for *Test 2* under *Dissolution* is being cancelled. A new *Test 2* is being proposed because FDA recently approved an ANDA for this product. Because of differences in dissolution rates in vitro, the new product was approved with a *Dissolution* test that differs from that currently official in the *USP* monograph. In the absence of any adverse comments, it is proposed to implement this revision via the *Sixth Interim Revision Announcement* pertaining to *USP 26–NF 21* with an official date of December 1, 2003.

(BPC: M. Marques) RTS—39544-1

Change to read:

Labeling—The labeling indicates whether the Tablets contain amorphous or crystalline Cefuroxime Axetil. If Tablets contain a mixture of amorphous and crystalline Cefuroxime Axetil, label to indicate the percentage of each contained therein.

•When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•6

Change to read:

Dissolution ⟨711⟩—

•*Test 1:*•6
Medium: 0.07 N hydrochloric acid; 900 mL.
Apparatus 2: 55 rpm.
Times: 15 and 45 minutes.
Procedure—Determine the amount of cefuroxime ($C_{16}H_{16}N_4O_8S$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Cefuroxime Axetil RS, equivalent to about 0.01 to 0.02 mg of cefuroxime ($C_{16}H_{16}N_4O_8S$) per mL, in the same *Medium.*
Tolerances—Not less than 60% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 75% (*Q*) is dissolved in 45 minutes; except that where Tablets are labeled to contain the equivalent of 500 mg of cefuroxime, not less than 50% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 70% (*Q*) is dissolved in 45 minutes.

•*Test 2:* If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Apparatus 2: 100 rpm.

Medium, Times, and *Procedure*—Proceed as directed under *Test 1*.

In-Process Revision

Tolerances—Not less than 60% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 15 minutes, and not less than 75% (*Q*) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved in 45 minutes.●6

BRIEFING

Ciclopirox Olamine, *USP 26* page 451 and page 395 of *PF* 29(2) [Mar.–Apr. 2003]. It is proposed to delete the *Loss on drying* test due to the difficulty of performing the test for this substance. The acceptance criteria for the *Assay* result are therefore modified to as-is basis. Additionally, the packaging requirement was modified to minimize the exposure to moisture.

(PA7b: B. Davani) RTS—39957-1

▲**Related compounds**—[NOTE—Carry out the operations avoiding exposure to actinic light. All materials that are in direct contact with Ciclopirox Olamine (i.e, column materials, reagents, solvents, etc.) should contain only very low amounts of extractable metal cations.]

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of an edetate disodium solution (0.96 in 1000), acetonitrile, and glacial acetic acid (770:230:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Rinsing solution—Prepare a mixture of water, acetonitrile, glacial acetic acid, and acetylacetone (500:500:1:1).

Standard stock solution—Dissolve 15 mg of USP Ciclopirox Related Compound A RS and 15 mg of USP Ciclopirox Related Compound B RS, accurately weighed, in 1 mL of acetonitrile and 7 mL of *Mobile phase*. Dilute the solution thus obtained to 10.0 mL with *Mobile phase* to obtain a solution having a known concentration of 1.5 mg of each Reference Standard per mL.

Standard solutions—Dilute 1.0 mL of *Standard stock solution* to 200.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1) to obtain *Standard solution A.* Dilute 2.0 mL of *Standard solution A* to 10.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1) to obtain *Standard solution B.*

Test solution—Dissolve 40 mg of Ciclopirox Olamine, accurately weighed, in a mixture of 2 mL of acetonitrile, 20 µL of glacial acetic acid, and 15 mL of *Mobile phase*. If necessary, use an ultrasonic bath to dissolve. Dilute with *Mobile phase* to 20.0 mL, and mix.

Resolution solution—Mix 5 mL of *Standard stock solution* with 5 mL of the *Test solution.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 298 nm and a 4.0-mm × 8-cm column that contains packaging L10. [NOTE—ciclopirox related compound A has an intense absorbance at 220 nm and 6-cyclohexyl-4-methyl-2(1*H*)-pyridone, ciclopirox related compound B, and ciclopirox have intense absorbances at 298 nm.] The flow rate is about 0.7 mL per minute. Chromatograph the *Resolution solution* at 298 nm, and record the peak responses as directed for *Procedure:* the resolution between the ciclopirox related compound B peak and ciclopirox peak is not less than 2.0. Chromatograph the *Standard solution B* at 298 nm, and record the peak responses as directed for *Procedure:* the chromatogram obtained shows at 298 nm a peak corresponding to ciclopirox related compound B with a signal-to-noise ratio of not less than 3. Chromatograph the *Test solution* at 298 nm, and record the peak responses as directed for *Procedure:* the tailing factor of the ciclopirox peak is less than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of *Standard solutions A* and *B* and the *Test solution* into the chromatograph, and record the chromatograms. [NOTE—In order to ensure desorption of disruptive metal ions, every new column must be rinsed with the *Rinsing solution* over a period of not less than 15 hours and then with the *Mobile phase* for not less than 5 hours with a flow rate of 0.2 mL per minute. The chromatographic run time is not less than 2.5 times the retention time of the ciclopirox peak.] The relative retention times are about 0.5 for ciclopirox related compound A, 0.9 for 6-cyclohexyl-4-methyl-2(1*H*)-pyridone, 1.0 for ciclopirox, and 1.3 for ciclopirox related compound B. The peak response at 220 nm of the ciclopirox related compound A peak in the chromatogram obtained from the *Test solution* is not more than the peak response at 220 nm of the corresponding peak in the chromatogram obtained from *Standard solution A* (0.5% with reference to ciclopirox). The sum of responses at 298 nm of the peaks in the chromatogram obtained from the *Test solution* is not more than the peak response at 298 nm of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution A* (0.5% with reference to ciclopirox). At 298 nm disregard any peak due to the solvent and any peak with a response less than the response

In-Process Revision

of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution B* at 298 nm (0.1% with reference to ciclopirox).▲*USP27*

Assay—

~~*Ferrous sulfate solution*—Transfer 600 mg of ferrous sulfate to a 25-mL volumetric flask. Add 0.6 mL of glacial acetic acid, dilute with water to volume, and mix.~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Ciclopirox Olamine RS in methanol to obtain a solution having a known concentration of about 0.4 mg per mL.~~

~~*Assay preparation*—Transfer about 40 mg of Ciclopirox Olamine, accurately weighed, to a 100-mL volumetric flask, dissolve in about 80 mL of methanol, dilute with methanol to volume, and mix.~~

~~*Procedure*—Transfer 5.0 mL of the *Standard preparation*, 5.0 mL of the *Assay preparation*, and 5.0 mL of methanol (blank preparation) to separate 25-mL volumetric flasks. Add 15 mL of methanol to each flask, and mix. Add 1.0 mL of *Ferrous sulfate solution* to each flask, mix, dilute with methanol to volume, and mix. Store the flasks in the dark for 1 hour. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* against the blank in 1-cm cells at the wavelength of maximum absorbance at about 440 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ in the portion taken using the formula:~~

~~$$100C(A_U/A_S),$$~~

~~in which C is the concentration, in mg per mL, of USP Ciclopirox Olamine RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.~~

▲Dissolve 200 mg of Ciclopirox Olamine, accurately weighed, in 2 mL of methanol. Add 38 mL of water, mix, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Determine the factor of the 0.1 N sodium hydroxide VS using 100 mg of benzoic acid, accurately weighed, and titrate under the conditions prescribed above. Each mL of 0.1 N sodium hydroxide is equivalent to 26.84 mg of $C_{12}H_{17}NO_2 \cdot C_2H_7NO$.▲*USP27*

BRIEFING

Ciprofloxacin, *USP 26* page 457 and page 2951 of the *First Supplement*. It is proposed to have new acceptance criteria for *Loss on drying* and *Residue on ignition* tests as well as to add a *Microbial limits* test when preparing Ciprofloxacin for Oral Suspension. Other *Labeling* requirements are also added where it is intended for use in preparing injectable dosage forms.

(PA7b: B. Davani; PSD: C. Okeke) RTS—39363-1

Change to read:

Packaging and storage—Preserve in tight, light-resistant containers.

■Store at 25°, excursion permitted between 15° and 30° and avoid excessive heat.■1S (*USP27*)

Add the following:

■**Labeling—**Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected for further processing during the preparation of injectable dosage forms. Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is so labeled. ■1S (*USP27*)

Add the following:

■**Microbial limits** ⟨61⟩—Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, the total microbial count does not exceed 1000 cfu per g and the total combined molds and yeast count does not exceed 100 cfu per g. It also meets the requirement for absence of *Salmonella* and *Escherichia coli*.■1S (*USP27*)

Change to read:

Loss on drying ⟨731⟩—Dry it in vacuum at 120° for 6 hours: it loses not more than 1.0% of its weight,

Assay—

~~*Mobile phase*, *Resolution solution*, and *Chromatographic system*~~—~~Prepare as directed in the *Assay* under *Ciprofloxacin Hydrochloride*.~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Ciprofloxacin Hydrochloride RS quantitatively in water to obtain a solution having a known concentration of about 0.3 mg per mL.~~

~~*Assay preparation*—Transfer 5 Tablets to a 500-mL volumetric flask, add about 400 mL of water, and sonicate for about 20 minutes. Dilute with water to volume, and mix. Dilute an accurately measured volume of this solution quantitatively with water to obtain a solution containing the equivalent of about 0.25 mg of ciprofloxacin per mL.~~

~~*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Ciprofloxacin Hydrochloride*. Calculate the quantity, in mg, of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) in each Tablet taken by the formula:~~

~~$(331.34/367.81)(CL/D)(r_U/r_S)$,~~

~~in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively, *C* is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation*, calculated on the anhydrous basis, *L* is the labeled quantity, in mg, of ciprofloxacin in each Tablet, *D* is the concentration, in mg per mL, of ciprofloxacin in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution, and r_U and r_S are the ciprofloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

■*Diluent*—Prepare a filtered and degassed mixture of 0.025 M phosphoric acid, previously adjusted (with triethylamine) to a pH of 2.0 ± 0.1, and acetonitrile (87:13).

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M phosphoric acid, previously adjusted (with triethylamine) to a pH of 3.0 ± 0.1, and acetonitrile (87:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Ciprofloxacin Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

Resolution solution—Dissolve a quantity of USP Ciprofloxacin Ethylenediamine Analog RS in the *Standard preparation* to obtain a solution containing about 0.05 mg per mL.

Assay preparation—Transfer 5 Tablets to a 500-mL volumetric flask, add about 400 mL of *Diluent*, and sonicate for about 20 minutes. Dilute with *Diluent* to volume, and mix. Quantitatively dilute an accurately measured volume of this solution, previously filtered through a 0.45-µm membrane filter, with *Diluent* to obtain a solution containing the equivalent of about 0.20 mg of ciprofloxacin per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm column that contains packing L1 and is operated at 30 ± 1°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the retention time for ciprofloxacin is between 6.4 and 10.8 minutes; the

relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin; and the resolution, *R*, between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak is not less than 6. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency, determined from the ciprofloxacin peak, is not less than 2500 theoretical plates; the tailing factor for the ciprofloxacin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the major peaks. Calculate the quantity, in mg, of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) in each Tablet taken by the formula:

$$(331.34/367.81)(CL/D)(r_U/r_S),$$

in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation*, calculated on the anhydrous basis; *L* is the labeled quantity, in mg, of ciprofloxacin in each Tablet; *D* is the concentration, in mg per mL, of ciprofloxacin in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the ciprofloxacin peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Cod Liver Oil, *USP 26* page 505. It is proposed to update the specifications in this monograph in order to harmonize the requirements with other pharmacopeias. In the Definition, it is proposed to add upper limits for vitamins A and D, since the maximum recommended daily intake for these vitamins is limited in the USA. Suitable antioxidants may be added. When used as dietary supplement, this article usually states the content of omega-3 acids. Therefore, a procedure for the determination of such acids is added, as well as the requirement to indicate their concentrations in the labeling. A new Reference Standard is added to properly identify the fatty acids in the gas chromatograms. The *Identification* test is improved with the addition of a fatty acid profile characteristic of Cod Liver Oil. A limit for anisidine value is added to ensure that the article is not rancid by oxidation of the polyunsaturated acids. A limit for *Mercury* is added given the concern of the authorities about methyl mercury being present in fish-derived products. Finally, it is proposed to substitute the outdated biological procedure for the determination of vitamin D, by a chromatographic procedure harmonized with other international pharmacopeias.

(DSN: G. Giancaspro) RTS—31789-1

Change to read:

» Cod Liver Oil is the partially destearinated fixed oil obtained from fresh livers of *Gadus morrhua* Linné and other species of Fam. Gadidae. Cod Liver Oil contains, in each g, not less than ~~255 µg (850 USP Units)~~

■180 µg (600 USP Units) and not more than 750 µg (2500 USP Units)■1S (*USP27*)
of vitamin A and not less than ~~2.125 µg (85 USP Units)~~

■1.5 µg (60 USP Units) and not more than 6.25 µg (250 USP Units)■1S (*USP27*)
of vitamin D.

Cod Liver Oil may be flavored by the addition of not more than 1 percent of a suitable flavor or a mixture of flavors.

■A suitable antioxidant may be added.■1S (*USP27*)

Change to read:

Labeling—The vitamin A potency and vitamin D potency, when designated on the label, are expressed in USP Units per g of oil. The potencies may be expressed also in metric units, on the basis that 1 USP Vitamin A Unit = 0.3 µg and 40 USP Vitamin D Units = 1 µg.

■Where the content of docosahexaenoic acid or eicosapentaenoic acid are claimed, state their concentrations in mg per g.■1S (*USP27*)

Identification — ~~**for vitamin A**— To 1 mL of a 1 in 40 solution in chloroform add 10 mL of antimony trichloride TS: a blue color results immediately.~~

■**A:** *Presence of vitamin A*—To 1 mL of a 1 in 40 solution in chloroform add 10 mL of antimony trichloride TS: a blue color results immediately.

B: *Fatty acid profile*—

Antioxidant solution—Dissolve an accurately weighed quantity of butylated hydroxytoluene in hexanes to obtain a solution having a concentration of 0.05 mg per mL.

Standard solution—Transfer 0.450 g of USP Cod Liver Oil RS, accurately weighed, into a 10-mL volumetric flask, and dissolve in and dilute with *Antioxidant solution* to volume. Transfer 2.0 mL of this solution into a quartz tube, and evaporate with gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol, cap tightly with a polytetrafluoroethylene-lined cap, mix, and heat in a water bath for 7 minutes. Cool, add 2 mL of boron trichloride–methanol solution, cover with nitrogen, cap tightly, mix, and heat in a water bath for 30 minutes. Cool to 40° to 50°, add 1 mL of isooctane, cap, and mix in a vortex mixer or shake vigorously for at least 30 seconds. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and mix in a vortex mixer or shake thoroughly for at least 15 seconds. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combine extracts twice with 1 mL of water, and dry over anhydrous sodium sulfate.

System suitability mixture—Prepare a mixture containing accurately weighed and equal amounts of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate. [NOTE—A suitable mixture is available from Supelco, Bellefonte, PA, as GLC-40 cat. number 1985-1AMP.]

Fatty acid		Lower limit (area %)	Upper limit (area %)
Saturated fatty acids:	Shorthand notation		
Myristic acid	14:0	2.0	6.0
Palmitic acid	16:0	7.0	14.0
Stearic acid	18:0	1.0	4.0
Mono-unsaturated fatty acids:			
Palmetoleic acid	16:1 n-7	4.5	11.5
cis-Vaccenic acid	18:1 n-7	2.0	7.0
Oleic acid	18:1 n-9	12.0	21.0
Gadoleic acid	20:1 n-11	1.0	5.5
Gondoic acid	20:1 n-9	5.0	17.0
Euricic acid	22:1 n-9	0	1.5
Cetoleic acid	22:1 n-11	5.0	12.0
Poly unsaturated fatty acids:			
Linoleic acid	18:2 n-6	0.5	3.0
γ-Linolenic acid	18-3 n-3	0	2.0
Moroctic acid	18:4 n-3	0.5	4.5
Eicosapentanoic acid	20:5 n-3	7.0	16.0
Docosahexanoic acid	22-6n-3	6.0	18.0

Test solution—Proceed as directed for the *Standard solution*, except to use an accurately weighed quantity of Cod Liver Oil.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m fused silica capillary column coated with a 0.25-µm film of G16. The temperature of the detector is maintained at 280° and that of the injection port at 250°. Initially the temperature of the column is equilibrated at 170°, then the temperature is increased at a rate of 1° per minute to 225°, and maintained at 225° for 20 minutes. The carrier gas is helium with a split flow ratio of 1:200. Chromatograph the *Standard solution*, the *System suitability mixture*, and the *Test solution*, and record the peak responses as directed for *Procedure:* the resolution between the peaks in the *Standard solution* due to methyl oleate and methyl *cis*-vaccinate is not less than 1.3, and between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement; the theoretical area percentages for methyl palmitate, metyl stearate, methyl arachidate, and methyl behenate are 24.4, 24.8, 25.2, and 25.6, respectively. In a suitable instrument, the area percentages from the *System suitability mixture* are within 1% of the theoretical values. The number of fatty acid methyl ester peaks exceeding 0.05% of the total area is at least 24, and the 24 largest peaks of the methyl esters account for more than 90% of the total area. (These correspond to the following, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, and 22:6 n-3.)

Procedure—Separately inject by equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percent for each fatty acid methyl ester taken by the formula:

$$100(r_a / r_b),$$

in which r_a is the average peak area of each individual fatty acid; and r_b is the total peak area from all peaks in the chromatogram, excepting the solvent front and butylated hydroxytoluene. ■1S (*USP27*)

Add the following:

■**Anisidine value** ⟨401⟩: not more than 30. ■1S (*USP27*)

Add the following:

■**Content of docosohexaenoic acid and eicosapentaenoic acid**—Proceed as directed in the monograph for *Fish Oil Rich in Omega-3 Acids*. ■1S (*USP27*)

Change to read:

Assay for vitamin D—~~Proceed with Oil as directed for *Biological Method* under *Vitamin D Assay* ⟨581⟩~~

■*Butylated hydroxytoluene solution*—Dissolve a quantity of butylated hydroxytoluene in chromatographic hexane to obtain a solution containing 10 mg per mL.

Aqueous potassium hydroxide solution—Dissolve 800 g of potassium hydroxide in 1000 mL of freshly boiled water, mix, and cool. [NOTE—Prepare this solution fresh daily.]

Alcoholic potassium hydroxide solution—Dissolve 3 g of potassium hydroxide in 50 mL of freshly boiled water, add 10 mL of alcohol, dilute with freshly boiled water to 100 mL, and mix. [NOTE—Prepare this solution fresh daily.]

Ascorbic acid solution—Dissolve 10 g of ascorbic acid in 100 mL of water. [NOTE—Prepare this solution fresh daily.]

Mobile phase A—Prepare a 3 in 1000 mixture of *n*-amyl alcohol in dehydrated hexane.

Mobile phase B—Prepare a mixture of acetonitrile, water, and phosphoric acid (96:3.8:0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Internal standard solution—Prepare a solution of USP Ergocalciferol RS in alcohol having a concentration of about 0.5 mg per 100 mL.

Standard preparation—Prepare a solution of USP Cholecalciferol RS in ethyl alcohol, having a known concentration of about 5 µg per mL. Transfer 2.0 mL of this solution and 2.0 mL of the *Internal standard solution* to a round-bottomed flask. Proceed as directed for the *Assay preparation 1* beginning with "Add 5 mL of...".

Assay preparation 1—Transfer an accurately weighed quantity of about 4.00 g of Cod Liver Oil, to a round-bottomed flask. Add 5 mL of *Ascorbic acid solution*, 100 mL of alcohol, and 10 mL of *Aqueous potassium hydroxide solution*, and mix. Reflux the mixture on a steam bath for 30 minutes. Add 100 mL of a sodium chloride solution (1 in 100). Cool rapidly under running water, and transfer the saponified mixture to a 500-mL separator, rinsing the saponification flask with 75 mL of a sodium chloride solution (1 in 100) and then with 150 mL of a mixture of ether and hexane (1:1). Shake the combined saponified mixture and rinsings vigorously for 30 seconds, and allow to stand until both layers are clear. Discard the lower layer. Wash the ether-hexane extracts by shaking vigorously with 50 mL of *Alcoholic potassium hydroxide solution*, and then washing with three 50-mL portions of a sodium chloride solution (1 in 100). Filter the upper layer through 5 g of anhydrous sodium sulfate on a fast filter paper into a 250-mL flask suitable for a rotary evaporator. Wash the filter with 10 mL of a mixture of ether and hexane (1:1), and combine with the extract. Evaporate the solvent at reduced pressure at a temperature not exceeding 30°, and fill with nitrogen when the evaporation is complete. Alternatively evaporate the solvent under a gentle stream of nitrogen at a temperature not exceeding 30°. Dissolve the residue in 1.5 mL of *Mobile phase A*. [NOTE—Gentle heating in an ultrasonic bath may be required. A large fraction of the white residue is cholesterol.]

Assay preparation 2—To 4.00 g of Cod Liver Oil, add 2.0 mL of *Internal standard solution*, and proceed as directed for *Assay preparation 1* beginning with "Add 5 mL of...".

Chromatographic system—Use a chromatograph, operated at room temperature, fitted with an UV detector that monitors absorption at 265 nm; a 25-cm × 4.6-mm stainless steel cleanup column packed with column packing L10 and using *Mobile phase A;* and a 15-cm × 4.6-mm stainless steel analytical column with 5-µm packing L1, and using *Mobile phase B*. Chromatograph five injections of the *Standard preparation*, and measure the peak responses as directed for *Procedure:* the resolution between cholecalciferol and ergocalciferol is not less than 1.4; and the relative standard deviation for the cholecalciferol peak response is not more than 2.0%.

Procedure—Separately inject equal volumes (about 350 µL) of the *Standard preparation*, *Assay preparation 1*, and *Assay preparation 2* into the clean-up chromatographic system. Collect separately the eluates from 2 minutes before until 2 minutes after the retention time of cholecalciferol in a glass tube, containing 1 mL of *Butylated hydroxytoluene solution* and fitted with a hermetic closure. Evaporate each tube under a stream of nitrogen at a temperature not exceeding 30°. Dissolve each residue in 1.5 mL of acetonitrile. Inject equal volumes, not exceeding 200 µL, into the analytical chromatographic system, and measure the peak responses at the retention times corresponding to cholecalciferol and ergocalciferol. Calculate the content of vitamin D, in µg, in the Cod Liver Oil taken by the formula:

$$2C(R_U / R_S),$$

in which C is the concentration, in µg per mL, of the USP Cholecalciferol RS in the *Standard preparation;* R_S is the response of the cholecalciferol relative to the internal standard in the *Standard preparation;* and R_U is the corrected relative response of *Assay preparation 2* calculated by the formula:

$$r_{U2} / [r_{IS2} - (r_{IS1} \times r_{U2} / r_{U1})],$$

in which, r_{U2} and r_{U1} are the peak responses for cholecalciferol in the *Assay preparation 1* and *2*, respectively; and r_{IS1} and r_{IS2} are the peak responses for ergocalciferol in the *Assay preparation 1* and *2*, respectively.■1S (*USP27*)

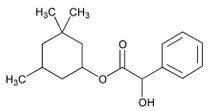
BRIEFING

Cyclandelate, page 353 of *PF 26*(2) [Mar.–April 2000]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision*.

(PA5: A. Wilk) RTS—39903-4

Add the following:

■Cyclandelate



$C_{17}H_{24}O_3$ 276.38

3,3,5-Trimethylcyclohexanol α-phenyl-α-hydroxyacetate.

1,5-*cis*-3,3,5-Trimethylcyclohexyl 2-hydroxy-2-phenyl acetate [*456-59-7*].

» Cyclandelate contains not less than 98.0 percent of $C_{17}H_{24}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in ~~well-closed~~ tight, light-resistant containers, and store below 40°, preferably between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Cyclandelate RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 0.5 µg per mL.

Medium: 96 percent alcohol. The solution exhibits absorption maxima between 250 and 254 nm, between 256 and 260 nm, and between 262 and 266 nm.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Dissolve 10 mg of Cyclandelate in 1 mL of alcohol.

Application volume: 5 µL.

Developing solvent system: a mixture of hexane, ethyl acetate, and glacial acetic acid (8:2:1).

Loss on drying ⟨731⟩—Dry 1 g over silica gel for 24 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Chromatographic purity—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*

Test solution—Transfer about 100 mg of Cyclandelate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard solution—Pipet 3.0 mL of the *Test solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Allow the chromatogram of the *Test solution* to run for a period of time that is about 3 times the

In-Process Revision

retention time of cyclandelate. The total area of all the peaks from the *Test solution*, other than the peak obtained from cyclandelate, is not greater than the peak area of cyclandelate obtained from the *Standard solution:* not more than 3.0% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Cyclandelate RS and dicyclohexyl phthalate in *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL and 0.08 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Cyclandelate RS in *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 100 mg of Cyclandelate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 228-nm detector and a 4.0-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between cyclandelate and dicyclohexyl phthalate is not less than 7. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{17}H_{24}O_3$ in the portion of Cyclandelate taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Cyclandelate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Cyclobenzaprine Hydrochloride, *USP 26* page 527. It is proposed to correct the concentration of the solvents used in the *Standard solution* in the test for *Organic volatile impurities*. This change is necessary because the test requires different concentrations of solvents than those described in the general test chapter *Organic Volatile Impurities* ⟨467⟩. The proposal reflects the actual concentrations that have to be used to be congruent with the actual chapter, but respecting the limit of 50 µg per g of chloroform.

(PA3: S. Salado) RTS—39640-3

Change to read:

Organic volatile impurities, *Method I* ⟨467⟩: meets the requirements.

Test solution: 200 mg per mL.

Standard solution—Proceed as directed except to use 100.0 µg of methylene chloride, ~~10.0 µg~~

■12.0 µg■1S (*USP27*) of chloroform, ~~and 20.0 µg each of benzene,~~

■76.0 µg of■1S (*USP27*) 1,4-dioxane, and

■16.0 µg of■1S (*USP27*) trichloroethylene.

In-Process Revision

BRIEFING

Dichlorphenamide, *USP 26* page 594. A revision to the monograph is proposed to reflect the proper use of the USP Dichlorphenamide Reference Standard in the *Assay.* The revision is in accordance with changes to the directions of use for the Reference Standard.

(PA6: L. Evans) RTS—39834-1

Change to read:

Assay—

Mobile solvent—Prepare a suitable solution of 0.02 M monobasic sodium phosphate and 0.02 M dibasic sodium phosphate in acetonitrile and water (approximately 1:1) such that the retention time of Dichlorphenamide is approximately 6 minutes.

Standard preparation—Dissolve ~~a previously dried and~~ ■an■1S (*USP27*) accurately weighed quantity of USP Dichlorphenamide RS in *Mobile solvent* to obtain a solution containing about 1 mg per mL.

Assay preparation—Accurately weigh about 50 mg of Dichlorphenamide, and prepare as directed for *Standard preparation*.

Procedure—Introduce separately 20-µL portions of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* ⟨621⟩) operated at 25°, by means of a suitable microsyringe or sampling valve, adjusting the operating parameters such that the peak obtained with the *Standard preparation* is full-scale. Typically, the apparatus is fitted with a 4-mm × 30-cm column, packed with packing L1, is equipped with an UV detector capable of monitoring absorption at 280 nm and a suitable recorder, and is capable of operating at a column pressure of up to 3500 psi. Five replicate injections of the *Standard preparation* show a relative standard deviation of not more than 1.5%. Calculate the quantity, in mg, of $C_6H_6Cl_2N_2O_4S_2$ in the portion of Dichlorphenamide taken by the formula:

$$50C(A_U/A_S),$$

in which C is the concentration, in mg per mL, of USP Dichlorphenamide RS in the *Standard preparation;* and A_U and A_S are the area responses obtained at equivalent retention times from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Dolasetron Mesylate, *USP 26* page 658. Comments were received that the use of some brands of L7 columns (such as Zorbax RX-C8) for the *Related compounds* test results in an inverted order of elution for the indole and dolasetron mesylate peaks. It is proposed to add a procedure for conditioning the columns that would result in the correct elution order. It was also shown that certain columns such as SynChropac RP8 and Zorbax SB-C8 exhibited the correct elution order and did not require conditioning. It is also proposed to correct the formulas under the *Related compounds* test. The graphic structure is also corrected.

Related compounds—

0.01 M Dibasic ammonium phosphate solution—Dissolve 132.1 g of dibasic ammonium phosphate in 1000 mL of water. Dilute 10.0 mL of this solution with about 990 mL of water, adjust with 2.0 M phosphoric acid to a pH of 7.0, and mix.

Diluent—Prepare a mixture of water and acetonitrile (4:1).

Solution A—Prepare a filtered and degassed mixture of *0.01 M Dibasic ammonium phosphate solution* and acetonitrile (1000 : 53).

Solution B—Prepare a filtered and degassed mixture of acetronitrile and *0.01 M Dibasic ammonium phosphate solution* (795 : 295).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution of indole and USP Dolasetron Mesylate RS in *Diluent* having known concentrations of about 0.004 mg per mL and 0.03 mg per mL, respectively.

Standard solution 1—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.03 mg per mL.

Standard solution 2—Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and USP Dolasetron Mesylate Related Compound A RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 6 mg per mL and 0.0072 mg per mL, respectively.

In-Process Revision

Test solution—Transfer about 150 mg of Dolasetron Mesylate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–28	100→0	0→100	linear gradient
28–38	250	100	isocratic
38–40	0→100	100→0	linear gradient
40–50	100	0	isocratic

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the first eluting peak, indole, and the second eluting peak, dolasetron mesylate, is not less than 1.5.

■[NOTE—If the dolasetron mesylate peak is found to elute before the indole peak, condition the column as follows. Fill up the column with *Solution A*, plug the column, and place the column in a convection oven at 105° for about 16 hours. Retest the column.]■1S (*USP27*)

Chromatograph *Standard solution 1*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of *Standard solution 1*, *Standard solution 2*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of dolasetron mesylate related compound A in the portion of Dolasetron Mesylate taken by the formula:

~~$(181.2/217.8)1000(r_U/r_S)$,~~

■$2500(181.2/217.8)(C_{RC}/W)(r_U/r_S)$,■1S (*USP27*)

in which 181.2 and 217.8 are the molecular weights of dolasetron mesylate related compound A base and dolasetron mesylate related compound A hydrochloride, respectively;

■C_{RC} is the concentration, in mg per mL, of USP Dolasetron Mesylate Related Compound A RS in *Standard solution 2;* W is the weight, in mg, of Dolasetron Mesylate taken to prepare the *Test solution*;■1S (*USP27*)

and r_U and r_S are the peak areas for dolasetron mesylate related compound A obtained from the *Test solution* and *Standard solution 2*, respectively: not more than 0.1% of dolasetron mesylate related compound A is found. Calculate the percentage of each impurity (other than dolasetron mesylate related compound A) in the portion of Dolasetron Mesylate taken by the formula:

~~$200(r_i/r_S)$,~~

■$2500(C/W)(r_i/r_S)$,■1S (*USP27*)

in which

■C is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in *Standard solution 1;* W is as defined above;■1S (*USP27*)

r_i is the peak area for each impurity obtained from the *Test solution;* and r_S is the peak area for dolasetron mesylate obtained from *Standard solution 1:* not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

BRIEFING

Ferrous Fumarate and Docusate Sodium Extended-Release Tablets, *USP 26* page 784. It is proposed to add a *Drug release* test to this monograph.

(BPC: M. Marques) RTS—35820-1

Add the following:

■**Drug release** ⟨724⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Times: 1 and 3 hours.

Determine the amount of Fe (II) dissolved, in filtered portions of the solution under test, employing the method described under *Assay for ferrous fumarate* with the following modification.

Standard solution—Transfer the appropriate amount of *Iron stock solution* to a volumetric flask, and dilute with 0.1 N hydrochloric acid in such a way that the final concentration is similar to that expected in the solution under test.

In-Process Revision

Tolerances—The percentages of the labeled amount of Fe (II) dissolved at the times specified conform to *Acceptance Table 1* under *Drug Release* ⟨724⟩.

Time (hours)	Amount dissolved
1	between 40% and 75%
3	not less than 80%■1S (*USP27*)

BRIEFING

Fexofenadine Hydrochloride Capsules, page 1793 of *PF* 28(6) [Nov.–Dec. 2002]. It is proposed to add an early time point to the *Dissolution* test to better control the quality of the product, in consideration that the drug substance can exist in two pseudopolymorphic forms, anhydrous and hydrate.

(BPC: M. Marques) RTS—39653-3

Add the following:

■Fexofenadine Hydrochloride Capsules

» Fexofenadine Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS. USP Fexofenadine Related Compound B RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: *Infrared Absorption* ⟨197K⟩—

Test specimen—Empty the contents of several Capsules, equivalent to about 60 mg of fexofenadine hydrochloride, into a suitable capped tube. Add 10 mL of a mixture of acetonitrile and methanol (10:1), and shake until the sample is dispersed. Allow to settle. Decant, filter, and collect the supernatant in a suitable beaker. Evaporate the solvent to near dryness by using a stream of nitrogen and with gentle heating from an appropriate source (steam, low-temperature hot plate). While still warm, add 5 mL of water and 5 drops of diluted hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for about 30 minutes. Pass through a 10- to 15-µm filtering crucible with fritted disk. Dry the precipitate in an air oven for 1 hour at 105°.

Water, *Method I* ⟨921⟩: between 3.5% and 8.0%, the titration being performed at 50° and the titration vessel being kept in a heated water jacket.

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 15 and 45 minutes.

Determine the amount of $C_{32}H_{39}NO_4 \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and ~~0.5 mL~~ 0.3 mL of phosphoric acid in 300 mL of water, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (700 : 300), and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

System suitability stock solution—[NOTE—A small amount of glacial acetic acid, not to exceed 5% of the total volume, is used, if necessary, to dissolve USP Fexofenadine Hydrochloride Related Compound A RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride Related Compound A RS in water to obtain a solution having a known concentration of 0.44 mg per mL.

System suitability solution—Prepare a solution of USP Fexofenadine Hydrochloride RS in *System suitability stock solution* containing about 0.01 mg of USP Fexofenadine Hydrochloride Related Compound A RS and 0.06 mg of USP Fexofenadine Hydrochloride RS per mL.

Standard solution—[NOTE—A small amount of methanol, not to exceed 0.5% of the total volume, is used, if necessary, to dissolve USP Fexofenadine Hydrochloride RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in water to obtain a solution having a known concentration of 0.07 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between fexofenadine and fexofenadine hydrochloride related compound A is not less than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and filtered portions of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine peaks. Calculate the quantity of $C_{32}H_{39}NO_4 \cdot HCl$ dissolved.

Tolerances—Not less than 50% (*Q*) of the labeled amount of $C_{32}H_{39}NO_4 \cdot HCl$ is dissolved in 15 minutes. Not less than 75% (*Q*) of the labeled amount of $C_{32}H_{39}NO_4 \cdot HCl$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Related compounds—

Phosphate–perchlorate buffer—Prepare as directed in the *Assay.*

Diluting solution, *Mobile phase*, *System suitability preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Fexofenadine Hydrochloride*.

Standard solution—Use the *Standard preparation*, prepared as directed in the *Assay* under *Fexofenadine Hydrochloride*.

Test solution—Use the *Assay stock preparation*, prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fexofenadine hydrochloride related compound A in the portion of Capsules taken by the formula:

$$100C(r_U / r_S),$$

in which *C* is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride Related Compound A RS in the *Standard solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively: ~~not more than 0.3% of fexofenadine hydrochloride related compound A is found.~~ not more than 0.3% of fexofenadine related compound A, not more than 0.2% of decarboxylated degradant, and not more than 0.1% of any other unknown impurity is found; and not more than 0.5% of total impurities is found.

In-Process Revision

Assay—

Phosphate–perchlorate buffer—Dissolve 6.64 g of monobasic sodium phosphate and 0.84 g of sodium perchlorate in 1000 mL of water. Adjust with phosphoric acid to a pH of ~~4.0~~ 2.0.

Diluting solution, *Mobile phase*, *System suitability preparation*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Fexofenadine Hydrochloride*.

Assay stock preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, mix the combined contents, and finely powder by using a mortar and pestle. Transfer a portion of the powder, equivalent to about 50 mg of fexofenadine hydrochloride, accurately weighed, to a 50-mL volumetric flask. Add 40 mL of *Diluting solution*, and shake by mechanical means for 60 minutes. Sonicate for about 2 minutes. Allow to cool to room temperature, dilute with *Diluting solution* to volume, and mix.

Assay preparation—Transfer 3.0 mL of the *Assay stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) in the portion of Capsules taken by the formula:

$$833.3C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

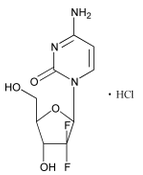
BRIEFING

Gemcitabine Hydrochloride, page 3141 of *PF* 27(5) [Sept.–Oct. 2001]; **Gemcitabine for Injection,** page 3142 of *PF* 27(5) [Sept.–Oct. 2001]. These new monographs, which previously appeared in *Pharmacopeial Previews*, are now forwarded to *In-Process Revision*. On the basis of comments received, minor changes are proposed in the *Assay* of *Gemcitabine Hydrochloride*. It is also proposed to add storage conditions to the *Packaging and storage* section and to add a *Chromatographic purity* test.

(PA6: L. Evans) RTS—38539-2

Add the following:

■Gemcitabine Hydrochloride



$C_9H_{11}F_2N_3O_4 \cdot HCl$ 299.66

Cytidine, 2′-deoxy-2′,2′-difluro-, monohydrochloride.

2′-Deoxy-2′,2′-difluorocytidine monohydrochloride (b-isomer) [*122111-03-9*].

» Gemcitabine Hydrochloride contains not less than 97.5 percent and not more than 101.5 percent of $C_9H_{11}F_2N_3O_4 \cdot HCl$, calculated on the as-is basis.

In-Process Revision

Caution—Gemcitabine Hydrochloride is a potent cytotoxic agent. Great care should be taken to prevent inhaling particles and exposing the skin to it.

Packaging and storage—Preserve in ~~well-closed~~ tight containers, and store at controlled room temperature.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Gemcitabine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements of the tests for *Chloride* ⟨191⟩.

Specific rotation ⟨781S⟩: between +43° and +50°, at 20°.

Test solution: 10 mg per mL.

pH ⟨791⟩: between 2.0 and 3.0, in a solution containing 10 mg per mL.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩: 0.001%.

Chromatographic purity—

Solution A—Proceed as directed for *Mobile phase* in the *Assay.*

Solution B—Prepare filtered and degassed methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*. Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Gemcitabine Hydrochloride RS and USP Cytosine RS in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2 µg per mL of each.

Test solution—Transfer about 50 mg of Gemcitabine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed under *Assay.* The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	97	3	Isocratic
8–13	97→50	3→50	Linear gradient
13–20	50	50	Isocratic
20–25	50→97	50→3	Re-equilibrate

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5 for gemcitabine α-anomer and 1.0 for gemcitabine; the resolution, *R*, between gemcitabine α-anomer and gemcitabine is not less than 8.0; and the tailing factor for gemcitabine is not more than 1.5. Chromatograph the standard solution and record the peak responses as directed for *Procedure:* the relative retention times are about 0.1 for cytosine and 1.0 for gemcitabine; the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject a volume (about 20µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of cytosine in the portion of Gemcitabine taken by the formula:

$$2.5(C_c / W)(r_t / r_s)$$

In-Process Revision

in which C_c is the concentration of USP Cytosine RS in the *Standard solution*, in µg per mL, W is the weight, in mg, of Gemcitabine taken, r_t is the peak response for cytosine in the *Test solution*, and r_s is the response for cytosine in the *Standard solution:* not more than 0.1% of cytosine is found. Calculate the percentage of each impurity other than cytosine in the portion of Gemcitabine taken by the formula:

$$2.5(C_s / W)(r_i / r_s)$$

in which C_s is the concentration of USP Gemcitabine Hydrochloride RS in the *Standard solution*, in µg per mL, W is the weight, in mg, of Gemcitabine taken, r_i is the peak response for each impurity in the *Test solution*, and r_s is the response due to gemcitabine in the *Standard solution:* not more than 0.1% of gemcitabine α-anomer or any other individual impurity is found and the sum of all impurities is not more than 0.2%. Exclude from the sum of all impurities any peaks that are below the limit of quantitation (0.02%).

Other requirements—Where the label states that Gemcitabine Hydrochloride is sterile, it meets the requirements for *Bacterial endotoxins* and *Sterility* under *Gemcitabine Hydrochloride for Injection.* Where the label states that Gemcitabine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Gemcitabine Hydrochloride for Injection.*

Assay—

Mobile phase—Prepare a filtered and degassed solution containing 13.8 g of monobasic sodium phosphate and 2.5 mL of phosphoric acid in 1000 mL of water. [NOTE—The pH of this solution is between 2.4 and 2.6.]

System suitability solution—Transfer about 10 mg of Gemcitabine Hydrochloride to a small vial, add 4 mL of a solution containing 168 mg of potassium hydroxide per mL of methanol, cap tightly, and sonicate. Heat at 55° for 6 to 16 hours, allow to cool, and transfer the contents to a 100-mL volumetric flask with successive washes of 1% (v/v) phosphoric acid. Dilute with 1% phosphoric acid to volume, and mix. [NOTE—This solution contains about 0.02 mg per mL of gemcitabine α-anomer.]

Standard preparation—Dissolve an accurately weighed quantity of USP Gemcitabine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Transfer about 20 mg of Gemcitabine Hydrochloride, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, R, between the gemcitabine α-anomer and gemcitabine is not less than 8.0; and the tailing factor determined from gemcitabine is not more than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{11}F_2N_3O_4 \cdot HCl$ in the portion of Gemcitabine Hydrochloride taken by the formula:

$$200C(r_U / r_S),$$

In-Process Revision

in which C is the concentration, in mg per mL, of USP Gemcitabine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Gemcitabine for Injection, page 3142 of *PF* 27(5) [Sept.–Oct. 2001]—See briefing under *Gemcitabine Hydrochloride*.

(PA6: L. Evans) RTS—38539-1

Add the following:

■Gemcitabine for Injection

» Gemcitabine for Injection contains an amount of Gemcitabine Hydrochloride equivalent to not less than 95 percent and not more than 105 percent of the labeled amount of gemcitabine ($C_9H_{11}F_2N_3O_4$).

Caution—Gemcitabine Hydrochloride is a potent cytotoxic agent. Great care should be taken to prevent inhaling particles and exposing the skin to it.

Packaging and storage—Preserve in *Containers for Sterile Solids*, as described under *Injections* ⟨1⟩. Store at controlled room temperature. Do not refrigerate after reconstitution.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Gemcitabine Hydrochloride RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩.

Solution: 16 µg per mL.

Medium: 0.14 M phosphate buffer with a pH of 2.5, prepared as follows. Add 13.8 g of monobasic sodium phosphate and 2.5 mL of phosphoric acid to 1000 mL of purified water.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Clarity of solution—Dissolve it in the solvent and at the concentration recommended in the labeling: not more than 10t (see *Spectrophotometry and Light-Scattering* ⟨851⟩), determined by ratio turbidimetry within 15 minutes of reconstitution, corrected for a diluent blank.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.05 USP Endotoxin Unit per mg of gemcitabine.

Sterility ⟨71⟩: meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

Uniformity of dosage units ⟨905⟩: meets the requirements for *Weight Variation.*

pH ⟨791⟩: between 2.7 and 3.3, in a solution containing 40 mg in each mL of 0.9% sodium chloride solution.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Chromatographic purity—

Mobile phase, *Standard solution*, *System Suitability Solution* and *Chromatographic system*—Proceed as directed under the test for *Chromatographic purity* for *Gemcitabine Hydrochloride.*

Test solution—Reconstitute the vial with an appropriate amount of water to achieve a solution of 2 mg per mL, based on the labeled content of gemcitabine.

In-Process Revision

Procedure— Proceed as directed under the *Chromatographic purity* for *Gemcitabine Hydrochloride*. Calculate the amount of cytosine expressed as percentage of Gemcitabine Hydrochloride by the formula:

$$0.1(263.20/299.66)(C_cV/L)(r_t / r_s)$$

in which 299.66 is the molecular weight of Gemcitabine Hydrochloride, 263.20 is the molecular weight of gemcitabine, V is the volume, in mL, of water used to reconstitute the vial, L is the labeled amount of gemcitabine in the vial, in mg, C_c is the concentration of USP Cytosine RS in the *Standard solution*, in µg per mL, r_t is the peak response for cytosine in the *Test solution*, and r_s is the response for cytosine in the *Standard solution:* not more than 0.1% of cytosine is found. Similarly, calculate the amount of each impurity other than cytosine, expressed as a percentage of gemcitabine hydrochloride, by the formula:

$$0.1(263.20/299.66)(C_sV/L)(r_i / r_s)$$

in which 299.66 is the molecular weight of Gemcitabine Hydrochloride, 263.20 is the molecular weight of gemcitabine, V is the volume, in mL, of water used to reconstitute the vial, L is the labeled amount of gemcitabine in the vial, in mg, C_s is the concentration of USP Gemcitabine Hydrochloride RS in the *Standard solution*, in µg per mL, r_i is the response for gemcitabine α-anomer or any other individual impurity, and r_s is the peak response for gemcitabine in the *Test solution*. Not more than 0.1% of gemcitabine α-anomer is found, not more than 0.2% each of any other impurity is found, and the sum of all impurities is not more than 0.3%. Exclude from the sum of all impurities any peaks that are below the limit of quantitation (0.02%).

Assay—

Mobile phase, *System suitability solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Gemcitabine Hydrochloride.*

Assay preparation—Constitute a suitable number of vials of Gemcitabine for Injection with purified water to obtain a solution having a concentration of about 0.1 mg per mL, based on the labeled content of gemcitabine.

Procedure—Proceed as directed in the *Assay* under *Gemcitabine Hydrochloride.* Calculate the amount, in mg, of gemcitabine ($C_9H_{11}F_2N_3O_4$) in each vial of Gemcitabine for Injection taken by the formula:

$$(263.20/299.66)(CV/N)(r_U / r_S),$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively; V is the total volume, in mL, of the *Assay preparation; N* is the number of vials taken; and the other terms are as defined therein.■1S (*USP27*)

BRIEFING

Idoxuridine, *USP 26* page 951. The calculation of respective absorptivities in the UV test has been clarified to reflect the new labeling requirement for the USP Idoxuridine RS.

(PA7b: B. Davani) RTS—39913-1

Change to read:

Identification—
A: *Infrared Absorption* ⟨197M⟩.
B: *Ultraviolet Absorption* ⟨197U⟩—
Solution: 35 µg per mL.
Medium: pH 12.0 buffer (prepared from 7.46 g of potassium chloride and 24 mL of 1 N sodium hydroxide dissolved in 2000 mL of water). Absorptivities at 279 nm, calculated on the dried basis

■for the test sample only,■1S (*USP27*)
do not differ by more than 2.0%.

In-Process Revision

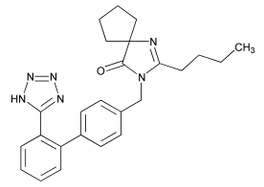
BRIEFING

Irbesartan, page 7156 of *PF* 24(6) [Nov.–Dec. 1998]; **Irbesartan Tablets,** page 7157 of *PF* 24(6) [Nov.–Dec. 1998]; **Irbesartan and Hydrochlorothiazide Tablets,** page 7158 of *PF* 24(6) [Nov.–Dec. 1998]. These new monographs, which previously appeared in *Pharmacopeial Previews*, are now forwarded with minor editorial style changes to *In-Process Revision*. The molecular weight of Irbesartan is revised to reflect the current atomic weight values published in *USP 26*.

(PA5: A. Wilk) RTS—39894-4

Add the following:

■Irbesartan



$C_{25}H_{28}N_6O$ ~~428.54~~ 428.53

1,3-Diazaspiro[4.4]non-1-en-4-one, 2-butyl-3-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-.

2-Butyl-3-[*p*-(*o*-1*H*-tetrazol-5-ylphenyl)benzyl]-1,3-diazaspiro[4.4]non-1-en-4-one [*138402-11-6*].

» Irbesartan contains not less than 98.0 percent and not more than 102.0 percent of $C_{25}H_{28}N_6O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—*USP Irbesartan RS.*

Identification, *Infrared Absorption* ⟨197K⟩.

Water, *Method I* ⟨921⟩: not more than 0.5%.

Chromatographic purity—

Diluent, *Triethylamine solution*, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Irbesartan taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.5% of any individual impurity is found, and not more than 1.0% of total impurities is found.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Assay—

Diluent—Prepare a solution of phosphoric acid (1 in 100).

Triethylamine solution—Add 1.0 mL of triethylamine to 1000 mL of water, mix, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of *Triethylamine solution* and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Irbesartan RS in *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Irbesartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a fluorometric detector that has an excitation wavelength of 250 nm and an emission wavelength of 371 nm, and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard*

In-Process Revision

preparation, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the irbesartan peaks. Calculate the quantity, in mg, of $C_{25}H_{28}N_6O$ in the portion of Irbesartan taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Irbesartan Tablets, page 7157 of *PF* 24(6) [Nov.–Dec. 1998]—See briefing under *Irbesartan*.

(PA5: A. Wilk) RTS—39894-5

Add the following:

■Irbesartan Tablets

» Irbesartan Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of irbesartan ($C_{25}H_{28}N_6O$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—*USP Irbesartan RS.*

Identification—The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{25}H_{28}N_6O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 254 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Irbesartan RS diluted in the same *Medium*.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{25}H_{28}N_6O$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Chromatographic purity—

Diluent, *Triethylamine solution*, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Irbesartan*.

Test solution—Use the *Assay preparation.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

In-Process Revision

Assay—

Diluent, *Triethylamine solution*, and *Mobile phase*—Proceed as directed in the *Assay* under *Irbesartan*.

Standard preparation—Dissolve an accurately weighed quantity of USP Irbesartan RS in *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 30 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 10 mg of irbesartan, to a 100-mL volumetric flask. Add about 80 mL of *Diluent,* and stir on a magnetic stir plate for 15 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of this solution for 10 minutes, and use the clear supernatant.

Chromatographic system—Prepare as directed in the *Assay* under *Irbesartan*. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and record the responses for the major peaks. Calculate the quantity, in mg, of irbesartan ($C_{25}H_{28}N_6O$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S *(USP27)*

BRIEFING

Irbesartan and Hydrochlorothiazide Tablets, page 7158 of *PF* 24(6) [Nov.–Dec. 1998]—See briefing under *Irbesartan*.

(PA5: A. Wilk) RTS—39894-6

Add the following:

■Irbesartan and Hydrochlorothiazide Tablets

» Irbesartan and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of irbesartan ($C_{25}H_{28}N_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—*USP Irbesartan RS. USP Hydrochlorothiazide RS.*

Identification—The relative retention time of the major peaks in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amounts of irbesartan ($C_{25}H_{28}N_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing the following method.

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—~~[NOTE—Use peak areas where peak responses are indicated.]~~ Separately inject equal volumes (about 50 µL) of the Standard solution and filtered portions

In-Process Revision

of the solutions under test into the chromatograph, record the chromatograms, and measure the ~~responses~~ areas for the major peaks. Calculate the quantities of irbesartan ($C_{25}H_{28}N_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved in comparison with a Standard solution having known concentrations of USP Irbesartan RS and USP Hydrochlorothiazide RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 75% (*Q*) of the labeled amounts of $C_{25}H_{28}N_6O$ and $C_7H_8ClN_3O_4S_2$ are dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Assay—

Triethylamine solution—Add 1.0 mL of triethylamine to 1000 mL of water, mix, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of *Triethylamine solution* and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 25 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 100-mL volumetric flask. Add 25*J* mg of USP Irbesartan RS, accurately weighed, *J* being the ratio of the labeled amount, in mg, of irbesartan to the labeled amount, in mg, of hydrochlorothiazide per Tablet. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 25 mg of hydrochlorothiazide, to a 100-mL volumetric flask. Add about 80 mL of *Mobile phase,* and stir on a magnetic stir plate for 15 minutes. Dilute with *Mobile phase* to volume, and mix. Centrifuge a portion of this solution for 10 minutes, and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak ~~responses~~ areas as directed for *Procedure:* the resolution, *R,* between hydrochlorothiazide and irbesartan is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and record the ~~responses~~ areas for the major peaks. Calculate the quantities, in mg, of irbesartan ($C_{25}H_{28}N_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S),$$

in which *C* is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard preparation;* and r_U and r_S are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP27*)

BRIEFING

Isradipine Capsules, page 4334 of *PF* 23(4) [July–Aug. 1997]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now being forwarded to *In-Process Revision*.

(PA5: A. Wilk) RTS—39894-3

In-Process Revision

Add the following:

■Isradipine Capsules

» Isradipine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{21}N_3O_5$.

Packaging and storage—Store in a tight container at controlled room temperature. Protect from light.

USP Reference standards ⟨11⟩—*USP Isradipine RS. USP Isradipine Related Compound A RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Solution—Transfer the contents of one Capsule into a suitable volumetric flask, dissolve the contents in the *Medium* by mechanical shaking for 15 minutes, and dilute with the *Medium* to obtain a solution containing 25 µg of isradipine per mL.

Medium: methanol.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay.*

Uniformity of dosage units ⟨905⟩: meet the requirements.

NOTE—Isradipine is light sensitive. Throughout the following procedures, protect test or assay specimens, the Reference Standards, and solutions containing them from unnecessary exposure to light. Use low-actinic glassware, unless otherwise directed.

Chromatographic purity—

Mobile phase, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Isradipine.*

Standard solution—Dissolve an accurately weighed quantity of USP Isradipine RS in *Mobile phase*, with the aid of sonication if necessary, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL. [NOTE—If necessary, use 1 mL of methanol per 20 mL of *Mobile phase* to dissolve the Reference Standard prior to diluting with *Mobile phase.*]

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks: the sum of all peak responses, other than that of isradipine, from the *Test solution* is not more than three times the isradipine response obtained from the *Standard solution* (1.5%); and no single peak response is greater than that of the isradipine peak response obtained from the *Standard solution* (0.5%).

Assay—

Mobile phase, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Isradipine.*

Assay preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix the combined contents. Transfer an accurately weighed quantity, equivalent to about 25 mg of isradipine, to a 100-mL volumetric flask. Add 5.0 mL of methanol and 5.0 mL of *Mobile phase*, and sonicate at room temperature for 15 minutes. Shake for 15 minutes in a mechanical shaker. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 5 mL of the filtrate.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

In-Process Revision

measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{21}N_3O_5$ in the portion of Capsules taken by the formula:

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Isradipine RS in the *Standard preparation;* and r_U and r_S are the isradipine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Ketamine Hydrochloride, *USP 26* page 1045 and page 1411 of *PF* 28(5) [Sept.–Oct. 2002]. On the basis of comments received, several changes are being proposed. In the test for *Related compounds* as proposed in *PF* 28(5), there are changes to the preparation of the *Standard solution* and the *Test solution*, the *Chromatographic system*, and the *Procedure*. These changes are being made in the interest of clarification and simplification of the method. In the *Assay*, the proposed changes published on page 1140 of *PF* 28(4) are canceled, and in the *Chromatographic system* in the *Assay* there is a new proposal to lower the resolution from 9.4 to 2.0. Interested parties are encouraged to submit comments to the USP Expert Committee on Veterinary Drugs (Standards).

(VET: I. DeVeau) RTS—38679-1; 39357-1; 39357-2; 39412-1; 39428-1; 39504-1

Change to read:

Related compounds—

~~*Buffer*, *Mobile phase*, and *System suitability solution*—Proceed as directed in the *Assay*.~~

~~*Standard solution*—Transfer 4.0 mL of the *System suitability solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having known concentrations of about 0.002 mg each of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS per mL.~~

~~*Test solution*—Transfer about 100 mg of Ketamine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.~~

~~*Chromatographic system*—Proceed as directed in the *Assay*. To evaluate the system suitability requirements, use the *System suitability solution* and the *Standard preparation*, as prepared in the *Assay*.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of ketamine related compound A in the portion of Ketamine Hydrochloride taken by the formula:~~

~~$5000(C/W)(r_U/r_S)$,~~

~~in which C is the concentration, in mg per mL, of USP Ketamine Related Compound A RS in the *Standard solution; W* is the weight, in mg, of Ketamine Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses for ketamine related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% of ketamine related compound A is found. In the chromatogram of the *Test solution*, the response of no other, unknown, impurity is greater than 0.3% of the ketamine peak response; and the sum of the responses of all unknown impurity peaks is not greater than 1.0% of the ketamine peak response.~~

■*Mobile phase*—Dissolve 0.95 g of sodium 1-hexanesulfonate in 1 liter of a solution consisting of a mixture of water and acetonitrile (3:1). Add 4 mL of acetic acid, and mix.

~~*Ketamine hydrochloride standard stock solution*—Dissolve an accurately weighed quantity of USP Ketamine Hydrochloride RS in *Mobile phase*, sonicating if necessary, to obtain a solution having a concentration of 1 mg per mL.~~

~~*Resolution solution*—Dissolve an accurately weighed quantity of USP Ketamine Related Compound A RS in *Mobile phase*, sonicating if necessary, to obtain a solution having a concentration of 0.5 mg per mL. To 1 mL of this solution, add 0.5 mL of *Ketamine hydrochloride standard stock solution*, and dilute with *Mobile phase* to 100 mL. [NOTE—Prepare immediately before use.]~~

Standard solution—Dissolve accurately weighed quantities of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS in *Mobile phase* (sonicate if necessary) to prepare a solution containing about 0.005 mg per mL of each compound. Prepare immediately before use.

Test solution—Transfer an accurately weighed quantity of about 50.0 mg of Ketamine Hydrochloride to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, sonicating if necessary. ~~Dilute 1.0 mL of the solution so obtained to 10.0 mL with *Mobile phase*. Dilute 1.0 mL of the resulting solution to 20.0 mL with *Mobile phase*.~~

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.0-mm × 4.0-mm guard column with a 4.0-mm × 12.5-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the ~~*Resolution solution,*~~ *Standard solution*, and record the peak responses as directed for *Procedure:* the order of elution is ketamine hydrochloride followed by ketamine related compound A; the resolution, *R*, between these two peaks is not less than 2.0; the retention time of ketamine hydrochloride is between 3.0 and 4.5 minutes (if necessary, adjust the concentration of water and acetonitrile); and the tailing factor is not greater than 1.5.

Procedure—Separately inject equal volumes (about 20 µL) of the ~~*Resolution solution,*~~ *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, identify the ketamine hydrochloride and ketamine related compound A peaks, and measure the areas of the major peaks. Calculate the area percentage of each impurity, relative to ketamine hydrochloride, taken by the formula:

~~$100(r_i/r_u)$,~~

~~in which r_i and r_u are the peak areas of the impurity and ketamine hydrochloride, respectively, in the *Test solution*.~~

$$5000(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Ketamine Hydrochloride taken to prepare the *Test solution;* r_i is the peak area of each individual impurity peak in the *Test solution;* and r_S is the response of the ketamine hydrochloride peak obtained from the *Standard solution*. Not more than 0.1% of ketamine related compound A is found; the response of no other unknown impurity is greater than 0.3% of the ketamine peak area; and the sum of the responses of all unknown impurity peaks is not greater than 1.0% of the ketamine peak response.■1S (*USP27*)

Change to read:

Assay—

Buffer—Dissolve 5.75 g of monobasic ammonium phosphate in 1000 mL of water. Add 6 mL of triethylamine, and adjust with phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 12.5 mg each, of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS, both accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase* with the aid of sonification if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer about 10 mg of USP Ketamine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add about 20 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 20 mg of Ketamine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add about 35 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the order of elution is ketamine followed by ketamine related compound A; the resolution, *R*, between ketamine and ketamine related compound A is not less than ~~9.4;~~

■2.0;■1S (*USP27*)

the column efficiency determined from the ketamine peak is not less than 9400 theoretical plates; and the tailing factor determined from the ketamine peak is not more than 1.6. Chromatograph the *Standard preparation*, and record the ketamine peak response as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 0.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{16}ClNO \cdot HCl$ in the portion of Ketamine Hydrochloride taken by the formula:

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the ketamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

In-Process Revision

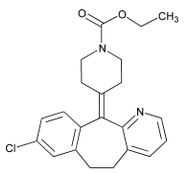
BRIEFING

Loratadine, page 1604 of *PF* 28(5) [Sept.–Oct. 2002]; **Loratadine Oral Solution,** page 1606 of *PF* 28(5) [Sept.–Oct. 2002]; **Loratadine Tablets,** page 1608 of *PF* 28(5) [Sept.–Oct. 2002]. These new monographs, which previously appeared in *Pharmacopeial Previews*, are now forwarded to *In-Process Revision* with minor editorial style changes. In the *Packaging and storage* section it is proposed to add a recommended temperature range for storage, to conform to the policy established by the USP Expert Committee on Packaging, Storage, and Distribution.

(PA1: K. Russo; PSD: C. Okeke) RTS—39761-1

Add the following:

■Loratadine



$C_{22}H_{23}ClN_2O_2$ 382.88

1-Piperidinecarboxylic acid, 4-(8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene)-, ethyl ester.

Ethyl 4-(8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene)-1-piperidinecarboxylate [*79794-75-5*].

» Loratadine contains not less than 98.5 percent and not more than 101.0 percent of $C_{22}H_{23}ClN_2O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store between 2° and 30°.

USP Reference standards ⟨11⟩—*USP Loratadine RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Melting range ⟨741⟩: between 132° and 137°.

Loss on drying ⟨731⟩—Dry it at 100° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Related compounds—

Mobile phase and *Diluent*—Prepare as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard preparation* in the *Assay.*

Standard solution—Pipet 5.0 mL of *Standard stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.8 µg per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The column temperature is maintained between 25° and 35°. The flow rate is about 1 mL per minute. Chromatograph the *Test solution*, and record the peak areas as directed for *Procedure:* the relative retention times are about 0.79 for 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl and 1.0 for loratadine. Chromatograph the *Standard solution*, and record the peak area of the main peak as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 4.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure all of the peak areas in the *Test solution* and the peak area of the main peak in the *Standard solution*. Calculate the percentage of each impurity in the portion of Loratadine taken by the formula:

$$10{,}000(C/F)(r_i / r_S)W,$$

in which C is the concentration, in mg per mL, of USP Loratadine RS in the *Standard solution; F* is the relative response factor for each impurity, if known, (F is 0.25 for 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl); r_i is the peak area response for each impurity in the *Test solution*; r_S is the peak area response of loratadine in the *Standard solution;* and W is the quantity, in mg, of Loratadine taken to prepare the *Test solution:* not more than 0.2% of 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl is found; not more than 0.1% of any other individual impurity is found; and not more than 0.3% of total impurities is found.

Assay—

0.01 M Dibasic potassium phosphate—Transfer about 1.74 g of anhydrous dibasic potassium phosphate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

0.6 M Dibasic potassium phosphate—Transfer 105 g of anhydrous dibasic potassium phosphate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Dibasic potassium phosphate*, methanol, and acetonitrile (7:6:6). Adjust with 10% phosphoric acid solution to an apparent pH of 7.2. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

0.05 N Hydrochloric acid—Transfer 500 mL of water to a 1000-mL volumetric flask, add 83 mL of hydrochloric acid, dilute with water to volume, and mix. Transfer 50 mL of this solution into a 1000-mL volumetric flask, dilute with water to volume, and mix.

Diluent—Transfer 400 mL of *0.05 N Hydrochloric acid* and 80 mL of *0.6 M Dibasic potassium phosphate* to a 1000-mL volumetric flask, dilute with a mixture of methanol and acetonitrile (1:1) to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Loratadine RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer about 40 mg of Loratadine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing 5-µm L7. The flow rate is about 1 mL per minute. The column temperature is maintained between 25° and 35°. Chromatograph the *Standard preparation*, and record the peak area responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{22}H_{23}ClN_2O_2$ in the portion of Loratadine taken by the formula:

In-Process Revision

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Loratadine RS in the *Standard preparation;* and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Loratadine Oral Solution, page 1606 of *PF* 28(5) [Sept.–Oct. 2002]—See briefing under *Loratadine*.

(PA1: K. Russo; PSD: C. Okeke) RTS—39761-3

Add the following:

■Loratadine Oral Solution

» Loratadine Oral Solution contains not less than 94.0 percent and not more than 105.0 percent of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$).

Packaging and storage—Preserve in tight containers, and store between 2° and 30°.

USP Reference standards ⟨11⟩—*USP Loratadine RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Place a volume of Oral Solution, equivalent to about 10 mg of loratadine, in a centrifuge tube. Add 10 mL of 0.2 N sodium hydroxide and 2.0 mL of dichloromethane. Rotate for 10 minutes. Centrifuge, and discard the aqueous phase.

Standard solution—Dissolve an accurately weighed quantity of USP Loratadine RS in dichloromethane to obtain a solution having a known concentration of about 5 mg per mL.

Developing solvent system: ethyl ether and diethylamine (40:1), in a paper-lined tank.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay.*

Antimicrobial effectiveness test ⟨51⟩: meets the requirements.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 100 per mL; and the total combined molds and yeasts count does not exceed 50 cfu per mL.

Deliverable volume ⟨698⟩: meets the requirement.

pH ⟨791⟩: between 2.5 and 3.1.

Related compounds—

Mobile phase—Prepare a mixture of 15 mmol sodium dodecyl sulfate in a mixture of water and acetonitrile (1:1). Adjust with phosphoric acid to a pH of 2.6 ± 0.1, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of *Mobile phase* and water (2:1).

System suitability solution 1—Dissolve an accurately weighed quantity of USP Loratadine RS, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.002 mg per mL.

System suitability solution 2—Quantitatively transfer 5.0 mL of *System suitability solution 1* into a suitable container, dilute with *Diluent* to 50 mL, and mix.

In-Process Revision

Resolution solution—Transfer an amount of Oral Solution, equivalent to 20 mg of loratadine, into a screw-cap, glass container. Add 1 mL of 3% aqueous hydrogen peroxide, and mix. Cap, and heat at 65° for 18 to 24 hours.

Test solution—Transfer an accurately measured volume of Oral Solution, equivalent to about 5 mg of loratadine, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 2 mL per minute. The column temperature is maintained between 30° and 40°. Chromatograph the *Resolution solution*, and record the peak areas as directed for *Procedure:* the relative retention times are about 0.70 for ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate, 0.84 for ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate, and 1.0 for loratadine; and the resolution, *R*, between loratadine and ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate is not less than 3.0. Chromatograph *System suitability solution 1*, and record the peak area response of the loratadine peak as directed for *Procedure:* the tailing factor is not less than 0.7 and not greater than 1.1. Chromatograph *System suitability solution 2*, and record the peak area response of the loratadine peak as directed for *Procedure:* the relative standard deviation for replicate injections of *System suitability solution 2* is not more than 10%.

Procedure—Inject about 50 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak area responses. Calculate the percentage of each individual related compound in the portion of Oral Solution taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the individual peak response of each related compound in the *Test solution;* and r_s is sum of the responses of all of the peaks, excluding excipient peaks: not more than 0.3% of ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than 0.3% of ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than 0.2% of any other individual impurity is found; and the sum of all impurities is not more than 0.5%.

Assay—

0.05 M Monobasic potassium phosphate solution—Transfer about 6.8 g of monobasic potassium phosphate, accurately weighed, to a 1-liter volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 3.0 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Monobasic potassium phosphate solution* and acetonitrile (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard preparation—Dissolve an accurately weighed quantity of butylparaben in a mixture of water and acetonitrile (7:3), and dilute quantitatively, and stepwise if necessary, with a mixture of water and acetonitrile (7:3) to obtain a solution having a concentration of about 0.3 mg per mL.

In-Process Revision

Standard stock peparation—Dissolve an accurately weighed quantity of USP Loratadine RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL.

Standard preparation—Transfer 5.0 mL of *Internal standard preparation*, 5.0 mL of *Standard stock preparation*, and 12 mL of water into a 50-mL volumetric flask. Dilute with a mixture of water and acetonitrile (7:3), and mix.

Assay preparation—Transfer an accurately measured quantity of Oral Solution, equivalent to 5 mg of loratadine, into a 50-mL volumetric flask. Pipet 5.0 mL of *Internal standard preparation* into the flask, dilute with a mixture of water and acetonitrile (7:3) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 5-µm packing L11. The flow rate is about 2 mL per minute. The column temperature is maintained between 20° and 30°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.78 for butylparaben and 1.0 for loratadine; the resolution, *R*, between loratadine and butylparaben is not less than 1.9; the tailing factor is not more than 1.6 for the loratadine and butylparaben peaks; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of loratadine ($C_{22}H_{23}ClN_2O_2$) in the portion of Oral Solution taken by the formula:

$$50C(R_U / R_S),$$

in which *C* is the concentration, in mg per mL, of USP Loratadine RS in the *Standard preparation;* and R_U and R_S are the ratios of loratadine to the internal standard peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Loratadine Tablets, page 1608 of *PF* 28(5) [Sept.–Oct. 2002]—See briefing under *Loratadine.*

(PA1: K. Russo; PSD: C. Okeke) RTS—39761-2

Add the following:

■Loratadine Tablets

» Loratadine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$).

Packaging and storage—Preserve in ~~well closed~~ tight containers, and store between 2° and 30°. Protect from excessive moisture if packaged in blisters.

USP Reference standards ⟨11⟩—*USP Loratadine RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer an accurately weighed quantity of Tablets, equivalent to about 20 mg of loratadine, to a centrifuge tube. Add 5.0 mL of a mixture of chloroform and methanol (1:1), rotate for 30 minutes, and centrifuge.

In-Process Revision

Standard solution—Dissolve an accurately weighed quantity of about 20 mg of USP Loratadine RS in 5 mL of a mixture of chloroform and methanol (1:1), and mix.

Application volume: 5 µL.

Developing solvent system: ethyl ether and diethylamine (40:1), in a paper-lined tank.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{22}H_{23}ClN_2O_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 280 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Loratadine RS in the same *Medium*.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{22}H_{23}ClN_2O_2$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Related compounds—

0.01 M Dibasic potassium phosphate, *0.6 M Dibasic potassium phosphate*, *Mobile phase*, *0.05 N Hydrochloric acid*, and *Diluent*—Proceed as directed in the *Assay* under *Loratadine*.

Standard stock solution—Prepare as directed for *Standard preparation* in the *Assay* under *Loratadine*.

Standard solution—Pipet 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with *Diluent* to volume. Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.8 µg per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Test solution*, and record the peak areas as directed for *Procedure:* the relative retention times are about 0.79 for 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl and 1.0 for loratadine. Chromatograph the *Standard solution*, and record the peak areas of the main peak as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure all of the peak area responses in the *Test solution* and the peak area of the main peak in the *Standard solution*. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$2500(C/L)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Loratadine RS in the *Standard solution; L* is the labeled quantity, in mg, of loratadine in each Tablet taken; r_i is the peak area response for each impurity in the *Test solution;* and r_S is the peak area response of loratadine in the *Standard solution:* not more than 0.2% of 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl is found; not more than 0.1% of any other individual impurity is found; and the sum of all impurities, other than 4-(8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl)-1-piperidinecarboxylate ethyl, is not more than 0.1%.

In-Process Revision

Assay—

0.01 M Dibasic potassium phosphate, *0.6 M Dibasic potassium phosphate*, *Mobile phase*, *0.05 N Hydrochloric acid*, *Diluent*, and *Standard preparation*—Proceed as directed in the *Assay* under *Loratadine*.

Assay preparation—Transfer 10 Tablets into a 250-mL volumetric flask, add 100 mL of *0.05 N Hydrochloric acid*, and shake for 40 minutes or until the Tablets are completely disintegrated. Add 75 mL of a mixture of methanol and acetonitrile (1:1), and mix. Add 20 mL of *0.6 M Dibasic potassium phosphate*, and mix for 5 minutes. Dilute with a mixture of methanol and acetonitrile (1:1) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay* under *Loratadine*. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the capacity factor, k', is not less than 3.5; the tailing factor is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak response for the major peaks. Calculate the quantity, in mg, of $C_{22}H_{23}ClN_2O_2$ in the portion of Tablets taken by the formula:

$$250C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Loratadine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Magnesium Oxide, *USP 26* page 1115 and page 2974 of the *First Supplement*. Because the *Labeling* section requires the indication of whether it is Light Magnesium Oxide or Heavy Magnesium Oxide, it is proposed to add the test for *Bulk density* to the monograph. Currently, the test to determine the grade of Magnesium Oxide is given only in the *Reference Tables*, under *Description and Solubility.*

(PA4: E. Gonikberg) RTS—39805-1

Add the following:

■**Bulk density,** *Method I* ⟨616⟩—Using the procedure specified in the chapter, determine the volume occupied by 25.0 g of Magnesium Oxide: the volume is approximately 200 to 250 mL for Light Magnesium Oxide, and is approximately 50 to 100 mL for Heavy Magnesium Oxide.■1S (*USP27*)

BRIEFING

Mangafodipir Trisodium, *USP 26* page 1121. Based on comments received, it is proposed to correct the unknown impurity level in the test for *Related compounds* to 0.3%, and set the limit of total impurities in the same test to 2.0%.

(RMI: A. Wilk) RTS—39859-1

Change to read:

Related compounds—

Ascorbic acid solution—Dissolve 0.4 g of ascorbic acid in 100 mL of water.

Phosphate buffer—Prepare as directed in the *Assay.*

Mobile phase—Prepare as directed in the *Assay.* [NOTE—Increasing the proportion of acetonitrile will decrease the retention times].

System suitability stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

System suitability solution 1—Prepare a solution of USP Mangafodipir Trisodium RS having a known concentration of about 4.0 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *System suitability stock solution*, 5.0 mL of *Phosphate buffer*, and 5.0 mL of *Ascorbic acid solution*. Dilute with nitrogen-purged water to volume, and mix to obtain a solution having a concentration of about 0.4 mg of USP Mangafodipir Trisodium RS, and about 0.01 mg each of USP Mangafodipir Related Compound A RS and USP Mangafodipir Related Compound B RS per mL. [NOTE—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

System suitability solution 2—Transfer about 10 mg of USP Mangafodipir Related Compound C RS to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and add 5.0 mL of *Phosphate buffer.*

Test solution—Transfer an accurately weighed quantity of Mangafodipir Trisodium, equivalent to about 100 mg of mangafodipir trisodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 50-mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [NOTE—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph *System suitability solution 2*, and record the peak responses as directed for *Procedure:* note the elution time to identify the mangafodipir related compound C peak, if present, in the chromatogram of *System suitability solution 1.* Chromatograph *System suitability solution 1*, and record the peak responses as directed for *Procedure:* the retention time for mangafodipir is between 18 and 30 minutes. The peak area for mangafodipir related compound C is less than 0.1%. [NOTE—If the peak area is more than 0.1% of the total of all peak areas, prepare fresh quantities of *Ascorbic acid solution* and *System suitability solution 1*, and repeat the test. If the peak area of mangafodipir related compound C is still greater than 0.1%, repeat the test using another column. A contaminated column can result in oxidation of Mn(II) to Mn(III), forming related compound C.] The tailing factor for the mangafodipir peak is not more than 2.3; the column efficiency is not less than 1000 theoretical plates; the resolution, *R*, between mangafodipir related compound B and mangafodipir is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10% for each peak. [NOTE—If the resolution is less than 1.5, adjust the *Mobile phase* by increasing the concentration of tetrabutylammonium hydrogen sulfate].

Procedure—Inject about 10 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all of the major peaks. The relative retention times for ascorbic acid, mangafodipir related compound A, Mn(II)-5-methyl dipyridoxal monophosphate (Mn(II)-5-methyl DPMP) if present, mangafodipir related compound C, mangafodipir related compound B, and mangafodipir are about 0.1, 0.3, 0.4, 0.6, 0.8, and 1.0, respectively. Calculate the percentages of mangafodipir related compound A, mangafodipir related compound B, mangafodipir related compound C, and Mn(II)-5-methyl DPMP in the portion of Mangafodipir Trisodium taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area of each impurity; and r_s is the sum of the areas of all of the peaks: not more than 0.5% each of mangafodipir related compound A and mangafodipir related compound B is found; not more than 0.6% of mangafodipir related compound C is found; not more than 0.3% of Mn(II)-5-methyl DPMP is found; not more than ~~0.1%~~

■0.3%■1S (*USP27*)
of any other impurity is found; ~~and~~

■■1S (*USP27*)
not more than a total of 0.5% of other impurities is found;

■and not more than a total of 2.0% of impurities is found.■1S (*USP27*)

BRIEFING

Mangafodipir Trisodium Injection, page 1419 of *PF* 28(5) [Sept.–Oct. 2002]. Based on the comments received, it is proposed to remove the sodium test from the *Identification* test *B*. It is also proposed to revise the Definition to correct the quantitative limits.

(RMI: A. Wilk) RTS—39549-1

Add the following:

■Mangafodipir Trisodium Injection

» Mangafodipir Trisodium Injection is a sterile solution of Mangafodipir Trisodium in Water for Injection. ~~It Each mL~~ It contains not less than ~~90.0 percent 6.81 mg 90.0 percent~~ 94.0 percent and not more than ~~110.0 percent 8.33 mg 110.0 percent~~ 106.0 percent of the labeled amount of mangafodipir trisodium ($C_{22}H_{27}MnN_4Na_3O_{14}P_2$). It may contain stabilizers and buffers. It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose containers of Type I glass. Store at controlled room temperature, with containers on their sides in the original carton.

~~**Labeling**—Label it to indicate that the maximum dose does not exceed 15 mL.~~

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Mangafodipir Trisodium RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

B: It meets the requirements of the tests for ~~*Sodium* ⟨191⟩ and~~ *Manganese* ⟨191⟩.

In-Process Revision

Bacterial endotoxins ⟨85⟩: not more than 0.66 USP Endotoxin Unit per mg of mangafodipir trisodium.

pH ⟨791⟩: between 8.4 and 9.2.

Osmolarity ⟨785⟩: between 244 and 330 mOsmol per kg of water.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Phosphate buffer and *Mobile phase*—Proceed as directed in the *Assay* under *Mangafodipir Trisodium*.

Standard preparation—Prepare a solution of USP Mangafodipir Trisodium RS in water having a known concentration of about 2 mg per mL. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [NOTE—Store under nitrogen to avoid excessive exposure to air and light.]

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of mangafodipir trisodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [NOTE—Store under nitrogen to avoid excessive exposure to air and light.]

Chromatographic system—Prepare as directed in the *Assay* under *Mangafodipir Trisodium*. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; and the tailing factor is not more than 2.3.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of mangafodipir trisodium ($C_{22}H_{27}MnN_4Na_3O_{14}P_2$) in each mL of the Injection taken by the formula:

$$250(C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Mangafodipir Trisodium RS in the *Standard preparation; V* is the volume, in mL, of Injection taken to prepare the *Assay preparation;* and r_U and r_S are the mangafodipir peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Mercaptopurine Tablets, *USP 26* page 1159. In accordance with the approved NDA for this product, it is proposed to replace the test for *Disintegration* with a test for *Dissolution*.

(BPC: M. Marques) RTS—37676-1

Delete the following:

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Determine the amount of $C_5H_4N_4S$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed solution of 0.1% acetic acid in water. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 3.9-mm × 15-cm column that contains packing

In-Process Revision

L1. The flow rate is about 2.5 mL per minute. Chromatograph replicate injections of the Standard solution prepared as described below for *Procedure*, and record the peak responses as directed for *Procedure:* the retention time for mercaptopurine is not less than 4 minutes, and the relative standard deviation is not more than 2.0%.

Procedure—Inject a volume (about 10 µL) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_5H_4N_4S$ dissolved in comparison with a Standard solution having a known concentration of USP Mercaptopurine RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_5H_4N_4S$ is dissolved in 60 minutes.■1S (*USP27*)

■*Standard solution*—Dissolve an accurately weighed quantity of USP Methamphetamine Hydrochloride RS in water to obtain a solution having a known concentration similar to the one expected in the *Test solution*. Dilute 2:1 with 0.15 M perchloric acid.

Test solution—Use filtered aliquots of the solution under test. Dilute 2:1 with 0.15 M perchloric acid.■1S (*USP27*)

Procedure— ~~Determine the amount of $C_{10}H_{15}N \cdot HCl$ dissolved by employing the following pressurized liquid chromatographic method. Use filtered aliquots of the solution under test diluted with 0.15 *M* perchloric acid if necessary. Prepare a Standard solution having a known concentration of USP Methamphetamine Hydrochloride RS in the same medium.~~ ■■1S (*USP27*) The liquid chromatograph is equipped with a 211-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard solution* (about 100 µL), record the chromatogram, and measure the response for the major peak: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 3.0%. Inject an equal volume of the ~~solution under test~~

■*Test solution*■1S (*USP27*)
into the chromatograph, record the chromatogram, and measure the response of the major peak. Calculate the quantity of $C_{10}H_{15}N \cdot HCl$ dissolved by comparison with the Standard solution.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{10}H_{15}N \cdot HCl$ is dissolved in 45 minutes.

BRIEFING

Methamphetamine Hydrochloride Tablets, *USP 26* page 1178. It is proposed to add instructions for the preparation of the *Standard solution* and *Test solution* in the *Dissolution* test.

Add the following:

■**Dissolution** ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 100 rpm.

Time: 30 minutes.

Standard solution—Dissolve an accurately weighed quantity of USP Methenamine Hippurate RS in water to obtain a solution having a known concentration of about 22 µg per mL.

Procedure—Determine the amount of $C_6H_{12}N_4 \cdot C_9H_9NO_3$ dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 227 nm on filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with the *Standard solution*.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_6H_{12}N_4 \cdot C_9H_9NO_3$ is dissolved in 30 minutes.■1S (*USP27*)

BRIEFING

Miconazole Nitrate Cream, *USP 26* page 1235 and page 1302 of *PF* 26(5). Based on comments received for the *PF* 26(5) proposals, the Expert Committee has decided to resubmit the previously cancelled version with the following additional changes. The instructions for the *Standard* and *Assay preparations* are modified to incorporate these comments. The *System suitability* criteria are also expanded to include a resolution requirement. Additionally, a correction was made to the formula for the calculation of Miconazole Nitrate content, and a storage condition has been added.

Packaging and storage—Preserve in collapsible tubes or tight containers,

■and store at controlled room temperature.■1S (*USP27*)

Change to read:

Assay—

~~*Internal standard solution*—Dissolve a suitable quantity of cholestane in a mixture of chloroform and methanol (1:1) to obtain a solution having a concentration of about 1 mg per mL.~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Miconazole Nitrate RS in methanol to obtain a solution having a known concentration of about 500 µg per mL. Transfer 10.0 mL of this solution to a test tube, and evaporate on a steam bath with the aid of a current of filtered air to dryness. Dissolve the residue in 2.0 mL of *Internal standard solution*. This *Standard preparation* has a concentration of about 2500 µg per mL.~~

~~*Assay preparation*—Transfer an accurately weighed portion of the Cream, equivalent to about 100 mg of miconazole nitrate, to a 100-mL volumetric flask. Dissolve in a mixture of isopropyl alcohol and chloroform (1:1), dilute with the same solvent mixture to volume, and mix. Pipet 25 mL of this solution into a 150-mL beaker and evaporate on a steam bath with the aid of a stream of nitrogen to dryness. Add 10 mL of chloroform to the residue, and heat on a steam bath just to boiling. Remove the beaker from the steam bath, and stir to dissolve. [NOTE—Avoid excessive evaporation of chloroform.] Add 50 mL of pentane in small portions with continuous stirring. Allow to crystallize for 10 to 15 minutes. Pass through a medium-porosity sintered-glass filter funnel with the aid of a current of air applied to the surface through a one-hole stopper fitted onto the funnel. Wash the beaker with four 5-mL portions of pentane and add the washings to the filter funnel. Wash the funnel and precipitate with four 5-mL portions of pentane. Dry the precipitate on the filter by allowing filtered air to pass through the funnel for several minutes. Dissolve the precipitate by washing the beaker and funnel with small portions of methanol, and collect the filtrate in a 50-mL volumetric flask using filtered air applied to the top of the funnel to aid in filtration. Dilute with methanol to volume, and mix. Transfer 10.0 mL of this stock solution to a test tube, and evaporate on a steam bath with the aid of a current of filtered air to dryness. Dissolve the residue in 2.0 mL of *Internal standard solution*.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.2-m column packed with 3% phase G32 on support S1A. The injection port, detector, and column temperatures are maintained at about 250°, 300°, and 250°, respectively, and helium is used as the carrier gas, flowing at a rate of about 50 mL per minute. The relative retention times for cholestane and miconazole nitrate are about 0.44 and 1.0, respectively. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between cholestane and miconazole nitrate is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.~~

~~*Procedure*—Separately inject equal volumes (about 1 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) in the portion of Cream taken by the formula:~~

$$~~0.04C(R_U/R_S)~~,$$

~~in which *C* is the concentration, in µg per mL, of USP Miconazole Nitrate RS in the *Standard preparation*; and R_U and R_S are the peak response ratios of miconazole nitrate to cholestane obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

■*Buffer solution*—Transfer 10 mL of triethylamine to a suitable flask, dilute with 1000 mL of water, adjust with phosphoric acid to a pH of about 2.5, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, acetonitrile, and tetrahydrofuran (8:5:4:3). Make adjustments if necessary (see *System Suitablility* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Miconazole Nitrate RS and benzoic acid in *Mobile phase*, and dilute quantitatively, and stepwise if

In-Process Revision

necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.28 and 0.02 mg per mL for miconazole nitrate and benzoic acid, respectively.

Assay preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 14 mg of miconazole nitrate, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to voulume, and mix. Sonicate in a water bath at 40° to 45° until the sample is completely dispersed, and mix. Cool the solution to below room temperature, mix, and filter a portion of the solution through a 0.45-µm teflon filter into an HPLC vial.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and 4.6-mm × 25-cm column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 45°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency for miconazole nitrate peak is not less than 7500 theoretical plates; the tailing factor for miconazole nitrate peak is not more than 2.0; and the relative standard deviation for replicate injections of miconazole nitrate is not more than 2.0%. The resolution between miconazole nitrate and benzoic acid is not less than 13.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) in the portion of Cream taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Miconazole Nitrate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Mitomycin, *USP 26* page 1241 and page 2976 of the *First Supplement*. Revisions are proposed to establish consistency with the system of labeling adopted in 1993 by the USP Drug Nomenclature Committee (see page 5618 of *PF* 19(4) [July–Aug. 1993]). Specifically, it is now proposed to include in the monograph for this drug substance a section on labeling that would require a statement specifying that where Mitomycin is intended for use in preparing injectable dosage forms, it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed, specifying that where the label states that it is sterile, it must meet the requirements of USP general test chapter *Sterility Tests* ⟨71⟩; and where the label states that it must be subjected to further processing, it must meet the requirements of USP general test chapter *Bacterial Endotoxins Test* ⟨85⟩. It is proposed also to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

Hemihydrate 275.31

» Nevirapine is anhydrous or contains not more than one-half molecule of water of hydration. It contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{14}N_4O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers. Store between 15° and 30°.

Labeling—Label it to indicate whether it is anhydrous or the hemihydrate.

USP Reference standards ⟨11⟩—*USP Nevirapine Anhydrous RS. USP Nevirapine Hemihydrate RS. USP Nevirapine Related Compound A RS. USP Nevirapine Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Do not dry the specimens.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Water, *Method I* ⟨921⟩—For anhydrous Nevirapine, proceed as directed for *Method Ic:* not more than 0.2%. For Nevirapine hemihydrate, proceed as directed for *Method Ia:* between 3.1% and 3.9%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Related compounds—

0.025 M Ammonium phosphate buffer, Mobile phase, Standard stock solution 1, Standard stock solution 2, Standard stock solution 3, and *Resolution solution*—Proceed as directed in the *Assay.*

In-Process Revision

Standard solution—Transfer 2.0 mL of the *Standard stock solution 1* to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer an accurately weighed quantity of Nevirapine, equivalent to about 24 mg of anhydrous nevirapine, to a 100-mL volumetric flask. Add 4 mL of acetonitrile and 80 mL of *Mobile phase*, and sonicate for at least 15 minutes. Allow to cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Chromatographic system—Prepare as directed in the *Assay*. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for nevirapine related compound B, 1.0 for nevirapine, and 1.5 for nevirapine related compound A; the resolution, *R*, between nevirapine related compound B and nevirapine is not less than 5.0; and the resolution between nevirapine and nevirapine related compound A is not less than 7.4. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least 80 minutes, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Nevirapine taken by the formula:

$$10{,}000(1/F)(C/W)(r_i/r_S),$$

in which F is the relative response factor for each impurity, which is equal to 1.3 for nevirapine related compound B and 1.0 for all other impurities; C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard solution; W* is the weight of Nevirapine, in mg, taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the nevirapine peak response obtained from the *Standard solution:* not more than 0.2% each of nevirapine related compound A, nevirapine related compound B, and the impurity having a relative retention time of about 2.8 is found; not more than 0.1% of any other individual impurity is found; and not more than 0.6% of total impurities is found.

Organic volatile impurities, *Method I* ⟨467⟩: meets the requirements.

Assay—

0.025 M Ammonium phosphate buffer—Transfer 2.88 g of monobasic ammonium phosphate to a 1000-mL volumetric flask, dissolve in 800 mL of water, adjust with 1 N sodium hydroxide to a pH of about 5.0, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.025 M Ammonium phosphate buffer* and acetonitrile (4:1).

Standard stock solution 1—Transfer an accurately weighed quantity of USP Nevirapine Anhydrous RS to a volumetric flask, add a volume of a mixture of *Mobile phase* and acetonitrile (20:1), sonicate for at least 15 minutes, allow to cool to room temperature, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.24 mg per mL. [NOTE—Do not use after 78 hours.]

Standard stock solution 2—Transfer an accurately weighed quantity of USP Nevirapine Related Compound A RS to a volumetric flask, add a volume of a mixture of *Mobile phase* and acetonitrile (3:1), sonicate for at least 15 minutes, allow to cool to room temperature, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.24 mg per mL.

Standard stock solution 3—Transfer an accurately weighed quantity of USP Nevirapine Related Compound B RS to a volumetric flask, add a volume of a mixture of *Mobile phase* and acetonitrile (2.2:1), sonicate for at least 30 minutes, allow to cool to room temperature, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.06 mg per mL.

Resolution solution—Transfer 3.0 mL of *Standard stock solution 1*, 3.0 mL of *Standard stock solution 2*, and 6.0 mL of *Standard stock solution 3* to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer 3.0 mL of *Standard stock solution 1* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Do not use after 78 hours.]

Assay preparation—Transfer an accurately weighed quantity of Nevirapine, equivalent to about 24 mg of anhydrous nevirapine, to a 100-mL volumetric flask. Add 4 mL of acetonitrile and 80 mL of *Mobile phase*, sonicate for at least 15 minutes, allow to cool to room temperature, dilute with *Mobile phase* to volume, and mix. Transfer 3.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing ~~L57.~~ L## (see ⟨621⟩ *Chromatography*). The flow rate is about 1 mL per minute. The column temperature is maintained at 35°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for nevirapine related compound B, 1.0 for nevirapine, and 1.5 for nevirapine related compound A; the resolution, *R*, between nevirapine related compound B and nevirapine is not less than 5.0; and the resolution between nevirapine and nevirapine related compound A is not less than 7.4. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{15}H_{14}N_4O$ in the portion of Nevirapine taken by the formula:

$$833.33C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Niacin, *USP 26* page 1304. It is proposed to change the medium in *Identification* test *B* and the *Assay* to phosphate buffer, having a pH of 7.0.

(DSN: L. Evans) RTS—39841-1

Change to read:

Identification—
A: *Infrared Absorption* ⟨197M⟩.

Change to read:

Assay— ~~Transfer about 200 mg of Niacin, accurately weighed, to a 500-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and a solution of USP Niacin RS in the same medium, at a concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 262 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_6H_5NO_2$ in the Niacin taken by the formula:~~

~~$$10C(A_U/A_S),$$~~

~~in which *C* is the concentration, in µg per mL, of USP Niacin RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Niacin and the Standard solution, respectively.~~

■*Buffer solution*—Dissolve 6.8 g of monobasic potassium phosphate in 1 L of water. Adjust with 50% sodium hydroxide solution to a pH of 7.0.

Assay preparation—Transfer about 200 mg of Niacin, accurately weighed, to a 500-mL volumetric flask, add the *Buffer solution* to dissolve, dilute with the *Buffer solution* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with the *Buffer solution* to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Assay preparation* and a solution of USP Niacin RS in the same medium (*Standard preparation*), at a concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 262 nm, with a suitable spectrophotometer, using the *Buffer solution* as the blank. Calculate the quantity, in mg, of $C_6H_5NO_2$ in the portion of Niacin taken by the formula:

$$10C(A_U/A_S),$$

in which *C* is the concentration, in µg per mL, of USP Niacin RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solution of the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

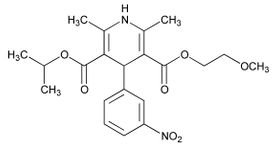
BRIEFING

Nimodipine, page 2041 of *PF* 27(1) [Jan.–Feb. 2001]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision*.

(PA5: A. Wilk) RTS—39903-5

Add the following:

■Nimodipine



$C_{21}H_{26}N_2O_7$ 418.44

3,5-Pyridinedicarboxylic acid, 1,4-dihydro-2,6-dimethyl- 4-(3-nitrophenyl)-, 2-methoxyethyl 1-methylethyl ester.

Isopropyl 2-methoxyethyl 1,4-dihydro-2,6-dimethyl-4-(*m*-nitrophenyl)-3,5-pyridinedicarboxylate [*66085-59-4*].

» Nimodipine contains not less than 98.5 percent and not more than 101.5 percent of $C_{21}H_{26}N_2O_7$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Nimodipine RS. USP Nimodipine Related Compound A RS.*

NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standards, and solutions containing them by conducting the procedures immediately under subdued light or using low-actinic glassware.

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of *Standard solution 1*, as obtained in the test for *Chromatographic purity.*

Specific rotation ⟨781S⟩: between –10° and +10°.

Test solution: 50 mg per mL, in acetone.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Related compounds—

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and tetrahydrofuran (3:1:1).

Standard solution 1—Transfer about 40 mg of USP Nimodipine RS, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of this second solution to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard solution 2—Transfer about 20.0 mg of USP Nimodipine Related Compound A RS, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard solution 3—Transfer 2.5 mL of *Standard solution 1* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard solution 4—Transfer 1.0 mL of *Standard solution 2* and 1.0 mL of *Standard solution 3* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 40 mg of Nimodipine, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm × 12.5-cm column that contains packing L1. The flow rate is about 2 mL per minute. The column temperature is maintained at 40°. Chromatograph *Standard solution 4*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for nimodipine related compound A and 1.0 for nimodipine; the resolution, *R*, between nimodipine related compound A and nimodipine is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of *Standard solution 1*, *Standard solution 4*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. [NOTE—Record the chromatogram of the *Test solution* for a period of time equivalent to four times the retention time of nimodipine.] Calculate the percentage of each impurity in the portion of Nimodipine taken by the formula:

$$100C(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Nimodipine Related Compound A RS in *Standard solution 4;* r_i is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of nimodipine related compound A obtained from *Standard solution 4:* not more than 0.1% of nimodipine related compound A is found; not more than 0.2% of any other individual impurity is found; and not more than 0.5% of total impurities is found.

In-Process Revision

Assay—Transfer about 180 mg of Nimodipine, accurately weighed, to a 100-mL beaker. Dissolve, with gentle heating, by stirring in a mixture of 25 mL of tertiary butyl alcohol and 25 mL of perchloric acid TS. Add 0.1 mL of ferroin TS. Titrate with 0.1 N ceric sulfate VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N ceric sulfate is equivalent to 20.92 mg of $C_{21}H_{26}N_2O_7$.■1S (*USP27*)

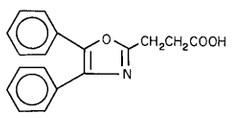
BRIEFING

Oxaprozin, page 97 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to add drying conditions for the sample in *Identification* test *B*.

(PA2: J. Kelly) RTS—39081-1

Add the following:

■Oxaprozin



$C_{18}H_{15}NO_3$ 293.32

2-Oxazolepropanoic acid, 4,5-diphenyl-.

4,5-Diphenyl-2-oxazolepropionic acid [*21256-18-8*].

» Oxaprozin contains not less than 98.5 percent and not more than 101.5 percent of $C_{18}H_{15}NO_3$, calculated on the dried basis.

NOTE—Because of light sensitivity, protect all oxaprozin samples and Standard solutions from light.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Oxaprozin RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩: previously dried at 105° for 2 hours.

B: *Ultraviolet Absorption* ⟨197U⟩: previously dried at 105° for 2 hours.

Solution: 10 µg per mL.

Medium: methanol. ~~The absorption of the sample~~ Absorptivity at 285 nm is between 45.5 and 49.5.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.3% of its weight.

Residue on ignition ⟨281⟩: not more than 0.3%.

Arsenic, *Method II* ⟨211⟩: 1 µg per g.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Chromatographic purity—

Solution A: 0.1% phosphoric acid adjusted with phosphoric acid to a pH of 2.00 ± 0.1.

Solution B: acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent A: a mixture of acetonitrile, methylene chloride, and water (48:1:1).

Diluent B: a mixture of acetonitrile and water (1:1).

Standard stock solution—Dissolve an accurately weighed quantity of USP Oxaprozin RS in acetonitrile to obtain a solution having a concentration of about 200 µg per mL.

In-Process Revision

Standard solution—Transfer 5.0 mL of *Standard stock solution* to a 200-mL volumetric flask, and dilute with *Diluent A* to volume.

Benzil solution: 200 µg of benzil per mL in acetonitrile.

Resolution solution—Transfer 5.0 mL of *Benzil solution* and 5.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Diluent A* to volume to obtain a solution having known concentrations of about 10 µg of each per mL.

Test solution A—[NOTE—*Test solution A* is used to monitor all known and unknown impurities, except imidazolic acid and oximide.] Transfer about 100 mg of Oxaprozin, accurately weighed, to a 100-mL volumetric flask, add 2 mL of methylene chloride, 2 mL of water, and 75 mL of acetonitrile, and sonicate after each solvent is added. Dilute with acetonitrile to volume.

Test solution B—[NOTE—*Test solution B* is used to monitor only imidazolic acid and oximide.] Transfer about 100 mg of Oxaprozin, accurately weighed, to a 100-mL volumetric flask, add 75 mL of *Diluent B* to dissolve the Oxaprozin, and dilute with *Diluent B* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is 1.0 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	70	30	equilibration
0–20	70	30	isocratic
21–60	70→0	30→100	linear gradient
60–61	0→70	100→30	linear gradient
61–70	70	30	isocratic

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 1.1 for benzil and 1.0 for oxaprozin; and the resolution, *R*, between oxaprozin and benzil is not less than 3.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 5.0 %.

Procedure—Inject 20 µL of *Test solution A* and *Test solution B* into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Oxaprozin taken by the formula:

$$100(Fr_i / r_s),$$

in which F is the relative response factor and is equal to 1.15 for ~~any~~ the imidazolic acid peak with a relative retention time of 0.14, 1.21 for any peak with a relative retention time of 0.42, 0.91 for ~~any~~ the oximide peak with a relative retention time of 0.73, 0.85 for any peak with a relative retention time of 0.84, 1.29 for any peak with a relative retention time of 1.08, 1.46 for any peak with a relative retention time of 1.50, and 2.09 for any peak with a relative retention time of 1.57; ~~and 1.0 for the oxaprozin peak~~ r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.1% of any impurity is found; not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found. [NOTE—The values of F for all known impurities except imidazolic acid and oximide were found using *Test solution A*, and the values of F for imidazolic acid and oximide were found using *Test solution B*.]

Organic volatile impurities, *Method V* ⟨467⟩: meets the requirements.

Solvent: dimethyl sulfoxide.

In-Process Revision

Assay—Dissolve about 400 mg of Oxaprozin, previously dried at 105° for 2 hours and accurately weighed, in about 100 mL of alcohol in a narrow-mouth container, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide is equivalent to 29.332 mg of oxaprozin.■1S (*USP27*)

BRIEFING

Oxaprozin Tablets, page 99 of *PF* 29(1) [Jan.–Feb. 2003]. The phrase ''calculated on the dried basis'' is editorially removed from the Definition of this newly proposed monograph.

(PA2: J. Kelly) RTS—39796-1

Add the following:

■Oxaprozin Tablets

» Oxaprozin Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of oxaprozin ($C_{18}H_{15}NO_3$).~~, calculated on the dried basis.~~

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Oxaprozin RS.*

NOTE—Because of light sensitivity, protect all oxaprozin samples and Standard solutions from light.

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution: 2 mg per mL of oxaprozin in acetone.

Developing solvent system: a mixture of ethyl acetate and glacial acetic acid (99:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.05 M monobasic potassium phosphate buffer, pH 7.4; 1000 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{18}H_{15}NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 286 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Oxaprozin RS in the same *Medium* (an amount of methanol not exceeding 5% of the final volume can be added to help solubilize the Reference Standard).

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{18}H_{15}NO_3$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Water, *Method Ia* ⟨921⟩: not more than 3.5%.

Assay—

0.1% Phosphoric acid, pH 2.00 ± 0.10—Add concentrated phosphoric acid, dropwise, to water to obtain a pH of 2.00 ± 0.10.

Mobile phase—Prepare a filtered and degassed solution of *0.1% Phosphoric acid, pH 2.00 ± 0.10* and acetonitrile (55:45).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxaprozin RS in acetonitrile to obtain a solution having a concentration of about 12 µg of oxaprozin per mL.

In-Process Revision

Assay stock preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of oxaprozin, to a 100-mL volumetric flask, add about 10 mL of water, and sonicate for 10 minutes. Add about 40 mL of acetonitrile, sonicate for 30 minutes, shake by mechanical means for an additional 30 minutes, add about 30 mL of acetonitrile, and sonicate for 10 minutes. Dilute with acetonitrile to volume.

Assay preparation—Quantitatively dilute the *Assay stock preparation* with acetonitrile to obtain a solution having a concentration of about 12 µg of oxaprozin per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of oxaprozin ($C_{18}H_{15}NO_3$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration in mg per mL of USP Oxaprozin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

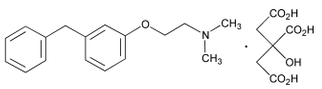
BRIEFING

Phenyltoloxamine Dihydrogen Citrate, page 428 of *PF* 29(2) [Mar.–Apr. 2003]. Because *Identification* test *A* is sufficient for distinguishing between the citrate form and the phenyltoloxamine base, and because *Identification* test *B* cannot discriminate the citrate salt from the phenyltoloxamine base and 2-benzylphenol (starting material), it is proposed to delete both *Identification* tests *B* and *C*. Several modifications to *Related compounds* are also proposed: in the preparation of the *Resolution solution*, replacing the extraction solvent, ethyl ether, and the reconstitution solvent, chloroform, with methylene chloride; and changing the sample weight from 800 mg to 400 mg in order for the peak response to be within the linear range of the HPLC detector. It is also proposed to (1) change the resolution criterion from not less than 2.0 to not less than 1.5 to meet *System suitability* requirements while maintaining sufficient resolution between the peaks; (2) revise the limit of phenyltoloxamine dihydrogen citrate related compound A to 0.2%; and (3) clarify the limit for other impurities.

(PA1: K. Russo) RTS—37538-1; 39771-1

Add the following:

■Phenyltoloxamine Dihydrogen Citrate



$C_{17}H_{21}NO \cdot C_6H_8O_7$ 447.47

N,*N*-Dimethyl-2-(α-phenyl-*o*-tolyloxy)ethylamine, citrate (1:1) salt.

2-(2-Dimethylaminoethoxy)diphenylmethane, citrate (1:1) salt [*1176-08-5*].

» Phenyltoloxamine Dihydrogen Citrate contains not less than 99.0 percent and not more than 101.0 percent of $C_{17}H_{21}NO \cdot C_6H_8O_7$, calculated on the dried basis.

Packaging and storage—~~Preserve in well-closed containers.~~ Preserve in well-closed containers and store at room temperature.

USP Reference standards ⟨11⟩—*USP Phenyltoloxamine Dihydrogen Citrate RS. USP Phenyltoloxamine Dihydrogen Citrate Related Compound A RS.*

In-Process Revision

Identification—

~~**A:** *Infrared Absorption* ⟨197K⟩.~~

~~**B:** *Ultraviolet Absorption* ⟨197U⟩—~~

~~*Solution:* 100 µg per mL.~~

~~*Medium:* 0.1 N hydrochloric acid.~~

~~**C:** Dissolve 0.5 g of Phenyltoloxamine Dihydrogen Citrate in 15 mL of hot water, add a slight excess of 5 M sodium hydroxide, filter, and add 2 N hydrochloric acid until the filtrate is neutral to litmus paper: the solution meets the requirements of the test for *Citrate* ⟨191⟩.~~, *Infrared Absorption* ⟨197K⟩.

Melting range, *Class 1a* ⟨741⟩: between 137° and 143°.

pH ⟨791⟩: between 3.2 and 4.2, in a solution (1 in 100).

Loss on drying ⟨731⟩—Dry it in vacuum at 80° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩: 20 µg per g.

Related compounds—

Resolution solution—In a separatory funnel dissolve about 10 mg each of USP Phenyltoloxamine Dihydrogen Citrate RS and USP Phenyltoloxamine Dihydrogen Citrate Related Compound A RS, accurately weighed, in 50 mL of water. Add 5 mL of ammonium hydroxide, and extract with three 10-mL portions of ~~ethyl ether~~ methylene chloride. Combine the extracts, dry the solution over anhydrous sodium sulfate, and gently evaporate to dryness. Dissolve the residue in 20 mL of ~~chloroform~~ methylene chloride.

Test solution—In a separatory funnel dissolve about ~~800 mg~~ 400 mg of Phenyltoloxamine Dihydrogen Citrate, accurately weighed, in 50 mL of water. Proceed as directed for *Resolution solution*, beginning with "Add 5 mL of ammonium hydroxide."

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a 0.32-mm × 25-m column coated with a 0.45-µm film of phase G27. The carrier gas is helium, flowing at a rate of about 29 cm per second, with a split flow rate of about 25 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at 190° for 3 minutes, then the temperature is increased at a rate of 4° per minute to 240°, and maintained at 240° for 8 minutes. The injection port and the detector temperatures are maintained at 280°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between phenyltoloxamine dihydrogen citrate and phenyltoloxamine dihydrogen citrate related compound A is not less than ~~2.0~~ 1.5.

Procedure—Inject a volume (about 1 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Phenyltoloxamine Dihydrogen Citrate taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response of each impurity; and r_s is the sum of the responses of all the peaks, excluding the solvent peaks: not more than 0.2% of phenyltoloxamine dihydrogen citrate related compound A; not more than 0.1% of any other individual impurity; ~~is found;~~ and not more than 1.0% of total impurities is found.

Organic volatile impurities, *Method 1* ⟨467⟩: meets the requirements.

Assay—Dissolve about 0.5 g of Phenyltoloxamine Dihydrogen Citrate, accurately weighed, in 80 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 44.75 mg of $C_{17}H_{21}NO \cdot C_6H_8O_7$. ■1S (*USP27*)

In-Process Revision

BRIEFING

Potassium Chloride, *USP 26* page 1502. It is proposed to revise the test for *Iodide or bromide* to include standard solutions of known concentrations for comparison purposes. The proposed procedure includes (1) a *Standard solution* for *Iodide* and a limit of 0.005% iodide that represents the visual detection limit and (2) a *Standard solution* for *Bromide* with a limit of 0.1% bromide that corresponds to the EP monograph for potassium chloride. It is proposed to use a chloramine T solution instead of chlorine TS to affect color development. Also, it is proposed to revise the *Packaging and storage* statement to include the recommended storage at up to 25 ± 2°, in accordance with the policy established by the USP Packaging, Storage, and Distribution Expert Committee.

(PA1: K. Russo; PSD: C. Okeke) RTS—38376-1; 39870-2

Change to read:

Packaging and storage—Preserve in well-closed containers, ■and store at up to 25 ± 2°.■1S (*USP27*)

Change to read:

Iodide or bromide— ~~Dissolve 2 g in 6 mL of water, add 1 mL of chloroform, and then add, dropwise, with constant agitation, 5 mL of a mixture of equal parts of chlorine TS and water: the chloroform is free from even a transient violet or a permanent orange color.~~

■IODIDE—

Standard stock solution—Transfer an accurately weighed quantity, about 41 mg, of potassium iodide to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Standard solution—Dilute 1.0 mL of *Standard stock solution* with water to 25 mL, and mix. Dilute 2.0 mL of this solution with water to 8 mL, and proceed as directed for *Test solution* beginning with "Add 1 mL each of chloroform . . .".

Test solution—Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 2 drops of a chloramine T solution (0.1 in 100), and shake gently. The violet color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution:* the limit is 0.005%.

BROMIDE—

Standard solution—Transfer an accurately weighed quantity, about 32 mg, of sodium bromide to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Dilute 2.0 mL of this solution with water to 8 mL, and proceed as directed for *Test solution* beginning with "Add 1 mL each of chloroform . . .".

Test solution—Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 5 drops of a chloramine T solution (1 in 100), and shake gently. The brown color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution:* the limit is 0.1%.■1S (*USP27*)

BRIEFING

Povidone, *USP 26* page 1519. On the basis of comments received, it is proposed to revise the Definition for clarification. Also, in the test for *Limit of aldehydes*, on the basis of reported problems with the solubility in *Phosphate buffer* of Povidones with K-values greater than 90, it is proposed to change the concentration of potassium pyrophosphate in the buffer from 50 g per 500 mL to 8.3 g per 500 mL. All Povidone types categorized by K-values are known to be soluble at room temperature at the lower buffer concentration.

(EMC: C. Sheehan; D. Bempong) RTS—39648-1

Change to read:

» Povidone is a synthetic polymer consisting essentially of linear 1-vinyl-2-pyrrolidinone groups, the degree of polymerization of which results in polymers of various molecular weights. ~~It is characterized by its viscosity in aqueous solution, relative to that of water, expressed as a K-value, ranging from 10 to 120. The K-value of Povidone having a nominal K-value of 15 or less is not less than 85.0 percent and not more than 115.0 percent of the nominal K-value, and K-value of Povidone having a nominal K-value or nominal K-value range with an average of more than 15 is not less than 90.0 percent and not more than 108.0 percent of the nominal K-value or average of the nominal K-value range.~~

In-Process Revision

■The different types of Povidone are characterized by their viscosity in aqueous solution, relative to that of water, expressed as a K-value. (See the section on *K-value* below.) The K-value of Povidone having a stated (nominal) K-value of 15 or less is not less than 85.0 percent and not more than 115.0 percent of the stated values. The K-value of Povidone having a stated K-value or a stated K-value range with an average of more than 15 is not less than 90.0 percent and not more than 108.0 percent of the stated value or of the average of the stated range.■1S (*USP27*)

Limit of aldehydes—

Phosphate buffer—Transfer ~~50.0 g~~

■8.3 g■1S (*USP27*) of potassium pyrophosphate to a 500-mL volumetric flask, and dissolve in 400 mL of water. Adjust, if necessary, with 1 N hydrochloric acid to a pH of 9.0, dilute with water to volume, and mix.

Aldehyde dehydrogenase solution—Transfer a quantity of lyophilized aldehyde dehydrogenase equivalent to 70 units to a glass vial, dissolve in 10.0 mL of water, and mix. [NOTE—This solution is stable for 8 hours at 4°.]

NAD solution—Transfer 40 mg of nicotinamide adenine dinucleotide to a glass vial, dissolve in 10.0 mL of *Phosphate buffer*, and mix. [NOTE—This solution is stable for 4 weeks at 4°.]

Standard preparation—Add about 2 mL of water to a glass weighing bottle, and weigh accurately. Add about 100 mg (about 0.13 mL) of freshly distilled acetaldehyde, and weigh accurately. Transfer this solution to a 100-mL volumetric flask. Rinse the weighing bottle with several portions of water, transferring each rinsing to the 100-mL volumetric flask. Dilute the solution in the 100-mL volumetric flask with water to volume, and mix. Store at 4° for about 20 hours. Pipet 1 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

Test preparation—Transfer about 2 g of Povidone, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Phosphate buffer*, dilute with *Phosphate buffer* to volume, and mix. Insert a stopper into the flask, heat at 60° for 1 hour, and cool to room temperature.

Procedure—Pipet 0.5 mL each of the *Standard preparation*, the *Test preparation*, and water to provide the reagent blank into separate 1-cm cells. Add 2.5 mL of *Phosphate buffer* and 0.2 mL of *NAD solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 2 to 3 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm, using water as the reference. Add 0.05 mL of *Aldehyde dehydrogenase solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 5 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm, using water as the reference. Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Povidone taken by the formula:

$$10(C/W)\left[\frac{(A_{U2}-A_{U1})-(A_{B2}-A_{B1})}{(A_{S2}-A_{S1})-(A_{B2}-A_{B1})}\right],$$

in which C is the concentration, in mg per mL, of acetaldehyde in the *Standard preparation; W* is the weight, in g, of Povidone taken; A_{U1}, A_{S1}, and A_{B1} are the absorbances of the solutions obtained from the *Test preparation*, the *Standard preparation*, and the water reagent blank, respectively, before addition of the *Aldehyde dehydrogenase solution;* and A_{U2}, A_{S2}, and A_{B2} are the absorbances of the solutions obtained from the *Test preparation*, the *Standard preparation*, and the water reagent blank, respectively, after addition of the *Aldehyde dehydrogenase solution:* not more than 0.05% is found.

BRIEFING

Protamine Sulfate Injection, *USP 26* page 1586. On the basis of comments and stability data received, it is proposed to revise the *Packaging and storage* section to change the specified storage temperature from refrigerator conditions to controlled room temperature. Interested parties are encouraged to submit comments to the Expert Committee on Packaging, Storage, and Distribution.

BRIEFING

Pseudoephedrine Hydrochloride Extended-Release Tablets, *USP 26* page 1591 and page 110 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to separate the *Drug release* tests according to the dosing, 12 and 24 hours. Also, in accordance with the approved supplement to the NDA, it is proposed to modify the *Tolerances* in *Drug release Test 2* from "not less than 90%" to "not less than

In-Process Revision

85%". In the absence of any significant adverse comment, it is proposed to implement this revision via the *Sixth Interim Revision Announcement* pertaining to *USP 26–NF 21*, with an official date of December 1, 2003.

(BPC: M. Marques) RTS—39898-1

Change to read:

» Pseudoephedrine Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ▪pseudoephedrine hydrochloride▪2S (*USP26*) ($C_{10}H_{15}NO \cdot HCl$).

Add the following:

•**Labeling**—When more than one *Drug Release* test is given, the labeling states the *Drug Release* test used only if *Test 1* is not used.•6

Add the following:

•**Drug release** ⟨724⟩—

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

Test 1:

Medium: water; 900 mL.

Apparatus 2: 50 rpm

Times: 1, 3, and 6 hours.

Standard solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.13 mg per mL.

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the procedure set forth in the *Assay*. Separately inject equal volumes (about 50 µL) of the *Standard solution* and the filtered solution under test. Calculate the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved per Tablet.

Times and Tolerances:

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 50% and 75%
6	not less than 75%

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

Medium, *Apparatus*, and *Times*—Proceed as directed for *Test 1*.

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 214 nm on portions of the solution under test, filtered through a 0.45-µm filter and suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Pseudoephedrine Hydrochloride RS in the same *Medium*.

Times and Tolerances:

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 60% and 80%
6	not less than 80%

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.

Medium: 0.9% sodium chloride in water; 50 mL.

Apparatus 7: 30 cycles per minute; 2–3 cm amplitude. To prepare the sample, see *Figure 1* below that illustrates the following steps:

1. Place one Tablet on a 5- × 5-cm nylon netting.
2. Fold netting over the Tablet. Continue folding until the Tablet is enclosed in netting.

In-Process Revision

3. Fold netting so that the two open ends meet. The Tablet should be enveloped in the center of the netting.
4. Insert rod (see *Figure 7c* under *Drug Release* ⟨724⟩) through netting to secure the Tablet.
5. Secure netting with HPLC plastic ferrules or other appropriate device. Trim the excess netting. Attach each sample holder to the vertically reciprocating sample holder.

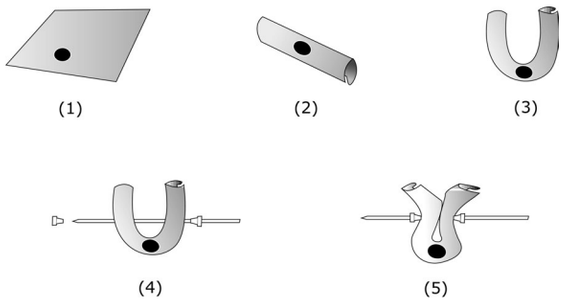

Fig. 1

Times: 2, 8, 14, and 24 hours.

Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the following method.

0.05 M Phosphate buffer, pH 6.8—Transfer 200 mL of water to a 1000-mL volumetric flask. Add 3.4 mL of phosphoric acid and 5 mL of triethylamine. Add water to almost 900 mL. Adjust with 1 N sodium hydroxide to a pH of about 6.8, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Phosphate buffer, pH 6.8* and methanol (9:1).

System suitability solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.4 mg per mL.

Standard solutions—Prepare solutions in water having accurately known concentrations of USP Pseudoephedrine Hydrochloride RS in a range around the expected concentration of the solution under test at each time interval.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solutions* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peak. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions*. Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at each time interval from a linear regression analysis of the calibration curve.

Times and Tolerances:

Time (hours)	Amount dissolved
2	between 20% and 35%
8	between 40% and 65%
14	between 60% and 90%
24	not less than ~~90%~~ 85%●6

Assay—

Mobile phase—Prepare a filtered and degassed mixture of alcohol and ammonium acetate solution (1 in 250) (17:3).

Standard preparation—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in alcohol to obtain a solution having a known concentration of about 1.2 mg per mL.

Assay preparation—Transfer not fewer than 20 Tablets to a suitable container, add 500 mL of alcohol, and homogenize until the Tablets are dispersed. Quantitatively transfer the contents of the container to a 1000-mL volumetric flask, dilute with alcohol to volume, mix, and allow to stand for solids to settle. Transfer 25.0 mL of the supernatant into a 50-mL volumetric flask, dilute with alcohol to volume, and mix.

■Pass a portion of this solution through a 0.45-µm filter before injection.■2S *(USP26)*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L3. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard prepa-*

In-Process Revision

ration, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

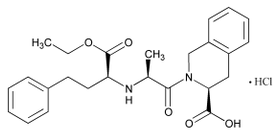
BRIEFING

Quinapril Hydrochloride, page 8429 of *PF* 25(4) [July–Aug. 1999]; **Quinapril Tablets,** page 8432 of *PF* 25(4) [July–Aug. 1999]. These new monographs, which previously appeared in *Pharmacopeial Previews*, are now being forwarded with minor editorial revisions to *In-Process Revision*. The molecular weight of quinapril hydrochloride is revised to reflect the current atomic weight values published in *USP 26*.

(PA5: A. Wilk) RTS—39894-1

Add the following:

■Quinapril Hydrochloride



$C_{25}H_{30}N_2O_5 \cdot HCl$ ~~474.99~~ 474.98

3-Isoquinolinecarboxylic acid, 2-[2-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]-1, 2,3,4-tetrahydro-, monohydrochloride, [3*S*-[2 [*R**(*R**)],3*R**]].

(*S*)-2-[(*S*)-*N*-[(*S*)-1-Carboxy-3-phenylpropyl]alanyl]-1,2,3,4-tetrahydro-3-isoquinolinecarboxylic acid, 1-ethyl ester, monohydrochloride [*82586-55-8*].

» Quinapril Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of $C_{25}H_{30}N_2O_5 \cdot HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Quinapril Hydrochloride RS. USP Quinapril Related Compound A RS. USP Quinapril Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Specific rotation ⟨781S⟩: between +14.4° and +15.4°.

Test solution: 20 mg per mL, in methanol.

Water, *Method I* ⟨921⟩: not more than 1.0%.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Limit of residual solvents—

Standard stock solution—Transfer about 50 mL of dimethylformamide to a 200-mL volumetric flask. Add about 75 mg each of acetone and acetonitrile and 30 mg each of methylene chloride and toluene, each accurately weighed by difference, and mix. Dilute with dimethylformamide to volume, and mix.

System suitability solution 1—Transfer about 25 mL of dimethylformamide to a 50-mL volumetric flask. Add 35 µL of dehydrated alcohol and 25 µL of methylene chloride. Dilute with dimethylformamide to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

In-Process Revision

System suitability solution 2—Transfer 2.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Standard solution—Transfer 4.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Test solution—Transfer about 60 mg of Quinapril Hydrochloride, accurately weighed, to a suitable headspace vial, add 5.0 mL of dimethylformamide, seal, and shake to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a headspace sampler, a 0.53-mm × 30-m fused-silica column coated with a 1.0-µm film of phase G16, and a split injection system. The carrier gas is helium, flowing at a rate of 6 mL per minute. The split flow rate is about 100 mL per minute, with a back pressure of 3.5 psi. The oven temperature of the headspace sampler is maintained at 60°, and the vial pressure is maintained at 6.1 psi. The temperature of the headspace loop and transfer lines is maintained at 65°. The vials are equilibrated for 10 minutes prior to injection, and injection occurs every 36 minutes. The chromatograph is programmed as follows. Initially the column temperature is maintained at 35° for 10 minutes, then the temperature is increased at a rate of 7° per minute to 150°, and maintained at 150° for 4 minutes. The injection port temperature is maintained at 180°, and the detector is maintained at 240°. Chromatograph *System suitability solution 1*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for methylene chloride and 1.0 for alcohol; the resolution, *R*, between methylene chloride and alcohol is not less than 1.2; the column efficiency, determined from the methylene chloride peak, is not less than 4900 theoretical plates; and the tailing factor for the methylene chloride peak is not more than 1.7. Chromatograph *System suitability solution 2*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 15.0%.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the percentages, by weight, of acetone, acetonitrile, methylene chloride, and toluene in the portion of Quinapril Hydrochloride taken by the formula:

$$0.2(W_S / W_Q)(r_U / r_S),$$

in which W_S is the weight, in mg, of the appropriate solvent taken to prepare the *Standard solution;* W_Q is the weight, in mg, of Quinapril Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses of the relevant solvent obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% each of acetone and acetonitrile is found; and not more than 0.1% each of methylene chloride and toluene is found.

Related compounds—

Diluent, *Mobile phase*, and *Chromatographic system*—Prepare as directed in the *Assay.*

System suitability solution—Prepare as directed for the *System suitability preparation* in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.5 mg of each per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of each quinapril related compound in the portion of Quinapril Hydrochloride taken by the formula:

$$100(V_U / W_U)C_S(r_U / r_S),$$

in which V_U is the volume, in mL, of the *Test solution;* W_U is the weight, in mg, of Quinapril Hydrochloride taken to prepare the *Test solution;* C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* and r_U and r_S are the peak areas of the corresponding quinapril related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% each of quinapril related compound A and quinapril related compound B is found. Calculate the percentage of each impurity in the portion of Quinapril Hydrochloride taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the sum of the responses of all the peaks obtained from the *Test solution:* not more than 0.2% of any individual impurity, other than quinapril related compound A and quinapril related compound B, is found; and not more than 2.0% of total impurities is found.

Content of chloride—Transfer about 100 mg of Quinapril Hydrochloride, accurately weighed, to a 100-mL beaker. Dissolve in 50 mL of water and 10 mL of alcohol. Acidify with nitric acid. Titrate with 0.01 N silver nitrate VS, and determine the endpoint potentiometrically, using suitable electrodes (see *Titrimetry* ⟨541⟩). Perform a blank determination, and make any necessary correction. Each mL of 0.01 N silver nitrate is equivalent to 0.3545 mg of chloride: not less than 7.2% and not more than 7.6% of chloride is found.

Assay—

Diluent—Prepare a mixture of pH 6.5, 0.025 M monobasic ammonium phosphate solution and acetonitrile (3:2).

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and methanesulfonic acid (72:28:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve accurately weighed quantities of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 2 mg of USP Quinapril Hydrochloride RS per mL and 0.005 mg each of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Quinapril Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 2 mg per mL.

Assay preparation—Transfer about 100 mg of Quinapril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector, a 4.6-mm × 3-cm guard column that contains 5-µm packing L10, and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the resolution between quinapril and quinapril related compound A is not less than 1.75; the resolution between quinapril and quinapril related compound B is not less than 3.5;

In-Process Revision

the column efficiency is not less than 550 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the quinapril hydrochloride peaks. Calculate the quantity, in mg, of $C_{25}H_{30}N_2O_5 \cdot HCl$ in the portion of Quinapril Hydrochloride taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Quinapril Tablets, page 8432 of *PF* 25(4) [July–Aug. 1999]—See briefing under *Quinapril Hydrochloride*.

(PA5: A. Wilk) RTS—39894-2

Add the following:

■Quinapril Tablets

» Quinapril Tablets contain an amount of Quinapril Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of quinapril ($C_{25}H_{30}N_2O_5$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—*USP Quinapril Hydrochloride RS. USP Quinapril Related Compound A RS. USP Quinapril Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer a quantity of finely powdered Tablets, equivalent to about 10.0 mg of quinapril, to a 15-mL centrifuge tube, add 5 mL of methanol, mix, and centrifuge for 10 minutes.

Standard solution—Transfer about 10.8 mg of USP Quinapril Hydrochloride RS to a 15-mL centrifuge tube, add 5 mL of methanol, mix, and centrifuge for 10 minutes.

Application volume: 25 µL.

Developing solvent system: a mixture of methanol and ethyl acetate (1:1).

Procedure—Proceed as directed in the chapter, except to wash the plate in methanol and air-dry it prior to use.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{25}H_{30}N_2O_5$ dissolved by employing the procedure set forth in the *Assay*, using a filtered portion of the solution under test as the *Assay preparation*, using methanol to prepare the *Standard preparation*, and making any necessary volumetric adjustments with water.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{25}H_{30}N_2O_5$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

In-Process Revision

PROCEDURE FOR CONTENT UNIFORMITY—

Solvent, *Buffered solvent*, *Mobile phase*, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Transfer 1 Tablet to a volumetric flask. Add a volume of *Solvent*, equivalent to about one half of the flask volume, sonicate for 5 minutes, and shake by mechanical means for about 15 minutes. Dilute with *Solvent* to volume, mix, and pass through a suitable filter, discarding the first portion of the filtrate. Dilute a portion of the filtrate quantitatively, and stepwise if necessary, with *Solvent* to obtain a solution containing about 0.108 mg of quinapril hydrochloride per mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of quinapril ($C_{25}H_{30}N_2O_5$) in each Tablet taken by the formula:

~~$(438.52/474.99)C(L/D)(r_U/r_S)$,~~

$$(438.52/474.98)C(L/D)(r_U/r_S),$$

in which 438.52 and ~~474.99~~ 474.98 are the molecular weights of quinapril and quinapril hydrochloride, respectively; C is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard solution; L* is the labeled quantity, in mg, of quinapril in each Tablet; D is the concentration, in mg per mL, of quinapril hydrochloride in the *Test solution;* and r_U and r_S are the quinapril peak areas obtained from the *Test solution* and the *Standard solution*, respectively.

Related compounds—

Solvent, *Buffered solvent*, and *Mobile phase*—Prepare as directed in the *Assay.*

Resolution solution—Dissolve accurately weighed quantities of USP Quinapril Hydrochloride RS, USP Quinapril Related Compound A RS, and USP Quinapril Related Compound B RS in *Solvent* to obtain a solution having known concentrations of about 0.1 mg of USP Quinapril Hydrochloride RS and 0.005 mg each of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS per mL.

Standard solution—Dissolve accurately weighed quantities of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS in *Solvent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.5 µg each of USP Quinapril Related Compound A RS and USP Quinapril Related Compound B RS per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution*, and record the peak areas as directed for *Procedure:* the relative retention times are about 0.6 for quinapril related compound B, 1.0 for quinapril, and 2.0 for quinapril related compound A; and the resolution, R, between quinapril and quinapril related compound A and between quinapril and quinapril related compound B is not less than 2.0. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure:* the column efficiency is not less than 600 theoretical plates; the tailing factor for the quinapril and quinapril related compound A peaks is less than 1.5 and that for the quinapril related compound B peak is less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for quinapril and not more than 3.0% for each quinapril related compound.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

In-Process Revision

areas for the major peaks. Calculate the quantity, in mg, of each quinapril related compound in the portion of Tablets taken by the formula:

$$500CD(r_U / r_S),$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; D* is the dilution factor used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding quinapril related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% of quinapril related compound A is found; not more than 3.0% of quinapril related compound B is found; and not more than 3.6% of total impurities is found.

Assay—

Solvent—Prepare a mixture of water and acetonitrile (65:35).

Buffered solvent—Prepare a mixture of pH 6.5, 0.05 M dibasic potassium phosphate and acetonitrile (65:35).

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and methanesulfonic acid (65:35:0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Quinapril Hydrochloride RS in *Solvent* to obtain a solution having a known concentration of about 1.08 mg per mL. Quantitatively dilute with *Buffered solvent* to obtain a solution having a known concentration of about 0.108 mg per mL.

Assay preparation—Transfer 10 Tablets to a 500-mL volumetric flask, add about 300 mL of *Solvent*, and sonicate until the Tablets have disintegrated. Shake by mechanical means for about 15 minutes, dilute with *Solvent* to volume, mix, and centrifuge. Dilute quantitatively, and stepwise if necessary, with *Solvent* to obtain a solution having a concentration of about 0.1 mg of quinapril per mL, and pass through a suitable filter, discarding the first portion of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 6.0-mm × 4-cm column that contains 3-µm packing L10. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure:* the column efficiency is not less than 600 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of quinapril ($C_{25}H_{30}N_2O_5$) in the portion of Tablets taken by the formula:

~~$500CD(438.52/474.99)(r_U / r_S),$~~

$$500CD(438.52/474.98)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Quinapril Hydrochloride RS in the *Standard preparation; D* is the dilution factor used to prepare the *Assay preparation;* 438.52 and ~~474.99~~ 474.98 are the molecular weights of quinapril and quinapril hydrochloride, respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

In-Process Revision

BRIEFING

Reserpine Tablets, *USP 26* page 1627. It is proposed to reduce the volume of *Dissolution Medium* from 900 mL to 500 mL to increase the sensitivity of the test.

(BPC: M. Marques) RTS—39853-1

Change to read:

Dissolution ⟨711⟩—[NOTE—Do not substitute membrane filters for filter paper where the filtration of reserpine-containing solutions is indicated. Reserpine has been shown to be adsorbed onto membranes.]

Medium: 0.1 N acetic acid; ~~900 mL.~~

■500 mL.■1S (*USP27*)

Apparatus 1: 100 rpm.

Time: 45 minutes.

p-Toluenesulfonic acid solution—Dissolve 1 g of *p*-toluenesulfonic acid in 100 mL of glacial acetic acid.

Standard solution—Dissolve an accurately weighed quantity of USP Reserpine RS in glacial acetic acid, and dilute quantitatively, and stepwise if necessary, with glacial acetic acid to obtain a solution having a known concentration of about 0.1 µg per mL.

Test solution—Pipet an aliquot of the filtered solution under test, containing about 11 µg of reserpine, into a 125-mL separatory funnel. Extract with three 10-mL portions of chloroform, collecting the extracts in a 100-mL volumetric flask, dilute with glacial acetic acid to volume, and mix.

Procedure—Into three individual 50-mL test tubes, pipet 10 mL each of the *Standard solution*, the *Test solution*, and glacial acetic acid to provide the blank. Treat each as follows. Add 10 mL of *p-Toluenesulfonic acid solution*, insert a stopper, and mix gently. Place in a steam bath for 10 minutes. Remove from the steam bath, and cool. Determine the amount of $C_{33}H_{40}N_2O_9$ dissolved from the fluorescences of the *Test solution* and the *Standard solution*, using a suitable spectrophotometer arranged to deliver activation radiation at 390 nm and to measure the resultant fluorescence at the emission wavelength of about 480 nm.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{33}H_{40}N_2O_9$ is dissolved in 45 minutes.

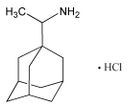
BRIEFING

Rimantadine Hydrochloride, page 5927 of *PF* 24(2) [Mar.–Apr. 1998]. It is proposed to change the solvents used in the tests for *Ordinary impurities*, *Limit of toluene*, and *Assay* to reflect new information.

(PA7b: B. Davani; PSD: C. Okeke) RTS—39422-1

Add the following:

■Rimantadine Hydrochloride



$C_{12}H_{21}N \cdot HCl$ 215.77

Tricyclo[3.3.1.1^{3,7}]-decane-1-methanamine, α-methyl-, hydrochloride.

α-Methyl-1-adamantanemethylamine hydrochloride [*1501-84-4*].

» Rimantadine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{21}N \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store between 15° to 30°.

USP Reference standards ⟨11⟩—*USP Rimantadine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the rimantadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

X-ray diffraction ⟨941⟩—The X-ray diffraction pattern conforms to that of USP Rimantadine Hydrochloride RS, similarly determined.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩: 20 µg per g.

In-Process Revision

Ordinary impurities ⟨466⟩—

Test solution—Transfer 100 mg of Rimantadine Hydrochloride to a 10-mL centrifuge tube, add 2 mL of 1 N sodium hydroxide, and mix. Add 2 mL of ~~methylene chloride,~~ chloroform, and mix on a vortex mixer for 1 minute. Allow the layers to separate, and apply 10 µL of the organic layer.

Standard solution—Proceed as directed for the *Test solution*, using USP Rimantadine Hydrochloride RS in place of the test specimen.

Eluant: a mixture of ethyl acetate, methanol, and ammonium hydroxide (80:10:4).

Procedure—Use a low-actinic glass tank. Dry the plate in a stream of hot air, then heat in an oven at 105° for 30 minutes. Allow the plate to cool to room temperature.

Visualization—Place the plate in an atmosphere of chlorine, prepared by mixing 1.5% potassium permanganate solution and diluted hydrochloric acid (1:1), for about 90 minutes. Allow to air-dry for 60 minutes, and follow with visualization technique 20.

Limit of toluene—

Standard solution—Transfer 10 µL of toluene to a 100-mL volumetric flask, dilute with ~~methylene chloride~~ chloroform to volume, and mix.

Test solution—Transfer about 750 mg of Rimantadine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dilute with ~~methylene chloride~~ chloroform to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 2-m column that contains 80- to 100-mesh support S1A. The column temperature is maintained at about 200°, and nitrogen is used as the carrier gas. The injection port and detector temperatures are maintained at about 250°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5 for toluene; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 9 minutes, and measure the responses for the toluene peaks. Calculate the percentage of toluene in the portion of Rimantadine Hydrochloride taken by the formula:

$$0.867(100/W_U)(r_U/r_S),$$

in which 0.867 is the specific gravity of toluene; W_U is the weight, in mg, of Rimantadine Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the toluene peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

Assay—

Internal standard solution—Transfer about 400 mg of *n*-eicosane to a 250-mL volumetric flask, dilute with ~~methylene chloride~~ hexane to volume, and mix.

Standard preparation—Transfer about 40 mg of USP Rimantadine Hydrochloride RS, accurately weighed, to a 50-mL centrifuge tube, add 15 mL of 1 N sodium hydroxide, and mix. Add 25.0 mL of *Internal standard solution*, and shake by mechanical means for about 15 minutes. Allow the layers to separate, and filter a portion of the ~~lower methylene chloride~~ top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Assay preparation—Using about 40 mg of Rimantadine Hydrochloride, accurately weighed, proceed as directed for *Standard preparation.*

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.8-m glass column that is packed with 3% phase G19 on 100- to 200-mesh support S1A. The column temperature is maintained at about 160°, and the injection port and detector temperatures are maintained at about 250°. Nitrogen is used as the carrier gas. Adjust the carrier flow rate and temperature so that the *n*-eicosane elutes at about 8 minutes. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0 for rimantadine; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{21}N \cdot HCl$ in the portion of Rimantadine Hydrochloride taken by the formula:

$$25C(R_U / R_S),$$

in which C is the concentration, in mg per mL, of USP Rimantadine Hydrochloride in the *Standard preparation;* and R_U and R_S are the ratios of the rimantadine peak response to the *n*-eicosane peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

BRIEFING

Rimantadine Hydrochloride Tablets, page 5929 of *PF* 24(2) [Mar.–April 1998]. It is proposed to change the solvents used in the tests for *Identification* and *Assay* to reflect new information.

(PA7b: B. Davani; PSD: C. Okeke) RTS—39422-2

Add the following:

■Rimantadine Hydrochloride Tablets

» Rimantadine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{21}N \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers, and store between 15° to 30°.

USP Reference standards ⟨11⟩—*USP Rimantadine Hydrochloride RS.*

Identification—

A: The retention time of the rimantadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

B: [*Caution—Avoid contact with o-tolidine when performing this test, and conduct the test in a well-ventilated hood.*] Weigh and finely powder not fewer than 5 Tablets. Transfer a portion of the powder, equivalent to 100 mg of rimantadine hydrochloride, to a 10-mL centrifuge tube, add 2 mL of 1 *N* sodium hydroxide, and mix. Add 2 mL of ~~methylene chloride,~~ chloroform and mix on a vortex mixer for 1 minute. Allow the layers to separate, and use the organic layer as the test solution. Separately apply 10 µL

In-Process Revision

of the test solution and 10 µL of a Standard solution of USP Rimantadine Hydrochloride RS, similarly prepared, to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a low-actinic glass chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (80:10:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, dry it in a stream of hot air, and then heat in an oven at 105° for 30 minutes. Allow the plate to cool to room temperature. Place the dried plate in an atmosphere of chlorine, prepared from a mixture of 1.5% potassium permanganate solution and 3 N hydrochloric acid (1:1), for about 90 minutes. Remove the plate, and allow it to air-dry for 60 minutes. Prepare a spray reagent as follows. Dissolve 160 mg of *o*-tolidine in 30 mL of glacial acetic acid, dilute with water to 500 mL, add 1 g of potassium iodide, and mix until the potassium iodide is dissolved. Locate the spots on the plate by spraying with the spray reagent: the R_F value of the principal spot in the chromatogram of the test solution corresponds to that of the principal spot obtained from the Standard solution.

Uniformity of dosage units ⟨905⟩: meet the requirements.

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{12}H_{21}N \cdot HCl$ dissolved, employing the procedure set forth in the *Assay.*

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{12}H_{21}N \cdot HCl$ is dissolved in 30 minutes.

Assay—

Internal standard solution, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Rimantadine Hydrochloride.*

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of rimantadine hydrochloride, to a 50-mL centrifuge tube, add 15 mL of 1 N sodium hydroxide, and mix. Add 25.0 mL of *Internal standard solution*, and shake by mechanical means for about 15 minutes. Allow the layers to separate, and filter a portion of the ~~lower methylene chloride~~ top hexane layer through anhydrous sodium sulfate. Use the clear filtrate as the *Assay preparation.*

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{21}N \cdot HCl$ in the portion of Tablets taken by the formula:

$$25C(R_U / R_S),$$

in which *C* is the concentration, in mg per mL, of USP Rimantadine Hydrochloride RS in the *Standard preparation;* and R_U and R_S are the ratios of the rimantadine peak response to the *n*-eicosane peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*USP27*)

In-Process Revision

BRIEFING

Simethicone, *USP 26* page 1680. In the *Identification* test, it is proposed to specify that toluene should be used as a blank to set the instrument.

Reducing sugars—~~A 10.0-g portion, accurately weighed, meets the requirements of the test for *Reducing sugars* under *Sorbitol*. The amount determined in this test is not included in the calculated amount under *Other Impurities*.~~

■To an amount of Sorbitol Solution, equivalent to 3.3 g on the anhydrous basis, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. ~~Proceed as directed in the test for *Reducing sugars* under *Mannitol*, beginning with "Heat so that boiling begins."~~ Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, on the anhydrous basis, as glucose. The amount determined in this test is not included in the calculated amount under *Other Impurities*.■1S (*USP27*)

Add the following:

■**Limit of nickel**—

Test solution—Dissolve 20.0 g of Sorbitol Solution in diluted acetic acid, and dilute with diluted acetic acid to 100.0 mL. Add 2.0 mL of a saturated ammonium pyrrolidine dithiocarbamate solution (containing about 10 g of ammonium pyrrolidine dithiocarbamate per liter) and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution—Prepare as directed for *Test solution*, except to omit the use of the Sorbitol Solution.

Standard solutions—Prepare as directed for *Test solution*, except to prepare three solutions by adding 0.5 mL, 1.0 mL, and 1.5 mL of nickel standard solution TS.

Procedure—~~Proceed as directed in the test for *Nickel* under *Mannitol*.~~ Set the instrument to zero using the *Blank solution*. Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a nickel hollow-cathode lamp and an air–acetylene flame. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution*. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Test solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the

axes represents the concentration of nickel in the *Test solution*. Not more than 1 µg per g, calculated on the anhydrous basis, is found. ■1S (*USP27*)

Change to read:

Assay—

Mobile phase, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sorbitol* ~~(see *NF* monograph).~~

Assay preparation— ~~Transfer an accurately weighed portion of Solution, equivalent to about 0.24 g of sorbitol, to a 50-mL volumetric flask, dilute with water to volume, and mix.~~

▲Accurately weigh about 0.12 g of Sorbitol Solution, dissolve in and dilute with water to about 20 g. Accurately record the final solution weight, and mix thoroughly. ▲*USP27*

Procedure—Proceed as directed in the *Assay* under *Sorbitol*. Calculate the ~~quantity, in mg, of $C_6H_{14}O_6$ in the portion of Solution taken by the formula:~~

In-Process Revision

Change to read:

Identification—

A: *Infrared Absorption* ⟨197S⟩—
Solution: 1 in 100.
Medium: chloroform.

B: Transfer about 100 mg of it, accurately weighed, to a 100-mL volumetric flask, and dissolve in 25 mL of alcohol. Dilute quantitatively and stepwise with sodium hydroxide solution (1 in 250) to obtain a 1 in 50,000 solution: the UV absorption spectrum of this solution exhibits maxima and minima only at the same wavelengths as that of a similar solution of USP Trimethoprim RS, concomitantly measured; and the respective absorptivities, calculated on the dried basis

■for the test sample only,■1S (*USP27*) at the wavelength of maximum absorbance at about 287 nm do not differ by more than 3.0%.

BRIEFING

Valsartan and Hydrochlorothiazide Tablets, page 129 of *PF* 29(1) [Jan.–Feb. 2003]. As recommended by the USP Reference Standards Committee, it is proposed to change the name of the impurity 4-amino-6-chloro-1,3-benzenedisulfonamide to benzothiadiazine related compound A for the official USP Reference Standard.

(PA5: A. Wilk) RTS—39855-1

Add the following:

■Valsartan and Hydrochlorothiazide Tablets

» Valsartan and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—~~*USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS.*~~ *USP Benzothiadiazine Related Compound A RS. USP Hydrochlorothiazide RS. USP Valsartan RS. USP Valsartan Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—To a centrifuge tube transfer an amount of ground Tablets, equivalent in weight to a single Tablet, add 2.0 mL of acetone, sonicate for 15 minutes, and centrifuge.

Application volume: 2 µL.

Developing solvent system: a mixture of ethyl acetate, dehydrated alcohol, and a solution (25 in 100) of ammonium hydroxide (8:2:1).

Procedure—Proceed as directed in the chapter, except to develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent system* for about 15 minutes prior to use. Allow the chromatogram to develop until the solvent front has moved at least 7 cm. After removing the plate and marking the solvent front, dry the plate under a current of warm air until it is completely dry. The R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45~~ 30 minutes.

Procedure—Determine the amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing UV absorption at the wavelengths of maximum absorbance at about 250 nm for valsartan ~~(cor-~~

In-Process Revision

~~rected for interference from hydrochlorothiazide on the basis of the absorbances of hydrochlorothiazide at 250 and 272 nm)~~ and at about 272 nm for hydrochlorothiazide on filtered portions of the solution under test, ~~suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having known concentrations of USP Valsartan RS and USP Hydrochlorothiazide RS in the same *Medium*~~ diluted with *Medium* if necessary. Calculate the quantity of $C_{24}H_{29}N_5O_3$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs250}}a_{\text{H272}} - A_{\text{obs272}}a_{\text{H250}}}{a_{\text{V250}}a_{\text{H272}} - a_{\text{V272}}a_{\text{H250}}}\right),$$

in which D is the sample dilution factor if used; A_{obs250} is the observed absorbance of the sample solution at 250 nm; A_{obs272} is the observed absorbance of the sample solution at 272 nm; a_{V250} is the absorptivity of valsartan at 250 nm; a_{V272} is the absorptivity of valsartan at 272 nm; a_{H250} is the absorptivity of hydrochlorothiazide at 250 nm; and a_{H272} is the absorptivity of hydrochlorothiazide at 272 nm. The absorptivities, a, are determined from separate Standard solutions of USP Valsartan RS and USP Hydrochlorothiazide RS in the *Medium* having known concentration and expressed in units as defined by *Spectrophotometry and Light-Scattering* ⟨851⟩. Calculate the quantity of $C_7H_8ClN_3O_4S_2$ dissolved, in mg, by the formula:

$$1000D\left(\frac{A_{\text{obs272}}a_{\text{V250}} - A_{\text{obs250}}a_{\text{V272}}}{a_{\text{V250}}a_{\text{H272}} - a_{\text{V272}}a_{\text{H250}}}\right),$$

in which the terms are as defined above.

Tolerances—Not less than ~~75%~~ 80% (Q) of the labeled amounts of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ is dissolved in ~~45~~ 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Diluent, *Solution A*, *Solution B*, *Mobile phase*, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation* as prepared in the *Assay.*

Test solution—Place 1 Tablet in a 200-mL volumetric flask, add 5 mL of water, and allow to stand for 5 minutes. Add about 100 mL of *Diluent*, and sonicate for 15 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at about 3000 rpm. Quantitatively dilute a volume of the clear supernatant with *Diluent* to obtain a solution having a concentration of about 0.2 mg of valsartan per mL.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(LC_S/C_U)(r_U/r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in the Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Test solution*, based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

Related compounds—

Diluent, *Solution A*, *Solution B*, and *Mobile phase*—Prepare as directed in the *Assay.*

In-Process Revision

Standard stock solution—Dissolve accurately weighed quantities of ~~USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, USP Hydrochlorothiazide RS, USP Valsartan RS, and USP Valsartan Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.03 mg per mL, 0.06 mg per mL, 0.08 mg per mL, and 0.2 mg per mL, respectively.

Resolution solution—Dilute 5.0 mL of *Standard stock solution* with *Diluent* to 100.0 mL, and mix.

Standard solution—Dilute 10.0 mL of *Resolution solution* with *Diluent* to 100.0 mL, and mix.

Test solution—Use the *Assay preparation* as specified.

Chromatographic system—Prepare as directed in the *Assay*. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between valsartan related compound B and valsartan, and between ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A and hydrochlorothiazide is not less than 1.4. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan and hydrochlorothiazide peaks, for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks, disregarding the peak, if any, with a retention time of about 22 minutes. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$2000C(r_U / r_S),$$

in which *C* is the concentration, in mg per mL, of ~~USP Valsartan Related Compound B RS or USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, or the relevant USP Reference Standard (when determining the quantity of other impurities) in the *Standard solution;* and r_U and r_S are the corresponding peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than ~~0.5%~~ 1.0% ~~each of valsartan related compound B and~~ of ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A is found; not more than 0.2% of any other impurity, excluding valsartan related compound A and valsartan related compound B, is found; and not more than ~~0.8%~~ 1.3% of total impurities, excluding valsartan related compound A and valsartan related compound B, is found. [NOTE—Valsartan related compound A is the enantiomer of valsartan and coelutes with valsartan in this test.]

Assay—

Diluent—Prepare a mixture of acetonitrile and water (1:1).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (90:10:0.1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and trifluoroacetic acid (90:10:0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12.5 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask. Add about 12.5*J* mg of USP Valsartan RS, accurately weighed, *J* being the ratio of the labeled amount, in mg, of valsartan to the labeled amount, in mg, of hydrochlorothiazide per Tablet. Add about 100 mL of *Diluent*, sonicate for 15 minutes, dilute with *Diluent* to volume, and mix. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Quan-

titatively dilute a volume of this solution with *Diluent* to obtain a solution having a known concentration of about 0.2 mg of USP Valsartan RS per mL.

Assay preparation—Transfer a number of Tablets, equivalent to about 62.5 mg of hydrochlorothiazide, to a 250-mL volumetric flask. Add 5 mL of water, and allow to stand for 5 minutes. Then add about 100 mL of *Diluent*, sonicate for 15 minutes, and shake for 30 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at 3000 rpm. Dilute 25.0 mL of the clear supernatant with *Diluent* to 200.0 mL, and mix (*Solution 1*). [NOTE—Retain a portion of *Solution 1* to use as the *Test solution* in the test for *Related compounds*.] Dilute an accurately measured volume of *Solution 1* with *Diluent* to obtain a solution containing about 0.2 mg of valsartan per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	90→10	10→90	linear gradient
25–27	10→90	90→10	linear gradient
27–40	90	10	isocratic

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$(LC_S/C_U)(r_U/r_S),$$

in which L is the labeled quantity, in mg, of the relevant analyte in each Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (*USP27*)

BRIEFING

Bacteriostatic Water for Injection, *USP 26* page 1939; **Sterile Water for Inhalation,** *USP 26* page 1939; **Sterile Water for Injection,** *USP 26* page 1939; **Sterile Water for Irrigation,** *USP 26* page 1939; **Sterile Purified Water** *USP 26* page 1940 and page 1272 of *PF* 28(4) [July–Aug. 2002]. In accordance with numerous requests received, the Expert Committee on Pharmaceutical Waters proposes to replace the various cross-references in all of the water monographs with a listing of the actual test requirements for each monograph. Although cross-referencing is established USP publication policy, it is recommended that the policy be waived in recognition of the fact that many readers in the field of water treatment are not regular users of *USP* and are not familiar with the cross-referencing style. It was also recommended that the *Note* under *Purified Water*, recently added to direct the reader to general information chapter ⟨1231⟩, also be added to all of the water monographs. It is proposed to add this *Note* for informational purposes only, and, therefore, to place it above and outside of the Definition.

It should be noted that the revision of all packaged water monographs is presently under study. However, because this action will take time, the revisions proposed herein are suggested as an interim measure to improve readability of the monographs. New proposals based on studies of the scientific content of the monographs will likely be published in *PF* early next year.

(PW: F. Barletta) RTS—39787-2

In-Process Revision

Add the following:

■NOTE—For microbiological guidance see general information chapter *Water for Pharmaceutical Purposes* ⟨1231⟩.■1S (*USP27*)

Add the following:

■**Sterility** ⟨71⟩: meets the requirements.■1S (*USP27*)

Add the following:

■**Particulate matter** ⟨788⟩: meets the requirements.■1S (*USP27*)

Add the following:

■**Calcium**—To 100 mL add 2 mL of ammonium oxalate TS: no turbidity is produced.■1S (*USP27*)

Add the following:

■**Carbon dioxide**—To 25 mL add 25 mL of calcium hydroxide TS: the mixture remains clear.■1S (*USP27*)

Add the following:

■**Sulfate**—To 100 mL add 1 mL of barium chloride TS: no turbidity is produced.■1S (*USP27*)

Delete the following:

■~~**Other requirements**—It meets the requirements of the test for *Particulate matter* under *Sterile Water for Injection* and all of the tests under *Sterile Purified Water*, except the tests for *pH*, *Ammonia*, *Chloride*, and *Oxidizable substances*.~~■1S (*USP27*)

BRIEFING

Sterile Water for Inhalation, *USP 26* page 1939—See briefing under *Bacteriostatic Water for Injection*.

(PW: F. Barletta) RTS—39787-1

Add the following:

■NOTE—For microbiological guidance, see general information chapter *Water for Pharmaceutical Purposes* ⟨1231⟩.■1S (*USP27*)

Add the following:

■**Sterility** ⟨71⟩: meets the requirements.■1S (*USP27*)

Add the following:

■**Ammonia**—For containers having a fill volume of less than 50 mL, dilute 50 mL of it with 50 mL of *High-Purity Water* (see *Reagents* under *Containers* ⟨661⟩), and use this dilution as the test solution; where the fill volume is 50 mL or more, use 100 mL of it as the test solution. To 100 mL of the test solution add 2 mL of alkaline mercuric-potassium iodide TS: any yellow color produced immediately is not darker than that of a control containing 30 µg of added ammonia (furnished by using 1.76 mL of 1.0 N ammonium hydroxide) in 100 mL of *High-Purity Water*. This corresponds to a limit of 0.6 mg per liter for containers having a fill volume of less than 50 mL and 0.3 mg per liter where the fill volume is 50 mL or more.■1S (*USP27*)

Add the following:

■**Calcium**—To 100 mL add 2 mL of ammonium oxalate TS: no turbidity is produced.■1S (*USP27*)

Add the following:

■**Carbon dioxide**—To 25 mL add 25 mL of calcium hydroxide TS: the mixture remains clear.■1S (*USP27*)

Add the following:

■**Chloride**—To 20 mL in a color-comparison tube add 5 drops of nitric acid and 1 mL of silver nitrate TS, and gently mix: any turbidity formed within 10 minutes is not greater than that produced in a similarly treated control consisting of 20 mL of *High-Purity Water* (see *Reagents* under *Containers* ⟨661⟩) containing 10 µg of chloride (0.5 mg per liter), viewed downward over a dark surface with light entering the tubes from the sides.■1S (*USP27*)

Add the following:

■**Sulfate**—To 100 mL add l mL of barium chloride TS: no turbidity is produced.■1S (*USP27*)

Add the following:

■**Oxidizable substances**—To 100 mL add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Water for Inhalation in containers having a fill volume of less than 50 mL, add 0.4 mL of 0.1 N potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of 0.1 N potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and filter through a sintered-glass filter: the pink color does not completely disappear.■1S (*USP27*)

Delete the following:

■~~**Other requirements**—It meets the requirements of all the tests under *Sterile Purified Water* except the test for *pH*.~~■1S (*USP27*)

BRIEFING

Sterile Water for Injection, *USP 26* page 1939—See briefing under *Bacteriostatic Water for Injection*.

(PW: F. Barletta) RTS—39787-5

Add the following:

■NOTE—For microbiological guidance, see general information chapter *Water for Pharmaceutical Purposes* ⟨1231⟩.■1S (*USP27*)

Add the following:

■**Sterility** ⟨71⟩: meets the requirements.■1S (*USP27*)

Add the following:

■**pH** ⟨791⟩: between 5.0 and 7.0 in a solution containing 0.3 mL of saturated potassium chloride solution per 100 mL of test specimen.■1S (*USP27*)

Add the following:

■**Ammonia**—For containers having a fill volume of less than 50 mL, dilute 50 mL of it with 50 mL of *High-Purity Water* (see *Reagents* under *Containers* ⟨661⟩), and use this dilution as the test solution; where the fill volume is 50 mL or more, use 100 mL of it as the test solution. To 100 mL of the test solution add 2 mL of alkaline mercuric-potassium iodide TS: any yellow color produced immediately is not darker than that of a control containing 30 µg of added ammonia (furnished by using 1.76 mL of 1.0 N ammonium hydroxide) in 100 mL of *High-Purity Water*. This corresponds to a limit of 0.6 mg per liter for containers having a fill volume of less than 50 mL and 0.3 mg per liter where the fill volume is 50 mL or more.■1S (*USP27*)

MONOGRAPHS (NF)

BRIEFING

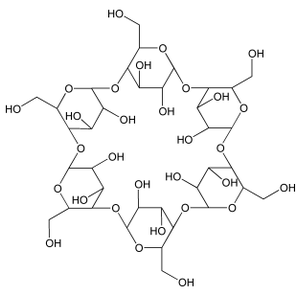
Alfadex, page 1611 of *PF* 28(5) [Sept.–Oct. 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now being forwarded with editorial style changes to *In-Process Revision*. It is also proposed to add storage conditions to the *Packaging and storage* section. The molecular weight of Alfadex is revised to reflect the current atomic weight values published in *USP 26*.

(EMC: E. Gonikberg; PSD: C. Okeke) RTS—39918-3

In-Process Revision

Add the following:

■Alfadex



$(C_6H_{10}O_5)_6$ ~~972.85~~ 972.84

Alpha cyclodextrin [*10016-20-3*].

» Alfadex is composed of six alpha-(1-4) linked D-glucopyranosyl units. It contains not less than 98.0 percent and not more than 101.0 percent of $(C_6H_{10}O_5)_6$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers. Store at up to 25°, excursion permitted between 15° and 30°. Avoid excessive heat and freezing. Protect from moisture.

USP Reference standards ⟨11⟩—*USP Alpha Cyclodextrin RS. USP Beta Cyclodextrin RS. USP Gamma Cyclodextrin RS.*

Clarity of solution—Dissolve 1.0 g in 100.0 mL of previously boiled and cooled water: the resulting solution is clear.

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

B: It meets the requirements of the test for *Specific rotation* ⟨781S⟩.

C: Mix 0.2 g with 2 mL of iodine TS, warm in a water bath to dissolve the test specimen, and allow to stand at room temperature: a yellow-brown precipitate is formed.

Specific rotation ⟨781S⟩: between +147° and +152° (t = 20°).

Test solution: 10 mg per mL, in water.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic bacterial count does not exceed 1000 per g.

pH ⟨791⟩—The pH of the mixture of 30 mL of its aqueous solution (1 in 100) and 1 mL of *Potassium chloride solution* is 5.0 to 8.0.

Potassium chloride solution—Transfer 22.4 g of potassium chloride into a 100-mL volumetric flask, and dilute with water to volume.

Loss on drying ⟨731⟩—Dry 1.0 g of it at 120° for 2 hours: it loses not more than 10.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%, determined on 1.0 g.

Heavy metals, *Method II* ⟨231⟩: 10 µg per g.

Reducing sugars—

Cupric solution—Dissolve 15 g of cupric sulfate in water to make 100 mL.

Tartrate solution—Dissolve 2.5 g of anhydrous sodium carbonate, 2.5 g of potassium sodium tartrate, 2.0 g of sodium bicarbonate, and 20 g of anhydrous sodium sulfate in water to make 100 mL.

Cupric–tartaric solution—Immediately before use, mix 1 part of *Cupric solution* with 25 parts of *Tartrate solution*.

Ammonium molybdate reagent—Mix 10 mL of a solution of disodium arsenate (6 in 100), 50 mL of a solution of ammonium molybdate (1 in 10), and 90 mL of diluted sulfuric acid, and dilute with water to 200 mL.

Test solution—Transfer about 1.0 g of Alfadex, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water that has been previously boiled and cooled to room temperature, to volume, and mix. To 1 mL of this solution add 1 mL of *Cupric–tartaric solution*. Heat on a water bath for 10 minutes, then cool to room temperature. Add 10 mL of *Ammonium molybdate reagent*, and allow to stand for 15 minutes.

Standard solution—Prepare at the same time and in the same manner as the *Test solution*, using 1 mL of a glucose solution that contains 20 mg in 1 liter.

Procedure—Concomitantly measure the absorbance of the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at 740 nm relative to that of water, with a suitable spectrophotometer. The absorbance of the *Test solution* is not greater than that of the *Standard solution* (0.2%).

Related compounds—

System suitability solution—Prepare as directed for *System suitability preparation* in the *Assay.*

Standard solution—Transfer 5.0 mL of the *System suitability solution* into a 50-mL volumetric flask, and dilute with water to volume.

Test solution—Use the *Assay stock preparation* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. For the *Test solution*, the areas of any peaks corresponding to beta cyclodextrin or to gamma cyclodextrin are not greater than half of the area of the corresponding peaks in the chromatogram of the *Standard solution* (0.25%), and the sum of the areas of all the

In-Process Revision

peaks, excluding the principal peak and the peaks corresponding to beta cyclodextrin or to gamma cyclodextrin, is not greater than half of the area of the peak corresponding to alpha cyclodextrin in the chromatogram of the *Standard solution* (0.5%).

Light-absorbing impurities—

Test solution—Transfer about 1.0 g of Alfadex, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water, which has been previously boiled and cooled to room temperature, to volume, and mix.

Procedure—Determine the absorbance of the *Test solution* in a 1-cm cell with a suitable spectrophotometer, after correcting for the blank: between 230 nm and 350 nm, the absorbance is not greater than 0.10; and between 350 nm and 750 nm, the absorbance is not greater than 0.05.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (90:10, v/v). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer 25 mg of USP Alpha Cyclodextrin RS, accurately weighed, in 25-mL volumetric flask, and dissolve in and dilute with water to volume.

System suitability preparation—Transfer 25 mg of USP Beta Cyclodextrin RS, 25 mg of USP Gamma Cyclodextrin RS, and 50 mg of USP Alpha Cyclodextrin RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water, and mix.

Assay stock preparation—Dissolve 250 mg of Alfadex, accurately weighed, in water with the aid of heat. Cool, and dilute to 25.0 mL with water to volume.

Assay preparation—Transfer 5.0 mL of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation*, and record the chromatograms for about 3.5 times the retention time of alpha cyclodextrin. Record the peak responses as directed for *Procedure:* the retention time of alpha cyclodextrin is about 4.5 minutes; the relative retention times are about 1.0 for alpha cyclodextrin, about 2.2 for beta cyclodextrin, and about 0.7 for gamma cyclodextrin; the resolution, R, between the gamma cyclodextrin and alpha cyclodextrin peaks is not less than 1.5; and for the alpha cyclodextrin peak, the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $(C_6H_{10}O_5)_6$ in the portion of Alfadex taken by the formula:

$$2500(C/W)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of alpha cyclodextrin in the *Standard preparation*, calculated on the dried basis, as determined from the concentration of USP Alpha Cyclodextrin RS corrected for the declared moisture content; W is the weight, in mg, of alpha cyclodextrin taken to prepare the *Assay stock preparation;* and R_U and R_S are the peak responses of the alpha cyclodextrin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.■1S (*NF22*)

In-Process Revision

BRIEFING

Low-Substituted Carboxymethylcellulose Sodium, page 1617 of *PF* 28(5) [Sept.–Oct. 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision*. It is proposed to add storage conditions to the *Packaging and storage* section.

(EMC: E. Gonikberg; PSD: C. Okeke) RTS—39918-2

Add the following:

■Low-Substituted Carboxymethylcellulose Sodium

Cellulose, carboxymethyl ether, sodium salt, low-substituted.

Carmellose sodium, low-substituted [*9004-32-4*].

» Low-Substituted Carboxymethylcellulose Sodium is the sodium salt of a partly *O*-(carboxymethylated) cellulose. It contains not less than 2.0 percent and not more than 4.5 percent of sodium (Na), calculated on the dried basis.

Packaging and storage—Preserve in ~~a~~ tight containers. Store at up to 25°, excursions permitted between 15° and 30°. Avoid excessive heat and freezing. Protect from moisture.

Labeling—When the settling volume is determined, label it to indicate the settling volume value.

Identification—

A: Shake 1 g of Low-Substituted Carboxymethylcellulose Sodium with 100 mL of sodium hydroxide solution (1 in 10): a suspension is produced.

B: Shake 1 g of Low-Substituted Carboxymethylcellulose Sodium with 50 mL of water. Transfer 1 mL of the mixture to a test tube, and add 1 mL of water and 1 mL of 1-naphthol TS. Incline the test tube, and add carefully 2 mL of sulfuric acid down the side so that it forms a lower layer: a reddish-purple color develops at the interface.

C: It meets the requirements of the test for *Residue on ignition.*

D: The solution prepared in the test for *Heavy metals* responds to the pyroantimonate precipitate test for *Sodium* ⟨191⟩.

pH ⟨791⟩—Shake 1 g of Low-Substituted Carboxymethylcellulose Sodium with 100 mL of carbon dioxide–free water, and centrifuge: the pH of the suspension is between 6.0 and 8.5.

Loss on drying ⟨731⟩—Dry 1.0 g of Low-Substituted Carboxymethylcellulose Sodium at 105° for 3 hours: it loses not more than 10.0% of its weight.

Settling volume—[NOTE—The following test, which can relate to excipient function, may be carried out, depending on the intended use in the formulation. In cases where there are no concerns regarding the settling volume of this article, this test may be omitted.] Where the labeling states the settling volume, determine the settling volume as follows. In a 100-mL graduated cylinder, transfer 20 mL of isopropyl alcohol, add 5.0 g of Low-Substituted Carboxymethylcellulose Sodium, and shake vigorously. Dilute with isopropyl alcohol to 30 mL, then with water to 50 mL, and shake vigorously. Within 15 minutes, repeat the shaking three times. Allow to stand for 4 hours, and determine the volume of the settled mass: it is between 15.0 mL and 35.0 mL.

Residue on ignition ⟨281⟩—Determined on 1.0 g of Low-Substituted Carboxymethylcellulose Sodium using a mixture of sulfuric acid and water (1:1) and an ignition temperature of 600 ± 50°: it is between 6.5% and 13.5%, calculated on the dried basis.

Water-soluble substances—Disperse 5.0 g of Low-Substituted Carboxymethylcellulose Sodium in 400 mL of water, and during the first 30 minutes, stir for 1 minute every 10 minutes. Allow to stand for 1 hour, and centrifuge, if necessary. Decant 100.0 mL of the supernatant onto a fast filter paper in a vacuum filtration funnel, apply a vacuum, and collect 75.0 mL of the filtrate. Evaporate in a tared platinum or porcelain dish, and dry at 105° for 4 hours: not more than 70% is found.

Heavy metals, *Method II* ⟨231⟩: To the residue obtained in the test for *Residue on ignition*, add 1 mL of hydrochloric acid, evaporate on a water bath, and dissolve in 20 mL of water [NOTE—Use this solution in *Identification* test *D*.]: the limit is 20 µg per g.

Limit of sodium chloride and sodium glycolate—

SODIUM CHLORIDE—Transfer an accurately weighed quantity of about 5 g of Low-Substituted Carboxymethylcellulose Sodium to a 250-mL conical flask, add 50 mL of water and 5 mL of 30% hydrogen peroxide, and heat on a water bath for 20 minutes, stirring occasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitric acid, and titrate, while stirring constantly with 0.05 N silver nitrate VS, determining the endpoint potentiometrically using a silver electrode and a mercurous sulfate electrode with a potassium sulfate bridge. Calculate the percentage of sodium chloride (NaCl) in the Low-Substituted Carboxymethylcellulose Sodium taken by the formula:

$$584.4VN/(100 - b)W,$$

in which 584.4 is the equivalence factor for sodium chloride; V is the volume, in mL, of silver nitrate; N is the normality of silver nitrate; b is the percentage obtained from the test for *Loss on drying*, determined separately; and W is the weight, in g, of the Low-Substituted Carboxymethylcellulose Sodium taken.

SODIUM GLYCOLATE—

Test solution—Transfer an accurately weighed quantity of about 500 mg of Low-Substituted Carboxymethylcellulose Sodium to a beaker, moisten thoroughly with 5 mL of glacial acetic acid, add 5 mL of water, and stir with a glass rod to ensure proper hydration (about 30 minutes). Add 80 mL of acetone while stirring, add 2 g of sodium chloride, and stir for several minutes to ensure the complete precipitation of carboxymethylcellulose. Filter through a fast filter paper, previously wetted with a small amount of acetone, and collect the filtrate in a 100-mL volumetric flask. Rinse the beaker and filter with acetone, and add the washings to the flask. Dilute the filtrate with acetone to volume, and mix. Allow to stand for 24 hours without shaking, and use the clear supernatant.

Standard stock solution—Transfer 100 mg of glycolic acid, previously dried overnight in a vacuum desiccator over phosphorus pentoxide and accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Standard solutions—Into four identical 100-mL volumetric flasks, transfer 0.5-mL, 1.0-mL, 1.5-mL, and 2.0-mL portions of the *Standard stock solution*, respectively. To each flask, add water to make 5 mL, add 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Blank—Use an acetone solution containing 5% of glacial acetic acid and 5% water.

Procedure—Transfer 2.0 mL of the *Test solution* and 2.0 mL of each *Standard solution* to separate 25-mL volumetric flasks. Place the uncovered flasks in a boiling water bath to remove the acetone, remove from the bath, and allow to

In-Process Revision

cool. To each flask, add 5.0 mL of 2,7-dihydroxynaphthalene TS, mix, add an additional 15 mL of 2,7-dihydroxynaphthalene TS, and mix again. Cover the mouth of each flask with a small piece of aluminum foil, place the flasks upright in a boiling water bath for 20 minutes, remove from the bath, cool, dilute with sulfuric acid to volume, and mix. Determine the absorbance of each solution at 540 nm with a suitable spectrophotometer against the *Blank*, and prepare a standard curve using the absorbances obtained from the *Standard solutions.* From the standard curve and the absorbance of the *Test solution*, determine the weight (*w*), in mg, of glycolic acid in the *Test solution*, and calculate the percentage of sodium glycolate in the Low-Substituted Carboxymethylcellulose Sodium taken by the formula:

$$(1.29)10w/[(100 - b)W],$$

in which 1.29 is a factor converting glycolic acid to sodium glycolate; *w* is the weight, in mg, of glycolic acid from the standard curve; *b* is the percentage obtained from the *Loss on drying* test, determined separately; and *W* is the weight, in g, of the Low-Substituted Carboxymethylcellulose Sodium taken. The sum of the percentages from the tests for *Sodium chloride* and *Sodium glycolate* is not more than 0.5%.

Content of sodium—Calculate the percentage of sodium in the Low-Substituted Carboxymethylcellulose Sodium taken by the formula:

$$0.3238A,$$

in which 0.3238 is a factor converting sodium sulfate to sodium; and *A* is the percentage obtained from the test for *Residue on ignition*, determined separately.■1S (*NF22*)

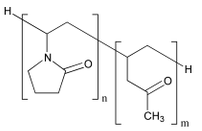
BRIEFING

Copovidone, page 948 of *PF* 28(3) [May–June 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision*. It is proposed to revise the current *Packaging and storage* statement to incorporate specifications provided by the manufacturer. Editorial style changes have also been made.

(EMC: C. Sheehan; PSD: C. Okeke) RTS—39919-1

Add the following:

■Copovidone



$(C_6H_9NO)_n + (C_4H_6O_2)_m$

Acetic acid ethenyl ester polymer with 1-ethenyl-2-pyrrolidone.

1-Vinyl-2-pyrrolidone polymer with vinyl acetate [*25086-89-9*].

» Copovidone is a copolymer of 1-vinyl-2-pyrrolidone and vinyl acetate in the mass proportion of 3:2. The nominal K-value of Copovidone as stated in the labeling is not less than 90.0 percent and not more than 110.0 percent.

Packaging and storage—Preserve in tight containers, protected from moisture. Store at 25°, excursion permitted up to 40°.

Labeling—Label it to indicate its nominal K-value.

USP Reference standards ⟨11⟩—*USP Copovidone RS.*

Clarity and color of solution—Dissolve 1.0 g in 10 mL of water: the solution is clear or slightly opalescent and colorless to pale yellow or pale red.

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: To 5 mL of a solution (1 in 50) add a few drops of iodine TS: a deep red color is produced.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 5.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Limit of aldehydes—

Phosphate buffer—Transfer 8.7 g of monobasic potassium phosphate to a 500-mL volumetric flask, and dissolve in 400 mL of water. Adjust, if necessary, with 1 N potassium hydroxide to a pH of 9.0, dilute with water to volume, and mix.

Aldehyde dehydrogenase solution—Transfer a quantity of lyophilized aldehyde dehydrogenase equivalent to 70 units to a glass vial, dissolve in 10.0 mL of water, and mix. [NOTE—This solution is stable for 8 hours at 4°.]

NAD solution—Transfer 40 mg of nicotinamide adenine dinucleotide to a glass vial, dissolve in 10.0 mL of *Phosphate buffer*, and mix. [NOTE—This solution is stable for 4 weeks at 4°.]

Blank solution—Use water.

Standard solution—Transfer about 2 mL of water at 4° to a glass weighing bottle, and weigh accurately. Add about 100 mg of freshly distilled acetaldehyde, and weigh accurately. Transfer this solution to a 100-mL volumetric flask. Rinse the weighing bottle with several portions of water at 4°, and transfer each rinsing to the 100-mL volumetric flask. Dilute the solution in the 100-mL volumetric flask with water at 4° to volume. Store at 4° for about 20 hours. Pipet 1 mL of this solution into a 100-mL volumetric flask, dilute with *Phosphate buffer* to volume, and mix.

Test solution—Transfer about 1 g of Copovidone, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Phosphate buffer*, dilute with *Phosphate buffer* to volume, and mix. Insert a stopper into the flask, heat at 60° for 1 hour, and cool to room temperature.

Procedure—Pipet 0.5 mL each of the *Standard solution*, the *Test solution*, and the *Blank solution* into separate 1-cm cells. Add 2.5 mL of *Phosphate buffer* and 0.2 mL of *NAD solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 2 to 3 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm. Add 0.05 mL of *Aldehyde dehydrogenase solution* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 5 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm. Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Copovidone taken by the formula:

$$10(C/W)\left[\frac{(A_{U2}-A_{U1})-(A_{B2}-A_{B1})}{(A_{S2}-A_{S1})-(A_{B2}-A_{B1})}\right],$$

in which C is the concentration, in mg per mL, of acetaldehyde in the *Standard solution; W* is the weight, in g, calculated on the dried basis, of Copovidone taken to prepare the *Test solution;* A_{U1}, A_{S1}, and A_{B1} are the absorbances of the solutions obtained from the *Test solution*, the *Standard solution*, and the *Blank solution*, respectively, before the addition of the *Aldehyde dehydrogenase solution;* and A_{U2}, A_{S2}, and A_{B2} are the absorbances of the solutions obtained from the *Test solution*, the *Standard solution*, and the *Blank solution*, respectively, after addition of the *Aldehyde dehydrogenase solution:* not more than 0.05% is found.

In-Process Revision

Limit of hydrazine—

Standard solution—Dissolve ~~an~~ accurately weighed ~~quantity~~ quantities of salicylaldazine and salicylaldehyde in toluene, and dilute quantitatively, and stepwise if necessary, with toluene to obtain a solution having ~~a~~ known concentrations of 9 µg and 10 mg per mL, respectively.

Test solution—Transfer the equivalent of 2.5 g of dried Copovidone, accurately weighed, to a 50-mL centrifuge tube, add 25 mL of water, and mix to dissolve. Add 500 µL of a 1 in 20 solution of salicylaldehyde in methanol, adjust the solution with 0.25 N sulfuric acid to a pH of about 2, swirl, and heat in a water bath at 60° for 15 minutes. Allow to cool, add 2.0 mL of toluene, insert a stopper in the tube, shake vigorously for 2 minutes, and centrifuge. Use the clear upper toluene layer as the *Test solution.*

Procedure—Separately apply 10 µL of the *Test solution* and the *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of dimethylsilanized chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ~~methanol and water (2:1)~~ acetonitrile and water (85:15) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under UV light at a wavelength of 365 nm: salicylaldazine appears as a fluorescent spot having an R_F value of about ~~0.3,~~ 0.6 to 0.7, and the fluorescence of any salicylaldazine spot from the *Test solution* is not more intense than that produced by the spot obtained from the *Standard solution:* not more than 1 µg per g is found.

Limit of peroxides—

Copovidone solution—Transfer the equivalent of 2.0 g of dried Copovidone, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test solution—Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, add 2 mL of titanium trichloride–sulfuric acid TS, and mix. Allow to stand for 30 minutes at room temperature.

Blank solution—Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, add 2 mL of 13% sulfuric acid, and mix.

Procedure—Determine the absorbance of the *Test solution* in a 1-cm cell at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer, using the *Blank solution* as the blank: the absorbance is not more than 0.35 (corresponding to not more than 0.04%, expressed as hydrogen peroxide).

Limit of monomers—Dissolve the equivalent of 5.0 g of dried Copovidone in 20 mL of methanol, and slowly add 20.0 mL of iodobromide TS. Allow to stand for 30 minutes, protected from light, with repeated shaking. Add 5 mL of potassium iodide solution (1 in 10), and titrate the liberated iodine with 0.1 N sodium thiosulfate VS until the solution is yellow. Continue the titration dropwise until the solution is colorless. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩): the difference between the volumes of 0.1 N sodium thiosulfate consumed in the blank and the specimen titrations is not more than 0.9 mL, corresponding to not more than 0.1% of monomers calculated as vinylpyrrolidone.

K-value—Transfer an accurately weighed quantity of undried Copovidone, equivalent to about 1.0 g on the dried basis, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 1 hour. Deter-

mine the viscosity, using a capillary-tube viscosimeter (see *Viscosity* ⟨911⟩), of this solution at 25 ± 0.2°. Calculate the K-value of Copovidone by the formula:

$$\frac{\sqrt{300c\log z+(c+1.5c\log z)^2}+1.5c\log z-c}{0.15c+0.003c^2},$$

in which c is the weight, in g, on the dried basis, of the specimen tested in each 100.0 mL of solution, and z is the viscosity of the test solution relative to that of water: the K-value is not less than 90.0% and not more than 110.0% of the K-value stated on the label.

Content of copolymerized vinyl acetate—Determine the saponification value as directed for *Saponification Value* under *Fats and Fixed Oils* ⟨401⟩. Calculate the percentage of copolymerized vinyl acetate in the Copovidone taken by the formula:

$$0.1(86.09/56.11)(S),$$

in which 86.09 and 56.11 are the molecular weights of vinyl acetate and potassium hydroxide, respectively, and S is the saponification value: not less than 35.3% and not more than 41.4% of the copolymerized vinyl acetate component, calculated on the dried basis, is found.

Nitrogen, *Method II* ⟨461⟩—Proceed as directed using about 0.1 g of Copovidone, accurately weighed. In the procedure, use 5 g of a powdered mixture of potassium sulfate, cupric sulfate, and titanium dioxide (33:1:1) instead of potassium sulfate and cupric sulfate (10:1), omit the use of hydrogen peroxide, and heat until the solution has a clear, yellow-green color and the sides of the flask are free from carbonaceous material. Then heat for a further 45 minutes, add 20 mL of water, instead of 70 mL, after the second heating, and use bromocresol green–methyl red TS instead of methyl red–methylene blue TS. Titrate the distillate with 0.05 N sulfuric acid VS until the color of the solution changes from green through pale grayish blue to pale grayish red-purple: the nitrogen content, on the dried basis, is not less than 7.0% and not more than 8.0%.■1S (*NF22*)

BRIEFING

Hymetellose, page 1633 of *PF* 28(5) [Sept.–Oct. 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision*. It is proposed to add storage conditions to the *Packaging and storage* section.

(EMC: E. Gonikberg; PSD: C. Okeke) RTS—39918-1

Add the following:

■Hymetellose

Methylhydroxyethylcellulose.

Cellulose 2-hydroxyethyl methyl ether [*9032-42-2*].

» Hymetellose is a partly *O*-(methylated) and *O*-(2-hydroxyethylated) cellulose.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursion permitted between 15° and 30°. Avoid excessive heat and freezing. Protect from moisture.

Labeling—Label it to indicate the viscosity of a solution (1 in 50) at 20°.

Identification—

A: Use the solution prepared in the test for *Color of solution.* Heat the solution in a water bath while stirring: at a temperature above 50°, the solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.

In-Process Revision

B: Transfer 1 mL of the solution from *Identification* test *A* to a glass plate, and allow the water to evaporate: a thin film is formed.

C: To 10 mL of the solution from *Identification* test *A*, add 0.3 mL of 2 N acetic acid and 2.5 mL of tannic acid TS: a yellowish-white, flocculent precipitate is formed that dissolves in ammonia TS.

D: In a test-tube about 160-mm long, thoroughly mix 1 g of Hymetellose with 2 g of finely powdered manganese sulfate. Introduce, to a depth of 2 cm into the upper part of the tube, a strip of filter paper impregnated with a freshly prepared *Diethanolamine–sodium nitroprusside solution.* Insert the tube 8 cm into a silicone-oil bath at 190° to 200°. The filter paper becomes blue within 10 minutes. Perform a blank test.

Diethanolamine–sodium nitroprusside solution—Prepare a sodium nitroprusside solution (1 in 20) and adjust with 1 N hydrochloric acid to a pH of 9.8. Mix 11 mL of this solution with 1 mL of a diethanolamine solution (1 in 5) in water.

E: Dissolve 0.2 g of Hymetellose completely, without heating, in 15 mL of 70% sulfuric acid. Pour the solution with stirring into 100 mL of ice water, and dilute with ice water to 250 mL. Transfer 1 mL of this solution to a test tube, and while cooling in ice water, add dropwise 8 mL of sulfuric acid, and mix thoroughly. Heat in a water bath for exactly 3 minutes, and immediately cool in ice water. While the mixture is cold, carefully add 0.6 mL of ninhydrin TS, and mix well. Allow to stand at 25°: a pink color is produced immediately and does not become violet within 100 minutes.

Color of solution—While stirring, add a portion equivalent to 1.0 g of the dried Hymetellose to 50 g of carbon dioxide-free water heated to 90°. Allow to cool, adjust the weight of the solution to 100 g with carbon dioxide-free water, and stir until dissolution is complete. This solution is not more intensely colored than a solution prepared immediately before use by mixing 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with *Diluent* to make 10 mL, and diluting 5 mL of this solution with *Diluent* to make 100 mL. Make the comparison by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* ⟨631⟩).

Diluent—Dilute 27.5 mL of hydrochloric acid to 1000 mL with water.

Clarity of solution—

Hydrazine sulfate solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours before use. [*Caution—Hydrazine sulfate is highly toxic. Avoid skin contact.*]

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent mixture—[NOTE—This suspension is stable for 2 months. Mix before use, and do not use if it adheres to the container.] To the flask containing *Methenamine solution*, add 25.0 mL of *Hydrazine sulfate solution*, mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—Use this suspension within 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent mixture* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspension—Transfer 30.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Use the solution from the test for *Color of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain

a depth of 40 mm. Similarly transfer a portion of the *Reference suspension* to a separate matching test tube. Compare the *Test solution* and the *Reference suspension* in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The *Test solution* is to be compared to the *Reference suspension* five minutes after preparation of the *Reference suspension.*] The *Test solution* is not more opalescent than the *Reference suspension.*

Viscosity ⟨911⟩—While stirring, add a portion equivalent to 6.0 g of the dried Hymetellose to 150 g of carbon dioxide-free water heated to 90°. Stir with a propeller-type stirrer for 10 minutes, place the flask in a bath of ice water, continue the stirring, and allow to remain in the bath of ice water for 40 minutes to ensure that dissolution is complete. Adjust the mass of the solution to 300 g, and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to 20 ± 0.1°, and determine the viscosity using a rotational viscometer with a shear rate of 10 per second: the apparent viscosity is not less than 75% and not more than 140% of the value stated on the label.

pH ⟨791⟩—Use the solution from the test for *Color of solution:* the pH is between 5.5 and 8.0.

Loss on drying ⟨731⟩—Dry about 1.0 g of Hymetellose at 105° to constant weight: it loses not more than 10.0% of its weight.

Residue on ignition ⟨281⟩: not more than 1.0%, determined on 1.0 g.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Chloride ⟨221⟩—Dilute 1.0 mL of the solution from the *Color of solution* test with water to 20 mL, and add 1 mL of nitric acid and 1 mL of silver nitrate TS. Mix, allow to stand for 5 minutes protected from direct sunlight, and compare the turbidity, if any, with that produced from a 10-mL aliquot of a control (prepared by diluting 0.71 mL of 0.020 N hydrochloric acid to 100 mL) in an equal volume of total solution containing the quantities of reagents used in the test (see *Visual Comparison* in the section *Procedure*, under *Spectrophotometry and Light-Scattering* ⟨851⟩): any turbidity produced by the test specimen does not exceed that of the control preparation (0.5%).■1S (*NF22*)

BRIEFING

Hypromellose Acetate Succinate, page 142 of *PF* 29(1) [Jan.–Feb. 2003]. On the basis of comments received, it has been determined that the previously proposed *Identification* test provides adequate results for fine grades. However, granular-grade samples may be rubbery and difficult to grind to the fine powder required for high-quality spectra. It is now proposed to use a single bounce attenuated total reflectance procedure that generates high-quality spectra for both fine and granular grades. The method was validated using a Spectra-Tech Foundation Series Thunderdome ATR accessory.

It is also proposed to replace the titration methods in the tests for *Limit of free succinic acid* and *Content of succinoyl groups* and the gas chromatographic method in the test for *Content of acetyl groups* with the tests for *Limit of free acetic and succinic acids* and *Content of acetyl and succinoyl groups*, using a single liquid chromatographic method. The method is based on analyses performed with a Phenomenex Aqua C18 brand of L1 column. The typical retention times for acetic acid and succinic acid are about 3.8 minutes and 7.4 minutes, respectively.

It is also proposed to replace the gas chromatographic procedure in the test for *Content of methoxy and hydroxypropoxy groups* with a new liquid chromatographic method based on analyses performed with a Keystone Aquasil brand of L1 column. The typical retention times for methyl iodide, isopropyl iodide, and *o*-xylene are about 8.1, 13.6, and 15.6 minutes, respectively.

In addition, editorial style changes have been made.

(EMC: E. Gonikberg) RTS—39722-1

Add the following:

■Hypromellose Acetate Succinate

Hydroxypropyl methylcellulose acetate succinate.

Cellulose, 2-hydroxypropyl methyl ether, acetate hydrogen butanedioate.

Cellulose, 2-hydroxypropyl methyl ether, acetate succinate [*71138-97-1*].

In-Process Revision

» Hypromellose Acetate Succinate is a mixture of acetic acid and monosuccinic acid esters of hydroxypropyl methylcellulose. When dried at 105° for 1 hour, it contains not less than 12.0 percent and not more than 28.0 percent of methoxy groups ($–OCH_3$), not less than 4.0 percent and not more than 23.0 percent of hydroxypropoxy groups ($–OCH_2CHOHCH_3$), not less than 2.0 percent and not more than 16.0 percent of acetyl groups ($–COCH_3$), and not less than 4.0 percent and not more than 28.0 percent of succinoyl groups ($–COC_2H_4COOH$).

Packaging and storage—Preserve in tight containers. Store at room temperature. Avoid excessive heat and freezing. Protect from moisture.

Labeling—Label it to indicate its nominal viscosity type.

USP Reference standards ⟨11⟩—*USP Hypromellose Acetate Succinate RS.*

Identification, ~~*Infrared Absorption* ⟨197K⟩, on undried specimen.~~ *Infrared Absorption* ⟨197A⟩—Do not dry specimens. Use a Fourier transform infrared spectrometer fitted with a suitable accessory for single bounce attenuated total reflectance (see *Spectrophotometry and Light-Scattering* ⟨851⟩) with a diamond crystal. Acquire a background single-beam spectrum with a clean diamond crystal sampling plate in place. Place the sample on the diamond crystal sampling surface with a microspatula or equivalent. For best results, the sample should cover the crystal surface under the pressure point tip. Using the pressure device, apply pressure to the sample, making sure the sample remains centered under the pressure tip. Acquire a single-beam spectrum of the sample, and make the necessary corrections for the background. Release the pressure device, and clear it from the sample area. Wipe the sample off the crystal and pressure device tip, and rinse both with acetone. The IR spectrum so obtained exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Hypromellose Acetate Succinate RS.

Viscosity ⟨911⟩—

Sodium hydroxide solution—Immediately before use, dissolve 4.3 g of sodium hydroxide in carbon dioxide-free water to make 1000 mL.

Procedure—To 2.00 g of Hypromellose Acetate Succinate, previously dried, add *Sodium hydroxide solution* to make 100.0 g, stopper the vessel, and dissolve by constant shaking for 30 minutes. Adjust the temperature of the solution to 20 ± 0.1°, and determine the viscosity in a suitable viscometer, as directed for *Procedure for Cellulose Derivatives* under *Viscosity* ⟨911⟩. Its viscosity is not less than 80% and not more than 120% of that stated on the label.

Loss on drying ⟨731⟩—Dry it at 105° for 1 hour: it loses not more than 5.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.20%, determined at 600 ± 50°.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

~~**Limit of free succinic acid**—Transfer about 1.5 g of Hypromellose Acetate Succinate, previously dried at 105° for 1 hour and accurately weighed, to a separator, dissolve in 50 mL of a mixture of dehydrated alcohol and dichloromethane (3:2, v/v), add 75 mL of water with shaking, and then add 50 mL of hexane and 1 g of sodium chloride. Shake well, and separate the lower water layer. Extract the organic layer with 50 mL of water, and combine the washing and the water layer. Add 3 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 5.904 mg of $C_4H_6O_4$: not more than 1.0% is found.~~

In-Process Revision

Limit of free acetic and succinic acids—

Phosphoric acid solution—Transfer 1.0 mL of 1.25 M phosphoric acid into a 50-mL volumetric flask, and dilute with water to volume.

0.02 M Phosphate buffer—Dissolve 5.44 g of monobasic potassium phosphate in 2 L of water.

Diluent—Adjust *0.02 M Phosphate buffer* with 1 N sodium hydroxide to a pH of 7.5.

Acetic acid stock solution—Add approximately 20 mL of water to a stoppered 100-mL volumetric flask, place the flask on a balance, and tare. Transfer 2.0 mL of the glacial acetic acid to the flask, and record the weight of the acid added. Fill the flask with water to volume. Transfer 6.0 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume.

Succinic acid stock solution—Accurately weigh about 130 mg of succinic acid into a 100-mL volumetric flask. Add about 50 mL of water, and swirl the contents until the succinic acid is fully dissolved. Fill the flask with water to volume.

Mobile phase—Adjust the *0.02 M Phosphate buffer* to a pH of 2.8 by dropwise addition of 6 M phosphoric acid. Filter through a 0.22-µm nylon filter.

Standard solution—Transfer 4.0 mL of the *Acetic acid stock solution* into a 25-mL volumetric flask. To the same flask, transfer 4.0 mL of the *Succinic acid stock solution*, dilute with *Mobile phase* to volume, and mix. Prepare this solution in duplicate.

Test solution—Accurately weigh about 102 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of *Diluent* to the vial, and stir the content for two hours. Then, transfer 4.0 mL of the *Phosphoric acid solution* to the same vial to bring the pH of the *Test solution* to 3 or less. Invert the vial several times to ensure complete mixing, centrifuge, and use the clear supernatant as a *Test solution*. Prepare this solution in duplicate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6 mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained between 20° to 30°. The flow rate is about 1 mL per minute, and the run time is about 15 minutes. Chromatograph the first preparation of the *Standard solution*, and record the peak responses as directed for *Procedure:* the column efficiency, determined from the succinic acid peak, is not less than 8000 theoretical plates; the tailing of this peak is between 0.9 and 1.5; and the relative standard deviation for six replicate injections is not more than 2.0% for each peak. Chromatograph the second preparation of the *Standard solution:* the difference in peak areas between the two standard solutions for both acetic and succinic acid peaks does not exceed 2%. [NOTE—After each run sequence, the column should be flushed first by 50% water and 50% acetonitrile for 60 minutes and then by 100% methanol for 60 minutes. The column should be stored in 100% methanol.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas corresponding to acetic and succinic acids. Calculate the percentage of free acetic acid, A_{free}, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$0.0768(W_A / W)(R_{UA} / R_{SA}),$$

in which W_A is the weight of glacial acetic acid, in mg, used to prepare the *Acetic acid stock solution; W* is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the *Test solution;* and R_{UA} and R_{SA} are the peak responses for acetic acid obtained from the *Test solution* and the *Standard*

In-Process Revision

solution, respectively. Calculate the percentage of free succinic acid, S_{free}, in the Hypromellose Acetate Succinate taken by the formula:

$$1.28(W_S / W)(R_{US} / R_{SS}),$$

in which W_S is the weight of succinic acid, in mg, used to prepare the *Succinic acid stock solution;* R_{US} and R_{SS} are the peak responses for succinic acid obtained from the *Test solution* and the *Standard solution*, respectively; and W is as defined above: the sum of free acetic acid and free succinic acid found does not exceed 1.0%.

Content of acetyl and succinoyl groups—

Mobile phase, *Standard solution*, *Acetic acid stock solution*, *Succinic acid stock solution*, *Phosphoric acid solution*, and *Chromatographic system*—Proceed as directed in the test for *Limit of free acetic and succinic acids*.

Test solution—Accurately weigh about 12.4 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of 1.0 N sodium hydroxide to the vial, and stir the solution for four hours. Then, add 4.0 mL of 1.25 M phosphoric acid to the same vial to bring the pH of the solution to 3 or less. Invert the test sample solution vial several times to ensure complete mixing, and filter through a 0.22-µm filter. Use the clear filtrate as the *Test solution*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas corresponding to acetic and succinic acids. Calculate the percentage of acetic acid, *A*, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$0.0768(W_A / W_U)(R_{UA} / R_{SA}),$$

in which W_A is the weight of acetic acid, in mg, used to prepare the *Acetic acid stock solution;* W_U is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the *Test solution;* and R_{UA} and R_{SA} are the peak responses for acetic acid obtained from the *Test solution* and the *Standard solution*, respectively. Calculate the percentage of acetyl groups ($-COCH_3$) in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$0.717(A - A_{free}),$$

in which A_{free} is the percentage of free acetic acid, as determined in the test for *Limit of free acetic and succinic acid*; and *A* is as defined above. Calculate the percentage of succinic acid, *S*, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$1.28(W_S / W_U)(R_{US} / R_{SS}),$$

in which W_S is the weight of succinic acid, in mg, used to prepare the *Succinic acid stock solution;* R_{US} and R_{SS} are the peak responses for succinic acid obtained from the *Test solution* and the *Standard solution*, respectively; and W_U is as defined above. Calculate the percentage of succinoyl groups ($-COC_2H_4COOH$) in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$0.856(S - S_{free}),$$

in which *S* is as defined above; and S_{free} is the percentage of free succinic acid, as determined in the test for *Limit of free acetic and succinic acids*.

~~**Content of methoxy and hydroxypropoxy groups**~~—

~~[*Caution—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the Test solution and the Standard solution in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.*]~~

~~*Hydriodic acid*—Use a reagent having a specific gravity of at least 1.69, equivalent to 55% HI.~~

In-Process Revision

Internal standard solution—Transfer about 2.5 g of toluene, accurately weighed, to a 100-mL volumetric flask containing 10 mL of *o*-xylene, dilute with *o*-xylene to volume, and mix.

Standard solution—Into a suitable serum vial weigh about 135 mg of adipic acid and 4.0 mL of *Hydriodic acid*, pipet 4 mL of *Internal standard solution* into the vial, and close the vial securely with a suitable septum stopper. Weigh accurately the vial and contents, add 30 µL of isopropyl iodide through the septum with a syringe, weigh again, and calculate the weight of isopropyl iodide added, by difference. Similarly, add 90 µL of methyl iodide, weigh again, and calculate the weight of methyl iodide added, by difference. Shake, and allow the layers to separate.

Test solution—Transfer about 0.065 g of Hypromellose Acetate Succinate, previously dried at 105° for 1 hour and accurately weighed, to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum-type closure, add an amount of adipic acid equal to the weight of the test specimen, and pipet 2 mL of *Internal standard solution* into the vial. Cautiously pipet 2 mL of *Hydriodic acid* into the mixture, immediately cap the vial tightly, and weigh accurately. Mix the contents of the vial continuously while heating at 150° for 60 minutes. Allow the vial to cool for about 45 minutes, and weigh again. If the weight loss is greater than 10 mg, discard the mixture, and prepare another *Test preparation*.

Chromatographic system—The gas chromatograph is equipped with a thermal conductivity detector and a 4-mm × 1.8-m glass column packed with 20% liquid phase G28 on 100- to 120-mesh support SIC that is not silanized. Helium is used as the carrier gas, and the temperature of the column is maintained at 130°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times of methyl iodide, isopropyl iodide, toluene, and *o*-xylene are approximately 1.0, 2.2, 3.6, and 8.0, respectively; and the resolution, *R*, between the toluene and isopropyl iodide peaks is not less than 2.0.

Calibration—Inject about 2 µL of the upper layer of the *Standard solution* into the gas chromatograph, and record the chromatograms. Calculate the relative response factor, F_M, of equal weights of toluene and methyl iodide taken by the formula:

$$Q_M / R_{SM},$$

in which Q_M is the quantity ratio of methyl iodide to toluene in the *Standard solution*, and R_{SM} is the peak area ratio of methyl iodide to toluene obtained from the *Standard solution*. Similarly, calculate the relative response factor, F_I, of equal weights of toluene and isopropyl iodide taken by the formula:

$$Q_I / R_{SI},$$

in which Q_I is the quantity ratio of isopropyl iodide to toluene in the *Standard solution*, and R_{SI} is the peak area ratio of isopropyl iodide to toluene obtained from the *Standard solution*.

Procedure—Inject about 2 µL of the upper layer of the *Test solution* into the gas chromatograph, and record the chromatograms. Calculate the percentage of methoxy groups (−OCH_3) in the portion of Hypromellose Acetate Succinate taken by the formula:

$$2(31/142)F_M R_{UM}(W_I / W_U),$$

in which 31/142 is the ratio of the formula weights of the methoxy group and methyl iodide; F_M is defined under *Calibration*; R_{UM} is the ratio of the area of the methyl iodide peak to that of the toluene peak obtained from the *Test solution*; W_I is the weight, in g, of toluene used to prepare the *Internal standard solution*; and W_U is the weight, in g, of

In-Process Revision

~~Hypromellose Acetate Succinate taken to prepare the *Test solution*. Similarly, calculate the percentage of hydroxypropoxy groups (–$OCH_2CHOHCH_3$) in the portion of Hypromellose Acetate Succinate taken by the formula:~~

~~$$2(75/170)F_xR_{xs}(W_x/W_s),$$~~

~~in which 75/170 is the ratio of the formula weights of the hydroxypropoxy group and isopropyl iodide; F_x is defined under *Calibration*; R_{xs} is the ratio of the area of the isopropyl iodide peak to that of the toluene peak obtained from the *Test solution*; W_x is the weight, in g, of toluene used to prepare the *Internal standard solution*; and W_s is the weight, in g, of Hypromellose Acetate Succinate taken to prepare the *Test solution*.~~

~~**Content of succinoyl groups**—Transfer about 1 g of Hypromellose Acetate Succinate, previously dried at 105° for 1 hour and accurately weighed, to a conical flask, dissolve in 50 mL of a mixture of alcohol, acetone, and water (2:2:1, v/v), add 2 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary corrections. Calculate the percentage of succinoyl groups by the formula:~~

~~$$(1.0108V/W) - 1.7120S,$$~~

~~in which V is the volume, in mL, of 0.1 N sodium hydroxide consumed after correction for the blank; W is the weight, in g, of Hypromellose Acetate Succinate taken; and S is the percentage of free succinic acid found as directed in the test for *Limit of free succinic acid*.~~

~~**Content of acetyl groups**—~~

~~*Apparatus*—Use the apparatus illustrated in *Figure 1*.~~

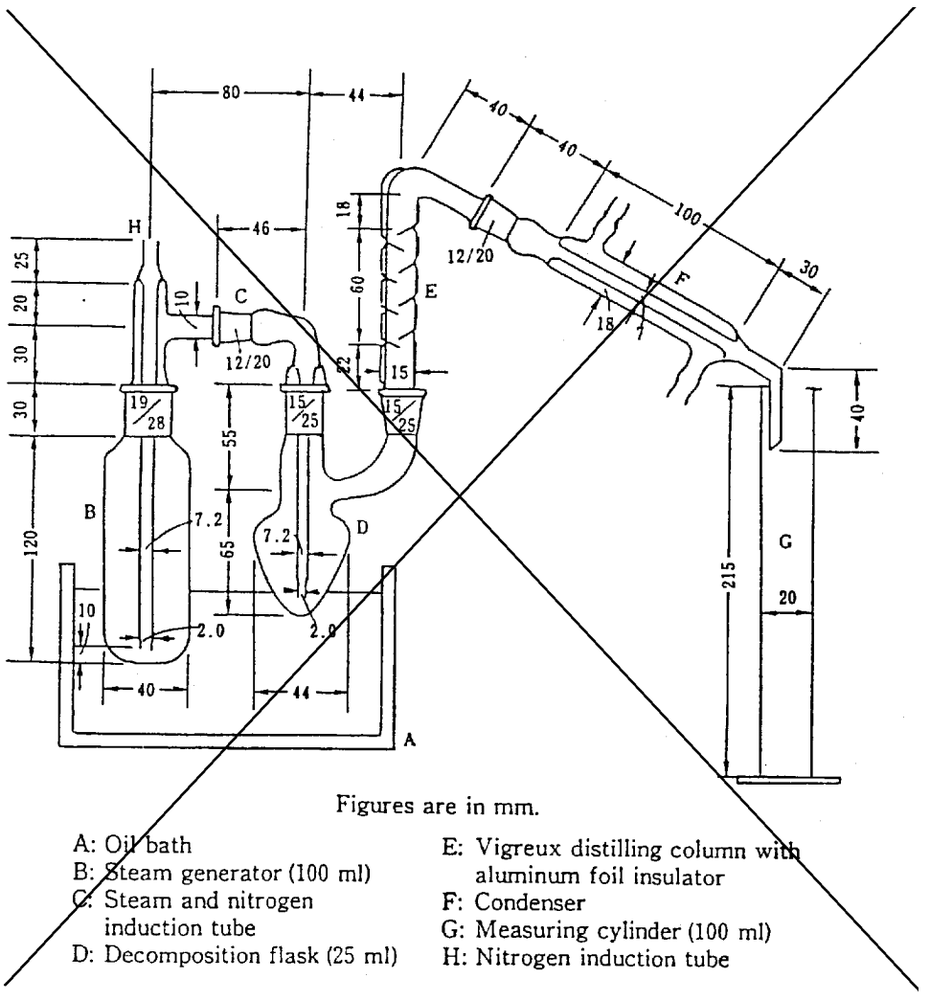


Figure 1: Apparatus for Determination of Content of Acetyl Groups

Internal standard solution—Transfer 1.0 mL of propionic acid into a 250-mL volumetric flask, and dilute with *Diluent* to volume.

Diluent—Use diluted phosphoric acid (1 in 5000).

Standard solution—Transfer about 100 mg of glacial acetic acid, accurately weighed, into a 100-mL volumetric flask, and dilute with *Diluent* to volume. Transfer 15 mL of this solution to another 100-mL volumetric flask, add 5.0 mL of the *Internal standard solution*, and dilute with *Diluent* to volume.

Test solution—Transfer about 150 mg of Hypromellose Acetate Succinate, previously dried at 105° for 1 hour and accurately weighed, to decomposition flask D, add 5 mL of sodium hydroxide TS, dissolve by shaking, and decompose in a water bath at 60° for 2 hours. After cooling, add 5 mL of diluted phosphoric acid (1 in 6), and immediately construct the apparatus as shown in Figure 1. Dip the decomposition flask and steam generator B in the oil bath at 155°, while passing nitrogen from nitrogen induction tube H at a rate of 1 to 2 bubbles per second, continue the distillation at the same temperature, and collect the distillate in measuring cylinder G. Take 60 mL of the distillate, wash the inside of

In-Process Revision

~~condenser F with 10 mL of water, combine the washing with the distillate in a 100-mL volumetric flask, add 5.0 mL of the *Internal standard solution*, and dilute with water to volume.~~

~~*Chromatographic system*—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m glass column packed with 60- to 80-mesh support S2. The carrier gas is helium, and the temperature of the column is maintained at 180°. Adjust the flow rate so that the internal standard peak elutes in about 5 minutes. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the elution order is acetic acid, followed by the internal standard peak. The resolution, *R*, between these peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for each of the two peaks.~~

~~*Procedure*—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the ratio, R_U, of the area of the acetic acid peak to the area of the internal standard peak in the chromatogram obtained from the *Test solution*, and similarly calculate the ratio, R_S, in the chromatogram obtained from the *Standard solution*. Calculate the percentage of acetyl groups (–$COCH_3$) in the portion of Hypromellose Acetate Succinate taken by the formula:~~

$$(R_U / R_S)(W_S / W) \times 0.15 \times 71.68,$$

~~in which W_S is the weight, in mg, of glacial acetic acid used to prepare the *Standard solution; W* is the weight, in mg, of the portion of Hypromellose Acetate Succinate taken; and the other terms are as defined therein.~~

Content of methoxy and 2-hydroxypropoxy groups—[*Caution—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the Test solution and the Standard solution in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.*]

Hydriodic acid—Use a reagent having a specific gravity of at least 1.69, equivalent to 55% hydrogen iodide.

Solution A—Prepare a mixture of water and methanol (90:10).

Solution B—Prepare a mixture of methanol and water (85:15).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer 2 mL of *o*-xylene into a stoppered 10-mL volumetric flask, place the flask on a balance, and tare. Add about 200 µL of methyl iodide, stopper the flask, and accurately weigh: the weight of methyl iodide is about 350 mg. Tare the flask again, add about 34 µL of isopropyl iodide, and accurately weigh the flask: the recorded weight of isopropyl iodide is about 50 mg. Dilute with *o*-xylene to volume, and mix.

Standard solution—Transfer about 85 mg of adipic acid into an 8-mL vial (or other suitable container), add 2 mL of *Hydriodic acid*, and add 2.0 mL of the *Standard stock solution*. Shake and allow the phases to separate. Carefully transfer approximately 1.5 mL of the *o*-xylene (top) layer to a small vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, and dilute with methanol to volume. [NOTE—This solution is stable for 8 hours at 5°.]

Test solution—Accurately weigh about 65 mg of Hypromellose Acetate Succinate into a 5-mL reaction vial, add 2.0 mL of *o*-xylene and about 100 mg of adipic acid. Add 2.0 mL of *Hydriodic acid*, and close the vial tightly with a cap. [*Caution—Use a cap that has a top safety relief valve, such*

In-Process Revision

as a Minniert valve, to prevent accidental explosion of the vial under high pressure when heated.] Weigh the vial before heating, and place the vial into a heating block at 150°. Shake the vial after 5 minutes and after 30 minutes of heating. Remove the vial from the heating block after 1 hour of heating, and cool. Weigh the vial. If the weight loss is greater than 10 mg, discard the mixture, and prepare another reaction solution. Carefully transfer approximately 1.5 mL of the top *o*-xylene layer into a small glass vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 ml of this solution into a 10-mL volumetric flask, and dilute to volume with methanol. [NOTE—This solution is stable for 8 hours at 5°.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6 mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0.00	70	30	equilibration
0→8.00	70→40	30→60	linear gradient
8.00→10.00	40→15	60→85	linear gradient
10.00→17.00	15	85	isocratic

[NOTE—These gradient elution times are established on an HPLC system with a dwell volume of approximately 2.0 mL. The injection time can be adjusted relative to the start of a run to accommodate the change in dwell volume from one HPLC system to another to achieve the separation described.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the column efficiency, determined from the methyl iodide peak, is not less than 10,000 theoretical plates; the tailing factor of this peak is between 0.9 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0% for each peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas corresponding to methyl iodide and isopropyl iodide. Calculate the percentage of methoxy groups ($-OCH_3$) in the portion of Hypromellose Acetate Succinate taken by the formula:

$$4.38(W_M / W)(R_{UM} / R_{SM}),$$

in which W_M is the weight of methyl iodide, in mg, used to prepare the *Standard stock solution;* W is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the *Test solution;* and R_{UM} and R_{SM} are the peak responses for methyl iodide obtained from the *Test solution* and the *Standard solution*, respectively. Calculate the percentage of 2-hydroxypropoxy groups ($-OCH_2CHOHCH_3$) in the portion of Hypromellose Acetate Succinate taken by the formula:

$$8.84(W_I / W)(R_{UI} / R_{SI}),$$

in which W_I is the weight of isopropyl iodide, in mg, used to prepare the *Standard stock solution;* R_{UI} and R_{SI} are the peak responses for methyl iodide obtained from the *Test solution* and the *Standard solution*, respectively; and W is as defined above.■1S (*NF22*)

In-Process Revision

BRIEFING

Maltitol Solution, *NF 21* page 2789 and page 146 of *PF* 29(1) [Jan.–Feb. 2003]; **Sorbitol,** *NF 21* page 2841 and page 152 of *PF* 29(1) [Jan.–Feb. 2003]; **Sorbitol Solution,** *USP 26* page 1707 and page 114 of *PF* 29(1) [Jan.–Feb. 2003]; **Noncrystallizing Sorbitol Solution,** *NF 21* page 2842 and page 156 of *PF* 29(1) [Jan.–Feb. 2003]; **Anhydrized Liquid Sorbitol,** page 154 of *PF* 29(1) [Jan.–Feb. 2003]. These monographs are being presented again with editorial changes to the tests for *Reducing sugars* and *Limit of nickel*. It is proposed to remove the cross-reference to the *Mannitol* monograph for the tests for *Reducing sugars* and *Limit of nickel*. The *In-Process Revision* proposal for the *Mannitol* monograph first appeared on page 3017 of *PF* 27(5) [Sept.–Oct. 2001].

(EMC: C. Sheehan) RTS—39694-1

Change to read:

» Maltitol Solution is a water solution ~~of a hydrogenated, partially hydrolyzed starch. It contains,~~

▲containing,▲*NF22*
on the anhydrous basis, not less than 50.0 percent of D-maltitol ($C_{12}H_{24}O_{11}$) (w/w), and not more than ~~16.0~~

▲8.0▲*NF22*
percent of D-sorbitol ($C_6H_{14}O_6$) (w/w). The amounts of total sugars, other polyhydric alcohols, and any polyol anhydrides, if detected, are not included in the requirements nor

▲in▲*NF22*
the calculated amount under *Other Impurities*.

Change to read:

Packaging and storage— ~~Preserve in tight containers.~~

▲Preserve in well-closed containers. Do not store below 20°.▲*NF22*

Change to read:

Identification—

A: ~~— *Developing solvent*— Prepare a mixture of *n* propyl alcohol, ethyl acetate, and water (70:20:10).~~

~~*Standard solution*— Dissolve USP Maltitol RS in water to obtain a solution having a concentration of 2.5 mg per mL.~~

~~*Test solution*— Dilute Maltitol Solution with water to obtain a solution containing, on the anhydrous basis, about 2.5 mg of maltitol per mL.~~

~~*Procedure*— Apply separately 2 µL each of the *Standard solution* and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the plate in a developing chamber containing the *Developing solvent* until the solvent front has moved about 17 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with sodium metaperiodate solution (1 in 500), air-dry for 15 minutes, spray with a 1 in 50 solution of 4,4′-tetramethyldiaminodiphenylmethane in a mixture of acetone and glacial acetic acid (4:1), and wait for 30 minutes to bring out the full color of the spots: the principal spot obtained from the *Test solution* corresponds in R_f value and color to that obtained from the *Standard solution*.~~

▲Dissolve 1.4 g of Maltitol Solution in 75 mL of water. Transfer 3 mL of this solution to a 15-cm test tube, add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix, and gently heat the tube in a flame for about 30 seconds: a deep pink or wine red color appears.▲*NF22*

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Add the following:

▲**Microbial limits** ⟨61⟩—The total aerobic microbial count using the *Plate Method* is not more than 10^3 cfu per mL, and the total combined molds and yeasts count is not more than 10^2 cfu per mL.▲*NF22*

Add the following:

▲**pH** ⟨791⟩: between 5.0 and 7.5, in a 14% (w/w) solution of Maltitol Solution in carbon dioxide-free water.▲*NF22*

▲~~**Heavy metals,** *Method II* ⟨231⟩: 0.001%.~~▲*NF22*

Change to read:

Reducing sugars— ~~Dilute 0.2 g with water to 2 mL. Add 5 mL of alkaline cupric citrate TS. Heat for 5 minutes in a boiling water bath: not more than a slight precipitate is formed. The amount determined in this test is not included in the calculated amount under *Other Impurities*.~~

In-Process Revision

■To an amount of Maltitol Solution, equivalent to 3.3 g on the anhydrous basis, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. ~~Proceed as directed in the test for *Reducing sugars* under *Mannitol*, beginning with "Heat so that boiling begins."~~ Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, on the anhydrous basis, as glucose. The amount determined in this test is not included in the calculated amount under *Other Impurities*.■1S (*NF22*)

Add the following:

■**Limit of nickel**—Proceed as directed in the test for *Limit of nickel* under *Sorbitol Solution*. Not more than 1 µg per g, calculated on the anhydrous basis, is found.■1S (*NF22*)

Change to read:

Assay—

Mobile phase—Use degassed water.

Standard preparation—Dissolve accurately weighed quantities of USP Maltitol RS and USP Sorbitol RS in water~~, and dilute quantitatively with water to obtain a solution having known concentrations of about 10.0 mg of maltitol and 1.6 mg of sorbitol per mL.~~

▲to obtain a solution having known concentrations of about 10 mg per g and 1.6 mg per g, respectively.▲*NF22*

Assay preparation—~~Transfer about 1 g of Solution, accurately weighed, to a 50-mL volumetric flask, dilute with water to volume, and mix.~~

▲Accurately weigh about 0.4 g of Maltitol Solution, and dissolve in and dilute with water to about 20 g. Accurately record the final solution weight, and mix thoroughly.▲*NF22*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector that is maintained at a constant temperature ~~and a 9-mm × 30-cm column that contains packing L19. The column temperature is maintained at 85 ± 0.5°,~~ ▲of about 35° and a 7.8-mm × 10-cm column that contains packing L34. The column temperature is maintained at a constant temperature of about 60°, controlled to within ± 2°,▲*NF22* and the flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:*

▲the relative retention times are about 0.38 for maltotriitol, 0.48 for maltitol, and 1.0 for sorbitol; the tailing factor for maltitol▲*NF22* and sorbitol▲*NF22* is not more than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about ~~20 µL~~ ▲10 µL)▲*NF22* of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. ~~The elution pattern includes a broad band, starting from the void volume, that includes the higher molecular weight hydrogenated polysaccharides, followed by 3 individual peaks representing maltotriitol, maltitol, and sorbitol. The relative retention times are about 0.45 for maltotriitol, 0.6 for maltitol, and 1.0 for sorbitol. Separately calculate the quantities, in mg, of sorbitol and maltitol in the portion of Solution taken by the formula:~~

~~$$50C(r_U/r_S),$$~~

~~in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*~~

▲Separately calculate the percentages, ~~of maltitol and sorbitol~~ on the anhydrous basis, of D-maltitol and D-sorbitol in the portion of Maltitol Solution taken by the formula:▲*NF22*

~~$$100(C_S/C_U)(r_U/r_S),$$~~

▲$$[10{,}000(C_S/C_U)(r_U/r_S)]/(100–W),$$

in which C_S is the concentration, in mg per g, of the appropriate USP Reference Standard in the *Standard preparation;* ~~, calculated on the anhydrous basis~~ C_U is the concentration, in mg per g, of ~~the corresponding analyte~~ Maltitol Solution in the *Assay preparation;* ~~, calculated on the anhydrous basis; and~~▲*NF22* r_U and r_S are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively;

▲and W is the percentage obtained in the test for *Water*.▲*NF22*

In-Process Revision

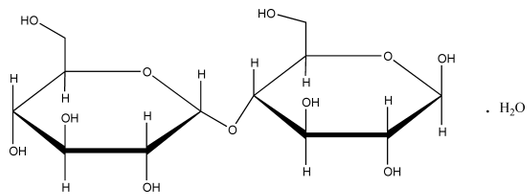
BRIEFING

Maltose, page 148 of *PF* 29(1) [Jan.–Feb. 2003]. This new monograph is being presented again with changes to the *Chromatographic system* under the *Assay.* It is proposed to add a flow rate and remove the resolution requirement of not less than 4.0 between maltose and glucose given that the method already specifies the relative retention times for the product components and requires the resolution to be at least 1.6 for maltotriose/maltose. Also see briefing under *Chromatography* ⟨621⟩.

(EMC: C. Sheehan; HDQ: M. Marques) RTS—39933-1; 39943-2

Add the following:

■Maltose



$C_{12}H_{22}O_{11} \cdot H_2O$ 360.31

and $C_{12}H_{22}O_{11}$ 342.30

4-*O*-α-D-Glucopyranosyl-β-D-glucopyranose.

» Maltose is a sugar. It contains one molecule of water of hydration or is anhydrous. It contains not less than 92.0 percent of maltose, calculated on the anhydrous basis. The amounts of other sugars, if detected, are not included in the requirements or the calculated amount under *Other Impurities.*

Packaging and storage— ~~Preserve in tight containers.~~ Preserve in well-closed containers. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Maltose Monohydrate RS.*

Identification—

A: Add 2 to 3 drops of a solution of Maltose (1 in 20) to 5 mL of hot alkaline cupric tartrate TS. A red precipitate is formed.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

pH ⟨791⟩—Prepare a 1 in 10 solution in carbon dioxide-free water. For the anhydrous form, it is between 3.7 and 4.7 and for the monohydrate form, it is between 4.0 and 5.5.

Water, *Method I* ⟨921⟩—The anhydrous form contains not more than 1.5%. The monohydrate form contains not less than 5.0% and not more than 6.5%.

Residue on ignition ⟨281⟩: not more than 0.05%, determined on a 2-g portion, accurately weighed.

Heavy metals, *Method I* ⟨231⟩: not more than 5 µg per g.

Dextrin, starch, and sulfite—Dissolve 1.0 g of Maltose in 10 mL of water, and add 1 drop of iodine TS: a yellow color develops. Then add 1 drop of starch TS to this portion: a blue color develops.

Assay—

Mobile phase—Use degassed water.

Resolution solution—Dissolve accurately weighed quantities of maltotriose, maltose, and glucose in water, to obtain a solution having concentrations of about 10 mg of each per g.

Standard preparation—Dissolve an accurately weighed quantity of USP Maltose Monohydrate RS in water, to obtain a solution having a concentration~~s~~ of about 10 mg ~~of each~~ per g. Calculate the exact concentration on the anhydrous basis.

In-Process Revision

Assay preparation—Dissolve about 0.10 g of Maltose, accurately weighed, in water, and dilute with water to about 10 g. Accurately record the final solution weight, and mix thoroughly.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatographic system is equipped with a refractive index detector maintained at a constant temperature of about 40°, and a 7.8-mm × 30-cm column that contains packing ~~L54~~ L## (See *Chromatography* ⟨621⟩). The column temperature is maintained at about 80°, controlled to within ± 2°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*. Adjust the flow rate to about 0.35 mL per minute such that the resolution, *R*, between maltotriose and maltose is not less than 1.6. ~~and that between maltose and glucose is not less than 4.0.~~ Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for maltotriose, 1.0 for maltose, and 1.2 for glucose; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of Maltose on the anhydrous basis, taken by the formula:

$$[10{,}000(C_S / C_U)(r_U / r_S)]/(100 - W),$$

in which C_S is the concentration, in mg per g, on the anhydrous basis of USP Maltose Monohydrate RS in the *Standard preparation;* C_U is the concentration, in mg per g, of Maltose in the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively; and *W* is the percentage obtained in the test for *Water*.■1S (*NF22*)

BRIEFING

Oral Solution Vehicle, page 1998 of *PF* 28(6) [Nov.–Dec. 2002]; **Oral Solution Vehicle Sugar Free,** page 1998 of *PF* 28(6) [Nov.–Dec. 2002]; **Oral Suspension Vehicle,** page 1999 of *PF* 28(6) [Nov.–Dec. 2002]. These proposed new monographs, which previously appeared in *Pharmacopeial Previews*, are now being forwarded, with changes, to *In-Process Revision*. These are monographs on vehicles, containing no therapeutic ingredients, that are provided for use in compounding pharmaceuticals. Thus, the monographs are proposed for inclusion in the *National Formulary.*

The monograph titles now proposed were adopted by the Expert Committee on Nomenclature and Labeling. The first term in the names, "Vehicle," identifies the article as a compounding medium, and the following terms, "for Oral Solution" and "for Oral Suspension," are used so that the intended function might be better understood. The addition of a *pH* specification is recommended as necessary to provide a target for the adjustment of pH, if necessary, that is specified in the compounding directions.

(CRX: C. Okeke; NL: C. Barnstein) RTS—39822-3

Add the following:

■~~Oral Solution Vehicle~~ Vehicle for Oral Solution

» Prepare ~~Oral Solution Vehicle~~ Vehicle for Oral Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Sucrose	80 g
Glycerin	5 g
Sorbitol	5 g
Sodium Phosphate, Dibasic	120 mg
Citric Acid	200 mg
Potassium Sorbate	100 mg
Methylparaben	100 mg
Purified Water, a sufficient quantity to make	100 mL

In-Process Revision

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about 30 mL of Purified Water to 70° to 75°. Add the Glycerin and Methylparaben, and stir until the Methylparaben is dissolved. Add the dibasic sodium phosphate, Citric Acid, Potassium Sorbate, and Sorbitol, and mix well. Add the Sucrose, and mix until dissolved; remove from the heat, and allow to cool. Add sufficient Purified Water to volume, and mix well. Adjust the pH if necessary. Package, and label.

Packaging and storage—Package in a tight, light-resistant container, and store at controlled room temperature.

Labeling—Label it to indicate that it is for use in compounding oral solutions and suspensions.

pH ⟨791⟩: an apparent pH between 4.0 and 5.0.

~~**Stability:**~~ **Beyond-use date:** ~~a beyond-use date of~~ not more than 6 months after preparation. A beyond-use date of more than 6 months may be assigned if supporting stability data exist. (See *Stability Criteria and Beyond-Use Dating* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.)■1S (*NF22*)

BRIEFING

Oral Solution Vehicle Sugar Free, page 1998 of *PF* 28(6) [Nov.–Dec. 2002]—See briefing under *Oral Solution Vehicle*.

(CRX: C. Okeke; NL: C. Barnstein) RTS—39822-4

Add the following:

■~~Oral Solution Vehicle Sugar Free~~ Vehicle for Oral Solution, Sugar Free

» Prepare ~~Oral Solution Vehicle Sugar Free~~ Vehicle for Oral Solution, Sugar Free as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Xanthan Gum	50 mg
Glycerin	10 mL
Sorbitol Solution	25 mL
Saccharin Sodium	100 mg
Citric Acid Monohydrate	1.5 g
Sodium Citrate	2 g
Methylparaben	100 mg
Potassium Sorbate	100 mg
Purified Water, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about

In-Process Revision

60 mL of water to about 70° to 75°. Add the Methylparaben, and stir until dissolved. Remove from the heat, and add the Glycerin, Sorbitol Solution, Saccharin Sodium, Citric Acid Monohydrate, Sodium Citrate, Potassium Sorbate, and Xanthan Gum. Add sufficient Purified Water to volume, and mix well. Adjust the pH if necessary. Package, and label.

Packaging and storage—Package in a tight, light-resistant container, and store at controlled room temperature.

Labeling—Label it to indicate that it is for use in compounding sugar-free oral solutions and suspensions.

pH ⟨791⟩: an apparent pH between 4.0 and 5.0.

Beyond-use date: ~~A beyond-use date of~~ not more than 6 months after preparation. A beyond-use date of more than 6 months may be assigned if supporting stability data exist. (See *Stability Criteria and Beyond-Use Dating* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.)■IS (*NF22*)

BRIEFING

Oral Suspension Vehicle, page 1999 of *PF* 28(6) [Nov.–Dec. 2002]—See briefing under *Oral Solution Vehicle.*

(CRX: C. Okeke; NL: C. Barnstein) RTS—39822-5

Add the following:

■~~Oral Suspension Vehicle~~ Vehicle for Oral Suspension

» Prepare ~~Oral Suspension Vehicle~~ Vehicle for Oral Suspension as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

Cellulose, Microcrystalline	800 mg
Xanthan Gum	200 mg
Carrageenan	150 mg
Carboxymethylcellulose Sodium (High Viscosity)	25 mg
Citric Acid	250 mg
Sodium Phosphate, Dibasic	120 mg
Simethicone	0.1 mL
Potassium Sorbate	100 mg
Methylparaben	100 mg
Purified water, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about 90 mL of the Purified Water to 70° to 75°. Dissolve the Methylparaben, followed by the Citric Acid, Dibasic Sodium Phosphate, and Potassium Sorbate in the heated water. Remove from the heat.

In-Process Revision

Constantly mixing, slowly sprinkle on the Microcrystalline Cellulose, Xanthan Gum, Carrageenan, and the Carboxymethylcellulose Sodium. Continue to stir until fully hydrated, add the Simethicone, and mix well. Add sufficient Purified Water to volume, and mix well. Adjust the pH if necessary. Package, and label.

Packaging and storage—Package in a tight, light-resistant container, and store at controlled room temperature.

Labeling—Label it to indicate that it is for use in compounding oral solutions.

pH ⟨791⟩: an apparent pH between 4.0 and 5.0.

~~**Stability**~~ **Beyond-use date**—See *Beyond-use date* under ~~*Oral Solution Vehicle Sugar Free.*~~ *Vehicle for Oral Solution, Sugar Free.* ■1S (*NF22*)

BRIEFING

Peanut Oil, *NF 21* page 2805. It is proposed to modify the existing Definition to specify that the material has been processed in a manner that reduces the levels of allergenic proteins in the finished product. Since the definition of refinement varies internationally, it is proposed to include specific processes involved in producing "fully refined" oil.

(EMC: C. Sheehan) RTS—39902-1

Change to read:

» Peanut Oil is the ~~refined fixed oil~~

▪fully-refined (alkali-refined, bleached, and deodorized at 230° to 260°) oil■1S (*NF22*)
obtained from the seed kernels of one or more of the cultivated varieties of *Arachis hypogaea* Linné (Fam. Leguminosae).

BRIEFING

Polyoxyl Lauryl Ether, page 1640 of *PF* 28(5) [Sept.–Oct. 2002]; **Polyoxyl Oleate,** page 1641 of *PF* 28(5) [Sept.–Oct. 2002]; **Polyoxyl Stearyl Ether,** page 1642 of *PF* 28(5) [Sept.–Oct. 2002]. These new monographs, which previously appeared in *Pharmacopeial Previews*, are now being forwarded with minor revisions to *In-Process Revision*.

(EMC: E. Gonikberg) RTS—39918-5

Add the following:

■Polyoxyl Lauryl Ether

Polyethylene glycol monolauryl ether [*9002-92-0*].

» Polyoxyl Lauryl Ether is a mixture of the monolauryl ethers of mixed polyethylene glycols, the average polymer length being equivalent to not less than 3 and not more than 23 oxyethylene units (nominal value). It contains various amounts of free lauryl alcohol, and it may contain some free polyethylene glycols.

Packaging and storage—Preserve in tight containers, and store in a cool, dry place.

Labeling—Label it to indicate the average nominal number of oxyethylene units.

USP Reference standards ⟨11⟩—*USP Polyoxyl Lauryl Ether RS.*

Appearance of solution—Dissolve 5.0 g of Polyoxyl Lauryl Ether in 50.0 mL of alcohol, and proceed as directed for *Appearance of solution* under *Polyoxyl Stearyl Ether.*

Identification—

A: *Infrared Absorption* ⟨197F⟩—Use a thin film of melted test specimen if the material is a solid.

B: Dissolve or disperse 0.1 g in 5 mL of alcohol, add 10 mL of diluted hydrochloric acid, 5 mL of barium chloride TS, and 10 mL of phosphomolybdic acid solution (1 in 10): a precipitate is formed.

Acid value ⟨401⟩: not more than 1.0, determined on 5.0 g.

Hydroxyl value ⟨401⟩: within the ranges specified in the accompanying table.

Oxyethylene Units per Molecule (Nominal Value)	Hydroxyl Value
3	165–185
4	145–165
5	130–140
9	90–100
10	85–95
12	73–83
15	64–74
20–23	40–60

Iodine value ⟨401⟩: not more than 2.0.

Saponification value ⟨401⟩: not more than 3.0, determined on 10.0 g.

Alkalinity—Dissolve 2.0 g of Polyoxyl Lauryl Ether in a hot mixture of 10 mL of alcohol and 10 mL of water. Add 0.05 mL of bromothymol blue TS, and titrate with 0.1 N hydrochloric acid to a yellow endpoint: not more than 0.5 mL of 0.1 N hydrochloric acid is required.

Water, *Method I* ⟨921⟩: not more than 3.0%.

Total ash ⟨561⟩: not more than 0.2%, determined on 2.0 g.

Limit of free ethylene oxide and dioxane—Proceed as directed for *Limit of free ethylene oxide and dioxane* under *Polyoxyl Stearyl Ether*. Not more than 1 µg per g of free ethylene oxide is found; and not more than 10 µg per g of dioxane is found.■IS (*NF22*)

BRIEFING

Polyoxyl Stearyl Ether, page 1642 of *PF* 28(5) [Sept.–Oct. 2002]—See briefing under *Polyoxyl Lauryl Ether*.

(EMC: E. Gonikberg) RTS—39918-4

Add the following:

■Polyoxyl Stearyl Ether

Polyethylene glycol monostearyl ether [*9005-00-9*].

» Polyoxyl Stearyl Ether is a mixture of the monostearyl ethers of mixed polyethylene glycols, the average polymer length being equivalent to not less than 2 and not more than 20 oxyethylene units (nominal value). It may contain various amounts of free lauryl alcohol and some free polyethylene glycol.

Packaging and storage—Preserve in tight containers, and store in a cool, dry place.

Labeling—Label it to indicate the average nominal number of oxyethylene units.

USP Reference standards ⟨11⟩—*USP Polyoxyl Stearyl Ether RS*.

Appearance of solution—Dissolve 5.0 g of Polyoxyl Stearyl Ether in 50.0 mL of alcohol. The solution is not more intensely colored than a solution prepared immediately before use by mixing 12.0 mL of ferric chloride CS, 5.0 mL of cobaltous chloride CS, and 2.0 mL of cupric sulfate CS with dilute hydrochloric acid (10 g per liter) to make 50.0 mL, and diluting 12.5 mL of this solution with dilute hydrochloric acid (10 g per liter) to make 100.0 mL. Make

In-Process Revision

the comparison by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* ⟨631⟩).

Identification—

A: *Infrared Absorption* ⟨197F⟩—Use a thin film of melted test specimen.

B: Dissolve or disperse 0.1 g in alcohol, add 10 mL of diluted hydrochloric acid, 5 mL of barium chloride TS, and 10 mL of phosphomolybdic acid solution (1 in 10): a precipitate is formed.

Acid value ⟨401⟩: not more than 1.0, determined on 5.0 g.

Hydroxyl value ⟨401⟩: within the ranges specified in the table below.

Oxyethylene Units per Molecule (Nominal Value)	Hydroxyl Value
2	150–180
10	75–90
20	40–60

Iodine value ⟨401⟩: not more than 2.0.

Saponification value ⟨401⟩: not more than 3.0, determined on 10.0 g.

Alkalinity—Dissolve 2.0 g of Polyoxyl Stearyl Ether in a hot mixture of 10 mL of alcohol and 10 mL of water. Add 0.05 mL of bromothymol blue TS, and titrate with 0.1 N hydrochloric acid to a yellow endpoint: not more than 0.5 mL of 0.1 N hydrochloric acid is required.

Water, *Method I* ⟨921⟩: not more than 3.0%.

Limit of free ethylene oxide and dioxane—[*Caution—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.*] [NOTE—Before using the Polyethylene Glycol 200 in this test, remove any volatile components from it by placing 500 mL of Polyethylene Glycol 200 in a 1000-mL round-bottom flask, attaching the flask to a rotary evaporator, and evaporating at a temperature of 60° and under a vacuum of 10–20 mm Hg for 6 hours.]

Acetaldehyde solution—Prepare a solution of acetaldehyde in water, containing a known concentration of about 10 µg per mL. [NOTE—Prepare the *Acetaldehyde solution* fresh just prior to use.]

Ethylene oxide stock solution—Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glass-stoppered conical flask, add about 50 mL of Polyethylene Glycol 200, and reweigh the flask. Transfer about 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in a mixture of sodium chloride and wet ice (1:3). Using a gas-tight syringe that has been previously cooled to –10°, transfer about 300 µL (corresponding to about 250 mg) of liquid ethylene oxide to the Polyethylene Glycol 200, and swirl gently to mix. Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by weight difference. Adjust the weight of the mixture with Polyethylene Glycol 200 to 100.0 g, replace the stopper, and swirl gently to mix. This stock solution contains about 2.5 mg of ethylene oxide per g. [NOTE—Prepare this stock solution fresh just prior to use, and store in a refrigerator.]

Ethylene oxide solution—Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add about 35 mL of Polyethylene Glycol 200, and reweigh the flask. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer about 1 g of the chilled *Ethylene oxide stock solution*, accurately weighed, to the tared, conical

flask. Adjust the weight of the solution with Polyethylene Glycol 200 to 50.0 g, replace the stopper, and swirl gently to mix. Transfer about 10 g of this solution, accurately weighed, to a 50-mL volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing about 10 µg of ethylene oxide per mL. [NOTE—Prepare this solution fresh just prior to use, and store in a refrigerator.]

Dioxane solution—Dissolve about 1.0 g of dioxane, accurately weighed, in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg of dioxane per mL.

Standard solution A—Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial, add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution*, seal the vial, and mix.

Standard solution B—Transfer about 1.0 g of the substance under test, accurately weighed, to another 10-mL pressure headspace vial, add 0.1 mL of *Ethylene oxide solution*, 0.1 mL of *Dioxane solution*, and 1.0 mL of *N*,*N*-dimethylacetamide. Seal the vial, and mix.

Test solution—Transfer about 1.0 g of the substance under test, accurately weighed, to a 10-mL pressure headspace vial, add 1.0 mL of *N*,*N*-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—[NOTE—The use of a headspace apparatus that automatically transfers a measured amount of headspace is allowed.] The gas chromatograph is equipped with a flame-ionization detector, maintained at about 250°, and a 0.32-mm × 30-m glass or quartz capillary column bonded with a 1.0-µm layer of phase G1. The injection port is equipped with a split injection port with a split ratio of 20:1 and is maintained at about 150°. The column temperature is maintained at 50° for 5 minutes after injection, then programmed to increase at the rate of 5° per minute to 180°, then at the rate of 30° per minute to 230° and then maintained at 230° for 5 minutes. Each vial is heated at a temperature of 90° for 45 minutes before a suitable portion of its headspace is injected. The carrier gas is helium flowing with a linear velocity of about 20 cm per second. [NOTE—If the headspace apparatus is used, then an injection time of 12 seconds and a transfer line temperature of 150° are recommended.] Chromatograph the gaseous phase of *Standard solution A*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for acetaldehyde and 1.0 for ethylene oxide; the resolution, *R*, between acetaldehyde and ethylene oxide is not less than 2.0; the dioxane peak is detected with a signal-to-noise ratio of not less than 5; and the relative standard deviation for replicate injections is not more than 15%.

Procedure—Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes (about 1 mL) of the gaseous headspace of *Standard solution B* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the mean areas of the ethylene oxide and dioxane peaks in the chromatogram obtained from the *Test solution* are not greater than half the mean areas of the corresponding peaks in the chromatogram obtained from *Standard solution B*. Calculate the concentration of ethylene oxide, in µg per g, in the portion of the substance under test taken by the formula:

$$Ar_U/[(r_S W_U) - (r_U W_S)],$$

in which A is the quantity, in µg, of ethylene oxide added to *Standard solution B;* r_U and r_S are the ethylene oxide peak responses obtained from the *Test solution* and *Standard solution B*, respectively; and W_U and W_S are the weights, in g, of the substance under test taken to prepare the *Test solution* and *Standard solution B*, respectively: not more than 1 µg per g is found.

In-Process Revision

Calculate the concentration of dioxane, in µg per g, in the portion of the substance under test taken by the formula:

$$A_D r_U / 5[(r_S W_U) - (r_U W_S)],$$

in which A_D is the amount, in µg, of dioxane added to *Standard solution B;* r_U and r_S are the dioxane peak responses obtained from the *Test solution* and *Standard solution B*, respectively; and W_U and W_S are as defined above: not more than 10 µg per g is found.■1S (*NF22*)

BRIEFING

Polyoxyl Oleate, page 1641 of *PF* 28(5) [Sept.–Oct. 2002]—See briefing under *Polyoxyl Lauryl Ether*. Also, it is proposed to add storage conditions to the *Packaging and storage* section.

(EMC: E. Gonikberg; PSD: C. Okeke) RTS—39917-1

Add the following:

■Polyoxyl Oleate

Polyethylene glycol monooleate. [*9004-96-0*].

» Polyoxyl Oleate is a mixture of the monoesters and diesters of oleic acid and mixed polyethylene glycols. It may be obtained by ethoxylation of oleic acid or by esterification of polyethylene glycols with oleic acid of animal or vegetable origin. It may contain free polyethylene glycol. The average polymer length is equivalent to either 5–6 or 10 oxyethylene units (nominal values). A suitable antioxidant may be added.

Packaging and storage—Preserve in tight containers, and store in a cool, dry place. Protect from moisture.

Labeling—Label it to indicate the number of ethylene oxide units per molecule (nominal value), and the name and concentration of any added antioxidant.

USP Reference standards ⟨11⟩—*USP Polyoxyl Oleate RS*.

Identification, *Infrared Absorption* ⟨197F⟩, on undried specimen.

Acid value ⟨401⟩: not more than 1.0, determined on 10.0 g.

Hydroxyl value ⟨401⟩—See table below.

Iodine value ⟨401⟩—See table below.

Peroxide value ⟨401⟩: not more than 12.0.

Saponification value ⟨401⟩—See table below.

	5–6 Ethylene Oxide Units	10 Ethylene Oxide Units
Hydroxyl value	50–70	65–90
Iodine value	50–60	27–34
Saponification value	105–120	68–85

Fatty acid composition ⟨401⟩—Polyoxyl Oleate exhibits the following composition profile of fatty acids, as determined in the USP general chapter section *Fatty Acid Composition:*

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
14	0	≤5.0
16	0	≤16.0
18	0	≤6.0
16	1	≤8.0
18	1	65.0–88.0

In-Process Revision

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
18	2	≤18.0
18	3	≤4.0
>18	—	≤4.0

Alkalinity—Dissolve 2.0 g of Polyoxyl Oleate in 20 mL of alcohol. To 2 mL of this solution, add 0.05 mL of phenol red TS: the solution is not red.

Total ash ⟨561⟩: not more than 0.3%, determined on 1.0 g.

Water, *Method I* ⟨921⟩: not more than 2.0%.

Limit of free ethylene oxide and dioxane—Proceed as directed for *Limit of free ethylene oxide and dioxane* under *Polyoxyl Stearyl Ether:* not more than 1 µg per g of free ethylene oxide is found; and not more than 10 µg per g of dioxane is found.■1S (*NF22*)

BRIEFING

Sodium Cetostearyl Sulfate. Because there is no existing *NF* monograph for this excipient, a new monograph, based on the Sodium Cetostearyl Sulfate monograph in the *European Pharmacopoeia*, *Fourth Edition*, page 1907, is being proposed.

(EMC: E. Gonikberg) RTS—39843-1

Add the following:

■Sodium Cetostearyl Sulfate

» Sodium Cetostearyl Sulfate is a mixture of sodium cetyl sulfate and sodium stearyl sulfate. It contains not less than 40.0 percent of sodium cetyl sulfate ($C_{16}H_{34}NaSO_4$), and the sum of the sodium cetyl sulfate content and sodium stearyl sulfate ($C_{18}H_{38}NaSO_4$) content is not less than 90.0 percent (both contents calculated on the anhydrous basis). It may contain a suitable buffer.

Packaging and storage—Preserve in well-closed containers. Store at temperature 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate the name and concentration of any added buffer.

USP Reference standards ⟨11⟩—*USP Cetyl Alcohol RS*. *USP Stearyl Alcohol RS*.

Identification—

A: The retention times of the two major peaks in the chromatogram of the *Assay preparation C* correspond to those in the chromatogram of the *Resolution solution*, as obtained in the *Assay*.

B: It meets the requirements of the flame test for *Sodium* ⟨191⟩.

C: Mix 10 mg with 10 mL of ethanol, and heat to boiling on a water bath, shaking frequently. Filter immediately, and evaporate to dryness. Dissolve the residue in 7 mL of water, add 3 mL of diluted hydrochloric acid, and evaporate the solution to half its volume. Allow to cool, and filter. To the filtrate, add 1 mL of barium chloride solution (6 in 100): a white crystalline precipitate is formed.

Acidity or alkalinity—Dissolve 500 mg with heating in a mixture of 10 mL of water and 15 mL of 90% alcohol. Add 0.1 mL of phenolphthalein TS: the solution is colorless. Add 0.1 mL of 0.1 N sodium hydroxide: the solution becomes red.

Water, *Method I* ⟨921⟩: not more than 1.5%.

In-Process Revision

Limit of sodium chloride and sodium sulfate—

Dichloroacetic acid solution—Dilute 67 mL of dichloroacetic acid to 300 mL with water, and neutralize to blue litmus paper using ammonia TS. Cool, add 33 mL of dichloroacetic acid, and dilute with water to 600 mL.

Sodium chloride—Dissolve about 5 g of Sodium Cetostearyl Sulfate, accurately weighed, in 50 mL of water, and add diluted nitric acid dropwise until the solution is neutral to blue litmus paper. Add 1 mL of potassium chromate TS, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Calculate the percentage of sodium chloride (NaCl) in the Sodium Cetostearyl Sulfate taken by the formula:

$$5.844VN/W,$$

in which 5.844 is the equivalence factor for sodium chloride; V is the volume, in mL, of silver nitrate solution; N is the normality of silver nitrate; and W is the weight, in g, of the Sodium Cetostearyl Sulfate taken.

Sodium sulfate—Dissolve 0.5 g of Sodium Cetostearyl Sulfate, accurately weighed, in 20 mL of water, warming gently if necessary, and add 1 mL of a solution containing 0.5 g per L of dithizone in acetone. If the solution is red, add 1 N nitric acid dropwise until a bluish-green color is obtained. Add 2.0 mL of *Dichloroacetic acid solution* and 80 mL of acetone, and titrate with 0.01 M lead nitrate VS until a persistent orange-red color is obtained. Calculate the percentage of sodium chloride (Na_2SO_4) in the Sodium Cetostearyl Sulfate taken by the formula:

$$14.20VM/W,$$

in which 14.20 is the equivalence factor for sodium sulfate; V is the volume, in mL, of lead nitrate solution; M is the molarity of lead nitrate; and W is the weight, in g, of the Sodium Cetostearyl Sulfate taken. The sum of the percentages of sodium chloride and sodium sulfate is not more than 8.0%.

Limit of free cetostearyl alcohol—Examine the chromatogram of the *Assay preparation A*, obtained as directed in the *Assay*. Calculate the percentage of free cetostearyl alcohol in the Sodium Cetostearyl Sulfate taken using the formula:

$$100(A_a + B_a) \times W_{ah} / (S_{a(corr)} \times W_a),$$

in which $(A_a + B_a)$ is the sum of the areas of the cetyl alcohol and stearyl alcohol peaks in the chromatogram of the *Assay preparation A;* $S_{a(corr)}$ is defined under *Assay;* W_{ah} is the weight of the internal standard, in mg, added in the preparation of the *Assay preparation A;* and W_a is the weight, in mg, of Sodium Cetostearyl Sulfate taken to prepare the *Assay preparation A:* not more than 4.0% is found.

Assay—

Resolution solution—Dissolve accurately weighed quantities of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS in alcohol to obtain a solution having a known concentration of about 5 mg of each per mL.

Internal standard solution—Prepare a solution of 1-heptadecanol in alcohol having a concentration of about 4 mg per mL.

Assay preparation A—Dissolve 300 mg of Sodium Cetostearyl Sulfate in 50 mL of alcohol, and add 2 mL of the *Internal standard solution* and 48 mL of water. Extract the solution with four 25-mL portions of pentane, adding 10-15 mL of saturated sodium chloride solution, if necessary, to facilitate the separation of the layers. Combine the organic layers, and reserve the hydro-alcoholic layers for the preparation of *Assay preparations C* and *D*. Wash the organic layer with two 30-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Assay preparation B—Dissolve 300 mg of Sodium Cetostearyl Sulfate in 50 mL of alcohol, and add 50 mL of water. Extract the solution with four 25-mL portions of pentane, adding 10-15 mL of saturated sodium chloride solution, if

necessary, to facilitate the separation of the layers. Combine the organic layers, wash with two 30-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Assay preparation C—Transfer 25 mL of the hydro-alcoholic solution obtained in the preparation of the *Assay preparation A* to a 200-mL flask that can be fitted with a reflux condenser. Add 20 mL of hydrochloric acid and 10 mL of the *Internal standard solution*, and boil under reflux for 2 hours. Allow to cool. Extract with four 20-mL portions of pentane. Wash the combined organic layer with two 20-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Assay preparation D—Transfer 25 mL of the hydro-alcoholic solution obtained in the preparation of the *Assay preparation A* to a 200-mL flask that can be fitted with a reflux condenser. Add 20 mL of hydrochloric acid and 10 mL of alcohol, and boil under reflux for 2 hours. Allow to cool. Extract with four 20-mL portions of pentane. Wash the combined organic layer with two 20-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.25-mm × 25-m fused silica capillary column that contains phase G2, and a split injection system with a split ratio of about 1:100. The carrier gas is nitrogen, flowing at a rate of 1 mL per minute. The column temperature is maintained at 150° at the time of injection, then programmed to increase at the rate of 5° per minute to 250°, and maintained at 250° for the duration of the analysis. The injection port and the detector temperatures are maintained at about 250°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Correction for interference—Inject about 1 µL of each of the *Assay preparations A* and *B* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. If the chromatogram of the *Assay preparation B* shows a peak at the same retention time as the internal standard peak in the chromatogram of the *Assay preparation A*, calculate the ratio, *r:*

$$r = S_{cb} / S_i,$$

in which S_{cb} is the area of the cetyl alcohol peak; and S_i is the area of the peak with the same retention time as the internal standard, respectively, in the chromatogram of the *Assay preparation B*. If *r* is less than 300, calculate the corrected area, $S_{a(corr)}$, of the peak corresponding to the internal standard in the chromatogram of the *Assay preparation A:*

$$S_{a(corr)} = S_{ha} - (S_i \times S_{ca} / S_{cb}),$$

in which S_{ha} and S_{ca} are the areas of the internal standard peak and the cetyl alcohol peak, respectively, in the chromatogram of the *Assay preparation A*.

Inject about 1 µL of each of the *Assay preparations C* and *D* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Carry out the correction for interference in the same manner as for the *Assay preparation A*, and calculate the corrected area, $S_{c(corr)}$, of the peak corresponding to the internal standard in the chromatogram of the *Assay preparation C*.

Procedure—Inject equal volumes of the *Resolution solution* and *Assay preparations C* and *D* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The substances are eluted in the following order: cetyl alcohol, 1-heptadecanol (internal standard), and stearyl alcohol. Identify the cetyl alcohol and stearyl alcohol peaks in the chromatograms of the *Assay preparations*

In-Process Revision

by comparison with the *Resolution solution*. Calculate the percentage of sodium cetyl sulfate in the portion of Sodium Cetostearyl Sulfate taken by the formula:

$$100A_c \times 1.421 \times W_{ch}(S_{c(corr)} \times W_c),$$

in which A_c is the area of the cetyl alcohol peak in the chromatogram of the *Assay preparation C;* W_{ch} is the weight of the internal standard, in mg, added in the preparation of the *Assay preparation C;* and W_c is the weight, in mg, of Sodium Cetostearyl Sulfate taken to prepare the *Assay preparation C*, calculated on the anhydrous basis.

Calculate the percentage of sodium stearyl sulfate in the portion of Sodium Cetostearyl Sulfate taken by the formula:

$$100\ B_c \times 1.377 \times W_{ch}/(S_{c(corr)} \times W_c),$$

in which B_c is the area of the stearyl alcohol peak in the chromatogram of the *Assay preparation C;* and the other terms are as defined above.■1S (*NF22*)

In-Process Revision

~~such a rate that it comes to a boil in approximately 4 minutes, and boil for 2 minutes, accurately timed. Collect the precipitated cuprous oxide in a tared filtering crucible previously washed successively with hot water, with alcohol, and with ether and then dried at 105° for 30 minutes. Thoroughly wash the collected cuprous oxide on the filter with hot water, then with 10 mL of alcohol, and finally with 10 mL of ether, and dry at 105° for 30 minutes: the weight of the cuprous oxide does not exceed 50 mg. The amount determined in this test is not included in the calculated amount under *Other Impurities*.~~

■Dissolve 3.3 g of Sorbitol in 3 mL of water with the aid of gentle heat. ~~Proceed as directed in the test for *Reducing sugars* under *Mannitol* beginning with "Cool, and add 20.0 mL of cupric citrate TS".~~ Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, as glucose. The amount determined in this test is not included in the calculated amount under *Other Impurities*.■1S (*NF22*)

Delete the following:

■~~**Total sugars**—Place 2.1 g in a 250-mL flask fitted with a ground-glass joint, add 40 mL of approximately 0.1 N hydrochloric acid, attach a reflux condenser, and reflux for 4 hours. Transfer the solution to a 400-mL beaker, rinsing the flask with about 10 mL of water, neutralize with 6 N sodium hydroxide, and proceed as directed in the test for *Reducing sugars*, beginning with "Add 50 mL of alkaline cupric tartrate TS": the weight of the cuprous oxide does not exceed 50 mg. The amount determined in this test is not included in the calculated amount under *Other Impurities*.~~■1S (*NF22*)

Add the following:

■**Limit of nickel**—~~Proceed as directed in the test for *Nickel* under *Mannitol*. Not more than 1 µg per g is found.~~

Test solution—Dissolve 20.0 g of Sorbitol in diluted acetic acid, and dilute with diluted acetic acid to 150 mL. Add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (containing about 10 g of ammonium pyrrolidinedithiocarbamate per liter) and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution—Prepare as directed for *Test solution*, except to omit the use of Sorbitol.

Standard solutions—Prepare as directed for *Test solution*, except to prepare three solutions by adding 0.5 mL, 1.0 mL, and 1.5 mL of nickel standard solution TS.

Procedure—Set the instrument to zero using the *Blank solution*. Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a nickel hollow-cathode lamp and an air–acetylene flame. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution*. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Test solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Test solution*. Not more than 1 µg per g is found.■1S (*NF22*)

Delete the following:

■~~**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements.~~■1S (*NF22*)

Add the following:

■**Other requirements**—If labeled for use in preparing parenteral dosage forms, it also meets the following requirements.

In-Process Revision

Clarity and color of solution—Dissolve a 10.0-g portion in carbon dioxide-free water, and dilute with carbon dioxide-free water to 100.0 mL: the solution is clear and colorless.

Bacterial endotoxins ⟨85⟩: not more than 4 USP Endotoxin Units per g for parenteral dosage forms having a concentration of less than 100 g of sorbitol per liter and not more than 2.5 USP Endotoxin Units per g for parenteral dosage forms having a concentration of 100 g or more of sorbitol per liter.

Chloride ⟨221⟩—A 1.5-g portion shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid. Not more than 0.0050% is found.

Sulfate ⟨221⟩—A 1.0-g portion shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid. Not more than 0.01% is found. ■1S (*NF22*)

In-Process Revision

BRIEFING

Anhydrized Liquid Sorbitol, page 154 of *PF* 29(1) [Jan.–Feb. 2003]—See briefing under *Maltitol Solution*.

(EMC: C. Sheehan) RTS—39694-5

Add the following:

■Anhydrized Liquid Sorbitol

» Anhydrized Liquid Sorbitol is a water solution containing, on the anhydrous basis, not less than 25.0 percent of D-sorbitol ($C_6H_{14}O_6$) and not less than 15.0 percent of 1,4-sorbitan ($C_6H_{12}O_5$). The amounts of total sugars, other polyhydric alcohols, and any other hexitol anhydrides, if detected, are not included in the requirements or in the calculated amount under *Other Impurities*.

Packaging and storage—~~Preserve in tight containers.~~ Preserve in well-closed containers. Do not store below 20°.

Labeling—The labeling indicates the percentage content, on the anhydrous basis, of D-sorbitol and 1,4-sorbitan.

USP Reference standards ⟨11⟩—*USP Sorbitol RS. USP 1,4-Sorbitan RS.*

Identification—

A: Dissolve 1.4 g of Anhydrized Liquid Sorbitol in 75 mL of water. Transfer 3 mL of this solution to a 15-cm test tube, add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix again, then gently heat the tube in a flame for about 30 seconds: a deep pink or wine-red color appears.

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Microbial limits ⟨61⟩—The total aerobic microbial count using the *Plate Method* is not more than 10^3 cfu per mL. The total combined molds and yeasts count is not more than 10^2 cfu per mL.

pH ⟨791⟩: between 4.0 and 7.0, in a 14% (w/w) solution of Anhydrized Liquid Sorbitol in carbon dioxide-free water.

Water, *Method I* ⟨921⟩: not more than 31.5%.

Residue on ignition ⟨281⟩: not more than 0.20%, calculated on the anhydrous basis. Determine on a 2-g portion, accurately weighed.

Reducing sugars—To an amount of Anhydrized Liquid Sorbitol, equivalent to 3.3 g, on the anhydrous basis, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. ~~Proceed as directed in the test for *Reducing sugars* under *Mannitol*, beginning with "Heat so that boiling begins."~~ Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, on the anhydrous basis, as glucose. The amount determined in this test is not included in the calculated amount under *Other Impurities*.

Limit of nickel—

Test solution—Dissolve 20.0 g of Anhydrized Liquid Sorbitol in diluted acetic acid, and dilute with diluted acetic acid to 100.0 mL. Add 2.0 mL of a saturated solution of ammonium pyrrolidine dithiocarbamate (about 10 g of ammonium pyrrolidine dithiocarbamate per liter) and 10.0 mL of methyl

In-Process Revision

isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution—Prepare as directed for the *Test solution*, except to omit the use of Anhydrized Liquid Sorbitol. Quantities should be increased five fold to ensure that a sufficient volume of *Blank solution* is available.

Standard solutions—Prepare as directed for the *Test solution*, except to prepare three solutions by adding 0.5 mL, 1.0 mL, and 1.5 mL of nickel standard solution TS.

Procedure— ~~Proceed as directed in the test for *Nickel* under *Mannitol*.~~ Set the instrument to zero using the *Blank solution*. Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a nickel hollow-cathode lamp and an air–acetylene flame. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution*. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Test solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Test solution*. Not more than 1 µg per g, calculated on the anhydrous basis, is found.

Assay—

Mobile phase—Use degassed water.

Resolution solution—Dissolve sorbitol, 1,4-sorbitan, isosorbide, and mannitol in water to obtain a solution having concentrations of about 10 mg per g, 4 mg per g, 4 mg per g, and 1 mg per g, respectively.

Standard preparation—Dissolve accurately weighed quantities of USP Sorbitol RS and USP 1,4-Sorbitan RS in water to obtain a solution having concentrations of about 10 mg per g and 4 mg per g, respectively.

Assay preparation—Dissolve about 0.40 g of Anhydrized Liquid Sorbitol, accurately weighed, in water, and dilute with water to about 20 g. Accurately record the final solution weight, and mix thoroughly.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector that is maintained at a constant temperature of about 35°, and a 7.8-mm × 10-cm column that contains packing L34. The column temperature is maintained at about 50°, controlled within ± 2°, and the flow rate is about 0.6 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between the 1,4-sorbitan and isosorbide is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses for 1,4-sorbitan and sorbitol as directed for *Procedure:* the relative retention times are about 0.35 for 1,4-sorbitan, 0.43 for isosorbide, 0.7 for mannitol, and 1.0 for sorbitol; and the relative standard deviation for replicate injections is not more than 2.0% for each analyte.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Separately calculate the percentages, on the anhydrous basis, of 1,4-sorbitan and sorbitol in the portion of Anhydrized Liquid Sorbitol taken by the formula:

$$[10{,}000(C_S / C_U)(r_U / r_S)]/(100 - W),$$

in which C_S is the concentration, in mg per g, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in mg per g, of the Anhydrized Liquid Sorbitol in the *Assay preparation;* r_U and r_S are the peak

In-Process Revision

responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively; and *W* is the percentage obtained in the test for *Water*.■1S (*NF22*)

BRIEFING

In-Process Revision

BRIEFING

Modified Starch, page 1221 of *PF* 28(4) [July–Aug. 2002]; **Pregelatinized Modified Starch,** page 1222 of *PF* 28(4) [July–Aug. 2002]. On the basis of comments received, these new monographs are being presented again with additional changes. It is proposed to include treatment with enzymes in the Definition for *Modified Starch*. It is proposed to include *Wheat starch* and *Potato starch* under *Botanic characteristics* as sources of Modified Starches. It is proposed to replace the existing *Identification* test *A* because it was found that some modified starch products gave results outside the criteria for this test and to modify *Identification* test *B* to be consistent with proposed changes to the draft harmonization *Corn Starch* monograph. Under the test for *Microbial limits*, it is proposed to include tests for both total microbial count and total combined molds and yeasts in order to achieve consistency with monographs of similar articles. It is also proposed to make the pH range consistent with Food Chemical Codex specifications for Food Starch, modified, and to use the test for *Oxidizing substances* from the current *Starch* monograph rather than from the current *Pregelatinized Starch* monograph.

(EMC: C. Sheehan; AMB: D. Porter) RTS—39959-1

Add the following:

■Modified Starch

» Modified Starch is Starch modified by chemical means. Food Starch may be acid-modified, bleached, oxidized, esterified, ~~or~~ etherified, or treated enzymatically to change the functional properties (21 CFR 172.892).

Packaging and storage—~~Preserve~~ Store in well-closed containers at temperatures ranging from 0° to 55°.

Botanic characteristics—

Corn starch—Polygonal, rounded or spheroidal granules up to about 35 µm in diameter and usually having a circular or several-rayed central cleft.

Tapioca starch—Spherical granules with one truncated side, typically 5 to 35 µm in diameter and usually having a circular or several-rayed central cleft.

Potato starch—Irregularly shaped, ovoid, or pear-shaped granules, usually 30 to 100 µm in size but occasionally exceeding 100 µm; or rounded, 10 to 35 µm in size. There are occasional compound granules having two to four components. The ovoid and pear-shaped granules have an eccentric hilum, and the rounded granules have accentric or slightly eccentric hilum. All granules show clearly visible concentric striations.

Wheat starch—Large and small granules, usually 10 to 60 µm in diameter. The central hilum and striations are visible or barely visible.

Identification—

A: ~~Prepare a smooth mixture of 1 g of Modified Starch with 2 mL of cold water, stir into 15 mL of boiling water, boil gently for 2 minutes, and cool to room temperature: the product is translucent to clear.~~ Prepare a 2% (w/w) sodium hydroxide solution. Weigh 0.6 g of Modified Starch, and transfer to a 25-mL glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vigorously to evenly disperse the starch. Add 10 g of 2% NaOH solution, cap, and shake vigorously for 1 minute to create a smooth mixture. Evaluate within 1 minute. The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.

B: A water slurry of the Modified Starch is colored ~~reddish violet~~ orange-red to deep blue by iodine TS.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^3 cfu per g; the total combined molds and yeasts count does not exceed 10^2 cfu per g.

pH ⟨791⟩—Weigh 20.0 ± 0.1 g of Modified Starch, transfer to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Stir using a magnetic stirrer at a moderate rate for about 5 minutes, and determine the pH to the nearest 0.1 unit: between ~~4.5 and 8.0.~~ 3.0 and 9.0.

In-Process Revision

Loss on drying ⟨731⟩—Dry it at 120° for 4 hours. ~~it loses not more than 14% of its weight.~~ *Corn starch*, *Wheat starch*, and *Tapioca starch:* not more than 15.0%; *Potato starch:* not more than 21.0%.

Residue on ignition ⟨281⟩: not more than 0.5%, a test specimen of 2.0 ± 0.1 g being used.

Iron ⟨241⟩: 0.002%, the *Test Preparation* being prepared as follows. Dissolve the residue obtained in the test for *Residue on ignition* in 8 mL of hydrochloric acid with the aid of gentle heating. Dilute with water to 100 mL in a volumetric flask, and mix. Dilute 25 mL of this solution with water to 47 ± 1 mL.

Oxidizing substances ~~To 5 g of Modified Starch add 20 mL of a mixture of methanol and water (1:1), then add 1 mL of 6 N acetic acid, and stir until a homogeneous suspension is obtained. Add 0.5 mL of a freshly prepared saturated solution of potassium iodide, mix, and allow to stand for 5 minutes: no distinct blue, brown, or purple color is observed.~~ Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide. Not more than 12.6 mL of 0.002 N sodium thiosulfate is required (180 µg per g, calculated as H_2O_2): not more than 0.018% of oxidizing substances is found.

Limit of sulfur dioxide—Mix 20.0 ± 0.1 g of Modified Starch with 200 mL of 5 percent alcohol until a smooth suspension is obtained, and vacuum filter through paper (Whatman No.1 or equivalent). To 100 mL of the filtrate add 3 mL of starch TS, and titrate with 0.10 N iodine to the first permanent blue color. Not more than 2.7 mL is consumed: not more than ~~0.008%~~ 0.005% of sulfur dioxide is found. ■1S (*NF22*)

BRIEFING

Pregelatinized Modified Starch, page 1222 of *PF* 28(4) [July–Aug. 2002]—See briefing under *Modified Starch*.

(EMC: C. Sheehan; AMB: D. Porter) RTS—39960-1

Add the following:

■Pregelatinized Modified Starch

» Pregelatinized Modified Starch is Modified Starch that has been chemically or mechanically processed, or both, to rupture all or part of the granules to produce a product that swells in cold water.

Identification—

A: ~~Prepare a smooth mixture of 1 g of Pregelatinized Modified Starch with 2 mL of cold water, stir into 15 mL of boiling water, boil gently for 2 minutes, and cool to room temperature: the product is translucent to clear.~~ Prepare a 2% (w/w) sodium hydroxide solution. Weigh 0.6 g of Pregelatinized Modified Starch, and transfer to a 25-mL glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vig-

In-Process Revision

orously to evenly disperse the starch. Add 10 g of 2% NaOH solution, cap, and shake vigorously for 1 minute to create a smooth mixture. Evaluate within 1 minute. The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.

B: An aqueous dispersion of Pregelatinized Modified Starch is colored ~~reddish violet~~ orange-red to deep blue by iodine TS.

pH ⟨791⟩—Wet 10.0 ± 0.1 g of Pregelatinized Modified Starch with 10 mL of alcohol, then dilute with water to 300 mL to obtain an aqueous dispersion. Stir continuously at a moderate rate for 5 minutes, and determine the pH to the nearest 0.1 unit: between ~~4.5 and 8.0.~~ 3.0 and 9.0.

Loss on drying ⟨731⟩—Dry it at 120° for 4 hours: it loses not more than 15% of its weight.

Residue on ignition ⟨281⟩: not more than 1.5%, a test specimen of 2.0 ± 0.1 g being used.

Oxidizing substances—To 5 g of Pregelatinized Modified Starch add 20 mL of a mixture of methanol and water (1:1), then add 1 mL of 6 N acetic acid, and stir until a homogeneous suspension is obtained. Add 0.5 mL of a freshly prepared saturated solution of potassium iodide, mix, and allow to stand for 5 minutes: no distinct blue, brown, or purple color is observed.

Limit of sulfur dioxide—Mix 20.0 ± 0.1 g of Pregelatinized Modified Starch with 100 mL of 95 percent alcohol, and stir for several minutes to completely wet the starch. Slowly add 100 mL of water, and stir until a smooth suspension is obtained. Allow the starch mixture to set undisturbed until most of the starch has settled, and filter the aqueous portion through paper (Whatman No. 1 or equivalent). To 100 mL of the clear filtrate add 100 mL of water, and mix. Add 3 mL of starch TS, and titrate with 0.010 N iodine to the first permanent blue or purple color. Not more than 2.7 mL is consumed: not more than ~~0.008%~~ 0.005% of sulfur dioxide is found.

Other requirements—It meets the requirements for *Packaging and storage* and in the tests for *Microbial limits* ~~*, Loss on drying*~~, and *Iron*~~, and *Oxidizing substances*~~ under *Modified Starch*. ■1S (*NF22*)

BRIEFING

Tapioca Starch, page 838 of *PF* 28(3) [May–June 2002]. This new monograph is being presented again with a proposed change to the *Packaging and storage* section, to incorporate specifications provided by the manufacturer. A new volumetric solution is also proposed for use in the test for *Limit of sulfur dioxide*.

(EMC: C. Sheehan; PSD: C. Okeke) RTS—39936-1

Add the following:

▲Tapioca Starch

» Tapioca Starch consists of the starch granules separated from the tubers of tapioca (cassava) [*Manihot utilissima* Pohl (Fam. Euphorbiaceae)].

Change to read:

Packaging and storage—Preserve in well-closed containers. ■Store at 25°, excursion permitted up to 40°.■1S (*NF22*)

Botanic characteristics—Examine Tapioca Starch under a microscope, using not less than 20× magnification and using glycerin as the mounting agent: it appears as spherical granules with one truncated side, typically having a 5- to 35-µm diameter and having circular or several-rayed central clefts.

In-Process Revision

Identification—

A: Suspend 1 g of Tapioca Starch in 50 mL of water, boil for 1 minute, and cool: a thin, cloudy mucilage is formed.

B: To 10 mL of the mucilage obtained in *Identification* test *A* add 0.04 mL each of iodine and potassium iodide TS: a reddish violet to dark blue color is produced, which disappears on heating and reappears on cooling.

Microbial limits ⟨61⟩—It meets the requirements of the test for absence of *Escherichia coli.* The total aerobic microbial count does not exceed 10^3 cfu per g, and the total combined molds and yeasts count does not exceed 10^2 cfu per g.

pH ⟨791⟩—Weigh 20.0 ± 0.1 g of Tapioca Starch, transfer to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Agitate continuously at a moderate rate for 5 minutes, then stop agitation, and immediately determine the pH: between 4.5 and 7.0.

Loss on drying ⟨731⟩—Dry it at 130° for 90 minutes: it loses not more than 16.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.6%, determined on a 1.0-g specimen.

Iron ⟨241⟩: 0.002%, the *Test Preparation* being prepared as follows. Shake ~~0.75 g~~ 0.25 g of Tapioca Starch with 15 mL of 0.1 N hydrochloric acid, and filter. Use 10 mL of this solution as the *Test Preparation.*

Limit of oxidizing substances—Transfer 4.0 g of Tapioca Starch to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Decant into a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5 to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodide color. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required: not more than 0.002% of oxidizing substances is found.

Change to read:

Limit of sulfur dioxide—Mix 20 g of Tapioca Starch with 200 mL of water until a smooth suspension is obtained, and filter. To 100 mL of the clear filtrate add 3 mL of starch TS, and titrate with ~~0.010 N~~ ■0.01 $N_{■1S\ (NF22)}$ iodine solution ■$VS_{■1S\ (NF22)}$ to the first permanent blue color. Not more than 1.7 mL is consumed: not more than 0.005% of sulfur dioxide is found.▲*NF22*

BRIEFING

Stearoyl Macrogolglycerides, page 1223 of *PF* 28(4) [July–Aug. 2002]. This proposed new monograph is being presented again with changes approved by the Expert Committee on Nomenclature and Labeling. The changes reflect terminology used in the United States, particularly in several excipient standards appearing in the *National Formulary.* The term "polyethylene glycol" and the "polyoxyl" designations for esters and ethers formed with polyethylene glycol and organic acids and alcohols or polyols replace the "macrogol" terminology that is seen elsewhere.

(EMC: C. Sheehan; NL: C. Barnstein) RTS—39930-1

Add the following:

■Stearoyl ~~Macrogolglycerides~~ Polyoxylglycerides

» Stearoyl ~~Macrogolglycerides~~ Polyoxylglycerides are mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of ~~macrogols~~ polyethylene glycols with a nominal

In-Process Revision

mean relative molecular weight between 300 and 4000. They are produced by partial alcoholysis of saturated oils, mainly containing triglycerides of stearic acid, with ~~macrogol,~~ polyethylene glycol, by esterification of glycerol and ~~macrogol~~ polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the hydrogenated oils. The Hydroxyl Value does not differ by more than 15 units from the nominal value, and the Saponification Value does not differ by more than 10 units from the nominal value. The average molecular weight is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value.

Packaging and storage—Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

Labeling—Label it to indicate the average nominal molecular weight of esters as part of the official title. The label also indicates the Hydroxyl Value and the Saponification Value.

USP Reference standards ⟨11⟩—*USP Stearoyl ~~Macrogol-glycerides~~ Polyoxylglycerides RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements for *Identification* test *B* under *Caprylocaproyl ~~Macrogolglycerides.~~ Polyoxylglycerides.*

Acid value ⟨401⟩: not more than 2.0, determined on a 2.0-g specimen.

Hydroxyl value ⟨401⟩—The Hydroxyl Value, between 25 and 56, does not differ by more than 15 units from the nominal value, determined on a 1.0-g specimen, accurately weighed.

Iodine value ⟨401⟩: not more than 2.0.

Peroxide value ⟨401⟩: not more than 6.0, determined on a 2.0-g specimen.

Saponification value ⟨401⟩—The Saponification Value, between 67 and 112, does not differ by more than 10 units from the nominal value, determined on a 2.0-g specimen.

Fatty acid composition ⟨401⟩: not more than 5.0% each of lauric acid and myristic acid is found; between 40.0% and 50.0% of palmitic acid is found; and between 48.0% and 58.0% of stearic acid is found.

Water, *Method I* ⟨921⟩: not more than 1.0%, determined on a 1.0-g specimen.

Total ash ⟨561⟩: not more than 0.2%, determined on a 1.0-g specimen.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Limit of free ethylene oxide and dioxane—Proceed as directed in the test for *Limit of free ethylene oxide and dioxane* under *Caprylocaproyl ~~Macrogolglycerides~~ Polyoxylglycerides:* not more than 1 µg of ethylene oxide per g is found; and not more than 10 µg of dioxane per g is found.

Limit of free glycerol—Proceed as directed in the test for *Limit of free glycerol* under *Caprylocaproyl ~~Macrogolglycerides~~ Polyoxylglycerides:* not more than 5.0% is found.■1S (*NF22*)

BRIEFING

⟨**311**⟩ **Alginates Assay,** *USP 26* page 2062 and page 643 of *PF* 26(3) [May–June 2000]. The modified general test chapter *Alginates Assay* ⟨311⟩, which previously appeared in *Pharmacopeial Previews*, is now forwarded, with changes, to *In-Process Revision*. It is proposed to revise the *System Suitability* section to address comments received regarding the blank determination and the determination of percentage carbon dioxide released from the standard. For clarification purposes, a formula for calculating the blank determination has been added and limits for percentage carbon dioxide released from the standard have also been added.

(EMC: D. Bempong) RTS—39912-1

Delete the following:

■~~In a suitable closed system, liberate the carbon dioxide from the uronic acid groups of about 250 mg of the test specimen by heating with about 6 N hydrochloric acid, and sweep the carbon dioxide by means of an inert gas into a titration vessel containing25.0 mL of 0.25 N sodium hydroxide VS. Add 10 mL of barium chloride solution (1 in 10) to the titration vessel, insert a tight stopper, and shake the flask gently for 1 to 2 minutes. Allow to stand for at least 5 minutes. Add 3 drops of phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS to the first loss of a pink endpoint. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 0.25 N sodium hydroxide consumed is equivalent to 5.5 mg of carbon dioxide (CO_2).~~

~~In a suitable system, precautions must be taken against leakage and overheating of the reaction mixture, and there should be adequate sweeping time and avoidance of entrainment of hydrochloric acid. The system is not considered to be suitable unless a 250-mg test specimen of D-glucuronolactone, accurately weighed, results in a net titration value between 11.0 and 11.7 mL of 0.25 N sodium hydroxide. One suitable system, with accompanying procedure, is given below.~~■1S (*USP27*)

Delete the following:

■~~APPARATUS~~

~~The apparatus shown in the accompanying diagram consists essentially of a soda-lime column, *A*, a mercury valve, *B*, connected through a side arm to a reaction flask, *D*, by means of a rubber connection, *C*. Flask *D* is a 100-mL round-bottom, long-neck boiling flask, resting in a suitable heating mantle, *E*.~~

~~The reaction flask is provided with a reflux condenser, *F*, to which is fitted a delivery tube, *G*, of 40-mL capacity, having a stopcock, *H*. The reflux condenser terminates in a trap, *I*, containing 25 g of 20-mesh zinc or tin, which can be connected with an absorption tower, *J*.~~

~~The absorption tower consists of a 45-cm tube fitted with a medium-porosity, sintered-glass disk sealed to the inner part above the side arm and having a delivery tube sealed to it extending down to the end of the tube. A trap, consisting of a bulb of approximately 100-mL capacity, is blown above the sintered-glass disk, and the outer portion of a ground spherical joint is sealed on above the bulb. A 250-mL conical flask, *K*, is connected to the bottom of the absorption tower. The top of the tower is connected to a soda lime tower, *L*, which is connected to a suitable pump to provide vacuum and air supply, the selection of which is made by a three-way stopcock, *M*. The volume of air or vacuum is controlled by a capillary tube regulator or needle valve, *N*.~~

~~All joints are size (35/25), ground spherical type.~~■1S (*USP27*)

Delete the following:

■~~PROCEDURE~~

~~Unless otherwise directed, transfer a specimen of about 250 mg, accurately weighed, into the reaction flask, *D*, add 25 mL of dilute hydrochloric acid (1 in 120), insert several boiling chips, and connect the flask to the reflux condenser, *F*, using phosphoric acid as a lubricant. [NOTE—Stopcock grease may be used for the other connections.] Check the system for air leaks by forcing mercury up into the inner tube of the mercury valve, *B*, to a height of about 5 cm. Turn off the pressure using the stopcock, *M*. If the mercury level does not fall appreciably after 1 to 2 minutes, the apparatus may be considered to be free from leaks. Draw carbon dioxide–free air through the apparatus at a rate of 3000 to 6000 mL per hour. Raise the heating mantle, *E*, to the flask, heat the specimen to boiling, and boil gently for 2 minutes. Turn off and lower the mantle, and allow the specimen to cool for 15 minutes. Charge the delivery tube, *G*, with 23 mL of hydrochloric acid. Disconnect the absorption tower, *J*, rapidly transfer 25.0 mL of 0.25 N sodium hydroxide VS to the tower, add 5 drops of butyl alcohol, and again connect the absorption tower. Draw carbon dioxide–free air through the apparatus at the rate of about 2000 mL per hour, add the hydrochloric acid to the reaction flask through the delivery tube, raise the heating mantle, and heat the reaction mixture to boiling. After 2 hours, discontinue the current of air and heating. Force the sodium hydroxide solution down into the flask, *K*, using gentle air pressure, and then rinse down the absorption tower with three 15-mL portions of water, forcing each washing into the flask with air pressure. Remove the flask, and add to it 10 mL of barium chloride solution (1 in 10). Insert the stopper in the flask, shake gently for about 2 minutes, add phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS. Perform a blank determination (see *Residual Ti-*~~

In-Process Revision

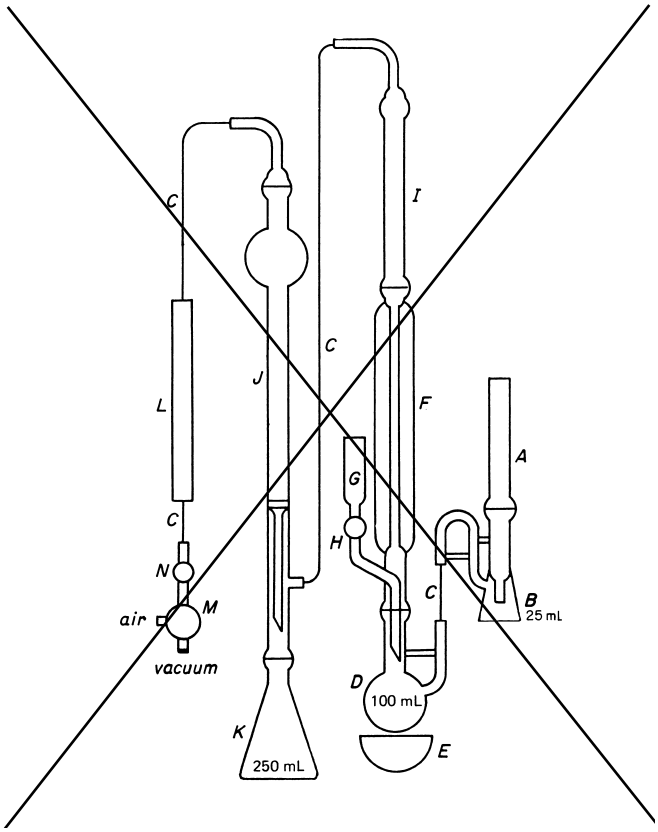
~~*trations* under *Titrimetry* ⟨541⟩. Each mL of 0.25 *N* sodium hydroxide consumed is equivalent to 5.5 mg of carbon dioxide (CO_2).~~ ■1S (*USP27*)

Add the following:

▪APPARATUS

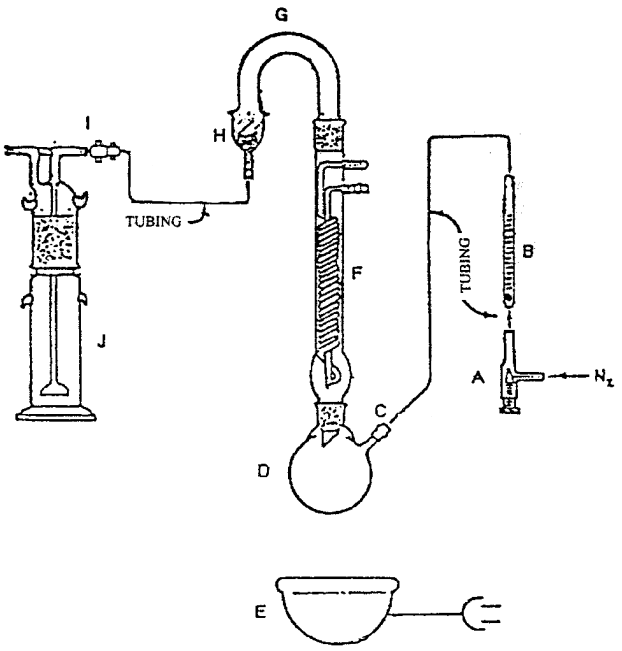
The required apparatus (see *Figure 1*) contains a capillary metering valve, *A*, followed by a flowmeter, *B*, to control and monitor the flow of nitrogen through the system. Halogenated vinyl plastic tubing* and a rubber fitting, *C*, are used to connect the flowmeter to a sidearm of a reaction flask, *D*. Flask *D* is a 250-mL round-bottom, boiling flask, resting in a suitable heating mantle, *E*. Flask *D* is provided with a 225-mm Hopkins coil reflux condenser, *F*. The condenser terminates in a U-shaped trap, *G*, which contains two 25-g bands of 20-mesh zinc, the bands being bounded and separated by three 3-inch plugs of glass wool. The trap terminates in an adapter, *H*, that by means of a halogenated vinyl plastic tubing and a twistcock connector, *I*, connects with a 250-mL gas washing bottle, *J*. The inlet (bubbling) tube extends almost to the bottom of the gas washing bottle, and it terminates in a fritted disc having a coarse porosity. The size of all glass joints is $^{24}/_{40}$, except for the $^{45}/_{50}$ joint of the gas washing bottle. ■1S (*USP27*)

Change to read:



~~Apparatus for Alginates Assay~~

* This type of tubing is commonly referred to as Tygon tubing. This note is added for clarity and it does not constitute USP's endorsement of this product.



■Fig. 1. Apparatus for Alginates Assay■1S (*USP27*)

Add the following:

■SYSTEM SUITABILITY

Using D-glucuronolactone as the standard, proceed as directed for *Procedure*, but do not perform preboiling steps. The system is suitable if the following criteria are met: (1) a blank determination results in a net titration value ~~between 0.2 and 0.6 mL of 0.1 N hydrochloric acid, and (2) the recovery obtained from the standard is between 99.0% and 101.0%.~~ *C*, between 0.02 and 0.06 mEq of 0.1 N hydrochloric acid, calculated as follows:

$$A_b - B_b,$$

in which A_b is the number of mEq of 0.25 N sodium hydroxide in the 25 mL used, and B_b is the number of mEq of 0.1 N hydrochloric acid used in the blank titration; and (2) the percentage of carbon dioxide, CO_2, obtained from the standard is between 24.7% and 25.3%.■1S (*USP27*)

Add the following:

■PROCEDURE

Unless otherwise directed in the individual monograph, transfer a specimen of about 250 mg, accurately weighed, into the reaction flask, *D*, add 50 mL of 0.1 N hydrochloric acid, insert several boiling chips, and connect the flask to the reflux condenser, *F*, using phosphoric acid as a lubricant. [NOTE—Stopcock grease may be used for the other connec-

In-Process Revision

tions.] Connect the nitrogen line to the sidearm of the flask, and adjust the flow of cooling water to about 2 liters per minute.

[NOTE—The following preboiling steps, outlined in this paragraph, are optional and need only be performed when the presence of inorganic carbonates is suspected.] Maintain the flow of nitrogen through the apparatus at 90 to 100 mL per minute. Raise the heating mantle, *E*, to the flask, heat the specimen to boiling, and boil gently for 2 minutes. Turn the heat off, lower the mantle, *E*, and allow to cool for about 10 minutes.

Connect the empty gas washing bottle assembly, *J*, and sweep the system with nitrogen at a rate of 90 to 100 mL per minute for 5 minutes. Reduce the nitrogen flow to 60 to 65 mL per minute, add 10 drops of butyl alcohol, 25.0 mL of 0.25 N sodium hydroxide VS, and 50 mL of distilled water into the bottle, rinsing down the inside of the gas washing bottle, and replace the cap. Detach the rubber fitting, *C*, from sidearm, and add 46 mL of hydrochloric acid through the sidearm of the boiling flask. Reattach the nitrogen line, raise the heating mantle, and heat the reaction mixture to boiling. After 2 hours of boiling, increase the nitrogen flow to 90 to 100 mL per minute, discontinue the heating, and lower the mantle. Allow to cool for 10 minutes. Disconnect, and disassemble the gas washing bottle. Using a directed stream of distilled water, thoroughly rinse all parts of the bubbling tube and cap, collecting the washings in the gas washing bottle. Use nitrogen to gently force all water out of the bubbling tube. To the bottle immediately add 10 mL of 10% barium chloride solution and a stirring bar. Insert a tight stopper, and stir gently for 1 minute. Allow to stand for at least 5 minutes. Add three drops of phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Calculate the percentage of carbon dioxide, CO_2, by the formula:

$$2200[(A - B) - C]/(1000W)(1 - D),$$

in which *A* is the number of mEq of 0.25 N sodium hydroxide in the 25 mL used; *B* is the number of mEq of 0.1 N hydrochloric acid used for the titration of the sample or the standard; *C* is the ~~number of mEq of 0.1 N hydrochloric acid used for the titration of the blank;~~ net titration value calculated in the blank determination. *W* is the weight, in g, of the sample or the standard taken; and *D* is the percentage obtained in the test for *Loss on drying* for the sample or for the standard. ■1S (*USP27*)

BRIEFING

⟨**341**⟩ **Antimicrobial Agents—Content,** *USP 26* page 2064. It is proposed to revise the *Standard Preparation* sections of the test for *Benzyl Alcohol* and the test for *Methylparaben and Propylparaben* under *General Gas Chromatographic Method* to include the use of the Reference Standards USP Benzyl Alcohol RS, USP Methylparaben RS, and USP Propylparaben RS which are now available. In addition, editorial style changes have been made.

(PA7b: B. Davani) RTS—39962-1

Change to read:

GENERAL GAS CHROMATOGRAPHIC METHOD

The general procedures set forth in the following paragraphs are applicable to the quantitative determination of benzyl alcohol, chlorobutanol, phenol, and the methyl, ethyl, propyl, and butyl esters of *p*-hydroxybenzoic acid, the latter being treated as a group, the individual members of which, if present, are capable of separate determination. Prepare the *Internal Standard Solution* and the *Standard Preparation* for each agent as directed individually below. Unless otherwise directed below, prepare the *Test Preparation* from accurately measured portions of the *Internal Standard Solution* and the sample under test, of such size that the concentration of the agent and the composition of the solvent correspond closely to the concentration and composition of the *Standard Preparation*. Suggested operating parameters of the gas chromatograph apparatus are given in the accompanying table, the carrier gas being helium or nitrogen, and the detector being the flame-ionization type.

Suggested Operating Parameters of Gas Chromatograph Apparatus

Agent	Column Size: Length	Column Size: ID	Column Packing Phases and Support	Flow Rate, mL per min.	Column Temperature
Benzyl Alcohol	1.8 m	3 mm	5% G16/S1A	50	140°
Chlorobutanol	1.8 m	2 mm	5% G16/S1A	20	110°
Phenol	1.2 m	3 mm	5% G16/S1A	50	145°
Parabens	1.8 m	2 mm	5% G2/S1A	20	150°

Benzyl Alcohol

Internal Standard Solution—Dissolve about 380 mg of phenol in 10 mL of methanol contained in a 200-mL volumetric flask. Add water to volume, and mix.

Standard Preparation—Dissolve about 180 mg of ~~benzyl alcohol,~~

■USP Benzyl Alcohol RS,■1S (*USP27*)
accurately weighed, in 20.0 mL of methanol contained in a 100-mL volumetric flask. Add *Internal Standard Solution* to volume, and mix.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure the areas under the peaks for benzyl alcohol and phenol. Calculate the content, in mg per mL, of benzyl alcohol (C_7H_8O) in the specimen taken by the formula:

$$100(C/V)(p_1/p_2)(P_2/P_1),$$

in which C is the concentration, in mg per mL, of benzyl alcohol in the *Standard Preparation; V* is the volume, in mL, of the specimen under test used in preparing each 100 mL of the *Test Preparation; p_1* and p_2 are the peak areas for benzyl alcohol and phenol, respectively, obtained from the *Test Preparation;* and P_1 and P_2 are the peak areas of benzyl alcohol and phenol, respectively, obtained from the *Standard Preparation*.

Chlorobutanol

Internal Standard Solution—Transfer about 140 mg of benzaldehyde to a 100-mL volumetric flask, add 10 mL of methanol, and swirl to dissolve. Dilute with water to volume, and mix.

Standard Preparation—Transfer about 125 mg of chlorobutanol, accurately weighed, to a 25-mL volumetric flask. Add 2 mL of methanol, swirl to dissolve, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal Standard Solution* to a 25-mL flask, and mix to obtain a solution having a known concentration of about 2.5 mg of chlorobutanol per mL.

Test Preparation—Dilute, if necessary, an accurately measured volume of the specimen under test quantitatively with methanol to obtain a solution containing not more than about 5.0 mg of chlorobutanol per mL. Combine 3.0 mL of this solution with 3.0 mL of *Internal Standard Solution*, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—See accompanying table for column dimensions, column packing phase and support, flow rate, and column temperature.] The injection port temperature is maintained at 180°, and the detector is maintained at 220°. Chromatograph the *Standard Preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for benzaldehyde and 1.0 for chlorobutanol; the resolution, R, between benzaldehyde and the chlorobutanol is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of chlorobutanol ($C_4H_7Cl_3O$) in each mL of the specimen under test by the formula:

$$C(L/D)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of chlorobutanol, calculated on the anhydrous basis, in the *Standard Preparation; L* is the labeled quantity, in mg, of chlorobutanol in each mL of the specimen under test; D is the concentration, in mg per mL, of chlorobutanol in the *Test Preparation*, based on the volume of specimen under test taken and the extent of dilution; and R_U and R_S are the ratios of the chlorobutanol peak to the benzaldehyde peak obtained from the *Test Preparation* and the *Standard Preparation*, respectively.

Phenol

Internal Standard Solution—Pipet 1 mL of benzyl alcohol into a 500-mL volumetric flask, add methanol to volume, and mix.

Standard Preparation—Dissolve about 75 mg of phenol, accurately weighed, in 7.5 mL of methanol contained in a 100-mL volumetric flask. Add 20.0 mL of *Internal Standard Solution*, then add water to volume, and mix.

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure the areas under the peaks for phenol and benzyl alcohol Calculate the content, in mg per mL, of phenol (C_6H_6O) in each mL of the specimen taken by the formula:

$$100(C/V)(p_1/p_2)(P_2/P_1),$$

in which C is the concentration, in mg per mL, of phenol in the *Standard Preparation; V* is the volume, in mL, of the specimen under test used in preparing each 100 mL of the *Test Preparation; p_1* and p_2 are the peak areas for phenol and benzyl alcohol, respectively, obtained from the *Test Preparation;* and P_1 and P_2 are the peak areas of phenol and benzyl alcohol, respectively, obtained from the *Standard Preparation*.

Methylparaben and Propylparaben

Internal Standard Solution—Place about 200 mg of benzophenone in a 250-mL volumetric flask, dilute with ether to volume, and mix.

Standard Preparation—Place 100 mg of ~~methylparaben~~

■USP Methylparaben RS■1S (*USP27*)
and 10 mg of ~~propylparaben,~~

■USP Propylparaben RS,■1S (*USP27*)
each accurately weighed, in a 200-mL volumetric flask, dilute with *Internal Standard Solution* to volume, and mix. Place 10 mL of this solution in a 25-mL conical flask, and proceed as directed for *Test Preparation*, beginning with "Add 3 mL of pyridine."

In-Process Revision

Test Preparation—Pipet 10 mL of the specimen under test and 10 mL of the *Internal Standard Solution* into a small separator. Shake vigorously, allow the layers to separate, draw off the aqueous layer into a second separator, and transfer the ether layer into a small flask through a funnel containing anhydrous sodium sulfate. Extract the aqueous layer with two 10-mL portions of ether, also filtering the extracts through the anhydrous sodium sulfate. Evaporate the combined extracts under a current of dry air until the volume is reduced to about 10 mL, then transfer the residue to a 25-mL conical flask. Add 3 mL of pyridine, complete the evaporation of the ether, and boil on a hot plate until the volume is reduced to about 1 mL. Cool, and add 1 mL of a suitable silylation agent, such as bis(trimethylsilyl)trifluoroacetamide, bis(trimethylsilyl)acetamide, or a mixture of hexamethyldisilazane and trimethylchlorosilane [2:1 or 3:1 (v/v)]. Mix, and allow to stand for not less than 15 minutes.

Procedure—Separately inject equal volumes (2 µL) of the silanized solution from the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure the areas under the peaks for methylparaben, propylparaben, and benzophenone. Calculate the content, in µg per mL, of methylparaben ($C_8H_8O_3$) in the sample under test by the formula:

$$10(C_M / V)(p_1 / p_3)(P_3 / P_1),$$

in which C_M is the concentration, in µg per mL, of methylparaben in the *Standard Preparation; V* is the volume, in mL, of the specimen taken; p_1 and p_3 are the peak areas for methylparaben and benzophenone, respectively, obtained from the *Test Preparation;* and P_1 and P_3 are the peak areas of methylparaben and benzophenone, respectively, obtained from the *Standard Preparation*. Similarly, calculate the content, in µg per mL, of propylparaben ($C_{10}H_{12}O_3$) in the specimen under test by the formula:

$$10(C_P / V)(p_2 / p_3)(P_3 / P_2),$$

in which C_P is the concentration, in µg per mL, of propylparaben in the *Standard Preparation; V* is the volume, in mL, of the specimen taken; p_2 and p_3 are the peak areas for propylparaben and benzophenone, respectively, obtained from the *Test Preparation;* and P_2 and P_3 are the peak areas of propylparaben and benzophenone, respectively, obtained from the *Standard Preparation*.

Ethylparaben and butylparaben may be determined in a similar manner.

BRIEFING

⟨386⟩ Environmentally Sensitive Preparations. The chapter previously proposed as *Shipping and Storage of Labile Preparations* ⟨1186⟩ (see page 495 of *PF* 28(2) [Mar.–Apr. 2002]), is canceled. A new chapter, *Environmentally Sensitive Preparations* ⟨386⟩, is proposed by the USP Expert Committee on Packaging, Storage, and Distribution. The Expert Committee believes that most articles are uncompromised in the manufacturer's original container when shipped or stored under stressful environmental conditions. However, there is uncertainty about the product's stability when it is removed from the manufacturer's original container and repackaged into another container that may be shipped or stored under stressful environmental conditions. This chapter is intended to focus on this process to ensure that proper communication and requirements are established to protect the integrity of the repackaged product until it reaches the patient.

The test criteria outlined for determining environmentally sensitive preparations are similar to test requirements recommended in the Q1A guidelines of the International Conference on Harmonization. The emphasis is placed on repackaging practices of a repackager, a pharmacist, or a manufacturer and also on the communication channel from the manufacturer to the repackaging pharmacist, and from the pharmacist to the patient. The USP Expert Committee believes that proper communication lines should be maintained from the manufacturer to the repackager and to the pharmacist. Some other aspects of the chapter remain the same. These include the use of temperature monitoring devices as referenced in *Monitoring Devices—Time, Temperature, and Humidity* ⟨1118⟩, and a consideration of the use of unit-of-use packaging (as discussed in *Packaging—Unit of Use* ⟨1136⟩) to obviate any form of repackaging.

In addition, there are some editorial changes, and some modification of the text based on the comments received from the previous publication of ⟨1186⟩. Other changes in this proposed chapter are intended to clarify the content.

(PSD: C. Okeke) RTS—39951-1

Add the following:

■⟨386⟩ ENVIRONMENTALLY SENSITIVE PREPARATIONS

In the interest of ensuring the integrity of a pharmaceutical article as it reaches the patient for a course of treatment, this chapter focuses on preparations that may be repackaged or dispensed in other than the market package so that proper storage and shipment instructions can be included with the official preparation. It is assumed that, as long as these packaged preparations are transported according to the directions in the package insert, the original manufacturer's packages are sufficient for assuring that these requirements are met.

An individual preparation is an *Environmentally Sensitive Preparation* if data indicate the failure of that preparation to conform to a monograph requirement after exposure to one of the following sets of criteria.

CRITERIA TO DETERMINE IF A PRODUCT IS AN ENVIRONMENTALLY SENSITIVE PREPARATION

NOTE—The dosage form may be protected from light during the studies.

1. Use pertinent stability data available on file, or

2. Determine if a preparation meets the test requirements (*a–d*) listed below. If a preparation does not meet a monograph requirement after exposure to conditions specified for requirement *a*, retest as directed for *b*, *c*, or *d*, as appropriate.

a. For any dosage form: 3 months at a temperature of 40 ± 2° and 75 ± 5% relative humidity in the market container, or 30 ± 2° and 60 ± 5% relative humidity for 6 months.

b. For solutions: 3 months at a temperature of 37° to 40 ± 2° and ambient humidity in the market container.

c. For semisolids and heterogeneous liquids, such as creams, transdermal systems, gels, emulsions, and suspensions; and for sterile solids for injection: 6 months at a temperature of 30 ± 2° and 60 ± 5% relative humidity in the market container.

d. For solid oral dosage form: 30 days at a temperature of 25 ± 2° and 60 ± 5% relative humidity in an open dish (i.e., the container without closure, coil, desiccant, or unsealed blisters).

Definitions

For the purpose of this chapter, a packager is defined as one who puts a drug product into a primary container for distribution to patients. A packager may be a repackager, a pharmacist, or a manufacturer.

Labeling, Storage, and Shipping

Decisions regarding the labeling of a product as an *Environmentally Sensitive Preparation* are the responsibility of the packager and are based on the product's characteristics and stability history.

Where data establish that a preparation is an *Environmentally Sensitive Preparation*, any of the following labeling and shipping arrangements are employed, as appropriate, to ensure monograph conformity.

a. The article is shipped in a manner that (1) ensures that its integrity is maintained, and (2) is based on product information, packaging data, and the distribution system used.

b. The article is shipped in suitable appropriate protective packaging—insulated package—that could include foil-laminated polyethylene bags, desiccant containers, or packages of sufficient desiccant capacity.

c. The article is shipped with a validated time–temperature monitoring device (see *Monitoring Devices—Time, Temperature, and Humidity* ⟨1118⟩and other good storage and shipping practice documents). The monitoring device is affixed either to the outer shipping package or to the packaging of individual containers (for example, for mixed shipments).

d. Unopened packages shall be moved through the distribution chain with the monitoring device intact.

e. Where shipping is expected to extend beyond 48 hours, instructions are included, specifying that the article is not to be used if the monitoring device discloses a cumulative history of exposure equivalent to more than 48 hours at or above a temperature of 40°. A manufacturer may make other assurances about packaging and distribution arrangements based on product data and information.

Instructions to the Pharmacist or Repackager

Suitable information must be available to identify an *Environmentally Sensitive Preparation* to the pharmacist or repackager along with appropriate instructions for handling the preparation. For example, the labeling of a manufac-

In-Process Revision

turer's multiple-unit package (or market repackage) of a humidity-sensitive preparation may include one or more of the following statements:

a. Do not dispense more than a 30-day supply of the prescription in one multiple-unit container.
b. Dispense it in a desiccant container of sufficient desiccant capacity.
c. Dispense it in a tight or Class A container (see *Containers—Permeation* ⟨671⟩) if it is not dispensed in a market package.
d. "Do not repackage", if the medication is not to be repackaged.
e. Dispense it in a unit-of-use container (see *Packaging—Unit of Use* ⟨1136⟩).
f. Label the patient's containers to state "use the contents within 30 days from the first day that individual container is opened".

Instructions to Institutional Settings

In an institutional setting, store packages of an *Environmentally Sensitive Preparation* at controlled room temperature or according to labeled requirements in the market package. Packages dispensed for use by a particular patient should bear a beyond-use date of 3 months or 90 days and a statement "Store at 20° to 25° (68° F to 77° F)", unless (1) data support other labeling or (2) other manufacturer's recommendations are applicable.

Instructions to the Manufacturer

For an *Environmentally Sensitive Preparation* for which data support other labeling, beyond-use dates, or exposure equivalents, the manufacturer must include labeling and information suitable for optimal handling by the practitioner or pharmacist, by the repackager, and by the patient. Product development or stability data can be used to determine appropriate labeling and shipping statements that will properly inform patients and practitioners.

When repackagers and pharmacists, including hospital, emergency medical services, mail service, Internet-based services, and other practitioners, request information about product behavior upon exposure to various temperature and humidity conditions, pharmaceutical manufacturers are encouraged to provide such information if available.

Exemptions

1. The following preparations are exempt from the above considerations: those labeled that they must be stored and transported refrigerated or frozen; labeled radiopharmaceuticals; and those shipped and received in not more than the time period specified on the outer package, provided data are available to show that the stability of the article is not compromised during that period under the expected conditions of temperature and/or humidity.
2. For classifying a preparation as an *Environmentally Sensitive Preparation*, the general chapter *Uniformity of Dosage Units* ⟨905⟩ does not apply.■1S (*USP27*)

BRIEFING

⟨**401**⟩ **Fats and Fixed Oils,** *USP 26* page 2086. It is proposed to add two general procedural sections, *Anisidine Value* and *Total Oxidation Value*, to this general test chapter because these procedures are proposed for several monographs containing polyunsaturated fatty acids.

(DSN: G. Giancaspro; ETM: C. Sheehan) RTS—39705-4

Add the following:

▪ANISIDINE VALUE

The anisidine value is defined as 100 times the optical density measured in a 1-cm cell of a solution containing 1 g of the substance to be examined in 100 mL of a mixture of solvents and reagents according to the method described below. [NOTE—Carry out the operations as rapidly as possible, avoiding exposure to actinic light.]

Test Solution A—Dissolve 0.500 g of the substance to be examined in isooctane, and dilute with the same solvent to 25.0 mL.

Test Solution B—To 5.0 mL of *Test Solution A* add 1.0 mL of a 2.5 g per L solution of *p*-anisidine in glacial acetic acid, shake, and store protected from light.

Standard Solution—To 5.0 mL of isooctane add 1.0 mL of a 2.5 g per L solution of *p*-anisidine in glacial acetic acid, shake, and store protected from light.

Procedure—Measure the absorbance of *Test Solution A* at 350 nm using isooctane as the blank. Measure the absorbance of *Test Solution B* at 350 nm exactly 10 minutes after its preparation, using the *Standard Solution* as the compensation liquid. Calculate the Anisidine Value from the expression:

$$\frac{25(1.2A_s - A_b)}{m},$$

in which A_S is the absorbance of *Test Solution B* at 350 nm; A_b is the absorbance of *Test Solution A* at 350 nm; and m is the weight, in g, of the substance to be examined in *Test Solution A*.▪1S (*USP27*)

Add the following:

▪TOTAL OXIDATION VALUE (TOTOX)

Total Oxidation Value is defined by the formula:

$$2PV + AV,$$

in which *PV* is the *Peroxide Value*, and *AV* is the *Anisidine Value*.▪1S (*USP27*)

BRIEFING

⟨429⟩ Light Diffraction Measurement of Particle Size, page 484 of *PF* 29(2) [Mar.–April 2003]. This new general test chapter, which was previously presented in 29 (2) is republished with additional revisions to clarify the text of this chapter: (1) Additional information on the use of microscopy to determine agglomerates is added to the opening paragraphs; (2) An elaboration of the use of the Mie theory is added under *Selection of an Appropriate Optical Model*; and (3) Recommendations to state the cell type, sample state and preparation, and the make and model of the equipment are included in the section *Conversion of Scattering Pattern into Particle Size Distribution*.

(ETM: J. Lane) RTS—39926-1

Add the following:

▪⟨429⟩ LIGHT DIFFRACTION MEASUREMENT OF PARTICLE SIZE

Light diffraction is one of the most widely used techniques for measuring the size of ~~particles in the range of 0.1 µm to 3 mm.~~ a wide range of particles from very fine to very coarse. ~~This popularity is partly due to the way precise measurements can be made quickly and easily. The method is also popular due to the flexibility of the technique, particularly the way.~~ The method is popular because it is quick and easy to use, flexible, and it can be adapted to measure samples presented in various physical forms. The method depends on ~~analyzing~~ the analysis of the diffraction pattern produced when particles are exposed to a collimated

In-Process Revision

beam of light. As the patterns are characteristic of the particle size, mathematical analysis can produce an accurate, ~~reproducible~~ repeatable picture of the size distribution.

This chapter provides guidance on the measurement of size distributions of particles in any phase system (e.g., powders, sprays, aerosols, suspensions, emulsions, and gas bubbles in liquids) through analysis of their angular light-scattering patterns. ~~The method is applicable to particle sizes ranging from approximately 0.1 µm to 3 mm.~~ Traditionally, the measurement of particle size using laser diffraction has been limited to particles in the range 0.1 µm to 3 mm. Due to recent advances in optics and lens and equipment design and construction, newer instruments are routinely capable of exceeding this range (e.g., 0.1 µm to 8 mm). It is the responsibility of the user to demonstrate the applicability of the instrument for its intended use and to validate any method prior to its adoption for routine use.

For nonspherical particles, an equivalent-sphere size distribution is obtained because the technique uses the assumption of spherical particles in its optical model. The resulting particle size distribution may be different from those obtained by methods based on other physical principles (such as sedimentation or sieving). The laser diffraction technique cannot distinguish between scattering by single particles and scattering by clusters of primary particles forming an agglomerate or an aggregate. If the presence of aggregates is suspected, this can be investigated using other techniques such as microscopy.

The laser diffraction technique is based on the phenomenon that particles scatter light in all directions with an intensity pattern that is dependent on particle size. All present instruments assume a spherical shape for the particles. Historically, the ~~laser diffraction technique started by taking~~ early laser diffraction instruments used only scattering at small angles ~~into consideration~~ and, thus, has been known by the following names: Fraunhofer diffraction, (near-) forward light scattering, and low-angle laser light scattering (LALLS).

However, the technique sincehas been broadened to include light scattering in a wider angular range ~~and~~ by application of the Mie theory, in addition to ~~approximating other techniques such as that from Fraunhofer~~ the Fraunhofer approximation and anomalous diffraction.

The measurement of particle size is an important aspect in the characterization of raw materials and drug formulations. To monitor production and particle stability, efficient and rapid methods for particle sizing are needed. The electronic measurement of samples offers a convenient solution to this problem. However, the electronic measurement will often have to be accompanied by microscopical investigation to determine the type of particles being investigated. Modern drug formulations may also be particulate formulations where the particle size will be below 100 µm, and reliable and reproducible methods are needed for the quality control of these drug products.

PRINCIPLE

A representative sample, dispersed at an adequate concentration in a suitable liquid or gas, is passed through the beam of a monochromatic light source, usually from a laser. The light scattered by the particles at various angles is measured by a multi-element detector, and numerical values relating to the scattering pattern are then recorded for subsequent analysis. These numerical scattering values are then transformed, using an appropriate optical model and mathematical procedure, to yield the proportion of total volume to a discrete number of size classes forming a volumetric particle size distribution (e.g., x_{50} describes a particle diameter corresponding to 50% of the cumulative undersize distribution).

APPARATUS

A typical setup for a laser diffraction instrument is shown in *Figure 1*.

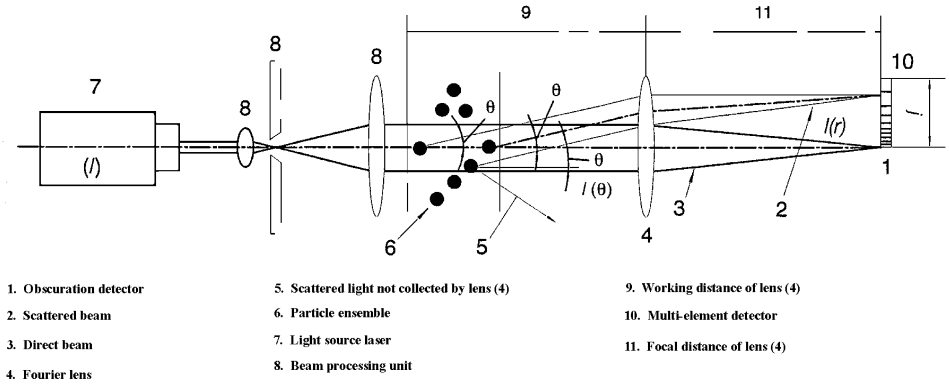


Fig. 1. Typical setup for a laser diffraction instrument.

A representative sample, dispersed at an adequate concentration, is passed through the light beam in a measuring zone by a transporting ~~medium~~ fluid (gas or liquid); this measuring zone should be within the working distance of the lens used. In some cases the particle stream in a process is illuminated directly by the laser beam for measurement, as in the case of sprays, aerosols, and air bubbles in liquids. In other cases (such as emulsions, pastes, and powders), representative samples can be dispersed in suitable liquids. Often dispersants (such as wetting agents or stabilizers) or mechanical forces (such as agitation or ultrasonication), or both, are applied to deagglomerate particles and to stabilize the dispersion. For these liquid dispersions, a recirculating system is most commonly used, consisting of an optical measurement cell, a dispersion bath (usually equipped with stirrer and ultrasonic elements), a pump, and tubing.

Dry powders can also be converted into aerosols through ~~application~~ the use of dry powder dispersers, which apply mechanical forces for deagglomeration. In this case, a dosing device feeds the disperser with a constant mass flow of sample. The disperser uses the energy of compressed gas or the differential pressure to a vacuum to disperse the particles. It outputs an aerosol that is blown through the measuring zone, usually into the inlet of a vacuum pipe that collects the particles.

There are two positions in which the particles can enter the laser beam. In the conventional case, the particles enter the parallel beam before and within the working distance ofthe collecting lens. In the so-called reversed Fourier optics case, the particles enter behind the collecting lens, and thus in a converging beam.

The advantage of the conventional setup is that a reasonable path length for the sample is allowed within the working distance of the lens. The second setup allows only small path lengths but enables measurement of scattered light at larger angles, which is useful when ~~submicrometer~~ submicron particles are present.

The interaction of the incident light beam with the dispersed particles results in a scattering pattern with different light intensities at various angles. The total angular intensity distribution, consisting of both direct and scattered light, is then focused by a positive lens or an assembly of lenses onto a multi-element detector. The lens(es) provide(s) for a scattering pattern which, within limits, is not dependent upon the location of the particles in the light beam. Thus the con-

In-Process Revision

tinuous angular intensity distribution is converted into a discrete spatial intensity distribution on a set of detector elements.

It is assumed that the recorded scattering pattern of the particle ensemble is identical to the sum of the patterns from all individual single scattering particles presented in random relative positions. Note that only a limited angular range of scattered light is collected by the lens(es), and thus by the detector.

PREPARATION OF THE SAMPLE

Prepare a representative sample of suitable volume for the measurement by an adequate sample splitting technique.

Sprays, aerosols, and gas bubbles in liquid should be measured directly, provided that their concentration is at an ~~adequate~~ appropriate level, since sampling or dilution is generally impossible without altering the particle size distribution.

The dispersion procedure is adjusted to the purpose of the measurement: for example, ~~one must decide~~ whether agglomerates should be detected or broken down to primary particles.

For the development of a method, it is necessary to check that comminution of the primary particles does not occur, and conversely that a good dispersion of the agglomerates has been achieved. ~~This~~ The dry particles may be examined microscopically before and after the addition and dispersion of aliquots of the dispersing liquid to determine if the particle size has changed, and if the agglomerates are dispersed but the primary particles are not fractured. The effect of the dispersion process can usually be ~~done~~ checked by changing the dispersing energy and monitoring the change of the size distribution. The measured size distribution does not change significantly if the sample is well dispersed and the particles are neither fragile nor soluble. Microscopy may also be used to investigate primary particle comminution and adequacy of dispersion.

Dispersion Liquids

A variety of liquids are available for the dispersion of powders and must have the following characteristics:

— be transparent at the laser wavelength and free from air bubbles or other particles,
— be compatible with the materials used in the instrument (O-ring, tubing, etc.),
— not dissolve or alter the size of the particulate materials,
— favor easy and stable dispersion of the particulate material,
— have suitable viscosity to enable calculation,
— have a refractive index ~~differing~~ that differs from that of the material (for the Mie calculation), and
— not be hazardous to health and meet safety requirements.

A low-foaming surfactant and dispersant may be used to facilitate the wetting of the particles and to stabilize the dispersion. A preliminary check on the dispersion quality can be made by visual or microscopic inspection of the suspension.

If very small samples are required, it is also possible to take fractional samples out of a well-mixed sample paste if the material is neither fragile nor soluble. The consistency of the paste then prevents segregation errors. The pastes are formed by adding dispersant to the sample dropwise, while mixing it with a spatula. As long as the mixture forms lumps, single drops should be added while continuing the mixing after each drop. A good consistency for the paste is one like honey or toothpaste. If the paste becomes too fluid by mistake, it cannot be used, and a new preparation is initiated.

Alternatively, a concentrated suspension may be prepared. While stirring this concentrated suspension, a small aliquot is removed and transferred to the optical measurement cell containing the blank dispersing medium. Care must be taken to ensure the complete transfer of the sample and that settling of the larger particles does not occur.

Where a dispersant that does not dissolve the particles cannot be found, it may be possible to use a prefiltered, saturated solution of the sample in the dispersing solvent as the dispersant. Such a saturated solution may be produced by stirring an excess of sample in the dispersing solvent for several hours. For weak acids and weak bases, buffering of the dispersing solvent at low or high pH, respectively, can assist in identifying a suitable dispersant. The saturated medium is filtered using a membrane filter to remove any undissolved sample before use. This approach is not suitable if the sample forms a more viscous concentrated solution.

Dispersion Gases

For dry dispersion and spray applications, a compressed gas is sometimes used. If used, it is essential that it is free from oil, water, and particles. To achieve this, a dryer with a filter is required. Any vacuum unit is located away from the measurement zone, so that the output of the hot air does not reach the measuring zone. Avoid drafts in order to avoid unstable particulate streams.

Concentration

The particle concentration in the dispersion should be above a minimum level, which for many instruments will correspond to about 5% obscuration, in order to produce an acceptable signal-to-noise ratio in the detector. Likewise, it should be below a maximum level in order to avoid multiple scattering (for example, 35% above 20 μm and 15% below 20 μm).

The ~~range of concentrations~~ optimum concentration is influenced by the laser beam width, the path length of the measurement zone, the optical properties of the particles, and the sensitivity of the detector elements. In view of the above, perform measurements at different particle concentrations in order to decide on the optimum concentration range that achieves the required obscuration for any typical sample of material.

MEASUREMENT

Setting Up the Instrument and Blank Measurement

After selection of the appropriate particle size range and proper alignment of the optical part of the instrument, a blank measurement is performed in which a particle-free dispersion medium is used.

Measurement of the Scattering of Dispersed Sample(s)

Generally, ~~a measuring time allowing for~~ a large number of detector scans or sweeps at short time intervals is used (typically some 2 seconds or 1000 sweeps). For each detector element an average signal is calculated, sometimes together with its standard deviation. Data are stored in the computer memory. The magnitude of the signal from each detector element depends upon the detection area, the light intensity, and the quantum efficiency. The coordinates (size and position) of the detector elements, together with the focal distance of the lens, determine the region of scattering angles for each element. ~~Generally all these~~ These factors are factory-determined and stored in the computer.

In-Process Revision

Most instruments also measure the intensity of the central laser beam. The difference between a dispersed sample and a blank experiment is given as an obscuration value, which is indicative of the total amount of scattering light and the particle concentration.

Selection of an Appropriate Optical Model

Most often either the Fraunhofer approximation or the Mie theory is used, ~~Sometimes other approximating theories are applied for calculation of the scattering matrix.~~ though other approximations are sometimes applied for calculation of the scattering matrix. Below approximately 25 µm, the differences between the optical models become more significant. In this size range, the proper application of the Mie theory (assuming accurate real and imaginary refractive index values) provides the greatest accuracy. When using the Mie theory, the refractive indices of particulate and medium, or their ratio, are entered into the instrument to allow calculation of the model matrix. Often, small values of the imaginary part of the refractive index (about 0.01–0.1) are applied to cope with the surface roughness of the particles.[1] In order to obtain traceable results, it is essential that the refractive index values used are reported.

Conversion of Scattering Pattern into Particle Size Distribution

This deconvolution step is the inverse of the calculation of a scattering pattern for a given particle size distribution. The fact that rapidly measured data always contain some random and systematic errors may cause erroneous size distribution results. Several mathematical procedures have been developed for use in the different instruments available. They ~~contain~~ allow for some weighting of deviations between measured and calculated scattering patterns (such as least squares), some constraints (such as non-negativity for amounts of particles), or (or in combination with) some smoothing of the size distribution curve. A new procedure uses the observed fluctuations of the detector signals to introduce proper weighting of these data and to calculate confidence intervals for the particle size distribution.

The algorithms used are specific to each make and model of equipment and are proprietary. The differences in the algorithms between different instruments can give rise to differences in the particle size statistics. For this reason, when reporting the particle size distribution and statistics for a given material, also report the cell type, sample state and preparation, together with the make and model of the equipment.

Replicates

The required precision of the method is dependent on the characteristics of the material (milled versus not milled, robust versus fragile), and also on the requirements of the application (formulation type and technique). Appropriate measurement conditions are established experimentally, in relation to the desired precision. In general, at least three different representative samples from the same batch are measured. The repeatability of ~~characteristic particle size in size distributions~~ the particle size distribution parameter is as follows: for any ~~chosen~~ central value of the distribution, for example the median ~~size~~ (x_{50}), the coefficient of variation is ~~smaller~~ less than 10%. ~~Values at the sides of the distribution, for example x_{10} and x_{90}, have a coefficient of variation not exceeding.~~ For values away from the center of the distribution, for example x_{10} and x_{90}, the coefficient of variation cannot exceed 15%. Below 10 µm, these maximum values are doubled.

[1] Small differences in the assumed complex refractive index may cause significant differences in the resulting particle size distributions.

System Suitability

The system suitability test is used to verify that the precision and accuracy are adequate for the analysis to be done. The test is based on the concept that the equipment, electronics, and analytical operations constitute an integral system that can be evaluated as such. This can be done by measuring at regular time intervals a control material of known size distribution. In general, unless otherwise specified in the individual monograph, the mean values of three measurements must deviate from the established value by less than 10% for x_{50}, and by less than 15% for x_{10} and x_{90}. Below 10 µm, these maximum values ~~must be~~ are doubled.

Reporting of Results

The distribution statistics are usually reported by the instrument data system. Most common parameters are calculated from the cumulative distribution by interpolation. Percentile sizes, x_m, represent the particle size in relation to which m percent of the distribution is smaller. (The notation d_m is also used and is equivalent to x_m.) Q_y represents the percent smaller than y microns. Mean sizes, such as $D_{4,3}$, the arithmetic volume mean diameter, can also be calculated by representing the distribution as a collection of spherical particles with diameters of the size band midpoints. Unless otherwise stated, parameters are calculated on the volume or mass basis.

~~VALIDATION~~ QUALIFICATION

Calibration

Laser diffraction systems are based on the direct measurement of the diffraction pattern of particles, but with idealized properties of the particles. Thus, calibration in the strict sense is not required. However, it is still necessary and desirable to confirm the correct operation of the instrument with a ~~validation~~ qualification procedure.

Accuracy and Repeatability

~~Primary validation~~ Primarily, qualification validation can be made with any certified or standard reference material, acceptable for use in the particular ~~industries.~~ industry. Here, the total measurement procedure is being examined, including sampling, sample dispersion, sample transport through the measuring zone, measurement, and the deconvolution procedure. It is essential that the total operational procedure is adequately described in full detail.

Certified or standard reference materials consisting of a known distribution having a range of spherical particles over one decade of size are preferred. They ~~must be~~ are certified to mass percentage by an absolute technique, if available, and used in conjunction with an agreed, detailed operational procedure. It is essential that the real and imaginary part of the complex refractive index are precisely specified for the material if the Mie theory is applied in data analysis.

The response of a laser diffraction instrument is considered adequate if the mean value of x_{50} obtained from at least three independent measurements ~~deviates by less than 3% from the certified range of values of the certified or standard reference material (i.e., the mean value together with its standard deviation).~~ does not exceed the certified range of values of the certified or standard reference material by more than 3%. The mean values for x_{10} and x_{90} must ~~deviate by less than 5% from the certified range of values.~~ not exceed the certified range of values by more than 5%. For repeatability, the coefficient of variation must be ~~smaller~~ less than 3% for x_{50} and ~~smaller~~ less than 5% for x_{10} and x_{90}. Below 10 µm, these maximum values ~~must be~~ are doubled.

In-Process Revision

Although the use of spherical materials is preferable, nonspherical ones may also be used. Preferably, these have certified or typical values coming from laser diffraction analyses according to an agreed, detailed operational procedure. If the reference values come from methods other than laser diffraction, a significant bias may result. The reason for this bias is that the different principles applied in the various methods may lead to different ~~sensitivity to the properties,~~ responses to the particles, and thus to different equivalent-sphere diameters for the same nonspherical particle.■1S (*USP27*)

BRIEFING

⟨467⟩ Organic Volatile Impurities, *USP 26* page 2077; **General Notices,** *USP 26* page 3; **⟨1086⟩ Impurities in Official Articles,** *USP 26* page 2331. General Chapter *Organic Volatile Impurities* ⟨467⟩, *General Notices* (*Foreign Substances and Impurities*), and General Chapter *Impurities in Official Articles* ⟨1086⟩ are being revised to provide consistency with the ICH Q3C Guideline (*Impurities: Guideline for Residual Solvents*) and to further harmonize with the *European Pharmacopoeia* (*2.4.24 Identification and control of residual solvents* and *5.4 Residual solvents*).

The current USP General Chapter *Organic Volatile Impurities* ⟨467⟩ is inconsistent with the ICH Q3C Guideline because of terminology and options for describing limits of Class 2 residual solvents. With respect to terminology, both the *General Notices* (*Foreign Substances and Impurities*) and General Chapter ⟨467⟩ use "organic volatile impurities" whereas the ICH Q3C Guideline uses "residual solvents". For options describing limits of Class 2 residual solvents, the ICH Q3C Guideline provides two options: Option 1, where concentration limits, based on defined permitted daily exposure, are applied to each individual substance, excipient, or product, and Option 2, where the drug product is tested or by summing the amounts of a residual solvent present in each of the components. In contrast, the current USP General Chapter ⟨467⟩ only provides test procedures for organic volatile impurities in Pharmacopeial articles.

In addition, the procedures in USP General Chapter ⟨467⟩ for organic volatile impurities do not provide adequate sensitivity for the determination of benzene. The chromatographic systems A and B specified in the *European Pharmacopoeia* General Chapter *2.4.24 Identification and control of residual solvents*, and in this revision proposal, provide the requisite sensitivity.

USP intends to propose revisions to the USP organic volatile impurities policy in three stages. In the first stage, the current USP General Chapter ⟨467⟩ will be revised, as shown in this proposal, to incorporate the ICH Q3C Guideline and the *European Pharmacopoeia* procedures for *2.4.24 Identification and control of residual solvents* and *5.4 Residual solvents*. Revisions are also proposed in this stage for USP General Chapter *Impurities in Official Articles* ⟨1086⟩ and for the *USP General Notices and Requirements* (*Foreign Substances and Impurities*) to reflect the ICH Q3C Guideline. These stage 1 proposals are published elsewhere in this number of *PF*. With the adoption of these proposals, the residual solvents will be controlled by the requirements for residual solvents in General Chapter ⟨467⟩ and the information in General Chapter ⟨1086⟩ together with the requirements in the *USP General Notices* for *Residual Solvents* under *Foreign Substances and Impurities*. Stage 2 of this revision process will involve publication of a request for data to support replacement of *Organic Volatile Impurities* ⟨467⟩ specifications with Residual Solvents specifications in specific monographs. This request will appear in the *Policies and Announcements* section of a forthcoming issue of *PF*. Also in stage 2, USP will propose a change in the title of General Chapter ⟨467⟩ from *Organic Volatile Impurities* to *Residual Solvents*. In stage 3, USP will propose deletion of analytical Methods I, IV, V, and VI from General Chapter ⟨467⟩. This proposal will be made because Methods I, V, and VI are not suitable for analyzing benzene at the required level and Method IV is quite similar to the EP System A procedure.

Comments regarding this proposal are invited and should be submitted by November 28, 2003.

(PA2: W. Paul) RTS—35842-1

Change to read:

⟨467⟩ ORGANIC VOLATILE IMPURITIES

~~NOTE—The requirements for limit of benzene are removed from any article for which *Organic Volatile Impurities* ⟨467⟩ is specified in a *USP* or *NF* monograph except where a specific limit for benzene is included in an individual monograph.~~

~~The following methods are presented for determination of organic volatile impurities in Pharmacopeial articles. The particular method to be used and any necessary method details and variations are specified in the individual monographs.~~

~~Unnecessary testing may be avoided where a manufacturer has assurance, based on knowledge of the manufacturing process and controlled handling, shipping, and storage of an article, that there is no potential for specific toxic solvents to be present and that the material, if tested, will comply with established standards. In particular, items shipped in nontight containers, within the regulations that apply to food additives,* can be considered not to have acquired toxic solvents during transportation. (See *Procedures* under *General Notices*.) [NOTE—The organic-free water specified in the following methods produces no significantly interfering peaks when chromatographed.]~~

~~**Ethylene Oxide**—The test for ethylene oxide is conducted only where specified in the individual monograph. The standard solution parameters and the method for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 µg per g.~~

~~METHOD I~~

~~A gas chromatograph capable of temperature programming and equipped with a wide-bore wall-coated open-tubular column and a flame-ionization detector is used in the following procedure.~~

~~**Standard Solution**—Prepare a solution, in organic-free water or the solvent specified in the monograph, containing, in each mL, 12.0 µg of methylene chloride, 7.6 µg of 1,4-dioxane, 1.6 µg of trichloroethylene, and 1.2 µg of chloroform. [NOTE—Prepare fresh daily.]~~

~~* 49 C.F.R. 177.841 (e)(1), (3) (1995).~~

Test Solution— Dissolve in organic-free water or the solvent specified in the monograph, an accurately weighed portion of the material to be tested to obtain a final solution having a known concentration of about 20 mg of the bulk pharmaceutical chemical per mL.

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 5-µm chemically cross-linked G27 stationary phase, and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. [NOTE— When a makeup gas is used, nitrogen is recommended.] The injection port temperature and the detector temperature are maintained at 70° and 260°, respectively. The column temperature is programmed according to the following steps. It is maintained at 35° for 5 minutes, then increased to 175° at a rate of 8° per minute, followed by an increase to 260° at a rate of 35° per minute and maintained for at least 16 minutes.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Separately inject equal volumes (about 1 µL) of the *Standard Solution* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the peak responses.

Identify, based on retention time, any peaks present in the chromatogram of the *Test Solution*. The identity and peak response in the chromatogram may be established as being from any of the organic volatile impurities listed in *Table 1* or from some other volatile impurity eluting with a comparable retention time by mass spectrometric relative abundance methods or by the use of a second validated column containing a different stationary phase.

Table 1

Organic Volatile Impurity	Limit (µg per g)
Chloroform	60
1,4-Dioxane	380
Methylene Chloride	600
Trichloroethylene	80

Unless otherwise specified in the individual monograph, the amount of each organic volatile impurity present in the material does not exceed the limit given in the accompanying table.

METHOD IV

Standard Solution— Prepare as directed for *Standard Solution* in *Method I*. Pipet 5 mL of the solution into a vial fitted with a septum and crimp cap, containing 1 g of anhydrous sodium sulfate, and seal. Heat the sealed vial at 80° for 60 minutes.

Test Solution— Transfer 100 mg, accurately weighed, of the material under test to a vial, add 5.0 mL of water, or the solvent specified in the monograph, and 1 g of anhydrous sodium sulfate, and seal with a septum and crimp cap. Heat the sealed vial at 80° for 60 minutes, or as specified in the individual monograph.

Chromatographic System and Procedure— [NOTE— The use of headspace apparatuses that automatically transfer a measured amount of headspace is allowed.] Proceed as directed under *Method V*, except to inject, using a heated gas-tight syringe, 1 mL of the headspace. Also, the use of a guard column in this headspace procedure is not necessary.

METHOD V

Standard Solution and Test Solution— Proceed as directed under *Method I*.

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 3.0-µm G43 stationary phase, and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. The injection port and detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps. It is maintained at 40° for 20 minutes, then increased rapidly to 240° and maintained for 20 minutes.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 3; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Proceed as directed under *Method I*, the injection volume being about 1 µL.

METHOD VI

Standard Solution and Test Solution— Proceed as directed under *Method I*.

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector. The column and column temperature conditions, as chosen from *Table 2*, are specified in the individual monograph. The carrier gas, linear velocity or flow rate, detector, and injector temperatures are appropriate to the column dimensions and column temperatures chosen in *Table 2*.

In-Process Revision

Table 2

Chromatographic Conditions	USP Column Designation	Column Size	Column Temperature
A	S3	3-mm × 2-m	190°
B	S2	3-mm × 2.1-m	160°
C	G16	0.53-mm × 30-m	40°
D	G39	3-mm × 2-m	65°
E	G16	3-mm × 2-m	70°
F	S4	2-mm × 2.5-m	Hold 120° (35 min.) Gradient 120°–200° (2°/min.) Hold 20 min.
H	G14	2-mm × 2.5-m	Hold 45° (3 min.) Gradient 45°–120° (8°/min.) Hold 15 min.
I	G27	0.53-mm × 30-m	Hold 35° (5 min.) 35°–175° (8°/min.) 175°–260° (35°/min.) Hold 16 min.
J	G16	0.33-mm × 30-m	Hold 50° (20 min.) 50°–165° (6°/min.) Hold 20 min.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure*: a suitable system is one that yields the chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure—Proceed as directed under *Method I*, the injection volume being about 1 µL.

METHOD FOR METHYLENE CHLORIDE IN COATED TABLETS

The limit of methylene chloride is 500 µg per day, based on the maximum labeled daily dose.

Stock Solution—Accurately transfer 3.8 µL (the equivalent of 5 mg) of methylene chloride into a 1000-mL volumetric flask, dilute with organic-free water to volume, and mix.

Standard Solution—[NOTE—Film-coated tablets are to be incised prior to preparation of the solution.] Transfer a number of whole tablets, equivalent to about 1 g, to a glass-stoppered flask. Pipet 20 mL of *Stock Solution* into the flask, insert the stopper tightly, place in an ultrasonic bath until the tablets are completely disintegrated, and centrifuge the resultant solution. Pipet 2 mL of the clear supernatant into a vial equipped with a septum and a metallic crimp cap, and seal. Place the vial in a water bath maintained at 85°, and allow to stand for about 20 minutes.

Sample Solution—Prepare in the same manner as the *Standard Solution* except use 20 mL of organic-free water instead of 20 mL of *Stock Solution*.

System Suitability Solution—Prepare a solution in organic-free water containing 5 µg per mL each of alcohol and methylene chloride. Transfer 2.0 mL to a vial equipped with a septum and a metallic crimp cap, and seal. Place the vial in a water bath at 85°, and allow to stand for 20 minutes.

Chromatographic System—(see *Chromatography* ⟨621⟩)—[NOTE—A headspace apparatus that automatically transfers a measured amount of headspace can be used.] Proceed as directed under *Method V*, except to inject, using a heated gas-tight syringe, 1 mL of headspace. Inject 1 mL of the gaseous phase of the *System Suitability Solution* as directed for *Procedure*: the resolution, *R*, between alcohol and methylene chloride is not less than 1.5. The relative standard deviation of replicate injections of the *Standard Solution* is not more than 10%.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard Solution* and the *Sample Solution* into the chromatograph. Record the chromatograms and measure the peak responses. Determine, based on a retention time comparison, if methylene chloride is detected in the *Sample Solution*. Determine the amount, in µg per tablet, of any methylene chloride detected. Calculate the maximum amount, in µg per tablet per day, of methylene chloride allowed in the dosage unit using the following formula:

$$\text{maximum allowed amount (µg/day/tablet)} = \frac{500\,(\text{µg/day})}{\text{maximum daily dose (mg)}} \times \text{labled tablet strength (mg/tablet)}$$

The amount of methylene chloride detected per tablet does not exceed the calculated maximum allowed amount.

▪RESIDUAL SOLVENTS LIMITS

For pharmacopeial purposes, residual solvents in pharmaceuticals are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The residual solvents are not completely removed by practical

manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance or an excipient may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical element in the synthetic process. This General Chapter does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Because residual solvents do not provide therapeutic benefit, they should be removed, to the extent possible, to meet ingredient and product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. Solvents that are known to cause unacceptable toxicities (Class 1, *Table 1*) should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment. Solvents associated with less severe toxicity (Class 2, *Table 2*) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, *Table 3*) should be used where practical. The complete list of solvents included in this General Chapter is given in Appendix 1. These tables and the list are not exhaustive. Where other solvents have been used, based on approval by the competent regulatory authority, such solvents may be added to the tables and list.

Testing of drug substances, excipients, and drug products for residual solvents should be performed when production or purification processes are known to result in the presence of such residual solvents. It is only necessary to test for residual solvents that are used or produced in the manufacture or purification processes.

Although manufacturers may choose to test the drug product, a cumulative procedure may be used to calculate the residual solvent levels in the product from the levels in its ingredients. If the calculation results in a level equal to or below that recommended in this General Chapter, no testing of the drug product for residual solvents needs to be considered. If, however, the calculated levels are above the recommended level, the drug product should be tested to ascertain whether the formulation process has reduced the relevant solvent levels to within acceptable amounts. A drug product should also be tested if a residual solvent is used during its manufacture.

See Appendix 2 for additional background information related to residual solvents.

CLASSIFICATION OF RESIDUAL SOLVENTS BY RISK ASSESSMENT

The term ‘‘tolerable daily intake’’ (TDI) is used by the International Program on Chemical Safety (IPCS) to describe exposure limits of toxic chemicals and the term ‘‘acceptable daily intake’’ (ADI) is used by the World Health Organization (WHO) and other national and international health authorities and institutes. The term ‘‘permitted daily exposure’’ (PDE) is defined as a pharmaceutically acceptable intake of residual solvents to avoid confusion of differing values for ADIs of the same substance.

Residual solvents specified in this General Chapter are listed in Appendix 1 by common names and structures. They were evaluated for their possible risk to human health and placed into one of three classes as follows:

Class 1	Residual Solvents: Solvents to be Avoided Known human carcinogens. Strongly suspected human carcinogens. Environmental hazards.
Class 2	Residual Solvents: Solvents to be Limited Nongenotoxic animal carcinogens or possible causative agents of other irreversible toxicity, such as neurotoxicity or terato genicity. Solvents suspected of other significant but reversible toxicities.
Class 3	Residual Solvents: Solvents with Low Toxic Potential Solvents with low toxic potential to humans; no health-based exposure limit is needed. [NOTE—Class 3 residual solvents may have PDEs of up to 50 mg ormore per day.]*

* For residual solvents with PDEs of more than 50 mg per day, see the discussion in the section *Class 3* under *Limits of Residual Solvents*.

PROCEDURES FOR ESTABLISHING EXPOSURE LIMITS

The procedure used to establish permitted daily exposures for residual solvents is presented in Appendix 3.

OPTIONS FOR DETERMINING LEVELS OF CLASS 2 RESIDUAL SOLVENTS

Two options are available to determine levels of Class 2 residual solvents.

Option 1

The concentration limits in ppm stated in *Table 2* are used. They were calculated using equation (1) below by assuming a product weight of 10 g administered daily.

$$\text{Concentration (ppm)} = \frac{1000 \times \text{PDE}}{\text{dose}} \quad (1)$$

Here, PDE is given in terms of mg per day, and dose is given in g per day.

These limits are considered acceptable for all drug substances, excipients, and drug products. Therefore, this option may be applied if the daily dose is not known or fixed. If all drug substances and excipients in a formulation meet the limits given in *Option 1*, these components may be used in any proportion. No further calculation is necessary provided the daily dose does not exceed 10 g. Products that are administered in doses greater than 10 g per day are to be considered under *Option 2*.

Option 2

It is not necessary for each component of the drug product to comply with the limits given in *Option 1*. The PDE in terms of mg per day as stated in *Table 2* can be used with the known maximum daily dose and equation (1) above to determine the concentration of residual solvent allowed in a drug product. Such limits are considered acceptable provided that it has been demonstrated that the residual solvent has been reduced to the practical minimum. The limits should be realistic in relation to analytical precision, manufacturing capability, and reasonable variation in the manufacturing process. The limits should also reflect contemporary manufacturing standards.

Option 2 may be applied by adding the amounts of a residual solvent present in each of the components of the drug product. The sum of the amounts of solvent per day should be less than that given by the PDE.

Consider an example of the application of *Option l* and *Option 2* to acetonitrile concentration in a drug product. The permitted daily exposure to acetonitrile is 4.1 mg per day; thus, the *Option 1* limit is 410 ppm. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	400	0.36
Excipient 2	3.8	800	3.04
Drug product	5.0	728	3.64

Excipient l meets the *Option l* limit, but the drug substance, excipient 2, and drug product do not meet the *Option l* limit. Nevertheless, the drug product meets the *Option 2* limit of 4.l mg per day and thus conforms to the acceptance criteria in this General Chapter.

Consider another example using acetonitrile as the residual solvent. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	2000	1.80
Excipient 2	3.8	800	3.04
Drug product	5.0	1016	5.08

In this example, the drug product meets neither the *Option 1* nor the *Option 2* limit. The manufacturer could test the drug product to determine if the formulation process reduced the level of acetonitrile. If the level of acetonitrile was not reduced to the allowed limit during formulation, the product fails the requirements of the test.

LIMITS OF RESIDUAL SOLVENTS

Ethylene Oxide

[NOTE—The test for ethylene oxide is conducted only where specified in the individual monograph.] The standard solution parameters and the procedure for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 µg per g.

Class 1

Class 1 residual solvents (*Table 1*) should not be employed in the manufacture of drug substances, excipients, and drug products because of the unacceptable toxicities or deleterious environmental effects of these residual solvents. However, if Class 1 residual solvents are used, their levels should be restricted as shown in *Table 1*, unless otherwise stated in the individual monograph. The solvent 1,1,1-

In-Process Revision

trichloroethane is included in *Table 1* because it is an environmental hazard. The stated limit of 1500 ppm is based on safety data.

When Class 1 residual solvents are used in the manufacture of a drugsubstance, excipient, or drug product, the methodology described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter is to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for inclusion in the relevant individual monograph.

Table 1. Class 1 Residual Solvents

Solvent	Concentration Limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

Class 2

Class 2 residual solvents (*Table 2*) should be limited in drug substances, excipients, and drug products because of the inherent toxicities of these residual solvents. PDEs are given to the nearest 0.1 mg per day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of the determination procedure. Precision should be determined as part of the procedure validation.

If Class 2 residual solvents are present at greater than their *Option 1* limits, they should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for inclusion in the relevant individual monograph.

NOTE—The following Class 2 residual solvents are not readily detected by the headspace injection conditions described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter: formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone, and sulfolane. Other appropriate validated procedures are to be employed for the control of these residual solvents. Such procedures shall be submitted to the USP for inclusion in the relevant individual monograph.

Table 2. Class 2 Residual Solvents

Solvent	PDE (mg/day)	Concentration limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
Dichloromethane	6.0	600
1,2-Dimethoxyethane	1.0	100
N,*N*-Dimethylacetamide	10.9	1090
N,*N*-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethylene glycol	6.2	620
Formamide	2.2	220

Solvent	PDE (mg/day)	Concentration limit (ppm)
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890
1,1,2-Trichloroethene	0.8	80
Xylene*	21.7	2170

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene

Class 3

Class 3 residual solvents (*Table 3*) may be regarded as less toxic and of lower risk to human health than Class 1 and Class 2 residual solvents. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the residual solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies.

Unless otherwise stated in the individual monograph, Class 3 residual solvents are limited to not more than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option l*). If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day, that residual solvent should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for inclusion in the relevant individual monograph.

Table 3. Class 3 Residual Solvents

(limited by GMP or other quality-based requirements in drug substances, excipients, and drug products)

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulfoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

Other Residual Solvents

The residual solvents listed in *Table 4* may also be of interest to manufacturers of drug substances, excipients, or drug products. However, no adequate toxicological data on which to base a PDE was found. Specifications for these residual solvents will be provided in the respective individual monograph.

In-Process Revision

Table 4. Other Residual Solvents

(for which no adequate toxicological data was found)

1,1-Diethoxypropane	Methyl isopropyl ketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Solvent Hexane
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.

Class 1 and Class 2 Residual Solvents

WATER-SOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, add 9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriateheadspace vial, add 5.0 mL of water, apply stopper, cap, and mix.

Class 2 Standard Stock Solution—Transfer 1.0 mL of USP Class 2 Residual Solvents Mixture RS to a 100-mL volumetric flask, dilute with water to volume, and mix.

Class 2 Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply stopper, cap, and mix.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, apply stopper, and cap.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution*, apply stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1:5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution*, *Class 1 System Suitability Solution*, and *Class 2 Standard Solution*, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R*, between acetonitrile and methylene chloride in the *Class 2 Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution*, *Class 2 Standard Solution*, and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak re-

sponse of any peak in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or the *Class 2 Standard Solution*, proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Table 5. Headspace Operating Parameters

	Headspace Operating Parameter Sets		
	1	2	3
Equilibration temperature (°)	80	105	80
Equilibration time (min.)	60	45	45
Transfer-line temperature (°)	85	110	105
Carrier gas: nitrogen or helium at an appropriate pressure			
Pressurization time (s)	30	30	30
Injection volume (mL)	1	1	1

Procedure B—

Class 1 Standard Stock Solution, *Class 1 Standard Solution*, *Class 2 Standard Stock Solution*, *Class 2 Standard Solution*, *Test Stock Solution*, *Test Solution*, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 0.25-µm layer of phase G16, or a 0.53-mm × 30-m wide-bore column coated with a 0.25-µm layer of phase G16. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second and a split ratio of 1:5. The column temperature is maintained at 50° for 20 minutes, then raised at a rate of 6° per minute to 165°, and maintained at 165° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution*, the *Class 1 System Suitability Solution*, and the *Class 2 Standard Solution*, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of benzene in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; the resolution, *R*, between acetonitrile and trichloroethylene in the *Class 2 Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution*, the *Class 2 Standard Solution*, and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in the *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or the *Class 2 Standard Solution*, proceed to *Procedure C* to quantify the peak; otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Solution, *Class 2 Standard Solution*, *Test Stock Solution*, *Test Solution*, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Standard Solution—Transfer an accurately measured volume of the USP Reference Standard for each peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of 1/100 of the value stated in *Table 1* or *2* (under *Concentration limit*). Transfer 5.0 mL of this solution to an appropriate headspace vial, apply stopper, and cap.

In-Process Revision

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—If the results of the chromatography from *Procedure A* are found to be inferior to those found with *Procedure B*, the *Chromatographic System* from *Procedure B* may be substituted.] The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1:5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution*, the *Class 1 System Suitability Solution*, and the *Class 2 Standard Solution*, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R*, between acetonitrile and methylene chloride in the *Class 2 Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution* and *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$4(C/W)(r_U/r_S),$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_S are the peak responses of each residual solvent obtained from the *Test Solution* and the *Standard Solution*, respectively.

WATER-INSOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution, *Class 1 Standard Solution*, *Class 1 System Suitability Solution*, *Class 2 Standard Stock Solution*, *Class 2 Standard Solution*, and *Chromatographic System*—Proceed as directed for *Procedure A* under *Water-Soluble Articles*.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix.

Test Solution 1—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of dimethylformamide, apply stopper, cap, and mix.

Test Solution 2—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with 1,3-dimethyl-2-imidazolidinone to volume, and mix. Transfer 5.0 mL of this solution to an appropriate headspace vial, add 1.0 mL of 1,3-dimethyl-2-imidazolidinone, apply stopper, cap, and mix.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution*, the *Class 2 Standard Solution*, *Test Solution 1*, and *Test Solution 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in *Test Solution 1* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or the *Class 2 Standard Solution,* proceed to *Procedure B* to verify the identity of the peak; otherwise the

article meets the requirements of this test. If the peak response for dimethylformamide or *N*,*N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2 Standard Solution*, proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Procedure B—

Class 1 Standard Stock Solution, *Class 1 Standard Solution*, *Class 2 Standard Stock Solution*, *Class 2 Standard Solution*, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A* under *Water-Soluble Articles*.

Test Stock Solution, Test Solution 1, and *Test Solution 2*—Proceed as directed for *Procedure A*.

Chromatographic System—Proceed as directed for *Procedure B* under *Water-Soluble Articles*.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution*, *Class 2 Standard Solution*, *Test Solution 1*, and/or *Test Solution 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in *Test Solution 1* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or the *Class 2 Standard Solution*, proceed to *Procedure C* to quantify the peak; otherwise the article meets the requirements of this test. If the peak response for dimethylformamide or *N*,*N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2 Standard Solution*, proceed to *Procedure C* to quantify the peak; otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Solution, *Class 1 System Suitability Solution*, and *Class 2 Standard Solution*—Proceed as directed for *Procedure A* under *Water-Soluble Articles*.

Test Stock Solution, *Test Solution 1*, and *Test Solution 2*—Proceed as directed for *Procedure A*.

Standard Solution, and *Chromatographic System*—Proceed as directed for *Procedure C* under *Water-Soluble Articles*.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution*, *Test Solution 1*, and/or *Test Solution 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$4(C/W)(r_U/r_S),$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_S are the peak responses of each residual solvent obtained from *Test Solution 1* or *Test Solution 2* and the *Standard Solution*, respectively.

Class 3 Residual Solvents

If only Class 3 solvents are present, the level of residual solvents is to be determined as directed under *Loss on Drying* ⟨731⟩. If the loss on drying value is greater than 0.5%, a water determination should be performedon the test sample as directed under *Water Determination* ⟨921⟩. Determine the water by *Method Ia*, unless otherwise specified in the individual monograph. If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day (corre-

In-Process Revision

sponding to 5000 ppm or 0.5% under *Option l*), that residual solvent should be identified and quantified, and the procedures as described above are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for inclusion in the relevant individual monograph. A flow diagram for the application of residual solvent limit tests is shown in *Figure 1*.

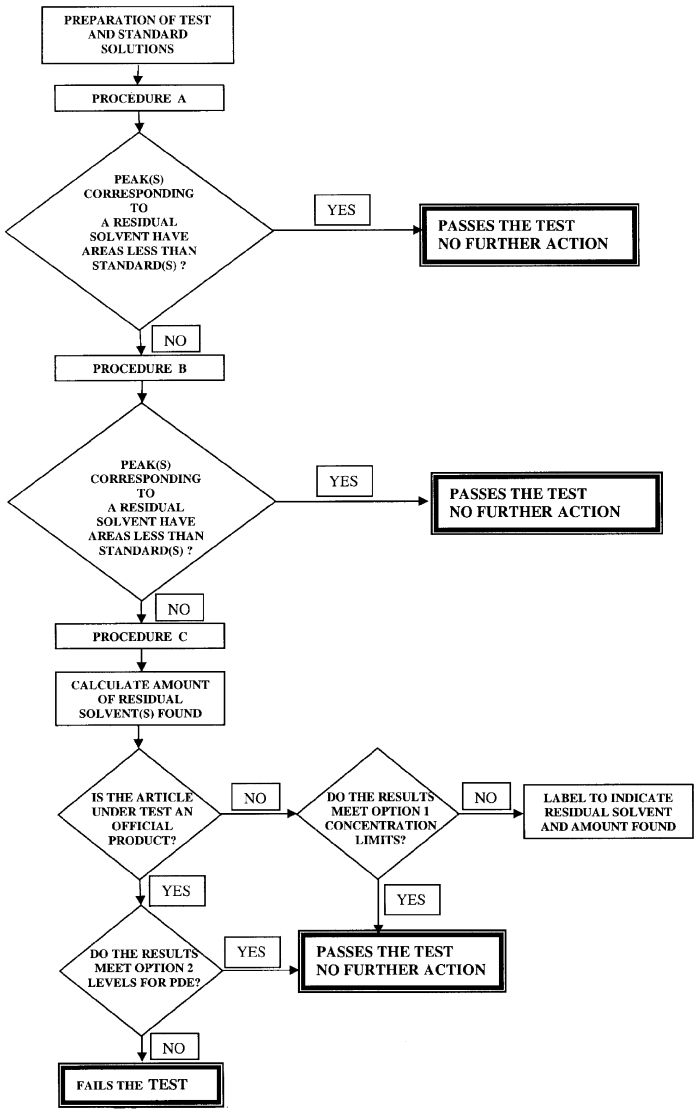

Fig. 1. Diagram relating to the identification of residual solvents and the application of limit tests.

OTHER ANALYTICAL PROCEDURES

The following procedures, with any necessary variations, are used where specified in the individual monographs.

Method I

A gas chromatograph capable of temperature programming and equipped with a wide-bore, wall-coated open tubular column and a flame-ionization detector is used in the following procedure.

Standard Solution—Prepare a solution, in organic-free water, or the solvent specified in the monograph, containing in each mL, 12.0 µg of methylene chloride, 7.6 µg of 1,4-dioxane, 1.6 µg of trichloroethylene, and 1.2 µg of chloroform. [NOTE—Prepare fresh daily.]

Test Solution—Dissolve in organic-free water, or the solvent specified in the monograph, an accurately weighed portion of the material to be tested to obtain a final solution having a known concentration of about 20 mg of the test material per mL.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused silica analytical column coated with a 5-µm chemically cross-linked G27 stationary phase and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. [NOTE—When a makeup gas is used, nitrogen is recommended.] The injection port temperature and the detector temperature are maintained at 70° and 260°, respectively. The column temperature is programmed as follows. Initially, the column temperature is maintained at 35° for 5 minutes, then increased at a rate of 8° per minute to 175°, followed by an increase at a rate of 35° per minute to 260°, and maintained at 260° for at least 16 minutes.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard Solution* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the peak responses.

Identify, on the basis of retention time, any peaks present in the chromatogram of the *Test Solution*. The identity and peak response in the chromatogram may be established as being from any of the organic volatile impurities listed in the table shown below or from some other volatile impurity eluting with a comparable retention time as determined by mass spectrometric relative abundance procedures or by the use of a second validated column containing a different stationary phase.

Unless otherwise specified in the individual monograph, the amount of each organic volatile impurity present in the material does not exceed the limit given in the table shown below.

Organic Volatile Impurity	Limit (µg per g)
Chloroform	60
1,4-Dioxane	380
Methylene Chloride	600
Trichloroethylene	80

Method IV

Standard Solution—Prepare as directed for *Standard Solution* in *Method I.* Pipet 5 mL of the solution into a vial fitted with a septum and crimp cap, containing 1 g of anhydrous sodium sulfate, and seal. Heat the sealed vial at 80° for 60 minutes.

Test Solution—Transfer 100 mg, accurately weighed, of the material under test to a vial, add 5.0 mL of water, or the solvent specified in the monograph, and 1 g of anhydrous

In-Process Revision

sodium sulfate, and seal with a septum and crimp cap. Heat the sealed vial at 80° for 60 minutes, or as specified in the individual monograph.

Chromatographic System and **Procedure**—[NOTE—The use of headspace apparatuses that automatically transfer a measured amount of headspace is allowed. Also, the use of a guard column in this headspace procedure is not necessary.] Proceed as directed for *Method V*, except to inject, using a heated gas-tight syringe, 1 mL of the headspace.

Method V

Standard Solution and **Test Solution**—Prepare as directed for *Method I*.

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused silica analytical column coated with a 3.0-µm G43 stationary phase, and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. The injection port and detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps. It is maintained at 40° for 20 minutes, then increased rapidly to 240°, and maintained at 240° for 20 minutes.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 3; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure—Proceed as directed for *Method I*, the injection volume being about 1 µL.

Method VI

Standard Solution and **Test Solution**—Prepare as directed for *Method I.*

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector. The column and column temperature conditions, as chosen from the list below (see *Table 6*), are specified in the individual monograph. The carrier gas, linear velocity or flow rate, and detector and injector temperatures are appropriate to the column dimensions and column temperatures chosen from the list below.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure:* a suitable system is one that yields the chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure—Proceed as directed for *Method I*, the injection volume being about 1 µL.

Table 6. Chromatographic Conditions for Method VI

Chromatographic Conditions	USP Column Designation	Column Size	Column Temperature
A	S3	3-mm × 2-m	190°
B	S2	3-mm × 2.1-m	160°
C	G16	0.53-mm × 30-m	40°
D	G39	3-mm × 2-m	65°
E	G16	3-mm × 2-m	70°
F	S4	2-mm × 2.5-m	Hold 120° (35 min.) Gradient 120°–200°(2°/min.) Hold 20 min.
H	G14	2-mm × 2.5-m	Hold 45° (3 min.) Gradient 45°–120° (8°/min.) Hold 15 min.
I	G27	0.53-mm × 30-m	Hold 35° (5 min.) 35°–175° (8° /min.) 175°–260°(35°/min.) Hold 16 min.
J	G16	0.33-mm × 30-m	Hold 50° (20 min.) 50°–165° (6°/min.) Hold 20 min.

In-Process Revision

GLOSSARY

Genotoxic carcinogens: Carcinogens that produce cancer by affecting genes or chromosomes.

Lowest-observed-effect level (LOEL): The lowest dose of a substance in a study or group of studies that produces biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Modifying factor: A factor determined by professional judgment of a toxicologist and applied to bioassay data so that the data can be safely related to humans.

Neurotoxicity: The ability of a substance to cause adverse effects on the nervous system.

No-observed-effect level (NOEL): The highest dose of a substance at which there are no biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Permitted daily exposure (PDE): The maximum acceptable intake per day of a residual solvent in pharmaceutical products.

Reversible toxicity: The occurrence of harmful effects that are caused by a substance and that disappear after exposure to the substance ends.

Strongly suspected human carcinogen: A substance for which there is no epidemiological evidence of carcinogenesis but for which there are positive genotoxicity data and clear evidence of carcinogenesis in rodents.

Teratogenicity: The occurrence of structural malformations in a developing fetus when a substance is administered during pregnancy.

APPENDIX 1. LIST OF RESIDUAL SOLVENTS INCLUDED IN THIS GENERAL CHAPTER

Solvent	Other Names	Structure	Class
Acetic acid	Ethanoic acid	CH_3COOH	Class 3
Acetone	2-Propanone Propan-2-one	CH_3COCH_3	Class 3
Acetonitrile		CH_3CN	Class 2
Anisole	Methoxybenzene		Class 3
Benzene	Benzol		Class 1
1-Butanol	*n*-Butyl alcohol Butan-1-ol	$CH_3(CH_2)_3OH$	Class 3
2-Butanol	*sec*-Butyl alcohol Butan-2-ol	$CH_3CH_2CH(OH)CH_3$	Class 3
Butyl acetate	Acetic acid butyl ester	$CH_3COO(CH_2)_3CH_3$	Class 3
tert-Butylmethyl ether	2-Methoxy-2-methylpropane	$(CH_3)_3COCH_3$	Class 3
Carbon tetrachloride	Tetrachloromethane	CCl_4	Class 1
Chlorobenzene			Class 2
Chloroform	Trichloromethane	$CHCl_3$	Class 2
Cumene	Isopropylbenzene (1-Methylethyl)benzene		Class 3

Solvent	Other Names	Structure	Class
Cyclohexane	Hexamethylene		Class 2
1,2-Dichloroethane	*sym*-Dichloroethane Ethylene dichloride Ethylene chloride	CH_2ClCH_2Cl	Class 1
1,1-Dichloroethene	1,1-Dichloroethylene Vinylidene chloride	$H_2C{=}CCl_2$	Class 1
1,2-Dichloroethene	1,2-Dichloroethylene Acetylene dichloride	$ClHC{=}CHCl$	Class 2
Dichloromethane	Methylene chloride	CH_2Cl_2	Class 2
1,2-Dimethoxyethane	Ethyleneglycol dimethyl ether Monoglyme Dimethyl cellosolve	$H_3COCH_2CH_2OCH_3$	Class 2
N,*N*-Dimethylacetamide	DMA	$CH_3CON(CH_3)_2$	Class 2
N,*N*-Dimethylformamide	DMF	$HCON(CH_3)_2$	Class 2
Dimethyl sulfoxide	Methylsulfinylmethane Methyl sulfoxide DMSO	$(CH_3)_2SO$	Class 3
1,4-Dioxane	*p*-Dioxane [1,4]Dioxane		Class 2
Ethanol	Ethyl alcohol	CH_3CH_2OH	Class 3
2-Ethoxyethanol	Cellosolve	$CH_3CH_2OCH_2CH_2OH$	Class 2
Ethyl acetate	Acetic acid ethyl ester	$CH_3COOCH_2CH_3$	Class 3
Ethylene glycol	1,2-Dihydroxyethane 1,2-Ethanediol	$HOCH_2CH_2OH$	Class 2
Ethyl ether	Diethyl ether Ethoxyethane 1,1′-Oxybisethane	$CH_3CH_2OCH_2CH_3$	Class 3
Ethyl formate	Formic acid ethyl ester	$HCOOCH_2CH_3$	Class 3
Formamide	Methanamide	$HCONH_2$	Class 2
Formic acid		HCOOH	Class 3

In-Process Revision

Solvent	Other Names	Structure	Class
Heptane	*n*-Heptane	$CH_3(CH_2)_5CH_3$	Class 3
Hexane	*n*-Hexane	$CH_3(CH_2)_4CH_3$	Class 2
Isobutyl acetate	Acetic acid isobutyl ester	$CH_3COOCH_2CH(CH_3)_2$	Class 3
Isopropyl acetate	Acetic acid isopropyl ester	$CH_3COOCH(CH_3)_2$	Class 3
Methanol	Methyl alcohol	CH_3OH	Class 2
2-Methoxyethanol	Methyl cellosolve	$CH_3OCH_2CH_2OH$	Class 2

APPENDIX 2. ADDITIONAL BACKGROUND

A2.1. Environmental Regulation of Organic Volatile Solvents

Several of the residual solvents frequently used in the production of pharmaceuticals are listed as toxic chemicals in Environmental Health Criteria (EHC) monographs and in the Integrated Risk Information System (IRIS). The objectives of such groups as the International Programme on Chemical Safety (IPCS), the United States Environmental Protection Agency (EPA), and the United States Food and Drug Administration (FDA), include the determination of acceptable exposure levels. The goal is maintenance of en-

vironmental integrity and protection of human health against the possible deleterious effects of chemicals resulting from long-term environmental exposure. The procedures involved in the estimation of maximum safe exposure limits are usually based on long-term studies. When long-term study data are unavailable, shorter term study data can be used with modification of the approach, such as use of larger safety factors. The approach described therein relates primarily to long-term or lifetime exposure of the general population in the ambient environment (i.e., ambient air, food, drinking water, and other media).

A2.2. Residual Solvents in Pharmaceuticals

Exposure limits in this General Chapter are established by referring to methodologies and toxicity data described in EHC and IRIS monographs. However, the following specific assumptions about residual solvents to be used in the synthesis and formulation of pharmaceutical products should be taken into account in establishing exposure limits.

1. Patients (not the general population) use pharmaceuticals to treat their diseases or for prophylaxis to prevent infection or disease.
2. The assumption of lifetime patient exposure is not necessary for most pharmaceutical products but may be appropriate as a working hypothesis to reduce risk to human health.
3. Residual solvents are unavoidable components in pharmaceutical production and will often be a part of medicinal products.
4. Residual solvents should not exceed recommended levels except in exceptional circumstances.
5. Data from toxicological studies that are used to determine acceptable levels for residual solvents should have been generated using appropriate protocols such as those described, for example, by the Organization for Economic Cooperation and Development (OECD), EPA, and the FDA Red Book.

APPENDIX 3. PROCEDURES FOR ESTABLISHING EXPOSURE LIMITS

The Gaylor-Kodell method of risk assessment (Gaylor, D. W. and Kodell, R. L. Linear Interpolation Algorithm for Low Dose Assessment of Toxic Substance. *Journal of Environmental Pathology and Toxicology*, 4:305, 1980) is appropriate for Class 1 carcinogenic solvents. Only in cases where reliable carcinogenicity data are available should extrapolation by the use of mathematical models be applied to setting exposure limits. Exposure limits for Class 1 residual solvents could be determined with the use of a large safety factor (i.e., 10,000 to 100,000) with respect to the no-observed-effect level (NOEL). Detection and quantification of these residual solvents should be performed by state-of-the-art analytical techniques.

Acceptable exposure levels in this General Chapter for Class 2 residual solvents were established by calculation of PDE values according to the procedures for setting exposure limits in pharmaceuticals (page 5748 of *Pharmacopeial Forum* 15(6) [Nov.–Dec. 1989]), and the method adopted by IPCS for Assessing Human Health Risk of Chemicals (*Environmental Health Criteria 170*, WHO, 1994). These procedures are similar to those used by the U.S. EPA (IRIS) and the U.S. FDA (*Red Book*) and others. The method is outlined here to give a better understanding of the origin of the PDE values. It is not necessary to perform these calculations in order to use the PDE values presented in *Table 2* of this document.

PDE is derived from the no-observed-effect level (NOEL), or the lowest-observed effect level (LOEL), in the most relevant animal study as follows:

$$\text{PDE} = \frac{\text{NOEL} \times \text{Weight Adjustment}}{\text{F1} \times \text{F2} \times \text{F3} \times \text{F4} \times \text{F5}} \quad (1)$$

The PDE is derived preferably from a NOEL. If no NOEL is obtained, the LOEL may be used. Modifying factors proposed here, for relating the data to humans, are the same kind of "uncertainty factors" used in Environmental Health Criteria (*Environmental Health Criteria* 170, WHO, Geneva, 1994) and "modifying factors" or "safety factors" in *Pharmacopeial Forum*. The assumption of 100 percent systemic exposure is used in all calculations regardless of route of administration.

The modifying factors are as follows:

F1 = A factor to account for extrapolation between species

- F1 = 2 for extrapolation from dogs to humans
- F1 = 2.5 for extrapolation from rabbits to humans
- F1 = 3 for extrapolation from monkeys to humans
- F1 = 5 for extrapolation from rats to humans
- F1 = 10 for extrapolation from other animals to humans
- F1 = 12 for extrapolation from mice to humans

F1 takes into account the comparative surface area to body weight ratios for the species concerned and for man. Surface area (S) is calculated as:

$$S = kM^{0.67}, \quad (2)$$

in which M = body weight, and the constant k has been taken to be 10. The body weights used in the equation are those shown below in *Table A3.-1*.

F2 = A factor of 10 to account for variability between individuals. A factor of 10 is generally given for all organic solvents, and 10 is used consistently in this General Chapter.

F3 = A variable factor to account for toxicity studies of short-term exposure.

- F3 = 1 for studies that last at least one half-lifetime (1 year for rodents or rabbits; 7 years for cats, dogs and monkeys).
- F3 = 1 for reproductive studies in which the whole period of organogenesis is covered.
- F3 = 2 for a 6-month study in rodents, or a 3.5-year study in nonrodents.
- F3 = 5 for a 3-month study in rodents, or a 2-year study in nonrodents.
- F3 = 10 for studies of a shorter duration.

In all cases, the higher factor has been used for study durations between the time points (e.g., a factor of 2 for a 9-month rodent study).

F4 = A factor that may be applied in cases of severe toxicity, e.g., nongenotoxic carcinogenicity, neurotoxicity, or teratogenicity. In studies of reproductive toxicity, the following factors are used:

- F4 = 1 for fetal toxicity associated with maternal toxicity
- F4 = 5 for fetal toxicity without maternal toxicity
- F4 = 5 for a teratogenic effect with maternal toxicity
- F4 = 10 for a teratogenic effect without maternal toxicity

In-Process Revision

F5 = A variable factor that may be applied if the no-effect level was not established.

When only a LOEL is available, a factor of up to 10 can be used depending on the severity of the toxicity. The weight adjustment assumes an arbitrary adult human body weight for either sex of 50 kilograms (kg). This relatively low weight provides an additional safety factor against the standard weights of 60 kg or 70 kg that are often used in this type of calculation. It is recognized that some adult patients weigh less than 50 kg; these patients are considered to be accommodated by the built-in safety factors used to determine a PDE. If the solvent was present in a formulation specifically intended for pediatric use, an adjustment for a lower body weight would be appropriate.

As an example of the application of this equation, consider a toxicity study of acetonitrile in mice that is summarized in *Pharmeuropa*, Vol. 9, No. 1, Supplement, April 1997, page S24. The NOEL is calculated to be 50.7 mg kg^{-1} day^{-1}. The PDE for acetonitrile in this study is calculated as follows:

$$\text{PDE} = \frac{50.7\ \text{mg kg}^{-1}\ \text{day}^{-1} \times 50\ \text{kg}}{12 \times 10 \times 5 \times 1 \times 1} = 4.22\ \text{mg day}^{-1}$$

In this example,

F1 = 12 to account for the extrapolation from mice to humans

F2 = 10 to account for differences between individual humans

F3 = 5 because the duration of the study was only 13 weeks

F4 = 1 because no severe toxicity was encountered

F5 = 1 because the no-effect level was determined

A3.-1. - Values Used in the Calculations in This Document

Rat body weight	425 g
Pregnant rat body weight	330 g
Mouse body weight	28 g
Pregnant mouse body weight	30g
Guinea-pig body weight	500 g
Rhesus monkey body weight	2.5 kg
Rabbit body weight (pregnant or not)	4 kg
Beagle dog body weight	11.5 kg
Rat respiratory volume	290 L/day
Mouse respiratory volume	43 L/day
Rabbit respiratory volume	1440 L/day
Guinea-pig respiratory volume	430 L day
Human respiratory volume	28,800 L/day
Dog respiratory volume	9000 L/day
Monkey respiratory volume	1150 L/day
Mouse water consumption	5 mL/day
Rat water consumption	30 mL/day
Rat food consumption	30 g/day

The equation for an ideal gas, $PV = nRT$, is used to convert concentrations of gases used in inhalation studies from units of ppm to units of mg/L or mg/m^3. Consider as an example the rat reproductive toxicity study by inhalation of carbon tetrachloride (molecular weight 153.84) summarized in *Pharmeuropa*, Vol. 9, No. 1, Supplement, April 1997, page S9.

$$\frac{n}{V} = \frac{P}{RT} = \frac{300 \times 10^{-6}\ \text{atm} \times 153\ 840\ \text{mg mol}^{-1}}{0.082\ \text{L atm K}^{-1}\ \text{mol}^{-1} \times 298\ \text{K}} = \frac{46.15\ \text{mg}}{24.45\ \text{L}} = 1.89\ \text{mg/L}$$

The relationship 1000 liters = 1 m^3 is used to convert to mg/m^3.■1S (*USP27*)

BRIEFING

⟨601⟩ Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers, *USP 26* page 2105 and page 1470 of *PF* 28(5) [Sept.–Oct. 2002]. Dose uniformity of inhalation formulations is regulated in the general chapters *Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩ and *Uniformity of Dosage Units* ⟨905⟩. The most recent revisions to these chapters (*PF* 28[5]) will be adopted in *USP 26*, *Supplement 2*. In that revision all delivered dose uniformity testing was placed in ⟨601⟩, leaving only the uniformity tests for premetered dosage units in ⟨905⟩. Clarifying changes were also made to the text on the subject of *Mass Balance* during cascade impaction testing.

In the present revision, the Aerosol Expert Committee has made five significant changes to the document.

(1) *Delivered-Dose Uniformity* testing for nasal sprays has been added and the chapter ⟨601⟩ title modified to *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, *and Dry Powder Inhalers*. In the longer term, the committee intends to add further tests under the subheading *Nasal Sprays.*

(2) The term "target-delivered dose" has been introduced and defined for the purpose of metered-dose and dry powder inhaler testing. The Committee recommended that this "target-delivered dose", not the label claim, should be used as the mean, about which the variance of the delivered dose is determined and specified. This is especially important for dry powder inhalers, for which the label claim is often significantly greater than the delivered dose. In such cases, the "target-delivered dose" is both method- and inhaler-dependent. Thus, it should be defined using a specific method, by determining the average dose delivered across a large number of the inhalers in question, preferably sampled from a variety of production batches.

(3) A new instrument, the "Next Generation Pharmaceutical Impactor", and associated methods for its use, has been added to ⟨601⟩. This cascade impactor is for use when determining the aerodynamic size distributions of drug doses delivered from metered-dose and dry powder inhalers. However, to aid with the global regulation of these products, these new methods have been harmonized between the *European Pharmacopoeia* and the *USP.*

(4) All of the cascade impactor testing methodology has been modified to reflect the new awareness that particle re-entrainment often confounds the determination of aerodynamic size distributions from metered-dose and dry powder inhalers. According to USP, stage coating is now to be required when performing cascade impaction, unless it has been proven to be unnecessary.

(5) Finally, *Apparatus 4*, the multistage liquid impinger, has a small number of stages and is used extensively outside the USA. Because the USP is used in countries other than the United States, the Aerosol Expert Committee has chosen to leave the method in place for countries other than the USA.

Acceptance criteria for dose uniformity are currently a subject of much debate. A STAGE 4 draft in the harmonization process of ⟨905⟩ has been published (*PF* 27[3], page 2615) that contains specifications for inhalers and unit doses for use in inhalers, which the Aerosol Expert Committee expects to see changed. Thus, acceptance criteria are not addressed in the presently proposed revision although the committee retains a long-term goal of changing the statistical principle for determining dose uniformity. It is intended to address this issue for delivered-dose uniformity in future revisions of ⟨601⟩.

⟨601⟩ AEROSOLS,

■NASAL SPRAYS,■1S (*USP27*) METERED-DOSE INHALERS, AND DRY POWDER INHALERS

This general chapter contains test methods for propellants, pressurized topical aerosols,

■nasal sprays,■1S (*USP27*)
metered-dose inhalers, and propellant-free dry powder inhalers used to aerosolize, or to aerosolize and meter, doses of powders for inhalation. Apply these methods, where indicated, in the testing of the appropriate dosage forms.

Change to read:

PROPELLANTS

Caution—Hydrocarbon propellants are highly flammable and explosive. Observe precautions, and perform sampling and analytical operations in a well-ventilated fume hood.

In-Process Revision

General Sampling Procedure

This procedure is used to obtain test specimens for those propellants that occur as gases at about 25° and that are stored in pressurized cylinders. Use a stainless steel sample cylinder equipped with a stainless steel valve and having a capacity of not less than 200 mL and a pressure rating of 240 psi or more. Dry the cylinder with the valve open at 110° for 2 hours, and evacuate the hot cylinder to less than 1 mm of mercury. Close the valve, cool, and weigh. Connect one end of a charging line tightly to the propellant container and the other end loosely to the sample cylinder. Carefully open the propellant container, and allow the propellant to flush out the charging line through the loose connection. Avoid excessive flushing, which causes moisture to freeze in the charging line and connections. Tighten the fitting on the sample cylinder, and open the sample cylinder valve, allowing the propellant to flow into the evacuated cylinder. Continue sampling until the desired amount of specimen is obtained, then close the propellant container valve, and finally close the sample cylinder valve. [*Caution—Do not overload the sample cylinder; hydraulic expansion due to temperature change can cause overloaded cylinders to explode.*] Again weigh the charged sample cylinder, and calculate the weight of the specimen.

Approximate Boiling Temperature

Transfer a 100-mL specimen to a tared, pear-shaped, 100-mL centrifuge tube containing a few boiling stones, and weigh. Suspend a thermometer in the liquid, and place the tube in a medium maintained at a temperature of 32° above the expected boiling temperature. When the thermometer reading becomes constant, record as the boiling temperature the thermometer reading after

■at least■2S (*USP26*)
5% of the specimen has distilled. Retain the remainder of the specimen for the determination of *High-Boiling Residues*.

High-Boiling Residues, Method I

Allow 85 mL of the specimen to distil, as directed in the test for *Approximate Boiling Temperature*, and transfer the centrifuge tube containing the remaining 15 mL of specimen to a medium maintained at a temperature 10° above the boiling temperature. After 30 minutes, remove the tube from the water bath, blot dry, and weigh. Calculate the weight of the residue.

High-Boiling Residues, Method II

Prepare a cooling coil from copper tubing (about 6 mm outside diameter × about 6.1 m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and acetone in a vacuum-jacketed flask, and connect one end of the tubing to the propellant sample cylinder. Carefully open the sample cylinder valve, flush the cooling coil with about 50 mL of the propellant, and discard this portion of liquefied propellant. Continue delivering liquefied propellant from the cooling coil, and collect it in a previously chilled 1000-mL sedimentation cone until the cone is filled to the 1000-mL mark. Allow the propellant to evaporate, using a warm water bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-mL portions of pentane, and combine the rinsings in a tared 150-mL evaporating dish. Transfer 100 mL of the pentane solvent to a second tared 150-mL evaporating dish, place both evaporating dishes on a water bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 minutes. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-minute periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the propellant as the difference between the weights of the residues in the two evaporating dishes.

Water Content

Proceed as directed under *Water Determination* ⟨921⟩, with the following modifications: (a) Provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas dispersion tube connected to a sampling cylinder. (b) Dilute the *Reagent* with anhydrous methanol to give a water equivalence factor of between 0.2 and 1.0 mg per mL; age this diluted solution for not less than 16 hours before standardization. (c) Obtain a 100-g specimen as directed under *General Sampling Procedure*, and introduce the specimen into the titration vessel through the gas dispersion tube at a rate of about 100 mL of gas per minute; if necessary, heat the sample cylinder gently to maintain this flow rate.

Other Determinations

For those aerosols that use propellants, perform the tests specified in the individual *NF* propellant monographs.

AEROSOLS

Because leaching of extractable substances into pressurized formulations should be minimized, valve materials and other components that are in contact with the product meet the requirements under *Elastomeric Closures for Injections* ⟨381⟩. [NOTE—Under *Physicochemical Test Procedures* in ⟨381⟩ the directions for preparing a sample require pre-extraction, which may cause an underestimate of the amount of extractables from a given component.] See also *Aerosols* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

Change to read:

TOPICAL AEROSOLS

■The following tests are applicable to topical aerosols containing drug, in suspension or solution, packaged under pressure, and released upon activation of an appropriate valve system.■1S (*USP27*)

Delivery Rate and Delivered Amount

Perform these tests only on containers fitted with continuous valves.

Delivery Rate—Select not fewer than four aerosol containers, shake, if the label includes this directive, remove the caps and covers, and actuate each valve for 2 to 3 seconds. Weigh each con-

tainer accurately, and immerse in a constant-temperature bath until the internal pressure is equilibrated at a temperature of 25° as determined by constancy of internal pressure, as directed under the *Pressure Test* below. Remove the containers from the bath, remove excess moisture by blotting with a paper towel, shake, if the label includes this directive, actuate each valve for 5.0 seconds (accurately timed by use of a stopwatch), and weigh each container again. Return the containers to the constant-temperature bath, and repeat the foregoing procedure three times for each container. Calculate the average *Delivery Rate*, in g per second, for each container.

Delivered Amount—Return the containers to the constant-temperature bath, continuing to deliver 5 second actuations to waste, until each container is exhausted. [NOTE—Ensure that sufficient time is allowed between each actuation to avoid significant canister cooling.] Calculate the total weight loss from each container. This is the *Delivered Amount.*

Pressure Test

Perform this test only on topical aerosols fitted with continuous valves.

Select not fewer than four aerosol containers, remove the caps and covers, and immerse in a constant-temperature bath until the internal pressure is constant at a temperature of 25°. Remove the containers from the bath, shake, and remove the actuator and water, if any, from the valve stem. Place each container in an upright position, and determine the pressure in each container by placing a calibrated pressure gauge on the valve stem, holding firmly, and actuating the valve so that it is fully open. The gauge is of a calibration approximating the expected pressure and is fitted with an adapter appropriate for the particular valve stem dimensions. Read the pressure directly from the gauge.

Minimum Fill

Topical aerosols meet the requirements for aerosols under *Minimum Fill* ⟨755⟩.

Leakage Test

Perform this test only on topical aerosols fitted with continuous valves.

Select 12 aerosol containers, and record the date and time to the nearest half hour. Weigh each container to the nearest mg, and record the weight, in mg, of each as W_1. Allow the containers to stand in an upright position at a temperature of 25.0 ± 2.0° for not less than 3 days, and again weigh each container, recording the weight, in mg, of each as W_2, and recording the date and time to the nearest half hour. Determine the time, T, in hours, during which the containers were under test. Calculate the leakage rate, in mg per year, of each container taken by the formula:

$$(365)(24 / T)(W_1 - W_2).$$

Where plastic-coated glass aerosol containers are tested, dry the containers in a desiccator for 12 to 18 hours, and allow them to stand in a constant-humidity environment for 24 hours prior to determining the initial weight as indicated above. Conduct the test under the same constant-humidity conditions. Empty the contents of each container tested by employing any safe technique (e.g., chill to reduce the internal pressure, remove the valve, and pour). Remove any residual contents by rinsing with suitable solvents, then rinse with a few portions of methanol. Retain as a unit the container, the valve, and all associated parts, and heat them at 100° for 5 minutes. Cool, weigh, record the weight as W_3, and determine the net fill weight ($W_1 - W_3$) for each container tested. [NOTE—If the average net fill weight has been determined previously, that value may be used in place of the value ($W_1 - W_3$) above.] The requirements are met if the average leakage rate per year for the 12 containers is not more than 3.5% of the net fill weight, and none of the containers leaks more than 5.0% of the net fill weight per year. If 1 container leaks more than 5.0% per year, and if none of the containers leaks more than 7.0% per year, determine the leakage rate of an additional 24 containers as directed herein. Not more than 2 of the 36 containers leak more than 5.0% of the net fill weight per year, and none of the 36 containers leaks more than 7.0% of the net fill weight per year. Where the net fill weight is less than 15 g and the label bears an expiration date, the requirements are met if the average leakage rate of the 12 containers is not more than 525 mg per year and none of the containers leaks more than 750 mg per year. If 1 container leaks more than 750 mg per year, but not more than 1.1 g per year, determine the leakage rate of an additional 24 containers as directed herein. Not more than 2 of the 36 containers leak more than 750 mg per year, and none of the 36 containers leaks more than 1.1 g per year. This test is in addition to the customary in-line leak testing of each container.

Total Number of Discharges per Container

Perform this test only on topical aerosols fitted with dose-metering valves, at the same time as, and on the same containers used for, the test for *Uniformity of Dosage Units* ⟨905⟩. Determine the total number of discharges or deliveries by counting the number of priming discharges plus those used in determining the spray contents, and continue to fire or discharge until the container or inhaler is empty. The requirements are met if all the containers or inhalers tested contain not less than the number of discharges stated on the label.

~~Uniformity of Dosage Units~~

■Delivered-Dose Uniformity■2S (*USP26*)

The test for ~~*Content*~~

■*Delivered-Dose*■2S (*USP26*)
Uniformity is required for topical aerosols fitted with dose-metering valves.

■For collection of the minimum dose, proceed as directed in the test for *Delivered-Dose Uniformity* under *Metered-Dose Inhalers and Dry Powder Inhalers*, as described below, except to modify the dose sampling apparatus so that it is capable of quantitatively capturing the delivered dose from the preparation being tested.■2S (*USP26*)
Unless otherwise stated in the individual monograph, apply the acceptance criteria for ~~*Metered-Dose Topical Aerosols* under *Uniformity of Dosage Units* ⟨905⟩~~

In-Process Revision

■*Metered-Dose Inhalers and Dry Powder Inhalers* as described below.■2S (*USP26*)

Add the following:

■NASAL SPRAYS

The following test is applicable to nasal sprays, formulated as aqueous suspensions or solutions of drug, presented in multi-dose containers and fitted with dose-metering valves. In all cases, and for all tests, prepare and test the nasal spray as directed on the label and the instructions for use.

Delivered-Dose Uniformity

Unless otherwise directed in the individual monograph, the drug content of the minimum delivered doses (minimum number of sprays per nostril as described on the label, or instructions for use) collected at the beginning of unit life (after priming as described on the label, or instructions for use) and at the label claim number of metered sprays, from each of 10 separate containers, must meet the following acceptance criteria: not more than 2 of the 20 doses are outside the range of 80% to 120% of label claim, and none are outside the range of 75% to 125% of label claim, while the mean for each of the beginning and end doses falls within the range of 85% to 115% of label claim. If 3–6 doses of the 20 doses collected are outside of 80% to120% of the label claim, but none are outside of 75% to 125% of label claim, and the means for each of the beginning and end doses fall within 85% to 115% of label claim, select 20 additional containers for second-tier testing. For second-tier testing, the requirements are met if not more than 6 of the 60 doses collected are outside the range of 80% to 120% of label claim, none are outside the range of 75% to 125% of label claim, and the means for each of the beginning and end doses fall within the range of 85% to 115% of label claim.

SAMPLING FOR DELIVERED-DOSE UNIFORMITY OF METERED-DOSE NASAL SPRAYS

General Sampling Procedure—To ensure reproducible in-vitro dose collection, it is recommended that a mechanical means of actuating the pump assembly be employed to deliver doses for collection. The mechanical actuation procedure should have adequate controls for the critical mechanical actuation parameters (e.g., actuation force, actuation speed, stroke length, rest periods, etc.). The test must be performed on units that have been primed according to the patient-use instructions. The test unit should be actuated in a vertical or near vertical, valve-up, position. The two doses collected at the beginning and end of the container life should be the dose immediately following priming and the dose corresponding to the last label claim number of doses from the container.

For suspension products, the delivered dose should be delivered into a suitable container (e.g., scintillation vial) in which quantitative transfer from the container under test can be accomplished. A validated analytical method is employed to determine the amount of drug in each delivered dose, and data are reported as a percent of label claim. For solution products, the delivered dose can be determined gravimetrically from the weight of the delivered dose, and the concentration and density of the fill solution of the product under test.■1S (*USP27*)

Change to read:

METERED-DOSE INHALERS AND DRY POWDER INHALERS

The following tests are applicable to metered-dose inhalers that are formulated as suspensions or solutions of active drug in propellants and dry powder inhalers presented as single or multidose units. The following test methods are specific to the aforementioned inhalers and may require modification when testing alternative inhalation technologies (for example, breath-actuated metered-dose inhalers, or dose-metering nebulizers). However, Pharmacopeial requirements for all dose-metering inhalation dosage forms require determination of the delivered dose and *Aerodynamic Size Distribution*. In all cases, and for all tests, prepare and test the inhaler as directed on the label and the instructions for use. When

these directions are not provided by the product manufacturer, follow the precise dose discharge directions included in the tests below.

~~**Uniformity of Dosage Units**~~

■Delivered-Dose Uniformity■2S (*USP26*)

~~The test for *Dose Uniformity over the Entire Contents* is required for metered-dose inhalers and for dry-powder inhalers containing drug inhalation powders in reservoirs. Test inhalations (powders or solutions) packaged in premetereddosage units (capsules and blister packages) as directed for *Content Uniformity* under *Uniformity of Dosage Units* ⟨905⟩.~~

~~■The test for *Delivered-Dose Uniformity* is required for inhalers (e.g., metered-dose inhalers or dry powder inhalers) containing drug formulation (e.g., solution, suspension, or powder) either in reservoirs or in premetered dosage units and for drug formulations packaged in reservoirs or in premetered dosage units where these containers are labeled for use with a named inhalation device. (For inhalations packaged in premetered dosage units, see also *Uniformity of Dosage Units* ⟨905⟩.)~~

~~Unless otherwise directed in the individual monograph, the drug content of the minimum delivered dose from each of 10 separate containers is determined in accordance with the procedure described below.~~

~~Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if not less than 9 of the 10 doses are between 75% and 125% of the label claim and none is outside the range of 65% to 135% of the label claim. If the contents of not more than three doses are outside the range of 75% to 125% of the label claim, but within the range of 65% to 135% of the label claim, select 20 additional containers, and follow the prescribed procedure for analyzing one minimum dose from each. The requirements are met if not more than three results, out of the 30 values, lie outside the range of 75% to 125% of label claim and none is outside the range of 65% to 135% of the label claim.~~■2S (*USP26*)

■The test for *Delivered-Dose Uniformity* is required for inhalers (e.g., metered-dose inhalers or dry powder inhalers) containing drug formulation (e.g., solution, suspension, or powder) either in reservoirs or in premetered dosage units, and for drug formulations packaged in reservoirs or in premetered dosage units where these containers are labeled for use with a named inhalation device. (For inhalations packaged in premetered dosage units, see also *Uniformity of Dosage Units* ⟨905⟩.) Note that the target-delivered dose is the expected mean drug content for a large number of delivered doses collected from many inhalers of the chosen product. In many cases, its value may depend upon the manner in which the test for delivered dose is performed. For metered-dose inhalers, the target-delivered dose is specified by the label claim, unless otherwise specified in the individual monograph. For dry powder inhalers, where the label claim is usually the packaged or metered-dose of drug, the target-delivered dose is specified in the individual monograph and is usually less than the label claim. Its value reflects the expected mean drug content for a large number of delivered doses collected from the product, using the method specified in the monograph.

Unless otherwise directed in the individual monograph, the drug content of the minimum delivered dose from each of 10 separate containers is determined in accordance with the procedure described below.

Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if not less than 9 of the 10 doses are between 75% and 125% of the specified target-delivered dose and none is outside the range of 65% to 135% of the specified target-delivered dose. If the contents of not more than 3 doses are outside the range of 75% to 125% of the specified target-delivered dose, but within the range of 65% to 135% of the specified target-delivered dose, select 20 additional containers, and follow the

In-Process Revision

prescribed procedure for analyzing 1 minimum dose from each. The requirements are met if not more than 3 results, out of the 30 values, lie outside the range of 75% to 125% of the specified target-delivered dose, and none is outside the range of 65% to 135% of the specified target-delivered dose.■1S (*USP27*)

~~DOSAGE UNIT SAMPLING FOR METERED-DOSE INHALERS~~

■SAMPLING THE DELIVERED DOSE FROM METERED-DOSE INHALERS■2S (*USP26*)

To determine the content of active ingredient in the discharged spray from a metered-dose inhaler, use the sampling apparatus described below, using a flow rate of 28.3 L of air per minute (±5%), unless otherwise stated in the individual monograph.

Apparatus A—The apparatus (see *Figure 1*) consists of a filter support base with an open-mesh filter support, such as a stainless steel screen, a collection tube that is clamped or screwed to the filter support base, and a mouthpiece adapter to ensure an airtight seal between the collection tube and the mouthpiece. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the sample collection tube. The vacuum connector is connected to a system comprising a vacuum source, flow regulator, and flowmeter. The source should be capable of pulling air through the complete assembly, including the filter and the inhaler to be tested, at the desired flow rate. When testing metered-dose inhalers, air should be drawn continuously through the system to avoid loss of drug into the atmosphere. The filter support base is designed to accommodate 25-mm diameter filter disks. At the airflow being used, the sample collection tube and the filter disk must be capable of quantitatively collecting the delivered dose. The filter disk and other materials used in the construction of the apparatus must be compatible with the drug and the solvents that are used to extract the drug from the filter. One end of the collection tube is designed to hold the filter disk tightly against the filter support base. When assembled, the joints between the components of the apparatus are airtight so that when a vacuum is applied to the base of the filter, all of the air drawn through the collection device passes through the inhaler.

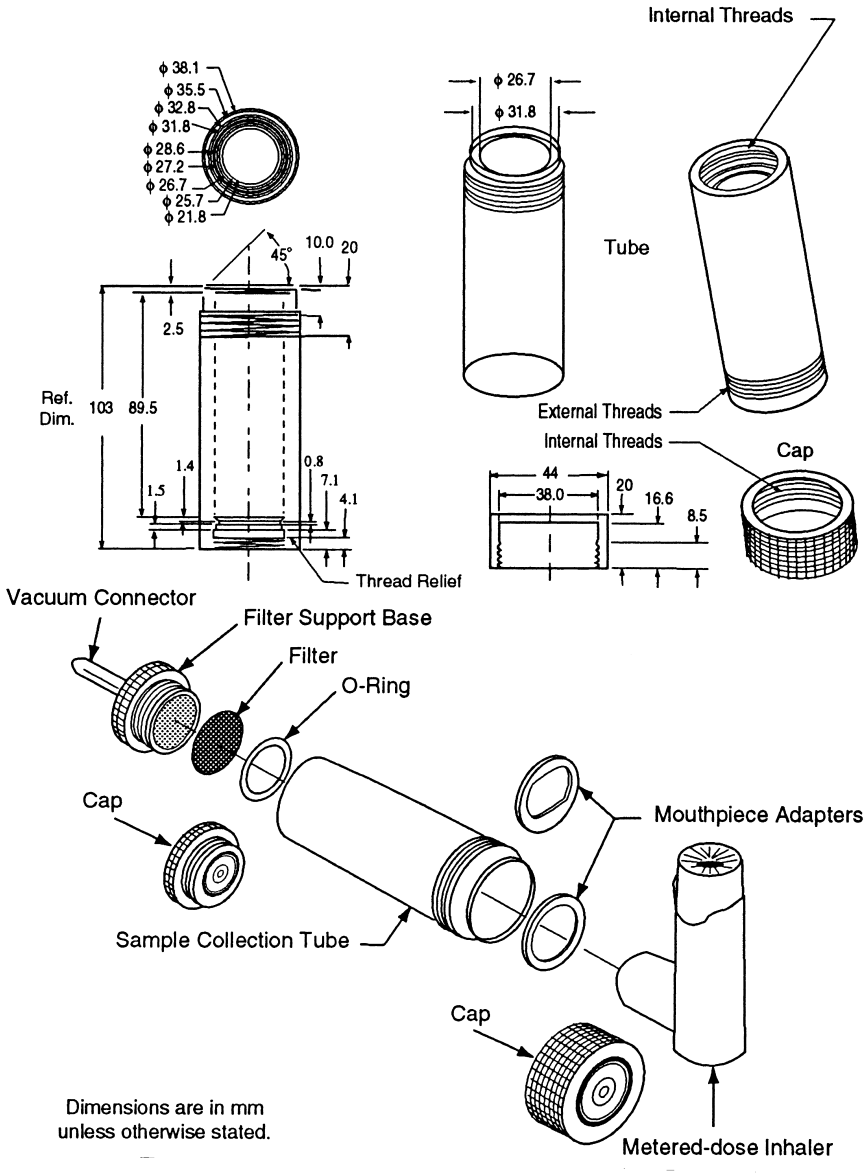

Fig. 1. Sampling apparatus for pressurized metered-dose inhalers

Procedure—

■Prepare the inhaler for use according to the label instructions.■2S (*USP26*)
Unless otherwise specified in the individual monograph, with the vacuum pump running, ensuring an airflow rate through the inhaler of 28.3 L of air per minute (±5%), discharge the minimum recommended dose into the apparatus through the mouthpiece adapter by depressing the valve for a duration sufficient to ensure that the dose has been completely discharged. Detach the inhaler from *Apparatus A*, and disconnect the vacuum. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent.

~~DOSAGE UNIT SAMPLING FOR DRY POWDER INHALERS~~

■SAMPLING THE DELIVERED DOSE FROM DRY POWDER INHALERS■2S (*USP26*)

To determine the content of active ingredient emitted from the mouthpiece of a dry powder inhaler, use *Apparatus B* (see *Figure 2*). This apparatus is capable of sampling the emitted doses at a variety of airflow rates.

In-Process Revision

Apparatus B—The apparatus is similar to that described in *Figure 1* for testing metered-dose inhalers. In this case, however, the filter and collection tube have a larger internal diameter to accommodate 47-mm diameter filter disks. This feature enables dosage collection at higher airflow rates—up to 100 L of air per minute—when necessary. A mouthpiece adapter ensures an airtight seal between the collection tube and the mouthpiece of the dry powder inhaler being tested. The mouthpiece adapter must ensure that the tip of the inhaler mouthpiece is flush with the open end of the sample collection tube. Tubing connectors, if they are used, should have an internal diameter greater than or equal to 8 mm to preclude their own internal diameters from creating significant airflow resistance. A vacuum pump with excess capacity must be selected in order to draw air, at the designated volumetric flow rate, through both the sampling apparatus and the inhaler simultaneously. A timer-controlled, low resistance, solenoid-operated, two-way valve is interposed between the vacuum pump and the flow-control valve to control the duration of flow. This type of valve enables 4.0 L of air ($\pm 5\%$) to be withdrawn from the mouthpiece of the inhaler at the designated flow rate. Flow control is achieved by ensuring that critical (sonic) flow occurs in the flow-control valve (absolute pressure ratio P3/P2 ≤ 0.5 under conditions of steady-state flow).

Procedure—Operate the apparatus at an airflow rate~~, Q,~~

■■1S (*USP27*)
which produces a pressure drop of 4 kPa (40.8 cm H_2O) over the inhaler to be tested, and a duration~~, T,~~

■■1S (*USP27*)
consistent with the withdrawal of 4 L of air from the mouthpiece of the inhaler. ~~[NOTE—If Q and T are defined otherwise in the monograph, use values of Q and T that are within 5% of those values. Determine the value of Q.]~~

■[NOTE—If the flow rate and duration are defined otherwise in the monograph, adjust the system to within 5% of those values.] Determine the test flow rate■1S (*USP27*)
using *Apparatus B* as follows. Insert an inhaler into the mouthpiece adapter to ensure an airtight seal. In cases where the drug packaging modifies the inhaler's resistance to airflow, use a loaded, drug-free inhaler (with previously emptied packaging). In other cases, use an unloaded (drug free) inhaler. Connect one port of a differential pressure transducer to the pressure tap, P1, and leave the other open to the atmosphere. Switch on the pump, and open the two-way solenoid valve. Adjust the flow-control valve until the pressure drop across the inhaler is 4.0 kPa (40.8 cm H_2O). Ensure that critical (sonic) flow occurs in the flow-control valve by determining the individual values for absolute pressure, P2 and P3, so that their ratio P3/P2 is less than or equal to 0.5. If this criterion cannot be achieved, it is likely that the vacuum pump is worn or of insufficient capacity. Critical (sonic) flow conditions in the flow-control valve are required in order to ensure that the volumetric airflow ~~is unaffected by pump fluctuations and minor changes in airflow resistance at the inhaler inlet.~~

■drawn from the mouthpiece is unaffected by pump fluctuations and changes in airflow resistance of the inhaler.■1S (*USP27*)
Remove the inhaler from the mouthpiece adapter and, without disturbing the flow-control valve, measure the airflow rate, ~~Q, by connecting a flowmeter~~

■drawn from the mouthpiece, Q_{out}, by connecting a flowmeter to the mouthpiece adaptor in an airtight fashion. Use a flowmeter■1S (*USP27*)
calibrated for the volumetric flow leaving the meter ~~to the mouthpiece adapter in an airtight fashion~~

■to directly determine Q_{out} or, if such a meter is unobtainable, calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For example, for a meter calibrated for the entering volumetric flow (Q_{in}), use the formula:

$$Q_{out} = Q_{in} P_0 / (P_0 - \Delta P),$$

where P_0 is the atmospheric pressure and ΔP is the pressure drop over the meter.■1S (*USP27*)
If the flow rate is greater than 100 L of air per minute, adjust the flow-control valve until ~~Q~~

■Q_{out}■1S (*USP27*)
equals 100 L per minute; otherwise, record the value of ~~Q~~

■Q_{out},■1S (*USP27*)
and leave the flow-control valve undisturbed. Define the test flow duration, ~~$T = 240/Q$~~

■$T = 240/Q_{out}$,■1S (*USP27*)
in seconds, so that a volume of 4.0 L of air ($\pm 5\%$) is withdrawn from the inhaler ~~during the withdrawal of the test dose~~

■at the test flow rate Q_{out},■1S (*USP27*)
and adjust the timer controlling the operation of the two-way solenoid valve accordingly. Prime or load the inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the solenoid valve closed, insert the inhaler mouthpiece horizontally into the mouthpiece adapter. Discharge the powder into the sampling apparatus by activating the timer controlling the solenoid valve and withdrawing 4.0 L of air from the inhaler at the previously defined airflow rate. If the labeled instructions so direct, repeat the operation so as to simulate the use of the inhaler by the patient (e.g., inhale two or three times, if necessary, to empty the capsule). Repeat the whole operation n –1 times beginning with the text, ''Prime or load the inhaler with powder,'' where n is the number of times defined in the labeling as the minimum recommended dose. Detach the dry powder inhaler from the sampling apparatus, and disconnect the vacuum tubing, D. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent. Where specified in individual monographs, perform this test under conditions of controlled temperature and humidity.

■Delivered-■2S (*USP26*)

Dose Uniformity over the Entire Contents

METERED-DOSE INHALERS

Apparatus—Use *Apparatus A* as directed in ~~*Dosage Unit Sampling for Metered-Dose Inhalers* under *Uniformity of Dosage Units* ⟨905⟩~~

■*Sampling the Delivered-Dose from Metered-Dose Inhalers* under *Delivered-Dose Uniformity*■2S (*USP26*)
at a flow rate of 28.3 L of air per minute (±5%).

Procedure—A single dose is defined as the number of sprays specified in the product labeling as the minimum recommended dose. ~~To determine the minimum dosing interval in hours, divide 24 hours by the maximum number of doses permitted per day, as stated in the labeling.~~

■■2S (*USP26*)
Select a single metered-dose inhaler, and follow the labeled instructions for priming, shaking, cleaning, and firing the inhaler throughout. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds, and fire one minimum recommended dose to waste. ~~Allow the inhaler to stand in either the valve up or valve down position, unless directed otherwise in the labeling, for the minimum dosing interval, or longer, and collect the next dose.~~

■Wait for 5 seconds, and collect the next dose.■2S (*USP26*)
Detach the inhaler from *Apparatus A*, and disconnect the vacuum. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent. Collect two more doses, allowing ~~the inhaler to stand for the minimum dosing interval, or longer, before collecting each dose.~~

■at least 5 seconds between doses.■2S (*USP26*)
Discharge the device to waste, waiting for not less than 5 seconds between actuations

■(unless otherwise specified in the individual monograph),■2S (*USP26*)
until $(n/2) + 1$ minimum recommended doses remain, in which n is the number of minimum recommended doses on the label. Collect four more doses, allowing ~~the inhaler to stand for the minimum dosing interval, or longer, before collecting each dose.~~

■at least 5 seconds between doses, unless otherwise specified in the individual monograph.■2S (*USP26*)
Discharge the device to waste, as before, until three doses remain. Collect the final three doses, allowing ~~the inhaler to stand for the minimum dosing interval, or longer, before collecting each dose. Note that in order to test within a reasonable time frame, there is no need to wait for the minimum dosing interval before expelling doses to waste. However, the rate of discharges to waste should not cause excessive canister cooling.~~

■at least 5 seconds between doses. Note that the rate of discharges to waste should not be such to cause excessive canister cooling.■2S (*USP26*)

DRY POWDER INHALERS

Apparatus—Use *Apparatus B* as directed in ~~Dosage Unit Sampling for Dry Powder Inhalers under *Uniformity of Dosage Units* ⟨905⟩~~

■*Sampling the Delivered Dose from Dry Powder Inhalers* under *Delivered-Dose Uniformity*■2S (*USP26*)
at the appropriate airflow rate for testing.

Procedure—~~For dry powder inhalers that contain multiple-dose reservoirs of dry powder, collect single doses, and proceed as directed for *Procedure* in the *Dosage Unit Sampling for Dry Powder Inhalers* under *Uniformity of Dosage Units* ⟨905⟩.~~

■Proceed as directed for *Procedure* in *Sampling the Delivered Dose from Dry Powder Inhalers* under *Delivered-Dose Uniformity.*■2S (*USP26*)
A single dose is defined as the number of actuations stated in the product labeling as the minimum recommended dose. Select a single inhaler and follow the labeled instructions for loading with powder, discharging and cleaning throughout. Collect a total of 10 doses—three doses at the beginning, four in the middle [(n/2) – 1 to (n/2) + 2, where n is the number of minimum recommended doses on the label], and three at the end—of the labeled contents following the labeled instructions.[+] ~~Allow the inhaler to stand in the upright position for the minimum dosing interval, or longer, as defined for *Procedure* above for metered-dose inhalers, before collecting each dose. In order to enable testing within a reasonable time frame, there is no need to wait for the minimum dosing interval before expelling a dose to waste.~~
■■2S (*USP26*)
Prior to collecting each of the doses to be analyzed, clean the inhaler as directed in the labeling.

Change to read:

Particle Size

The particle or droplet size distribution in the spray discharged from metered-dose inhalers, and the particle size distribution in the cloud discharged from dry powder inhalers, are important characteristics used in judging inhaler performance. While particle size measurement by microscopy can be used to evaluate the number of large particles, agglomerates, and foreign particulates in the emissions of metered-dose inhalers (e.g., *Epinephrine Bitartrate Inhalation Aerosol*), whenever possible this test should be replaced with a method to determine the aerodynamic size distribution of the drug aerosol leaving the inhaler. The aerodynamic size distribution defines the manner in which an aerosol deposits during inhalation. When there is a log-normal distribution, the aerodynamic size distribution may be characterized by the mass median aerodynamic diameter (MMAD) and geometric standard deviation (GSD). The aerodynamic size distribution of the drug leaving metered-dose and dry powder inhalers is determined using *Apparatus 1*, *2*, *3*, ~~or *4*~~

■*4*, *5*, or *6*■1S (*USP27*)
as specified in this chapter. A fine particle dose or fine particle fraction can also be determined as that portion of the inhaler output having an aerodynamic diameter less than the size defined in the individual monograph. This may be expected to correlate with the drug dose or that fraction of the drug dose that penetrates the lung during inhalation. Individual monographs may also define the emitted fractions of the delivered dose in more than one aerodynamic size range.

AERODYNAMIC SIZE DISTRIBUTION

Cascade impaction devices classify aerosol particles and droplets on the basis of those particles' aerodynamic diameters. The principle of their operation, whereby they separate aerosol particles and droplets from a moving airstream on the basis of particle or droplet inertia, is shown in *Figure 3.* Because the dimensions of the induction port used to connect inhalers to the cascade impactors and impingers ~~(shown in *Apparatus 1*, *2*, *3*, *4* and~~

■(shown in *Apparatus 1*, *2*, *3*, *4*, *5*, and *6*)■1S (*USP27*)
also define the mass of drug that enters the aerodynamic sizing device, these are carefully defined and, where possible, are held constant between each apparatus (see *Figures 4*, *6*, *7*, ~~*8*, and~~

■*8*, and *9*).■1S (*USP27*)
Because the size distributions produced by different impactors are often a function of impactor design and the airflow rate through them, there is a need to standardize the instruments that are used to test inhalers ~~(i.e., *Apparatus 1* for metered-dose inhalers)~~

■(i.e., *Apparatus 1* or *6* for metered-dose inhalers)■1S (*USP27*)
or to provide guidelines on system suitability where different apparatuses may be used ~~(i.e., *Apparatus 2*, *3*, or *4* for dry powder inhalers).~~

■(i.e., *Apparatus 2*, *3*, *4*, or *5* for dry powder inhalers).■1S (*USP27*)

~~**System Suitability**~~

■■2S (*USP26*).

Because of the varied nature of the formulations and devices being tested, the cascade impaction system and technique selected for testing an inhaler should fulfill a number of criteria.

Stage Mensuration—Manufacturers of cascade impaction devices provide a definitive calibration for the separation characteristics of each impaction stage in terms of the relationship between the stage collection efficiency and the aerodynamic diameter of particles and droplets passing through it as an aerosol. Calibration is a property of the jet dimensions, the spatial arrangement of the jet and its collection surface, and the airflow rate passing through it. Because jets can corrode and wear over time, the critical dimensions of each stage, which define that impaction stage's calibration, must be measured on a regular basis. This process, known as stage mensuration, replaces the need for repetitive calibration (using standard aerosols) and ensures that only devices that conform to specifications are used for testing inhaler output. The process involves the measurement and adjustment of the critical dimensions of the instrument.

Interstage Drug Loss (wall losses)—Where method variations are possible and there is no apparatus specified in the monograph, the selected technique should ensure that not more than 5% of the inhaler's total delivered drug mass (into the impactor) is subject to loss between the impaction device's sample collection surfaces. In the event that interstage drug losses are known to be greater than 5%, either the procedure should be performed in such a way that wall losses are included along with the associated collection plate, or an alternative apparatus should be used. As an example, the following procedures described for *Apparatus 1* and *3* have been written to include wall losses along with the associated collection plate. Provided, however, that such losses are known to be less than or equal to 5% of the total delivered drug mass into the impactor and that there are no instructions to the contrary in an individual monograph, the technique may be simplified by only assaying drug on the collection plates.

Re-Entrainment—Where method variations are possible, the selected technique should seek to minimize particle re-entrainment (from an upper to a lower impaction stage) on stages that contribute to size fractions defined in the individual monograph, especially where this may affect the amounts of drug collected. Minimizing the number of sampled doses, the use of coated particle collection surfaces, and proving that multiple-dose techniques produce statistically similar results to those from smaller numbers of doses, are all methods that can be used for this purpose. In the event that re-entrainment cannot be avoided, the number of doses collected, the time interval between doses, and the total duration of airflow through the cascade impaction device should be standardized. Under these circumstances, the presentation of impaction data should not presume the validity of the impactor's calibration (i.e., aerodynamic diameter ranges should not be assigned to drug masses collected on specific stages).

By using appropriate assay methods and a suitable mensurated impaction device, aerodynamic particle size distributions can be determined for drugs leaving the mouthpieces of metered-dose or dry powder inhalers. If temperature or humidity limits for use of the inhaler are stated on the label, it may be necessary to control

the temperature and humidity of the air surrounding and passing through the device to conform to those limits. Ambient conditions are presumed, unless otherwise specified in individual monographs. ~~In addition to the size distribution, good analytical practice dictates that a complete mass balance must be performed in order to confirm that all of the drug discharged from the inhaler was captured and measured in the induction port-cascade impactor apparatus. This is not a test of the inhaler but serves to ensure that the test results are valid.~~

■*Mass Balance*—In addition to the size distribution, good analytical practice dictates that a mass-balance be performed in order to confirm that the amount of the drug discharged from the inhaler, which is captured and measured in the induction port-cascade impactor apparatus, is within an acceptable range around the ~~label claim~~ ■expected value.■1S (*USP27*) The total mass of drug collected in all of the components (material balance) divided by the total number of minimum recommended doses discharged is not less than 75% and not more than 125% of the average minimum recommended dose determined during testing for *Delivered-Dose Uniformity*. This is not a test of the inhaler but serves to ensure that the test results are valid.■2S (*USP26*)

Use one of the multistage impaction devices shown below, or an equivalent, to determine aerodynamic particle size distributions of drugs leaving the mouthpieces of metered-dose or dry powder inhalers. ~~*Apparatus 1* (*Figure 4*) is~~

■*Apparatus 1* and *6* [*Figures 4* and *9* (without preseparator), respectively] are■1S (*USP27*) intended for use with metered-dose inhalers at a single airflow rate. ~~*Apparatus 2*, *3*, and *4* (Figures *6*, *7*, and *8*, respectively)~~

■*Apparatus 2*, *3*, *4*, and *5* (*Figures 6*, *7*, *8*, and *9*, respectively)■1S (*USP27*) are intended for use with dry powder inhalers at the appropriate airflow rate, ~~*Q* determined earlier, provided that the value of *Q*~~

■Q_{out}, determined earlier, provided that the value of Q_{out}■1S (*USP27*) falls in the range 30–100 L per minute.

~~NOTE—If *Q* is greater than 100 L per minute, testing should be performed at 100 L per minute; if *Q* < 30 L per minute, testing is performed at 30 L per minute.~~

■NOTE—If Q_{out} is greater than 100 L per minute, testing should be performed with Q_{out} set at 100 L per minute; if Q_{out} is less than 30 L per minute, testing is performed with Q_{out} at 30 L per minute.■1S (*USP27*)

Apparatus 1 for Metered-Dose Inhalers—Use this apparatus, or an equivalent, at a flow rate of 28.3 L per minute (±5%), as specified by the manufacturer of the cascade impactor.

Design—The design and assembly of this apparatus and the induction port to connect the device to an inhaler are shown in *Figures 4*, *4a*, and *4b*[2].

Procedure—Set up the multistage cascade impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device.

■To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary.■1S (*USP27*) Attach the induction port and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port as shown in *Figure 4*. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks. Turn on the vacuum pump to draw air through the cascade impactor, and calibrate the airflow through the system with an appropriate flowmeter attached to the open end of the induction port. Adjust the flow-control valve on the vacuum pump to achieve steady flow through the system at the required rate, and ensure that the airflow through the system is within ±5% of the flow rate specified by the manufacturer. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds and discharge one delivery to waste. With the vacuum pump running, insert the mouthpiece into the mouthpiece adapter and immediately fire the minimum recommended dose into the cascade impactor. Keep the valve depressed for a duration sufficient to ensure that the dose has been completely discharged. If additional sprays are required for the sample, wait for 5 seconds before removing the inhaler from the mouthpiece adapter, shake the inhaler, reinsert it into the mouthpiece adapter, and immediately fire the next minimum recommended dose. Repeat until the required number of doses have been discharged. The number of minimum recommended doses discharged must be sufficient to ensure an accurate and precise determination of *Aerodynamic Size Distribution*. [NOTE—The number of minimum recommended doses is typically not greater than 10.] After the last dose has been discharged, remove the inhaler from the mouthpiece adapter. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Disassemble the cascade impactor, place each stage and its associated collection plate or filter in a separate container, and rinse the drug from each of them. [NOTE—If it has been determined that wall losses in the impactor are less than or equal to 5%, then the collection plates only may be used.] ~~see *System Suitability* above.~~

■■2S (*USP26*)
Dilute each quantitatively to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the components. ~~The total mass of drug collected in all of the components (material bal-~~

[2] A suitable cascade impactor is available as Model Mk II from Graseby Inc., 500 Technology Court, Smyrna, GA, 30082. The impactor is used without the preseparator. The inhaler is connected to the impactor via the induction port, atop the entrance cone shown in *Figure 4*. If an equivalent impactor is employed, the induction port in *Figure 4a* should be used, although the entrance cone (*Figure 4b*) should be replaced with one to fit the impactor in question. Note that the internal surfaces of the induction port (*Figure 4a*) are designed to fit flush with their counterparts in the entrance cone (*Figure 4b*). This design avoids aerosol capture at the junction of the two pipes.

In-Process Revision

~~ance) divided by the total number of minimum recommended doses discharged is not less than 75% and not more than 125% of the average minimum recommended dose determined during testing for *Uniformity of Dosage Units*. If the total mass is outside of the acceptable range, the test must be repeated.~~

■■2S (*USP26*)
To analyze the data, proceed as directed under *Data Analysis*.

Apparatus 2 for Dry Powder Inhalers—

Design—The design and assembly of *Apparatus 2*, and the induction port to connect the device to an inhaler, are shown in *Figure 6*.[3] [NOTE—The induction port is shown in detail in *Figure 4a*.] The impactor has five impaction stages and an after filter. At a volumetric airflow rate of 60 L per minute (the nominal flow rate, Q_n), the cutoff aerodynamic diameters $D_{50,Qn}$ of Stages 1 to 5 are 10, 5, 2.5, 1.25, and 0.625 µm, respectively. The after filter effectively retains aerosolized drug in the particle size range up to 0.625 µm. Set up the multistage cascade impactor with the control system as specified in *Figure 5*. ~~If necessary, coat the particle collection surface of each of the stages to ensure that particles that impact on a given stage are not re-entrained in the flowing airstream. Assemble the impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device. Attach the induction port and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks.~~

■To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary.■1S (*USP27*)
Assemble the impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device. Attach the induction port and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks.

Turn on the vacuum pump, open the solenoid valve, and calibrate the airflow through the system as follows. Connect a flowmeter ~~calibrated for the volumetric flow rate leaving the meter,to the induction port.~~

■to the induction port. Use a flowmeter calibrated for the volumetric flow leaving the meter to directly determine Q_{out}, or, if such a meter is unobtainable, calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For example, for a meter calibrated for the entering volumetric flow (Q_{in}), use the formula:

$$Q_{out} = Q_{in}P_0 / (P_0 - \Delta P),$$

where P_0 is the atmospheric pressure and ΔP is the pressure drop over the meter. ■1S (*USP27*)
Adjust the flow-control valve to achieve a steady flow through the system at the required rate, ~~Q, so that Q~~

■Q_{out}, so that Q_{out}■1S (*USP27*)
is within ±5% of the value determined during testing for ~~*Uniformity of Dosage Units*~~.

■*Delivered-Dose Uniformity.*■2S (*USP26*)
Ensure that critical flow occurs in the flow-control valve, at the ~~value of Q to be used during testing,~~

■airflow rate to be used during testing, by■1S (*USP27*)
using the following procedure. With the inhaler in place, and the intended flow running, measure the absolute pressure on both sides of the flow-control valve (P2 and P3 in *Figure 5*). A ratio of P3/P2 ≤ 0.5 indicates critical flow. Switch to a more powerful pump, and remeasure the test flow rate if P3/P2 > 0.5. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens this valve for a duration of T seconds

■as determined during testing for *Delivered-Dose Uniformity.*■1S (*USP27*)
Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by opening the two-way solenoid valve for a duration of T seconds. After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.

Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Disassemble the cascade impactor, and place the after filter in a separate container. Rinse the drug from each of the stages and the filter, and dilute each quantitatively to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the components. ~~The total mass of drug collected in all of the components (material balance) divided by the total number of minimum recommended doses discharged is not less than 75% and not more than 125% of the average minimum recommended dose determined during testing for *Uniformity of Dosage Units*. If the total mass is outside of the acceptable range, the test must be repeated.~~

■■2S (*USP26*)
Determine the cutoff diameters of each of the individual stages of the impactor, at the value of ~~Q~~

■$Q = Q_{out}$■1S (*USP27*)
employed in the test by the formula:

$$D_{50,Q} = D_{50,Qn}(Q_n / Q)^{1/2}, \quad \text{(Eq. 1)}$$

where $D_{50,Q}$ is the cutoff diameter at the flow rate, Q, employed in the test, and the subscript, n, refers to the nominal values determined when Q_n equals 60 L per minute. Thus, when Q equals 40 L per minute, the cutoff diameter of Stage 2 is given by the formula:

$$D_{50,40LPM} = 5\ \mu m \times [60/40]^{1/2} = 6.1\ \mu m.$$

[3] The cascade impactor is available as the Model 160 Marple-Miller Impactor from MSP Corporation, Minneapolis, MN. The inhaler should be connected to the impactor via the induction port, shown in *Figure 4a*.

General Procedure—Perform the test using *Apparatus 2* at the airflow rate, ~~*Q*~~,

■Q_{out}■1S (*USP27*)
determined earlier, during testing for ~~*Uniformity of Dosage Units*~~

■*Delivered-Dose Uniformity*,■2S (*USP26*)
provided ~~*Q*~~,

■Q_{out}■1S (*USP27*)
is less than or equal to 100 L per minute. [NOTE—If ~~*Q*~~,

■Q_{out}■1S (*USP27*)
is greater than 100 L per minute, use an airflow rate of 100 L per minute.] Connect the apparatus to a flow control system that is based upon critical (sonic) flow as specified in *Figure 5* (see also *Table 2*).

n.a.: not applicable.

Apparatus 3 for Dry Powder Inhalers—
Design—Apparatus 3 is identical to *Apparatus 1 (Figure 4)*, except that the manufacturer's preseparator is added atop Stage 0 to collect large masses of noninhalable powder prior to their entry into the impactor, and the outlet nipple, used to connect to vacuum tubing B *(Figure 5)*, is replaced with one having an internal diameter $\geq$ 8 mm. To connect the preseparator of the impactor to the induction port *(Figure 4a)*, a specially designed top for the preseparator must be used. This is shown in *Figure 7*.[4] The impactor, therefore, has eight stages, a preseparator (to collect large particulates), and an after filter. At a volumetric airflow rate of 28.3 L per minute (the nominal flow rate, Q_n), the cutoff aerodynamic diameters $D_{50,Qn}$ of Stages 0 to 7 are 9.0, 5.8, 4.7, 3.3, 2.1, 1.1, 0.7, and 0.4 µm, respectively. The after filter effectively retains aerosolized drug in the particle size range up to 0.4 µm. Connect the cascade impactor into the control system specified in *Figure 5*. Omit Stage 6 and Stage 7 from the impactor if the test flow rate, ~~Q~~,

■Q_{out},■1S (*USP27*)
used during testing for ~~*Uniformity of Dosage Units*~~

■*Delivered-Dose Uniformity*■2S (*USP26*)
was greater than or equal to 60 L per minute. ~~If necessary, coat the particle collection surface of each of the stages to ensure that particles that impact on a given stage are not re-entrained in the flowing airstream.~~

■To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary.■1S (*USP27*)

[4] The cascade impactor is available as the Andersen 1ACFM Non-Viable Cascade Impactor (Mark II) from Graseby Inc., 500 Technology Court, Smyrna, GA, 30082. The impactor is used with the preseparator.

Assemble the impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device. Place an appropriate volume (up to 10 mL) of an appropriate solvent into the preseparator, or coat the particle collection surfaces of the preseparator to prevent re-entrainment of impacted particles. [*Caution—Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.*] Attach a molded mouthpiece adapter to the end of the induction port to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks.

Turn on the vacuum pump, open the two-way solenoid valve, and calibrate the airflow through the system as follows. Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Once the inhaler is positioned, discharge the powder into the apparatus by activating the timer and opening the two-way solenoid valve for the required duration, $T \pm 5\%$,

■as determined during testing for *Delivered-Dose Uniformity*.■1S (*USP27*)
After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, remove the inhaler from the mouthpiece adapter, and switch off the vacuum pump.

Carefully disassemble the apparatus. Using a suitable solvent, rinse the drug from the mouthpiece adapter, induction port, and preseparator, and dilute quantitatively to an appropriate volume.

Rinse the drug from each stage, and the impaction plate immediately below, into appropriately sized flasks. Quantitatively dilute each flask to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the samples. ~~The total mass of drug collected in all of the components (material balance) divided by the total number of minimum recommended doses discharged is not less than 75% and not more than 125% of the average minimum recommended dose determined during testing for *Uniformity of Dosage Units*. If the total mass is outside of this range, the test must be repeated.~~

■■2S (*USP26*)
The aerodynamic cutoff diameters of the individual stages of this device, in the airflow range between 30 and 100 L per minute, are currently ~~unknown~~

■not well established.■1S (*USP27*)
Do not use the formula in Equation 1 to calculate cutoff diameters.

Procedure—Proceed as directed in the *General Procedure* under *Apparatus 2*, except to use *Apparatus 3*.

Apparatus 4 for Dry Powder Inhalers—

■NOTE—*Apparatus 4*, the multistage liquid impinger, has a small number of stages and is used extensively outside the USA. It is provided here for the benefit of users in countries other than the USA.■1S (*USP27*)

Design—The design and assembly of *Apparatus 4* are shown in Figures *8*, *8a*, and *8b*.[5] The induction port, used to connect the device to an inhaler, is shown in *Figure 4a*. The device is a multistage liquid impinger consisting of impaction Stages 1, 2, 3, and 4 and an integral after filter (Stage 5). The collection stages of the liquid impinger (see *Figure 8* and *Table 3*) are kept moist, unlike those of traditional impactors, such as *Apparatus 1*, *2*, and *3;* wetting may produce an effect similar to coating the stages of *Apparatus 2* and *3* at certain flow rates, although this should be confirmed by demonstrating control over re-entrainment as described earlier. ~~(see *System Suitability*).~~

■■2S (*USP26*)
An impaction stage comprises an upper horizontal metal partition wall (B) through which a metal inlet jet tube (A) with its impaction plate (D) is protruding; a glass cylinder (E) with sampling port (F), forming the vertical wall of the stage; and a lower horizontal metal partition wall (G) through which a jet tube (H) connects to the lower stage. The tube into Stage 4 (U) ends in a multijet arrangement. The impaction plate (D) is secured in a metal frame (J), which is fastened by two wires (K) to a sleeve (L) secured on the jet tube (C). For more detail of the jet tube and impaction plate, see *Figure 8a*. The horizontal plane of the collection plate is perpendicular to the axis of the jet tube and centrally aligned. The upper surface of the impaction plate is slightly raised above the edge of the metal frame. A recess around the perimeter of the horizontal partition wall guides the position of the glass cylinder. The glass cylinders are sealed against the horizontal partition walls with gaskets (M) and clamped together by six bolts (N). The sampling ports are sealed by stoppers. The bottom side of the lower partition wall of Stage 4 has a concentric protrusion fitted with a rubber O-ring (P) that seals against the edge of a filter placed in the filter holder. The filter holder (R) is a basin with a concentric recess in which a perforated filter support (S) is flush-fitted. The filter holder is designed for 76-mm diameter filters. The whole impaction stage assembly is clamped onto the filter holder by two snap locks (T). The impinger is equipped with an induction port *(Figure 4a)* that fits onto the Stage 1 inlet jet tube. A rubber O-ring on the jet tube provides an airtight connection to the induction port. An elastomeric mouthpiece adapter to fit the inhaler being tested provides an airtight seal between the inhaler and the induction port.

At a volumetric airflow rate of 60 L per minute (the nominal flow rate, Q_n), the cutoff aerodynamic diameters $D_{50,Qn}$ of Stages 1 to 4 are 13.0, 6.8, 3.1, and 1.7 µm, respectively. The after filter effectively retains aerosolized drug in the particle size range up to 1.7 µm. Ensure that *Apparatus 4* is clean and free of drug solution from any previous tests. Place a 76-mm diameter filter in the filter stage, and assemble the apparatus. Use a low pressure filter capable of quantitatively collecting the passing drug aerosol, which also allows a quantitative recovery of the collected drug. Set up *Apparatus 4* using the control system as specified in *Figure 5*. Attach the induction port *(Figure 4a)* and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the apparatus are connected with airtight seals to prevent leaks. Turn on the vacuum pump, open the two-way solenoid valve, and calibrate the airflow through the system as follows. Connect a flowmeter, calibrated for the volumetric flow rate leaving the meter, tothe induction port. Adjust the flow-control valve to achieve a steady flow through the system at the required rate, ~~Q, so that Q~~

■Q_{out}, so that Q_{out}■1S (*USP27*)
is within ± 5% of the value determined during testing for ~~*Uniformity of Dosage Units.*~~

■*Delivered-Dose Uniformity.*■2S (*USP26*)
Ensure that critical flow occurs in the flow-control valve, at the value of ~~Q~~

■Q_{out}■1S (*USP27*)
to be used during testing, using the following procedure. With the inhaler in place, and the intended flow running, measure the absolute pressure on both sides of the flow-control valve (P2 and P3 in *Figure 5*). A ratio of P3/P2 ≤ 0.5 indicates critical flow. Switch to a more powerful pump, and remeasure the test flow rate if P3/P2 > 0.5. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens that valve for the same duration, *T*, as used during testing for ~~*Uniformity of Dosage Units.*~~

■*Delivered-Dose Uniformity.*■2S (*USP26*)
Dispense 20 mL of a solvent, capable of dissolving the drug, into each of the four upper stages of *Apparatus 4*, and replace the stoppers. [*Caution—Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.*] Tilt the apparatus to wet the stoppers, thereby neutralizing their electrostatic charge. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens the valve for the same duration, *T*, as used during testing for ~~*Uniformity of Dosage Units*~~.

■*Delivered-Dose Uniformity.*■2S (*USP26*)
Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by activating the timer and opening the two-way solenoid valve for the required duration, T ± 5%. After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to

[5] The five-stage impinger is available from Copley Instruments, plc, Nottingham, UK. The inhaler should be connected to the impactor via the induction port, shown in Fig. 4 and 4a.

In-Process Revision

the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.

Dismantle the filter stage of *Apparatus 4*. Carefully remove the filter, and extract the drug with solvent. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Rinse the inside of the inlet jet tube to Stage 1 *(Figure 8)*, allowing the solvent to flow into the stage. Rinse the drug from the inner walls and the collection plate of each of the four upper stages of the apparatus, into the solution in the respective stage, by tilting and rotating the apparatus, while ensuring that no liquid transfer occurs between the stages. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the six volumes of solvent. Ensure that the method corrects for possible evaporation of the solvent during the test. This may involve the use of an internal standard (of known original concentration in the solvent and assayed at the same time as the drug) or the quantitative transfer of the liquid contents from each of the stages, followed by dilution to a known volume. ~~The total mass of drug collected in all of the components (material balance) divided by the total number of minimum recommended doses discharged is not less than 75%, and not more than 125% of the average minimum recommended dose determined during testing for *Uniformity of Dosage Units*. If the total mass is outside of this range, the test must be repeated.~~

■■2S (*USP26*)
Determine the cutoff diameters of each of the individual stages of the impactor, at the value of ~~*Q*~~

■$Q = Q_{out}$■1S (*USP27*)
employed in the test by the formula:

$$D_{50,Q} = D_{50,Qn}\,(Qn/Q)^{1/2},$$

where $D_{50,Q}$ is the cutoff diameter at the flow rate, Q, employed in the test, and the subscript, n, refers to the nominal values determined when Q_n equals 60 L of air per minute. Thus, when Q equals 40 L of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$D_{50,40\mathrm{LPM}} = 6.8\ \mu\mathrm{m} \times (60/40)^{1/2} = 8.3\ \mu\mathrm{m}.$$

Procedure—Proceed as directed in the *General Procedure* under *Apparatus 2*, except to use *Apparatus 4*.

■Apparatus 5 for Dry Powder Inhalers

Design—The design and assembly of *Apparatus 5*[6] are shown in *Figures 9*, *9a*, *9b*, *9c*, and *9d*. The induction port, used to connect the device to an inhaler, is shown in *Figure 4a*. The device is a cascade impactor with seven stages and a micro-orifice collector (MOC). Over the design flow-rate range of 30 to 100 L per minute, the 50% efficiency cutoff diameters of the stages (D_{50} values) range between 0.24 μm to 11.7 μm, evenly spaced on a logarithmic scale. In the design flow-rate range, there are always at least five stages with D_{50} values between 0.5 μm and 6.5 μm. The collection efficiency curves for each stage are sharp and minimize overlap between stages.

The impactor layout has removable impaction cups with all the cups in one plane (*Figures 9–9c*). There are three main sections to the impactor: the bottom frame that holds the impaction cups, the seal body that holds the jets, and the lid that contains the interstage passageways (shown in *Figures 9–9b*). Multiple nozzles are used at all but the first stage (*Figure 9c*). The flow passes through the impactor in a sawtooth pattern.

Stage mensuration is performed periodically together with confirmation of other dimensions critical to the effective operation of the impactor. Critical dimensions are provided below in *Table 5*.

[6] The cascade impactor is available as the Next Generation Pharmaceutical Impactor from MSP Corporation, Minneapolis, MN.

Table 5. Critical Dimensions for the Next Generation Pharmaceutical Impactor

Description	Dimension (mm)
Preseparator (dimension a—see *Figure 9d*)	12.80 ± 0.05
Stage 1[1] Nozzle diameter	14.30 ± 0.05
Stage 2[1]Nozzle diameter	4.882 ± 0.04
Stage 3[1] Nozzle diameter	2.185 ± 0.02
Stage 4[1] Nozzle diameter	1.207 ± 0.01
Stage 5[1] Nozzle diameter	0.608 ± 0.01
Stage 6[1] Nozzle diameter	0.323 ± 0.01
Stage 7[1] Nozzle diameter	0.206 ± 0.01
MOC [1]	0.070 (nominally 0.065 to 0.072)
Cup Depth (Dimension b—see *Figure 9b*)	14.625 ± 0.10
Collection cup surface roughness	0.5 to 2 μm
Stage 1 Nozzle to seal body distance [2]—dimension c	0 ± 0.14
Stage 2 Nozzle to seal body distance [2]—dimension c	5.186 to 5.286
Stage 3 Nozzle to seal body distance [2]—dimension c	8.415 to 8.475
Stage 4 Nozzle to seal body distance [2]—dimension c	11.349 to 11.409
Stage 5 Nozzle to seal body distance [2]—dimension c	13.146 to 13.206
Stage 6 Nozzle to seal body distance [2]—dimension c	13.969 to 14.029
Stage 7 Nozzle to seal body distance [2]—dimension c	13.970 to 14.030
MOC Nozzle to seal body distance [2]—dimension c	14.470 to 14.530

[1] See *Figure 9c.*
[2] See *Figure 9b.*

In-Process Revision

In routine operation, the seal body and lid are held together as a single assembly. The impaction cups are accessible when this assembly is opened at the end of an inhaler test. The cups are held in a support tray, so that all cups can be removed from the impactor simultaneously by lifting out the tray. The impactor is ready for another test as soon as another tray of cups is inserted and the lid is closed.

A metal induction port with internal dimensions identical to those defined in *Figure 4a* is connected to the impactor inlet. When necessary, with dry powder inhalers, a preseparator can be added to avoid overloading the first stage. This preseparator connects between the induction port and the impactor. A suitable mouthpiece adapter is used to provide an airtight seal between the inhaler and the induction port.

At a volumetric airflow rate of 60 L per minute (the assigned reference flow rate for cutoff-diameter calculations, Q_n), the cutoff-aerodynamic diameters $D_{50,Qn}$ of Stages 1 to 7 are 8.06, 4.46, 2.82, 1.66, 0.94, 0.55 and 0.34 µm, respectively. The apparatus contains a terminal micro-orifice collector (MOC) that for most formulations may eliminate the need for a final filter as determined by method validation. The MOC is an impactor nozzle plate and collection cup. The nozzle plate contains, nominally, 4032 jets, each a nominal 70 µm in diameter. Most particles not captured on Stage 7 of the impactor will be captured on the cup surface below the MOC. (For impactors operated at 60 L per minute, the MOC is capable of collecting 80% of 0.14-µm particles). For formulations with a significant fraction of particles not captured by the MOC, there is an optional filter holder that can replace the MOC or be placed downstream of the MOC containing a suitable after-filter (glass fiber is often suitable).

Procedure—Assemble the apparatus with the preseparator (*Figure 9d*), unless experiments have shown that its omission does not result in increased interstage drug losses (>5%) or particle re-entrainment, in which case the preseparator may be omitted.

Place fresh cups into the apertures in the cup tray. To ensureefficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with the seal body attached, and operate the handle to lock the impactor together so that the system is airtight.

The preseparator may be assembled as follows: assemble the preseparator insert into the preseparator base; fit the preseparator base to the impactor inlet; add 15 mL of the solvent used for sample recovery to the central cup of the preseparator insert; place the preseparator body on top of this assembly; and close the two catches. [*Caution—Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (e.g., alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.*]

Connect a metal induction port with internal dimensions as defined in *Figure 4a* either to the impactor inlet or to the preseparator inlet atop the cascade impactor (*Figure 9d*). Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the inhaler, when inserted, lines up along the horizontal axis of the induction port. The front face of the inhaler mouthpiece is flush with the front face of the induction port. When attached to the mouthpiece adapter, the inhaler should be positioned in the same orientation as intended for use. Connect the apparatus to a flow system according to the scheme specified in *Figure 5*.

Unless otherwise prescribed, conduct the test at the flow rate used in the test for *Delivered-Dose Uniformity* drawing 4 L of air from the mouthpiece of the inhaler and through the apparatus. Connect a flowmeter to the induction port. Use a flowmeter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the formula:

$$Q_{out} = Q_{in}P_0 / (P_0 - \Delta P),$$

where P_0 is the atmospheric pressure and ΔP is the pressure drop over the meter. Adjust the flow control valve to achieve steady flow through the system at the required rate, Q_{out} ($\pm 5\%$). Ensure that critical flow occurs in the flow-control valve by the procedure described for *Apparatus 2*. Adjust

the timer controlling the operation of the two-way solenoid valve so that it opens the valve for the same duration, *T*, as used during testing for *Delivered-Dose Uniformity*.

Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by activating the timer and opening the two-way solenoid valve for the required duration, $T + 5\%$. After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.

Dismantle the apparatus, and recover drug for analysis as follows: remove the induction port and mouthpiece adapter from the preseparator and extract the drug into an aliquot of solvent; remove the preseparator from the impactor, without spilling the cup liquid into the impactor; seal the outlet of the preseparator with a suitable stopper; add an aliquot of drug recovery solvent, if necessary; seal the preseparator inlet with another suitable stopper; and shake and rotate the preseparator gently and slowly, to extract the active ingredient from all inner surfaces.

Open the impactor by releasing the handle and lifting the lid. Remove the cup tray, with the collection cups, and recover the active ingredient from each cup into an aliquot of solvent. Using the method of analysis specified in the individual monograph, determine the mass of drug contained in each of the aliquots of solvent.

Determine the cutoff diameters of each of the individual stages of the impactor, at the value of $Q = Q_{out}$ employed in the test by the formula:

$$D_{50,Q} = D_{50,Qn} (Q_n / Q)^X, \quad \text{(Eq. 2)}$$

where $D_{50,Q}$ is the cutoff diameter at the flow rate, Q, employed in the test, and the subscript, n, refers to the nominal or reference value for $Q_n = 60$ L of air per minute (see *Table 6*). The values for the exponent, x, are listed in *Table 6*. Thus, when $Q = 40$ L of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$D_{50,40LPM} = 4.46\ \mu m \times (60 / 40)^{0.52} = 5.51\ \mu m.$$

Analyze the data as directed under *Data Analysis*.

Table 6. Cutoff Aerodynamic Diameter for Stages of *Apparatus 5* and *6*

Use Eq. 2 to calculate $D_{50,Q}$ for flow rates, Q, in the range 30 to 100 L per minute with $Q_n = 60$ L per minute.

Stage	$D_{50,Qn}$	x
1	8.06	0.54
2	4.46	0.52
3	2.82	0.50
4	1.66	0.47
5	0.94	0.53
6	0.55	0.60
7	0.34	0.67

In-Process Revision

Apparatus 6 for Metered-Dose Inhalers

Design—Apparatus 6 is identical to *Apparatus 5* (*Figures 9-9d*), except that the preseparator is not to be used. Use this apparatus at a flow rate of 30 L per minute (±5%), unless otherwise prescribed in the individual monograph.

Procedure—Assemble the apparatus without the preseparator. Place fresh cups into the apertures in the cup tray. To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with seal body attached, and operate the handle to lock the impactor together so that the system is airtight. Connect a metal induction port with internal dimensions as defined in *Figure 4a* to the impactor inlet. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Turn on the vacuum pump to draw air through the cascade impactor, and calibrate the airflow through the system with an appropriate flowmeter attached to the open end of the induction port. Adjust the flow-control valve on the vacuum pump to achieve steady flow through the system at the required rate, and ensure that the airflow through the system is within ±5% of this flow rate. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds, and discharge one delivery to waste. With the vacuum pump running, insert the mouthpiece into the mouthpiece adapter, and immediately fire the minimum recommended dose into the cascade impactor. Keep the valve depressed for a duration sufficient to ensure that the dose has been completely discharged. If additional sprays are required for the sample, wait for 5 seconds before removing the inhaler from the mouthpiece adapter, shake the inhaler, reinsert it into the mouthpiece adapter, and immediately fire the next minimum recommended dose.

Repeat until the required number of doses have been discharged. The number of minimum recommended doses discharged must be sufficient to ensure an accurate and precise determination of *Aerodynamic Size Distribution*. [NOTE—The number of minimum recommended doses is typically not greater than 10.] After the last dose has been discharged, remove the inhaler from the mouthpiece adapter. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume.

Dismantle the apparatus, and recover the drug for analysis as follows: remove the induction port and mouthpiece adapter from the apparatus, and recover the deposited drug into an aliquot of solvent; open the impactor by releasing the handle and lifting the lid; remove the cup tray, with the collection cups; and extract the active ingredient in each cup into an aliquot of solvent. Using the method of analysis specified in the individual monograph, determine the quantity of active ingredient contained in each of the aliquots of solvent.

Determine the cutoff diameters of each of the individual stages of the impactor, at the value of Q employed in the test by using Eq. 2 with values obtained from *Table 6*. Thus, when Q = 30 L of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$D_{50,30\text{LPM}} = 4.46\ \mu\text{m} \times (60/30)^{0.52} = 6.40\ \mu\text{m}.$$

To analyze the data, proceed as directed under *Data Analysis*.■1S (*USP27*)

Sums Of Masses	ΣA^c	ΣB^c	ΣA^c	ΣB^c	ΣA^c	ΣB^c	ΣA^c	ΣB^c	ΣA^c	ΣB^c	ΣA^c	ΣB^c

[a] Stages 6 and 7 are omitted from *Apparatus 3* at airflow rates >60 L per minute.
[b] Stage 5 of *Apparatus 4* is the filter stage (see *Figure 8*).
[c] ΣA is the total drug mass recovered from the apparatus; ΣB is the mass of drug recovered from the impactor (*Apparatus 1*, *3*, *5* and *6*) or from the impactor stages beneath the uppermost stage (*Apparatus 2*, and *4*).
[d] For *Apparatus 5* and *6*, values for the drug masses AF and BF refer to collections from the MOC, and/or the after-filter if used.■1S (*USP27*)

CALCULATIONS

Fine Particle Dose and Fine Particle Fraction—Calculate the total mass, ΣA, of drug delivered from the mouthpiece of the inhaler into the apparatus. Then calculate the total mass, *R*, of drug found on the stages of the apparatus and the filter that captured the drug in the fine particle size range appropriate for the particular drug being tested. The *Fine Particle Dose* is calculated by the formula:

$$R / n,$$

where *R* is as stated above, and *n* is the number of doses discharged during the test. The *Fine Particle Fraction* that would be delivered from the inhaler is then calculated by the formula:

$$R / \Sigma A.$$

Cumulative Percentage (Cum%) of Drug Mass Less Than Stated Aerodynamic Diameter—Construct ~~*Table 6*~~

■*Table 8*■1S (*USP27*)
by dividing the mass of drug on the filter stage by ΣB ~~(see *Table 5*).~~

■(see *Table 7*).■1S (*USP27*)

Multiply the quotient by 100, and enter this number as a percentage opposite the effective cutoff diameter of the stage immediately above it in the impactor or impinger stack. For *Apparatus 2* or *4*, use Eq. 1 to calculate the stage cutoff diameters, $D_{50,Q}$, at the airflow rate, *Q*, employed during the test.

■For *Apparatus 5* and *6*, use Eq. 2 with *Table 6*.■1S (*USP27*)
For *Apparatus 1*, use the cutoff diameters quoted by the manufacturer. For *Apparatus 3*, present the data as cumulative percentages of mass on and below the stated stage, and avoid assigning values to stage cutoff diameters.

Repeat the calculation for each of the stages in the impactor or impinger stack, in reverse numerical order (largest to smallest stage number). For each stage, calculate the cumulative percentage of mass less than the stated aerodynamic diameter by adding the percentage of the mass on that stage to the total percentage from the stages below and entering the value opposite the effective cutoff diameter of the stage above it in the stack. Thus, the percentage of drug on the filter can be seen to have aerodynamic diameters less than the cutoff diameter of the stage above the filter, and the percentage on the filter plus the percentage on the stage above have diameters less than the cutoff diameter of the stage above that, and so on. Repeat the calculation for each of the remaining stages in reverse numerical order ~~(see *Table 6*).~~

■(see *Table 8*).■1S (*USP27*)

~~**Table 6. Cutoff Aerodynamic Diameter for Stages of *Apparatus 5 and 6***~~

~~Use Eq. 2 to calculate $D_{50,Q}$ for flow rates, Q, in the range 30 to 100 L per minute with Q_n = 60 L per minute.~~

~~*Stage*~~	~~D_{50,Q_n}~~	~~*x*~~

[a] Stages 6 and 7 are omitted from *Apparatus 3* at flow rates >60 L per minute; thus, values for b and c should be omitted for *Apparatus 3*, where necessary.
[b] The filter stage in *Apparatus 4* is Stage 5 (see *Figure 8*).
[c] [(mass on stage / ΣB) × 100] % + (total% of ΣB from stages below).
[d] The 50% cutoff diameter of the stage immediately above that indicated (e.g., for Stage 4, enter the cutoff diameter for Stage 3; for *Apparatus 2* or *4*, calculate as $D_{50,Q}$ from Eq. 1; for *Apparatus 5* or *6*, calculate as $D_{50,Q}$ from Eq. 2 using *Table 6*). Values entered in the Table are correct for *Apparatus 1*, *2*, *4*, *5*, and *6* only when used at 28.3, 60.0, 60.0, 60.0, and 60.0 liters per minute, respectively.
[e] The D_{50} values are only valid at a flow rate of 28.3 L per minute.■1S (*USP27*)

If necessary, and where appropriate, plot the percentage of mass less than the stated aerodynamic diameters, versus the aerodynamic diameter, $D_{50,Q}$, on log probability paper. Calculate the GSD by the equation:

$$GSD = \sqrt{\frac{Size\ X}{Size\ Y}}.$$

Use these data and/or plot to determine values for MMAD and GSD etc., as appropriate and when necessary (see *Figure 10*).

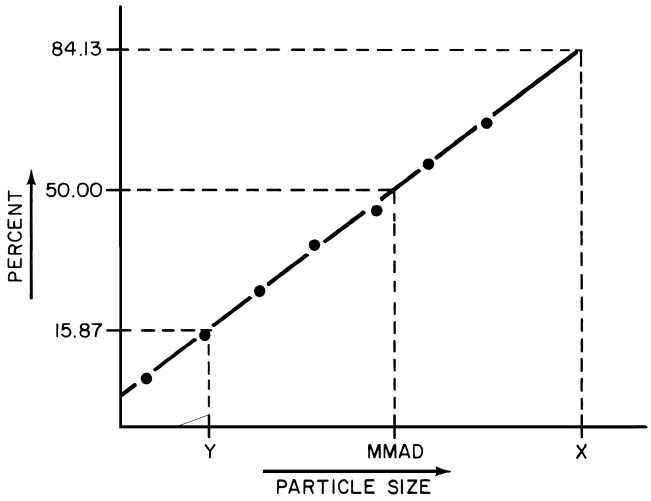

Fig. 10. Plot of cumulative percentage of mass less than the stated aerodynamic diameter versus aerodynamic diameter.

BRIEFING

⟨**621**⟩ **Chromatography,** *USP 26* page 2126, page 3008 of the *First Supplement*, and page 842 of *PF* 29(3) [May–June 2003]. The current process of including a new chromatographic reagent in *USP–NF* is by creating a new L, G, or S designation, as appropriate, numbering it, and describing the packing, phase, or support. The numbering is sequential. This process is creating some confusion between the official *USP–NF* and the proposed text in *Pharmacopeial Forum*. When a proposal is published in *Pharmacopeial Forum* that requires a new chromatographic reagent, a new numbered designation is created, and this number will be pending until the monograph that calls for this column becomes official in the next official publication, whether Supplement or the next Book. Meanwhile a designation previously proposed in *Pharmacopeial Forum* may be forwarded to the next official publication using the same numbered designation.

To avoid this confusion, henceforth, the chromatographic reagents will receive a numbered designation ONLY when the text becomes official. During the proposal period—publication in *Pharmacopeial Forum*—the new chromatographic reagent will be identified in the general test chapter *Chromatography* ⟨621⟩ by L##, G##, or S## with the title of the monograph and the brand name of the column in parentheses. In the text of the monograph that requires the new reagent, L##, G##, or S## will appear with a cross reference (see *Chromatography* ⟨621⟩). No numbers will be assigned during the proposal period.

Other revisions to this chapter include the following: Information regarding a suitable column L24 is updated. In the monograph *Paclitaxel*, packing L43 was developed for the column (TAC-1, manufactured by Whatman) that was used to develop and validate the *Related compounds, Test 1*. This column has a propyl spacer between the pentafluorophenyl groups and the silica particles. As of this date, we have not received any information from reviewers that this kind of column without the propyl spacer can be used for this test; therefore, the description of L43 is being modified to only refer to columns with a propyl spacer.

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to 10 µm in diameter.

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

In-Process Revision

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 10 µm in diameter.

L9—10-µm irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel 10 µm in diameter having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.[5]

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, 5 to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L31—A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate ■dextrans■1S (*USP26*) by molecular size over a range of 4,000 to ■500,000■1S (*USP26*) Da. It is spherical, silica-based, and processed to provide pH stability.[6]

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles

■by a propyl spacer,■1S (*USP27*)
5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.[7]

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.[8]

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.[9]

[5] Available as ~~Fractogel TSK HW 40F and distributed by Merck and Co.~~

■ YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■1S (*USP27*)

[6] Available as TSKgel G4000 SWXL from TosoHaas (www.tosohaas.com).

[7] Available as CarboPac MA1 and distributed by Dionex Corporation.

[8] Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.

[9] Available as OmniPac PAX-500 and distributed by Dionex Corporation.

▲L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.[10]
L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.[11] ▲*USP26*
■L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column. [12] ■1S (*USP26*)

■L~~53~~ ## (Alendronic Acid Tablets, PRP-X100)—An anion-exchange resin consisting of a rigid, spherical styrene-divinylbenzene copolymer with trimethylammonium groups at a loading of about 2 mEq per g, 3 to 20 µm in diameter.[14] ■1S (*USP27*)

■L~~54~~ ## (Maltose, Aminex HPX-87N)—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about 7 to 11 µm in diameter.[25] ■1S (*USP27*)

■L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter allowing resolution of oligosaccharides in the molecular weight range of 180 to 3000.[18] ■2S (*USP26*)

■L~~57~~ ## (Nevirapine, Supelcosil ABZ)—Spherical, porous silica gel, 3 or 5 µm in diameter, the surface of which has been covalently modified with palmitamidopropyl groups and endcapped with acetamidopropyl groups to a ligand density of about 6 µmoles per m^2.[19] ■1S (*USP27*)

■L~~58~~ ## (Albumin Human, TSKgel G3000 SW)—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa. It is spherical (10 µm), silica-based, and processed to provide hydrophilic characteristics and pH stability.[20] ■1S (*USP27*)

■L~~59~~ ## (Clonidine, Zorbax SB-C3)—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.[21] ■1S (*USP27*)

■L~~60~~ ## (Bethanecol Chloride, Bethanecol Chloride Tablets, IC-Pak C M/D)—A strong cation exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.[23] ■1S (*USP27*)

■L~~61~~ ## (Lycopene, Lycopene Preparation, YMC 30)—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter. ■1S (*USP27*)

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00:0.90:0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17—75% Phenyl-25% methylpolysiloxane.
G18—Polyalkylene glycol.

[10] Available as Chiralpak AD from Chiral Technologies, Inc., 730 Springdale Drive, P.O. Box 564, Exton, PA 19341.
[11] Available as TSK IC SW Cation from TosoHaas.
[12] Available as IonPac CS14 distributed by Dionex Corporation (www.dionex.com).
[14] Available as PRP-X100 from Hamilton Company (www.hamiltoncompany.com).
[25] Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143), Group Headquarters, Bio-Rad Laboratories, 2000 Alfred Nobel Dr., Hercules, California 94547 (www.discover.bio-rad.com).
[18] Available as Superdex Peptide 10/300 GL from Amersham Biosciences (www.amershambiosciences.com).
[19] Available as Supelcosil ABZ from Supelco. (www.sigma-aldrich.com/supelco)
[20] Available as TSKgel G3000SW Column (analytical column) and TSKgel Guard (guard column) from Tosoh Biosep (part numbers 05103 and 05317, respectively). (www.tosohbiosep.com)
[21] Available as Zorbax SB-C3 from Agilent Technologies. (www.agilent.-com/chem)
[23] Available as IC-Pak C M/D from Waters Corp. (www.waters.com).

In-Process Revision

G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.
G20—Polyethylene glycol (av. mol. wt. of 380 to 420).
G21—Neopentyl glycol succinate.
G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and adiepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.
G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.
G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.
G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36—1% Vinyl-5% phenylmethylpolysiloxane.
G37—Polyimide.
G38—Phase G1 containing a small percentage of a tailing inhibitor.[13]
G39—Polyethylene glycol (av. mol. wt. about 1500).
G40—Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).
G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).
G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).
G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.
G45—Divinylbenzene-ethylene glycol-dimethylacrylate.
G46—14% Cyanopropylphenyl-86% methylpolysiloxane.
G47—Polyethylene glycol (av. mol. wt. of about 8000).
G48—Highly polar, partially cross-linked cyanopolysiloxane.

■G49—Proprietary derivatized phenyl groups on a polysiloxane backbone.[14] ■1S (*USP26*)

■G~~50~~ ## (Docosahexaenoic Acid)—Polyethylene glycol, cross-linked (av. mol. wt. of more than 20,000).[24] ■1S (*USP27*)

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane[15] to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed.[15]

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 μm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 μm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 μm.

S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 μm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.[16]

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

[13] A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc., Supelco Park, Bellefonte, PA 16823.

[14] A suitable grade is available commercially as "Optima Delta 3" from Machery-Nagel, Inc., 215 River Vale Road, River Vale, NJ 07675.

[24] A suitable grade is available commercially as Famewax from Restek.

[15] Unless otherwise specified in the individual monograph, silanized support is intended.

[16] Commercially available as SP1500 on Carbopack B from Supelco.

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1086**⟩ **Impurities in Official Articles,** *USP 26* page 2331—See briefing under *Organic Volatile Impurities* ⟨467⟩. In addition, editorial style changes have been made.

(PA2: W. Paul) RTS—39967-2

Change to read:

DEFINITIONS

Foreign Substances

Foreign substances, which are introduced by contamination or adulteration, are not consequences of the synthesis or preparation of compendial articles and thus cannot be anticipated when monograph tests and assays are selected. The presence of objectionable foreign substances not revealed by monograph tests and assays constitutes a variance from the official standard. Examples of foreign substances include ephedrine in Ipecac or a pesticide in an oral liquid analgesic. Allowance is made in this Pharmacopeia for the detection of foreign substances by unofficial methods. (See *Foreign Substances and Impurities*, in the section *Tests and Assays*, under *General Notices and Requirements.*)

▪Residual Solvents

Residual solvents are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance may enhance the yield or determine characteristics such as crystal form, purity, and solubility and, as such, may be a critical parameter in the synthetic process. Because there is no therapeutic benefit from residual solvents, they should be removed to the extent possible to meet product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. A classification of residual solvents by risk assessment is presented in the *Residual Solvents Limits* section of *Organic Volatile Impurities* ⟨467⟩. Class 1 solvents should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment.▪IS (*USP27*)

Toxic Impurities

Toxic impurities have significant undesirable biological activity, even as minor components, and require individual identification and quantitation by specific tests. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Based on validation data, individualized tests and specifications are selected. These feature comparison to a Reference Standard of the impurity, if available. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as toxic impurities.

Concomitant Components

Concomitant components are characteristic of many bulk pharmaceutical chemicals and are not considered to be impurities in the Pharmacopeial sense. Limits on contents, or specified ranges, or defined mixtures are set forth for concomitant components in this Pharmacopeia. Examples of concomitant components are geometric and optical isomers (or racemates) and antibiotics that are mixtures. Any component that can be considered a toxic impurity because of significant undesirable biological effect is not considered to be a concomitant component.

Signal Impurities

Signal impurities are distinct from ordinary impurities in that they require individual identification and quantitation by specific tests. Based on validation data, individualized tests and specifications are selected. These feature a comparison to a reference standard of the impurity, if available.

Signal impurities may include some process-related impurities or degradation products that provide key information about the process, such as diazotizable substances in thiazides. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as signal impurities rather than ordinary impurities.

In-Process Revision

Ordinary Impurities

Ordinary impurities are those species in bulk pharmaceutical chemicals that are innocuous by virtue of having no significant, undesirable biological activity in the amounts present. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Selections of tests and assays allow for anticipated amounts of impurities that are unobjectionable for the customary use of the article. The presence of ordinary impurities is controlled in monographs in this Pharmacopeia by including tests for *Ordinary Impurities* ⟨466⟩. Tests for *related substances* or *chromatographic purity* may also control the presence of ordinary impurities.

Unless otherwise specified in an individual monograph, estimation of the amount and number of ordinary impurities is made by relative methods rather than by strict comparison to individual Reference Standards. Nonspecific detection of ordinary impurities is also consistent with this classification.

The value of 2.0% was selected as the general limit on ordinary impurities in monographs where documentation did not support adoption of other values. This value represents the maximum allowable impact from this source of variation, when taken with the variation allowed by the composite of other Pharmacopeial tests and assays for both the bulk pharmaceutical chemical and the preparations.

Where a monograph sets limits on concomitant components, signal impurities, and/or toxic impurities, these species are not to be included in the estimation of ordinary impurities unless so stated in the individual monograph.

Related Substances

Related substances are structurally related to a drug substance. These substances may be identified or unidentified degradation products or impurities arising from a manufacturing process or during storage of a material.

Process Contaminants

Process contaminants are identified or unidentified substances (excluding related substances and water), including reagents, inorganics (e.g., heavy metals, chloride, or sulfate), raw materials, and solvents. These substances may be introduced during manufacturing or handling procedures.

BRIEFING

⟨**1136**⟩ **Packaging—Unit of Use,** page 1302 of *PF* 28(4) [July–Aug. 2002]. This general information chapter, which previously appeared in *Pharmacopeial Previews*, is now forwarded to *In-Process Revision* with the following revisions based on comments received:

- In the *Introduction* section of the chapter, including a paragraph that provides useful information on the advantages of unit-of-use packaging.
- In the section *Packaging Closure Types*, incorporating a reference to child-resistant packaging into the text of nonreclosables and a reference to the Poison Prevention Packaging Act of 1970 (PPPA) and 16 CFR 1700, which authorizes the use of special packaging to protect children from serious injury.
- In the definition of single-unit and unit-dose containers, providing clarification and adding other definitions relating to unit-of-use packaging to eliminate any contradiction to the existing definitions in the *General Notices andRequirements*.
- The advantages of bar coding on labels are outlined and its use is advocated to eliminate medication errors.

Other changes were made to clarify the intent of the chapter and to improve its readability.

(PSD: C. Okeke) RTS—39708-1

Add the following:

■⟨1136⟩ PACKAGING—UNIT OF USE

INTRODUCTION

This chapter is intended to provide guidance in the application of unit-of-use packaging. Unit-of-use packaging, when provided by the manufacturer, offers some of the following attractive advantages. (1) The ability to dispense a dosage form to a patient in the manufacturer's original container ensures that the suitability of the container has been established based on the manufacturer's stability studies. (2) Counting and repackaging of dosage units in the pharmacy is eliminated, thereby reducing the possibility of human error. (3) The pharmacist is able to affix the label for the patient onto the unit-of-use package and is free to use the manufacturer's expiration date as the beyond-use date (provided that the date is equivalent to one year or less, and that other factors were considered that might cause a different beyond-use date to be necessary). (4) The number of dosage units in a single unit-of-use package may be determined on a case-by-case basis.

DEFINITION

CONTAINER–CLOSURE SYSTEM is equivalent to a packaging system. It is the sum of the packaging components that, together, contain and protect the dosage form.

UNIT-OF-USE PACKAGE is a container–closure system that is designed to hold a specific quantity of a drug product for a specific use and that is to be dispensed to a patient without any modification except for the addition of appropriate labeling (see *General Notices and Requirements*). The packaging of a unit-of-use system may be a multiple-unit container or a ~~unit-dose~~ single-unit container. A unit of use may be a drug product in either a liquid or solid dosage form (see also the FDA *Guidance for Industry on Container Closure Systems for Packaging Human Drugs and Biologics*). [NOTE—The terms unit-of-use package and a unit-of-use container may be used interchangeably.]

DEBLISTERING is the process of removing medication from a blister-type container.

IMMEDIATE CONTAINER is a container that is in direct contact with the article or preparation.

MATERIALS OF CONSTRUCTION include substances used to manufacture or package components such as glass, plastics [including high-density polyethylene (HDPE), low-density polyethylene (LDPE), and polypropylene (PP)], resins, and other materials as listed in the general test chapter *Containers* ⟨661⟩ and in the FDA *Guidance for Industry on Container Closure Systems for Packaging Human Drugs and Biologics.*

TYPE OF CONTAINER FOR UNIT OF USE

Single-Unit Container

A single-unit container is a unit-dose or a single-dose container intended for either oral or parenteral use. See *General Notices and Requirements*.

UNIT-DOSE CONTAINER

A ~~single-unit container or a single-dose container,~~ unit-dose container, intended for oral use, is a container that has been packaged in the dosage regime for the course of the therapy appropriate for the drug that is to be administered.

SINGLE-DOSE CONTAINER

A single-dose container, intended for parenteral use, is a container that has been packaged in the dosage regime for the course of the therapy appropriate for the drug that is to be administered.

Multiple-Unit Container

A multiple-unit or a multiple-dose container is prepackaged in bottles or containers for injections of the drug in appropriate quantities. A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

MATERIALS OF CONSTRUCTION

Unit-of-Use Container

The Poison Prevention Packaging Act (PPPA) of 1970 authorizes the use of special packaging—child-resistant and senior-friendly packaging. Child-resistant packaging protects children from serious injury or illness from ingesting or handling hazardous household products including drugs.

Unit-of-use containers are required to be child resistant. Unit-of-use containers in child resistant single-unit containers include supported blisters, such as separate, peel,

push, and tear notch; and enclosed or in-card blisters, such as pull tabs, slide packs, etc. Unit-of-use containers in multiple unit containers include glass and plastic containers.

GLASS

~~The packaging material equivalent to the immediate container that is glass meets the glass test requirements~~ Any glass packaging material used in the immediate container should meet the glass test requirements for *Limits for Glass Types* and *Chemical Resistance—Glass Containers: Powdered Glass*, *Water Attack at 121°*, and *Arsenic* under the general test chapter *Containers* ⟨661⟩.

PLASTIC

~~The packaging material equivalent to the immediate container that is plastic meets the test requirements~~ Any plastic packaging material used in the immediate container should meet the plastic test requirements for *Plastics* in the general test chapters *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩. Depending on the type of plastic packaging material used, the packaging material meets the requirements for *Biological Tests—Plastics and Other Polymers*, *Physicochemical Tests—Plastics*, *Polyethylene Containers*, *Polyethylene Terephthalate/Polyethylene Terephthalate G*, and *Polypropylene Containers.*

The test for moisture vapor transmission may be carried out as described in the general test chapter *Containers—Permeation* ⟨671⟩ for multiple-unit and unit-dose containers.

PACKAGING CLOSURE TYPES

Reclosables and nonreclosables may be used for both solid and liquid dosage forms. Both must be packaged in compliance with the 16 CFR 1700.15 standards.

Reclosables

Reclosables are containers with suitable closures that may incorporate tamper evidence and child-resistance capabilities. Reclosables may be used for glass or plastic containers.

Nonreclosables

Nonreclosables are containers with closures that are nonreclosable such as blisters, sachets, strips, and other single-unit containers. Nonreclosables may include packs such as cold-formed foil blisters, foil strip packs, and PVC/Aclar combining multilayer materials that are thermo-formed or cold-formed foil blisters (see *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩). Nonreclosables may be child resistant depending on the intended use and place of use. Household nonreclosables are subject to the PPPA as defined in 16 CRF 1700.14. However, because of some unit-dose designs, not all unit-dose packages comply with the PPPA.

LABELING

The unit-of-use containers are labeled as such to include ~~manufacturer's lot numbers, accuracy or bar codes, and expiration dates~~ expiration dates, and in some instances, the manufacturer's lot numbers and bar codes as provided in the *Labeling* section of the *General Notices and Requirements* under *Preservation*, *Packaging*, *Storage*, *and Labeling*. Some of the advantages of having bar codes on the label include reduced medication errors, improved inventory control, and improved access to medication identity. The labeling covers information placed in the ~~pack by the manufacturer and the label added at the dispensing stage by the pharmacist.~~ container by the manufacturer (see *General Notices and Requirements*). Acceptable labeling can range from the full labeling for multiple-unit containers to

an abbreviated labeling when the container is too small to include all the text. Full labeling may also be provided on the carton if it is not present on the immediate container.

REPACKAGING AND REPROCESSING

Unit-of-use containers are reprocessed or repackaged as instructed by the manufacturer or as directed in the general test chapter *Containers* ⟨661⟩ or in the general information chapter *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩. A unit-of-use package may not be reprocessed by a pharmacist once it has been deblistered from a unit-dose container (see *General Notices and Requirements* for application of the appropriate beyond-use date for a multiple-unit or unit-dose container). However, under current Good Manufacturing Practices (cGMPs) and tight quality controls, the manufacturer or contract repackager may repackage and reprocess unit-of-use containers.

RESPONSIBILITY OF THE DISPENSER

~~The unit of use package shall contain such label information as the following:~~

Labeling

The labeling on a unit-of-use container also includes a label added at the dispensing stage by the pharmacist. Prior to dispensing the unit-of-use package, the dispenser shall add label(s) that provide the following information:

(1) the name of the patient;

(2) the name and strength, the directions for use as prescribed by a doctor or health-care provider, and the name of the prescriber; and

(3) any storage instruction, ~~appropriate package insert, length of days of use,~~ beyond-use date, and other information as deemed appropriate by federal and state laws.

In the pharmacy setting, pharmacists are encouraged to use bar codes, in conjunction with computerized prescription orders, to confirm that the right drug is being dispensed to the right patient. Bar coding would minimize errors and create opportunity for medication traceability and accountability.

Information to Patient

Patients must be given information that applies to the specific brand of product being dispensed.

INFORMATION FROM MANUFACTURERS

The manufacturer should provide appropriate product development or stability data information that can be used to determine appropriate labeling, storage, and shipping statements that will properly inform patients and practitioners. The manufacturer may make other assurances based on product information and data on packaging and distribution arrangements. In the event that a product is not to be repackaged, the manufacturer may state so in the labeling. The manufacturer also includes labeling and information suitable for optimal handling by the practitioner and the patient. The labeling and information should be bar coded to eliminate medication error and promote medication traceability.

QUALITY CONTROL OF PACKAGING SYSTEM

The packaging system shall meet the general considerations for system suitability, protection, safety, and performance characteristics as described in the FDA *Guidance for Industry on Container Closure Systems for Packaging*

In-Process Revision

Human Drugs and Biologics, in the general test chapter *Containers* ⟨661⟩, and in the general information chapter *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩.■1S (*USP27*)

BRIEFING

⟨1178⟩ Good Repackaging Practices. This new general information chapter is intended to provide repackagers with guidance on applying good repackaging practices for drug products. It illustrates the distinction between repackaging a drug product under the purview of FDA and a pharmacist who repackages under the jurisdiction of the State Boards of Pharmacy. This chapter was drafted under the currently available FDA guidance documents and 21 CFR in relation to good manufacturing practices. Comments on this chapter should be addressed to Dr. Claudia Okeke.

(PSD: C. Okeke) RTS—39904-1

Add the following:

■⟨1178⟩ GOOD REPACKAGING PRACTICES

This chapter is intended to provide guidance to those engaged in repackaging of drug products in accordance with 21 CFR 10.90. A pharmacist who repackages under the state law needs to apply the principal information provided in the general information chapter *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩, and other beyond-use date references in the *General Notices and Requirements* under the *Expiration Dating* section.

This chapter provides information to any person who removes drugs from their original manufacturer's container and repacks them into a different container–closure system for resale or for distribution to hospitals or other pharmacies. It does not apply to repackaging of any *radioactive* drug products, including oral solids.

A repackager referred to here may also be a contract packager, a contract repackager, or a contract prepackager. The words ''repackager'' and ''repacker'' are the same in this text and may be used interchangeably. These functions are beyond the regular practice of a pharmacist. A repackager or prepackager is required to register with the FDA and comply with current Good Manufacturing Practices (cGMPs) regulations in 21 CFR 210 and 211.

A repackager is expected to meet the requirements of packaging practice under 21 CFR 210 through 226. Since the packaging practice relates to packaging, processing, or holding a drug product intended for administration to humans or animals, the repackager is expected to comply with regulations that relate to the sections pertaining to quality control, personnel qualifications, building and facilities, equipment, production and process controls, packaging and labeling controls, laboratory controls, batch records and reprints, distribution records, storage control records, and complaint files.

DEFINITIONS

For the purposes of this chapter repackager, contract packager, contract repackager, contract prepackager, and prepackager are defined as follows:

A REPACKAGER is one who purchases and removes a drug product from the manufacturer's market container or bulk dosage container and places the product into a different container for distribution for human or animal use. A repackager may or may not take ownership from the manufacturer. A repackager is engaged in the repackaging of drugs (see also *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩ for more definitions of a repackager).

A CONTRACT PACKAGER is one who is contracted by the original drug manufacturer to package or repackage their product into a single- or multi-unit container chosen by the manufacturer. These containers should meet all the applicable requirements in this chapter, pertinent sections in general test chapters *Containers* ⟨661⟩, and *Containers—Permeation* ⟨671⟩, and comply with 21 CFR food additive requirements.

AN EQUIVALENT CONTAINER–CLOSURE SYSTEM refers to a container–closure system that yields the same, or better, moisture vapor transmission rate (MVTR), oxygen transmission, and light transmission as the original market container. These values may be determined by the repackager, or they may be obtained from the container–closure vendor for the specific container–closure system under consideration.

BEYOND-USE DATE (BUD) AND DISCARD-AFTER DATE are equivalent and are assigned using the criteria stated in the relevant section below.

EXPIRATION DATE is determined using stability studies and is not the same as beyond-use date or discard-after date.

FACILITIES

The facility in which repackaging is practiced should be operated in conformity with cGMPs. The environmental conditions during the packaging and storage operation of the drug product should comply with the *controlled room temperature* (see *General Notices*), storage in a *dry place*, and other requirements as directed by the manufacturer or supplier, especially if the drug requires storage at special temperature and humidity conditions (see *Good Storage and Shipping Practices* ⟨1079⟩).

ACQUISITION PROCESS

The repackager is expected to perform appropriate analytical testing for all pertinent specifications, such as identity and strength of each active ingredient, and any other finished product tests to establish valid analytical data. The repackager is expected to maintain records of such analyses on a batch-by-batch basis for the repackaged product that is either transferred to the repackager by the manufacturer or independently maintained by the repackager.

"Bulk" in this text refers to the quantity of either drug product or dosage form. The following criteria should be considered by the repackager upon receipt of bulk prior to repackaging.

(a) The bulk article should be distributed to the repackager by the manufacturer in accordance with all regulatory requirements and accompanied by appropriate labeling and a valid expiration date. The repackager should also receive Material Safety Data Sheets (MSDS), Certificates of Analysis, and sample market labeling, including inserts from the drug product manufacturer.

(b) The bulk article should be received intact and undamaged and in properly labeled containers with the Certificate of Analysis.

(c) The bulk article should undergo definitive organoleptic evaluations to confirm its identity (e.g., physical appearance, marking, color, and odor) and to confirm the labeling as described by the manufacturer.

(d) Records should be maintained to validate the identity and quantity of each shipment received and each lot and bar coded information of bulk article received. This record should also include the manufacturer or supplier and its lot numbers and the date of receipt.

(e) The repackager should store and maintain the bulk under storage conditions specified by the manufacturer,

In-Process Revision

and/or as directed under *controlled room temperature* (see *General Notices*).

REPACKAGING PROCESS

The following criteria should be observed.

(a) The repackaging operations should be conducted under conditions that meet specified storage temperature definitions (see *General Notices*). Conditions of operation include maintenance of *controlled room temperature* in the area where the repackaging operation is conducted or other conditions as instructed by the manufacturer.

(b) The manufacturer should include, in the package insert or in other appropriate literature supplied to the repackager, the following information about the packaging: materials of construction of the market package, its MVTR (see ⟨671⟩), as well as oxygen transmission and light transmission characteristics in order to enable the repackager to select properly an equivalent container–closure system. If the repackager does not use a container–closure system equivalent to the manufacturer's market package, then the repackager must generate stability data for the drug product in the new container–closure system to justify the expiration date or BUD assigned.

(c) The repackaging containers are labeled with the same labeling information as the market label that is used by the manufacturer. The conditions on the labeling should meet those required under 21 CFR 201, 211.122, 211.125, and 211.130.

(d) Written procedures should be maintained to ensure that correct labels, labeling, and packaging materials are used for drug products.

(e) All requirements for repackaging of bulk products should meet 21 CFR 211.

(f) The packaging materials should meet the test requirements provided in 21 CFR in direct food additives or additives that have been approved as food contact substances. See general chapters ⟨661⟩, ⟨671⟩, and ⟨1146⟩.

LABELING

A repackager should provide appropriate labeling of the product identical to the manufacturer's approved market container. All repackaged products should be labeled with an appropriate BUD in the absence of stability data, or with an expiration date in cases where suitable stability studies, determined in CFR 211.166 (for recommended conditions see *International Conference on Harmonization ICH Q1A Stability Testing of New Drug Substances and Products*), have been performed on the product using the repackager's container. The expiration date will ensure that the products meet applicable standards of identity, strength, quality, and purity at the time of use.

EXPIRATION DATE/BEYOND-USE DATE

Expiration Date

Stability studies are performed on the drug product in the original manufacturer's containers to establish an expiration date. When a drug is repackaged into a different container, the product's expiration date is altered or interrupted.

(a) The repackager may perform stability studies on the repackaged products to establish an expiration date for the product based on scientific evaluation of the drug product in the container–closure system in which it is to be marketed.

(b) A repackager may use the manufacturer's original expiration date without additional stability testing if the drug product is repackaged into an equivalent container–closuresystem that is at least as protective as,

or more protective than, the original system and complies with criteria established for equivalency. Establishment of system equivalency means that the requirements of general test chapters ⟨661⟩ and ⟨671⟩ are met; and the specifications such as light transmission, seals, or desiccants associated with the original container–closure system, or special protective materials in which the drug product is marketed, are the same. Comparison of container–closure systems may be done through stress testing of the product after storage under exaggerated conditions of temperature and humidity.

If the repackager does not use a container–closure system equivalent to the manufacturer's market package, then the repackager must generate stability data for the drug product in the new container–closure system to justify the expiration date or BUD assigned.

(c) A repackager should not use the equivalency container–closure system criteria to repackage drug products where such products have been identified by the manufacturer to have stability problems or if the manufacturer specifically states that the product should not be repackaged using the equivalency container–closure system criteria. In this case, a repackager needs to demonstrate the stability of the drug product in the repackager's container–closure system.

(d) Establishing the expiration date in this case is applicable for unit-dose containers, multiple-unit containers, and unit-of-use container types.

Beyond-Use Date or Discard-After Date

In the absence of stability data, where a repackager repackages a product into a unit-dose or multiple-unit container without conducting appropriate stability studies to support expiration dates used, the period of use of the product is limited by the BUD for the repackaged product, which must be less than the expiration date.

UNIT-DOSE PACKAGING

For unit-dose packaging, the following criteria should be considered.

(1) The original bulk container of the drug product to be used for repackaging has not been previously opened.

(2) The contents of the original bulk drug product to be repackaged are repackaged at one time.

(3) The unit-dose container meets general test chapter ⟨671⟩ testing requirements for either Class A or Class B containers.

(4) The unit-dose container meets or exceeds the manufacturer's specification for light resistance.

(5) The conditions of storage meet the storage specifications in *General Notices* and as described in the labeling by the manufacturer of the bulk product. Where no specific storage conditions are specified, the product should be maintained at *controlled room temperature* and in a *dry place* during repackaging.

(6) The BUD used for the repackaged product does not exceed 6 months from the date of repackaging.

(7) The BUD does not exceed the manufacturer's expiration date.

(8) The BUD does not exceed 25% of the time between the date of repackaging and the expiration date shown on the manufacturer's bulk article container of the drug being repackaged.

(9) Documentation should be in place to show that the preceding criteria (items 1–8) were met. Documentation to show the type of packaging material used and the testing for these materials is also kept.

In-Process Revision

(10) The repackager may not repackage if the manufacturer specifically states "Do not repackage." However, the repackager may affix the repackager's labeling if it is in accordance with FDA requirements and in agreement with the manufacturer of the drug product.

(11) The repackager may not use the expiration date and BUD interchangeably because they imply the presence or absence of stability testing, respectively.

MULTIPLE-UNIT PACKAGING

The *General Notices* define multiple-unit packaging as a package that contains more than one single-dosage unit. For multiple-unit packaging the following criteria should be considered in assigning a BUD.

(1) The original bulk container of drug product to be used for repackaging has not been previously opened.

(2) The contents of the original bulk drug product to be packaged are repackaged at one time.

(3) The conditions of storage meet the storage specifications in the *General Notices* and as described in the labeling of the manufacturer's bulk product. Where no specific storage conditions are specified, the product should be maintained at *controlled room temperature* and in a *dry place* during repackaging.

(4) The type of container used for repackaging should be the same type used by the manufacturer as the market container, and the product container should comply with the requirements for containers as directed under general test chapter *Containers* ⟨661⟩, as well as the requirements of 21 CFR for food additives, or be an approved food contact substance. For example, if the manufacturer packages in glass, the repackager should repackage in glass of the same type used by the manufacturer or in chemical-resistant glass containers.

(5) Where the original container is a material other than glass or high density polyethylene (HDPE), the repackager may use a container demonstrated to be equivalent to, or exceed, the protective properties of the manufacturer's multiple-unit market container when performing the applicable tests as described in general test chapters ⟨661⟩ and ⟨671⟩.

(6) Where the original container is polyethylene, the repackager may repackage in a chemical-resistant glass container or a polyethylene container. These containers should meet the appropriate tests and specifications in 21 CFR and general test chapters ⟨661⟩ and ⟨671⟩.

(7) The container meets or exceeds the test results of the manufacturer's multiple-unit market container for light transmission.

(8) The container meets or exceeds the manufacturer's container in special protective features: methods used to prevent leaching of container materials or the use of desiccants to maintain low moisture content. [NOTE—Desiccants should always be packaged on top of the drug product.]

(9) The container meets or exceeds the manufacturer's container test results for "tight" as provided in general test chapters ⟨661⟩ and ⟨671⟩.

(10) For all products, if the repackager uses a container that is equivalent in MVTR to the manufacturer's container or one that has a higher barrier, then the BUD should be 12 months or the manufacturer's expiration date, whichever is less. (See ⟨1146⟩ for description of low- and high-barrier packaging.)

(11) The repackager may not repackage the original bulk container of drug product if the manufacturer specifically states "Do not repackage." However, the repackager may affix the repackager's labeling if this is in accordance with FDA requirements or the specifications of the drug product manufacturer.

MINIMUM REQUIREMENTS

(a) A repackager is expected to comply with cGMPs and 21 CFR 211.170(b) for retained samples of repackaged drug products. Any alteration or manipulation of the repackaging process should be documented in accordance with the requirements in 21 CFR 211.

(b) A repackager is expected to repack penicillins, or products such as penicillins, in facilities separate from those facilities used for drug products as described in 21 CFR 211.42 and 21 CFR 211.46.

SHIPPING AND DISTRIBUTION

For products identified by the manufacturer as moisture- and temperature-sensitive, the repackager must follow the specifications provided by the manufacturer during repackaging, shipping, and distribution.

(a) A repackager may not repackage a moisture- and temperature-sensitive product if the manufacturer so instructs, except if the repackager is only altering the labeling in accordance with FDA requirements.

(b) The repackaging container should show the equivalent or better, in protective properties, than the manufacturer's original container. For moisture-sensitive products, a higher-barrier container should be used for repackaging.

(c) The repackager should have proper documentation in place to show the equivalency in protection of the container used.

(d) The storage and handling of the drug product should meet the conditions specifically instructed by the manufacturer of the product.

(e) The repackager should label the container"Contains moisture-sensitive product."

For all other products, the repackager should follow the same guidelines provided in *Good Storage and Shipping Practices* ⟨1079⟩ [To come] that are applicable to a manufacturer.■1S (*USP27*)

BRIEFING

⟨1265⟩ Written Prescription Drug Information—Guidelines, page 1538 of *PF* 28(5) [Sept.–Oct. 2002]. Based on comments received from the proposal in 28(5), additional revisions are made to clarify the intent of this general information chapter.

(PSD: C. Okeke) RTS—39716-1

Add the following:

■⟨1265⟩ WRITTEN PRESCRIPTION DRUG INFORMATION—GUIDELINES

The purpose of these guidelines—comprising format, content, and accessibility of prescription drug leaflets—is to help ensure that leaflets are useful. In this context, useful means that recipients receive, understand, and are motivated to apply written information about their medicines to achieve maximum benefit and minimize harm. Dispensers, prescribers, and health-care providers who counsel patients about their medicines are intended to be the primary audience for these guidelines.

FORMAT GUIDELINES

1. Group all information from the same category, using brief, clear titles and bullets or subheadings as needed. Avoid symbols and subheadings not directly connected to the information they mark.
2. Be consistent in the placement and labeling of categories of information in all leaflets.
3. Provide information at the sixth-grade reading level or below, if possible (never above eighth-grade level). Do

In-Process Revision

not exclude information to achieve a lower reading level.

4. Use simple, common, accurate terms (for example, use ''noise in the ears'', not ''tinnitus'').
5. Use direct language that avoids words with opposite meanings (for example, use ''decrease blood pressure'', not ''increase low blood pressure effect'').
6. Provide reasons for instructions (for example, ''take with food to avoid upset stomach'').
7. Emphasize the most important information. Clearly distinguish warnings from instructions or from other text that may be misinterpreted as warnings.
8. Accompany each pictogram, if used, with corresponding text placed close to the pictogram. Use the simplest pictograms possible. For pictograms intended to prompt patients to ask questions or inform health-care providers, add text such as ''Tell Doctor'' or ''Ask Pharmacist''.
9. Make text readable by using 12-point or larger type, both uppercase and lowercase letters, an easy-to-read font (for example, a ~~sans~~ serif font), and adequate space between lines and paragraphs. To call attention to important information, use a larger, boldface type.
10. Evaluate format by performing tests of readability, comprehension, memory, problem solving, and behavioral efficacy and intention, using representative samples of the target population.

CONTENT GUIDELINES

1. Provide enough detail to facilitate correct use, achieve maximum benefit, and minimize harm including a statement that identifies activities (such as driving or sunbathing) that the patient should avoid.
2. Write text that is unbiased in content and tone and scientifically accurate. The uses described should be consistent with FDA-approved labeling or otherwise permitted by FDA, or should appear in federally recognized drug compendia. Distinguish unlabeled from labeled use. ~~For labeled use, state the date on which it was approved.~~
3. For drugs sold under a brand name, provide both brand and generic names and include a pronunciation guide for each.
4. Describe the drug and its dosage form. Include indications and contraindications, specific directions for use, what to do if a dose is missed, and what to do in the event of an overdose or poisoning.
5. Do not use abbreviations.
6. Indicate the intended type of benefit (for example, ''cure'', ''prevention'', ''to help relieve symptoms''). Indicate how—and how soon—the patient should recognize the benefit and what to do if none is observed.
7. Give a balanced evaluation of risks and benefits.
8. List side effects, in order of severity, ~~with estimated frequency and action to be taken if one or more occur~~ such as ''serious,'' ''most common,'' and other similar type groupings. It may not be appropriate to provide sufficient detail for the patient to be able to monitor serious or ~~frequently occurring~~ common side effects. ~~If no side effects are known, say so.~~ Provide guidance to consult the doctor or pharmacist, and indicate that all the side effects are not listed.
9. List ~~drug-drug, drug-food, drug-lab test, and drug-disease interactions. If no such interactions are known, say so. If appropriate, include botanicals, dietary supplements, and over-the-counter medicines, as well as other prescription medicines. If known, include estimated severity of interactions (mild, moderate, or severe). one or two most important interactions, as described earlier.~~ sufficiently specific and comprehensive information

that includes the provision of all important risk information. Patients should be advised to be sure to inform the provider about all the medicines they are taking.

10. Indicate the potential for therapeutic duplication if the drug is available under multiple names or over-the-counter, or if the active ingredient is contained in other products.
11. If known, include a statement concerning the safety of use in the presence of other conditions and during pregnancy or breast-feeding. Direct affected patients to discuss their condition with health-care providers. If the safety of use during pregnancy or breast-feeding has not been established, say so.
12. State whether safety and efficacy have been established in pediatric, geriatric, and other special populations. ~~and, if so, for what ages and doses.~~ Patients should be encouraged to discuss with their health-care provider any recommendations for dosage adjustment.
13. Illustrate information with diagrams when appropriate. Label the diagram components (for example, device parts) if they are not obvious. The words on the label should be prominently placed thereon with such conspicuousness and in such terms as to render them likely to be read and understood by the ordinary individual under customary conditions of purchase and use.
14. Include the following:
    ~~a. a warning to keep out of the reach of young children~~
    ~~b. a statement about the importance of adhering to dosing instructions~~
    ~~c.~~ a. a statement that the product is to be used only by the person for whom it was prescribed,
    ~~d.~~ b. storage information,
    ~~e.~~ c. a completeness disclaimer advising the patient to discuss this issue with the health-care provider,
    ~~f. a direction to check the expiration or beyond use date~~
    ~~g.~~ d. the publisher of the leaflet and the date the leaflet was developed or revised,
    ~~h.~~ e. sources of in-depth information and answers to questions, and
    ~~i.~~ f. other relevant general statements.
15. The patient should be advised about risks of developing dependence on, or tolerance to, the medications.

ACCESSIBILITY GUIDELINES

1. Write text that is relevant to the intended use of the drug.
2. Design the leaflets to be easy to recognize, consistent in format, and easy to store and retrieve.
3. Supplement the leaflets with oral counseling of patients, including children, the elderly, and caregivers.
4. Include a statement asking the patient to reread the leaflet.
5. Distribute the leaflets with all prescription medicines to consumers (namely, persons independently responsible for any aspect of medicine use or for giving medicines to others).
6. Produce leaflets in Spanish, ~~as well as in English;~~ English, or other languages; and establish criteria for producing them in other languages and for special populations (for example, children, visually handicapped, etc.). [NOTE—Ideally, prescription drug information leaflets would be customized for the patient's condition and for other relevant information (for example, gender, age, or physical limitations), and would be available in the patient's primary language. Currently, such customization is neither feasible nor practical, but it remains a goal.]■IS (*USP27*)

In-Process Revision

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Acetaldehyde, *USP 26* page 2462. Throughout the years, several members of the staff at USP have managed the *Reagents, Indicators, and Solutions* section of the *USP–NF*, adding or modifying single entries, but never treating this section as a whole document. Therefore, an extensive revision of this section, which includes *Reagent Specifications* and *Reagent Footnotes*, is proposed in this *PF* to make the information more consistent and user-friendly. Some obsolete reagents and their respective footnotes were deleted. Some specifications were, as much as possible, harmonized with the American Chemical Society (ACS) Reagent Specifications. Also, the contact information for possible suppliers was updated. Following is a list of all the reagent specifications affected by this revision.

Acetyl Chloride
Alum
Alumina, Activated
4-Amino-3-hydroxy-1-naphthalenesulfonic Acid
Ammonia Detector Tube
Ammonia Water, Stronger
Arsenic Trioxide
Benzoic Acid
7 Percent Bovine Serum Albumin Certified Standard
Butyl Acetate, Normal
Butyl Alcohol
Butyl Alcohol, Tertiary
4-(Butylamino)benzoic Acid
n-Butylboronic Acid
Calcium Acetate

Change to read:

Acetaldehyde, CH_3CHO—**44.05**—Colorless liquid. Miscible with water and alcohol.

~~*Assay*~~ ~~Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 30-m × 0.25-mm capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 30°; the detector temperature is maintained at 300°; the column temperature is maintained at 30° and programmed to rise 10° per minute to 150°. The area of the CH_3CHO peak is not less than 99% of the total peak area.~~

~~*Refractive index* ⟨831⟩: between 1.330 and 1.334, at 20°.~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Acetyl Chloride, *USP 26* page 2462—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-3

Change to read:

Acetyl Chloride, CH_3COCl—**78.50**—Clear, colorless liquid, having a strong, pungent odor. Is decomposed by water and by alcohol. Miscible with benzene and with chloroform. Specific gravity: about 1.1.

~~*Boiling range* (Reagent test)~~ ~~Not less than 94% distils between 49° and 53°.~~

~~*Residue on evaporation*~~ ~~Evaporate 10 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 2.5 mg (about 0.02%).~~

~~*Miscibility with benzene* and *with chloroform*~~ ~~Separate 5-mL portions give clear solutions with 20 mL of benzene and with 20 mL of chloroform.~~

~~*Solubility*~~ ~~Place 5 mL in a 50-mL graduated cylinder, and cautiously add, dropwise, about 3 mL of water, shaking after each addition until the reaction is complete, then dilute with water to 50 mL: the solution is clear.~~

~~*Phosphorus compounds*~~ ~~To 5 mL of the solution obtained in the preceding test add 3 mL of nitric acid, and evaporate on a steam bath to dryness. The residue, dissolved in 20 mL of water, shows not more than 0.03 mg of PO_4 (0.02% as P) [See *Phosphate in Reagents*].~~

~~*Heavy metals*~~ ~~Dilute 10 mL of the solution obtained in the test for *Solubility* with 30 mL of water, add 10 mL of hydrogen sulfide TS, and render alkaline with ammonia TS: no noticeable change in color is produced.~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Albumin Bovine Serum. This new reagent is to be used in the *Total protein* test in the proposed monograph *Anthrax Vaccine Adsorbed*.

(HDQ: M. Marques) RTS—39997-1

Add the following:

■**Albumin Bovine Serum**— [*9048-46-8*]—Almost colorless to faintly yellow powder. Not less than 95% pure. Solubility, 40 mg in 1 mL of water. Molecular weight is approximately 66,000. Use a suitable grade. Store between 2° and 8°.■1S (*USP27*)

BRIEFING

Alum, *USP 26* page 2464—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-4

Change to read:

Alum (*Ammonium Alum*, *Aluminum Ammonium Sulfate*), $AlNH_4(SO_4)_2 \cdot 12H_2O$—**453.33**—Large, colorless crystals or crystalline fragments or a white powder. Soluble in 7 parts of water and in about 0.5 part of boiling water; insoluble in alcohol.

~~*Insoluble matter* (Reagent test): not more than 1 mg, from 10 g (0.01%).~~

~~*Chloride* (Reagent test)~~ ~~Two g shows not more than 0.02 mg of Cl (0.001%).~~

~~*Alkalies and alkaline earths*~~ ~~Dissolve 2 g in 140 mL of water, add 2 drops of methyl orange TS, then add ammonia TS in small portions until the color just turns yellow. Boil for 2 minutes, dilute with water to 150 mL, and filter. Evaporate 75 mL of the filtrate, and ignite the residue: the ignited residue weighs not more than 2.5 mg (0.25%).~~

~~*Arsenic* (Reagent test)~~ ~~The stain produced by 1 g does not exceed that produced by 0.002 mg of As (2 ppm as As).~~

~~*Heavy metals* (Reagent test): 0.001%.~~

~~*Iron* ⟨241⟩~~ ~~Dissolve 1.0 g in 40 mL of water, add 4 mL of hydrochloric acid, mix, and dilute with water to 50 mL. Dilute 25 mL of this solution with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.002%).~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Calcium Acetate, *USP 26* page 2473—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-16

Change to read:

Calcium Acetate, $Ca(C_2H_3O_2)_2 \cdot H_2O$—**176.18**—White, crystalline granules or powder. Soluble in about 3 parts of water; slightly soluble in alcohol.
~~*Insoluble matter* (Reagent test): not more than 1.0 mg, from 10 g (0.010%).~~
~~*Alkalinity and acidity*—To a solution of 2.0 g in 25 mL of water add phenolphthalein TS: no pink color is produced. Then add 0.10 *N* sodium hydroxide until a pink color is produced after shaking: not more than 0.70 mL of the alkali is required (0.2% as CH_3COOH).~~
~~*Chloride* (Reagent test)—One g shows not more than 0.05 mg of Cl (0.005%).~~
~~*Sulfate* (Reagent test, *Method I*)—One g shows not more than 0.4 mg of SO_4 (0.04%).~~
~~*Alkalies and magnesium*—Dissolve 1 g in 50 mL of water. Add 2 mL of hydrochloric acid, heat to boiling, and add 35 mL of oxalic acid solution (1 in 20). Slowly neutralize the solution, while it is cooling, with stronger ammonia water, then dilute with water to 100 mL, and allow to stand for 4 hours or overnight. Filter, and to 50 mL of the filtrate add 5 drops of sulfuric acid, evaporate, and ignite to constant weight: not more than 1.5 mg of residue remains (0.3% as SO_4).~~
~~*Barium*—Dissolve 2 g in 15 mL of water, add 2 drops of glacial acetic acid, filter, and add to the filtrate 0.3 mL of potassium dichromate solution (1 in 10): no turbidity is produced within 10 minutes (about 0.01%).~~
~~*Heavy metals* (Reagent test): 0.001%.~~
~~*Iron* ⟨241⟩—Dissolve 500 mg in 47 mL of water containing 2 mL of hydrochloric acid. The solution shows not more than 0.01 mg of Fe (0.002%).~~

BRIEFING

Casein, *USP 26* page 2474—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-21

Change to read:

Casein~~[13]~~

■■1S (*USP27*)
—White or slightly yellow, odorless, granular powder. Insoluble in water and in other neutral solvents; readily dissolved by ammonia TS and by solutions of alkali hydroxides, usually forming a cloudy solution.

Residue on ignition (Reagent test)—Ignite 2 g: the residue weighs not more than 20 mg (1.0%).

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 10.0% of its weight.

Alkalinity—Shake 1 g with 20 mL of water for 10 minutes, and filter: the filtrate is not alkaline to red litmus paper.

Soluble substances—When the filtrate from the *Alkalinity* test is evaporated and dried at 105°, the residue weighs not more than 1 mg (0.1%).

Fats—Dissolve 1 g in a mixture of 10 mL of water and 5 mL of alcoholic ammonia TS, and shake out with two 20-mL portions of solvent hexane. Evaporate the hexane at a low temperature, and dry at 80°: the weight of the residue does not exceed 5 mg (0.5%).

Nitrogen content, *Method I* ⟨461⟩—Between 15.2% and 16.0% of N is found, on the anhydrous basis.

Where vitamin-free casein is required, use casein that has been rendered free from the fat-soluble vitamins by continuous extraction with hot alcohol for 48 hours followed by air-drying to remove the solvent.

BRIEFING

Cation-Exchange Resin, Styrene-Divinylbenzene, Strongly Acidic, *USP 26* page 2474—See briefing under *Acetaldehyde*.

In-Process Revision

BRIEFING

Ceric Ammonium Sulfate, *USP 26* page 2474—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-23

Change to read:

Ceric Ammonium Sulfate, $Ce(SO_4)_2 \cdot 2(NH_4)_2SO_4 \cdot 2H_2O$—**632.55**—Yellow to yellowish orange crystals. Dissolves slowly in water, but more rapidly when mineral acids are present.

~~*Assay*—Weigh accurately about 1 g, dissolve in 10 mL of dilute sulfuric acid (1 in 10), and add 40 mL of water. Add orthophenanthroline TS, and titrate with freshly standardized 0.1 *N* ferrous ammonium sulfate VS. Each mL of 0.1 *N* ferrous ammonium sulfate is equivalent to 63.26 mg of $Ce(SO_4)_2 \cdot 2(NH_4)_2SO_4 \cdot 2H_2O$: not less than 94% is found.~~

~~*Iron*—Dissolve 100 mg in 30 mL of dilute sulfuric acid (1 in 10), and add hydrogen peroxide TS, dropwise, until the solution is colorless. Add stronger ammonia TS until the pH is between 1 and 3, cool to room temperature, further adjust to a pH of 3.5 (using a glass electrode), and dilute to 50 mL. To 5 mL of this solution add 5 mL of water, mix, and add 6 mL of hydroxylamine hydrochloride solution (1 in 10) and 4 mL of a slightly acidified solution of orthophenanthroline (1 in 1000): any red color produced is not darker than that of a control containing 0.1 mg of added Fe and the volumes of acid and hydrogen peroxide TS used with the test specimen (0.1%).~~

~~*Phosphate*—Dissolve 200 mg in 30 mL of dilute sulfuric acid (1 in 10), add 30 percent hydrogen peroxide until the solution is colorless, and boil to remove the excess peroxide. Cool, and dilute to 100 mL. To 5 mL of the resulting solution add 55 mL of water, and adjust to a pH of 2 to 3 with ammonium hydroxide. [NOTE—Adjust the pH carefully, since the formation of a permanent precipitate will interfere with succeeding operations. Should a permanent precipitate be formed, discard the solution, and start with a fresh aliquot of the test solution.]Add 500 mg of ammonium molybdate, and adjust to a pH of 1.8 (using a glass electrode) with dilute hydrochloric acid (1 in 10). Heat the solution to boiling, cool, add 10 mL of hydrochloric acid, and then dilute to 100 mL. Transfer to a separator, add 35 mL of ether, shake vigorously, allow to separate, and discard the water layer. Wash the ether layer twice by shaking with separate 10 mL portions of dilute hydrochloric acid (1 in 10), discarding the aqueous layer each time. Add 0.20 mL of a freshly prepared solution of 2 g of stannous chloride in 100 mL of hydrochloric acid, shake well, and allow the layers to separate: any blue color in the ether layer is not darker than that of a control prepared by adding the equivalent of 0.01 mg of PO_4 to 5 mL of dilute sulfuric acid (3 in 25) and treating exactly as the 5 mL of test solution (0.1%).~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Chloramine T, *USP 26* page 2475—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-24

Change to read:

Chloramine T (*Sodium p-Toluenesulfonchloramide*), $C_7H_7ClNNaO_2S \cdot 3H_2O$—**281.69**~~—White or faintly yellow efflorescent crystals or crystalline powder, having a slight odor of chlorine. Freely soluble in water and in boiling water; soluble in alcohol with decomposition; insoluble in benzene, in chloroform, and in ether. Store in tight containers, protected from light, in a cold place.~~

~~*Assay*—Weigh accurately about 400 mg, and dissolve in 50 mL of water. Add, in the order named, 10 mL of potassium iodide TS and 5 mL of diluted sulfuric acid, allow to stand for 10 minutes, and titrate the liberated iodine with 0.1 *N* sodium thiosulfate VS. Each mL of 0.1 *N* sodium thiosulfate solution is equivalent to 14.1 mg of $C_7H_7ClNNaO_2S \cdot 3H_2O$. Between 98.0% and 103.0% of $C_7H_7ClNNaO_2S \cdot 3H_2O$ is found.~~

~~*Ortho compound*—Boil 2.0 g with a mixture of 10 mL of water and 1.0 g of sodium metabisulfite, cool in ice, and filter rapidly: the residue, after being washed with three 5-mL portions of ice-cold water and dried in vacuum over phosphorus pentoxide, melts at a temperature not lower than 134°.~~

~~*Sodium chloride*—Weigh accurately about 1 g, shake with 15 mL of dehydrated alcohol, filter, wash the residue with two 5-mL portions of dehydrated alcohol, and dry at 105° to constant weight: the residue represents not more than 1.5% of the weight taken.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Cobaltous Acetate, *USP 26* page 2477—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-31

Change to read:

Cobaltous Acetate (*Cobalt Acetate*), $Co(C_2H_3O_2)_2 \cdot 4H_2O$—**249.08**—Red, needle-like crystals. Soluble in water and in alcohol.

~~*Insoluble matter* (Reagent test): not more than 1 mg, from 5 g, dissolved in 100 mL of water containing 2 mL of glacial acetic acid (0.02%).~~

~~*Chloride* (Reagent test)—One g shows not more than 0.1 mg of Cl (0.01%).~~

~~*Nitrate*—Dissolve 500 mg in 10 mL of water, add, with stirring, 10 mL of sodium hydroxide TS, and heat on a steam bath for 30 minutes. Cool, dilute with water to 20 mL, mix, and filter. To 10 mL of the filtrate add 5 mg of sodium chloride, 0.1 mL of indigo carmine TS, and 10 mL of sulfuric acid: the blue color does not entirely disappear in 1 minute (about 0.02%).~~

~~*Sulfate* (Reagent test, *Method II*)—The filtrate from the test for *Insoluble matter*, exclusive of washings, yields not more than 2.5 mg of residue (0.02%).~~

~~*Substances not precipitated by hydrogen sulfide*—Dissolve 2 g in about 90 mL of water, and add 2 g of ammonium chloride and sufficient ammonia TS to redissolve the precipitate first formed. Pass hydrogen sulfide into this solution until the cobalt is completely precipitated. Dilute with water to 100.0 mL, mix, and filter. Evaporate 50 mL of the filtrate nearly to dryness, add 0.5 mL of sulfuric acid, and ignite at 800 ± 25° to constant weight: the residue weighs not more than 3 mg (0.3% as SO_4).~~

~~*Copper*—Dissolve 500 mg in 30 mL of water, and add 1 mL of hydrochloric acid (A). Dissolve another 500 mg in 20 mL of water, and add 1 mL of hydrochloric acid and 10 mL of hydrogen sulfide TS (B). No difference in color between A and B is noticeable.~~

~~*Nickel*—Dissolve 1 g in 200 mL of water, add 1 g of sodium citrate, heat to boiling, add 100 mL of an alcohol solution of dimethylglyoxime (1 in 100), then add 15 mL of ammonia TS, and allow to stand overnight. Filter through a tared filtering crucible, wash with water, then with diluted alcohol, and dry at 105° to constant weight: the precipitate weighs not more than 25 mg (0.5%).~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Coomassie Blue G-250. This new reagent is to be used in the *Identification*, *Western Blot* and *Total protein content* tests in the proposed monograph *Anthrax Vaccine Adsorbed*.

(HDQ: M. Marques) RTS—39997-2

Add the following:

■**Coomassie Blue G-250** (*Coomassie Brilliant Blue G-250*, *Serva Blue G*), $C_{47}H_{48}N_3O_7S_2Na$—**854.0** [*6104-58-1*]—A dark blue powder. Soluble in water. Use a suitable grade. Store between 15° and 30°.■1S (*USP27*)

BRIEFING

Cupric Chloride, *USP 26* page 2478—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-33

Change to read:

Cupric Chloride, $CuCl_2 \cdot 2H_2O$—**170.48**—Bluish green deliquescent crystals. Freely soluble in water; soluble in alcohol; slightly soluble in ether.

~~*Insoluble matter* (Reagent test): not more than 1.0 mg, from 10 g (0.010%). Save the combined filtrate and washings for the test for *Sulfate*.~~

~~*Nitrate*—Dissolve 500 mg in 30 mL of dilute sulfuric acid (1 in 30). Slowly add the solution, with constant stirring, to 20 mL of sodium hydroxide solution (1 in 10), and digest on a steam bath for 15 minutes. Cool, with water dilute to 50 mL, and filter. To 10 mL of the clear filtrate, add 0.05 mL of indigo carmine TS followed by 10 mL of sulfuric acid: the blue color does not entirely disappear within 5 minutes (about 0.15%).~~

~~*Sulfate* (Reagent test, *Method II*)—The combined filtrate and washings retained from the test for *Insoluble matter* yield not more than 1.2 mg of residue (0.005%).~~

~~*Substances not precipitated by hydrogen sulfide*—Dissolve 2 g in 100 mL of water, add 1 mL of sulfuric acid, heat the solution to 70°, and pass hydrogen sulfide into the solution until the copper is completely precipitated. Allow the precipitate to settle, and filter without washing. Transfer 50.0 mL of the filtrate to a tared evaporating dish, and evaporate on a steam bath to dryness. Gently ignite the dish over a flame, and then at 800 ± 25° to constant weight. Cool, and weigh: the residue weighs not more than 1.0 mg (0.1%). Retain the residue for the *Iron* test.~~

~~*Iron* ⟨241⟩—To the residue retained from the preceding test, add 2 mL of hydrochloric acid, 2 mL of water, and 0.05 mL of nitric acid. Evaporate slowly on a steam bath to dryness, then take up the residue in 1 mL of hydrochloric acid and 10 mL of water. Dilute with water to 100 mL, and mix. To 20 mL of the dilution add 10 mL of water, and mix: 10 mL of this solution shows not more than 0.01 mg of Fe (0.015%). Retain the residue dilution for use in the test for *Other metals*.~~

~~*Other metals*—To 20 mL of the residue solution retained from the test for *Iron* add a slight excess of ammonium hydroxide, boil the solution for 1 minute, filter, and wash the residue with water until the combined filtrate and washings measure 20 mL. Neutralize the filtrate with diluted hydrochloric acid, dilute with water to 25 mL, and add 0.15 mL of ammonium hydroxide and 1 mL of hydrogen sulfide TS: any color produced is not darker than that of a control containing, in the same volume, 0.15 mL of ammonium hydroxide, 1 mL of hydrogen sulfide TS, and 0.02 mg of added Ni (0.01% as Ni).~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Dextran, High Molecular Weight, *USP 26* page 2479—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-34

Change to read:

Dextran, High Molecular Weight—A dextran molecular weight standard having a weight-average molecular weight, M_W, of 1 to 2×10^6 Da and a weight-average molecular weight to number-average molecular weight ratio, M_W/M_N, of 1.0 to 1.8.~~93~~

■10■1S (*USP27*)

BRIEFING

Dichloroacetic Acid. This new reagent is used in the test for *Limit of sodium chloride and sodium sulfate* under *Sodium Cetostearyl Sulfate*, which appears elsewhere in this number of *PF*.

(HDQ: E. Gonikberg; M. Marques) RTS—39843-2

Add the following:

■**Dichloroacetic Acid,** $C_2H_2Cl_2O_2$—**128.9** [*79-43-6*]—Colorless liquid. Miscible with water, with alcohol, and with ether. Use a suitable grade.■1S (*USP27*)

BRIEFING

Diethylamine, *USP 26* page 2481—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-35

Change to read:

Diethylamine, $(C_2H_5)_2NH$—**73.14**—Colorless, flammable, strongly alkaline liquid. Miscible with water and with alcohol. Forms a hydrate with water. *May be irritating to skin and mucous membranes*. Store in well-closed containers.

~~*Assay*—To 50 mL of water add 6 to 8 drops of a freshly prepared mixed indicator (prepared by mixing 5 parts of a 1 in 1000 solution of bromocresol green in methanol with 1 part of a 1 in 1000 solution of methyl red in methanol), and neutralize with 0.1 *N* hydrochloric acid to the disappearance of the green color. Weigh accurately about 2 g of specimen in a tared, glass-stoppered, 250 mL conical flask containing a few mL of the neutralized water. Add the remainder of the neutralized water, and titrate with 1 *N*~~

~~hydrochloric acid VS to the disappearance of the green color. Each mL of 1 *N* hydrochloric acid is equivalent to 73.1 mg of $(C_2H_5)_2NH$. Not less than 99.0% is found.~~

~~*Specific gravity* ⟨841⟩: between 0.700 and 0.705.~~

~~*Boiling range* (Reagent test): between 55° and 58°.~~

~~*Residue after evaporation*—Evaporate 14 mL (10 g) in a tared dish on a steam bath to dryness, dry at 105° for 1 hour, cool, and weigh: the weight of the residue does not exceed 1.0 mg (0.010%).~~

~~*Water-insoluble substances*—Transfer 25 mL to a 125-mL conical flask, and add 25 mL of water in 5-mL portions, shaking the flask well after each addition. Add another 25 mL of specimen to 25 mL of water in the same manner. No cloudiness or turbidity is produced in either instance.~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

1,3-Dimethyl-2-imidazolidinone. This new reagent is used as a component of the *Test solution for dimethylformamide and N,N-dimethyl acetamide* in *Procedure A for Water-Insoluble Articles* in the section *Identification, Control, and Quantification of Residual Solvents* under *Organic Volatile Impurities* ⟨467⟩, which appears in the *In-Process Revision* section of this *PF*.

(HDQ: M. Marques) RTS—39967-3

Add the following:

■**1,3-Dimethyl-2-imidazolidinone,** $C_5H_{10}N_2O$—**114.15**

[*80-73-9*]—Use a suitable grade.■1S (*USP27*)

BRIEFING

Dimethyl Sulfoxide, Spectrophotometric Grade, *USP 26* page 2482—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-36

Change to read:

Dimethyl Sulfoxide, Spectrophotometric Grade—Use methyl sulfoxide ~~reagent meeting the following additional specifications:~~

~~*Assay*—Inject an appropriate specimen (about 0.1 µL) into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a thermal conductivity detector, and obtain the chromatogram. Under typical conditions, the instrument contains a 2-m × 3-mm glass column packed with 20% phase G16 on support S1. The column is maintained at about 95°, and the injection port and the thermal conductivity detector block are maintained at about 180°. Helium is used as the carrier gas at a flow rate of about 50 mL per minute. The area of the symmetric methyl sulfoxide peak is at least 99% of the total peak area.~~

~~*Ultraviolet absorption*—Determine the UV absorbance of the specimen in a 1-cm cell, from 400 to 262 nm, using water as the blank: the absorbance does not exceed 1.00 at 262 nm, 0.360 at 270 nm, 0.080 at 300 nm, and 0.010 in the range of 340 to 400 nm. The absorbance curve is smooth and does not show extraneous absorbances within the range observed.~~

■ACS reagent grade.■1S (*USP27*)

BRIEFING

2,4-Dinitrofluorobenzene, *USP 26* page 2484—See briefing under *Acetaldehyde*.

BRIEFING

Lead Perchlorate, *USP 26* page 2492—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-51

Change to read:

Lead Perchlorate, $Pb(ClO_4)_2 \cdot 3H_2O$—**460.15**—~~White crystals.~~

~~*Assay*—Transfer about 1.8 g, accurately weighed, to a suitable container, and dissolve in 50 mL of water. Pass the solution through a suitable short cation-exchange column, collecting the eluate in a suitable container. Wash the column with water until the eluate is neutral to blue litmus, and combine the washings with the first eluate. Add 5 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 23.01 mg of $Pb(ClO_4)_2 \cdot 3H_2O$.~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Lithium Chloride, *USP 26* page 2492—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-52

Change to read:

Lithium Chloride, LiCl—**42.39**—~~White, deliquescent crystals or granules. Freely soluble in water; soluble in acetone, in alcohol, in amyl alcohol, and in ether. Preserve in tight containers.~~

~~*Assay*—Dissolve about 1.3 g, previously dried at 120° for 1 hour and accurately weighed, in water to make 50.0 mL. Pipet 5 mL of the solution into a 250-mL conical flask, and add 5 mL of glacial acetic acid, 50 mL of methanol, and 2 drops of eosin Y TS. Titrate slowly with 0.1 *N* silver nitrate VS, adding it dropwise toward the end, until the color changes to an intense, slightly fluorescent red. Each mL of 0.1 *N* silver nitrate is equivalent to 4.239 mg of LiCl. Not less than 98% is found.~~

~~*Neutrality*—Dissolve 2 g in 20 mL of water, and add 1 drop of methyl red TS: any red color produced is changed to yellow on the addition of not more than 0.30 mL of 0.020 *N* sodium hydroxide. Any yellow color produced is changed to pink on the addition of not more than 0.30 mL of 0.020 *N* hydrochloric acid.~~

~~*Insoluble matter* (Reagent test): not more than 1.0 mg, from 10 g (0.010%).~~

~~*Nitrate* (Reagent test)—A 1-g portion dissolved in 2 mL of water shows no more color than that observed in 1.0 mL of *Standard Nitrate Solution* (0.001%).~~

~~*Phosphate* (Reagent test)—A 2-g portion shows not more than 0.02 mg of PO_4 (0.001%).~~

~~*Sulfate* (Reagent test, *Method I*)—A 1-g portion shows not more than 0.2 mg of SO_4 (0.02%).~~

~~*Ammonium*—~~

~~STANDARD AMMONIUM SOLUTION—Dissolve 296 mg of ammonium chloride in water to make 1 liter. This solution contains the equivalent of 0.1 mg of ammonium (NH_4) per mL.~~

~~PROCEDURE—To a solution of 900 mg in 50 mL of water add 1 mL of sodium hydroxide solution (1 in 10) and 2 mL of alkaline mercuric-potassium iodide TS: no more color is produced than that produced by 0.3 mL of *Standard Ammonium Solution*, diluted with water to 50 mL and treated similarly (0.003%).~~

~~*Barium*—Dissolve 2 g in 20 mL of water, filter, and divide the filtrate into two equal portions. To one portion add 1 mL of diluted sulfuric acid, and to the other add 1 mL of water: after 2 hours, the two portions are equally clear.~~

~~*Calcium* (Reagent test)—Dissolve 2.50 g in water to make 100 mL (*Test Solution*). Dissolve another 2.50 g in a mixture of 5.00 mL of *Standard Calcium Solution* and water to make 100 mL (*Control Solution*). Determine the calcium as directed under *Flame Photometry for Reagents* (Reagent test) (0.02%).~~

~~*Heavy metals* (Reagent test): 0.001%.~~

~~*Iron* ⟨241⟩—A solution of 500 mg in 47 mL of water containing 2 mL of hydrochloric acid shows not more than 0.01 mg of Fe (0.002%).~~

~~*Magnesium*—~~

~~STANDARD MAGNESIUM SOLUTION—Dissolve 1.014 g of clear, non-efflorescent crystals of magnesium sulfate in water to make 1 liter. This solution contains the equivalent of 0.1 mg of magnesium (Mg) per mL.~~

~~PROCEDURE—To a solution of 1 g in 45 mL of water add 0.5 mL of thiazole yellow solution (1 in 10,000) and 5 mL of sodium hydroxide solution (1 in 10): no more pink color is produced than that produced by 1 mL of *Standard Magnesium Solution*, diluted with water to 45 mL and treated similarly (0.1%).~~

~~*Potassium* (Reagent test)—Dissolve 5.0 g in water to make 100 mL (*Sample Solution*). Dissolve another 5.0 g in a mixture of 1.00 mL of *Standard Potassium Solution* and water to make 100 mL (*Control Solution*). Determine the potassium as directed under *Flame Photometry for Reagents* (Reagent test) (0.01%).~~

~~*Sodium* (Reagent test)—Dissolve 0.20 g in water to make 100 mL (*Test Solution*). Dissolve another 0.20 g in a mixture of 20 mL of *Standard Sodium Solution* and water to make 100 mL (*Control Solution*). Determine the sodium as directed under *Flame Photometry for Reagents* (Reagent test) (0.1%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Lithium Hydroxide, *USP 26* page 2492—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-53

Change to read:

Lithium Hydroxide, $LiOH \cdot H_2O$—**41.96**—~~White crystals. Soluble in water; insoluble in alcohol.~~

~~*Assay*—Dissolve about 160 mg, accurately weighed, in 50 mL of water, add phenolphthalein TS, and titrate with 0.1 *N* hydrochloric acid VS to a colorless end point. Each mL of 0.1 *N* hydrochloric acid is equivalent to 4.196 mg of $LiOH \cdot H_2O$. Not less than 98% is found.~~

~~*Insoluble matter* (Reagent test): not more than 1.0 mg, from 10 g (0.01%).~~

~~*Chloride* (Reagent test)—A 200-mg portion shows not more than 0.02 mg of Cl (0.01%).~~

~~*Sulfate* (Reagent test, *Method I*)—Dissolve 400 mg in 10 mL of water, and neutralize with *3 N* hydrochloric acid. Add 0.1 mL of bromine TS, boil to remove the excess bromine, add 2 mL of *3 N* hydrochloric acid, filter, and dilute with water to 40 mL: 20 mL of this solution shows not more than 0.10 mg of SO_4 (0.05%).~~

~~*Heavy metals* (Reagent test): 0.002%.~~

~~*Iron* ⟨241⟩: One g shows not more than 0.02 mg of Fe (0.002%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Lithium Perchlorate, *USP 26* page 2493—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-54

Change to read:

Lithium Perchlorate, $LiClO_4$—**106.39**~~—Small, white crystals. Freely soluble in water; sparingly soluble in alcohol, in acetone, in ether, and in ethyl acetate.~~

~~*Insoluble matter* (Reagent test): not more than 1 mg, from 20 g, dissolved in 200 mL of water (0.005%).~~

~~*pH:* between 6.0 and 7.5, in a solution of 10 g in 200 mL of ammonia- and carbon dioxide-free water.~~

~~*Chloride* (Reagent test)—One g shows not more than 0.03 mg of Cl (0.003%).~~

~~*Sulfate* (Reagent test, *Method II*)—Dissolve 40 g in 300 mL of water, add 2 mL of hydrochloric acid, and heat the solution to boiling. Add 5 mL of barium chloride TS, digest on a steam bath for 2 hours, and allow to stand overnight. If any precipitate is formed, filter, wash thoroughly, and ignite: the residue weighs not more than 1 mg (0.001%).~~

~~*Heavy metals* (Reagent test): 5 ppm.~~

~~*Iron*—Dissolve 1 g in water, and dilute with water to 20 mL. Add 1 mL of hydroxylamine hydrochloride solution (1 in 10), 4 mL of a slightly acidified solution of orthophenanthroline, and 1 mL of sodium acetate solution (1 in 10), and allow to stand for 1 hour: any red color produced is not darker than that of a control containing 0.005 mg of added Fe (5 ppm).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Mercuric Nitrate, *USP 26* page 2493—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-55

Change to read:

Mercuric Nitrate, ~~$Hg(NO_3)_2 \cdot H_2O$~~

■$Hg(NO_3)_2 \cdot xH_2O$■1S (*USP27*)
—**342.62**—Use ACS reagent grade.

■This reagent is available as either the mono- or dihydrate.■1S (*USP27*)

BRIEFING

Mercuric Sulfate, *USP 26* page 2478—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-57

Change to read:

Mercuric Sulfate, $HgSO_4$—**296.65**~~—Fine, white, heavy powder. Is odorless. One g dissolves in about 20 mL of sodium chloride solution (1 in 5)~~

~~*Assay*—Weigh accurately about 500 mg, and dissolve in 50 mL of dilute nitric acid (1 in 2). Add 1 mL of ferric nitrate solution (1 in 10), and titrate with 0.1 *N* ammonium thiocyanate VS. Each mL of 0.1 *N* ammonium thiocyanate consumed is equivalent to 10.03 mg of Hg. Between 67% and 67.5% of Hg is found.~~

~~*Residue on ignition*—Ignite 10 g at a rate such that 1 to 2 hours is required to volatilize the test specimen, and ignite at 800 ± 25° for 15 minutes: the residue weighs not more than 1 mg (0.01%).~~

~~*Chloride*—Mix 1 g with 50 mL of water, add 1 mL of formic acid, and add, dropwise, sodium hydroxidesolution (1 in 10) until a small amount of permanent precipitate is formed. Reflux the suspension until all of the mercury is reduced to metal and the solution is clear. Cool, filter through a chloride-free paper, wash with two 15-mL portions of water, and dilute with water to 90 mL. To 30 mL add 1 mL of nitric acid and 1 mL of silver nitrate TS, mix, and allow to stand for 5 minutes: any turbidity produced does not exceed that of a control prepared by adding 0.01 mg of Cl to 30 mL of water and treating as the 30 mL of test solution (0.003%).~~

In-Process Revision

~~*Iron* ⟨241⟩—To the *Residue on ignition* add 3 mL of dilute hydrochloric acid (1 in 2), cover with a watch glass, and digest on a steam bath for 20 minutes. Remove the watch glass, and evaporate to dryness. Take up the residue in a mixture of 1 mL of dilute hydrochloric acid (1 in 2) and 30 mL of water, filter if necessary, and dilute with water to 100 mL. To 10 mL of the solution add 2 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.001%).~~

~~*Mercurous mercury*—Place 5.0 g in a glass-stoppered flask, add 100 mL of potassium iodide solution (15 in 100), 5.0 mL of 0.1 *N* iodine VS, and 3 mL of 1 *N* hydrochloric acid, and allow to stand in the dark, with frequent agitation, for 1 hour. Titrate the excess iodine with 0.1 *N* sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached: not more than 0.38 mL of the 0.1 *N* iodine is consumed, correction being made for any iodine consumed in a blank (0.15%).~~

~~*Nitrate*—Disperse 1 g in 9 mL of water, add 1 mL of sodium chloride solution (1 in 200), mix, and add 0.1 mL of indigo carmine TS and 10 mL of sulfuric acid: the blue color of the clear solution is not entirely discharged within 5 minutes (0.005%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Methenamine. This new reagent is used to prepare *Lead Nitrate, 0.01 M* in the test for *Limit of sodium chloride and sodium sulfate* under *Sodium Cetostearyl Sulfate*, which appears elsewhere in this number of *PF*.

(HDQ: M. Marques) RTS—39843-5

Add the following:

■**Methenamine**—Use *Methenamine* ⟨USP monograph⟩.■1S (*USP27*)

BRIEFING

Methoxyethanol, *USP 26* page 2478—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-58

Change to read:

Methoxyethanol (*Ethylene Glycol Monomethyl Ether; 2-Methoxyethanol*), $CH_3OCH_2CH_2OH$—**76.09**~~—Clear, colorless to slightly yellow liquid. Miscible with water, with acetone, with alcohol, with ether, with dimethylformamide, and with glycerin. Refractive index ($n20_D$): 1.420.[*Caution—Is poisonous; use with adequate ventilation.*]~~

~~*Specific gravity* ⟨841⟩: between 0.960 and 0.964.~~

~~*Boiling range* ⟨Reagent test⟩—Distil 100 mL: 95% distils between 123° and 126°.~~

~~*Acidity*—To 62 mL (60 g) add phenolphthalein TS, and titrate with 0.1 *N* alcoholic potassium hydroxide: not more than 1 mL is required to produce a pink endpoint that persists for not less than 15 seconds (0.01% as CH_3COOH).~~

~~*Dilution test*—Measure 10 mL into a glass-stoppered, 100-mL graduate. Dilute with water to 100 mL, insert the stopper, and mix: no haze or turbidity is observed after the mixture has been allowed to stand at room temperature for 2 hours.~~

~~*Water, Method I* ⟨921⟩: not more than 0.05%.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

2-Methoxyethanol, *USP 26* page 2478—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-59

Change to read:

2-Methoxyethanol (*Ethylene Glycol Monomethyl Ether; Methoxyethanol*), $CH_3OCH_2CH_2OH$—**76.09**~~—Clear, colorless to slightly yellow liquid. Miscible with water, with acetone, with alcohol, with ether, with dimethylformamide, and with glycerin. Refractive index (n^{20}_D): 1.420.[*Caution—Is poisonous; use with adequate ventilation.*]~~

~~*Specific gravity* ⟨841⟩: between 0.960 and 0.964.~~

~~*Boiling range* ⟨Reagent test⟩—Distill 100 mL: 95% distills between 123° and 126°.~~

~~*Acidity*—To 62 mL (60 g) add phenolphthalein TS, and titrate with 0.1 N alcoholic potassium hydroxide: not more than 1 mL is required to produce a pink endpoint that persists for not less than 15 seconds (0.01% as CH_3COOH).~~

~~*Dilution test*—Measure 10 mL into a glass-stoppered, 100-mL graduate. Dilute with water to 100 mL, insert the stopper, and mix: no haze or turbidity is observed after the mixture has been allowed to stand at room temperature for 2 hours.~~

~~*Water, Method I* ⟨921⟩: not more than 0.05%.~~

■—See *Methoxyethanol*.■1S (*USP27*)

BRIEFING

***p*-Methylaminophenol Sulfate,** *USP 26* page 2496—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-62

Change to read:

***p*-Methylaminophenol Sulfate,** $(p\text{-}CH_3NHC_6H_4OH)_2 \cdot H_2SO_4$—**344.38**~~—White, or yellow-white, small crystals or a crystalline powder. Discolors on exposure to air. Soluble in cold water; freely soluble in boiling water; slightly soluble in alcohol; insoluble in ether. Store in well-closed containers, protected from light.~~

~~*Solubility in HCl*—Add 100 mg to 2 mL of hydrochloric acid: it dissolves quickly and completely.~~

~~*o-Aminophenol*—To the solution from the preceding test add 1 drop of ferric chloride TS: no reddish brown color is produced.~~

~~*Residue on ignition* (Reagent test)—The residue from 2 g weighs not more than 2 mg (0.1%).~~

~~*Chloride*—To a solution of 1 g in 20 mL of water add 1 mL of nitric acid and 1 mL of silver nitrate TS: not more than a faint opalescence is produced.~~

~~*Suitability for phosphate test*—Dissolve 2 g in 100 mL of water. To 10 mL of this solution add 90 mL of water and 20 g of sodium bisulfite. Confirm the suitability of the reagent solution by the following test:~~

~~Add 1 mL of the reagent solution to each of four solutions containing 25 mL of 0.5 *N* sulfuric acid and 1 mL of a solution of 5 g ammonium molybdate in 100 mL of 1 *N* sulfuric acid. Add 0.005 mg of phosphate (PO_4) to one of the solutions, 0.01 mg to a second, and 0.02 mg to a third. Allow to stand at room temperature for 2 hours: the solutions in the three tubes show readily perceptible differences in blue color corresponding to the relative amounts of phosphate added, and the one to which 0.005 mg of phosphate was added is perceptibly a deeper blue than the blank.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Methyl Behenate, *USP 26* page 2494. It is proposed to include additional information regarding the temperature programming in the *Assay* test.

(HDQ: M. Marques) RTS—39883-1

Change to read:

Methyl Behenate, $C_{23}H_{46}O_2$—**354.61**—White powder.

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a thermal conductivity detector, helium being used as the carrier gas. The following conditions have been found suitable: a 1.8-m × 2.0-mm glass column packed with 5% G3 phase on support S1A; the injection port temperature is maintained at 300°; the detector temperature is maintained at 300°;~~ the column temperature is maintained at 220° and programmed to rise 3° per minute to 220°.~~

■ the initial temperature of the oven is 220°, which is held for 2 minutes, and then programmed to rise 3° per minute to attain a final temperature of 270°, which is held for 10 minutes.■1S (*USP27*)

The area of the $C_{23}H_{46}O_2$ peak is not less than 98% of the total peak area.

Melting range ⟨741⟩: between 54° and 56°.

BRIEFING

Methyl Chloroform, *USP 26* page 2478—See briefing under Acetaldehyde.

(HDQ: M. Marques) RTS—39837-60

Change to read:

Methyl Chloroform (*Methylchloroform; 1,1,1-Trichloroethane*), CH_3CCl_3—**133.40**~~—Colorless, heavy liquid. Insoluble in water but is slightly hygroscopic. Miscible with alcohol, with ether, and with chloroform.~~

~~*Boiling range* (Reagent test)—Distil 100 mL: the difference between the temperatures observed when 1 and 95 mL have distilled does not exceed 1.6°. Its boiling temperature at 760 mm of Hg pressure is about 74°.~~

~~*Specific gravity* ⟨841⟩: between 1.312 and 1.321.~~

~~*Acidity*—Pipet 25 mL into 25 mL of alcohol neutralized to bromothymol blue TS with 0.02 *N* sodium hydroxide. Mix gently, and titrate with 0.020 *N* sodium hydroxide VS: not more than 0.50 mL is required to restore the blue color (0.001% as HCl).~~

~~*Residue on evaporation*—Evaporate 76 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 1 mg (about 0.001%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Methyl Ethyl Ketone, *USP 26* page 2495—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-61

Change to read:

Methyl Ethyl Ketone, $CH_3COC_2H_5$—**72.11**~~—Colorless liquid, having an acetone-like odor. Soluble in water. Miscible with alcohol, with ether, and with benzene.~~

~~*Boiling range* (Reagent test): between 79.0° and 81.0°.~~

~~*Specific gravity* ⟨841⟩: between 0.801 and 0.803.~~

~~*Residue on evaporation*—Evaporate 50 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 1.0 mg (0.0025%).~~

In-Process Revision

~~*Acidity*—Add 25 mL to 10 mL of 80 percent alcohol, previously neutralized to phenolphthalein TS with 0.02 *N* sodium hydroxide. Titrate with 0.020 *N* sodium hydroxide VS to the production of a pink color that persists for notless than 15 seconds: not more than 0.50 mL is consumed (0.003% as CH_3COOH).~~

~~*Solubility in water*—Add 5 mL to 40 mL of carbon dioxide-free water, and allow to stand for 20 minutes: the solution remains clear.~~

■—Use ACS reagent grade 2-Butanone.■1S (*USP27*)

BRIEFING

BRIEFING

Osmium Tetroxide, *USP 26* page 2499—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-70

Change to read:

Osmium Tetroxide (*Osmic Acid; Perosmic Anhydride*), OsO_4—**254.23**~~—Colorless or slightly yellow, hygroscopic crystals or crystalline granules. Very pungent odor. Decomposed by light. Slowly soluble in about 20 parts of water; soluble in alcohol and in ether, with decomposition. It softens at about 35°, melts between 40° and 42°, and boils at about 130°.~~

~~*Caution—Osmium Tetroxide vapors are poisonous and highly irritating to the eyes and to the respiratory membranes.*~~

~~*Solubility*—Dissolve 200 mg in 1 mL of carbon tetrachloride: a clear and not more than slightly yellow solution results, and no appreciable amount of insoluble residue remains.~~

~~*Nonvolatile matter*—Evaporate the solution remaining from the test for *Solubility* on a steam bath *in a well-ventilated hood* to dryness, and dry at 105° for 1 hour: the residue weighs not more than 0.4 mg (0.2%).~~

~~*Heavy metals*—To the residue from the test for *Nonvolatile matter* add 2 mL of hydrochloric acid, and evaporate the solution to dryness. Take up the residue in a few mL of water, dilute with water to 25 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing 0.01 mg of added Pb (0.005%).~~

■—Use ACS reagent grade.■1S (*USP27*)

In-Process Revision

BRIEFING

Periodic Acid, *USP 26* page 2501—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-71

Change to read:

Periodic Acid, H_5IO_6—**227.94**—White to pale yellow crystals. Very soluble in water. Undergoes slow decomposition to iodic acid.

~~*Assay*—Dissolve about 120 mg, accurately weighed, in water. Add 5 mL of hydrochloric acid and 5 g of potassium iodide, then add 3 mL of starch TS, and titrate the liberated iodine with 0.1 *N* sodium thiosulfate VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 *N* sodium thiosulfate is equivalent to 2.849 mg of H_5IO_6. Not less than 99% is found.~~

~~*Insoluble matter* (Reagent test): not more than 1.0 mg, from 10.0 g (0.01%).~~

~~*Residue on ignition* (Reagent test): not more than 2 mg, from 10.0 g, ignited for 10 minutes (0.02%). [Retain for *Heavy metals* test.]~~

~~*Sulfate*—Weigh accurately 1 g, add 10 to 20 mg of anhydrous sodium carbonate, and evaporate to dryness three times with 5-mL portions of hydrochloric acid. Dissolve in 25 mL of water, add 1 mL of dilute hydrochloric acid (1 in 10), then add 1 mL of barium chloride TS, and compare the turbidity with that of *Standard Sulfate Solution* (See *Sulfate in Reagents*). One g shows not more than 0.1 mg of SO_4 (0.01%).~~

~~*Other halogens*—Dissolve 1.0 g in 100 mL of water, add 1 mL of phosphoric acid and 5 mL of 30 percent hydrogen peroxide, and boil to expel iodine. Dilute with water to 100 mL. To a 20-mL aliquot add 3 mL of nitric acid and 1 mL of silver nitrate TS. Compare the turbidity with that of a solution similarly prepared from a *Standard Chloride Solution* (See *Chloride in Reagents*) containing 0.02 mg of chloride (0.01%).~~

~~*Heavy metals*—To the *Residue on ignition* add several drops of acetic acid, and warm to dissolve. Transfer to a test tube and add 10 mL of hydrogen sulfide TS. Compare the color with that of *Standard Lead Solution* (See *Heavy Metals* ⟨231⟩) containing 0.5 mg of Pb (0.005%).~~

~~*Iron*—Dissolve 1.0 g in 50 mL of water, add 1 mL of dilute sulfuric acid (1 in 2) and 10 mL of hydroxylamine hydrochloride solution (1 in 5), and evaporate to dryness to expel iodine. Dissolve the residue in water, add 2 mL of 1,10-phenanthroline solution (1 in 1000) and 10 mL of sodium acetate solution (1 in 5), and compare the color with that of a solution containing 0.03 mg of iron, treated similarly (0.003%).~~

■Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Potassium Phosphate, Tribasic, *USP 26* page 2504—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-78

Change to read:

Potassium Phosphate, Tribasic, K_3PO_4—**212.27**—Deliquescent, orthorhombic crystals. Use ~~a suitable grade.~~

■ACS reagent grade.■1S (*USP27*)

BRIEFING

***n*-Propyl Alcohol,** *USP 26* page 2505—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-79

Change to read:

***n*-Propyl Alcohol** (*1-Propanol*), $CH_3CH_2CH_2OH$—**60.10**~~—Clear, colorless liquid, having an ethanol like odor. Miscible with water and with most organic solvents. Specific gravity: about 0.803.~~

~~*Boiling range* (Reagent test)—Not less than 95% distils between 95° and 98°.~~

In-Process Revision

~~*Residue on evaporation*—Evaporate 25 mL (20 g) on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 1 mg (0.005%).~~

~~*Acidity*—Add 0.2 mL of phenolphthalein TS to 20 mL of water, and titrate with 0.1 *N* sodium hydroxide until a slight pink color persists after shaking. Add 10 mL of the alcohol, and titrate with 0.10 *N* sodium hydroxide: not more than 0.20 mL is required to restore the pink color (about 0.015% as CH_3COOH).~~

~~*Alkalinity*—Add 2 drops of methyl red TS to a solution of 6 mL in 25 mL of carbon dioxide–free water, and titrate with 0.02 *N* sulfuric acid: not more than 0.3 mL is required to produce a red color (about 0.002% as NH_3).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Protein Molecular Weight Standard. This new reagent is used in the test for *Content of 83 kDa protein* in the proposed monograph *Anthrax Vaccine Adsorbed*.

(HDQ: M. Marques) RTS—39998-5

Add the following:

■**Protein Molecular Weight Standard**—Also known as protein molecular weight markers (for SDS-PAGE) and consists of a mixture of several proteins of well-defined molecular weights. The products are generally available in a suitable buffer containing a suitable reducing agent (generally, 100 mM DDT), a preservative (for example, sodium azide), and 50% glycerol to prevent freezing. Use a suitable grade. Store at –20°.■1S (*USP27*)

BRIEFING

Sodium 1-Decanesulfonate, *USP 26* page 2511—See briefing under Acetaldehyde.

(HDQ: M. Marques) RTS—39837-85

Change to read:

Sodium 1-Decanesulfonate—Use a suitable grade.[74]

■■1S (*USP27*)

BRIEFING

Sodium Acetate, *USP 26* page 2508—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-80

Change to read:

Sodium Acetate, $NaC_2H_3O_2 \cdot 3H_2O$—**136.08**—Use ACS reagent grade

■Sodium Acetate Trihydrate.■1S (*USP27*)

BRIEFING

Sodium Acetate, Anhydrous, *USP 26* page 2508—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-81

Change to read:

Sodium Acetate, Anhydrous, $NaC_2H_3O_2$—**82.03**~~—Grayish white masses or powder. Hygroscopic. Freely soluble in water.~~

~~*Loss on drying* ⟨731⟩—Dry it at 120° to constant weight: it loses not more than 3.0% of its weight.~~

~~*Neutrality*—Dissolve 5 g in 100 mL of carbon dioxide–free water, cool to 10°, and add phenolphthalein TS. If a pink color is produced, it is discharged by the addition of not more than 0.50 mL of 0.020 *N* hydrochloric acid. If no pink color is produced, the addition of 0.50 mL of 0.020 *N* sodium hydroxide produces a pink color (about 0.02% of alkali as Na_2CO_3, or about 0.012% of acid as CH_3COOH).~~

~~*Chloride* (Reagent test)—One g shows not more than 0.1 mg of Cl (0.01%).~~

~~*Heavy metals* (Reagent test): 0.0015%.~~

~~*Sulfate* (Reagent test, *Method I*)—One g shows not more than 0.2 mg of SO_4 (0.02%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Sodium Arsenite, Twentieth-Molar (0.05 M). It is proposed to add this new volumetric solution.

(HDQ: M. Marques) RTS—39804-1

Add the following:

■Sodium Arsenite, Twentieth-Molar (0.05 M)
$NaAsO_2$ **129.91**

6.496 g in 1000 mL

Transfer 4.9455 g of arsenic trioxide, which has been pulverized and dried at 100° to constant weight, to a 1000-mL volumetric flask, dissolve it in 40 mL of 1 N sodium hydroxide, and add 1 N sulfuric acid or 1 N hydrochloric acid until the solution is neutral or only slightly acid to litmus. Add 30 g of sodium bicarbonate, dilute with water to volume, and mix.■1S (*USP27*)

BRIEFING

Sodium Borate, *USP 26* page 2510—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-82

Change to read:

Sodium Borate (*Borax; Sodium Tetraborate*), $Na_2B_4O_7 \cdot 10H_2O$—**381.37**—Use ACS reagent grade. [NOTE—Certified Borax is available from the National Institute of Standards and Technology, Washington, DC, ~~20234~~

■www.nist.gov,■1S (*USP27*) as standard sample No. 187.]

BRIEFING

Sodium Bromide, *USP 26* page 2510—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-83

Change to read:

Sodium Bromide, NaBr—**102.89**~~—White, odorless, cubical crystals or granular powder. Soluble in water; slightly soluble in alcohol.~~

~~*Insoluble matter* (Reagent test)—The insoluble matter from 20 g, dissolved in 150 mL of hot water, weighs not more than 1 mg (0.005%).~~

~~*pH* ⟨791⟩: between 5.5 and 7.5, in a solution (1 in 20).~~

~~*Barium*—Dissolve 6 g in 15 mL of water, add 5 mL of acetic acid, 5 mL of 30 percent hydrogen peroxide, and 1 mL of hydrochloric acid, and digest in a covered beaker until the reaction ceases. Remove the cover, and evaporate to dryness. Dissolve the residue in 15 mL of water, filter if necessary, dilute with water to 23 mL, and add 2 mL of potassium dichromate solution (1 in 10). Add ammonium hydroxide until the orange color has been dissipated and the yellow color persists, then add 25 mL of methanol, stir vigorously, and allow to stand for 10 minutes: any turbidity produced does not exceed that of a control containing 1.0 g of test specimen and 100 µg of added barium ion (0.002%).~~

~~*Bromate*—Dissolve 1 g in 10 mL of oxygen-free water, add 100 µL of potassium iodide solution (1 in 10), 1 mL of starch TS, and 25 µL of dilute sulfuric acid (1 in 36), and allow to stand at 25°: no blue or violet color is produced within 10 minutes (about 0.001%).~~

~~*Calcium, magnesium,* and R_2O_3 *precipitate*—To the filtrate from the test for *Insoluble matter* add 5 mL of ammonium oxalate TS, 2 mL of ammonium phosphate TS, and 10 mL of ammonium hydroxide. Allow to stand for about 16 hours, filter, wash with dilute ammonia TS (1 in 4), ignite, and weigh: the weight of the residue is not more than 1 mg (0.005%).~~

~~*Chloride*—Dissolve 500 mg in 15 mL of dilute nitric acid (1 in 3) in a small conical flask, add 3 mL of 30 percent hydrogen peroxide, and digest on a steam bath until the solution is colorless. Wash down the sides of the flask with a small quantity of water, digest for an additional 15 minutes, cool, and dilute with water to 200 mL. Dilute a 2 mL aliquot with water to 25 mL, and add 1 mL of nitric acid and 1 mL of silver nitrate TS: any turbidity produced does not exceed that of a control containing 10 µg of added chloride ion (0.2%).~~

~~*Heavy metals* (Reagent test): 0.0005%.~~

~~*Iron* ⟨241⟩—Two g, dissolved in 47 mL of water containing 2 mL of hydrochloric acid, shows not more than 0.01 mg of Fe (5 ppm).~~

~~*Nitrogen compounds* (Reagent test)—One g shows not more than 5 µg of N (0.0005%).~~

~~*Potassium* (Reagent test)—~~

~~TEST SOLUTION—Dissolve 10 g in water, dilute with water to 100 mL, and mix.~~

~~SAMPLE SOLUTION—Dilute 10.0 mL of *Test solution* with water to 100 mL, and mix.~~

~~CONTROL SOLUTION—To 10.0 mL of *Test solution* add 50 µg of potassium ion (K), dilute with water to 100 mL, and mix. The limit is 0.005%.~~

~~*Sulfate*—Dissolve 10 g in 100 mL of water, filter if necessary, and add 1 mL of hydrochloric acid: the solution yields not more than 1.2 mg of residue (0.005%).~~

■—Use ACS reagent grade.■1S (*USP27*)

In-Process Revision

BRIEFING

Sodium Dichromate, *USP 26* page 2510—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-84

Change to read:

Sodium Dichromate, $Na_2Cr_2O_7 \cdot 2H_2O$ (for chromic acid cleaning mixture)—**298.00**~~— Orange-red crystals or granules. Very soluble in water; insoluble in alcohol.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Sodium Oxalate, *USP 26* page 2511—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-86

Change to read:

Sodium Oxalate, $Na_2C_2O_4$—**134.00**—Use ACS reagent grade. [NOTE—Sodium Oxalate of a quality suitable as a primary standard is available from the Office of Standard Reference Materials, National Institute of Standards and Technology, Washington, DC,~~ 20234,~~

as standard sample ~~No. 40g.~~

■No. 40.]■1S (*USP27*)

BRIEFING

Sodium Perchlorate, *USP 26* page 2512—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-87

Change to read:

Sodium Perchlorate, $NaClO_4 \cdot H_2O$—**140.46**~~— Colorless, deliquescent crystals. Decomposes at about 150°. Soluble in 95% alcohol.~~

~~*Assay*— Dry about 1.5 g in a vacuum desiccator at 80° to constant weight. Mix 750 mg, accurately weighed, of the dried and powdered test specimen with 5 g of powdered sodium nitrite in a nickel crucible, cover the crucible, and heat it over a free flame until the mixture is well melted. Maintain it in this state, without raising the temperature much higher, for 30 minutes. Allow to cool, add 20 mL of hot water, and digest until the melt is dissolved. Filter into a 200-mL volumetric flask, wash any undissolved matter thoroughly with hot water, cool, dilute with water to volume, and mix.~~

~~Transfer 50.0 mL of the solution to a 250-mL, glass-stoppered flask, add 25.0 mL of 0.1 *N* silver nitrate VS, then add slowly 6 mL of dilute nitric acid (1 in 6), and heat on the steam bath to expel oxides of nitrogen. Cool, add 3 mL of nitrobenzene, shake well for 1 to 2 minutes, then add 4 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 *N* silver nitrate is equivalent to 12.24 mg of $NaClO_4$: not less than 98.0% of $NaClO_4$ is found.~~

~~*Insoluble matter*— Dissolve 10 g in 50 mL of water, heat to boiling, and filter through a tared sintered-glass crucible. Wash well with water, rinsing the beaker thoroughly. Dry at 105° for 2 hours, and weigh. The weight of the insoluble residue does not exceed 1 mg (0.01%).~~

~~*Chlorate and chloride* (*as Cl*)— Dissolve 1 g in 10 mL of water, add 1 mL of 0.1 *N* ferrous sulfate, and heat on the steam bath for 15 minutes. Cool, dilute with water to 50 mL, and add 1 mL of nitric acid and 1 mL of silver nitrate TS. Any turbidity does not exceed that produced by 0.1 mg of chloride (Cl) contained in a similarly treated blank (0.01% of Cl).~~

~~*Sulfate*— Dissolve 1 g in 10 mL of water, and add 0.05 mL of diluted hydrochloric acid and 1 mL of barium chloride TS. Any turbidity produced in 10 minutes does not exceed that produced in a blank containing 0.05 mg of added SO_4 (0.005%).~~

~~*Calcium*— Dissolve 500 mg in 10 mL of hot water, add 0.25 mL of ammonia TS and 3 mL of ammonium oxalate TS, and keep the solution hot. No turbidity is produced in 5 minutes (about 0.02%).~~

~~*Heavy metals* (Reagent test)— Dissolve 1 g in 25 mL of water: the heavy metals limit is 0.002%.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Sodium Pyrophosphate, *USP 26* page 2512—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-88

Change to read:

Sodium Pyrophosphate, ~~$Na_4P_2O_7$~~

■ $Na_4P_2O_7 \cdot 10H_2O$■1S (*USP27*)

BRIEFING

Sodium Sulfate, *USP 26* page 2512—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-89

Change to read:

Sodium Sulfate (*Glauber's Salt*), $Na_2SO_4 \cdot 10H_2O$—**322.20—** ~~Colorless, odorless crystals or white granules. Is efflorescent. Melts at 32.5°. Soluble in 1.5 parts of water; soluble in glycerin; insoluble in alcohol. Store in well-closed containers, protected from heat.~~

~~*Insoluble matter* (Reagent test): not more than 1 mg, from 10 g (0.01%).~~

~~*pH*—The pH of a solution of 10 g in 200 mL of ammonia-free and carbon dioxide-free water is between 5.2 and 8.2.~~

~~*Arsenic* (Reagent test)—The stain produced by 3 g does not exceed that produced by 0.003 mg of As (1 ppm).~~

~~*Calcium, magnesium, and R_2O_3 precipitate*—Dissolve 5 g in 75 mL of water, filter, and add 5 mL of ammonium oxalate TS, 2 mL of ammonium phosphate TS, and 10 mL of ammonium hydroxide. Stir well, and allow to stand overnight. If any precipitate forms, filter, wash with dilute ammonia TS (1 in 4), and ignite: the residue weighs not more than 1 mg (0.02%).~~

~~*Chloride*—Dissolve 1 g in 50 mL of water, and filter if necessary. To 25 mL of the solution add 1 mL of nitric acid and 1 mL of silver nitrate TS: any turbidity produced does not exceed that of a control containing 0.01 mg of Cl (0.002%).~~

~~*Heavy metals* (Reagent test): 5 ppm.~~

~~*Iron* ⟨241⟩—One g, dissolved in 47 mL of water containing 2 mL of hydrochloric acid, shows not more than 0.01 mg of Fe (0.001%).~~

~~*Nitrogen compounds* (Reagent test)—Two g shows not more than 0.01 mg of N (5 ppm).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Sodium Tetraphenylborate—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-90

Add the following:

■**Sodium Tetraphenylborate,** $NaB(C_6H_5)_4$—**342.22**—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Starch, Soluble, Purified, *USP 26* page 2513—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-91

Change to read:

Starch, Soluble, Purified ~~76~~

■■1S (*USP27*)
—White, amorphous powder; under microscopic examination it shows the characteristic form of potato starch. Soluble in hot water; very slightly soluble in alcohol.

TEST SOLUTION FOR DETERMINATION OF PH AND SENSITIVITY—Stir 2.0 g in 10 mL of water, add boiling water to make 100 mL, and boil for 2minutes. The hot solution is almost clear. On cooling, the solution may become opalescent or turbid, but does not gel. Use it as the *Test solution*.

pH ⟨791⟩—The pH of the *Test solution* is between 6.0 and 7.5.

Sensitivity—Mix 2.5 mL of *Test solution*, 97.5 mL of water, and 0.50 mL of 0.010 N iodine: a distinct blue color results, and it disappears upon the addition of 0.50 mL of 0.010 N sodium thiosulfate.

Absorbance—Prepare a pH 5.3 buffer solution by dissolving 43.5 g of sodium acetate (trihydrate) and 4.5 mL of glacial acetic acid in water, transferring the resultant solution to a 250-mL volumetric flask, adding water to volume, and mixing.

Dissolve 1.00 g of Soluble, Purified Starch in 2.5 mL of the buffer solution by warming, transfer to a 100-mL volumetric flask, add water to volume, and mix. Add 0.50 mL of this solution to a 100-mL volumetric flask containing about 75 mL of water, 1 mL of 1 N hydrochloric acid, and 1.5 mL of 0.020 N iodine, swirling the flask during the addition. Add water to volume, mix, and allow to stand in the dark for 1 hour. The absorbance of this solution, measured at 575 nm in a 1-cm cell against a blank, is between 0.5 and 0.6.

Reducing substances—Shake 10.0 g with 100 mL of water for 15 minutes, and allow to settle for about 12 hours. Filter a portion of the supernatant through fine sintered glass. To 50 mL of the filtrate add 50 mL of alkaline cupric tartrate TS, and boil for 1 to 2 minutes. Filter the resulting cuprous oxide, wash it with hot water and then with alcohol, and dry it at 105° for 2 hours: not more than 47 mg is found, corresponding to 0.7% of reducing sugars as maltose.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 10% of its weight.

Residue on ignition ⟨281⟩: not more than 0.5%.

In-Process Revision

BRIEFING

Succinic Acid, *USP 26* page 2514—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-92

Change to read:

Succinic Acid, $C_4H_6O_4$—**118.09** [*771-50-6*]—Use ~~a suitable grade.~~

■ACS reagent grade.■1S (*USP27*)

BRIEFING

Sulfamic Acid, *USP 26* page 2514—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-93

Change to read:

Sulfamic Acid, HSO_3NH_2—**97.09**~~—Colorless or white crystals. Soluble in water; slightly soluble in alcohol.~~

~~*Assay*—Weigh accurately about 400 mg, previously dried over sulfuric acid for 2 hours, and dissolve in 30 mL of water contained in a small flask. Add phenolphthalein TS, and titrate with 0.1 *N* sodium hydroxide VS. Each mL of 0.1 *N* sodium hydroxide consumed is equivalent to 9.709 mg of HSO_3NH_2. Not less than 99.5% is found.~~

~~*Insoluble matter* (Reagent test): not more than 1 mg, from 10 g dissolved in 200 mL of water (0.01%).~~

~~*Residue on ignition* (Reagent test)—Ignite 5 g: the residue weighs not more than 0.5 mg (0.01%).~~

~~*Chloride* (Reagent test)—One g shows not more than 0.01 mg of Cl (0.001%).~~

~~*Heavy metals*—Dissolve 4 g in 30 mL of water, neutralize with stronger ammonia water to litmus, and dilute with water to 40 mL. To 30 mL add 2 mL of diluted acetic acid, dilute with water to 40 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing the remaining 10 mL of test solution and 0.02 mg of added Pb (0.001%).~~

~~*Iron* ⟨241⟩—Two g, dissolved in 47 mL of water containing 2 mL of hydrochloric acid, shows not more than 0.01 mg of Fe (5 ppm).~~

~~*Sulfate* (Reagent test, *Method I*)—Dissolve 1 g in 50 mL of water: 20 mL of the solution shows not more than 0.2 mg of SO_4 (0.05%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Sulfur Dioxide Detector Tube, *USP 26* page 2515—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-94

Change to read:

Sulfur Dioxide Detector Tube—A fuse-sealed glass tube so designed that gas may be passed through it and containing suitable absorbing filters and support media for an iodine-starch indicator. ~~[NOTE—A suitable detector tube that conforms to the monograph specification is available from Draeger Safety, Inc., P.O. Box 120, Pittsburgh, PA 15230-0120 as Reference Number CH 31701, Measuring Range 1 to 25 ppm. Tubes having conditions other than those specified in the monograph may be used in accordance with the section entitled *Tests and Assays* in the *General Notices*.]~~

■*Measuring range:* 1 to 25 ppm.[110]■1S (*USP27*)

BRIEFING

Tannic Acid *(Tannin), USP 26* page 2515—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-95

Change to read:

Tannic Acid (*Tannin*)~~—Yellowish to light brown, glistening scales, or an amorphous powder. Is odorless or has a faint, characteristic odor. Very soluble in water and in alcohol; less soluble in dehydrated alcohol. Soluble in acetone; practically insoluble in benzene, in chloroform, and in ether. Store in light-resistant containers.~~

~~*Solubility*—A solution of 2 g in 10 mL of water is clear or practically so.~~

~~*Residue on ignition* (Reagent test)—Ignite 1 g with 1 mL of sulfuric acid: the residue weighs not more than 1 mg (0.1%).~~

~~*Loss on drying* ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 12% of its weight.~~

~~*Dextrin, gum, and resinous substances*—Dissolve 2 g in 10 mL of warm water: the solution is clear or not more than faintly turbid. Filter if necessary, and divide the filtrate into two equal portions. To one portion add 10 mL of alcohol. To the other portion add 10 mL of water: no turbidity is produced in either solution.~~

~~*Heavy metals*—To the *Residue on ignition* add 1 mL each of hydrochloric acid and nitric acid, and evaporate on a steam bath to dryness. Take up with 1 mL of 1 *N* hydrochloric acid and a few mL of hot water, dilute with water to 40 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing 0.02 mg of added Pb (0.002%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

2′,4′,5′,7′-Tetrabromofluorescein. This new reagent is to be used in the *Benzethonium chloride* test in the proposed monograph *Anthrax Vaccine Adsorbed.*

(HDQ: M. Marques) RTS—39998-6

Add the following:

■**2′,4′,5′,7′-Tetrabromofluorescein** (*Eosin Y, Eosin Yellowish*, *Eosin Bromo ES*, *Solvent Red 43*, *Acid Red 87*), $C_{20}H_8Br_4O_5$—**167.8** [*630-20-6*]—Dark red to brown powder. Solubility 0.1% in water (clear orange solution). Use a suitable grade.■1S (*USP27*)

BRIEFING

Tetrabutylammonium Bromide, *USP 26* page 2515—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-96

Change to read:

Tetrabutylammonium Bromide, $(C_4H_9)_4NBr$—**322.37**—~~White crystalline powder.~~

~~*Assay*~~ ~~Dissolve about 34 mg, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 *N* perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 *N* perchloric acid is equivalent to 32.24 mg of $(C_4H_9)_4NBr$. Not less than 99% is found.~~

~~*Melting range* ⟨741⟩: between 103° and 105°.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

1,1,2,2-Tetrachloroethane. This new reagent is to be used in the *Benzethonium chloride* test in the proposed monograph *Anthrax Vaccine Adsorbed.*

(HDQ: M. Marques) RTS—39998-7

Add the following:

■**1,1,2,2-Tetrachloroethane,** $C_2H_2Cl_4$—**167.8** [*630-20-6*]—Colorless clear liquid. Specific gravity: 1.553. Refractive index at 20° is 1.481. Use a suitable grade.■1S (*USP27*)

BRIEFING

Tetrahydrofuran, *USP 26* page 2516—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-97

Change to read:

Tetrahydrofuran, C_4H_8O—**72.11**—~~Colorless liquid, having a characteristic, pungent odor. Miscible with water and with common organic solvents. When mixed with water, generates some heat and shrinks in volume; when mixed with chloroform, generates considerable heat. The name and concentration of any suitable preservative, not exceeding 0.1%, added to prevent formation of peroxides, are stated on the label. Preserve in small, well-filled containers, protected from light.~~

~~*Specific gravity* ⟨841⟩: between 0.884 and 0.886.~~

~~*Distilling range*, *Method II* ⟨721⟩: between 65° and 66°.~~

~~*Acidity*~~ ~~Mix 5.0 mL with 10 mL of water and 1 drop of methyl red TS: any pink color produced is changed to yellow by addition of not more than 0.25 mL of 0.020 *N* sodium hydroxide.~~

~~*Water*, *Method I* ⟨921⟩: not more than 0.1%.~~

~~*Residue on evaporation*~~ ~~Evaporate 10 mL (12 g) on a steam bath to dryness, and dry the residue at 105° for 1 hour: the weight of the residue is not more than 2 mg if a preservative is present, or not more than 1 mg if no preservative is declared on the label.~~

■—Use ACS reagent grade.■1S (*USP27*)

In-Process Revision

BRIEFING

Tetramethylammonium Bromide, *USP 26* page 2516—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-99

Change to read:

Tetramethylammonium Bromide, $(CH_3)_4NBr$—**154.05**—~~Colorless crystals. Soluble in water; sparingly soluble in absolute alcohol; insoluble in chloroform and in ether.~~

~~*Assay*—Transfer about 400 mg, accurately weighed, to a beaker, add 50 mL of water and 10 mL of diluted nitric acid, swirl to dissolve the test specimen, add 50.0 mL of 0.1 *N* silver nitrate VS, and mix. Add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate VS: each mL of 0.1 *N* silver nitrate consumed is equivalent to 15.41 mg of $(CH_3)_4NBr$. Not less than 98% is found.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Thiourea, *USP 26* page 2517—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-100

Change to read:

Thiourea, $(NH_2)_2CS$—**76.12**—~~White, odorless crystals or a white, crystalline powder. Soluble in water and in alcohol.~~

~~*Assay*—Weigh accurately 1 g, transfer to a 250 mL volumetric flask, dissolve in 50 mL of water, and dilute with water to volume. Pipet 20 mL of the well-mixed solution into a suitable flask, and add 25.0 mL of 0.1 *N* silver nitrate VS and 10 mL of ammonia TS. Shake vigorously for 2 minutes, heat to boiling, and cool. Add 60 mL of diluted nitric acid, shake vigorously, filter, and wash the residue well with water. Add 2 mL of ferric ammonium sulfate TS to the combined filtrate and washings, and titrate with 0.1 *N* ammonium thiocyanate VS. Each mL of 0.1 *N* silver nitrate consumed is equivalent to 3.806 mg of $(NH_2)_2CS$. Not less than 99% is found.~~

~~*Solubility*—A solution of 1 g in 20 mL of water is complete, clear, and colorless.~~

~~*Melting range, Method I* ⟨741⟩: between 176° and 182°.~~

~~*Loss on drying* ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.~~

~~*Residue on ignition* (Reagent test)—Ignite 1 g with 0.5 mL of sulfuric acid: the residue weighs not more than 1.5 mg (0.15%).~~

~~*Sensitiveness*—Dissolve 280 mg of bismuth subnitrate in 12 mL of nitric acid, and dilute with water to 200 mL. Dilute 1 mL of this solution with water to 100 mL, and to 10 mL of the dilution add 1 mL of test solution (1 in 5): a distinct yellow color is produced immediately.~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

***p*-Toluenesulfonic Acid,** *USP 26* page 2518—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-101

Change to read:

***p*-Toluenesulfonic Acid,** $CH_3C_6H_4SO_3H \cdot H_2O$—**190.22**—~~White, hygroscopic crystals or crystalline powder. Soluble in water, in alcohol, and in ether.~~

~~*Assay*—Weigh accurately about 5 g, previously dried over sulfuric acid for 18 hours, and dissolve in about 250 mL of water contained in a 500-mL conical flask. Add 0.15 mL of bromothymol blue TS, and titrate with 1 *N* sodium hydroxide VS to a blue end-point. Each mL of 1 *N* sodium hydroxide is equivalent to 190.2 mg of $CH_3C_6H_4SO_3H \cdot H_2O$. Not less than 99% is found.~~

~~*Melting range* ⟨741⟩: between 104° and 106°, the test specimen having been dried over sulfuric acid for 18 hours.~~

~~*Loss on drying* ⟨731⟩—Dry it over sulfuric acid to constant weight: it loses not more than 1% of its weight.~~

~~*Solubility*—Separate 200-mg portions dissolve completely in 5 mL of alcohol and in 5 mL of ether, respectively.~~

~~*Residue on ignition* ⟨281⟩: negligible, from 200 mg.~~

~~*Free sulfate*—Dissolve 500 mg in 10 mL of water, and add 1 mL of dilute hydrochloric acid (1 in 20) and 1 mL of barium chloride TS: any turbidity produced within 10 minutes does not exceed that of a control containing 0.05 mg of added SO_4 (0.01%).~~

■—Use ACS reagent grade.■1S (*USP27*)

BRIEFING

Trichlorotrifluoroethane, *USP 26* page 2518—See briefing under *Acetaldehyde*.

Change to read:

Trichlorotrifluoroethane—Use ~~a suitable grade.~~[80]

■ACS reagent grade.■1S (*USP27*)

BRIEFING

Water Vapor Detector Tube, *USP 26* page 2521—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-103

Change to read:

Water Vapor Detector Tube—A fuse-sealed glass tube so designed that gas may be passed through it and containing suitable absorbing filters and support media for the indicator, which consists of a selenium sol in suspension in sulfuric acid. ~~[NOTE—A suitable detector tube that conforms to the monograph specification is available from Draeger Safety, Inc., P.O. Box 120, Pittsburgh, PA 15230-0120 as Reference Number 67 28531, Measuring Range 5 to 250 mg per cubic meter. Tubes having conditions other than those specified in the monograph may be used in accordance with the section entitled *Tests and Assays* in the *General Notices and Requirements*.]~~

■*Measuring range:* 5 to 250 mg per cubic meter.[110] ■1S (*USP27*)

BRIEFING

Zinc Acetate, *USP 26* page 2522—See briefing under *Acetaldehyde*.

(HDQ: M. Marques) RTS—39837-104

Change to read:

Zinc Acetate, $Zn(CH_3COO)_2 \cdot 2H_2O$—**219.51**~~—Colorless crystals or white, crystalline plates, having a slight odor of acetic acid. A 1-g portion dissolves in about 2.5 mL of water and in about 30 mL of alcohol.~~

~~*Insoluble matter* (Reagent test)—Twenty g, dissolved in 200 mL of water and 2 mL of glacial acetic acid, shows not more than 1.0 mg of insoluble matter (0.005%).~~

~~*Chloride* (Reagent test)—Two g shows not more than 0.01 mg of Cl (5 ppm).~~

~~*Nitrate*—Dissolve 1 g in 10 mL of water and 50 µL of indigo carmine TS, and then add 10 mL of sulfuric acid: the blue color persists for 5 minutes (about 0.005%).~~

~~*Sulfate* (Reagent test, *Method II*)—Dissolve 20 g in 200 mL of water, add 1 mL of hydrochloric acid, and filter: the filtrate, 10 mL of barium chloride TS being used, yields not more than 1.0 mg of residue (0.002% as SO_4).~~

~~*Alkalies and earths*—Dissolve 2 g in 140 mL of water, add 10 mL of stronger ammonia TS, completely precipitate the zinc with hydrogen sulfide, and filter. To 75 mL of the filtrate add 5 drops of sulfuric acid, evaporate, and ignite: the residue weighs not more than 1 mg (0.1%).~~

~~*Arsenic* ⟨211⟩—Dissolve 6 g in water: the limit is 0.5 ppm.~~

~~*Iron* ⟨241⟩—Dissolve 2 g in 45 mL of water, and add 2 mL of hydrochloric acid: the solution shows not more than 0.01 mg (5 ppm).~~

~~*Lead* ⟨251⟩—Dissolve 1 g in 20 mL of water. To 5 mL of the solution add 0.02 mg of Pb and 12 mL of potassium cyanide solution (3 in 20), and dilute with water to 50 mL (*A*). To the remaining 15 mL add 12 mL of the potassium cyanide solution, and dilute to 50 mL with water (*B*). Then to each add 5 drops of sodium sulfide TS: *B* is not darker than *A* (0.004%).~~

■—Use ACS reagent grade.■1S (*USP27*)

VOLUMETRIC SOLUTIONS

BRIEFING

Lead Nitrate, Hundredth-Molar (0.01 M). This new volumetric solution is used in the test for *Limit of sodium chloride and sodium sulfate* under *Sodium Cetostearyl Sulfate*, which appears elsewhere in this number of *PF*.

(HDQ: M. Marques) RTS—39843-4

Change to read:

■**Lead Nitrate, Hundredth-Molar (0.01 M)**
$Pb(NO_3)_2$, **331.21**

3.312 g in 1000 mL

Xylenol Orange Triturate—Triturate 1 part of xylenol orange with 99 parts of potassium nitrate.

0.1 M Lead Nitrate—Dissolve 33 g of lead nitrate in 1000 mL of water. Standardize the solution as follows. To 20.0 mL of the lead nitrate solution add 300 mL of water. Add about 50 mg of *Xylenol Orange Triturate*, and add methenamine until the solution becomes violet-pink. Titrate with 0.1 M edetate disodium VS to the yellow endpoint. Calculate the molarity.

Dilute 50.0 mL of *0.1 M Lead Nitrate* to 500.0 mL with water.■1S (*USP27*)

In-Process Revision

BRIEFING

Reagent Footnotes, *USP 26* page 2538, page 3013 of the *First Supplement*, page 3373 of *PF* 27(6) [Nov.–Dec. 2001], page 553 of *PF* 28(2) [Mar.–Apr. 2001], page 1952 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], and page 508 of *PF* 29(2) [Mar. –Apr. 2003]. An extensive revision to items in the *Reagent Specifications* and *Reagent Footnotes* sections is made to provide a more consistent and user-friendly document. Some obsolete reagents and their respective footnotes are deleted; and, to the extent possible, specifications are harmonized with the American Chemical Society Reagent Specifications. Also, the contact information for possible suppliers is updated. See briefing under Acetaldehyde, which appears elsewhere in this number of *PF*.

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 26* page 2540, page 3014 of the *First Supplement*, and page 508 of *PF* 29(2) [Mar.–Apr. 2003].

(HDQ) RTS—39761-2; 39894-2; 39894-3; 39894-5; 39894-6

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Add the following:

■**Alfadex:** A white or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol; practically insoluble in ethanol and in methylene chloride.■1S (*USP27*)

In-Process Revision

Add the following:

■**Betahistine Hydrochloride:** White to almost yellow, crystalline powder. Very hygroscopic. Melts between 151° and 154°. Very soluble in water; freely soluble in alcohol; practically insoluble in isopropyl alcohol.■1S (*USP27*)

Add the following:

■**Low-Substituted Carboxymethylcellulose Sodium:** A white or almost white powder or short fibers. Practically insoluble in acetone, in alcohol, and in toluene. It swells in water to form a gel.■1S (*USP27*)

Change to read:

Cefixime: White to light yellow, crystalline powder. ~~Freely soluble in methanol; soluble~~

■Soluble in methanol and■1S (*USP27*)
in propylene glycol; slightly soluble in alcohol, in acetone, and in glycerin; very slightly soluble in 70% sorbitol and in octanol; practically insoluble in ether, in ethyl acetate, in hexane, and in water.

Delete the following:

■~~**Cinoxate:** Slightly yellow, practically odorless, viscous liquid. Very slightly soluble in water; slightly soluble in glycerin; soluble in propylene glycol. Miscible with alcohol and with vegetable oils.~~■1S (*USP27*)

Add the following:

■**Cyclandelate:** White, crystalline powder. Very soluble in acetonitrile, in alcohol, and in ether; practically insoluble in water. Melts at about 58°.■1S (*USP27*)

Add the following:

■**Gemcitabine Hydrochloride:** White to off-white solid. Soluble in water; slightly soluble in methanol; practically insoluble in alcohol and in polar organic solvents.■1S (*USP27*)

Change to read:

~~**Hydroxypropyl Methylcellulose:**~~

■**Hypromellose:**■1S (*USP27*)
White to slightly off-white, fibrous or granular powder. Swells in water and produces a clear to opalescent, viscous, colloidal mixture. Insoluble in dehydrated alcohol, in ether, and in chloroform. *NF category:* Coating agent; suspending and/or viscosity-increasing agent; tablet binder.

Change to read:

~~**Hydroxypropyl Methylcellulose 2208:**~~

■**Hypromellose 2208:**■1S (*USP27*)
White to slightly off-white, fibrous or granular powder. Swells in water and produces a clear to opalescent, viscous, colloidal mixture. Insoluble in dehydrated alcohol, in ether, and in chloroform. *NF category:* Coating agent; suspending and/or viscosity-increasing agent; tablet binder.

Change to read:

~~**Hydroxypropyl Methylcellulose 2906:**~~

■**Hypromellose 2906:**■1S (*USP27*)
White to slightly off-white, fibrous or granular powder. Swells in water and produces a clear to opalescent, viscous, colloidal mixture. Insoluble in dehydrated alcohol, in ether, and in chloroform. *NF category:* Coating agent; suspending and/or viscosity-increasing agent; tablet binder.

Change to read:

~~**Hydroxypropyl Methylcellulose 2910:**~~

■**Hypromellose 2910:**■1S (*USP27*)
White to slightly off-white, fibrous or granular powder. Swells in water and produces a clear to opalescent, viscous, colloidal mixture. Insoluble in dehydrated alcohol, in ether, and in chloroform. *NF category:* Coating agent; suspending and/or viscosity-increasing agent; tablet binder.

Add the following:

■**Hymetellose:** A white, yellowish-white or grayish-white powder or granules. Hygroscopic after drying. Dissolves in cold water, giving a colloidal solution; insoluble in hot water, in acetone, in alcohol, in ether, and in toluene.■1S (*USP27*)

Add the following:

■**Irbesartan:** White to off-white crystalline powder. Slightly soluble in alcohol and in methylene chloride; practically insoluble in water.■1S (*USP27*)

Add the following:

■**Loratadine:** White to off-white powder. Freely soluble in acetone, in chloroform, in methanol, and in toluene; insoluble in water.■1S (*USP27*)

Change to read:

Magnesium Oxide: Very bulky, white powder known as Light Magnesium Oxide or relatively dense, white powder known as Heavy Magnesium Oxide. ~~Five g of Light Magnesium Oxide occupies a volume of approximately 40 to 50 mL, while 5 g of Heavy Magnesium Oxide occupies a volume of approximately 10 to 20 mL.~~

■■1S (*USP27*)
Soluble in dilute acids; practically insoluble in water; insoluble in alcohol.

Delete the following:

■~~**Mandelic Acid:** White to yellowish white crystals or crystalline powder. Almost odorless. Gradually turns yellow and decomposes on prolonged exposure to light. Freely soluble in ether, in isopropyl alcohol, and in water; very soluble in alcohol; soluble in chloroform.~~■1S (*USP27*)

Add the following:

■**Nimodipine:** Light yellow or yellow, crystalline powder; affected by light. Freely soluble in ethyl acetate; sparingly soluble in alcohol; practically insoluble in water. Exhibits polymorphism.■1S (*USP27*)

Add the following:

■**Polyoxyl Lauryl Ether:** A material with 3–5 oxyethylene units per molecule is a colorless liquid. Soluble or dispersible in alcohol; practically insoluble in water and in hexane. A material with 9–23 oxyethylene units per molecule is a white, waxy mass. Soluble or dispersible in water; soluble in alcohol; practically insoluble in hexane. *NF category:* Emulsifying and/or solubilizing agent.■1S (*USP27*)

Add the following:

■**Polyoxyl Oleate:** A slightly yellowish, viscous liquid. Dispersible in water and in oils; soluble in alcohol and in isopropyl alcohol; miscible with fatty oils and with waxes. Its refractive index is about 1.466.■1S (*USP27*)

Add the following:

■**Polyoxyl Stearyl Ether:** A white to yellowish-white, waxy, unctuous mass, pellets, microbeads, or flakes. Polyoxyl Stearyl Ether with 2 oxyethylene units per molecule is practically insoluble in water; soluble in alcohol, with heating, and in methylene chloride. Polyoxyl Stearyl Ether with 10 oxyethylene units per molecule is soluble in water and in alcohol. Polyoxyl Stearyl Ether with 20 oxethylene units per molecule is soluble in water, in alcohol, and in methylene chloride. After melting, it solidifies at about 45°.■1S (*USP27*)

Add the following:

■**Quinapril Hydrochloride:** White to off-white powder, with a pink cast at times. Freely soluble in aqueous solvents.■1S (*USP27*)

Add the following:

■**Sodium Cetostearyl Sulfate:** A white or pale yellow, amorphous or crystalline powder. Soluble in hotwater giving an opalescent solution; partly soluble in alcohol; practically insoluble in cold water.■1S (*USP27*)

Add the following:

■~~**Stearoyl Macrogolglycerides:**~~ **Stearoyl Polyoxylglycerides:** Pale yellow, waxy solids. Dispersible in warm water and in warm paraffin; freely soluble in methylene chloride; soluble in warm methanol. *NF category:* Ointment base; solvent.■1S (*USP27*)

DIETARY SUPPLEMENTS–MONOGRAPHS

BRIEFING

Chaste Tree, page 139 of *PF* 28(1) [Jan.–Feb. 2002]; **Powdered Chaste Tree,** page 142 of *PF* 28(1) [Jan.–Feb. 2002]; **Powdered Chaste Tree Extract.** The first two monographs, which were previously presented in *Pharmacopeial Previews*, are now forwarded to *In-Process Revision*. The *Powdered Chaste Tree Extract* monograph is also proposed at this time using the methods and procedures for *Content of casticin* and *Content of agnuside* as directed in the *Chaste Tree* monograph.

(DSB: G. Giancaspro) RTS—35382-1

In-Process Revision

Add the following:

■Chaste Tree

» Chaste Tree consists of the dried ripe fruits of *Vitex agnus-castus* L. (Fam. Verbenaceae). It contains not less than 0.05 percent of agnuside and not less than 0.08 percent of casticin, calculated on the dried basis.

Packaging and storage—~~Store~~ Preserve in a well-closed ~~light-resistant~~ container, ~~protected from moisture~~and store at controlled room temperature.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Agnuside RS. USP Casticin RS. USP Powdered Chaste Tree Extract RS.*

Botanic characteristics—

Macroscopic—Mature chaste tree fruits are spherical to ovoid, 2 to 4 mm in diameter, very hard, usually with a short pedicil. The fruit is reddish brown to black, slightly rough, and covered with glandular hairs. There are four grooves perpendicular to one another, and a slight depression on the apex, more evident on large fruits. The internal appearance of the fruit is yellowish. The internal structure of the fruit includes four compartments, each containing an oblong seed with a high fat content. A group of up to six spongy, light tan, immature fruits also accompanies mature fruits. The fruit is often covered by a tubular, greenish gray, fine tomentous calyx, which is persistent and has five teeth.

Microscopic—The exocarp is brown and narrow, consisting of parenchymatous cells with thin walls and partially lignified cells with many pitted thickenings on the inside. In surface view, the exocarp shows an epidermis of polygonal cells with irregular thickenings and glandular hairs, each with a short single-celled stalk and a four-celled head containing essential oil. The outer mesocarp consists of several layers of brown, isodiametric parenchyma cells. The inner mesocarp consists of finely pitted sclerenchymatous cells, some with moderately thickened walls, others consisting of isodiametric stone cells with small lumen. The endocarp consists of a layer of small brown sclereid cells. The seeds are small, having large cotyledons surrounded by thin-walled large parenchymatous cells that have ribbed thickenings. The nutritive tissue and the cells of the germ contain aleuron grains and oil globules. Starch is absent. The outer epidermis of calyx is composed of polygonal cells, covered by abundant unicellular or multicellular curved trichomes. The inner epidermis of calyx is glabrous and composed of rectangular, elongated cells with slightly wavy walls.

Identification—

A: *Thin Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer about 1 g of the powdered plant material to a screw-capped centrifuge tube. Add 10 mL of methanol, and heat in a water bath at 60° for 10 to15 minutes, cool, and filter. Apply 60 µL to the plate in bands that are 2 cm in length.

Standard solution—Transfer about 100 mg of USP Powdered Chaste Tree Extract RS to a screw-capped centrifuge tube. Add 1 mL of methanol, and heat in a water bath at 60° for 10 minutes. Centrifuge, and use the clear supernatant. Apply 20 to 30 µL to the plate.

Developing solvent system—Use the upper phase of a mixture of ethyl acetate, methanol, and water (77:15:8).

Spray reagent—Prepare a solution of *p*-dimethylaminobenzaldehyde in 1 N hydrochloric acid containing 10 mg per mL.

Procedure—Develop the chromatogram to a length of not less than 18 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat for 10 minutes at 120°. The chromatogram obtained from the *Test solution* shows the following: a blue zone (at an R_F value of about 0.21) that turns pink in time due to the presence of aucubin and that corresponds in color and R_F value to a similar zone in the chromatogram of the *Standard solution*; a blue zone (at an R_F value of about 0.44) that turns pink in time as a result of the presence of agnuside and that corresponds in color and R_F value to a similar zone in the chromatogram of the *Standard solution*; one yellow zone at an R_F value that is between that of agnuside and aucubin and corresponds in color and R_F value to a similar zone in the chromatogram of the *Standard solution*; and one yellowish-green zone (above a blue zone) that is near the solvent front and that corresponds in color and R_F value to a similar zone in the chromatogram of the *Standard solution.* Other colored zones of varying intensities may be observed in the chromatogram of the *Test solution.*

B: The chromatogram of the *Test solution* in the test for *Content of casticin* shows a peak at the retention time corresponding to the casticin peak in the chromatogram of the *Standard solution.*

Microbial limits ⟨2021⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^6 per g, the total combined molds and yeast count does not exceed 10^4 per g, and the enterobacterial count does not exceed 10^3.

Loss on drying ⟨731⟩: not more than 10.0%.

Foreign organic matter ⟨561⟩: not more than 3.0%.

Total ash ⟨561⟩: not more than 8.0%.

Acid-insoluble ash ⟨561⟩: not more than 2.0%.

Pesticide residues ⟨561⟩: meets the requirements.

Heavy metals, *Method III* ⟨231⟩: not more than 20 µg per g.

Content of casticin—

Solution A—Use filtered and degassed methanol.

Solution B—Use a filtered and degassed solution of 5.88 g of phosphoric acid in 1000 mL of water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Casticin RS in methanol, with sonication. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.05 mg per mL. Filter through a cellulose membrane having a 0.45-µm or finer porosity.

Test solution—Accurately weigh approximately 1000 mg of ground plant material, and place in a suitable container with stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at 19000 rpm for 2 minutes. Filter each supernatant, and transfer to a 250-mL round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness. Dissolve the residue in methanol, quantitatively transfer to a 20-mL volumetric flask, and dilute with methanol to volume. Filter through a cellular membrane having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 348-nm detector and a 3.1-mm × 12.5-cm column that contains 5-µm packing L1. The column temperature is maintained at 25°.

In-Process Revision

The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	Equilibration
0–13	50→65	50→35	Linear gradient
13–18	65→100	35→0	Linear gradient
18–23	100→50	0→50	Linear gradient

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor for casticin is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention time of the peak corresponding to casticin in the *Test solution* by comparison with the chromatogram of the *Standard solution.* Calculate the percentage of casticin in the portion of Chaste Tree taken by the formula:

$$2000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Casticin RS in the *Standard solution; W* is the weight, in mg, of the Chaste Tree taken to prepare the *Test solution;* and r_U and r_S are the peak responses of casticin obtained from the *Test solution* and the *Standard solution*, respectively.

Content of agnuside—

Solvent: a mixture of water and methanol (95:5).

Solution A—Use filtered and degassed acetonitrile.

Solution B—Use a filtered and degassed solution of 5.88 g of phosphoric acid in 1000 mL of water.

Standard solution—Dissolve an accurately weighed quantity of USP Agnuside RS in *Solvent*, with sonication. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg per mL. Filter through a cellulose membrane having a 0.45-µm or finer porosity.

Test solution—Accurately weigh approximately 1000 mg of ground plant material, and place in a suitable container with a stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at 19000 rpm for 2 minutes. Centrifuge, and transfer each supernatant to a 250-mL round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness, and dissolve the residue in 2 mL of *Solvent.* Quantitatively transfer the solution to a solid-phase extraction cartridge packed with neutral aluminum oxide previously conditioned with 5 mL of *Solvent.* Connect the cartridge to a vacuum pressure not exceeding 300 mbar, and collect the eluate. Rinse the round-bottom flask with 2 mL of *Solvent*, and pass this solution through the cartridge, apply the vacuum, and collect the eluate. Rinse the cartridge with 4 mL of *Solvent*, and collect the eluate. Combine the eluates from the cartridge, transfer to a 10-mL volumetric flask, and dilute with *Solvent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 258-nm detector and a 3.1-mm × 12.5-cm column that contains 5-µm packing L1. The column temperature is maintained at 25°.

The flow rate is about 1.3 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	7	93	Equilibration
0–0.6	7→10	93→90	Linear gradient
0.6–5	10	90	Isocratic
5–7	10→14	90→86	Linear gradient
7–13	14→15	86→85	Linear gradient
13–13.1	15→100	85→0	Linear gradient
13.1–18	100	0	Isocratic
18–18.1	100→7	0→93	Linear gradient
18.1–23	7	93	Re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor for agnuside is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention time of the peak corresponding to agnuside in the the *Test solution* by comparison with the chromatogram obtained from the *Standard solution.* Calculate the percentage of agnuside in the portion of Chaste Tree taken by the formula:

$$1000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Agnuside RS in the *Standard solution; W* is the weight, in mg, of the Chaste Tree taken to prepare the *Test solution;* and r_U and r_S are the peak responses of agnuside obtained from the *Test solution* and the *Standard solution*, respectively.■1S (*USP27*)

BRIEFING

Powdered Chaste Tree, page 142 of *PF* 28(1) [Jan.–Feb. 2002]—See briefing under *Chaste Tree.*

(DSB: G. Giancaspro) RTS—35382-2

Add the following:

■Powdered Chaste Tree

» Powdered Chaste Tree is Chaste Tree reduced to a powder or a very fine powder. It contains not less than 0.05 percent of agnuside and not less than 0.08 percent of casticin, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.

USP Reference standards ⟨11⟩—*USP Agnuside RS. USP Casticin RS. USP Powdered Chaste Tree Extract RS.*

Botanic characteristics—Powdered Chaste Tree is dark brown, with a musty, slightly aromatic odor, and a taste resembling that of sage. The following characteristics are present: fragments of the calyx with covering and glandular trichomes on the outer side and rectangular, elongated cells with slightly wavy walls on the inner side; fragments of exocarp with trichomes and cells with large pits in the outer wall; thin-walled parenchymatous cells and globules of fixed oil; stone-pitted cells from the mesocarp; ovoid, lignified cells with bands of reticulate thickening from the testa; and endosperm and cotyledons with fixed oil.

In-Process Revision

Other requirements—It meets the requirements of the tests for *Identification*, *Microbial limits*, *Loss on drying*, *Total ash*, *Acid-insoluble ash*, *Pesticide residues*, *Heavy metals*, *Content of casticin*, and *Content of agnuside* under *Chaste Tree*.■ IS (*USP27*)

BRIEFING

Powdered Chaste Tree Extract. Because there is no existing monograph for this article, this new monograph is being proposed. See also the briefing under *Chaste Tree*.

(DSB: G. Giancaspro) RTS—39958-1

Add the following:

■Powdered Chaste Tree Extract

» Powdered Chaste Tree Extract is prepared from Chaste Tree by extraction with hydroalcoholic mixtures or other suitable solvents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of casticin and agnuside, calculated on the dried basis. It may contain suitable added substances.

Packaging and storage—Preserve in tight containers, and store in a cool place, protected from light.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of casticin and agnuside, the extracting solvent or solvent mixture used for preparation, the ratio of the starting crude plant material to Powdered Extract, the percentage of native extract, and the name and quantity of any added substances. It meets the requirements for *Labeling* under *Botanical Extracts* ⟨565⟩.

USP Reference standards ⟨11⟩—*USP Agnuside RS. USP Casticin RS. USP Powdered Chaste Tree Extract RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent, *Standard solution*, *Developing solvent system*, and *Procedure*—Proceed as directed for *Identification* in *Chaste Tree*.

Test solution—Shake the amount of Extract equivalent to 10 mg of the labeled amount of agnuside in 10 mL of methanol, and heat in a water bath at 60°. Centrifuge or filter before use.

B: The chromatogram of the *Test solution* obtained as directed in the *Content of casticin*, exhibits a peak at the retention time corresponding to casticin.

C: The chromatogram of the *Test solution* obtained as directed in the *Content of agnuside*, exhibits a peak at the retention time corresponding to agnuside.

Loss on drying ⟨731⟩: not more than 6.0%.

Heavy metals, *Method II* ⟨231⟩: not more than 20 µg per g.

Organic volatile impurities, *Method VI* ⟨467⟩: meet the requirements.

Microbial limits ⟨2021⟩—The total bacterial count does not exceed 10^4 per g. The total combined molds and yeasts count does not exceed 10^3 per g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Content of casticin—

Solution A, *Solution B*, *Standard solution*, and *Chromatographic system*—Proceed as directed under *Chaste Tree*.

Test solution—Transfer an accurately weighed amount of Extract equivalent to about 2.5 mg of labeled content of casticin into a 50-mL volumetric flask. Add 25 mL of methanol, and sonicate in a bath at 40° for 10 minutes shaking to disperse the solid. Cool to room temperature, and dilute with methanol to volume, and mix. Centrifuge or pass through a filter having a 0.45-µm or finer porosity.

Procedure—Proceed as directed for *Procedure* under *Chaste Tree*. Calculate the percentage of casticin in the portion of Powdered Chaste Tree Extract taken by the formula:

$$5000(C/W)(r_U/r_S),$$

in which, the terms are defined therein.

Content of agnuside—

Solvent, *Solution A*, *Solution B*, *Standard solution*, and *Chromatographic system*—Proceed as directed under *Chaste Tree*.

Test solution—Transfer an accurately weighed amount of Extract equivalent to about 6.25 mg of labeled content of agnuside into a 50-mL volumetric flask. Add about 25 mL of *Solvent* and sonicate a bath at 40° for 10 minutes shaking to disperse the solid. Cool to room temperature and dilute to volume with *Solvent* and mix. Centrifuge or pass through a filter having a 0.45-µm or finer porosity.

Procedure—Proceed as directed for *Procedure* under *Chaste Tree*. Calculate the percentage of agnuside in the portion of Powdered Chaste Tree Extract taken by the formula:

$$5000(C/W)(r_U/r_S),$$

in which, the terms are as defined therein.

Other requirements—It meets the requirements for *Packaging and Storage*, *Residual Solvents*, and *Pesticide Residues* under *Botanical Extracts* ⟨565⟩.■1S (*USP27*)

BRIEFING

Chondroitin Sulfate Sodium, *NF 21* page 2721, page 3018 of the *First Supplement*, and page 456 of *PF* 29(2) [Mar.–Apr. 2003]. Significant differences between chondroitin of fish origin and the type of chondroitin described by this monograph are found in the IR spectra between 1000 cm^{-1} and 450 cm^{-1}. No significant difference is observed between chondroitin from avian, porcine, and bovine origins in this region. Therefore, it is proposed to remove the limitation in the spectral range under *Identification* test *A*. In the test for *Residue on ignition*, it is proposed not to omit the addition of sulfuric acid. Having removed the proposed requirement to detect sulfate ions as obtained in the *Residue on ignition* test (see pages 3059–3063 of *PF* 27(5) [Sept.–Oct. 2001]) from the *Identification* tests in the monograph, the omission of sulfuric acid is no longer necessary. It is reported that more consistent results are obtained when sulfuric acid is added to char the test specimen as directed in the general chapter *Residue on Ignition* ⟨281⟩.

REINFORCED MEDIUM FOR CLOSTRIDIA

Beef Extract	10.0 g
Peptone	10.0 g
Yeast Extract	3.0 g
Soluble Starch	1.0 g
Glucose Monohydrate	5.0 g
Cysteine Hydrochloride	0.5 g
Sodium Chloride	5.0 g
Sodium Acetate	3.0 g
Agar	0.5 g
Water	1000 mL

Dissolve agar in water by heating to boiling, while stirring continuously. Adjust the pH if necessary, and sterilize.

pH after sterilization: 6.8 ± 0.2.

COLUMBIA AGAR

Pancreatic Digest of Casein	10.0 g
Meat Peptic digest	5.0 g
Heart Pancreatic digest	3.0 g
Yeast Extract	5.0 g
Corn Starch	1.0 g
Sodium Chloride	5.0 g
Agar	15.0 g
Water	1000 mL

Dissolve agar in water by heating to boiling with continuous stirring. If necessary, adjust the pH. Sterilize, and allow to cool to 45° to 50°. Add gentamicin sulfate, equivalent to about 20 mg of gentamicin base, and pour into Petri dishes.

pH after sterilization: 7.3 ± 0.2.

Procedure—Take two equal portions of the *Test preparation*, heat one to 80° for 10 minutes, and cool rapidly. Transfer 10 mL of each portion to separate containers, each containing each 100 mL of *Reinforced Medium for Clostridia*, and incubate under anaerobic conditions at 35° to 37° for 48 hours. After incubation subculture each specimen on *Columbia Agar Medium* to which gentamicin has been added, and incubate under anaerobic conditions at 35° to 37° for 48 hours. Examine the plates, and interpret as follows: if no growth of Gram-positive rods is detected, the test specimen meets the requirement for the absence of *Clostridium* species.

If growth occurs, subculture each distinct colony on *Columbia Agar Medium*, and separately incubate in aerobic and in anaerobic conditions at 35° to 37° for 48 hours. The occurrence of only anaerobic growth of Gram-positive bacilli, giving a negative catalase reaction, indicates the presence of *Clostridium sporogenes* species. To perform the catalase test, transfer discrete colonies to glass slides, and apply a drop of dilute hydrogen peroxide solution: the reaction is negative if no gas bubbles evolve. If the test specimen exhibits none of these characteristics, it meets the requirement for the absence of *Clostridium* species.■1S (*NF21*)

Change to read:

Residue on ignition ⟨281⟩: between 20.0% and 30.0%, on the dried basis. ~~, omitting the addition of sulfuric acid.~~

BRIEFING

Fish Oil Rich in Omega-3 Acids. Because there is no existing *USP* or *NF* monograph for this article, this new monograph is being proposed. The chromatographic procedure was validated using a Supelcowax-10 brand of capillary column G16. Typical retention times are 19.4 minutes for eicosapentaenoic acid (EPA) methyl ester, 24.2 minutes for methyl tricosanoate, and 28.8 minutes for docosahexaenoic acid (DHA) methyl ester. Oxidation indexes and limits for heavy metals and pesticides are based on the Council for Responsible Nutrition's voluntary monograph for omega-3 acids.

(DSN: G. Giancaspro) RTS—39705-1

Add the following:

■Fish Oil Rich in Omega-3 Acids

» Fish Oil Rich in Omega-3 Acids is the purified, winterized, and deodorized fatty oil obtained from fish of the families *Engraulidae*, *Carangidae*, *Clupeidae*, *Osmeridae*, *Scrombroidae*, and *Ammodytidae*. The omega-3 acids are defined as the following: alpha-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), eicosapentaenoic acid (EPA) (C20:5 n-3), heneicosapentaenoic acid (C21:5 n-3), docosapentaenoic acid (C22:5 n-3), and docosahexaenoic acid (DHA) (C22:6 n-3). It contains not less than 28.0 percent of total omega-3 acids, expressed as triglycerides, consisting of not less than 13.0 percent of EPA and not less than 9.0 percent of DHA. Suitable antioxidants in appropriate concentrations may be added.

Packaging and storage—Preserve in tight, light-resistant containers at controlled room temperature. It may be bottled or otherwise packaged in containers from which air has been expelled by production of vacuum or by an inert gas.

Labeling—The label states the average content of DHA and EPA in mg per g. It also states the name and concentration of any added antioxidant.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Cod Liver Oil RS*. *USP Methyl Tricosanoate RS*.

Identification—The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester obtained in the chromatogram of the *Test solutions* in the test for *Content of EPA and DHA* correspond to those for the respective compounds in the chromatogram of the *Standard solution*. The sum of the area for EPA and DHA methyl esters is not less than 28% of the total detected area for the methyl esters, and no other peak in the chromatogram has an area higher than 20% of the total detected area for the methyl esters. The chromatogram of *Test solution 1* exhibits at least 15 additional peaks at the retention times of the methyl esters of unsaturated fatty acids exhibited in the chromatogram of the *Standard solution.*

Acid value ⟨401⟩—Not more than 3.

Anisidine value ⟨401⟩—Not more than 20.0.

Peroxide value ⟨401⟩—Not more than 5.0.

Total oxidation value (TOTOX) ⟨401⟩—Not more than 26, calculated by the formula:

$$(2 \times PV) + AV,$$

in which *PV* is the *Peroxide value*, and *AV* is the *Anisidine value*.

Unsaponifiable matter ⟨401⟩—Not more than 1.5 percent.

Stearin—100 mL remains clear after cooling at 0° for 3 hours.

Absorbance—Not more than 0.70, determined at 233 nm.

Limit of arsenic—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

Standard stock solution—Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in the test for *Arsenic* ⟨221⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of arsenic per mL.

Standard solutions—Dilute the *Standard stock solution* with *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025 and 0.050 µg per mL, of Arsenic.

Test solution—For preparation of the *Test solution*, use a microwave oven with a magnetron frequency of about 2455 MHz and a selectable output power of 0 to 950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytef liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [*Caution—Wear proper eye protection and protective clothing and gloves.*] Transfer approximately 500 mg of sample, accurately weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 minutes followed by 25% power for 45 minutes. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature (a cool water bath may be used to speed the cooling process). Vent the vessels when they reach room

temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 minutes at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

1% Palladium stock solution—Transfer 1 g of ultrapure palladium metal, accurately weighed, into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 3 mL of *1% Palladium stock solution* and 2 mL of *1% Magnesium nitrate stock solution* into a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Procedure—Program the graphite furnace as follows: (1) dry at 115° using a 1-second ramp, a 65-second hold, and a 300 mL per minute argon flow; (2) char the sample at 1000° using a 1-second ramp, a 20-second hold, and a 300 mL per minute air flow; (3) cool down, and purge the air from the furnace for 10 seconds using a 20° set temperature and a 300 mL per minute argon flow; (4) atomize at 2400° using a 0-second ramp and a 5-second hold with the argon flow stopped; and (5) clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Test solutions* and the *Blank*, and 5 µL of the modifier solution, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg per mL, of arsenic in each mL of the test solution by interpolation from the regression line. Calculate the content of arsenic in the specimen taken by the formula:

$$25\ C/W,$$

in which W is the weight, in g, of Fish Oil taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of lead—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

10% Ammonium dihydrogen phosphate stock solution—Transfer 10 g of ultrapure ammonium dihydrogen phosphate, accurately weighed, into a 100-mL volumetric flask. Add 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid,

In-Process Revision

and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 4 mL of *10% Ammonium dihydrogen phosphate stock solution* and 2 mL of *1% Magnesium nitrate stock solution* into a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Standard stock solution—Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in the test for *Heavy Metals* ⟨231⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of lead per mL.

Test solution—Prepare as directed for *Test solution* in the test for *Limit of arsenic*.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solutions—Dilute the *Standard stock solution* with *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025, and 0.050 µg per mL of lead.

Procedure—Program the graphite furnace as follows: (1) dry at 120° using a 1-second ramp, a 55-second hold, and a 300 mL per minute argon flow; (2) char the sample at 850° using a 1-second ramp, a 30-second hold, and a 300 mL per minute air flow; (3) cool down, and purge the air from the furnace for 10 seconds using a 20° set temperature and a 300 mL per minute argon flow; (4) atomize at 2100° using a 0-second ramp and a 5-second hold with the argon flow stopped; and (5) clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Test solutions* and the *Blank*, and 5 µL of the *Modifier working solution*, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg per mL, of lead in each mL of the *Test solution* by interpolation from the regression line. Calculate the content of lead in the specimen taken by the formula:

$$25\ C/W,$$

in which W is the weight, in g, of Fish Oil taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of cadmium—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

10% Ammonium dihydrogenphosphate stock solution—Transfer 10 g of ultrapure ammonium dihydrogen phosphate, accurately weighed, into a 100-mL volumetric flask. Add 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute to 100 mL with deionized water.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, into a teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and

warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 4 mL of *10% Ammonium dihydrogen phosphate stock solution* and 2 mL of *1% Magnesium nitrate stock solution* into a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Standard stock solution—Transfer 137.2 mg of cadmium nitrate to a 1000-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of cadmium per mL.

Test solution—Prepare as directed for *Test solution* in the test for *Limit of arsenic*.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solutions—Dilute the *Standard stock solution* with *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025, and 0.050 µg per mL of cadmium.

Procedure—Program the graphite furnace as follows: (1) dry at 120° using a 1-second ramp, a 55-second hold, and a 300 mL per minute argon flow; (2) char the sample at 850° using a 1-second ramp, a 30-second hold, and a 300 mL per minute air flow; (3) cool down, and purge the air from the furnace for 10 seconds using a 20° set temperature and a 300 mL per minute argon flow; (4) atomize at 2400° using a 0-second ramp and a 5-second hold with the argon flow stopped; and (5) clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Test solutions* and the *Blank*, and 5 µL of the *Modifier working solution*, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg per mL, of cadmium in eachmL of the *Test solution* by interpolation from the regression line. Calculate the content of cadmium in the specimen taken by the formula:

$$25\ C/W,$$

in which *W* is the weight, in g, of Fish Oil taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of mercury—Proceed as directed under *Method IIb* in the general chapter *Mercury* ⟨261⟩, except to use a *Standard Mercury Solution* having the equivalent of 0.025 µg per mL of mercury.

Test solution—Prepare as directed for the *Test solution* in the test for *Limit of arsenic*.

Limit of pesticides—Determine the content of polychlorinated dibenzo-*para*-dioxins (PCDDs), polychlorinated dibenzofurans (PCDFs), and total polychlorinated biphenyls (PCBs) using the Environmental Protection Agency's Method No. 1613, Revision B. The sum of polychlorinated dibenzo-*para*-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) is not more than 2 pg of WHO toxic equivalent factors per g. The content of total polychlorinated biphenyls (PCBs) is not more than 0.09 µg per g.

Content of EPA and DHA—

Antioxidant solution—Dissolve an accurately weighed amount of butylated hydroxytoluene in hexanes to obtain a solution having a concentration of 0.05 mg per mL.

In-Process Revision

Standard stock solution—Transfer 0.450 g of USP Cod Liver Oil RS accurately weighed, into a 10-mL volumetric flask, dissolve in *Antioxidant solution*, and dilute with the same solvent to volume.

Standard solution—Transfer 2.0 mL of the *Standard stock solution* into a quartz tube, and evaporate the solvent with a gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol, cap tightly with a polytetrafluoroethylene lined cap, mix, and heat in a water bath for 7 minutes. Cool, add 2 mL of boron trichloride-methanol solution, cover with nitrogen, cap tightly, mix, and heat in a water bath for 30 minutes. Cool to 40° to 50°, add 1 mL of isooctane, cap, and vortex or shake vigorously for at least 30 seconds. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and vortex or shake thoroughly for at least 15 seconds. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combined extracts with 2 quantities, each of 1 mL of water, and dry over anhydrous sodium sulfate.

System suitability mixture—Prepare a mixture having equal amounts, accurately weighed, of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate. [NOTE—A suitable mixture is available from Supelco, Bellefonte, Pa., as GLC-40, cat. number 1985-1AMP.]

Internal standard solution—Transfer an accurately weighed amount of USP Methyl Tricosanoate RS of about 70.0 mg to a 10-mL volumetric flask. Dissolve in isooctane, and dilute with the same solvent to volume.

Stock test solution—Transfer 0.300 g of Fish Oil Rich in Omega-3 Acids, accurately weighed, into a 10-mL volumetric flask, dissolve with *Antioxidant solution*, and dilute with the same solvent to volume.

Test solution 1—Proceed as directed for the *Standard solution*, using the *Stock test solution*.

Test solution 2— Transfer 1.0 mL of the *Internal standard solution* into a quartz tube. Then proceed as directed for *Test solution 1*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame ionization detector and a 0.25-mm × 30-m fused silica capillary column coated with a 0.25-µm film of G16. The temperature of the detector is maintained at 280° and that of the injection port at 250°. The column temperature is initially set at 170°, then increased at a rate of 1° per minute to 225°, and is maintained at 225° for 20 minutes. The carrier gas is helium with a split flow ratio of 1:200. Chromatograph the *Standard solution*, *System suitability mixture*, *Test solution 1*, and *Test solution 2*, and record the peak responses as directed for *Procedure:* the resolution between the peaks in the *Standard solution* due to methyl oleate and methyl *cis*-vaccinate is not less than 1.3, and between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement. The theoretical area percentages for methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate are 24.4, 24.8, 25.2, and 25.6, respectively. In a suitable instrument, the area percentages from the *System suitability mixture* are within 1% of the theoretical values. The number of fatty acid methyl ester peaks exceeding 0.05 percent of the total area in the chromatogram of the *Standard solution* is at least 24, and the 24 largest peaks of the methyl esters account for more than 90 percent of the total area. (These correspond to, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, 22:6 n-3.)

Procedure—Separately inject duplicate equal volumes (about 1 µL) of the *Standard solution*, *Test solution 1*, and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak responses. Identify the retention times of the relevant fatty acids methyl esters by comparison of the chromatogram of the *Standard solution* with the reference chromatogram supplied with the USP Cod Liver Oil RS. Identify the retention time for the *Internal standard solution* by comparison of the chromatograms of *Test solution 1* and *Test solution 2*. Calculate the area percent for each fatty acid methyl ester taken by the formula:

$$100(r_A / r_B),$$

in which r_A is the average peak area of each individual fatty acid; and r_B is the total peak area from all peaks in the chromatogram, excepting the solvent front and butylated hydroxytoluene. Calculate the percentage of EPA or DHA in the Fish Oil Rich in Omega-3 Acids taken by the formula:

$$500FC(r_i / r_S)/1.04W,$$

in which 500 is the factor to express the content of DHA and EPA as free fatty acids in percentage, considering a 1 to 5 sample dilution; 1.04 is the factor to convert the methyl tricosanoate into tricosanoic acid; C is the concentration, in mg per mL, of the *Internal standard solution; W* is the weight, in mg, of the Fish Oil Rich in Omega-3 Acids taken to prepare the *Stock test solution; F* is the theoretical response factor of EPA or DHA, respectively, relative to the internal standard (0.99 for EPA and 0.97 for DHA); r_i is the peak response of either EPA or DHA in the chromatogram of *Test solution 2;* and r_S is the corrected peak response of the internal standard in *Test solution 2* calculated as follows:

$$[(r_{S2} / r_{EPA2}) - (r_{S1} / r_{EPA1})]\, r_{EPA2},$$

in which r_{S2} is the peak response of any peak at the locus of the internal standard in the chromatogram of *Test solution 2;* r_{S1} is the peak response of any peak at the locus of the internal standard in the chromatogram of *Test solution 1;* r_{EPA1} is the peak response of EPA in the chromatogram of *Test solution 1;* and r_{EPA2} is the peak response of EPA in the chromatogram of *Test solution 2*.■1S (*USP27*)

BRIEFING

Fish Oil Rich in Omega-3 Acids Capsules. Because there is no existing *USP* or *NF* monograph for this article, this new monograph is being proposed. See also the briefing under *Fish Oil Rich in Omega-3 Acids*.

(DSN: G. Giancaspro) RTS—39705-2

Add the following:

■Fish Oil Rich in Omega-3 Acids Capsules

» Fish Oil Rich in Omega-3 Acids Capsules contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Fish Oil Rich in Omega-3 Acids. The oil contained in Fish Oil Rich in Omega-3 Acids Capsules conforms to the definition for *Fish Oil Rich in Omega-3 Acids*.

Packaging and storage—Preserve in tight containers at room temperature. Protect from light.

Labeling—The label states the amount of docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA) in mg per Capsule.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Cod Liver Oil RS*. *USP Methyl Tricosanoate RS*.

Identification—Proceed as directed for *Identification* under *Fish Oil Rich in Omega-3 Acids*. The oil contained in the Capsules meets the requirements.

Weight variation ⟨2091⟩: meets the requirements.

Dissolution ⟨711 ⟩—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes; 30 minutes.

Procedure—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 minutes but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 minutes but not more than 30 minutes.

Other requirements—The contents of the Capsules meet the requirements of the tests for *Unsaponifiable matter*, *Acid value*, *Anisidine value*, *Total oxidation value*, *Heavy metals*, and *Pesticides* under *Fish Oil Rich in Omega-3 Acids*.

Content of fish oil—Accurately weigh not fewer than 10 Capsules in a tared weighing bottle. With a sharp blade, or by other appropriate means, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of isooctane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the isooctane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per capsule.

Content of DHA and EPA—Proceed as directed for *Content of DHA and EPA* under *Fish Oil Rich in Omega-3 Acids*.■1S (*USP27*)

BRIEFING

Maritime Pine, page 1903 of *PF* 28(6) [Nov.–Dec. 2002]; **Maritime Pine Extract,** page 1905 of *PF* 28(6) [Nov.–Dec. 2002]. It is proposed to revise the storage conditions in the *Packaging and storage* section.

(DSB: G. Giancaspro; PSD: C. Okeke) RTS—39821-1

Add the following:

■Maritime Pine

» Maritime Pine consists of the bark of stems of *Pinus pinaster* Aiton (*Pinus maritima* Poir.) Fam. Pinaceae. It contains not less than 8.0 percent and not more than 12.0 percent of procyanidins, calculated on the dried basis.

NOTE—This article is intended to be used in the preparation of extracts only and is not for direct human consumption.

Change to read:

Packaging and storage—Store at ~~room temperature.~~■25°, excursion permitted between 15° and 30°. Preserve in a well-closed container, and■1S (*USP27*) protect from moisture and excessive heat.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Maritime Pine Extract RS.*

Botanical characteristics—

Macroscopic—Bark pieces are typically 1 to 3 cm thick. The inner bark is plane to slightly concave, whitish to light brown, striped longitudinally; shiny and of slightly irregular surface, only a few millimeters thick. Abrupt change to a sequence of hard, convex, nearly parallel layers alternating with smooth, light brown layers. Up to 50 or more layers present, depending on the age of the bark. Outer surface of bark is dark reddish-brown composed of irregular scaly patches, with deep V-shaped fissures. Outer surface may also be gray, gray-green, or green-yellow due to presence of lichens.

Microscopic (*transverse section of bark*)—Light inner bark has irregular lateral stripes consisting of three to five cell layers of long, slender sieve cells with large pitted horizontal cell walls and large polygonal parenchyma cells containing single, irregular, rounded starch grain, 3 to 15 mm wide. Lateral stripes are separated from each other by ray parenchyma cells. Ray parenchyma cells are homogeneous in appearance, one to four cell layers thick and four and twenty cell layers high, each cell containing single, irregular, rounded starch grain, 3 to 15 mm wide. Cylindrical parenchyma cells with thin cell wall arranged in vertical rows with calcium oxalate prisms are also present. Outer part of the inner bark contains plate-shaped cells of undifferentiated periderm and older periderm with multiple layers of phellogen. The phellogen grows three to seven rows of phellum to the exterior and two to four rows of small cell phelloderm to the interior. The oldest and outermost part of the bark is composed of lignified sections of phelloderm and phellum cells, 15 to 35 mm thick, separated by collapsed phellogen. Phelloderm and phellum cells are up to 100 mm wide, square, rectangular, polygonal, or irregularly shaped. The cell walls are colorless. Phelloderm cells are moderately pitted with a reddish-brown content. Phellum cells have a thicker cell wall, strongly pitted, undulated contour, and a yellowish-brown to brownish-red content. Radially in between layers of phelloderm and phellum are layers of ray parenchyma cells, five to eight cells thick, rounded to radially stretched, thin walled, strongly pitted with collapsed cells and dead sieve cells.

Identification—

A: Pulverize 1 g of the dried Maritime Pine. Add 10 mg of the powdered material to 1 mL of methanol. Add 6 mL of a mixture of butanol and hydrochloric acid (95:5 v/v). Heat for 2 minutes in a water bath: the solution turns red.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Add 2 g of the powdered dried material to 20 mL of water. Place in a water bath for 20 minutes, and centrifuge. Extract the supernatant with 40 mL of ethyl acetate. Evaporate the ethyl acetate layer to dryness under a stream of nitrogen, with gentle heating. Dissolve the residue so obtained in 0.25 mL of alcohol.

Standard solution—Prepare a solution of USP Maritime Pine Extract RS in alcohol, having a concentration of about 25 mg per mL. [NOTE—Retain a portion of this solution for use in *Identification* test *C*.]

Application volume: 5 µL.

Developing solvent system: a mixture of ethyl acetate, methanol, and water (100:10:6).

Spray reagent: a mixture of alcohol and phosphoric acid (1:1), containing 1% of vanillin.

Procedure—Proceed as directed in the chapter, except to dry the plate with the aid of a current of air, spray with the *Spray reagent*, and dry at 110° for 10 minutes. A red band

In-Process Revision

appears in the upper part of the chromatogram of the *Test solution*, at an R_F value of about 0.82, corresponding to a similar band in the chromatogram of the *Standard solution* (*presence of catechin*). The lower part of the chromatogram of the *Test solution* also shows red bands, at an R_F value of about 0.45 (*presence of oligomeric and polymeric procyanidins*). Two other red bands in the chromatogram of the *Test solution* correspond to those at similar R_F values in the chromatogram of the *Standard solution* (*presence of dimeric procyanidins*). A blue band appears in the chromatogram of the *Test solution* between the bands for catechin and the dimeric procyanidins, corresponding in color and R_F value to a similar band in the chromatogram of the *Standard solution*.

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Use the *Test solution* prepared as directed for *Identification* test *B*.

Standard solution 1—Use the *Standard solution* prepared as directed for *Identification* test *B*.

Standard solution 2—Prepare a solution of ferulic acid and protocatechuic acid containing 1 mg of each per mL.

Application volume: 10 µL.

Developing solvent system: a mixture of methylene chloride, methanol, and glacial acetic acid, and water (80:15:2:2).

Spray reagent—Prepare a 5% ferric chloride solution in methanol.

Procedure—Proceed as directed in the chapter, except to dry the plate at 110° and examine the plate under short-wavelength UV light. The upper third of the chromatogram of the *Test solution* exhibits three bands. The uppermost band is close to the solvent front. The middle third of the chromatogram of the *Test solution* exhibits a band corresponding in R_F value to the bands in the chromatograms of *Standard solution 1* and *Standard solution 2* (*presence of ferulic acid*). The lower third of the chromatogram of the *Test solution* exhibits a band corresponding to bands of similar R_F value in the chromatograms of *Standard solution 1* and *Standard solution 2* (*presence of protocatechuic acid*). A band near the origin is also visible in the chromatogram of the *Test solution*. Spray the plate with the *Spray reagent*, and dry at 110°. The bands due to ferulic acid and protocatechuic acid turn grayish-green and orange, respectively. A grayish-green band becomes visible in the chromatogram of the *Test solution* above the protocatechuic acid band (*presence of caffeic acid*). The band near the origin of the chromatogram of the *Test solution* turns orange.

Water content ⟨561⟩: not more than 35.0%.

Foreign organic matter ⟨561⟩: not more than 5%.

Total ash ⟨561⟩: not more than 1.5%.

Content of procyanidins—

Reagent solution A—Prepare a mixture of butanol and hydrochloric acid (95:5). [NOTE—Prepare this solution on the day of use.]

Reagent solution B—Dissolve 2 g of ferric ammonium sulfate in a mixture of 100 mL of water and 17.5 mL of hydrochloric acid. [NOTE—This solution can be used within 15 days of preparation.]

Test solution—Dry crushed Maritime Pine at 110° for 3 hours. Place about 1.9 g of the crushed material, accurately weighed, in a 20-mL vial, and add 10 mL of methanol. Crimp the vial and sonicate for 2 minutes. Heat in boiling water for 10 minutes. Cool to room temperature, allow the sediment to settle, and transfer the supernatant to a 100-mL volumetric flask, passing it through a filter having a 0.45-µm porosity. Wash the sediment two times with 10 mL of methanol, and transfer the solution into the same 100-mL

volumetric flask, again passing it through a filter having a 0.45-µm porosity. Dilute with methanol to volume, and mix. Transfer 1.0 mL of that solution into a 20-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Transfer 1.0 mL of the *Test solution* and 1.0 mL of methanol to two separate 10-mL vials. To each flask add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B* to each flask. Seal the vials with crimp caps. Mix, and heat in a water bath for 40 minutes. Quickly cool to room temperature in an ice bath. Quantitatively transfer these solutions, with the aid of *Reagent solution A*, to two separate 10-mL volumetric flasks, dilute with *Reagent solution A* to volume, and mix. Determine the absorbance of the solution obtained from the *Test solution* at 546 nm, using the methanol-containing solution as the blank. Calculate the percentage of total procyanidins in the portion of Maritime Pine taken by the formula:

$$(2000A_U)/(36.7W),$$

in which A_U is the absorbance of the solution obtained from the *Test solution;* 36.7 is the absorptivity of the maritime pine procyanidins; and W is the weight, in g, of the Maritime Pine taken to prepare the *Test solution*.■2S (*USP27*)

BRIEFING

Maritime Pine Extract, page 1905 of *PF* 28(6) [Nov.–Dec. 2002]—See briefing under *Maritime Pine*.

(DSB: G. Giancaspro; PSD: C. Okeke) RTS—39821-2

Add the following:

■Maritime Pine Extract

» Maritime Pine Extract is prepared from the pulverized Maritime Pine using suitable solvents. It contains between 65 and 75 percent of procyanidins, calculated on the dried basis.

Change to read:

Packaging and storage— ~~Store in tight containers, protected from light.~~ ■Preserve in tight containers, and store at 25°, excursion permitted between 15° and 30°. Protect from light.■1S (*USP27*)

Labeling—The label states the official name of the article, the Latin binomial, and the part of the plant from which the article was prepared, in addition to the information required for *Labeling* under *Botanical extracts* ⟨565⟩.

USP Reference standards ⟨11⟩—*USP Maritime Pine Extract RS*.

Identification—

A: Dissolve 50 mg of Extract in 6 mL of a mixture of butanol and hydrochloric acid (95:5). Heat in a water bath for 2 minutes: the solution turns dark red.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Dissolve a quantity of Extract in methanol to obtain a solution having a concentration of about 25 mg per mL.

Standard solution 1—Prepare a solution of USP Maritime Pine Extract RS in methanol having a concentration of about 25 mg per mL.

Standard solution 2—Prepare a solution of ferulic acid in methanol having a concentration of about 1 mg per mL.

Application volume: 5 µL.

In-Process Revision

Developing solvent system: a mixture of methylene chloride, methanol, glacial acetic acid, and water (80:15:2:2).

Spray reagent—Prepare a 5% ferric chloride solution in methanol.

Procedure—Proceed as directed in the chapter, except to dry the plate at 110° and to examine the plate under short-wavelength and long-wavelength UV light. The chromatogram of *Standard solution 1* exhibits bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively. Spray the plate with the *Spray reagent*, and dry at 110° for 10 minutes. The bands due to ferulic acid and protocatechuic acid turn grayish-green and orange, respectively. Grayish-green bands become visible in the chromatogram of *Standard solution 1* above and below protocatechuic acid indicating the presence of caffeic acid and catechin, respectively. The chromatogram of the *Test solution* exhibits bands due to caffeic acid, protocatechuic acid, and ferulic acid that correspond in color and R_F value to those in the chromatogram of *Standard solution 1*.

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Use the *Test solution* prepared as directed for *Identification* test *B*.

Standard solution—Use the *Standard solution 1* prepared as directed for *Identification* test *B*.

Application volume: 5 µL.

Developing solvent system: a mixture of ethyl acetate, formic acid, and water (100:10:6).

Spray reagent: a mixture of phosphoric acid and alcohol (1:1), containing 1% of vanillin.

Procedure—Proceed as directed in the chapter, except to spray the plate with the *Spray reagent*, and heat at 110° for 10 minutes. Three red bands appear in the middle third of the chromatogram of the *Standard solution* corresponding to two dimeric procyanidins and catechin. The chromatogram of the *Standard solution* also exhibits a blue band between the upper band due to upper dimeric procyanidins and the band due to catechin. The chromatogram of the *Test solution* contains bands that correspond to those found in the chromatogram of the *Standard solution*.

D: Proceed as directed in the following liquid-chromatographic procedure.

Solution A—Use filtered and degassed methanol.

Solution B—Carefully weigh 1 g of phosphoric acid, and dilute with water. Transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Standard solution—Dissolve an accurately weighed quantity of USP Maritime Pine Extract RS in *Solution A* to obtain a solution having a known concentration of about 2 mg per mL. Pass through a membrane having a 0.45-µm or finer porosity.

Test solution—Weigh about 20 mg of Extract. Add 10 mL of *Solution A*, and sonicate for 10 minutes. Pass through a membrane having a 0.45-µm or finer porosity, discarding the first 4 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains base-deactivated packing L7 having less than 5-µm particle size. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	8	92	Equilibration
0–40	8→34	92→66	Linear gradient
40–45	34→2	66→98	Linear gradient
45–50	2	98	Isocratic
50–52	2→8	98→92	Linear gradient
52–57	8	92	Isocratic

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the chromatogram obtained is similar to the Reference Chromatogram provided with the USP Maritime Pine Extract RS; the resolution, *R*, between taxifolin and ferulic acid is not less than 3.0; and the tailing factor for taxifolin is not more than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for catechin, caffeic acid, taxifolin, and ferulic acid, identifying the peaks by comparison of the chromatogram of the *Standard solution* with the Reference Chromatogram: the chromatogram of the *Test solution* exhibits peaks for catechin, caffeic acid, taxifolin, and ferulic acid at the retention times corresponding to those in the chromatogram of the *Standard solution*.

Microbial limits ⟨2021⟩—The total aerobic microbial count does not exceed 10^4 per g, the total combined molds and yeasts count does not exceed 10^3 per g, and it meets the requirements of the tests for absence of *Salmonella* species, and *Escherichia coli*.

Loss on drying ⟨731⟩—Dry about 1.0 g of Extract, accurately weighed, for 3 hours at 110°: it loses not more than 8.0% of its weight.

Total ash ⟨561⟩: not more than 0.7%.

Pesticide residue ⟨561⟩: meets the requirement.

Limit of water-insoluble substances—Accurately weigh 0.50 g of Extract, and stir in 50 mL of water at 20° for 15 minutes. Pass through a fine sintered-glass filter, previously weighed. Dry the filter at 110° for 3 hours, cool to room temperature, and weigh the filter. Calculate the amount of water-insoluble material: not more than 10% of the amount of Extract taken.

Content of procyanidins—

Reagent solution A—Prepare a mixture of butanol and hydrochloric acid (95:5). [NOTE—Prepare this solution on the day of use.]

Reagent solution B—Dissolve 2 g of ferric ammonium sulfate in a mixture of 100 mL of water and 17.5 mL of hydrochloric acid. [NOTE—This solution can be used within 15 days of preparation.]

Test solution—Transfer about 0.125 g of Extract, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 1.0 mL of this solution to a 20-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Transfer 1.0 mL of the *Test solution* and 1.0 mL of methanol to two separate 10-mL vials. To each flask add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B*. Seal the vials with crimp caps. Mix, and heat in a water bath for 40 minutes. Quickly cool to room temperature in an ice bath. Quantitatively transfer these solutions, with the aid of *Reagent solution A*, to two separate10-mL volumetric flasks, dilute with *Reagent solution A* to volume, and mix. Determine the absorbance of the solution obtained from the *Test solution* at 546 nm, using the methanol-containing solution as the blank. Calculate the percentage of total procyanidins in the portion of Extract taken by the formula:

$$(2000A_U)/(36.7W),$$

in which A_U is the absorbance of the solution obtained from the *Test solution;* 36.7 is the absorptivity of the maritime pine procyanidins; and W is the weight, in g, of the Extract taken to prepare the *Test solution*.

Other requirements—It meets the requirements for *Heavy metals* under *Botanical Extracts* ⟨565⟩. ■2S (*NF21*)

In-Process Revision

BRIEFING

Nettle, page 105of *PF* 28(1) [Jan.–Feb. 2002]; **Powdered Nettle,** page 108 of *PF* 28(1) [Jan.–Feb. 2002]; **Powdered Nettle Extract,** page 109 of *PF* 28(1) [Jan.–Feb. 2002]. It is proposed to change the names of these monographs to Stinging Nettle, Powdered Stinging Nettle, and Powdered Stinging Nettle Extract, respectively. Although *Urica urens*, known in commerce as "dwarf nettle," may be present as a minor component of these articles, the predominant species is *Urtica dioica*. The proposed title change reflects the standard common name recognized in the American Herbal Products Association's *Herbs of Commerce* for the predominant species recognized in the monographs. Total amino acid is determined via a spectrophotometric procedure using glutamic and aspartic acids as reference standards. The gas chromatographic procedures used in the test for *Content of* β-*sitosterol* are based on analyses performed with the HP-1 brand of G2 column. Typical retention times for cholesterol and β-sitosterol are about 14 and 20 minutes, respectively. The gradient liquid chromatographic procedure used in the test for *Content of scopoletin* is based on analyses performed with the Kromasil C18 brand of L1 column. Typical retention times for scopoletin, cholesterol, and β-sitosterol are 12, 14, and 20 minutes, respectively.

(DSB: G. Giancaspro; NL: W. L. Paul) RTS—39963-1

Add the following:

■~~Nettle Nettles~~ Stinging Nettle

» ~~Nettle Nettles~~ Stinging Nettle consists of dried roots and rhizomes of *Urtica dioica* ~~(Linné)~~ L. ssp dioica. (Fam. Urticaceae), ~~known in commerce as stinging nettle,~~ and may contain *Urtica urens* ~~(Linné),~~ L., known in commerce as dwarf nettle, ~~their hybrids, or mixtures of them~~ as a minor component. It contains not less than 0.8 percent of total amino acids, not less than 0.05 percent of β-sitosterol ($C_{29}H_{50}O$), and not less than 3 µg per g of scopoletin ($C_{10}H_8O_4$), calculated on the dried basis.

Packaging and storage—~~Store~~ Preserve in tight containers, protected from light. ~~moisture, and excessive heat.~~ Store at controlled room temperature.

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Aspartic Acid RS. USP Glutamic Acid RS. USP Scopoletin RS. USP* β-*Sitosterol RS.*

Botanic characteristics—

Macroscopic—The rhizome is irregularly bent, about 3 to 10 mm thick, and light gray-brown on the outside; thin roots spring from the knotty bulges of a lengthwise furrow. A transverse cut of the rhizome shows it is fibrous, light yellowish white, and usually has a small medulla cave. The roots are often very long, usually 0.5 to 2 mm thick, light yellow-brown on the outside, and contain some deep longitudinal furrows; a transverse cut shows a pale and almost pure-white color.

Histology—The transverse section of the rhizome and root shows the following characteristics. The rhizome has a narrow cork composed of brown, thin-walled cells, a few rows of tangentially elongated cortical parenchyma, and a pericyclic region with numerous fibers occurring singly or, more frequently, in small groups. Fibers are much elongated with very thick and lignified walls. Some cells of the pericycle and outer part of secondary phloem contain large globular compound crystals of calcium oxalate. The vascular cambial region is distinct and continuous with narrow radial groups of vascular tissue separated by wide medullary rays. The secondary phloem is mainly parenchymatous with groups of thin-walled sieve tissue. The xylem is dense and completely lignified, containing scattered vessels, isolated or in small groups, associated with moderately thickened xylem parenchyma cells and numerous thicker-walled xylem fibers with slit-shaped pits. Individual vessels have fairly large, closely arranged, bordered pits, while the adjacent parenchyma has simple

or bordered pits. Medullary rays indicate alternating areas of lignified and unlignified cells, appearing as tangential bands between the vascular bundles, each composed of five or six layers of cells; the lignified cells have moderately thickened walls with simple pits. The pith is composed of rounded, unlignified parenchyma, collapsed in the central part to form a cavity. Mature roots show a thin cork, narrow phelloderm, and secondary phloem and xylem with alternating areas of lignified and unlignified parenchyma in the wide medullary rays, similar to that found in the rhizome.

Identification, *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture.

Test solution—Extract 1 g of powder by refluxing with 10 mL of a solution containing toluene, ethyl acetate, and methanol (7:2:1) for 15 minutes, cool, and filter. Evaporate the filtrate to dryness under reduced pressure at less than 40°, and dissolve the residue in 2 mL of the toluene, ethyl acetate, methanol solution.

Standard solution—Dissolve an accurately weighed quantity of USP Scopoletin RS and USP β-Sitosterol RS in methanol to obtain a solution having a known concentration of 0.05 and 0.5 mg per mL, respectively.

Application volume: 20 µL for the *Test solution;* 10 µL for the *Standard solution*.

Developing solvent system: diethyl ether and methanol (9:1).

Procedure—Proceed as directed in the chapter. Examine the plates under UV light at 365 nm. Spray the plate with about 10 mL of a mixture of water, 85% phosphoric acid, and 10% vanillin in 96% ethanol (4.5:4.5:1); heat between 100° and 105° for 10 minutes; and examine under daylight. The chromatogram of the *Test solution* exhibits a violet-red zone corresponding to the β-sitosterol peak at the same R_F value as the β-sitosterol peak in the chromatogram of the *Standard solution*. Weakly violet-red zones above and below β-sitosterol, corresponding to β-sitosterol-glucoside, are visible.

Microbial limits ⟨2021⟩—The total aerobic microbial count does not exceed ~~10^7~~ 10^6 cfu per g, the total combined molds and yeasts count does not exceed ~~10^5~~ 10^4 cfu per g, ~~the coliform count does not exceed 10^4 cfu per g,~~ and the ~~enterobacterial~~ bile-tolerant Gram-negative bacteria count does not exceed ~~10^4~~ 10^3 cfu per g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*~~and *Staphylococcus aureus.*~~

Loss on drying ⟨731⟩—Dry 1.0 g of ~~Nettle Nettles~~ Stinging Nettle, finely powdered, at 105° for 2 hours: it loses not more than 12.0% of its weight.

Foreign organic matter ⟨561⟩: not more than 2.0%.

Total ash ⟨561⟩: not more than 10%.

Pesticide residues ⟨561⟩: meets the requirements.

Content of total amino acids—

pH 5.5 Acetate buffer—Mix 5.40 g of anhydrous sodium acetate, 0.3 mL of glacial acetic acid, and water to a final volume of 100 mL.

Reagent solution—Prepare a solution containing about 1.00 g of ninhydrin, 1.50 g of hydrindantin, and 37.5 mL of propylene glycol, and adjust with *pH 5.5 Acetate buffer* to 50.0 mL. [NOTE—Prepare the *Reagent solution* daily.]

Standard solution—Dissolve accurately weighed quantities of USP Glutamic Acid RS and USP Aspartic Acid RS in water to obtain a solution having a known concentration of about 0.1 mg of each per mL.

Test solution—Finely powder an amount of ~~Nettle Nettles~~ Stinging Nettle, and transfer about 1.0 g, accurately weighed, to 80 mL of water. Place in an ultrasonic bath

In-Process Revision

for 25 minutes, and centrifuge. Transfer the supernatant to a 100-mL volumetric flask, dilute with water to volume, and filter.

Procedure—Transfer 5.0 mL of the *Test solution* and 1.0 mL of the *Standard solution* to two separate, appropriately labeled, 50-mL volumetric flasks. Add 4.0 mL of water to the *Standard solution* and 5.0 mL of *Reagent solution* to both the *Test solution* and the *Standard solution*. Heat in a boiling water bath for 30 minutes, cool, and adjust with a mixture of ethanol and water (1:1) to volume. Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* in 1-cm cells at the wavelength of maximum absorbance at about 570 nm with a suitable spectrophotometer. Prepare a blank using 5.0 mL of water, and treat similarly to the *Test solution*. Calculate the percentageof total amino acids in the portion of ~~Nettle Nettles~~ Stinging Nettle taken by the formula:

$$2000(A_U / A_S)(W_S / W_U),$$

in which A_U and A_S are the absorbances of the *Test solution* and the *Standard solution*, respectively; W_S is the sum of the weights, in mg, of USP Glutamic Acid RS and USP Aspartic Acid RS, calculated on the dried basis, in the *Standard solution;* and W_U is the weight, in mg, of dried ~~Nettle Nettles~~ Stinging Nettle in the *Test solution:* not less than 0.8% of total amino acids is found.

Content of β-sitosterol—

Derivatizing reagent—Prepare a solution containing equal volumes (1:1:1) of BSTFA [*N*,*O*-bis(trimethylsilyl)trifluoroacetamide], anhydrous pyridine, and a mixture of BSA [*N*,*O*-(trimethylsilyl)acetamide], TMSI (*N*-trimethylsilyimidazole), and TMCS (trimethylchlorosilane) (3:3:2).

Internal standard solution—Dissolve an accurately weighed quantity of cholesterol in chloroform to obtain a solution having a known concentration of about 10 mg per mL.

Standard solution—Dissolve 50 mg of USP β-Sitosterol RS, accurately weighed, in 2.0 mL of chloroform, add 1 mL of *Internal standard solution*, and dilute with chloroform to 5 mL. Transfer 0.5 mL of this solution to a 10-mL round-bottomed flask, dry the solvent under reduced pressure, add 1 mL of *Derivatizing reagent*, and mix.

Test solution—Finely powder an amount of ~~Nettle Nettles~~ Stinging Nettle, transfer 50.0 g to a Soxhlet apparatus, treat with chloroform, and extract for 6 hours. The volume of chloroform used is at least twice the volume of the thimble with an appropriate-size flask. Dry the solvent under reduced pressure, add 1.0 mL of *Internal standard solution*, and dilute with chloroform to 10 mL. Transfer 0.5 mL of this solution to a 10-mL round-bottomed flask, dry the solvent under reduced pressure, and add 0.5 mL of *Derivatizing reagent*.

Chromatographic system (see *Chromatography*⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.20-mm × 25-m fused-silica capillary column coated with a 0.35-µm film of phase G2. The carrier gas is helium, flowing at a rate of about 0.5 mL per minute. The injection port and detector temperatures are maintained at 325°. The column temperature is initially held at 300°, and maintained at this temperature for 60 minutes. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor for each sterol peak is not more than 2.0; and the relative standard deviation for replicate injections determined from each sterol peak is not more than 5.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses of the sterols. Calculate the percentage of β-sitosterol in the portion of ~~Nettle Nettles~~ Stinging Nettle taken by the formula:

$$100(R_U/R_S)(C_S/C_U),$$

in which R_U and R_S are the peak response ratios of β-sitosterol to the internal standard obtained from the *Standard solution* and the *Test solution*, respectively; C_S is the concentration, in mg per mL, of USP β-Sitosterol RS in the *Standard solution;* and C_U is the concentration, in mg per mL, of ~~Nettle Nettles~~ Stinging Nettle in the *Test solution:* not less than 0.05% of β-sitosterol is found.

Content of scopoletin—

Solution A—Use water.

Solution B—Use methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Scopoletin RS in methanol to obtain a solution having a known concentration of about 0.02 µg per mL.

Test solution—Finely powder an amount of ~~Nettle Nettles~~ Stinging Nettle, and mix 4.000 g, accurately weighed, with 25 mL of methanol. Place in an ultrasonic bath for 25 minutes, and centrifuge. Transfer 0.5 mL of the solution to a 10-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a fluorescence detector set at an excitation wavelength of 366 nm and an emission wavelength of 420 nm and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	75	25	equilibration
0–2	75→60	25→40	linear gradient
2–8	60	40	isocratic
8–10	60→0	40→100	linear gradient
10–15	0	100	isocratic
15–20	0→75	100→25	linear gradient
20–30	75	25	isocratic

Chromatograph about 10 µL of the *Standard solution*, and record the peak responses as directed for *Procedure:* the capacity factor (k') determined from the scopoletin peak is not less than 5; the tailing factor for the scopoletin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for scopoletin. Calculate the content of scopoletin ($C_{10}H_8O_4$), in µg per g, in the portion of ~~Nettle Nettles~~ Stinging Nettle taken by the formula:

$$10{,}000(r_U/r_S)(C_S/C_U),$$

in which r_U and r_S are the peak responses of scopoletin in the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of USP Scopoletin RS in the *Standard solution;* and C_U is the concentration, in mg per mL, of ~~Nettle Nettles~~ Stinging Nettle in the *Test solution:* not less than 3 µg per g of scopoletin is found. ■1S (*USP27*)

In-Process Revision

BRIEFING

Powdered Nettle, page 108 of *PF* 28(1) [Jan.–Feb. 2002]—See briefing under *Nettle.*

(DSB: G. Giancaspro) RTS—39963-2

Add the following:

■Powdered ~~Nettle Nettles~~ Stinging Nettle

» Powdered ~~Nettle Nettles~~ Stinging Nettle is ~~Nettle Nettles~~ Stinging Nettle reduced to a fine or very fine powder.

Packaging and storage—Store in tight containers, protected from light and ~~moisture~~ excessive heat.

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Aspartic Acid RS*. *USP Glutamic Acid RS*. *USP Scopoletin RS*. *USP* β-*Sitosterol RS*.

Botanic characteristics—[NOTE—The test is carried out under a microscope using chloral hydrate solution.] The powder is yellowish to brownish gray, and shows several fragments of net and dot vessels with a strongly varying diameter, usually between 50 and 150 µm. Few, if any, dotted bast fibers are present. Clearly dotted wood fibers, about 200 to 800 µm in length, thin-walled parenchyma cells, sometimes with calcium oxalate glands and occasionally with single crystals and fragments of cork consisting of flat-shaped, thin-walled cells are also present.

Other requirements—It meets the requirements of the tests for *Identification*, *Microbial limits*, *Foreign organic matter*, *Total ash*, *Pesticide residues*, *Content of total amino acids, Content of* β-*sitosterol*, and *Content of scopoletin* under ~~*Nettle Nettles*~~ *Stinging Nettle.* ■1S (*USP27*)

BRIEFING

Powdered Nettle Extract, page 109 of *PF* 28(1) [Jan.–Feb. 2002]—See briefing under *Nettle*.

(DSB: G. Giancaspro) RTS—39963-3

Add the following:

■Powdered ~~Nettle Nettles~~ Stinging Nettle Extract

» Powdered ~~Nettle Nettles~~ Stinging Nettle Extract is prepared from comminuted Stinging Nettle with 60 percent alcohol or other suitable solvents. It contains not less than 5.0 percent of total amino acids, not less than 0.1 percent of β-sitosterol ($C_{29}H_{50}O$) and not less than 30 µg per g of scopoletin ($C_{10}H_8O_4$). The ratio of the starting crude plant material to Powdered Extract is 10:1.

Packaging and storage—Store in tight containers, protected from light ~~and moisture~~ at controlled room temperature.

Labeling—The label states the official name of the article, the Latin binomial, and, following the official name, the part of the plant from which the article was prepared. Label it to

indicate the content of total amino acids, β-sitosterol, scopoletin, the extracting solvent used for preparation, and the ratio of the starting crude plant material to Powdered Extract.

USP Reference standards ⟨11⟩—*USP Aspartic Acid RS*. *USP Glutamic Acid RS*. *USP Scopoletin RS*. *USP* β-*Sitosterol RS*.

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent, *Standard solution*, *Application volume*, *Developing solvent system*, and *Procedure*—Proceed as directed for the test for *Identification* under ~~*Nettle Nettles.*~~ *Stinging Nettle.*

Test solution—Dissolve 0.6 g of Powdered Extract, accurately weighed, in a mixture of toluene, ethyl acetate, and methanol (7:2:1), filter, and dry under reduced pressure at a temperature below 40°. Dissolve the residue in 2.0 mL of the toluene, ethyl acetate, and methanol mixture.

B: The retention time of β-sitosterol in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Content of* β-*sitosterol*.

C: The retention time of scopoletin in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Content of scopoletin.*

Microbial limits ⟨2021⟩—The total aerobic microbial count does not exceed ~~10^4~~ 10^3 cfu per g, the total combined molds and yeasts count does not exceed ~~10^2~~ 10^2 cfu per g. ~~the coliform count does not exceed 10^2 cfu,~~ It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. ~~*Staphylococcus aureus.*~~

Loss on drying ⟨731⟩—Dry about 1.0 g of Powdered Extract, accurately weighed, at 105° for 2 hours: it loses not more than 8.0% of its weight.

Total ash ⟨561⟩: not more than 20.0%.

Pesticide residues ⟨561⟩: meets the requirements.

Organic volatile impurities, *Method I* ⟨467⟩: meets the requirements.

Alcohol content, *Method II* ⟨611⟩ (*if present*): not more than 1.0%.

Content of total amino acids—

pH 5.5 Acetate buffer, *Reagent solution*, and *Standard solution*—Proceed as directed for *Content of total amino acids* under ~~*Nettle Nettles*~~ *Stinging Nettle.*

Test solution—Dissolve 50 mg of Powdered Extract, accurately weighed, in 80 mL of water, shake for 10 minutes, dilute with water to 100 mL, and filter.

Procedure—Proceed as directed for *Content of total amino acids* under ~~*Nettle Nettles*~~ *Stinging Nettle,* except to calculate the percentage of total amino acids taken by the formula:

$$2000(A_U/A_S)(W_S/W_U),$$

in which W_U is the weight, in mg, of the Powdered Extract in the *Test solution;* and the other terms are as defined therein: not less than 5.0% of total amino acids is found.

Content of β-sitosterol—

Derivatizing reagent, *Internal standard solution*, *Standard solution*, and *Chromatographic system*—Proceed as directed for *Content of* β-*sitosterol* under ~~Nettle Nettles~~ *Stinging Nettle.*

Test solution—Transfer 20.0 g of Powdered Extract, accurately weighed, to a Soxhlet apparatus, treat with chloroform, and extract for 6 hours. The volume of chloroform used is at least twice the volume of the thimble with an appropriate-size flask. Dry the solvent under reduced pressure, add 1.0 mL of *Internal standard solution*, and dilute with

In-Process Revision

chloroform to 10 mL. Transfer 0.5 mL of this solution to a 10-mL round-bottomed flask, dry the solvent under reduced pressure, and add 0.5 mL of *Derivatizing reagent*.

Procedure—Proceed as directed for *Content of* β*-sitosterol* under ~~Nettle Nettles~~ *Stinging Nettle*, except to calculate the percentage of β-sitosterol in the portion of Powdered Extract taken by the formula:

$$100(R_U / R_S)(C_S / C_U),$$

in which C_U is the concentration, in mg per mL, of Powdered Extract in the *Test solution;* and the other terms are as defined therein: not less than 0.1% of β-sitosterol is found.

Content of scopoletin—

Solution A, *Solution B*, *Mobile phase*, *Standard solution*, and *Chromatographic system*—Proceed as directed for *Content of scopoletin* under ~~Nettle Nettles~~ *Stinging Nettle.*

Test solution—Dissolve 200 mg of Powdered Extract, accurately weighed, in 25 mL of methanol, place in an ultrasonic bath for 25 minutes, and centrifuge. Transfer 0.5 mL of this solution to a 10-mL volumetric flask, and dilute with methanol to volume.

Procedure—Proceed as directed for *Content of scopoletin* under ~~Nettle Nettles~~ *Stinging Nettle,* except to calculate the content of scopoletin ($C_{10}H_8O_4$) in the portion of Powdered Extract taken by the formula:

$$10{,}000(r_U / r_S)(C_S / C_U),$$

in which C_U is the concentration, in mg per mL of Powdered Extract in the *Test solution;* and the other terms are as defined therein: not less than 30 µg per g of scopoletin is found.■1S (*USP27*)

BRIEFING

Saw Palmetto Capsules, page 3025 of the *First Supplement.* It is proposed to revise the Definition to reflect the same ratio of lauric acid to caprylic acid presented in the monograph for *Saw Palmetto Extract*.

(DSB: G. Giancaspro) RTS—39827-1

Change to read:

» Saw Palmetto Capsules contain Saw Palmetto Extract. Capsules contain not less than 22.0 percent of lauric acid and not more than 34.0 percent of the labeled amount of Saw Palmetto Extract. The ratio of the concentrations of lauric acid to caprylic acid is not less than ~~10~~

■8.5■1S (*USP27*)

and not more than 17.5. The ratio of the concentrations of lauric acid to myristic acid is not less than 2.2 and not more than 2.8.

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

Allopurinol—See PF Vol. 28 No. 5, page 1387.
Allopurinol Tablets—See PF Vol. 29 No. 3, page 604.
Allyl Isothiocyanate—See PF Vol. 27 No. 3, page 2509.
Alprazolam—See PF Vol. 27 No. 3, page 2509.
Alprazolam Tablets—See PF Vol. 27 No. 3, page 2509.
Alprostadil—See PF Vol. 29 No. 2, page 392.
Alprostadil Injection—See PF Vol. 28 No. 5, page 1389.
Altretamine—See PF Vol. 27 No. 3, page 2514.
Altretamine Capsules—See PF Vol. 27 No. 3, page 2514.
Potassium Alum—See PF Vol. 27 No. 3, page 2515.
Alumina and Magnesia Oral Suspension—See PF Vol. 27 No. 3, page 2515.
Alumina and Magnesia Tablets—See PF Vol. 27 No. 3, page 2515.
Alumina, Magnesia, and Calcium Carbonate Oral Suspension—See PF Vol. 27 No. 6, page 3241.
Alumina, Magnesia, and Calcium Carbonate Tablets—See PF Vol. 27 No. 3, page 2515.
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—See PF Vol. 27 No. 6, page 3241.
Amiloride Hydrochloride and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 605.
Amoxicillin Tablets—See PF Vol. 29 No. 1, page 48.
Amoxicillin and Clavulanate Potassium for Oral Suspension—See PF Vol. 29 No. 3, page 605.
Amoxicillin and Clavulanate Potassium Tablets—See PF Vol. 29 No. 3, page 605.
Amphetamine Sulfate—See PF Vol. 28 No. 3, page 744.
Ampicillin—See PF Vol. 28 No. 6, page 1766.
Ampicillin Capsules—See PF Vol. 28 No. 6, page 1766.

Ampicillin for Injectable Suspension—See PF Vol. 28 No. 6, page 1766.
Ampicillin Tablets—See PF Vol. 28 No. 6, page 1767.
Amprolium Oral Solution—See PF Vol. 29 No. 3, page 606.
L-Asparagine—See PF Vol. 29 No. 3, page 687.
Aspartic Acid—See PF Vol. 28 No. 5, page 1391.
Aspirin and Codeine Phosphate Tablets—See PF Vol. 29 No. 3, page 606.
Astemizole Tablets—See PF Vol. 28 No. 3, page 745.
Atenolol Tablets—See PF Vol. 29 No. 1, page 49.
Atenolol and Chlorthalidone Tablets—See PF Vol. 29 No. 3, page 606.
Atovaquone Oral Suspension—See PF Vol. 29 No. 1, page 49.
Azithromycin—See PF Vol. 29 No. 1, page 50.
Azithromycin Capsules—See PF Vol. 27 No. 6, page 3394.
Barium Sulfate Paste—See PF Vol. 25 No. 4, page 8479.
Benazepril Hydrochloride—See PF Vol. 28 No. 6, page 1768.
Benazepril Hydrochloride Tablets—See PF Vol. 29 No. 3, page 606.
Benzethonium Chloride Concentrate—See PF Vol. 29 No. 3, page 608.
Benztropine Mesylate Tablets—See PF Vol. 28 No. 5, page 1392.
Betahistine Hydrochloride—See PF Vol. 26 No. 5, page 1401.
Betamethasone—See PF Vol. 28 No. 6, page 1772.
Betamethasone Cream—See PF Vol. 28 No. 6, page 1773.
Betamethasone Acetate—See PF Vol. 28 No. 6, page 1773.
Bethanechol Chloride—See PF Vol. 29 No. 1, page 52.
Bethanechol Chloride Tablets—See PF Vol. 29 No. 1, page 54.
Bismuth Subsalicylate Oral Suspension—See PF Vol. 28 No. 2, page 627.
Bismuth Subsalicylate Tablets—See PF Vol. 28 No. 5, page 1603.
Bisoprolol Fumarate—See PF Vol. 29 No. 3, page 609.
Bisoprolol Fumarate Tablets—See PF Vol. 29 No. 3, page 610.
Bisoprolol Fumarate and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 612.
Brinzolamide Ophthalmic Suspension—See PF Vol. 28 No. 6, page 1774.
Bromodiphenhydramine Hydrochloride and Codeine Phosphate Syrup—See PF Vol. 27 No. 5, page 2980.
Bromodiphenhydramine Hydrochloride Elixir—See PF Vol. 28 No. 6, page 1776.
Bromodiphenhydramine Hydrochloride Oral Solution—See PF Vol. 28 No. 6, page 1777.
Butalbital, Acetaminophen, and Caffeine Tablets—See PF Vol. 29 No. 3, page 615.
Calcium Carbonate Lozenges—See PF Vol. 28 No. 6, page 1778.
Calcium Carbonate Tablets—See PF Vol. 28 No. 5, page 1392.
Dibasic Calcium Phosphate—See PF Vol. 22 No. 6, page 3029.
Anhydrous Dibasic Calcium Phosphate—See PF Vol. 22 No. 6, page 2011.
Carbidopa and Levodopa Tablets—See PF Vol. 29 No. 3, page 615.
Cefaclor Capsules—See PF Vol. 29 No. 1, page 56.
Cefazolin Ophthalmic Solution—See PF Vol. 28 No. 2, page 261.
Cefipime for Injection—See PF Vol. 28 No. 6, page 1778.
Cefixime—See PF Vol. 29 No. 3, page 616.
Ceftazidime for Injection—See PF Vol. 29 No. 3, page 617.
Cefuroxime Axetil for Oral Suspension—See PF Vol. 28 No. 6, page 1780.
Cephalexin Tablets for Oral Suspension—See PF Vol. 28 No. 6, page 1782.
Ciclopirox—See PF Vol. 29 No. 2, page 393.
Ciclopirox Olamine—See PF Vol. 29 No. 2, page 395.
Cimetidine Tablets—See PF Vol. 28 No. 1, page 52.
Clavulanate Potassium—See PF Vol. 29 No. 3, page 617.
Clindamycin Phosphate—See PF Vol. 29 No. 1, page 57.
Clindamycin Phosphate Topical Solution—See PF Vol. 28 No. 5, page 1393.
Clindamycin Phosphate Vaginal Inserts—See PF Vol. 29 No. 3, page 620.
Clonazepam Tablets—See PF Vol. 29 No. 3, page 621.
Clonidine—See PF Vol. 29 No. 1, page 58.
Clonidine Hydrochloride Injection—See PF Vol. 26 No. 2, page 351.
Clonidine Transdermal System—See PF Vol. 28 No. 2, page 265.
Clotrimazole Vaginal Inserts—See PF Vol. 29 No. 3, page 622.
Clotrimazole Vaginal Tablets—See PF Vol. 29 No. 3, page 623.
Clotrimazole and Betamethasone Dipropionate Cream—See PF Vol. 29 No. 3, page 623.
Clozapine—See PF Vol. 29 No. 3, page 623.
Cod Liver Oil Capsules—See PF Vol. 29 No. 3, page 623.
Corticotropin Injection—See PF Vol. 28 No. 6, page 1783.
Corticotropin for Injection—See PF Vol. 28 No. 6, page 1784.
Cyanocobalamin Co 57 Capsules—See PF Vol. 29 No. 2, page 397.
Cyanocobalamin Co 57 Oral Solution—See PF Vol. 29 No. 2, page 398.
Cyclandelate—See PF Vol. 26 No. 2, page 353.
Cyclosporine Capsules—See PF Vol. 27 No. 4, page 2721.
Demeclocycline Hydrochloride Capsules—See PF Vol. 29 No. 3, page 625.
Demeclocycline Hydrochloride Tablets—See PF Vol. 29 No. 3, page 625.
Desmopressin Acetate—See PF Vol. 24 No. 2, page 5773.
Desmopressin Injection—See PF Vol. 24 No. 2, page 5778.
Desmopressin Nasal Spray Solution—See PF Vol. 24 No. 2, page 5779.
Desogestrel—See PF Vol. 28 No. 6, page 1785.
Desogestrel and Ethinyl Estradiol Tablets—See PF Vol. 28 No. 5, page 1394.
Dexamethasone Injection—See PF Vol. 28 No. 5, page 1402.
Dextran 1—See PF Vol. 28 No. 6, page 1787.
Dextran 40—See PF Vol. 29 No. 2, page 399.
Dextran 70—See PF Vol. 29 No. 2, page 401.
Dextroamphetamine Sulfate—See PF Vol. 28 No. 3, page 751.
Diethylstilbestrol Diphosphate Tablets—See PF Vol. 23 No. 1, page 3385.
Digoxin Tablets—See PF Vol. 28 No. 1, page 55.
Dihydroergotamine Mesylate Nasal Solution—See PF Vol. 25 No. 6, page 9078.
Dimenhydrinate Injection—See PF Vol. 28 No. 3, page 752.
Dimenhydrinate Syrup—See PF Vol. 28 No. 3, page 755.
Dimenhydrinate Tablets—See PF Vol. 28 No. 3, page 756.
Dipryidamole Tablets—See PF Vol. 28 No. 5, page 1402.
Divalproex Sodium Delayed-Release Tablets—See PF Vol. 29 No. 3, page 625.
Dobutamine in Dextrose Injection—See PF Vol. 28 No. 5, page 1403.
Dolasetron Mesylate Injection—See PF Vol. 29 No. 1, page 60.
Doxazosin Mesylate—See PF Vol. 29 No. 1, page 61.
Doxazosin Tablets—See PF Vol. 29 No. 1, page 64.
Doxorubicin Hydrochloride—See PF Vol. 29 No. 1, page 66.
Egg Phospholipids—See PF Vol. 29 No. 2, page 401.
Ergoloid Mesylates Tablets—See PF Vol. 29 No. 3, page 626.
Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension—See PF Vol. 29 No. 3, page 626.
Estradiol Transdermal System—See PF Vol. 25 No. 6, page 9080.
Ethambutol Hydrochloride Tablets—See PF Vol. 28 No. 5, page 1406.
Ethosuximide Oral Solution—See PF Vol. 28 No. 5, page 1407.
Ethotoin—See PF Vol. 29 No. 1, page 66.
Ethylenediamine—See PF Vol. 28 No. 6, page 1789.
Etoposide—See PF Vol. 28 No. 5, page 1407.
Famotidine Tablets—See PF Vol. 29 No. 3, page 627.
Ferric Subsulfate Solution—See PF Vol. 28 No. 6, page 1789.
Ferric Sulfate—See PF Vol. 28 No. 6, page 1790.
Ferrous Fumarate—See PF Vol. 29 No. 3, page 629.
Ferrous Gluconate—See PF Vol. 29 No. 3, page 630.
Ferumoxides Injection—See PF Vol. 28 No. 3, page 758.
Fexofenadine Hydrochloride—See PF Vol. 28 No. 6, page 1790.
Fexofenadine Hydrochloride Capsules—See PF Vol. 28 No. 6, page 1793.

Finasteride Tablets—See PF Vol. 29 No. 2, page 403.
Flucytosine Capsules—See PF Vol. 29 No. 1, page 68.
Fludarabine Phosphate—See PF Vol. 28 No. 6, page 1795.
Fludarabine Phosphate for Injection—See PF Vol. 28 No. 6, page 1799.
Fluoxetine Hydrochloride—See PF Vol. 28 No. 6, page 1802.
Fluoxetine Tablets—See PF Vol. 28 No. 6, page 1803.
Fluoxetine Delayed-Release Capsules—See PF Vol. 29 No. 2, page 403.
Flutamide—See PF Vol. 29 No. 2, page 405.
Flutamide Capsules—See PF Vol. 29 No. 2, page 407.
Fluvastatin Capsules—See PF Vol. 25 No. 4, page 8423.
Folic Acid Tablets—See PF Vol. 29 No. 2, page 409.
Fosphenytoin Sodium Injection—See PF Vol. 29 No. 1, page 68.
Gabapentin—See PF Vol. 29 No. 1, page 72.
Gabapentin Capsules—See PF Vol. 28 No. 2, page 298.
Gadoversetamide—See PF Vol. 29 No. 2, page 410.
Gadoversetamide Injection—See PF Vol. 29 No. 2, page 415.
Ganciclovir—See PF Vol. 29 No. 3, page 630.
Ganciclovir for Injection—See PF Vol. 29 No. 3, page 630.
Gemcitabine Hydrochloride—See PF Vol. 27 No. 5, page 3141.
Gemcitabine for Injection—See PF Vol. 27 No. 5, page 3142.
Gemfibrozil—See PF Vol. 27 No. 6, page 3289.
Glipizide—See PF Vol. 29 No. 2, page 417.
Glyburide Tablets—See PF Vol. 29 No. 2, page 418.
Glycerin Injection—See PF Vol. 27 No. 5, page 3143.
Gonadorelin Hydrochloride—See PF Vol. 27 No. 3, page 2552.
Graftskin—See PF Vol. 28 No. 6, page 1804.
Heparin Sodium—See PF Vol. 29 No. 1, page 75.
0.1 Normal Hydrochloric Acid Intravenous Injection—See PF Vol. 27 No. 5, page 3144.
Hydrocodone Bitartrate—See PF Vol. 29 No. 3, page 630.
Hydrocodone Bitartrate and Acetaminophen Tablets—See PF Vol. 29 No. 3, page 633.
Hydrocodone Bitartate and Homatropine Methylbromide Tablets—See PF Vol. 28 No. 4, page 1267.
Ibuprofen Capsules—See PF Vol. 26 No. 2, page 360.
Indapamide Tablets—See PF Vol. 28 No. 5, page 1410.
Indinavir Sulfate—See PF Vol. 27 No. 2, page 2165.
Indinavir Sulfate Capsules—See PF Vol. 26 No. 6, page 1641.
Indium In 111 Ibritumomab Tiuxetan Injection—See PF Vol. 28 No. 6, page 1815.
Indocyanine Green—See PF Vol. 28 No. 3, page 765.
Indomethacin Topical Gel—See PF Vol. 24 No. 2, page 5808.
Inulin in Sodium Chloride Injection—See PF Vol. 28 No. 6, page 1817.
Iodixanol—See PF Vol. 29 No. 1, page 79.
Iodixanol Injection—See PF Vol. 29 No. 1, page 80.
Iodoform—See PF Vol. 28 No. 6, page 1817.
Irbesartan—See PF Vol. 24 No. 6, page 7156.
Irbesartan Tablets—See PF Vol. 24 No. 6, page 7157.
Irbesartan and Hydrochlorothiazide Tablets—See PF Vol. 24 No. 6, page 7158.
Isradipine Capsules—See PF Vol. 23 No. 4, page 4334.
Ivermectin—See PF Vol. 27 No. 1, page 1790.
Ketamine Hydrochloride—See PF Vol. 28 No. 5, page 1411.
Lactic Acid—See PF Vol. 28 No. 6, page 1817.
Lamivudine—See PF Vol. 29 No. 2, page 419.
Leuprolide Acetate—See PF Vol. 28 No. 5, page 1412.
Leuprolide Acetate Injection—See PF Vol. 25 No. 5, page 8722.
Levodopa Capsules—See PF Vol. 29 No. 3, page 633.
Levocarnitine—See PF Vol. 28 No. 1, page 71.
Levothyroxine Sodium Tablets—See PF Vol. 29 No. 3, page 634.
Lindane—See PF Vol. 29 No. 3, page 635.
Lindane Cream—See PF Vol. 29 No. 3, page 635.
Lindane Lotion—See PF Vol. 29 No. 3, page 635.
Lindane Shampoo—See PF Vol. 29 No. 3, page 636.
Lipid Injectable Emulsion—See PF Vol. 29 No. 2, page 421.
Loperamide Hydrochloride Oral Solution—See PF Vol. 28 No. 5, page 1418.
Loratadine—See PF Vol. 28 No. 5, page 1604.
Loratadine Tablets—See PF Vol. 28 No. 5, page 1608.
Loratadine Oral Solution—See PF Vol. 28 No. 5, page 1606.
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution—See PF Vol. 26 No. 4, page 1050.
Mangafodipir Trisodium Injection—See PF Vol. 28 No. 5, page 1419.
Manganese Gluconate—See PF Vol. 29 No. 3, page 636.
Mannitol—See PF Vol. 27 No. 5, page 3017.
Mannitol Injection—See PF Vol. 28 No. 1, page 73.
Mecamylamine Hydrochloride—See PF Vol. 28 No. 6, page 1817.
Mecamylamine Hydrochloride Tablets—See PF Vol. 28 No. 2, page 322.
Mechlorethamine Hydrochloride—See PF Vol. 29 No. 3, page 636.
Megestrol Acetate Oral Suspension—See PF Vol. 29 No. 1, page 80.
Melphalan Tablets—See PF Vol. 29 No. 3, page 637.
Mephobarbital Tablets—See PF Vol. 26 No. 1, page 178.
Mepivicaine Hydrochloride Injection—See PF Vol. 28 No. 6, page 1820.
Methadone Hydrochloride Tablets—See PF Vol. 28 No. 6, page 1820.
Methadone Hydrochloride Tablets for Oral Suspension—See PF Vol. 28 No. 6, page 1821.
Metronidazole Benzoate—See PF Vol. 25 No. 2, page 7747.
Mexiletine Hydrochloride Capsules—See PF Vol. 29 No. 3, page 638.
Miconazole Nitrate Cream—See PF Vol. 26 No. 5, page 1302.
Milrinone—See PF Vol. 27 No. 2, page 2175.
Minocycline Hydrochloride—See PF Vol. 28 No. 3, page 770.
Misoprostol—See PF Vol. 26 No. 5, page 1304.
Misoprostol Dispersion—See PF Vol. 28 No. 3, page 772.
Misoprostol Tablets—See PF Vol. 26 No. 5, page 1310.
Molindone Hydrochloride Tablets—See PF Vol. 24 No. 1, page 5461.
Morphine Sulfate Extended-Release Capsules—See PF Vol. 28 No. 6, page 1822.
Myrrh Topical Solution—See PF Vol. 28 No. 6, page 1825.
Nabumetone Tablets—See PF Vol. 29 No. 1, page 82.
Naltrexone Hydrochloride Tablets—See PF Vol. 29 No. 1, page 83.
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution—See PF Vol. 28 No. 6, page 1825.
Naratriptan Hydrochloride—See PF Vol. 29 No. 3, page 638.
Naratriptan Tablets—See PF Vol. 29 No. 1, page 84.
Nevirapine—See PF Vol. 28 No. 6, page 1832.
Nimodipine—See PF Vol. 22 No. 1, page 2041.
Ammonia N 13 Injection—See PF Vol. 29 No. 3, page 641.
Norgestimate—See PF Vol. 29 No. 2, page 423.
Norgestimate and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 1, page 87.
Nystatin—See PF Vol. 28 No. 4, page 1271.
Nystatin Cream—See PF Vol. 28 No. 1, page 134.
Nystatin Lozenges—See PF Vol. 28 No. 1, page 135.
Nystatin Ointment—See PF Vol. 28 No. 1, page 136.
Nystatin Topical Powder—See PF Vol. 28 No. 1, page 136.
Nystatin Oral Suspension—See PF Vol. 28 No. 1, page 136.
Nystatin Tablets—See PF Vol. 28 No. 1, page 137.
Nystatin Vaginal Inserts—See PF Vol. 29 No. 3, page 641.
Nystatin Vaginal Tablets—See PF Vol. 29 No. 3, page 642.
Nystatin and Triamcinolone Acetonide Cream—See PF Vol. 28 No. 1, page 137.
Nystatin and Triamcinolone Acetonide Ointment—See PF Vol. 28 No. 1, page 138.
Octinoxate—See PF Vol. 29 No. 3, page 642.
Octisalate (Formerly Octyl Salicylate)—See PF Vol. 28 No. 5, page 1420.
Omeprazole Delayed-Release Capsules—See PF Vol. 29 No. 2, page 424.
Ondansetron Hydrochloride—See PF Vol. 29 No. 1, page 92.
Ondansetron Injection—See PF Vol. 28 No. 6, page 1835.
Ondansetron Oral Solution—See PF Vol. 26 No. 1, page 34.

In-Process Revision

Ranitidine Oral Solution—See PF Vol. 28 No. 2, page 360.
Red Blood Cells—See PF Vol. 29 No. 2, page 431.
Rifampin and Isoniazid Capsules—See PF Vol. 28 No. 6, page 1862.
Rifampin, Isoniazid, and Pyrazinamide Tablets—See PF Vol. 28 No. 6, page 1865.
Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets—See PF Vol. 29 No. 1, page 112.
Rimantadine Hydrochloride—See PF Vol. 24 No. 2, page 5927.
Rimantadine Hydrochloride Tablets—See PF Vol. 24 No. 2, page 5929.
Saquinavir Capsules—See PF Vol. 27 No. 2, page 2197.
Scopolamine Hydrobromide—See PF Vol. 28 No. 6, page 1868.
Sevoflurane—See PF Vol. 27 No. 3, page 2577.
Shark Liver Oil—See PF Vol. 26 No. 6, page 1643.
Sildenafil Citrate—See PF Vol. 24 No. 6, page 7182.
Sildenafil Tablets—See PF Vol. 24 No. 6, page 7184.
Simvastatin Tablets—See PF Vol. 29 No. 2, page 437.
Sodium Bicarbonate—See PF Vol. 28 No. 5, page 1446.
Sodium Butyrate—See PF Vol. 28 No. 6, page 1868.
Sodium Chloride—See PF Vol. 20 No. 5, page 7991.
Somatropin—See PF Vol. 25 No. 4, page 8540.
Somatropin for Injection—See PF Vol. 25 No. 4, page 8551.
Sorbitol Solution—See PF Vol. 29 No. 1, page 114.
Sotalol Hydrochloride—See PF Vol. 29 No. 3, page 663.
Sotalol Hydrochloride Tablets—See PF Vol. 29 No. 3, page 666.
Spironolactone—See PF Vol. 29 No. 3, page 668.
Spironolactone Oral Suspension—See PF Vol. 24 No. 2, page 5813.
Spironolactone and Hydrochlorothiazide Oral Suspension—See PF Vol. 24 No. 2, page 5814.
Spironolactone and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 669.
Topical Starch—See PF Vol. 29 No. 3, page 669.
Sterile, Single-Use Plastic Large-Volume Containers for Human Blood and Blood Components—See PF Vol. 23 No. 5, page 4651.
Triple Sulfa Vaginal Inserts—See PF Vol. 29 No. 3, page 669.
Triple Sulfa Vaginal Tablets—See PF Vol. 29 No. 3, page 670.
Sulfadimethoxine—See PF Vol. 28 No. 6, page 1871.
Sulfadimethoxine Sodium—See PF Vol. 28 No. 6, page 1872.
Sulfamethoxazole and Trimethoprim Injection—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Oral Suspension—See PF Vol. 29 No. 3, page 670.
Sulfamethoxazole and Trimethoprim Tablets—See PF Vol. 29 No. 3, page 670.
Sulfasalazine Delayed-Release Tablets—See PF Vol. 29 No. 3, page 670.
Sumatriptan—See PF Vol. 29 No. 1, page 116.
Sumatriptan Nasal Spray—See PF Vol. 29 No. 1, page 119.
Sumatriptan Succinate—See PF Vol. 27 No. 5, page 3157.
Sutilains—See PF Vol. 27 No. 2, page 2199.
Sutilains Ointment—See PF Vol. 27 No. 2, page 2201.
Terazosin Hydrochloride—See PF Vol. 29 No. 1, page 121.
Terbutaline Sulfate Inhalation Aerosol—See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection—See PF Vol. 26 No. 3, page 756.
Theophylline Syrup—See PF Vol. 27 No. 1, page 1819.
Thiacetarsamide—See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection—See PF Vol. 29 No. 1, page 127.
Tiamulin Fumarate—See PF Vol. 28 No. 6, page 1872.
Tobramycin Inhalation Solution—See PF Vol. 29 No. 2, page 438.
Torsemide—See PF Vol. 28 No. 2, page 382.
Triamterene Capsules—See PF Vol. 29 No. 3, page 671.
Triamterene and Hydrochlorothiazide Capsules—See PF Vol. 29 No. 3, page 672.
Triamterene and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 3, page 672.
Trichlorfon—See PF Vol. 26 No. 6, page 1576.

Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 3, page 672.
Unithiol—See PF Vol. 25 No. 2, page 7752.
Urea C for Oral Solution—See PF Vol. 29 No. 2, page 441.
Urofollitropin—See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection—See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate—See PF Vol. 24 No. 3, page 6180.
Ursodiol—See PF Vol. 29 No. 1, page 128.
Valproic Acid—See PF Vol. 29 No. 3, page 673.
Valproic Acid Injection—See PF Vol. 26 No. 4, page 939.
Valsartan—See PF Vol. 29 No. 3, page 673.
Valsartan Capsules—See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 1, page 129.
Vecuronium Bromide—See PF Vol. 28 No. 6, page 1886.
Vecuronium Bromide for Injection—See PF Vol. 25 No. 4, page 8449.
Verteporfin—See PF Vol. 29 No. 2, page 442.
Verteporfin for Injection—See PF Vol. 29 No. 3, page 677.
Vitamin E—See PF Vol. 27 No. 5, page 3159.
Vitamin E Capsules—See PF Vol. 28 No. 6, page 1889.
Water for Injection—See PF Vol. 29 No. 3, page 679.
Purified Water—See PF Vol. 29 No. 3, page 680.
Water for Hemodialysis—See PF Vol. 29 No. 3, page 680.
Whole Blood—See PF Vol. 29 No. 2, page 445.
Yttrium 90 Ibritumomab Tiuxetan Injection—See PF Vol. 29 No. 3, page 681.
Zileuton—See PF Vol. 29 No. 2, page 447.
Zinc Gluconate—See PF Vol. 29 No. 3, page 683.

EXCIPIENTS

Excipients, USP and NF Excipients, Listed by Category—See PF Vol. 21 No. 5, page 1258; PF Vol. 25 No. 5, page 8887; PF Vol. 28 No. 4, page 1206 and 1273; PF Vol. 28 No. 3, page 796; PF Vol. 28 No. 6, page 1891; PF Vol. 29 No. 1, page 135; PF Vol. 29 No. 2, page 450; PF Vol. 29 No. 3, page 684.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨1⟩ Injections—See PF Vol. 29 No. 3, page 707.
⟨11⟩ USP Reference Standards—See PF Vol. 22 No. 6, page 3212; PF Vol. 23 No. 4, page 4500; PF Vol. 23 No. 6, page 5180; PF Vol. 24 No. 5, page 6925; PF Vol. 25 No. 3, page 8222; PF Vol. 25 No. 4, page 8561; PF Vol. 25 No. 5, page 8893; PF Vol. 25 No. 6, page 9222; PF Vol. 26 No. 1, page 218; PF Vol. 26 No. 2, page 471; PF Vol. 26 No. 3, page 793; PF Vol. 26 No. 4, page 1101; PF Vol. 26 No. 5, page 1369; PF Vol. 26 No. 6, page 1606; PF Vol. 27 No. 1, page 1832; PF Vol. 27 No. 2, page 2268; PF Vol. 27 No. 3, page 2594; PF Vol. 27 No. 4, page 2806; PF Vol. 27 No. 5, page 3071; PF Vol. 27 No. 6, page 3348; PF Vol. 28 No. 1, page 111; PF Vol. 28 No. 2, page 433, PF Vol. 28 No. 3, page 839, PF Vol. 28 No. 4, page 1224, PF Vol. 28 No. 5, page 1468; PF Vol. 28 No. 6, page 1913; PF Vol. 29 No. 1, page 163; PF Vol. 29 No. 2, page 483; PF Vol. 29 No. 3, page 710.

Apparatus for Tests and Assays

⟨41⟩ Weights and Balances—See PF Vol. 26 No. 6, page 1607.

Microbiological Tests

⟨61⟩ Microbial Limit Tests—See PF Vol. 27 No. 2, page 2269.
⟨62⟩ Microbiological Procedures for Absence of Objectionable Microorganisms—See PF Vol. 27 No. 2, page 2269.

Chemical Tests and Assays

IDENTIFICATION TESTS

⟨197⟩ Spectrophotometric Identification Test—See PF Vol. 29 No. 3, page 711.

LIMIT TESTS

⟨231⟩ Heavy Metals—See PF Vol. 27 No. 3, page 2619.
⟨267⟩ Porosimetry by Mercury Intrusion—See PF Vol. 29 No. 3, page 712.
⟨281⟩ Residue on Ignition—See PF Vol. 28 No. 1, page 129; PF Vol. 28 No. 6, page 1915.

OTHER TESTS AND ASSAYS

⟨311⟩ Alginates Assay—See PF Vol. 26 No. 3, page 643.
⟨381⟩ Elastomeric Closures for Injections—See PF Vol. 29 No. 1, page 164.
⟨429⟩ Light Diffraction Measurement of Particle Size—See PF Vol. 29 No. 2, page 484.
⟨518⟩ Solution Calorimetry—See PF Vol. 28 No. 4, page 1299.
⟨581⟩ Vitamin D Assay—See PF Vol. 26 No. 4, page 1111.

Physical Tests and Determinations

⟨601⟩ Aerosols, Metered-Dose Inhjalers, and Dry Powder Inhalers—See PF Vol. 28 No. 5, page 1470.
⟨621⟩ Chromatography—See PF Vol. 29 No. 1, page 170.
⟨625⟩ Clarity and Degree of Opalescence of Liquids—See PF Vol. 26 No. 6, page 1616.
⟨627⟩ Degree of Color of Liquids—See PF Vol. 26 No. 6, page 1617.
⟨643⟩ Total Organic Carbon—See PF Vol. 28 No. 6, page 1921.
⟨661⟩ Containers—See PF Vol. 29 No. 2, page 490.
⟨696⟩ Crystallinity Determination by Solution Calorimetry—See PF Vol. 29 No. 1, page 175.
⟨699⟩ Density of Solids—See PF Vol. 28 No. 2, page 603.
⟨724⟩ Drug Release—See PF Vol. 29 No. 3, page 715.
⟨730⟩ Inductively Coupled Plasma (ICP)—See PF Vol. 28 No. 6, page 1922.
⟨788⟩ Particulate Matter in Injections—See PF Vol. 28 No. 6, page 1930.
⟨789⟩ Particulate Matter in Ophthalmic Solutions—See PF Vol. 28 No. 5, page 1496.
⟨795⟩ Pharmaceutical Compounding—Nonsterile Preparations—See PF Vol. 29 No. 1, page 179.
⟨811⟩ Powder Fineness—See PF Vol. 28 No. 2, page 611.
⟨823⟩ Radiopharmaceuticals for Positron Emission Tomography—Compounding—See PF Vol. 29 No. 2, page 494.
⟨846⟩ Specific Surface Area—See PF Vol. 28 No. 2, page 612.
⟨851⟩ Spectrophotometry and Light-Scattering—See PF Vol. 29 No. 3, page 722.
⟨905⟩ Uniformity of Dosage Units—See PF Vol. 28 No. 5, page 1498.
⟨941⟩ X-Ray Diffraction—See PF Vol. 28 No. 5, page 1500.

General Information

⟨1010⟩ Analytical Data—Interpretation and Treatment—See PF Vol. 29 No. 1, page 187.
⟨1047⟩ Biotechnology-Derived Articles—Tests—See PF Vol. 27 No. 2, page 2277.
⟨1051⟩ Cleaning Glass Apparatus—See PF Vol. 28 No. 5, page 1503.
⟨1072⟩ Disinfectants and Antiseptics—See PF Vol. 29 No. 3, page 726.
⟨1075⟩ Good Compounding Practices—See PF Vol. 29 No. 2, page 497.
⟨1078⟩ Good Manufacturing Practices for Bulk Pharmaceutical Excipients—See PF Vol. 28 No. 5, page 1504.

⟨1080⟩ Bulk Pharmaceutical Excipients—Certificate of Analysis—See PF Vol. 28 No. 5, page 1650.
⟨1089⟩ In Vitro, Absorption-Indicating Cell Culture System—See PF Vol. 25 No. 5, page 8733.
⟨1111⟩ Microbiological Attributes of Nonsterile Pharmaceutical Products—See PF Vol. 25 No. 2, page 7785.
⟨1116⟩ Microbiological Evaluation of Clean Rooms and Other Controlled Environments—See PF Vol. 25 No. 3, page 8264.
⟨1118⟩ Monitoring Devices—Time, Temperature, and Humidity—See PF Vol. 29 No. 1, page 206.
⟨1119⟩ Near Infrared Spectrophotometry—See PF Vol. 29 No. 3, page 735.
⟨1136⟩ Packaging—Unit of Use—See PF Vol. 28 No. 4, page 1302.
⟨1141⟩ Packaging, Storage, and Distribution of Pharmacopeial Articles—See PF Vol. 26 No. 2, page 493.
⟨1151⟩ Pharmaceutical Dosage Forms—See PF Vol. 26 No. 2, page 499.
⟨1160⟩ Pharmaceutical Calculations in Prescription Compounding—See PF Vol. 29 No. 1, page 224.
⟨1172⟩ Photostability Testing—See PF Vol. 26 No. 2, page 384.
⟨1174⟩ Powder Flow—See PF Vol. 28 No. 2, page 618.
⟨1175⟩ Preformulation Guidelines—See PF Vol. 26 No. 6, page 1672.
⟨1191⟩ Stability Consideration in Dispensing Practice—See PF Vol. 28 No. 1, page 112.
⟨1195⟩ Significant Change Guide for Bulk Pharmaceutical Excipients—See PF Vol. 28 No. 5, page 1662.
⟨1198⟩ Standardized Imprint Codes for Solid Oral Dosage Forms—See PF Vol. 28 No. 1, page 152.
⟨1206⟩ Sterile Drug Products for Home Use—See PF Vol. 29 No. 3, page 750.
⟨1209⟩ Sterilization—Chemical and Physicochemical Indicators and Integrators—See PF Vol. 29 No. 1, page 243.
⟨1216⟩ Tablet Friability—See PF Vol. 25 No. 1, page 7466.
⟨1222⟩ Terminally Sterilized Pharmaceutical Products—Parametric Release—See PF Vol. 29 No. 1, page 247.
⟨1223⟩ Validation of Alternative Microbiological Methods—See PF Vol. 29 No. 1, page 256.
⟨1230⟩ Water for Health Applications—See PF Vol. 29 No. 3, page 810.
⟨1265⟩ Written Prescription Drug Information—Guidelines—See PF Vol. 28 No. 5, page 1539.

Dietary Supplements

⟨2021⟩ Microbial Limit Tests—Nutritional Supplements—See PF Vol. 29 No. 1, page 268.
⟨2022⟩ Microbiological Procedures for Absence of Objectionable Microorganisms in Nutritional and Dietary Articles—See PF Vol. 29 No. 1, page 287.
⟨2023⟩ Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements—See PF Vol. 29 No. 1, page 296.
⟨2040⟩ Disintegration and Dissolution of Nutritional Supplements—See PF Vol. 29 No. 2, page 513.
⟨2091⟩ Uniformity of Dietary Supplement Intake Units—See PF Vol. 28 No. 5, page 1549.
⟨2750⟩ Manufacturing Practices for Nutritional Supplements—See PF Vol. 28 No. 2, page 534.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

2-Acetamidophenol—See PF Vol. 25 No. 6, page 9107.
Agarose—See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard—See PF Vol. 28 No. 4, page 1234.
Ammonium Pyrrolidinedithiocarbamate—See PF Vol. 27 No. 5, page 3115.
Anti-A Blood Grouping Reagent, Anti-B Blood Grouping Reagent, and Anti-A,B Blood Grouping Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D (Rh_o) Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D Reagent—See PF Vol. 29 No. 2, page 506.
Antihuman Globulin Reagent—See PF Vol. 29 No. 2, page 506.
Antithrombin III for Amidolytic Test—See PF Vol. 29 No. 1, page 264.
Bacterial Alkaline Protease Preparation—See PF Vol. 28 No. 2, page 552.
Barbituric Acid—See PF Vol. 29 No. 1, page 265.
Benzil—See PF Vol. 28 No. 4, page 1305.
Blood Group A_1 and Blood Group B Red Blood Cells—See PF Vol. 29 No. 2, page 506.
Bromelain—See PF Vol. 28 No. 2, page 552.
Bromobimane—See PF Vol 25 No. 2, page 7804.
Branched Polymeric Sucrose—See PF Vol. 27 No. 6, page 3363.
1,4-Butanediol—See PF Vol 25 No. 5, page 8747.
Butyrolactone—See PF Vol. 22 No. 6, page 3248.
dl-Camphene—See PF Vol. 28 No. 6, page 1951.
Capric Acid—See PF Vol 25 No. 5, page 8749.
Cesium Chloride—See PF Vol. 28 No. 3, page 849.
0.5 M Copper Sulfate Solution—See PF Vol. 26 No. 5, page 1382.
Cyclohexylmethanol—See PF Vol. 28 No. 3, page 849.
DEAE-Agarose—See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase—See PF Vol. 27 No. 6, page 3365.
Deoxythymidine Triphosphate—See PF Vol. 27 No. 6, page 3365.
Dibutylammonium Phosphate—See PF Vol. 26 No. 4, page 1132.
Dicyclohexyl—See PF Vol. 28 No. 3, page 849.
Dicyclohexyl Phthalate—See PF Vol. 26 No. 2, page 504.
Diethylpyrocarbonate—See PF Vol. 27 No. 6, page 3365.
Diisobutylene—See PF Vol. 28 No. 4, page 1305.
N,N-Dimethyldodecylamine-N-oxide—See PF Vol. 27 No. 4, page 2837.
2,5-Dimethylphenol—See PF Vol. 27 No. 6, page 3364.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bromide—See PF Vol. 27 No. 6, page 3365.
Dioleoylglycerol—See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol—See PF Vol. 28 No. 3, page 849.
Disodium Arsenate—See PF Vol. 28 No. 4, page 1305.
Drabkin's Reagent—See PF Vol. 29 No. 2, page 507.
Escin—See PF Vol. 27 No. 4, page 2837.
17α-Estradiol—See PF Vol. 27 No. 2, page 2278.
Ethidium Bromide—See PF Vol. 27 No. 6, page 3366.
Ethylbenzene—See PF Vol. 28 No. 3, page 850.
Ferulic Acid—See PF Vol. 28 No. 6, page 1951.
9-Fluorenylmethyl Chloroformate—See PF Vol. 25 No. 5, page 8916.
Formamide, Anhydrous—See PF Vol. 27 No. 5, page 3115.
Glucose—See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid—See PF Vol. 27 No. 6, page 3366.
L-Glutamine—See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate—See PF Vol. 27 No. 6, page 3366.
Heptafluorobutyric Acid—See PF Vol. 26 No. 4, page 1132.
Hexadecane—See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide—See PF Vol. 29 No. 1, page 265.
Hexamethylenetetramine—See PF Vol. 28 No. 3, page 850.
L-Histidine Hydrochloride Monohydrate—See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide—See PF Vol. 28 No. 4, page 1305.
Hydrocodone Diol—See PF Vol. 28 No. 4, page 1306.
IgG-Coated Red Cells—See PF Vol. 29 No. 2, page 507.
Iodoethane—See PF Vol. 24 No. 6, page 7327.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isomaltotriose—See PF Vol. 28 No. 6, page 1952.
Lanthanum Chloride—See PF Vol. 29 No. 2, page 507.

Lanthanum Oxide—See PF Vol. 28 No. 3, page 851.
Lead Acetate Paper—See PF Vol. 29 No. 1, page 265.
Linoleic Acid—See PF Vol. 27 No. 6, page 3367.
α-Lipoic Acid—See PF Vol. 27 No. 6, page 3367.
2-Methyl-5-nitroimidazole—See PF Vol. 25 No. 2, page 7804.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride—See PF Vol. 25 No. 3, page 8280.
Monooleoylglycerol—See PF Vol. 26 No. 6, page 1622.
Nickel(II) Sulfate Heptahydrate—See PF Vol. 27 No. 5, page 3116.
Nitric Acid, Lead-Free—See PF Vol. 28 No. 3, page 851.
Nonylphenol Polyoxyethylene Ether—See PF Vol. 27 No. 6, page 3368.
Oligo-deoxythymidine—See PF Vol. 27 No. 6, page 3368.
Pentadecanoic Acid Methyl Ester—See PF Vol. 26 No. 6, page 1622.
o-Phenanthroline Monohydrochloride Monohydrate—See PF Vol. 27 No. 1, page 1904.
Phenol Red, Sodium—See PF Vol. 27 No. 6, page 3368.
Polyoxyethylene (23) Lauryl Ether—See PF Vol. 29 No. 2, page 507.
Polyoxyethylene (20) Sorbitan Monolaurate—See PF Vol. 27 No. 6, page 3368.
Protocatechuic Acid—See PF Vol. 28 No. 6, page 1952.
Putrescine Dihydrochloride—See PF Vol. 27 No. 6, page 3369.
Pyruvic Acid—See PF Vol. 28 No. 5, page 1542.
Red-Cell Lysing Agent—See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase—See PF Vol. 27 No. 6, page 3369.
Ribonuclease Inhibitor—See PF Vol. 27 No. 6, page 3369.
Sodium Iodate—See PF Vol. 27 No. 6, page 3369.
Tetrahydro-2-furancarboxylic Acid—See PF Vol. 25 No. 5, page 8748.
N-(2-Tetrahydrofuroyl)piperazine—See PF Vol. 25 No. 5, page 8748.
1,1,4,4-Tetraphenyl-1,3-butadiene—See PF Vol. 26 No. 6, page 1623.
Thymidine—See PF Vol. 27 No. 6, page 3369.
Trioleoylglycerol—See PF Vol. 26 No. 6, page 1623.
Tropine—See PF Vol. 28 No. 4, page 1306.
L-Tyrosine Disodium—See PF Vol. 27 No. 6, page 3370.
Vinyl Acetate—See PF Vol. 21 No. 2, page 466.
2-Vinylpyridine—See PF Vol. 26 No. 2, page 504.
1-Vinyl-2-pyrrolidone—See PF Vol. 22 No. 6, page 3249.
m-Xylene—See PF Vol. 28 No. 6, page 1952.
Zinc Sulfate Heptahydrate—See PF Vol. 26 No. 2, page 504.

Indicator Test Papers

Methyl Green—See PF Vol. 28 No. 4, page 1306.
Methyl Green—Iodomercurate Paper—See PF Vol. 28 No. 4, page 1306.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.
Ninhydrin TS—See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

BRIEFING

Microcrystalline Cellulose, *NF 21* page 2713. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for the subject article. The revisions presented in this proposal, which represents the revised OFFICIAL INQUIRY STAGE 4 draft in the harmonization process, reflect those changes suggested by EP and JP. Because of significant changes within the CONSENSUS STAGE 5B draft, the draft has been reverted back to the OFFICIAL INQUIRY STAGE 4. Readers are urged to review these *In-Process Revision* proposals carefully and to respond to USP no later than August 31, 2003.

Major changes from the current *NF* monograph include the following:

(1) Definition—No change.
(2) *Packaging and storage*—Storage conditions are added.
(3) *Labeling*—No change.
(4) *Identification* test *B*—This test is deleted. The former test *C* is now labeled as test *B*. The deleted test is considered a functionality test, which is not appropriate for Harmonization.
(5) *Microbial limits*—No change.
(6) *Conductivity*—No change.
(7) *pH*—The upper limit is increased to 7.5 from 7.0 to conform to EP and JP standards and to be consistent with the monograph for *Powdered Cellulose*.
(8) *Loss on drying*—No change.
(9) *Residue on ignition*—The standard for this test was increased to not more than 0.1%, which conforms to EP standards.
(10) *Bulk density*—No change.
(11) *Water-soluble substances*—The standard for this test was changed from 0.24% to 0.25%.
(12) *Ether-soluble substances*—No change.
(13) *Heavy metals*—No change.
(14) *Organic volatile impurities*—No change.

(EMC: J. Lane) RTS—39840-1

Change to read:

Microcrystalline Cellulose

Cellulose.

Cellulose [*9004-34-6*].

» Microcrystalline Cellulose is purified, partially depolymerized cellulose prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

Packaging and storage—Preserve in tight containers at room temperature.

Labeling—The labeling indicates the nominal loss on drying, bulk density, and degree of polymerization values. Degree of polymerization compliance is determined using *Identification* test *B*. Where the particle size distribution is stated in the labeling, the labeling indicates the d_{10}, d_{50}, and d_{90} values and the range for each.

Identification—

A: Prepare iodinated zinc chloride solution by dissolving 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Microcrystalline Cellulose on a watch glass, and disperse in 2 mL of iodinated zinc chloride solution: the substance takes on a violet-blue color.

B: Transfer 1.3 g of Microcrystalline Cellulose, accurately weighed to 0.1 mg, to a 125-mL conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanical shaker until completely dissolved. Transfer 7.0 mL of the solution to a calibrated number 150 Cannon-Fenske or equivalent[1] viscosimeter. Allow the solution to equilibrate at 25 $\pm$ 0.1° for not less than 5 minutes. Time the flow between the 2 marks on the viscosimeter, and record the flow time, t_1, in seconds. Calculate the kinematic viscosity, $(KV)_1$, of the Microcrystalline Cellulose taken by the formula:

$$t_1(k_1),$$

[1] A Ubbelohde 1C viscosimeter is equivalent to a Cannon-Fenske 150 viscosimeter. A Ubbelohde 1 viscosimeter is equivalent to a Cannon-Fenske 100 viscosimeter.

in which k_1 is the viscosimeter constant (see *Viscosity* ⟨911⟩). Obtain the flow time, t_2, for a 0.5 M cupriethylenediamine hydroxide solution using a number 100 Cannon-Fenske or equivalent[1] viscosimeter. Calculate the kinematic viscosity, $(KV)_2$, of the solvent by the formula:

$$t_2(k_2),$$

in which k_2 is the viscosimeter constant. Determine the relative viscosity, η_{rel}, of the Microcrystalline Cellulose specimen taken by the formula:

$$(KV)_1 / (KV)_2.$$

Determine the intrinsic viscosity, $[\eta]c$, by interpolation, using the *Intrinsic Viscosity Table* in the *Reference Tables* section. Calculate the degree of polymerization, *P*, by the formula:

$$(95)[\eta]c / W_S[(100 - \%LOD)/100],$$

in which W_S is the weight, in g, of the Microcrystalline Cellulose taken, and % *LOD* is the value obtained from the test for *Loss on drying.* The degree of polymerization is not greater than 350, and is within the labeled specification.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 per g, the total combined molds and yeasts count does not exceed 100 per g, and it meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* and for absence of *Escherichia coli* and *Salmonella* species.

Conductivity—Shake about 5 g with 40 mL of water for 20 minutes, and centrifuge. Retain the supernatant liquid for use in the *pH* test. Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard[2] having a conductivity of 100 µS per cm, measure the conductivity of the supernatant solution after a stable reading is obtained, and measure the conductivity of the water used to prepare the test specimen. The conductivity of the supernatant solution does not exceed the conductivity of the water by more than 75 µS per cm.

pH ⟨791⟩: between 5.0 and 7.5 in the supernatant solution obtained in the *Conductivity* test.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 7.0% of its weight, or some other lower percentage, or is within a percentage range, as specified in the labeling.

Residue on ignition ⟨281⟩: not more than 0.1%. Ignition temperature 600 ± 50°.

Bulk density—Use a volume meter[3] that has been fitted with a 10-mesh screen. The volume meter is freestanding of the brass or stainless steel cup, which is calibrated to a capacity of 25.0 ± 0.05 mL and has an inside diameter of 30.0 ± 2.0 mm. Weigh the empty cup, position it under the chute, and slowly pour the powder from a height of 5.1 cm (2 inches) above the funnel through the volume meter, at a rate suitable to prevent clogging, until the cup overflows. [NOTE—If excessive clogging of the screen occurs, remove

[2] Commercially available conductivity calibration solutions for conductivity meter standardization, standardized by methods traceable to the National Institute of Science and Technology (NIST), may be used. Solutions prepared according to instructions given in ASTM Standard D1125 may be used provided the conductivity of the resultant solution is the same as that of the solution prepared from the NIST-certified material.

[3] A suitable apparatus is described as the Scott Volumeter in ASTM B 329, available from the American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19429-2959.

the screen.] Level the excess powder, and weigh the filled cup. Calculate the bulk density by dividing the weight of the powder in the cup by the volume of the cup: the bulk density is within the labeled specification.

Water-soluble substances—Shake 5.0 g with about 80 mL of water for 10 minutes, filter with the aid of vacuum through filter paper (Whatman No. 42 or equivalent) into a vacuum flask. Transfer the filtrate to a tared beaker, evaporate to dryness without charring, dry at 105° for 1 hour, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 12.5 mg (0.25%).

Ether-soluble substances—Place 10.0 g in a chromatography column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at 105° for 30 minutes, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 5.0 mg (0.05%).

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

BRIEFING

Powdered Cellulose, *NF 21* page 2714. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for the subject article. The revisions presented in this proposal, which represents the revised OFFICIAL INQUIRY STAGE 4 draft in the harmonization process, reflect those changes suggested by EP and JP. Because of significant changes within the CONSENSUS STAGE 5B draft, the draft has been reverted back to the OFFICIAL INQUIRY STAGE 4. Readers are urged to review these *In-Process Revision* proposals carefully and to respond to USP no later than July 31, 2003.

Major changes from the current *NF* monograph include the following:

(1) Definition—No change.
(2) *Packaging and storage*—Storage conditions are added.
(3) *Labeling*—No change.
(4) *Identification* test *B*—This test is deleted. The former test *C* is now labeled as test *B*. The deleted test is considered a functionality test, which is not appropriate for Harmonization.
(5) *Microbial limits*—No change.
(6) *pH*—No change.
(7) *Loss on drying*—The limit is increased to 6.5% from 6.0% to conform to EP and JP standards. The drying time is increased to 3 hours from 2 hours.
(8) *Residue on ignition*—No change.
(9) *Water-soluble substances*—No change.
(10) *Ether-soluble substances*—No change.
(11) *Heavy metals*—No change.
(12) *Organic volatile impurities*—No change.

Powdered Cellulose

» Powdered Cellulose is purified, mechanically disintegrated cellulose prepared by processing alpha cellulose obtained as a pulp from fibrous plant materials.

Packaging and storage—Preserve in tight containers at room temperature.

Labeling—The labeling indicates the nominal degree of polymerization value. Degree of polymerization compliance is determined using *Identification* test *B*.

Identification—

A: Prepare iodinated zinc chloride solution by dissolving 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Powdered Cellulose on a watch glass, and disperse in 2 mL of iodinated zinc chloride solution: the substance takes on a violet-blue color.

B: Transfer 0.25 g of Powdered Cellulose, accurately weighed to 0.1 mg, to a 125-mL conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanical shaker until completely dissolved. Transfer 7.0 mL of the solution to a calibrated number 150 Cannon-Fenske or equivalent[1] viscosimeter. Allow the solution to equilibrate at 25 ± 0.1° for not less than 5 minutes. Time the flow between the 2 marks on the viscosimeter, and record the flow time, t_1, in seconds. Calculate the kinematic viscosity, $(KV)_1$, of the Powdered Cellulose taken by the formula:

$$t_1\ (k_1),$$

in which k_1 is the viscosimeter constant (see *Viscosity* ⟨911⟩). Obtain the flow time, t_2, for a 0.5 M cupriethylenediamine hydroxide solution using a number 100 Cannon-Fenske or equivalent[1] viscosimeter. Calculate the kinematic viscosity, $(KV)_2$, of the solvent by the formula:

$$t_2\ (k_2),$$

in which k_2 is the viscosimeter constant. Determine the relative viscosity, η_{rel}, of the Powdered Cellulose specimen taken by the formula:

$$(KV)_1 / (KV)_2.$$

Determine the intrinsic viscosity, $[\eta]c$, by interpolation, using the *Intrinsic Viscosity Table* in the *Reference Tables* section. Calculate the degree of polymerization, *P*, by the formula:

$$(95)[\eta]c / W_S[(100 - \%LOD)/100],$$

in which W_S is the weight, in g, of the Powdered Cellulose taken, and %*LOD* is the value obtained from the test for *Loss on drying*. The degree of polymerization is between 440 and 2250 and is within the labeled specification.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 per g, the total combined molds and yeasts count does not exceed 100 per g, and it meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* and for absence of *Escherichia coli* and *Salmonella* species.

pH ⟨791⟩—Mix 10 g with 90 mL of water, and allow to stand with occasional stirring for 1 hour: the pH of the supernatant liquid is between 5.0 and 7.5.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 6.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.3%, calculated on the dried basis, the addition of sulfuric acid being omitted from the procedure. Ignition temperature of 600 ± 50°.

Water-soluble substances—Mix 6.0 g with 90 mL of recently boiled and cooled water, and allow to stand with occasional stirring for 10 minutes. Filter, with the aid of vacuum, discard the first 10 mL of the filtrate, and pass the filtrate through the same filter a second time, if necessary, to obtain a clear filtrate. Evaporate a 15.0-mL portion of the filtrate in a tared evaporating dish to dryness without charring, dry at 105° for 1 hour, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 15.0 mg (1.5%).

Ether-soluble substances—Place 10.0 g in a chromatography column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the resi-

[1] A Ubbelohde 1C viscosimeter is equivalent to a Cannon-Fenske 150 viscosimeter. A Ubbelohde 1 viscosimeter is equivalent to a Cannon-Fenske 100 viscosimeter.

due at 105° for 30 minutes, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 15.0 mg (0.15%).

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

MONOGRAPHS (NF)

BRIEFING

Polyethylene Glycol, *NF 21* page 2810, page 382 of the *Addendum to the First Interim Revision Announcement to USP 26–NF 21* in *PF* 29(2) [Mar.–Apr. 2003], and page 702 of *PF* 29(3) [May–June 2003]. The following revisions are an effort to update the current *NF* monograph. Most of the changes are intiated by proposed changes within the international harmonization process. Major changes proposed include the following:

(1) Definition—The limits for the average molecular weight have been deleted from the monograph. This was considered redundant when viscosity is tested and limited.
(2) *Packaging and storage*—Well-closed containers has been changed to tight containers, due to the potential volatility of some low molecular weight polyethylene glycols that are in liquid form.
(3) *Labeling*—Allowance and labeling for blends of polyethylene glycols are added.
(4) *USP Reference standards*—Two new reference standards are added to comply with the proposed IR test.
(5) *Completeness and color of solution*—A numerical limit specification for color is added to reduce the subjectivity of the current *Completeness and color of solution* test.
(6) *Identification*—The addition of a new, definitive *Identification* test based on IR spectroscopy performed by comparison with two reference substances: one of low molecular weight (300), and one of high molecular weight (8000). The test for *Viscosity* was also moved to the *Identification* section, because it can be used to distinguish between the various types of materials.
(7) *Viscosity*—A new method for *Viscosity* has been proposed, as it is easier to perform and complies to the range of 200 to 35,000 molecular weight. The temperature is changed from 98.9 ± 0.3° to 20 ± 3°. *Viscosity* was moved and is now under *Identification*.
(8) *Average molecular weight*—This test is deleted, based on the viscosity-molecular weight relationship among the polyethylene glycols.
(9) *pH*—The limit is changed from between 4.5 and 7.5 to 4.0 and 7.5.
(10) *Residue on ignition*—A sample weight of 10g is proposed, which is sufficient for a limit of not more than 0.1%.
(11) *Heavy metals*—This test has been deleted because polyethylene glycol is totally organic and not derived from any materials that usually contain heavy metals.
(12) *Limit of free ethylene oxide and 1,4-dioxane*—No change.
(13) *Limit of ethylene glycol and diethylene glycol*—A proposed capillary gas chromatographic method for the *Limit of ethylene glycol and diethylene glycol* test and a reduced limit based on the current limit in the *U.S. Code of Federal Regulations*. The limit was changed to not more than 620 ppm for ethylene glycol to comply with current International Conference on Harmonization (ICH) guidelines.
(14) *Water*—A new test for *Water* is added, with a limit corresponding to that in the *JP* monograph test.
(15) *Formaldehyde limit*—This test is added to reduce cross-linking, when polyethylene glycol is used with gelatin capsules.
(16) *Organic volatile impurities*—This test has been deleted because it is unnecessary for this compound.

(EMC: J. Lane) RTS—39925-1

Delete the following:
~~Pharmacy Equivalent Name: PEG~~

Change to read:

» Polyethylene Glycol is an addition polymer of ethylene oxide and water, represented by the formula:

$$H(OCH_2CH_2)_nOH,$$

in which *n* represents the average number of oxyethylene groups. ~~The average molecular weight is not less than 95.0 percent and not more than 105.0 percent of the labeled nominal value if the labeled nominal value is below 1000; it is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value if the labeled nominal value is between 1000 and 7000; it is not less than 87.5 percent and not more than 112.5 percent of the labeled nominal value if the labeled nominal value is above 7000.~~

The nominal average molecular weight is from 200 to 35,000. For blends of two or more discrete Polyethylene Glycols, each Polyethylene Glycol component of the blend must meet the monograph requirements for its nominal average molecular weight, and the blend must meet all other monograph requirements, except for viscosity. •It may contain a suitable antioxidant.•1

Change to read:
Packaging and storage—Preserve in tight containers,

away from direct sunlight. [Appropriate storage conditions to come.]

Change to read:

Labeling—Label it to state, as part of the official title, the average nominal molecular weight of the Polyethylene Glycol.

Blends of two or more discrete Polyethylene Glycols must be labeled to state, as part of the official title, the word "blend."

•Label it to indicate the name and quantity of any added antioxidant.•1

Add the following:

USP Reference standards ⟨11⟩—*USP Polyethylene Glycol 300 RS. USP Polyethylene Glycol 8000 RS.*

Change to read:

Completeness and color of solution—~~A solution of 5 g of Polyethylene Glycol in 50 mL of water is colorless; it is clear for liquid grades and not more than slightly hazy for solid grades.~~

Dissolve 5 g of Polyethylene Glycol in 50 mL of water. The color of the solution is not greater than 25 Pt-Co, and at 25 ± 5° the solution is clear for nominal molecular weights less than or equal to 1000 and not more than slightly hazy for nominal molecular weights greater than 1000.

Add the following:

Identification—

A: *Infrared Absorption* ⟨197F⟩—Use a thin film of test specimen, melt if necessary, on undried specimen, in the range from 4000 cm^{-1} to 600 cm^{-1}.

B: It complies with the test for *Viscosity.*

Change to read:

Viscosity ⟨911⟩—Determine its

kinematic

viscosity, using a capillary viscosimeter giving a flow time of not less than 200 seconds, and a liquid bath maintained at ~~98.9 ± 0.3° C (210° F)~~ 20 ± 3°. For Polyethylene Gycols having a relative molecular weight greater than 400, determine the viscosity on a 50% w/w solution of the substance to be examined.

The viscosity is within the limits specified in the accompanying table. For a Polyethylene Glycol not listed in the table, calculate the limits by interpolation.

Nominal Average Molecular Weight	Kinematic Viscosity Range, Centistokes ($mm^2 \cdot s^{-1}$)
200	53–62
300	71–94
400	94–116
600	13.9–18.5
1000	20.4–27.7
1500	31–46
3000	69–93
3350	76–110
4000	102–158
6000	185–250
8000	240–472
10,000	500–675
12,000	1000–1300
20,000	2500–3200
35,000	10,000–13,000

Delete the following:

~~**Average molecular weight**~~

~~*Phthalic anhydride solution*—Place 49.0 g of phthalic anhydride into an amber bottle, and dissolve in 300 mL of pyridine from a freshly opened bottle or that has been freshly distilled over phthalic anhydride. Shake vigorously until completely dissolved. Add 7 g of imidazole, swirl carefully to dissolve, and allow to stand for 16 hours before using.~~

~~*Test preparation for liquid Polyethylene Glycols*—Carefully introduce 25.0 mL of the *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add an accurately weighed amount of the specimen, equivalent to its expected average molecular weight divided by 160. Insert the stopper in the bottle, and wrap it securely in a cloth bag.~~

~~*Test preparation for solid Polyethylene Glycols*—Carefully introduce 25.0 mL of *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add an accurately weighed amount of the specimen, equivalent to its expected molecular weight divided by 160; however, because of limited solubility, do not use more than 25 g. Add 25 mL of pyridine, from a freshly opened bottle or that has been freshly distilled over phthalic anhydride, swirl to dissolve, insert the stopper in the bottle, and wrap it securely in a cloth bag.~~

~~*Procedure*—Immerse the bottle in a water bath maintained at a temperature between 96° and 100°, to the same depth as that of the mixture in the bottle. Remove the bottles from the bath after 5 minutes, and, without unwrapping, swirl for 30 seconds to homogenize. Heat in the water bath for 30 minutes (60 minutes for Polyethylene Glycols having molecular weights of 3000 or higher), then remove from the bath, and allow it to cool to room temperature. Uncap the bottle carefully to release any pressure, remove from the bag, add 10 mL of water, and swirl thoroughly. Wait 2 minutes, add 0.5 mL of a solution of phenolphthalein in pyridine (1 in 100), and titrate with 0.5 N sodium hydroxide VS to the first pink color that persists for 15 seconds, recording the volume, in mL, of 0.5 N sodium hydroxide required as *S*. Perform a blank determination on 25.0 mL of *Phthalic anhydride solution* plus any additional pyridine added to the bottle, and record the volume, in mL, of 0.5 N sodium hydroxide required as *B*. Calculate the average molecular weight by the formula:~~

$$~~[2000W]/[(B - S)(N)],~~$$

~~in which *W* is the weight, in g, of the Polyethylene Glycol taken for the *Test preparation*, $(B - S)$ is the difference between the volumes of 0.5 N sodium hydroxide consumed by the blank and by the specimen, and *N* is the normality of the sodium hydroxide solution.~~

Change to read:

pH ⟨791⟩: ~~between 4.5 and 7.5, determined potentiometrically, in a solution prepared by dissolving 5.0 g of Polyethylene Glycol in 100 mL of carbon dioxide–free water and adding 0.30 mL of saturated potassium chloride solution.~~

Dissolve 5.0 g of Polyethylene Glycol in 100 mL of water with an unadjusted pH of 5.0 or greater, stirring in a sealed bottle, if necessary. To this solution, add 0.30 mL of a saturated solution of potassium chloride. The test solution should be maintained at 25 ± 2° during the measurement. The measured pH is between 4.0 and 7.5.

Add the following:

Water, *Method Ia* ⟨921⟩: not more than 1.0%.

Change to read:

Residue on ignition ⟨281⟩: not more than 0.1%, a ~~25-g~~

10-g

specimen and a tared platinum dish being used, and the residue being moistened with 2 mL of sulfuric acid.

Delete the following:

~~**Heavy metals** ⟨231⟩—Mix 4.0 g with 5.0 mL of 0.1 N hydrochloric acid, and dilute with water to 25 mL: the limit is 5 ppm.~~

Delete the following:

~~**Limit of ethylene glycol and diethylene glycol** (for Polyethylene Glycol having a nominal molecular weight less than 450)—~~

~~*Standard preparation*—Prepare an aqueous solution containing 500 µg each of ethylene glycol and of diethylene glycol per mL.~~

~~*Test preparation*—Transfer about 4 g of Polyethylene Glycol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 1.5-m stainless steel column packed with 12% G13 on support S1NS. The carrier gas is nitrogen or another suitable inert gas, flowing at a rate of 50 mL per minute. The column temperature is maintained at about 140°, the injection port temperature is maintained at about 250°, and the flame-ionization detector temperature is maintained at 280°.~~

~~*Procedure*—Inject a volume (about 2.0 µL) of the *Standard preparation* into the chromatograph, and record the chromatogram, adjusting the operational conditions to obtain peaks not less than 10 cm in height. Measure the heights of the first (ethylene glycol) and second (diethylene glycol) peaks, and record the values as P_1 and P_2, respectively. Inject a volume (about 2.0 µL) of the *Test preparation* into the chromatograph, and record the chromatogram under the same conditions as those employed for the *Standard preparation*. Measure the heights of the first (ethylene glycol) and second (diethylene glycol) peaks, and record the values as p_1 and p_2, respectively. Calculate the percentage of ethylene glycol in the portion of Polyethylene Glycol taken by the formula:~~

~~$$(C_1p_1)/(P_1W),$$~~

~~in which C_1 is the concentration, in µg per mL, of ethylene glycol in the *Standard preparation;* and W is the weight, in mg, of Polyethylene Glycol taken. Calculate the percentage of diethylene glycol in the portion of Polyethylene Glycol taken by the formula:~~

~~$$(C_2p_2)/(P_2W),$$~~

~~in which C_2 is the concentration, in µg per mL, of diethylene glycol in the *Standard preparation:* not more than 0.25% of the sum of ethylene glycol and diethylene glycol is found.~~

Delete the following:

~~**Limit of ethylene glycol and diethylene glycol** (for Polyethylene Glycol having a nominal molecular weight 450 or above but not more than 1000)—~~

~~*Ceric ammonium nitrate solution*—Dissolve 6.25 g of ceric ammonium nitrate in 100 mL of 0.25 N nitric acid. Use within 3 days.~~

~~*Standard preparation*—Transfer 62.5 mg of diethylene glycol to a 25-mL volumetric flask, dissolve in a mixture of equal volumes of freshly distilled acetonitrile and water, dilute with the same mixture to volume, and mix.~~

~~*Test preparation*—Dissolve 50.0 g of Polyethylene Glycol in 75 mL of diphenyl ether, previously warmed, if necessary, just to melt the crystals, in a 250-mL distilling flask. Slowly distil at a pressure of 1 mm to 2 mm of mercury, into a receiver graduated to 100 mL in 1-mL subdivisions, until 25 mL of distillate has been collected. Add 20.0 mL of water to the distillate, shake vigorously, and allow the layers to separate. Cool in an ice bath to solidify the diphenyl ether and facilitate its removal. Filter the separated aqueous layer, wash the diphenyl ether with 5.0 mL of ice-cold water, pass the washings through the filter, and collect the filtrate and washings in a 25-mL volumetric flask. Warm to room temperature, dilute with water to volume, if necessary, and mix. Mix this solution with 25.0 mL of freshly distilled acetonitrile in a glass-stoppered, 125-mL conical flask.~~

~~*Procedure*—Transfer 10.0 mL each of the *Standard preparation* and the *Test preparation* to separate 50-mL flasks, each containing 15.0 mL of *Ceric ammonium nitrate solution*, and mix. Within 2 to 5 minutes, concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 450 nm, with a suitable spectrophotometer, using a blank consisting of a mixture of 15.0 mL of *Ceric ammonium nitrate solution* and 10.0 mL of a mixture of equal volumes of freshly distilled acetonitrile and water: the absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation*, corresponding to not more than 0.25% of combined ethylene glycol and diethylene glycol.~~

Add the following:

Limit of ethylene glycol and diethylene glycol—

NOTE—Applies to Polyethylene Glycol having a nominal molecular weight of 200 or above but not more than 1000; testing not required for nominal molecular weights greater than 1000.

Internal standard solution—Prepare a solution in water containing about 1000 µg of 1,4-butanediol in each mL.

Standard solution—Prepare a solution in water containing about 500 µg of ethylene glycol, about 500 µg of diethylene glycol, and about 500 µg of 1,4-butanediol in each mL.

Test solution—Transfer about 4 g of Polyethylene Glycol, accurately weighed, to a small bottle. Pipet 5 mL of *Internal standard solution* and 1 mL of water into the bottle. Cap the bottle, and shake to mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a split injection system, and a 0.53-mm × 30-m fused-silica analytical column coated with 1.2-µm film of phase G16 (or, preferably, its bonded equivalent). The carrier gas is helium, flowing at a rate of about 40 cm per second, and the split vent flow is about 100 mL per minute. The injection port and detector temperatures are maintained at 250° and 260°, respectively. The column temperature is programmed to increase from 180° to 260° at a rate of 10° per minute, and then it is maintained at 260° for at least 22 minutes.

Procedure—Inject 1 µL of the *Standard solution* into the chromatograph, record the chromatogram, and record the areas of the first (ethylene glycol), the second (internal standard), and third (diethylene glycol) peaks as r_{SE}, r_{SI}, and r_{SD}, respectively. Inject 1 µL of the *Test solution* into the chromatograph, and record the chromatogram as directed for *Standard solution*. Use the retention times observed in the chromatogram of the *Standard solution* to identify the peaks in the chromatogram of the *Test solution* corresponding to ethylene glycol, the internal standard, and diethylene glycol. Record the areas of the ethylene glycol, the internal standard, and diethylene glycol peaks as r_E, r_I, and r_D, respectively. Calculate the response factors, F_N, of ethylene glycol and diethylene glycol by the formula:

$$(C_N r_{SI}) / (C_{SI} r_{SN}),$$

in which C_N is the concentration, in µg per mL, of the analyte of interest in the *Standard solution*; r_{SI} is the peak area for the internal standard obtained from the *Standard solution*; C_{SI} is the concentration, in µg per mL, of the internal standard in the *Standard solution*; and r_{SN} is the peak area for the analyte of interest obtained from the *Standard solution*. Calculate the percentages, by weight, of ethylene glycol and diethylene glycol in the portion of Polyethylene Glycol taken by the formula:

$$(F_N C_I r_N) / (2000 r_I W),$$

in which F_N is as obtained above; C_I is the concentration, in µg per mL, of the internal standard in the *Internal standard solution*; r_N and r_I are the peak areas of the analyte of interest and the internal standard, respectively, obtained from the *Test solution*; and W is the weight, in g, of Polyethylene Glycol in the *Test solution*: not more than 620 ppm ethylene glycol and not more than 0.2% of ethylene glycol and diethylene glycol combined is found.

Add the following:

Limit of formaldehyde—

Chromotropic acid sodium solution—Dissolve 0.60 g of chromotropic acid disodium salt in about 80 mL of water, and dilute with water to 100 mL. [NOTE—Use this solution within 24 hours.]

Test solution—To 1.0 g, add 5.0 mL of *Chromotropic acid sodium solution,* and cool in iced water. Allow to stand for 15 minutes; and dilute slowly with water to 10 mL.

Reference solution—Dilute 0.860 g of formaldehyde solution to 100 mL with water. Dilute 1.0 mL of this solution to 100 mL with water. In a 10 mL flask, mix 1.00 mL of this solution with 5.0 mL of *Chromotropic acid sodium solution,* cool in iced water. Allow to stand for 15 minutes, and dilute slowly with water to 10 mL.

Blank solution—In a 10-mL flask mix 1.00 mL of water with 5.0 mL of *Chromotropic acid sodium solution*, and cool in iced water. Dilute slowly with water to 10 mL. Determine at 567 nm against the *Blank solution*, that the absorbance of the *Test solution* is not higher than that of the *Reference solution* (0.003%).

Delete the following:

~~**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements for chloroform, methylene chloride, and trichloroethylene.~~

DIETARY SUPPLEMENTS MONOGRAPHS

BRIEFING

Pygeum; Pygeum Extract; Pygeum Capsules. Because there are no existing *USP* monographs for these botanicals, new monographs are being previewed.

(DSB: G. Giancaspro) RTS—37249-1

Add the following:

Pygeum

» Pygeum consists of the bark of *Prunus africana* (Hook f.) Kalkman (*Pygeum africanum* Hook f.) Rosaceae. It contains not less than 9.0 percent of extractable matters.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Pygeum Extract RS*. *USP* β-*Sitosterol RS*.

Botanic characteristics—

Macroscopic—Bark pieces consist of long fragments of variable dimensions, from only a few cm to 1-m long with a thickness varying from a few mm to 1–2 cm. The color is brown, more or less dark on the external surface; light brown to red brown on the internal surface. The external part of the bark presents a very dark and fissured rhytidome that in the samples of old trees is fragmented in more or less square plaques of about 1 to 5 cm. The thickness varies from 1 mm in young plants or branches to 5–8 mm in old plants. The outer surface may also be covered with whitish lichens or thin filamentous moss. The internal bark, under the rhytidome, is clearer and has a more reddish coloration, with a long fibrous break, from reddish to light brown and dark brown in color, often presenting concentrical stratification cracks. The internal surface is more clear and presents small wrinkles.

Microscopic—The transverse section of the bark presents a suberized bed having a thickness depending on the age of the plant, consisting of multiple layers of small, square cells with the walls of moderate thickness. It presents a cortical parenchyma of more or less round cells, with a few apparent formations of very thin-walled sclerites, definitely sharp. Often, in the parenchyma, there are groups of cells containing oxalate druses; a few bigger cells with highly thickened walls can also be observed. It shows a liber with phloem zones and presenting medulary rays. The phloemical portions contain groups of fibrous cells with highly thickened

walls as well as phloemical and parenchymal elements sometimes containing druses of oxalate. The medulary rays are of conical shape, larger on the external surface and thinner on the internal side; they can also contain druses of oxalate.

Thin-layer chromatographic identification test ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Transfer about 10 g of the powdered plant material to a soxhlet apparatus. Extract with 150 mL of methylene chloride for 4 hours. Evaporate the extract under vacuum to dryness. Dissolve the residue with 10 mL of methylene chloride. Apply 10 µL to the plate.

Standard solution 1—Prepare a solution of USP Pygeum Extract RS in chloroform having a concentration of about 10 mg per mL.

Standard solution 2—Prepare a solution of USP β-Sitosterol RS in chloroform having a concentration of about 1 mg per mL.

Developing solvent system: methylene chloride in a saturated chamber.

Spray reagent—Prepare a solution of sulfuric acid and water (1:1).

Procedure—Develop the chromatogram to a length of not less than 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat the plate at 100° for 10 minutes. Examine the plate under white light: the chromatogram obtained with the *Test solution* shows one red-violet zone turning to grayish brown near the origin that corresponds in color and R_F value to that in the chromatogram of *Standard solution 1*; one red-violet zone turning to grayish brown at an R_F about 0.08, corresponding in color and R_F value to that in the chromatogram of the *Standard solution 2;* above these spots a grayish brown zone may be present, corresponding in color and R_F value to that in the chromatogram of the *Standard solution 1;* and other colored zones of varying intensities may be observed in the chromatogram of the *Test solution.*

Total ash ⟨561⟩: not more than 10.0%.

Loss on drying ⟨731⟩—Dry it at 60° for 15 hours: it loses not more than 10.0% of its weight.

Foreign organic matter ⟨561⟩: not more than 5.0%.

Pesticide residues ⟨561⟩: meets the requirements.

Heavy metals ⟨231⟩: not more than 20 µg per g.

Extractable matter—Extract 2.00 g of the powdered material in a soxhlet apparatus with 150 mL of alcohol for 6 hours. Evaporate the solution to dryness under vacuum, and dry the residue at 105° for 24 hours.

⟨11⟩ USP Reference Standards

Add the following:

USP Pygeum Extract RS.

BRIEFING

Pygeum Extract; Pygeum Capsules. The chromatographic procedure for the *Content of sterols* is based on determinations performed with a capillary column HP-5 brand of G27 silica bonded stationary phase. Typical retention times are 12.5 minutes for 5α-cholestanol, 17.8 minutes for campesterol, 18.7 minutes for stigmasterol, and 19.0 minutes for β-sitosterol. The chromatographic procedure for the *Content of docosyl ferulate* is based on determinations performed on a Supersphere 60, RP-8 brand column of packing L7. The typical retention time for docosyl ferulate is about 12.5 minutes. See also the briefing under *Pygeum*.

(DSB: G. Giancaspro) RTS—37249-2

Add the following:

Pygeum Extract

» Pygeum Extract is prepared from the pulverized Pygeum using suitable solvents. It contains not less than 90 percent and not more than 110 percent of the labeled amount of docosyl ferulate and not less than 90 percent and not more than 110 percent of the labeled amount of total sterols as β-sitosterol.

Packaging and storage—Store in tight containers, protected from light.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. Label the content in percentage of total sterols as β-sitosterol and the content in percentage of docosyl ferulate. It also meets the requirements for labeling in the chapter *Extracts* ⟨565⟩.

USP Reference standards ⟨11⟩—*USP Pygeum Extract RS*. *USP* β-*Sitosterol RS*. *USP Docosyl Ferulate RS*.

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve about 150 mg of Extract in 10 mL of chloroform. Apply 10 µL to the plate.

Standard solution 1—Prepare a solution of USP Pygeum Extract RS in chloroform having a concentration of about 15 mg per mL.

Standard solution 2—Prepare a solution of USP β-Sitosterol RS in chloroform having a concentration of about 2 mg per mL.

Developing solvent system: methylene chloride in a saturated chamber.

Spray reagent—Prepare a solution of sulfuric acid and water (1:1).

Procedure—Develop the chromatogram to a length of not less than 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and heat the plate at 100° for 10 minutes. Examine the plate under white light: the chromatogram obtained with the *Test solution* shows one red-violet zone turning to grayish brown near the origin that corresponds in color and R_F value to that in the chromatogram of *Standard solution 1*; one red-violet zone turning to grayish brown at an R_F of about 0.08 corresponding in color and R_F value to that in the chromatogram of *Standard solution 2*; above these spots a grayish brown zone may be present, corresponding in color and R_F value to that in the chromatogram of *Standard solution 1*; and other colored zones of varying intensities may be observed in the chromatogram of the *Test solution*.

B: The chromatogram of the *Test solution,* obtained as directed in the *Content of docosyl ferulate* exhibits peak for docosyl ferulate, the retention time of which corresponds to that exhibited by the *Standard solution*.

Loss on drying ⟨731⟩—Dry about 1.0 g of Extract, accurately weighed, for 3 hours at 110°: it loses not more than 10% of its weight.

Ash content ⟨561⟩: not more than 0.5%.

Heavy metals ⟨565⟩: meets the requirement.

Residual solvents ⟨565⟩: meets the requirement.

Pesticide residue ⟨561⟩: meets the requirement.

Aflatoxins ⟨561⟩: not more than 4 µg per kg of total aflatoxins B1, B2, G1, and G2; not more than 2 µg per kg of aflatoxin B1.

Microbial limits ⟨2021⟩—The total aerobic microbial count does not exceed 10^4 per g, the total combined molds and yeasts count does not exceed 10^3 per g, and it meets the requirements of the tests for absence of *Salmonella* species, and *Escherichia coli*.

Content of sterols—

Derivatizing solution: a mixture of bis(trimethylsilyl)acetamide and trimethylchlorosilane (9:1).

Internal standard solution—Prepare a solution containing 2 mg per mL of 5α-cholestane in chloroform.

System suitability solution—Prepare a solution containing about 2 mg per mL each of campesterol, stigmasterol, and USP β-Sistosterol RS. Transfer 2.0 mL of this solution and 2.0 mL of *Internal standard solution* to a 10-mL volumetric flask, and dilute with chloroform to volume. Evaporate about 500 µL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 µL of *Derivatizing solution* and 20 µL of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Standard stock solution—Prepare a solution of USP β-Sitosterol RS in chloroform having a known concentration of about 2.0 mg per mL.

Standard solution—Transfer 2.0 mL of the *Standard stock solution* and 2.0 mL of *Internal standard solution* to a 10-mL volumetric flask, and dilute with chloroform to volume. Evaporate about 500 µL of this solution to dryness using a stream of nitrogen. Dissolve the residue in 80 µL of *Derivatizing solution* and 20 µL of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Test solution—Transfer an accurately weighed quantity of about 100 mg of Extract into a 100-mL, round-bottomed flask. Add 2.0 mL of *Internal standard solution* and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at 100° for 30 minutes. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8. Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8 that has been conditioned with a 2-column volume of *n*-hexane [Note—A suitable cartridge is Chromabond NH2, manufactured by Macheray Nagel, or equivalent.] Collect the eluate. Elute twice with a 1-column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate about 500 µL of this solution to dryness under a stream of nitrogen. Dissolve the residue with 80 µL of *Derivatizing solution* and 20 µL of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a 0.32-mm × 30-m capillary column coated with a G27 phase of 0.25-µm thickness. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 250° for 5 minutes, then the temperature is increased at a rate of 5° per minute to 320°. The injection port and detector temperature are both maintained at 285°. The carrier gas is helium, with a flow rate adjusted to obtain a retention time of about 19 minutes for β-sitosterol, a split ratio of 1:50, and the make up is helium. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.66, 0.94, 0.96, and 1.00 for 5α-cholestane, campesterol, stigmasterol, and β-sitosterol, respectively; the resolution, *R*, between campesterol and stigmasterol is not less than 2;

the column efficiency is not less than 150,000 for the 5α-cholestane peak; and the tailing factor for each relevant peak is not more than 2.0.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with the *System suitability solution*.

Separately calculate the percentages of campesterol, stigmasterol, and β-sitosterol respectively in the portion of Extract taken by the formula:

$$200C/W(R_U/R_S),$$

in which C is the concentration of β-sitosterol, in mg per mL, in the *Standard solution; W* is the weight, in mg, of the Extract taken to prepare the *Test solution;* R_U is the ratio of the appropriate sterol peak to the internal standard in the chromatogram of the *Test solution;* and R_S is the ratio of the β-sitosterol peak to the 5α-cholestane internal standard in the chromatogram of the *Standard solution*. Calculate the total content of sterols in percentage by adding the individual percentages.

Content of docosyl ferulate—

Solution A—Use mixture of methanol and water (95:5).

Solution B—Use a filtered and degassed mixture of *Solution A* and acetonitrile.

Mobile phase—Use variable mixtures of *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Docosyl Ferulate RS with chloroform and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.02 mg per mL. Filter with a 0.45-µm membrane or finer porosity.

Test solution—Weigh approximately 250 mg of Extract. Add 5 mL of chloroform, and quantitatively transfer to a 25-mL volumetric flask. Dilute with acetonitrile to volume, and mix. Filter with a 0.45-µm membrane or finer porosity discarding the first 4 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 323-nm detector and a 4-mm × 25-cm column that contains packing L7, and is maintained at a temperature of 25°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the column efficiency for the peak of docosyl ferulate is not less than 1700 theoretical plates; and the tailing factor for docosyl ferulate is not more than 2.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Calculate the percentage of docosyl ferulate in the portion of Extract taken by the formula:

$$2500C/W(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Docosyl Ferulate RS in the *Standard solution; W* is the weight, in mg, of the portion of Extract taken to prepare the *Test solution;* and r_U and r_S are the peak responses for docosyl

ferulate in the *Test solution* and the *Standard solution*, respectively.

⟨11⟩ **USP Reference Standards**

Add the following:

USP Docosyl Ferulate RS.

BRIEFING

Pygeum Capsules—See briefings under *Pygeum* and *Pygeum Extract*.

(DSB: G. Giancaspro) RTS—37249-3

Add the following:

Pygeum Capsules

» Pygeum Capsules contain Pygeum Extract. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Extract, calculated as sterols and docosyl ferulate.

Packaging and storage—Preserve in tight containers at controlled room temperature.

Labeling—The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the amount of Extract, in mg per Capsule. Label the Capsules to indicate the amount of sterols and docosyl ferulate in percentage of the Extract contained in the Capsules.

USP Reference standards ⟨11⟩—*USP* β-*Sitosterol RS. USP Pygeum Extract RS. USP Docosyl Ferulate RS.*

Identification—

A: The chromatogram of the *Test solution*, obtained as directed in the *Content of sterols*, exhibits peaks for campesterol, stigmasterol and β-sitosterol, the retention times of which correspond to those exhibited by the *Standard solution*.

B: The chromatogram of the *Test solution*, obtained as directed in the *Content of docosyl ferulate*, exhibits a peak for docosyl ferulate, the retention time of which corresponds to that exhibited by the *Standard solution*.

Disintegration ⟨2040⟩: meet the requirements for disintegration of botanical dosage forms.

RUPTURE TEST—[NOTE—See *Dissolution* ⟨711⟩ for *Apparatus*.]

Medium: simulated gastric fluid TS; 500 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes.

Procedure—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

Weight variation ⟨2091⟩: meet the requirements.

Microbial limits ⟨2021⟩—The total bacterial count does not exceed 10^3 per g. The total combined molds and yeasts count does not exceed 10^2 per g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Content of sterols—

Derivatizing solution, *Internal standard solution*, *System suitability solution*, *Standard stock solution*, *Standard solution*, and *Chromatographic system*—Proceed as directed in *Pygeum Extract*.

Test solution—Transfer an accurately weighed quantity of Capsules, equivalent to about 100 mg of the labeled amount of Extract, into a 100-mL, round-bottomed flask. Add 2.0 mL of *Internal standard solution* and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at 100° for 30 minutes. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8. Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8 that has been conditioned with a 2-column volume of *n*-hexane. [NOTE—A suitable cartridge is Chromabond NH2, manufactured by Macheray Nagel, or equivalent.] Collect the eluate. Elute twice with a 1-column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate about 500 µL of this solution to dryness under a stream of nitrogen. Dissolve the residue with 80 µL of *Derivatizing solution* and 20 µL of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Procedure—Proceed as directed in *Pygeum Extract*. Separately calculate the content, in mg, of campesterol, stigmasterol, and β-sitosterol, respectively in the portion of Capsules taken by the formula:

$$2C(R_U / R_S),$$

in which C is the concentration of β-sitosterol, in mg per mL, in the *Standard solution;* R_U is the ratio of the appropriate sterol peak to the internal standard in the chromatogram of the *Test solution;* and R_S is the ratio of the β-sitosterol peak to the 5α-cholestane internal standard in the chromatogram of the *Standard solution*. Calculate the total content of sterols, in mg, by adding the individual contents.

Content of docosyl ferulate—

Solution A, *Solution B*, *Mobile phase*, and *Chromatographic system*—Proceed as directed for the *Content of docosyl ferulate* in *Pygeum Extract*.

Standard solution—Dissolve an accurately weighed quantity of USP Docosyl Ferulate RS with chloroform, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.01 mg per mL. Filter with a 0.45-µm membrane or finer porosity.

Test solution—Accurately weigh the contents of not fewer than 20 Capsules, and transfer an accurately weighed quantity of the material, equivalent to 0.2 mg of the labeled amount of docosyl ferulate, to a 50-mL beaker. Add 5 mL of chloroform, and dissolve in an ultrasonic bath. Transfer to a 20-mL volumetric flask with the aid of not more than 2 mL of chloroform. Dilute with acetonitrile to volume, and mix. Filter through a 0.45-µm membrane or finer porosity.

Procedure—Proceed as directed for the *Procedure* under *Content of docosyl ferulate* in *Pygeum Extract*, except to inject about 30 µL into the chromatograph. Calculate the content of docosyl ferulate, in mg, in the portion of Capsules taken by the formula:

$$20C(r_U / r_S),$$

in which the terms are as defined therein.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 29(4) [July–Aug. 2003]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

An Atomic Spectroscopic Method as an Alternative to Both USP *Heavy Metals* ⟨231⟩ *and USP Residue on Ignition* ⟨281⟩

Tiebang Wang,[1] Jane Wu, Xiujuan Jia, Xiaodong Bu, Ivan Santos, and Richard S. Egan, *Analytical Research Department, Merck Research Laboratories, Merck & Co., Inc.*

ABSTRACT A multi-element inductively coupled plasma–mass spectrometry (ICP–MS) method has been demonstrated to be a suitable alternative to both USP *Heavy Metals* ⟨231⟩ and USP *Residue on Ignition* ⟨281⟩ for drug substances, intermediates, and raw materials. This ICP–MS method, combined with a direct-dissolution sample preparation procedure, is simpler, faster, more sensitive, and element specific. It consumes less sample and provides semiquantitative to quantitative results covering all elements of pharmaceutical interest and offers other advantages discussed herein.

INTRODUCTION

Metal or inorganic contamination of bulk drug substances, intermediates, and raw materials may be introduced in many ways, e.g., from reagents, solvents, electrodes, reaction vessels, plumbing and other equipment used in the synthesis, as well as via exposure to airborne particles or from container–closure systems. Most importantly, metals may be introduced by the utilization of catalysts at various steps during the synthesis. Because metals can catalyze decomposition and are potentially toxic, the metal content of process intermediates and final drug substances is widely monitored.

The United States Pharmacopoeia (USP) *Heavy Metals* ⟨231⟩ and similar tests provided in the European Pharmacopoeia (Ph. Eur.) and the Japanese Pharmacopoeia (JP) (*1–3*), consist of the precipitation of metal sulfides from an aqueous solution and the visual comparison of the color of that preparation to the color of a simultaneously and similarly treated standard lead solution. In order to obtain an aqueous solution for testing, ignition and combustion of the samples in a muffle furnace is often required in a preliminary step. In addition, after one adjusts the pH and adds either freshly prepared hydrogen sulfide or thioacetamide–glycerin base TS, the colors of the different metal sulfides range from white to yellow, orange, brown, and black (*4*), making the visual comparison with the dark brown–colored lead sulfide difficult. Furthermore, apart from the colors of the formed sulfides, there is no information about the identities of the metals that caused the positive result.

USP *Residue on Ignition (ROI)* ⟨281⟩ (*5*) and the similar sulfated ash limit test in Ph. Eur. also do not provide any information about the identity of inorganic impurities in the samples. These tests consist of heating 1 to 2 g of the sample in a suitable crucible that previously has been ignited, cooled, and weighed until the substance is thoroughly charred. The charred substance is then moistened by 1 mL of sulfuric acid, heated again until white fumes no longer are evolved, and ignited at 800 ±25° until the carbon is consumed. The residue is then cooled in a desiccator before it is weighed to determine the percentage of residue. Sometimes this procedure must be repeated in order to get a constant weight of the residue.

For USP *Heavy Metals* ⟨231⟩, Pb, Hg, Bi, As, Sb, Sn, Cd, Ag, Cu, and Mo typically will respond, but for USP *Residue on Ignition* ⟨281⟩, all elements that potentially react with sulfuric acid to form sulfated ash will respond. However, we observe that most of the time the alkaline and alkaline earth elements produce substantial amounts of sulfated ash.

Although both methods are still widely accepted and used in the pharmaceutical industry, they are nonspecific, insensitive, time-consuming, and labor intensive. USP *Heavy Metals* ⟨231⟩ has been shown to be suitable only for a few limited elements and has not been shown to be equally sensitive to all. In our laboratory it frequently yields either low recoveries or erroneous results. USP *ROI* ⟨281⟩ is not applicable to drug substances that are inorganic (e.g., sodium) salts. In addition, each test consumes a minimum of 1 to 2 g of sample, which can be a major problem when the quantities of the intermediates or the drug substances to be tested are limited.

Attempts have been made to improve these pharmacopeial methods to alleviate some of the limitations and shortcomings, but no major improvements have been achieved (*6–7*). We have recently published an ICP–MS method as an alternative to USP *Heavy Metals* ⟨231⟩ (*8*) and now wish to provide justification to expand its use to also cover USP *ROI* ⟨281⟩.

NEW TECHNOLOGY

Since 1980 ICP–MS has emerged as a major and powerful technique in elemental analysis (*9*), an area traditionally dominated by optical atomic spectrometry methods. In approximately 10 years, ICP–MS has progressed from a laboratory experiment to commercial development and wide-

[1] Correspondence should be addressed to Tiebang Wang, Analytical Research Department, Merck Research Laboratories, P.O. Box 2000, R80L-115, Rahway, NJ 07065-0900, USA; telephone: 732.594.8457; e-mail: tiebang_wang@merck.com.

Pharmacopeial Forum
Vol. 29(4) [July–Aug. 2003]

spread analytical application (*10–16*). This growth is fueled primarily by the fact that ICP–MS offers extremely low detection limits that range from sub–part per billion (ppb) to sub–part per trillion (ppt) detection limits for most elements. In most cases, these detection limits are 100 to 1000 times superior to those that can be routinely achieved by Inductively Coupled Plasma–Atomic Emission Spectrometry (ICP–AES). In addition, these detection limits are broadly achieved for almost all elements across the periodic table. Furthermore, the simpler mass spectra versus the much more complex optical spectra of the elements make this technique a quick tool for automated qualitative, semiquantitative, and quantitative elemental analysis.

In view of the superior and broad detection capability of ICP–MS and also because of the limitations inherent in USP *Heavy Metals* ⟨231⟩ and USP *Residue on Ignition* ⟨281⟩ prescribed by USP and Ph. Eur., a multi-element survey type ICP–MS method has been developed and employed at Merck as an alternative method. This method analyzes all sulfide-forming and sulfate-forming elements plus other elements with greatly enhanced specificity, sensitivity, speed, precision, and accuracy. In addition, because only part-per-million (ppm) levels of metals of pharmaceutical interest will be noted and reported, data processing and interpretation are also extremely simple. In most cases, a 5-second glance at the raw data will reveal the answers to the corresponding equivalent USP limit tests—that is, they pass or fail the limit tests for both heavy metals and *ROI* in a single run because more than 95% of the compounds tested contain no significant amount of inorganic impurities.

SAMPLE PREPARATION

In addition to the extreme sensitivity and specificity of the ICP–MS method, the sample preparation scheme for the simultaneous *Heavy Metals* and *ROI* tests is also simple and straightforward. Experience of handling thousands of pharmaceutical samples reveals that at least 99% of these samples are readily soluble in 80% (v/v) nitric acid solution. On some occasions, sonication may be needed to solubilize the samples or speed up their solubilization. In rare cases when samples do not dissolve, either a microwave digestion method can be used or the USP *Heavy Metals* and *ROI* tests can be carried out as usual. With the method proposed in this article, each sample can be prepared and analyzed in less than 15 minutes after initialization of the instrument, provided no microwave digestion is needed. By contrast, the USP *Heavy Metals* and *ROI* tests may each take several hours or longer to perform for one sample, particularly when sample combustion/digestion is involved. Another advantage of the proposed method is that only about 10 to 100 mg of sample is consumed for both the *Heavy Metals* and *ROI* tests using the ICP–MS method.

Furthermore, for potent compounds and other hazardous materials, the samples are denatured in 80% (v/v) nitric acid during the sample preparation procedure, and the dissolved samples can be analyzed safely using the ICP–MS method. In contrast, to perform the USP *Heavy Metals* test and particularly the USP *ROI* test, expensive and cumbersome containment facilities are required during sample preparation. In most laboratories, this would render the USP *Heavy Metals* and *ROI* tests impractical for potent and hazardous compounds.

METHOD PROCEDURE

Instrumentation—A Perkin-Elmer Elan 6000 Inductively Coupled Plasma–Mass Spectrometer (ICP–MS) equipped with an AS-91 auto-sampler was used throughout this study. The instrumental conditions and general method parameters are listed in *Table 1*.

Sample Analysis—After instrument warm-up (30–40 minutes), a two-point calibration of the ICP–MS is carried out by analyzing the calibration blank (80% nitric acid solution) and the mixed 69-element calibration standard (20 µg/L for all elements except Na, Si, P, K, Ca, and Fe, which are 1000 µg/L). All regulatory samples are spiked at a level equivalent to 10 mg/kg (10 ppm) of the metals that are sensitive to USP *Heavy Metals* ⟨231⟩ in solid sample (10 µg/L in solution). A spike recovery of 60–140% is required for each element. To monitor the drift of the instrument, the mixed 69-element standard (ICP–MS) is reanalyzed as a sample every 10 samples and at the end of the analysis.

REPORTING RESULTS

A) Heavy Metals Test—If those elements sensitive to the USP Heavy Metals test or the sum of these elements are found to have a concentration of higher than 10 ppm, the sample should be reanalyzed for those specific elements by a different atomic spectroscopic method such as ICP–AES and/or atomic absorption spectrometry.

B) ROI Test—Results from the ICP–MS analysis will be used for the conversions from ppm cations to the equivalent USP *ROI* ⟨281⟩ unless a % *ROI* result of higher than 0.05% is obtained. In this case, those elements with concentrations higher than their corresponding Limits of Quantitation or 10 ppm (whichever is larger) should be analyzed by a different atomic spectroscopic method (such as ICP–AES and/or atomic absorption spectrometry), and the results from the ICP–AES and/or atomic absorption spectrometry will be used for the conversions from ppm cations to the equivalent USP ⟨281⟩ *ROI.*

METHOD VALIDATION

Validation of the method for use as an alternative to the USP *Heavy Metals* ⟨231⟩ test was provided in our recent publication (8). That validation is also applicable for use of the method as an alternative for USP *ROI* ⟨281⟩, and the data will not be repeated here.

In summary, the analysis of National Institute of Standards and Technology (NIST) 1643d (Trace Elements in Water) standard reference material and the spiking experiments showed excellent to acceptable accuracy for a semi-quantitative method, with the exception of Fe (results shown in *Table 2*). The erroneously high data for Fe using both ^{54}Fe and ^{57}Fe result from spectral interferences mainly from $^{14}N^{40}Ar$, $^{16}O^{38}Ar$, and $^{40}Ar^{16}O^{1}H$, which cannot be circumvented with the current instrument capabilities. Spiked samples also demonstrated acceptable method precision, and spiked blanks provided Limit of Detection (LOD) and Limit of Quantitation (LOQ) values that were below part-per-million (ppm) levels for all elements of pharmaceutical interest. The LOD and LOQ values are provided in *Table 3*.

Matrix effects and spectral interference—Positive results at moderate levels for some elements in the presence of one or more other high-level elements should always be investigated further for spectral interferences or by confirming the results with an alternative method such as ICP–AES or Graphite Furnace Atomic Absorption Spectroscopy (GFAAS). Matrix effects are minimized by running the calibration blank and calibration standard in the same matrix as in the samples and by dissolving a minimum amount of sample in the solution to be analyzed (0.1% total dissolved solids), taking advantage of the extremely high sensitivity of the ICP–MS. Spectral interferences are monitored by using more than one isotope for the same element whenever possible for some interference-prone low-mass elements.

EQUIVALENCE OF THE ICP–MS METHOD TO USP ⟨281⟩ *ROI*

A demonstration of the equivalence of the ICP–MS method and the USP ⟨281⟩ *ROI* procedure was provided by the analysis of six typical drug substances by both methods. The results are given in *Table 4* and *Table 5*. The agreements are excellent.

UTILIZATION OF THE METHOD

A survey method that permits simultaneous qualitative to quantitative detection (depending on the elements and the concentration levels) of up to 69 elements, including all those of pharmaceutical interest, in less than 15 minutes would be viewed by some as a giant leap forward compared to traditional USP methods. The use of such a method, which employs a very sophisticated and expensive instrument, as an alternative to a seemingly economical wet chemical test that has been in use for decades would be viewed by others as technological overkill.

We take a less extreme view and believe that because the equipment is already present in the laboratory to address other very challenging analytical problems, its application to more mundane uses is simply good resource management. We have found that the extensive use of the ICP–MS for this elemental survey analysis does not degrade its capability for even more challenging tasks.

CONCLUSION

The proposed method uses direct dissolution of the samples in 80% nitric acid solution combined with ICP–MS as the analytical tool. It is an attractive alternative method for both USP *Heavy Metals* ⟨231⟩ and USP *ROI* ⟨281⟩. The availability of the ICP–MS in the laboratory offers much more rapid, sensitive, precise, simple, and element-specific analysis. Furthermore, it consumes far less sample and is safely applicable to potent compounds and other hazardous materials.

ACKNOWLEDGMENT

The authors wish to thank Jean Wyvratt of Merck & Co. for a careful review and helpful suggestions.

Biopharmaceutical Characterization of Herbal Medicinal Products

The FIP Working Group on Herbal Medicinal Products consists of the following experts: Dr. Friedrich Lang (Firma Schwabe, Karlsruhe, Germany, chair of the group),* Prof.-Dr. Konstantin Keller (Bundesinstitut für Arzneimittel und Medizinprodukte, Bonn, Germany), Dr. Michael Ihrig (Zentrallaboratorium Deutscher Apotheker, Eschborn, Germany), Joy van Oudtshoorn-Eckard (J & B Pharmaceutical Consultants, Pretoria, South Africa), Prof.-Dr. Helga Möller (Zentrallaboratorium Deutscher Apotheker, Eschborn, Germany), Dr. Srini Srinivasan (United States Pharmacopoeia, Rockville, MD), Dr. Yu He-ci (Hankintatukku OY, Finland)

ABSTRACT In this article, a working group of the International Pharmaceutical Federation (FIP) presents their revised discussion paper on the biopharmaceutical characterization of herbal medicinal products. This revision takes into account scientific contributions made after the first publication of the draft and has been substantially extended. Based on knowledge of their composition and efficacy, plant extracts can be classified into 3 categories: A, B, and C. In the case of substitution of herbal medicinal products containing extracts from category A, the Note for Guidance on the Investigation of Bioavailability and Bioequivalence (BA/BE) should fully be addressed. A waiver of bioequivalence studies or clinical studies is possible if justified according to the Note for Guidance (high solubility and rapid or similar dissolution). In the case of herbal medicinal products (HMPs) containing class B or C extracts, the Note for Guidance on BA/BE in principle should be considered. An assessment should be made concerning pharmaceutical equivalence of the extracts used in the test and reference formulations, their solubility under physiological conditions (>90%), and the dissolution profile of active and/or lipophilic markers. If no markers are available in the case of class C extracts, the dissolution test may be dropped if no problems are expected from the solubility characteristics of the extracts. A waiver of bioequivalence studies or clinical studies is possible if justified according to the Note for Guidance (high solubility and rapid or similar dissolution in comparison to the reference product). The therapeutic equivalence of HMPs containing class B and C extracts in many instances may be demonstrated by clinical studies rather than via BA/BE studies.

INTRODUCTION

In 1999 the FIP Special Interest Group (SIG) on the Quality of Pharmaceuticals established a working group to elaborate recommendations for biopharmaceutical characterization of Herbal Medicinal Products (HMPs). Considering the current European and American regulatory guidelines on quality for HMPs, the SIG embarked on a clarification of biopharmaceutical characteristics taking into account the new classification of HMPs. A first draft was published in *Die Pharmazeutische Industrie* [63(10), 2001] and *Pharmacopeial Forum* [28(1) 2002].

Comments meanwhile were collected by the authors and were integrated into the final version as far as possible. A scientific symposium dedicated to the topic was organized in Berlin by the German Pharmaceutical Society. Due to the complexity of the matter, not all scientific views could be harmonized. The publication is now updated and substantially extended. The issues of the pharmaceutical equivalence of plant extracts and dissolution from pharmaceutical formulations are clarified and integrated into the concept paper. Further aspects of the solubility of plant extracts have been elaborated. The decision trees are simplified and put into more concrete terms. The citation index has been extended. The FIP working group would like to emphasize that the present proposals form a discussion paper and are not binding recommendations. The group is aware that HMPs are not in all cases and countries regarded as part of the science-based medicine. Often plant extracts are used in the form of dietary supplements and food products. This publication deals mainly with scientifically accepted HMPs.

In contrast to chemically defined drug products, the biopharmaceutical quality and behavior of HMPs often are not well documented. In most cases an in vitro/in vivo biopharmaceutical characterization is complicated by the complex composition of herbal drug preparations, the extensive metabolism of constituents, and the resulting analytical difficulties. Further, the pharmacokinetics and bioavailability of HMPs are seldom described in the literature (*1*, *2*). The active pharmaceutical ingredient (API) of HMPs is generally defined to be the whole herbal preparation (the extract) in its entirety. Individual (or groups of) constituents have only in selected cases been identified as being responsible for the therapeutic activity of HMPs (see *Table 1*). HMPs containing raw plant material or teas, as well as liquid formulations, are not considered in this article. The existing tight network of rules concerning dissolution testing (*3*) and investigation of BA/BE (*4*) has not yet been transferred completely to HMPs. Early efforts in this direction include USP drafts of monographs on dietary supplement products that include dissolution testing (*5*) and a European Medical Evaluation Agency (EMEA) Note for Guidance on Specifications for HMPs (*6*).

In many cases it may be assumed (as is usual for chemically defined APIs also) that complete and rapid dissolution of the whole plant extract from a solid oral formulation is a prerequisite for nonproblematic bioavailability and clinical

* Address correspondence to: Dr. Friedrich Lang, Dr. Willmar Schwabe Arzneimittel, Willmar-Schwabe-Strasse 4, 76227 Karlsruhe, Germany.

efficacy of HMPs. Some lipid extracts and essential oils, however, are not easily soluble and do not dissolve completely from the pharmaceutical formulation. Such extracts and formulations may be indicative of biopharmaceutical problems. Yet HMPs are often uncritically substituted by physicians, pharmacists, and patients. The present article proposes some scientific aspects and strategies concerning biopharmaceutical studies for HMPs from the same plant and suggests cases in which clinical or bioequivalence studies may be replaced or waived by in vitro studies.

SPECIAL ASPECTS AND CLASSIFICATION OF HMPs

Because the whole herbal drug preparation, i.e., the extract, is regarded as the active pharmaceutical ingredient, several extract classes, depending on the pharmaceutical-analytical, pharmacological-toxicological, and clinical findings, can be identified. [NOTE—this classification has been introduced in the general monograph "Extracta" of the *European Pharmacopoeia.*]

(A) *Standardized extracts* contain constituents (single or groups) that are solely responsible for the acknowledged and documented therapeutic activity. Standardization (adjustment) to a defined content is acceptable (e.g., standardized Senna leaf dry extract) using inert excipients or preparations with a higher or lower content.

(B) *Quantified extracts* contain chemically defined constituents (single or groups) possessing relevant pharmacological properties (active markers). These substances are likely to contribute to the clinical efficacy; however, evidence that they are solely responsible for such clinical efficacy is not yet available (e.g., extracts of Ginkgo or St. John's Wort). The characterization of these extracts should take into consideration as far as possible the particular state of knowledge concerning the documented efficacy, quality, and safety of an extract. Standardization by blending different lots of a herbal drug before extraction or by mixing different lots of herbal drug preparations is appropriate/acceptable. Adjustment/standardization using excipients is not acceptable.

(C) *Other extracts* contain no constituents documented as being determinant or relevant for efficacy or as having pharmacological or clinical relevance. In these cases, chemically defined constituents (markers) without known therapeutic activity may be used for control purposes (e.g., Valerian or Stinging Nettle Root Extract). These markers may be used to monitor Good Manufacturing Practices (GMPs) or as an indicator for the assay of the drug product.

This classification implies that an extract may be upgraded from class C to B and even to class A as further knowledge is acquired about the extract. The proposed classification seems to be useful to determine the scientific level and future efforts for a biopharmaceutical characterization of HMPs. *Table 1* lists some examples from the European and German Pharmacopoeias (*7*).

In many cases HMPs are based on traditionally known herbal materials and preparations (extracts). Their use is often well established but not based on systematic preclinical and clinical studies. HMPs may show great differences in the class of extracts used (even if they come from the same plant), the dosage forms, and strengths. In the case of substitution of one product for another, the importance of BA/BE has frequently been ignored in the past.

In only a few cases have HMPs been developed using documented pharmacological, toxicological, and clinical experimental studies involving traditional herbs (e.g., *Silibinum marianum* in Europe) or herbs originally not included for traditional use (e.g., *Ginkgo biloba*). These HMPs often contain concentrated or purified extracts in order to improve the dosage or to reduce side effects. For such new or highly developed HMPs, scientific aspects should be investigated if a product is intended to be substituted for the original approved herbal medicinal product.

THE IMPORTANCE OF THE NOTE FOR GUIDANCE ON THE INVESTIGATION OF BIOAVAILABILITY AND BIOEQUIVALENCE

The current EMEA note for guidance on the investigation of BA/BE (designed in principle for chemically defined active substances) contains definitions and processes that may also be applicable to HMPs.

PHARMACEUTICAL EQUIVALENCE

Medicinal products are pharmaceutically equivalent if they contain the same amount of the same active substance(s) in the same dosage forms that meet the same or comparable standards. Pharmaceutical equivalence does not necessarily imply bioequivalence because differences in the excipients and/or the manufacturing process may lead to faster or slower dissolution and/or absorption.

PHARMACEUTICAL ALTERNATIVES

Medicinal products are pharmaceutical alternatives if they contain the same active moiety but differ in chemical form (salt, ester, etc.) of that moiety or in the dosage form or strength.

ESSENTIALLY SIMILAR PRODUCTS

A medicinal product is essentially similar to an original product when it satisfies the criteria of having the same qualitative and quantitative composition in terms of active substance(s), of having the same pharmaceutical form, and of being bioequivalent unless it is apparent in the light of scientific knowledge that it differs from the original product regarding safety and efficacy (see also "The Rules Governing Medicinal Products in the European Community," Notice to Applicants, Vol. 2A). By extension it is generally considered that for immediate-release products the concept of essential similarity also applies to different oral forms (tablets and capsules) with the same active substance. Concerns about differences in essentially similar medicinal products arise because of the use of different excipients and methods of manufacture that ultimately may have an influence on

safety and efficacy. In the case of immediate-release dosage forms, a bioequivalence study is the widely accepted means of demonstrating that these differences have no impact on the performance of the formulation with respect to rate and extent of absorption. It is desirable that excipients be devoid of any effect, that their safe use be ensured by appropriate warning in the package label, and that they not interfere with either the release or the absorption process. An essentially similar product can be used instead of the innovator product. The latter is a medicinal product authorized and marketed on the basis of a full dossier, i.e., one that includes chemical, biological, pharmaceutical, pharmacological-toxicological, and clinical data. A reference product thus must be an innovator product.

THERAPEUTIC EQUIVALENCE

A medicinal product is therapeutically equivalent to another product if it contains the same active substance or active moiety and clinically shows the same efficacy and safety as that product whose efficacy and safety has been established. In practice, demonstration of bioequivalence is generally the most appropriate method of substantiating therapeutic equivalence between medicinal products that are pharmaceutical equivalents or pharmaceutical alternatives, provided they contain only excipients that are generally recognized as not having an influence on safety and efficacy. However in some cases when similar extent of absorption but different rates of absorption are observed, the products still can be judged therapeutically equivalent if those differences are not of therapeutic relevance. A clinical study probably will be necessary to prove that differences in absorption rate are not therapeutically relevant.

BIOPHARMACEUTICAL CLASSIFICATION SYSTEM (BCS)

The Biopharmaceutical Classification System was originally developed for chemically defined synthetic drug substances (*8*). BCS takes into account the physicochemical characteristics of a compound, in particular solubility (in aqueous buffer systems of physiological pH) and permeability (through gastrointestinal barriers simulated by in vitro and in vivo models). According to the BCS, APIs are classified into four groups (group I, high solubility–high permeability; group II, low solubility–high permeability; group III, high solubility–low permeability; group IV, low solubility–low permeability). In this context high solubility is defined so that the highest dosage strength is entirely soluble in 250 mL of buffer, and high permeability indicates that more than 80% of the dose is absorbed after oral administration. It seems to be scientifically plausible that the solubility and dissolution characteristics of an API may be much more pharmaceutically influenced and controlled than the permeability. According to BCS a waiver of BA/BE studies may be granted for Class I drugs. By extension a waiver has also been proposed for Class III drugs (*9*, *10*).

The solubility part of the BCS principles was recently integrated in the final Note for Guidance on the investigation of BA/BE concerning immediate-release dosage forms. The Note for Guidance confirms that the investigation of solubility and the rapid dissolution of an API are of greater importance than permeability. According to the Note for Guidance, in order to justify a waiver of in vivo bioequivalence studies in the case of products containing approved active substances, the following characteristics should be considered:

Characteristics related to the active substance:

- risk of therapeutic failure or adverse reactions
- risk of bioinequivalence
- pharmacokinetic properties.

Solubility: In general, when the active substance is highly water soluble the product could be exempted from bioequivalence studies unless, considering the other characteristics, the exemption could entail a potential risk. An active substance is considered highly water soluble if the amount contained in the highest dose strength of an immediate-release product can be dissolved in 250 ml of each of three buffers within the range of pH 1–8 at 37 °C (preferably at or about pH 1.0, 4.6, and 6.8).

Characteristics related to the medicinal product:

- excipients (no interaction expected)
- manufacture (not critical).

Rapid dissolution: To justify exemption from bioequivalence studies, in vitro data should demonstrate the similarity of dissolution profiles between the test product and the reference product in each of three buffers within the range of pH 1–8 at 37 °C (preferably at or about pH 1.0, 4.6, and 6.8). However in cases where more than 85% of the active substance is dissolved within 15 minutes, the similarity of the dissolution profiles may be accepted, and the f2 similarity values need not be calculated.

INTERPRETATION OF THE DEFINITIONS FOR HMPs

PHARMACEUTICAL EQUIVALENCE

Pharmaceutical Equivalence of Plant Extracts.

The definitions in the EMEA note for guidance on BA/BE were set with chemically defined active substances and finished products in mind. In contrast to synthetic drug substances, the composition of a plant extract is determined by the manufacturing process and the quality of the plant material. Only for plant extracts belonging to class A is it accepted that defined constituents are responsible for the therapeutic activity independent of the composition of other components. For example, milk thistle extracts containing between 40 and 80% of silymarin as known active constituents are regarded as pharmaceutically alternative even if not strictly pharmaceutically equivalent. This is similar to chemically defined APIs in the form of different salts that may be seen as pharmaceutical alternatives. In other words, in the case of class A extracts pharmaceutical equivalence is not relevant.

In the case of class B and C extracts the question of pharmaceutical equivalence is much more difficult. A strict interpretation of the above for HMPs would imply that extracts from the same plant are not pharmaceutically equivalent if manufactured by different methods and especially if one uses different extraction solvents. At present in order to check for pharmaceutical equivalence of class B and C extracts, at least the specified herbal material, the drug:extract ratio (DER), and the principal extraction method (mainly the primary extraction solvent) should be taken into account. Unfortunately these characteristics alone cannot guarantee constant composition of plant extracts and a clear evaluation of pharmaceutical equivalence.

Pharmaceutically equivalent extracts theoretically should be congruent concerning the qualitative and quantitative composition of all constituents. Pharmaceutical equivalence seems to be still more important if efficacy and safety have been exclusively demonstrated with an individual plant extract in a specific formulation and specification. From an analytical point of view full pharmaceutical equivalence is extremely difficult to demonstrate. Plant extracts may consist of hundreds or even thousands of constituents. Even if obtained from the same plant and using the same manufacturing procedure, extracts may be different. This may be caused by quality differences of the harvested plant material due to agricultural conditions and climate. For practical analytical reasons often only some chromatographic fingerprints may be examined. But even if fingerprints match (semi)quantitatively, actual differences in the chemical composition of two extracts cannot be excluded. In this context some have debated whether plant extracts obtained from the same plant using solvents with similar extraction power and similar extraction procedures could be seen (less strictly) as therapeutic alternatives. In many other cases the therapeutical indications will definitely be related to the product's manufacturing process, as in the example of *Ginkgo biloba* extract.

The question of pharmaceutical equivalence of extracts from the same plant thus has to be decided on two levels. First, for extracts described in medicinal monographs: If extracts from the same plant but different manufacturing methods are summarized in monographs of ESCOP, WHO, CORE-SPCs (EMEA), or others, they are acknowledged as therapeutically equivalent despite the differences of their composition. Second, for extracts not described in medicinal monographs, only extracts manufactured with the same process (e.g., solvent, DER) may be assumed to be pharmaceutically and therapeutically equivalent.

Pharmaceutical equivalence of the finished HMPs.

Different formulations using the same extracts (e.g., coated tablets or soft gelatin capsules, even immediate-release types) may not be regarded as pharmaceutical equivalents without evaluation of the dissolution characteristics of the extract; see "Comments and Examples" below.

SOLUBILITY

The BCS system as described above may be helpful for HMPs as well (*11*). For immediate-release HMPs the solubility of the whole extract and (if known) pharmacologically active constituents may be regarded as crucial characteristics for a waiver of bioequivalence or clinical studies. A specific feature of plant extracts (even if they are extracted with pure water) is, however, that the solubility characteristics may change after drying. After plant extracts are dissolved in aqueous systems, cloudy solutions may result because of polymeric residues caused by tannins, polyphenols, etc. On the other hand, turbidities and insoluble residues seen on rehydration may be caused by lipophilic constituents that are important for the therapeutic activity of the extract. It is, therefore, difficult to set an acceptance criterion for "highly soluble" in the case of a plant extract.

If it could be demonstrated that a nonsoluble residue of a plant extract consists only of nonspecific polymeric compounds such as polyphenols, phlobaphenes, proteides, etc. and does not contain low-molecular-weight constituents assumed to possess pharmacological activity, then a solubility of >90% would seem to be adequate for the characterization of an extract as highly soluble. Under that condition and if the other requirements of the Note for Guidance (see above) are fulfilled, a waiver of clinical or bioequivalence studies may be acceptable in the case of substitution of HMPs.

IN VITRO DISSOLUTION OF HMPs

In vitro dissolution testing is performed to determine the rate and quantity of active drug substances dissolved in a specific time. It is an important tool to characterize during the development phase the biopharmaceutical quality of finished drug formulations containing chemically defined drug substances and is used as a further control of marketed products. Comprehensive Guidelines for Dissolution Testing of Solid Oral Products have been established by FIP (*3*).

Pharmacopeial Forum
Vol. 29(4) [July–Aug. 2003]

The EMEA Note for Guidance on specifications of HMPs in principle includes dissolution tests that may, however, be omitted in the case of immediate-release HMPs that do not contain constituents with known therapeutic activity (the Note for Guidance assumes that all conventional solid oral dosage forms with rapid disintegration are immediate-release HMPs). The EMEA Note for Guidance on specifications does not distinguish between HMPs containing standardized, quantified, or other extracts. In accordance with the EMEA Note for Guidance on specifications, disintegration instead of dissolution testing may be sufficient for rapidly dissolving products containing herbal drug preparations that are highly soluble throughout the physiological pH range. Acceptance criteria with a single-point measurement are appropriate for immediate-release drug products. Multiple-point acceptance criteria are necessary for modified-release dosage forms only.

The EMEA concept should be extended along the following lines: Pharmaceutical formulations containing class A extracts should be characterized for the in vitro release of the active constituent(s) because dissolution characteristics different from those expected from the solubility cannot be excluded. For extracts of class B or C where the plant extract as a whole is the API, a holistic description of the in vitro dissolution behavior of all constituents usually is not feasible. Sometimes groups of constituents may be analyzed with fingerprint techniques such as HPLC with photodiode array detection. Only in selected cases will it be possible to use nonspecific methods (for example gravimetric analysis) and thus to characterize the dissolution of the whole extract (*12*). If pharmacologically active markers are known (class B) they may be used as dissolution markers. This makes sense especially if the chosen marker is not very soluble in aqueous systems and therefore may serve as a true indicator of potential dissolution problems. The same is valid for class C extracts if a reliable and representative dissolution marker can be found.

For example, Valerian extracts (class C) contain about 0.5% valerenic acid. Valerenic acid is rather lipophilic and seems to be suitable as a dissolution indicator. Ginkgo extracts contain lipophilic ginkgolides that may be traced analytically for dissolution testing (*13*, *14*). In the case of St. Johns Wort extract, hyperforin or hypericines are useful dissolution markers (*15*). Recently some dissolution indicators have been proposed in *USP–NF* monographs for multivitamin preparations (*16*).

Summarizing:

Class A The API is standardized to a defined content of the active constituent. The dissolution test is feasible. The dissolution profiles of the reference and test products may be compared and checked for rapid or similar dissolution.

Class B The API is quantified concerning defined constituents (active markers). These substances contribute to the clinical efficacy. The dissolution test is feasible for active markers. Other dissolution-indicating markers may be used if justified. The dissolution profiles of the reference and test products may be compared and checked for rapid or similar dissolution.

Class C No constituents are known to be relevant for pharmacological and therapeutical effects. Dissolution-indicating markers may be used in order to compare the dissolution profiles of the reference and test products and to check for rapid or similar dissolution. If it is not feasible (if no marker can be found or no holistic method is available), the dissolution test may be dropped if no problems may be expected from the solubility characteristics of the extract.

DECISION STRATEGIES

IMMEDIATE-RELEASE HMPs CONTAINING EXTRACTS FROM CLASS A

HMPs based on class A extracts are treated like chemically defined pharmaceutical products. In the case of substitution, the Note for Guidance on BA/BE should be fully considered. A waiver of bioequivalence studies may be considered under the conditions described in the Note for Guidance. This means that the active constituent(s) of the standardized extract should be completely soluble under physiological conditions and rapidly dissolved from the formulation ($\geq$85% at 15 min). If this is not the case, the similarity of the dissolution profiles between the test and reference products should be demonstrated.

IMMEDIATE-RELEASE HMPS CONTAINING EXTRACTS FROM CLASSES B AND C

In order to assess the therapeutical equivalence and the possibility of a substitution of HMPs, a decision tree may be applied involving three steps: pharmaceutical equivalence of extracts, their solubility, and dissolution from the formulations (see *Figure 1*). In the case of immediate-release HMPs containing class B or C extracts, the Note for Guidance on BA/BE in principle should be considered. An assessment should be made concerning the pharmaceutical equivalence of the extracts used in the test and reference formulations, their solubility under physiological conditions (>90%), and the dissolution profiles of active and/or lipophilic markers. If no markers are available in the case of class C extracts, the dissolution test may be dropped if no problems may be expected from the solubility characteristics of the extracts.

COMMENTS AND EXAMPLES

EXAMPLE HMPs BASED ON CLASS A EXTRACTS

This example involves formulations containing dry extracts of milk thistle (*Carduus marianus*). The reference product is a hard gelatin capsule containing a dry extract from milk thistle fruits and weighing 173–186.7 mg, corresponding to 140 mg silymarin (calculated as silibinin). The primary extraction solvent is ethyl acetate >97%. The DER is 36–44:1. The test product to be substituted for the reference product is a coated tablet containing dry extract from milk thistle fruits 170–200 mg, corresponding to 140 mg silymarin (calculated as silibinin). The primary extraction solvent is acetone. The DER is 35–45:1.

The milk thistle extracts in the test and reference product contain the same amount of silymarin as the active constituent and are pharmaceutically alternative. The solubility of milk thistle extracts and silymarin under physiological conditions is low. The pharmaceutical formulations are not pharmaceutically equivalent. A risk of bioinequivalence may be expected due to the differences in the solubility of the extracts and due to possible differences in the dissolution profiles of the pharmaceutical formulations. The requirements of the Note for Guidance are not fulfilled. BE studies, where relevant, are feasible for silymarin (*17*). Bioequivalence should be demonstrated by relevant studies or alternatively by unique clinical studies. The acceptance criteria for the silymarin dissolution rate should be specified for registration and routine control purposes for the marketed product.

EXAMPLE HMPs BASED ON CLASS B EXTRACTS

The first example involves formulations containing dry extracts of St. John's Wort (*Hypericum perforatum*). The reference product is a 300-mg coated tablet containing dry extract from St. John's Wort. The extraction solvent is methanol 80% (v/v). The DER is 4–7:1. The test product is a 425-mg hard gelatin capsule containing dry extract from St. John's Wort. The extraction solvent is methanol 60% (m/m). The DER is 3.5–6:1.

The reference and test product are not pharmaceutically equivalent regarding the extracts and the pharmaceutical formulations. The solubility of St. John's Wort extracts is >90% (see experimental data below). The known active (lipophilic) markers, hyperforin and hypericines, are not soluble under the BCS test conditions. The dissolution of the extracts and active markers is not rapid. The characteristics according to the Note for Guidance are not fulfilled. Bioanalytical examinations are feasible for hyperforin and hypericin (*18*, *19*). BA/BE studies with respect to those active markers are possible. Alternatively, clinical studies may be conducted with the test product. The specification for dissolution of active markers should be specified for registration and routine control purposes for the marketed product.

The second example involves formulations containing dry extracts of Valerian roots (*Valerianae officinalis*). The reference product is a 125-mg sugar-coated tablet containing Valerian root extract. The extraction solvent is ethanol 70% (v/v). The DER is 4–6.7:1. The test product is a 500-mg film-coated tablet containing Valerian root extract. The extraction solvent is ethanol 70% (v/v). The DER is 4–7:1.

The valerian extracts contained in the reference and test formulations may be regarded as pharmaceutically equivalent. Their solubility is high. Even in the high dose of 500 mg, the Valerian extract is soluble in all BCS buffers. If it can be shown that the extracts are rapidly dissolved from the formulation, bioequivalence or clinical studies may be waived.

EXPERIMENTAL DATA AND GUIDE FOR PRACTICAL ASPECTS OF SOLUBILITY TESTS

GENERAL CONDITIONS FOR THE DETERMINATION OF THE SOLUBILITY OF EXTRACTS AND ACTIVE MARKERS IN BCS BUFFERS

The general procedure for determining the solubility of extracts and active markers in BCS buffers involves determining the quantity of extract that remains after dissolving the highest strength of the product in 250 mL of solvents (buffers) I–III (I: pH 1.0; II: pH 4.6; III: pH 6.8; see reference *1*) at 37 °C. After stirring for 60 min the residues are filtered and gravimetrically determined after drying at 100 °C for 2 h. Because plant extracts often contain rather insoluble matrix components such as tannins, proteins, and other polymeric compounds assumed not to be linked to efficacy, extracts with a solubility of >90% are classified as very soluble. Extracts with a solubility >90% are classified as problematic. Active markers are also classified as problematic if their solubility from extracts is >90%.

EXAMPLE: CLASS A EXTRACT

This example involves formulations containing dry extracts of milk thistle (*Carduus marianus*). Milk thistle dry extract (200 mg) corresponding to the specification of the test product was dissolved in buffers I–III as described (see above). The solubility data obtained are listed in *Table 2*. The solubility data of silibinin were taken from literature (*20*). The data may be transferred to the solubility of silymarin. Because the data demonstrate solubility less than 30%, the requirements of BCS and the Note for Guidance are not fulfilled.

EXAMPLE: CLASS B EXTRACT

This example involves formulations containing dry extracts of St. John's Wort (*Hypericum perforatum*). St John's Wort dry extract (425 mg) corresponding to the specification of the reference product was dissolved in the buffers I–III as described (see above). The solubility data obtained are listed in *Table 3*.

EXAMPLE: CLASS C EXTRACT

This example concerns formulations containing dry extracts of Valerian root (*Valerianae officinalis*). Valerian root dry extract (500 mg) corresponding to the specification of

the reference product was dissolved in buffers I–III as described (see above). The solubility data are listed in *Table 4*. In every case the solubility criteria are fulfilled.

SUMMARY

Plant extracts can be classified according to one's knowledge of their composition and efficacy into 3 categories (A, B, and C). In the case of substitution of herbal medicinal products containing extracts from category A, the Note for Guidance on the Investigation of Bioavailability and Bioequivalence should fully be addressed. A waiver of bioequiv-
alence studies or clinical studies may be justified according to the Note for Guidance (particularly for products that show high solubility and rapid or similar dissolution).

In the case of HMPs containing class B or C extracts, the Note for Guidance on BA/BE in principle should be considered. An assessment should be made concerning pharmaceutical equivalence of the extracts used in the test and reference formulations, their solubility under physiological conditions (>90%), and the dissolution profile of active and/or lipophilic markers. If no markers are available in the case of class C extracts, the dissolution test may be dropped if no problems may be expected from the solubility characteristics of the extracts. A waiver of bioequivalence studies or clinical studies is possible if justified according to the Note for Guidance (in the case of products that display high solubility and rapid or similar dissolution in comparison to the reference product). The therapeutic equivalence of HMPs containing class B and C extracts in many instances may be demonstrated via clinical studies rather than by means of BE/BE studies.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2003 USP DICTIONARY SUPPLEMENT 2

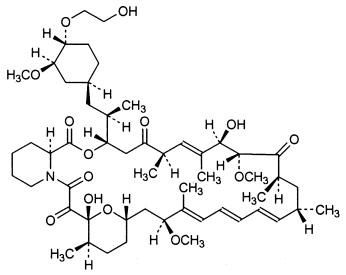
IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2003 edition of the USP Dictionary (USPD) up to date. The cumulative contents of the supplements to the current (2003) edition will be included in the next complete edition of the Dictionary.

New United States Adopted Names (USAN)

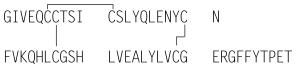
The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

Desmoteplase [*2003*] (des moe te′ plase). Plasminogen activator (Desmodus rotundus isoform α1 protein moiety reduced). Molecular weight is 55,000–58,000 daltons. *CAS-145137-38-8*. INN. *Treatment of acute myocardial infarction, acute ischemic stroke, pulmonary embolism and hemodialysis.* ✧*rDSPA alpha 1*

Everolimus [*2003*] (e ver oh′ li mus). $C_{53}H_{83}NO_{14}$. 958.25. (1) (1*R*,9*S*,12*S*,15*R*,16*E*,18*R*,19*R*,21*R*,23*S*,24*E*,26*E*,28*E*,30*S*,32*S*,35*R*)-1,18-Dihydroxy-12-[(1*R*)-2-[(1*S*,3*R*,4*R*)-4-(2-hydroxyethoxy)-3-methoxycyclohexyl]-1-methylethyl]-19,30-dimethoxy-15,17,21,23,29,35-hexamethyl-11,36-dioxa-4-azatricyclo[30.3.1.0^{4,9}]hexatriaconta-16,24,26,28-tetraene-2,3,10,14,20-pentaone; (2) (3*S*,6*R*,7*E*,9*R*,10*R*,12*R*,14*S*,15*E*,17*E*,19*E*,21*S*,23*S*,26*R*,27*R*,34a*S*)-9,10,12,13,14,21,22,23,24,25,26,27,32,33,34,34a-Hexadecahydro-9,27-dihydroxy-3-[(1*R*)-2-[(1*S*,3*R*,4*R*)-4-(2-hydroxyethoxy)-3-methoxycyclohexyl]-1-methylethyl]-10,21-dimethoxy-6,8,12,14,20,26-hexamethyl-23,27-epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclohentriacontine-1,5,11,28,29(4*H*,6*H*,31*H*)-pentone; (3) 42-*O*-(2-Hydroxyethyl)rapamycin. *CAS-159351-69-6*. INN. *Immunosuppressant.* (Novartis Pharma) ✧*RAD001*

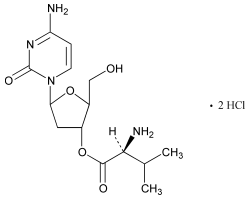


Insulin Glulisine [*2003*] (in′ soo lin gloo lis′ een). $C_{258}H_{384}N_{64}O_{78}S_6$. 5823. (1) Insulin (human),3^{B}-L-lysine,29^{B}-L-glutamic acid-; (2) [3^{B}-L-Lysine,29^{B}-L-glutamic acid]insulin (human). *CAS-207748-29-6*. INN. *Treatment of type 1 and type 2 diabetes.* (Aventis) ✧*HMR 1964*



Talizumab [*2003*] (tal iz′ ue mab). $C_{6518}H_{10020}N_{1728}O_{2036}S_{42}$. Immunoglobulin G, anti-(human immunoglobulin E Fc region) (human-mouse monoclonal Hu901 γ-chain), disulfide with human-mouse monoclonal Hu901 κ-chain, dimer. Molecular weight is approximately 146,348 daltons. *CAS-380610-22-0. Treatment to increase the threshold for peanut-induced anaphylaxis from unintended ingestion by those with peanut allergy.* ✧*TNX-901*

Valtorcitabine Dihydrochloride [*2003*] (val tore site′ ah been). $C_{14}H_{22}N_4O_5.2HCl$. 399.28. (1) L-Valine, 3′-ester with 2′-deoxycytidine, dihydrochloride; (2) 4-Amino-1-[3-*O*-[(2*S*)-2-amino-3-methylbutanoyl]-2-deoxy-β-D-*erythro*-pentofuranosyl]pyrimidin-2(1*H*)-one dihydrochloride. *CAS-359689-54-6. Antiviral; treatment of Hepatitis B.* ✧*NM-147*

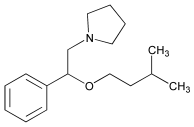


Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

Amixetrine

Change the chemical structure to read:



Carbomer 910

Change the name of the manufacturer of Carbopol 910 to read:

(Noveon).

Carbomer 934

Change the name of the manufacturer of Carbopol 934 to read:

(Noveon).

Carbomer 934P

Change the name of the manufacturer of Carbopol 934P and Carbopol 974P to read:

(Noveon).

Carbomer 940

Change the name of the manufacturer of Carbopol 940 and Carbopol 980 to read:

(Noveon).

Carbomer 941

Change the name of the manufacturer of Carbopol 941, Carbopol 981, and Carbopol 971P to read:

(Noveon).

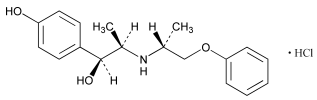
Carbomer 1342

Change the name of the manufacturer of Carbopol 1342, Pemulen TR-1, and Pemulen TR-2 to read:

(Noveon).

Isoxsuprine Hydrochloride

Change the chemical structure to read:



Octoxynol 9

Add the following brand name and manufacturer to read:

Triton X-100 (Union Carbide).

Phenoxybenzamine Hydrochloride

Change the name of the manufacturer to read:

(WellSpring Pharmaceutical Corporation).

Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Helath Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Recommended International Nonproprietary Names

The following 46 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol 16, No. 3, 2002.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Acolbifene	Efaproxiral	Lonafarnib	Peramivir
Asoprisnil	Fadolmidine	Lubazodone	Talibegron
Atomoxetine	Flindokalner	Luliconazole	Tariquidar
Bazedoxifene	Gimatecan	Meldonium	Tebanicline
Bifarcept	Icaridin	Metelimumab	Tecastemizole
Coluracetam	Iguratimod	Mitemcinal	Technetium (^{99m}Tc) Fanolesomab
Dapivirine	Illaprazole	Naxifylline	Tigecycline
Deferasirox	Indiplon	Oglufanide	Tiviciclovir
Degarelix	Indisulam	Olcegepant	Tosagestin
Dersalazine	Leconotide	Oregovomab	Trabectedin
Detiviciclovir	Licofelone	Otamixaban	Zosuquidar
Edonentan		Palifermin	

Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary.* A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Suggested USAN	Category
Aclofarabine Baltarabine Clofarabine Colfarabine Crofarabine Eclofarabine Iclofarabine	*Treatment of primary refractory or relapsed acute myelogenous leukemia (AML) or acute lymphoblastic leukemia (ALL)*

Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Nomenclature

Suggested INN	Category
Adaglen Jaocebrin Resevinadine	*Central benzodiazepine receptor (BZR) partial inverse agonist and a novel cognitive enhancer*
Adecatumumab Epcatumumab	*Treatment of Ep-CAM positive tumors*
Antithrombin Alfa Antithrombin Alfa (human) Antithrombin Alfa (recombinant)	*Anticoagulant*
Arblurbifenil	*Antineoplastic*
Artofisopam	*Treatment of irritable bowel syndrome, Crohn's disease, antianxiety, and antistress*
Celatopurone Emitobran Marcerion	*Mitochondrial benzodiazepine receptor (MBR)-selective agonist; anxiolytic and antidepressant agent*
Certolizumab Pegol	*Treatment of rheumatoid arthritis and inflammatory bowel disease; Crohn's disease*
Ciluprovir	*Treatment of Hepatitis C infection*
Clofarabine	*Treatment of primary refractory or relapsed acute myelogenous leukemia (AML) and acute lymphoblastic leukemia (ALL)*
Dobroxaban Flomerixaban Riveroxaban	*Prevention and treatment of thromboembolic disorders*
Doranidazole	*Hypoxic cell radiosensitizer*
Ecocipladib	*Treatment of pain and symptomatic management of arthritis*
Ecteinibin Ecteinoturbein Trabectedin Trantiblectein Turbinectein	*Antineoplastic*
Enzastaurin	*Antineoplastic*
Etomilast Tiamilast Tietomilast	*Phosphodiesterase IV inhibitor*
Histamine	*Injection treatment (in combination with interleukin-2) for the treatment of advanced metastatic melanoma with liver metastases*
Lumiliximab	*Treatment of allergic asthma, allergic rhinitis, chronic lymphocytic leukemia*
Maraglitazar	*Treatment of Type 2 diabetes, mixed dyslipidemia, atherosclerosis, and metabolic syndrome*
Marpitant Citrate	*Treatment and control of emesis*
Miglustat Miglutrastat	*Treatment of lipid storage diseases*
Mubritinib	*Treatment of cancer*
Nobentan	*Antineoplastic*
Obasermin	*HGF-1 hormone replacement used in the treatment of diabetes*
Osurtan Palasurtan Urosurtan	*Urotensin receptor antagonist for oral use in cardiovascular indications such as heart failure, hypertension, diabetes, and renal failure*

Suggested INN	Category
Paclitaxel Poliglutamex	*Anticancer therapy as a single agent or in combination with other anticancer therapies*
Parathyroid Hormone	*Treatment of osteoporosis*
Ramelreon	*Treatment of sleep disorders*
Razaxaban	*Anticoagulant; antithrombotic inhibitor of coagulant factor Xa*
Solabegron	*β-3 Adrenergic receptor agonist intended for use as an antidiabetic*
Sonaglitazar	*Antidiabetic; antidyslipidemic*
Tanprogecet	*Oral contraceptive*
Tegludutide	*Treatment of intestinal diseases*
Testosterone Undecanoate	Testosterone replacement therapy
Tiplactinin	*Treatment of fibrinolytic impairment diseases*
Undecanoate	*Radical; has been used in conjunction with testosterone, as testosterone undecanoate*
Yttrium Y 90 Epratuzumab	*Radioimmunotherapy (RAIT) for non-Hodgkin's B-cell lymphoma patients*
Yttrium Y 90 Labetuzumab	*Radioimmunotherapy (RAIT) of CEA-expressing tumors in colorectal, pancreatic, lung, breast, ovarian, and medullary thyroid cancer*

REFERENCE STANDARDS CATALOG

USING AND ORDERING USP REFERENCE STANDARDS

Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the *United States Pharmacopeia–National Formulary* (*USP–NF*). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the *USP–NF*. The Reference Standards also lend themselves to many other applications, including measurements required to attain accurate and reproducible results in modern chromatographic and spectrophotometric methods.

Rigorous Testing and Quality Control

USP Reference Standards are selected for their high purity, critical characteristics, and suitability for the intended purpose. Unless a USP Reference Standard label states a specific potency or content, the USP Reference Standard is taken as being 100% pure for the USP purposes for which it is provided.

Heterogeneous substances, of natural origin, are also designated "Reference Standards" where needed. Usually these are the counterparts of international standards.

USP Reference Standards are established through a process of rigorous testing, evaluation, and quality control (See page 6 for a process overview). They are independently tested in three or more laboratories—USP, FDA, and academic and industrial laboratories throughout the United States. The Reference Standards are released under the authority of USP's Board of Trustees, on the recommendation of the USP Reference Standards Expert Committee, which approves selection and suitability of each lot.

Reference Standards Categories

USP offers more than 1,440 Reference Standards for pharmaceuticals, excipients, and dietary supplements. On pages 7–43 of this catalog, you'll find a full list of available USP and NF Reference Standards, with information updated through May 2003. The list includes:

- Reference Standards required by the current official edition of *USP–NF*.
- Reference Standards not required in the current *USP–NF*, but for which sufficient demand remains.
- Reference Standards specified in the current edition of the Food Chemicals Codex (FCC).
- Authentic Substances (AS)—highly purified samples of chemicals, including substances of abuse, required by analytical, clinical, pharmaceutical, and research laboratories.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration (DEA) of the U.S. Department of Justice.

USP also collaborates with the World Health Organization in its program to provide international biological standards and chemical reference materials for antibiotics, biologicals, and chemotherapeutic agents. Some USP Reference Standards are standardized in terms of the corresponding international standards.

Proper Use of USP Reference Standards

USP Reference Standards are provided primarily for quality control use in conducting the pharmacopeial assays and tests described in the *USP–NF*. Neither Reference Standards nor Authentic Substances are intended for use as drugs, dietary supplements, or medical devices.

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Users of USP Reference Standards should refer to General Chapter ⟨11⟩ in the *USP–NF*:

Listing and directions in USP–NF

- Refer to the list of revisions, additions, and deletions of individual USP Reference Standards in *USP 26–NF 21*. Individual *USP* or *NF* monographs specify the USP Reference Standard(s) required for assay and test procedures. The *USP 26–NF 21* General Test Chapter ⟨11⟩ USP Reference Standards provides additional information and instructions for proper use and storage. Note that if specific instructions for use appearing on the label of a USP Reference Standard differ from the instructions in Chapter ⟨11⟩, the instructions on the label take precedence.
- Consult the cumulative updates to Reference Standards information provided in *USP–NF Supplements* and also in *USP–NF* Interim Revision Announcements, which are published in USP's bimonthly journal, *Pharmacopeial Forum*.

Suitability for use

- The user must ascertain that the Reference Standards they are using are an official lot.
- The user must determine the suitability of Reference Standards for applications and uses not in the *USP–NF*.

USING AND ORDERING USP REFERENCE STANDARDS

Storing

- Ensure that the USP Reference Standards are stored in their original stoppered containers, according to any special label directions, away from heat and humidity, and protected from light.

Weighing

- Ensure that Reference Standard substances are accurately weighed—taking due account of relatively large errors potentially associated with weighing small masses—where it is directed that a standard solution or a standard preparation be prepared for a quantitative determination. See *USP 26–NF 21* General Chapters ⟨41⟩ *Weights and Balances* and ⟨31⟩ *Volumetric Apparatus*, and *USP–NF* General Notices, for information regarding appropriate use of USP Reference Standards.

Drying

- Use a clean and dry vessel, and not the original container, as the drying vessel where a USP Reference Standard is required to be dried before use.
- Make sure not to dry a specimen repeatedly at temperatures above 25 degrees.
- Follow any special drying requirements specified on the Reference Standards label or in specific sections of *USP* or *NF* monographs (note that any specific instructions on the label or in the monograph supersede the usual instructions in Procedures under Tests and Assays in *USP–NF* General Notices).
- Follow Method I under *USP–NF* General Chapter ⟨921⟩ *Water Determination* where the titrimetric determination of water is required at the time a Reference Standard is to be used. Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, users must titrate about 50 mg of the Reference Standard with a fourfold dilution of the reagent.

ORDERING USP REFERENCE STANDARDS

Four convenient ways to order

1. Phone: Call USP with your requirements: (800) 227-8772 from the U.S. or Canada and (301) 881-0666 from other countries. Please note that DEA controlled substances cannot be placed over the phone.
   Hours of operation:
   Monday–Friday
   8:30AM–6:00PM
   Fax: Fax your orders to (301) 816-8148.
   Online: Order through the World Wide Web at http://www.usp.org/refstd. Please note that DEA controlled substances cannot be ordered online.
   Mail: Send all mail orders to:
   U.S. Pharmacopeia
   Customer Service Department
   12601 Twinbrook Parkway
   Rockville, MD 20852, USA

Important Order/Policy Information

For fax and mail orders, please use the order form at the back of this catalog. Official purchase orders on company letterhead may also be used to order USP Reference Standards. The purchase orders *must have billing and shipping addresses* and should include the catalog number, the name of the official Reference Standard, and the number of units ordered. Lot numbers need not be specified on written purchase orders as USP only ships current official lots. Confirmation orders may be sent and *must* clearly be designated as such. The USP does not assume responsibility for duplication of orders not clearly marked as confirmation orders.

Pricing

USP Reference Standards must be ordered in whole units. Please note that one unit may include several individual containers.

Reference Standards unit prices included in the product listings from pages 7–43 of this catalog are effective until December 31, 2003. Please note that prices and package sizes are subject to change without notice.

No Returns or Exchanges

USP Reference Standards may not be returned or exchanged for refund.

Quantity Discounts

A 5% discount is allowed for 5–24 units of any one Reference Standard in a single order, and a 10% discount for 25 or more units of any one Reference Standard in a single order. These discounts are subject to change without notice.

Shipping

- Reference Standards orders can only be shipped to a street address and not to P.O. boxes.
- Orders to the U.S. and Ontario, Canada are shipped via air courier of USP's choice at a charge of $11 or via air courier of the customer's choice at an additional $25 charge.
- Non-controlled substance orders to Canadian provinces other than Ontario are shipped via air courier of USP's choice at a

USING AND ORDERING USP REFERENCE STANDARDS

charge of U.S. $70. Carriers of the customer's choice incur an additional $25 charge.
- Non-controlled substance orders to be shipped outside the U.S. and Canada are accepted directly by USP only when customs forms related to export are not required. They are shipped via air courier of USP's choice at a charge of U.S. $70. Carriers of the customer's choice incur an additional $25 charge.
- Shipping in cold pack can be done at customer request for an extra charge of $25.
- Controlled substance orders to anywhere outside the U.S. are shipped via air courier of USP's choice with a charge of U.S. $220.
- An additional shipping charge may be assessed for dangerous goods shipments.
- An additional shipping charge of $75 will be assessed for rush/same-day shipments.
- Customers may provide their shipping account numbers to have shipping charged directly.

Payment
- Full payment in advance, in U.S. dollars, is required for all U.S. orders unless open account status has been granted by USP's Finance Department. To apply for open account status, an application can be requested by calling (301) 816-8177.
- Full payment in advance, in U.S. dollars, is required for all non-U.S. orders.
- Payment may be made by check, money orders, credit cards (VISA, MasterCard, American Express), and electronic wire transfer (please call (301) 816-8177 to get bank information for wire transfers). The customer is responsible for any bank fees and must include it in the payment. The customer is also responsible for any other fees such as customs duties, taxes, or tariffs.

List Chemicals

The following Reference Standards are ''List Chemicals'':

Dihydroergotamine Mesylate
[*]Ephedrine Sulfate
Ergonovine Maleate
Ergotamine Tartrate
Methylergonovine Maleate
Phenylpropanolamine Bitartrate
Phenylpropanolamine HCl
Pseudoephedrine HCl
Pseudoephedrine Sulfate

[*] Shipping this list chemical internationally requires a 15-day waiting period, but does not require an import permit.

An organization in the United States seeking to purchase a List Chemical Reference Standard for resale to another customer must have a DEA registration (either a controlled substance or List Chemical registration). If an organization in the United States is purchasing the List Chemical Reference Standard for its own analytical use, it must provide USP with a letter on company letterhead describing the reason for the purchase.

CONTROLLED DRUG SUBSTANCE ORDER

DEA Requirements (U.S. Orders)

For all orders for controlled drug substances—regulated by the U.S. Drug Enforcement Administration (DEA)—to be shipped within the U.S., a copy of the customer's current DEA Registration Certificate must be on file with USP. To order Schedule I and II standards, customers must submit, with their order forms or purchase orders, a DEA Form 222-C, properly completed. In addition, customers ordering DEA Schedules III and IV must provide appropriate DEA registration numbers for those schedules on their order forms or purchase orders.

DEA Requirements (International Orders)

For all international controlled drug substance orders, please contact Julie Smith at (301) 816-8164 or foreigncontrols@usp.org.

All orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped outside the U.S. must be accompanied by:
1. Full payment.
2. An import permit (in English or with an English translation attached) valid at least 6 months from the date of its receipt by USP Customer Service.
3. A statement of non-reexport and use for medical or scientific purposes (in English or with an English translation attached).
4. Purchase Order or Price Quote given by USP.

On receiving the order, USP takes 2-3 business days to:
- Review all documents to make sure they are adequate and appropriate.
- Complete and legally approve the required DEA forms.
- Forward the forms to the DEA office to obtain the necessary Export Permits.

USING AND ORDERING USP REFERENCE STANDARDS

USP cannot ship items without an Export Permit. While it typically takes 6–10 weeks to get the permit from the DEA, USP has no control over the time in which permits are issued. On receiving the Export Permit, USP completes processing of the order in 1–3 days and ships out the materials through its freight forwarder.

Controlled substances (CI, CII, CIII, CIV, CV) shipped to an international address, including Canada, add $25 per unit.

For controlled substance orders to be shipped to Mexico, in addition to the DEA processing period, an additional week is required to obtain a certificate from the Mexican Embassy, authorizing the shipment to enter the country. Customers will pay an additional $114 to cover the fee charged by the Mexican Embassy per import permit.

Back Orders

USP will ship a back-ordered item if that item becomes available within 30 days of the date the order is placed if there is a valid open P.O. or payment for the item. If the order is more than 30 days old when the item becomes available, the customer will receive a Notice of Availability (NOA), indicating that the item is available. Such items will be shipped only after USP receives written authorization by the customer. The order will be canceled if the Reference Standard does not become available within six months of the original order. NOAs not replied to within 45 days of generation will be cancelled, and the customer account will be credited appropriately.

Customers may send confirmation orders for back-ordered Reference Standards that subsequently become available. They must clearly designate the confirmation orders as such—USP is not responsible for duplication of orders not clearly designated.

HOW TO READ PRODUCT LISTINGS

Column 1 (Catalog Number): Catalog number currently assigned to each Reference Standard and Authentic Substance. ***Please include this number in your orders.***

Column 2 (Former Catalog Number): Catalog numbers assigned prior to July 2002. These numbers are provided for your convenience so you can easily cross-reference current numbers against your earlier orders.

Column 3 (Description): Product description as designated in *USP–NF*, the product label, and / or the Drug Enforcement Administration Control Schedule, as applicable. The quantity of material per container follows the name in parentheses (all materials are in single containers unless otherwise specified).

Column 4 (Current Lot): Current lot designation of each ***official*** item being distributed as of the date of this catalog. If the current lot is blank, the item is not in distribution.

Column 5 (Change Code): Codes that identify any change in USP Reference Standards status or information since the **May/June 2003,** official Catalog. Code interpretations are as follows:

Change Code	Interpretation
1	New Reference Standard
2	New lot
3	Change in package size or description
4	Correction of typographical error
5	New catalog number—use for all orders
6	Previous lot no longer official; only current lot to be used
7	Valid use date of previous lot extended
8	Change in catalog number and / or name, see cross-reference section
9	Discontinued

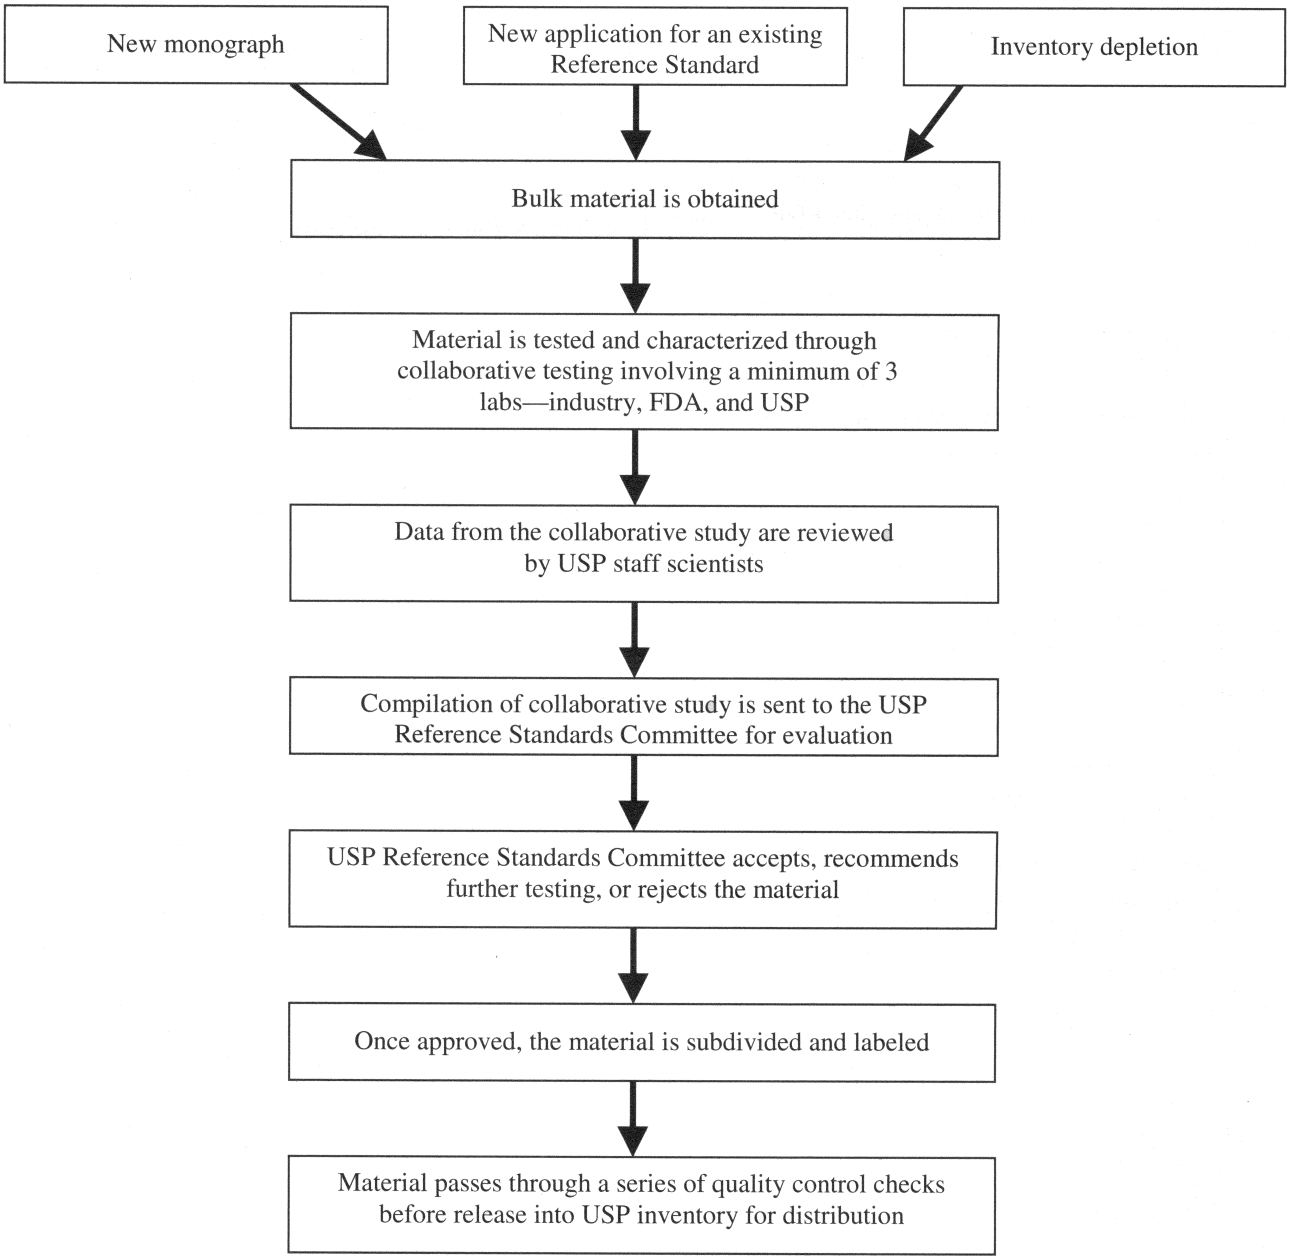
Column 6 (Previous Lot/Valid Use Date): Identifies lots no longer being distributed. The indicated month and in parenthesis indicates the date (last day of the month) through which that lot was valid as an official USP Reference Standard. (e.g. "F-1 (06/00)" means lot F-1 is no longer being distributed, but was considered official through June 30, 2000.)

Column 7 (CAS Number)*: Chemical Abstracts Service number, when available, for USP Reference Standards and Authentic Substances. In case of mixtures, typically, the CAS number of the analyte of interest is listed.

Column 8 (Price) lists the price of the reference standard.

* CAS numbers are provided for informational purposes only and their listing in the USP Reference Standards Catalog does not indicate official designation of any CAS number to a salt, isomer, hydration state, or other chemical form of any specific Reference Standard or Authentic Substance.

DEVELOPMENT PROCESS FOR USP STANDARDS



USP Reference Standards and Authentic Substances

Cat. No.	Former Cat. No.	Description	Curr. Lot	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1000601	00060-1	Acebutolol Hydrochloride (125 mg)	F-1			[34381-68-5]	$150
1001003	00100-3	Acenocoumarol (200 mg)	F			[152-72-7]	$150
1001502	00150-2	Acepromazine Maleate (250 mg)	F-2		F-1 (05/02)	[3598-37-6]	$150
1002505		Acesulfame Potassium (200 mg)	F0C136	1		[55589-62-3]	$250
1003009	00300-9	Acetaminophen (400 mg)	J-1		J (05/02) I (05/99)	[103-90-2]	$119
1004001	00400-1	Acetanilide Melting Point Standard (500 mg) (Approximately 114 degrees)	L		K (02/00)	[103-84-4]	$72
1005004	00500-4	Acetazolamide (2 g)	J			[59-66-5]	$150
1006007	00600-7	Acetohexamide (250 mg)	H		G-1 (06/99)	[968-81-0]	$150

PHARMACOPEIAL FORUM VOL. 29 NO. 5 **SEPT.–OCT. 2003**

* The *USP–NF* (*USP27–NF22*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

Moving?

Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

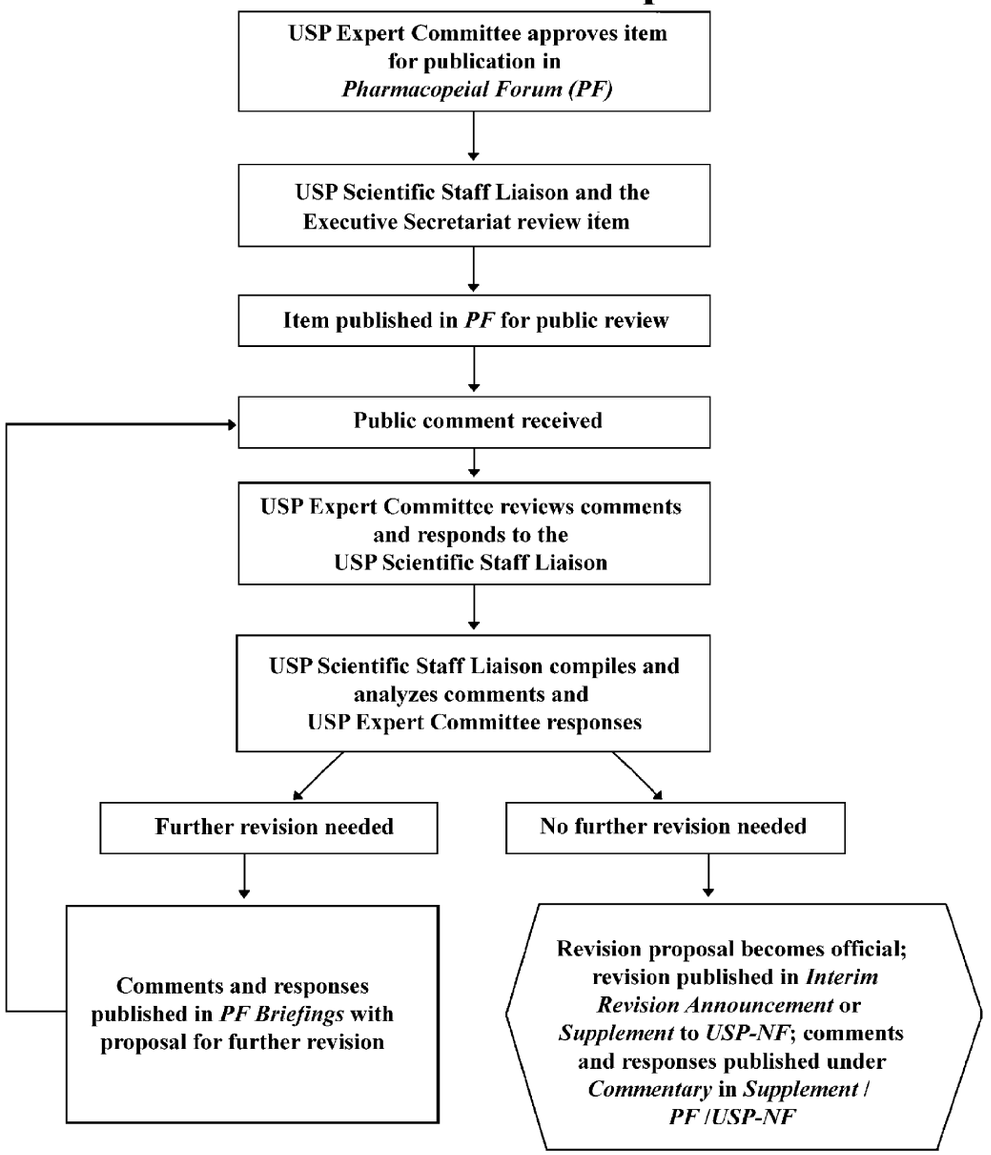
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section.

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed method and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed method and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■■ or ●● or ▲▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision*, both separate sections of *Harmonization.* •For *In-Process Revision*, new or revised text is marked with symbols (■■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 29(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content†
ESC	Excipients—Substances and Characterization†
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7—Antibiotics
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

* **HDQ** Indicates USP Headquarters items.
† The Expert Committee has been renamed. The old name, Excipients—Substances and Characterization (ESC) has been changed to Excipient Monograph Content (EMC).

STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Senior Scientific Associate	cma@usp.org	(301) 816-8139	Pharmaceutical Analysis 1 (PA1)

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

PROPOSED NEW LABELING AND TESTING REQUIREMENTS FOR ACTIVE PHARMACEUTICAL INGREDIENTS INTENDED FOR USE IN FORMULATING INJECTABLE DOSAGE FORMS. Many monographs in the *USP* provide standards of quality for active pharmaceutical ingredients (API) that may be used in formulating injectable dosage forms. Therefore, it is proposed that any such active ingredient should be *labeled* to state either that it is sterile or that it must be subjected to further processing during the formulation of injectable dosage forms. Further, if it is labeled as sterile, it must meet the requirements for *Sterility* and *Bacterial endotoxins*. On the other hand, if the label states that it must be subjected to further processing during the formulation of injectable dosage forms, it must meet the requirements for *Bacterial endotoxins*.

Requirements such as these were adopted about ten yeas ago for a number of active antibiotic pharmaceutical ingredients labeled as "Sterile" or that had to be subjected to further processing during the formulation of injectable dosage forms. Therefore, these requirements are proposed to be applied to a number of active pharmaceutical ingredients. Proposals appearing in this issue of *PF* are presented in groups based on the USP Expert Committee responsible for them, specifically, PA1, PA4, and PA5. Proposals for other active pharmaceutical ingredients will appear in future issues of *PF*.

USP CONFERENCE ON BIOLOGICAL AND BIOTECHNOLOGICAL DRUG SUBSTANCES AND PRODUCTS, NOVEMBER 19–21, 2003.

This conference will be held in the Marriot Crystal City Gateway in Crystal City, Virginia. It is intended for those responsible for the development and maintenance of quality standards in this field. There are several objectives for this meeting:

- To involve industry and regulatory agencies in the development of quality standards for these products
- To promote the utility of standards for these products as necessary from regulatory and quality perspectives
- To involve stakeholders in the development of the future USP blueprint in these areas
- To promote the utility of USP as a neutral body bridging industry and the regulatory agencies for the benefit of public health.

This conference will consist of formal presentations and workshops led by nationally and internationally recognized experts in different areas of interest to the biological and biotechnological industry. Conference topics will include the following:

- Equivalence of biological and biotechnological drug substances and products
- Biotechnology-derived products
- Blood-derived products
- Vaccines
- Cell and gene therapy, and tissue engineering
- Bioassay
- Ancillary products.

For program information, contact Lokesh Bhattacharyya at 301-816-8201 or lb@usp.org. For conference registration information, call 301-816-8226, or register online at www.usp.org/conferences.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF*. We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF*. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

NEW *DIETARY SUPPLEMENTS* SECTION OF THE *USP*. As previously noted in earlier Announcements, beginning with *USP 27–NF 22*, all dietary supplement monographs will appear in the new *Dietary Supplements* section of the *USP*. Also, the section of *Pharmacopeial Forum* that was formerly entitled *Nutritional Supplements*

is being changed to *Dietary Supplements*. Monographs that formerly appeared in the *Nutritional Supplements* section will subsequently appear in the new *Dietary Supplements* section of the *USP* when they become official. Therefore, in addition to retaining the monographs that are in the current *Nutritional Supplements* section, the new section will include the following dietary supplement monographs that will be moved from the *NF*:

Chamomille
Choline Bitartrate
Choline Chloride
Chondroitin Sulfate Sodium
Chondroitin Sulfate Sodium Tablets
Chromium Picolinate
Cranberry Liquid Preparation
Echinacea angustifolia
Echinacea angustifolia, Powdered
Echinacea angustifolia, Powdered Extract
Echinacea pallida
Echinacea pallida, Powdered
Echinacea pallida, Powdered Extract
Echinacea purpurea Root
Echinacea purpurea Root, Powdered Extract
Echinacea purpurea, Powdered
Eleuthero
Eleuthero, Powdered
Eleuthero, Powdered Extract
Feverfew
Feverfew, Powdered
Garlic
Garlic Delayed-Release Tablets
Garlic Fluidextract
Garlic, Powdered
Garlic, Powdered Extract
Ginger
Ginger Tincture
Ginger, Powdered
Ginkgo
Ginseng, American
Ginseng, American, Powdered
Ginseng, American, Powdered Extract
Ginseng, Asian
Ginseng, Asian Tablets
Ginseng, Asian Powdered
Ginseng, Asian, Powdered Extract
Glucosamine and Chondroitin Sulfate Sodium Tablets
Glucosamine Hydrochloride
Glucosamine Sulfate Potassium Chloride
Glucosamine Sulfate Sodium Chloride
Glucosamine Tablets
Goldenseal
Goldenseal, Powdered
Goldenseal, Powdered Extract
Hawthorn Leaf with Flower
Hawthorn Leaf with Flower, Powdered
Horse Chestnut
Horse Chestnut, Powdered
Horse Chestnut, Powdered Extract
Licorice
Licorice, Powdered
Licorice, Powdered Extract
Lipoic Acid, Alpha
Lipoic Acid, Alpha Capsules
Lipoic Acid, Alpha Tablets
Milk Thistle
Milk Thistle Capsules
Milk Thistle Tablets
Milk Thistle, Powdered
Milk Thistle, Powdered Extract
Red Clover
Red Clover Tablets
Red Clover, Powdered
Red Clover, Powdered Extract
St. John's Wort
St. John's Wort, Powdered
St. John's Wort, Powdered Extract
Saw Palmetto
Saw Palmetto Capsules
Saw Palmetto Extract
Saw Palmetto, Powdered
Selenomethionine
Valerian
Valerian Tablets
Valerian, Powdered
Valerian, Powdered Extract

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Barbara B. Hubert, Director, Pharmacopeial Education, BBH@usp.org, 301-816-8333, or Diana Lenahan, Program Associate, DPL@usp.org, 301-816-8530. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2003

Date	Name of course	Location
September 15 and 16	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
September 18	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
September 24	Fundamentals of Titration	USP Headquarters, Rockville, MD
October 8	Analytical Method Validation	USP Headquarters, Rockville, MD
October 20 and 21	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
November 17 and 18	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 8	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 9	Standards 101: Advanced Use of *USP–NF*, General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
December 15 and 16	Fundamentals of Dissolution	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

***USP–NF* AVAILABLE IN THREE ELECTRONIC FORMATS.** The trusted reference for official pharmaceutical standards is available in three convenient electronic formats—CD, intranet, and online. The CD is ideal for single users who prefer to have *USP–NF* on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official *USP–NF* content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

***CHROMATOGRAPHIC REAGENTS* NOW AVAILABLE.** *Chromatographic Reagents* lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in *Pharmacopeial Forum* (*PF*) since 1980. *Chromatographic Reagents* also helps to track which column reagents were used to validate methods that have become official and are included in *USP–NF*. The branded column reagents list is updated bimonthly through *Pharmacopeial Forum*. *Chromatographic Reagents* can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for *USP 27–NF 22* is as follows:

	Comment Deadline	**Publication Date**	**Official Date**
Main Book	May 15, 2003	November 2003	January 2004
Supplement One	October 15, 2003	February 2004	April 2004
Supplement Two	February 17, 2004	June 2004	August 2004

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements*, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2003	Apr. 1, 2003
PF 29(2) [Mar.–Apr. 2003]	Mar. 2003	Not Applicable
2nd IRA [published in *PF* 29(2)]	Mar. 2003	Apr. 1, 2003
PF 29(3) [May–June 2003]	May 2003	Not Applicable
3rd IRA [published in *PF* 29(3)]	May 2003	June 1, 2003
2nd Supplement	June 2003	Aug. 1, 2003
PF 29(4) [July–Aug. 2003]	July 2003	Not Applicable
4th IRA [published in *PF* 29(4)]	July 2003	Aug. 1, 2003
PF 29(5) [Sept.–Oct. 2003]	Sept. 2003	Not Applicable
5th IRA [published in *PF* 29(5)]	Sept. 2003	Oct. 1, 2003
PF 29(6) [Nov.–Dec. 2003]	Nov. 2003*	Not Applicable
6th IRA [published in *PF* 29(6)]	Nov. 2003*	Dec. 1, 2003*

* Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ■new text■, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ■■, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ■2S (*USP 26*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 26*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 26–NF 21*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FIFTH INTERIM REVISION ANNOUNCEMENT to *USP 26* and to *NF 21*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official October 1, 2003. **Released September 1, 2003.**

All inquiries and comments regarding *USP 26* text and *NF 21* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 26* or *NF 21* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Acesulfame Potassium RS (January 1, 2004)
USP Alendronate Sodium RS (November 1, 2003)
USP Allantoin RS (March 1, 2004)
USP Amifostine Disulfide RS (March 1, 2004)
USP Aminopentamide Sulfate RS (September 1, 2003)
USP Amitraz RS (November 1, 2003)
USP Ammonium Chloride RS (March 1, 2004)
USP Powdered Asian Ginsing Extract RS (September 1, 2003)
USP Aspartame Acesulfame RS (March 1, 2004)
USP Betahistine Hydrochloride RS (January 1, 2004)
USP Brinzolamide RS (November 1, 2003)
USP Brinzolamide Related Compound A RS (November 1, 2003)
USP Brinzolamide Related Compound B RS (November 1, 2003)
USP Bupropion Hydrochloride RS (March 1, 2004)
USP Cefipime Hydrochloride RS (January 1, 2004)
USP Cefipime Hydrochloride System Suitability RS (January 1, 2004)
USP Cetyl Palmitate RS (November 1, 2003)
USP Choline Bitartrate RS (January 1, 2004)
USP Choline Chloride RS (March 1, 2004)
USP Chondroitin Sulfate Sodium RS (September 1, 2003)
USP Clozapine RS (November 1, 2003)
USP Copovidone RS (March 1, 2004)
USP Desflurane Related Compound A RS (March 1, 2004)
USP Desogestrel RS (September 1, 2003)
USP Desogestrel Related Compound A RS (September 1, 2003)
USP Desogestrel Related Compound B RS (September 1, 2003)
USP Desogestrel Related Compound C RS (September 1, 2003)
USP Dextran V_o Marker RS (September 1, 2003)

USP 26 MONOGRAPHS

Levothyroxine Sodium Tablets

Change to read:

Dissolution ⟨711⟩—[NOTE—All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass. •Do not use paddle stirrers with synthetic coating.•5]

▲TEST 1—▲*USP26*

Medium: 0.01 N hydrochloric acid containing 0.2% sodium ■lauryl■1S *(USP26)* sulfate; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of methanol and 0.1% phosphoric acid (60:40). •Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).•5

Standard solution—Prepare a stock solution of USP Levothyroxine RS in methanol having a known concentration of about 0.1 mg per mL. Dilute this stock solution with *Dissolution Medium* to obtain a solution having a concentration similar to that expected in the *Test solution*.

Test solution—[NOTE—Prior to use, check the filters for absorptive loss of drug.] Use a filtered portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 800 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

▲TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

Time: 15 minutes.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 15 minutes.▲*USP26*

•TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

Medium: 0.01 N hydrochloric acid; 500 mL for tablets labeled to contain between 25 µg and 175 µg of levothyroxine sodium; 900 mL for tablets labeled to contain 200 µg or 300 µg of levothyroxine sodium.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and 85% orthophosphoric acid (700:500:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution by transferring about 100 mg of USP Levothyroxine RS, accurately weighed, to a 100-mL volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for about 2 minutes, dilute with alcohol to volume, and mix. Dilute this stock solution with a mixture of alcohol and water (1:1) to obtain a solution having a concentration of 0.01 mg of levothyroxine per mL. Dilute this intermediate solution with *Dissolution Medium* to obtain a solution having a concentration similar to that expected in the *Test solution.*

Test solution—Use a centrifuged portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.0-mm × 12.5-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 500 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.•5

Triamterene Capsules

Change to read:

Dissolution ⟨711⟩—

•TEST 1—

Medium: 1% w/v of polysorbate 20 in 0.1 N acetic acid; 900 mL.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Procedure—Proceed as directed for *Test 2.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{12}H_{11}N_7$ is dissolved in 120 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{12}H_{11}N_7$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 357 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Triamterene RS in the same *Medium.*

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{12}H_{11}N_7$ is dissolved in 45 minutes.•5

Interim Revision Announcement

DIETARY SUPPLEMENTS—MONOGRAPHS

Chondroitin Sulfate Tablets

Change to read:

Labeling—Label it to indicate the species of the source from which the chondroitin used to prepare the Tablets was derived. •The label states the content of chondroitin sulfate sodium on the dried basis; the corresponding content of chondroitin sulfate sodium on the hydrous basis may also be stated.•5

Glucosamine and Chondroitin Sulfate Tablets

Change to read:

Labeling—The label indicates the types of glucosamine salts contained in the article, and the species source from which chondroitin was derived. •The label states the content of chondroitin sulfate sodium on the dried basis; the corresponding content of chondroitin sulfate sodium on the hydrous basis may also be stated.•5

⟨724⟩ DRUG RELEASE

Change to read:

EXTENDED-RELEASE ARTICLES—GENERAL DRUG RELEASE STANDARD

Apparatus 1 and Apparatus 2

Apparatus—Proceed as directed under *Dissolution* ⟨711⟩.

Apparatus Suitability Test, Dissolution Medium, and Procedure—Proceed as directed under *Dissolution* ⟨711⟩.

Time—The test-time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ±2% of the stated time.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 1*. Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q_i, the amount dissolved at each specified fractional dosing interval. Where more than one range is specified in the individual monograph, the acceptance criteria apply individually to each range.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Apparatus 3 (Reciprocating Cylinder)

Apparatus—The assembly consists of a set of cylindrical, flat-bottomed glass vessels; a set of glass reciprocating cylinders; stainless steel fittings (type 316 or equivalent) and screens that are made of suitable nonsorbing and nonreactive material and that are designed to fit the tops and bottoms of the reciprocating cylinders; and a motor and drive assembly to reciprocate the cylinders vertically inside the vessels and, if desired, index the reciprocating cylinders horizontally to a different row of vessels. The vessels are partially immersed in a suitable water bath of any convenient size that permits holding the temperature at 37 ± 0.5° during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating cylinder. A device is used that allows the reciprocation rate to be selected and maintained at the dip rate specified in the individual monograph, within ± 5%. An apparatus that permits observation of the specimens and reciprocating cylinders is preferable. The components conform to the dimensions shown in *Figure 1* unless otherwise specified in the individual monograph.

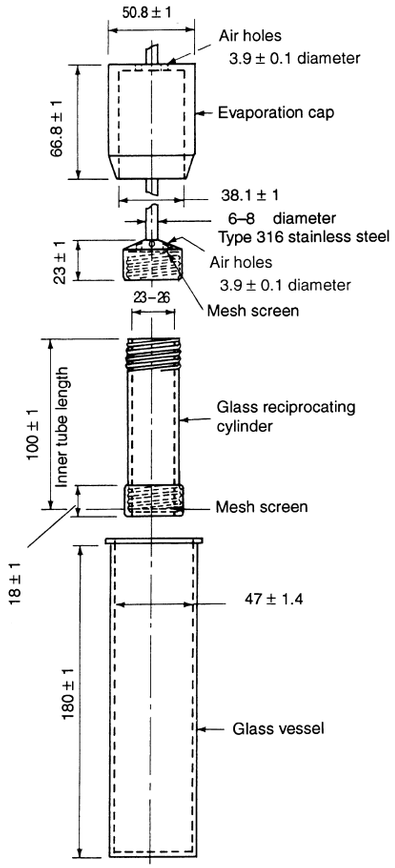

Fig. 1. Apparatus 3.
(All measurements are expressed in mm unless noted otherwise.)

USP Reference Standards ⟨11⟩—USP Chlorpheniramine Extended-Release Tablets RS *(Drug Release Calibrator, Single Unit).*

Apparatus Suitability Test—Individually test 1 tablet of the USP Drug Release Calibrator Tablets (Single Unit) according to the operation conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that calibrator in the apparatus tested.

Dissolution Medium—Proceed as directed under *Dissolution* ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage-form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage-form unit, and immediately operate the apparatus as specified in the individual monograph. During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed in the individual monograph. If necessary, repeat the test with additional dosage-form units.

Where capsule shells interfere with the analysis, remove the contents of not fewer than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of *Dissolution Medium.* Perform the analysis as directed in the individual monograph. Make any necessary correction. Correction factors greater than 25% of the labeled content are unacceptable.

Time and Interpretation—Proceed as directed under *Apparatus 1 and 2.*

Apparatus 4 (Flow-Through Cell)

Apparatus—The assembly consists of a reservoir and a pump for the *Dissolution Medium;* a flow-through cell; a water bath that maintains the *Dissolution Medium* at 37 ± 0.5° (see *Figures 2* and *3*). The cell size is specified in the individual monograph.

(All measurements are expressed in mm unless noted otherwise.)

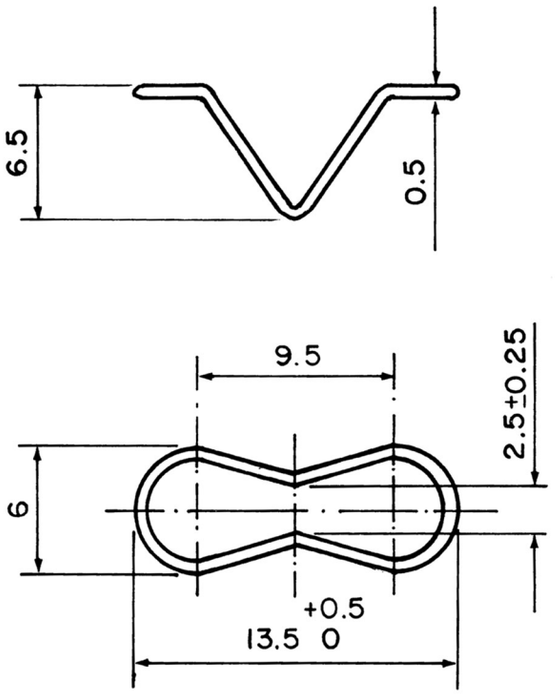

Fig. 3a. Tablet holder for the small cell.
(All measurements are expressed in mm unless noted otherwise.)

The pump forces the *Dissolution Medium* upwards through the flow-through cell. The pump has a delivery range between 240 and 960 mL per hour, with standard flow rates of 4, 8, and 16 mL per minute. It must be volumetric to deliver constant flow independent of flow resistance in the filter device; the flow profile is sinusoidal with a pulsation of 120 ± 10 pulses per minute.

The flow-through cell (see *Figures 2* and *3*), of transparent and inert material, is mounted vertically with a filter system (specified in the individual monograph) that prevents escape of undissolved particles from the top of the cell; standard cell diameters are 12 and 22.6 mm; the bottom cone is usually filled with small glass beads of about 1-mm diameter with one bead of about 5 mm positioned at the apex to protect the fluid entry tube; a tablet holder (see *Figures 2a* and *3a*) is available for positioning of special dosage forms, for example, inlay tablets. The cell is immersed in a water bath, and the temperature is maintained at 37 ± 0.5°.

The apparatus uses a clamp mechanism and two O-rings for the fixation of the cell assembly. The pump is separated from the dissolution unit in order to shield the latter against any vibrations originating from the pump. The position of the pump should not be on a level higher than the reservoir flasks. Tube connections are as short as possible. Use polytef tubing with a 1.6-mm inner diameter and chemically inert flanged-end connections.

Apparatus Suitability Test and Dissolution Medium—Proceed as directed under *Dissolution* ⟨711⟩.

Interim Revision Announcement

Procedure—Place the glass beads into the cell specified in the monograph. Place 1 dosage-form unit on top of the beads or, if specified in the monograph, on a wire carrier. Assemble the filter head and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified in the individual monograph and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed in the individual monograph. Repeat the test with additional dosage-form units.

Where capsule shells interfere with the analysis, remove the contents of not fewer than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of *Dissolution Medium.* Perform the analysis as directed in the individual monograph. Make any necessary correction. Correction factors greater than 25% of the labeled content are unacceptable.

Time and Interpretation—Proceed as directed under *Apparatus 1 and 2.*

Change to read:

TRANSDERMAL DELIVERY SYSTEMS—GENERAL DRUG RELEASE STANDARDS

Apparatus 5 (Paddle over Disk)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described under *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly[1] designed for holding the transdermal system at the bottom of the vessel. Other appropriate devices may be used, provided they do not sorb, react with, or interfere with the specimen being tested[2]. The temperature is maintained at 32 ± 0.5°. A distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly is maintained during the test. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any "dead" volume between the disk assembly and the bottom of the vessel. The disk assembly holds the system flat and is positioned such that the release surface is parallel with the bottom of the paddle blade (see *Figure 4*).

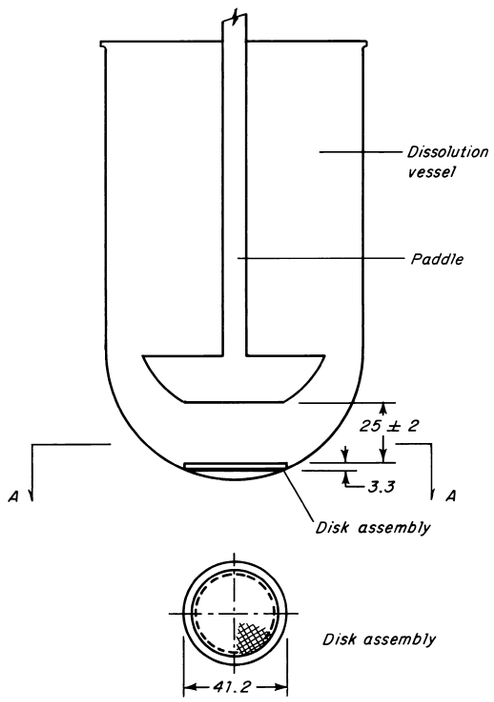

Fig. 4. Paddle Over Disk.
(All measurements are expressed in mm unless noted otherwise.)

Apparatus Suitability Test and Dissolution Medium—Proceed as directed for *Apparatus 2* under *Dissolution* ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5°. Apply the transdermal system to the disk assembly, assuring that the release surface of the system is as flat as possible. The system may be attached to the disk by applying a suitable adhesive[3] to the disk assembly. Dry for 1 minute. Press the system, release surface side up, onto the adhesive-coated side of the disk assembly. If a membrane[4] is used to support the system, it is applied so that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up

[1] Disk assembly (stainless support disk) may be obtained from Millipore Corp., Ashley Rd., Bedford, MA 01730.

[2] A suitable device is the watchglass-patch-polytef mesh sandwich assembly available as the Transdermal Sandwich™ from Hanson Research Corp., 9810 Variel Ave., Chatsworth, CA 91311.

Change to read:

[3] Use Dow Corning, •MD7-4502 Silicone Adhesive 65% in ethyl acetate,•5 or the equivalent.

[4] Use Cuprophan, Type 150 pm, 11 ± 0.5-µm thick, an inert, porous cellulosic material, which is available from Medicell International Ltd., 239 Liverpool Road, London NI ILX, England.

Interim Revision Announcement

and parallel to the edge of the paddle blade and surface of the *Dissolution Medium.* The bottom edge of the paddle is 25 ± 2 mm from the surface of the disk assembly. Immediately operate the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

Time—The test time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ±15 minutes or ±2% of the stated time, the tolerance that results in the narrowest time interval being selected.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 4* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 4

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units (L_1 + L_2) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units (L_1 + L_2 + L_3) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range; and none of the units is outside the stated range by more than 20% of the average of the stated range.

Apparatus 6 (Cylinder)

Apparatus—Use the vessel assembly from *Apparatus 1* as described under *Dissolution* ⟨711⟩, except to replace the basket and shaft with a stainless steel cylinder stirring element and to maintain the temperature at 32 ± 0.5° during the test. The shaft and cylinder components of the stirring element are fabricated of stainless steel to the specifications shown in *Figure 5*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

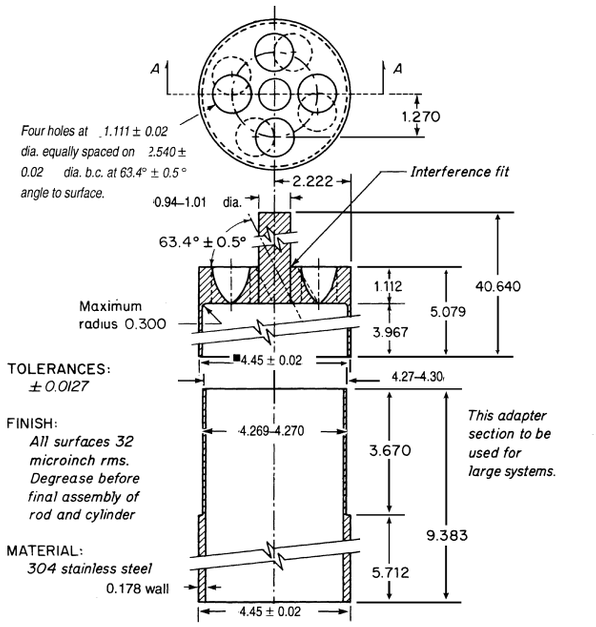

Fig. 5. Cylinder Stirring Element.[5]
(All measurements are expressed in cm unless noted otherwise.)

Dissolution Medium—Use the medium specified in the individual monograph (see *Dissolution* ⟨711⟩).

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5°. Unless otherwise directed in the individual monograph, prepare the test system prior to the test as follows. Remove the protective liner from the system, and place the adhesive side on a piece of Cuprophan[4] that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan covered side down, on a clean surface, and apply a suitable adhesive[3] to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 minute. Carefully apply the adhesive-coated side of the system to the exterior of the cylinder such that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

Time—Proceed as directed under *Apparatus 5.*

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 4* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

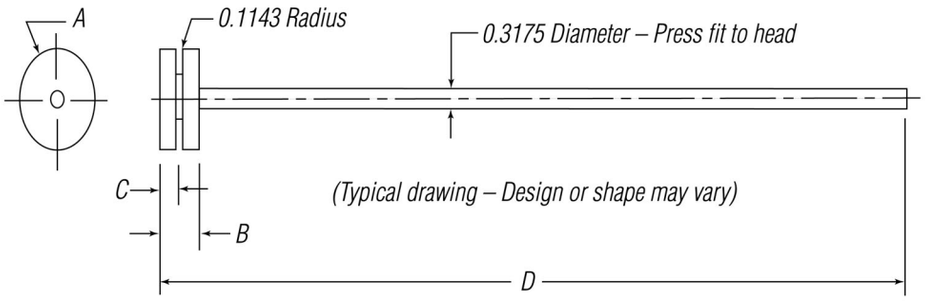
[5] The cylinder stirring element is available from Accurate Tool, Inc., 25 Diaz St., Stamford, CT 06907, or from VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513.

Interim Revision Announcement

Apparatus 7 (Reciprocating Holder)

NOTE—This apparatus may also be specified for use with a variety of dosage forms.

Apparatus—The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material[6], a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels automatically if desired, and a set of suitable sample holders (see *Figure 6* and *Figures 7a–7d*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T,* inside the containers at 32 ± 0.5° or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder. Apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder as specified in the individual monograph.



Dimensions are in centimeters

	HEAD				ROD		O-RING

[c] SS/P=Either stainless steel or Plexiglas.

Fig. 6. Reciprocating Disk Sample Holder.[7]

[6] The materials should not sorb, react with, or interfere with the specimen being tested.

[7] The reciprocating disk sample holder may be purchased from ALZA Corp., 1900 Charleston Road, P.O. Box 7210, Mt. View, CA 94039–7210 or VanKel Technology Group.

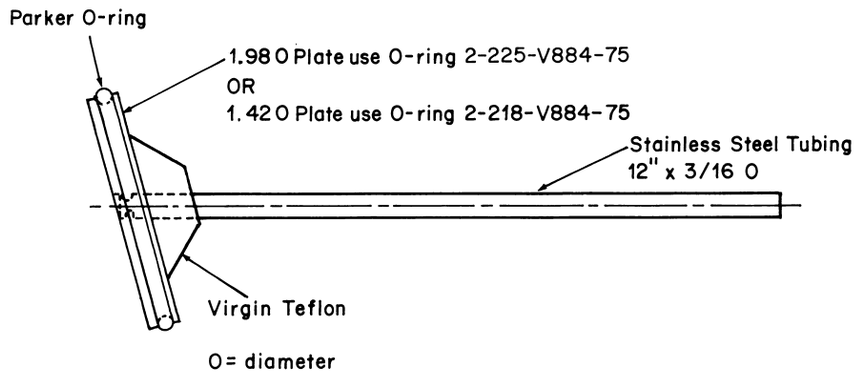

Fig. 7a. Transdermal system holder—angled disk.

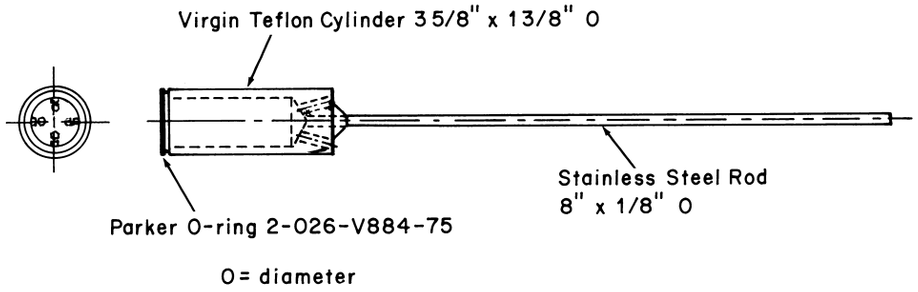

Fig. 7b. Transdermal system holder—cylinder.

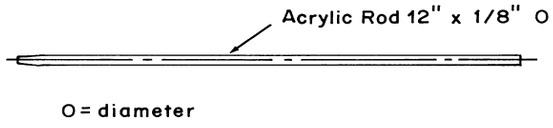

Fig. 7c. Oral extended-release tablet holder—rod, pointed for gluing.

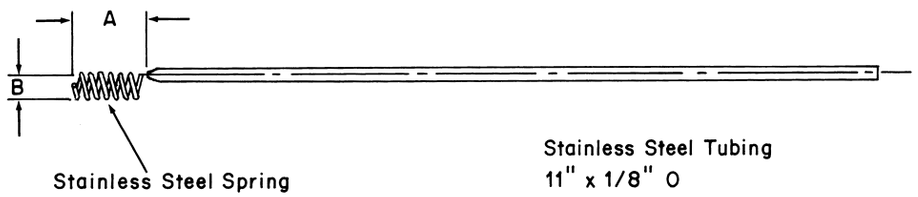

Stainless Steel Spring Dimensions

A	B
1.45	.58 O
1.40	.31 O
.96	.33 O
.60	.25 O

O = diameter

Fig. 7d. Oral extended-release tablet holder—spring holder.

Dissolution Medium—Use the *Dissolution Medium* specified in the individual monograph (see *Dissolution* ⟨711⟩).

Sample Preparation A (Coated tablet drug delivery system)—Attach each system to be tested to a suitable sample holder (e.g., by gluing system edge with 2-cyano acrylate glue onto the end of a plastic rod or by placing the system into a small nylon net bag at the end of a plastic rod or within a metal coil attached to a metal rod).

Sample Preparation B (Transdermal drug delivery system)—Press the system onto a dry, unused piece of Cuprophan[4], nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitable sized sample holder with a suitable O-ring such that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

Sample Preparation C (Other drug delivery systems)—Attach each system to be tested to a suitable holder as described in the individual monograph.

Procedure—Suspend each sample holder from a vertically reciprocating shaker such that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container pre-equilibrated to temperature, *T.* Reciprocate at a frequency of about 30 cycles per minute with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (i.e., water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 1* for coated tablet drug delivery systems, to *Acceptance Table 4* for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 26–NF 21*. The page number indicates where the item is found in *USP 26–NF 21*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions; (2) proposed revisions placed directly under *In-Process Revision*; or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, thus:

•new text•

if slated for an *Interim Revision Announcement to USP 26–NF 21* (*IRA*), thus:

▲new text▲*USP27*

if slated for *USP 27–NF 22*, and thus:

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, and ■2S (*USP 27*) indicates that the proposed revision is slated for the *Second Supplement to USP 27*, and ▲*USP27* and ▲*NF22* indicate that the revisions are proposed for *USP 27* and *NF 22*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

In-Process Revision

MONOGRAPHS (USP)

BRIEFING

Alprostadil, *USP 26* page 67 and page 2941 of the *First Supplement;* **Carboprost Tromethamine,** *USP 26* page 339; **Cortisone Acetate,** *USP 26* page 517; **Desoxycorticosterone Acetate,** *USP 26* page 556; **Dexamethasone Acetate,** *USP 26* page 562; **Diethylstilbestrol,** *USP 26* page 604; **Ergonovine Maleate,** *USP 26* page 721; **Estradiol,** *USP 26* page 742; **Conjugated Estrogens,** *USP 26* page 747; **Estrone,** *USP 26* page 750; **Hydrocortisone,** *USP 26* page 913 and page 2969 of the *First Supplement;* **Hydroxyprogesterone Caproate,** *USP 26* page 933; **Medroxyprogesterone Acetate,** *USP 26* page 1139 and page 2974 of the *First Supplement;* **Methylergonovine Maleate,** *USP 26* page 1206; **Methylprednisolone Acetate,** *USP 26* page 1211; **Nandrolone Decanoate,** *USP 26* page 1269; **Prednisolone Acetate,** *USP 26* page 1529; **Progesterone,** *USP 26* page 1554; **Ritodrine Hydrochloride,** *USP 26* page 1652; **Testosterone,** *USP 26* page 1781; **Triamcinolone Acetonide,** *USP 26* page 1864. Revisions are proposed to establish consistency with the system of labeling established in 1993 by the USP Drug Nomenclature Committee (page 5618 of *PF* 19(4)[July–Aug. 1993]). Specifically, it is now proposed to include in each monograph of drug substances (active pharmaceutical ingredients) intended for use in preparing injectable dosage forms, a statement that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed stating that, where the label states that it is sterile, it must meet the requirements of the test for *Sterility* ⟨71⟩ and of the test for *Bacterial endotoxins* ⟨85⟩. In addition, where the label states that it must be subjected to further processing during the preparation of injectable dosage forms, it must meet the requirements of the test for *Bacterial endotoxins* ⟨85⟩. In some of the monographs it is also proposed to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

(PA1: C. Anthony) RTS—40156-1

In-Process Revision

Add the following:

■**Labeling—**Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■2S (*USP27*)

Change to read:

USP Reference standards ⟨11⟩—*USP Alprostadil RS.*

■*USP Endotoxin RS.*■2S (*USP27*)
USP Prostaglandin A_1 RS. ■*USP Prostaglandin B_1 RS.*■*USP26*

Change to read:

Limit of foreign prostaglandins—

▲TEST 1—

NOTES—Use freshly prepared solutions. Measure the peak responses at the following wavelengths: prostaglandin A_1 at 224 nm; prostaglandin B_1 at 280 nm; and all other foreign prostaglandin impurities at 200 nm.

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Alprostadil RS, USP Prostaglandin A_1 RS, and USP Prostaglandin B_1 RS in a mixture of methanol and water (9:1), and dilute quantitatively, and stepwise if necessary, with a mixture of methanol and water (9:1) to obtain a solution having known concentrations of about 6 µg per mL, 15 µg per mL, and 6 µg per mL, respectively.

Test solution—Dissolve about 15 mg of Alprostadil, accurately weighed, in 5 mL of a mixture of methanol and water (9:1), and mix.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution between prostaglandin A_1 and alprostadil is not less than 7.5, and the relative standard deviation from the peaks at their respective wavelength for replicated injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses at 200 nm, 224 nm, and 280 nm. Calculate the percentage of prostaglandin A_1 and prostaglandin B_1 in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Prostaglandin A_1 RS or USP Prostaglandin B_1 RS in the *Standard solution; W* is the weight, in mg, of Alprostadil taken for the *Test solution; r_i* is the peak response for prostaglandin A_1 or prostaglandin B_1 obtained from the *Test solution;* and r_S is the peak response of prostaglandin A_1 or prostaglandin B_1 obtained from the *Standard solution:* not more than 1.5% of prostaglandin A_1 is found; and not more than 0.1% of prostaglandin B_1 is found. Calculate the percentage of each impurity occurring at 200 nm and eluting before prostaglandin A_1 in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard solution; r_i* is the peak response for each impurity obtained from the *Test solution; r_S* is the peak response for alprostadil obtained from the *Standard solution;* and the other terms are as defined herein: not more than 0.9% of any foreign prostaglandin impurity is found. Calculate the percentage of any impurity having a relative retention time of 0.6, relative to the prostaglandin A_1 peak detected at 224 nm, in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Prostaglandin A_1 RS in the *Standard solution; r_i* is the peak response for any impurity having a relative retention time of 0.6, relative to the prostaglandin A_1 peak, obtained from the *Test solution; r_S* is the peak response of prostaglandin A_1 obtained from the *Standard solution;* and the other terms are as defined herein: not more than 0.9% of any impurity having a relative retention time of 0.6, relative to the prostaglandin A_1 peak, is found.

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of methanol, acetonitrile, and 0.02 M monobasic potassium phosphate (2:1:1), and adjust with phosphoric acid to a pH of 3. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Alprostadil RS in a mixture of acetonitrile and water (1:1) to obtain a solution having a known concentration of about 10 µg per mL.

Test solution—Dissolve about 25 mg of Alprostadil, accurately weighed, in 5 mL of a mixture of acetonitrile and water (1:1), using ultrasound if necessary.

Identification solution—Use the *Standard solution* under *Test 1.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a photodiode array detector or equivalent capable of detecting UV wavelengths between 200 nm and 300 nm and a 4.6-mm x 25-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Identification solution* as directed for *Procedure:* the relative retention times for prostaglandin A_1 and alprostadil are about 1.2 and 1.0, respectively; the resolution between prostaglandin A_1 and alprostadil is not less that 4.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation determined from the main peak for replicated injections is not ~~less~~

▲more▲*USP27*
than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses at 200 nm, 224 nm, and 280 nm. Calculate the percentage of each impurity occurring at 200 nm and eluting after prostaglandin A_1, excluding prostaglandin B_1, in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard solution; W* is the weight, in mg, of Alprostadil taken for the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for alprostadil obtained from the *Standard solution:* the sum of the peaks having relative retention times of 2.0 and 2.3 is not more than 0.6%; not more than 0.9% of any other foreign prostaglandin impurity is found; and not more than 2.0% of total impurities is found, the results for *Test 1* and *Test 2* being added.▲*USP26*

Add the following:

■**Other requirements—**Where the label states that Alprostadil is sterile, it meets the requirements of the tests for *Sterility* and *Bacterial endotoxins* under *Alprostadil Injection.* Where the label states that Alprostadil must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements of the test for *Bacterial endotoxins* under *Alprostadil Injection.*■2S (*USP27*)

BRIEFING

Amifostine, *USP 26* page 110; **Aminocaproic Acid,** *USP 26* page 119; **Atenolol,** *USP 26* page 185; **Bretylium Tosylate,** *USP 26* page 263; **Bumetanide,** *USP 26* page 274; **Chlorothiazide,** *USP 26* page 425; **Deslanoside,** *USP 26* page 553; **Diazoxide,** *USP 26* page 590; **Dipyridamole,** *USP 26* page 644; **Dobutamine Hydrochloride,** *USP 26* page 651; **Dopamine Hydrochloride,** *USP 26* page 659; **Ethacrynic Acid,** *USP 26* page 754; **Fenoldopam Mesylate,** *USP 26* page 776 and page 2964 of the *First Supplement;* **Furosemide,** *USP 26* page 837; **Hydralazine Hydrochloride,** *USP 26* page 907; **Inamrinone,** *USP 26* page 958; **Labetalol Hydrochloride,** *USP 26* page 1051; **Menadiol Sodium Diphosphate,** *USP 26* page 1145; **Menadione,** *USP 26* page 1146; **Metaraminol Bitartrate,** *USP 26* page 1173; **Methyldopate Hydrochloride,** *USP 26* page 1203; **Methylene Blue,** *USP 26* page 1205; **Metoprolol Tartrate,** *USP 26* page 1222; **Diluted Nitroglycerin,** *USP 26* page 1319; **Norepinephrine Bitartrate,** *USP 26* page 1327; **Papaverine Hydrochloride,** *USP 26* page 1395; **Phentolamine Mesylate,** *USP 26* page 1455; **Procainamide Hydrochloride,** *USP 26* page 1543; **Propranolol Hydrochloride,** *USP 26* page 1577; **Quinidine Gluconate,** *USP 26* page 1605; **Reserpine,** *USP 26* page 1625; **Sodium Nitrite,** *USP 26* page 1700; **Sodium Nitroprusside,** *USP 26* page 1700; **Tolazoline Hydrochloride,** *USP 26* page 1852; **Urea,** *USP 26* page 1912; **Verapamil Hydrochloride,** *USP 26* page 1924. It is proposed to revise these monographs to establish consistency with the system of labeling established in 1993 by the USP Drug Nomenclature Committee (see page 5618 of *PF* 19(4) [July-Aug. 1993]). Specifically, for drug substances (active pharmaceutical ingredients) intended for use in preparing injectable dosage forms, it is proposed to include a *Labeling* statement to indicate that the drug substance is sterile or must be subjected to further processing during the preparation of injectable dosage forms. A new section on *Other requirements* is proposed to specify that where the label states that it is sterile, it must meet the requirements under *Sterility Tests* ⟨71⟩ and *Bacterial Endotoxins Test* ⟨85⟩. In addition, where the label states that it must be subjected to further processing during the preparation of injectable dosage forms, it must meet the requirements under *Bacterial Endotoxins Test* ⟨85⟩. Also, in several of these monographs, it is proposed to revise the section on *Packaging and storage* to indicate appropriate storage temperatures.

BRIEFING

Azithromycin, *USP 26* page 199 and page 50 of *PF* 29(1) [Jan.–Feb. 2003]. It is proposed to provide standards of quality for Azithromycin that is in the form of the monohydrate, in addition to the current form, which is the dihydrate. It is proposed to revise the section on *Labeling* to require that the article be labeled to state whether it is the monohydrate or the dihydrate. It is proposed to provide different *Water* limits of not less than 1.8% and not more than 4.0% for the monohydrate form of Azithromycin. The theoretical *Water* content of Azithromycin (monohydrate) is 2.35%. In addition, because of the possible presence of adsorbed surface moisture, a *Loss on drying* test using the thermogravimetric technique is proposed that would reveal *Loss on drying* in two stages: the determination of surface or adsorbed water by heating it from ambient temperature to about 80°, and the loss of monohydrate between 80° and 130°. While the monohydrate may adsorb surface water, Azithromycin dihydrate does not.

Add the following:

■**Loss on drying** (where it is labeled as Azithromycin monohydrate and has a *Water* content of between 4.0% and 6.5%) (see *Thermal Analysis* ⟨891⟩)—[NOTE—The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity.] Determine the percentage of volatile substances by thermogravimetric analysis in an appropriately calibrated instrument, using about 10 mg of Azithromycin, accurately weighed. Heat the specimen at the rate of 10° per minute between ambient temperature and 150° in an atmosphere of nitrogen at a flow rate of 100 mL per minute. From the thermogram determine the accumulated loss in weight between ambient temperature and

In-Process Revision

about 80° on the plateau, and from 80° to 130°: it loses not more than 4.5% of its weight between ambient temperature and about 80°, and between 1.8% and 2.6% between 80° and 130°.■2S (*USP27*)

Add the following:

▲**Limit of related substances—**[NOTE—Use water that has a resistivity of not less than 18 Mohm-cm.]

Mobile phase—Proceed as directed in the *Assay.*

pH 7.5 Potassium phosphate buffer—Transfer 2.7 g of monobasic potassium phosphate to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Adjust with 10 N potassium hydroxide to a pH of 7.5 ± 0.1.

Dilution solution—Prepare a mixture of *pH 7.5 Potassium phosphate buffer* and acetonitrile (750:250).

Standard stock solution—Dissolve accurately weighed quantities of USP Desosaminylazithromycin RS, USP *N*-Demethylazithromycin RS, and USP Azithromycin RS quantitatively with acetonitrile to obtain a solution having known concentrations of about 45, 105, and 160 µg per mL, respectively.

Standard solution—Transfer 4.0 mL of *Standard stock solution* to a 200-mL volumetric flask, dilute with *Dilution solution* to volume, and mix. This solution contains known concentrations of USP Desosaminylazithromycin RS, USP *N*-Demethylazithromycin RS, and USP Azithromycin RS of about 0.9, 2.1, and 3.2 µg per mL, respectively.

Test solution—Transfer about 33 mg of Azithromycin, accurately weighed, to a 100-mL volumetric flask, add 5 mL of acetonitrile, and sonicate for about 20 seconds to dissolve. Dilute with *Dilution solution* to volume, and mix. [NOTE—Use this solution within 6 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an amperometric electrochemical detector with dual glassy carbon electrodes operated in the oxidative screen mode with electrode 1 set at +0.70 ± 0.05 V and electrode 2 set at +0.85 ± 0.05 V , and the background current optimized to 95 ± 25 nanoamperes, a 4.6-mm × 5-cm guard column that contains 5-µm packing L29, and a 4.6-mm × 15-cm analytical column that contains 5-µm packing L29 or 3-µm packing L49 without the guard column. [NOTE—In general, maintain electrode 1 at 0.12 V less than electrode 2, and maintain the electrodes at a constant temperature of about 26°.] The flow rate is about 0.4 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.38 for desosaminylazithromycin, 0.54 for *N*-demethylazithromycin, and 1.0 for azithromycin; the column efficiency is not less than 1500 theoretical plates for the azithromycin peak; the tailing factor for each of these compounds is not more than 1.5; and the relative standard deviation for replicate injections is not more than 5% for each of these compounds.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, using an elution period for the *Test solution* that is 3.3 times the elution time of the azithromycin peak in the chromatogram of the *Standard solution,* and measure the areas for all of the peaks. Calculate the percentages of desosaminylazithromycin and *N*-demethylazithromycin in the Azithromycin taken by the formula:

$$0.1(CP/W)(r_i / r_S),$$

in which C is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard solution; P* is the designated potency, in percentage, of the relevant Reference Standard; W is the weight, in mg, of Azithromycin taken to prepare the *Test solution;* and r_i and r_S are the peak area responses for the relevant analyte in the chromatograms

In-Process Revision

obtained from the *Test solution* and the *Standard solution,* respectively. Calculate the percentages of other related substances in the Azithromycin taken by the formula:

$$0.01(CP/W)(r_i/r_S),$$

in which C is the concentration, in µg per mL, of USP Azithromycin RS in the *Standard solution; P* is the designated purity, in µg per mg, of USP Azithromycin RS; W is the weight, in mg, of Azithromycin taken to prepare the *Test solution;* r_i is the peak area response for an individual related substance peak in the chromatogram obtained from the *Test solution;* and r_S is the peak area response for the azithromycin peak in the chromatogram obtained from the *Standard solution.* Not more than 0.3% of desosaminylazithromycin, 0.7% of *N*-demethylazithromycin, and 1.0% of any other individual related substance is found, and the sum of all related substances is not more than 3.0%.▲*USP27*

BRIEFING

BCG Live. Because there is no existing *USP* monograph for this article, a new monograph is being proposed.

(VVI: L. Bhattacharyya) RTS—40073-1; 40074-1; 40075-1; 40076-1

Add the following:

■BCG Live

» BCG Live is a freeze-dried preparation of attenuated live bacteria derived from a culture of Bacillus Calmette-Guérin (*Mycobacterium bovis,* var. BCG) and used in the treatment of carcinoma *in situ* and papilloma tumors of the urinary bladder. The bacteria are grown in a medium that does not contain substances known to cause toxic or allergic reactions in human beings or to cause the bacteria to become virulent for guinea pigs. The culture is harvested and formulated to contain one or more excipients. The freeze-dried preparation is reconstituted and diluted further aseptically with a sterile diluent for use. A reconstituted dose contains 1.0–19.2 $\times 10^8$ cfu. BCG Live does not contain a preservative.

Packaging and storage—Preserve in single-dose hermetic Type I glass containers and store at a temperature between 2° and 8° away from direct sunlight. Do not freeze.

Expiration date—The product is stable for 1 year when stored between 2° and 8°.

Labeling—Label it to indicate the dry weight of bacteria in a vial, cfu per dose, storage conditions, expiration date, and that it is not to be used after the expiration date given on the package. Label it to state that it should be protected from direct sunlight and that it should be used immediately after reconstitution/dilution. Label it to indicate that it is for intravesical use and "Rx only."

Identification—

Carbol fuchsin solution—Transfer 10 g of basic fuchsin powder and 100 mL of alcohol to a 100-mL bottle. Mix using a magnetic stir bar and a magnetic stirrer to dissolve. Transfer the solution to a 1-L Erlenmeyer flask. Add 50 mL of Liquefied Phenol and 850 mL of water. Mix, and filter. Store at room temperature. [NOTE—The solution is stable up to 3 months when stored at ambient temperature.]

Acid–alcohol solution—Transfer 970 mL of alcohol to a 1-L bottle, add 30 mL of hydrochloric acid, and mix. Store at room temperature. [NOTE—The solution is stable up to 3 months when stored at ambient temperature.]

Methylene blue solution—Transfer 4.5 g of methylene blue to a 2-L Erlenmeyer flask, and add 450 mL alcohol. Add 150 mg of potassium hydroxide and 1500 mL of water to the flask. Mix until the solutes dissolve and filter. Store at ambient temperature. [NOTE—The solution is stable up to 1 year when stored at ambient temperature.]

Standard suspension—Use approved U.S. Reference BCG Live.

Test suspension—Reconstitute the freeze-dried BCG Live according to the manufacturer's instructions for human use with the diluent recommended by the manufacturer.

Negative control—Use the diluent recommended by the manufacturer for reconstitution of BCG Live.

Procedure—Prepare a suitable bacteriological loop and flame it where it joins the handle until it is red-hot. Allow the loop to cool down to room temperature without touching anything. Transfer a loop-full of each of the *Standard suspension,* the *Test suspension,* and the *Negative control* on separate slides. Wash the loop in a stream of water, flame it, and allow it to cool down as described above in between the transfers. [NOTE—Alternatively separate loops may be used for the transfer of different solutions.] Heat-fix each slide by passing it over a flame four times. [NOTE—Too much heat may cause the slide to break.] Flood the slides with the *Carbol fuchsin solution,* and heat them over a steam bath for about 5 minutes. [NOTE—Make sure that the entire slide is covered with the *Carbol fuchsin solution* throughout the staining procedure.] Rinse the slides with water. Flood the slides with the *Acid–alcohol solution* until no more color comes out and the slides are clear of stain visible to the naked eye (about 30 seconds). Rinse the slides thoroughly with water and drain any excess water from the slides. Flood the slides with the *Methylene blue solution* for about 30 seconds to 1 minute, and rinse them with water. Examine the slides under a microscope. Bacteria in the *Standard suspension* and the *Test suspension* stain red, and the negative control is colorless. The morphological characteristics of the stains from the *Test suspension* are similar to those from the *Standard suspension*.

Safety—It meets the requirements as set forth for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

Sterility ⟨71⟩— It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined.*

Virulent mycobacteria—

Test suspension—Reconstitute the freeze-dried BCG Live according to the manufacturer's instructions for human use with the diluent recommended by the manufacturer and dilute aseptically to about 5 mg per mL with sterile 0.9% sodium chloride solution.

Procedure—Randomly select not less than six guinea pigs (male or female), each weighing 250 to 300 g. Inject each animal with 1.0 mL of the *Test suspension* intramuscularly in the rear left internal thigh, and observe them for a period of 6 weeks. Note the number of animals that survive at the end of the observation period, and then sacrifice them. Perform autopsies of all animals post mortem to examine them for microscopic tuberculous infections, particularly at the popliteal and inguinal lymph nodes, lungs, as well as at the injection site. If the results are not conclusive, perform a histological examination following the procedure described in *Identification,* except for the following: suitable tissue sections are used instead of the *Test suspension,* no *Standard suspension* is required, and the tuberculous infections are demonstrated by red stains in a blue background. [NOTE—The blue color is due to the staining of the nonacid-fast cells by methylene blue.] At the end of the observation period, not less than two-thirds of the animals survive; no

In-Process Revision

sign of tuberculosis is detected in animals that survive, as well as those that died; and the animals that survive gain weight.

Skin reactivity—

Test suspensions—Reconstitute the freeze-dried BCG Live according to the manufacturer's instructions for human use with the diluent recommended by the manufacturer. Dilute the solution further 1:10, 1:100, and 1:1000 aseptically using the same diluent.

Procedure—Randomly select four guinea pigs (male or female), each weighing 250 to 300 g. Inject 0.1 mL of each of the four suspensions intradermally at different sites on the back of each animal. After 4 weeks, the animals are shaved so that the injection sites and any reactions are made clearly visible. The diameters of the reactions are measured and the presence of necrosis or nodules noted. The reaction for the largest dose is between 4 and 10 mm and the smallest dose inducing no nodule. Each animal gains weight during the observation period.

Tuberculin sensitivity—

Tuberculin solution—Use tuberculin, purified protein derivative, solution containing 25 U.S. Tuberculin Units per 0.1 mL. Dilute aseptically, if necessary, with sterile 0.9% sodium chloride solution.

Procedure—Perform on the same animals on which the *Skin reactivity* test is performed. After the *Skin reactivity* test is completed, inject each animal intradermally with 0.1 mL of the *Tuberculin solution* on the back and observe after 18 to 24 hours. An erythematous reaction of not less than 10 mm in diameter is measured on each animal.

Residual moisture, *Method Ic* ⟨921⟩: Not more than 2.5%.

Viability—Determine the potencies of BCG Live using not less than 5 containers before freeze-drying and an equal number of containers after freeze-drying, following the procedure described under *Potency,* except use the vaccine before freeze-drying as is. The loss in viability due to freeze-drying is not more than 90%.

Potency—

Culture medium—Prepare the culture medium as described below: Dissolve, adjust the pH to 7.0 with a sodium hydroxide solution, and sterilize by filtration.

Components	Weight
Asparagine	5.0 g
Monobasic potassium phosphate	5.0 g
Potassium sulfate	0.5 g
Magnesium citrate	1.5 g
Monosodium glutamate	19.0 g
Glycerin	20.0 mL
Water	900.0 mL
5% aqueous solution of albumin bovine serum	100.0 mL

Agar solution—Transfer 1.5 g of agar to an Erlenmeyer flask and add 100 mL of water. Close the mouth airtight with a suitable cotton plug and autoclave at 120° for 15 to 30 minutes. With the mouth tightly closed by the cotton plug, cool the solution to 42° and maintain in a water bath at 42° until use.

Test suspensions—Reconstitute not less than 5 containers of the freeze-dried BCG Live according to the manufacturer's instructions for human use with the diluent recommended by the manufacturer.

Procedure—[NOTE—Work in a laminar-flow biological safety cabinet under aseptic conditions.] Transfer 4.5 mL of the *Culture medium* to each of a series of 16 mm × 125 mm screw-capped test tubes. Arrange the tubes in rows such that each row contains 10 tubes. Mark the tubes from 1 to 10. Add 0.5 mL of thoroughly mixed *Test suspension* from one container to the first test tube (Tube number 1)

In-Process Revision

of a row, mix, and transfer 0.5 mL to the next test tube (Tube number 2). Mix thoroughly and transfer 0.5 mL to the next test tube (Tube number 3). Repeat the process of mixing and serially transferring to each consecutive tube and discard 0.5 mL from the last test tube. Repeat the same process to serially dilute reconstituted vaccine from the other containers such that the reconstituted vaccine from each container can be diluted serially along separate rows. From each row select the test tube that is expected to contain 10 to 50 cfu, and the test tubes that have immediately higher and immediately lower cfu, and incubate them in a water bath at 42° for about 10 minutes. Add 0.5 mL of *Agar solution* to each test tube, mix thoroughly, transfer on a sterile 0.5% agar-gel plate, and immediately spread the solution uniformly on the plate. Incubate the plates at 35° to 37° for 3 to 4 weeks. For each container, count the number of colonies on the plates that contain between 10 to 50 of them and calculate the cfu in each container.■2S (*USP27*)

BRIEFING

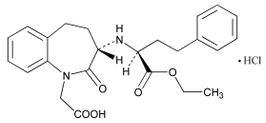
Benazepril Hydrochloride, page 1768 of *PF* 28(6) [Nov.–Dec. 2002]. This new monograph is presented again with changes proposed by the innovator firm. It is proposed to include *Absorbance of solution* and *Absorbtivity* sections, and a test for chlorides in the *Identification* section. It is also proposed to modify *Test 2, Related compounds* section, to include benazepril related compounds C, D, E, F, and G, and to specify their limits. The proposed method is based on the analyses performed with the µBondapak C-18 brand of L1 column; the typical retention time for benazepril hydrochloride is 6.5 minutes. The storage statement is amended according to PSD guidelines.

(PA5: A.Wilk) RTS—39650-1

In-Process Revision

Add the following:

■Benazepril Hydrochloride



$C_{24}H_{28}N_2O_5 \cdot HCl$ ~~460.96~~ 460.95

1 *H*-1-Benzazepine-1-acetic acid, 3-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-, monohydrochloride, [*S*-(*R**,*R**)]-.

(3*S*)-3-[[(1*S*)-1-Carboxy-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, 3-ethyl ester, monohydrochloride [*86541-74-4*].

» Benazepril Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{28}N_2O_5 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at a temperature below 30°, preferably between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Benazepril Hydrochloride RS. USP Benazepril Related Compound A RS. USP Benazepril Related Compound B RS. USP Benazepril Related Compound C RS. USP Benazepril Related Compound D RS. USP Benazepril Related Compound E RS. USP Benazepril Related Compound F RS. USP Benazepril Related Compound G RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It responds to the test for *Chloride* ⟨191⟩.

Absorbance of solution—The absorbance of a 1 in 100 solution of it in methanol, determined in a 2-cm cell at 420 nm, is not more than 0.03, methanol being used as the blank.

Absorbtivity—

Test Preparation: 25 mg in 1000 mL of methanol.

Procedure—Proceed as directed under *Spectrophotometry and Light-Scattering* ⟨851⟩, and measure the absorbance at 238 nm: the absorptivity is between 21.0 and 23.2.

~~**Specific rotation** ⟨781S⟩: between −136° and −141°, determined at 20°.~~

~~*Test solution:* 10 mg per mL, in dehydrated alcohol.~~

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than ~~1.5%~~ 0.5% of its weight.

Residue on ignition ⟨281⟩—Ignite at 600°. Not more than 0.1% residue is found.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

~~**Limit of ethyl acetate**~~

~~*Standard solution*~~ ~~Pipet 0.5 mL of ethyl acetate into a 100-mL volumetric flask, and determine the weight added by difference. Dissolve in and dilute with dimethylformamide to volume, and mix. Pipet 3.0 mL of this solution into a 25-mL volumetric flask, dilute with dimethylformamide to volume, and mix. Pipet 1.0 mL of this solution into a 10-mL volumetric flask, dilute with dimethylformamide to volume, and mix.~~

~~*Test solution*~~ ~~Transfer 100 mg of Benazepril Hydrochloride, accurately weighed, to a 1-mL volumetric flask. Dissolve in and dilute with dimethylformamide to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)~~ ~~The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with support S1 S2. The carrier gas is helium, flowing at a rate of 30 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 160° for 8 minutes, then the temperature is increased at a rate of 20° per minute to 200°, and maintained at 200° for 20 minutes. The injection port temperature is maintained at 120°, and the detector is maintained at 270°.~~

~~*Procedure*~~ ~~Separately inject equal volumes (about 2 µL) of the *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage, by weight, of ethyl acetate in the portion of Benazepril Hydrochloride taken by the formula:~~

$$~~0.012(W_S/W_U)(r_U/r_S),~~$$

~~in which W_S is the weight, in mg, of ethyl acetate taken to prepare the *Standard solution;* W_U is the weight, in mg, of Benazepril Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses of ethyl acetate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of ethyl acetate is found.~~

~~**Limit of chloroform and alcohol**~~

~~*Standard solution*~~ ~~Pipet 0.5 mL each of chloroform and alcohol into separate 100-mL volumetric flasks, and determine the weight of each by difference. Dissolve in and dilute the contents of each flask with dimethylformamide to volume, and mix. Pipet 2.0 mL of each of these solutions into a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix.~~

~~*Test solution*~~ ~~Prepare as directed for *Test solution* under *Limit of ethyl acetate.*~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)~~ ~~Proceed as directed for *Limit of ethyl acetate*, except to increase the column temperature from 160° to 300° 200°, and maintain at 300° 200° for 30 minutes.~~

~~*Procedure*~~ ~~Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the~~

In-Process Revision

~~areas for the major peaks. Separately calculate the percentages, by weight, of chloroform and alcohol in the portion of Benazepril Hydrochloride taken by the formula:~~

~~$0.02(W_S / W_U)(r_U / r_S)$,~~

~~in which W_S is the weight, in mg, of either chloroform or alcohol taken to prepare the *Standard solution*; W_U is the weight, in mg, of Benazepril Hydrochloride taken to prepare the *Test solution*; and r_U and r_S are the peak responses of either chloroform or alcohol obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% 0.1% of chloroform is found; and not more than 0.1% 0.5% of alcohol is found.~~

Related compounds—

TEST 1 *(for benazepril related compound A)—*

~~*Zinc sulfate solution*—Dissolve 0.719 g of zinc sulfate heptahydrate in sufficient water to make 1000 mL. Dilute 100 mL of this solution with water to 1000 mL, and mix.~~

pH 6.0 Phosphate buffer—Dissolve 9.66 g of monobasic potassium phosphate and 2.68 g of dibasic sodium phosphate, heptahydrate in about 900 mL of water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of ~~*Zinc sulfate solution* and dehydrated alcohol (975:25).~~ *pH 6.0 Phosphate buffer* and methanol (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Benazepril stock solution*—Dissolve an accurately weighed quantity of USP Benazepril RS in *Zinc sulfate solution* to obtain a solution having a known concentration of about 0.5 mg per mL.~~

Resolution solution—~~Pipet 25.0 mL of *Benazepril stock solution* and 25.0 mL of *Standard solution* into a suitable flask, and mix. Prepare a mixture of *Benazepril stock solution* and *Standard solution* (1:1).~~ Dissolve an accurately weighed quantity of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound A RS in *Mobile phase,* and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL and 0.005 mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Benazepril Related Compound A RS in ~~*Zinc sulfate solution*~~ *Mobile phase* to obtain a solution having a known concentration of about ~~0.5 mg~~ 0.05 mg per mL.

Standard solution—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 5 µg per mL.

Dilute standard solution—~~Pipet 1.0 mL of the *Standard solution* into a 100-mL volumetric flask, and dilute with *Benazepril stock solution* to volume.~~ Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

Test solution—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a ~~100-mL~~ 50-mL volumetric flask, dissolve in and dilute with ~~*Zinc sulfate solution*~~ *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a ~~4.6-mm × 25-cm~~ 4.0-mm × 10-cm column that contains packing ~~L32.~~ L41. The flow rate is about ~~1 mL~~ 0.9 mL per minute. The column temperature is maintained at ~~50°.~~ 30°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~1.8~~ 2.3 for benazepril related compound A and 1.0 for benazepril hydrochloride; and the resolution, *R,* between benazepril hydrochloride and benazepril related compound A is not less than ~~5.0.~~ 2.0. Chro-

In-Process Revision

matograph the *Dilute standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is ~~greater~~ not less than 10:1. Chromatograph the *Standard solution:* the relative standard deviation for replicate injections determined from the benazepril ~~hydrochloride~~ related compound A peak is not more than ~~3.5%.~~ 10%.

Procedure—Separately inject equal volumes (about 50 µL) of the ~~*Dilute standard*~~ *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ~~areas for all the peaks.~~ area for the benazepril related compound A peak. Calculate the percentage of benazepril related compound A in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Benazepril Related Compound A RS in the ~~*Dilute standard*~~ *Standard solution;* C_T is the concentration, in mg per mL, of Benazepril Hydrochloride in the *Test solution;* r_U is the peak response for benazepril related compound A obtained from the *Test solution;* and r_S is the peak response for benazepril related compound A obtained from the ~~*Dilute standard*~~ *Standard solution:* not more than ~~0.5%~~ 0.1% of benazepril related compound A is found.

TEST 2 *(for benazepril related compound B, ~~and other impurities)~~ C, D, E, F, and G)—*

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—~~Pipet 5.0 mL of *System suitability solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Dissolve accurately weighed quantities of USP Benazepril Related Compound B RS, USP Benazepril Related Compound C RS, USP Benazepril Related Compound D RS, USP Benazepril Related Compound E RS, USP Benazepril Related Compound F RS, and USP Benazepril Related Compound G RS in *Mobile phase* to obtain a solution having known concentrations of about 10 µg per mL of each related compound.

Test solution—Transfer about ~~100~~ 50 mg of Benazepril Hydrochloride, accurately weighed, to a ~~100-mL~~ 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for ~~benazepril related compound B.~~ all the peaks. Calculate the percentage of benazepril related compounds ~~B~~ in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of ~~USP Benazepril Related Compound B RS~~ the relevant Reference Standard in the *Standard solution;* C_T is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution;* r_U is the peak response for the relevant benazepril related compound ~~B~~ obtained from the *Test solution;* and r_S is the peak response for the relevant benazepril related compound ~~B~~ obtained from the *Standard solution* (See *Table 1* for values). ~~not more than 1.0% of benazepril related compound B is found. Calculate the percentage of each impurity (other than benazepril related compound B) in the portion of Benazepril Hydrochloride taken by the formula:~~

~~$100(F r_i / r_S),$~~

~~in which *F,* the relative response factor, is equal to 0.53, 0.66, and 0.86 for peaks with relative retention times of 0.43, 0.51, and 0.60, respectively, and 1.0 for all other peaks; 0.4 [(3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid], 0.5 [*t*-butyl-(3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetate], and~~

In-Process Revision

~~0.6 [(3-(1-carboxy-3-phenyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid], respectively, and 1.0 for all other peaks including peaks at relative retention times of 1.8 [(3-(1-ethoxyearbonyl-3-cyclohexyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid] and 2.1 [ethyl (3-(1-ethoxycarbonyl-3-phenyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid]; *r*$_i$ is the peak response for each impurity obtained from the *Test solution;* and *r*$_s$ is the sum of the responses of all the peaks: not more than 0.5% of any impurity is found; and not more than 2.0% of total impurities is found, the results of *Test 1* and *Test 2* being added.~~

Table 1

Relative Retention Time	Benazepril Related Compound	Limit (%)
0.4	E[1]	0.2
0.5	F[2]	0.2
0.6	C[3]	0.3
1.5	B[4]	0.5
1.7	D[5]	0.2
2.0	G[6]	0.2

[1] 3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid

[2] t-butyl-3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid

[3] (3-(1-carboxy-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid

[4] Mixture of diastereoisomers (3-(1-ethoxycarbonyl-3-phenyl-(1*R*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid and and (3-(1-ethoxycarbonyl-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*R*)-benzazepine)-1-acetic acid

[5] (3-(1-ethoxycarbonyl-3-cyclohexyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid

[6] (3-(1-ethoxycarbonyl-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid ethyl ester

In addition to not exceeding the limits for benazepril related compounds in *Table 1*, not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities (excluding benazepril related compound A from *Test 1*) is found.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Solvent: dimethylformamide.

Assay—

Tetrabutylammonium bromide solution—Dissolve 0.81 g of tetrabutylammonium bromide in 360 mL of water containing 0.2 mL of glacial acetic acid.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Tetrabutylammonium bromide solution* ~~(2:1).~~ (64:36). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound B RS in *Mobile phase* to obtain a solution having known concentrations of about ~~0.2 mg~~ 0.4 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Benazepril Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer about ~~50 mg~~ 10 mg of Benazepril Hydrochloride, accurately weighed, to a ~~250-mL~~ 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 0.3-cm guard column that contains ~~7-µm~~ packing L1 connected to a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and

In-Process Revision

record the peak responses as directed for *Procedure:* ~~the relative retention times are about 1.5 for benazepril related compound B and 1.0 for benazepril hydrochloride;~~ the resolution, *R,* between benazepril hydrochloride and benazepril related compound B is not less than ~~4.0;~~ 1.7 and the relative standard deviation for replicate injections determined from benazepril hydrochloride and benazepril related compound B is not more than ~~1.0%~~ 2.0% for each.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $C_{24}H_{28}N_2O_5 \cdot HCl$ in the portion of Benazepril Hydrochloride taken by the formula:

$$250C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

Packaging and storage—Preserve in collapsible tubes or in tight containers.

■Store at 25°, excursions permitted between 15° and 30°. Protect from freezing.■2S (*USP27*)

Change to read:

~~**Identification—**~~

■Thin-layer chromatographic identification test ⟨201⟩—■2S (*USP27*)

~~Transfer about 1.5 g of Cream to a glass-stoppered, 50-mL centrifuge tube. Add 15 mL of methanol-hydrochloric acid solution prepared by mixing 1 volume of dilute hydrochloric acid (1 in 120) with 4 volumes of methanol. Shake to obtain a homogeneous mixture. Add 30 mL of solvent hexane, mix for 10 minutes, and centrifuge. Using a suitable syringe, transfer the lower aqueous phase to a second centrifuge tube, add about 20 mL of water, and mix. Extract this aqueous mixture with chloroform by shaking, centrifuging, and removing the lower, chloroform phase with a syringe. Evaporate the chloroform on a steam bath with the aid of a stream of nitrogen to dryness, cool, and dissolve the residue in chloroform to obtain a solution containing about 150 µg of betamethasone dipropionate per mL. Apply 40 µL of this solution and 40 µL of a Standard solution of USP Betamethasone Dipropionate RS in chloroform containing 150 µg per mL to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograph in a solvent system consisting of a mixture of chloroform and acetone (7:1) until the solvent has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Observe the dried spots under a short-wavelength (254-nm) UV light source: the R_F value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.~~

■*Test solution*—Transfer about 1.5 g of Cream to a glass-stoppered, 50-mL centrifuge tube. In-Process Revision

during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Bupivacaine Hydrochloride Injection*.■2S (*USP27*)

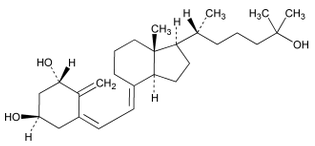
BRIEFING

Calcitriol. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for *Chromatographic purity* and in the *Assay* is based on analyses performed with the Symmetry or Zorbax brands of L7 column. The typical retention time for calcitriol is about 17 to 20 minutes. See also the briefing under *Calcitriol Injection*.

(PA4: E. Gonikberg) RTS—37377-1

Add the following:

■Calcitriol



$C_{27}H_{44}O_3$ 416.64

9,10-Secocholesta-5,7,10(19)-triene-1,3,25-triol, (1α,3β,5*Z*,7*E*)-.

(5*Z*,7*E*)-9,10-Secocholesta-5,7,10(19)-triene-1α,3β,25-triol [*32222-06-3*].

» Calcitriol contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{44}O_3$, calculated on the anhydrous basis.

Caution—Care should be taken to prevent inhaling particles of Calcitriol and exposing the skin to it.

Packaging and storage—Preserve in tight, light-resistant containers, and store under nitrogen in a refrigerator between 2° and 8°.

USP Reference standards ⟨11⟩—*USP Calcitriol RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Chromatographic purity—[NOTE—Avoid unnecessary exposure of solutions to light or air.]

Buffer solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard preparation* in the *Assay.*

Standard solution—Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Prepare as directed for *Assay preparation* in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph; record the chromatograms for at least two times the retention time of the calcitriol peak; and measure the peak responses, disregarding any peak having an area less than 0.1 times that of the main peak in the chromatogram of the *Standard solution*. Calculate the percentage of any individual impurity in the portion of Calcitriol taken by the formula:

$$100(r_i / r_s),$$

In-Process Revision

in which r_i is the peak response of any individual peak other than the main calcitriol peak and the precalcitriol peak; and r_s is the sum of the responses of all the peaks: not more than 0.5% of any individual impurity is found; and not more than 1.0% of total impurities is found.

Assay—[NOTE—Avoid unnecessary exposure of solutions to light or air.]

Tris buffer solution—Dissolve 1.0 g of tris(hydroxymethyl)aminomethane in 900 mL of water, adjust with phosphoric acid to a pH of 7.0 to 7.5, dilute with water to make 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Tris buffer solution* (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Prepare a solution of USP Calcitriol RS in *Mobile phase* (without heating) having a known concentration of about 100 µg of calcitriol per mL.

System suitability solution—Heat 2.0 mL of the *Standard preparation* at 80° for 30 minutes.

Assay preparation—Transfer about 1.0 mg of Calcitriol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume without heating, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for precalcitriol and 1.0 for calcitriol; the resolution, *R*, between precalcitriol and calcitriol is not less than 3.5; and the relative standard deviation for replicate injections, determined from the calcitriol peak, is not more than 1.0%. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 10,000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of $C_{27}H_{44}O_3$ in the portion of Calcitriol taken by the formula:

$$10C(r_U / r_S),$$

in which *C* is the concentration, in µg per mL, of calcitriol in the *Standard preparation;* and r_U and r_S are the peak responses of the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Calcitriol Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Ultrasphere ODS brand of 5-µm L1 guard column and the Ultrasphere ODS brand of 3-µm L1 analytical column. The typical retention time for calcitriol is about 20 to 25 minutes. See also the briefing under *Calcitriol*.

(PA4: E. Gonikberg) RTS—37377-2

In-Process Revision

Add the following:

■Calcitriol Injection

» Calcitriol Injection is a terminally sterilized solution of Calcitriol. It contains an amount of Calcitriol equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of calcitriol ($C_{27}H_{44}O_3$). It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature (15° to 30°).

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Calcitriol Solution RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 100 USP Endotoxin Units per µg of calcitriol.

pH ⟨791⟩: between 5.9 and 7.0, determined on a portion to which 0.30 mL of saturated potassium chloride solution has been added for each 100 mL of Injection.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Aluminum ⟨206⟩: not more than 1 µg per mL.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—[NOTE—Avoid unnecessary exposure of solutions to light or air.]

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (74:26). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩) so that the retention time for calcitriol is not less than 20 minutes.

Standard preparation—Transfer 3.0 mL of USP Calcitriol Solution RS, equilibrated to room temperature, to a container, add 3.0 mL of water, and mix.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 3 µg of calcitriol, to a container, add a sufficient amount of water to dilute to a total volume of 3.0 mL, add 3.0 mL of methanol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 264-nm detector, a 4.6-mm × 4.5-cm guard column that contains 5-µm packing L1; and a 4.6-mm × 7.5-cm analytical column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of calcitriol ($C_{37}H_{44}O_3$) in the portion of the Injection taken by the formula:

$$6C(r_U / r_S),$$

in which C is the concentration, in µg per mL, of calcitriol in the *Standard preparation,* calculated based on the content of calcitriol in the USP Calcitriol Solution RS; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Cefadroxil, *USP 26* page 353. It is proposed to simplify and improve the thin-layer chromatographic procedure in the test for *Chromatographic purity.* It has been reported that no spots were detected after developing and spraying the plate and allowing it to air dry. In addition, when the sprayed plate was heated for 20 minutes at 110°, the spots were faint and barely detected. On the other hand, it was also found that observing the unsprayed plate under short-wavelength UV light provided good visualization. It is therefore proposed to omit the spraying with ninhydrin solution and to use short-wavelength UV light for visualization. On the basis of a suggestion received, it is also proposed to include a reference solution of D-α-4-hydroxyphenylglycine to confirm the elution position of that entity. In addition, editorial style changes have been made.

(PA7: W. Wright) RTS—39819-1

Change to read:

Chromatographic purity—

Adsorbent: a 0.25-mm layer fo chromatographic silica gel mixture.

Solvent—Prepare a mixture of alcohol, water, and 2.4 N hydrochloric acid (75:22:3).

Test solution—Prepare a solution of Cefadroxil in *Solvent* containing 25 mg per mL.

Standard solution 1—Dilute 1.0 mL of the *Test solution* with *Solvent,* to 100 mL and mix.

Standard solution 2—Prepare a solution in *Solvent* containing 0.25 mg each of 7-aminodesacetoxycephalosporanic acid and D-α-4-hydroxyphenylglycine per mL.

■*Standard solution 3*—Prepare a solution in *Solvent* containing 0.25 mg of D-α-4-hydroxyphenylglycine per mL.■2S (*USP27*)

Resolution solution—Mix 1.0 mL of the *Test solution* and 1.0 mL of *Standard solution 2.*

Developing solvent system: a mixture of ethyl acetate, alcohol, water, and formic acid (14:5:5:1).

Procedure—Apply separate 2-µL portions of the *Test solution, Standard solution 1, Standard solution 2,* and

■*Standard solution 3,* and■2S (*USP27*)
a 4-µL portion of the *Resolution solution* to a suitable thin-layer chromatographic plate (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩), and develop the chromatograms until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the plate to dry, ~~Spray the plate with a solution prepared by dissolving 3 g of ninhydrin in 100 mL of a 4.55% solution of sodium metabisulfite. Allow the plate to dry,~~

■■2S (*USP27*)
and examine the chromatograms

■under short-wavelength UV light:■2S (*USP27*)
any secondary spot in the chromatogram obtained from the *Test solution* corresponding to 7-aminodesacetoxycephalosporanic acid or D-α-4-hydroxyphenylglycine is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 2* (1.0%), and any spot, other than the principal spot and any spot corresponding to 7-aminodesacetoxycephalosporanic acid or D-α-4-hydroxyphenylglycine, is not more intense than the principal spot in the chromatogram obtained from *Standard solution 1* (1.0%). In a valid test, the chromatogram obtained from the *Resolution solution* shows three clearly separated spots.

BRIEFING

Cefepime Hydrochloride, *USP 26* page 358. It is proposed to improve the system suitability requirements in the liquid chromatographic test for *Related compounds.* Currently, the requirement for the resolution, *R,* between cefepime related compound A and cefepime related compound B is not less than 10. It is proposed to add a second resolution requirement of not less than 5 between cefepime and cefepime related compound A.

(PA7: W. Wright) RTS—39828-1

Change to read:

Related compounds~~—~~

Potassium phosphate solution—Dissolve 0.68 g of monobasic potassium phosphate in 1000 mL of water.

Solution A—Prepare a mixture of *Potassium phosphate solution* and acetonitrile (9:1). Adjust with a potassium hydroxide solution (2 in 100) to a pH of 5.0, filter, and degas.

Solution B—Prepare a mixture of *Potassium phosphate solution* and acetonitrile (1:1). Adjust with a potassium hydroxide solution (2 in 100) to a pH of 5.0, filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Cefepime Hydrochloride System Suitability RS in *Solution A* containing about 1.4 mg per mL.

Test solution—Transfer about 70 mg of Cefepime Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, sonicate, and mix. [NOTE—Inject this solution immediately, or store in a refrigerator and inject within 12 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	100	0	isocratic
10–30	100→50	0→50	linear gradient
30–35	50	50	isocratic
35–36	50→100	50→0	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 2.7 for cefepime related compound A, 4.3 for cefepime related compound B, and 1.0 for cefepime; and the resolution, *R,*

■between cefepime and cefepime related compound A is not less than 5 and■2S (*USP27*)
between cefepime related compound A and cefepime related compound B is not less than 10. Chromatograph the *Test solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′,* is more than 0.6; the column efficiency is not less than 4000 theoretical plates; and the tailing factor is not more than 1.1.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Cefepime Hydrochloride taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.3% of cefepime related compound A is found; not more than 0.2% of cefepime related compound B is found; and not more than 0.1% of any other impurity is found.

In-Process Revision

BRIEFING

Cefuroxime Axetil for Oral Suspension, page 3086 of the *Second Supplement to USP 26*. It is proposed to revise the liquid chromatographic *Assay* for *Cefuroxime Axetil for Oral Suspension*. It is proposed to delete the *Internal standard solution* from the method. It has been found that the main peak for acetanilide obtained with the *Internal standard solution* occurs at about the same retention time as an impurity peak in the chromatogram of the *Assay preparation* without the *Internal standard solution*. It is also proposed to add a system suitability test for resolution between cefuroxime axetil and cefuroxime axetil delta-3 isomers.

(PA7: W. Wright) RTS—39989-1

Change to read:

Assay—

0.2 M Monobasic ammonium phosphate, Mobile phase, ~~*Internal standard solution, Resolution solution, Standard preparation,*~~

■■2S (*USP27*)
and *Chromatographic system*—Proceed as directed in the *Assay* under *Cefuroxime Axetil*.

■*Resolution solution*—In a 50-mL volumetric flask, mix 10.0 mL of a solution of USP Cefuroxime Axetil RS in methanol containing 1.2 mg per mL, 5.0 mL of methanol, and 3.8 mL of a solution of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol containing 0.16 mg per mL. Dilute with *0.2 M Monobasic ammonium phosphate* to volume, and mix.

Standard preparation—Transfer about 30 mg of USP Cefuroxime Axetil RS, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Promptly transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 8.8 mL of methanol, dilute with *0.2 M Monobasic ammonium phosphate* to volume, and mix.■2S (*USP27*)

Assay preparation—Transfer to a 100-mL volumetric flask an accurately measured portion of Cefuroxime Axetil for Oral Suspension, freshly mixed and free from air bubbles, constituted as directed in the labeling, and equivalent to about 250 mg of cefuroxime. Add about 50 mL of methanol, and shake by mechanical means for about 10 minutes. Dilute with methanol to volume, and mix. Filter a portion of this stock solution, and transfer 5.0 mL of the filtrate to a 50-mL volumetric flask. Add ~~5.0 mL of *Internal standard solution* and 8.8 mL~~

■13.8 mL■2S (*USP27*)
of methanol, dilute with *0.2 M Monobasic ammonium phosphate* to volume, and mix. [NOTE—Protect this *Assay preparation* from light and use promptly, or refrigerate and use on the day prepared.]

Procedure—Proceed as directed in the *Assay* under *Cefuroxime Axetil*. Calculate the quantity, in mg, of cefuroxime ($C_{16}H_{16}N_4O_8S$) in each mL of Cefuroxime Axetil for Oral Suspension taken by the formula:

~~$(W_S P_S/12500V)(100-K)(R_U/R_S)$,~~

■$(W_S P_S /12{,}500V)(100 - K)(r_U / r_S)$,■2S (*USP27*)

in which V is the volume, in mL, of Cefuroxime Axetil for Oral Suspension taken to prepare the *Assay preparation;*

■r_U and r_S are the sums of the peak responses of the cefuroxime axetil diasterioisomers A and B obtained from the *Assay preparation* and the *Standard preparation,* respectively;■2S (*USP27*)
and the other terms are as defined therein.

In-Process Revision

BRIEFING

Clonidine Transdermal System, page 265 of *PF* 28(2) [Mar.–Apr. 2002]. It is proposed to change the wording in *Tolerances* under the *Drug release* test to better describe the rate of drug release in vitro.

(BPC: M. Marques) RTS—38682

Add the following:

■Clonidine Transdermal System

» Clonidine Transdermal System contains not less than ~~80.0 percent and not more than 120.0 percent of the labeled amount of clonidine ($C_9H_9Cl_2N_3$).2.0 mg and not more than 3.0 mg of clonidine, if labeled to deliver 0.1 mg of clonidine per day for one week; not less than 4.0 mg and not more than 6.0 mg of clonidine, if labeled to deliver 0.2 mg of clonidine per day for one week; and not less than 6.0 mg and not more than 9.0 mg of clonidine, if labeled to deliver 0.3 mg of clonidine per day for one week.~~ 80.0 percent and not more than 120.0 percent of the labeled amount of clonidine ($C_9H_9Cl_2N_3$).

Packaging and storage—Preserve in sealed, single-dose containers at a temperature not exceeding 30°.

Labeling—The label states the total amount of clonidine in the Transdermal System and the release rate, in mg per day, for the duration of the application of one system.

USP Reference standards ⟨11⟩—*USP Clonidine Hydrochloride RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Uniformity of dosage units ⟨905⟩: meets the requirements.

Drug release ⟨724⟩—

Medium: 0.001 M phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; ~~160 mL~~ 200 mL for systems containing more than 5 mg of clonidine.

Time: 8, 24, 96, and 168 hours.

~~*Apparatus 7*—Proceed as directed in the chapter. [Size of sample holder to come.]~~

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder-angled disk (see *Figure 7a*). The appropriate size of the holder, 1.42"or 1.98", should be chosen based on the size of the system to prevent overhang. Use 100-mL beakers for *Medium* volumes of 80 mL and 300-mL beakers for *Medium* volumes of 200 mL. Gently press the transdermal system to a dry, smooth, square piece of cellulose membrane*, or equivalent, with the adhesive side against the membrane. Attach the membrane/system to a suitable inert sample holder with a Viton O-ring, or equivalent, such that the backing of the system is adjacent to, and centered on, the bottom of the sample holder. Trim the excess of cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker such that each system is continuously immersed in a beaker containing the specified volume of *Medium.* The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3° prior to immersing the test sample. Agitate the sample in an up-down motion at a frequency of 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. The *Medium* must be added daily to the beakers during each interval to maintain sample im-

* A suitable cellulose membrane is available as Cuprophan 80M, from Membrana GmbH, Oehder Strasse 28, D-42289, Wuppertal, Germany, fax number +49 02 02 60 57 15.

mersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium*, weighed and pre-equilibrated to 32.0 ± 0.3°.

Determine the amount of $C_9H_9Cl_2N_3$ released by employing the following method.

~~*Solvent*—Dissolve 2.04 g of monobasic potassium phosphate and 2.88 g of 1-pentanesulfonic acid sodium 1-pentanesulfonate in 300 mL of water. Adjust with phosphoric acid to a pH of 3.5.~~

Mobile phase—~~Prepare a filtered and degassed mixture of *Solvent* and methanol (26:14). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~ Use a filtered and degassed 0.1% solution of triethylamine in a mixture of water and methanol (70:30), adjust with phosphoric acid to a pH of 6.0 ± 0.2. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Test solution*—At each of the test times, withdraw a 10-mL aliquot of the solution from each container.~~

~~*Standard solution*—Prepare a solution of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of clonidine similar to that of the *Test solution.*~~

System suitability solution—Prepare a solution of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of about 10 µg per mL.

Standard solutions—Prepare a minimum of four standard solutions of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the *Test solutions.*

Test solutions—At the end of each release interval, allow beakers to cool to room temperature and make up for evaporative *Medium* losses by adding *Medium* to obtain the original weight. Mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~210-nm~~ 220-nm detector and a ~~4.0-mm × 30-cm~~ 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than ~~2~~ 2.0; the capacity factor is not less than 0.5; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about ~~50 µL~~ 25 µL) of filtered portions of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Construct a standard curve of concentration (µg per mL) of clonidine in the *Standard solutions* versus peak area by linear regression analysis. The correlation coefficient is not less than 0.995. Calculate the release rate of clonidine by the formula:

$$CV/TA,$$

in which C is the concentration, µg per mL, of clonidine in the sample obtained from the standard curve; V is the volume, in mL, of the *Medium;* T is the time, in hours; and A is the area, in cm^2, of the transdermal system.

~~*Tolerances*—The amount of $C_9H_9Cl_2N_3$ released, as a percentage of the labeled amount of the dose absorbed in vivo, as µg per hour per cm^2, at the times specified conforms to *Acceptance Table 4.*~~

~~Time (hours)~~	~~Amount dissolved~~
~~8~~	~~between 28% and 68%~~
~~96~~	~~between 116% and 288%~~
~~168~~	~~between 170% and 357%~~

In-Process Revision

~~The amount of $C_9H_9Cl_2N_3$ released, as a percentage of the labeled amount of the dose absorbed in vivo, as µg per hour per cm², at the times specified conforms to *Acceptance Table 4.*~~ The release rate of $C_9H_9Cl_2N_3$ from the Transdermal System, expressed as µg per hour per cm^2 at the times specified, conforms to *Acceptance Table 4.*

~~Time (hours)~~	~~Amount dissolved (µg/h·cm²)~~
~~8~~	~~between 7.5 and 16.0~~
~~24~~	~~between 1.5 and 6.0~~
~~96~~	~~between 1.5 and 4.6~~
~~168~~	~~between 1.5 and 3.3~~

Time (hours)	Time for sampling (hours)	~~Amount dissolved~~ Release rate (µg/h/cm²)
0–8	8	between 7.5 and 16.0
8–24	24	between 1.5 and 4.6
24–96	96	between 1.5 and 4.6
96–168	168	between 1.5 and 3.3

Chromatographic purity—

Buffer solution—Dissolve 2.0 g of sodium 1-pentanesulfonate, 13.61 g of monobasic potassium phosphate, and 2 mL of triethylamine in about 1000 mL of water in a 2-liter volumetric flask, adjust with phosphoric acid to a pH of 4.0 ± 0.1, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (1:1), and, if necessary, adjust with phosphoric acid to a pH of 4.5 ± 0.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent 1—Dissolve 1 mL of triethylamine in about 800 mL of water in a 1-liter volumetric flask, adjust with phosphoric acid to a pH of 10.0 ± 0.1, dilute with water to volume, and mix. Transfer this solution to a 2-liter volumetric flask, dilute with acetonitrile to volume, and mix.

Diluent 2—Dissolve 1 mL of triethylamine and 4.36 g of dibasic potassium phosphate in about 800 mL of water in a 1-liter volumetric flask, adjust with phosphoric acid to a pH of 10.0 ± 0.1, dilute with water to volume, and mix. Transfer this solution to a 2-liter volumetric flask, dilute with acetonitrile to volume, and mix.

Standard solution—Dissolve an accurately weighed quantity of USP Clonidine Hydrochloride RS in *Diluent 1* to obtain a solution having a known concentration of about 0.1 mg per mL. Dilute an accurately measured volume of this solution quantitatively with *Diluent 2* to obtain a solution having a known concentration of about 16.2 µg of USP Clonidine Hydrochloride RS per mL (equivalent to about 14.0 µg of clonidine per mL).

Test solution—Carefully peel the release liner from each Transdermal System, and place a number of Transdermal Systems, equivalent to about 15 mg of clonidine, into a 150-mL polytef-lined screw-cap tube. Add 30 mL of *n*-heptane, cap, and mix on a vortex mixer for 2 minutes. Allow to stand for about 3 hours, but every 30 minutes during this period mix on a vortex mixer until the Transdermal Systems are delaminated. Add 0.3 mL of methanol and 45 mL of 0.01 N sulfuric acid, shake for at least 2 minutes, and centrifuge. Retain the *n*-heptane layer, and transfer the aqueous supernatant layer to a second 150-mL polytef-lined screw-cap tube. Add 9 mL of ammonium hydroxide to the aqueous supernatant layer, and mix. Extract the *n*-heptane layer with an additional 45 mL of 0.01 N sulfuric acid for at least 2 minutes, and combine this aqueous supernatant layer with the first aqueous layer in the 150-mL polytef-lined screw-

cap tube. [NOTE—The total length of time of extraction with 0.01 N sulfuric acid should not exceed 1 hour to avoid degradation of any related impurity that may be present.] Extract the aqueous layer by shaking vigorously for 2 minutes with each of two 30-mL portions of chloroform, collecting the chloroform extracts in a 150-mL polytef-lined screw-cap tube. Evaporate the chloroform extracts under nitrogen to dryness, and dissolve the residue in 15.0 mL of *Diluent 2.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the Transdermal Systems taken by the formula:

$$(230.10/266.56)(1.5C/NL)(r_U/r_S),$$

in which 230.10 and 266.56 are the molecular weights of clonidine and clonidine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Clonidine Hydrochloride RS in the *Standard solution; N* is the number of Transdermal Systems taken to prepare the *Test solution; L* is the labeled amount, in mg, of clonidine in each Transdermal System taken; r_U is the peak response for each impurity obtained from the *Test solution;* and r_S is the clonidine peak response obtained from the *Standard solution:* ~~not more than 1.4% of total impurities is found.~~ not more than 1.4% of any impurity is found, and not more than 2.4% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of sodium 1-pentanesulfonate and methanol (63:36). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Clonidine Hydrochloride RS in 0.01 N sulfuric acid, and dilute quantitatively, and stepwise if necessary, with 0.01 N sulfuric acid to obtain a solution having a known concentration of about ~~46 µg per mL.~~ 0.046T per mL (equivalent to about 0.040T of clonidine per mL), T being the total amount, in mg, of clonidine in each Transdermal System.

Assay preparation—Carefully peel the release liner from 1 Transdermal System, and cut the Transdermal System into segments. Quantitatively transfer the segments into an appropriate polytef-lined screw-cap centrifuge tube, add 10 mL of 0.01 N sulfuric acid saturated with *n*-heptane, accurately measured, cap, and heat to 60° for 3 hours. Add 10 mL of *n*-heptane, cap, shake vigorously for 1 minute, and heat to 60° for about 16 hours. Allow the solution to cool to room temperature, add 15 mL of 0.01 N sulfuric acid saturated with *n*-heptane, cap, and mix in a vortex mixer for about 2 minutes. Allow to separate, and filter the aqueous layer. [NOTE—If backing membrane has not delaminated, repeat with a new Transdermal System.] Use the aqueous layer as the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector, a 3.9-mm × 2-cm guard column that contains packing L2, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak re-

In-Process Revision

sponses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of clonidine ($C_9H_9Cl_2N_3$) in the Transdermal System taken by the formula:

~~$21.58C(r_U/r_S)$,~~

$$(230.10/266.56)(25C)(r_U/r_S),$$

in which 230.10 and 266.56 are the molecular weights of clonidine and clonidine hydrochloride, respectively; *C* is the concentration, in µg per mL, of USP Clonidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

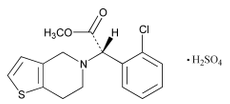
BRIEFING

Clopidogrel Bisulfate. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a 4.6-mm × 15-cm Ultron ES-OVM brand of 5-µm column that contains packing L## (see *Chromatography* ⟨621⟩). The typical retention time for clopidogrel is about 4.6 minutes.

(PA5: A. Wilk) RTS—40048-1

Add the following:

■Clopidogrel Bisulfate



$C_{16}H_{16}ClNO_2S \cdot H_2SO_4$ 419.90

Thieno[3,2-*c*]pyridine-5(4*H*)-acetic acid, α-(2-chlorophenyl)-6,7-dihydro-, methyl ester, (*S*)-, sulfate (1:1).

Methyl (+)-(*S*)-α-(*o*-chlorophenyl)-6,7-dihydrothieno[3,2-*c*]pyridine-5(4*H*)-acetate, sulfate (1:1) [*120202-66-6*].

» Clopidogrel Bisulfate contains not less than 97.0 percent and not more than 101.5 percent of $C_{16}H_{16}ClNO_2S \cdot H_2SO_4$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Clopidogrel Bisulfate RS. USP Clopidogrel Related Compound A RS. USP Clopidogrel Related Compound B RS. USP Clopidogrel Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

C: It responds to the test for *Sulfate* ⟨191⟩.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Related compounds—

Phosphate buffer, Mobile phase, Standard stock solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Clopidogrel Related Compound A RS, USP Clopidogrel Related Compound B RS, and USP Clopidogrel Related Compound C RS in methanol, and dilute with methanol to obtain a solution having concentrations of about 0.1, 0.4, and 0.3 mg per mL, respectively. Dilute this solution with *Mobile phase,* and mix to obtain a solution having final concentrations of about 10, 40, and 30 µg per mL, respectively.

Test solution—Transfer about 100 mg of Clopidogrel Bisulfate, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of related compounds in the portion of Clopidogrel Bisulfate taken by the formula:

$$100(C_S / C_T)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of relevant USP Clopidogrel Related Compound RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Clopidogrel Bisulfate in the *Test solution;* r_U is the peak response for clopidogrel related compound obtained from the *Test solution;* and r_S is the peak response for relevant clopidogrel related compound obtained from the *Standard solution:* not more than 0.2% of clopidogrel related compound A is found, not more than 0.3% of clopidogrel related compound B is found, not more than 1.0% of clopidogrel related compound C is found, not more than 0.1% of any other impurity is found, and not more than 1.5% of total impurities is found.

Assay—

Phosphate buffer—Dissolve 1.36 g of monobasic potassium phosphate in about 500 mL of water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 100 mg of USP Clopidogrel Bisulfate RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix.

Standard preparation—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

System suitability solution—Dissolve an accurately weighed quantity of USP Clopidogrel Related Compound B RS in methanol, and mix with a suitable portion of *Standard stock solution,* to obtain concentrations of about 1.0 and 0.5 mg per mL, respectively. Dilute this solution with *Mobile phase,* and mix to obtain a solution having a final concentration of about 0.05 mg per mL of clopidogrel bisulfate and about 0.1 mg per mL of clopidogrel related compound B.

In-Process Revision

Assay preparation—Transfer about 100 mg of Clopidogrel Bisulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L## (see *Chromatography* ⟨621⟩). The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 and 1.2 for enantiomers of clopidogrel related compound B, respectively, and 1.0 for clopidogrel; and the resolution, *R,* between clopidogrel and the first enantiomer of clopidogrel related compound B is not less than 2.5. Chromatograph the *Standard preparation:* the relative standard deviation for replicate injections determined from clopidogrel bisulfate is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of $C_{16}H_{16}ClNO_2S \cdot H_2SO_4$ in the portion of Clopidogrel taken by the formula:

$$1000C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Clopidogrel Bisulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Desogestrel and Ethinyl Estradiol Tablets, page 1394 of *PF* 28(5) [Sept.–Oct. 2002]. It is proposed to specify the purity of the sodium lauryl sulfate used to prepare the *Dissolution Medium* in the *Dissolution* test.

(BPC: M. Marques) RTS—38623-1; 35216-4

Add the following:

■Desogestrel and Ethinyl Estradiol Tablets

» Desogestrel and Ethinyl Estradiol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of desogestrel ($C_{22}H_{30}O$) and ethinyl estradiol ($C_{20}H_{24}O_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—*USP Desogestrel RS.* ~~*USP Desogestrel Related Compound B RS. USP Desogestrel Related Compound C RS.*~~ *USP Ethinyl Estradiol RS.* ~~*USP Ethinyl Estradiol Related Compound A RS.*~~

Thin-layer chromatographic identification test ⟨201⟩—

~~*Adsorbent:* octadecylsilanized chromatographic silica gel mixture.~~

~~*Test solution*—Transfer a quantity of finely ground Tablets, equivalent to about 2.4 mg of desogestrel, to a stoppered 10-mL centrifuge tube, add 4.8 mL of acetone, and shake vigorously for 1 minute. Centrifuge for 5 minutes, and transfer 2.7 mL of the clear supernatant into a suitable container, protected from light. Evaporate to dryness in a hood using nitrogen at room temperature, and dissolve the residue so obtained in 0.45 mL of methylene chloride. 0.25 mL of a mixture of hexanes, methanol, and isopropyl alcohol (90:15:5).~~

~~*Standard solutions*—Prepare separate solutions in methylene chloride, a mixture of hexanes, methanol, and isopropyl alcohol (90:15:5) to contain about 2–3 mg of USP Desogestrel RS per mL and 0.5–0.6 mg of USP Ethinyl Estradiol RS per mL.~~

~~*Application volume:* 1–10 µL.~~

~~*Developing solvent system:* a mixture of toluene and ethyl acetate (80:20).~~

~~*Procedure*—Proceed as directed in the chapter. Spray the plate with a solution of sulfuric acid in alcohol (1 in 50), and dry at 110° for 5 to 10 minutes. Visualize the spots under long-wavelength UV light: ethinyl estradiol and desogestrel exhibit R_F values of about 0.30 and 0.58, respectively.~~

Test solution—Transfer 25 Tablets to a suitable container, add 50 mL of water, and sonicate until the Tablets disintegrate (if necessary, remove any coating with water before sonication). Place the sample in a separatory funnel, add 25 mL of ether, and shake well to extract the actives. Using a glass pipet, transfer the ether layer to a clean beaker, and evaporate to about 10 mL.

Standard solution—Dissolve a quantity of USP Desogestrel RS and USP Ethinyl Estradiol RS in methanol to obtain a solution containing about 0.15 mg per mL and 0.03 mg per mL, respectively.

Application volume: 30 µL.

Developing solvent system: a mixture of chloroform and alcohol (96:4).

Procedure—Proceed as directed in the chapter, and then air-dry. Spray the plate with a mixture of methanol and sulfuric acid (50:50), place in an oven at 105° for about five minutes, and examine the plate: meets the requirements.

Dissolution ⟨711⟩—

Medium: 0.05% ~~sodium lauryl sulfate dodecyl sodium sulfate~~ sodium lauryl sulfate with an assay content of not less than 95%; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amounts of desogestrel ($C_{22}H_{30}O$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved by employing the following method.

In-Process Revision

~~*Diluent, Solution A, Solution B,* and *Mobile phase*—Proceed as directed in the *Assay.*~~

~~*Standard solution*—Dissolve accurately weighed quantities of USP Desogestrel RS and USP Ethinyl Estradiol RS, and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a solution having known concentrations equivalent to the expected concentrations of the solution under test. [NOTE—A volume of acetonitrile *Diluent* not exceeding 6% of the final total volume of the *Standard solution* may be used to dissolve USP Desogestrel RS, and a volume of a mixture of methanol and water (90:10) *Diluent* not exceeding 4% of the final total volume of the *Standard solution* may be used to dissolve USP Ethinyl Estradiol RS.]~~

~~*Chromatographic system*—Proceed as directed in the *Assay.* To evaluate the system suitability requirements, use the *Standard preparation* prepared as directed in the *Assay.*~~

~~*Procedure*—Separately inject equal volumes (about 200 µL) of the *Standard solution* and a filtered centrifuged portion of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities of desogestrel ($C_{22}H_{30}O$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved by comparison with the corresponding peak responses obtained from the *Standard solution* and the solution under test.~~

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Desogestrel standard stock solution—Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.25 mg per mL.

Ethinyl estradiol standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.25 mg per mL.

Desogestrel intermediate standard solution—Transfer 1.0 mL of *Desogestrel standard stock solution* to a 50-mL volumetric flask. Dilute with *Dissolution Medium* to volume, and mix. This solution contains about 0.005 mg per mL of USP Desogestrel RS.

Ethinyl estradiol intermediate standard solution—Transfer 1.0 mL of *Ethinyl estradiol standard stock solution* to a 50-mL volumetric flask. Dilute with *Dissolution Medium* to volume, and mix. This solution contains about 0.005 mg per mL of USP Ethinyl Estradiol RS.

Standard preparation—Dilute quantitative portions of *Desogestrel intermediate standard solution* and *Ethinyl estradiol intermediate standard solution* with *Dissolution Medium* to obtain a solution containing about 0.3 µg per mL and 0.06 µg per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Test preparation—Centrifuge a portion of the dissolution sample, and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector (for desogestrel analysis), a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of 285 nm and an emission wavelength of 310 nm; a 4.6-mm × 15-cm column that contains packing L11; and a 4.6-mm × 12.5-mm guard column that also contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention

In-Process Revision

times are about 0.2 for ethinyl estradiol and 1.0 for desogestrel, and the relative standard deviation is not more than 3.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$ dissolved by the formula:

$$(0.05C)(100/K)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Desogestrel RS or USP Ethinyl Estradiol RS in the *Standard preparation; K* is the labeled amount, in mg per Tablet, of $C_{22}H_{30}O$ or $C_{20}H_{24}O_2$; and r_U and r_S are the peak responses obtained for desogestrel or ethinyl estradiol from the *Test preparation* and the *Standard preparation,* respectively.

Tolerances—Not less than 80% *(Q)* of each of the labeled amounts of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements for *Content Uniformity* with respect to desogestrel and to ethinyl estradiol.

Loss on drying ⟨731⟩—Powder ~~20-40~~ 40 Tablets, and dry the portion at 105° for 3 hours: it loses not more than 4.0% of its weight.

Water, *Method Ic* ⟨921⟩: ~~not more than 5.4%, using 35 mg of ground Tablets heated at 170°.~~ not more than 5.4% using a portion of the Tablet of about 35 mg and a suitable evaporation technique that releases the water by heating the specimen in a stream of dry inert gas, this gas then being passed into the cell.

Related compounds—

~~*Diluent, Solution A, Solution B, Mobile phase, Desogestrel standard stock solution,* and *Ethinyl estradiol standard stock solution*—Prepare as directed in the *Assay.*~~

~~*Related compounds standard stock solution*—Separately dissolve accurately weighed quantities of USP Ethinyl Estradiol Related Compound A RS, USP Desogestrel Related Compound B RS, and USP Desogestrel Related Compound C RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentrations of about 0.006 mg per mL, 0.00375 mg per mL, and 0.00375 mg per mL, respectively. concentration of about 50% relative to the expected concentration of ethinyl estradiol and desogestrel in the *Test solution.*~~

~~*Standard solution*—Transfer 5.0 mL of *Ethinyl estradiol standard stock solution* and 2.0 mL of *Related compounds standard stock solution* to a 100 mL volumetric flask, add an accurately measured volume of *Desogestrel standard stock solution* to obtain a final solution having a concentration, in mg per mL, corresponding to the expected concentration of desogestrel in the *Test solution.* Dilute with *Diluent* to volume, and mix. Transfer 2.0 mL of *Related compounds standard stock solution* and an accurately measured volume each of *Ethinyl estradiol standard stock solution* and *Desogestrel standard stock solution* to a 100 mL volumetric flask to obtain a final solution having an accurately known concentration in mg per mL, corresponding approximately to the expected concentration of desogestrel and ethinyl estradiol in the *Test solution.* Dilute with *Diluent* to volume, and mix.~~

~~*Test solution*—Use the *Assay preparation.*~~

In-Process Revision

~~*Chromatographic system*~~—~~Prepare as directed in the *Assay*. [NOTE—The related compounds A and C Ethinyl estradiol related compound A and desogestrel related compound C are monitored using a wavelength of 230 250 nm, and all other compounds are monitored at 210 205 nm.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the ethinyl estradiol peak is not less than 2500 theoretical plates; the tailing factor for the ethinyl estradiol peak is between 0.9 and 1.5; and the relative standard deviation for replicate injections determined from the desogestrel and ethinyl estradiol peaks is not more than 2.0%, and not more than 5.0% determined from the peaks for each related compound.~~

~~*Procedure*—Separately inject equal volumes (about 25 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak heights areasresponses for ethinyl estradiol related compound A, desogestrel related compound B, and desogestrel related compound C, disregarding the peak, if any, with a retention time of about 12 minutes.Calculate the percentage of ethinyl estradiol related compound A in the portion of Tablets taken by the formula:~~

$$~~4166.6C(r_U/r_S),~~$$

$$~~200(C/L)(r_U/r_S),~~$$

~~in which *C* is the concentration, in mg per mL, of USP Ethinyl Estradiol Related Compound A RS in the *Standard solution; L* is the labeled amount, in mg, of ethinyl estradiol in each Tablet; and r_U and r_S are the peak heights areas responses for ethinyl estradiol related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% 2.0% of ethinyl estradiol related compound A is found. Calculate the percentages of desogestrel related compound B and desogestrel related compound C in the portion of Tablets taken by the formula:~~

$$~~666.6C(r_U/r_S),~~$$

$$~~200(C/L)(r_U/r_S),~~$$

~~in which *C* is the concentration, in mg per mL, of USP Desogestrel Related Compound B RS or USP Desogestrel Related Compound C RS in the *Standard solution; L* is the labeled amount, in mg, of desogestrel in each Tablet; and r_U and r_S are the peak heights areas responses for desogestrel related compound B or desogestrel related compound C, as appropriate, obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% each 2.0% of desogestrel related compound B is found; not more than 3.0% of desogestrel related compound C is found; and not more than 2.0% 5.0% of total related compounds is found.~~

Solution A—Prepare a mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50).

Solution B—Prepare a mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (80:20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (50:50).

In-Process Revision

Desogestrel standard stock solution—Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

Ethinyl estradiol standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

Standard solution—Dilute quantitative portions of *Desogestrel standard stock solution* and *Ethinyl estradiol standard stock solution* with *Diluent* to obtain a solution containing about 0.6 µg per mL and 0.12 µg per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Test solution 1—Transfer 20 Tablets to a 200-mL volumetric flask. Add about 120 mL of *Diluent,* and shake for about 30 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of the dissolution sample, and use the clear supernatant.

Test solution 2—Dilute a portion of *Test solution 1* with *Diluent* to obtain a solution containing about 0.6 µg per mL of ethinyl estradiol.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a programmable variable wavelength UV detector and a spectrofluorometric detector with an excitation wavelength of 285 nm and an emission wavelength of 310 nm; a 4.6-mm × 15-cm column that contains packing L11; and a 4.6-mm × 12.5-mm guard column that also contains packing L11. The chromatograph is programmed as follows: Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are 0.18 for ethinyl estradiol and 1.0 for desogestrel; the resolution, *R,* between ethinyl estradiol and desogestrel is not less than 2.0; the tailing factor is not more than 2.0 for ethinyl estradiol and desogestrel; and the relative standard deviation for replicate injections is not more than 2.0%.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution	UV Detector (nm)	Flow Rate (mL/min.)
0	100	0	equilibration	210	2
0–4	100	0	isocratic	210	2
4–10	100	0	isocratic	244	2
10–20	100	0	isocratic	210	2
20–25	0	100	linear gradient	210	2.5
25–30	0	100	isocratic	210	3
30–32	100	0	linear gradient	210	2
32–35	100	0	re-equilibration	210	2

In-Process Revision

Procedure—Inject a volume (about 200 µL) of *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of 17β-ethinyl estradiol in the portion of Tablets taken by the formula:

$$100(r_U / r_S),$$

in which r_U is the height of any peak at relative retention time of 0.20; and r_S is the peak height of ethinyl estradiol obtained with the spectrofluorometric detector. Inject a volume (about 200 µL) of *Test solution 1* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of estrone in the portion of Tablets taken by the formula:

$$100(r_U / r_S) - E,$$

in which r_U is the height of any peak at relative retention time of 0.20; r_S is the peak height of ethinyl estradiol obtained with the UV detector at 210 nm; and E is the percentage of 17β-ethinyl estradiol obtained in the Tablets. Calculate the percentage of 3-ketodesogestrel in the portion of Tablets taken by the formula:

$$100(1/F)(r_U / r_S),$$

in which r_U is the height of any peak at relative retention time of 0.32 obtained with the UV detector at 244 nm; r_S is the peak height of desogestrel obtained with the UV detector at 210 nm; and F is the relative response factor, equal to 4.1. Calculate the percentage of any other impurity taken by the formula:

$$100(r_i / r_S),$$

in which r_i is the height of any peak other than those mentioned above; and r_S is the peak height of ethinyl estradiol obtained with the UV detector. Any peak below 0.1% is not considered. Not more than 0.5% of ethinyl estradiol impurities is found; not more than 0.5% of desogestrel impurities is found; and not more than 2.0% of total impurities is found.

Assay—

~~*Diluent*—Prepare a mixture of acetonitrile methanol and water (4:1). (60:40).~~

~~*Solution A*—Use acetonitrile.~~

~~*Solution B*—Prepare a filtered and degassed mixture of acetonitrile and water (1:1).~~

~~*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Desogestrel standard stock solution*—Dissolve an accurately weighed quantity of USP Desogestrel RS in *Diluent* methanol to obtain a solution having a known concentration of about 0.25 0.35 mg per mL.~~

~~*Ethinyl estradiol standard stock solution*—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in *Diluent* methanol to obtain a solution having a known concentration of about 0.25 0.21 mg per mL.~~

~~*Standard preparation*—Transfer 5.0 mL of *Ethinyl estradiol standard stock solution* to a 100 mL volumetric flask, and add an accurately measured volume of *Desogestrel standard stock solution* to obtain a solution having a known concentration, in mg per mL, corresponding to the expected concentration of desogestrel in the *Assay preparation*. Dilute with *Diluent* to volume, and mix. Transfer an accurately measured volume each of *Ethinyl estradiol standard stock solution* and *Desogestrel standard stock solution* to a 100 mL volumetric flask to obtain a final solution having an accurately known concentration in mg per mL, corresponding approximately to the expected concentration of desogestrel and ethinyl estradiol in the *Assay preparation*. Dilute with *Diluent* to volume, and mix.~~

In-Process Revision

Assay preparation—Transfer 10 14 10 Tablets to a 30-mL 50-mL stoppered centrifuge tube, add 20.0 30 mL of *Diluent,* and sonicate for 25 minutes with intermittent mixing on a vortex mixer, until all Tablets have broken apart. Extract for 30 minutes on a benchtop shaker. Centrifuge, and use the clear supernatant. [NOTE—Retain a portion of this solution to use as the *Test solution* in the test for *Related compounds.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 210 205 nm and at 230 250 230 nm and a 4.6-mm × 15-cm 25-cm column that contains stable-bonded 5-µm packing L1. The flow rate is about 2 1.5 mL per minute, and the column temperature is maintained at 40°. The chromatograph is programmed as follows. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the column efficiency determined from the ethinyl estradiol peak is not less than 2500 theoretical plates; the tailing factor for the ethinyl estradiol peak is between 0.9 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0% 1.5%,determined from the desogestrel and ethinyl estradiol peaks.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–4.5 0–12.0	0	100	isocratic
4.5–4.6 12.0–12.1	0→100	100→0	linear gradient
4.6–10.7 12.1–25.0	100	0	isocratic
10.7–10.8 25.0–25.1	100→0	0→100	linear gradient
25.1–30.0	0	100	isocratic

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas at 210 205nm. Separately calculate the amounts, in µg, of desogestrel ($C_{22}H_{30}O$) and ethinyl estradiol ($C_{20}H_{24}O_2$) in the portion of Tablets taken by the formula:

$$(LC_S/C_U)(r_U/r_S),$$

in which L is the labeled quantity, in µg, of the relevant analyte in each Tablet; C_S is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in µg per mL, of the corresponding analyte in the *Assay preparation,* based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (50:50).

Desogestrel standard stock solution—Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

Ethinyl estradiol standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

In-Process Revision

Standard preparation—Dilute appropriate aliquots of *Desogestrel standard stock solution* and *Ethinyl estradiol standard stock solution* with *Diluent* to obtain a solution having a known concentration of about 0.6 µg per mL and 0.12 µg per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Assay preparation—Transfer 20 Tablets into a 200-mL volumetric flask. Add about 120 mL of *Diluent,* and shake for about 30 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of the sample, and transfer an accurately measured volume to a 50-mL volumetric flask to obtain a final concentration of about 0.6 µg per mL of desogestrel. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector (for desogestrel analysis), a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of 285 nm and an emission wavelength of 310 nm; a 4.6-mm × 15-cm column that contains packing L11; and a 4.6-mm × 12.5-mm guard column that also contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.2 for ethinyl estradiol and 1.0 for desogestrel; the tailing factor for both analytes is not more than 2.0; and the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of desogestrel ($C_{22}H_{30}O$) and ethinyl estradiol ($C_{20}H_{24}O_2$) in the portion of Tablets taken by the formula:

$$(500C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Desogestrel RS or USP Ethinyl Estradiol RS in the *Standard preparation; V* is the volume of the aliquot of solution taken for the *Assay preparation;* and r_U and r_S are the peak responses for desogestrel or ethinyl estradiol obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Dicyclomine Hydrochloride Capsules, *USP 26* page 598 and page 2953 of the *First Supplement;* **Dicyclomine Hydrochloride Injection,** *USP 26* page 599; **Dicyclomine Hydrochloride Oral Solution,** *USP 26* page 599; **Dicyclomine Hydrochloride Syrup,** *USP 26* page 600; **Dicyclomine Hydrochloride Tablets,** *USP 26* page 600. It is proposed to replace the gas chromatographic *Assay* with a stability-indicating liquid chromatographic procedure to improve the ruggedness of the method. There was also a concern that dicyclomine hydrochloride could degrade in the injection port and column due to the high temperatures during the analysis. The new *Assay* procedure is based on the analyses performed with 3.5-µm XTerra RP-8 brand of L7 column. The typical retention time for the dicyclomine peak is about 5.5 minutes.

(PA4: E. Gonikberg) RTS—39530-5

Change to read:

Assay—

~~*Internal standard solution*—Dissolve a quantity of phenacetin in methanol to obtain a solution having a concentration of about 2.5 mg per mL.~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Dicyclomine Hydrochloride RS in methanol to obtain a solution having a known concentration of about 1 mg per mL. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution,* dilute with methanol to volume, and mix.~~

~~*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix the contents. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of dicyclomine hydrochloride, to a 25-mL volumetric flask, add 10.0 mL of *Internal standard solution,* dilute with methanol to volume, and mix. Filter 15 mL of this solution, discarding the first 5 mL, and transfer 5.0 mL to a 10-mL volumetric flask. Dilute with methanol to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 15-m × 0.5-mm fused-silica column coated with a 1-µm phase G3. The column is maintained at 160° for 2 minutes, then programmed at 20° per minute for 4 minutes, and held at a final temperature of 240° for 5 minutes. The injection port and detector temperatures are maintained at 250°. Nitrogen is used as the carrier gas at a flow rate of 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between phenacetin and dicyclomine is not less than 2; the tailing factor for dicyclomine is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dicyclomine hydrochloride ($C_{19}H_{35}NO_2 \cdot HCl$) in the portion of Capsules taken by the formula:~~

$$~~50C(R_U / R_S),~~$$

~~in which *C* is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation;* and R_U and R_S are the ■peak response ratios of dicyclomine to phenacetin■1S (*USP26*)~~ obtained from the *Assay preparation* and the *Standard preparation,* respectively.

■*0.02 M Phosphate buffer, pH 7.5*—Dissolve 2.72 g of monobasic potassium phosphate in 900 mL of water, adjust with 10% sodium hydroxide to a pH of 7.5 ± 0.1, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a mixture of acetonitrile and *0.02 M Phosphate buffer, pH 7.5* (70:30), filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (70:30).

In-Process Revision

Standard preparation—Dissolve an accurately weighed quantity of USP Dicyclomine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.4 mg per mL. [NOTE—This solution is stable for 2 days].

Assay preparation—Remove, as completely as possible, the contents of not less than 20 Capsules, and mix the contents. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of dicyclomine hydrochloride, to a 50-mL volumetric flask. Add 2.0 mL of water, and sonicate for at least 2 minutes to disperse the sample. Add 35 mL of acetonitrile, sonicate for at least 5 minutes, and shake on a mechanical shaker for at least 30 minutes. Add 10 mL of water, allow the preparation to equilibrate to room temperature, then dilute with water to volume, and mix. Centrifuge, for at least 5 minutes, a portion of this solution in a 15-mL glass centrifuge tube. Use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column containing 3-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{35}NO_2 \cdot HCl$ in the portion of Capsules taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the areas of the dicyclomine peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP27*)

BRIEFING

Dicyclomine Hydrochloride Injection, *USP 26* page 599. It was reported that the current *Assay* method did not work as written due to sample preparation and extraction issues. On the basis of comments received, it is proposed to replace the gas chromatographic *Assay* with a stability-indicating liquid chromatographic procedure. See also briefing under *Dicyclomine Hydrochloride Capsules*.

BRIEFING

Dihydroergotamine Mesylate, *USP 26* page 617. It is proposed to update the monograph replacing the TLC related alkaloids and UV-VIS assay tests with an HPLC method. *Identification* test *C* is changed accordingly as well. This method was validated with a Hypersil ODS brand of L1 packing. The typical retention time for dihydroergotamine mesylate is about 12.5 minutes.

(PA3: S. Salado) RTS—39766-1

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 50 µg per mL.

Medium: 70% alcohol. Absorptivities at 280 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: ~~The principal spot from the *Test preparation* found in the test for *Related alkaloids* corresponds in R_f value to that obtained from the *Standard preparation*.~~

In-Process Revision

■The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*■2S (*USP27*)

Delete the following:

■~~**Related alkaloids—**~~

~~*Solvent mixture*—Mix 10 volumes of chloroform, 10 volumes of methanol, and 1 volume of ammonium hydroxide.~~

~~*Test preparation*—Prepare a solution of Dihydroergotamine Mesylate in *Solvent mixture* to contain 20 mg per mL.~~

~~*Standard preparation* and *Standard dilutions*—Prepare a solution of USP Dihydroergotamine Mesylate RS in *Solvent mixture* to contain 20 mg per mL *(Standard preparation).* Prepare a series of dilutions of *Standard preparation* in *Solvent mixture* to contain 0.40 mg, 0.20 mg, and 0.10 mg per mL *(Standard dilutions).*~~

~~*Procedure*—In a suitable chromatographic chamber arranged for thin-layer chromatography place a volume of a solvent system consisting of a mixture of chloroform and alcohol (9:1) sufficient to develop the chromatogram, cover, and allow to equilibrate for 30 minutes. Apply 5-µL portions of *Test preparation, Standard preparation,* and each of the three *Standard dilutions* to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a solution prepared by dissolving 800 mg of *p*-dimethylaminobenzaldehyde in a cooled mixture of 80 g of alcohol and 20 g of sulfuric acid. The R_f value of the principal spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation.* Estimate the concentration of any other spots observed in the lane for the *Test preparation* by comparison with the *Standard dilutions.* The spots from the 0.40-, 0.20-, and 0.10-mg-per-mL dilutions are equivalent to 2.0%, 1.0%, and 0.50% of impurities, respectively. The sum of the impurities is not greater than 2.0%.~~■2S (*USP27*)

Add the following:

■**Chromatographic purity—**

Diluent 1, Diluent 2, Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution 1— Use the *Standard preparation* prepared as directed in the *Assay.*

Standard solution 2—Dilute a known volume of *Standard solution 1* with *Diluent 2* and stepwise if necessary with *Diluent 2* to obtain a solution containing about 0.3 µg per mL.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	60	40	equilibration
0–12	60–50	40–50	linear gradient
12–20	50–15	50–85	linear gradient
20–25	15	85	isocratic
24–25	15–60	85–40	linear gradient
25–31	60	40	re-equilibration

Chromatograph 10 µL of *Standard solution 1,* and record the peak areas as directed for *Procedure:* the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Standard solution 2,* and record the peak areas as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution 2* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the analyte peaks. Calculate the percentage of each impurity in the portion of Dihydroergotamine Mesylate taken by the formula:

$$5000\ (C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard solution 2; W* is the weight, in mg, of Dihydroergotamine Mesylate taken to prepare the *Test solution;* r_i is the peak area of each im-

In-Process Revision

purity obtained from the *Test solution;* and r_S is the peak area of dihydroergotamine mesylate obtained from the *Standard solution 2:* not more than 0.5% of one individual impurity is found; not more than 1.0% of total impurities is found. ■2S (*USP27*)

Change to read:

Assay—

~~*Standard preparation*—Transfer about 10 mg of USP Dihydroergotamine Mesylate RS, accurately weighed, to a 200-mL volumetric flask, add 2 mL of methanol, dilute with tartaric acid solution (1 in 100) to volume, and mix.~~

~~*Assay preparation*—Using about 10 mg of Dihydroergotamine Mesylate, accurately weighed, prepare as directed for *Standard preparation.*~~

~~*Procedure*—Transfer 3.0 mL each of the *Standard preparation,* the *Assay preparation,* and tartaric acid solution (1 in 100) to provide the blank, to separate conical flasks. Add 6.0 mL of *p*-dimethylaminobenzaldehyde TS to each, shake, and allow to stand for 20 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 585 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ in the portion of Dihydroergotamine Mesylate taken by the formula:~~

~~$$0.2C(A_U/A_S),$$~~

~~in which C is the concentration, in µg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard preparation,* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.~~

■*Diluent 1*—Prepare a solution of 0.1 mL of phosphoric acid in 1000 mL of water.

Diluent 2—Prepare a mixture of *Diluent 1* and acetonitrile (60:40).

Solution A—Prepare a filtered and degassed mixture of water, 25 percent ammonia water, and 98% formic acid (1000:10:5). Adjust the pH to 8.50.

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Solution A* (80:20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Dihydroergotamine Mesylate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Diluent 1* to obtain a solution having a known concentration of about 0.6 mg per mL. [NOTE—The final ratio of acetonitrile and *Diluent 1* should be similar to the final ratio obtained in the *Assay preparation.*]

Assay preparation—Transfer about 30 mg of Dihydroergotamine Mesylate, accurately weighed, to a 50-mL volumetric flask, dissolve with 20 mL of acetonitrile, dilute with *Diluent* 1 to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	60	40	equilibration
0–12	60–50	40–50	linear gradient
12–20	50–15	50–85	linear gradient
20–25	15	85	isocratic
24–25	15–60	85–40	linear gradient
25–31	60	40	re-equilibration

Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and
