Ascorbic Acid Tablets (USP 28) ..... 60
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules (USP 28) ..... 60
Aztreonam (USP 28) ..... 61
Baclofen Tablets (USP 28) ..... 61
Betamethasone Tablets (USP 28) ..... 62
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal, or Plastic Carriers [new] (USP 28) ..... 63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions [new] (USP 28) ..... 66
Red Blood Cells [new] (USP 28) ..... 69
Whole Blood [new] (USP 28) ..... 76
Brompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution (USP 28) ..... 79
Brompheniramine Maleate and Pseudoephedrine Sulfate Syrup (USP 28) ..... 80
Butalbital, Acetaminophen, and Caffeine Tablets (USP 28) ..... 80
Calcium Lactate Tablets (USP 28) ..... 81
Calcium Pantothenate Tablets (USP 28) ..... 81
Carboprost Tromethamine (USP 28) ..... 82
Cefpodoxime Proxetil (USP 28) ..... 82
Cefprozil for Oral Suspension (USP 28) ..... 83
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules (USP 28) ..... 83
Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Oral Solution (USP 28) ..... 84
Clarithromycin for Oral Suspension (USP 28) ..... 84
Clonidine Transdermal System [new] (USP 28) ..... 84
Colchicine Tablets (USP 28) ..... 91
Cyclizine Hydrochloride Tablets (USP 28) ..... 91
Cyclosporine Oral Solution (USP 28) ..... 92
Demeclocyline Oral Suspension (USP 28) ..... 92
Desflurane (USP 28) ..... 93
Dexamethasone Oral Solution (USP 28) ..... 93
Dexbrompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution (USP 28) ..... 93
Dextroamphetamine Sulfate Capsules (USP 28) ..... 94
Dextroamphetamine Sulfate Tablets (USP 28) ..... 94
Dextromethorphan Hydrobromide Oral Solution (USP 28) ..... 95
Dextromethorphan Hydrobromide Syrup (USP 28) ..... 95
Diazepam (USP 28) ..... 96
Diethylcarbamazine Citrate Tablets (USP 28) ..... 97
Diphenhydramine Hydrochloride Capsules (USP 28) ..... 97
Diphenhydramine and Pseudoephedrine Capsules (USP 28) ..... 98
Dorzolamide Hydrochloride (USP 28) ..... 99
Dyphylline and Guaifenesin Tablets (USP 28) ..... 100
Ephedrine Sulfate Syrup (USP 28) ..... 101
Conjugated Estrogens Tablets (USP 28) ..... 101
Ethosuximide Capsules (USP 28) ..... 102
Etoposide (USP 28) ..... 103
Fluconazole [new] (USP 28) ..... 103
Fluoxymesterone Tablets (USP 28) ..... 105
Glycopyrrolate Tablets (USP 28) ..... 105
Guaifenesin Capsules (USP 28) ..... 106
Guaifenesin Oral Solution (USP 28) ..... 107
Guaifenesin Syrup (USP 28) ..... 107
Guaifenesin Tablets (USP 28) ..... 107
Guaifenesin and Codeine Phosphate Oral Solution (USP 28) ..... 108
Guaifenesin and Codeine Phosphate Syrup (USP 28) ..... 108
Homosalate (USP 28) ..... 108
Hydrocodone Bitartrate and Acetaminophen Tablets (USP 28) ..... 109
Ibuprofen Oral Suspension (USP 28) ..... 110
Indomethacin Oral Suspension (USP 28) ..... 110
Irbesartan [new] (USP 28) ..... 110
Isosorbide Dinitrate Sublingual Tablets (USP 28) ..... 113
Ivermectin [new] (USP 28) ..... 114
Kanamycin Sulfate Capsules (USP 28) ..... 120
Levothyroxine Sodium Tablets (USP 28) ..... 120
Lisinopril Tablets (USP 28) ..... 121
Loperamide Hydrochloride Tablets (USP 28) ..... 122
Loratadine Oral Solution [new] (USP 28) ..... 122
Losartan Potassium [new] (USP 28) ..... 125
Meclizine Hydrochloride Tablets (USP 28) ..... 127
Meperidine Hydrochloride Oral Solution (USP 28) ..... 128
Meperidine Hydrochloride Syrup (USP 28) ..... 129
Meprobamate Tablets (USP 28) ..... 129
Methadone Hydrochloride Oral Solution (USP 28) ..... 130
Methenamine Tablets (USP 28) ..... 130
Methocarbamol Tablets (USP 28) ..... 130
Methylphenidate Hydrochloride Tablets (USP 28) ..... 131
Nadolol and Bendroflumethiazide Tablets (USP 28) ..... 132
Nalidixic Acid (USP 28) ..... 132
Naproxen Oral Suspension (USP 28) ..... 133
Neomycin Sulfate Oral Solution (USP 28) ..... 133
Neostigmine Bromide Tablets (USP 28) ..... 133
Netilmicin Sulfate (USP 28) ..... 134
Netilmicin Sulfate Injection (USP 28) ..... 136
Nevirapine [new] (USP 28) ..... 136
Niacinamide Tablets (USP 28) ..... 139
Nitrofurantoin Capsules (USP 28) ..... 139
Nystatin (USP 28) ..... 141
Nystatin for Oral Suspension (USP 28) ..... 143
Omeprazole Delayed-Release Capsules [new] (USP 28) ..... 143
Oxandrolone (USP 28) ..... 148
Oxycodone Hydrochloride Oral Solution (USP 28) ..... 150
Oxycodone and Acetaminophen Capsules (USP 28) ..... 151
Oxycodone and Acetaminophen Tablets (USP 28) ..... 151
Oxycodone and Aspirin Tablets (USP 28) ..... 152
Oxytocin Injection (USP 28) ..... 153
Penicillamine Capsules (USP 28) ..... 153
Penicillin G Potassium for Injection (USP 28) ..... 154
Penicillin G Sodium for Injection (USP 28) ..... 154
Pentobarbital (USP 28) ..... 154
Pentobarbital Sodium (USP 28) ..... 157
Phentermine Hydrochloride Capsules (USP 28) ..... 159
Phentermine Hydrochloride Tablets (USP 28) ..... 160
Phenylpropanolamine Hydrochloride Capsules (USP 28) ..... 161
Phenylpropanolamine Hydrochloride Oral Solution (USP 28) ..... 161
Phenylpropanolamine Hydrochloride Tablets (USP 28) ..... 162
Phenyltoloxamine Dihydrogen Citrate [new] (USP 28) ..... 162
Pimozide Tablets (USP 28) ..... 164
Pindolol Tablets (USP 28) ..... 165
Piperazine Citrate Tablets (USP 28) ..... 165
Platelets [new] (USP 28) ..... 166
Prednisone Oral Solution (USP 28) ..... 169
Procyclidine Hydrochloride Tablets (USP 28) ..... 169
Propantheline Bromide Tablets (USP 28) ..... 170
Propoxyphene Hydrochloride and Acetaminophen Tablets（USP 28） ..... 170
Propoxyphene Napsylate Oral Suspension（USP 28） ..... 171
Pseudoephedrine Hydrochloride Oral Solution（USP 28） ..... 171
Pseudoephedrine Hydrochloride Syrup（USP 28） ..... 172
Pseudoephedrine Hydrochloride Tablets（USP 28） ..... 172
Pseudoephedrine Hydrochloride，Carbinoxamine Maleate，and Dextromethorphan Hydrobromide Oral Solution（USP 28） ..... 173
Psyllium Hemicellulose［new］（USP 28） ..... 173

Fax: 1-301-816-8373
http://www.usp.org
Pharmacopeial Forum is covered in Current Contents/Life Sciences and in the Science Citation Index (SCI), in International Pharmaceutical Abstracts, and in Current Awareness in Biological Sciences.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

## Moving?

Our subscribers' records and publication labels are computergenerated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, PF Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852. Fax: (301) 816-8148.

## STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through Pharmacopeial Forum $(P F)$, for the development of official pharmaceutical standards.

USP publishes Pharmacopeial Forum ( $P F$ ) bimonthly as the working vehicle of the USP Council of Experts. PF provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the United States Pharmacopeia and the National Formulary ( $U S P-N F$ ).
$P F$ includes the following:

1. Potential revisions-entirely new standards, revision ideas, and drafts not yet targeted for official adoption (Pharmacopeial Previews)
2. Proposed revisions - new or revised standards targeted for official adoption (In-Process Revision)
3. Adopted revisions-new or revised standards that become official and binding before the publication of the next $U S P$ NF or Supplement (Interim Revision Announcement)
USP welcomes comments and data on potential, proposed, or official standards. ${ }^{*}$ Comments, along with USP's responses, will be published either in PF Briefings, the Commentary section of $P F$, the Commentary section of Supplements to $U S P-N F$, or the Commentary section of $U S P-N F$.
[^1]The chart below shows the public review and comment process and its relationship to standards development.

# Public Review and Comment Process for Standards Development 

Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

## HOW TO USE PF

This section provides descriptions of the various parts of $P F$. It also includes Committee Designations and the Staff Directory.

The contents of the different sections of $P F$ are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the Staff Directory) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

# Proposed and Adopted Revisions 

| Section | Content | How Readers Can Respond |
| :---: | :---: | :---: |
| Pharmacopeial <br> Previews <br> Early ideas for revisions | -Briefing: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: <br> - the controversial nature of an item; <br> - the application of new technologies that require further study; and <br> - articles produced by multiple sources. | Review drafts and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview. |
| In-Process Revision Revisions targeted for adoption | -BriEfing: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see Standards Development). New or revised text is marked with symbols ( ${ }^{\square}$ or ) to specify the tentative earliest date on which the revision would be officially adopted. | Review material and send comments promptly to USP staff liaison (see the Staff Directory). Guidelines on how to comment are found at the end of the Po licies and Announcements section. |
| Harmonization <br> Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally | -Briefing: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under Pharmacopeial Previews or under In-Process Revision, both separate sections of Harmonization. <br> -For In-Process Revision, new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted. | Review material and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview or In-Process Revision. |
| Interim Revision Announcement Adopted standards | Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols | Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance. |

## Other Sections

## Committee Designations

Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

## Staff Directory

Names of all USP scientific staff liaisons with contact information.

## Policies and Announcements

- General scientific and policy issues affecting $U S P-N F$ standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

## Stimuli to the Revision Process

- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

## Nomenclature

- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the USP Dictionary of USAN and International Drug Names
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

## Index

Cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).

## Reference Standards Catalog

List of official USP Reference Standards specified in $U S P-N F$, along with availability and ordering information.

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

Update of chromatographic reagents based on the proposals published in this issue of $P F$.

## EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

| AER | Aerosols |
| :--- | :--- |
| AMB | Analytical Microbiology |
| BBP | Blood and Blood Products |
| BNA | Bioavailability and Nutrient Absorption |
| BNT | Biotechnology and Natural Therapeutics and Diagnostics |
| BPC | Biopharmaceutics |
| BST | Biostatistics |
| CRX | Compounding Pharmacy |
| DSB | Dietary Supplements-Botanicals |
| DSI | Dietary Supplements-Information |
| DSN | Dietary Supplements-Non-Botanicals |
| EMC | Excipient Monograph Content ${ }^{\dagger}$ |
| ESC | Excipients-Substances and Characterization ${ }^{\dagger}$ |
| ETM | Excipients-Test Methods |
| GCT | Gene Therapy, Cell Therapy, and Tissue Engineering |
| GTB | General Toxicity and Biocompatibility |
| NL | Nomenclature and Labeling |
| PA1 | Pharmaceutical Analysis 1 |
| PA2 | Pharmaceutical Analysis 2 |
| PA3 | Pharmaceutical Analysis 3 |
| PA4 | Pharmaceutical Analysis 4 |
| PA5 | Pharmaceutical Analysis 5 |
| PA6 | Pharmaceutical Analysis 6 |
| PA7 | Pharmaceutical Analysis 7-Antibiotics |
| PDF | Pharmaceutical Dosage Forms |
| PPC | Parenteral Products-Compounding and Preparation |
| PPI | Parenteral Products-Industrial |
| PSD | Packaging, Storage, and Distribution |
| PW | Pharmaceutical Waters |
| RMI | Radiopharmaceuticals and Medical Imaging |
| SMU | Safe Medication Use |
| VET | Veterinary Drugs |
| VVI | Vaccines, Virology, and Immunology |
|  |  |

## POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on $U S P-N F$ standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE USP-NF. We are pleased to announce the availability of the USP Guideline for Submitting Requests for Revision to the USP-NF. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the

USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.
The following list indicates tentatively scheduled course dates. For further information, contact Barbara B. Hubert, Director, Pharmacopeial Education, BBH@usp.org, 301-816-8333, or Diana Lenahan, Program Associate, DPL@ usp.org, 301-816-8530. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2004

| Date | Name of course | Location |
| :---: | :---: | :---: |
| January 12 and 13 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| January 14 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| February 4 and 5 | Fundamentals of Titrations | USP Headquarters, Rockville, MD |
| February 9 | Standards 100: Fundamentals of the Use of $U S P$ $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| February 10 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| March 22 and 23 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| March 24 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| April 1 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| April 21 and 22 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| May 19 | Standards 100: Fundamentals of the Use of USP$N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| May 20 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| June 10 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| July 19 and 20 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| August 10 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| August 11 | Standards 100: Fundamentals of the Use of USP$N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| August 12 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| October 14 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| October 18 and 19 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| November 11 | Analytical Method Validation | USP Headquarters, Rockville, MD |

Calendar of Pharmacopeial Education Courses, 2004 (continued)

| Date | Name of course | Location |
| :--- | :--- | :--- |
| November 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| November 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |

VISIT THE USP WEB SITE AT 〈http://www.usp.org〉. Various resources related to Pharmacopeial standards are presented, including highlights from $P F$.

## USP-NF AVAILABLE IN THREE ELECTRONIC

 FORMATS. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats-CD, intranet, and online. The CD is ideal for single users who prefer to have $U S P-N F$ on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official $U S P-N F$ content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.CHROMATOGRAPHIC REAGENTS NOW AVAILABLE. Chromatographic Reagents lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in Pharmacopeial Forum (PF) since 1980. Chromatographic Reagents also helps to track which column reagents were used to validate methods that have become official and are included in $U S P-N F$. The branded column reagents list is updated bimonthly through Pharmacopeial Forum. Chromatographic Reagents can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official

Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907

F 67029 Strasbourg Cedex 1
France
NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a $P F$ should be submitted to the appropriate USP scientific staff liaison identified at the end of the Briefing accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the Staff Directory included in every $P F$.

Please note that $U S P-N F$ is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for USP 27-NF 22 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2003 | November 2003 | January 2004 |
| Supplement One | October 15, 2003 | February 2004 | April 2004 |
| Supplement Two | February 17, 2004 | June 2004 | August 2004 |

The publication and comment schedule for USP $28-N F 23$ is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2004 | November 2004 | January 2005 |
| Supplement One | October 15, 2004 | February 2005 | April 2005 |
| Supplement Two | February 17, 2005 | June 2005 | August 2005 |

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in Supplements to $U S P-N F$ (twice yearly). Between Supplements, official revisions are published in PF in the Interim Revision Announcement; these revisions are also incorporated in the upcoming Supplement. The electronic version of $U S P-N F$ is updated as each Supplement becomes available and, therefore, contains all official text up to and including the contents of the latest Supplement.

## INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the $U S P-N F$ that become effective before the effective date of the next Supplement or that were not ready for adoption by the closing date for the upcoming Supplement. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.
Symbols-Interim revisions are shown with new text (if any) enclosed in circles, ${ }^{\bullet}$ new text. Text enclosed in squares, $\mathbf{■ n e w}^{\mathbf{n}}$ text $\mathbf{n}$, has already been adopted in a Supplement. Where the symbols appear together with no enclosed text, such as $\bullet \bullet$ or $■$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the IRA or Supplement in which the revision first appeared. For example, ${ }_{\bullet 2}$ indicates that the revision was officially adopted in the Second Interim Revision Announcement, and $\mathbf{m}_{2 \mathrm{~S} \text { (USP27) }}$ indicates that the revision was officially adopted in the Second Supplement to USP 27.

Errata-At the end of the Interim Revision Announcement section is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in $U S P-N F$. If necessary, this list will be updated with every issue of $P F$. This information will also be cumulative in the next available Supplement, and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

## New USP Reference Standards

The following USP Reference Standards, which were indicated in past Supplements to $U S P-N F$ as being not yet available, have since become available. Thus, the official date of each USP 27 or NF 22 standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Acesulfame Potassium RS (January 1, 2004)
USP Allantoin RS (March 1, 2004)
USP Amifostine Disulfide RS (March 1, 2004)
USP Ammonium Chloride RS (March 1, 2004)
USP Aspartame Acesulfame RS (March 1, 2004)
USP Benazepril Hydrochloride RS (July 1, 2004)
USP Benazepril Related Compound A RS (May 1, 2004)
USP Benazepril Related Compound B RS (May 1, 2004)
USP Betahistine Hydrochloride RS (January 1, 2004)
USP Bupropion Hydrochloride RS (March 1, 2004)
USP Cefipime Hydrochloride RS (January 1, 2004)
USP Cefipime Hydrochloride System Suitability RS (January 1, 2004)

USP Chlorhexidine RS (July 1, 2004)
USP Chlorhexidine Acetate RS (July 1, 2004)
USP Choline Bitartrate RS (January 1, 2004)
USP Choline Chloride RS (March 1, 2004)
USP Clonazepam Related Compound C RS (July 1, 2004)
USP Copovidone RS (March 1, 2004)
USP Desflurane RS (May 1, 2004)
USP Desflurane Related Compound A RS (March 1, 2004)
USP Dextran 40 RS (May 1, 2004)
USP Dextran 70 RS (May 1, 2004)
USP Dolasetron Mesylate RS (July 1, 2004)
USP Dolasetron Mesylate Related Compound A RS (July 1, 2004)
USP Dorzolamide Hydrochloride Related Compound A RS (January 1,2004$)$
USP Doxazosin Mesylate RS (March 1, 2004)
USP Powdered Eleuthero Extract RS (July 1, 2004)
USP Fenoldopam Mesylate RS (March 1, 2004)
USP Fenoldopam Related Compound A RS (January 1, 2004)
USP Fenoldopam Related Compound B RS (January 1, 2004)
USP Flumazenil RS (May 1, 2004)
USP Fluoxetine Related Compound C RS (July 1, 2004)
USP Formononetin RS (March 1, 2004)
USP Fosphenytoin Sodium RS (March 1, 2004)
USP Gadoversetamide RS (March 1, 2004)
USP Gadoversetamide Related Compound A RS (March 1, 2004)
USP Ganciclovir RS (May 1, 2004)
USP Ganciclovir Related Compound A RS (July 1, 2004)
USP Gemfibrozil Related Compound A RS (January 1, 2004)
USP Glucosamine Hydrochloride RS (July 1, 2004)
USP Hydrocodone Bitartrate Related Compound A CII RS (March 1, 2004)
USP Isoflupredone Acetate RS (January 1, 2004)
USP Powdered Kava Extract RS (March 1, 2004)
USP Kawain RS (March 1, 2004)
USP Ketamine Related Compound A RS (January 1, 2004)
USP Lamivudine RS (July 1, 2004)
USP Meropenem RS (March 1, 2004)
USP Metformin Hydrochloride RS (March 1, 2004)
USP Metformin Related Compound A RS (March 1, 2004)
USP Metoprolol Related Compound A RS (July 1, 2004)
USP Nabumetone RS (January 1, 2004)
USP Norgestimate RS (January 1, 2004)
USP Ondansetron Hydrochloride RS (March 1, 2004)
USP Ondansetron Related Compound A RS (March 1, 2004)
USP Ondansetron Related Compound C RS (March 1, 2004)
USP Ondansetron Related Compound D RS (March 1, 2004)

USP Oxaprozin RS (January 1, 2004)
USP Oxfendazole RS (March 1, 2004)
USP Paclitaxel RS (March 1, 2004)
USP Paclitaxel Related Compound A RS (March 1, 2004)
USP Paclitaxel Related Compound B RS (March 1, 2004)
USP Paroxetine Related Compound D RS (May 1, 2004)
USP Phenytoin Related Compound A RS (March 1, 2004)
USP Phenytoin Related Compound B RS (July 1, 2004)
USP Quinapril Related Compound A RS (January 1, 2004)
USP Quinapril Related Compound B RS (January 1, 2004)
USP Quinine Hydrochloride Dihydrate RS (March 1, 2004)
USP Ramipril RS (January 1, 2004)
USP Ramipril Related Compound A RS (January 1, 2004)
USP Powdered Red Clover Extract RS (May 1, 2004)
USP Rimantidine Hydrochloride RS (July 1, 2004)
USP Scopoletin RS (July 1, 2004)
USP Sevoflurane RS (May 1, 2004)
USP Sevoflurane Related Compound A RS (May 1, 2004)
USP Sodium Starch Glycolate RS (January 1, 2004)
USP Sotalol Hydrochlride RS (July 1, 2004)
USP Sotalol Related Compound A RS (May 1, 2004)
USP Sotalol Related Compound B RS (May 1, 2004)
USP Sotalol Related Compound C RS (May 1, 2004)
USP Stearoyl Polyoxyglycerides RS (May 1, 2004)
USP Sumatriptan RS (March 1, 2004)
USP Sumatriptan Succinate RS (March 1, 2004)
USP Sumatriptan Succinate Related Compound A RS (March 1, 2004)

USP Sumatriptan Succinate Related Compound C RS (March 1, 2004)

USP Tacrine Hydrochloride RS (January 1, 2004)
USP Taurine RS (January 1, 2004)
USP Terazosin Hydrochloride RS (March 1, 2004)
USP Terazosin Related Compound A RS (March 1, 2004)
USP Terazosin Related Compound B RS (March 1, 2004)
USP Terazosin Related Compound C RS (March 1, 2004)
USP Tiamulin Fumarate RS (July 1, 2004)
USP Tiamulin Related Compound A RS (July 1, 2004)
USP Tinidazole RS (January 1, 2004)
USP Tinidazole Related Compound A RS (January 1, 2004)
USP Thalidomide RS (January 1, 2004)
USP Urea C13 RS (January 1, 2004)
USP Valsartan Related Compound A RS (March 1, 2004)
USP Valsartan Related Compound C RS (March 1, 2004)
USP Verteporfin RS (March 1, 2004)
USP Verteporfin Related Compound A RS (March 1, 2004)
USP Vinorelbin Related Compound A RS (March 1, 2004)
USP Vinorelbine Tartrate RS (May 1, 2004)
USP Vitexin RS (March 1, 2004)
USP Zileuton RS (January 1, 2004)

The official dates of any USP 27 or NF 22 standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

## USP Alteplase RS

USP Amiloxate RS
USP Positive Bioreaction RS
USP Cefpiramide RS
USP Cinoxate RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Enalapril Related Compound B RS
USP Enzacamene RS
USP Fludeoxyglucose RS
USP Ginseng Extract RS
USP Gonadorelin Hydrochloride RS
USP Hypericin RS

USP Lactase RS
USP Medroxyprogesterone Acetate Related Compound A RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Ondansetron Related Compound B RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Sargramostim RS
USP Sulisobenzone RS

USP $\Delta^{8}$-tetrahydrocannabinol RS
USP $\Delta^{9}$-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS
USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

## USP 27 MONOGRAPHS

## Gemfibrozil

## Change to read:

Related compounds-
Mobile phase - Add 10 mL of glacial acetic acid to 750 mL of methanol in a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, mix, and pass through a membrane filter.
System suitability solution-Dissolve accurately weighed quantities of USP Gemfibrozil RS, USP Gemfibrozil Related Compound A RS, and 2,5-dimethylphenol in Mobile phase to obtain a solution having known concentrations of about 0.2 mg per mL , 0.05 mg per mL , and 0.05 mg per mL , respectively.

Standard solution-Transfer 10 mg each of USP Gemfibrozil RS and USP Gemfibrozil Related Compound A RS, both accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.
Test solution-Transfer about 100 mg of Gemfibrozil, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $276-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L 1 . The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.35 for 2,5-dimethylphenol, 1.0 for gemfibrozil, and 2.1 for gemfibrozil related compound A; and the relative standard deviation for replicate injection is not more than $3.0 \%$.
Procedure-Separately inject equal volumes (about $100 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for at least three times the retention time of gemfibrozil, and measure the areas for the major peaks. Calculate the percentage of gemfibrozil related compound A in the portion of Gemfibrozil taken by the formula:

$$
\bullet 1000(C / W)\left(r_{U} / r_{S}\right), \bullet 1
$$

in which $C$ is the concentration, in mg per mL , of USP Gemfibrozil Related Compound A RS in the Standard solution; ${ }^{\bullet} W$ is the weight, in mg , of Gemfibrozil taken to prepare the Test solution; 1 and $r_{U}$ and $r_{S}$ are the peak areas for gemfibrozil related compound A obtained from the Test solution and the Standard solution, respectively: not more than $0.1 \%$ of gemfibrozil related compound A is found. Calculate the percentage of any other impurity in the portion of Gemfibrozil taken by the formula:

$$
\bullet 1000\left(C_{G} / W\right)\left(r_{i} / r_{G}\right), \bullet \bullet
$$

in which ${ }^{\bullet} C_{G}$ is the concentration, in mg per mL , of USP Gemfibrozil RS in the Standard solution; $r_{i}$ is the peak area of each individual impurity obtained from the Test solution; $r_{G}$ is the gemfibrozil peak area obtained from the Standard solution; and $W$ is as defined above: 1 not more than $0.1 \%$ of any other impurity is found; and not more than $0.5 \%$ of total impurities is found.

## Loperamide Hydrochloride Oral Solution

## Change to read:

$\mathbf{p H}\langle 791\rangle$ : between 2.7 and ${ }^{\mathbf{6}} 6.5 . \bullet 1$

## Lovastatin

## Change to read:

## Limit of lovastatin related compound A-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and 0.01 M phosphoric acid (13:7). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Dissolve accurately weighed quantities of USP Lovastatin RS and USP Lovastatin Related Compound A RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution containing $2.0 \mu \mathrm{~g}$ of each per mL.

Standard solution-Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about $2.0 \mu \mathrm{~g}$ per mL .
Test solution-Transfer about 25 mg of Lovastatin, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $200-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The column temperature is maintained at $40^{\circ}$. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for lovastatin and 1.3 for lovastatin related compound A ; and the resolution, $R$, between lovastatin and lovastatin related compound A is not less than 6.0. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.
Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of lovastatin related compound A in the portion of Lovastatin taken by the formula:

$$
2.5 F(C / W)\left(r_{U} / r_{S}\right)
$$

in which $F$ is the response factor for lovastatin related compound A and is equal to $1.6 ; C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Lovastatin RS in the Standard solution; $W$ is the weight, in mg , of Lovastatin in the Test solution; $r_{U}$ is the peak response for lovastatin related compound A obtained from the Test solution; and $r_{S}$ is the peak response for lovastatin obtained from the Standard solution: not more than ${ }^{\bullet} 0.5 \%_{\bullet}$ of lovastatin related compound A is found.

## Quinidine Gluconate Extended-Release Tablets

## Change to read:

Drug release $\langle 724\rangle$ -
TEST 1-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 1.

Medium: $\mathrm{pH} 5.4,0.1 \mathrm{M}$ acetate buffer prepared as follows. Add 6.9 g of anhydrous sodium acetate and 0.525 mL of glacial acetic acid to 1 L of water, and mix. Adjust with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of $5.4 ; 900 \mathrm{~mL}$.

Apparatus 2: 75 rpm .
Times: 1, 2, 4, and 8 hours.
Procedure-Determine the amount of $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{2} \cdot \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{7}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 235 nm , using filtered aliquots of the solution under test, diluted with Medium if necessary, in comparison with a Standard solution having a known concentration of USP Quinidine Gluconate RS in the same Medium.

Tolerances-The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $30 \%$ and $50 \%$ |
| 2 | between $45 \%$ and $65 \%$ |
| 4 | between $60 \%$ and $85 \%$ |
| 8 | not less than $85 \%$ |

TEST 4-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 4.

Medium: 0.1 N hydrochloric acid; 600 mL .
Apparatus 2: 75 rpm .
Times and Procedure - Proceed as directed for Test 1.
Tolerances-The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $30 \%$ and $45 \%$ |
| 2 | between $45 \%$ and $60 \%$ |
| 4 | between $60 \%$ and $80 \%$ |
| 8 | not less than $85 \%$ |

${ }^{-}$TEST 5-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 5.

Medium, Apparatus, and Procedure-Proceed as directed for Test 1, using 8-mesh sinker baskets. ${ }^{*}$

Times: 1, 2, and 4 hours.
Tolerances-The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $20 \%$ and $50 \%$ |
| 2 | between $40 \%$ and $70 \%$ |
| 4 | not less than $75 \%$ |

## ERRATA

Following is a list of errata and corrections to $U S P 27-N F 22$. The page number indicates where the item is found in USP 27-NF 22. If necessary, this list will be updated with every issue of $P F$. This information will also be available as a cumulative table in the next available Supplement and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

| Page | Title | Section | Description |
| :---: | :---: | :---: | :---: |
| 454 | Ciprofloxacin | Sulfate | Lines 4 and 5: Change "a concentration of 18.1 mg per mL, , to: a concentration of $18.1 \mu \mathrm{~g}$ per mL |
| 1286 | Narasin Granular | Assay | Lines 24-27 under Procedure: Change " $(1.402 D+$ $0.0111 I)(D+I)$, in which $D$ and $I$ are the specified percentages of narasin $D$ and narasin $D+I$ in USP Narasin RS," to: $(1.402 D+0.0111 I) /(D+I)$, in which $D$ and $I$ are the specified percentages of narasin D and narasin I in USP Narasin RS, |
| 1516 | Potassium Chloride Extended-Release Tablets | Assay | Line 5 of Assay preparation 2: following "using a magnetic bar" reinsert official text as follows: , for 90 minutes. Dilute with a mixture of acetonitrile and water (1:1) to volume. Allow to stand for 90 minutes. Pass through a filter having a $0.2-\mu \mathrm{m}$ porosity. Transfer an accurately measured volume of the filtrate, quantitatively dilute with water to obtain a solution having a concentration of about 0.06 mg per mL , and mix. [NOTE-Retain a portion of the filtrate for use in the test for Identification.] Transfer 5.0 mL of the resulting solution to a $100-\mathrm{mL}$ volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix. |
| 1716 | Sotalol Hydrochloride | Limit of methanol, isopropyl alcohol, and acetone | Line 3 under Chromatographic system: Change " 1.8 $\mathrm{mm} \times 1.8-\mathrm{m}$ glass column" to: $2.0-\mathrm{mm} \times 1.8-\mathrm{m}$ glass column |
| 1842 | Tiamulin Fumarate | Chromatographic purity | Line 8 under Procedure: Change "bisdimethylderivative" to: bisdimethylthioderivative |
| 2111 | 〈11〉 USP Reference Standards | USP Isradipine Related Compound A RS | Change "isopropyl methyl 4-(4-benzofurazanyl)-2,6-di-methyl-3,5-pyridinecarboxylate" to: isopropyl methyl 4-(4-benzofurazanyl)-2,6-dimethyl-3,5-pyridinedicarboxylate |
| 2662 | Reagent Specifications | Methyl Carbamate | Reagent mistakenly omitted. Reinstate as: <br> Methyl Carbamate, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NO}_{2}-75.07$-White crystals. Freely soluble in water. <br> Melting range $\langle 741\rangle$ : between $54^{\circ}$ and $56^{\circ}$. |
| 2747 | Reference Tables | Description and Solubility | Line 2 under Cephapirin Benzathine: Change "freely soluble in alcohol;" to: insoluble in alcohol; |
| 2799 | Alcoholmetric Table | Column 8, line for 26\% | Change the Specific gravity in air " 0.9653 " to: 0.9635 |

## IN-PROCESS REVISION

This section contains proposals for adoption as official $U S P$ or $N F$ standards (either proposed new standards or proposed revisions of current $U S P$ or $N F$ standards). These may be any of the following: (1) items that previously appeared under Pharmacopeial Previews and are now formally proposed as revisions; (2) proposed revisions placed directly under In-Process Revision; or (3) modifications of revisions previously proposed under In-Process Revision. Readers should review material in this section and provide comments to the staff liaison (use the Staff Directory to find the contact information). Information on how to comment is found in the Policies and Announcements section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

## BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How to Use $P F$ ), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, thus:

- new text.
if slated for an Interim Revision Announcement to USP 27-NF 22 (IRA), thus:
$\Delta_{\text {new text }}{ }_{\text {USP28 }}$
if slated for $U S P 28-N F 23$, and thus:
-new text.
if slated for a Supplement to $U S P-N F$. The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ 。 or $\boldsymbol{\bullet}^{\boldsymbol{n}}$ or ${ }^{\boldsymbol{\Delta}}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular IRA or Supplement or indicates the USP or NF as the publication where the revision will appear if approved. For example, $\bullet 2$ indicates that the revision is proposed for the Second Interim Revision Announcement, and $\mathbf{■}^{2 S}$ (USP 27) indicates that the proposed revision is slated for the Second Supplement to USP 27, and $\Delta_{\triangle S P 28}$ and ${ }_{\triangle N F 23}$ indicate that the revisions are proposed for $U S P 28$ and $N F 23$, respectively.

Official Title Changes Where the specification "Monograph title change" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

## Briefing

Acetaminophen Oral Solution, USP 27 page 17 and page 2494 of $P F 27$ (3) [May-June 2001]; Acetaminophen Oral Suspension, USP 27 page 18 and page 2494 of $P F$ 27(3) [May-June 2001]; Oral Powder Containing at Least Three of the FollowingAcetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine, USP 27 page 28 and page 2496 of $P F$ 27(3) [May-June 2001]; Oral Solution Containing at Least Three of the Following-Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine, USP 27 page 30 and page 2496 of $P F$ 27(3) [May-June 2001]; Acetaminophen and Codeine Phosphate Oral Solution, USP 27 page 34 and page 2497 of $P F$ 27(3) [May-June 2001]; Acetaminophen and Codeine Phosphate Oral Suspension, USP 27 page 35 and page 2497 of $P F 27$ (3) [May-June 2001]; Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution, USP 27 page 36 and page 2499 of PF 27(3) [May-June 2001]; Brompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution, USP 27 page 272; Brompheniramine Maleate and Pseudoephedrine Sulfate Syrup, USP 27 page 273; Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Oral Solution, USP 27 page 432; Dexamethasone Oral Solution, USP 27 page 560; Dexbrompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution, USP 27 page 567; Dexbromethorphan Hydrobromide Oral Solution, USP 27 page 581; Dextromethorphan Hydrobromide Syrup, USP 27 page 581; Guaifenesin Oral Solution, $U S P 27$ page 888; Guaifenesin Syrup, $U S P 27$ page 888; Guaifenesin and Codeine Phosphate Oral Solution, USP 27page 889; Guaifenesin and Codeine Phosphate Syrup, USP 27 page 890; Ibuprofen Oral Suspension, USP 27 page 954; Indomethacin Oral Suspension, USP 27 page 978; Meperidine Hydrochloride Oral Solution, USP 27 page 1161; Meperidine Hydrochloride Syrup, USP 27 page 1161; Methadone Hydrochloride Oral Solution, USP 27 page 1186; Naproxen Oral Suspension, USP 27 page 1283; Oxycodone Hydrochloride Oral Solution, USP 27 page 1376; Phenylpropanolamine Hydrochloride Oral Solution, USP 27 page 1477; Prednisone Oral Solution, USP 27 page 1545; Propoxyphene Napsylate Oral Suspension, $U S P 27$ page 1583; Pseudoephedrine Hydrochloride Oral Solution, USP 27 page 1599; Pseudoephedrine Hydrochloride Syrup, USP 27 page 1599; Pseudoephedrine Hydrochloride, Carbinoxamine Maleate, and Dextromethorphan Hydrobromide Oral Solution, USP 27 page 1601 . It is proposed to improve the standards in monographs for a number of Oral Solutions, Syrups, and Oral Suspensions, as well as powders for Oral Solution and for Oral Suspension. It is proposed to add requirements for Uniformity of dosage units $<905>$ to apply to single-unit containers, and Deliverable volume $<698>$ to apply to multiple-unit containers.

## BRIEFING

Acetaminophen and Aspirin Tablets, USP 27 page 19 and page 2495 of $P F$ 27(3) [May-June 2001]. USP Expert Committee on Biopharmaceutics has decided not to accept any new proposal for the test for Dissolution test employing pooled sampling. The Committee felt that the use of pooled sampling techniques prevents interpretation of intertablet variability. As a result of this decision, the instructions for pooled samples will be removed from the USP general chapter Dissolution $\langle 711\rangle$, and the instructions for the use of previously approved pooled sampling will be incorporated into each of the current USP monographs that uses the pooled sampling technique.

The monographs affected by this decision are the following: Acetaminophen and Aspirin Tablets
Acetaminophen and Codeine Phosphate Capsules
Acetaminophen and Diphenhydramine Citrate Tablets
Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets
Acetaminophen and Pseudoephedrine Hydrochloride Tablets
Tablets containing at least three of the following-Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine
Capsules containing at least three of the following-Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine
Tablets containing at least three of the following-Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine
Acetohydroxamic Acid Tablets
Albuterol Tablets
Alprazolam Tablets
Amantadine Hydrochloride Capsules
Aminosalicylate Sodium Tablets
Amphetamine Sulfate Tablets
Ampicillin Capsules
Ampicillin Tablets
Ascorbic Acid Tablets
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules
Baclofen Tablets
Betamethasone Tablets
Butalbital, Acetominophen, and Caffeine Tablets
Calcium Lactate Tablets
Calcium Pantothenate Tablets
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules
Colchicine Tablets
Cyclizine Hydrochloride Tablets
Dextroamphetamine Sulfate Capsules
Dextroamphetamine Sulfate Tablets
Diethylcarbamazine Citrate Tablets
Diphenhydramine Hydrochloride Capsules
Diphenhydramine and Pseudoephedrine Capsules
Dyphylline and Guaifenesin Tablets
Ethosuximide Capsules
Glycopyrrolate Tablets
Guaifenesin Capsules
Guaifenesin Tablets
Hydrocodone Bitartrate and Acetaminophen Tablets
Isosorbide Dinitrate Sublingual Tablets
Kanamycin Sulfate Capsules
Lisinopril Tablets
Loperamide Hydrochloride Tablets
Meclizine Hydrochloride Tablets
Meprobamate Tablets
Methenamine Tablets
Methocarbamol Tablets
Methylphenidate Hydrochloride Tablets
Nadolol and Bendroflumethiazide Tablets
Neostigmine Bromide Tablets

Niacinamide Tablets
Oxycodone and Acetaminophen Capsules
Oxycodone and Acetaminophen Tablets
Oxycodone and Aspirin Tablets
Penicillamine Capsules
Phentermine Hydrochloride Capsules
Phentermine Hydrochloride Tablets
Phenylpropanolamine Hydrochloride Capsules
Phenylpropanolamine Hydrochloride Tablets
Pimozide Tablets
Pindolol Tablets
Piperazine Citrate Tablets
Procyclidine Hydrochloride Tablets
Propantheline Bromide Tablets
Propoxyphene Hydrochloride and Acetaminophen Tablets
Pseudoephedrine Hydrochloride Tablets
Pyridoxine Hydrochloride Tablets
Pyrilamine Maleate Tablets
Terbutaline Sulfate Tablets
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets
Thiamine Hydrochloride Tablets
Timolol Maleate Tablets
Triprolodine and Pseudoephedrine Hydrochlorides Tablets

Change to read:
Dissolution Proedure for a Pooled sample
$\Delta$
〈711 ${ }^{\text {USP28 }}$
Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 45 minutes.
Mobile phase-Prepare as directed in the Assay.
Solvent mixture-Prepare as directed in the Assay.
Internal standard solution-Prepare a solution of benzoic acid in methanol having a concentration of about 1 mg per mL .

Standard preparation I-Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the Solvent mixture to obtain a solution having a known concentration of about $70 \mu \mathrm{~g}$ per mL . Combine 4.0 mL of this solution and 1.0 mL of the Internal standard solution, and mix.

Standard preparation II-Dissolve accurately weighed quantities of USP Acetaminophen RS and USP Aspirin RS in the Solvent mixture to obtain a solution having known concentrations of about $360 \mu \mathrm{~g}$ of acetaminophen and about $360 \mu \mathrm{~g}$ of aspirin per mL . Combine 4.0 mL of this solution and 1.0 mL of the Internal standard solution, and mix.

Test preparation-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated
Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$.
Combine equal volumes of the filtered solutions of the 6 or
12 individual specimens withdrawn, and use the pooled
sample as the test solution. $\mathbf{\triangle U S P 2 8}$
Combine 4.0 mL of a-filtered pertion of the selution under test
$\boldsymbol{\Delta}_{\text {the pooled sample }}^{\mathbf{\Delta} U S P 28}{ }^{\text {a }}$
and 1.0 mL of the Internal standard solution, and mix.
Chromatographic system-Proceed as directed in the Assay.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the two Standard preparations and the Test preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.4 for salicylic acid, 0.6 for aspirin, and 1.0 for benzoic acid. Determine the amount of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$ dissolved by the formula:

$$
90(C / W)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Acetaminophen RS in Standard preparation II; $R_{U}$ and $R_{S}$ are the relative peak response ratios obtained from the Test preparation and Standard preparation II, respectively; and $W$ is the labeled amount, in mg , of acetaminophen. Determine the amount of aspirin $\left(\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}\right)$ dissolved by the formula:

$$
\left[\left[90 C_{1}\left(R_{U 1} / R_{S I}\right)\right]+\left[90 C_{2}\left(R_{U 2} / R_{S 2}\right)(1.3044)\right]\right] / W
$$

in which $C_{1}$ and $C_{2}$ are the concentrations, in $\mu \mathrm{g}$ per mL, of USP Aspirin RS in Standard preparation II and USP Salicylic Acid RS in Standard preparation $I$, respectively; $R_{U I}$ and $R_{S I}$ are the relative peak response ratios for the aspirin peak and the internal standard peak obtained from the Test preparation and Standard preparation $I I$, respectively; $R_{U 2}$ and $R_{S 2}$ are the relative peak response ratios for the salicylic acid peak and the internal standard peak obtained from the Test preparation and Standard preparation I, respectively; and $W$ is the labeled amount, in mg , of aspirin.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$ and not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$ are dissolved in 45 minutes:
${ }^{\Delta}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

## Acceptance Table for a Pooled Sample

Dissolution, Proedtre for a Pooled Sample

Medium: pH 5.8 phosphate buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions); 900 mL .

Apparatus 2: 50 rpm .
Time: 45 minutes.
Determine the amounts of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$, diphenhydramine hydrochloride $\left(\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{HCl}\right)$, and pseudoephedrine hydrochloride $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}\right)$ dissolved by employing the following method.

Buffer solution, Diluting solvent, Mobile phase, and Chromatographic system-Proceed as directed in the Assay for acetaminophen.

Standard solution-Prepare as directed for the Standard preparation in the Assay for acetaminophen.

Test solution 1 - Combine equalvolumes of the filtered selutions under test, and use the pooled sample.
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as Test solution 1.

Test solution 2-Transfer 5.0 mL of Test solution 1 to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Procedure-Using Test solution 1 and the Standard solution, and making any necessary volumetric adjustments, proceed as directed in the Assay for diphenhydramine hydrochloride and the $A s$ say for pseudoephedrine hydrochloride, and determine the amounts of diphenhydramine hydrochloride ( $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{HCl}$ ) and pseudoephedrine hydrochloride $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}\right)$ dissolved. Using Test solution 2 and the Standard solution, and making any necessary volumetric adjustments, proceed as directed in the Assay for acetaminophen, and determine the amount of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$ dissolved.
Tolerances-Not less than $75 \%(Q)$ of the labeled amounts of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}, \mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{HCl}$, and $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}$ is dissolved in 45 minutes;
${ }^{\Delta}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

| Number |  |  |
| :---: | :---: | :---: |
| Stage | Tested | Acceptance Criteria |
| S1 | 6 | Average amount dissolved is not less than $Q+10 \%$. |
| S2 | 6 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}\right)$ is equal to or greater than $Q+5 \%$. |
| S3 | 12 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}+\right.$ <br> $\mathrm{S}_{3}$ ) is equal to or greater than $Q$ |

FOR TABLETS LABELED AS CHEWABLE-
Medium: pH 5.8 phosphate buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions); 900 mL .

Apparatus 2: 75 rpm .
Time: 45 minutes.
Tolerances-Not less than 75\% (Q) of the labeled amounts of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}, \mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{HCl}$, and $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}$ is dissolved in 45 minutes.

Dissolution Procdure for a Pooled sample
$\Delta$
〈 711 USP 28
Medium: pH 5.8 phosphate buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions); 900 mL .

Apparatus 2: 50 rpm .
Time: 45 minutes.
Determine the amount of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$ and pseudoephedrine hydrochloride $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}\right)$ dissolved by employing the following method.

Mobile phase-Proceed as directed in the Assay.
Standard solution-Prepare a solution in Dissolution Medium having known concentrations of about $L / 900 \mathrm{mg}$ of USP Pseudoephedrine Hydrochloride RS and $L J / 900 \mathrm{mg}$ of USP Acetaminophen RS per mL , in which $L$ is the labeled quantity, in mg , of pseudoephedrine hydrochloride in each Tablet; and $J$ is the ratio of the labeled quantity, in mg , of acetaminophen to the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet.

Test solution Use a fllered pertion of the solution under test.
${ }^{\text {® }}$ Proceed as directed for Procedure for Capsules, Uncoated
Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$.
Combine equal volumes of the filtered solutions of the 6 or
12 individual specimens withdrawn, and use the pooled sample. $\Delta U S P 28$

Chromatographic system-Proceed as directed in the Assay, except to inject the Standard solution.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen and pseudoephedrine peaks. Calculate the quantity, in mg, of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$ and pseudoephedrine hydrochloride $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}\right)$ dissolved by the formula:

$$
900 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of the appropriate USP Reference Standard in the Standard solution; and $r_{U}$ and $r_{S}$ are the peak responses of the corresponding analyte obtained from the Test solution and the Standard solution, respectively.
Tolerances-Not less than $75 \%$ (Q) of the labeled amounts of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$ and $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO} \cdot \mathrm{HCl}$ is dissolved in 45 minutes:
the requirements are met if the quantities of active ingredients dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample.

Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredients specified, expressed as a percentage of the labeled content.

BRIEFING
Alprazolam Tablets, USP 27 page 65 -See briefing under Acetaminophen and Aspirin Tablets.
(BPC: M. Marques) RTS-40311-1

## Change to read:

Dissolution Proedure for a Pooled Sample

Stock buffer solution-Dissolve 160 g of monobasic potassium phosphate and 40 g of dibasic potassium phosphate in water, and dilute with water to obtain 2.0 liters of solution. Add, with mixing, phosphoric acid or potassium hydroxide solution (45 in 100), as necessary to adjust the solution such that, when this Stock buffer solution is diluted 1 in 10 with water, the resulting solution has a pH of $6.0 \pm 0.1$.

Buffer solution-Prepare a 1 in 10 dilution of Stock buffer solution in water to obtain a Working buffer solution having a pH of 6.0 $\pm 0.1$.

Medium: Buffer solution; 500 mL .
Apparatus 1: 100 rpm .
Time: 30 minutes.
Procedure-
Stock standard solution-Prepare a solution in methanol of USP Alprazolam RS having a known concentration of about 0.05 mg per mL.

Standard solution-Add 50 mL of Stock buffer solution and 250 mL of water to a $500-\mathrm{mL}$ volumetric flask. Add to the flask 5.0 mL of Stock standard solution for every 0.25 mg of alprazolam contained in the Tablet being assayed. Dilute with water to volume, and mix.

Mobile phase-Prepare a degassed and filtered solution of Buffer solution, acetonitrile, and tetrahydrofuran (60:35:5). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ analytical column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed under Procedure: the column efficiency is not less than 500 theoretical plates, and the relative standard deviation for replicate injections is not more than $3.0 \%$.

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated
Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$.

Dissolution, Procedure for a Pooled Sample
$\langle 711\rangle \frac{-}{4}$
Medium: water; 500 mL .
Apparatus 1: 100 rpm .
Time: 45 minutes.
Mobile phase-Dissolve 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of dilute glacial acetic acid (14 in 100) and 400 mL of methanol. Adjust by the dropwise addition of glacial acetic acid to a pH of $3.3 \pm 0.1$, if necessary, filter, and degas the solution. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph replicate injections of the Standard solution, prepared as directed below, and record the peak responses as directed for Procedure: the relative standard deviation is not more than $2.0 \%$.

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. USP28 Inject a volume (about $500 \mu \mathrm{~L}$ ) of the selution under test
${ }^{\Delta}$ pooled sample ${ }_{\Delta U S P 28}$
into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ dissolved in comparison with a Standard solution having a known concentration of USP Dextroamphetamine Sulfate RS in the same medium and similarly chromatographed.
Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ is dissolved in 45 minutes:
${ }^{\Delta}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

## Add the following:

## ©Antithrombin III Human

## » Antithrombin III Human is a glycoprotein,

 which is the major inhibitor of thrombin and other activated clotting factors including factors IX, X, XI, and XII, and the cofactor through which heparin exerts its effect. It is obtained from human plasma of healthy donors who must, as far as can be ascertained, be free from detectable agents of infection transmissible by transfusion of blood or blood derivatives. The method of manufacturing includes steps that have been shown to remove or inactivate known agents of infection. If sub-stances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to an acceptable level and any residues are such as not to compromise the safety of the preparation for patients. The antithrombin III concentrate is passed through a bacteria-retentive filter, filled aseptically into its final, sterile containers, and immediately frozen. It is then freeze-dried, and the containers are closed under vacuum. No antimicrobial preservative is added at any stage of production. Antithrombin III Human complies with the requirements for Biologicals $\langle 1041\rangle$. When reconstituted in the recommended volume of diluent, the potency is not less than 25 USP Antithrombin III Units per mL. [note-One USP Antithrombin III Unit is the amount of antithrombin III that forms a complex with one unit of thrombin at $25^{\circ}$ in the presence of heparin at a pH of 8.4.]

Packaging and storage-Use a Type I glass container with an appropriate stopper and seal. Store protected from light between $2^{\circ}$ and $8^{\circ}$, excursions permitted at room temperature.

Labeling-The labeling should state the content of antithrombin III expressed in USP Antithrombin III Units. The diluent and the volume to be used to reconstitute the preparation are indicated.

USP Reference standards $\langle 11\rangle$ —USP Albumin Human $R S$. USP Antithrombin III Human RS. USP Heparin Sodium RS.

Identification-It meets the requirements of the Assay.
$\mathbf{p H}\langle 791\rangle$ —Reconstitute with the diluent according to the manufacturer's instruction: between 6.0 and 7.5 .

Osmolality $\langle 785\rangle$ —Reconstitute with the diluent according to the manufacturer's instruction: not less than 240 mosmol per kg for the solution.

## Heparin content-

pH 8.4 Buffer—Dissolve tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing $0.1 \%$ polyethylene glycol 6000 to obtain a solution having concentrations of $0.050 \mathrm{M}, 0.0075 \mathrm{M}$, and 0.175 M, respectively. Adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

Chromogenic substrate solution-Prepare a solution of chromogenic substrate for amidolytic test for factor $\mathrm{X}_{\mathrm{a}}$ in water to obtain a solution of concentration of 2.5 mM .

Factor $X_{a}$ solution-Dissolve an accurately weighed quantity of Factor $\mathrm{X}_{\mathrm{a}}$ in $p H$ 8.4 Buffer to obtain a solution containing about 20 nanokatalytic units (nkats).

Stopping solution-Prepare a $20 \%(\mathrm{v} / \mathrm{v})$ solution of acetic acid in water.

Standard solution-Dissolve an accurately weighed quantity of USP Antithrombin III Human RS in pH 8.4 Buffer to obtain a solution containing 1.0 USP Antithrombin III Unit.

Test solution-Dissolve an accurately weighed quantity of Antithrombin III Human in $p H$ 8.4 Buffer to obtain a solution containing 1.0 USP Antithrombin III Unit.

Procedure-Pipet $250 \mu \mathrm{~L}$ each of pH 8.4 Buffer, the Standard solution, and the Test solution to suitable tubes placed in a water bath set at $37^{\circ}$. Add $250 \mu \mathrm{~L}$ of Factor $X_{a}$ solution, pre-warmed at $37^{\circ}$, to each tube, mix, and incubate for 2 minutes. Add $250 \mu \mathrm{~L}$ of Chromogenic substrate solution pre-warmed at $37^{\circ}$ to each tube, mix, and incubate for 120
seconds. Stop the reaction by adding $250 \mu \mathrm{~L}$ Stopping solution. Record the absorbance at 405 nm using pH 8.4 Buffer as the blank.

Calculation-Calculate the USP Heparin Unit per USP Antithrombin III Unit using the formula:

$$
P_{R}\left(A_{F}-A_{T}\right) /\left(A_{F}-A_{R}\right),
$$

in which, $A_{F}, A_{R}$, and $A_{T}$ are the absorbance values from pH 8.4 Buffer, the Standard solution, and the Test solution, respectively; and $P_{R}$ is the heparin content of USP Antithrombin III Human RS in USP Heparin Unit per USP Antithrombin III Unit: not more than 0.1 USP Heparin Unit per USP Antithrombin III Unit.

Sterility $\langle 71\rangle$-It meets the requirements when tested as directed for Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined.

Water, Method I $\langle 921\rangle$ : not more than $3.0 \%$.
Pyrogen $\langle 151\rangle$-Inject per kg of the rabbit's weight 50 USP Antithrombin III Units, calculated from the activity stated on the label. It meets the requirements.

General safety-It meets the requirements for biologics as set forth for Safety Tests-Biologicals under Biological Reactivity Tests, In Vivo $\langle 88\rangle$.

## Molecular weight distribution-

Mobile phase-Prepare a suitable degassed and filtered solution containing 0.1 M sodium phosphate, 0.15 M sodium chloride, and $0.05 \%$ sodium azide, having a pH of 6.5 .
$V_{o}$ - Marker solution-Prepare a solution of thyroglobulin in Mobile phase containing 4 to 5 mg per mL .

Test solution-Prepare a solution of Antithrombin III Human containing 8 to 10 mg per mL .

System suitability solution-Dilute USP Albumin Human RS, if necessary, with water to obtain a solution containing approximately $5 \%$.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $7.5 \times 75-\mathrm{mm}$ guard column, a $7.5 \times 300-\mathrm{mm}$ analytical column, both containing packing L\#\# (see Chromatography $\langle 621\rangle$ ), maintained at ambient temperature, and a $280-\mathrm{nm}$ UV detector. The flow rate is 0.5 mL per minute maintained constant to $\pm 1 \%$; the tailing factor is between 0.5 and 2.5 ; and the column efficiency is greater than 1500 theoretical plates.

Procedure-Inject $10 \mu \mathrm{~L}$ System suitability solution, and record the chromatogram. Inject $10 \mu \mathrm{~L}$ each of $V_{o}$ - Marker solution and the Test solution. Note the retention times of the major peak in the $V_{o}$ - Marker solution chromatogram. The relative peak area of the high molecular weight peak eluting at about the same retention time as the major peak in the $V_{o}$ - Marker solution chromatogram, or earlier, is not more than $13 \%$.

## Total protein content-

Trichloroacetic acid solution-Prepare a solution of trichloroacetic acid in water containing 100 g trichloroacetic acid per 100 mL of the solution.

Test solution-Dissolve an accurately weighed quantity of Antithrombin III Human in 0.15 M sodium chloride solution to obtain a solution containing about 7.5 mg per mL .

Blank: 0.15 M solution of sodium chloride.
Procedure-To each of 2.0 mL of the Test solution and the Blank in suitable centrifuge tubes add 1.5 mL of Trichloroacetic acid solution. Mix, allow to stand for at least 10 min utes, centrifuge for 5 minutes, and decant the supernatant. Resuspend the precipitates in 1.5 mL of Trichloroacetic acid solution, centrifuge for 5 minutes, decant the supernatant, and hold the tubes inverted on a filter paper to drain. Quantitatively transfer the residues with a minimum quantity of water to a micro-Kjeldahl flask, and determine the
nitrogen content using Method II (see Nitrogen Determination $\langle 461\rangle$ ). Multiply the result, corrected for the Blank, by 6.25 to calculate the quantity of protein.

Assay-
pH 8.4 Buffer-Dissolve tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing $0.1 \%$ polyethylene glycol 6000 to obtain a solution having concentrations of $0.050 \mathrm{M}, 0.0075 \mathrm{M}$, and 0.175 M, respectively. Adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

Albumin-pH 8.4 buffer—Prepare a $0.05 \%(\mathrm{w} / \mathrm{v})$ solution of Albumin Human in pH 8.4 Buffer.
Polybrene buffer-Prepare a 10 mg per mL solution of polybrene in Albumin-pH 8.4 buffer.

Heparin buffer-Dissolve an accurately weighed amount of USP Heparin Sodium RS in Albumin-pH 8.4 Buffer to obtain a solution containing 15 USP Heparin Unit per mL.

Thrombin bovine solution-Reconstitute thrombin bovine, and dilute with Albumin-pH 8.4 buffer to obtain a solution having a concentration of 1000 Thrombin Units per mL.

Chromogenic substrate solution for factor $I I_{a}$ - Prepare a solution of chromogenic substrate for amidolytic test (see Reagents Specifications in the section Reagents, Indicators, and Solutions) for factor $\mathrm{II}_{\mathrm{a}}$ in water to obtain a solution having a concentration of about 5.0 mM , and dilute the solution further with Polybrene Buffer to 1.0 mM .

Stopping solution-Prepare a $20 \%(\mathrm{v} / \mathrm{v})$ solution of acetic acid in water.
Standard preparation A-Dissolve an accurately weighed quantity of USP Antithrombin III Human RS in Heparin buffer to obtain a solution containing 1.0 USP Antithrombin III Unit.

Standard preparations B, C, D, and E-Dilute Standard preparation $A$ with Heparin buffer $60-, 120-, 180$-, and 300fold.

Test preparation $A$-Dissolve an accurately weighed quantity of Antithrombin III Human in Heparin buffer to obtain a solution having about the same concentration as Standard preparation $A$.

Test preparations B, C, $D$, and $E$-Dilute Test preparation A 60-, 120-, 180-, and 300-fold with Heparin buffer.

Procedure—Pipet $400 \mu \mathrm{~L}$ each of Standard preparations $B, C, D$, and $E$, and Test preparation $B, C, D$, and $E$ to suitable tubes placed in a water bath set at $37^{\circ}$. Add $200 \mu \mathrm{~L}$ of Thrombin bovine solution, prewarmed at $37^{\circ}$, to each tube, mix, and incubate for 1 minute. Add $200 \mu \mathrm{~L}$ of Chromogenic substrate solution for factor $I I_{a}$ prewarmed at $37^{\circ}$ to each tube, mix, and incubate for 60 seconds. Stop the reaction by adding $200 \mu \mathrm{~L}$ Stopping solution. To prepare a blank, add the reagents in reverse order, starting with 200 $\mu \mathrm{L}$ Stopping solution, followed by the addition of $200 \mu \mathrm{~L}$ of Chromogenic substrate solution for factor $I I_{a}$, then adding $200 \mu \mathrm{~L}$ of Thrombin bovine solution, and ending with $400 \mu \mathrm{~L}$ Heparin buffer. Record the absorbance at 405 nm against the blank.

Calculations-For Standard preparations and Test preparations calculate the regression of the absorbance against log concentrations, and calculate the activity of Antithrombin III Human in USP Antithrombin III Units using a suitable statistical method for parallel-line assays. The four independent relative activity estimates are then combined to obtain the final mean and the confidence limits are calculated. The estimated potency is not less than $80 \%$ and not greater than $120 \%$ of the potency stated on the label. The specific activity is not less than 6.0 USP Antithrombin III

Units per mg of total protein. The confidence interval $(p=0.95)$ is between than $90 \%$ to $110 \%$ of the estimated potency. $\mathbf{U S P 2 8}$

## Briefing

Aztreonam, USP 27 page 200. It is proposed to revise the IR Identification test. In the current procedure the sample under test and the Reference Standard are dissolved in methanol to obtain a solution having a concentration of 3 mg per mL . Then 0.5 mL of this solution is added to 200 mg of potassium bromide, dried, mixed, and compressed into a disc. This procedure was intended to yield "polymorphic equalization" of the $\alpha$ and $\beta$ crystalline forms. However, it was found that the methanol solution was not clear and that the IR spectra were unpredictable. Various drying conditions were tried but no improvement was observed. It was found that consistent spectra were obtained from discs prepared from undried Aztreonam intimately mixed with potassium bromide as directed in general chapter Spectrophotometric Identification Tests $\langle 197\rangle$.

## BRIEFING

Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers; Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions. The development of these proposed new monographs reflects the wide range of forms of biological indicators. The monographs are structured similarly to the official USP monographs pertaining to biological indicators. The proposed monographs refer to sections of the proposed revision to the general chapter Biological Indicators-Resistance Performance Tests $\langle 55\rangle$, published elsewhere in this issue of $P F$.

Comments should be sent to USP Headquarters for consideration by the Expert Committee on Analytical Microbiology no later than March 1, 2004.
(AMB: D. Porter) RTS-40482-1

## Add the following:

## - Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers

» Biological indicators for moist heat, dry heat, and gaseous modes of sterilization may be metal or plastic carriers inoculated with a culture of viable spores derived from one of several steriliza-tion-resistant microorganisms, based on the intended sterilization use. Cultures used for inoculation of metal or plastic carriers may include Clostridium sporogenes, Geobacillus stearothermophilus (formerly B. stearothermophilus), Bacillus atrophaeus (formerly B. subtilus), or Bacillus coagulans. The metal or plastic carriers should be individually packaged for use either within the package or for use upon removal from the package as an unpackaged biological indicator. The packaged biological indicator on the metal or plastic carrier has a particular labeled spore count of not less than $10^{4}$ and not more than $10^{9}$ spores per carrier. It has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value ( $D$ value, in minutes), specified by:

Survival time (in minutes) $=$ not less than (labeled $D$ value $) \times(\log$ of labeled spore count per carrier -2 ), and

Kill time $($ in minutes $)=$ not more than (labeled $D$ value $) \times(\log$ of labeled spore count per carrier $+4)$.

Packaging and storage-Preserve in the original package under the conditions recommended on the label, and protect the package from light, toxic substances, excessive heat, and high relative humidity or moisture. The packaging or container materials do not adversely affect the performance of the article used as directed in the labeling.

Expiration date-The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture. The date of manufacture is the date on which the first determination of the total viable count was made.

Labeling-Label the package or package insert to state that it is a biological indicator prepared on a metal carrier for use in label-specified applications for moist heat, dry heat, and/ or gaseous sterilization. State the biological indicator $D$ val$u e$ obtained under defined exposures to stated sterilization conditions using the Survival Curve method, SpearmanKarber method, or Stumbo-Murphy-Cochran method of $D$ value analysis. State the survival time and kill time for the biological indicator carrier under specified conditions on the label. The total count viable spore count per carrier following heat shock treatment must also appear on the label. State in the labeling the size of the carrier, the strain and ATCC number of the spore suspension used to inoculate the carriers, and instructions for spore recovery and for safe disposal of the carriers. Indicate in the labeling that the stated $D$ value is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the metal or plastic carrier biological indicator for the user's particular purpose and exposure conditions.

Identification-Identification schemes are listed for four microorganisms that may be used as biological indicators for metal or plastic carriers.

Clostridium sporogenes, ATCC No. 7955. The biological indicator microorganism complies with the morphological, cultural, and biochemical characteristics of the strain derived from Clostridium sporogenes, ATCC No.7955. Under microscopic examination it consists of Gram-positive rods with oval endospores in subterminally swollen cells. When incubated in appropriate media between $30^{\circ}$ to $40^{\circ}$ for 72 hours, growth occurs under anaerobic conditions. Similarly inoculated media incubated aerobically between $30^{\circ}$ to $40^{\circ}$ for 72 hours shows no evidence of growth in the same period. When examined using conventional biochemical tests for the microbial characterization, glucose is fermented while adonitol, dulitol, erythritol, and sorbose are not; hydrogen sulfide and ammonia are produced. Gelatin is hydrolyzed; lipase is produced. The mol $\% \mathrm{G}+\mathrm{C}$ (guanine plus cytosine) content of DNA is $26 .{ }^{1}$

Geobacillus stearothermophilus (formerly Bacillus stearothermophilus), ATCC No. 7953. The mol \% G + C content of DNA is 43.5 to $62.2 .{ }^{1}$ It meets the requirements of the Identification test under Biological Indicator for Steam Sterilization, Paper Carrier.

Bacillus atrophaeus (formerly Bacillus subtilis), ATCC No. 9372 . The mol $\% \mathrm{G}+\mathrm{C}$ content of DNA is 41.5 to $47.5^{1}$. It meets the requirements of the Identification tests under Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier.

Bacillus coagulans, ATCC No. 51232. The biological indicator microorganism complies with the morphological, cultural, and biochemical characteristics of the strain derived from Bacillus coagulans, ATCC No. 51232. Under

[^6]microscopic examination it consists of Gram-positive rods, and considerable morphological variation may occur, with sporangia not appreciably swollen by oval or cylindrical spores, not sporangia swollen by oval spores. Minimal nutritional requirements may be diverse. Various amino acids and vitamins may potentiate its growth. When incubated in appropriate media at $50 \pm 2^{\circ}$ for 72 hours, growth occurs under aerobic conditions. Optimum growth pH is close to 6.0. The $\mathrm{mol} \% \mathrm{G}+\mathrm{C}$ content of DNA is 44.3 to 50.3 . ${ }^{1}$

D value-Proceed as directed in the relevant procedure for D Value Determination under Biological Indicators-Resistance Performance Tests $\langle 55\rangle$. The requirements of the test are met if the determined $D$ value is within $20 \%$ of the labeled $D$ value for the selected sterilizing temperature, and if the confidence limits of the estimate are within $10 \%$ of the determined $D$ value. While calculations for the Limited Spearman-Karber D-value method appears in chapter Biological Indicators-Resistance Performance Tests $\langle 55\rangle$, it is included for compendia or referee testing of biological indicators. It is recognized that other methods, such as the Stumbo-Murphy-Cochran procedure or the Survival Curve method, can be routinely used by manufacturers or users of biological indicators for $D$-value determinations. The $D$-value method used by a manufacturer should be stated in the manufacturer's literature.

Survival time and kill time-Follow the procedure for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers in the section Survival Time and Kill Time under D-Value Determination in chapter Biological Indicators-Resistance Performance Tests $\langle 55$.$\rangle The requirements of the test are$ met if all of the carriers subjected to sterilization exposure conditions intended to indicate survival show evidence of growth among the exposed carriers, while none of the carriers subjected to conditions designed to induce total kill
show growth. If for either the survival test or the kill time test, not more than one carrier out of both groups fails the survival or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. If all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survival test time or meet the kill requirement for the kill test, whichever is applicable, the requirements are met.

Total viable spore count-Proceed as directed for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers in the section Total Viable Spore Count under Biological IndicatorsResistance Performance Tests $\langle 55\rangle$. The requirements of the test are met if the average number of viable spores per carrier are within $-50 \%$ and $+300 \%$ of the labeled count per carrier or within a lesser range that may be stated by the manufacturer.

Purity-There is no evidence of contamination with other microorganisms following examination of spores recovered from the metal or plastic carriers using a suitable plate culture medium.

Disposal-Prior to destruction or discarding the metal or plastic carriers, sterilize by moist heat sterilization to ensure that the carrier surface is exposed to $121^{\circ}$ for not less than 30 minutes, or by an equivalent method recommended by the manufacturer. $\triangle$ USP28

## BRIEFING

Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions-See briefing under Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers.

Comments should be sent to USP Headquarters for consideration by the Expert Committee on Analytical Microbiology no later than March 1, 2004.
(AMB: D. Porter) RTS-40482-2

## Add the following:

## - Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions

» Liquid spore suspensions may be used to prepare biological indicators for moist heat, dry heat, and gaseous modes of sterilization. On the basis of the intended sterilization use, the suspension is prepared inoculated from a culture of viable spores derived from one of several sterilization resistant microorganisms. Cultures used for liquid spore suspensions may include the following: Clostridium sporogenes, Geobacillus stearothermophilus (formerly B. stearothermophilus), Bacillus atrophaeus (formerly B. subtilus), or Bacillus coagulans. Each tube or container containing the spore suspension is individually packaged for use. The packaged biological indicator spore suspension has a particular labeled spore count of not less than $10^{4}$, and not more than $10^{9}$, spores per mL of suspension. The suspending medium or vehicle is identified according to chemical composition. It has a survival time and kill time appro-
priate to the labeled spore count, and to the decimal reduction value (the $D$ value, in minutes), specified by:

Survival time (in minutes) $=$ not less than (labeled $D$ value $) \times(\log$ of labeled spore count per mL from 1:100 dilution of original suspension -2 ); and

Kill time $($ in minutes $)=$ not more than (labeled $D$ value $) \times(\log$ of labeled spore count per mL $+4)$.

Packaging and storage-Preserve in the original tube or container under the conditions recommended on the label, and protect the contents of the tube or container from light, toxic substances, and excessive heat. The materials of composition of the tube or container must not adversely affect the performance of the spore suspension.

Expiration date-The expiration date is determined on the basis of stability studies. The date of manufacture is the date on which the first determination of the total viable count was made.

Labeling-Label the spore suspension tube or container or package insert to state that it is a biological indicator spore suspension for use in label specified applications for moistheat, dry-heat, and/or gaseous sterilization. State the biological indicator $D$ value obtained under defined exposures to stated sterilization conditions using the Survival Curve Method of $D$-value analysis. State the Survival time and kill time for the biological indicator suspension under specified conditions on the label. The total count viable spore count per mL of the suspension following heat shock treatment must also appear on the label. State in the labeling the strain and ATCC number of the microorganisms used in the spore suspension and instructions for spore recovery and for safe
disposal of the suspension. Indicate in the labeling that the stated $D$ value is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the biological indicator spore suspension for the user's particular purpose and exposure conditions.

Identification-Identification information is listed below for four microorganisms that may be supplied as biological indicator spore suspensions:

Clostridium sporogenes, ATCC No. 7955. The biological indicator microorganism complies with the morphological, cultural, and biochemical characteristics of the strain derived from Clostridium sporogenes, ATCC 7955. Under microscopic examination it consists of Gram-positive rods with oval endospores in subterminally swollen cells. When incubated in appropriate media at $30^{\circ}$ to $40^{\circ}$ for 72 hours, growth occurs under anaerobic conditions. Similarly inoculated media incubated aerobically at $30^{\circ}$ to $40^{\circ}$ for 72 hours shows no evidence of growth in the same period. When examined using conventional biochemical tests for the microbial characterization, glucose is fermented while adonitol, dulitol, erythritol, and sorbose are not; $\mathrm{H}_{2} \mathrm{~S}$ and ammonia are produced. Gelatin is hydrolyzed; lipase is produced. The mol \% G + C content of DNA is $26 .{ }^{1}$

Geobacillus stearothermophilus (formerly Bacillus stearothermophilus), ATCC No. 7953. The mol \% G + C content of DNA is 43.5 to $62.2 .{ }^{1}$ It responds to the Identification test under Biological Indicator for Steam Sterilization, Paper Carrier.

[^7]Bacillus atrophaeus (formerly Bacillus subtilis), ATCC No. 9372 . The mol $\% \mathrm{G}+\mathrm{C}$ content of DNA is 41.5 to 47.5. ${ }^{1}$ It meets the requirements of the Identification test under Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier.
Bacillus coagulans, ATCC No. 51232. The biological indicator microorganism complies with the morphological, cultural, and biochemical characteristics of the strain derived from Bacillus coagulans, ATCC no. 51232. Under microscopic examination it consists of Gram-positive rods, and considerable morphological variation may occur, with sporangia not appreciably swollen by oval or cylindrical spores, not sporangia swollen by oval spores. Minimal nutritional requirements may be diverse. Various amino acids and vitamins may potentate its growth. When incubated in appropriate media at $50 \pm 2^{\circ}$ for 72 hours, growth occurs under aerobic conditions. Optimum growth pH is close to 6.0. The $\mathrm{mol} \% \mathrm{G}+\mathrm{C}$ content of DNA is 44.3 to 50.3 . ${ }^{1}$

D value-If the biological indicators are being used in moist-heat or dry-heat sterilization, proceed as directed for the relevant procedure in the section $D$-Value Determination under Biological Indicators-Resistance Performance Tests $\langle 55\rangle$. The requirements of the test are met if the plot of the biological indicator survivor curve on a semi-log scale results in a straight line with an $R$-value of $>95 \%$.

While calculations for the Limited Spearman-Karber $D$ value method appears in Biological Indicators-Resistance Performance Tests $\langle 55\rangle$, it is included for compendia or referee testing of biological indicators. It is recognized that other methods such as the Stumbo-Murphy-Cochran procedure, or the Survival Curve method can be routinely used by manufacturers or users of biological indicators for $D$-value determinations. The Survival Curve method for establish-
ment of $D$ values in liquid suspensions will be used for referee purposes. The $D$-value method used by a manufacturer should be stated in the manufacturer's literature.

Survival time and kill time-Follow the procedure for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspension under Survival Time and Kill Time in the section D-Value Determination under Biological Indicators-Resistance Performance Tests $\langle 55\rangle$. The test is conducted using 1:100 dilution aliquots of the original suspension to inoculate carrier substrates that are most likely to be used by the purchaser of the spore suspensions for a given mode of sterilization. The following represents examples of substrates that may be used in the survival-time and kill-time test for specific spore suspensions. Metallic, plastic, or paper substrates may be used for C. sporogenes, G. stearothermophilus, B. atrophaeus, and B. coagulans. Following a total viable count analysis, the inoculated substrates are subjected to sterilization exposure conditions intended to indicate survival. The inoculated carriers must show evidence of growth among the exposed carriers. A second study is conducted to demonstrate the conditions necessary to result in total kill of the carriers. None of the carriers subjected to conditions designed to induce total kill should show growth. If for either the survival-time test or the kill-time test, not more than one carrier out of both groups fails the survival or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. For biological indicators for use with moist-heat or dry-heat sterilization, if all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survi-val-time test or meet the kill requirement for the kill-time test, whichever is applicable, the requirements are met.

Total viable spore count-Proceed as directed for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions in the section Total Viable Spore Count under Biological IndicatorsResistance Performance Tests $\langle 55\rangle$. The requirements for this test are met if the total viable spore count within the suspension is within $\pm 1 \log$ of the value stipulated by the manufacturer.

Purity-There is no evidence of contamination with other microorganisms following examination of spores recovered from the metal carriers using suitable plate-culture medium.

Shipment—Spore suspensions must be shipped following EPA requirements for the shipment of biological and/or etiological agents.

Disposal-Spore suspensions that a user or manufacturer wishes to dispose of are first sterilized by moist heat by a process that achieves temperatures of approximately $121^{\circ}$ for not less than 30 minutes. Alternative sterilization methods yielding equivalent or greater levels of lethality may be used. $\triangle$ USP28

Briefing
Red Blood Cells, USP 27 page 262 and page 431 of $P F$ 29(2) [Mar.-Apr. 2003]. It is proposed to revise the existing abbreviated monograph for Red Blood Cells to update the Definition and sections on Packaging and storage, Expiration date, and Labeling and to include test specifications, procedures, and acceptance criteria consistent with current FDA requirements. The revised monograph is intended to apply to Red Blood Cells regardless of the method of preparation, i.e., whole blood derived or derived from apheresis. It describes the requirements for an acceptable unit of allogeneic red blood cells. The procedures for ABO blood group, Rh type, Leukocyte count, and Adequacy of deglycerolization were adapted from the $A A B B$ Technical Manual (50th Anniversary Edition), 2002, 14th Edition, American Association of Blood Banks, Bethesda, MD. The procedure for Hemoglobin content is recommended by the National Institutes of Health and approved by the International Committee on Standardization in Hematology as the standard method for hemoglobin assay. The proposed hemoglobin content of 50 g is the minimum amount of hemoglobin in a unit of red cells collected under minimally acceptable parameters. Specifically, a
$405-\mathrm{mL}$ collection (the lower limit of a $450-\mathrm{mL}$ collection $\pm$ $10 \%$ ) with a minimum donor hematocrit of $38 \%$. In this case, $405 \mathrm{~mL} \times 0.38=154 \mathrm{~mL}$ red cell mass, which equates approximately to 50 g hemoglobin. The volume stated refers to the total fluid volume, including any residual plasma, anticoagulants, or additive solution. Total volumes will vary depending on processing method. A range is given here to accommodate process methods and to give clinicians a reference for calculating transfusion volumes given to a patient. The proposed hemoglobin content and volume of Red Blood Cells, Leukocyte Reduced are calculated numbers based on a minimum of $85 \%$ recovery of starting material of Red Blood Cells during leukoreduction filtration. The $85 \%$ recovery is a CBER/FDA minimum, a minimum defined in the Circular of Information, and also a minimum recovery claim of filter manufacturers. Actual recovery is typically higher. The proposed hemoglobin content in Red Blood Cells, Deglycerolized is a calculated number based on an $80 \%$ recovery from the starting material of Red Blood Cells. The $80 \%$ recovery is an FDA minimum and a minimum defined in the Circular of Information. Actual recovery is typically higher. The volume is not reduced because it is adjusted after deglycerolization. The proposed hemoglobin content of Red Blood Cells, Leukocyte Reduced and Deglycerolized is a calculated number based on an $80 \%$ recovery of starting material of Red Blood Cells, Leukoreduced. The $80 \%$ recovery is an FDA minimum and a minimum defined in the Circular of Information. Actual recovery is typically higher. The volume is not reduced because it is adjusted after deglycerolization.

## Change to read:

\# Red Bleod Cells conforms to the regulations of the federal Food and Drug Administration concerning biologies ( 640.10 to 640.18 ) (see Biolegics $\langle 1044\rangle$ ). It is the remaining red blood cells of whole human blood that has been collected from suitable whole blood donors, and from which plasma has been removed. It may be prepared at any time during the dating period of the whole blood from which it is derived, by centrifuging or undisturbed sedimentation for the separation of plasma and cells, not later than 21 days after the blood has been drawn, except that when acid citrate dextrese adenine solution has been used as the anticoagulant, sueh preparation may be made within 35 days therefrom. It contains a portion of the plasma sufficient to ensure optional cell preservation or contains a cryophylactic substance if it is for extended manufacturers' storage at $65^{\circ}$ or colder.
\#Red BloodCells is the pertion of blood that contains hemoglobin and is derived from whole human blood, from which plasma is removed by mantal centrifugation or sedimentation, or by apheresis, in which case the plasma is automatically removed and returned directly to the donor. Red Blood-Cells derived from whole human blood may be prepared at any time dur ing the dating period of the whole human blood from which it is derived.

Red Blood Cells may be further processed by filtation for removal of leukocytes, may be washed to remove proteins, may be frozen and thawed, or may be

#### Abstract

rejurenated using validated and approved procedures. The source blood for Red Blood Cells must be tested for syphilis, hepatitis $B$, and human T-cell virus Type 4 and Type 2 using approved commercially available test kits, the results of which must be below the limits of detection speciffed in the respective test kits by the manufacturers. In addition, the source blood must alse be tested for hepatitis C and for antibodies to HIV using a nucleic acid assay, the results of which must be below the approved limits of detection for the meth ed. A unit (dose) of Red Blood Cells contains a minimum of 50 g of hemoglobin in a total volume of about 180 mL to 325 mL . A unit (dose) of Red Blood Cells, Leukecytes Redured, contains a minimum of 42.5 g of hemeglobin in a total volume of about 150 mL to 275 mL and has a residual leukneytermin of less than 5-* $10^{6} . A$ unit (dose) of Red Blood Cells, Deglyeerolized, eontains a minimum of 40 g of hemoglobin in a total velume of about 180 mL to 325 mL . A unit (dose) of Red Blood-Cells, Leuk eytes-Redueed and Deglyeerelized, contains a minimum of 35 g of hemoglebin in a total volume of about 180 mL to 325 mL and has a residtal leukeyte count of less than $5 \times 10^{6}$ :

${ }^{\wedge}$ Red Blood Cells is the portion of blood that contains hemoglobin and is derived from human whole blood, from which plasma and cellular components are removed by centrifugation, sedimentation, or, by apheresis, in which case the plasma is automatically removed and returned directly to the donor. Red Blood Cells derived from whole blood may be prepared at any time during the dating period of the whole blood from which it is derived.

Red Blood Cells may be further processed by addition of red cell preservatives, irradiation to inactivate lymphocytes, filtration for removal of leukocytes, washing to remove proteins, freezing and thawing, or rejuvenation using validated and approved procedures. The source blood for Red Blood Cells must be tested for syphilis, hepatitis B virus, hepatitis $C$ virus, human T-cell virus (HTLV) type I and type II, human immunodefi-
ciency virus (HIV) type 1 and type 2 , and unexpected antibodies to red cell antigens using FDA-approved and licensed commercially available test kits, the results of which must be below the limits of detection specified in the respective test kits by the manufacturers. In addition, the source blood must also be tested for hepatitis C and HIV using FDA-approved nucleic acid assays, the results of which must be below the approved limits of detection for the method. A unit (dose) of Red Blood Cells contains a minimum of 50 g of hemoglobin in a total volume of approximately 180 to 325 mL . A unit (dose) of Red Blood Cells, Leukocytes Reduced contains a minimum of 42.5 g of hemoglobin in a total volume of approximately 150 to 275 mL , and has a residual leukocyte count of less than $5 \times 10^{6}$. A unit (dose) of Red Blood Cells, Deglycerolized contains a minimum of 40 g of hemoglobin in a total volume of approximately 180 to 325 mL . A unit (dose) of Red Blood Cells, Leukocytes Reduced and Deglycerolized contains a minimum of 34 g of hemoglobin in a total volume of approximately 180 to 325 mL and has a residual leukocyte count of less than $5 \times 10^{6}$. A unit (dose) of Red Blood Cells, Pheresis contains a mean hemoglobin content of 60 g of hemoglobin. A unit (dose) of Red Blood Cells, Pheresis, Leucocytes Reduced contains a mean hemoglobin content of 51 g (or $153-\mathrm{mL}$ packed red cell volume, and has a residual leukocyte count of less than $5 \times 10^{6} \cdot$ aUSP2s $^{\text {us }}$

Packaging and storage-Preserve in a hermetic container, which is of colorless, transparent, sterile, pyrogen free Type I or Type H glass, or of a suitable plastic material(seeTransfusion and Infusion Assemblies $\langle 164\rangle$ ), in which it was placed by the precessor. Store if unfrozen at a temperature between $1^{\circ}$ and $6^{\circ}$, held enstant within a $2^{\circ}$ rang exeept during shipment when the temperature may be between $1^{\circ}$ and $10^{\circ}$, and store if for extended manufacturers' stor age in frozen form at $65^{\circ}$ or colder. The entainer of Red Blood Gells is aceompanied by a securely attached smaller container holding an original pilot sample of blood taken from the doner at the same time as the whole human bleod, or a pillat sample of Red Blood Cells removed at the time of its preparation.
${ }^{\Delta}$ Collect into an approved container (see Transfusion and Infusion Assemblies $\langle 161\rangle$ ) containing a sterile, pyrogenfree approved anticoagulant (see Anticoagulant Citrate Dextrose Solution, Anticoagulant Citrate Phosphate Dextrose, or Anticoagulant Citrate Phosphate Dextrose Adenine Solution). An approved additive solution may be added after removal of the plasma. Store Red Blood Cells in the original container, or transfer to an equivalent container using a technique that does not compromise sterility. Liquid Red Blood Cells is stored at a temperature between $1^{\circ}$ and $6^{\circ}$ (see General Notices and Requirements). Frozen Red Blood Cells is stored at $-65^{\circ}$ or colder. $\triangle$ USP28

## Change to read:

Expiration date-The-expiration date-for unfrozen-Red Blood Gells is not later than that of the whole human blood from which it is derived if plasma has not been removed, except that if the her metic seal of the container is broken during preparation, the expira tion date is net later than 24 hours after the seat is broken. The expiration date for frozen Red Blood Cells is not later than 3 years after the date of collection of the souree blood when stored at $65^{\circ}$ er colder and not later than 24 hours after removal from- $65^{\circ}$ stor age provided it is then stored at the temperature for unfrozen Red Blood Cells.
${ }^{\Delta}$ Red Blood Cells in Anticoagulant Citrate Dextrose Solution, Anticoagulant Citrate Phosphate Dextrose Solution, or in Anticoagulant Citrate Phosphate Dextrose-Dextrose Solution may be stored for up to 21 days at $1^{\circ}$ to $6^{\circ}$ after the blood has been drawn. Red Blood Cells in Anticoagulant Citrate Phosphate Dextrose Adenine Solution may be stored for up to 35 days at $1^{\circ}$ to $6^{\circ}$. Red Blood Cells may be stored in an approved additive solution (AS), ${ }^{*}$ for up to

[^8]42 days at $1^{\circ}$ to $6^{\circ}$. If the hermetic seal of the container is broken during collection, preparation, or further processing, the expiration date is not later than 24 hours after the seal is broken. The expiration far frozen Red Blood Cells is net later than 3 years frem the date feollection when stored at $65^{\circ}$ or colder, except when RedBlood Cells are prepared for freezing with high glycerel content ( $40 \%$ glycerol), in which case they may be stored for not more than 10 years from the The expiration date for frozen Red Blood Cells prepared with low glycerol content ( $20 \%$ glycerol) is not later than 10 years from the date of collection when stored at $-120^{\circ}$ or colder, except when Red Blood Cells is prepared for freezing with high glycerol content ( $40 \%$ glycerol), in which case it may be stored at $-65^{\circ}$ or colder for no later than 10 years from date of collection. If the frozen Red Blood Cells is processed for freezing or for thawing, in an open system, the expiration date for the thawed Red Blood Cells is 24 hours after removal from $-65^{\circ}$ storage, provided it is then stored at the temperature of unfrozen Red Blood Cells. . USP28 $^{\text {S }}$

## Change to read:

Labeling In addition to labeling requirements of Whole Blood applieable to this produet, labelit to indieate the approved variation to which it conforms, such as "Frozen," or "Deglycerolized." Label it also with the instruction to use a filter in the administration equipment.
${ }^{\Delta}$ Label the container to indicate the volume of the whole human blood collected from the donor, the collection date, the donation number or other coding means to uniquely identify the unit and to provide traceability to the donor, and the expiration date. Label it to indicate the type of anticoagulant used to collect whole human blood and any additive solutions added subsequent to collection. Label it also to identify donor status (i.e., volunteer or paid). Label it also with the following statements: "See Circular of Information for indications, contraindications, cautions, and methods of infusion."; "Properly identify recipient."; and "Caution: Rx only." In addition, label it to indicate the product name as
indicated in Table 1. [NOTE-The name is determined by the method of preparation of the Red Blood Cells (derived from whole human blood or from apheresis) and by performing the necessary testing to ensure that the product meets the minimum requirements for the named products, as indicated in Table 1.]

Table 1. Red Blood Cells Preparations

| Product Name | Method of Preparation |

| B | Negative |
| AB | Positive |
| AB | Negative |
| O | Positive |
| O |  |

## Add the following:

${ }^{4}$ USP Reference standards $\langle 11\rangle — U S P$ Hemoglobin
$R S_{. \Delta U S P 28}$

## Add the following:

${ }^{4}$ Identification-
A: ABO blood group-
Anti-A reagent-Use menoclenal-or polyelenal anti-A
blood grouping reagent, two different lots from the same or different manufacturers. Dilute, if neeessary, following the manufacturer's instructions. Use approved commercially available monoclonal or polyclonal anti-A blood grouping reagent, two different lots from the same or different manufacturers. Use in accordance with manufacturer's instructions.

Anti-B reagent-Use monoclonal-or polyclonal anti B
blood grouping reagent, two different lots from the same or different manufacturers. Dilute, if neeessary, following the manufacturer's instructions. Use approved commercially available monoclonal or polyclonal anti-B blood grouping reagent, two different lots from the same or different manufacturers. Use in accordance with manufacturer's instructions.

Anti-AB reagent-Use anti AB blood grouping reagent.
Bilute, if neeessary, following the manufacturer's instrue-
Use approved commercially available anti-AB blood grouping reagent. Use in accordance with manufacturer's instructions.

Control preparations-On the day of use, dilute Blood Group $\mathrm{A}_{1}$ (Control preparation $A_{1}$ ) and Blood Group B (Control preparation B) red blood cells, obtained from an approved commercial source or prepared by the testing laboratory, with $0.9 \%$ saline to suspensions of approximately the same concentration between $2 \%$ to $5 \%(\mathrm{v} / \mathrm{v})$. [NOTE-If the Blood Group $\mathrm{A}_{1}$ and Blood Group B red blood cells are prepared in the testing laboratory from whole blood of a known blood group, it must be prepared on the day of use following the procedure for the Test preparation under Whole Blood.]

Test preparation-On the day of use, dilute Red Blood Cells with $0.9 \%$ saline to a suspension of about the same concentration as the Control preparations.

Procedure-On a suitable U-bottomed microtiter plate, place 1 drop of $0.9 \%$ saline in each of three different wells in a row (Blank Row). Place 1 drop from one of the lots of Anti-A reagentin each of three different wells in a second row. Place 1 drop from the second lot of Anti-A reagent in each of three different wells in a third row. Repeat the same with two different lots of Anti-B reagent and one lot of Anti$A B$ reagent in separate rows. To each row, add one drop of Control preparation $A_{1}$, Control preparation $B$, and the Test preparation in the first, second, and the third well, respectively, of each row. Mix the contents of the wells by gently tapping the sides of the plate. Centrifuge the plate at the appropriate conditions established for the centrifuge. Resuspend the cell buttons by manually tapping the plate or with the aid of a suitable mechanical shaker. Read the optical densities at different wells using a suitable automated photometric microtiter plate reader. Compare the optical density of each well in the Blank Row with the optical density of the wells to which the corresponding Control preparation $A_{1}$, Control preparation B, or Test preparation were added. [NOTE-A high optical density comparable to those obtained for the wells in the Blank Row indicates negative results (no hemagglutination), which can be corroborated by visual observation of smooth suspensions. A low optical density indicates positive results (hemagglutination), which can be corroborated by visual observation of formation of clumps.] The ble group of Red Bleod Cells is $\Lambda, B$, of O-ceording to whether the Test preparation is hemagglutinated by $A n t i-A$ reagent, Anti-Breagent, or neither, respecThe blood group of Red Blood Cells is A, B, AB, or O accordingly as the Test preparation is hemagglutinated by Anti-A reagent, Anti-B reagent, both reagents, or neither, re-
spectively. The blood group of the Test preparation conforms to the blood group indicated on the label. Thest is not valid if Control preparation $A_{+}$and Contol preparat tion $B$ are not gegolutinated by Anti A reagent and Anti Bre agent, respectively, and both Control preparations are not agglutinated by Anti-AB-rent. The test is not valid if Control preparations for Blood Group A and Blood Group B red blood cells are not agglutinated by Anti-A Reagent and Anti-B Reagent, respectively, or if both Control preparations are not agglutinated by Anti-AB Reagent. The test is also not valid if the Test preparation is not agglutinated by Anti- $A B$ reagent but is agglutinated by either Anti-A reagent or Anti-B reagent, or is agglutinated by Anti-AB reagent but not by either Anti-A reagent or Anti-B reagent.
B: Rh type-
TEST 1-
Anti-D $\left(R h_{o}\right)$ reagent-Use anti-D $\left(\mathrm{Rh}_{0}\right)$ blood grouping reagent approved for use in microtiter plate tests. Dilute, if necessary, following the manufacturer's instructions.

Test preparation-On the day of use, dilute Red Blood Cells with $0.9 \%$ saline to obtain a $2 \%$ to $5 \%(\mathrm{v} / \mathrm{v})$ suspension.

Procedure-On a suitable U-bottom microtiter plate, place 1 drop each of $0.9 \%$ saline and Anti-D $\left(R h_{o}\right)$ reagent in two separate wells. Label them as the B well (Blank) and the T well, respectively. Add 1 drop of Test preparation to each well, and mix by gently tapping the side of the plate. Centrifuge the plate at appropriate conditions established for the centrifuge. Resuspend the cell buttons by manually tapping the plate or with the aid of a suitable mechanical shaker. Read the optical densities of the wells using a suitable automated photometric microtiter plate reader, and determine if the Red Blood Cells in the T well is agglutinated as described under Identification test $A$. If the T well indicates negative results (no hemagglutination), incubate the
plate at $37^{\circ}$ for 15 minutes, centrifuge, resuspend the cells, and read the optical densities of the wells as above. Agglutination of cells after immediate-spin or after $37^{\circ}$ incubation indicates Rh positive typing of Red Blood Cells. The test is valid if cells in the B well are not agglutinated. If the cells are not agglutinated in the T well, proceed as directed in Test 2.

## TEST 2-

Anti-D reagent-Use anti-D blood grouping reagent approved for use for a weak D blood group test.

Antihuman globulin reagent-Use polyspecific or antiIgG antihuman globulin reagent. Dilute, if necessary, following the manufacturer's instructions.

Control preparation-Use IgG-coated red cells approved for use as a control for Rh typing. Dilute with $0.9 \%$ saline to obtain a $2 \%$ solution.

Test preparation-Prepare as directed for Test 1.
Procedure—Place 1 drop of $0.9 \%$ saline into a suitable test tube and 1 drop of Anti-D reagent in another, and mark them as the Blank and Anti-D, respectively. To each tube add 1 drop of Test preparation, mix, and incubate at $37^{\circ}$ for 15 to 30 minutes. Centrifuge the tubes at about 1000 g for 15 to 30 seconds. Gently resuspend the cell buttons, and examine them for hemagglutination (formation of clump) by visual examination. The Rh typing of Red Blood Cells is positive or negative according to whether the cells in Anti-D tube are agglutinated or not. If the cells are not agglutinated, add 1 mL of $0.9 \%$ saline to the Anti-D tube, and resuspend the cells. Centrifuge the tube at about 1000 g for 1 minute and remove the saline completely. Repeat the step two to three times more to wash the Red Blood Cells. Add 1 drop of $0.9 \%$ saline and 1 to 2 drops of Antihuman globulin reagent to the Anti-D tube. Mix gently, and centrifuge the tube at about 1000 g for 15 to 30 seconds. Gently resuspend the cell button, add 1 drop of Control prepara-
tion, mix gently, centrifuge as above, and examine for agglutination. The Rh Type of the Test preparation conforms to the Rh Type indicated on the label. The test is not valid if the cells in the Anti-D tube are not agglutinated after addition of the Control preparation. Also, for the test to be valid, the cells in the Blank tube not-must not beagglutinated. $\triangle U S P 28$

## Add the following:

${ }^{4}$ Visual inspection-Inspect visually during storage and immediately prior to use. If the color or physical appearance is abnormal or there is any indication or suspicion of microbial contamination, the unit is unsuitable for transfusion. $\triangle$ USP28

## Add the following:

${ }^{\wedge}$ Hemoglobin content-
Drabkin's solution-Dissolve Drabkin's reagent in a suitable volume of water, and add a suitable volume of a $30 \%$ (w/v) polyoxyethylene (23) lauryl ether solution such that the final concentrations of potassium cyanide, potassium ferrocyanide, and polyoxyethylene (23) lauryl ether in the solution are approximately $0.75 \mathrm{mM}, 0.6 \mathrm{mM}$, and $0.015 \%$, respectively. Store the solution in the dark between $18^{\circ}$ to $26^{\circ}$. [Caution-Drabkin's reagent and Drabkin's solution contain cyanide and are HIGHLY TOXIC. Do not inhale or swallow or allow contact with skin or with eyes. Wear suitable protective clothing, gloves, and eye and face protection. Do not mix with acids. Contact with acids liberates a very toxic gas. If ingested, perform gastric lavage, and immediately call a physician.]

## Blank solution: water.

Standard solution A-Transfer about 300 mg USP Hemoglobin RS, accurately weighed, to a $2-\mathrm{mL}$ volumetric tube, add 1 mL water, dissolve, dilute with water to volume, and mix.

Standard solution B-Mix $50 \mu \mathrm{~L}$ of Standard solution $A$ with $25 \mu \mathrm{~L}$ of water.

Standard solution C—Mix $50 \mu \mathrm{~L}$ of Standard solution $A$ with $100 \mu \mathrm{~L}$ of water.

Test solution-Mix $50 \mu \mathrm{~L}$ of Red Blood Cells with $50 \mu \mathrm{~L}$ of water.

Procedure-Label suitable tubes as B1, B2, SA1, SA2, SB1, SB2, SC1, SC2, T1, and T2. Add 5.0 mL of Drabkin's solution to each tube. Add $20 \mu \mathrm{~L}$ of water to each of B1 and B2, $20 \mu \mathrm{~L}$ of Standard solution $A$ to each of SA1 and SA2, $20 \mu \mathrm{~L}$ of Standard solution B to each of SB1 and SB2, 20 $\mu \mathrm{L}$ of Standard solution $C$ to each of SC1 and SC2, and 20 $\mu \mathrm{L}$ of Test solution to each of T 1 and T 2 , rinsing the pipet tip three to four times with Drabkin's solution, and mix. Allow to stand for at least 15 minutes at room temperature. [NOTERed Blood cells with appreciable carboxyhemoglobin content, such as those obtained from smokers, may require longer reaction time. If the donor characteristics are not known, the incubation time should be optimized prior to testing.] Read the absorbances of the solutions against the solution in tube B1 at 540 nm . The absorbance of the solution in tube B 2 is recorded at the end. The test is not valid if the absorbance of the solution in tube B2 is not within $\pm 0.005$.

Calculations-Calculate the concentrations, in mg per mL , of hemoglobin in Standard solution A, B, and C. Plot a calibration curve of absorbance values against the hemoglobin concentration by drawing a best-fit straight line using the least-square linear regression analysis. From the absorbance value of the Test solution, obtain the concentration, in mg per mL , of hemoglobin in the Test solution. Multiply the value by 2 to obtain the concentration, in mg per mL , of hemoglobin in Red Blood Cells. Calculate the total hemoglobin content in the Red Blood Cells unit, in g, by the formula:

Conc. of hemoglobin (in $\mathrm{mg} / \mathrm{mL}$ ) $\times$ the volume of the Red Blood Cells unit (in mL) $/ 10^{3}$. $\mathbf{\Delta U S P 2 8}$

## Add the following:

${ }^{4}$ Leukocyte count-[NOTE-Perform at least six repeaf the .f Pipet $40 \mu \mathrm{~L}$ of a suitable red cell-lysing agent into a clean test tube, add $100 \mu \mathrm{~L}$ of Red Blood Cells diluted with $0.9 \%$ saline, if necessary, such that the hematocrit of Red Blood Cells is not greater than $60 \%$. Mix by pipetting up and down several times. Add $360 \mu \mathrm{~L}$ of $0.01 \%$ (w/v) crystal violet in $15 \%(\mathrm{v} / \mathrm{v})$ acetic acid into the mixture, and mix thoroughly. Fit a hemocytometer with a $50-\mu \mathrm{L}$ counting volume and a bright background, with a cover slip, and load the counting chamber with the mixture until the counting area is completely covered, but not overfull. Cover the counting chamber with a suitable moist lid to prevent evaporation, and allow to settle undisturbed for 10 to 15 minutes. Remove the lid, place the chamber on the stage of a light microscope fitted with $10 \times$ ocular lens and $20 \times$ objective. Count the leukocytes in the entire $50-\mu \mathrm{L}$ counting volume. Calculate the leukocyte count in Red Blood Cells, expressed in leukocytes per $\mu \mathrm{L}$, by dividing the observed leukocyte count by 10. Calculate the total number of leukocytes in the Red Blood Cells unit by using the following formula:

Total leukocytes $=$ leukocytes $/ \mu \mathrm{L} \times 10^{3} \times$ the volume of the Red Blood Cells unit in mL. |  |
| :--- | :--- | :--- |
| 28 |

## Add the following:

${ }^{\wedge}$ Adequacy of deglycerolization (for Red Blood Cells, De-glycerolized)-Interrupt the last wash cycle of the deglycerolization process at a point where the wash fluid is visible in the clear tubing segment leading to the waste receptacle. Hold the tubing against a well-lighted, white background. Note the coloration of the fluid in the tubing, and compare
it to a suitable hemolysis color comparator standard. The color of the fluid should be no stronger than the block indicating $3 \%$ hemolysis. [NOTE-If the level of hemolysis is more than $3 \%$, continue the wash process, and repeat the test until the color is within acceptable limits.] $]_{\triangle U S P 28}$

## BRIEFING

Whole Blood, USP 27 page 262 and page 445 of PF 29(2) [Mar.-Apr. 2003]. It is proposed to revise the existing abbreviated monograph for Whole Blood to update the Definition and sections on Packaging and storage, Expiration date, and Labeling and to include test specifications, procedures, and acceptance criteria consistent with the current FDA requirements. The proposed hemoglobin content of 50 g is the minimum amount of hemoglobin in a unit of red cells collected under minimally acceptable parameters, specifically, a $405-\mathrm{mL}$ collection (the lower limit of a $450 \pm 10 \% \mathrm{~mL}$ collection) with a minimum donor hematocrit of $38 \%$. In this case, a $405-\mathrm{mL}$ collection corresponds to $405 \mathrm{~mL} \times 0.38=154 \mathrm{~mL}$ red cell mass, which equates approximately to 50 g of hemoglobin. The volume stated refers to the total fluid volume, including any residual plasma, anticoagulants, or additive solution. Total volumes will vary depending on processing method. A range is given here to accommodate process methods and to give clinicians a reference for calculating transfusion volumes given to a patient.

The procedures for $A B O$ blood group, Rh type, and Leukocyte count were adapted from the $A A B B$ Technical Manual (50th Anniversary Edition), 2002, 14th Edition, American Association of Blood Banks, Bethesda, MD. The procedure for Hemoglobin content is recommended by the National Institutes of Health and approved by the International Committee on Standardization in Hematology as the standard method for hemoglobin assay.
(BBP: R. Tirumalai) RTS-40461-2

Packaging and storage-Preserve in the eontainer inte-which-it was originally drawn. Use pyregen free, sterile containers of coler less, transparent, Type- -or Type- II glass, or of a suitable-plastie material (see Transfusion and Infusion Assemblies $\langle 164\rangle$ ). The enntainer is provided with a hermetic eontamination proef clesureAccessory equipment supplied with the blood is sterile and pyregen free (see Transfusion and Infusion Assemblies $\langle 164\rangle$ ). Store at a temperature between $1^{\circ}$ and $6^{\circ}$ held constant within a $2^{\circ}$ range, exeept during shipment, when the temperature may be bewween $1^{\circ}$ and $10^{\circ}$. The eentainer of Whele-Bleod is aeempanied by at least ene securely attached smaller container holding an original pilet sample of blood, for test purpeses, taken at the same time from the same dener, with the same antieergulant. Both centainers bear the dener's identification symbel or number.
${ }^{\wedge}$ Collect into an approved container (see Transfusion and Infusion Assemblies and Similar Medical Devices 〈161〉) containing a sterile, pyrogen-free approved anticoagulant (see USP monographs Anticoagulant Citrate Dextrose Solution, Anticoagulant Citrate Phosphate Dextrose Solution, or Anticoagulant Citrate Phosphate Dextrose Adenine Solution). Store Whole Blood in the original container, or transfer to an equivalent one using a technique that does not compromise sterility. Whole Blood is stored at a temperature between $1^{\circ}$ and $6^{\circ}$ unless platelets are to be prepared, in which case the blood is stored for no longer than 6 hewrs
following collection at a temperature between $20^{\circ}$ to $24^{\circ} 8$ hours following collection at room temperature. (see General Notices and Requirements). $\mathbf{\Delta U S P 2 8}$

## Change to read:

Expiration date-Its expiration date is not later than 21 days after the date of bleeding the doner, if it contains anticoagulant cittate dextrose solution or anticeagulant ittrate phosphate dextrose solut tion, as the anticongulant; or not later than 35 days if it contains anticoagulant citrate phesphate dextrese adenine-solution as the antieoagulant; or not later than- 48 hours after date of bleeding the doner, if it contains heparin ion as the antieongulant.
${ }^{\Delta}$ Whole Blood collected in Anticoagulant Citrate Dextrose Solution, Anticoagulant Citrate Phosphate Dextrose Solution, or in Anticoagulant Citrate Phosphate Dextrose-Dextrose Solution may be stored for up to 21 days at $1^{\circ}$ to $6^{\circ}$ after the blood has been drawn. Whole Blood collected in Anticoagulant Citrate Phosphate Dextrose Adenine Solution may be stored for up to 35 days at $1^{\circ}$ to $6^{\circ}$. If the hermetic seal of the container is broken during collection, preparation, or further processing, the expiration date is not later than 24 hours after the seal is broken (when blood is stored at $1^{\circ}$ to $6^{\circ}$ ), but not to exceed the original expiration date of the unit. $\triangle U S P 28$

Change to read:
Labeling-Label it to indicate the doner classification, quantity and kind of anticoagulant used and the correspending volume of blood, the designation of $A B O$ blood group and Rh factors, and in the case of Group $O$ blood, whether or not isoagglatinin titers or other tests for exclusion of specified Group-O bloods were per formed and to indieate any group classifieation of the blood result ing therefrom. If an $A B O$ blood group color scheme is used, the tabeling color used shall be: Group A (yellow), Group B (pink), Group O (blue), and Group AB (white). Label it also with the type and result of a serolegie test for syphilis, of to indicate that it was nomreactive in such test; and with the type and result of a test for hepatitis $B$ surface antigen, or to indicate that it was non reactive in such test. If it has been issued prior to determination of test results, tabel it also with a waming not to use it until the test results have been received and to specify that a crossmatch be performed. Where applicable, label it as "Modified," and indicate that antihemophilic factor has been removed and that it should not be used for patients requiring that factor.
${ }^{\Delta}$ Label the container to indicate the volume of the Whole Blood collected from the donor, the collection date, the donation number or other coding means to uniquely identify the unit and to provide traceability to the donor, and itsex piration date. Label it to indicate the ype of anticoagulant und it the storage temperature and the expiration
date (see below). Label it to indicate the type of anticoagulant or other preservative solution used to collect it. Label it also to identify donor status (i.e., volunteer or paid). Label it also with the following statements: "See Circular of Information for indications, contraindications, cautions, and methods of infusion."; "Properly identify recipient."; and "Caution: Rx only." Label it to indicate the ABO group and Rh type, as indicated in Table 1. [NOTE-Each Whole Blood product must have a determination made as to its ABO group and Rh type and specificity of unexpected red cell antibodies, if any.] If an ABO blood group color scheme is used, use the following labeling color: Group A (yellow), Group B (pink), Group O (blue), and Group AB (white). Label Whole Blood with the type and results of tests for adventitious agents. If it has been issued prior to determination of the test results, label it also with a warning not to use it until the test results have been received and to further specify that acress match must be performed. If it has been issued prior to determination of the test results, label it also with the warning "Donor Untested" and to further specify "Uncrossmatched Blood," when appropriate. If the unit of Whole Blood was filtered to reduce leukocytes, label it as "Whole Blood, Leukocytes Reduced."

## Change to read:

Dissolution Procedure for a Pooled Sample
$\Delta$
$\left\langle\mathbf{7 1 1 1}^{\text {USP28 }}\right.$
Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 30 minutes.
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. $\triangle$ USP28
Mobile phase and Chromatographic system-Prepare as directed in the Assay.
Standard preparation-Prepare a solution in methanol having known concentrations of about 0.02 A mg of USP Acetaminophen RS per mL, $0.02 B \mathrm{mg}$ of USP Butalbital RS per mL, and $0.02 C \mathrm{mg}$ of USP Caffeine RS per mL , in which $A, B$, and $C$ are the labeled amounts, in mg, of acetaminophen, butalbital, and caffeine, respectively, per Tablet. Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Procedure-Filter apertion the solution under test
${ }^{\Delta}$ the pooled sample ${ }_{\Delta U S P 28}$
through a suitable filter having a porosity of $10 \mu \mathrm{~m}$ or finer. Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the filtrate and the Standard preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of butalbital $\left(\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{3}\right)$, acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$, and caffeine $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}\right)$ dissolved by the same formula:

$$
900 C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of the appropriate USP Reference Standard in the Standard preparation, and $r_{U}$ and $r_{s}$ are the peak responses of the corresponding analyte obtained from the solution under test and the Standard preparation, respectively.
Tolerances-Not less than $80 \%(Q)$ of the labeled amounts of $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{3}, \mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$, and $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$ are dissolved in 30 minutes:
${ }^{\Delta}$ the requirements are met if the quantities of active ingredients dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results
conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredients specified, expressed as a percentage of the labeled content.

## Acceptance Table for a Pooled Sample

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Carboprost Tromethamine is sterile, it meets the requirements der for Sterility Fest- $\langle 74\rangle$ ): and for Bacterial endotoxins under Carboprost Tromethamine Injection. Where the label states that Carboprost Tromethamine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Carboprost Tromethamine Injection. $\mathbf{\Delta U S P 2 8}$

## BRIEFING

Cefpodoxime Proxetil, USP 27 page 377. It is proposed to revise the test for Heavy metals by replacing Method I with Method $I I$. Method $I$ is applied to articles that yield clear, colorless Test Preparations. Method II is applied to substances that do not yield clear, colorless solutions or to substances that interfere with the precipitation of metals by the sulfide ion. Method II is also used
for fixed and volatile oils. Because Cefpodoxime Proxetil does not dissolve in water, it is proposed to use Method II, which involves igniting the specimen under test to obtain a sulfated residue that is then dissolved in hydrochloric acid.
(PA7a: W. Wright) RTS-40517-1

Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules, USP 27 page 417-See briefing under Acetaminophen and Aspirin Tablets.
(BPC: M. Marques) RTS-40315-2

## Change to read:

Dissolution Procedure for a Pooled Sample
${ }_{\langle }^{4}$ U 411$\rangle-$
Medium: water; 900 mL .
Apparatus 1: 100 rpm .
Time: 30 minutes.
Determine the amounts of chlordiazepoxide hydrochloride $\left(\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{ClN}_{3} \mathrm{O} \cdot \mathrm{HCl}\right)$ and clidinium bromide $\left(\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{BrNO}_{3}\right)$ dissolved using the following method.

- Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. $\qquad$ Solution $A$-Dissolve 1.92 g of sodium 1-pentanesulfonate in
900 mL of water. Adjust the solution with dilute sulfuric acid (1 in 100 ) to a pH of $3.8 \pm 0.1$, dilute with water to 1.0 liter, and mix.
Mobile phase-Prepare a filtered and degassed mixture of Solution $A$, tetrahydrofuran, and methanol (75:18:6). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chromatographic system-The liquid chromatograph is equipped with a $212-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for Procedure: the resolution between the two components is not less than 5.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about $100 \mu \mathrm{~L}$ ) of the Standard solution and aflered portion of the solution under test
$\Delta_{\text {the pooled sample }}^{\text {USSP28 }}$
into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for clidinium bromide and 1.0 for chlordiazepoxide hydrochloride. Calculate the amounts of chlordiazepoxide hydrochloride ( $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{ClN} \mathrm{N}_{3} \mathrm{O} \cdot \mathrm{HCl}$ ) and clidinium bromide $\left(\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{BrNO}_{3}\right)$ dissolved in comparison with a Standard solution having known concentrations of USP Chlordiazepoxide Hydrochloride RS and USP Clidinium Bromide RS, similarly prepared and chromatographed.
Tolerances- Not less than $75 \%(Q)$ each of the labeled amounts of $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{ClN}_{3} \mathrm{O} \cdot \mathrm{HCl}$ and $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{BrNO}_{3}$ are dissolved in 30 minutes:
$\Delta$ the requirements are met if the quantities of active ingredients dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredients, expressed as a percentage of the labeled content.

## BRIEFING

Clonidine Transdermal System, page 1441 of $P F$ 29(5) [Sept.-Oct. 2003]. On the basis of comments received, it is proposed to revise the Identification, Chromatographic purity, and Assay sections. It is also proposed to revise the Reference standards section to add new Clonidine Related Compound B RS. Analyses were performed with a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ Capcell-UG 120 (Shiseido) column that contains $5-\mu \mathrm{m}$ L1 packing. Typical retention times are about 3.5 for clonidine and 5.6 minutes for clonidide related compound B .
(PA5: A. Wilk) RTS-40494-1

## Add the following:

## ${ }^{\wedge}$ Clonidine Transdermal System

» Clonidine Transdermal System contains not less than 80.0 pereent and not more than 120.0 pereent ef the labeled amount ofelonidine $\left(\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}\right) \cdot 2.0 \mathrm{mg}$ and net more than 3.0 mg
ef clonidine, if labeled to deliver 0.1 mg of clonidine per day for one week; not less than 4.0 mg and not more than 6.0 mg of clonidine, if labeled todeliver 0.2 mg of clonidine per day for one week; and not less than 6.0 mg and not more than 9.0 mg of clenidine, if labeled to deliver 0.3 mg of elonidine per day for one week. 80.0 percent and not more than 120.0 percent of the labeled amount of clonidine $\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}\right)$.

Packaging and storage-Preserve in sealed, single-dose containers at a temperature not exceeding $30^{\circ}$.

Labeling-The label states the total amount of clonidine in the Transdermal System and the release rate, in mg per day, for the duration of the application of one system.

USP Reference standards $\langle 11\rangle$ —USP Clonidine Hydrochloride RS. USP Clonidine Related Compound B RS.

NOTE-Throughout the following procedures avoid the use of tetrahydrofuran stabilized with butylated hydroxytoluene (BHT). In the presence of peroxides, BHT may react with clonidine, producing impurity peaks.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
pH 9.2, 2M Tris buffer-Dissolve 121.14 g of tris(hydroxymethyl)aminomethane in 500 mL of water. Adjust pH to 9.2 using dilute hydrochloric acid.

Sample preparation-Carefully peel the release liner from each Transdermal System and place a number of Transdermal Systems, equivalent to about 25 mg of clonidine into a $50-\mathrm{mL}$ screw-capped centrifuge tube. Add 5 mL of chloroform and vortex for 5 minutes. Let stand for 30 minutes, vortexing intermittently. Transfer the chloroform solution to another $50-\mathrm{mL}$ centrifuge tube and wash the residue with an additional 3 mL of chloroform, combining the extracts. Add 2 mL of 0.5 N hydrochloric acid to the
extract, vortex for 1 minute, and centrifuge at about 1000 rpm for 4 minutes. Remove and discard the bottom chloroform layer. Extract the aqueous layer with 4 mL of chloroform. Centrifuge at about 1000 rpm for an additional 5 minutes and again discard the bottom chloroform layer. Add 5 mL of pH 9.2 , 2M Tris buffer and 3 mL of methylene chloride. Vortex for 1 minute. Centrifuge at about 1000 rpm for 4 minutes. Transfer the bottom methylene chloride layer into a $100-\mathrm{mL}$ beaker and dry the methylene chloride with anhydrous sodium sulfate (about $1 / 4$ liquid height). Decant and evaporate to dryness with a stream of nitrogen. Dry at $105^{\circ}$ for 30 minutes and allow to cool in a desiccator. Determine the infrared absorption spectrum of the residue obtained from the Sample preparation and USP Clonidine Hydrochloride RS in the wavelength region of 3500 to $3600 \mathrm{~cm}^{-1}$.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Uniformity of dosage units $\langle 905\rangle$ : meets the requirements.
Drug release $\langle 724\rangle$ -
Medium: 0.001 M phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; 160 mL 200 mL for systems containing more than 5 mg of clonidine.

Time: 8, 24, 96, and 168 hours.
Apparatus 7 Proceed directed in the chapter. [Size of sample holder to come.]

Apparatus 7-Proceed as directed in the chapter, using the transdermal system holder-angled disk (see Figure $7 a)$. The appropriate size of the holder, 1.42 or 1.98 inches, should be chosen based on the size of the system to prevent overhang. Use $100-\mathrm{mL}$ beakers for Medium volumes of $80-$ mL and $300-\mathrm{mL}$ beakers for Medium volumes of 200 mL . Gently press the transdermal system to a dry, smooth, square
piece of cellulose membrane ${ }^{*}$, or equivalent, with the adhesive side against the membrane. Attach the membrane/system to a suitable inert sample holder with a Viton O-ring, or equivalent, such that the backing of the system is adjacent to, and centered on, the bottom of the sample holder. Trim the excess of cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker such that each system is continuously immersed in a beaker containing the specified volume of Medium. The filled beakers are weighed and pre-equilibrated to $32.0 \pm 0.3^{\circ}$ prior to immersing the test sample. Agitate the sample in an updown motion at a frequency of 30 cycles per minute with an amplitude of $2.0 \pm 0.1 \mathrm{~cm}$. The Medium must be added daily to the beakers during each interval to maintain sample immersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of Medium, weighed and pre-equilibrated to $32.0 \pm 0.3^{\circ}$.

Determine the amount of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released by employing the following method.

Solvent Dissolve 2.04-g of menebasic petassium phesphate and 2.88 g of 1 - pentanesulfonic acid sodium 1- pentanesulfenate in 300 mL of water. Adjust with phespheric acid to a pH of 3.5 .
Mobile phase -Prepare a filtered and degassed mixture of Solvent and methanol (26:14). Make adjustments if neeessary (see Systen Suitability under Chromatography $\langle 624\rangle$ ). Use a filtered and degassed $0.1 \%$ solution of triethylamine in a mixture of water and methanol (70:30), adjust with phosphoric acid to a pH of $6.0 \pm 0.2$. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Fest solution At each of the test times, withdraw a 10
mL aliquet of the solution from each container.

[^9]Standard solution Prepare a solution of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of elonidine similar to that of the Test solution.

System suitability solution-Prepare a solution of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of about $10 \mu \mathrm{~g}$ per mL .

Standard solutions-Prepare a minimum of four standard solutions of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the Test solutions.

Test solutions-At the end of each release interval, allow the beakers to cool to room temperature and make up for evaporative Medium losses by adding Medium to obtain the original weight. Mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{mm} 220-$ nm detector and a $4.0-\mathrm{mm} \times 30-\mathrm{cm} 4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the tailing factor is not more than $\mathcal{Z 2 . 0}$; the capacity factor is not less than 0.5 ; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure—Separately inject equal volumes (about 50 $\mu \mathrm{L} 25 \mu \mathrm{~L}$ ) of filtered portions of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Construct a standard curve of concentration ( $\mu \mathrm{g}$ per mL ) of clonidine in the Standard solutions versus peak area by linear regression analysis. The correlation coefficient is
not less than 0.995 . Calculate the release rate of clonidine by the formula:

## CV/TA,

in which $C$ is the concentration, $\mu \mathrm{g}$ per mL , of clonidine in the sample obtained from the standard curve; $V$ is the volume, in mL , of the Medium; $T$ is the time, in hours; and $A$ is the area, in $\mathrm{cm}^{2}$, of the transdermal system.

Tolerances The amer $\mathrm{C}_{2} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released,as a per centage of the labeled amount of the dose absorbed in vive, as $\mu \mathrm{g}$ per hour per $\mathrm{cm}^{2}$, at the times specified conforms to Aceeptane Table 4.

| Fime (hours) | Amount dissolved |
| :---: | :---: |
| 8 | between 28\% and 68\% |
| 96 | between 116\% and 288\% |
| 168 | between 170\% and 357\% |
| Time (hems) | Amount dissolved (Hg/h |
|  | ( $\mathrm{m}^{2}$ ) |
| 8 | between 7.5 and 16.0 |
| 24 | between 1.5 and 6.0 |
| 96 | between 1.5 and-4.6 |
| 168 | between 1.5 and 3.3 |

The amoun of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released, as a percentag of the tabeled ameunt of the dose absorbedin vive, as us per hour per $\mathrm{cm}^{2}$, at the time specified conforms to Aceeptance Table 4. The release rate of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ from the Transdermal System, expressed as $\mu \mathrm{g}$ per hour per $\mathrm{cm}^{2}$ at the times specified, conforms to Acceptance Table 4.

| Time <br> (hours) | Time for sampling <br> (hours) | Ament Release rate $\left(\mu \mathrm{g} / \mathrm{h} / \mathrm{cm}^{2}\right)$ |
| :---: | :---: | :---: |
| $0-8$ | 8 | between 7.5 and 16.0 |
| $8-24$ | 24 | between 1.5 and 4.6 |
| $24-96$ | 96 | between 1.5 and 4.6 |
| $96-168$ | 168 | between 1.5 and 3.3 |

## Chromatographic purity-

Buffer solution Dissolve 2.0 of of sodium 1-pentanesul fenate, 13.61 g of menobasic potassium phosphate, and 2 mL of triethylamine in abou 1000 mL of water in a 2 - liter velumetric flask, adjust with phosphoric acid to a pHef 4.0 $\pm 0.1$, dilute with water to volume, and mix.

Mobile phase Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $1: 1$ ), and, if neeessary, adjust with phosphoric acid to a pH of $4.5 \pm 0.1$. Make ad justments if neersary (see System Suitability under Chromatay (621)).
Biltuent 1 Dissolve 1 mL of triethylamine in about 800 mL of water in a 1 liter volumetric flask, adjust with phes phoric acid to a pH of $10.0 \pm 0.1$, dilute with water to wot tume, and mix. Transfer this solution to a 2 - liter volumetrie flask, dilute with aee itrile to volume, and mix.
Biltuent 2 Dissolve 1 mL of triethylamine and 4.36 g of dibasic petassium phesphate in about 800 mL of water in a 1- liter velumetric flask, adjust with phespheric acid to a pH of $10.0 \pm 0.1$, dilute with water to velume, and mix. Transfer this solution to a 2 - liter velumetrie flask, dilute with acetonitrile to volume, and mix.

Standar solution Dissolve an aceurately weighed quantity of USP Clonidine Hydrochloride RS in Diltent + to obtain a solution having a known concentration of about 0.1 mg per mL . Dilute an aceurately meastred volume of this solution quantitatively with Piltent 2 to obtain a solu-
tion having aknown concentration of about 16.2 нg of USP Glenidine Hydrechloride RS per mL (equivalent to about 14.0 нe of clenidine per mL).

Fest solution Carefully peel the release liner from each Transdermal System, and place a number of Transdermal Systems, equivalent abou 15 mg of elonidine, into a 150 mL polytef lined serew-cap tube. Add 30 mL of $n$ heptane, cap, and mix on a vortex mixer for 2 minutes. Allow to stand for about 3 hours, but every 30 minutes during this period mix on a vertex mixer until the Transdermal Systems are delaminated. Add 0.3 mL of methanol and 45 mL of 0.01 N sulfuric acid, shake for at least 2 minutes, and cen trifuge. Retain the $n$-heptane layer, and transfer the aqueous supernatant layer to a secend $150-\mathrm{mL}$ pelytef lined serew eap ube. Add 9 mL of ammenium hydroxide to the queous supernatant layer, and mix. Extract the $n$ heptane layer with an additional 45 mL of 0.01 N sulfuric acid for at least 2 minutes, and combine this queous supernatant layer with the first aqueous layer in the 150 mL polytef lined serew equ tube. [NOTE-The length of time of extration with 0.01 N sulfuric acid should not exceed 1 heur to avoid degradation of any related impurity that may be present.] Ex tract the aqueus layer by shaking vigorously for 2 minutes with of of 30 mL pertions of chloreform, collecting the chloreformextracts in a 150 - mL polytef lined serew eap tube. Evaperate the chloreform extracts under nitregen to dryness, and dissolve the residue in 15.0 mL of Diltuent 2.

Chromagraphic system (see Chromatography- (624)) The liquidehrematograph is equipped with a 210 - mm detec tor and a $-4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ column that contains packing E10. The flow rate is about 1 mL per minnte. Chromatograph the Statedard solution, and record the peak responses as directed for Proedtre: the column efficiency is not less
than 4000 theoretieal plater; the tailing factor is not more than 1.5 ; and the relative standard deviation for replieate injections is not more than $2.0 \%$.

Procedure Separately inject equal volumes (about 20 $\mu L)$ of the Staturd solution and the Test solution into the ehromatograph, record the chromatograms, and measure the peak responses. Caleulate the percentage of each impurity in the Transdermal Systems taken by the formula:-

$$
(230.10 / 266.56)(1.5 \mathrm{C} / N L)\left(r_{4} \psi_{s}\right),
$$

in which 230.10 and 266.56 are the moleeular weights of elenidine and-clonidine hydrochloride, respectively; $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Clenidine Hydroehloride RS in the Standard solution, $N$ is the number of Transdermal Systems taken to prepare the Test solution; $L$ is the labeled amount, in me, of clonidine in each Transdermal System taken; $r_{t}$ is the peak respense for each impurity ebtained from the Test solution; and $\Psi_{s}$ is the clonidine peak respense obtained frem the Standatd solution: not more than $1.4 \%$ of total impurities is found. not more than $1.4 \%$ of any impurity is found, and not more than $2.4 \%$ of total impurities is found.

Mobile phase, Diluent, System suitability solution, and Chromatographic system—Proceed as directed in the Assay.
Standard solution-Dissolve an accurately weighed quantity of USP Clonidine Related Compound B RS in tetrahydrofuran, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1 mg per mL . Prepare a minimum of four Standard solutions in Diluent that bracket the expected clonidine related compound B concentration in the sample. The standard concentrations should be within the range of 0.2 to 10.0 $\mu \mathrm{g}$ per mL . Standard solutions are stable for up to 2 days if stored at $4^{\circ}$.

Test solution-Use the Test preparation as directed in the Assay.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of at least three Standard solutions that will bracket the expected sample concentration range and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the clonidine related compound B. Calculate the peak response ratios of the analyte, and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient; it should be not less than 0.995 . Determine the concentration of the clonidine related compound B. Calculate the amount, in $\mu \mathrm{g}$ per $\mathrm{cm}^{2}$, of the clonidine related compound B in the portion of the Transdermal System taken by the formula:

## $C V / A$,

in which $C$ is the concentration of clonidine related compound B , in $\mu \mathrm{g}$ per mL , obtained from the linear regression analysis, $V$ is the volume of the Test solution in mL , and $A$ is the area of the sample system in $\mathrm{cm}^{2}$. Not more than $10.0 \mu \mathrm{~g}$ per $\mathrm{cm}^{2}$ of clonidine related compound $B$ is found.

Assay-
Hobile phase Prepare a fllered and degassed mixture of sedium 1 pentanesulfenate and methanol ( $63: 36$ ). Make adjustments if neessary (see-System Suitability under Chremay (621)).
Mobile phase-Prepare a filtered and degassed mixture of sodium 1 pentanesulfenate and methanol (63:36). Make ad justments if neessary (see System Suitability under Chromagraphy (621)).

Standerd preparation Dissolve an aceurately weighed quantit USP Clenidine Hydrochloride RS in 0.01 Nsut furie acid, and dilute quantitatively, and stepwise if neeessary, with 0.01 N sulfuric acid to obtain a solution having
a known coneentration of about 46 kg per mL. $0.046 T$ per mL (equivalent to abet $0.040 T$ of clonidine per mL ), $T$ being the total ameunt, in mg, of elonidine in each Transdermal System.

Assay preparation Carefully peel the release liner from 1 Transdermal System, and eut the Transdermal System inte segments. Quantitatively transfer the segments into an appropriate polytef lined serew cap centrifuge tube, add-10 mL of 0.01 N sulfuric acid saturated with $n$ heptane, ac eurately meastred, eap, and heat to $60^{\circ}$ for 3 hours. Add 10 mL of $n$ heptane, cap, shake vigorously for 1 minute, and heat to $60^{\circ}$ for about 16 hours. Allow the solution to eool to reom temperature, add 15 mL of 0.01 N sulfuric acid saturated with $n$ heptane, cap, and mix in a vortex mixer for about 2 minutes. Allow to separate, and filter the aqueous layer. [NOTE-If backing membrane has not delaminated, repeat with a new Transdermal System.] Use the aqueous fayer as the Assay preparation.

Chromatggraphic system (see Chromatgraphy (624)) The liquid chromatograph is equipped with a 210 - mm detec ter, a $3.9 \mathrm{~mm} \times 2 \mathrm{~cm}$ grard column that eontains packing L2, and a $3.9 \mathrm{~mm} \times 30 \mathrm{~cm}$ column that contains packing E1. The flow rate is 1.5 mL per minute. Chromato graph the Statated preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replieate injections is net more than $2.0 \%$.

Proedure Separately inject equal volumes (about 50 $\mu \mathrm{L})$ of the Stated preparation and the -sssay preparation into the chromatograph, record the chromatograms, and measure the respenses for the major peaks. Caleulate the
quantity, in $\mathrm{K}_{\mathrm{g}}$, of elonidine $\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{C}_{2} \mathrm{~N}_{3}\right)$ in the Transtermat
System taken by the formula:-

$$
21.58 \mathrm{C}\left(r_{4}+r_{s}\right)
$$

## $(230.10 / 266.56)(25 C)\left(F_{4}++_{5}\right)$,

in which 230.10 and 266.56 are the molecular weights of elonidine and clonidine hydrochloride, respectively; $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Clonidine Hydro-ehloride-RS in the Standtard prepatation; and $\Psi_{t}$ and $\Psi_{s}$ are the peak respenses obtained frem the Assay preparation and the Standard preparation, respectively.

Mobile phase-Dissolve 4 mL of triethylamine in 1.6 L of water and adjust with phosphoric acid to a pH of 3.0 . Add 2.4 L of acetonitrile, stir the solution for 30 minutes, filter, and degas. Make adjustments if necessary (see System suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of tetrahydrofuran and methanol (1:1).
Standard preparation-Dissolve a suitable amount, accurately weighed, of USP Clonidine Hydrochloride RS in tetrahydrofuran to obtain a solution having a known concentration of about 1 mg per mL . Prepare a minimum of four Standard solutions in Diluent that bracket the expected clonidine concentration in the sample. The standard concentrations should be within the range of 50 to $300 \mu \mathrm{~g}$ per mL . Standard preparations are stable for up to 2 days if stored at $4^{\circ}$.

Test preparation-Remove each Transdermal System from its package, discard the release liner from each system, and transfer into a $50-\mathrm{mL}$ centrifuge tube with a Teflon-lined screw cap. Add the appropriate volume of tetrahydrofuran.

| For systems containing about 2.5 mg of clonidine | 7.0 mL |
| :---: | :---: |
| For systems containing about 5.0 mg of clonidine | 14.0 mL |
| For systems containing about 7.5 mg of clonidine | 21.0 mL |

Vortex vigorously until the systems are washed down and fully submerged in the tetrahydrofuran. Let the systems soak in tetrahydrofuran for about 5 minutes and vortex until the systems are completely delaminated. Allow the systems to remain submerged for an additional 60 minutes, vortexing every 30 minutes. Add methanol in a volume equal to the volume of tetrahydrofuran and vortex vigorously. The solution turns milky. Centrifuge for ten minutes at 2000 rpm. Use the supernatant as the Test preparation.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a detector capable of measuring at 210 nm and 242 nm , and a $4.6-\mathrm{mm} \times$ $15-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1 mL per minute. The detector is programmed initially to 242 nm and 210 nm after the elution of the clonidine peak but prior to the elution of the clonidine related compound $B$. The relative retention time is 1.0 for clonidine and 1.5 for clonidine related compound B. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution between clonidine and clonidine related compound $B$ is not less than 2.0 ; the capacity factor, $k^{\prime}$, is not less than 0.6 for clonidine; and the tailing factor for both clonidine and clonidine related compound $B$ is not more than 3.0. The relative standard deviation of the clonidine peak area for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of at least three Standard solutions that will bracket the expected sample concentration range and the Test preparation into the chromatograph, record the chromatograms, and measure the responses for the clonidine. Calculate the peak response ratios of the analyte and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient; it should be not less than 0.995. Calculate the amount, in mg , of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ in the Transdermal System taken by the formula:
CV/1000,
in which $C$ is the concentration of clonidine, in $\mu \mathrm{g}$ per mL , obtained from the linear regression analysis, $V$ is the volume of the Test preparation in mL per sample system. $\Delta$ USP28

## Assay-

Internal standard solution-Transfer 2.0 mL of hatethane
${ }^{\boldsymbol{\Delta}}$ USP Halothane $\mathrm{RS}_{\Delta U S P 28}$
to a $100-\mathrm{mL}$ volumetric flask, dilute with $p$-xylene to volume, and mix.

Standard preparation-Transfer 1.0 mL of Internal standard solution to a $2.0-\mathrm{mL}$ septum-capped vial, cap, seal, and weigh accurately. Using a cold syringe, inject about $25 \mu \mathrm{~L}$ of USP Desflurane RS, previously cooled to $0^{\circ}$ to $5^{\circ}$, into the vial. Allow the vial to come to ambient temperature, accurately weigh it, and calculate the quantity, in mg , of USP Desflurane RS added.

Assay preparation-Transfer 1.0 mL of Internal standard solution to a $2.0-\mathrm{mL}$ septum-capped vial, cap, seal, and weigh accurately. Using a cold syringe, inject about $25 \mu \mathrm{~L}$ of Desflurane, previously cooled to $0^{\circ}$ to $5^{\circ}$, into the vial. Allow the vial to come to ambient temperature, accurately weigh it, and calculate the quantity, in mg , of Desflurane added.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a flame-ionization detector and a $2.4-\mathrm{mm} \times 3.7-\mathrm{m}$ stainless steel column coated with polytef and packed with $10 \%$ phase G31 and $15 \%$ phase G18 on 80 - to $100-$ mesh support S1A. Helium is used as the carrier gas at a flow rate of about 24 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at about $80^{\circ}$ for 2.5 minutes, then increased at a rate of $2^{\circ}$ per minute, to $88^{\circ}$, maintained at $88^{\circ}$ for 3 minutes, then increased to $175^{\circ}$ at a rate of $70^{\circ}$ per minute, and maintained at $175^{\circ}$ for 4 minutes. The injector port is maintained at about $200^{\circ}$, and the detector at about $250^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are 1.0 for desflurane and about 2.8 for halothane; the resolution, $R$, between the desflurane peak and the halothane peak is not less than 8 ; and the relative standard deviation for the ratios of the desflurane peak response to the halothane peak response obtained for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak area responses for the halothane and desflurane peaks. Calculate the percentage of $\mathrm{C}_{3} \mathrm{H}_{2} \mathrm{~F}_{6} \mathrm{O}$ in the Desflurane taken by the formula:

$$
100\left(W_{S} / W_{U}\right)\left(R_{U} / R_{S}\right)
$$

in which $W_{S}$ is the quantity, in mg, of USP Desflurane RS used to prepare the Standard preparation; $W_{U}$ is the quantity, in mg , of Desflurane used to prepare the Assay preparation; and $R_{U}$ and $R_{S}$ are the ratios of the peak area responses of desflurane to that of halothane obtained from the Assay preparation and the Standard preparation, respectively.

Dissolution Proedtre for a Pooled Sample

Medium: water; 500 mL .
Apparatus 1: 100 rpm .
Time: 45 minutes.
Determine the amount of $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ dissolved by employing the following method.

Mobile phase-Dissolve 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of dilute glacial acetic acid (14 in $100)$ and 400 mL of methanol. Adjust by the dropwise addition of glacial acetic acid to a pH of $3.3 \pm 0.1$, if necessary, filter, and degas the solution. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation is not more than $2.0 \%$.

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. AUSP28
Inject a volume (about $100 \mu \mathrm{~L}$ ) of the solution under test
${ }^{\Delta}$ pooled sample ${ }_{\Delta U S P 28}$
into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ dissolved in comparison with a Standard solution having a known concentration of USP Dextroamphetamine Sulfate RS in the same Medium and similarly chromatographed.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ is dissolved in 45 minutes:

## Briefing

Diazepam, USP 27 page 587 and page 1869 of PF29(6) [Nov.Dec. 2003]. Because the name of the Reference Standard USP 3-Amino-6-chloro-1-methyl-4-phenylcarbostyril RS has been changed to USP Diazepam. Related Compound B RS, [see USP Reference Standards $\langle 11\rangle$ in the Sixth Interim Revision Announcement published in PF 29(6)], it is proposed to make the corresponding change wherever the name of this Reference Standard appears in the text of the monograph. In addition, minor editorial style changes have been made.
(PA3: S. Salado) RTS-40444-1

## Change to read:

Packaging and storage-Preserve in tight, light-resistant containers.
$\square$ Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ} \cdot \mathbf{m} 2 \mathrm{~S}$ (USP27)

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of in-
jectable dosage forms. $\quad$ 2S (USP27)

## Change to read:

USP Nordazepam RS.

## Change to read:

## Related compounds-

Mobile phase, System suitability solution, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Dissolve accurately weighed quantities of USP 3-Amine 6-hlore-1 methyl-4 phenylearbostyril PS,
${ }^{\Delta}$ USP Diazepam Related Compound B RS,
USP Diazepam Related Compound A RS, and USP Nordazepam RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about $1 \mu \mathrm{~g}$ per $\mathrm{mL}, 0.1 \mu \mathrm{~g}$ per mL , and $3 \mu \mathrm{~g}$ per mL , respectively.
Test solution-Transfer about 10 mg of Diazepam, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 3 amine 6 chloro 1 methyl 4 phenylearbestyil,
${ }^{\Delta}$ diazepam related compound B
diazepam related compound B, , $U S P 28$
diazepam related compound A , and nordazepam in the portion of Diazepam taken by the formula:

$$
\left(C_{R} / W\right)\left(r_{U} / r_{S}\right)
$$

in which $C_{R}$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP 3 Amine 6 ehlore-1 methyl-4 phenylearbostyril PS,
${ }^{\wedge}$ USP Diazepam Related Compound B RS, ${ }_{\text {USP28 }}$
USP Diazepam Related Compound A RS, or USP Nordazepam RS in the Standard solution; $W$ is the weight, in mg, of Diazepam taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and the Standard solution, respectively: not more than $0.01 \%$ of diazepam related compound A, not more than $0.1 \%$ of 3 amine- 6 ehlore- 1 meth Y4 phenylearbostyil,
${ }^{\boldsymbol{\Delta}}$ diazepam related compound $\mathrm{B},{ }_{\mathbf{\triangle S S P 2 8}}$ and not more than $0.3 \%$ of nordazepam are found.

Calculate the percentage of any other impurity in the portion of Diazepam taken by the formula:

$$
\left(C_{S} / W\right)\left(r_{i} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP 3 Amine 6 ehlore 1 methyl 4 phenylearbestyril Rs
${ }^{\mathbf{\Delta}}$ USP Diazepam Related Compound $\mathrm{BRS}_{\Delta U S P 28}$ in the Standard solution; $r_{i}$ is the peak response for any other impurity obtained from the Test solution; and $r_{S}$ is the peak response of USP 3-Amine 6-chlere-1 methyl-4 phenylearbestyril RS
${ }^{\boldsymbol{A}}$ USP Diazepam Related Compound B RS ${ }_{\mathbf{A S P 2 8}}$ obtained from the Standard solution: not more than $0.1 \%$ of any other impurity is found, and not more than $1.0 \%$ of the total impurities is found.

## Add the following:

-Other requirements-Where the label states that Diazepam is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Diazepam Injection. Where the label states that Diazepam must be subjected to further
processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Diazepam Injection.■2S (USP27)

## BRIEFING

## Briefing

Dorzolamide Hydrochloride, USP 27 page 662. On the basis of comments received, it is proposed to change the calculation and the theoretical plates specification in the test for Limit of dorzolamide hydrochloride related compound $A$ to better reflect the procedure used in the validation of the method. It is also proposed to simplify the buffer preparation and to revise the calculation in the test for Chromatographic purity to reflect the original submission that is based on percent area. In addition, editorial changes are proposed in the Assay.
(PA6: L. Evans) RTS—39833-1; 39833-2; 39833-3; 39833-4

## Change to read:

Limit of dorzolamide hydrochloride related compound A-
Mobile phase-Prepare a filtered and degassed mixture of tertbutyl methyl ether, chromatographic $n$-heptane, acetonitrile, and water ( $63: 35: 2: 0.2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Transfer about 18 mg of USP Dorzolamide Hydrochloride RS and 2 mg of USP Dorzolamide Hydrochloride Related Compound A RS, each accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, dissolve in 4 mL of 0.5 N ammonium hydroxide, add 4 mL of ethyl acetate, and mix. Separate the ethyl acetate layer, and transfer to a $15-\mathrm{mL}$ centrifuge tube. Add 4 mL of ethyl acetate to the aqueous layer, mix, separate the ethyl acetate layer, and combine it with the first extract. Evaporate the combined organic layers to dryness on a water bath maintained at $50^{\circ}$ under a stream of nitrogen. Dissolve the residue in 3 mL of acetonitrile, add 3 drops of (S)-(-)- $\alpha$-methylbenzyl isocyanate
${ }^{\boldsymbol{\Delta}}$ [NOTE-Discard the reagent if it is colored.], $]_{\text {USP } 28}$
and allow to react for 5 minutes on a water bath maintained at $50^{\circ}$. under a stream of nitrogen. [NOTE-Diseard the solution if it is fored.]
$\Delta$
EvUSP28
Evaporate the mixture to dryness on a water bath maintained at $50^{\circ}$ under a stream of nitrogen. Dissolve the residue in 10 mL of a mixture of tert-butyl methyl ether, glacial acetic acid, and acetonitrile (87:10:3).

Test solution-Transfer about 20 mg of Dorzolamide Hydrochloride, accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, and proceed as directed for System suitability solution beginning with "dissolve in 4 mL ".

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the System suitability solution, and record the peak respenses
areas $_{\triangle U S P 28}$
as directed for Procedure: the relative retention times are about 1.0 for dorzolamide and 1.5 for dorzolamide hydrochloride related compound A ; the resolution, $R$, between dorzolamide and dorzolamide hydrochloride related compound A is not less than 4.0; the column efficiency
${ }^{\boldsymbol{\Delta}}$ for the dorzolamide hydrochloride peak $\mathbf{\Delta U S P 2 8}$ is not less than 6000
44000 ${ }_{\text {USP } 28}$
theoretical plates; the tailing factor is not more than 1.4; and the relative standard deviation for replicate injections determined from the dorzolamide peak is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the System suitability solution and the Test solution into the chromatograph, record the chromatograms, and measure the respenses for

Drug release $\langle 724\rangle$ —Proceed as directed for Extended-Release Articles-General Drug Release Standard.

TEST 1 (for products labeled as 0.3-,
${ }^{\Delta} 0.45$ -
and $0.625-\mathrm{mg}$ tablets)-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 1.

Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Mobile phase-Prepare a filtered and degassed mixture of 0.025 M monobasic potassium phosphate and acetonitrile (3:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Transfer 10 Tablets to a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, and stir vigorously by mechanical means for at least 3 hours. Pipet a filtered $100-\mathrm{mL}$ aliquot of the solution into a $900-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Test solution-Filter a portion of the solution under test. [NOTEIt is recommended that the filters selected be tested for binding affinity.]

Chromatographic system-The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 3.0-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the Standard solution, and record the responses as directed for Procedure: the relative retention times are about 0.9 for equilin sulfate and 1.0 for estrone sulfate, the estrone sulfate peak being the last major peak in the chromatogram; the resolution, $R$, between equilin sulfate and estrone sulfate is not less than 1.5; and the relative standard deviation for the estrone sulfate peak is not more than $1.5 \%$. [NOTE-If estrone is present it may be retained on the column for a period longer than 50 minutes and interfere in later chromatographic runs.]
Procedure-Separately inject equal volumes (between 20 and $200 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the estrone sulfate peaks. Calculate the percentage of estrone sodium sulfate released by the formula:

$$
100\left(r_{U} / r_{S}\right)
$$

in which $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and the Standard solution, respectively.

Times and tolerances-The percentages of estrone sodium sulfate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | between $19 \%$ and $49 \%$ |
| 5 | between $66 \%$ and $96 \%$ |
| 8 | not less than $80 \%$ |

TEST 2 (for products labeled as $0.9-\mathrm{mg}$ tablets)-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 2.

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and Procedure-Proceed as directed for Test 1 .

Times and tolerances-The percentages of estrone sodium sulfate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | between $12 \%$ and $37 \%$ |
| 5 | between $57 \%$ and $85 \%$ |
| 8 | not less than $80 \%$ |

TEST 3 (for products labeled as $1.25-$ and $2.50-\mathrm{mg}$ tablets)-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 3.

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and Procedure-Proceed as directed for Test 1 .

Times and tolerances-The percentages of estrone sodium sulfate dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | between 3\% and $22 \%$ |
| 5 | between $37 \%$ and $67 \%$ |
| 8 | between $66 \%$ and $96 \%$ |
| 12 | not less than $80 \%$ |

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation is not more than $2.0 \%$.

Procedure-
${ }^{\mathbf{\Delta}}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. UUSP28
Inject an accurately measured volume (about $50 \mu \mathrm{~L}$ ) of filtered pertion of the solution under test
${ }^{\Delta}$ the pooled sample ${ }_{\mathbf{n}_{U S P 28}}$
into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the amount of $\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{NO}_{2}$ dissolved by comparison with a Standard solution, having a known concentration of USP Ethosuximide RS in the same Medium, similarly chromatographed.
Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{NO}_{2}$ is dissolved in 30 minutes:
${ }^{\boldsymbol{\Delta}}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

## Acceptance Table for a Pooled Sample

Number

| Stage | Tested | Acceptance Criteria |
| :---: | :---: | :---: |
| $\mathrm{S}_{1}$ | 6 | Average amount dissolved is not less <br> than $Q+10 \%$. |
| $\mathrm{S}_{2}$ | 6 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}\right)$ is <br> equal to or greater than $Q+5 \%$. <br> $\mathrm{S}_{3}$ |
| 12 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}+\right.$ <br> $\left.\mathrm{S}_{3}\right)$ is equal to or greater than $Q$. |  |

## BriEfing

Etoposide, USP 27 page 772. It is proposed to revise the calculation in the test for Related compounds to accurately determine the level of impurity found.
(PA6: L. Evans) RTS-40445-1

## Change to read:

Related compounds-
Buffer solution-Prepare as directed in the Assay.
Solution A-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (80:20).

Solution $B$-Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (60:40).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed under Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluting solution-Prepare a filtered mixture of 0.02 M sodium acetate, previously adjusted with acetic acid to a pH of 4.0 , and acetonitrile (70:30).

Standard solution-Dissolve an accurately weighed quantity of USP Etoposide RS in Diluting solution to obtain a Stock standard solution having a known concentration of about 2.0 mg per mL . Dilute this Stock standard solution quantitatively, and stepwise with Diluting solution to obtain a solution having a known concentration of about $10 \mu \mathrm{~g}$ per mL .

System suitability solution-Transfer about 20 mg of $n$-propylparaben, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with Diluting solution to volume. Transfer 5 mL of this solution and 5 mL of the Stock standard solution to a $50-\mathrm{mL}$ volumetric flask, and dilute with Diluting solution to volume. Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Diluting solution to volume, and mix.

Test solution-Transfer about 100 mg of Etoposide, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with Diluting solution to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11 having a diameter of less than $5 \mu \mathrm{~m}$. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution using Solution A, and record the peak responses as directed for Procedure: the relative retention times are about 0.20 for lignan $\mathrm{P}, 1.0$ for etoposide, and 1.43 for picroetoposide; and the resolution, $R$, between propylparaben and etoposide is not less than 1.1. The chromatograph is programmed for Procedure as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-15$ | 100 | 0 | isocratic |
| $15-30$ | $100 \rightarrow 40$ | $0 \rightarrow 60$ | linear gradient |
| $30-40$ | 40 | 60 | isocratic |
| $40-42$ | $40 \rightarrow 0$ | $60 \rightarrow 100$ | linear gradient |
| $42-45$ | 0 | 100 | isocratic |
| $45-47$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $47-50$ | 100 | 0 | re-equilibration |

Procedure-Separately inject equal volumes (about $25 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for at least 40 minutes, and measure the peak responses. Calculate the percentages of lignan P and picroetoposide in the portion of Etoposide taken by the formula:

$$
50\left(r_{i}+r_{s}\right),
$$

$$
\Delta^{\Delta} 5000(C / W)\left(r_{i} / r_{s}\right)_{\mathbf{\Delta U S P 2 8}}
$$

in which $C$ is the concentration, in mg per mL , of USP Etoposide RS in the Standard solution;
${ }^{\wedge} W$ is the weight, in mg , of Etoposide taken to prepare the

## Test solution; ${ }_{\mathbf{\Delta U S P} 28}$

$r_{i}$ is the peak response for each related compound obtained from the Test solution; and $r_{S}$ is the peak response for etoposide obtained from the Standard solution: not more than $0.5 \%$ of lignan P and $1.0 \%$ of picroetoposide is found. Calculate the quantity of any other impurity observed in the chromatogram of the Test solution by the same formula: not more than $2.0 \%$ of all related compounds and other impurities is found.

## BRIEFING

Fluconazole. Because there is no existing $U S P$ monograph for this drug substance, a new monograph is being proposed based on data submitted to USP. The liquid chromatographic procedures in the test for Related compounds are based on analyses performed with a Symmetry ${ }^{\mathbb{B}}$ (Waters) brand of L1 column. Typical retention times are about 4.9 minutes for fluconazole related compound A 8.0 minutes for fluconazole related compound B 8.5 minutes for fluconazole related compound C and 9.9 minutes for fluconazole.
(PA7b: B. Davani) RTS-40268-1

## Add the following:

©Fluconazole

$\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~F}_{2} \mathrm{~N}_{6} \mathrm{O} \quad 306.27$
1H-1,2,4-Triazole-1-ethanol, 1-(2,4-difluorophenyl)-1-(1H-1,2,4-triazol-1-ylmethyl)-.

# 2,4-Difluoro-1', $1^{\prime}$-bis( 1 H -1,2,4-triazol-1-ylmethyl)benzyl alcohol [86386-73-4]. 

» Fluconazole contains not less than 98.5 percent and not more than 101.5 percent of $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~F}_{2} \mathrm{~N}_{6} \mathrm{O}$, calculated on the dried basis.

Packaging and storage-Preserve in tight containers and store below $30^{\circ}$.

USP Reference standards $\langle 11\rangle-U S P$ Fluconazole $R S$. USP Fluconazole Related Compound A RS. USP Fluconazole Related Compound B RS. USP Fluconazole Related Compound C RS.

Clarity and color of solutions-Dissolve sample in methanol to obtain a 5 in 100 solution (w/v): the solution is clear and colorless.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Solution: $200 \mu \mathrm{~g}$ per mL .
Medium: alcohol.
Melting range $\langle 741\rangle$ : between $138^{\circ}$ and $142^{\circ}$.
Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on a 0.5 g sample.

Iron $\langle 241\rangle$ —Accurately weigh 0.5 g of sample into a test tube. Dissolve in 5 mL of alcohol, add 5 mL of distilled water, and mix. The limit is $0.002 \%$.

## Related compounds-

Mobile phase-Prepare a mixture of water and acetonitrile (80:20)

System suitability solution-Use the Standard solution.

Standard solution-Transfer accurately weighed quantities of USP Fluconazole RS, USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS to a suitable volumetric flask, dissolve in acetonitrile, dilute quantitatively, and stepwise if necessary, with Mobile phase, to volume and mix to obtain a solution having known concentrations of $10 \mu \mathrm{~g}$ per mL of each.
Test solution-Transfer about 30 mg of Fluconazole, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase, to volume and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $260-\mathrm{nm}$ detector, and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L1. The flow rate is about 0.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: typical retention times are about 4.9 minutes for fluconazole related compound $\mathrm{A}, 8.0$ minutes for fluconazole related compound $\mathrm{B}, 8.5$ minutes for fluconazole related compound C , and 9.9 minutes for fluconazole; the resolution, $R$, between fluconazole related compound $B$ and fluconazole related compound $C$ is not less than 1.5 ; and the relative standard deviation of each peak for replicate injections is not more than $5.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fluconazole related compound A, fuconazole related compound B , fluconazole related compound C , and any other impurities in the portion of Fluconazole taken by the formula:

$$
1000(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, USP Fluconazole Related Compound C RS, or USP Fluconazole RS, respectively, in the Standard solution; $W$ is the weight, in mg, of Fluconazole taken to prepare the Test solution; $r_{U}$ is the peak response obtained from Test solution; and $r_{S}$ is the average peak response of fluconazole related compound A , fluconazole related compound B , fluconazole related compound C or fluconazole obtained from replicate injections of the Standard solution: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.3 \%$ of total impurities is found.

Assay—Dissolve about 200 mg of Fluconazole, accurately weighed, in 100 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, using a suitable anhydrous electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 15.31 mg of $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~F}_{2} \mathrm{~N}_{6} \mathrm{O}_{\mathbf{\Delta} \text { USP } 28}$

## BRIEFING

Fluoxymesterone Tablets, USP 27 page 826. It is proposed to replace the reagent norethindrone used in the Internal standard solution in the Dissolution test by the use of the USP Norethindrone RS.

» Irbesartan contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{25} \mathrm{H}_{28} \mathrm{~N}_{6} \mathrm{O}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight containers, and store at a temperature below $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Irbesartan RS. USP
Irbesartan Related Compound A RS.

Identification-Infrated Absorption- $\langle 197 \mathrm{~K}\rangle=$
A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Water, Method $I\langle 921\rangle$ : not more than $0.5 \%$.
Heavy metals, Method II $\langle 231\rangle$ : 0.002\%

## Limit of azide-

Mobile phase-Prepare a filtered and degassed 0.1 N sodium hydroxide solution (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Transfer about 25 mg of sodium azide, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Pipet $250 \mu \mathrm{~L}$ of this solution into a $200-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. This solution contains about $0.312 \mu \mathrm{~g}$ of sodium azide per mL .

Test solution-Transfer about 100 mg of Irbesartan, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a conductimetric detector, and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L46. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the signal to noise ratio for the azide peak is not less than 10.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak area for azide peak. Calculate the amount of azide in ppm in the portion of Irbesartan taken by the formula:

$$
1000\left(C_{S} / C_{T}\right)(42.02 / 65.01)\left(r_{U} / r_{S}\right),
$$

in which $C_{S}$ is the concentration, in $\mu \mathrm{g}$ per mL , of sodium azide in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of Irbesartan in the Test solution; $r_{U}$ is the peak area for azide obtained from the Test solution; and $r_{S}$ is the peak area for azide obtained from the Standard solution: not more than 10 ppm of azide is found.

## Chromatographie purity -

Diluent, Triethylamine solution, Mobile phase, and Chromagraphic system Proee directed in the Assaly:
Fest solution Use the Assaly preparation.
Procedure Inject volume (about $20-\mu L$ ) of the Test solution inte the chrematograph, record the chromatogram, and measure the peak respenses. Calculate the pereentage of each impurity in the pertion of Irbesartan taken by the for mula:-

$$
100\left(x_{i}+x_{t}\right),
$$

in which $r_{i}$ is the peak respense for each impurity, and $r_{t}$ is the sum of the respenses of all the peaks: not more than $0.5 \%$ of any individual impurity is found, and not more than $1.0 \%$ of total impurities is found.

## Related compounds-

pH 3.2 Phosphate buffer, Mobile phase, and Dilute standard solution-Proceed as directed in the Assay.

Standard solution-Prepare as directed for the System suitability solution in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay. Chromatograph the Standard solution and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
area for irbesartan related compound A peak. Calculate the percentage of irbesartan related compound A in the portion of Irbesartan taken by the formula:

$$
100\left(C_{S} / C_{T}\right)\left(r_{U} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Irbesartan Related Compound A RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of Irbesartan in the Test solution; $r_{U}$ is the peak response for irbesartan related compound A obtained from the Test solution; and $r_{S}$ is the peak response for irbesartan related compound A obtained from the Standard solution: not more than $0.2 \%$ of irbesar$\tan$ related compound A is found, not more than $0.1 \%$ of any other impurity is found; and not more than $0.5 \%$ of total impurities is found.

Organic volatile impurities, Methot $I V(467) \div$ meets the requirements.

## Assay -

Diluent Prepare a solution of phespheric acid (1 in 100). Triethylamine solution Add 1.0 mL of triethylamine - $\theta$ 1000 mL of water, mix, and adjust with phespheric acid to a pH of 3.5

Mobile phase Prepare a filtered and degassed mixture of Friethylamine solution and acetonitrile (1:1). Make adjustments if neeessary (see Systen Suitability under Chromatograply $\langle 621$ ).).

Standard preparation- Dissolve-an aceurately weighed quantity of USP Irbesatan RS in Diltent to obtain a solut tion having a known concentration of about 0.5 mg per mL . Assay preparation Transfer about 50 mg of Irbesartan, accurately weighed, to a $100-\mathrm{mL}$ volumetric flack, dissolve in and dillte with Diluent to velume, and mix.

Chromatographic system (see Chromatography- $\langle 621\rangle$ ) The liquid chromatograph is equipped with a fluorometrie detector that has an excitation wavelength of 250 nm and an emission wavelength of 371 nm , and a $4.6 \mathrm{~mm} \times 15$
em coltumn that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chrematograph the Standard preparation, and record the peak respenses as directed for Procedure: the relative standard deviation for replicate in jections is net mere than $2.0 \%$.

Proecture Separately inject equal voltumes (about 20 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation inte the chromatograph, record the chromatograms, and measure the respenses for the irbesartan peaks. Caleulate the quantity, in mg, of $\mathrm{C}_{25} \mathrm{H}_{28} \mathrm{~N}_{6} \mathrm{O}$ in the pertion of Irbesartan taken by the formula:

$$
100 C\left(r_{t}+r_{s}\right)
$$

in which $C$ is the concentration, in mg per $m L$, of USP Ir besartan RS in the Standard preparation; and $r_{t}$-and $\Psi_{s}$ are the peak respenses obtained frem the $A s s a y$ preparation and the Standard preparation, respectively.

## Assay-

pH 3.2 Phosphate buffer-Mix 5.5 mL of phosphoric acid with about 950 mL of water, and adjust pH to 3.2 with triethylamine.

Mobile phase-Prepare a filtered and degassed mixture of pH 3.2 phosphate buffer and acetonitrile (67:33). Make adjustments if necessary (see System Suitability under Chromatography (621〉).

System suitability solution-Dissolve accurately weighed quantities of USP Irbesartan RS and USP Irbesartan Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.05 mg per mL of each USP Reference Standard.
Dilute standard solution-Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL.

Standard preparation-Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL . Assay preparation-Transfer about 50 mg of Irbesartan, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for irbesartan related compound A and 1.0 for irbesartan; the resolution, R , between irbesartan and irbesartan related compound A is not less than 2.0. Chromatograph the Standard preparation, and record the peak response as directed for Procedure: the standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $\mathrm{C}_{25} \mathrm{H}_{28} \mathrm{~N}_{6} \mathrm{O}$ in the portion of Irbesartan taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Irbesartan RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\Delta$ USP28

## Change to read:

Dissolution Procedure for a Pooled Sample

Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 20 minutes.
Mobile phase-Prepare a suitable degassed and filtered mixture of $\mathrm{pH} 3.0,0.1 \mathrm{M}$ ammonium sulfate and methanol ( $50: 50$ ).

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, prepared as directed below, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled samples as the test solution. $\triangle$ USP28
Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and an flltered
${ }^{\Delta}$ AUSP28
aliquot of the selution under
${ }^{\Delta}$ pooled sample ${ }_{\Delta U S P 28}$
into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{8}$ dissolved in comparison with a Standard solution having a known concentration of USP Isosorbide Dinitrate RS, similarly prepared and chromatographed.
Tolerances-Not less than $80 \%$ ( $Q$ ) of the labeled amount of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{8}$ is dissolved in 20 minutes:
$\Delta$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$, or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

| Acceptance Table for a Pooled Sample |  |  |
| :---: | :---: | :---: |
| Number |  |  |
| Stage | Tested | Acceptance Criteria |
| $\mathrm{S}_{1}$ | 6 | Average amount dissolved is not less than $Q+10 \%$. |
| $\mathrm{S}_{2}$ | 6 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}\right)$ is equal to or greater than $Q+5 \%$. |
| $\mathrm{S}_{3}$ | 12 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}+\right.$ <br> $\mathrm{S}_{3}$ ) is equal to or greater than $Q$. |

## Briefing

Ivermectin, page 1519 of $P F 29(5)$ [Sept.-Oct. 2003]. Storage temperatures have been added to the Packaging and storage statement.
(VET: I. DeVeau; PSD: C. Okeke) RTS-40446-1

## Add the following:

## A Ivermectin

Component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ :
Avermectin $\mathrm{A}_{1 \mathrm{a}}$, 5-O-demethyl-22,23-dihydro-
( $2 \mathrm{a} E, 4 E, 8 E$ )-(5'S, $6 S, 6^{\prime} R, 7 S, 11 R, 13 R, 15 S, 17 \mathrm{a} R, 20-$
$R, 20$ a $R, 20 \mathrm{~b} S)-6^{\prime}-(S)-s e c-\mathrm{Buty}-$ $3^{\prime}, 4^{\prime}, 5^{\prime}, 6,6^{\prime}, 7,10,11,14,15,17 \mathrm{a}, 20,20 \mathrm{a}, 20 \mathrm{~b}-$ tetradecahy-dro-20,20b-dihydroxy[11,15-methano- $2 H, 13 H, 17 H$ furo $[4,3,2-p q][2,6]$ benzodioxacyclooctadecin-13, $2^{\prime}$ -[2H]pyran]-7-yl 2,6-dideoxy-4-O-(2,6-dideoxy-3-O-methyl- $\alpha$-L-arabino-hexopyranosyl)-3-O-methyl- $\alpha-\mathrm{L}-$ arabino-hexopyranoside [70161-11-4].

Component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ :
Avermectin $\mathrm{A}_{1 \mathrm{a}}$, 5-O-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-.
( $2 \mathrm{a} E, 4 E, 8 E$ )-( $5^{\prime} S, 6 S, 6^{\prime} R, 7 S, 11 R, 13 R, 15 S, 17 \mathrm{a} R, 20-$ $R, 20 \mathrm{a} R, 20 \mathrm{~b} S)-3^{\prime}, 4^{\prime}, 5^{\prime}, 6,6^{\prime}, 7,10,11,-$ oxospiro[11,15-methano- $2 H, 13 H, 17 H$-furo[4,3,2-pq][2,6]benzodioxa-cyclooctadecin-13, $2^{\prime}[2 H]$ pyran $]-7-y l 2,6$-dideoxy-4-O-(2,6-dideoxy-3-O-methyl- $\alpha$-L-arabino-hexopyrano-syl)-3-O-methyl- $\alpha$-L-arabino-hexopyranoside [70209-81-3].

H-Ivermectin is a mixture of 5- $\theta$-demethyl-22,23dihydreavermectin $A_{14}$ (compenent $B_{4+}$ ) and 5- demethyl 25-de( 1 methylpropyl) 22, 23-dihydre-25-( 1 methylethyl)avermectin $\Lambda_{\text {tb }}$ (component $\mathrm{B}_{46}$. It contains not less than 95.0 pereent of compenent $B_{46}$ plus compenent $B_{t a}$-caleulated on the water, ethanol aleohel, and formamide free basis.
» Ivermectin is a mixture of Avermectin $\mathrm{A}_{1 \mathrm{a}}$, 5-$O$-demethyl-22,23-dihydro-(component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ) and Avermectin $\mathrm{A}_{1 \mathrm{a}}, 5-O$-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methyl-ethyl)-(component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ ). It contains not less than 90.0 percent of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$, and the sum of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ plus component $\mathrm{H}_{2} \mathrm{~B}_{1 \text { b }}$ is not less than 95.0 percent and not more than 100.5 percent, calculated on the anhydrous and al-cohol- and formamide-free basis. It may contain a small amounts of suitable antioxidant and chelating agents.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-If it is intended for veterinary use only, it is so labeled. Label it to state the name(s) and amount(s) of any added substance(s). Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards $\langle 11\rangle$ —USP Ivermectin RS.
Clarity of solution-Transfer 1 g to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with toluene to volume, and mix: the solution is clear.

Color of solution-Pass a portion of the solution prepared in the test for Clarity of solution through a fine-porosity, sin-tered-glass filter. Determine the absorbance of the filtrate at 440 nm in a $1-\mathrm{cm}$ cell using toluene as the blank: the absorbance is not more than $0.024(1-0.01 V)$, in which $V$ is the sum of the percentages of water, alcohol, and formamide in the Ivermectin taken.

## Identification-

A: The-chrematogram of the Assay preparation, obtained as directed in the Assat, exhibits major peaks for eompenent $B_{t+a}$ and compenent $B_{t b}$, the retention times-of
which correspend to these exhibited in the chromategram of the Standared preparation, obtained as directed in the $A s$ say, and the ratio of compenent $\mathrm{B}_{1+}$ to compenent $\mathrm{B}_{4 \mathrm{~m}}$ is not less than-9.0:1 9.0:1.0. Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.

B: Ultraviolet Absorption $\langle 197 U\rangle$ -
Solution: $20 \mu \mathrm{~g}$ per mL.
Medium: methanol. The spectrum exhibits maxima at about 238 nm and 245 nm and a shoulder at about 253 nm, and the absorptivity at the wavelength of maximmm abserption at about 245 nm is between 37.2 and 39.2 , caleu lated on the water, ethanol aleohol, and formamide free basis. The retention times of the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak and the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ peak in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.

Clarity and-color of solution Dissolve 1.0 g of it in tol Hene to obtain 50 mL of solution: the solution is clear and its abserbance at 440 nm in a $1-\mathrm{em}$ eell is net mere than 0.024 , toluene being used as the blank.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-17^{\circ}$ and $-20^{\circ}$, deter mined at $20^{\circ}$ and calculated on the water-, ethanet alco-hol-, and formamide-free basis.

Test solution: 255 mg per mL , in methanol.
Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : 0.002\%.
Limit of ethanol alcohol and formamide-
Standerd solutions. Transfer 3.0 mL of dehydrated aleo-
hol to a $100-\mathrm{mL}$ volumetric flask, dilute with water to vol ume, and mix (Solution A). Transfer 1.0 mL of formamide to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix (Solution B). Transfer 3.0 mL of Solution 4 and 3.0 mb Of Solution B to a $100-\mathrm{mL}$ volumetric flask, dilute-with water to volume, and mix to obtain a solution having concentrations of ethanol aleohol and formamide of 0.0009 and
0.0003 mL per mL , respectively (Solution C). Transfer 8.0 mL of Solution $A$ and 8.0 mL of Solution B-10-100-mE velumetric flask, dilute with water to volume, and mix to ebtain a solution having concentrations of ethanel alcehel and formamide of 0.0024 and 0.0008 mL per mL , respectively (Solution D). Transfer 4.0 mL of Solution $C$ and- 4.0 mL of Solution $D$ to separate $15-\mathrm{mL}$ centrifuge tubes, add 2.0 mL of $m$ xylene to each tube, stopper, mix, centrifuge, and diseard the upper m-xylene-layers. The retained lower fayers are Standard solutions $C$ and $P$.

Fest solution Transfer 120 mg of Ivermectin, aceurately weighed, to a 15 mL centrifuge tube, and dissolve in 2.0 mb of $m$-kylene. Add 2.0 mL of water, mix, and centrifugeTransfer the $m-x y l e n e$ layer to a $15-\mathrm{mL}$ centrifuge tube, and extract again with 2.0 mL of water. Diseard the $m-x y$ lene layer, and combine the two aqueous layers to obtain the Fest solution.

Chromatographic system (see Chromatography $\langle 621$ )) The gas chrematograph is equipped with a flame ionization detector and contains a $1.8-\mathrm{ml} \times 3.2-\mathrm{mm}$ column packed with 80-10-100-mesh support S2. The injection pert is maintained at about $190^{\circ}$, and the detector is maintained at about $250^{\circ}$. Helimm is used as the carrier gas at a flow rate of about 40 mL per mintute. The coltumn is maintained at about $150^{\circ}$ fer 12 mintutes after injection, then raised at a rate of $20^{\circ}$ per minute to $180^{\circ}$, and then held for 20 minutes.

Precedure Separately inject equal volumes (about $2 \mu \mathrm{HL}$ ) Of Standard solutions $C$ and $D$ and the Test solution inte the ehromatograph, record the chromatograms, and measure the ethanel aleohol and formamide peak respenses. Plet the peak respenses for ethanol aleohol and formamide versus eoncentrations, in mL per mL, of ethanol aleohol and forma mide, respectively, obtained from Standard solutions $C$ and D. From the graphs so obtained, determine the concentrations of ethanol aleohol and formamide in the Test solution.
[NOTE-In the event that the peak respenses of the Test solthfion are-signifieantly outside the ranger of peak respenses ebtained with Standard solutions $C$ and $D$, prepare additional Standard solutions, and chrematograph them to obtain peak responses bracketing those obtained with the Fest solution.] Caleulate the pereentages of ethanol aleohel and formamide in the pertion of Ivermectin taken by the for-mula:-

## $400,000 \mathrm{Cd} / \mathrm{H}$,

in which $C$ is the cencentration of ethanelaleohelor formamide, in mL per mL, of the Test solution, $d$ is the density of ethanel aleehel ( 0.79 ) or formamide- $(1.13)$, and $W$ is the weight, in mg, of Ivermectin taken: not more than $5.0 \%$ of ethanel alcohel $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ and $3.0 \%$ of formamide-are found.

Internal standard solution-Dilute 0.5 mL of isopropyl alcohol with water to 100 mL , and mix.

Standard solution 1—Transfer 3.02 .0 mL of dehydrated alcohol to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution 2-Transfer 1.0 mL of formamide to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution 3-Transfer 5.0 mL of Standard solution 1 and 5.0 mL of Standard solution 2 to a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of formamide and alcohol of 0.001 and 0.0030 .002 mL per mL , respectively. Transfer 2.0 mL of this solution to a $15-\mathrm{mL}$ centrifuge tube, add 2.0 mL of $m$-xylene, insert the stopper, mix, and centrifuge. Remove the upper $m$-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix. Each mL of this solution contains about 0.00120 .0008 mL of alcohol and 0.0004 mL of formamide.

Standard solution 4-Transfer 10.0 mL of Standard solution 1 and 10.0 mL of Standard solution 2 to a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of alcohol and formamide of 0.0060 .004 and 0.002 mL per mL , respectively. Transfer 2.0 mL of this solution to a $15-\mathrm{mL}$ centrifuge tube, add 2.0 mL of $m$-xylene, insert the stopper, mix, and centrifuge. Remove the upper $m$-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix. Each mL of this solution contains about 0.00240 .0016 mL of alcohol and 0.0008 mL of formamide.

Test solution-Transfer 120 mg of Ivermectin, accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, and dissolve in 2.0 mL of $m$-xylene, heating in a water bath at $45 \pm 5^{\circ}$, if necessary. Add 2.0 mL of water, mix, and centrifuge. Transfer the $m$ xylene layer to a $15-\mathrm{mL}$ centrifuge tube, and extract with 2.0 mL of water. Discard the upper $m$-xylene layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused-silica analytical column coated with a $3-\mu \mathrm{m}$ G43 stationary phase. The carrier gas is helium, with a $1: 5$ split ratio and a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at about $40^{\circ}$ for 5 minutes after injection, and then increased at a rate of $20^{\circ}$ per minute to $180^{\circ}$, and maintained at $180^{\circ}$ for 2 minutes. The injection port temperature is maintained at about $140^{\circ}$, and the detector temperature is maintained at about $250^{\circ}$.

Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of Standard solution 3, Standard solution 4, and the Test solution into the chromatograph, record the chromatograms,
and measure the peak responses for alcohol, formamide, and isopropyl alcohol. Plot the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol versus concentrations, in mL per mL , of alcohol and formamide, respectively, obtained from Standard solution 3 and Standard solution 4. From the graphs so obtained, and using the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol obtained from the chromatogram of the Test solution, determine the concentrations, $C$, of alcohol and formamide in the Test solution. [NOTE-In the event that the peak responses of the Test solution are significantly outside the ranges of peak responses obtained from Standard solution 3 and Standard solution 4, prepare additional Standard solutions, and chromatograph them to obtain peak responses bracketing those obtained with the Test solution.] Calculate the percentages of alcohol and formamide in the portion of Ivermectin taken by the formula:

$$
500,000 C D / W
$$

in which $C$ is the concentration of alcohol or formamide, as appropriate, in mL per mL , in the Test solution; $D$ is the density of alcohol (0.79) or formamide (1.13); and $W$ is the weight, in mg, of Ivermectin taken: not more than $5.0 \%$ of alcohol and $3.0 \%$ of formamide is found.

Related sthbstances compounds-Using the chromato gram of the Assaly preparation obtained as direeted in the Assay, caleulate the percentage of each related substance compound in the Ivermectin taken by the formula:-

$$
100 r_{i}+r_{i}
$$

in which $r_{i}$ is the respense of each individual peak, exeept thes of compenent $B_{t a}$ and compenent $B_{4}$, and $r_{t}$ is the sum of the respense of all of the peaks in the chrematogram.

Not more than 2\% of any individual related substance com pound is found, and the sum of all related substances is not mere than $4 \%$.

Mobile phase and Chromatographic system—Proceed as directed in the Assay.

Standard stock solution-Proceed as directed for Standard preparation in the Assay.

Standard solution 1-Transfer 1.0 mL of the Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Standard solution 2-Transfer 5.0 mL of Standard solution 1 to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Test solution-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of Standard solution 1, Standard solution 2, and the Test solution into the chromatograph, record the chromatogram of the Test solution for a period of time equivalent to twice the retention time of the prineipal main peak in the chromatogram obtained from Standard solution 1, and measure the respenses for the major peaks. In the-chremategram obtained from the Test solution, the area of any peak with at retention time of 1.3 to 1.5 about 1.2 to 1.4 , relative to the prineipal peak, is net greater than twiee 2.5 times the area-of the prineipal peak in the chromatogram obtained from Stat dard selution $1(2.0 \%$ 2.5\%); the area of any other peak, aside-from the twe principal peaks, is not greater than the area of the principal peak in the chromatogram obtained from Standard solution $1(1.0 \%)$; and the sum of the areas of all the peaks, apart from the two principal peaks, is not greater than four times the area of the principal peak in the ehromagram obtained from Sta solut solion-1 (4.0\%) $(4 \%)$. Disregard any peak with an area less than that of
the prineipal peak in the chrematogram of Statheded solution $\mathcal{Z}(0.05 \%)$ ) peak areas. Calculate the percentage of each impurity by the formula:

$$
100 r_{i} /\left(r_{s}-r_{b}\right)
$$

in which $r_{i}$ is the peak area for each individual impurity in the Test solution chromatogram; $r_{s}$ is the sum of all peaks in the Test solution chromatogram; and $r_{b}$ is the total area of all peaks in a blank chromatogram: not more than $2.5 \%$ is found for the sum of all peaks with a relative retention time of about 1.3 to 1.4 (corresponding to $\mathrm{H}_{4} \mathrm{~B}_{1 \mathrm{a}}$ isomers and $\Delta^{2,3}$ $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ); not more than $1 \%$ is found for the peak with a relative retention time of about 0.7 (corresponding to 8 a -oxo$\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ); not more than $0.7 \%$ is found for the peak with a relative retention time of about 0.5 (corresponding to Avermectin $\mathrm{B}_{1 \mathrm{a}}$ ); not more than $0.5 \%$ is found for any other individual impurity peak; not more than $1 \%$ is found for the sum of all other individual peaks; and not more than $4 \%$ is found for the sum of the areas of all the peaks, apart from the two main peaks $\left(\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}\right.$ and $\left.\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}\right)$. Disregard any peak with an area less than that of the two main peaks $\left(\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}\right.$ and $\left.\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}\right)$ in the chromatogram of Standard solution 2 ( $0.05 \%$ ).

## Assay-

Mobile phase Prepare a mixture of acetonitrile, metha nol, and water ( $530: 350: 120$ ), filter through a filter having a peresity of $1 \mu \mathrm{~m}$-r less, and degas. Make adjustments if neeessary (see System Suitability under Chromatography〈 624$\rangle$ ).

Standard preparation Dissolve an aceurately weighed quantity of USP Ivermectin RS quantitatively in Mobile phase to obtain a-solution having a-known concentration of about 0.5 mg per mL .
Assay preparation Transfer about 40 mg of Ivermeetin, aceurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in methanol, dilute with Mobile phase to volume, and mix.

Chromatographie system (see-Chromatography $\langle 621\rangle$ )
The liquid chrematograph is equipped with a 254 -nm detecfor and a $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chrematograph the Standard preparation, and record the peak respenses as directed under Procedure: compenent $\mathrm{B}_{46}$ is eluted at a retention time of about 14 minutes, followed by compenent $B_{1+1}$-at a retention time of about 17 minutes. The resolution, $R$, between the peaks for component $B_{4 b}$ and eompenent $\mathrm{B}_{\text {tut }}$ is not less than 3.0 , the column effieiency determined frem the compenent $B_{1+n}$ peak is net less than 2000 theoretical plates, the tailing factor for the compenent $B_{1+}$ peak is not more than 2.5 , and the relative standard deviation of the peak respenses for compenent $B_{\text {tet }}$ for replieate injections is not mere than $1.0 \%$.

Proedure [NOTE-Use peak areas where peak respenses are indicated.] Separately inject equal volumes (about $50-\mu \mathrm{L}$ ) of the Standerd preparation and the Assay preparation into the chromatograph, record the chromategrams over a period of time that is wice the retention time Of the peak for compenent $B_{1+n}$, and measure the peak respenses for compenent $B_{t+}$ and compenent $B_{4 b}$. Caleulate the pereentage of compenent $B_{14}$ plus component $B_{40}$ in the portion of Ivermectin taken by the formula:-

$$
100(C P / H)\left(F_{\downarrow}++_{s}\right)
$$

in which $C$ is the concentration, in mg per $m L$, of USP Ivermectin RS in the Standard preparation, $P$ is the designated percentage of the sum of compenent $B_{t+n}$ and compenent $B_{t h}$ in the USP Ivermectin RS, $W$ is the weight, in mg, of Ivermectin taken to prepare the $A s s a y$ preparation, and $r_{t}$ and $r_{s}$ are the sums of the peak respenses for compenent $B_{\text {ten }}$ and eomponent $\mathrm{B}_{\mathrm{tb}}$-obtained from the Assay preparation and the Standard preparation, respectively.

Mobile phase-Prepare a mixture of acetonitrile, methanol, and water (53:35:12), pass through a filter having a $1-$ $\mu \mathrm{m}$ or finer porosity, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ). Increasing the proportion of water increases the elution times and allows better separation of impurities.

Standard preparation-Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution having a known concentration of about 0.8 mg per mL .

Assay preparation-Transfer about 80 mg of Ivermectin, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix. Sonicate, if necessary.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ and 1.0 for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$; the resolution, $R$, between component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ and component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ is not less than 3.0; the column efficiency determined from the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak is not less than 5000 theoretical plates; the tailing factor for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak is not more than 2.5 ; and the relative standard deviation for replicate injections is not more than $1.0 \%$ determined from the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ and component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$. Calculate the quantity, in mg , of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}\left(\mathrm{C}_{48} \mathrm{H}_{74} \mathrm{O}_{14}\right)$ and component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}\left(\mathrm{C}_{47} \mathrm{H}_{72} \mathrm{O}_{14}\right)$ in the portion of Ivermectin taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ or component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ or component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

${ }^{6}$ Pe net use paddle-stirrers with synthetic enating.os]
$\triangle$ USP28
TEST 1 -
Medium: 0.01 N hydrochloric acid containing $0.2 \%$ sodium lauryl sulfate; 500 mL .

Apparatus 2: 50 rpm .
Time: 45 minutes.
Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$ dissolved by employing the following method.

Mobile phase-Prepare a filtered and degassed mixture of methanol and $0.1 \%$ phosphoric acid ( $60: 40$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ). $\bullet 5$

Standard solution-Prepare a stock solution of USP Levothyroxine RS in methanol having a known concentration of about 0.1 mg per mL . Dilute this stock solution with Dissolution Medium to obtain a solution having a concentration similar to that expected in the Test solution.

Test solution-[NOTE-Prior to use, check the filters for absorptive loss of drug.] Use a filtered portion of the solution under test.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $225-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5 ; and the relative standard deviation is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about $800 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$ dissolved.

Tolerances-Not less than $70 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$ is dissolved in 45 minutes.

TEST 2-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and Procedure-Proceed as directed for Test 1.
$\Delta_{\text {TEST } 3-[T o ~ c o m e .] ~}^{\mathbf{\Delta U S P 2 8}}$

- TEST 4-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 4.
${ }^{\Delta}$ [NOTE-Do not use paddle stirrers with synthetic coating. $]_{\text {Medium }}$.

Medium: 0.01 N hydrochloric acid; 500 mL for tablets labeled to contain between $25 \mu \mathrm{~g}$ and $175 \mu \mathrm{~g}$ of levothyroxine sodium; 900 mL for tablets labeled to contain $200 \mu \mathrm{~g}$ or $300 \mu \mathrm{~g}$ of levothyroxine sodium.

Apparatus 2: 75 rpm .
Time: 45 minutes.
Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$ dissolved by employing the following method.

Mobile phase-Prepare a filtered and degassed mixture of water, acetonitrile, and $85 \%$ orthophosphoric acid (700:500:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Prepare a stock solution by transferring about 100 mg of USP Levothyroxine RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for about 2 minutes, dilute with alcohol to volume, and mix. Dilute this stock solution with a mixture of alcohol and water (1:1) to obtain a solution having a concentration of 0.01 mg of levothyroxine per mL . Dilute this intermediate solution with Dissolution Medium to obtain a solution having a concentration similar to that expected in the Test solution.

Test solution-Use a centrifuged portion of the solution under test.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $225-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about $500 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{I}_{4} \mathrm{NNaO}_{4}$ is dissolved in 45 minutes. 05

Packaging and storage-Preserve in tight containers, and store between $2^{\circ}$ and $30^{\circ} 25^{\circ} \cdot \mathbf{\Delta U S P 2 8}$

USP Reference standards $\langle 11\rangle-U S P$ Loratadine $R S$.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ —

Test solution-Place a volume of Oral Solution, equivalent to about 10 mg of loratadine, in a centrifuge tube. Add 10 mL of 0.2 N sodium hydroxide and 2.0 mL of dichloromethane. Rotate for 10 minutes. Centrifuge, and discard the aqueous phase.

Standard solution-Dissolve an accurately weighed quantity of USP Loratadine RS in dichloromethane to obtain a solution having a known concentration of about 5 mg per mL .

Developing solvent system: ethyl ether and diethylamine (40:1), in a paper-lined tank.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Antimicrobial effectiveness test $\langle 51\rangle$ : meets the requirements.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed 100 per mL ; and the total combined molds and yeasts count does not exceed 50 cfu per mL.

Deliverable volume $\langle 698\rangle$ : meets the requirement.
$\mathbf{p H}\langle 791\rangle$ : between 2.5 and 3.1.

## Related compounds-

Mobile phase-Prepare a mixture of 15 mmol sodium dodecyl sulfate in a mixture of water and acetonitrile (1:1). Adjust with phosphoric acid to a pH of $2.6 \pm 0.1$, filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of Mobile phase and water (2:1).

System suitability solution 1-Dissolve an accurately weighed quantity of USP Loratadine RS, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.002 mg per mL .

System suitability solution 2-Quantitatively transfer 5.0 mL of System suitability solution 1 into a suitable container, dilute with Diluent to 50 mL , and mix.

Resolution solution-Transfer an amount of Oral Solution, equivalent to 20 mg of loratadine, into a screw-cap, glass container. Add 1 mL of $3 \%$ aqueous hydrogen peroxide, and mix. Cap, and heat at $65^{\circ}$ for 18 to 24 hours.

Test solution-Transfer an accurately measured volume of Oral Solution, equivalent to about 5 mg of loratadine, to a $25-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 2 mL per minute. The column temperature is maintained between $30^{\circ}$ and $40^{\circ}$.

Chromatograph the Resolution solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.70 for ethyl 4-[8-chloro-5,6-dihydro-4-(hydro-xymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yli-dene]-1-piperidinecarboxylate, 0.84 for ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11 H -benzo[5,6]cyclohep-ta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate, and 1.0 for loratadine; and the resolution, $R$, between loratadine and ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate is not less than 3.0. Chromatograph System suitability solution 1, and record the peak area response of the loratadine peak as directed for Procedure: the tailing factor is not less than 0.7 and not greater than 1.1. Chromatograph System suitability solution 2, and record the peak area response of the loratadine peak as directed for Procedure: the relative standard deviation for replicate injections of System suitability solution 2 is not more than $10 \%$.

Procedure-Inject about $50 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak area responses. Calculate the percentage of each individual related compound in the portion of Oral Solution taken by the formula:

$$
100\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ is the individual peak response of each related compound in the Test solution; and $r_{s}$ is sum of the responses of all of the peaks, excluding excipient peaks: not more than $0.3 \%$ of ethyl 4-[8-chloro-5,6-dihydro-4-(hydro-xymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yli-dene]-1-piperidinecarboxylate is found; not more than $0.3 \%$ of ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than $0.2 \%$ of any other individual impurity is found; and the sum of all impurities is not more than $0.5 \%$.

Assay-
0.05 M Monobasic potassium phosphate solution-Transfer about 6.8 g of monobasic potassium phosphate, accurately weighed, to a 1-liter volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of $3.0 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of 0.05 M Monobasic potassium phosphate solution and acetonitrile (7:3). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard preparation-Dissolve an accurately weighed quantity of butylparaben in a mixture of water and acetonitrile (7:3), and dilute quantitatively, and stepwise if necessary, with a mixture of water and acetonitrile (7:3) to obtain a solution having a concentration of about 0.3 mg per mL .

Standard stock peparation-Dissolve an accurately weighed quantity of USP Loratadine RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL .
Standard preparation-Transfer 5.0 mL of Internal standard preparation, 5.0 mL of Standard stock preparation, and 12 mL of water into a $50-\mathrm{mL}$ volumetric flask. Dilute with a mixture of water and acetonitrile (7:3), and mix.

Assay preparation-Transfer an accurately measured quantity of Oral Solution, equivalent to 5 mg of loratadine, into a $50-\mathrm{mL}$ volumetric flask. Pipet 5.0 mL of Internal standard preparation into the flask, dilute with a mixture of water and acetonitrile (7:3) to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L11. The flow rate is about 2 mL per minute. The column temperature is maintained between $20^{\circ}$ and $30^{\circ}$.

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.78 for butylparaben and 1.0 for loratadine; the resolution, $R$, between loratadine and butylparaben is not less than 1.9; the tailing factor is not more than 1.6 for the loratadine and butylparaben peaks; and the relative standard deviation for replicate injections is not more than $2 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg of loratadine $\left(\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{ClN}_{2} \mathrm{O}_{2}\right)$ in the portion of Oral Solution taken by the formula:

$$
50 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Loratadine RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the ratios of loratadine to the internal standard peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP27)

## Add the following:

## ©Losartan Potassium

$\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{ClKN}_{6} \mathrm{O} \quad 461.00$
$1 H$-Imidazole-5-methanol, 2-butyl-4-chloro-1-[[2'-(1H-tet-razol-5-yl)[1, 1'-biphenyl]-4-yl]methyl]-, monopotassium salt.

2-Butyl-4-chloro-1-[p-(o-1 H -tetrazol-5-ylphenyl)benzyl] imidazole-5-methanol, monopotassium salt [124750-99-8].
» Losartan Potassium contains not less than 98.5 percent and not more than 101.0 percent of $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{ClKN}_{6} \mathrm{O}$ calculated on the anhydrous, sol-vent-free basis.

Packaging and storage-Preserve in well-closed containers. Store at controlled room temperature

USP Reference Standards $\langle 11\rangle$ —USP Losartan Potassium $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$ -
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Solution: $10 \mu \mathrm{~g}$ per mL .
Medium: methanol.
C: It meets the requirements of the test for Potassium $\langle 191\rangle$.

Water, Method $I\langle 921\rangle$ : not more than $0.5 \%$.
Heavy metals, Method II $\langle 231\rangle$ : 0.001\%.

## Limit of cyclohexane and isopropyl alcohol-

Standard solution-Accurately prepare a solution having a known concentration of about 0.05 mg per mL of cyclohexane and 0.05 mg per mL of isopropyl alcohol in dimethylformamide.

Test solution-Transfer 500 mg of Losartan Potassium to a $10-\mathrm{mL}$ volumetric flask that contains 5 mL of dimethylformamide, dissolve using a vortex mixer, dilute with dimethylformamide to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and contains a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ column containing packing G27 of $1.5-\mu \mathrm{m}$ film thickness. The carrier gas is helium, flowing at a rate of about 6 mL per minute. The chromatograph is programmed as follows. Initially the column is maintained at $50^{\circ}$ for 5 minutes, then the temperature is increased at a rate of $30^{\circ}$ per minute to $200^{\circ}$, and maintained at $200^{\circ}$ for 5 minutes. The injection port and detector block temperature are each maintained at $220^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the retention times are about 2 minutes for isopropyl alcohol and 4 minutes for cyclohexane; the resolution, $R$, between cyclohexane and isopropyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than $8.0 \%$.

Procedure-Inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Test solution and the Standard solution into the gas chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of cyclohexane and isopropyl alcohol taken by the formula:

$$
100(C / /)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of cyclohexane or isopropyl alcohol in the Standard solution; $I$ is the concentration, in mg per mL , of Losartan in the Test solution; and $r_{U}$ and $r_{S}$ are the responses of cyclohexane or iso-
propyl alcohol in the Test solution and the Standard solution, respectively: not more than $0.1 \%$ of cyclohexane; and not more than $0.2 \%$ of isopropyl alcohol is found.

## Chromatographic purity-

Solution A-Prepare a $0.1 \%$ solution of phosphoric acid in water.

Solution B-Use acetonitrile.
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$.

System suitability solution-Dissolve an accurately weighed quantity of USP Losartan Potassium RS and triphenylmethanol in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.3 mg per mL and 0.002 mg per mL , respectively.

Test solution-Transfer about 30 mg of Losartan Potassium, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column containing packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 75 | 25 | equilibration |
| $0-25$ | $75 \rightarrow 10$ | $25 \rightarrow 90$ | linear gradient |
| $25-35$ | 10 | 90 | isocratic |
| $35-45$ | $10 \rightarrow 75$ | $90 \rightarrow 25$ | linear gradient |
| $45-50$ | 75 | 25 | re-equilibration |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for losartan and 1.9 for triphenylmethanol; and the tailing factor for losartan is not more than 1.6. [NOTE-The typical retention time for triphenylmethanol is about 20 minutes.]

Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Losartan Potassium taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses for all the peaks: not more than $0.2 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

## Assay-

Solution A and Solution B-Proceed as directed for Chromatographic purity.

Mobile phase-Prepare a filtered and degassed mixture of Solution $A$ and Solution B (3:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation - Dissolve an accurately weighed quantity of USP Losartan Potassium RS in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.25 mg per mL.

Assay preparation-Transfer about 25 mg of Losartan Potassium, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at about $35^{\circ}$. Chromatograph the

Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 5600 theoretical plates; the tailing factor is not more than 1.4 ; and the relative standard deviation for replicate injections is not more than $0.5 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{ClKN}_{6} \mathrm{O}$ in the portion of Losar$\tan$ Potassium taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Losartan Potassium RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas for the losartan peak obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

## BRIEFING

(BPC: M. Marques) RTS-40313-4

## Change to read:

Dissolution, Preedure for a Pooled Sample

Medium: 0.01 N hydrochloric acid; 900 mL . Apparatus 1: 100 rpm .
Time: 45 minutes.
Determine the amount of $\mathrm{C}_{25} \mathrm{H}_{27} \mathrm{ClN}_{2} \cdot 2 \mathrm{HCl}$ dissolved by employing the following method.
Mobile phase-Prepare a suitable degassed and filtered mixture of water and methanol ( $55: 45$ ) that contains 0.69 g of monobasic sodium phosphate in each 100 mL and is adjusted with phosphoric acid, if necessary, to a pH of 4.0 .

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector, a 4.6$\mathrm{mm} \times 25-\mathrm{cm}$ precolumn positioned between the pump and the injection valve that contains packing L27, and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ analytical column that contains packing L9. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation is not more than $2.0 \%$.

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled
sample as the test solution. $\begin{aligned} & \text { USP28 }\end{aligned}$
Inject about $100 \mu \mathrm{~L}$ of a filtered

- 4 USP28
portion of the solution under test,
$\Delta_{\text {pooled sample }}^{{ }_{U U S 28}}$
suitably diluted with Mobile phase, if necessary, into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the amount of $\mathrm{C}_{25} \mathrm{H}_{27} \mathrm{ClN}_{2} \cdot 2 \mathrm{HCl}$ dissolved from the peak response obtained in comparison with the peak response obtained from the Standard solution having a known concentration of USP Meclizine Hydrochloride RS in a mixture of Dissolution Medium and Mobile phase (1:1), similarly chromatographed. An amount of alcohol not to exceed $1 \%$ of the total volume of the Standard solution may be used to dissolve USP Meclizine Hydrochloride RS prior to dilution.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{25} \mathrm{H}_{27} \mathrm{ClN}_{2} \cdot 2 \mathrm{HCl}$ is dissolved in 45 minutes:
$\Delta_{t}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

A: Prepare a solution containing 10 mg of netilmicin per mL . Apply $5 \mu \mathrm{~L}$ of this solution, $5 \mu \mathrm{~L}$ of a Standard solution of USP Netilmicin Sulfate RS containing 10 mg of netilmiein per mL , and $5 \mu \mathrm{~L}$ of a $1: 1$ mixture of the two solutions to a suitable thin layer ehrematographic plate (see-Chromatography (621)) coated with a 0.25 mm layer of chromatographic siliea gel mixture. Allow the spots to dry, place the plate in a developing chamber fitted for con tinuous flow, thin layer chromatography, develop the chromatogram in a solvent system consisting of a mixture of methanol, ammonium hydroxide, and chloroform ( $60: 30: 25$ ) for 1.5 hours. Remove the plate from the developing chamber, allow the selvent to evaperate, and heat the plate at $110^{\circ}$ for 15 minutes. Spray the plate with a 1 in 100 solution of ninhydrin in butanol to whieh 1 mL of pyridine has been added: netilmicin appears as a brown spot, and the spots obtained from the test solution and from the mixture of test solution and Standard solution, respectively, correspond in distance from the origin to that of the spet from the Standard solution.
${ }^{\Delta}$ The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the As-
say. USP28
B: ${ }^{\text {It }}$ USP28 responds to the tests for Sulfate $\langle 191\rangle$.

## Add the following:

${ }^{\Delta}$ Chromatographic purity-
Dilute phosphoric acid, Mobile phase, Resolution solution, Assay preparation, and Chromatographic sys-tem-Proceed as directed in the Assay.

Test solution-Use the Assay preparation.
Reference solution-Transfer 1.0 mL of the Assay preparation to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution and the Reference solution into the chromatograph, and measure the area responses for all
${ }^{\wedge}$ previously dried in a vacuum at a pressure not exceeding 5 mm mercury for 1 hour, $\boldsymbol{\Delta U S P 2 8}$
the peaks, except those due to the solvent. Calculate the percentage of each impurity in the portion of Netilmicin Sulfate taken by the formula:

$$
\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ is the peak response of each impurity peak in the chromatogram obtained from the Test solution, and $r_{S}$ is the netilmicin peak response in the chromatogram obtained from the Reference solution. Not more than $1 \%$ of any individual impurity is found, and the total of all impurities is not more than 5\%. ${ }^{\text {UUSP28 }}$

## Change to read:

Assay Preceed as directed under Antibioties Mierobial Asseys: $\langle 81\rangle=$
${ }^{\Delta}$ Dilute phosphoric acid-Dilute 5.0 mL of phosphoric acid to 1000 mL with water, and mix.

Mobile phase-Dissolve 20.22 g of sodium heptaneslfonate in Dilute phosphoric acid, dilute with Dilute phosphoric acid to 1000 mL , and mix. To 620 mL of this solution add 380 ml of acetonitrile, mix, and pass through a $0.45-\mathrm{nm}$ porosity filter. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Prepare a solution in Mobile phase containing about 1 mg of USP Netilmicin Sulfate RS and 1 mg of USP Sisomicin Sulfate RS per mL.

Standard preparation-Transfer about 50 mg of USP Netilmicin Sulfate RS to a low-actinic, previously accurately tared, $50-\mathrm{mL}$ volumetric flask. Place the flask in a vacuum desiccator under a vacuum of less than 5 mm of mercury for 1 hour. Accurately weigh the flask, and determine the dry weight of the USP Netilmicin Sulfate RS taken. Dissolve in, and dilute with, Mobile phase to volume, and mix.

Assay preparation-Transfer about 50 mg of Netilmicin Sulfate to a low-actinic, previously accurately tared, 50mL volumetric flask. Place the flask in a vacuum desiccator under a vacuum of less than 5 mm of mercury for 1 hour.

Accurately weigh the flask, and determine the dry weight of the Netilmicin Sulfate taken. Dissolve in, and dilute with, Mobile phase to volume, and mix.

Chromatographic system-(see Chromatography $\langle 621\rangle)$-The chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed under Procedure: the resolution of the sismicin and netilmicin peaks is not less than 1 . Chromatograph the Standard preparation, and record the peak responses as directed under Procedure: The column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than $1 \%$.

Procedue-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, and measure the area responses for the main peaks. Calculate the quantity, in $\mu \mathrm{g}$, of netilmicin $\left(\mathrm{C}_{21} \mathrm{H}_{41} \mathrm{~N}_{5} \mathrm{O}_{7}\right)$ per mg of Netilmicin Sulfate taken by the formula:

$$
\left(W_{S} P / W_{U}\right)\left(r_{U} / r_{S}\right),
$$

in which $W_{S}$ is the dry weight, in mg , of USP Netilmicin Sulfate RS taken to prepare the Standard preparation; $P$ is the designated potency, in $\mu \mathrm{g}$ of netilmicin $\left(\mathrm{C}_{21} \mathrm{H}_{41} \mathrm{~N}_{5} \mathrm{O}_{7}\right)$ per mg, of the USP Netilmicin Sulfate RS; $W_{U}$ is the dry weight, in mg , of the Netilmicin Sulfate taken to prepare the Assay preparation; and $r_{U}$ and $r_{S}$ are the netilmicin peak responses obtained from the Assay preparation and the Standard preparation, respectively. USPP28 $^{\text {U }}$

${ }^{\triangle}$ Dilute phosphoric acid, Mobile phase, Resolution solution, Standard preparation, and Chromatographic sys-tem-Proceed as directed in the Assay under Netilmicin Sulfate.

Assay preparation-Transfer an accurately measured volume of Netilmicin Sulfate Injection, equivalent to about 100 mg of netilmicin, to a low-actinic, $100-\mathrm{mL}$ volumetric flask.

Dilute with Mobile phase to volume, and mix.
Procedure-Proceed as directed for Procedure in the $A s$ say under Netilmicin Sulfate. Calculate the quantity, in mg, of netilmicin $\left(\mathrm{C}_{21} \mathrm{H}_{41} \mathrm{~N}_{5} \mathrm{O}_{7}\right)$ in each mL of Netilmicin Sulfate Injection taken by the formula:

$$
0.1\left(W_{S} P / 50 V\right)\left(r_{U} / r_{S}\right)
$$

in which $V$ is the volume, in mL, of Netilmicin Sulfate Injection taken to prepare the Assay preparation, and the other terms are as defined therein. $\Delta$ USP28

Briefing
Nevirapine, page 1054 of $P F$ 29(4) [July-Aug. 2003]. On the basis of new information received, the following modifications have been proposed. (1) The term "Specified and unspecified impurities" rather than "Related compounds" is used in accordance with ICH terminology. (2) For Organic volatile impurities, Method $V$ rather than Method 1 is used. (3) The water determination for the anhydrous form is performed by Method la rather than Method 1c. Additional editorial changes are made to clarify the injection volumes as well as the system suitability criteria for the Resolution solution.
(PA7b: B. Davani) RTS-40312-1

## Add the following:

## ${ }^{\Delta}$ Nevirapine

$\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{4} \mathrm{O} \quad 266.30$
$6 H$-Dipyrido[3,2-b:2', $\left.3^{\prime}-e\right][1,4]$ diazepin-6-one, 11-cyclo-
propyl-5,11-dihydro-4-methyl-.
11-Cyclopropyl-5,11-dihydro-4-methyl-6H-dipyrido[3,2-
$\left.b: 2^{\prime}, 3^{\prime}-e\right][1,4]$ diazepin-6-one [129618-40-2].

Hemihydrate 275.31
» Nevirapine is anhydrous or contains net mere tham one-half molecule of water of hydration. It contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{4} \mathrm{O}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight containers.
Store ben $15^{\circ}$ and $30^{\circ}$, at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label it to indicate whether it is anhydrous or the hemihydrate.

USP Reference standards $\langle 11\rangle — U S P$ Nevirapine Anhydrous RS. USP Nevirapine Hemihydrate RS. USP Nevirapine Related Compound A RS. USP Nevirapine Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ —Do not dry the specimens.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Water, Method I $\langle 921\rangle$-For Nevirapine anhydrous: preeeed directed for Mether not more than $0.2 \%$. For Nevirapine hemihydrate: preas direed for Method between $3.1 \%$ and $3.9 \%$.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Related-empounds Specified and unspecified impurities -
0.025 M Ammonium phosphate buffer, Mobile phase, Standard stock solution 1, Standard stock solution 2, Standard stock solution 3, and Resolution solution-Proceed as directed in the Assay.

Standard solution-Transfer 2.0 mL of the Standard stock solution 1 to a $200-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Test solution-Transfer an accurately weighed quantity of Nevirapine, equivalent to about 24 mg of nevirapine anhydrous, to a $100-\mathrm{mL}$ volumetric flask. Add 4 mL of acetonitrile and 80 mL of Mobile phase, and sonicate for at least 15 minutes. Allow to cool to room temperature, dilute with Mo bile phase to volume, and mix.

Chromatographic system-Proceed as directed in the Assay. Chromatograph the Resolution solution (approximately $25 \mu \mathrm{~L}$ ), and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for nevirapine related compound $\mathrm{B}, 1.0$ for nevirapine, 1.5 for nevirapine related compound A , and 2.8 for nevirapine impurity C ; the resolution, $R$, between nevirapine related compound B and nevirapine is not less than 5.0; and the resolution between nevirapine and nevirapine related compound A is not less than 7.4. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for at least 80 minutes, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Nevirapine taken by the formula:

$$
10,000(1 / F)(C / W)\left(r_{i} / r_{S}\right)
$$

in which $F$ is the relative response factor for each impurity, which is equal to 1.3 for nevirapine related compound $B$ and 1.0 for all other impurities; $C$ is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the Standard solution; $W$ is the weight of Nevirapine, in mg , taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the nevirapine peak response obtained from the Standard solution: not more than $0.2 \%$ each of nevirapine related compound A, nevirapine related compound B , and the impurity having a relative retion of 2.8 is found; nevirapine impurity C is found; not more than $0.1 \%$ of any other individual unspecified impurity is found; and not more than $0.6 \%$ of total impurities is found.

Organic volatile impurities, $I$ Method $V\langle 467\rangle$ : meets the requirements.

## Assay-

0.025 M Ammonium phosphate buffer-Transfer 2.88 g of monobasic ammonium phosphate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in 800 mL of water, adjust with 1 N sodium hydroxide to a pH of about 5.0, dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of 0.025 M Ammonium phosphate buffer and acetonitrile (4:1).

Standard stock solution 1-Transfer an accurately weighed quantity of USP Nevirapine Anhydrous RS to a volumetric flask, add a volume of a mixture of Mobile phase and acetonitrile (20:1), sonicate for at least 15 minutes, allow to cool to room temperature, dilute with Mobile phase to volume, and mix to obtain a solution having a known concentration of about 0.24 mg per mL . [NOTE-Do not use after 78 hours.]

Standard stock solution 2-Transfer an accurately weighed quantity of USP Nevirapine Related Compound A RS to a volumetric flask, add a volume of a mixture of Mobile phase and acetonitrile (3:1), sonicate for at least 15 minutes, allow to cool to room temperature, dilute with Mobile phase to volume, and mix to obtain a solution having a known concentration of about 0.24 mg per mL .

Resolution solution-Transfer 3.0 mL of Standard stock solution 1, 3.0 mL of Standard stock solution 2, and 6.0 mL of Standard stock solution 3 to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Standard preparation-Transfer 3.0 mL of Standard stock solution 1 to a $25-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. [NOTE-Do not use after 78 hours.]

Assay preparation-Transfer an accurately weighed quantity of Nevirapine, equivalent to about 24 mg of nevirapine anhydrous, to a $100-\mathrm{mL}$ volumetric flask. Add 4 mL of acetonitrile and 80 mL of Mobile phase, sonicate for at least 15 minutes, allow to cool to room temperature, dilute with Mobile phase to volume, and mix. Transfer 3.0 mL of this solution to a $25-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L57. L\#\# (see Chromatography $\langle 621\rangle$ ). The flow rate is about 1 mL per minute. The column temperature is maintained at $35^{\circ}$. Chromatograph the Resolution solution (approximately $25 \mu \mathrm{~L}$ ), and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for nevirapine related compound $\mathrm{B}, 1.0$ for nevirapine, 1.5 for nevirapine related compound A , and 2.8 for nevirapine impurity C ; the resolution, $R$, between nevirapine related compound B and nevirapine is not less than 5.0 ; and the resolution between nevirapine and nevirapine related compound A is not less than 7.4. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$. $2.0 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{4} \mathrm{O}$ in the portion of Nevirapine taken by the formula:

$$
833.33 C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Nevirapine Anhydrous RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements. PROCEDURE FOR CONTENT UNIFORMITY-
Test solution-Transfer the contents of 1 Capsule to a suitable flask, and add a volume of dimethylformamide to obtain a solution having a concentration of about 1.2 mg of nitrofurantoin per mL . Shake the flask for 15 minutes.
${ }^{\boldsymbol{\Delta}}$ [nOTE-If necessary, the sample may be homogenized using a disperser.] $]_{\triangle S P 28}$
In the case of a $50-$ or $100-\mathrm{mg}$ Capsule transfer 40.0 mL of this solution to a suitable flask, and proceed as directed for Assay preparation in the Assay, beginning with "add 50.0 mL of Internal standard solution." In the case of a $25-\mathrm{mg}$ Capsule, transfer 20.0 mL of the solution to a suitable flask, and add 25.0 mL of Internal standard solution instead of 50.0 mL .

Procedure-Proceed as directed in the Assay, using the follow-
ing Test solution instead of the Assay preparation.

## Change to read:

## Assay-

pH 7.0 phosphate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic systemProceed as directed in the Assay under Nitrofurantoin.

Assay preparation-Transfer, as completely as possible, the contents of 20 Capsules to a $500-\mathrm{mL}$ flask. Place the emptied capsules in a beaker, add 25 mL of dimethylformamide, and agitate for 1 minute. Decant into the flask containing the Capsule contents. Rinse the emptied capsules with another two $25-\mathrm{mL}$ portions of dimethylformamide, and decant into the flask. Add sufficient dimethylformamide to bring the volume to about 250 mL . Insert the stopper in the flask, and shake by mechanical means for 15 minutes. Dilute with dimethylformamide to volume, and mix.
${ }^{\boldsymbol{\Delta}}$ [NOTE-If necessary, the sample may be homogenized using a disperser.] $]_{\Delta U S P 28}$

## Add the following:

## ${ }^{4}$ Composition-

Solution $A$-Prepare a mixture of 0.05 M ammonium acetate and acetonitrile (71:29).

Solution B-Prepare a mixture of acetonitrile and 0.05 M ammonium acetate (60:40).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Quantitatively dissolve an accurately weighed quantity of USP Nystatin RS in dimethyl sulfoxide to obtain a solution having a known concentration of about 0.4 mg per mL . [NOTE-Protect this solution from light and use within 24 hours, if stored in the refrigerator.]

Test solution-Transfer about 20 mg of Nystatin, accurately weighed, to a low-actinic $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with dimethyl sulfoxide to volume, and mix. [NOTE-Use this solution within 24 hours, if stored in the refrigerator.]
System suitability solution-Dissolve about 20 mg of Ny statin in 25 mL of methanol, dilute with water to 50 mL , and mix. To 10.0 mL of this solution add 2.0 mL of diluted hydrochloric acid, and allow to stand at room temperature for 1 hour.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $304-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains base-deactivated end-capped $5-\mu \mathrm{m}$ packing L1. The column is
maintained at a constant temperature of about $30^{\circ}$. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-25$ | 100 | 0 | isocratic |
| $25-35$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | gradient |
| $35-40$ | 0 | 100 | isocratic |
| $40-45$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | gradient |
| $45-50$ | 100 | 0 | equilibrium |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the two major peaks is not less than 3.5. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the main nystatin A1 peak elutes at about 14 minutes.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak area responses for all of the peaks, disregarding any peaks eluting in less than 2 minutes. Calculate the percentage of each peak by the formula:

$$
100 r_{i} / r_{T},
$$

in which $r_{i}$ is the response of an individual peak; and $r_{T}$ is the total of all of the responses, any peaks eluting in less than 2 minutes being disregarded. Not less than $85.0 \%$ of nystatin A1 is found; and not more than $4.0 \%$ of any other individual component is found. $\triangle U S P 28$

## Add the following:

${ }^{\text {© }}$ Deliverable volume $\langle 698\rangle$ FOR POWDER PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements. $\triangle U S P 28$

[^10](PA4: E. Gonikberg; BPC: M. Marques) RTS-40646-1 ; 40215-1; 40104-1

## Add the following:

## ©Omeprazole Delayed-Release Capsules

» Omeprazole Delayed-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of omeprazole $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers. Store between $15^{\circ}$ and $30^{\circ}$.

Labeling-When more than one Drug Release test is given, the labeling states the Drug Release test used only if Test 1 is not used.

USP Reference standards $\langle 11\rangle$ —USP Omeprazole $R S$.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Adsorbent: $0.25-\mathrm{mm}$ chromatographic silica gel mixture, prewashed with methanol.
Diluent: a mixture of methylene chloride and methanol (1:1).

Test solution-Transfer the contents of not fewer than 5 Capsules to a mortar, grind the Capsules, and mix. Transfer a weighed quantity of the powder, equivalent to about 10 mg of omeprazole, to a suitable container. Add 2 mL of Diluent, sonicate for 5 minutes, and allow to settle for 20 minutes before applying to the plate.
Standard solution-Dissolve an accurately weighed quantity of USP Omeprazole RS in Diluent to obtain a solution having a known concentration of about 5 mg per mL .

Developing solvent system: a mixture of methylene chloride saturated with ammonia, methylene chloride, and isopropyl alcohol (2:2:1).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release, Meth A $\langle 724\rangle$ -

```
ACID_STAGE-
    Medium: 0.1 N hydrechloric acid; 500 mL.
    Apparatus 2: paddles constructed of, or coated with, poly
#f,100 rpm.
```

Time: 2 hours.

## Procedure: Proceed as directed for Buffer stage.

TEST 1, METHOD A $\langle 724\rangle$ -
ACID RESISTANCE STAGE-
Medium: 0.1 N hydrochloric acid; 500 mL .
Apparatus 2: 100 rpm .
Time: 2 hours.
pH 7.6 phosphate buffer, Mobile phase, and
Chromatographic system and Proce-Proceed as directed under Buffer stage.

Standard solution-Transfer about 50 mg of USP Omeprazole RS, accurately weighed, to a $250-\mathrm{mL}$ volumetric flask, dissolve in 50 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix. Transfer 10.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, add 20 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix.

Test solution-After 2 hours, filter the Dissolution Medium containing the pellets through a sieve with an aperture of not more than 0.2 mm . Collect the pellets on the sieve, and rinse them with water. Using approximately 60 mL of 0.01 M sodium borate solution, carefully transfer the pellets quantitatively to a $100-\mathrm{mL}$ volumetric flask. Sonicate for about 20 minutes until the pellets are broken up. Add 20 mL of alcohol to the flask, dilute with 0.01 M sodium borate solution to volume, and mix. Dilute an appropriate amount of this solution with 0.01 M sodium borate solution to obtain a solution having a concentration of about 0.02 mg per mL .

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of omeprazole $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\right)$ dissolved in the Medium by the formula:

$$
T-C D\left(r_{U} / r_{S}\right)
$$

in which $T$ is the labeled quantity, in mg , of omeprazole in the capsule; $C$ is the concentration, in mg per mL , of USP Omeprazole RS in the Standard solution; $D$ is the dilution factor used in preparing the Test solution; and $r_{U}$ and $\mathrm{r}_{S}$ are the omeprazole peak responses obtained from Test solution and Standard solution, respectively.

Tolerances-Level $\mathrm{L}_{1}$ : no individual value exceeds $10 \%$ $15 \%$ of omeprazole dissolved. Level $\mathrm{L}_{2}$ : the average of 12 units is not more than $10 \% 20 \%$ of omeprazole dissolved, and no individual unit is greater than $25 \% 35 \%$ of omeprazole dissolved. Level $L_{3}$ : the average of 24 units is not more than $10 \% 20 \%$ of omeprazole dissolved, not more than 2 units are greater than $35 \%$ of omeprazole dissolved, and no individual unit is greater than $25 \% 45 \%$ of omeprazole dissolved.

## BUFFER STAGE- <br> Medium: pH 6.8 phosphate buffer, 900 mL , prepared by

 adding 400 mL of 0.235 M dibasic sedium phesphate to the vessel and adjusting, if necessary, with 2 N hydrechlerie acid or 2 N sodium hydroxide to a pH of $6.8 \pm 0.05$ -Medium: pH 6.8 phosphate buffer, 900 mL .
Proceed as directed under Acid resistance stage with a new set of capsules from the same batch. After 2 hours, add 400 mL of 0.235 M dibasic sodium phosphate to the 500 mL of 0.1 N hydrochloric acid medium in the vessel. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of $6.8 \pm 0.05$.

Apparatus 2: 100 rpm .

## Proedtre-

At the end of 30 minutes, determine the amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ dissolved in pH 6.8 Phosphate buffer by employing the following method.
pH 10.4, 0.235 M Dibasic sodium phosphate—Dissolve 33.36 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with 2 N sodium hydroxide to a pH of $10.4 \pm 0.1$.
pH 6.8 Phosphate buffer-Add 400 mL of 0.1 N hydrochloric acid to 320 mL of pH 10.4, 0.235 M Dibasic sodium phosphate, and adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of $6.8 \pm 0.05$.
pH 7.6 Phosphate buffer-Dissolve 0.718 g of monobasic sodium phosphate and 4.49 g of dibasic sodium phosphate in 1000 mL of water. Adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of $7.6 \pm 0.1$. Dilute 250 mL of this solution with water to 1000 mL .
Mobile phase-Transfer 340 mL of acetonitrile to a 1000mL volumetric flask, dilute with $p H$ 7.6 Phosphate buffer to volume, and pass through a membrane filter having a 0.5 $\mu \mathrm{m}$ or finer porosity. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution 1 (for Capsules labeled 10 mg )-Dissolve an accurately weighed quantity of USP Omeprazole RS in alcohol to obtain a solution having a known concentration of about 2 mg per mL . Dilute with pH 6.8 Phosphate buffer quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.01 mg per mL . To 10 mL of this solution immediately add 2 mL of 0.25 M sodium hydroxide, and mix. [NOTE-Do not allow the solution to stand before adding the sodium hydroxide solution.]

Standard solution 2 (for Capsules labeled 20 mg and 40 mg )—Proceed as directed for Standard solution 1, except to obtain a solution having a known concentration of about 0.02 mg per mL before mixing with 2 mL of 0.25 M sodium hydroxide.

Test solution 1 (for Capsules containing 10 mg and 20 mg )-Transfer immediately 5.0 mL of the solution under test to a test tube containing 1.0 mL of 0.25 M sodium hydroxide. Mix well, and pass through a membrane filter having a $1.2-\mu \mathrm{m}$ or finer porosity. Protect from light.
Test solution 2 (for Capsules labeled 40 mg )—Transfer immediately 5.0 mL of the solution under test to a test tube containing 2.0 mL of 0.25 M sodium hydroxide and 5 mL of pH 6.8 Phosphate buffer. Mix well, and pass through a membrane filter having a $1.2-\mu \mathrm{m}$ or finer porosity. Protect from light.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 12.5-\mathrm{cm}$ analytical column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the appropriate Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the appropriate Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of omeprazole $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\right)$ dissolved by the formula:

$$
V C D\left(r_{U} / r_{S}\right)
$$

in which $V$ is the volume of Medium in each vessel; $C$ is the concentration, in mg per mL, of USP Omeprazole RS in the appropriate Standard solution; $D$ is the dilution factor used in preparing the appropriate Test solution; and $r_{U}$ and $r_{S}$ are the omeprazole peak responses obtained from the appropriate Test solution and Standard solution, respectively.

Tolerances-For Capsules labeled 10 and 20 mg , not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ is dissolved in 30 minutes. For Capsules labeled 40 mg , not less than $70 \%(Q)$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ is dissolved in 30 minutes.

TEST $2\langle 711\rangle$ —
If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 2.

## ACID RESISTANCE STAGE-

Medium: 0.1 N hydrochloric acid; 900 mL .
Apparatus 1: 100 rpm .
Time: 2 hours.
Procedure-After two hours, remove each sample from the basket, and transfer quantitatively into separate volumetric flasks to obtain a solution having a final concentration of about 0.2 mg per mL . Proceed as directed under Assay, Assay preparation starting with "Add about 50 mL of Diluent ...". Calculate the quantity, in mg , of omeprazole $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\right)$ dissolved in the Medium by the formula:

$$
T-C D\left(r_{U} / r_{S}\right)
$$

in which $T$ is the assayed quantity, in mg , of omeprazole in the capsule; $C$ is the concentration, in mg per mL , of USP Omeprazole RS in the Standard solution; $D$ is the dilution factor used in preparing the Test solution; and $r_{U}$ and $r_{S}$ are the omeprazole peak responses obtained from Test solution and Standard solution, respectively.

Tolerances-It complies with the following Acceptance Table:

Acceptance Table
Level Criteria
$L_{1} \quad$ the average of the 6 units is not more than $10 \%$ of omeprazole dissolved
$\mathrm{L}_{2}$ the average of the 12 units is not more than
$10 \%$ of omeprazole dissolved
$L_{3}$ the average of the 24 units is not more than $10 \%$ of omeprazole dissolved

## BUFFER STAGE-

Medium: 0.05 M pH 6.8 phosphate buffer; 900 mL (see Reagents, Indicators, and Solutions).

Apparatus 1: 100 rpm .
Time: 45 minutes.
Procedure-Proceed as directed under Acid resistance stage with a new set of capsules from the same batch. After 2 hours, replace the acid medium with the buffer medium and continue the test for 45 more minutes. Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 305 nm of portions of the solutions under test filtered through a $0.2 \mu \mathrm{~m}$ nylon filter, in comparison with a Standard solution having a known concentration of USP Omeprazole RS in the same Medium.

Tolerances-It complies with the Acceptance Table under Dissolution $\langle 711\rangle$. Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ is dissolved in 45 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Chromatographic purity-

Diluent, Solution A, Solution B, Mobile phase, and Chromatographic system - Proceed as directed in the Assay.

Standard solution-Prepare as directed for the Standard preparation in the Assay.

Test solution-Use the Assay preparation.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$
(10 C / F A)\left(r_{i} / r_{S}\right),
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Omeprazole RS in the Standard solution; $F$ is the relative response factor (see Note below for values); $A$ is the quantity, in mg , of omeprazole in the portion of Capsules taken, as determined in the Assay; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for omeprazole obtained from the Standard solution: not more than $0.5 \%$ of any individual impurity is found, and not more than $2.0 \%$ of total impurities is found. [NOTE-The relative response factor, $F$, equals 1.6 and 3.1 for peaks with a relative retention time of about 0.33 and 0.64 , respectively; and equals 1.0 for peaks obtained from all other impurities.]

## Assay-

Diluent-Dissolve 7.6 g of sodium borate decahydrate in about 800 mL of water. Add 1.0 g of edetate disodium, and adjust with $50 \%$ sodium hydroxide solution to a pH of 11.0 $\pm 0.1$. Transfer the solution to a $2000-\mathrm{mL}$ volumetric flask, add 400 mL of dehydrated alcohol, and dilute with water to volume.

Solution A-Prepare a filtered and degassed solution of 6.0 g of glycine in 1500 mL of water. Adjust with $50 \%$ sodium hydroxide solution to a pH of 9.0 , and dilute with water to 2000 mL .

Solution B-Use a filtered and degassed mixture of acetonitrile and methanol (85:15).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make
adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard preparation-Dissolve, by sonicating, an accurately weighed quantity of USP Omeprazole RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.2 mg per mL .

Assay preparation-Weigh and mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the mixture, equivalent to about 20 mg of omeprazole, to a $100-\mathrm{mL}$ volumetric flask, add about 50 mL of Diluent, and sonicate for 15 minutes. Cool, dilute with Diluent to volume, mix, and pass through a membrane filter having $0.45-\mu \mathrm{m}$ or finer porosity. [NOTE-Bubbles may form just before bringing the solution to volume. Add a few drops of dehydrated alcohol to dissipate the bubbles if they persist for more than a few minutes.]
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $305-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ basedeactivated packing L7. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $\%$ | $\%$ | Elution |
| $0-20$ | $88 \rightarrow 40$ | $12 \rightarrow 60$ | linear gradient |
| $20-21$ | $40 \rightarrow 88$ | $60 \rightarrow 12$ | linear gradient |
| $21-25$ | 88 | 12 | isocratic |

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 20,000 theoretical plates; the tailing factor is not less than 0.8 and not more than 2 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg , of omeprazole $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}\right)$ in the portion of Capsules taken by the formula:

$$
\begin{aligned}
& 100 C\left(r_{4}+r_{s}\right), \\
& D C\left(r_{U} / r_{S}\right)
\end{aligned}
$$

in which $D$ is the dilution factor of the Assay preparation; $C$ is the concentration, in mg per mL , of USP Omeprazole RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

## BriEfing

Oxandrolone, USP 27 page 1366 and page 1835 of $P F 28(6)$ [Nov.-Dec. 2002]. It is proposed to replace the liquid chromatographic procedure in the test for Related compounds with a gradient elution method that provides greater sensitivity to the impurities.

percent of $\mathrm{C}_{19} \mathrm{H}_{30} \mathrm{O}_{3}$, calculated on the dried basis.

## Change to read:

Identification-
A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Prepare a solution in chloroform containing 5 mg per mL. Apply $10 \mu \mathrm{~L}$ each of this solution and a solution of USPOxandrotone RS in chloroform, containing 5 mg per mL to a suitable thinlayer chromatographic plate (see Chromatography $\langle 621$ ) ) eonted with a 0.25 mm layer of chromategraphic siliea gel. Allow the
spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and methanol (19:1) until the solvent from has moved about three fourths of the length of the plate. Remove the plate frem the developing chamber, mark the solvent fromt, and allow the solvent to evaporate. Loeate the spets on the plate by lightly spraying with dilute sulfuric acid ( 1 in 2) and heating on a hot plate or under a lamp until spets appear: the $R_{f}$ value of the prineipal spet obtained from the test solution eorrespends to that obtained from the Standard solution.
${ }^{\Delta}$ The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the As-
say. $\triangle$ USP28

Dissolution Preedure for a Porled Sample
$\triangle$
〈711) ${ }^{\text {USP28 }}$
Medium: 0.1 N hydrochloric acid; 900 mL .
Apparatus 1: 100 rpm .
Time: 30 minutes.
Dilute hydrochloric acid-Dilute 37 mL of hydrochloric acid with water to 1 L .

Ammonium sulfamate reagent-Dissolve 250 mg of ammonium sulfamate in 100 mL of Dilute hydrochloric acid.
$N$-(1-Naphthyl)ethylenediamine dihydrochloride reagent-Dissolve 100 mg of N -(1-naphthyl)ethylenediamine dihydrochloride in 100 mL of Dilute hydrochloric acid.

Sulfanilamide-mercuric chloride reagent-Dissolve 100 mg of sulfanilamide and 100 mg of mercuric chloride in 100 mL of Dilute hydrochloric acid.

Sodium nitrite reagent-Dissolve 200 mg of sodium nitrite in 100 mL of dilute sulfuric acid (1 in 50). Prepare fresh.

Standard preparation-Dissolve an accurately weighed quantity of USP Penicillamine RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about $250 \mu \mathrm{~g}$ per mL .

Procedure-
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the Test solution. $\mathbf{4 S P 2 8}$
Pipet an aliquot of the filtered test solution,
${ }^{\Delta}$ pooled sample ${ }_{\text {aUSP28 }}$
estimated to contain about $278 \mu \mathrm{~g}$ of penicillamine, into a $100-\mathrm{mL}$ volumetric flask. Into a similar flask pipet an equivalent volume of 0.1 N hydrochloric acid to provide a reagent blank, and into a third $100-\mathrm{mL}$ volumetric flask pipet 1 mL of Standard preparation. Treat each flask as follows. Add by pipet 3 mL of Sodium nitrite reagent, and mix by swirling occasionally. After 5 minutes, add 10 mL of Ammonium sulfamate reagent, swirl, and allow to stand for an additional 5 minutes. Add 5 mL of Sulfanilamide-mercuric chloride reagent, swirl, and immediately add 10 mL of N -(1Naphthyl)ethylenediamine dihydrochloride reagent. Dilute with water to volume, and mix. Determine the absorbances of both solutions in $1-\mathrm{cm}$ cells at the wavelength of maximum absorbance at about 540 nm , with a suitable spectrophotometer, against the reagent blank. Calculate the percentage dissolution of the Capsule taken by the formula:

$$
90(C / W V)\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Penicillamine RS in the Standard preparation; $W$ is the labeled quantity, in mg , of penicillamine in the Capsule; $V$ is the volume, in mL , of the aliquot of test solution used; and $A_{U}$ and $A_{S}$ are the absorbances of the solutions from the test solution and the Standard preparation, respectively.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{NO}_{2} \mathrm{~S}$ is dissolved in 30 minutes:
${ }^{\Delta}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

| $\mathrm{S}_{2}$ | 6 | Average amount dissolved $\left(\mathrm{S}_{1}+\mathrm{S}_{2}\right)$ is equal to or greater than $Q+5 \%$. |
| $\mathrm{S}_{3}$ | 12 | Average amount dissolved ( $\mathrm{S}_{1}+\mathrm{S}_{2}+$ <br> $\mathrm{S}_{3}$ ) is equal to or greater than $Q$. |

## Briefing

Penicillin G Potassium for Injection, USP 27 page 1420. It is proposed to revise the $p H$ ranges specified in these monographs to reflect the pH standards for products intended for injection that do not contain any added substances, in addition to the current pH ranges that more properly apply to products that contain sodium citrate. The $p H$ range of 5.0 to 7.5 is proposed for Penicillin G Potassium for Injection and for Penicillin G Sodium for Injection, respectively, when they contain no added substances. This reflects the limits previously provided in the corresponding monographs for Sterile Penicillin G Potassium and Sterile Penicillin G Sodium included in USP 23, pages 1170 and 1179, respectively, which contained no added substances.

${ }^{\Delta}$ The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the $A s$ say. $\triangle U S P 28$

## Add the following:

${ }^{4}$ Related compounds-
Mobile phase-Prepare as directed in the Assay.
Standard solution-Dissolve an accurately weighed quantity of USP Pentobarbital RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.001 mg per mL .

Test solution-Transfer about 100 mg of Pentobarbital, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add about 80 mL of Mobile phase, and sonicate until dissolved. Dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2.5; the column efficiency is not less than 15,000 theoretical plates; the tailing factor is not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $15.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Pentobarbital taken by the formula:

$$
(10,000 / F)(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Pentobarbital RS in the Standard solution; $F$ is the relative response factor of the impurity according the table below; $W$ is the weight, in mg, of pentobarbital, on dried basis, used to prepare the Test solution; $r_{i}$ is the peak area for any impurity in the Test solution; and $r_{S}$ is the peak area for pentobarbital
in the Standard solution: the impurities meet the requirements given in the table below:

| Compound name | Relative <br> retention <br> time | Relative <br> Response <br> Factor | Limit <br> (\%) |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \text { 6-Imino-5-ethyl-5- } \\ \text { (1-methylbutyl) } \\ \text { barbituric acid } \end{gathered}$ | about 0.39 | 1.5 | 0.2 |
| 5-Ethyl-5-(1-ethylpropyl) barbituric acid * | about 0.93 | 1.0 | 0.1 |
| Pentobarbital | 1.0 | - | - |
| $\begin{gathered} \text { 5-Ethyl-5-(1,3-di- } \\ \text { methylbutyl) } \\ \text { barbituric acid } \end{gathered}$ | about 1.5 | 0.9 | 0.3 |
| Unknown impurities | - | 1.0 | 0.1 |
| Total | - | - | 0.5 |

* Where the material is labeled as intended solely for veterinary use, the limit of 5-ethyl-5-(1-ethylpropyl) barbituric acid is $3.0 \%{ }_{\mathbf{\triangle} U S P 28}$

## Delete the following:

${ }^{4}$ Isomer eontent Transfer $300 \pm 5$ mg to a round bottom flack equipped with a standard taper, sround glass joint, and add 4 mL of water. Add, dropwise, sodium hydroxide solution ( 4 in 10 ) just to dissolve the specimen (about 3 or 4 dreps), then add 10 mL of aleohol. Add $300 \pm 5$ me of $p$ nitrobenzyl bromide, mix, attacha condenser, and reflux for 30 minutes. Cool, filter under reduced pressure, and wash the residue with four 5 mL pertions of water. Transfer the residue, asempletely as pessible, to a small flack, add 25 mL of aleohol, and reflux for 10 minutes: the solid dissolves completely. Coul, and filter under redueed pressure: the $p$ nitroben zylderivative so obtained, after being dried at $105^{\circ}$ for 30 minutes, melts empletely between $136^{\circ}$ and $146^{\circ}$, when determined by the procedure for Class Ia (see Melting Range or Temperature $\langle 744\rangle)_{\Delta U S P 28}$

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Pentobarbital is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Pentobarbital Sodium Injection. Where the label states that Pentobarbital must be
subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Pentobarbital Sodium Injection. $\mathbf{\triangle}$ USP28

${ }^{*}$ Where the material is labeled as intended solely for veterinary use, the limit of 5-ethyl-5-(1-ethylpropyl) barbituric acid is $3.0 \%$. $\mathbf{\perp}$ USP28

## Delete the following:

${ }^{4}$ Isomer content Dissolve $300 \pm 5 \mathrm{mg}$ in 5.0 mL of water, and dissolve $300 \pm 5$ mg of $p$ nitrobenzyl bromide in 10.0 mL of at eehel. Mix the solutions, reflux for 30 minutes, coel to $25^{\circ}$, and fitter by suetion. Wash the cellected selid with four 5 mL per tiens of water, transfer as completely as practicable to a small flask, add 25.0 mL of aleohel, and reflux for 10 minutes: the selid dissolves completely. Cool the solution to $25^{\circ}$, and filter by suction: the collected solid, after being dried at $105^{\circ}$ for 30 minutes, melts ermpletely between $136^{\circ}$ and $146^{\circ}$, when determined by the procedure for Class Ia (see Melting Range or Temperatare $\langle 744\rangle$ ). $\mathbf{A}$ USP28

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Pentobarbital Sodium is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Pentobarbital Sodium Injection. Where the label states that Pentobarbital Sodium must be subjected fo further processing during the prepara-
tion of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Pentobarbital Sodium Injection. $\triangle$ USP28

## Change to read:

## Assay-

Biluting solvent Use freshly prepared dilute-ammonium hy droxide (1 in 200).

Standard preparation Dissolvenan aeeurately weighed quantity of USP Pentobarbital RS in Diluting selvent to obtain a selution having a known concentration of about $10 \mu \mathrm{~g}$ per mL .

Assay preparation Transfer about 25 me of pentebarbital se dium, previeusly dried and uceurately weighed, in a 50 mL volu metric flack, immediately dilute with Diluting solvent to volume, and mix. Pipet 2 mL of this solution into a 100 mL volumetrie flack, add Diluting solvent to volume, and mix.

Procedure Coneomitantly determine the absorbances of the Assay preparation and the Standard preparation in 1 em cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using Diluting solvent as the blank. Calculate the quantity, in mor, of $\mathrm{C}_{4} \mathrm{H}_{47} \mathrm{~N}_{2} \mathrm{NaO}_{3}$ in the pertion of Pentebarbital Sodium taken by the formala:

$$
2.56(248.26 / 226.28)\left(A_{\downarrow}+A_{\&}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP PentobarbitalPS in the Standard preparation; 248.26 and 226.28 are the $m e-$ lecular weights of pentobarbital sodium and pentobarbitat, respectively; and $A_{t}$ and $A_{s}$ are the abserbances of the $4 s s a y$ preparation and the Standard preparation, respectively.
${ }^{\Delta}$ NOTE-Use the value for Loss on drying obtained at the same time as the preparation of the Test solution in the test for Related compounds and the Assay preparation in the Assay.

Mobile phase, Standard preparation, and Chromatographic system-Proceed as described in the Assay under

## Pentobarbital.

Assay preparation-Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add about 80 mL of Mobile phase, and sonicate until dissolved. Dilute with Mobile phase to volume, and mix. Transfer 10.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses for the major peak. Calculate
the quantity, in mg , of $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{~N}_{2} \mathrm{NaO}_{3}$ in the portion of Pentobarbital Sodium taken by the formula:

$$
(248.25 / 226.27) 1000 C\left(r_{U} / r_{S}\right)
$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; $C$ is the concentration, in mg per mL , of USP Pentobarbital RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{A U S P 2 8}^{\text {. }}$

Phentermine Hydrochloride Tablets, USP 27 page 1467See briefing under Acetaminophen and Aspirin Tablets.
(BPC: M. Marques) RTS-40313-20

Change to read:
Dissolution Preedure for a Pooled Sample

Medium: water; 900 mL . Use 500 mL for Tablets containing 15 mg of phentermine hydrochloride or less.
Apparatus 2: 50 rpm .
Time: 45 minutes.
Determine the amount of $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{~N} \cdot \mathrm{HCl}$ dissolved by employing the following method.

Ion-pair solution-Dissolve 1.1 g of sodium 1-heptanesulfonate in 1 liter of water. Add 3.5 mL of glacial acetic acid, and mix.
Mobile phase-Prepare a filtered and degassed mixture of methanol and Ion-pair solution (21:19). Adjust with phosphoric acid to a pH of 2.5 . Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Phentermine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration approximately equivalent to the Test solution.

Test solution-Use a filtered portion of the pooled sample under test.
${ }^{\Delta}$ Proceed as directed for Procedure for Capsules, Uncoated
Tablets, and Plain Coated Tablets under Dissolution $\langle 711\rangle$.
Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. $\Delta$ USP28

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $208-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $25 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Determine the amount, in mg , of phentermine hydrochloride $\left(\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{~N} \cdot \mathrm{HCl}\right)$ dissolved by the formula:

$$
V C\left(r_{U} / r_{S}\right)
$$

in which $V$ is the volume of dissolution media used per vessel; $C$ is the concentration, in mg per mL , of USP Phentermine Hydrochloride RS in the Standard solution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and the Standard solution, respectively.

Tolerances-Not less than $75 \%$ (Q) of the labeled amount of $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{~N} \cdot \mathrm{HCl}$ is dissolved in 45 minutes:
${ }^{\Delta}$ the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying Acceptance Table for a Pooled Sample. Continue testing through the three stages unless the results conform
at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity $Q$, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

& \text { Selution: } 100 \text { Hg per mL. } \\
& \text { Medium: } 0.1 \text { N hydrechleric acid. }
\end{aligned}
$$

C: Dissolve 0.5 g of Phenyltoloxamine Dihydrogen Ci
trate in 15 mL of het water, add a-slight excess of $5 \mathrm{M}-\mathrm{se}$ dium hydroxide, filter, and add 2 N hydrochloric acid untit the filtrate is neutral to litmus paper: the solution meets the requirements of the test for Citrate $\langle 194\rangle$ =Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.

Melting range, Class $1 a\langle 741\rangle$ : between $137^{\circ}$ and $143^{\circ}$. $\mathbf{p H}\langle 791\rangle$ : between 3.2 and 4.2, in a solution (1 in 100).

Loss on drying $\langle 731\rangle$-Dry it in vacuum at $80^{\circ}$ for 3 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method $I\langle 231\rangle: 20 \mu \mathrm{~g}$ per g .

## Related compounds-

Resolution solution-In a separatory funnel dissolve about 10 mg each of USP Phenyltoloxamine Pihydrogen Citrate RS and USP Phenyltoloxamine Bihydrogen Citrate Related Compound A RS, accurately weighed, in 50 mL of water. Add 5 mL of ammonium hydroxide, and extract with three $10-\mathrm{mL}$ portions of ethylether methylene chloride.

Combine the extracts, dry the solution over anhydrous sodium sulfate, and gently evaporate to dryness. Dissolve the residue in 20 mL of ehlorem methylene chloride.

Test solution-In a separatory funnel dissolve about 800 mg 400 mg of Phenyltoloxamine Bihydrog Citrate, accurately weighed, in 50 mL of water. Proceed as directed for Resolution solution, beginning with "Add 5 mL of ammonium hydroxide."
Chromatographic system (see Chromatography $\langle 621\rangle$ ) The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a $0.32-\mathrm{mm} \times 25$ m column coated with a $0.45-\mu \mathrm{m}$ film of phase G27. The carrier gas is helium, flowing at a rate of about 29 cm per second, with a split flow rate of about 25 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at $190^{\circ}$ for 3 minutes, then the temperature is increased at a rate of $4^{\circ}$ per minute to $240^{\circ}$, and maintained at $240^{\circ}$ for 8 minutes. The injection port and the detector temperatures are maintained at $280^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between phenyltoloxamine dihydrege itrate and phenyltoloxamine dihydrege citrate related compound A is not less than z.0 1.5.

Procedure-Inject a volume (about $1 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Phenyltoloxamine BihydreCitrate taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response of each impurity; and $r_{s}$ is the sum of the responses of all the peaks, excluding the solvent peaks: not more than $0.2 \%$ of phenyltoloxamine dihy
drogen citrate related compound A ; not more than $0.1 \%$ of any other individual impurity; is found; and not more than $1.0 \%$ of total impurities is found.

Organic volatile impurities, Method $1\langle 467\rangle$ : meets the requirements.

Assay-Dissolve about 0.5 g of Phenyltoloxamine Pihy dregen Citrate, accurately weighed, in 80 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N perchloric acid is equivalent to 44.75 mg of $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7 \cdot \mathbf{\Delta} \text { USP28 }}$

## Briefing

Platelets. Because there is no existing USP monograph for this product, a new monograph is being proposed.
(BBP: R. Tirumalai) RTS-40379-1

## Add the following:

## ©Platelets

» Platelets is the portion of blood that contains platelet cells. It is derived from human whole blood from which red blood cells and a portion of the plasma are removed by centrifugation, sedimentation, or apheresis. In the apheresis removal method, the red blood cells and plasma are automatically removed and returned directly to the donor. Platelets derived from whole blood must be prepared within 4 hours after collecting the whole blood from which it is derived, or within the time frame specified for the blood collecting, processing, and storage system used.

Platelets may be derived from whole blood collected in any approved anticoagulant solution (see USP monographs for anticoagulant solutions). Platelets prepared by apheresis must be collected using Anticoagulant Citrate Dextrose Solution A as the anticoagulant solution.

Platelets derived from whole blood must have a minimum of $5.5 \times 10^{10}$ platelet cells suspended in a volume of 40 to 70 mL of original plasma. Platelets produced by apheresis must have a mini-
mum of $3.0 \times 10^{11}$ platelet cells, suspended in 100 to 500 mL of original plasma or in an approved additive solution.

Platelets derived from whole blood or by apheresis may be further processed by filtration for removal of leukocytes, or by irradiation to inactivate lymphocytes. Platelets derived from whole blood may be pooled from multiple donors to form one dose of platelets.

Leukocytes may be removed from platelets by filtration using an approved platelet leukoreduction filter. Platelets derived from whole blood must contain less than $8.3 \times 10^{5}$ leukocytes after filtration.

The source blood for platelets must be tested for syphilis, hepatitis $B$, and human T-cell virus (HTLV) Type I and Type II, using FDA approved and licensed commercially available test kits. The test results must be below the limits of detection specified by the manufacturers of the respective test kits. The source blood must also be tested for hepatitis C and HIV Type 1 and Type 2, using FDA approved nucleic acid assays. The test results must be below the approved limits of detection for the tests used.

Packaging and storage-Store platelets in an approved container. Platelets may be stored in plasma or in an approved additive solution at $20^{\circ}$ to $24^{\circ}$ with continuous gentle agitation for no more than 5 days after date of preparation.

Labeling-Label the container to indicate the collection date, the donation number or other coding means to uniquely identify the unit and to provide traceability to the donor, approximate volume, storage temperature, and its expiration date. Indicate the anticoagulant solution used and any additive solutions added subsequent to collection. Also label the container to identify donor status (for example, volunteer or paid). Label it also with the following statements: "See Circular of Information for the Use of Human Blood and Blood Components for indications, contraindications, cautions, and methods of infusion;" "Properly identify intended recipient;" "This product may transmit infectious agents;" and "Rx only." In addition, label the container to indicate the product name as indicated in Table 1. [NOTE-The name is determined by the method of platelets preparation (derived from whole blood or by apheresis) and by performing the necessary testing to ensure that the product meets the minimum requirements for the named products, as indicated in Table 1.]

Table 1. Names of Platelet Preparations

| Product Name | Method of Preparation |
| :--- | :---: |
| Platelets | Prepared from a single unit of whole human blood within 8 hours of |
|  | collection. |
| Platelets, Pooled | Individual platelet units derived from whole human blood and pooled |
|  | by sterile techniques. [NOTE-Label this preparation with a unique |
|  | identifying number related to the number of individual units pooled, |
|  | and with an expiration date of 4 hours after pooling of the individual |
|  | units.] |
| Platelets, Pheresis | Prepared by apheresis from a single donor. |
| Platelets, Leukocyte Reduced | Contains less than $8.3 \times 10^{5}$ leukocytes, either from the method of |
|  | separation from whole blood by filtration. |
| Platelets, Pheresis, Leukocyte Reduced | Contains not more than $5 \times 10^{6}$ white blood cells, prepared by filtration. |

[NOTE-Platelets prepared by apheresis should be labeled with the donor's ABO blood group and Rh factors. Test the donor's whole blood or red blood cells as directed under Whole Blood or Red Blood Cells, respectively.]

Identification-Dilute a small volume of platelets 1:1000 with $0.9 \%$ sodium chloride solution. Place a small drop of the diluted platelets onto the end of a clean glass microscope slide. Obtain a second clean glass microscope slide and draw its edge across the drop of platelets so that capillary action spreads the drop across the first slide. Push the second slide in one smooth motion across the first slide to make a smear of platelets. Allow the smear to dry. Apply a liberal amount ( 1 to 2 mL ) of Wright's stain to the platelet smear and allow to stand for 2 minutes. Dip the slide in deionized water and gently blot dry with absorbent paper. Examine the slide using a microscope at $100 \times$ with bright illumination. Platelets appear as anuclear, round, or oval shapes approximately 0.1 to $0.2 \mu \mathrm{~m}$ in diameter, with some fine purple granulation. The platelets may occasionally appear to have a purple center with clear cytoplasm at the periphery.

Platelet count-Use a commercially available, validated hematology analyzer to determine platelet count. Proceed as directed in the instrument's operating manual.

Residual leukocyte count-Place $100 \mu \mathrm{~L}$ of platelets into a suitable test tube. Add $400 \mu \mathrm{~L}$ of $0.01 \%$ ( $\mathrm{w} / \mathrm{v}$ ) crystal violet in $15 \%(\mathrm{v} / \mathrm{v})$ acetic acid, and mix thoroughly. Fit a hemocytometer with a $50-\mu \mathrm{L}$ counting volume and a bright background with a cover slip. Load the counting chamber with the mixture until the counting area is completely covered, but do not overfill. Cover the counting chamber with a suitable moist lid to prevent evaporation, and allow to settle undisturbed for 10 to 15 minutes. Remove the lid and place the chamber on the stage of a light microscope fitted with a $10 \times$ ocular lens and $20 \times$ objective. Count the leukocytes in the entire $50-\mu \mathrm{L}$ counting volume. Calculate the leukocyte count in the platelets, expressed in leukocytes per $\mu \mathrm{L}$,
by dividing the observed leukocyte count by 10 . Calculate the total number of leukocytes in the red blood cell unit as follows:

Total leukocytes $=$ leukocytes $/ \mu \mathrm{L} \times 10^{3} \times$ volume of the platelet unit in mL .

$\mathbf{p H}\langle 791\rangle$ (for stored Platelets)—Transfer aseptically a volume appropriate for the equipment: pH must be greater than 6.2 throughout the storage period. | USP28 |

## BRIEFING

Psyllium Hemicellulose. Because there is no existing USP monograph for this article, a new monograph is being proposed.
(DSB: G. Giancaspro) RTS-40087-1

## Add the following:

## ©Psyllium Hemicellulose

» Psyllium Hemicellulose is the alkali soluble fraction of the husk from Plantago ovata Forssk. It consists of a combination of highly substituted arabinoxylan polysaccharides. These polysaccharides are linear chains of xylose units ( $\beta$ $(1 \rightarrow 4)$-xylan) to which are attached single units of arabinose and additional xylose. Rhamnose, galactose, glucose, and rhamnosyluronic acid re-
sidues are also present as minor constituents. It contains not less than 75.0 percent of dietary soluble fiber, calculated on the dried basis.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

## Identification-

A: The powdered mucilage stains red with ruthenium red TS and lead acetate TS.

B: It meets the requirements of the test for Swell vol-

## ите.

Total acidity-To a beaker, transfer 40 mL of the supernatant as obtained below in the test for Swell volume without disturbing the gel. Add 1 mL of phenolphthalein TS, and titrate with 0.03 N sodium hydroxide. Not more than 1.8 mL is consumed.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $10^{3}$ per $g$ and the total combined molds and yeasts count does not exceed $10^{2}$ per g . It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.

Loss on drying $\langle 731\rangle$-Dry at $105^{\circ}$ for 3 hours: it loses not more than $12.0 \%$ of its weight.

Total ash $\langle 561\rangle$ : not more than $5.0 \%$.
Acid-insoluble ash $\langle 561\rangle$ : not more than $1.0 \%$.

## Limit of alcohol-

Internal standard solution-Transfer 5.0 mL of $n$-propyl alcohol into a $500-\mathrm{mL}$ volumetric flask containing approximately 450 mL of water. Dilute with water to volume, insert the stopper into the flask, and mix well.
Standard stock solution-Transfer 5.0 mL of absolute alcohol at $20 \pm 2^{\circ}$ into a $500-\mathrm{mL}$ volumetric flask containing approximately 450 mL of water. Dilute with water to volume, insert the stopper into the flask, and mix well.

Standard solution-Transfer 10.0 mL of the Standard stock solution and 10.0 mL of Internal standard solution into a $100-\mathrm{mL}$ volumetric flask. Dilute with water to volume, insert the stopper into the flask, and mix well.

Test solution-Transfer 0.5 g of Psyllium Hemicellulose, accurately weighed, into a $150-\mathrm{mL}$ conical flask. Add about 90 mL of water, insert the stopper into the flask, and stir rapidly for 3 hours using a magnetic stirrer. Add 10.0 mL of the Internal standard solution, and mix well. Pass the sample through a filter having a $0.45-\mu \mathrm{m}$ porosity.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused silica analytical column coated with $3.0-\mu \mathrm{m}$ G43 stationary phase. A $0.53-\mathrm{mm}$ $\times 2-\mathrm{m}$ fused silica guard column may be used. The chromatograph is programmed as follows. Initially, the column temperature is equilibrated at $40^{\circ}$ for 5 minutes. The temperature is then increased at a rate of $10^{\circ}$ per minute to $230^{\circ}$, and is maintained at $230^{\circ}$ for 3 minutes. The injection port temperature is maintained at $250^{\circ}$, and the detector is maintained at $300^{\circ}$. The carrier gas is helium. The split flow ratio is about $10: 1$, and the flow rate is maintained at about 4.0 mL per minute. Inject the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2 \%$.

Procedure-Separately inject equal volumes (about 0.5 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of alcohol in the portion of Psyllium Hemicellulose taken by the formula:

$$
1000(C / W)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of alcohol in the Standard stock solution; $W$ is the weight, in mg , of Psyllium Hemicellulose taken; and $R_{U}$ and $R_{S}$ are the ratios of the peak responses of alcohol to those of $n$-propyl alcohol from the Test solution and the Standard solution, respectively: not more than $12.0 \%(\mathrm{w} / \mathrm{w})$ is found.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Heavy metals, Method II $\langle 231\rangle: 10 \mu \mathrm{~g}$ per g.
Swell volume-Add 0.50 g of Psyllium Hemicellulose to a glass-stoppered, $100-\mathrm{mL}$ graduated mixing cylinder. To avoid material clumping, hold the cylinder at a $45^{\circ}$ angle, and gently rotate it while using a wash bottle to forcefully add about 30 mL of water. Add water to bring the total volume to 100 mL , and cap the cylinder. Invert the cylinder several times until a uniform suspension is achieved, and allow to stand. Gently invert the cylinder several times again at 4 hours and 8 hours after the initial sample preparation, and allow to stand. Allow the gel to settle for 16 hours. Determine the volume of the gel: not less than 80 mL per g of Psyllium Hemicellulose is found.

## Content of soluble dietary fiber-

Alcohol solution -Transfer 82.0 mL of alcohol to a 100mL volumetric flask, dilute with water to volume, and mix.

Buffer solution-Dissolve 1.95 g of 2-( N -morpholino)ethanesulfonic acid and 1.22 g of tris(hydroxymethyl)aminomethane in 170 mL of water. Adjust with 6 N sodium hydroxide to a pH of 8.2 , dilute with water to 200 mL , and mix. [NOTE-It is important to adjust the pH to 8.2 at $24^{\circ}$. If the Buffer solution temperature is $20^{\circ}$, adjust the pH to 8.3 ; if the temperature is $28^{\circ}$, adjust the pH to 8.1 . For deviations between $20^{\circ}$ and $28^{\circ}$, adjust by interpolation.]
Acid solution-Prepare 0.561 N hydrochloric acid by dissolving 9.35 mL of 6 N hydrochloric acid in 70 mL of water. Dilute with water to 100.0 mL , and mix.

Phosphate buffer-Prepare a pH 6.0 phosphate buffer (see Buffer Solutions under Reagents, Indicators, and Solutions).

Protease solution-Dissolve 5 mg of protease in 0.1 mL of Phosphate buffer.

Enzyme purity-To ensure the absence of undesirable enzymatic activities and the presence of desirable enzymatic activities, proceed as directed for Test preparations and Procedure using the substrates listed in the following table in place of Psyllium Hemicellulose. The enzyme preparation is suitable if more than $90 \%$ of the original weight of pectin, arabinogalactan, and $\beta$-glucan is recovered; not more than $2 \%$ of the original weight of casein and corn starch is recovered; and not more than $1 \%$ of the original weight of wheat starch is recovered. [NOTE-Test the enzyme purity of every new lot of enzyme and at 6-month intervals thereafter.]

| Substrate | Weight in g | Activity Tested |
| :--- | :---: | :--- |
| Pectin | 0.2 | Pectinase |
| Arabinogalac- | 0.2 | Hemicellulase |
| tan | 0.2 | $\beta$-Glucanase |
| $\beta$-Glucan | 1.0 | $\alpha$-Amylase and <br> amyloglucosidase |
| Wheat starch | 1.0 | $\alpha$-Amylase and <br> amyloglucosidase |
| Corn starch | 0.3 | Protease |
| Casein |  |  |

Blank preparations-Using two $400-\mathrm{mL}$ tall-form beakers, appropriately labeled, proceed as directed for Procedure without Psyllium Hemicellulose.

Test preparations-Weigh accurately, in duplicate, approximately 0.2 g of Psyllium Hemicellulose, previously milled to very fine powder. [NOTE-Duplicates should differ
by less than 1 mg in weight.] Transfer duplicate samples to appropriately labeled $400-\mathrm{mL}$, tall-form beakers, and proceed as directed for Procedure.

Procedure-Treat each preparation in the following manner. Add 40 mL of Buffer solution to the beaker. [NOTEFor the Test preparation, stir until Psyllium Hemicellulose is completely dispersed.] Add $125 \mu \mathrm{~L}$ of heat-stable $\alpha$-amylase solution, and stir to ensure uniform mixing. Cover the beaker with aluminum foil, and incubate over a water bath maintained at $95^{\circ}$ to $100^{\circ}$ for 15 minutes, with continuous agitation. [NOTE-Start timing once the water bath temperature reaches $95^{\circ}$; a total time of 35 minutes is usually sufficient.] Remove the beaker from the water bath, and cool to $60^{\circ}$. Remove the aluminum foil, scrape any ring from inside the beaker, and disperse any gels in the bottom of the beaker with a spatula. Rinse the walls of the beaker and the spatula with 10 mL of water, collecting the rinsings in the beaker. Add $500 \mu \mathrm{~L}$ of Protease solution. Cover with aluminum foil, and incubate over a water bath maintained at $60 \pm$ $3^{\circ}$ for 30 minutes with continuous agitation. [NOTE-Start timing when the bath temperature reaches $60^{\circ}$.] Remove the foil, and transfer 5 mL of Acid solution while stirring. Adjust, if necessary, with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of $4.28 \pm 0.07$ at $60^{\circ}$. [NOTE-It is important to adjust the pH to 4.28 while the solution in the beaker is maintained at $60^{\circ}$, otherwise the pH will increase at lower temperatures.] Add $150 \mu \mathrm{~L}$ of amyloglucosidase solution with stirring. Cover with aluminum foil, and incubate over a water bath maintained at $60 \pm 3^{\circ}$ for 30 minutes with constant agitation. [NOTE-Start timing once the water bath reaches $60^{\circ}$.] Transfer approximately 40 mL of the beaker contents to a $50-\mathrm{mL}$ centrifuge tube, and sonicate the tube contents for 3 minutes. ${ }^{*}$ Centrifuge at 10,000-14,000

[^11]rpm for 10 minutes. Carefully pour the supernatant into an appropriately labeled $600-\mathrm{mL}$ tared beaker. Do not disturb any pellet in the bottom of the centrifuge tube. Add the remaining sample from the original $400-\mathrm{mL}$ beaker into the centrifuge tube still containing the pellet. Rinse the 400mL beaker with $15-20 \mathrm{~mL}$ of water, and add the rinsing to the $50-\mathrm{mL}$ centrifuge tube. Centrifuge the sample at $10,000-14,000 \mathrm{rpm}$ for 10 minutes. Carefully pour the supernatant into the $600-\mathrm{mL}$ beaker containing the first supernatant. Add 390 mL (measured before heating) of alcohol at $60^{\circ}$ to the $600-\mathrm{mL}$ beaker. Cover the beaker, and allow to stand for at least 1 hour to form a precipitate.

Place 3 g of chromatographic siliceous earth into a clean air-dried crucible with a fritted disk. Heat the crucible containing chromatographic siliceous earth at $525^{\circ}$ in a muffle furnace for at least 4 hours. Cool. Pass deionized water through the crucible while applying constant suction. Rinse with acetone, and allow to air-dry. Store the crucible in a convection oven at approximately $130^{\circ}$ for at least 2 hours before use. Weigh the prepared crucible to 0.1 mg before use. Wet the chromatographic siliceous earth in the crucible using a stream of Alcohol solution from a washing bottle, and apply suction to evenly distribute the chromatographic siliceous earth over the fritted disk. Maintaining the suction, transfer the supernatant and precipitate from the beaker to the crucible, and filter. Transfer any solid residue in the beaker with the aid of Alcohol solution. [NOTE-In some cases, gums may form during filtration, trapping liquid in the residue. If so, break the surface film with a spatula to improve filtration.] Wash the residue in the crucible sequentially with 30 mL of Alcohol solution, 20 mL of alcohol, and 20 mL of acetone. Dry the crucible containing the residue at $100^{\circ}$ in a convection oven for at least 4 hours, cool to room temperature in a desiccator.

Determine the weight of the residue $(R)$.

Use one of the duplicate residues from the Test preparations and one of the blank residues from the Blank preparations to determine the protein content, in mg, by placing the residue in a $500-\mathrm{mL}$ Kjeldahl flask, and proceeding as directed for Method I under Nitrogen Determination $\langle 461\rangle$. The protein content is determined by multiplying the content of nitrogen found by 6.25 . Incinerate the residue from the remaining duplicate of the Test preparation and the Blank preparation as directed for Total Ash under Articles of Botanical Origin $\langle 561\rangle$ at a reduced temperature of $525^{\circ}$, and determine the ash content as directed. Calculate the corrected average weight of the blank, in $\mathrm{mg}, B$, by the formula:

$$
R_{B}-P_{B}-A_{B}
$$

in which $R_{B}$ is the weight, in mg , of the average blank residue for duplicate blank determinations; $P_{B}$ is the content, in mg , of protein found in the blank; and $A_{B}$ is the content, in mg , of ash found in the blank. Calculate the content of soluble dietary fiber, in percentage, by the formula:

$$
100\left(R_{U}-P_{U}-A_{U}-B\right) / W_{U},
$$

in which $R_{U}$ is the the weight, in mg , of average residue for the duplicate Test preparations; $P_{U}$ is the content of protein, in mg , found in the Psyllium Hemicellulose; $A_{U}$ is the content of ash, in mg , found in the Psyllium Hemicellulose; $B$ is the average weight of the blank as calculated above; and $W_{U}$ is the average weight, in mg , of the Psyllium Hemicellulose taken. $\Delta$ USP28

## BriEfing

Pyridoxine Hydrochloride Tablets, USP 27 page 1609—See briefing under Acetaminophen and Aspirin Tablets.

## Briefing

Sevoflurane, page 1571 of $P F$ 29(5) [Sept.-Oct. 2003]. It is proposed to revise the Packaging and storage section to include a recommended storage temperature range in accordance with the current policies of the USP Packaging, Storage, and Distribution (PSD) Expert Committee. It is also proposed to revise the names of two of the Reference Standards: USP Sevomethyl Ether RS is changed to USP Sevoflurane Related Compound B RS, and USP Hexafluoroisopropanol RS is changed to USP Sevoflurane Related Compound C RS.
(PA1: K. Russo; PSD: C. Okeke) RTS-40649-2
» Sevoflurane contains not less than 99.9 99.97 percent and not more than 100.0100 .00 percent of $\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{~F}_{7} \mathrm{O}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. Replace the cap securely after each use.

USP Reference standards $\langle 11\rangle-U S P$ Sevoflurane $R S$. USP Sevoflurane Related Compound A RS.USP Sevenethyl Ether (SAEE) RS. USP He RS. USP Sevoflurane Related Compound B RS. USP Sevoflurane Related Compound C RS.

Identification, Infrared Absorption-The IR absorption spectrum of Sevoflurane, obtained using a gas cell, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Sevoflurane RS.

Refractive index $\langle 831\rangle$ : between 1.2745 and 1.2760 , at $20^{\circ}$.

Acidity or alkalinity-Transfer 20.0 mL of Sevoflurane and 20.0 mL of carbon dioxide-free water to a separatory funnel, shake for 3 minutes, and allow the layers to separate: the aqueous layer requires not more than 0.10 mL of 0.010 N sodium hydroxide or not more than 0.60 mL of 0.010 N hydrochloric acid for neutralization, bromocresol purple TS being used as the indicator.

Water, Method $I\langle 921\rangle$ : 0.03\% and 0.2\%. not more than $0.2 \% ; 0.1 \%$. and, when packeged in glas eontainers, not less than $0.03 \%$.

Limit of fluoride-[NOTE-Use plastic utensils throughout this test.]
Buffer solution-Transfer 110 g of sodium chloride and 1 g of sodium citrate to a $2000-\mathrm{mL}$ volumetric flask, and dissolve in 700 mL of water. Carefully add 150 g of sodium hydroxide, and shake to dissolve. Cool to room temperature, and carefully add 450 mL of glacial acetic acid while stir-
ring. Cool, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix. [NOTE-The pH of this solution is between 5.0 and 5.5 . This solution may be used for six weeks when stored at room temperature.]

Solution A-Transfer about 221 mg of sodium fluoride, previously dried at $150^{\circ}$ for 4 hours and accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Add about 20 mL of water, and mix to dissolve. Add 1.0 mL of 0.01 N sodium hydroxide, and dilute with water to volume. Each mL of this solution contains 1 mg of fluoride. Store in a tightly closed plastic container. [NOTE-This solution may be used for two weeks when stored in a refrigerator.]

Standard stock solutions-Quantitatively transfer accurately measured volumes of Solution $A$ to separate 100mL volumetric flasks, and dilute with water to obtain solutions having known concentrations of about 5, 2, 0.5 , and $0.2 \mu \mathrm{~g}$ of fluoride per mL .

Standard solutions-Transfer 25.0 mL of each of the Standard stock solutions to separate $50-\mathrm{mL}$ volumetric flasks, dilute with Buffer solution to volume, and mix.

Test solution-Pipet 50.0 mL of Sevoflurane and 50.0 mL of water into a separatory funnel, shake vigorously for 3 minutes, and allow the liquids to separate completely. Transfer 25.0 mL of the aqueous top layer to a $50-\mathrm{mL}$ volumetric flask, dilute with Buffer solution to volume, and mix.

Procedure-Concomitantly measure the potentials, in mV, of the Standard stock solutions, Standard solutions, and Test solution with a pH meter (see $\mathrm{pH}\langle 791\rangle$ ) capable of a minimum reproducibility of $\pm 0.2 \mathrm{mV}$ and equipped with a fluoride-specific ion-indicating electrode and a glass-sleeved calomel reference electrode. [NOTE-When taking measurements, transfer the solution under test to a $100-\mathrm{mL}$ beaker containing a polytef-coated stirring bar, and immerse the electrodes. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained in
about 2 to 3 minutes, and record the potential. Rinse the electrodes with the Buffer solution, and dry, taking care to avoid damaging the crystal of the specific-ion electrode. A satisfactory response is achieved if the difference between the potentials obtained with the Standard stock solutions having fluoride concentrations of 5 and $0.5 \mu \mathrm{~g}$ per mL is in the range between 50 and 60 mV .] Plot the logarithms of the fluoride concentrations, in $\mu \mathrm{g}$ per mL , of the Standard solutions versus potentials, in mV. From the graph so obtained and the measured potential of the Test solution, determine the concentration, in $\mu \mathrm{g}$ per mL , of fluoride in the Test solution: not more than $2 \mu \mathrm{~g}$ per mL is found.

Limit of nonvolatile residue-Transfer 10.0 mL of Sevoflurane to an accurately weighed evaporating dish, evaporate to dryness on a steam bath, and dry the residue at $105^{\circ}$ for 2 hours: the weight of the residue does not exceed 1.0 mg .

## Limit of peroxide-

Titanium tetrachloride solution-Separately cool 1.0 mL of 6 N hydrochloric acid and 1.0 mL of titanium tetrachloride in small beakers surrounded by crushed ice. Add titanium tetrachloride dropwise to the chilled acid. Allow to stand at ice-bath temperature until all of the yellow solid dissolves, dilute with 6 N hydrochloric acid to 100 mL , and mix.

Standard stock solution-Prepare a solution of 30 percent hydrogen peroxide in water ( 1 in 400).
Standard solution-Transfer 15.0 mL of the Standard stock solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of the solution so obtained and 5.0 mL of Titanium tetrachloride solution to a $10-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solution-Transfer 50.0 mL of Sevoflurane and 5.0 mL of Titanium tetrachloride solution to a separatory funnel, shake vigorously, allow the layers to separate, drain, and discard the lower layer. Carefully collect the top layer in a $10-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Procedure-Concomitantly determine the absorbances of the Standard solution and the Test solution at a wavelength of about 410 nm , with a suitable spectrophotometer, using a $1-\mathrm{cm}$ cell and a mixture of Titanium tetrachloride solution and water (1:1) as the blank. Calculate the peroxide concentration, in $\mu \mathrm{g}$ per mL , in the portion of Sevoflurane taken by the formula:

$$
0.22\left(A_{U} / A_{S}\right)
$$

in which $A_{U}$ and $A_{S}$ are the absorbances obtained from the Test solution and the Standard solution, respectively: not more than $0.22 \mu \mathrm{~g}$ per mL is found.

## Chromatographic purity -

Internal stated solution-Use dimethoxymethane.
Standerd solutions Prepare solutions, proceeding for each as follows. Transfer 2.0 mL of ethylene dichloride into a serew capped vial, immediately seal with a cap and septum, and place on a balanee. Using a mierosyringe, transfer about $20 \mu \mathrm{~L}$ of USP Sevellurane RS, aceurately measured, to the vial by inserting the syringe needle through the septum. Record the quantity, in me, of USP Sevollurane RS added. Using the same method, transfer about $20 \mu \mathrm{~L}$ of Internal stataderd soldtion to the vial, and record the quantity, in mg, of the Internal standard solution added.

Fest solution Transfer 20.0 mL of Seveflurane to a vial, and insert the stopper. Using a mierosyringe, add $5 \mu \mathrm{~L}$ of Internal standed solution, aceurately measured, to the vial. Chromagraphic system (see Chromatgraphy (624)) The gas chromatograph is equipped with a flame-ionization detector and a $0.32 \mathrm{~mm} \times 30 \mathrm{~m}$ fused silica capillary col
umnerat with $3.0-\mu \mathrm{m}$ film of liguid phase G19. Prior to use, condition the column overnight at a temperature of $250^{\circ}$. The column temperature is programmed as follows. Initially it is maintained at $40^{\circ}$ for 10 minutes, then in ereased a rate of $10^{\circ}$ per minte to $200^{\circ}$, and maintained at $200^{\circ}$ for at least 14 minutes. The injection port temperature is maintained at $200^{\circ}$. The detector temperature is maintained at $225^{\circ}$. The split ratio is $1: 20$. Helium is used as the earrier gas, flowing at a rate of about 1.0 mL per minute. Chromatograph one of the Staterd solutions, and reeord the chromatograms as directed for Procedure, adjusting the recorder sensitivity to obtain the sevollurane peak on seale: the relative retentime are 0.57 for $1,1,3,3$ pentafluoroisopropenyl fluoremethyl ether, 0.62 for methyl 2,2,2-triflure-1 (triflueremethy) ethyl ether, 0.74 for seveflur ane, and 1.0 for the internal standard; the column efficiency is not less than 6000 theoretieal plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Test solution, adjusting the recorder sensitivity to obtain peak heights of at least $10 \%$ of full seale for the two impurities, and record the ehromatograms as directed for Procedure: the resolution, $R$, between these iw im purities is not less than 2.0 .

Proedtre Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the Statedard solutions and the Test solution int the chromatograph, record the ehromatograms, and measure the areas of the major peaks. Caleulate the relative respense factor, $F$, for each of the Staturd solutions by the formula:

$$
\left(W_{f}+W_{s}\right) R_{s}
$$

in which $H_{f}$ is the weight, in mg, of the intemal standard in the Standard solution; $W_{s}$ is the weight, in mg, of USP Seweflurane RS in the Standerd solution; and $R_{s}$ is the average respense ratio of the seveflurane peak to that of the internal standard obtained from the Standard solutions: the relative respense factors for the Standerd solutions do not differ by
more than $3.0 \%$ frem their average. Caleulate the quantity, in $\mu \mathrm{y}$ per g , of each impurity in the pertion of Sevelturane taken by the formula:

$$
250(0.859 / 1.525)\left(R_{i}+F\right)
$$

in which 0.859 and 1.525 are the specific gravities of the internal standard and seveflurane, respectively; $R_{i}$ is the re spenseratio of the impurity peak to that of the internalstan dard obtained from the Test solution; and $F$ is the average relative response facter obtained as directed above: not more than 25 kg per of of $1,1,3,3$-pentafluoroisopropenyt flueromethylether, not more than 50 fig per gof methyt 2,2,2-trifluere-1 (triflueremethyl) ethylether, and not mere than $25 \mu$ gis per of of any other individualimpurity are found; and not more than 50 pg per of of totalimpurities, exeluding the nomed above, is found.

## Intern stan Use dimethoxymethane.

Standard solution - Transfer 2.0 mL of ethylene
dichloride to serew eapped vial, immediately seal with a eap and septum, and place on a balanee. Inject about $20 \mu \mathrm{~L}$ of USP Seveflurane PS and $20 \mu \mathrm{~L}$ of the Internal statard solution, beth aceurately measured, into the vial through the septum, and weigh the vial after each injection.
Standard solution 2 Transfer 2.0 mL of ethylene dichloride to serew eapped vial, immediately seal with a eap and septum, and place on a balanee. Inject about $20-\mu \mathrm{L}$ ef USP Sevelluane Related Compound A RS and $20 \mu \mathrm{~L}$ of the Internal standerd solution, both aceurately measured, into the vial through the septum, and weigh the vial after each injection.

Fest solution Transfer 20.0 mL of Seveflurane to a vial, and insert the stopper. Using a microsyringe, add about $5 \mu \mathrm{~L}$ of the Internal standard solution, aceurately measured, to the vial.

Chromatigraphic system (see Chromatography (621)) The gas chromatograph is equipped with a flame ionization detectrond contains $0.32 \mathrm{~mm} \times 30 \mathrm{~m}$ fused-silicacapil lary column coated with a $3.0 \mu \mathrm{~m}$ film of liquid phase G43. Prior to use, condition the column overnight at a temperature of $250^{\circ}$. The earrier gas is helium, flowing at a rate of about $1.0-\mathrm{mL}$ per minute. The chromatograph is programmed as follows. Initially the column temperature is maintained at $40^{\circ}$ for 10 minutes, then it is inereased at a rate of $10^{\circ}$ per minute to $200^{\circ}$, and maintained at $200^{\circ}$ for not less than 14 minutes. The injection port temperature is maintaine at $200^{\circ}$, and the detector temperature is maintained at $225^{\circ}$. The split ratio is $1: 20$. Chrematograph Standard solution 1 and Statadard soldtion 2, and record the peak respense directed for Proedure, adjusting the recorder sensitivity to obtain the seveflurane peak on seale: the relative retention times are about 0.57 for seveflurane related eompernd $\Lambda, 0.74$ for seveflurane, and 1.0 for the internat standard; the resolution, $R$, between seveflurane and seveflurane related compound $\Lambda$ is not less than 2.0; the column efficieney is not less than 6000 theoretieal plates; and the relative standard deviation for replieate injections, determined from the peak area ratio of seveflurane to the internal standard, is not more than $2.0 \%$.

Procedure Separately injec equal volumes (about $2 \mu \mathrm{~L}$ ) of Stand solution 1, Stand solution 2, and Test solution into the chromatograph, record the chrematograms, and measure the areas of the major peaks. Caleulate the relative respense factor, $F$, for each Standetrd solution taken by the fermela:

$$
R_{s}\left(H_{f}+H_{s}\right),
$$

in which $R_{s}$ is the peak are ratio of seveflurane to the internal standard obtained from the chromatogram; $H_{t}$ is the weight, in mg, of the internal standard in the partieular Standatrd solution; and $H_{s}$ is the weight, in mg, ofUSP Sevellur-
ane RS-or USP Seveflurane Related Compound $A$ RS in the eorrespending Standard solution. Caleulate the quantity, in Hg per g , of sevellurane related compound $A$ in the pertion
of Seveflurane taken by the formula:

$$
250\left(R_{i}+F\right)
$$

in whieh $R_{i}$ is the peak respense ratio of sevoflurane related empound $A$ to the internal standard obtained from the Test solution; and $F$ is the relative respense factor obtained as directed above: not more than 25 - $\mu$ g per g of sevellurane related compound $A$ is found. Caleulate the quantity, in Hg per g, of each impurity, other than sevoflurane related eompound $\Lambda$, in the pertion of Seveflurane taken by the for mula:-

$$
250\left(R_{i}+F\right)
$$

in which $R_{i}$ is the peak respense ratio of each impurity to the internal standard obtained from the Test solution; and $F$ is the average relative-respense facter obtained as directed above: not more than 100 ug per of of any impurity, other than sevoflurane related compound $A$, is found; and not more than 300 pg per g of totalimpurities is found.

## Related compounds-

Standard stock solution-Accurately weigh $10 \mathrm{~mL}(15 \mathrm{~g})$ of USP Sevoflurane RS in a suitable vial fitted with a septum, and successively add $25 \mu \mathrm{~L}(\sim 0.0375 \mathrm{~g})$ each of USP Sevoflurane Related Compound A RS, USP Sevomethyt Ether (SME) RS, and USP Hexafluoroisopropanol RS. USP Sevoflurane Related Compound B RS, and USP Sevoflurane Related Compound C RS. Record the weight after addition of each impurity.

Standard solution-Accurately weigh about 20 mL of USP Sevoflurane RS in a suitable vial fitted with a septum, and add $0.2 \mathrm{~mL}(\sim 0.3 \mathrm{~g})$ of the Standard stock solution. Record the exact weight of Standard stock solution added.

Test solution-The test sample is used as is.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and contains a $2.1-\mathrm{mm} \times 4-\mathrm{m}$ silicosteel column packed with $5 \%$ G35 on 80 - to 100 -mesh support S12. The carrier gas is helium, flowing at a rate of 25 mL per minute. Initially the column temperature is maintained at $70^{\circ}$ for 20 minutes, then it is increased at a rate of $8^{\circ}$ per minute to $170^{\circ}$, and maintained at $170^{\circ}$ for 17.5 minutes. The injection port temperature is maintained at $175^{\circ}$, and the detector temperature is maintained at $200^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are 0.67 for sevoflurane related compound $\mathrm{A}, 1.0$ for sevemethylether, and 2.88 for hexaftureisopropanel; sevoflurane related compound B and 2.88 for sevoflurane related compound C ; the resolution, $R$, between sevoflurane related compound A and se vemethyl ether sevoflurane related compound B is not less than 6; and the relative standard deviation, determined from the semethylether sevoflurane related compound B peak, for replicate injections is not more than $2 \%$.

Procedure—Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas of all the peaks. Record the chromatogram for at least 50 minutes. Calculate the relative response factors, $F$, of sevoflurane related compound $A$ and hewafluereiseprepanel relative to that of sevemethyl ether sevoflurane related compound $C$ relative to that of sevoflurane related compound $B$ taken by the formula:

$$
\left(\epsilon_{s}+\epsilon_{\text {shaf }}\right)\left(r_{\text {sumf }}+r_{s}\right) \text {, }
$$

$$
\left(C_{S} / C_{B}\right)\left(r_{B} / r_{S}\right)
$$

in which $C_{S}$ and $r_{S}$ are the concentration and the peak area for either sevoflurane related compound A or her propal sevoflurane related compound C in the Standard solution; and $\mathrm{G}_{\text {and }} \mathrm{C}_{B}$ and $r_{B}$ are the concentration and the peak area for enethy sevoflurane related compound B in the Standard solution. The calculated relative response factors for sevoflurane related compound A and hexallureispropand sevoflurane related compound C must be in the range of 1.08 to 1.31 and 2.28 to 2.79 , respectively.

Calculate the percentages ( $\mathrm{w} / \mathrm{w}$ ) of impurities present in the Test solution, which are also found in the Standard solution, by the formula:

$$
C_{S}\left(r_{i} / r_{S}\right),
$$

in which $r_{i}$ and $r_{S}$ are the peak responses of impurities in the Test solution and in the Standard solution; and $C_{S}$ is the concentration ( $w / w$ ) of the impurities in the Standard solution. The other known impurities, that are not present in the Standard solution, are identified by their relative retention times and their amounts present are determined using their respective relative response factors (Table 1) by the formula:

Use relative response factor of SME sevoflurane related compound B to calculate the unknown impurities. $F$ is the relative response factor of the known impurity not present in
the Standard solution; $\epsilon C_{B}$ is the concentration (w/w) of SME sevoflurane related compound B in the Standard solution; and $\Psi r_{B}$ is the peak area of SME sevoflurane related compound B in the Standard solution. Not more than $0.0025 \%$ of sevoflurane related compound A is found; not more than $0.01 \%$ of any other single impurity is found; and not more than $0.03 \%$ of total impurities is found.

Table 1

|  | Relative <br> Retention | Relative <br> Response <br> Time |
| :--- | :---: | :---: |
| Impurity | 1 | 1 |
| Sactor |  |  |
| flurane related com- |  |  |
| $\quad$ pound B |  |  |
| 2-Chloropropane | 0.48 | 0.4092 |
| Dichloromethane | 0.76 | 1.5141 |
| Chlorosevo ether | 2.23 | 1.0884 |
| Hexafluoroisopropyl | 1.47 | 1.3068 |
| $\quad$ formate |  |  |
| Unknown impurities | - | 1 |

Assay-Using the results from the test for Related compounds, calculate the percentage of $\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{~F}_{7} \mathrm{O}$ in the volume of Sevoflurane taken by subtracting the sum of percentages for all impurities found from $100.0 \% 100.00 \%$. $\mathbf{\triangle U S P 2 8}$

## Briefing

Simethicone, USP 27 page 1689 and page 1078 of $P F$ 29(4) [July-Aug. 2003]. It is proposed to clarify that in the Identification test, the blank should be prepared using the procedure in the Assay, to be consistent with the preparation of the Test solution and the Standard solution.

» Sumatriptan contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}$, calculated on the anhydrous and solvent-free basis.

Packaging and storage-Preserve in tight, light resistant containers. Protect from freezing, and store below $30^{\circ}$.

USP Reference standards $\langle 11\rangle-U S P$ Sumatriptan $R S$. USP Sumatriptan Succinate RS. USP Sumatriptan Succinate Related Compound A RS. USP Sumatriptan Succinate Related Compound B C RS. USP Sumatriptan Succinate Related Impurities $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Limit of sumatriptan stecinate related compound $A$ -
10 M Ammonium acetate solution-Dissolve 77.1 g of ammonium acetate in 100 mL of water.

Mobile phase_Prepare a filtered and degassed mixture of methanol and 10 M Ammonium acetate solution (9:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Sumatriptan Succinate Related Compound A RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.00625 mg per mL .

Test solution-Transfer about 100 mg of Sumatriptan, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L3. The flow rate is about 2.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5 \%$.

Procedure—Separately inject equal volumes (about 20 $\mu \mathrm{L})$ of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of
sumatriptan suceinate related compound A in the portion of Sumatriptan taken by the formula:

$$
100(495.7 / 613.8)\left(C_{S} / C_{U}\right)\left(r_{U} / r_{S}\right)
$$

in which 495.7 and 613.8 are the molecular weights of sumatriptan related compound $A$ and sumatriptan succinate related compound A , respectively; $C_{S}$ is the concentration, in mg per mL, of USP Sumatriptan Succinate Related Compound A RS in the Standard solution; $C_{U}$ is the concentration, in mg per mL , of Sumatriptan in the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses for sumatriptan suecinate related compound A obtained from the Test solution and the Standard solution, respectively: not more than $0.6 \%$ is found.

## Chromatographic purity Related compounds-

Piltent and Mobile phase-Prepare as directed in the As say.

Resolution solution-Prepare as directed for the System suitability solution in the $A$ ssay.

Diluent and System suitability solution-Proceed as directed in the Assay.

Buffer solution-Dissolve about 1.7 mL of dibutylamine, about 0.6 mL of phosphoric acid, and about 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust to a pH of about 7.5 with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide, and dilute with water to 1000 mL , and mix.
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (3:1). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Identification solution-Prepare a solution of USP Sumatriptan Succinate Related Impurities RS in Mobile phase having a concentration of about 3 mg per mL .

Test solution-Dissolve an accurately weighed quantity of Sumatriptan in Diluent to obtain a solution having a concentration of about 2 mg per mL .

#### Abstract

Chromatographic system (see Chromatography- $\langle 621\rangle$ )Prepare as directed in the Assaly. Chromatograph the Resotution solution, and record the peak respenses as directed for Procedure: the relative retention times are about 0.8 for sumatriptan succinate related compound $B$ and 1.0 for suma triptan; and the reselution, $R$, between sumatriptan suceinate related compeund $B$ and sumatriptan is not less than 1.5 .

Procedure Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution inte the chromatograph, record the chremategram, and measure all of the peak areas. Caleulate the pereentage of each impurity in the pertion of Sumatriptan taken by the formula:- $$
100\left(x_{i}+r_{s}\right)
$$ in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the respenses of all of the peaks: not more than $0.2 \%$ of any impurity with a relative retention time of about 0.26 is found; not more than $0.5 \%$ of any impurities with

relative retention times of about 0.58 or about 0.79 are found; net mere than $0.3 \%$ of any other impurity is found; and the total of all impurities, including the amount found in the test for Limit of sumatriptan succinate related compound $A$, is net more than $1.5 \%$

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for sumatriptan succinate related compound C and 1.0 for sumatriptan; the resolution, $R$, between sumatriptan succinate related compound $C$ and sumatriptan is not less than 1.5. Chromatograph the Identification solution, and record the peak responses as directed for Procedure: identify the peaks according to Table 1.

Table 1

| Compound name | Relative retention time | Limit (\%) |
| :---: | :---: | :---: |
| [3-[2-(dimethylamino $N$-oxide)ethyl]-1H-indol-5-yl]- N -methylmethanesulfona- | about 0.3 | 0.2 |
| mide |  |  |
| [3-[2-(methylamino)ethyl]-1 $H$-indol-5-yl]- N -methylmethanesulfonamide | about 0.6 | 0.5 |
| Sumatriptan succinate related compound C | about 0.9 | 0.5 |
| Sumatriptan suceinate | 1.0 | - |
| [3-[2-(aminoethyl)-1H-indol-5-yl]-N-methylmethanesulfonamide | about 0.4 | 0.1 |
| Unknown impurities | - | 0.1 |
| Total | - | 1.5 |

[NOTE-The calculation of total impurities includes the amount of sumatriptan related compound A, determined in the test for Limit of sumatriptan related compound $A$.]

Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Sumatriptan taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity, and $r_{s}$ is the sum of the responses of all the peaks: meet the requirements given in Table 1.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Assay-
Diluent Dissolve 2.59-g of menebasic sedium phesphate in 600 mL of water, adjust to a pH of 6.5 with a solut tion of $50 \%$ (w/v) sodium hydroxide, dilute to 750 mL with water, add 250 mL of acetonitrile, and mix.

AObile phase Dissolve-0.97g of dibutylamine, 0.735 g of phosphoric acid, and 2.59 g of menobasic sodium phosphate in 750 mL of water, adjust to a pH of 6.5 with a solut tion of $50 \%$ (w/v) sodium hydroxide, and dilute to 1000 mL with water. Mix 750 mL of the solution so obtained with 250 mL of acetonitrile, mix, filter, and degas. Make adjustments if necessury (see System Suitability under Chrematography (621)).

Diluent-Dissolve 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide to a pH of about 6.5 , and dilute to 1000 mL with water. Mix 750 mL of this solution with 250 mL of acetonitrile.

Buffer solution-Dissolve about 1.7 mL of dibutylamine, about 0.6 mL of phosphoric acid, and about 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide to a pH of about 6.5 , and dilute with water to 1000 mL , and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (3:1). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
System suitability solution-Dissolve accurately weighed quantities of USP Sumatriptan Succinate RS and USP Sumatriptan Succinate Related Compound B C RS in Diluent to obtain a solution having known concentrations of about 0.140 .28 mg per mL and 0.070 .14 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Sumatriptan Succinate RS, and dissolve in Diluent to obtain a solution having a known concentration of about 0.14 mg per mL .
Assay preparation-Transfer about 10 mg of Sumatriptan, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume, and mix.

$$
\text { Elaromatographie system (see-Chromatography }\langle 621\rangle \text { ) }
$$

The liquid chromategraphis equipped with a 282 nm deteeErand a $4.6 \mathrm{~mm} \times 25 \mathrm{~mm}$ eolumn that contains 5 mm packing L1. The flow rate is about 1.5 mL per minute. Chremategraph the System suitability solution and the Standard preparation, and record the peak respenses as directed for Procedure: the relative retention times are about 0.8 for su matriptan succinate related compeund B and 1.0 for sumat triptan; the resolution, $R$, between sumatriptan-suceinate related compeund $B$ and sumatriptan is not less than 1.5; and the relative standard-deviation for replicate injections of the Staded preparation is not more than $1.5 \%$.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for sumatriptan succinate related com-
pound C and 1.0 for sumatriptan; the resolution, $R$, between sumatriptan succinate related compound C and sumatriptan is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount of $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}$, in mg, in the portion of Sumatriptan taken by the formula:

$$
(295.4 / 413.5) 100 C\left(r_{U} / r_{S}\right)
$$

in which 295.4 and 413.5 are the molecular weights of sumatriptan and sumatriptan succinate, respectively; $C$ is the concentration, in mg per mL, of USP Sumatriptan Succinate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for sumatriptan obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

## Assay-

Dilute perchloric acid solution-Prepare a solution containing $6 \%$ of perchloric acid.

Buffer solution-Transfer 10 g of ammonium carbonate to a $1000-\mathrm{mL}$ volumetric flask, and dissolve in about 800 mL of water. Add 24 mL of Dilute perchloric acid solution, dilute with water to volume, mix, and filter.

Mobile phase-Prepare a mixture of methanol, Buffer solution, and acetonitrile, (49:28:23), filter, and degas.

System suitability solution-Dissolve accurately weighed quantities of USP Tiamulin Fumarate RS and USP Tosyl Pleuromutilim RS
${ }^{\boldsymbol{\Delta}}$ USP Tiamulin Related Compound $\mathrm{A} \mathrm{RS}_{\mathbf{\Delta U S P 2 8}}$
in Mobile phase to obtain a solution having known concentrations of about 0.08 mg of each per mL .

Standard preparation-Dissolve an accurately weighed quantity of USP Tiamulin Fumarate RS in Mobile phase to obtain a solution having a known concentration of about 4 mg per mL .

Assay preparation-Transfer about 200 mg , accurately weighed, to a 50 mL -volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $212-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at $30 \pm 3^{\circ}$. Chromatograph the Standard preparation and the System suitability solution, and record the peak responses as directed for Procedure: pleuremutilin
${ }^{\boldsymbol{\Delta}}$ the tiamulin related compound $\mathrm{A}_{\mathbf{\Delta U S P 2 8}}$
peak elutes prior to the tiamulin fumarate peak; the resolution, $R$, between pleuremutilin
$\boldsymbol{\Delta}_{\text {tiamulin related compound }} \mathrm{A}_{\mathbf{\Delta} U S P 28}$
and tiamulin fumarate is not less than 2.0 ; the capacity factor, $k^{\prime}$, determined from the tiamulin fumarate peak, is not less than 2.0 ; the column efficiency is not less than 14,000 ; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{28} \mathrm{H}_{47} \mathrm{NO}_{4} \mathrm{~S} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ in the portion of Tiamulin Fumarate taken by the formula:

$$
50 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Tiamulin Fumarate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the tiamulin fumarate peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Briefing

Vecuronium Bromide, page 1886 of $P F 28$ (6) [Nov.-Dec. 2002]. It is proposed to include a HPLC method in the test for Related compounds instead of TLC. This method was validated using a Altima C18 brand of L1 column. In a typical chromatogram, the vecuronium bromide peak appears at about 18 minutes. The name of vecuronium bromide related compound D has been modified for this proposal, and the water content has been updated to accommodate approved products.
(PA3: S. Salado) RTS-39775-1

## Add the following:

## © Vecuronium Bromide

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.
Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-16^{\circ}$ and $-20^{\circ}$, at $20^{\circ}$.
Test solution: 10 mg per mL , in dehydrated alcohol.
Bacterial endotoxins $\langle 85\rangle$ : not more than 10 USP Endotoxin Units per mg of vecuronium bromide.

Loss on drying $\langle 731\rangle$ - Dry it $80^{\circ}$ for 2 hours to constant weight: it loses net mere than $2.0 \%$ of its weight. Dry it at $105^{\circ}$ for two hours: it loses not more than $2.0 \% 2.5 \%$ of its weight.

## Related compounds-

Solution A, Solution B, Mobile phase, and Diltuent Preeeed as directed in the Assety.

System suitability solution Dissolve aceurately weighed quantities of USP Vecurenium Bromide RS andUSP Veeurenium Bromide Related Compeund $A$ RS in Diltent to-obfain a solution having known concentrations of about 0.5 mgs per mL and 0.4 mg per mL , respectively.

Festsoltion Dissolvean aceurately weighedquantity of Vecurenium Bremide in Diltent to obtain a solution having a concentration of about 4 mg per mL .

Ghromatographic system Prepare as directed in the As say. Chromatograph the System suitability solution, andreeord the peak respenses as directed for Proedtre: the relative retention times are about 0.85 for vecurenium bremide related compeund $\Lambda$ and 1.0 for vecurenium bremide; the resolution, $R$, between vecurenium bromide and veeurenium bremide related compound $A$ is not less than 5.0 ; the eolumn efficiency is not less than 5000 theoretical plates; the tailing factors for vecurenium bromide and vecuronium bromide related compeund $A$ are net more than 2.0 ; and the relative standard deviation for replicate injections is not mere than $2.0 \%$

Proedure Inject a volume (about $20 \mu \mathrm{LL}$ ) of the Test solution inte the chremategraph, record the chrematogram, and measure the peak respenses. Calculate the percentage of any impurity in the pertion of Vecurenium Bromide taken by the formula:

$$
100\left(r_{i} \not r_{s}\right)
$$

in which $r_{i}$ is the peak respense for each individual impurity, and $r_{s}$ is the sum of the responses of all the peaks: not more than 2\% of total impurities is found.

TEST 1-
Dragendorff's reagent Mix 850 mg of bismuth subnitrate with 40 mL of water and 10 mL of glacial acetic acid (Solution 4). Dissolve-8 g of petassitum iodide in 20 mL of water (Solution B). Mix Solution $A$ and Solution B. Dilute 1.0 mL of the solution so-obtained with 10 mL of $50 \%$ (v) *) glacial acetic acid solution.
$5 \%$ Hydrogen peroxide solution Dilute about 16.6 mL of $30 \%$ hydregen peroxide with water to 100 mL .

Sodium iodide solution Dissolve 1.5 g of sodiumiodide in 50 mL of acetone.

Piltent Preparea mixture of acetonitrile and chloroform $(9: 1)$.
Adsorbent: 0.1 mm layer of chromatographic 5 Hm-silica gel mixture (see-Chrematography $\langle 621\rangle$ ).

Fest solution Transfer about 50 mg of Vecurenitum Bremide, aceurately weighed, to a $5-\mathrm{mL}$ volumetric flack. Dis solve in and dilute with Diltent to volume, and mix.

Standard solution 1 Dissolve-an aceurately weighed pertion of USP Vecurenium Bromide RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a-solution having a known concentration of 10 He per mL.

Standard solution 2 Dissolve aceurately weighed portions of USP Vecurenium Bromide Related Compound D A RS, USP Veeurenitm Bremide-Related-Compound B RS, USP Vecurenium Bromide Related Compeund E D RS, and USP Paneurenium Bromide RS in Diluent, and dilete quantitatively, and stepwise if necessary, with Diltent to obtain a solution having known concentrations of about $20 \mu \mathrm{~g}$ per $\mathrm{mL}, 20 \mu \mathrm{~g}$ per $\mathrm{mL}, 20 \mu \mathrm{~g}$ per mL , and $10 \mu \mathrm{~g}$ per mL , respectively.

Application volume: 10 mL .
Developing solvent syistem: a mixture of Sodiun iodide seltition, acetone, and methyl ethyl ketone (5:5:1).

Procedure Proced as directed for Thin Layer Chromatography under Chromatography- $\langle 621$ ). Dry the plate for 2 minutes in acurrent of cold air, and spray it with $5 \%$ Hydrogen peroxide solution. Dry it in a current of air and then spray with Dragendorff's reagent. Repent the procedure beginning with "spray it with $5 \%$ Hydrogen peroxide solttion": the spetcorrespending to the prineipalspet ebtained from Standard solution 1 is visible; the $R_{F}$ values of analytes are as follows:

| Analyte | $\mathrm{R}_{\text {F }}$ |
| :---: | :---: |
| pancuronium bremide | about 0.25 |
| vecuronium bromide | about 0.50 |
| vecuronium bromide related |  |
| empernd D-A | about 0.70 |
| vecurenitum bremide related |  |
| compound B- | about 0.60 |
| veeuronium bromide related |  |
| eompound ED | about 0.85 |

Any spet in the chromategram obtained frem the Test solut fion, except for the principal spet, is net more intense that the correspending spet in the chromategram obtained from Standard solution 2: not more than-0.2\% each of vecurenium bremide related compeund $D \Lambda$, vecurenium bremide related compernd $B$, and vecuronium bremide related com peund E $D$ is found; and net more than $0.1 \%$ of paneurenium bromide is found. Any unknown spet obtained in the chromatogram of the Test solution is not more-intense than the principal spet in the chromategram obtained from the Standard solution 1 : net mere than $0.1 \%$ of any indivi dual unknown impurity is found.

## TEST $2-$

Pragendorff's reagent, Diltent, Test solution, and 5\%
Hydrogen peroxide solttion- Proced as directed in Test 1. Sodium iodide solution 1- Dissolve 1.5 g of sodium io dide in 95 mL of iseprepyl aleohel.

Sodium iodide solution 2 Proceed as directed for Sodium iodide solution in Test 1.

Adsorbent: 0.1 mm layer of ehrematographic 5 - mm silica gel mixture (see Chromatography $\langle 621\rangle$ ).

Standard solution Dissolve an aceurately weighed por tion of USP Vecurenitm Bremide RelatedCompeundC RS in Diluent to obtain a solution having a known concentration of 20 mg per mL .

Application volume: $10 \mu \mathrm{HL}$.
Peveloping solvent system 1: a mixture of Sodiun iodide solution 1 and water (95:5).

Developing solvent system 2: a mixture of Sodium iodide solution 2, aeetone, and methyl ethyl ketone ( $5: 5: 1$ ).

Procedtre Apply the Test soltution on the rightcorner of the plate at 1.5 cm frem each side. Intreduce the plate inte the unsaturated developing chamber containing Developing solvent systen 1. Cover, and maintain the system until the solvent fremt has moved to a point about 10 cm above the initial applieation. Dry the plate in acurrent of cold air untit the isepropyl alcohol odor disappears. Retate the plate $90^{\circ}$, eensidering the-side of the previous deposition of the Test solution as base. Apply the Standtrd solution at 1.5 cm frem the base and at not less than 1.5 cm from the line to which the solvent front has moved previously. Introduce the plate inte the saturated developing chamber containing Developing solvent system 2. Cover, and maintain the system until the solvent ascends to a peint about 8 cm above the initiat spets. Dry the plate for 2 minutes in acurrent of cold air, and spray it with $5 \%$ Hydrogen peroxide solution. Dry it in a eurrent of cold air, and then spray with Dragendorff's reagent. Repeat the procedure, starting from'"spray it with 5\% Hydrogen peroxide solution", the spot correspending to the prineipal spet obtained from the-Standard solution is visible. Any spet in the chromatogram obtained from the Test solution is not more intense than the respective spet in the-chremategram obtained from the Standerd solution:
net more than $0.2 \%$ of vecurenitum bremide related compound $C$ is found; and not mere than $1.0 \%$ of totalimpurities is found, the results of Test 1 and Test 2 being added.

Cation suppressor regeneration solution: 0.02 M tetrabutylammonium hydroxide.

Mobile phase-Mix 1500 mL of water, 250 mL of methanol, 45 mL of tetrahydrofuran, and 1 mL of hydrochloric acid in a $2000-\mathrm{mL}$ volumetric flask. Leave at room temperature for few minutes, and dilute with water to volume. Mix, filter, and degas. [NOTE-Avoid evaporation of tetrahydrofuran during degassing.]

Standard solution-Dissolve an accurately weighed quantity of USP Vecuronium Bromide RS, USP Pancuronium Bromide RS, USP Vecuronium Bromide Related Compound A RS, USP Vecuronium Bromide Related Compound B RS, USP Vecuronium Bromide Related Compound C RS, and USP Vecuronium Bromide Related Compound F RS in 0.0025 N hydrochloric acid, and dilute quantitatively and stepwise if necessary, to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ of each compound per mL .

Test solution-Transfer about 25 mg of Vecuronium Bromide, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.0025 N hydrochloric acid to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid ion chromatograph is equipped with a conductivity detector, a $4-\mathrm{mm}$ cation suppressor and a $4.6-\mathrm{mm} \times 25-$ cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The flow rate for the cation suppressor is about 2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are given in Table 1; the ratio of the height of the vecuronium bromide related compound A peak to the height of the valley between the vecur-
onium bromide related compound A peak and the pancuronium bromide peak is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $10.0 \%$ for each compound.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each vecuronium bromide related compound in the portion of Vecuronium Bromide taken by the formula:

$$
2.5(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL of the relevant USP Reference Standard in the Standard solution; $W$ is the weight, in mg , of Vecuronium Bromide taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas for the correspondent vecuronium bromide related compound obtained from the Test solution and Standard solution, respectively: the limits of impurities are specified in Table 1. [NOTE-Use the peak area of vecuronium bromide in the Standard solution as $r_{S}$ to calculate any unknown impurity.]

|  | Relative |  |
| :--- | :---: | :---: |
| Compound <br> Name | Retention <br> Time | Limit <br> $\%$ |

## Assay-

Solution A-Transfer 8.0 g of sodium perchlorate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in 6.0 mL of water, dilute with acetonitrile to volume, and mix.

Solution B-Prepare a mixture of methanol and $25 \%$ ammonium hydroxide containing 0.03 M ammonium chloride (992:8).

Mobile phase-Prepare a filtered and degassed mixture of Solution $A$ and Solution B (3:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluent-Pipet 10.0 mL of 1 M hydrochloric acid into a $1000-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix.
Standard preparation-Dissolve an accurately weighed quantity of USP Vecuronium Bromide RS in Diluent to obtain a solution having a known concentration of about 0.5 mg per mL .
Assay preparation-Dissolve an accurately weighed quantity of Vecuronium Bromide in Diluent to obtain a solution having a concentration of about 0.5 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L3. The flow rate is about 0.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak re-
sponses as directed for Procedure: the column efficiency is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{34} \mathrm{H}_{57} \mathrm{BrN}_{2} \mathrm{O}_{4}$ in the portion of Vecuronium Bromide taken by the formula:

$$
C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Vecuronium Bromide RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\Delta$ USP28

## DIETARY SUPPLEMENTSMONOGRAPHS

## Briefing

Chondroitin Sulfate Sodium, USP 27 page 1980 and page 1270 of $P F 29(4)$ [July-Aug. 2003]. It is proposed to modify the titration procedure in the test for Content of chondroitin sulfate sodium by dissolving the test specimens in a more concentrated buffer solution containing polysorbate 80. The introduction of a pH 7 phosphate buffer into the diluent at the final concentration of 5 mM results in improved method performance in the presence of pH modifying matrices. The addition of polysorbate 80 significantly improves the titration curve shape by preventing rapid curve falloff due to self-aggregation of the particles. Concentrations of the Standard solutions for the calibration curve were modified to fit nominal volumes of standard volumetric equipment usually available in analytical laboratories. In protein determination, Folin-Ciocalteu phenol TS must be further diluted before use. In response to suggestions received from interested parties that the requirement for the demonstration of the absence of Clostridium spp. be deleted, the USP Analytical Microbiology Expert Committee determined that because there is no potential risk to the consumer from Clostridium in the use of the substance, except for infants, there is no need to test for this organism. The Expert Committee decided to concur with the proposed deletion of this test. A new procedure for the test for Electrophoretic purity is proposed to re-
place the current procedure using nitrocellulose membranes. This revision is based on the difficulties of handling nitrocellulose membranes and the fact that they become overloaded with the $10-\mu \mathrm{L}$ application volume making it difficult to detect glycosaminoglycans (GAGs) impurities with mobilities close to that of the chondroitin sulfate anion. Cellulose acetate membranes are easier to handle, and they do not require a cooling plate. Comments regarding these proposed monograph revisions are invited and should be submitted by February 29, 2004.

| Water | 000 mb |

Dissolve agar in water by heating to beiling with continuous stir ring. If necessary, adjust the pH . Sterilize, and allow to cool to $-45^{\circ}$ to $50^{\circ}$. Add gentamicin culfate, equivalent to about 20 mg of gen tamiein base, and pour into Petri dishes.
pH-after sterilization: $7.3 \pm 0.2$.
Preedure Tak equal portions of the Test Preparation, heat one $10-80^{\circ}$ for 10 minutes, and cool rapidly. Transfer 10 mL of each pertion to separate containers, each containing each 100 mL of Reinforced Medium for Clostridia, and incubate under anaerebic conditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. After ineubation subeulture each specimen on Columbia-Agat Medium to which gentamiein has been added, and ineubate under anaerobic eonditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. Examine the plates, and interpret as follows: if no growth of Gram peritive rods is detected, the test specimen meets the requirement for the absence of Clostridium species.

If growth-oeeurs, subeulture each distinct colony on Columbia Agat Mediun, and separately incubate in aerobic and in anaerebic eenditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. The ocurrence of only anaerobic growth of Gram pesitive bacilli, giving a negative catalase reaction, indieates the presence of Clostridiun sporogenes species. To perform the catalase test, transfer discretecolonies to glass slides, and apply a drop of dilute hydrogen peroxide solution: the reaction is negative if no gas bubbles evolve. If the test spect menexhibits none of the characteristies, it meets the requirement for the absence of Clestriditan -species. $\triangle$ USP28

volumetric flask, dissolve in and dilute with water to volume, and mix.

Procedure-Adhere a cellophane sheet to the top of a cooling plate of the electropheretic equipment by means of some water drops. Remove any air bubbles. Soak acut $6 \times 12 \mathrm{~cm}$ cellulese nitrate gel having a $0.45 \mu \mathrm{~m}$ porosity in 0.4 M Barium acte buf fer, pH 5.0 for 5 minutes, and remove any exeess solution between the filter paper and the cellulese-strip. Apply $10 \mu \mathrm{~L}$ each of Stan dard solution 1, Standard solution 2, Standard solution 3, and the Fest solution as bands to the gel near the eathede. [NOTE Back the eellophane sheet with a plastic shee for protection to prevent the gel from breaking; otherwise use a supported nitrocellulose membrane, and place it on top of the ellophane sheet.] Attach the strip to the suppert bridge of an electrophoresis chamber containing 1 M Bariun acte buffer, pH 5.0 in each side of the chamber. Ensure that each end of the strip is in contact with 1 M Bariun acetate buffer, $\mathrm{p} H$-5.0. Connect the electrodes, clese the cover, start the water cireulation for gel cooling until the temperature of the plate is about $10^{\circ}$, and apply a 20 mA eurrent ab abeut 330 V for 1 hour. Switch off the current, diseonnect the electrodes, remove the plastic sheet, and immerse the gel in the Staining reagent for 10 min utes. Wash with water to remove any unbound Staining reagent, and compare the bands: the electropherogram obtained from the Test solution exhibits a major band that is similar in position to the band obtained from. Standard solution 1. The band obtained from Standard solution 3 remains red ( $\mathrm{p} H$ buffering apacity), and the band correspending to Stand solution 2 is clearly visible at a mobility similarto the band obtained frem Standerd solution 1. Any seendary band in the electropherogram of the Test solution is not more intense than the band obtained frem Standard solution -2. Net more than $1 \%$ of any individual impurity is found.
${ }^{\Delta}$ Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate membranes ${ }^{1}$ (a small submarine gel chamber or one dedicated to membrane media) with 0.1 M Barium acetate buffer, pH 5.0. Soak a cellulose acetate membrane about 5 to $6 \mathrm{~cm} \times 12$ to 14 cm in 0.1 M Barium acetate buffer, pH 5.0 for 10 minutes, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator ${ }^{2}$ suitable for electrophoresis, apply equal volumes (about $0.5 \mu \mathrm{~L}$ ) of the Test solution, Standard solution 1, and Standard solution 2 to the brighter side of the membrane held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped in at least 0.5 - to $1.0-\mathrm{cm}$ deep into the buffer chambers. Apply a constant 60 volts (about 6 mA at the start) for 2 hours. [NOTE-

[^12]Perform the application of solutions and voltage within 5 minutes because further drying of the blotted paper reduces sensitivity.] Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in Staining reagent for 5 minutes. Then stir the solution gently for 1 minute. Remove the membrane, and destain in $5 \%$ acetic acid until the background clears. Compare the bands. The electropherogram obtained from the Test solution exhibits a major band that is identical in position to the band obtained from Standard solution 1. The band obtained from Standard solution 2 is clearly visible at a mobility similar to the band obtained from Standard solution 1. Any secondary band in the electropherogram of the Test solution is not more intense than the band obtained from Standard solution 2. Not more than $2 \%$ of any individual impurity is found. Document the results by taking a picture within 15 minutes of completion of destaining. $\Delta$ USP28

## Limit of protein-

Alkaline cupric tartaric reagent-Dissolve 200 mg of sodium tartrate dihydrate in 10 mL of water, and mark as Solution A. Dissolve 100 mg of cupric sulfate in 10 mL of water, and mark as Solution B. Dissolve 2.0 g of anhydrous sodium carbonate in 0.1 M sodium hydroxide, dilute with 0.1 M sodium hydroxide to 100 mL , and mark as Solution C. Mix well 1 mL of Solution $A$ and 1 mL of Solution B, and to the mixture slowly add 100 mL of Solution $C$ with stirring. Use within 24 hours, and discard afterwards. USSP $_{27}$
Standard solution-Transfer an accurately measured volume of 7 percent bovine serum albumin certified standard to a suitable container, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about $35 \mu \mathrm{~g}$ per mL .
Test solution-Transfer an accurately weighed amount of Chondroitin Sulfate Sodium, equivalent to 60 mg of the dried substance, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.
Procedure—Add 2.0 mL of freshly prepared ${ }^{\mathbf{A}}$ Alkaline cupric tartaric reagent ${ }_{\text {USP } 27}$ to test tubes containing 2.0 mL of water, 2.0 mL of the Test solution, or 2.0 mL of the Standard solution, and mix. After about 10 minutes, add 1.0 mL of Folin-Ciocalteu phenol TS,
$\Delta_{\text {diluted with water (1:5) and }}^{\mathbf{\Delta U S P 2 8}}$
prepared immediately before use, to each test tube, and mix
$\Delta_{\text {immediately }}$ and vigorously. AUSP28 $^{\text {and }}$
After 30 minutes, measure the absorbance of each solution at 750 nm against the blank. The absorbance of the Test solution is not greater than the absorbance of the Standard solution: not more than $6.0 \%$ of proteins is found, calculated on the dried basis.

## Briefing

Ubidecarenone Capsules, USP 27 page 2040. It is proposed to clarify the wording of Assay Preparation 1 in the Assay to indicate the solvent used in the dilution.
(DSN: L. Evans) RTS-40549-1

## Change to read:

Assay-[NOTE-Conduct this test promptly with minimum exposure to actinic light.]
Solvent-Prepare a mixture of dehydrated alcohol and n-hexane (2:5).

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and water (55:40:5). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Ubidecarenone RS in Solvent to obtain a solution having a known concentration of 1.0 mg per mL . Dilute a portion of this solution with dehydrated alcohol to obtain a solution having a known concentration of about $40 \mu \mathrm{~g}$ per mL .

Resolution solution-Dissolve an accurately weighed quantity of coenzyme $\mathrm{Q}_{9}$ in Solvent to obtain a solution having a concentration of 1.0 mg per mL . Dilute a portion of this solution with dehydrated alcohol to obtain a solution having a concentration of about $40 \mu \mathrm{~g}$ per mL . Mix equal volumes of this solution and the Standard preparation.

Assay preparation 1 (for soft gelatin Capsules)-Using a suitable cutting instrument, open an accurately counted number of Capsules, equivalent to about 200 mg of ubidecarenone. Quantitatively transfer the shells and contents to a suitable container, add 100 mL of Solvent, and shake by mechanical means for 30 minutes. Using small portions of Solvent, quantitatively transfer this mixture to a $200-\mathrm{mL}$ volumetric flask, dilute with Solvent to volume, and mix. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a $25-\mathrm{mL}$ volumetric flask, add 2.5 mL of a $0.1 \%$ solution of anhydrous ferric chloride in alcohol,
${ }^{\Delta}$ dilute with alcohol to volume, $\triangle U S P 28$ and mix.
Assay preparation 2 (for hard gelatin Capsules)-Empty and thoroughly mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ubidecarenone, to a $100-\mathrm{mL}$ volumetric flask, add 60 mL of Solvent, and shake by mechanical means for $30 \mathrm{~min}-$ utes. Dilute with Solvent to volume, and mix. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a $25-\mathrm{mL}$ volumetric flask, add 2.5 mL of a $0.1 \%$ solution of anhydrous ferric chloride in alcohol, dilute with alcohol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and an $8-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2.5 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between ubidecarenone and coenzyme $\mathrm{Q}_{9}$ is not less than 2.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $15 \mu \mathrm{~L}$ ) of the Standard preparation and Assay preparation 1 or Assay preparation 2 into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ubidecarenone $\left(\mathrm{C}_{59} \mathrm{H}_{90} \mathrm{O}_{4}\right)$ in each soft gelatin Capsule taken by the formula:

## $5000(C / N)\left(r_{U} / r_{S}\right)$,

in which $C$ is the concentration, in mg per mL , of USP Ubidecarenone RS in the Standard preparation; $N$ is the number of Capsules taken to prepare Assay preparation 1; and $r_{U}$ and $r_{S}$ are the peak responses obtained from Assay preparation 1 and the Standard preparation, respectively. Calculate the quantity, in mg , of ubidecarenone $\left(\mathrm{C}_{59} \mathrm{H}_{90} \mathrm{O}_{4}\right)$ in the portion of hard gelatin Capsules taken by the formula:

$$
2500 C\left(r_{U} / r_{S}\right)
$$

in which $r_{U}$ is the peak response obtained from Assay preparation 2 ; and the other terms are as defined herein.

## MONOGRAPHS (NF)

## BRIEFING

Alfadex, page 1092 of $P F$ 29(4) [July-Aug. 2003]. It is proposed to add requirements for combined molds and yeasts count to the test for Microbial limits.
(EMC: E. Gonikberg; AMB: D. Porter) RTS-40632-1

## Add the following:

## AAlfadex

$\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{6} \quad 972.85972 .84$
Alpha cyclodextrin [10016-20-3].
» Alfadex is composed of six alpha-(1-4) linked D-glucopyranosyl units. It contains not less than 98.0 percent and not more than 101.0 percent of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{6}$, calculated on the dried basis.

Packaging and storage-Preserve in tight containers. Store at to $25 \pm 2^{\circ}$. Avoideressive heat and freezing.

## Protect from moisture.

USP Reference standards $\langle 11\rangle$ —USP Alpha Cyclodextrin RS. USP Beta Cyclodextrin RS. USP Gamma Cyclodextrin $R S$.

Clarity of solution-Dissolve 1.0 g in 100.0 mL of previously boiled and cooled water: the resulting solution is clear.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

B: It meets the requirements of the test for Specific rotation $\langle 781 \mathrm{~S}\rangle$.

C: Mix 0.2 g with 2 mL of iodine TS, warm in a water bath to dissolve the test specimen, and allow to stand at room temperature: a yellow-brown precipitate is formed.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+147^{\circ}$ and $+152^{\circ}$ $\left(\mathrm{t}=20^{\circ}\right)$.

Test solution: 10 mg per mL , in water.
Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic bacterial count does not exceed 1000 cfu per g . The total combined molds and yeasts count does not exceed 100 cfu per g.
$\mathbf{p H}\langle 791\rangle$ - The pH of the mixture of 30 mL of its aqueous solution (1 in 100) and 1 mL of Potassium chloride solution is 5.0 to 8.0 .

Potassium chloride solution-Transfer 22.4 g of potassium chloride into a $100-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Loss on drying $\langle 731\rangle$ —Dry 1.0 g of it at $120^{\circ}$ for 2 hours: it loses not more than $10.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

Heavy metals, Method II $\langle 231\rangle: 10 \mu \mathrm{~g}$ per g.

## Reducing sugars-

Cupric solution-Dissolve 15 g of cupric sulfate in water to make 100 mL .

Tartrate solution-Dissolve 2.5 g of anhydrous sodium carbonate, 2.5 g of potassium sodium tartrate, 2.0 g of sodium bicarbonate, and 20 g of anhydrous sodium sulfate in water to make 100 mL .

Cupric-tartaric solution-Immediately before use, mix 1 part of Cupric solution with 25 parts of Tartrate solution.
Ammonium molybdate reagent-Mix 10 mL of a solution of disodium arsenate ( 6 in 100), 50 mL of a solution of ammonium molybdate ( 1 in 10), and 90 mL of diluted sulfuric acid, and dilute with water to 200 mL .

Test solution-Transfer about 1.0 g of Alfadex, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water that has been previously boiled and cooled to room temperature, to volume, and mix. To 1 mL of this solution add 1 mL of Cupric-tartaric solution. Heat on a water bath for 10 minutes, then cool to room temperature. Add 10 mL of Ammonium molybdate reagent, and allow to stand for 15 minutes.

Standard solution-Prepare at the same time and in the same manner as the Test solution, using 1 mL of a glucose solution that contains 20 mg in 1 liter.
Procedure-Concomitantly measure the absorbance of the Test solution and the Standard solution at the wavelength of maximum absorbance at 740 nm relative to that
of water, with a suitable spectrophotometer. The absorbance of the Test solution is not greater than that of the Standard solution ( $0.2 \%$ ).

## Related compounds-

System suitability solution-Prepare as directed for System suitability preparation in the Assay.
Standard solution-Transfer 5.0 mL of the System suitability solution into a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Test solution-Use the Assay stock preparation prepared as directed in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. For the Test solution, the areas of any peaks corresponding to beta cyclodextrin or to gamma cyclodextrin are not greater than half of the area of the corresponding peaks in the chromatogram of the Standard solution $(0.25 \%)$, and the sum of the areas of all the peaks, excluding the principal peak and the peaks corresponding to beta cyclodextrin or to gamma cyclodextrin, is not greater than half of the area of the peak corresponding to alpha cyclodextrin in the chromatogram of the Standard solution ( $0.5 \%$ ).

Light-absorbing impurities-
Test solution-Transfer about 1.0 g of Alfadex, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water, which has been previously boiled and cooled to room temperature, to volume, and mix.

Procedure-Determine the absorbance of the Test solution in a $1-\mathrm{cm}$ cell with a suitable spectrophotometer, after correcting for the blank: between 230 nm and 350 nm , the absorbance is not greater than 0.10 ; and between 350 nm and 750 nm , the absorbance is not greater than 0.05 .

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of water and methanol (90:10, v/v). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard preparation-Transfer 25 mg of USP Alpha Cyclodextrin RS, accurately weighed, in $25-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with water to volume.
System suitability preparation-Transfer 25 mg of USP Beta Cyclodextrin RS, 25 mg of USP Gamma Cyclodextrin RS, and 50 mg of USP Alpha Cyclodextrin RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water, and mix.

Assay stock preparation-Dissolve 250 mg of Alfadex, accurately weighed, in water with the aid of heat. Cool, and dilute with water to 25.0 mL .

Assay preparation-Transfer 5.0 mL of the Assay stock preparation to a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a refractive index detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability preparation, and record the chromatograms for about 3.5 times the retention time of alpha cyclodextrin. Record the peak responses as directed for Procedure: the retention time of alpha cyclodextrin is about 4.5 minutes; the relative retention times are
about 1.0 for alpha cyclodextrin, about 2.2 for beta cyclodextrin, and about 0.7 for gamma cyclodextrin; the resolution, $R$, between the gamma cyclodextrin and alpha cyclodextrin peaks is not less than 1.5 ; and for the alpha cyclodextrin peak, the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{6}$ in the portion of Alfadex taken by the formula:

$$
2500(C / W)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of alpha cyclodextrin in the Standard preparation, calculated on the dried basis, as determined from the concentration of USP Alpha Cyclodextrin RS corrected for the declared moisture content; $W$ is the weight, in mg, of alpha cyclodextrin taken to prepare the Assay stock preparation; and $R_{U}$ and $R_{S}$ are the peak responses of the alpha cyclodextrin peak obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta N F 2 3}^{\text {. }}$

## BriEfing

#### Abstract

L-Asparagine, page 687 of $P F$ 29(3) [May-June 2003]. Asparagine is the name now proposed for the title of this new NF monograph because letters or numbers as prefixes to names are not included in titles of USP monographs. L-Asparagine, a chemical name in which " $L$-" designates the stereochemical configuration for asparagine, is now included in the chemical information that precedes the official standards of the monograph on this amino acid. On the basis of comments received, it is also proposed to add the statement of hydration state to the Definition.

(NL: C. Barnstein; EMC: E. Gonikberg) RTS-40672-1

## Add the following:

## 4t-Asparagine Asparagine

$\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{3} \cdot \mathrm{H}_{2} \mathrm{O} \quad 150.13$

L-Asparagine
L- $\alpha$-Aminosuccinamic acid, monohydrate [5794-13-8].
Anhydrous 132.12 [70-47-3].
" E-Asparagine Asparagine is anhydrous, or contains one molecule of water of hydration. It contains not less than 98.0 percent and not more than 101.5 percent of $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{3}$, as L-asparagine, calculated on the dried basis.

Packaging and storage-Preserve in well-closed, light-resistant containers. Store rom tomperature, and avidexeessive heat and freezing. Protect from moisture.

Labeling-Label it to indicate whether it is anhydrous or the monohydrate.

USP Reference standards $\langle 11\rangle-U S P_{ \pm-A s p a r a g i n e ~ R S . ~}^{\text {R }}$ USP Asparagine RS.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+33.0^{\circ}$ and $+36.5^{\circ}$, measured at $20^{\circ}$.

Test solution: 10 mg per mL in 6 N hydrochloric acid.
Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $10^{3}$ per g , and the total combined molds and yeasts count does not exceed $10^{2}$ cfu per $g$.

Loss on drying $\langle 731\rangle$-Dry it at $130^{\circ}$ for 3 hours: the anhydrous form loses not more than $1.0 \%$ of its weight, and the monohydrate loses between $11.5 \%$ and $12.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

Lead $\langle 251\rangle$ —Prepare a Test Preparation using a 1-g portion of E Asparagine, Asparagine, and use 5 mL of Diluted Standard Lead Solution ( $5 \mu \mathrm{~g}$ of Pb ) for the test: the limit is $5 \mu \mathrm{~g}$ per $g$.

## Chromatographic purity-

Adsorbent: $0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution: 10 mg per mL .
Standard solution-Prepare a solution of USP gine RS USP Asparagine RS in water having a known concentration of about 0.05 mg per mL .
Application volume: $5 \mu \mathrm{~L}$.
Developing solvent system: a mixture of butyl alcohol, water, and glacial acetic acid ( $3: 1: 1$ ).

Spray reagent-Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butyl alcohol and glacial acetic acid (95:5).
Procedure—Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$, and then dry the plate at $80^{\circ}$ for 30 minutes. Spray the plate with the Spray reagent, heat at $80^{\circ}$ for 10 minutes, and examine under white light: no secondary spot in the chromatogram obtained from the Test solution is larger or more intense than the principal spot in the chromatogram obtained from the Standard solution ( $0.5 \%$ ); and not more than $1.0 \%$ of total impurities is found.

Assay—Dissolve about 130 mg of E -Aspagine, Asparagine, accurately weighed, in 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS (see Titrimetry $\langle 541\rangle$ ), determining the endpoint
potentiometrically. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 13.21 mg of $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{3}$, calculated on the dried basis. $\Delta N F 23$

## BRIEFING

Betadex, NF 22 page 2831. It is proposed to modify the Chromatographic system in the Assay to allow for the refractive index detector to be maintained at temperatures other than $25 \pm 2^{\circ}$. This is in response to comments received that most refractive index detectors cannot maintain a constant temperature of $25^{\circ}$.
(EMC: D. Bempong) RTS-40636-1

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water (65:35). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Dissolve 2.0 g of glycerol in water contained in a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Filter through a $0.45-\mu \mathrm{m}$ membrane filter. Use fresh or store in a freezer, thaw in hot water, and mix.

Standard preparation - Dissolve an accurately weighed quantity of USP Beta Cyclodextrin RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 10 mg per mL. Use fresh or store in a freezer, thaw in hot water, and mix. Mix 1.0 mL of this solution with 1.0 mL of Internal standard solution.

System suitability preparation-Prepare a solution in water containing about 5 mg per mL each of USP Alpha Cyclodextrin RS and USP Beta Cyclodextrin RS. Filter through a $0.45-\mu \mathrm{m}$ membrane filter.
Assay preparation-Transfer about 1 g of Betadex, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Filter this solution through a $0.45-\mu \mathrm{m}$ membrane filter. Mix 1.0 mL with 1.0 mL of Internal standard solution.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The tiquid chromatograph is equipped with a refractive indes detector that is maintained at a constant temperature of $25^{\circ}$, a $4.6 \mathrm{~mm}-*$ 25 cm column that contains $10-\mathrm{mm}$ packing L 8 , and a gurard col umn that contains packing L8. The columms are maintained at a constant temperature of $25 \pm 2^{\circ}$, and the flow rate is about 2.0 mL per minute.
${ }^{\Delta}$ The chromatograph is equipped with a refractive index detector, a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L8, and a guard column that contains packing L8. The columns and, if necessary, the detector are maintained
at a constant temperature of about $25 \pm 2^{\circ}$, and the flow rate is about 2.0 mL per minute. If the column or detector is operated at a temperature other than $25 \pm 2^{\circ}$, the system also must be shown to meet all system suitability requirements. $\Delta N F 23$
Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$, and the alpha cyclodextrin and beta cyclodextrin peaks exhibit baseline separation, the relative retention times being about 0.8 and 1.0 , respectively.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{7}$ in the portion of Betadex taken by the formula:

$$
100 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of anhydrous beta cyclodextrin in the Standard preparation, as determined from the concentration of USP Beta Cyclodextrin RS corrected for moisture content by a titrimetric water determination, and $R_{U}$ and $R_{S}$ are the peak response ratios of the beta cyclodextrin peak to the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Cocoa Butter, NF 22 page 2853. On the basis of comments received, it is proposed to revise the system suitability requirement in the test for Fatty acid composition. It is proposed to change the current relative standard deviation requirement of not more than $2.0 \%$ to not more than $5.0 \%$.
(EMC: C. Sheehan) RTS-40487-1

## Change to read:

## Fatty acid composition-

Test solution-Place about 100 to 150 mg of Cocoa Butter in a $50-\mathrm{mL}$ round-bottom flask, and add 4 mL of 0.5 N sodium hydroxide solution, prepared in methanol. Add a few boiling chips to the flask, connect the round-bottom flask to a condenser, and boil the mixture under total reflux until the fat globules go into solution. Add 5.0 mL of a 2.0 M borontrifluoride in methanol solution to the boiling mixture via the condenser, and continue boiling for 2 minutes. Add 2 to 5 mL of chromatographic $n$-heptane to the boiling mixture via the condenser, and boil for another minute. Remove the flask from the source of heat, and remove the reflux condenser. Add saturated sodium chloride solution, and swirl the flask gently. Add more of the saturated sodium chloride solution to bring the liquid level into the neck of the round-bottom flask.

Transfer about 1 mL of the organic layer into a glass-stoppered test tube, add some anhydrous sodium sulfate to remove the last traces of water, and filter. Use the filtrate.
System suitability solution-Dissolve suitable quantities of methyl stearate and methyl oleate in $n$-heptane to obtain a solution having a known concentration of about 1 mg per mL for each component.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a flame-ionization detector maintained at a temperature of about $250^{\circ}$, a $0.25-\mathrm{mm} \times 15-\mathrm{m}$ fused-silica capillary column coated with $0.25-\mu \mathrm{m}$ stationary phase G19, and a split injection system with a split ratio of about $60: 1$, maintained at a temperature of about $250^{\circ}$. The carrier gas is helium flowing at a linear velocity of about 48 cm per second. The column temperature is programmed to increase linearly from $180^{\circ}$ to $240^{\circ}$ at a rate of $10^{\circ}$ per minute, and is maintained at $240^{\circ}$ for 5 minutes. [NOTE--The components of interest elute during the temperature program. The final hold at a temperature of $240^{\circ}$ serves only to facilitate elution of higher boiling components.] Inject about $0.1 \mu \mathrm{~L}$ of the System suitability solution into the chromatograph, record the chromatogram, and measure the responses for the major peaks: the resolution, $R$, between the stearate and oleate peaks is not less than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
${ }^{4} 5.0 \%$. ${ }^{\text {AF }}$.
The relative retention times are about 0.97 for stearate and 1.0 for oleate.

Procedure-Inject about $0.1 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the areas for the peaks of the methyl esters of the fatty acids. [NOTE-The relative retention times for palmitate, stearate, oleate, linoleate, linolenate (if present), and arachidate are about $1.0,1.55,1.60,1.72$, 1.89 , and 2.30 , respectively.] Calculate the percentage of each fatty acid methyl ester in the specimen of Cocoa Butter taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the response of each peak; and $r_{s}$ is the sum of the responses of all of the peaks: the percentages of palmitate, stearate, oleate, linoleate, linolenate (if present), and arachidate are in the ranges of 23 to 30,31 to 37,31 to $38,1.6$ to $4.8,0$ to 1.5 , and 0 to 1.5 , respectively.

2-Phenoxyethanol, page 1900 of $P F$ 28(6) [Nov.-Dec. 2002] A monograph for this article was previously proposed under the name 2-Phenoxyethanol. Phenoxyethanol is the name now proposed for the title of this monograph because numbers or letters as prefixes to names are not included in titles of $U S P$ or NF monographs. 2-Phenoxyethanol, a chemical name in which "2-" designates the position of the phenoxy-substituent on the ethyl alcohol molecule, is now included in the chemical information that precedes the official standards of the monograph for this excipient.

It is proposed to replace a spectrophotometric procedure in the test for Limit of phenol and two different gas chromatographic procedures in the Chromatographic purity test and Assay with a single gas chromatographic procedure. This gas chromatographic procedure is based on analyses performed with Chrompack CP-Sil 8 CB
brand of G27 column. The typical retention times for phenol and phenoxyethanol are about 8.4 minutes and 15 minutes, respectively.
On the basis of data supporting the antimicrobial effectiveness of this excipient, it is proposed to delete the test for Microbial limits. It is also proposed to make changes in the Definition, Labeling, and Bacterial endotoxins sections.
(EMC: E. Gonikberg; AMB: D. Porter; NL: C. Barnstein) RTS—39836-1; 40020-4; 40596-1

## Add the following:

## 42-Phenoxyethanol

$\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{O}_{2} \quad 138.17$

2-Phenoxyethanol
2-Phenoxyethyl alcohol
Ethylene glycol, 2-monophenyl ether [122-99-6].
» $z$ Phenoxyethanol contains not less than 99.0
98.0 percent and not more than 100.5102 .0 percent of 2-phenoxyethanol.

Packaging and storage-Preserve in tight containers, in a cool, dry place, protected from light.

Labeling-Where it is intended for use in ecines nistered either intramuseularly or subeutaneously, articles administered parenterally, it is so labeled.

Bacterial endotoxins $\langle 85\rangle$ - Where it is intended for use in vaceines administered either intramuseularly or subeutaarsly, articles administered parenterally, it contains not more than 2.9 USP Endotoxin Units per mg.

## Limit of phenol-

Fest solution Dissolve abeut 1.0 g of 2 Phenoxyethanol, accurately weighed, in $50-\mathrm{mL}$ of methylene chloride, add 4 mL of sodium hydroxide solution ( 8.5 in 100 ) and 10 mL of water, and shake well. Separate, and diseard the lower layer. Wash the upper (aqueous) layer with two $20-\mathrm{mL}$ pertions of methylene chloride, and discard the washings. Transfer the aqueous layer to a 100 mb volumetric flask, dilute to vot ume with water, and mix.

Procedure Determine the absorbance of the Test solth fion in a 1 em cell at the maximmm at about 287 nm with a-suitable-spectrophotemeter, correcting for the blank. The abserbance is net mere than 0.27: net mere than $0.1 \%$ of phenel is found.

Phenol solution, Standard solution, Test solution, and Chromatographic system-Prepare as directed under Chromatographic purity.
Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of phenol in the portion of Phenoxyethanol taken by the formula:

$$
150(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of phenol in the Standard solution; $W$ is the weight of Phenoxyethanol, in mg , taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are peak areas of the phenol peak in the chromatograms obtained from the Test solution and the Standard solution, respectively: not more than $0.1 \%$ is found.

## Chromatographic purity-

Internal standard solution Transfer about 1.25 g of methyl latrate to a $25-\mathrm{mL}$ volumetric flask, dissolve and dilute to volume with methylene chloride, and mix.

Fest stock solution Transfer about 10.0 of of 2 Phenok yethanel, aceurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve and dilute to volume with methylene chloride, and mix.

Test solution 1 Transfer 5.0 mL of the Test stock solution to a $10-\mathrm{mL}$ volumetric flask and dilute to volume with meth-Hene-chloride, and mix.

Fest solution 22 Transfer 5.0 mL of the Test stock solution to a 10 mL volumetric flask, add $1.0-\mathrm{mL}$ of the Internat standerd solution, dilute to volume with methylene-chleride, and mix.

Standard solution Transfer 1.0 mL of Test solution 1 to a 100 mL volumetric flask, add 10.0 mL of the Internal standetrd solution, and dilute to volume with methylene-chleride.

Chromatographic system (see Chromatography- $\langle 621$ )) The gas chromatograph is equipped with a flame-ienization detector and $-4-\mathrm{mm} \times 1.5 \mathrm{~m}$ columm packed with $3 \%$ liq tid phase-G3 on suppert S1A. The coltumn temperature-is maintained at $130^{\circ}$, and the injection pert and the detector are maintained at $200^{\circ}$. Nitregen is used as the carrier gas at a flow rate of about 30 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the 2 phenoxyethanel peak elutes before the internal standard peak; and the resolution, $R$, between the 2 phenoxyethanel and the internal standard is not less than- 12. Chromatograph Test solution 1, and record the peak respenses as directed for Procedure: no peak appears at the retention time correspending to that of the internal standard; if a peak is observed at that retention time, make any neeessary correction for factors of dilution, and determine the area
due to the interfering compenent that must be-subtracted frem the area of the internal standard peak in the chromatogram of Test solution 2. 2.

Procedure Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the-Standard solution and Test solution 2 into the-gas ehromatograph, record the ehrematograms for a period of time that is not less than five times the retention time of $Z$ phenoxyethanol, and measure the responses for all the peaks. The peak arearatio of the sum of all peaks (exeluding the main peak, the solvent peak, and the internal-standard peak) to the internal standard obtained from Test solution $z$ is not more than the peak area ratio of 2 phenoxyethanel to the internal standard obtained from the Standard soltation: not more than $1.0 \%$ of total impurities is found.

Phenol solution-Prepare a solution of phenol in isopropyl alcohol having a known concentration of about 0.25 mg of phenol per mL.

Standard solution-Dissolve an accurately weighed quantity of USP Phenoxyethanol RS in Phenol solution to obtain a solution having a known concentration of about 5 mg of phenoxyethanol per mL. Accurately transfer $500 \mu \mathrm{~L}$ of this solution to a vial, add $1000 \mu \mathrm{~L}$ of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 sec onds.

Test solution-Accurately transfer $500 \mu \mathrm{~L}$ of Phenoxyethanol to a tared vial, and determine the weight of Phenoxyethanol taken. Add $1000 \mu \mathrm{~L}$ of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 sec onds.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.32-\mathrm{mm} \times 10-\mathrm{m}$ capillary column coated with a $5-\mu \mathrm{m}$ film of stationary phase G27. The carrier gas is helium with a split flow rate of 44 mL per minute. The injector port and the detector are both maintained at $300^{\circ}$.

The column temperature is programmed as follows: the starting column temperature is $80^{\circ}$; after injection, it is increased to $260^{\circ}$ at a rate of $8^{\circ}$ per minute, then held for 10 minutes. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the resolution, $R$, between phenol and phenoxyethanol peaks is not less than 10 ; and the relative standard deviation for replicate injections for the phenoxyethanol peak is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of total impurities in the portion of Phenoxyethanol taken by the formula:

$$
150(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of phenoxyethanol in the Standard solution; $W$ is the weight of Phenoxyethanol, in mg, taken to prepare the Test solution; $r_{U}$ is the sum of all additional peak areas in the chromatogram obtained from the Test solution, excluding the main peak, the solvent peak, and the phenol peak; and $r_{S}$ is the peak area of the phenoxyethanol peak in the chromatogram obtained from the Standard solution: not more than $1.0 \%$ of total impurities is found.

## Assay-

Internal standard solution Prepare a-solution of phenol in methanel containing about 0.5 mg per mL .

Standard preparation- Dissolve an aeeurately weighed quantity of USP 2 Phenoxyethanol RS in Internal standerd solution to obtain a solution having a known coneentration of about 1 mg per mL.

Assay preparation Transfer about 100 mg of 2 Phenow yethanol, aceurately weighed, to 100 mL volumetric flask, dissolve in and dilute with Internal standerdsolution to voltme, and mix.

Chromatographic system (see Chromatography (621)) The gas chromatograph is equipped with a flame ionization detectrand a $4 \mathrm{~mm} \times 1.8 \mathrm{~m}$ column packed with $5 \%$ phase $G 16$ on packing S1A. The column is maintained at about $165^{\circ}$, the injection pert at about $200^{\circ}$, and the detector block at about $250^{\circ}$. Nitregen is used as the earrier gas, flowing at rat ofabeut 50 mL per minute. Chremategraph the Standated preparation, and record the peak areas as directed for Procedure: the resolution, $R$, between the internal standard and 2 phenoxyethanel is net less the 2.0 ; the tailing factor is not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Proedure Separately inject equal volumes (about $1 \mu$ L) of the Standerd preparation and the Assay preparation into the gas chrematograph, record the ehrematograms, and measure the areas of the major peaks. Caleulate the quantity, in mg, of $\mathrm{G}_{8} H_{4} \mathrm{O}_{2}$ in the pertion of 2 Phenoxyethanol taken by the formula:

$$
1000 \in\left(R_{L}+R_{s}\right),
$$

in which $C$ is the oneentration, in me per mL, of USP 2 Phenoxyethanol RS in the Standard preparation; and $R_{\psi}$ and $R_{s}$ are the peak area ratio of 2 phenoxyethanol to the internal-standard obtained from the Assay preparation and the-Stadely preparation, respectively.

Phenol solution and Chromatographic system-Prepare as directed under Chromatographic purity.

Standard preparation-Use the Standard solution, prepared as directed under Chromatographic purity.
Assay preparation-Transfer about 500 mg of Phenoxyethanol, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with isopropyl alcohol to volume, and mix. Accurately transfer $500 \mu \mathrm{~L}$ of this solution to a vial, add $1000 \mu \mathrm{~L}$ of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 seconds.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the quantity, in mg, of $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{O}_{2}$ in the portion of Phenoxyethanol taken by the formula:

$$
150 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Phenoxyethanol RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the responses of the phenoxyethanol peak obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta F F 2 3}^{\text {. }}$

# Microbiological Tests 

## BRIEFING

$\langle 55\rangle$ Biological Indicators-Resistance Performance Tests, USP 27 page 2150 . It is proposed to revise the sections on Total Viable Spore Count and D-Value Determination to add requirements specified in the proposed new monographs for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers and Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions, also appearing in this issue of $P F$ (see the briefing for each proposed monograph). Comments regarding this proposal are invited and should be received by February 29, 2004.
(AMB: D. Porter) RTS-40563-1

## TOTAL VIABLE SPORE COUNT

Remove three specimens of the relevant biologieal indienter
${ }^{\boldsymbol{\Delta}}$ For paper carrier biological indicators, remove three spe-
cimens of the relevant biological indicators ${ }_{\triangle U S P 28}$
from their original individual containers. Disperse the paper into component fibers by placing the test specimens in a sterile 250 mL cup of a suitable blender containing 100 mL of chilled, sterilized Purified Water and blending for 3 to 5 minutes to achieve a homogeneous suspension. Transfer a $10-\mathrm{mL}$ aliquot of the suspension to a sterile, screw-capped 16-×125-mm tube. For Biological Indicator for Steam Sterilization, Paper Carrier, heat the tube containing the suspension in a water bath at $95^{\circ}$ to $100^{\circ}$ for 15 minutes (heat shock), starting the timing when the temperature reaches $95^{\circ}$. For Biological Indicator for Dry-Heat Sterilization, Paper Carrier, and for Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, heat the tube containing the suspension in a water bath at $80^{\circ}$ to $85^{\circ}$ for 10 minutes, starting the timing when the temperature
$\Delta^{\circ}$ of the spore suspension ${ }_{\triangle U S P 28}$
reaches $80^{\circ}$. Cool rapidly in an ice-water bath at $0^{\circ}$ to $4^{\circ}$. Transfer two $1-\mathrm{mL}$ aliquots to suitable tubes, and make appropriate serial dilutions in sterilized Purified Water, the dilutions being selected as calculated to yield preferably 30 to 300 colonies, but not less than 6 , on each of a pair of plates when treated as described below. Where the biological indicator has a low spore concentration, it may be necessary to modify the dilution series and to use more plates at each dilution. Prepare a separate series of plates for each aliquot. Place 1.0 mL of each selected dilution in each of two 15$\times 100-\mathrm{mm}$ Petri dishes. Within 20 minutes, add to each plate 20 mL of Soybean-Casein Digest Agar Medium (see Microbial Limit Tests $\langle 61\rangle$ ) that has been melted and cooled to $45^{\circ}$ to $50^{\circ}$. Swirl to attain a homogeneous suspension, and allow to solidify. Incubate the plates in an inverted position at $55^{\circ}$ to $60^{\circ}$ for Biological Indicator for Steam Sterilization, Paper Carrier, and at $30^{\circ}$ to $35^{\circ}$ for

Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier and for Biological Indicator for Dry-Heat Sterilization, Paper Carrier or at the optimal recovery temperature specified by the manufacturer, and examine the plates after 24 and 48 hours, recording for each plate the number of colonies, and using the number of colonies after 48 hours to calculate the results. Calculate the average number of spores per specimen from the results, using the appropriate dilution factor. The test is valid if the log number of spores per carrier at 48 hours is equal to or greater than the log number after 24 hours in each case. For Biological Indicator for Steam Sterilization, Self-Contained, aseptically remove the spore strip from the container, and proceed as directed for Biological Indicator for Steam Sterilization, Paper Carrier.
${ }^{\mathbf{\Delta}}$ For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers, aseptically remove the three metal or plastic carriers from their original packaging or container. Place each carrier in a suitable sterile flask or container containing 100 mL of chilled Purified Water, and sonicate or shake on a reciprocal shaker for 3 to 5 minutes. A previous study should be conducted that ensures the recovery method results in at least $70 \%$ recovery of the labeled spore viable count. Transfer a $10-\mathrm{mL}$ aliquot of the suspension to a sterile, screw-capped $16-\times 125-\mathrm{mm}$ tube. Heat the tubes containing suspensions of Clostridium sporogenes, Bacillus atrophaeus, and Bacillus coagulans at $80^{\circ}$ to $85^{\circ}$ for 10 minutes. Heat the tubes containing a suspension of Geobacillus stearothermophilus at $95^{\circ}$ to $100^{\circ}$ for 15 minutes. Start the timing when the lowest temperature of the stated temperature ranges is reached. Cool rapidly in an ice-water bath at $0^{\circ}$ to $4^{\circ}$. Transfer two 1mL aliquots to suitable tubes, and make appropriate serial dilutions in Purified Water. The selected dilutions should be those that will preferably yield 30 to 300 colonies but not fewer than 6 on each pair of plates when treated as described below. When the biological indicator has a low spore concentration, it may be necessary to modify the dilution series and to use more plates at each dilution. Prepare a separate series of plates for each aliquot. Place 1.0 mL of each selected dilution in each of two $15-\times 100-\mathrm{mm}$ Petri dishes. Within 20 minutes add the aliquot to each plate con-
taining 20 mL of agar that has been melted and cooled to between $45^{\circ}$ and $50^{\circ}$. Swirl to attain a homogeneous suspension.

For C. sporogenes, use Yeast Extract Agar, and incubate anaerobically at $32^{\circ}$ to $37^{\circ}$ for not less than 72 hours. For $G$. stearothermophilus, B. atrophaeus, and B. coagulans, use Soybean-Casein Digest Agar Medium and incubate the plates in an inverted position aerobically at the following respective temperatures for each microorganism: $55^{\circ}$ to $60^{\circ}, 30^{\circ}$ to $35^{\circ}$, and $48^{\circ}$ to $52^{\circ}$, or at the optimum temperature specified by the biological indicator manufacturer. Examine the plates after 48 and 72 hours of incubation for $C$. sporogenes. Examine the plates after 24 and 48 hours for $G$. stearothermophilus, B. atrophaeus, and B. coagulans. Record the number of colonies on each plate using the number of colonies appearing at 48 or 72 hours. Calculate the average number of spores per carrier from the results using the appropriate dilution factor. The test is valid if the log number of spores per carrier at 48 hours is equal to or greater than the log number after 24 hours in each case.
For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions, prepare a 1:100 dilution of the original spore suspension in chilled Purified Water contained in a sterile, screw-capped $16-\times 125-\mathrm{mm}$ tube, and proceed with the viable spore count procedures specified under Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers. $\mathbf{\triangle U S P 2 8}$

## D-VALUE DETERMINATION

For all tests described in this section, handle each test specimen with aseptic precautions, using sterilized equipment where applicable.

## Apparatus

For Biological Indicator for Dry-Heat Sterilization, Paper Carrier use an apparatus of known thermodynamic characteristics that has been validated for compliance with the requirements for safety ${ }^{1}$ and performance, ${ }^{2}$ that consists of a sterilizing chamber equipped with a means of heating the contained air, preferably electrically rather than gas fired, and that has adequate movement of the air through forced ventilation (by mechanical devices such as blowers), with sensing and control devices for temperature and timing capable of indicating with an accuracy of not more than $0.5^{\circ}$ and 1 -second intervals, respectively. The geometrical pattern of the heat source(s) is such as to enable the biological indicators under test to be uniformly heated under the specified conditions. The temperature profile in the chamber is known, and cold spots, hot spots, and slow heat zones identified. The chamber has the capability to work within a temperature range of $40^{\circ}$ to $300^{\circ}$, with an accuracy at any particular setting of not less than $\pm 2^{\circ}$. The apparatus is equipped with a suitable additional access door or port so as to enable the entry and insertion (or removal) of specimens within 6 seconds and to enable the temperature to return to the set temperature within 0.5 minute where the specified temperature is $120^{\circ}$ to $190^{\circ}$ and within 1.0 minute where such temperature is $220^{\circ}$ and above.

For Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier use an apparatus that consists of a test chamber, with a means of ensuring adequate mixing of the sterilant gas and a means of heating the sterilant gas to not lower than the preselected operating temperature so that no liquid enters the test chamber, equipped with temperature control and monitoring, pressure control, humidification, and gas concentration monitoring devices. Detailed specifications and operational parameters for suitable apparatus are those published in Standard for a Biological Indica-tor-Evaluator Resistometer for Ethylene Oxide Gas Vessels (BIER/EO) Gas Vessels. ${ }^{3}$

For Biological Indicator for Steam Sterilization, Paper Carrier, and for Biological Indicator for Steam Sterilization, Self-Contained use an apparatus that consists of a chamber equipped with heating, temperature, and steam control and monitoring devices. Detailed specifications and operational parameters for suitable apparatus are those published in Standard for a Biological Indica-tor-Evaluator Resistometer for Saturated Steam (BIER/Steam Vessels). ${ }^{4}$

## Procedure

Carry out the tests for $D$ value at each of the applicable sets of sterilization conditions for which the packaged biological indicator under test is labeled for use. Take a sufficient number of groups of specimens of biological indicators in their original individual containers, each group consisting of 5 to 10 specimens. The number of groups provides a range of observations from not less than one la-

[^13]beled $D$ value below the labeled survival time through not less than one labeled $D$ value above the labeled kill time. Place each group on a separate suitable specimen holder that permits each specimen to be exposed to the prescribed sterilizing condition at a specific location in the sterilizing chamber. Check the apparatus for operating parameters using specimen holders without specimens. Select a series of sterilizing times in increments from the shortest time for the specimens to be tested. The differences in sterilizing times over the series are as constant as feasible, and the difference between adjacent times is no greater than $75 \%$ of the labeled $D$ value.

For Biological Indicator for Dry-Heat Sterilization, Paper Carrier preheat the sterilizing chamber for 30 minutes. Open the access door or port, place one of the holders with a group of specimens in the sterilizing chamber, close the access door or port, and continue to operate the apparatus. Commence timing the heat exposure when the chamber temperature returns to $2^{\circ}$ below the specified temperature. After the contents have been subjected to the sterilizing condition for a predetermined time selected from a series of time increments, remove the holder with the heated specimens, and replace it with another holder with specimens. Repeat the sterilizing procedure similarly, but for another predetermined time, and continue with successive groups until all have been heated appropriately.

For Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier proceed as follows:

1. Evacuate the test chamber to a pressure of not more than 100 $\pm 3 \mathrm{~mm}$ of mercury.
2. Inject sufficient water vapor (e.g., saturated steam) to bring the chamber contents to within $10 \%$ relative humidity of the required humidification condition, and allow the chamber to equilibrate with moisture and to temperature for about 30 minutes.
3. Inject a sufficient quantity of temperature-equilibrated ethylene oxide gas to attain the appropriate concentration $\pm 30 \mathrm{mg}$ of ethylene oxide per L .
4. Subject a group of specimens to the appropriate temperature, humidification, and gas concentration conditions for the required time.
5. Evacuate the test chamber to a pressure of $100 \pm 3 \mathrm{~mm}$ of mercury, and release the vacuum with sterile filtered air. Repeat this until not less than $99 \%$ of the remaining gas has been removed, and remove the holder(s) with the exposed specimens. For exposing further groups of specimens to the sterilization conditions, proceed with steps 6 and 7 .
6. Flush the test chamber five times with filtered air after evacuation each time to a pressure of not more than $100 \pm 3 \mathrm{~mm}$ of mercury.
7. Repeat the entire sterilizing procedure, steps 1 through 6 , for other groups of unexposed specimens, but maintain the specified conditions of step 4 for each of the other required times.

For Biological Indicator for Steam Sterilization, Paper Carrier, exhaust the sterilizing chamber, and within 15 seconds of opening the door, place one of the holders with a group of specimens in the sterilizing chamber, and operate the apparatus to heat up the chamber contents as quickly as possible. After the contents have been subjected to the sterilizing condition for a predetermined time selected from the series of time increments, exhaust the chamber as quickly as possible. Remove the holder with the heated specimens, and replace it with another group of specimens. Repeat the sterilizing procedure similarly, but for another predetermined time, and continue with successive groups until all have been appropriately heated.

For Biological Indicator for Steam Sterilization, Self-Contained follow the procedure indicated for Biological Indicator for Steam Sterilization, Paper Carrier, but handle each self-contained unit as a biological indicator system, with the $D$ value determined for the self-contained system.
${ }^{\text {4 For Biological Indicators for Moist Heat, Dry Heat, and }}$ Gaseous Modes of Sterilization, Metal or Plastic Carriers, follow the same procedures as listed for steam, dry heat, and ethylene oxide biological indicators, paper carriers that are described in this section. The $D$-value exposure conditions for hard surface carriers, such as metal and plastic are the same as the conditions used to determine the $D$ value for paper carriers. If the manufacturer's label permits usage of the biological indicator carrier with all modes of sterilization, then $D$-value, survival-time, and kill-time data will need to be provided by the manufacturer for each mode of sterilization. It is highly likely that metal and plastic biological indicators will be used for gaseous sterilization methods including vapor phase hydrogen peroxide and chlorine dioxide surface sterilization. In those cases the manufacturer will need to define the testing equipment and operational parameters to be used in $D$-value testing. At this time apparatus for conducting $D$-value analyses using vapor phase hydrogen peroxide and chlorine dioxide is not defined in a U.S. standard. The manufacturer, therefore, needs to assure that equipment used for gaseous $D$-val$u e$ determinations is equipped with temperature and relative humidity controls and that the equipment permits adequate mixing of the gaseous sterilant within the chamber environment. Where technology is available, the test chamber should be equipped with monitoring devices for temperature, pressure, humidification, and gas concentration. If gas concentration cannot be accurately measured, the manufacturer must provide the calculation methods used for determining the gaseous phase concentration during the exposure period of the carriers to the gaseous sterilant. The test chamber must also attain an exposure gas concentration in a defined time range and be maintained at a constant gas concentration range for a stated period.

For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions, conduct $D$-value determinations for each of the microorganisms that are provided as a liquid spore crop suspension. The test is conducted using $0.1-\mathrm{mL}$ aliquots of the original suspension, transferred to 9.9 mL of Purified Water in a sterile tube. Follow $D$-value procedures specified under Biological Indicator for Steam Sterilization, Paper Carrier. Using the Survival Curve method for determination of $D$ values, follow incubation procedures included in Total viable spore count under Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers. The label for $B$. athrophaeus must contain a moist heat, as well as a dry heat, value. The dry heat $D$ value will need to be obtained by inoculating a suitable hard surface carrier, such as metal or glass, with 0.1 mL of the original spore suspension prior to exposing the carrier to conditions stated under Biological Indicator for Steam Sterilization, Paper Carrier. $\mathbf{\Delta U S P 2 8}$

## Recovery

After completion of the sterilizing procedure for Biological Indicator for Dry-Heat Sterilization, Paper Carrier, Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, or Biological Indicator for Steam Sterilization, Paper Carrier, whichever is applicable, and within a noted time not more than 4 hours, aseptically remove and add each strip to 10 to 30 mL of Soybean-Casein Digest Medium (see Media under Sterility Tests $\langle 71\rangle$ ) to submerge the biological indicator completely in a suitable tube. For each Biological Indicator for Steam Sterilization, Self-Contained specimen, the paper strip is immersed in the self-contained medium according to manufacturers' instructions, within a noted time not more than 4 hours. Incubate each tube at a temperature of $55^{\circ}$ to $60^{\circ}$ for Biological Indicator for Steam Sterilization, Paper Carrier and Biological Indicator for Steam Sterilization, Self-Contained or at $30^{\circ}$ to $35^{\circ}$ for Biological Indicator for Dry-Heat Sterilization, Paper Carrier, and Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier or in any case at the optimal recovery temperature specified by the manufacturer. Observe each inoculated mediumcontaining tube at 24 and 48 hours, and every 1 or 2 days thereafter for a total of 7 days after inoculation. (Where growth is observed at any particular observation time, further incubation of the specimen(s) concerned may be omitted.) Note the number of specimens showing no evidence of growth at any time.
${ }^{4}$ For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers, recovery of spores from the biological indicator carriers will follow recovery procedures described in the procedures under Total Viable Spore Count. Any one of several described $D$-value determination methods for paper carrier biological indicators may be used to calculate the $D$ value for metal or plastic carriers. Incubation conditions for the four microorganisms that may be used for metal and plastic biological indicators are described in the Total Viable Spore Count section.

For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions, the method of recovery following sterilization exposure conditions are those methods described in the Total Viable Spore Count section for liquid suspensions, and when a dry heat $D$-value determination is made from $B$. athrophaeus suspensions, the same recovery procedures as described under Biological Indicator for Steam Sterilization, Paper Carrier are followed. $\Delta U S P 28$

## Calculation

This chapter describes the use of the Limited Spearman-Karber Method for determining the $D$ value of biological indicators on spore paper carriers. Use this method in the event of a compendial issue or regulatory referee testing of a biological indicator system. It is recognized that other methods, such as the Survival Curve Method and the Stumbo-Murphy-Cochran procedure, may be routinely used by manufacturers and users of biological indicators to determine $D$ values. The calculation of the $D$ value using the Limited Spearman-Karber Method is based on the use of 10 biological indicators per group. [NOTE-If less than 10 biological indicators are used (i.e., 5), the formula and the various calculation steps will have to be modified, including the Replacement of Missing Values; however, the requirements of the test remain the same.]

Designate the number of specimens taken for each group (i.e., 10) by $n$, and the difference between adjacent times (in minutes) by $\delta$. Designate for each group of the series the number of specimens showing no growth by:

$$
f_{1}, f_{2}, \ldots f_{k}
$$

in which $f_{1}$ is the response of all 10 specimens showing growth $(0 /$ 10 inactivated) in the group held for the shortest time for such result that is adjacent to an intermediate mortality; and $f_{k}$ is the response of all 10 specimens of the group showing no growth (10/ 10 inactivated) in the group held for the longest time for such result that is adjacent to an intermediate mortality. Do not use for the cal-
culations observations for groups beyond the ends of the series, $f_{1}$ and $f_{k}$, giving results that are not adjacent to an intermediate mortality. The test is valid if there is available a result $(0 / 10)$ from a group held for a shorter time than that for the selected shortest time result $\left(f_{1}\right)$, and there is available a result $(10 / 10)$ from a group held for a longer time than that for the selected longest time result $\left(f_{k}\right)$. Calculate the mean heating time, $T$, for achieving complete kill by the equation:

$$
T=T_{k}-\delta / 2-\left(\delta / 10 \times \sum_{l=1}^{k-1} f_{l}\right)
$$

in which $T_{k}$ is the time for achieving the result $f_{k}$. Calculate the $D$ value by the equation:

$$
D=\left(\frac{T}{\log N_{0}+0.2507}\right)
$$

in which $N_{0}$ is the average spore count per carrier determined by Total Viable Spore Count (see above) at the time of making this test. Calculate the variance of $T, V_{T}$, by the equation:

$$
V_{T}=\frac{\delta^{2}}{n^{2}(n-1)} \times \sum_{l=1}^{k-1} f_{l}\left(10-f_{l}\right)
$$

in which $\delta$ represents a constant interval between successive exposures, as defined above.

The standard deviation, $s_{T}$, is the square root of the variance:

$$
s_{T}=\sqrt{V_{T}}
$$

Calculate the lower and upper 95\% confidence limits (approximate CL ) for the $D$ value by the equation:

$$
\text { approximate CL for } D=\left(T \pm 2 s_{T} / \log N_{0}+0.2507\right)
$$

## Replacement of Missing Values

If not more than 1 specimen from a group and not more than 2 specimens from all of the groups giving the results $f_{1}$ through $f_{k}$ are missing, replace each missing value by adding 0 to the number showing no growth, if the number showing no growth in the remaining 9 specimens of that group is 4 or less, and adding 1 if the number showing no growth in the remaining 9 specimens of that group is 5 or more.

## Survival Time and Kill Time

Take two groups, each consisting of 10 specimens of the relevant biological indicator, in their original, individual containers. Place the specimens of a group in suitable specimen holders that permit each specimen to be exposed to the sterilizing conditions at a specific location in the sterilizing chamber. Check the chamber for operating parameters by preheating it to the selected temperature $\pm 2^{\circ}$ in the cases of Biological Indicator for Dry-Heat Sterilization, Paper Carrier and Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier or $\pm 0.5^{\circ}$ in the cases of Biological Indicator for Steam Sterilization, Paper Carrier and Biological Indicator for Steam Sterilization, Self-Contained.

For Biological Indicator for Dry-Heat Sterilization, Paper Carrier, preheat the unit to temperature, and equilibrate the heat chamber. Open the access door or port, and place the holder(s) in the chamber, close the access door or port, and continue to operate the apparatus. Commence timing the heat exposure when the chamber temperature returns to the lower limit of the selected temperature. Expose the specimens for the required survival time, enter the chamber, and remove the holder(s) containing the 10 specimens. Repeat the above procedure immediately, or preheat if a substantial interval has elapsed, so as to subject the second holder(s) containing 10 specimens similarly to the first conditions, but for the required kill time.

For Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier preheat the chamber to equilibrium at the selected temperature $\pm 2^{\circ}$, and initiate and monitor the operating steps 1 through 6 as described for D-Value Determination, appropriate for the combination of gas concentration, temperature, and relative humidity, using a gassing time in step 4 appropriate to the survival time. Repeat the above procedure with two or more groups each consisting of 10 specimens, but using a gassing time in step 4 appropriate to the kill time.

For Biological Indicator for Steam Sterilization, Paper Carrier and Biological Indicator for Steam Sterilization, Self-Contained exhaust the steam chamber, and open the door. Within 15 seconds of opening the door place the loaded holder(s) into the chamber, and operate the apparatus to heat the chamber contents as quickly as possible. Expose the specimens for the required survival time, counting the exposure from the time when the temperature record shows that the chamber has reached the required temperature. Exhaust the chamber as quickly as possible at the end of the exposure period. When the chamber can be safely entered, remove the holder(s) containing the specimens. Repeat the above procedure immediately, or preheat if a substantial interval has elapsed, so as to subject the holder(s) containing 10 specimens similarly to the first exposure. Repeat the above procedure with two more groups each consisting of 10 specimens, but expose the specimens for the required kill time. In each case for the Biological Indicator for Dry-Heat Sterilization, Paper Carrier, Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, or Biological Indicator for Steam Sterilization, Paper Carrier, whichever is appropriate, after completion of the sterilizing procedure, and within a noted time not more than 4 hours, aseptically remove and add each carrier to 10 to 30 mL of Soybean-Casein Digest Medium (see Media under Sterility Tests $\langle 71\rangle$ ) to submerge the biological indicator completely in a suitable tube. Incubate each tube at a temperature of $55^{\circ}$ to $60^{\circ}$ in the case of Biological Indicator for Steam Sterilization, Paper Carrier, or of $30^{\circ}$ to $35^{\circ}$ in the cases of Biological Indicator for Dry-Heat Sterilization, Paper Carrier,
and Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, or at the optimal temperature specified by the manufacturer. For Biological Indicator for Steam Sterilization, Self-Contained the paper strip is immersed in self-contained medium according to manufacturers' instructions within a noted time not more than 4 hours and incubated at $55^{\circ}$ to $60^{\circ}$. Observe each inoculated medium-containing tube at 24 and 48 hours, and every 1 or 2 days thereafter for a total of 7 days after inoculation. (Where growth is observed at any particular observation time, further incubation of the specimen(s) concerned may be omitted.) Note the specimens showing no evidence of growth at any time.
${ }^{\boldsymbol{\Delta}}$ For Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers, use the conditions stated for paper strips as described in this section. The method of sterilization selected is dependent on the intended mode of sterilization for the biological indicator.

The Survival time and kill time for Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions is described in the Official Monograph under the same heading. $\triangle U S P 28$

## Chemical Tests and Assays

LIMIT TESTS

BRIEFING
<231〉 Heavy Metals, USP 27 page 2204 and page 1603 of $P F$ 29(5) [Sept.-Oct. 2003]. It is proposed to add a Monitor Preparation to Method III.

## Physieochemieal Test Procedures

The following tests are designed to determine pertinent physieo－ ehemical extraction characteristies of elastomeric elosures．Sinee the tests are based on the extraction of the elastomer，it is essentiat that the designated amoun of sufface are of sample be available． meach ease，the specified surface area is available for extraction at the designated temperature．The test methods are devised to detect the majority of expected variations．

Extraction－Solvents－
A：Purified Water．
B：Drug product vehicle（where applieable）．
C：Isoprepyl aleohel．
Apparatus
Autuclave Use an atuclave capable of maintaining a tempera ture of $121 \pm 2^{\circ}$ ，equipped with a thermemeter，a pressure gauge， and a rack adequate to accommodate the test containers above the water level．

Oven Use an oven，preferably a foreed draft model，that will maintain an operating temperature of $105^{\circ} \pm 2^{\circ}$ ．

Reflux Apparattr Use a suitable reflux apparatus having a eapacity of about 500 mL ．

Proeedure－
Preparation of Sample Place in a suitable extraction container a－sufficient number of elastomeric closures to provide $100 \mathrm{~cm}^{2}-0 f$ expesed surface area．Add 300 mL of purified water to ach con fainer，cover with a suitable inverted beaker，and autoclave at 124 $\pm 0.5^{\circ}$ for 30 minuter．［NOTE－Adjust so that the mperature rises rapidly，preferably within 2 to -5 minutes．］Deeant，using a stainless steel sereen to hold the elosures in the containers．Rinse with 100 mL of purified water，gently swinl，and discard the rinsings．Repeat with a second 100 mL pertion of purified water．Treat all blank eontainers in a similar manner．

Extract（with use of Extion Solvent A）Place a properly prepared sample，having an exposed surface area $100 \mathrm{~cm}^{2}$ ，im a suitable container，and add 200 mL of purified water．Cover with a suitable inverted beaker，and extract by heating in an autoclave at $121^{\circ}$ for 2 hours，allowing alequate time for the liquid within the eentainer to reach the extraction temperattre．Allow the attelave to cool rapidly，and cool to room temperature．Treat the blank con－ tainer in a similar manner．

Extracts（with use of Extran Solvent Bor C）Place aprop－ erly prepared sample，having an expesed sufface area of $100 \mathrm{~cm}^{2}$ ； in a suitable Reflux Apparatucentrining 200 mL of Extraction folvent，and reflux for 30 minutes．Treat the blank in a similar man－ ner．

Turbidity [NoTE-Use Extracts prepared with Extraction Sol vent $A, B$, or $C$.$] Agitate the container, and transfer a sufficient$ quantity of Extract, diluted with Extraction Solvent, if necessary, to cell. Measure the turbidity in a suitable ratio turbidimeter (see Spectrophemetry and Light Seattering (854)) against fixed reproducible standards.* The turbidity is the difference between the values obtained for the blank and the sample expressed in Nephelemetric Turbidity Units (NTU), an arbitrafy linear numerieal seale expressing a haze range from absolute clarity to the zone of turbid-势

Redueing Agents-[NOTE-Use Extracts prepared with Extrac tion Solvent A.] Agitate the container, transfer 50 mL of sample extract to a suitable eontainer, and titrate with 0.01 N iodine VS, using 3 mL of stareh TS as the indientor. Treat the blank extract in a similar manner. The difference between the blank and the sample titration is expressed in mL of 0.01 N iodine.

Heary Metals- $\langle\mathbf{z 3 1}\rangle$ - [NOTE-Use Extracts prepared with Ex tan Solvent 4 or $B$.] Transfer 20 mL of the blank and the sant ple ex racts to separate color comparisen tubes. Transfer 2, 6 , and 10 mL of Standed Lead Solution into separate color comparisen tubes, add 2 mL of 1 N acetic acid to each tube, and adjust the vol ume to 25 mL with purified water. Add 10 mL of freshly prepared hydregen sulfide TS to each tube, mix, allow to stand for 5 min utes, and view downward over a white surface. Determine the amount of heary metals in the blank and in the sample. The heary metals content is the difference between the blank and the sample. pH-Change [NOTE-Use Extracts prepared with Extraction Solven $A$ or $B$, adding to extracts obtained with Solvent $A$ suffit eient potassium ehloride to provide a concentration of $0.1 \%$.] Determine the pH of sample extracts $A$ and $B$ potentiometrieally, performing blank determinations with blank extracts $A$ and $B$, and making any necessary corrections. The pH change is the dif ference between the blank and the sample.

Total Extraetables [NOTE-Use Extrets prepared with Ex action Solvent $A, B$, or $C$.] Agitate the containers, and transfer 100 mL aliquets of the blank and the sample to separate, taredeva perating dishes. Evaperate on a steam bath to dryness (Extrats prepared with Extraction Solvent C) or in an oven at $100^{\circ}$, dry at $105^{\circ}$ for 1 hour, cool in a desicentor, and weigh. Caleulate the totat extractables, in me, by the formula:-

$$
z\left(H_{t}-\quad H_{B}\right)
$$

in whieh $H_{y}$ is the weight, in mg, of residue found in the-sample extract aliquet, and $W_{B}$ is the weight, in mg, of residue found in the blank solution aliquet.

## ${ }^{\triangle}$ INTRODUCTION

Elastomeric closures for containers used in the types of preparations defined in the general test chapter Injections $\langle 1\rangle$ are made of materials obtained by vulcanization (cross-linking) polymerization, polyaddition, or polycondensation of macromolecular organic substances (elastomers). Closure formulations contain natural or synthetic elastomers and inorganic and organic additives to aid or control vulcanization, impart physical and chemical proper-

[^14]ties or color, stabilize the closure formulation, or for other purposes. This chapter applies to closures formulated with natural or synthetic elastomeric substances. This chapter does not apply to closures made from silicone elastomer, ła minated closures, or laequered closures, although it does apply to the base elastomer of such eontedestres. however, it does apply to closures treated with silicone (e.g., Dimethicone, $N F$ ). For laminated or coated closures (e.g., PTFE or lacquer coatings), the physicochemical and identification tests apply only to the base elastomer, and not to the laminate coat. However, the functionality tests apply to the entire coated elastomeric closure.

This chapter states test limits for Type I and Type II elastomeric closures: Examples of Type I closures are those used for single-dose containers for aqueous solutions, aqueous suspensions, or solids intended to be reconstituted with an aqueous vehicle. Type II closures are those that, having properties optimized for special uses, may not meet all requirements listed for Type I closures due to physical configuration, material of construction, or both. Examples of Type II closures are those used for multiple-dose containers for injections; single-dose or multiple-dose containers for injections containing vegetable oils, including emulsions and liposomal formulations; er injectable formulations containing other nonaqueous vehicles; Elastomeric seals for injection sites on IV sets, needle shields, or other seals requiring stretchability or resealability may also be ineluded in this and containers of solids intended to be reconstituted with a nonaqueous vehicle.

This chapter is intended as an initial screen to identify elastomeric closures that might be appropriate for use with parenteral preparations on the basis of their biological compatibility, their aqueous extract physicochemical properties, and their functionality. All elastomeric closures suitable for use with parenteral preparations comply with either Type I
or Type II test limits. However, this specification is not intended to serve as the sole evaluation criterion for the selection of such closures. It is the responsibility of the manufacturer of the parenteral preparation to ensure that the closures chosen for use with a partieular preparation enform to the following:-

The components of the preparation in contact with the elestre are not adserbed onte the surface of the clestres and do not migrate into or through the closure to anextent sufficient to affect the preparation adversely. The closure doe not leach substances in quantities suf ficient to affeet product stability assays or tests and the quantity of these substance are harmless in the amounts administered to the patient population for whom the product is intended.

The closures perform all required functions and are eompatible with the preparation for which they are used throughout the product's labeled expiration date.

The following closure evaluation requirements are beyond the scope of this chapter:
-the establishment of closure identification tests and specifications;
-the verification of closure-product physicochemical compatibility;
-the identification and safety determination of closure leachables found in the packaged product; and -the verification of packaged product closure functionality under actual storage and use conditions.

The manufacturer of the preparation must obtain from the supplier an assurance that the composition of the closure does not vary and that it is identical to that of the closure used during compatibility testing. When the supplier informs the manufacturer of the preparation of changes in the composition, compatibility testing must be
repeated, totally or partially, depending on the nature of the changes. Closures must be properly stored, cleaned for removal of environmental contaminants and endotoxins, and sterilized prior to use in packaging parenteral products.

## CHARACTERISTICS

Elastomeric closures are homogeneous and practically free from flash and adventitious materials (e.g., fibers, foreign particles, waste rubber).
Identification of the type of elastomeric material used for the closures is not within the seope of this chapter. The identifieation tests given below distingurisher between elastomeric and monelastomeric closures but does not differentiate the various ypes of material. Identifieation tests ther than these described in this menegraph may be used an routine basis in order to verify that the closures in question are of the same formulation as these previously ap proved for use. Other analytieal methods that may be applied for identification purpes inelude the following:

- determination of relative density
- determination of sulphated ash
- determination of sulphur content
- thin layer chromatography carried out on an extract
- UV absorption spectrophotemetry of an extract
- IR abserption spectrophotometry of a pyrolysate

## IDENTIFICATION TESTS

Identifieation Test A: Streteh a strip of material with a eross section of 1 to $5 \mathrm{~mm}^{2}$ to twice its original length. After holding at wice its length for 1 minute, allow the strip to relax for 30 seconds. The elastomer conforms to the requirements for elasticity if it contracts to less than 1.2 times its eriginal length within 30 -secends.

Identification Test B: Heat 1 to 2 gof material in a heat resistant test tube over an open flame to dry the sample, and eontinue heating until pyrolysate vapers are condensed near the top edge of the test tube. Deposit several drops of the pyrolysate on a potassium bromide dise, and examine by IR abserption spectrephetemetry. The-sample conforms te the test if the IR absorption spectrum matehes that of a ref erence sample of the elastomer.

Identifieation Test C (see Residue on Ignition-(z81));: The residtue is within $\pm 10 \%$ of the result obtained with a reference sample of the elastomer.

Closures are made of a wide variety of elastomeric materials and optional polymeric coatings. For this reason, it is beyond the scope of this chapter to specify identification tests that encompass all possible closure presentations. However, it is the responsibility of the closure supplier and the pharmaceutical manufacturer to verify the identity of the closure elastomeric formulation and any coating or laminate materials used according to suitable, specific identification tests. Examples of some of the analytical test methodologies that may be used include specific gravity determination, sulfated ash determination, sulfur content determination, thin-layer chromatography of an extract, UV spectrophotometry of an extract, or IR absorption spectrophotometry of a pyrolysate.

## TEST PROCEDURES

## Pretest Preparation-of Sample

Whenever pessible, closures should be put into ready tousecondition before being tested, by processing the closures in a manner that will be utilized in normal production con ditions. If clesure-silieonization has been found to-skew physicochemieal analysis results, this process may be elimifated from the proeessing steps. If it is net feasible or practical to utilize normal production conditions, clesures are to
be prepared according to the following procedtre. Place a sufficient number of uncut elastomeric closures to provide $150 \mathrm{~cm}^{2}$-ff expesed surface area in a wide-neeked Type-I glass flack. Add 300 mL of water, cover with an inverted beresilieate-glass beaker, and heat in an autoclave-so that a temperature of $121 \pm 2^{\circ}$ is reached within 20 10-30 min utes, and maintain this temperature for 30 minutes. As quickly as pessible after autoclaving, separate the liquid from the elastomers by decantation. Rinse closures with 100 mL of water, gently swirl, and diseard the rinsings. Repeat the rinsing with a secend 100 mL pertion of water. [NOTE_If clesures undergo normal production conditions ether than autoclaving or steam-sterilization, conditions which are known to affect closure biological reactivity, phy sicochemical characteristies, or functionality (e.g., gamma irradiation), such proeesses must be included in the-sample preparation. $]$

Before performing biological, physicochemical, or functionality tests, it is advisable to pretreat and process closures in a manner simulating actual conditions of use. This is especially important if closures are exposed to processes that may significantly impact the biological, physicochemical, or functionality characteristics of the closure (e.g., gamma irradiation). Elastomeric closures that are normally siliconized prior to use may undergo physicochemical testing without siliconization in order to avoid potential method interference and/or difficulties in interpreting test results. It is appropriate to document the conditions of closure processing, pretreatment, and siliconization when reporting test results.

## Biological Tests

Two stages of testing are indicated. The first stage is the performance of an in vitro test necording to the Agar Diffut sion Test procedure as described in general test chapter Bio-
logical Reactivity Tests, In Vitro $\langle 87\rangle$. Materials that meet the requirements of the in vitro test are not required to undergo further testing.

Materials that do not meet the requirements of the in vitro test are subjected to the second stage of testing, which is the performance of the in vivo tests, Systemic Injection Test and Intracutaneous Test, according to the procedures set forth in the general test chapter Biological Reactivity Tests, In Vivo <88〉.

Type I and Type II closures must both conform to the requirements of either the in vitro or the in vivo biological reactivity tests. [NOTE-Also see the general information chapter The Biocompatibility of Material Used in Drug Containers, Medical Devices, and Implants $\langle 1031\rangle$.]

## Physicochemical Tests

## PREPARATION OF SOLUTION S

Place uncut closures corresponding to a surface area of about $100 \mathrm{~cm}^{2}$ into a suitable glass container, cover with Purified Water or Water for Injection, boil for 5 minutes, and rinse with cold Purified Water or Water for Injection. Place the washed closures into a Type I glass wide-necked flask (see Containers $\langle 661\rangle$ ), add 200 mL of Purified Water or Water for Injection, and weigh. Cover the mouth of the flask with a Type I glass beaker. Heat in an autoclave so that a temperature of $121 \pm 2^{\circ}$ is reached within 20 to 30 minutes, and maintain this temperature for 30 minutes. Cool to room temperature over a period of about 30 minutes. Add Purified Water or Water for Injection to bring it up to the original mass. Shake and immediately decant, and collect the solution. [NOTE-This solution must be shaken before being used in each of the tests.]

## APPEARANCE OF SOLUTION

NOTE-The determination of turbidity may be performed instrumentally using a turbidimeter or by visual comparison.

Opalescence Stock Suspension-Prepare an aqueous solution containing $1 \%$ hydrazine sulfate, and allow to stand for 4 to 6 hours. Prepare an aqueous solution containing $10 \%$ hexamethylenetetramine. Mix equal parts of these solutions, and allow to stand for 24 hours. This Opase Suspension Opalescence Stock Suspension is stable for about 2 months, provided it is stored in a glass container free from surface defects. Mix well before use to ensure nonadherence of material to the container. Discard if the suspension adheres to the glass.

Opalescence Stoek Solution Standard SuspensionPrepare a solution by diluting 15 mL of the Suspansion Opalescence Stock Suspension with water to 1000 mL .

Reference Solution Suspension A-Prepare asolution eontaining 10 mL of freshly prepared Opalese Stock Solution and of water. Prepare a suspension containing 5.0 mL of freshly prepared Opalescence Standard Suspension and 95.0 mL of water.

Reference Solution Suspension B-Prepare alution entrining 30 mL of Opalescence Stock Solution and of Prepare a suspension containing 10.0 mL of Opalescence Standard Suspension and 90.0 mL of water.

Reference Suspension C-Prepare a suspension containing 30.0 mL of Opalescence Standard Suspension and 70.0 mL of water.

Procedure A-Use identical test tubes made of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm . Fill one tube to a depth of 40 mm with Solution S, and three others to the same depth with Reference Suspensions $A, B$, and $C$. Compare the solutions in diffuse daylight 5 minutes after preparation of the reference
suspensions, viewing vertically against a black background. The light conditions shall be such that Reference Suspension $A$ can be readily distinguished from water and that Reference Suspension $B$ can be readily distinguished from Reference Suspension $A$.

Procedure B-Measure the turbidity in a suitable turbidimeter (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) against Reference Suspensions $B$ and $C$.

Requirement-Solution $S$ is not more opalescent than
Referene Solution 4 for Type I closures and not more opalescent than Reference Solution B for Type H-closures. Solution $S$ is not more intensely colored than an equal quantity of examined through identieal, colorless, transparent, and neur tral glass containers, viewed vertically against a white backgreund in diffuse daylight. The difference in Formazine turbidity units (FTU) between Solution $S$ and Reference Suspension $B$ is not greater than 6 FTU for Type I closures and the difference between Solution $S$ and Reference Suspension $C$ is not greater than 18 FTU for Type II closures. For visual inspection Solution $S$ is not more opalescent than Reference Suspension A for Type I closures and not more opalescent than Reference Suspension B for Type II closures. Solution $S$ is not more intensely colored than an equal quantity of a mixture of 6.0 mL of Matching Fluid $O$ (see Color and Achromicity $\langle 631\rangle$ ) and 94.0 mL of diluted hydrochloric acid, examined through identical, colorless, transparent, and neutral glass containers, viewed vertically against a white background in diffuse daylight.

## ACIDITY OR ALKALINITY

Bromothymol Blue Solution-Dissolve 50 mg of bromothymol blue in a mixture of 4 mL of 0.02 M sodium hydroxide and 20 mL of alcohol, and dilute with water to 100 mL .

Procedure-Transfer 20 mL of Solution $S$ to a suitable container, and add 0.1 mL of bromothymol blue TS. Bromothymol Blue Solution. Not more than 0.3 mL of 0.01 N sodium hydroxide produces a blue color. Continue using this same solution to test for alkalinity: not more than 0.8 mL of 0.01 N hydrochloric acid produces a yellow color.

## UV ABSORBANCE

[NOTE-Perform this test within 5 hours of preparing Solution $S$. If dilution of the filtrate is required, the test result must be corrected.] Filter Solution $S$ through a filter, having a $0.45-\mu \mathrm{m}$ porosity discarding the first few mL of the filtrate. Record the UV spectrum between 220 nm 200 nm and 360 nm in a $1-\mathrm{cm}$ cell, with water in a matched cell in the reference beam: the absorbances at these wavelengths do not exceed 0.2 for Type I closures or 4.0 for Type II closures.

## REDUCING SUBSTANCES

[NOTE-Perform this test within 4to 5 hours of Stand prepare preparing Solution S.] Transfer 20.0 mL of Solution $S$ to a $250-\mathrm{mL}$ conical flask, and add 1 mL of diluted sulfuric acid 25 mL of alkaline eupric eitrate TS, and 20 mL of 0.002 N petassium permanganate. and 20 mL of 0.002 M potassium permanganate. Cover the flask, boil for 3 minutes, and cool rapidly to room temperature. Add 1 g of potassium iodide, and titrate with 0.01 N sodium thiosulfate VS, using 0.25 mL of starch solution TS as the endpoint is approached. Perform a blank determination, omitting the specimen, and note the difference in volume of 0.01 N sodium thiosulfate required. The difference between the titration volumes is not greater than 3.0 mL for Type I closures and not greater than 7.0 mL for Type II closures.

## HEAVY METALS

Proceed as directed for Method I under Heavy Metals $\langle 231\rangle$ : not more than $0.0002 \%$ ( 2 ppm ).

## SOLUBLE ZINC CONTENT

Test Solution-Transfer 10.0 mL of Solution $S$ to a 100mL volumetric flask, add 0.5 mL of 0.1 N hydrochloric acid, dilute with 0.1 N hydrochloric acid to volume, and mix.

Zinc Standard Solution-Dissolve an accurately weighed quantity of zinc sulfate in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution having a known concentration of 5 mg of zinc per mL .

Reference Solution-Transfer 1 mL of Zinc Standard Solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 10.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add 0.5 mL of 0.1 N hydrechloric acid, dilute with 0.1 N hydrochloric acid to volume, and mix.

Procedure-Concomitantly determine the absorbances of the Reference Solution and the Test Solution at the zinc emission line at 213.8 nm , with a suitable atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) equipped with a zinc hollow-cathode lamp and an air-acetylene flame, and using 0.1 N hydrochloric acid as the blank. The absorbance of the Test Solution is not greater than that of the Reference Solution.

## AMMONIUM

Take 5 mL of Solution $S$, and if necessary adjust the pH to alkaline using sodium hydroxide TS. Dilute with water to 15 mL , and add 0.3 mL of alkaline mercuric-potassium iodide TS. Prepare a control by dissolving an accurately weighed quantity of ammonium chloride in water and diluting step-
wise to obtain a solution having a known concentration of 1 $\mu \mathrm{g}$ of ammonium ( 1 ppm ) per mL . To 10 mL of this solution add the same amount of sodium hydroxide TS as was added to Solution $S$. Dilute with water to 15 mL , and add 0.3 mL of alkaline mercuric-potassium iodide TS. Any yellow color produced immediaty after 5 minutes is no darker than the color obtained in the control ( 2 ppm ).

## TOTAL SOLIDS

Evaporate 50 mL of Solution $S$ on a water bath to dryness. Dry the residue at $100^{\circ}$ to $105^{\circ}$ for 1 hour, and weigh: not more than 2.0 mg for Type I closures and not more than 4.0 mg for Type II closures is obtained.

## VOLATILE SULFIDES

Place closures, cut if necessary, with a total surface area of $20 \pm 1 \mathrm{~cm}^{2}$ in a $100-\mathrm{mL}$ flask, and add 50 mL of a $2 \%$ citric acid solution. Separately prepare a control solution by placing 0.154 mg of sodium sulfide in a $100-\mathrm{mL}$ flask, and dissolving in 50 mL of a $2 \%$ citric acid solution. Place a piece of lead acetate paper over the mouth of each flask, and maintain the paper in position by placing over it an inverted weighing bottle. Heat the flasks in an autoclave at $121 \pm$ $2^{\circ}$ for 30 minutes. Any black stain on the paper produced by Solution $S$ is not more intense than that produced by the control solution.

## Functionality Tests

NOTE-The following functionality tests of penetrability, fragmentation, and self-sealing, are performed on closures intended to be pierced by a hypodermic needle. The selfsealing test is required only for closures intended for multi-
ple-dose containers. The needle specified for each test is a lubricated long bevel (bevel angle $12 \pm 2^{\circ}$ ) hypodermic needle ${ }^{1}$ with an external diameter of 0.8 mm (21 gauge). However, if needles other than the one specified are required for a specific product package, the manufacturer of the product may consider using these test procedures to verify the closure's functionality under actual conditions of use. In this case, the needle used is described when reporting test results.

## PENETRABILITY

This test is performed on closures intended to be pierced by a hypodermic needle. Fill 10 suitable vials to the nominal volume (or capacity) with water, fit the closures to be examined, and secure with a cap. Using a new tubried leng bevel (bevel angle $12 \pm 2^{\circ}$ ) hypodermic needle, with anew ternal diameter of 0.8 mm , for each sample, hypodermic needle as described above for each sample, pierce the closure with the needle perpendicular to the surface. The force for piercing is not greater than $10 \mathrm{~N}(1 \mathrm{kgf})$ determined with an accuracy of $\pm 0.25 \mathrm{~N}$ ( 25 gf ) for each closure.

## FRAGMENTATION

This test is performed on clesures intended to be piereed

## by a hypodermic needle.

## Aqueous Type I Closures for Liquid Preparations-

Fill 12 clean vials with water to 4 mL less than the nominal capacity. Fit the closures to be examined, secure with a cap, and allow to stand for 16 hours.

Type II Closures for Liquid Preparations-Fill 12 clean vials with sesame oil to 4 mL less than the nominal capacity. Fit the closures to be examined, secure with a cap, and allow to stand for 16 hours.

[^15]Closures for Dry Preparations-Fit closures to be examined into 12 clean vials, Using a hypodermic needle as leseribe above, inject int ach vial 1 mL of water while removing 1 mL of air. Repeat this procedure 4 times for each elestre, piercing each time at different site. Use a new nee dle for each clestre, cheeking that it is not blunted during the test. Filter the liquid in the vials through a filter having a perosity of $0.45 \mu \mathrm{~m}$, and count the rubber fragments vi swally. There are no more than 5 fragments visible ( $\leq-50$ Hm). In ease of doubt or dispute, the particles are to been amined mieroseopieally to determine their nature and size. and secure each with a cap.

Procedure-Using a hypodermic needle as described above, fitted to a clean syringe, inject into each vial 1 mL of water while removing 1 mL of air. [NOTE-For Type II Closures for Liquid Preparations, inject 1 mL of sesame oil while removing 1 mL of air.] Repeat this procedure 4 times for each closure, piercing each time at a different site. Use a new needle for each closure, checking that it is not blunted during the test. Filter the liquid in all the vials through a single filter having a porosity not greater than $0.5 \mu \mathrm{~m}$, and count the rubber fragments visually. There are no more than 5 fragments visible. This limit is based on the assumption that fragments with a diameter $\geq 50 \mu \mathrm{~m}$ are visible to the naked eye. In case of doubt or dispute, the particles are examined microscopically to determine their nature and size.

## SELF-SEALING CAPACITY

This test is performed on closures intended for use with multiple-dose containers. Fill 10 suitable vials with water to the nominal volume. Fit the closures that are to be examined, and cap. Using a hypodermic needle with 0.8 mm diameter, as described above for each closure, pierce each closure 10 times, piercing each time at a different site. Im-
merse the 10 vials in a solution of $0.5 \%$ methylene blue, and reduce the external pressure by 27 kPa for 10 minutes. Restore to atmospheric pressure, and leave the vials immersed for 30 minutes. Rinse the outside of the vials. None of the vials contain any trace of blue solution. $\triangle$ USP28
(Official January 1, 2006)

## Physical Tests and Determinations

## BRIEFING

(621〉Chromatography, USP 27 page 2272, page 170 of $P F$ 29(1) [Jan.-Feb. 2003], and page 2023 of PF 29(6) [Nov.-Dec. 2003]. The revisions proposed to the System Suitability section in this $P F$ are based on comments received regarding the proposals in $P F$ 29(1). Many comments were received concerning the specific numerical values chosen for permitted changes. Several correspondents suggested that these values should harmonize with the EP general chapter 2.2.46 Chromatographic Separation Techniques. On the basis of these comments, the Expert Committee decided that some of the numbers for allowable changes should be revised and that an effort should be made to harmonize with the $E P$. Additional text is added to address concerns regarding the multiple adjustments, the dwell volume, and the particle size for gas chromatography. The packing used in the test for Molecular weight distribution in the Antithrombin III Human monograph, appearing elsewhere in this $P F$, is added to the L packing already designated for Albumin Human under the Chromatographic Reagents section.

## SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the resolution and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

The resolution, $R$, [NOTE-All terms and symbols are defined in the Glossary of Symbols] is a function of column efficiency, $N$, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the
drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, $S_{R}$, if the requirement is $2.0 \%$ or less; data from six replicate injections are used if the relative standard deviation requirement is more than $2.0 \%$.

The tailing factor, $T$, a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see Fig. 2). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

Fig. 2. Asymmetrical chromatographic peak.
These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see Procedures under Tests and Assays in the General Notices). Adjustments of operating enditions to meet system suit ability requirements may be necessary.
${ }^{\boldsymbol{\Delta}}$ If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum specification that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when Reference Standards suitable standards (including Reference Standards) are available for all ant lytes compounds used in the suitability test and are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to cir-
cumvent replacing a deteriorated column. Multiple adjustmens that may have a cumulative effect in the performance of the system are to be avoided.
pH of Mobile Phase (HPLC)-The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within $\pm 0.2 \pm 0.5$ units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within $\pm 10 \%$, provided the permitted pH variation (see above) is met.

## Ratio of Components in Mobile Phase (HPLC)-The

 of the miner The following adjustment limits apply to minor components of the mobile phase (specified at $50 \%$ or less). The amount(s) of these component(s) can be adjusted by $\pm 30 \%$ relative or $\pm 2 \%$ absolute (i.e., in relation to the total mobile phase), whichever is larger. However, the change in any component cannot exceed $\pm 10 \%$ absolute, nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.
## Binary Mixtures-

SPECIFIED RATIO OF $50: 50$ - Thirty percent of 50 is $15 \%$ absolute, but this exceeds the maximum permitted change of $\pm 10 \%$ absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40:60 to $60: 40$.

SPECIFIED RATIO OF 95:5-Thirty percent of 5 is $1.5 \% \mathrm{ab}-$ solute. However, because adjustments up to $\pm 2 \%$ absolute are allowed, the ratio may be adjusted within the range of 93:7 to 97:3.

SPECIFIED RATIO OF 2:98-Thirty percent of 2 is $0.6 \%$ absolute. In this case an absolute adjustment of $\pm 2 \%$ is not allowed because it would reduce the amount of the first component to zero. Therefore the maximum allowed adjustment is within the range of 1.4:98.6 to 2.6:97.4.

## Ternary Mixtures-

SPECIFIED RATIO OF 60:35:5-For the second component, $30 \%$ of 35 is $10.5 \%$ absolute, which exceeds the maximum permitted change of $\pm 10 \%$ absolute in any component. Therefore the second component may be adjusted only within the range of $25 \%$ to $45 \%$ absolute. For the third component, $30 \%$ of 5 is $1.5 \%$ absolute. Since $\pm 2 \%$ absolute is permitted and provides more flexibility, the third component may be adjusted within the range of $3 \%$ to $7 \%$ absolute. In all cases, a sufficient quantity of the first component is used to give a total of $100 \%$. Therefore, mixture ranges of 50:45:5 to 70:25:5 or 58:35:7 to 62:35:3 would meet the requirement.

## Betectar Wavelength of UV-Visible Detector

 (HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, $\pm 3 \mathrm{~nm}$.Column Length (GC, HPLC): can be adjusted by as much as $\pm 70 \% .-50 \%$ to $+100 \%$.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as $\pm 25 \% 50 \% . \pm 25 \%$ for HPLC and $\pm 50 \%$ for GC.

Film Thickness (Capillary GC): can be adjusted by as much as $-50 \%$ to $+100 \%$.

Particle Size (HPLC): can be reduced by as much as 50\%.

Particle Size (GC): going from a larger to a smaller/a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter
of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as $\pm 50 \%$.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. It may be increased to as much as twice the volume speciffed, provided there are no adverse effects-on factors-sueh as baseline, peak shapes, resolution, linearity, and retention times.

Column Temperature (HPLC): can be adjusted by as much as $\pm 20^{\circ} . \pm 10^{\circ}$. Column thermostating is recommended to improve control and reproducibility of retention time.

Column Temperature (GC): can be adjusted by as much
as $\pm 2 \%$, in terms of absolute temperature $\pm 10 \%$.
Oven Temperature Program (GC)—Adjustment of
temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one to another, an adjustment of up to $\pm 20 \%$ is permitted.

Gradient Elution (HPLC)—The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column. $\triangle$ USP28

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.
The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be
performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails
$\Delta_{\text {system suitability }}^{\mathbf{\Delta U S P 2 8}}$
requirements are unacceptable.

## CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE-Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

## Packings

L1-Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L2-Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L3-Porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L4-Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.
L5-Alumina of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L6-Strong cation-exchange packing-sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L7-Octylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L8-An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, $10 \mu \mathrm{~m}$ in diameter.

L9- $10-\mu \mathrm{m}$ irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10-Nitrile groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L11-Phenyl groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L12-A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L13-Trimethylsilane chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L14-Silica gel $10 \mu \mathrm{~m}$ in diameter having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating.
L15-Hexylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L16-Dimethylsilane chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L17-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to $11 \mu \mathrm{~m}$ in diameter.

L18-Amino and cyano groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L19-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about $9 \mu \mathrm{~m}$ in diameter.

L20-Dihydroxypropane groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L21-A rigid, spherical styrene-divinylbenzene copolymer, 5 to $10 \mu \mathrm{~m}$ in diameter.

L22-A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about $10 \mu \mathrm{~m}$ in size.

L23-An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about $10 \mu \mathrm{~m}$ in size.

L24-A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to $63 \mu \mathrm{~m}$ in diameter. ${ }^{5}$

L25-Packing having the capacity to separate compounds with a molecular weight range from 100-5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26-Butyl silane chemically bonded to totally porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L27-Porous silica particles, 30 to $50 \mu \mathrm{~m}$ in diameter.
L28-A multifunctional support, which consists of a high purity, $100 \AA$, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C 8 functionality.

L29-Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 $\mu \mathrm{m}$ in diameter with a pore volume of $80 \AA$.

L30-Ethyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L31-A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of $8.5-\mu \mathrm{m}$ macroporous particles having a pore size of $2000 \AA$ and consisting of ethylvinylbenzene cross-linked with $55 \%$ divinylbenzene.

L32-A chiral ligand-exchange packing-L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L33-Packing having the capacity to separate dextrans by molecular size over a range of 4000 to $500,000 \mathrm{Da}$. It is spherical, silica-based, and processed to provide pH stability. ${ }^{6}$

L34-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about $9 \mu \mathrm{~m}$ in diameter.

L35-A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of $150 \AA$.

L36-A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to $5-\mu \mathrm{m}$ aminopropyl silica.

L37-Packing having the capacity to separate proteins by molecular size over a range of 2,000 to $40,000 \mathrm{Da}$. It is a polymethacrylate gel.

L38-A methacrylate-based size-exclusion packing for watersoluble samples.

L39-A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40-Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to $20 \mu \mathrm{~m}$ in diameter.

L41-Immobilized $\alpha_{1}$-acid glycoprotein on spherical silica particles, $5 \mu \mathrm{~m}$ in diameter.

L42-Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, $5 \mu \mathrm{~m}$ in diameter.

L43-Pentafluorophenyl groups chemically bonded to silica particles
$\square$ by a propyl spacer, $\boldsymbol{m}_{1 S}$ (USP27)
5 to $10 \mu \mathrm{~m}$ in diameter.

[^16]■YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■1S (USP27)
${ }^{6}$ Available as TSKgel G4000 SWXL from TosoHaas (www.tosohaas.com).

L44-A multifunctional support, which consists of a high purity, $60 \AA$, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C 8 functionality.

L45-Beta cyclodextrin bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L46-Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, $10 \mu \mathrm{~m}$ in diameter.

L47-High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, $8 \mu \mathrm{~m}$ in diameter. ${ }^{7}$

L48-Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, $15 \mu \mathrm{~m}$ in diameter.

L49-A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{8}$

L50-Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to $15 \mu \mathrm{~m}$ in diameter, and a surface area not less than $350 \mathrm{~m}^{2}$ per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene. ${ }^{9}$

L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{10}$

L52-A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{11}$

L53-Weak cation-exchange resin consisting of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to 15 $\mu \mathrm{m}$ diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than $500 \mu \mathrm{Eq} /$ column. ${ }^{12}$

L54-A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 $\mu \mathrm{m}$ in diameter. ${ }^{13}$
${ }^{\boldsymbol{\Delta}}$ L55-A strong cation-exchange resin made of porous silica coated with polybutadiene-maleic acid copolymer, about $5 \mu \mathrm{~m}$ in diameter. ${ }^{14}$
${ }^{\mathbf{\Delta}}$ L56-Propyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{15}{ }_{\Delta U S P 27}$
-L53 \#\# (Alendronic Acid Tablets, PRP-X100)—An an-ion-exchange resin consisting of a rigid, spherical styrenedivinylbenzene copolymer with trimethylammonium groups at a loading of about 2 mEq per g, 3 to $20 \mu \mathrm{~m}$ in diameter. ${ }^{\text {is }}$ (USP27)

[^17]-L54 \#\# (Maltose, Aminex HPX-87N)—Strong cationexchange resin consisting of sulfonated cross-linked styr-ene-divinylbenzene copolymer in the sodium form, about 7 to $11 \mu \mathrm{~m}$ in diameter. ${ }^{\mathrm{b}}$ (1S (USP27)
-L57 \#\# (Nevirapine, Supelcosil ABZ)—Spherical, porous silica gel, 3 or $5 \mu \mathrm{~m}$ in diameter, the surface of which has been covalently modified with palmitamidopropyl groups and endcapped with acetamidopropyl groups to a ligand density of about $6 \mu$ moles per $\mathrm{m}^{2}$. ${ }^{\mathrm{c}}$ (IS (USP27)
-L58 \#\# (Albumin Human, Antithrombin III Human, TSKgel G3000 SW)—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa . It is spherical $(10 \mu \mathrm{~m})$, silica-based, and processed to provide hydrophilic characteristics and pH stability. ${ }^{\text {d }}{ }_{1 S}$ (USP27)
-L59 \#\# (Clonidine, Zorbax SB-C3)—Propyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{21}{ }^{1 S}$ (USP27)
-L60 \#\# Bethanecol Chloride, Bethanecol Chloride Tablets, IC-Pak C M/D)—A strong cation exchange resin made of porous silica coated with polybutadiene-maleic acid copolymer, about $5 \mu \mathrm{~m}$ in diameter. ${ }^{23}$ 1S (USP27)
-L64 \#\# (Lycopene, Lycopene Preparation, YMC 30)-
C30 silane bonded phase on a fully porous spherical silica, 3 to $15 \mu \mathrm{~m}$ in diameter. $\quad 1 \mathrm{~S}$ (USP27)

[^18]-L\#\# (Clopidogrel Bisulfate, Ultron ES-OVM)—A chir-al-recognition protein, ovomucoid, chemically bonded to silica particles, about $5 \mu \mathrm{~m}$ in diameter, with a pore size of $120 \AA$. $\quad$ 2S (USP27)

## Phases

G1-Dimethylpolysiloxane oil.
G2-Dimethylpolysiloxane gum.
G3-50\% Phenyl-50\% methylpolysiloxane.
G4-Diethylene glycol succinate polyester.
G5-3-Cyanopropylpolysiloxane.
G6-Trifluoropropylmethylpolysiloxane.
G7-50\% 3-Cyanopropyl-50\% phenylmethylsilicone.
G8-80\% Bis(3-cyanopropyl)-20\% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).

G9-Methylvinylpolysiloxane.
G10-Polyamide formed by reacting a $\mathrm{C}_{36}$ dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00:0.90:0.20.

G11-Bis(2-ethylhexyl) sebacate polyester.
G12-Phenyldiethanolamine succinate polyester.
G13-Sorbitol.
G14-Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15-Polyethylene glycol (av. mol. wt. of 3000 to 3700 ).
G16-Polyethylene glycol compound (av. mol. wt. about 15,000 ). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.

G17-75\% Phenyl-25\% methylpolysiloxane.
G18-Polyalkylene glycol.
G19-25\% Phenyl-25\% cyanopropyl-50\% methylsilicone.
G20-Polyethylene glycol (av. mol. wt. of 380 to 420).
G21-Neopentyl glycol succinate.
G22-Bis(2-ethylhexyl) phthalate.
G23-Polyethylene glycol adipate.
G24-Diisodecyl phthalate.
G25-Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax $20 \mathrm{M}-\mathrm{TPA}$ from suppliers of chromatographic reagents.

G26-25\% 2-Cyanoethyl-75\% methylpolysiloxane.
G27-5\% Phenyl-95\% methylpolysiloxane.
G28-25\% Phenyl-75\% methylpolysiloxane.
G29-3, 3'-Thiodipropionitrile.
G30--Tetraethylene glycol dimethyl ether.
G31-Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30 ); Nonoxynol 30 .

G32-20\% Phenylmethyl-80\% dimethylpolysiloxane.
G33-20\% Carborane-80\% methylsilicone.
G34-Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35-A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36-1\% Vinyl-5\% phenylmethylpolysiloxane.
G37-Polyimide.
G38-Phase G1 containing a small percentage of a tailing inhibitor. ${ }^{16}$

G39—Polyethylene glycol (av. mol. wt. about 1500).
G40-Ethylene glycol adipate.
G41-Phenylmethyldimethylsilicone ( $10 \%$ phenyl-substituted).
G42-35\% phenyl-65\% dimethylpolysiloxane (percentages refer to molar substitution).

G43-6\% cyanopropylphenyl-94\% dimethylpolysiloxane (percentages refer to molar substitution).

G44-2\% low molecular weight petrolatum hydrocarbon grease and $1 \%$ solution of potassium hydroxide.

G45-Divinylbenzene-ethylene glycol-dimethylacrylate.
G46-14\% Cyanopropylphenyl-86\% methylpolysiloxane.
G47-Polyethylene glycol (av. mol. wt. of about 8000).
G48-Highly polar, partially cross-linked cyanopolysiloxane.
G49_Proprietary derivatized phenyl groups on a polysiloxane backbene. ${ }^{17}$
-G50 \#\# (Docosahexaenoic Acid)—Polyethylene glycol, cross-linked (av. mol. wt. of more than 20,000). ${ }^{\mathrm{e}}{ }^{1 S}{ }_{\text {(USP27) }}$

## Supports

NOTE--Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A-Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with $\mathrm{Na}_{2} \mathrm{CO}_{3}$ flux and calcining above $900^{\circ}$. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ${ }^{18}$ to mask surface silanol groups.

S1AB-The siliceous earth as described above is both acid- and base-washed. ${ }^{18}$

S1C-A support prepared from crushed firebrick and calcined or burned with a clay binder above $900^{\circ}$ with subsequent acidwash. It may be silanized.

S1NS-The siliceous earth is untreated.
S2-Styrene-divinylbenzene copolymer having a nominal surface area of less than $50 \mathrm{~m}^{2}$ per g and an average pore diameter of 0.3 to $0.4 \mu \mathrm{~m}$.

S3-Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to $600 \mathrm{~m}^{2}$ per $g$ and an average pore diameter of $0.0075 \mu \mathrm{~m}$.

S4-Styrene-divinylbenzene copolymer with aromatic - O and N groups, having a nominal surface area of 400 to $600 \mathrm{~m}^{2}$ per $g$ and an average pore diameter of $0.0076 \mu \mathrm{~m}$.

S5-40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

[^19]S6-Styrene-divinylbenzene copolymer having a nominal surface area of 250 to $350 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0091 \mu \mathrm{~m}$.

S7-Graphitized carbon having a nominal surface area of $12 \mathrm{~m}^{2}$ per $g$.

S8-Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9-A porous polymer based on 2,6-diphenyl-p-phenylene oxide.

S10-A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11-Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g modified with small amounts of petrolatum and polyethylene glycol compound. ${ }^{19}$

S12-Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g .

## Briefing

$\langle 645\rangle$ Water Conductivity, USP 27 page 2286. It is proposed to clarify the language in Stage 1 under Procedure to emphasize that it is a step function, not interpolation. The intention of the Pharmaceutical Waters Expert Committee is to use the more conservative conductivity values.
(PW: F. Barletta) RTS-40694-1

## Change to read:

## PROCEDURE

## Stage 1

1. Determine the temperature of the water and the conductivity of the water using a nontemperature-compensated conductivity reading. The measurement may be performed in a suitable container or as an on-line measurement.
2. Using the Stage 1-Temperature and Conductivity Requirements table, find the temperature value that is not greater than the measured temperature,
${ }^{\Delta}$ i.e., the next lower temperature. $\mathbf{u U S P}^{\text {US }}$.
The corresponding conductivity value is the limit that ture.
On this table is the limit. [NOTE-Do not interpolate.]
3. If the measured conductivity is not greater than the table val3. If the measured conductivity is not greater than the table value, the water meets the requirements of the test for conductivity. If
the conductivity is higher than the table value, proceed with Stage 2.
[^20]| Stage 1——Temperature and Conductivity Requirements <br> (for nontemperature-compensated conductivity <br> measurements only) |  |
| :---: | :---: |
| Temperature | Conductivity Requirement $(\mu \mathrm{S} / \mathrm{cm})$ |
| 0 | 0.6 |
| 5 | 0.8 |
| 10 | 0.9 |
| 15 | 1.0 |
| 20 | 1.1 |
| 25 | 1.3 |
| 30 | 1.4 |
| 35 | 1.5 |
| 40 | 1.7 |
| 45 | 1.8 |
| 50 | 1.9 |
| 55 | 2.1 |
| 60 | 2.2 |
| 65 | 2.4 |
| 70 | 2.5 |
| 75 | 2.7 |
| 80 | 2.7 |
| 85 | 2.7 |
| 90 | 2.7 |
| 95 | 2.9 |
| 100 | 3.1 |

## Stage 2

4. Transfer a sufficient amount of water ( 100 mL or more) to a suitable container, and stir the test specimen. Adjust the temperature, if necessary, and, while maintaining it at $25 \pm 1^{\circ}$, begin vigorously agitating the test specimen while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than a net of $0.1 \mu \mathrm{~S} / \mathrm{cm}$ per 5 minutes, note the conductivity.
5. If the conductivity is not greater than $2.1 \mu \mathrm{~S} / \mathrm{cm}$, the water meets the requirements of the test for conductivity. If the conductivity is greater than $2.1 \mu \mathrm{~S} / \mathrm{cm}$, proceed with Stage 3.

## Stage 3

6. Perform this test within approximately 5 minutes of the conductivity determination in Step 5, while maintaining the sample temperature at $25 \pm 1^{\circ}$. Add a saturated potassium chloride solution to the same water sample ( 0.3 mL per 100 mL of the test specimen), and determine the pH to the nearest 0.1 pH unit, as directed under $p H\langle 791\rangle$.
7. Referring to the Stage 3-pH and Conductivity Requirements table, determine the conductivity limit at the measured pH value. If the measured conductivity in Step 4 is not greater than the conductivity requirements for the pH determined in Step 6, the water meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0 to 7.0 , the water does not meet the requirements of the test for conductivity.

Stage 3-pH and Conductivity Requirements (for atmosphere and temperature equilibrated samples only)

|  | Conductivity Requirement $(\mu \mathrm{S} / \mathrm{cm})$ |
| :---: | :---: |
| 5.0 | 4.7 |
| 5.1 | 4.1 |

## BRIEFING

〈711〉 Dissolution, USP 27 page 2303. The USP Expert Committee on Biopharmaceutics has decided that it will no longer encourage the inclusion of new dissolution procedures based on pooled sampling as found in the general chapter $\langle 711\rangle$. The Committee finds that the procedure for pooled sampling prevents the observation of intertablet variability otherwise possible with unit sampling. As a result of the Committee decision, it is proposed to delete the Procedure for a Pooled Sample for Capsules, Uncoated Tablets, and Plain Coated Tablets and the Interpretation for a Pooled Sample from the general chapter text. The procedure and interpretation text removed from the general chapter will be incorporated into the tests for Dissolution in the individual monographs where pooled sampling is currently employed.
(BPC: W. Brown) RTS-40597-1

## Delete the following:

${ }^{\wedge}$ Procedure-for a Pooled Sample for Capsules, Uneoated Tablets, and-Plain-Coated Tablets Use this procedure where Proedure for a Porled Sample is specified in the individualmenograph. Proeed as directed under Procedure for Gapsules, Uneoated Tablets, and Plain-Coated Tablets. Combine-equat velume of the filtered solutions of the six or twelve individual speeimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of the active ingredient dissolved in the pooled sample. $\triangle$ USP28

## Change to read: <br> Interpretation-

Unit Sample-Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to the accompanying Acceptance Table. Continue testing through the three stages unless the results conform at either $\mathrm{S}_{1}$ or $\mathrm{S}_{2}$. The quantity, $Q$, is the amount of dissolved active ingredient specified in the individual monograph, expressed as a percentage of the labeled content; the $5 \%, 15 \%$, and $25 \%$ values in the Acceptance Table are percentages of the labeled content so that these values and $Q$ are in the same terms.

Acceptance Table

|  | Number <br> Tested | Acceptance Criteria |

# GENERAL CHAPTERS 

## General Information

## BRIEFING

$\langle 1010\rangle$ Analytical Data-Interpretation and Treatment, page 187 of $P F$ 29(1) [Jan.-Feb. 2003]. This proposed new general information chapter is again presented with changes reflecting comments received. In addition, the Expert Committee on Biostatistics has rewritten Appendices $D$ and $E$ to clarify the examples given for evaluation of analytical methods. This general informational chapter addresses the needs of the nonstatistician scientist who may be called upon to employ the basic statistical methods given. The Expert Committee recommends that the information contained in this proposal not be viewed as defining acceptable statistical practice for compendial purposes. The scope of this chapter does not allow a complete disquisition on statistical methods available for such purposes. Thus the content should be viewed as a basic primer with practical applications. To allow further exploration of the statistical principles given, a list of references is given as Appendix $F$.

Comments regarding this proposal are invited and should be submitted by May 15, 2004.

## Add the following:

## © $\langle 1010\rangle$ ANALYTICAL DATAINTERPRETATION AND TREATMENT

## INTRODUCTION

This chapter provides information regarding acceptable practices for the analysis and consistent interpretation of data obtained from chemical and other analyses. Basic statistical approaches for evaluating data are described, and the treatment of outliers and comparison of analytical methods are discussed in some detail. It she inferred, however, that the analysis tools mentioned in this
ehapter form an exhaustive list. Other, equally valid, statistieal methods may be used at the discretion of the manufactarer.
[NOTE-It should not be inferred that the analysis tools mentioned in this chapter form an exhaustive list. Other, equally valid, statistical methods may be used at the discretion of the manufacturer.]

Assurance of the quality of pharmaceuticals is accomplished by combining a number of practices, including robust formulation design, validation, testing of starting materials, in-process testing, and final-product testing. Each of these practices is dependent on reliable test methods. In the development process, test procedures are developed and validated to ensure that the manufactured products are thoroughly characterized. Final-product testing provides further assurance that the products are consistently safe, efficacious, and in compliance with their specifications.

Measurements are inherently variable. The variability of biological tests has long been recognized by the USP. For example, the need to consider this variability when analyzing biological test data is addressed under Design and Analysis of Biological Assays $\langle 111\rangle$. The chemical analysis measurements commonly used to analyze pharmaceuticals are also inherently variable, although less so than those of the biological tests. However, in many instances the acceptance criteria are proportionally tighter, and thus, this smaller allowable variability has to be considered when analyzing data generated using analytical procedures. If the variability of a measurement is not characterized and stated along with the result of the measurement, then the data can only be interpreted in the most limited sense. For example, stating that the difference between the averages from two laboratories when testing a common set of samples is
$10 \%$ has limited interpretation, in terms of how important such a difference is, without knowledge of the intralaboratory variability.

This chapter provides gridance direction for scientifically acceptable treatment and interpretation of data. Statistical tools that may be helpful in the interpretation of analytical data are described. Many descriptive statistics, such as the mean and standard deviation, are in common use. Other statistical tools, such as outlier tests, can be performed using several different, scientifically valid approaches, and examples of these tools and their applications are also included. The framework within which the results from a compendial test are interpreted is clearly outlined in Test Results, Statistics, and Standards under General Notices and Requirements. Selected references that might be helpful in obtaining additional information on the statistical tools discussed in this chapter are listed in Appendix $F$ at the end of the chapter. USP does not endorse these citations, and they do not represent an exhaustive list. Further information about many of the methods cited in this chapter may also be found in most statistical textbooks.

## PREREQUISITE LABORATORY PRACTICES AND PRINCIPLES

The sound application of statistical principles to laboratory data requires the assumption that such data have been collected in a traceable (i.e., documented) and unbiased manner. To ensure this, the following practices are beneficial.

## Sound Record Keeping

Laboratory records are maintained with sufficient detail, so that other equally qualified analysts can reconstruct the experimental conditions and review the results obtained.

When collecting data, the data should generally be obtained with more decimal places than the specification requires and rounded only after final calculations are completed.

## Sampling Considerations

Effective sampling is an important step in the assessment of a quality attribute of an article. The purpose of sampling is to provide representative data (the sample) for estimating the properties of the population (the article). How to attain such a sample depends entirely on the question that is to be answered by the sample data. In general, use of a random process is considered the most appropriate way of selecting a sample. Indeed, a random and independent sample is necessary to ensure that the resulting data produce valid estimates of the properties of the population. Generating a nonrandom or "convenience" sample risks the possibility that the estimates will be biased. The most straightforward type of random sampling is called simple random sampling, a process in which every unit of the population has an equal chance of appearing in the sample. However, sometimes this method of selecting a random sample is not optimal because it cannot guarantee equal representation among factors (i.e., time, location, machine) that may influence the critical properties of the article. For example, if it requires 12 hours to manufacture all of the units in a lot and it is vital that the sample be representative of the entire production process, then taking a simple random sample after the production has been completed may not be appropriate because there can be no guarantee that such a sample will contain a similar number of units made from every time period within the 12hour process. Instead, it is better to take a systematic random sample whereby a unit is randomly selected from the production process at systematically selected times or locations (e.g., sampling every 30 minutes from the units produced at
that time) to ensure that units taken throughout the entire manufacturing process are included in the sample. Another type of random sampling procedure is needed if, for example, a product is filled into vials using four different filling machines. In this case it would be important to capture a random sample of vials from each of the filling machines. A stratified random sample, which randomly samples an equal number of vials from each of the four filling machines, would satisfy this requirement. Regardless of the reason for taking a sample (e.g., batch-release testing), a sampling pron should be established to provide details on how the sample is to be obtained to ensure that the sample is representative of the entirety of the article and that the resulting data have the required sensitivity. The sample should be che representive. The optimal sampling strategy will depend on knowledge of the manufacturing and analytical measurement processes. Once the sampling scheme has been defined, it is likely that the sampling will include some element of random selection. Finally, there must be sufficient sample collected for the original analysis, subsequent verification analyses, and other analyses.

Tests discussed in the remainder of this chapter assume that simple random sampling has been performed.

## Use of Reference Standards

Where the use of the USP Reference Standard is specified, the USP Reference Standard, or a secondary standard traceable to the USP Reference Standard, is used. Because the assignment of a value to a standard is one of the most important factors that influences the accuracy of an assy, analysis, it is critical that this be done correctly. The procedures outlined belaw may be useful in this regard.

## System Performance Verification <br> The performanee of an analytieal system should be evaltuted at specified time intervals to ensure that the appropriate level of performance has been maintained. In addition, an ongoing routine assessment may be performed at appropriate intervals by analyzing a control sample, whese analy tieal properties have been carefully determined, or using

 ether means, such as, variation ameng the standards, back ground signal-to noise ratios, ete. If a change in the operating properties of the analytical procedtre is observed, proper performanee needs to be re-established, and all results obtained between the last acceptable performance ver iffien to berifying an acceptable level of performance for an analytical system in routine or continuous use can be a valuable practice. This may be accomplished by analyzing a control sample at appropriate intervals, or using other means, such as, variation among the standards, background signal-to-noise ratios, etc. Attention to the measured parameter, such as charting the results obtained by analysis of a control sample, can signal a change in performance that requires adjustment of the analytical system.
## Method Validation

All methods are appropriately validated as specified under Validation of Compendial Methods $\langle 1225\rangle$. The USP NF methods are assumed to be valid and to comply with the GFR. An already validated method should be applied to a new sample formulation only after confliming that the new matrix doe not interfere with the aecuracy, linearity, or precision of the method. Methods published in the $U S P-N F$ have been validated and meet the Current Good

Manufacturing Practices regulatory requirement for validation as established in the Code of Federal Regulations. A validated method may be used to test a new formulation only after confirming that the new formulation does not interfere with the accuracy, linearity, or precision of the method. It may not be assumed that a validated method could correctly measure the active ingredient in a formulation that is different from that used in establishing the original validity of the method.

## MEASUREMENT PRINCIPLES AND VARIATION

All measurements are, at best, estimates of the actual ("true" or "accepted") value for they contain random variability (also referred to as random error) and may also contain systematic variation (bias). Thus, the measured value differs from the actual value because of variability inherent in the measurement. If an array of measurements consists of individual results that are representative of the whole, statistical methods can be used to estimate informative properties of the entirety, and statistical tests are available to investigate whether it is likely that these properties comply with given requirements. The resulting statistical analyses should address the variability associated with the measurement process as well as that of the entity being measured. Statistical measures used to assess the direction and magnitude of these errors include the mean, standard deviation, and expressions derived therefrom, such as the coefficient of variation (CV, also called the relative standard deviation, RSD). The estimated variability can be used to calculate confidence intervals for the mean, or measures of variability, and tolerance intervals capturing a specified proportion of the individual measurements.

The use of statistical measures must be tempered with good judgment, especially with regard to representative sampling. Most of the statistical measures and tests cited in this chapter rely on the assumptions that the distribution of the entire population is represented by a normal distribution and that the analyzed sample is a representative subset of this population. The normal (or Gaussian) distribution is bell-shaped and symmetric about its center and has certain ether characteristics that are required for these tests to be valid. If the assumption of a normal distribution for the population is not warranted, then normality can often be achieved (at least approximately) through an appropriate transformation of the measurement values. For example, many variables have distributions with longer right tails than left. Such distributions can often be made approximately normal through a log transformation. An alternative approach would be to use "distribution-free" or "nonparametric" statistical procedures that do not require that the shape of the population be that of a normal distribution. When the objective is to construct a confidence interval for the mean or for the difference between two means, for example, then the normality assumption is not as important because of the central limit theorem. However, one must verify normality of data to construct valid confidence intervals for standard deviations and ratios of standard deviations, perform some outlier tests, and construct valid statistical tolerance limits. In the latter case, normality is a critical assumption. Simple graphical methods, such as dot plots, histograms, and normal probability plots, are useful aids for investigating this assumption.

A single analytical measurement may be useful in quality assessment if the sample is from a whole that has been prepared using a well-validated, documented process and if the analytical errors are well known. The obtained analytical result may be qualified by including an estimate of the associated errors. There may be instances when one might consider the use of averaging because the variability associated with an average value is always reduced as compared to the variability in the individual measurements. The choice of whether to use individual measurements or averages will depend upon the use of the measure and its variability. For example, when multiple measurements are obtained on the same sample aliquot, such as from multiple injections of the sample in an HPLC method, it is generally advisable to average the resulting data for the reason discussed above. Howere, if the datare obtained from independent samples taken from the lot, then averaging would enly be advisable if lot uniformity had already been cen firmed.

Variability is associated with the dispersion of observations around the center of a distribution. The most commonly used statistic to measure the center is the sample mean ( $\bar{x}$ ):

Method variability can be estimated in various ways. The most common and useful assessment of a method's variability is the determination of the standard deviation based on repeated independent ${ }^{1}$, tmeorrelate measurements of a control sample. The standard deviation, $s$, is calculated by the formula:

$$
s=\sqrt{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2} /(n-1)}
$$

in which $x_{i}$ is the individual measurement in a set of $n$ measurements; and $\bar{x}$ is the mean of all the measurements. The relative standard deviation (RSD) is then calculated as:

$$
R S D=\frac{s}{x} \cdot 100 \%
$$

and expressed as a percentage. For biologieal assays, the data often need to be log transformed to achieve nermality. An alternative form for the RSD that is appropriate when the data have been log (base e) transformed is:

[^21]where in this ease $s$ would be the standard deviation of the log (base ) transformed data. ${ }^{2}$ If the data requires $\log$ tranformation to achieve normality (e.g., for biological assays), then alternative methods are available. ${ }^{3}$

A control sample is defined as a homogeneous and stable sample that is tested at specific intervals sufficient to monitor the performance of the method for which it was established. Test data from a control sample can be used to monitor the method variability or be used as part of ther for reperting systatability requirements. ${ }^{4}$ The control sample should be essentially the same as the test sample and should be treated similarly whenever possible. A control chart can be constructed and used to monitor the method performance on a continuing basis as shown under Appendix $A$.

A precision study should be conducted to provide a better estimate of method variability. The precision study may be designed to determine intermediate precision (atinat ity - "between run" + "within run" variability) (which includes the components of both "between run" and "within-
z-An alternative formula for caleulating RSD-for biolegieal assays is

${ }^{3}$ When data has been $\log$ (base $e$ ) transformed to achieve normality, alternative forms for the RSD are:

$$
R S D=100 \% \cdot\left(e^{s}-1\right)
$$

and

$$
R S D=100 \% \cdot \sqrt{e^{s^{2}}-1}
$$

where, in this case, $s$ is the standard deviation of the $\log$ (base $e$ ) transformed data.
${ }^{4}$ See System Suitability under Chromatography $\langle 621\rangle$.
run" variability) and repeatability ("within-run" variability). The intermediate precision studies should allow for changes in the experimental conditions that might be expected, such as different analysts, different preparations of reagents, different days, and different instruments. To perform a precision study, the test is repeated several times. Each run must be completely independent of the others to provide accurate estimates of the various components of variability. In addition, within each run, replicates are made in order to estimate repeatability. See an example of a precision study under Appendix B.
A confidence interval for the mean may be considered in the interpretation of data. Such intervals are calculated from several data points using the sample mean $(\bar{x})$ and sample standard deviation $(s)$ according to the formula:

$$
\left(\bar{x}-t_{\alpha / 2, n-1} \frac{s}{\sqrt{n}}, \bar{x}+t_{\alpha / 2, n-1} \frac{s}{\sqrt{n}}\right),
$$

in which $t_{\alpha 2, n-1}$ is a statistical number dependent upon the sample size $(n)$, the number of degrees of freedom $(n-1)$, and the desired confidence level $(1-\alpha)$. Its values are obtained from published tables of the Student $t$-distribution. The confidence interval provides an estimate of the range within which the "true" population mean ( $\mu$ ) falls, and it also evaluates the reliability of the sample mean as an estimate of the true mean. If the same experimental set-up were to be replicated over and over and a $95 \%$ (for example) confidence interval for the true mean is calculated each time, then $95 \%$ of such intervals would be expected to contain the true mean, $\mu$. One cannot say with certainty whether or not the confidence interval derived from a specific set of data actually collected contains $\mu$. However, it can be said that, assuming the data are normally distributed and the
standard deviation was correctly estimated, the procedure used to construct the confidence interval guarantees that $95 \%$ of such confidence intervals contain $\mu$.

## OUTLYING RESULTS

Occasionally, observed analytical results are very different from those expected. Aberrant, anomalous, contaminated, discordant, spurious, suspicious or wild observations; and flyers, rogues, and mavericks are properly called outlying results. Like all laboratory results, these outliers must be documented, interpreted, and managed. Such results may be accurate measurements of the entity being measured, but are very different from what is expected. Alternatively, due to an error in the analytical system, the results may not be typical, even though the entity being measured is typical. When an outlying result is obtained, systematic laboratory and process investigations of the result are conducted to determine if an assignable cause for the result can be established. Factors to be considered when investigating an outlying result include-but are not limited to-human error, instrumentation error, calculation error, and product or component deficiency. If an assignable cause that is not related to a product or component deficiency can be identified, then retesting may be performed on the same sample, if possible, or on a new sample. Resampling should be a rare event. The precision and accuracy of the method, the Reference Standard, process trends, and the specification limits should all be examined. Data may be invalidated, based on this documented investigation, and eliminated from subsequent calculations.

If no documentable, assignable cause for the outlying laboratory result is found, the result may be tested, as part of the overall investigation, to determine whether it is an outlier.

However, careful consideration is warranted when using these tests. Two types of errors may occur with outlier tests: (a) labeling observations as outliers when they really are not; and (b) failing to identify outliers when they truly exist.

Clearly, the first type of error could have a mere significant impact on pharmaceutical laberatory results in particular. This type of error is minimized when potential outliers are further awy frem the other observations. Any judgment about the acceptability of data in which outliers are observed requires careful interpretation.
"Outlier labeling" is informal recognition of suspicious laboratory values that should be further investigated with more formal methods. The selection of the correct outlier identification technique often depends on the initial recognition of the number and location of the values. Outlier labeling is most often done visually with graphical techniques. "Outlier identification" is the use of statistical significance tests to confirm that the values are inconsistent with the known or assumed statistical model.

When used appropriately, outlier tests are valuable tools for pharmaceutical laboratories. Several tests exist for detecting outliers. Examples illustrating three of these procedures, the Extreme Studentized Deviate (ESD) Test, Dixon's Q Test, and Hampel's Rule, are presented in Appendix C.

Choosing the appropriate outlier test will depend on the sample size and distributional assumptions. Many of these tests (e.g., the Generalized Extreme Studentized Deviate ESD Test) require the assumption that the data generated by the laboratory on the test samples can be thought of as a random sample from a population that is normally distributed, possibly after transformation. If a transformation is made to the data, the outlier test is applied to the transformed data. Common transformations include taking the logarithm or square root of the data. Other approaches to handling single and multiple outliers are available and can
also be used. These include tests that use robust measures of central tendency and spread, such as the median and median absolute deviation and exploratory data analysis (EDA) methods. "Outlier accommodation" is the use of robust techniques, such as tests based on the order or rank of each data value in the data set instead of the actual data value, to produce results that are not adversely influenced by the presence of outliers. The use of such methods reduces the risks associated with both types of error in the identification of outliers.
"Outlier rejection" is the actual removal of the identified outlier from the data set. However, an outlier test cannot be the sole means for removing an outlying result from the laboratory data. An outlier test may be useful as part of the evaluation of the significance of that result, along with other data. Outlier tests have no applicability in cases where the variability in the product is what is being assessed, such as content uniformity, dissolution, or release-rate determination. In these applications, a value determined to be an outlier may in fact be an accurate result of a nonuniform product. All data, especially outliers, should be kept for future review. Unusual data, when seen in the context of other historical data, are often not unusual after all but reflect the influences of additional sources of variation.

In summary, the rejection or retention of an apparent outlier can be a serious source of bias. The nature of the testing as well as scientific understanding of the manufacturing process and analytical method have to be considered to determine the source of the apparent outlier. An outlier test can never take the place of a thorough laboratory investigation. Rather, it is performed only when the investigation is inconclusive and no deviations in the manufacture or testing of the product were noted. Even if sueh statistientests indiente a value to be an outlier, it should be retained in the record
and given full consideration in the assessment of conformance to aceeptance criteria. It is good practice to perform the ealeulations with and without the outlier to assess its im
pact. Even if such statistical tests indicate that one or more values are outliers, they should still be retained in the record. Including or excluding outliers in calculations to assess conformance to acceptance criteria should be based on scientific judgment and the internal policies of the manufacturer. It is often useful to perform the calculations with and without the outliers to evaluate their impact.

Outliers that are attributed to measurement process errors should be reported (i.e., footnoted), but not included in further statistical calculations. When assessing conformance to a particular acceptance criterion, it is important to define whether the reportable result (the result that is compared to the limits) is an average value, an individual measurement, or something else. If, for example, the acceptance criterion was derived for an average, then it would not be statistically appropriate to require individual measurements to also satisfy the criterion because the variability associated with the average of a series of measurements is smaller than that of any individual measurement.

## COMPARISON OF ANALYTICAL METHODS

It is often necessary to compare two methods to determine if their average results or their variabilities differ by an amount that is deemed important. The goal of a method comparison experiment is to generate adequate data to evaluate the equivalency of the two methods over a range of concentrations. Some of the considerations to be made when performing such comparisons are discussed in this section.

## Precision

Precision is the degree of agreement among individual test results when the analytical method is applied repeatedly to a homogeneous sample. For an alternative method to be considered to have "comparable" precision to that of a current method, its precision (see Analytical Performance Characteristics under Validation of Compendial Methods $\langle 1225\rangle$ ) must not be worse than that of the current method by an amount deemed important. A decrease in precision (or increase in variability) can lead to an increase in the number of results expected to fail required specifications. On the other hand, an alternative method providing improved precision is acceptable.

One way of comparing the precision of two methods is by estimating the variance for each method (the sample variance, $s^{2}$, is the square of the sample standard deviation) and calculating a confidence interval for the ratio of (true) variances, where the ratio is defined as the variance of the alternative method to that of the current method. Thise done in terms of standard deviations well. An example is outlined under Appendix $D$. The upper limit of the confidence interval should be compared to an upper limit deemed acceptable, a priori, by the analytical laboratory. If the upper limit of the confidence interval is less than this upper acceptable limit, then the precision of the alternative method is considered acceptable in the sense that the use of the alternative method will not lead to an important loss in precision. Note that if the upper limit of the confidence interval is less than one, then the alternative method has been shown to have improved precision relative to the current method.

The confidence interval method just described is preferred to applying the two-sample $F$-test to test the statistical significance of the ratio of variances. To perform the two-sample $F$-test, the calculated ratio of sample variances would be
compared to a critical value based on tabulated values of the $F$ distribution for the desired level of confidence and the number of degrees of freedom for each variance. Tables providing $F$-values are available in most standard statistical textbooks. If the calculated ratio exceeds this critical value, a statistically significant difference in precision is said to exist between the two methods. However, if the calculated ratio is less than the critical value, this does not prove that the methods have the same or equivalent level of precision; but rather that there was not enough evidence to prove that a statistically significant difference did, in fact, exist.

## Accuracy

Comparison of the accuracy (see Analytical Performance Characteristics under Validation of Compendial Methods $\langle 1225\rangle$ ) of methods provides information useful in determining if the new method is equivalent, on the average, to the current method. A simple method for making this comparison is by calculating a confidence interval for the difference in true means, where the difference is defined as the sample mean of the alternative method minus that of the current method.

The confidence interval should be compared to a lower and upper range deemed acceptable, a priori, by the laboratory. If the confidence interval falls entirely within this acceptable range, then the two methods can be considered equivalent, in the sense that the average difference between them is not of practical concern. The lower and upper limits of the confidence interval only show how large the true difference between the two methods may be, not whether this difference is considered tolerable. Such an assessment can only be made within the appropriate scientific context.

The confidence interval method just described is preferred to the practice of applying a two-sample $t$ test to test the statistical significance of the difference in averages. One way to perform the two-sample $t$-test is to calculate the confidence interval and to examine whether or not it contains the value zero. The two methods have a statistically significant difference in averages if the confidence interval excludes zero. A statistically significant difference may not be large enough to have practical importance to the laboratory because it may have arisen as a result of highly precise data or a larger sample size. On the other hand, it is possible that no statistically significant difference is found, which happens when the confidence interval includes zero, and yet an important practical difference cannot be ruled out. This might occur, for example, if the data are highly variable or the sample size is too small. Thus, while the outcome of the two-sample $t$-test indicates whether or not a statistically significant difference has been observed, it is not informative with regard to the presence or absence of a difference of practical importance.

## Determination of Sample Size

The geal of a methed comparison experiment is to gener-
ate adequate data to evaluate the equivalency of two methods over a range of concentrations. Samplesize determination is similar to that for testing hypetheses abeut averages differenees, Sample size determination is based on the comparison of the accuracy and precision of the two methods ${ }^{5}$ and is similar to that for testing hypotheses about average differences in the former case and variance ratios in
the latter case, but the meaning of some of the input is different. The first component to be specified is $\delta$, the largest acceptable difference between the two methods that, if achieved, still leads to the conclusion of equivalence. That is, if the two methods differ by no more than $\delta$, they are considered acceptably similar. The comparison can be twosided as just expressed, considering a difference of $\delta$ in either direction, as would be used when comparing means. Alternatively, it can be one-sided as in the case of comparing variances where a decrease in variability is acceptable and equivalency is concluded if the variability of the more variable method is not more than $\delta \%$ greater than that of the less variable method. A researcher will need to state $\delta$ based on knowledge of the current method and/or its use, or it may be calculated. One consideration, when there are specifications to satisfy, is that the new method should not differ by so much from the current method as to risk generating out-of-specification results. One then chooses $\delta$ to have a low likelihood of this happening by, for example, comparing the distribution of data for the current method to the specification limits. This could be done graphically or by using a tolerance interval, an example of which is given in Appendix $E$. In general, the choice for $\delta$ must depend on the scientific requirements of the laboratory, not just on the desire to test only a small number of samples.
The next two components relate to the likelihood of error. The data could lead to a conclusion of similarity when the methods are unacceptably different (as defined by $\delta$ ). This is

[^22]called a false positive or Type I error. The error could also be in the other direction; that is, the methods could be similar, but the data do not permit that conclusion. This is a false negative or Type II error. With statistical methods, it is not possible to completely eliminate the possibility of either error. However, by choosing the sample size appropriately, the probability of each of these errors can be made acceptably small. The acceptable maximum probability of a Type I error is commonly denoted as $\alpha$ and is commonly taken as $5 \%$, but may be chosen differently. The desired maximum probability of a Type II error is commonly denoted by $\beta$. Often, $\beta$ is specified by indirectly by choosing a desired level of $1-$ $\beta$, which is called the "power" of the test. In the context of equivalency testing, power is the probability of correctly concluding that two identieal methods are equivalent. Power is commonly taken to be $80 \%$ or $90 \%$ (corresponding to a $\beta$ of $20 \%$ or $10 \%$ ), though other values may be chosen. The protocol for the experiment should specify $\delta, \alpha$, and power. The sample size will depend on all of these components. An example is given in $F$ Appendix E. Although ApF Appendix $E$ determines only a single value, it is often useful to determine a table of sample sizes corresponding to different choices of $\delta, \alpha$, and power. Such a table often allows for a more informed choice of sample size to better balance the competing priorities of resources and risks (false negative and false positive conclusions).

APPENDIX A: CONTROL CHARTS

Fig. 1. Individtul $X$ or individual measurements control ehat for control samples. In this particular example, the mean for all the samples ( $x$ ) is 100 , the upper control limit is 104.5 , and the lower control limit is 95.5 .

Fig. 1. Individual $X$ or individual measurements control chart for control samples. In this particular example, the mean for all the samples $(\bar{x})$ is 102.0 , the UCL is 106.5 , and the LCL is 97.5 .

Figure 1 illustrates a control chart for individual values. There are several different methods for calculating the upper control limit (UCL) and lower control limit (LCL). One of the more commonly used methods involves the moving range, which is defined as the absolute difference between two consecutive measurements $\left(\left|x_{\mathrm{i}}-x_{\mathrm{i}-1}\right|\right)$. These moving ranges are averaged ( $\overline{M R}$ ) and used in the following formulae:

$$
\begin{aligned}
& U C L=\bar{x}+3 \frac{\overline{M R}}{d_{2}} \\
& L C L=\bar{x}-3 \frac{\overline{M R}}{d_{2}}
\end{aligned}
$$

where $\bar{x}$ is the sample mean, and $d_{2}$ is based on the number of observations associated with the moving range calculation. Where $n=2$ (two consecutive measurements), as here, $d_{2}=1.128$. For the example in Figure 1, the $\overline{M R}$ was 1.7:

$$
U C L=102.0+3 \frac{1.7}{1.128}=106.5
$$

$$
L C L=102.0-3 \frac{1.7}{1.128}=97.5
$$

## APPENDIX B: PRECISION STUDY

Table 1 displays data collected from a precision study. This study consisted of five independent runs and, within each run, results from three replicates were collected.

Performing an analysis of variance (ANOVA) on the data in Table 1 leads to the ANOVA table (Table 1A). Because there were an equal number of replicates per run in the precision study, values for Variance Run and Variance Rep can be derived from the ANOVA table in a straightforward manner. The equations below calculate the variability associated with both the runs and the replicates where the $M S_{\text {within }}$ represents the "error" or "within-run" mean square, and $M S_{\text {between }}$ represents the "between-run" mean square.

$$
\text { Variance }_{\text {Rep }}=M S_{\text {within }}=0.102
$$

$$
\text { Variance }_{\text {Run }}=\frac{M S_{\text {between }}-M S_{\text {within }}}{\# \text { of reps per run }}=\frac{3.550-0.102}{3}=1.149
$$

Estimates can still be obtained with unequal replication, but the formulae are more complex. Studying the relative magnitude of the two variance components is important when designing and interpreting a precision study. For example, for these data the between-run component of variability is
much larger than the within-run component. This suggests that performing additional runs would be more beneficial to reducing variability than performing more replication per run (see Table 2 below).

Table 2 shows the computed variance and RSD of the mean (i.e., of the reportable value) for different combinations of number of runs and number of replicates per run using the formulae:

Standard deviation of the mean $=\sqrt{\text { Variance of the mean }}$

$$
R S D=\frac{\text { Standard deviation of the mean }}{\text { Average of all results }} \times 100 \%
$$

For example, the Variance of the mean, Standard deviation of the mean, and RSD of a test involving two runs and three replicates per each run are $0.592,0.769$, and $0.76 \%$ respectively, as shown below.

Variance of the mean $=\frac{1.149}{2}+\frac{0.102}{(2 \cdot 3)}=0.592$

$$
\text { Standard deviation of the mean }=\sqrt{0.592}=0.769
$$

$$
R S D=\frac{0.769}{100.96} \times 100 \%=0.76 \%
$$

Where 100.96 is the mean for all the data points in Table 1. As illustrated in Table 2, increasing the number of runs from one to two provides a more dramatic reduction in the variability of the reportable value than does increasing the number of replicates per run.

No distributional assumptions were made on the data in Table 1 as the purpose of this Appendix is to illustrate the calculations involved in a precision study. In general, if the datare nermally distributed in the precision stady, then the standard deviation of the mean should be reported. How ever, if the log transformed data are nermally distributed, then the RSD should be reperted.

## APPENDIX C: EXAMPLES OF OUTLIER TESTS FOR ANALYTICAL DATA

Given the following set of 10 measurements: 100.0, $100.1,100.3,100.0,99.7,99.9,100.2,99.5,100.0$, and $95.7($ mean $=99.5$, standard deviation $=1.369)$ are there any outliers?

## Generalized Extreme Studentized Deviate (ESD) Test

This is a modified version of the ESD Test that allows for testing up to a previously specified number, $r$, of outliers from a normally distributed population. Let $r$ equal 2 , and $n$ equal 10 .

Stage $1(\mathrm{n}=10)-$ Normalize each result by subtracting the mean from each value and dividing this difference by the standard deviation (see Table 3). ${ }^{6}$

Take the absolute value of these results, select the maximum value $\left(\left|\mathrm{R}_{1}\right|=2.805\right)$, and compare it to a previously specified tabled critical value $\lambda_{1}(2.290)$ based on the selected significance level (for example, 5\%). The maximum value is larger than the tabled value and is identified as being inconsistent with the assumed model of normality. Sources for $\lambda$ values are included in many statistical textbooks. remaining data. Sources for $\lambda$-values are included in many statistical textbooks. Caution should be exercised when using any statistical table to ensure that the correct notations (i.e., level of acceptable error) are used when extracting table values.

Stage $2(\mathrm{n}=9)$-Remove the observation corresponding to the maximum absolute normalized result from the original data set, so that $n$ is now 9. Again, find the mean and standard deviation (Table 3, right two columns), normalize each value, and take the absolute value of these results. Find the maximum of the absolute values of the 9 normalized results $\left(\left|R_{2}\right|=1.905\right)$, and compare it to $\lambda_{2}(2.215)$. The maximum value is not larger than the tabled value.

Conclusion-The result from the first stage, 95.7 , is declared to be an outlier, but the result from the second stage, 99.5, is not an outlier.

## Dixon-Type Tests

Similar to the ESD test, the two smallest values will be tested as outliers; again assuming the data come from a single normal population.
${ }^{6}$ The difference between each value and the mean is termed the residual. Other Studentized residual outlier tests exist where the residual, instead of being divided by the standard deviation, can be divided by the standard deviation times the square root of $n-1$ divided by $n$.

Stage $1(\mathrm{n}=10)$-The results are ordered on the basis of their magnitude (i.e., $X_{n}$ is the largest observation, $X_{n-1}$ is the second largest, etc., and $X_{1}$ is the smallest observation). Dixon's Test has different ratios based on the sample size (in this example, with $n=10$ ), to declare $X_{1}$ an outlier, the following ratio, $Q_{4}$, is caleulated by the formula:-

$r_{11}$, is calculated by the formula:

$$
r_{11}=\frac{X_{2}-X_{1}}{X_{n-1}-X_{1}}
$$

A different ratio would be employed if the largest data peint was tested as an outlier. The $Q_{4}$ result is compared to a $\pi_{4}$ value in a table of critieal values. If $Q_{4+}$ is grenter than $\pi_{H+}$, then it is declared an outlier. For the above set of data, $Q_{H}=$ $(99.5-95.7) /(100.2 \quad 95.7)=0.80$. This ratio is greater that \# $_{4}$, which is 0.477 at the $5 \%$ significance level. Sources for $Q$ values are ineluded in many statistieal textbooks. A different ratio would be employed if the largest data point was tested as an outlier. The $r_{11}$ result is compared to an $r_{11,0.05}$ value in a table of critical values. If $r_{11}$ is greater than $r_{11,0.05}$, then it is declared an outlier. For the above set of data, $r_{11}=$ $(99.5-95.7) /(100.2-95.7)=0.84$. This ratio is greater than $r_{11,0.05}$, which is 0.477 at the $5 \%$ significance level. Sources for $r_{11,0.05}$-values are included in many statistical textbooks.

Stage 2 Remove the smallest observation frem the ori ginal data set, so that $n$ is now -9 . The same $Q_{H}$ - equation is used, but a new critical $\pi 11$ value for $n=9$ is needed ( $\pi_{1+}=$ 0.512). Now $\mathrm{Q}_{4}=(99.7-99.5) /(100.2-99.5)-0.29$, which is less than $\pi_{H}$ and not signiffeant at the $5 \%$ level.

Stage 2-Remove the smallest observation from the original data set, so that $n$ is now 9 . The same $r_{11}$ equation is used, but a new critical $r_{11,0.05}$ value for $n=9$ is needed ( $r_{11}$, $0.05=0.512)$. Now $r_{11}=(99.7-99.5) /(100.2-99.5)=0.29$, which is less than $r_{11,0.05}$ and not significant at the $5 \%$ level.

Conclusion-Therefore, 95.7 is declared to be an outlier. This stepwise procedure is not an exact procedure for testing for the second outlier as the result of the second test is conditional upon the first. Because the sample size is also reduced in the second stage, the end result is a procedure that usually lacks the sensitivity of the exact procedures that Dixon provides for testing for two outliers simultaneously; however, these procedures are beyond the scope of this Appendix.

Both tests previously illustrated in this Appendix as sumed that the samples-were taken from a normally distributed population. Other tests are also available, including these based on rebust measures, such as the median and median abselute deviation (MAD). One-such method is ealled Hampel's Rule and is deseribed below.

## Hampel's Rule

Step 1-The first step in applying Hampel's Rule is to normalize the data. However, instead of subtracting the mean from the data each data point and dividing the difference by the standard deviation, the median is subtracted from each data value and the resulting differences are divided by the MAD MAD (see below). The calculation of MAD is done in three stages. First, the median is subtracted from each data point. Next, the absolute values of the differences are obtained. These are called the absolute deviations. Finally, the median of the absolute deviations is calculated and multiplied by the constant 1.483 to obtain MAD.

Step 2-The second step is to take the absolute value of the normalized data. Any such result that is greater than 3.5 is declared to be an outlier. Table 4 summarizes the calculations.

The value of 95.7 is again identified as an outlier. This value can then be removed from the data set and Hampel's Rule re-applied to the remaining data. The resulting table is displayed as Table 5. Similar to the previous examples, 99.5 is not considered an outlier.

## APPENDIX D: COMPARISON OF METHODS— PRECISION

The following example illustrates the calculation of a $90 \%$ confidence interval for the ratio of (true) variances for the purpose of comparing the precision of two methods. It is assumed that the data distribution for both methods is approximately normal. The laberabelie that the preeision of the alternative method is acceptable if its standard deviation is not more than fold greater than that of the eurrent method. $\Lambda$ A $90 \%$ (tw-sided) confidence interval is used when a $5 \%$ one-sided test is sought. Here, the test is ene sided, since only the increased standard deviation of the alternative methed is of concem. Some care must beekercised in using two sided intervals in this way, as they must have the property of equal tails-mest common intervals have this property. For this example, assume the laboratory will accept the alternative method if its precision (as measured by the variance) is no more than four-fold greater than that of the current method.

To determine the appropriate sample size for precision, one possible method involves a trial and error approach using the following formula:

Power $=\operatorname{Pr}\left[F>\frac{1}{4} F_{\alpha, n-1, n-1}\right]$
where $n$ is the smallest sample size required to give the desired power, which is the likelihood of correctly claiming the alternative method has acceptable precision when in fact the two methods have equal precision; $\alpha$ is the risk of wrongly claiming the alternative method has acceptable precision; and the 4 is the allowed upper limit for an increase in variance. F-values are found in commonly available tables of critical values of the $F$-distribution. $F_{\alpha, n-l, n-1}$ is the upper $\alpha$ percentile of an $F$-distribution with $n-1$ numerator and $n-$ 1 denominator degrees of freedom; that is, the value exceeded with probability $\alpha$. Suppose initially the laboratory guessed a sample size of 11 per method was necessary (10 numerator and denominator degrees of freedom); the power calculation would be as follows: ${ }^{7}$

$$
\begin{array}{r}
\operatorname{Pr}\left[F>\frac{1}{4} F_{\alpha, n-1, n-1}\right]=\operatorname{Pr}\left[F>\frac{1}{4} F_{.05,10,10}\right]= \\
\operatorname{Pr}\left[F>\frac{2.978}{4}\right]=0.6311
\end{array}
$$

In this case the power was only $63 \%$; that is, even if the two methods had exactly equal variances, with only 11 samples per method, there is only a $63 \%$ chance that the experiment will lead to data that permit a conclusion of no more than a four-fold increase in variance. Most commonly, sample size is chosen to have at least $80 \%$ power, with choices of $90 \%$ power or higher also used. To determine the appropriate sample size, various numbers can be tested until a probability is found that exceeds the acceptable limit (e.g., power > 0.90 ). For example, the power determination for sample sizes of 12-20 are displayed in Table 6. In this case, the in-

[^23]itial guess at a sample size of 11 was not adequate for comparing precision, but 15 samples per method would provide a large enough sample size if $80 \%$ power were desired, or 20 per method for $90 \%$ power.

Typically the sample size for precision comparisons will be larger than for accuracy comparisons. If the sample size for precision is so large as to be impractical for the laboratory to conduct the study, there are some options. The first is to reconsider the choice of an allowable increase in variance. For larger allowable increases in variance, the required sample size for a fixed power will be smaller. Another alternative is to plan an interim analysis at a smaller sample size, with the possibility of proceeding to a larger sample size if needed. In this case, it is strongly advisable to seek professional help from a statistician.

Now, suppose the laboratory opts for $90 \%$ power and obtains the results presented in Table 7 based on the data generated from 20 independent runs per method.

Ratio $=$ Alternative Method Variance/Current Method Variance $=45.0 / 25.0=1.8$
Lower Limit of Confidene Interval-Ratiol $/ F_{95}=1.84$ 2.85-0.63 Lower Limit of Confidence Interval = Ratio/ $F_{\text {.05 }}=1.8 / 2.168=0.83$
Upper Limit of Confidence Interval-Ratio $/ F_{05}=1.81$ 0.39-4.62 Upper Limit of Confidence Interval = Ratio/ $F_{.95}=1.8 / 0.461=3.90$

NOTE- $F_{\text {.05 and }} F_{95}$-are tabulated 5 th and 95 th percentiles from an $F$ distribution, in this example with 15 and 10 degree of freedom.

Discussion The experiment cannot prove that the preeision of the alternative method is aceeptable because the upper limit of the confidene interval (4.6) is greater than the upper aceeptable limit $\left(2^{2}=4\right)$. Because the lower limit of the confidence interval was less than 1 , there is not a statistieally signiffeant difference (at the 10\% level) between
the precision of the alternative method and the precision of the current method. Nevertheless, based on the scientifie requirement of the laboratory, there is not sufficient informat tion to allow for the use of the alternative methed. In such a ease, a second experiment with a larger sample-size-should be performed. How much additional testing should oeeur ean be derived by assuming the true ratio of variances (alternative/current) is 1.8 and increasing the sample sizes until the upper limit of the confidence interval beeomes less than 4. For example, if sample-size for the alternative methed is increased to 41 and the sample size for the current method increased to 31, then the upper limit of the confidence inter wal would be 3.6, which is less than-4.

For this application, a 90\% (two-sided) confidence interval is used when a $5 \%$ one-sided test is sought. The test is one-sided, because only an increase in standard deviation of the alternative method is of concern. Some care must be exercised in using two-sided intervals in this way, as they must have the property of equal tails-most common intervals have this property. Because the upper limit of the confidence interval, 3.90 , is less than the allowed limit, 4.0 , the study has demonstrated that the alternative method has acceptable precision. If the same results had been obtained from a study with a sample size of 15 -as if $80 \%$ power had been cho-sen-the laboratory would not be able to conclude that the alternative method had acceptable precision (upper confidence limit of 4.47).

## APPENDIX E: COMPARISON OF METHODSDETERMINING THE LARGEST ACCEPTABLE DIFFERENCE, $\delta$, BETWEEN TWO METHODS

This Appendix describes one approach to determining the difference, $\delta$, between two methods (alternative-current), a difference that, if achieved, still leads to the conclusion of equivalence between the two methods. Without any other
prior information to guide the laboratory in the choice of $\delta$, it is a reasonable way to proceed. Sample size calculations under various scenarios are discussed in this Appendix.

## Tolerance Interval Determination

Suppose the sample mean and the standard deviation for the current method are 99.5 and 2.0 , respectively. Ther tes were caleulated using the last 50 results generated by this particular method. These values were calculated using the last 50 results generated by this specific method for a particular (control) sample. Given this information, the tolerance limits can be calculated by the following formula:

$$
\bar{x} \pm K s
$$

in which $\bar{x}$ is the mean; $s$ is the standard deviation; and $K$ is based on the level of confidence, the proportion of results to be captured in the interval, and the sample size, $n$. Tables providing $K$ values are available. In this example, the value of $K$ required to enclose $95 \%$ of the population with $95 \%$ confidence for 50 samples is $\mathcal{Z . 3 7 9}-2.382$. The tolerance limits are calculated as follows:

$$
99.5 \pm 2.379 \times 2.0
$$

$$
99.5 \pm 2.382 \times 2.0
$$

hence, the tolerance interval is $(94.7,104.3)$.

## Comparison of the Tolerance Limits to the

## Specification Limits

Assume the specification interval for this method is (90.0, 110.0). The following quantities can be defined: the lower specification limit (LSL) is 90.0, the upper specification limit (USL) is 110.0, the lower tolerance limit (LTL) is 94.7, and the upper tolerance limit (UTL) is 104.3. Calculate the acceptable difference, $(\delta)$, in the following manner:

$$
\begin{aligned}
& A=\mathrm{LTL}-\mathrm{LSL} \text { for } \mathrm{LTL} \geq \mathrm{LSL} \\
& (A=94.7-90.0=4.7) \\
& B=\mathrm{USL}-\mathrm{UTL} \text { for } \mathrm{USL} \geq \mathrm{UTL} \\
& (B=110.0-104.3=5.7) ; \text { and } \\
& \delta=\text { minimum }(A, B)=4.7
\end{aligned}
$$

Fig. 2. A graph of the quantities calculated above.
With this choice of $\delta$, and assuming the two methods have comparable precision, the confidence interval for the difference in means between the two methods (alternative-current) should fall within -4.7 and +4.7 to claim that no important difference exists between the two methods.

Quality control analytical laboratories eftemetimes deal with $99 \%$ tolerance limits, in which cases the interval will widen. Using the previous example, the value of $K$ required to enclose $99 \%$ of the population with $99 \%$ confidence for 50 samples is 3.390 . The tolerance limits are calculated as follows:

$$
99.5 \pm 3.390 \times 2.0
$$

the resultant wider tolerance interval is $(92.7,106.3)$. Similarly, the new LTL of 92.7 and UTL of 106.3 would produce a smaller $\delta$ :

$$
\begin{aligned}
& A=\mathrm{LTL}-\mathrm{LSL} \text { for } \mathrm{LTL} \geq \mathrm{LSL} \\
& (A=92.7-90.0=2.7) \\
& B=\mathrm{USL}-\mathrm{UTL} \text { for } \mathrm{USL} \geq \mathrm{UTL} \\
& (B=110.0-106.3=3.7) ; \text { and } \\
& \delta=\text { minimum }(A, B)=2.7
\end{aligned}
$$

Choosing a larger $\delta$ leads to a smaller $n$ but at the cost of increasing the risk of making the wrong conclusion.

## Sample Size

Formulae are available that can be used for a specified $\delta$, under the assumption that the population variances are known and equal, to calculate the number of samples required to be tested per method, $n$. The level of confidence and power must also be specified. [NOTE-Power refers to the probability of correctly concluding that two identical methods are equivalent.] For example, if $\delta=4.7$, and the two population variances are assumed to equal 4.0, then, for a $5 \%$ level ef confidence test ${ }^{8}$ and $80 \%$ power (with associated $z$-values of 1.645 and 1.282 , repectively), the sample size is approximated by the following formula:

$$
n \geq \frac{2 \sigma^{2}}{\delta^{2}}\left(z_{\alpha}+z_{\beta / 2}\right)^{2}
$$

$$
n \geq \frac{2(4)}{(4.7)^{2}}(1.645+1.282)^{2}=3.10
$$

Thus, assuming each method has a population variance, $\sigma^{2}$, of 4.0 , the number of samples, $n$, required to conclude with $80 \%$ probability that the two methods are equivalent $(90 \%$ confidence interval for the difference in the true means falls between -4.7 and +4.7 ) when in fact they are identical (the true mean difference is zero) is 4 . Because the normal distribution was used in the above formula, 4 is actually a lower bound on the needed sample size. If feasible, one might want to use a larger sample size. Values for $z$ for common confidence levels are presented in Table 8. The formula above makes three assumptions: 1) the variance used in the sample size calculation is based on a sufficiently large

[^24]amount of prior data to be treated as known; 2) the prior known variance will be used in the analysis of the new experiment, or the sample size for the new experiment is sufficiently large so that the normal distribution is a good approximation to the $t$ distribution; and 3) the laboratory is confident that there is no actual difference in the means, the most optimistic case. It is not common for all three of these assumptions to hold. The formula above should be treated most often as an initial approximation. Deviations from the three assumptions will lead to a larger required sample size. In general, we recommend seeking assistance from someone familiar with the necessary methods.

When a $\log$ transformation is required to achieve normality, the sample size formula needs to be slightly adjusted as shown below. Instead of formulating the problem in terms of the population variance and the largest acceptable difference, $\delta$, between the two methods, it now is formulated in terms of the population RSD and the largest acceptable proportional difference between the two methods.

$$
n \geq \frac{2 \sigma_{L}^{2}}{\delta_{L}^{2}}\left(z_{\alpha}+z_{\beta / 2}\right)^{2}
$$

where
and $\rho$ represents the largest acceptable proportional difference between the two methods ((alternative-current)/current) and the population RSDs are assumed known and equal.

## APPENDIX F: COMPARHSON OF METHODSCALCULATION OF SAMPLE SIZE

Formulae are available that ean be used for a specified $\delta$, under the assumption that the pepulation variances are known and equal, to calculate the number of samples required to be tested per method, $n$. The level of confidence and power must also be specified. [NOTE Power refers to the probability of correctly concluding that identient methods arequivalent.] For example, if $\delta=4.7$, and the two population rarianees are assumed to equal-4.0, then, for a-95\% level of confidene and $80 \%$ power (with assoeiated $z$ values of 1.64 and 1.28 , repectively), the sample size is approximated by the following formula:-

$n \geq \frac{2(4)}{(47)^{2}}(1.64+1.28)^{2}-(0.36)(8.53)=3.07$

Thus, assuming each method has a pepulation variance, $\sigma^{2}$, Of 4.0 , the number of samples, $n$, required to conclude with $80 \%$ probability that the methods are equivalent $(90 \%$ eonfidence interval for the difference in the true means falls between -4.7 and +4.7 ) when in fact they are identical (the true mean difference is zere) is 3. Because the normal dis tribution was used in the above formula, 3 is actually a low
er bound on the needed sample-size. If feasible, one might want to use a larger sample-size. Values of $z$ for commen eenfidence-levels are given in the fellowing table.

A more conservative but exact approach is to use the pooled sample variance as an estimate of the commen popufation variance and to use the correspending student twat ues, adjusting them for different sample sizes. Tables providing $t$ values are available in statistical textbooks. Using the same-information, the caleulations would be as follows:

$$
n \geq \frac{2(4)}{(4.7)^{2}}(2.02+1.47)^{2}-(0.36)(12.18)=4.38
$$

In this case, using the pooled sample variance of 4.0 , the number of samples required is 5 . Note that this was the smallest $n$ that satisffed the above inequality.

In many cases, information is provided in terms of a lar gest acceptable percent difference, $p$, and the pepulation RSDs are assumed to be known and equal. This neeessarily implies that the pepulation variances are unequal. The sample size formula then becomes-

or, alternatively,

where $R S D_{\text {est }}$ is the pooled sample $R S D$. Note that in the above formulae, $\rho$ - is interpreted as the propertional change in average respense frem the current method to the alternative method as a function of the geometric mean of the twe methods.

## APPENDIX G: F: ADDITIONAL SOURCES OF INFORMATION

There may be a variety of statistical tests that can be used to evaluate any given set of data. This chapter presents several tests for interpreting and managing analytical data, but many other similar tests could also be employed. The chapter simply highlighted illustrates the analysis of data and some of the more commen upproaches. using statistically acceptable methods. As mentioned in the Introduction, specific tests are presented for illustrative purposes, and USP does not endorse any of these tests as the sole approach for handling analytical data. Additional information and alternative tests can be found in the references listed below or in many statistical textbooks.

BRIEFING
〈1051〉Cleaning Glass Apparatus, USP 27 page 2493.The proposed revisions further clarify the glassware cleaning recommendations provided in this chapter. In addition, minor editorial style changes have been made.
(PW: F. Barletta) RTS-39550-1

## Change to read:

Success in conducting many Pharmacopeial assays and tests depends upon the utmost cleanliness of the glassware apparatus used. Specifieally,
${ }^{\Delta}$ For example,
the accuracy of the assays of heparin sodium and vitamin $\mathrm{B}_{12}$ activity, as well as the pyrogen and total organic carbon tests, are particularly dependent upon scrupulously clean glassware.

One effective method used in the past for cleaning glassware is the application of hot nitric acid. A second traditional method for removing organic matter that does not require heat is the use of a chromic acid-sulfuric acid mixture. However, the chromic acid wash is not recommended because of the hazardous and toxic nature of the material.
Several safer alternatives including the use of cleansing agents, such as trisodium phosphate and synthetic detergents, have proven highly useful, but require prolonged rinsing.
${ }^{\Delta}$ It may be useful to rinse with diluted nitric or sulfuric acid prior to rinsing with water. This operation will facilitate re-
moval of residual alkaline material. $\triangle U S P 28$
For optical measurements, special care is required for cleaning containers, but the use of both chromic acid and highly alkaline solutions should be avoided.
Effective removal of organic matter is very important for testing pharmaceutical waters in accordance with the general test chapter Total Organic Carbon $\langle 643\rangle$. It has been demonstrated that an alkaline detergent comprised of potassium hydroxide as the primary ingredient ${ }^{*}$ leaves the least amount of organic matter residuals. Heating in a muffle furnace produces comparable results and is the least labor-intensive procedure; however, it requires specialized equipment.

In all cases, it is important to verify that the cleaning procedure is appropriate for the particular test or assay being undertaken. This can be accomplished via blank runs, scientific judgments, residuals data from cleansing agent and detergent manufacturers, or other controls. Specifically, special care is required for cleaning containers for optical measurement applications; the use of highly alkaline and the no longer recommended chromic acid solutions should be avoided.
${ }^{\Delta}$ Finally, a statement should be included in the cleaning protocol describing how the success of the cleaning procedure will be assessed. $\Delta U S P 28$

## Briefing

$\langle\mathbf{1 0 8 2}\rangle$ Genotoxicity Testing. This new proposed general information chapter presents a number of test procedures that may be used to test for genotoxicity of compendial articles as indicated in the general information chapter The Biocompatibility of Materials Used in Drug Containers, Medical Devices, and Implants $\langle 1031\rangle$. The methods included in this new chapter are capable of detecting mutations, chemical changes to DNA, and alterations in chromosomal structure, and are divided into in vitro and in vivo methods. In vitro methods include Salmonella typhimurium Reverse Mutation Assay, Escherichia coli Reverse Mutation Assay, Saccharomyces cerevisiae Gene Mutation Assay, Mammalian Cell Gene Mutation Tests, Tests for Detection of Chemical Damage to DNA: DNA Damage and Repair/Unscheduled DNA Synthesis in Mammalian Cells, Saccharomyces cerevisiae Mitotic Recombination Assay, Mammalian Cytogenetic Test, and Sister Chromatid Exchange Assay in Mammalian Cells. In vivo methods include Micronucleus Test, Mammalian Bone Marrow Cytogenetic TestChromosomal Analysis, Rodent Dominant Lethal Test, Mammalian Germ-Cell Cytogenetic Assay, Mouse Spot Test, and Mouse Heritable Translocation Assay.

Comments should be sent to USP headquarters for consideration by the Expert Committee on General Toxicology and Biocompatibility no later than March 1, 2004.
(GTB: D. Porter) RTS-40476-1

## Add the following:

## - <1082 $\rangle$ GENOTOXICITY TESTING

Testing for genotoxicity seeks to determine whether the material under test causes some form of damage to DNA, to one or more genes, or to one or more chromosomes of an organism. The damage could include one or more of the following:

1. Mutation, such as that caused by an insertion, deletion, translocation, or substitution of one or more nucleotides into DNA.
2. A chemical change to the DNA, such as the intercalation of acridine into DNA, or abnormal base parings.
3. Alterations in the structure of one or more chromosomes, or a change in the number of chromosomes.
[^26]A single nucleotide deletion, addition, or translocation can lead to far-reaching effects on a cell (and potentially the organism as well). The deletion can cause a frame-shift mutation in which the codons beyond the point of the deletion/addition are no longer correct. This can result in the production of a messenger RNA that is subsequently translated into a protein with an incorrect amino acid sequence. Most often, such a protein will no longer perform its intended role as well, if at all. Even worse is the possibility that the mutant protein will have deleterious effects. If the deletion/addition/translocation occurs in a regulatory portion of the DNA, normal gene expression can be disrupted, resulting in interrupted DNA or RNA synthesis, or unscheduled DNA or RNA synthesis. A single nucleotide substitution can lead to inherited diseases such as sickle cell disease or phenylketonuria. Somatic effects include the possible activation of ras oncogenes and epithelial cancers. A deletion and/or translocation can cause inherited diseases such as hemophilia and Duchenne's muscular dystrophy. Somatic effects can include the activation of myc and abl oncogenes, and the appearance of cancers such as lymphomas and leukemias.

The interaction between nucleotide bases from one DNA strand to another, or between the template DNA strand and the nascent messenger RNA strand, is due to hydrogen bonding. Upon binding of a chemical, such as acridine, to a portion of a DNA strand, it is possible that subsequent hydrogen bonding in that region of nucleotides intended for new DNA or messenger RNA synthesis would be disrupted. This disruption can result in miscoded strands.

In some circumstances where a gross change in chromosome structure or number has occurred, it is possible to observe this microscopically. Alterations in chromosomal structure include breaks, deletions, and rearrangements. The loss or gain of an entire chromosome can lead to inherited diseases, such as Down's or Turner's syndrome, and somatic effects, such as the loss of tumor suppressor genes and the appearance of various cancers.

Changes to one or a few nucleotides require observations for changes in a potentially wide array of physiological activities. Many agents can cause damage to DNA at high concentrations. Of particular interest in genotoxicity testing is determining whether an article under test can induce DNA damage at concentrations that are not overtly toxic at the level of the organism (subtoxic levels). The purpose of this chapter is to provide guidance on evaluating the potential for genotoxicity caused by medical devices and implants. The need for testing medical devices and implants for genotoxicity may be determined by the flowcharts and tables provided in the general information chapter The Biocompatibility of Materials Used in Drug Containers, Medical Devices, and Implants $\langle 1031\rangle$.

A multi-step process, delineated in general information chapter $\langle 1031\rangle$, is followed in determining which, if any, toxicological tests need to be performed on a given article. In some cases, sufficient evidence may be available from previously marketed articles to satisfy toxicology requirements (see Fig. 1 in general information chapter $\langle 1031\rangle$ ). Important factors addressed in Fig. 1 (general information chapter $\langle 1031\rangle$ ) include the type and extent of contact with the body, the chemical composition, the manufacturing process, and the sterilization process, along with the aforementioned similarity to previously marketed articles.

If it is determined that further toxicological testing is necessary, the classification of medical devices provided in Table 2 of general information chapter $\langle 1031\rangle$ is important, because the degree and extent of toxicological testing is strongly influenced by the nature of the bodily contact of the article. The classification derived from Table 2 (general information chapter $\langle 1031\rangle$ ), coupled with the length of expo-
sure to the article used as stated in Tables 3-5 (general information chapter $\langle 1031\rangle$ ), is used to determine which toxicological tests need to be performed. Table 1 below presents information extracted from Tables 3-5 of general information chapter $\langle 1031\rangle$ indicating those circumstances for which genotoxicity testing is required.

Table 1. Articles Requiring Genotoxicity Testing Based on Article Category and Length of Exposure

| Device Category | Body Contact | Contact <br> Duration ${ }^{\mathrm{a}}$ |
| :--- | :--- | :---: |
| Surface devices | Mucosal membrane | C |
| External communicating devices | Breached or compromised surfaces | Blood path, indirect |
|  | Tissue, bone, or dentin communicating | C |
| Implant devices | Circulating blood | $\mathrm{B}, \mathrm{C}$ |
|  | Tissue or bone | $\mathrm{A}^{\mathrm{b}}, \mathrm{B}, \mathrm{C}$ |
| Blood | $\mathrm{B}, \mathrm{C}$ |  |

a Legend: A-Limited (less than 24 hours); B—Prolonged (24 hours to 30 days); C—Permanent (more than 30 days). ${ }^{\mathrm{b}}$ Test that may be applicable.

## TEST PROCEDURES

## General

In most circumstances, more than one type of test should
dependent upon the in vitro results. If the results from the in vitro testing clearly indicate that the article under test has genotoxic properties, in vivo testing need not be performed.

There are many instances where not all of the in vitro tests within a battery indicate that an article may be genotoxic. Because there are numerous mechanisms by which DNA and/or chromosomes may be damaged, and because a test battery should include methods examining different mechanisms, the lack of perfect correlation is to be expected. If the results of the test battery suggest that an article may be genotoxic, then subsequent in vivo tests may be appropriate.

## Sample Preparation ${ }^{1}$

This section provides general guidance on preparing samples for genotoxicity testing. The article should be in its final form before testing (i.e., the final product). If the configuration of the final product is such that testing it in its final form is impractical, then representative portions of it should be evaluated. An important point is that should the article be composed of several types of material, a representative portion of each part of the article that can contact bodily surfaces should be evaluated. This includes portions of the device with surface coatings, seams, adhesives, etc. If a portion of the article is composed of a chemical or chemicals thought to have increased potential for genotoxicity, it may be appropriate to test the material to a disproportionate degree relative to its abundance in the article. If the article cures in situ, it should be evaluated following the minimum time of curing that may occur in the clinical setting.

In all cases, the test article, any associated reference standards, and positive and negative controls should be handled in a manner preventing either chemical or microbial contamination. If the test article is normally supplied nonsterile, but is then sterilized prior to use, the article should be sterilized according to the manufacturer's instructions prior to use. Likewise, when designing the genotoxicity study, it is important to bear in mind whether there is a potential for the article to undergo repeated sterilization cycles.

In many cases, an article to be tested needs to be cut into smaller pieces prior to testing/extraction. These cut surfaces have the potential to expose different chemical entities to the test system. This may be particularly important to consider if an article might undergo such cutting prior to actual clinical use. Conversely, it may not be necessary to include portions of the article that are not exposed to body fluids during

[^27]clinical use. These determinations are critical to ensuring the appropriateness of the extraction/processing procedures, and in turn, the relevance and accuracy of the test results.

## Sample Extraction

For the many tests to be performed in assessing genotoxicity, it will be necessary to prepare an extract of the article to be tested. In performing extractions of articles to be evaluated, it is important to consider a number of points. In vitro test systems require that the solvents used in the extraction procedures be compatible with cell-based methods and should be chosen for their similarity to body fluids that will contact the article during clinical use. Harsh solvents are not useful in such cases. Extraction media should be evaluated for their cytotoxic potential. Media that may be useful for extraction include physiological saline, liquid culture media (minus serum), various vegetable oils, low concentration of dimethyl sulfoxide (DMSO), various low concentration mixtures of alcohol with other liquids, polyethylene glycol made iso-osmotic, etc. The general chapter Biological Reactivity Tests, In Vitro $\langle 87\rangle$ lists Sodium Chloride Injection as another extraction medium.

It is important that extractions are done in suitable containers that will not alter the chemical nature of the product being extracted. General chapter $\langle 87\rangle$ indicates that glass containers made of Type I glass be used. If the container is to be sealed, then the exposed surface of the elastomeric liner should be completely protected with an inert solid disk 50 to $75 \mu \mathrm{~m}$ in thickness.

The extraction conditions should be such that the potential for altering the chemical nature (hence genotoxic potential) of the article is minimized. Given the generally longterm exposure of organisms to the test articles being examined for genotoxicity, the most appropriate extraction conditions may be at $37^{\circ}$ for 24-72 hours. The extraction period
may be shortened by the use of higher temperatures, but it should be demonstrated that such elevated temperatures do not alter the chemical nature of the article. In cases where an article may be exposed to higher temperatures prior to clinical use, extraction at a higher temperature would be appropriate.
The quantity of article to be extracted is related to the thickness of the article and the type of material of which it is composed. For natural elastomers $\leq 1.0 \mathrm{~mm}$ thick, the ratio of article to extractant should be $3 \mathrm{~cm}^{2}$ per mL of extractant. If the natural elastomer is $>1.0 \mathrm{~mm}$ thick, the ratio should be $1.25 \mathrm{~cm}^{2}$ per mL . For other materials with readily measured surface areas $\leq 0.5 \mathrm{~mm}$ thick, the ratio should be 6 $\mathrm{cm}^{2}$ per mL , with thicker materials extracted at $3 \mathrm{~cm}^{2}$ per mL . For those articles for which a surface area cannot be readily determined, a ratio of 0.1 to 0.2 g per mL should be used.

## Test Battery Selection

There are a number of approaches that may be taken when designing the test battery for use with a particular article. When the chemistry of the article and its likely breakdown products are well established, the in vitro tests might be selected because of their known sensitivity to the classes of compounds pertinent to the article. In some cases, cells from a variety of species/phyla may be employed. At times, the use of a base test possessing a wealth of historical data might be coupled with one or more tests selected for their sensitivity to those aspects of the base test that provide weak results. Finally, selecting in vitro tests that can reflect the potential forms of damage discussed above (changes to the nucleotide sequence of DNA, chemical changes to DNA, chromosomal alterations) is often an effective approach given that no assumptions need to be made about chemical classes or the mode of genotoxicity.

## IN VITRO TESTS

There are many in vitro tests available for use in genotoxicity testing. Following the general approach suggested in this chapter, three or more tests should be selected based upon their ability to reflect the three separate mechanisms of genotoxicity described above. The tests in this section are divided into those that detect mutation (e.g., changes to the nucleotide sequence of DNA), those that detect chemical changes to the DNA, and those that detect chromosomal damage.

## Tests for Detection of Mutation

## Salmonella typhimurium REVERSE MUTATION ASSAY

This test is based upon measuring an increase in the number of histidine-independent colonies of Salmonella typhimurium beyond the number of naturally occurring revertants as a result of exposure to the test article. The reversion to histidine independence could be due to base changes or frame shift mutations. The test is performed by exposing bacteria to the test article, with or without the presence of a metabolic activation system, on minimal medium (lacking histidine). The article can be a solid or an extract made from a solid.

Bacteria-There should be at least 4 strains of Salmonella typhimurium used in this method, including TA 1535, TA 1537, TA 98, and TA 100. Other strains may be used, when appropriate. It is best to employ seed lot techniques of culturing to ensure that no microorganisms in the test are more than 5 passages removed from the original culture as provided by an appropriate cell repository. The bacteria should be grown in a suitable broth medium (such as fluid lactose medium) to the late exponential to early stationary phase $\left(10^{8}-10^{9}\right.$ cfu per mL ). Incubation should be at a temperature of $32.5 \pm 2.5^{\circ}$.

The bacteria should be examined to ensure that the appropriate phenotype is present. The requirement for histidine in the culture medium should be demonstrated. The rate of spontaneous reversion to histidine independence should also be established by culturing on minimal medium. Bacteria displaying a higher rate of reversion relative to earlier rates for that lot should not be used. Expected antibiotic resistance, such as to ampicillin, should also be demonstrated.

Metabolic Activation System—A suitable metabolic activation system may be prepared from the livers of rodents. The system contains a postmitochondrial fraction supplemented with various cofactors. Such systems can be made within the laboratory, or purchased from various commercial suppliers. A number of agents may be used to induce activation of liver enzymes.

Medium-An appropriate medium for conducting the test should be histidine free, and may include ampicillin. Such media may be obtained commercially.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. Concentrations of test article that are not overtly cytotoxic should be used. A cytotoxic effect on the bacteria may be demonstrated by a reduction in the density of the bacterial lawn for cultures plated on growth medium plus the test article, by a reduction in the number of spontaneous revertants, or by the degree of survival of cultures treated and then plated on growth media. The maximum noncytotoxic concentration, plus at least four lower concentrations, should be tested.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive chemical controls are strain-specific. Sodium azide is effective with TA 1535
and TA 100, 2-nitrofluorene is effective with TA 98, and 2-aminoanthracene is effective with TA 1537. 2-Aminoanthracene is an effective positive control when metabolic activation systems are included. Other positive and negative controls may be appropriate as well.

Test Performance-Culture plates ( 10 cm may be used) containing solidified histidine-free medium may be used. The test article should be mixed with 0.1 mL of the bacterial culture as described in Bacteria and 2 mL of molten (overlay) agar. [NOTE-The agar should be cooled to approximately $42^{\circ}$ to $45^{\circ}$ before adding the bacteria.] If a metabolic activation system is to be included, it should be added after the addition of the bacteria and test article. Negative controls should include the same components minus the test article. The contents in the overlay agar tube should be poured over the surface of a plate of solidified agar and the agar overlay should be allowed to cool and solidify. Plates should be incubated at $32.5 \pm 2.5^{\circ}$ for $48-72$ hours, after which the number of colonies should be counted.

Observations and Interpretation-The number of revertant colonies (those that can grow on medium without histidine) should be recorded for all plates. Statistical comparisons between test and control plates should be made to determine if a statistically significant difference in the number of revertants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of revertants is seen. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference, or single test point difference between test and controls is found, the article is not genotoxic in this test system.

## Escherichia coli REVERSE MUTATION ASSAY

This test, similar to the Salmonella typhimurium Reverse Mutation Assay, measures the reversion of specific strains of bacteria from a particular amino acid dependence to an independent state. In this case, the reversion is from a trypto-phan-dependent to independent state. Also, as in the Salmonella typhimurium Reverse Mutation Assay, bacteria should be exposed to the test article with and without a metabolic activation system.

Bacteria-Culturing of bacteria should be done in the same manner and under the same conditions as described for Bacteria in the Salmonella typhimurium Reverse Mutation Assay. The strains that should be used are Escherichia coli WP2, WP2 uvrA, and WP2 uvrA pKM 101. If appropriate, other strains may be used.

The bacteria should be examined to ensure that the appropriate phenotype is present. The requirement for tryptophan in the culture medium should be demonstrated. The rate of spontaneous reversion to tryptophan independence should also be established by culturing on minimal medium. Bacteria displaying a higher rate of reversion relative to earlier rates for that lot should not be used. Expected antibiotic resistance, such as to ampicillin, and sensitivity to mitomycin C, should also be demonstrated.

Metabolic Activation System—A suitable metabolic activation system may be the same as that described for the Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.

Medium-An appropriate medium for conducting the test should be tryptophan-free, and may include ampicillin. Such media may be obtained commercially.
Test Article-See Test Article in the Salmonella typhimurium Reverse Mutation Assay.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Methyl methane sulfonate, 4-nitroquinoline oxide or $N$-ethyl $N$-nitro nitrosoguanidine are effective positive controls when metabolic activation systems are not included. 2-Aminoanthracene may be used as a positive control when a metabolic activation system is included. Other positive and negative controls may be appropriate as well.

Test Performance-Perform the test using the same procedure as that described for Test Performance in the Salmonella typhimurium Reverse Mutation Assay.

Observations and Interpretation-Perform as described for Observations and Interpretation in the Salmonella typhimurium Reverse Mutation Assay. The criteria for the determination of potential genotoxicity for a test article are also the same as those in the Salmonella typhimurium Reverse Mutation Assay.

## Saccharomyces cerevisiae GENE MUTATION ASSAY

This is another assay designed to identify mutations due to base substitutions or frame shifts in DNA. In this case, the test microorganism is a eukaryotic cell type (a species of yeast). There are a variety of mutations present in the most commonly used haploid strain of Saccharomyces cerevisiae that may be reversed, resulting in a number of different outcomes. In some cases, resistance to antibiotics such as canavanine and cycloheximide has developed as result of a reverse mutation. In other cases, red mutants requiring adenine become white mutants, still requiring adenine. Other mutations in the most commonly used strain include lys $1-1, \operatorname{trp} 5-48$, his $1-7$, and hom 3-10. The most commonly used diploid strain is homozygous for ilv 1-92.

Yeast—Although a number of strains of Saccharomyces cerevisiae may be used, the most commonly used yeast haploid strain is XV 185-14C, and the most commonly used diploid strain is $\mathrm{D}_{7}$. Typical incubation temperatures for yeast are $22.5 \pm 2.5^{\circ}$.

The yeast should be examined to ensure that the appropriate phenotype is present. The requirement for particular amino acids, or sensitivity to specific antibiotics, or particular color phenotypes, etc., should be demonstrated as appropriate to the test system. The rate of spontaneous reversion should also be established by culturing on a medium appropriate to a given test system. Yeast displaying a higher rate of reversion relative to earlier rates for that lot should not be used.

Metabolic Activation System-A suitable metabolic activation system may be the same as that described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.

Medium-Since there are a variety of potential reversions that may be tested for, there are a variety of media that may be suitable. A growth medium should be used in order to enrich the cells to the point where 1 mL of culture would contain $1-5 \times 10^{7}$ cells per mL . Other media should be used to select for revertants. For example, if the appearance of cycloheximide-resistant mutations is to be examined, the selective media should include a concentration of cycloheximide inhibitory to nonrevertants.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. It is necessary to use concentrations of test article that are not overtly cytotoxic. A
cytotoxic effect on the bacteria may be demonstrated by a reduction in cell viability and growth. The maximum noncytotoxic concentration, plus at least 4 other lower concentrations, should be used.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation system, and those that do require a metabolic activation system. Examples of those that act without the metabolic activation system include methylmethanesulfonate, ethylmethanesulfonate, and 4-nitroquinoline- N -oxide. N Nitrosodimethylamine and cyclophosphamide are examples of positive controls requiring the presence of a metabolic activation system. Other positive and negative controls may be appropriate as well.
Test Performance-Typically, $1-5 \times 10^{7}$ cells per mL in the growth phase should be exposed to the test article in liquid culture for up to 18 hours at $22.5 \pm 2.5^{\circ}$ using a shaking incubator. Metabolic activation systems would be added to this preparation. After incubation, the cells should be pelleted in a centrifuge in a nondestructive manner. The pellet should be washed and resuspended for placement on the surface of the appropriate selective medium. The plates are then incubated for $4-7$ days at $22.5 \pm 2.5^{\circ}$. Negative controls undergo the same treatment, except that no exposure to the test article occurs. Repeat the study using cells in the stationary phase if the results of the first study are negative.

Observations and Interpretation-The number of revertants found on the test plates, and spontaneous revertants on the control plates, should be determined. The number of colonies plated should be determined through the use of
plates containing growth medium for the yeast. The frequency of mutants on both the control and the test plates should then be calculated.

Statistical comparisons between test and control plates should be made to determine if a statistically significant difference in the number of revertants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of revertants is seen. Also, a statistically significant difference between test and controls of at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant doseresponse difference nor a single, test-point difference between test and controls is found, the article is not genotoxic in this test system.

## IN VITRO MAMMALIAN CELL GENE MUTATION TESTS

This is another test designed to show mutations involving frame shifts or base pair changes resulting in a mutation from a cell sensitive to pyrimidine analogs such as bromodeoxyuridine ( BrdU ) to an insensitive form. Of the commonly used cell lines for this procedure, the cells normally contain functional thymidine kinase (TK), hypox-anthine-guanine phophoribosyl transferase (HPRT) and $\mathrm{Na}^{+} / \mathrm{K}^{+}$ATPase enzymes. When functional TK is present, the presence of a pyrimidine analog such as BrdU results in the incorporation of the analog into nucleotides, a mutation that leads to disruption of normal cell activities. A mutant cell with a deficient TK will not incorporate the analog, thus the cell survives. A similar situation exists for cells with normal HPRT, where the presence of a compound like 8azaguanine leads to disruption of cellular function, whereas the mutant cell with a dysfunctional HPRT will not incorpo-
rate the analog. When the presence of an inactivated $\mathrm{Na}^{+} / \mathrm{K}^{+}$ ATPase is under investigation, ouabain may be used as the selective agent.
Mammalian Cells-The most commonly used cell lines are L5178Y mouse lymphoma cells, and V-79 and L5178Y Chinese hamster cells. Required conditions for culturing are provided by the suppliers. Cell lines should not be passaged indefinitely; the karyotypes should be examined periodically; and the cells should also be examined to ensure that they are not undergoing an increased rate of spontaneous mutation leading to insensitivity to the selective agents.

Culture conditions should be appropriate to the cells. Commercial suppliers of mammalian cell lines will generally provide information on culture conditions, including appropriate media, supplements, etc. Mammalian cells are often incubated at $37^{\circ}$ in $5 \%$ carbon dioxide at saturated relative humidity.

Metabolic Activation System—A suitable metabolic activation system may be the same as that described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.

Test Article-Extracts of solid test articles should be prepared as that described for Preparation of Extracts in the Biological Reactivity Tests, In Vivo $\langle 88\rangle$. It is necessary to use concentrations of test article that are not overtly cytotoxic. At least 4 other lower concentrations should be used as well.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation
system, and those that do require a metabolic activation system. A search of numerous toxicological databases on the Internet can provide examples of suitable positive controls.

Table 2 lists the names of several toxicological databases available on the Internet and gives their URLs (Uniform Resource Locators).

${ }^{\mathrm{b}}$ This is a specific document published by the California Environmental Protection Agency.

Test Performance-Monolayer cultures or cell suspensions may be used. They should be exposed to the test article in full growth medium with or without a metabolic activation system for a length of time sufficient to allow development of the mutant phenotype under investigation. After that time, the cultures should be subdivided such that half
of the cells are seeded into full growth medium and the other half into medium containing the selective agent. A cell count of the suspension prior to seeding should be made in order to permit calculating normal plating efficiency and the rate of mutation.

Observations and Interpretation-Using the cell counts for negative controls and for test articles, the rate of mutation formation should be calculated as a percentage of the controls. The results should be examined for the presence of statistically significant differences between test and controls.

An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of mutants is seen. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference or single test point difference between test and controls is found, the article is not genotoxic in this test system.

## Tests for Detection of Chemical Damage to DNA: DNA Damage and Repair/Unscheduled DNA Synthesis in Mammalian Cells In Vitro

Mammalian cells possess enzymatic machinery with which damaged portions of DNA can be excised, then replaced via new synthesis of DNA. Such synthesis of DNA can be considered to be unscheduled in the sense that it does not occur as part of mitosis. The synthesis of DNA may be monitored by the uptake of radiolabeled thymidine $\left({ }^{3} \mathrm{H}-\right.$ TdR). Various means may be employed by which scheduled DNA synthesis (due to mitotic activity) may be inhibited, thereby facilitating the determination of unscheduled DNA synthesis.

Mammalian Cells-A wide range of mammalian cells may be used in this test. These include established lines, short-term rat hepatocyte cultures, and human lymphocyte cultures. Various methods may be used in culturing hepatocytes and lymphocytes.

For established cell lines, required conditions for culturing are provided by the suppliers. Cell lines should not be passaged indefinitely, the karyotypes should be examined
periodically, and the cells should also be examined to ensure that they are not undergoing an increased rate of spontaneous mutation leading to insensitivity to the selective agents.

Culture conditions should be appropriate to the cells in use. Commercial suppliers of mammalian cell lines will generally provide information on culture conditions, including appropriate media, supplements, etc. Mammalian cells are often incubated at $37^{\circ}$ in $5 \%$ carbon dioxide at saturated relative humidity.

Metabolic Activation System—A suitable metabolic activation system may be the same as described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay. This system would not be used if rat hepatocytes are chosen for the test.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The highest concentration of test article should cause some mild cytotoxic effects. At least four other lower concentrations should be used as well.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation system and those that do require a metabolic activation system (a metabolic activation system should not be used with rat hepatocyte cultures). A search of numerous toxicological databases on the Internet can provide examples of suitable positive controls. Table 1 lists the names of several toxicological databases available on the Internet, and gives their URLs. Positive controls for use with rat hepatocyte cultures include 7,12-dimethylbenzanthracene and 2-acetylaminofluorene. For established cell lines, positive controls include

4-nitroquinoline- $N$-oxide (without a metabolic activation system) and $N$-dimethylnitrosoamine (with metabolic activation).

Test Performance-Regardless of the cell type used, the test procedure involves exposing cell cultures to the test article, with labeled thymidine (approximately $10 \mu \mathrm{Ci}$ per mL ) added simultaneously or shortly after the period of exposure to the test article. Two methods of determining the amount of unscheduled DNA synthesis are indicated below.

Autoradiographic Method-After exposure to the test article and labeled thymidine, the cells (in suspension) should be placed on microscope slides and air-dried. Nuclei may be swollen by exposing the microscope slides with attached cells to $1 \%$ sodium citrate for 10 minutes. Cells should then be fixed using a mixture of alcohol and acetic acid (3:1) (three changes). The slides should then be air-dried for at least 24 hours, dipped into a suitable autoradiographic emulsion (in a darkroom), air-dried again, placed in a lightproof container, and stored at $4^{\circ}$ for $7-10$ days. No moisture should be allowed to enter the containers during storage. Next, the exposed emulsion should be developed in D19, then fixed. A suitable counter stain (such as one containing hematoxylin and eosin) should be applied.
Liquid Scintillation Counting Method-Because there is no microscopic examination with this method, it is important to block normal mitotic synthesis of DNA. Such blockage may be accomplished by the use of arginine-deficient medium, low serum, hydroxyurea in the culture medium, or by other appropriate means. The cells may then be exposed to the test article with labeled thymidine as described above. After the exposure, DNA should be extracted from the cells [NOTE-Numerous techniques are available, and commercial kits are also available for DNA extraction]. The total DNA should be calculated and the extent of labeled thymidine uptake determined.

## Observations and Interpretation-

Autoradiographic Method-Grains overlying at least 50 nuclei per slide should be determined microscopically. Because some background grain formation may occur, the average number of grains overlying 3 cytoplasmic areas should be subtracted from the number of grains overlying the nucleus. This value is the net nuclear gain count. Average the net nuclear gain counts as appropriate to obtain mean nuclear gain counts. Only nuclei with normal appearances should be counted. Cells with mitotic figures should not be counted. These counts should be done for both test article-treated cultures and for controls.

The test article is considered to cause increased unscheduled DNA synthesis if the following applies:
a. there is at least, on average, an increase of 5 or more for the mean nuclear grain count per test article-treated nucleus versus associated controls, or
b. the percentage of nuclei with 6 or more grains is $10 \%$ or above that of the population examined, relative to associated controls.

Liquid Scintillation Counting Method-The total DNA should be calculated and the extent of labeled thymidine uptake determined. This should be done for both test articletreated cultures and for controls. The incorporation of labeled thymidine should be reported in terms of dpm per $\mu \mathrm{g}$ of DNA. Differences between test and controls should be evaluated statistically.

An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the extent of unscheduled DNA synthesis is found. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor single test point difference between test and controls is found, the article is not genotoxic in this test system.

## Tests for Detection of Chromosomal Damage

## Saccharomyces cerevisiae MITOTIC RECOMBINATION ASSAY

This test is designed to identify changes to the structure of DNA caused by exposure to a test article. The structural change might involve crossing over during mitosis or a translocation of a portion of DNA from one location on a single strand to another location on the same strand. Specific diploid strains of the yeast, Saccharomyces cerevisiae, are used.
Crossing over may manifest itself in the form of homozygous recessive colonies arising from a previously heterozygous strain of yeast. Translocation of a portion of DNA from one location to another on the same strand (also known as mitotic gene conversion) may cause the development of revertants from auxotrophic states (mutants requiring particular nutritional additives not required by normal, or prototrophic yeast). Such translocations may occur upon exposure of yeast containing two differing defective alleles for the same gene.

Yeast—Although a number of strains of Saccharomyces cerevisiae may be used, the most commonly used strains for detection of mitotic crossing over are $\mathrm{D}_{5}$ or $\mathrm{D}_{7}$. The $\mathrm{D}_{7}$ strain is XV $185-14 \mathrm{C}$, and the most commonly used strains for detection of translocation are $\mathrm{D}_{4}, \mathrm{D}_{7}$, and $\mathrm{JD}_{1}$. Typical incubation temperatures for yeast are $22.5 \pm 2.5^{\circ}$.

The yeast should be examined to ensure that the appropriate phenotype is present. The requirement for particular amino acids, or sensitivity to specific antibiotics, or particular color phenotypes, etc., should be demonstrated as appropriate to the test system. The rate of spontaneous reversion should also be established by culturing on a medium appropriate to a given test system. Yeast displaying a higher rate of reversion relative to earlier rates for that lot should not be used.

Metabolic Activation System—A suitable metabolic activation system may be the same as that described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.

Media-Because there are a variety of potential reversions/mutations that may be tested for, there are a variety of media that may be suitable. A growth medium should be used in order to enrich the cells to the point where 1 mL of culture would contain $1-5 \times 10^{7}$ cells per mL . Other media should be used to select for revertants. For example, if the appearance of prototrophic revertants is to be detected, the selective media should not include the substance needed by the auxotrophs.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. Concentrations of test article that are not overtly cytotoxic should be used. A cytotoxic effect on the bacteria may be demonstrated by a reduction in cell viability and growth. The maximum noncytotoxic concentration, plus at least four other lower concentrations, should be used.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation system and those that do require a metabolic activation system. Examples of those that act without the metabolic activation system include methylmethanesulfonate, ethylmethanesulfonate, and 4-nitroquinoline- N -oxide. Cy clophosphamide is an example of a positive control requiring the presence of a metabolic activation system. Other positive and negative controls may be appropriate as well.

Test Performance-Typically, $1-5 \times 10^{7}$ cells per mL in the growth phase should be exposed to the test article extract in liquid culture for up to 18 hours at $22.5 \pm 2.5^{\circ}$ using a shaking incubator. Metabolic activation systems should be added to this preparation. After incubation, the cells should be pelleted in a centrifuge in a nondestructive manner. The pellet should be washed and resuspended for placement on the surface of the appropriate selective medium. The plates are then incubated for $4-7$ days at $22.5 \pm 2.5^{\circ}$. Negative controls undergo the same treatment, except that no exposure to the test article extract occurs. If plates are being used to detect the presence of red and pink homozygous colonies due to mitotic crossing over, incubate the plates in a refrigerator ( $2^{\circ}$ to $8^{\circ}$ ) for 24-48 hours to permit development of the pigmentation. Repeat the study using cells in the stationary phase if the results of the first study are negative.

Observations and Interpretation-The number of revertants/recombinations found on the test plates and the number of spontaneous revertants/recombinations on the control plates should be determined. The number of colonies plated should be determined by using plates containing growth medium for the yeast. The frequency of mutants on both the control and the test plates should then be calculated.

Statistical comparisons between the test and control plates should be made to determine if a statistically significant difference in the number of revertants/recombinants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of revertants is observed. Also, a statistically significant difference between the test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## IN VITRO MAMMALIAN CYTOGENETIC TEST

In this procedure, any of a number of mammalian cell types are exposed in culture to a test article. Shortly before harvesting of the cells, they are exposed to agents that stop mitotic activity. Any cells that had reached the metaphase stage of mitosis will be stopped at the point where the chromosomes (paired chromatids at this stage) are lined up along the midline of the cell undergoing mitosis. This greatly facilitates the subsequent microscopic examination for structural alterations to the chromosomes/chromatids.

The alterations to structure may involve the chromosome prior to mitosis, in which case both sister chromatids will be altered, or the alteration may involve only one of the sister chromatids. In the latter case, the effect of the test article was not at the level of the chromosome prior to mitosis.
Mammalian Cells-A wide range of mammalian primary cell cultures or established cell lines may be used. The advantages to using primary cultures include a greater likelihood that the chromosomal structure is normal. Disadvantages include the considerable increase in labor and technical skill required to obtain the cells from the tissue source, and the limited number of passages to be expected from a primary, nontransformed culture of the cells. Many appropriate established lines are available from commercial suppliers. Required conditions for culturing are provided by the suppliers. While these advantages are important, and include the ability of many of these cell lines to be passaged many times, such lines also have the disadvantage of an increased likelihood of abnormal karyotypes. Therefore, cell lines should not be passaged indefinitely, and the karyotypes should be examined on a routine basis to ensure that the cells undergoing exposure to test articles are not demonstrating an increased rate of spontaneous abnormal karyotype development.

Culture conditions should be as appropriate to the cells in use. Commercial suppliers of mammalian cell lines will generally provide information on culture conditions, including appropriate media, supplements, etc. Mammalian cells are often incubated at $37^{\circ}$ in $5 \%$ carbon dioxide at saturated relative humidity.

Metabolic Activation System-A suitable metabolic activation system may be the same as that described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. It is necessary to use concentrations of test article that are not overtly cytotoxic. A cytotoxic effect on the cells may be demonstrated by a reduction in cell viability and growth. The maximum concentration should be that which causes approximately a $50 \%$ reduction in mitoses. This will be manifested by a reduction in cell doublings. At least four other lower concentrations should be used as well.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation system and those that do require a metabolic activation system. A search of numerous toxicological databases on the Internet can provide examples of suitable positive controls. For example, ethylmethanesulfonate can be identified by such a search.

Test Performance-The specifics of the culturing will depend upon the cell type used. Established cell lines should be generated from stock cultures, possibly originating from cells stored frozen in liquid nitrogen (or in the vapor phase above liquid nitrogen). The cells should be seeded at an ap-
propriate density that is also dependent upon the type of cell used. Commercial suppliers will generally indicate details pertinent to subculturing for each established cell type. If human lymphocytes are to be used, whole, heparinized blood should be placed in the culture medium. A mitogen should be added to induce mitotic activity. An example of a suitable mitogen is phytohemagglutinin.

If established cell lines are used, exposure to the test article should occur while the cells are in the exponential growth phase. This means that the cells should be exposed prior to reaching confluence, or when evidence of slowing of growth is observed. Human lymphocytes (mitogen stimulated) should be treated in the same manner. Cells should be exposed to a test article both in the presence and absence of a metabolic activation system.
The length of time over which the cells should be exposed to the test article is dependent in part on the specific cell type and its normal rate of mitotic division, and in part upon whether the test article alters the normal mitotic rate. Therefore, cells should be examined at several times postadministration of the test article. Human lymphocyte cultures, which grow in suspension, can have the test article added at different times, allowing for a single harvest time with cells having undergone exposure for different lengths of time.

Regardless of the cell type used, an agent that inhibits mitotic activity, such as colchicine, should be added to the cultures approximately 2 hours before the cells are harvested for examination. Colchicine acts by disrupting microtubule formation. Normal functioning of the microtubules is required for ongoing mitotic activity.

For cells grown as monolayers, harvesting would require disruption of the monolayers in a manner that does not disrupt the cells. There are a number of methods for loosening monolayers and preparations of suspensions, including the
use of trypsin/EDTA. Portions of the cell suspension (derived from monolayers or from suspension cultures) should be applied to microscope slides, then fixed and stained such that the chromosomes may be examined. A number of stains are suitable.

Observations and Interpretation-Chromosomal aberrations seen in cells in metaphase should be determined. Table 3 lists some of the aberrations that may be checked. For established cell lines, cells with the modal chromosome number $\pm 2$ centromeres may be counted. If human lymphocytes are used, only cells with 46 centromeres should be examined. The number of cells examined should be based on knowledge of the spontaneous (negative control) appearance of altered chromosomes and on the statistical power desired. A statistical power calculation requires (1) knowledge of the typical variance for the test system, (2) a prior determination of the Type I and Type II errors that are acceptable, and (3) the minimum detectable difference required. It is best that statistical power calculations be performed a priori, although after-the-fact power calculations may be done to determine the realized sensitivity of the test.

Table 3. Some Examples of Chromosomal

## Aberrations

| Chromosomal breakage (micronuclei) |
| :--- |
| Chromosomal bridges |
| Chromosomal fragments |
| Chromosomal gaps |
| Dicentric chromosomes |
| Polyploidy |
| Hyperdiploidy |
| Chromatid deletion |
| Chromatid gaps |
| Chromatid breakage (fragments) |
| Sister chromatid exchanges |

Chromosomal bridges
Chromosomal fragments
Chromosomal gaps
Dicentric chromosomes
Polyploidy
Hyperdiploidy
Chromatid deletion
Chromatid gaps
Chromatid breakage (fragments)
Sister chromatid exchanges

The number of cells in the test samples showing chromosomal aberrations and the spontaneously occurring chromosomal aberrations on the control plates should be determined. The number of metaphase cells counted for both article-treated test cells and controls should be recorded. The frequency of mutants for both control and test cell cultures should then be calculated.

Statistical comparisons between test and control cultures should be made to determine if a statistically significant difference in the number of mutants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of mutants is observed. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## IN VITRO SISTER CHROMATID EXCHANGE ASSAY IN MAMMALIAN CELLS

During the process of mitosis, each chromosome replicates, forming two sister chromatids. One possible outcome of exposure of a test article to a genotoxic agent is an increase in the rate of sister chromatid exchange. In such exchanges, the DNA strand of each chromatid breaks, presumably at homologous loci, then the strands recombine with the opposite sister chromatid. In order to evaluate such recombination events, it is necessary that one be able to distinguish between the two sister chromatids. In this method, cells are cultured in the presence of BrdU after the period of incubation with the test article for two cell cycles. Then the cells are exposed to an agent that blocks microtubule function (such as colchicine), and the cells are stained in one of several possible ways such that sister chromatid exchanges can be quantified.

Mammalian Cells-A variety of mammalian cell lines may be appropriate for this method, both established cell lines such as Chinese hamster ovary or lung cells, or human lymphocytes. Many such appropriate established lines are available from commercial suppliers. Required conditions for culturing are provided by the suppliers. Cell lines should not be passaged indefinitely, and the karyotypes should be examined on a routine basis to ensure that the cells undergoing exposure to test articles are not demonstrating an increased rate of spontaneous sister chromatid exchange.

Culture conditions should be as appropriate to the cells in use. Commercial suppliers of mammalian cell lines will generally provide information on culture conditions, including appropriate media, supplements, etc. Mammalian cells are often incubated at $37^{\circ}$ in $5 \%$ carbon dioxide at saturated relative humidity.

Metabolic Activation System—A suitable metabolic activation system may be the same as that described for Metabolic Activation System in the Salmonella typhimurium Reverse Mutation Assay.
Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The highest concentration of test article that should be used should give rise to a significant but not lethal toxic effect. At least two other lower concentrations should be used as well.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Positive controls should include those that act without the presence of a metabolic activation system and those that do require a metabolic activation system. A search of numerous toxicological databases on the Internet can provide examples of suitable positive controls. For example, ethylmethanesulfonate can be identified by
such a search as a suitable positive control in the absence of a metabolic activation system. Dimethylnitrosamine is a suitable positive control when a metabolic activation system is present.

Test Performance-Cells derived from established cell lines should be used while they are in the exponential growth phase. Human lymphocytes should be used in a semisynchronous condition. The cells (approximately $10^{6}$ ) should be exposed to the test article ranging from 1-2 hours up through 2 complete cell cycles. The exposure to a test article should include cultures both with and without a metabolic activation system. At the end of the exposure period, the cells should be centrifuged and washed clear of the test article. Next, the cells should be cultured in the presence of $\operatorname{BrdU}(10 \mu \mathrm{M}$ final concentration) for 2 cell cycles ( 2 doublings). The length of time required for the 2 cycles should be determined empirically. It is possible that the time needed for a cell doubling prior to exposure to the test article may have changed as a result of the exposure.

At the end of the exposure period to BrdU, the cells should be treated with an inhibitor of microtubule function (e.g., colchicine or colcemid). This will cause cells that are in metaphase to retain that distribution of the sister chromatids. Any of a variety of cytological techniques could be used to make chromosome preparations. For example, the cells can be treated with 0.75 M KCl to cause swelling, then washed at least 3 times in a mixture of methanol and acetic acid (3:1) for fixation. The cells can then be placed on microscope slides, and air dried.
The slides can then be stained for approximately 10 min utes in Hoechst 33258 (about $5 \mu \mathrm{~g}$ per mL ) in $\mathrm{M} / 15$ Sorensen's buffer. Then the cells may be mounted in the same buffer and exposed to UV light for a period of time long enough to permit identification of the sister chromatids. After

UV exposure, the cells should be stained with $10 \%$ Giemsa for 10 minutes, then washed and mounted in a commercially available mounting medium.

Observations and Interpretation-At a minimum, 25 metaphase cells should be examined for both control and test article-treated cultures to establish the rates of spontaneously occurring and test article-induced sister chromatid exchange. For established cell lines, cells with the modal chromosome number $\pm 2$ centromeres may be counted. If human lymphocytes are used, only cells with 46 centromeres should be examined.

The number of sister chromatid exchanges, the number of chromosomes, and the mean number of sister chromatid exchanges per chromosome should be determined. Statistical comparisons between test and control cultures should be made to determine if a statistically significant difference in the number of sister chromatid exchanges exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of sister chromatid exchanges is observed. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## IN VIVO TESTS

## MICRONUCLEUS TEST

This test is designed to detect damage to chromosomes and/or the mitotic spindle as a consequence of exposure to test articles. New erythrocytes are being continuously produced as a consequence of mitotic divisions of stem cells in the bone marrow. Because of the high rate of mitotic activity of these cells, test articles that have toxic effects on chromosomes and/or the mitotic spindle can be easily identified
through the use of hematopoietic stem cells. Moreover, as a mature erythrocyte is formed, its principal nucleus is expelled. However, should a micronuclei form as a result of damage caused to the stem cell (chromosomal damage and/or mitotic spindle damage can cause this), the micronuclei are not expelled, and are easily visualized.

Animals-Adult male and/or female mice may be used. [NOTE-Other species may also be used.] A suitable strain is CD-1, although others are acceptable. Prior to use, it is essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. At least 5 test animals and 5 control animals should be used per group (dose level). Animals may be grouphoused, and provided food and water ad libitum.

Test Article—Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. When $\mathrm{LD}_{50}$ data are available for the test article, the highest concentration tested may be set at $50 \%$ of the $\mathrm{LD}_{50}$. Two other doses, a low of $10 \%$ of the $\mathrm{LD}_{50}$ and an intermediate dose, should be used. In some cases it may not be possible to obtain an $\mathrm{LD}_{50}$ for the test article. In that case, the highest concentration should be chosen to emulate the maximum exposure (proportionately) that a human might experience for the test article.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). Trimethylenemelamine may be used as a positive control.

Test Performance-Most often, the test article is administered once via oral gavage. In some cases the test article may be given more than once, but there should be no cytotoxicity evident in the bone marrow cells should this be
done. Bone marrow samples should typically be taken at 12, 48 and 72 hours after the last dose was administered. To collect the samples, the animals are euthanized and the marrow from the femurs should be aspirated and collected in 5 mL of fetal calf serum. After centrifugation, the cells should be smeared onto microscope slides and stained appropriately. One such stain is May-Gruenwald solution and Giemsa, followed by clearing in water.

Observations and Interpretation-At least 1000 polychromatic erythrocytes should be evaluated for the presence of micronuclei. The percentage of polychromatic erythrocytes with micronuclei should be determined. Other cell types should be counted as well, because some test articles may cause toxic effects on hematopoiesis other than that evidenced by increased numbers of micronuclei. The percentage of polychromatic erythrocytes versus normochromatic erythrocytes should also be determined.
The results should be analyzed statistically for the presence of significant differences between test and control animals. A significant increase in the number of polychromatic erythrocytes with micronuclei in test animals versus controls, occurring in a dose-related manner, is indicative of a toxic effect. Likewise, if such a significant difference is found for at least one dose, a toxic effect for the test article is again indicated. If no significant differences are found between test and control articles, the article would not be considered genotoxic in this test system.

IN VIVO MAMMALIAN BONE MARROW CYTOGENETIC TESTCHROMOSOMAL ANALYSIS

This in vivo test is designed to test for the presence of damage to chromosomes/chromatids as a result of exposure to test articles. After exposure of the animals to the test article, bone marrow cells are removed and chromosomal preparations are made. The cells examined are in the metaphase stage of mitosis.

Animals-Healthy young adult male and/or female rodents of a variety of species may be used. Prior to use, it essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. At least 5 test animals and 5 control animals should be used per group (dose level). Animals may be grouphoused (by sex), and provided food and water ad libitum.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The maximum dose can be the maximal amount that is tolerated or that which produces some cytotoxic effects (such as reduction in the normal rate of mitoses). If desired, lower doses can also be evaluated.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). A search of numerous toxicological databases on the Internet (Table 2) can provide examples of suitable positive controls. The positive control selected should be known to cause chromosomal damage in vivo.

Test Performance-The test article extract should be administered via oral gavage or by intraperitoneal injection. If desired, other routes of administration may be used. Most often, the test article should be administered only once, although repeated dosing is permissible depending upon toxicological information. Animals should receive intraperitoneal injections of an agent known to block microtubule function (such as colchicine) at least 3 hours prior to the collection of marrow samples. The treatment with the microtubule inhibitor may have to occur earlier in order to accumulate enough cells in metaphase. Bone marrow samples should typically be taken at 6,24 , and 48 hours after the
last dose was administered. To collect the samples, the animals are euthanized and the marrow from the femurs should be aspirated and collected in 5 mL of fetal calf serum. After centrifugation, the cells should be smeared onto microscope slides and stained appropriately. One such stain is MayGruenwald solution and Giemsa, followed by clearing in water.

Observations and Interpretation-Chromosomal aberrations seen in cells in metaphase should be determined. Table 3 lists some of the aberrations that may be checked for. The number of cells examined should be based on knowledge of the spontaneous (negative control) appearance of altered chromosomes and the statistical power desired. A statistical power calculation requires (1) knowledge of the typical variance for the test system, (2) a prior determination of the Type I and Type II errors that are acceptable, and (3) the minimum detectable difference required. It is best that statistical power calculations be performed a priori, although after-the-fact power calculations may be done to determine the realized sensitivity of the test.

The number of cells in the test animals showing chromosomal aberrations and the spontaneously occurring chromosomal aberrations in control animals should be determined. The number of metaphase cells counted for both test articletreated animals and controls should be recorded. The frequency of mutants for both control and test animals should then be calculated.

Statistical comparisons between test and control animals should be made to determine if a statistically significant difference in the number of mutants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of mutants is seen. Also, a statistically significant difference between test and controls for at least 1 test article concentration (in studies where more than 1 dose is used) is indicative of a gen-
otoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## RODENT DOMINANT LETHAL TEST

This in vivo test is used to detect damage to germ cells resulting from exposure to test articles. In particular, this test detects dominant lethal mutations. Such mutations do not cause dysfunction of the gametes, but result in lethality to the fertilized egg or developing embryos. Most such dominant lethal mutations are thought to be the result of chromosomal damage, although the possibility of gene mutations such as a frame shift cannot be ruled out.

Animals-Most often, healthy, sexually mature male and/or female rats or mice are used. Prior to use, it is essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines established for the humane treatment of animals in the appropriate regulatory requirements. Animals may be group-housed (by sex), and provided food and water ad libitum. The number of animals to use should be based on a statistical power calculation factoring in desired error rates, variability, and sensitivity. In a typical experiment, $30-50$ animals would be used per mating interval, with enough mating intervals used to span the stages of germ cell development in male animals.
Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo 〈88〉. The maximum dose should cause some signs of toxicity, for example, a slight reduction in fertility. Nontoxic substances may be tested at 5 g per kg if practical, otherwise at the highest dose possible.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). A search of numerous toxicological databases on the Internet (Table 2) can provide examples of suitable positive controls. Examples of suitable positive controls include triethylenemelamine, cyclophosphamide, and ethyl methanesulfonate.

Test Performance-The test article extract should be administered to males via oral gavage or by intraperitoneal injection. If desired, other routes of administration may be used. Most often, the test article extract should be administered only once, although repeated dosing is permissible depending on toxicological information. Treated males should be mated to untreated females at a sufficient number of intervals to span the range of gamete development in the males. Females should be euthanized in the second half of pregnancy, and the uteri and ovaries removed for examination.

Observations and Interpretation-The number of corpora lutea should be determined from the ovaries. The number of live and dead implantations in the uteri should be determined. Using these values, the postimplantation loss may be calculated by taking the ratio of dead versus total implants. The pre-implantation loss may be calculated by taking the ratio of corpora lutea versus implantations. Determining the ratio of implantations in the test versus control animals may be another means of calculating the pre-implantation loss.

Statistical comparisons between test and control animals should be made to determine if a statistically significant difference in pre- or post-implantation losses exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of losses is observed. Also, a statistically significant difference
between test and controls for at least 1 test article concentration (in studies where more than 1 dose is used) is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## MAMMALIAN GERM-CELL CYTOGENETIC ASSAY

This test is similar to the Rodent Dominant Lethal Test in that male rodents are exposed to test articles, as a result of which damage to the germ cells may occur. In this test, chromosomal damage is assessed using chromosomal preparations derived from testes. As with previous tests, the cells examined are in metaphase, and the accumulation of cells in that stage is facilitated by the use of an agent inhibitory to microtubule function.

Animals-Most often, healthy, sexually mature male mice or Chinese hamsters are used, although other species may also be used. Prior to use, it is essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. Animals may be group-housed and provided food and water ad libitum. There should be at least 5 animals used per experimental and control group.
Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The maximum dose should cause some signs of cytotoxicity. Nontoxic substances may be tested at 5 g per kg if practical, otherwise at the highest dose possible. At least two other concentrations should be used to establish a dose-response relationship.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). A search of numerous toxicological databases on the Internet (Table 2) can provide examples of suitable positive controls. A suitable positive control should be one known to cause chromosomal abberations in vivo visible in metaphase spermatocytes.
Test Performance-The test article extract should be administered to males via oral gavage or by intraperitoneal injection. If desired, other routes of administration may be used. Most often, the test article should be administered only once, although repeated dosing is permissible depending on toxicological information. At appropriate times prior to euthanization of the animals and testes collection, an agent inhibitory to microtubule function (such as colchicine) should be administered. For mice, the agent may be administered 3-5 hours prior to euthanasia. More time may be required for Chinese hamsters. Typically, testes should be collected at 6,24 , and 48 hours.

A variety of techniques may be used to obtain cells undergoing spermatogenesis from the testes. These cells may be treated with 0.75 M KCl to cause swelling, then washed at least 3 times in a mixture of methanol and acetic acid (3:1) for fixation. The cells can then be placed on microscope slides and air dried. The cells can then be stained with $10 \%$ Giemsa for 10 minutes to facilitate observation of chromosomal/chromatidal damage.

Observations and Interpretation-At least 100 metaphase cells (with the full complement of centromeres) should be scored. Chromosome/chromatid damage (see Table 3) should be tabulated. Also, the ratio of spermatogonial mitoses to first and second meiotic metaphases can serve as an index of cytotoxicity.

The number of cells showing chromosomal aberrations found in the test samples, and spontaneously occurring chromosomal aberrations in controls, should be determined. The number of metaphase cells counted for both test articletreated cells and controls should be recorded. The frequency of mutants for both control and test cell samples should then be calculated.

Statistical comparisons between test and control animals should be made to determine if a statistically significant difference in the number of mutants exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of mutants is observed. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## MOUSE SPOT TEST

Pregnant females heterozygous for a number of genes affecting coat pigmentation as caused by the action of melanoblasts are used in this method. The principle is that a mutation of the dominant allele while the embryo is developing would permit phenotypic expression of the recessive allele, resulting in a change in coat pigmentation. An increase in the frequency of these spots in test animals versus controls is indicative of a genotoxic effect.

Animals-For this method, it is necessary to use pregnant animals from specific mating pairs in order to obtain the required heterozygotic embryos. Appropriate matings would be between T strain mice and HT strain mice, or between T strain mice and C57/B1. Other matings may also be appropriate. Prior to use, it essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals
should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. Animals may be group-housed and provided food and water ad libitum. There should be a sufficient number of pregnant females to generate enough offspring for a statistical analysis of the data. The specific test system will govern the numbers required.

Test Article-Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The maximum dose should cause some signs of toxicity such as reduced liter size. Nontoxic substances may be tested at 1 g per kg if practical, otherwise at the highest dose possible. At least one other concentration should be used.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (ex-
tracted as appropriate). A search of numerous toxicological databases on the Internet (Table 2) can provide examples of suitable positive controls. A suitable positive control should be one known to cause increases in spots due to somatic mutations.

Test Performance-The test article extract should be administered to males via oral gavage or by intraperitoneal injection. If desired, other routes of administration may be used. Most often, the test article should be administered only once on days 8,9 , or 10 of pregnancy, although repeated dosing over these days is permissible.

The offspring should be evaluated for the presence of spots between 3-4 weeks following birth. There are 3 types of spots to be distinguished, as indicated in Table 4.

Table 4. Types of Spots to be Evaluated in the Mouse Spot Test

| Spot Type | Description | Presumed Cause |
| :--- | :--- | :--- |
| WMVS | White spots within 5 mm of mid-ventral line | Cell killing |
| MDS | Yellow, agouti-like spots associated with <br> mammae, genitalia, throat, axillary and <br> inguinal areas, mid-forehead | Misdifferentiation |
| RS | Pigmented and white spots randomly <br> distributed | Somatic mutation |

Observations and Interpretation-The number of spots of the three types described in Table 4 should be determined. The spots of greatest importance in this test are the RS spots, as they are presumed to be due to somatic mutations.

Statistical comparisons between test and control animals should be made to determine if a statistically significant difference in the number of RS spots exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of RS spots
is observed. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference nor a single test-point difference between test and controls is found, the article is not genotoxic in this test system.

## MOUSE HERITABLE TRANSLOCATION ASSAY

This test is designed to detect structural and numerical changes to chromosomes and to germ cells in the progeny of the test animals. There are a number of approaches that may be used in this method. In some cases, only male progeny are examined. In others, progeny of both sexes are examined. When females are used, they are examined, in part, for X-chromosome loss. Some carriers of translocations, and females missing one X -chromosome, show reduced fertility. In some cases, translocations cause complete sterility. Cytogenetic examination is also performed in this method using germ cells in metaphase from $F_{1}$ males or the male offspring derived from $F_{1}$ females.

Animals-For this method, mice are most often used. No specific strain is required, although the litter size should average more than 8 , and be relatively constant. Prior to use, it is essential to acclimatize the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. Animals may be group-housed and provided food and water ad libitum. There should be a sufficient number of pregnant females to generate enough
offspring for a statistical analysis of the data. The most common mode of testing with this method involves an analysis of $F_{1}$ males, and typically at least $500 F_{1}$ males should be used. The number of P animals should be determined accordingly.
Test Article—Extracts of solid test articles should be prepared as described in Preparation of Extracts under Biological Reactivity Tests, In Vivo $\langle 88\rangle$. The maximum dose should cause some signs of toxicity, but not such that reproductive behavior or animal survival is affected. Nontoxic substances may be tested at 1 g per kg if practical, otherwise at the highest dose possible. At least two other concentrations should be used.

Controls-Both positive and negative controls should be used to check system performance. USP High-Density Polyethylene RS may be used as a negative control (extracted as appropriate). A search of numerous toxicological databases on the Internet (see Table 2) can provide examples of suitable positive controls. A suitable positive control should be one known to cause increased heritable translocations.

Test Performance-The test article extract should be administered to males via oral intubation or by intraperitoneal injection. If desired, other routes of administration may be used. Most often, the test article should be administered only once, although repeated dosing is permissible. Both males and females should be treated. Subsequent matings after treatment should be timed such that every stage of gametogenic development is covered. After mating, the females should be housed individually. After birth, the number and the sexes of the progeny should be recorded. The females may be discarded if no longer needed for the test.

Most frequently, the $\mathrm{F}_{1}$ males would be examined by cytogenetic analysis. Testes preparation should be made as described in the Mammalian Germ-Cell Cytogenetic Assay. Carriers of translocations will have multivalent configurations at diakinesis-metaphase I in at least two primary spermatocytes. Mitotic metaphases from spermatogonia or bone marrow should be examined in males with small testes and meiotic breakdown prior to diakinesis. Evidence for a c/t type translocation in males is evidenced by the presence of an unusually long and/or short chromosome in each of 10 cells. Some translocations that lead to male sterility can be identified only by banding analysis of mitotic chromosomes.

In some cases, the $F_{1}$ animals undergo fertility testing with subsequent evaluation of $\mathrm{F}_{2}$ progeny. The reduction of fertility of the $F_{1}$ animals may result in reduced litter sizes, or in differences observed during an analysis of uterine content of the females, such as was performed in the Rodent Dominant Lethal Test. The $\mathrm{F}_{2}$ animals may be the result of matings between $F_{1}$ males and females, or between $F_{1}$ males with other females from the same colony, but not $F_{1}$ females. Regardless of the pairings, the size and sexes from the $F_{2}$ progeny are recorded. $F_{2}$ progeny of small litters are kept for further testing if $F_{1}$ females were used in the pairings. Female carriers of translocations are identified by the cytogenetic analysis of their male offspring, the results of
which demonstrate the presence of translocations. $\mathrm{F}_{1}$ females that had lost an X-chromosome will have altered sex ratios in their litters (from 1:1 to 1:2 males to females). If the $\mathrm{F}_{2}$ litter meets pre-established criteria for normalcy, further testing of the $\mathrm{F}_{1}$ animal(s) would not be required, as the animal(s) would be classified as normal. If the first $\mathrm{F}_{2}$ litter does not serve to identify a carrier in the $\mathrm{F}_{1}$ cross, one or more subsequent $\mathrm{F}_{2}$ litters can be analyzed. If a clear determination of the $\mathrm{F}_{1}$ animal(s) status still can't be made, cytogenetic and uterine analyses may be performed. Uterine content may be performed as described in the Rodent Dominant Lethal Test.

Observations and Interpretation-Table 5 lists the observations to be made depending upon the type of assessment. Statistical comparisons between test and control animals should be made to determine if a statistically significant difference in the number of translocations exists. An indication of potential genotoxicity may be found if a statistically significant dose-response relationship to the number of translocations is seen. Also, a statistically significant difference between test and controls for at least 1 test article concentration is indicative of a genotoxic effect. If neither a significant dose-response difference, nor single test-point difference between test and controls is found, the article is not genotoxic in this test system.

Table 5. Observations to be Made Based on Type of Assessment for Mouse Heritable Translocation Assay

| Type of <br> Assessment |  |
| :--- | :--- |
| Fertility of $\mathrm{F}_{1}$ animals | Mean litter size of normal matings, individual litter sizes of translocation carriers. |
|  | Mean number of live and dead uterine implants for each mating of $\mathrm{F}_{1}$ |
|  | translocation carriers. |
| Cytogenetic analyses of cells | Number and types of multivalent configurations and the total number of cells per |
| in diakinesis-metaphase I | translocation carrier. |
| Sterile $\mathrm{F}_{1}$ carriers | Total number of matings, duration of mating period. Testes weights and cyto- |
|  | genetic analysis results. |
| XO females | Mean litter size, sex ratio of $\mathrm{F}_{2}$ progeny, cytogenetic analysis results. |

## BRIEFING

$\langle\mathbf{1 1 8 4}\rangle$ Sensitization Testing. This new proposed general information chapter presents a number of test procedures that may be used to test for the sensitization potential of compendial articles as indicated in general information chapter The Biocompatibility of Materials Used in Drug Containers, Medical Devices, and Implants $\langle 1031\rangle$.

There are six methods presented using guinea pigs, and three methods that use mice. The guinea pig methods include the Magnusson \& Kligman Maximization, Standard Buehler, Open Epicutaneous, Freund's Complete Adjuvant, Optimization, and Split Adjuvant tests. The mouse tests include the Local Lymph Node Assay, Mouse Ear Swelling, and Vitamin A Enhancement tests.

Comments should be sent to USP Headquarters for consideration by the Expert Committee on General Toxicology and Biocompatibility no later than March 1, 2004.
(GTB: D. Porter) RTS-40475-1

## Add the following:

## ^ <1184〉 SENSITIZATION TESTING

## INTRODUCTION

This chapter considers sensitization and hypersensitization in the context of medical devices and implants, and describes methodologies for testing such articles for their potential to cause sensitization.

There are four types of hypersensitization reactions according to the Gell and Coombs classification system. Type I reactions involve the fixation of IgE to mast cells that subsequently release pharmacologically active substances, such as histamine. Type II reactions are the result of IgG and/or IgM binding to target cells, followed by complement fixation and cell lysis. Type III reactions are caused by the presence of antigen-antibody complexes that cause physical damage such as kidney damage due to glomerular blockage.

Type IV reactions are cell-mediated (involve the action of T cells and their interaction with the human lymphocyte antigens). Type IV reactions are also called delayed-type hyper-
sensitivity reactions. Table 1 below summarizes the types of reactions, the mediators of the reactions, and examples of representative diseases.

Table 1. The Four Types of Hypersensitization Reactions*, Mediators, and Disease Examples

| Reaction |  |  |
| :---: | :---: | :---: |
| Class | Mediators | Disease Examples |
| Type I | IgE molecules bound to mast cells interact with antigen to release pharmacologically active substances | Hay fever, bronchial asthma, other atopic reactions |
| Type II | IgM and/or IgM molecules interact with target cells, fix complement, cell lysis | Various drug allergies, erythroblastosis fetalis, hemolytic anemia, thrombocytopenia |
| Type III | Antigen-antibody complexes, complement | Arthus reaction, serum sickness, allergic glomerulonephritis |
| Type IV | T lymphocytes, antigen, monocytes, macrophages | Contact dermatitis |

If further toxicological testing is necessary, the classification of medical devices provided in Table 2 from general information chapter $\langle 1031\rangle$ is important, as the degree and extent of toxicological testing that is required is strongly influenced by the nature and duration of the bodily contact with the article. The classification derived from Table 2 (chapter $\langle 1031\rangle$ ), coupled with the length of exposure to the article, is used in Tables 3-5 (chapter $\langle 1031\rangle$ ) to determine which toxicological tests need to be performed. Table 2 below presents information extracted from Tables 3-5 of chapter $\langle 1031\rangle$ indicating those circumstances for which sensitization testing should be considered.

Table 2. Articles For Which Sensitization Testing Should Be Considered Based on Article Category and Length of Exposure

| Device Category | Body Contact | Contact Duration |
| :--- | :--- | :--- |
| Surface devices | Skin | $\mathrm{A}^{\mathrm{a}}, \mathrm{B}^{\mathrm{b}}, \mathrm{C}^{\mathrm{c}}$ |
|  | Mucosal membrane | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
|  | Breached or compromised surfaces | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
| External communicating devices | Blood path, indirect | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
|  | Tissue, bone, or dentin communicating | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
|  | Circulating blood | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
| Implant devices | Tissue or bone | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |
|  | Blood | $\mathrm{A}, \mathrm{B}, \mathrm{C}$ |

${ }^{a}$ A: limited (less than 24 hours);
${ }^{\mathrm{b}}$ B: prolonged ( 24 hours to 30 days);
${ }^{\text {c }} \mathrm{C}$ : permanent (more than 30 days)

There are 9 test methodologies reviewed in this chapter. Table 3 lists the methods and the species with which they are performed.

Table 3. Test Methodologies That May Be Used in Sensitization Testing, and Species Required for Test

| Test | Species Used in <br> Test |
| :--- | :--- |
| Magnusson \& Kligman <br> Maximization | Guinea pig |
| Standard Buehler |  |
| Open Epicutaneous | Guinea pig |
| Freund's Complete Adjuvant | Guinea pig |
| Optimization | Guinea pig pig |
| Split Adjuvant | Guinea pig |
| Local Lymph Node Assay | Mouse |
| Mouse Ear Swelling | Mouse |
| Vitamin A Enhancement | Mouse |

Given the preponderance of testing performed with either the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT) or Buehler Tests (BT), those tests will be reviewed in detail in this chapter. A brief summary of the remaining tests is provided as alternatives to the more frequently used procedures.

Each test should be periodically validated in the performing laboratory using positive controls such as hexyl cinnamic aldehyde, mercaptobenzothiazole, or benzocaine (positive controls recommended by the Organization for Economic Cooperation and Development [OECD]).

## MAGNUSSON \& KLIGMAN GUINEA PIG MAXIMIZATION TEST (GPMT)

## Animals

Either male and female albino guinea pigs or both may be used. All animals should be in good health and weigh between 300 g and 500 g at the start of the experiment. The females should not be pregnant, nor should they have borne young previously. Prior to use, it is essential to acclimatize
the animals to the laboratory conditions for at least 5 days. All animals should be handled in accordance with the guidelines in the appropriate regulatory requirements established for the humane treatment of animals. At least 10 test animals and 5 control animals should be used. To obtain sufficient analytical power (i.e., to detect weak sensitizers) it may be necessary to use 20 test animals and 10 control animals. Additional animals may be required to establish the proper doses to administer (see Determination of Test Article Concentration).

## Housing and Feeding

The animal room should be held at $20 \pm 3^{\circ}$, at $30 \%$ to $70 \%$ relative humidity, with 12 hours of light and dark. Animals may be housed individually or in group housing. Standard laboratory diets may be used (those satisfactory for guinea pigs ensure an adequate amount of ascorbic acid). Drinking water should be available ad libitum.

## Animal Pretest Preparation

Animals should be randomized via a validated randomization method. For example, such methods may utilize random number tables or computer-generated random numbers. Sites on the animals intended for test article application (intrascapular region) should have the hair removed in a manner that does not abrade the skin. This may be accomplished via clipping, shaving, or with chemical depilatories. The chemical depilatory must not elicit irritation of its own. General observations of the animals prior to use in the test should be recorded, including any indication of ill health (do not use such animals in tests), and body weights.

## Test Article Preparation ${ }^{1}$

The use of this test requires that the test article can be injected intradermally. When the test article is not suitable for direct administration, extracts should be prepared according to the procedure provided in general chapter Biological Reactivity Tests, In Vivo 〈88〉.

## Determination of Test Article Concentration

The purpose of this preliminary study is to determine the concentrations of Test Article Preparation to be used during the initial induction phase and the second challenge phase of a GPMT study. Two or three animals may be used for the concentration determination.

A range of concentrations of the test article, or extracts of the article, should be injected intradermally ( 0.1 mL per site), using the solvent that will be employed in the Test Procedure. The concentration that causes only mild to moderate irritation (no extensive skin destruction, with no evidence of overt systemic toxicity to the animals) should be used in the Intradermal Injection Induction Phase of the Test Procedure.

Using two or more animals, apply via occlusive dressings and patches, a range of concentrations of test article or extracts of the article. Remove the dressings/patches after 24 hours, and examine the sites for erythema. Choose the concentration that causes only slight erythema for the Topical Application Induction Phase of the Test Procedure. Use the highest concentration of test article or extract that does not cause erythema for the Challenge Phase of the Test Procedure. If the irritation threshold is not reached, then select the highest possible concentration for the Topical Application Induction Phase and Challenge Phase of the Test Procedure.

[^28]
## Test Procedure

## INTRADERMAL INJECTION INDUCTION PHASE

This phase requires three pairs of injections administered intradermally, with the test and control injection of each pair on opposite sides intrascapularly. Each injection should contain 0.1 mL , with injection pairs 1 and 2 administered nearer to the head, and injection pair 3 administered slightly farther towards the tail. The pairs are nominally within an area of 8 $\mathrm{cm}^{2}$. The pairs of injections consist of the following:

Injection pair 1: A 1:1 (v/v) mixture of Freund's Complete Adjuvant (FCA), an oil-water emulsion containing mycobacteria, and the appropriate solvent/vehicle (see Biological Reactivity Tests, In Vivo $\langle 88\rangle$ ). Control animals receive a mixture of FCA and physiological saline (1:1).

Injection pair 2: The Test Article Preparation in the concentration as specified in

Determination of Test Article Concentration, using the appropriate solvent/vehicle. Control animals receive only the solvent/vehicle.

Injection pair 3: The Test Article Preparation in the concentration as specified in Determination of Test Article Concentration in a 1:1 (v/v) mixture with FCA. Control animals receive an injection of a $1: 1(\mathrm{v} / \mathrm{v})$ mixture of FCA and solvent/vehicle.

## TOPICAL APPLICATION INDUCTION PHASE

Seven days ( $\pm 1$ day) after completion of the Intradermal Injection Induction Phase, administer the test sample by topical application to the intrascapular region of each animal. For both test and control animals, if the Test Article Preparation does not cause skin irritation, apply $10 \%$ sodium lauryl sulfate in petrolatum approximately 24 hours before the start of the Topical Application Induction Phase to induce a local irritation.

Test animals should have $2-\times 4-\mathrm{cm}$ pieces of filter paper or absorbent gauze fully loaded with the Test Article Preparation (prepared within 24 hours of use) using the concentration selected in Determination of Test Article Concentration applied to each injection site. The filter paper or absorbent gauze should be secured to the animals using occlusive dressings. Control animals receive the same treatment, except that the appropriate solvent/vehicle is used instead of the test article.

Remove the dressings and patches approximately 48 hours after application.

## CHALLENGE PHASE

This phase should occur $14 \pm 1$ days after the Topical Application Induction Phase. Hair should be removed from the test application sites. Filter paper patches or chambers are soaked with a freshly prepared Test Article Preparation in the concentration specified in Determination of Test Article Concentration. This is done for all test and control animals. The patches or chambers are secured with an occlusive dressing and removed after $24 \pm 2$ hours.

## Observations

At approximately 24, 48, and 72 hours after removal of the challenge patches, the application sites should be examined for signs of reactions. Of particular importance are in-
stances where the reaction of the test animals exceeds that of the control animals. All signs of reactivity should be recorded, with particular attention paid to signs of erythema and edema. A true edematous reaction will blanch under gentle pressure. The longer the period of blanching, the greater the severity of edema.

## Interpretation

There is more than one way of evaluating and grading the results from GPMT. Tables 4, 5 and 6 list details for three such grading systems. Grades of 1 or higher in the test animals, with grades of less than 1 in control animals, are indicative of sensitization. If control animals display grade 1 reactivity, and if the test animals display reactivity above the greatest reactivity seen in the control animals, sensitization due to the test article is again suspected. The percentages in Table 4 need to be revised if there are only 10 test animals (i.e., the caegories would be $0,<10 \%, 10 \%-30 \%, 31 \%-$ $60 \%, 61 \%-80 \%$, and $81 \%-100 \%$.) If there are 20 test animals, then multiples of $5 \%$ are appropriate.

## Table 4. Classification Based on Percent of

## Responsive Test Animals

| \% of Positives |
| :---: |
| in |

Test Group $\quad$ Assigned Grade Class

Table 5. Classification Based on Erythema and Edema Formation

| Erythema and Eschar | Grade |
| :--- | :---: |
| No erythema | 0 |
| Slight or equivocal erythema | $<1$ |
| Well-defined erythema | 2 |
| Moderate erythema | 3 |
| Severe erythema to slight eschar formation | 4 |

| Edema |  |
| :--- | :---: |
| No edema | 0 |
| Slight or equivocal edema | $<1$ |
| Well-defined edema | 2 |
| Moderate edema | 3 |
| Severe edema | 4 |

The results should be submitted for statistical analysis (e.g., chi-square contingency table) to determine if the differences in scores between treated and control animals are significant. The response of the test group versus the control group should be compared statistically. (The Mann-Whitney U test can be used for the comparison.)

Table 6. Classification Based on Erythema

> Formation Alone

| Erythema formation | Grade |
| :--- | :---: |
| No erythema | 0 |
| Discrete or patchy erythema | 1 |
| Moderate and confluent erythema | 2 |
| Intense erythema and swelling | 3 |

## Rechallenge

The extent of any response in the negative control group, under experimental conditions, shows the irritation potential of the Test Article Preparation. In this case, test and control animals should be rechallenged 1 week later on the un-
treated side of the animal, with a reduced concentration of the Test Article Preparation. A sensitized guinea pig will react to some degree to both challenges. A weak reaction occurring at a single time point in only one challenge should cast strong doubt as to whether that guinea pig is truly sensitized. ${ }^{2}$

## STANDARD BUEHLER TESTS (SBT)

Animals<br>See Animals in the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT).

## Housing and Feeding

See Housing and Feeding in the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT).

## Animal Pretest Preparation

See Animal Pretest Preparation under Magnusson \& Kligman Guinea Pig Maximization Test (GPMT). The fur of the guinea pig may be removed from one flank by clipping.

## Test Article Preparation

See Test Article Preparation in the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT).

[^29]
## Determination of Test Article Concentration

The purpose of this preliminary study is to determine the concentrations of Test Article Preparation to be used during the initial induction phase and the second challenge phase of an SBT study. Two or three animals may be used for the concentration determination.

A range of concentrations of the test article, or extracts of the article, should be applied using patches (for example, four $4 \mathrm{~cm}^{2}$ absorbant pads) or chambers. The patches should be held in place using tape (if necessary) and occlusive dressings. The patches should be removed after approximately 6 hours, and any residues of the test chemical are removed from the test site. Observations are made at that time, and at 24 and 48 hours.

The concentration that causes only mild to moderate irritation (slight erythema, with no evidence of overt toxicity to the animals) and can be applied repeatedly to the same site should be used in the Induction Phase of the Test Procedure. Use the highest concentration of test article or extract that does not cause erythema for the Challenge Phase of the Test Procedure.

## Test Procedure

## INDUCTION PHASE

Apply 0.4 mL of the Test Article Preparation in an appropriate solvent/vehicle at the dose identified in Determination of Test Article Concentration. Use patches similar to those used in Determination of Test Article Concentration. The patches should be applied to one flank (hair clipped off) and held in place occlusively for 6 hours. The animals may need to be restrained to ensure occlusion. Patches and any visible residues should be removed after 6 hours. Control animals also receive patches, but these contain only the appropriate solvent/vehicle. This process should be repeated
three times a week for both test and control animals on the same site for three consecutive weeks (weekly intervals are used in the modified Buehler Test).

## CHALLENGE PHASE

This phase should be carried out 14 days after the last application of the Induction Phase. Clip the hair off the previously untested flank of each animal 24 hours before the challenge application. As in the Induction Phase, apply patches containing the test article (concentration specified in Determination of Test Article Concentration) or solvent/vehicle alone to the untested areas of the test and control animals. To obtain well-defined edges at the application sites, commercial chambers with a lipped edge are preferred. Secure the patches with occlusive dressings, and keep them in place for 6 hours. Remove all patches after 6 hours.

## Observations

At $22 \pm 2$ hours after removal of the patches, the application sites should have the animal's fur removed via clipping or depilation. After approximately 2 more hours, grade the sites (Tables 4, 5 or 6 may be employed). All signs of reactivity should be recorded, with particular attention paid to signs of erythema and edema. Repeat the grading once again after 24 to 48 hours more have elapsed. The response of the test group versus the control group can be compared statistically. (The Mann-Whitney U test can be used for the comparison.)

## Interpretation

The results should be submitted for a statistical analysis (e.g., chi-square contingency table) to determine if the differences in scores between treated and control animals are significant.

See Interpretation in the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT).

## Rechallenge

See Rechallenge in the Magnusson \& Kligman Guinea Pig Maximization Test (GPMT).

## OTHER SENSITIZATION TEST PROCEDURES

The Magnusson \& Kligman Guinea Pig Maximization Test and the Standard Buehler Tests are the most frequently performed sensitization tests. However, there are a number of other methods that may be useful in the assessment of the potential for sensitization. Some may be applicable to both solid test articles and extracts, some only to extracts.
Where the use of guinea pigs is called for in the following tests, the animals and their housing should meet the requirements as specified for Animals in the Magnusson \& Kligman Guinea Pig Maximization Test. The fur of the guinea pig should be removed from test sites as indicated for Animal Pretest Preparation in the Magnusson \& Kligman Guinea Pig Maximization Test.

## Draize Test

This was the first predictive test accepted by the regulatory agencies, and is still in use. The test uses guinea pigs and the test article is administered via intradermal injections.

## TEST ARTICLE PREPARATION

This test requires that the test article be in the form of a solution that may be directly applied to the animal's skin. Therefore, extracts of the material would need to be made. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the preparation procedure.

## INDUCTION PHASE

One flank of each of 20 guinea pigs is shaved, then 0.05 mL of a $0.1 \%$ solution of test article is injected into the anterior flank. The next day, and then every other day thereafter up to day $20,0.1 \mathrm{~mL}$ of the test article is injected into a new site on the same flank.

## CHALLENGE PHASE

This phase begins 2 weeks after the final injection of the Induction Phase. The untreated flank is shaved, then 0.05 mL of test article is injected into each of the 20 guinea pigs. Twenty previously untreated animals serve as the controls, and receive injections of the test article as well.

## OBSERVATIONS

The test sites of all control and test animals are evaluated for erythema at 24 and 48 hours after the challenge injections. The degree of reaction in test animals is compared to the reaction in control animals. A larger and/or more intense response by the test animals versus the control animals is indicative of sensitization.

## Open Epicutaneous Test

This test uses guinea pigs. The goal is to determine the dose required to induce sensitization by simulating human usage via topical application of the test article.

## TEST MATERIAL PREPARATION

This test requires that the test article be in the form of a solution that may be directly applied to the animal's skin. Therefore, extracts of the material need to be made. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the preparation procedure.

## PRELIMINARY TESTING

A series of concentrations of test article is applied to $2 \mathrm{~cm}^{2}$ areas of skin on the anterior flank of 6 to 8 guinea pigs ( 0.025 mL per application). The test sites should be examined for erythema 24 hours after test article administration. The highest concentration that does not cause irritation (maximum nonirritant concentration) and the lowest concentration causing erythema in approximately $25 \%$ of the animals (minimum irritant concentration) are determined.

## INDUCTION PHASE

The test article (or control vehicle) is applied to $8 \mathrm{~cm}^{2}$ areas of the flank skin of 6 to 8 guinea pigs daily for 3 weeks, or five times a week for 4 weeks. The amount per application is 0.01 mL . A set of increasing concentrations is again employed, ranging from the minimum irritant concentration using a stepwise progression. The test article should be applied to the same sites each time, unless irritation develops, in which case a new site on the same flank should be used. Control animals receive the same series of treatments using the vehicle instead of the test article.

## CHALLENGE PHASE

Each animal is challenged on the untreated flank 24 to 72 hours after the last Induction Phase treatment using 0.025 mL applied to $2 \mathrm{~cm}^{2}$ areas. A set of increasing concentrations is used, from minimum irritant concentration to the maximum nonirritant concentration, and five lower concentrations are also used.

## OBSERVATIONS

The test sites are evaluated at 24,48 , and 72 hours posttreatment. The maximum concentration that does not cause irritation in the control group is determined. Animals from
the test groups that develop inflammatory responses at concentrations lower than the maximum nonirritating concentration in the controls should be considered to be sensitized.

## Freund's Complete Adjuvant Test

This test is based upon the use of intradermal injections using the test article in a mixture of Freund's complete adjuvant and distilled water (50:50).

## TEST MATERIAL PREPARATION

Because this test uses intradermal injections, extracts of the test material need to be made in order to use this procedure. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the extraction procedure.

## PRELIMINARY TESTING

The minimum irritating and the maximum nonirritating concentrations are determined in the same manner as for Preliminary Testing in the Open Epicutaneous Test.

## INDUCTION PHASE

The test area consists of six $2 \mathrm{~cm}^{2}$ areas across the shoulders of the guinea pigs. Two groups of 10 to 20 guinea pigs each should be used. The test group animals are injected intradermally with 0.1 mL of a $5 \%$ solution of the test article extract in FCA/water. Control animals receive injections with FCA/water without the test article. These injections are repeated every 4 days until a total of three injections have been given.

## CHALLENGE PHASE

This phase should begin 2 weeks after the last injection of the Induction Phase. Topical applications of 0.025 mL of test article at the minimum irritating and the maximum non-
irritating concentrations, plus two lower concentrations, are administered to $2 \mathrm{~cm}^{2}$ areas of the shaved flank. The test sites should remain uncovered.

## OBSERVATIONS

The test sites are examined for the presence of erythema 24,48 and 72 hours after the topical applications. The minimum nonirritating concentration in the control animals should be determined. Those test animals that display erythema at concentrations lower than the minimum nonirritating concentration in the control animals should be considered to be sensitized.

## Optimization Test

This test has some similarities to the older Draize Test. Unlike the Draize Test, however, this test uses both intradermal and topical treatments, and includes adjuvant for some induction injections.

## TEST MATERIAL PREPARATION

As with other test procedures that incorporate intradermal injections, the test article needs to be in a form suitable for injection. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the extraction procedure.

## INDUCTION PHASE

Twenty test and 20 control guinea pigs are used. A total of 10 intradermal injections should be given to each animal. Test animals receive 0.1 mL of a mixture of $0.1 \%$ test article and $0.9 \%$ saline ( $50: 50$ ) on day 1 , with one injection into a shaved flank, and another into a portion of shaved dorsal skin. Two and 4 days later, one intradermal injection of the test article in saline is given to eight new dorsal sites. Every other day during weeks 2 and 3, the test article is injected intradermally into 10 sites over the shoulders in a

50:50 mixture of saline and FCA. The same sequence of injections is given to the 20 control animals, except that no test article is included with the saline or saline/FCA injections.

## CHALLENGE PHASE

Thirty-five days after the first injection, the animals are challenged topically with 0.1 mL of the $0.1 \%$ solution of test article in saline (for test animals). The control animals receive saline injections only. At 45 days after the first injection, a second topical challenge is given. A nonirritating concentration of test article ( 0.05 mL ) is applied topically to a $1 \mathrm{~cm}^{2}$ area of untreated skin. This site should then be covered with a $2 \mathrm{~cm}^{2}$ piece of filter paper, after which an occlusive dressing should be applied. The patch should be removed after 24 hours.

## OBSERVATIONS

Twenty-four hours after each injection during week 1, the thickness of a fold of skin over the injection sites for each animal should be measured using a caliper ( mm ), and the two largest cross-diameters of each erythematous reactions should be recorded (mm). The reaction volumes are calculated by multiplying the fold thickness by the products of the two cross-diameters (expressed as $\mu \mathrm{L}$ ). The mean reaction ( +1 SD ) volume during week 1 should be calculated for each animal.

Challenge reaction volumes are calculated for each animal following the injections at day 35 . If an animal develops a challenge reaction volume greater than its mean reaction volume +1 SD , it should be considered sensitized.

Following the patch testing challenge, the test sites are evaluated for erythema and edema. Evaluations should be made using Table 5.

The number of positive animals should be compared statistically with the pseudopositive control animals. This should be done for both intradermal injection results and patch testing results. The Fisher exact test may be used.

The results from the intradermal injections and the patch testing, following separate statistical analysis, may be combined and evaluated using Table 7 in order to classify a test article as a strong, moderate, or weak sensitizer; or not a sensitizer.

Table 7. Classification Scheme for Test Articles Based on the Optimization Test

| Intradermal | Patch Test |  |
| :--- | :--- | :--- |
| $\%$ of Positive | \% of Positive |  |
| Animals | animals | Classification |
| $\mathrm{S}^{*},>75$ | and/or S, $>50$ | Strong sensitizer |
| $\mathrm{S}, 50-75$ | and/or S, 30-50 | Moderate sensitizer |
| $\mathrm{S}, 30-50$ | N.S. ${ }^{*}, 0-30$ | Weak sensitizer |
| N.S., 0-30 | N.S., 0 | Not a sensitizer |
| ${ }^{\text {N }} \mathrm{S}=$ significant, N.S. $=$ not significant |  |  |

## Split Adjuvant Test

This test makes use of both FCA and skin damage. The test article is applied topically.

## TEST MATERIAL PREPARATION

Because this test employs topical test article applications, the article can be either in solid or liquid form. If extracts are to be made, see chapter Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for extraction procedures.

## INDUCTION PHASE

Ten to 20 guinea pigs are used for both test and control groups. An area of back skin immediately behind the scapulas should be shaved to the extent that the skin becomes glis-
tening. The shaved areas should then be treated with dry ice for 5 to 10 seconds. A dressing made of loose mesh gauze with stretch adhesive and a $2-\times 2-\mathrm{cm}$ opening should be placed over the treated area, then secured with adhesive tape. The test article ( 0.2 mL of viscous materials, 0.1 mL of liquids, or solid material) is placed within the opening in the dressing on top of the treated skin. Two layers of \#2 filter paper should be placed over the test article, then backed by occlusive tape. Then the filter paper/occlusive backed material should be secured to the surrounding dressing with adhesive tape. After 2 days have passed, the filter paper should be lifted from the test sites, and the test article reapplied on the same site. The filter paper and backing should be secured once again. After 2 more days, the filter paper should be lifted and two injections of 0.075 mL of FCA should be administered into the edges of the test site. Then the test material is once again applied, and the filter paper/backing resecured. The test article should be reapplied once more on day 7 and the filter paper/backing resealed. On day 9 , the filter paper and all associated dressing material should be removed.

## CHALLENGE PHASE

On day 22 following the induction treatment, 0.5 mL of test material (or the solid article) should be applied to a $2-\times$ $2-\mathrm{cm}$ area of shaved midback. The test sites should be covered by filter paper and backed by adhesive tape. This should be held in place with an elastic bandage secured with adhesive tape. Control animals receive the same challenge phase treatment. The preparation should be removed after 24 hours.

## OBSERVATIONS

Twenty-four, 48 , and 72 hours after the removal of the challenge phase preparation, the test sites should be evaluated for erythema and edema. The grading scheme of Table 5 could be employed.

## Mouse Ear Swelling Test

There are a number of potential advantages in using mice versus guinea pigs for sensitization methods. The classic guinea pig tests tend to be costly and require a long time to complete. Moreover, with the dependence upon relatively subjective scoring based on edema and erythema, methodological robustness, and ruggedness may be questionable. This test uses mice and employs both topical exposures and injections.

## ANIMALS

Female, 6 to 8 -week old CF-1, Balb/c, or Swiss mice should be used. They may be group housed in direct bedding cages. Acclimatization should be for at least 5 to 7 days. Food (appropriate mouse feed) and water should be available ad libitum. No animals with damaged pinnae should be used in the study. The thickness of both ears of each animal should be measured and recorded at this time.

## TEST MATERIAL PREPARATION

As with other test procedures that incorporate intradermal injections, the test article needs to be in a form suitable for injection. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the extraction procedure.

## PRELIMINARY TESTING

The minimally irritating and maximally nonirritating concentrations of test article for this procedure should be determined. This is done by using four groups of two mice and examining the effects of at least four concentrations of test article.

## INDUCTION PHASE

The abdomens of the animals should be shaved, then tapestripped using a surgical adhesive tape until the test area is glistening. A single injection of 0.05 mL of FCA is subdivided into two injection sites administered intradermally within the shaved/stripped area, but along the borders. After the adjuvant injections, $100 \mu \mathrm{~L}$ of test article (using the minimally irritating concentration) or vehicle (controls) is applied to the center of the shaved test areas. After the test areas dry, the mice should be returned to their cages. The tape stripping and application of test article (but not FCA) is repeated each day for the next 3 days.

## CHALLENGE PHASE

This phase should occur 7 days after the final topical induction application. The test article (highest nonirritating concentration) should be applied topically ( $20 \mu \mathrm{~L}$ ) to one ear, while the opposite ear receives $10 \mu \mathrm{~L}$ of vehicle alone. This should be done for both test and control animals.

## OBSERVATIONS

The thickness of both ears of each animal should be recorded after 24 and 48 hours postchallenge. The measurements should be made with a caliper (a spring-loaded caliper is preferable). A sensitized animal is one in which the test article-treated ear is at least $20 \%$ thicker than its opposite ear. For the test to be valid, the test article-treated ears of control animals should not be more than $10 \%$ thicker than
the opposite ears. If the control animal ears do not meet the requirements, the test should be repeated using lower concentrations.

## Local Lymph Node Test

This test is based on the observation that exposure of the mice to sensitizers can cause hyperplasia of T cells within the auricular lymph nodes of mice. The method combines both in vivo and in vitro phases, and requires the use of radioisotopes. An unusual aspect of this test is that no challenge phase is required.

## ANIMALS

Four groups of four mice at least, male or female CBA/ca mice (only one sex in a given test) between the ages of 8 to 12 weeks should be used.

## TEST MATERIAL PREPARATION

Although in theory one could apply a solid test article to the dorsal surface of the ear of a mouse, in practice an extract of such an article should be used. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the extraction procedure.

## PRELIMINARY TESTING

A nontoxic concentration of test article should be used. If not already established, a preliminary test for overt toxicity may be required to establish a suitable dose.

## INDUCTION PHASE

Twenty-five $\mu \mathrm{L}$ of the appropriate test article concentration, or vehicle (controls), should be applied to the dorsal surface of each pinna for 3 consecutive days. Five days after the first treatment, the animals should be injected, via the tail vein, with 2.5 mL of phosphate buffered saline containing
$20 \mu \mathrm{ci}$ of ${ }^{3} \mathrm{H}$-methyl thymidine. Five hours after the isotopic injection, the animals should be euthanized. The draining auricular lymph nodes should be removed from each animal of each test and control group. The nodes from all animals within a given group should be combined, such that a single cell suspension can be made from each group of animals. The cell suspension can be made by passing the nodes through a 200 -mesh stainless steel gauze using a syringe plunger. The cells should then be centrifuged at $190 \times g$ for 10 minutes, resuspended in 3 mL of $5 \%$ trichloroacetic acid (TCA), and held overnight at $4^{\circ}$.

The resulting precipitate should be recovered by centrifugation, and the pelleted precipitate should be resuspended in 1 mL of $5 \%$ TCA. The suspension should then be placed in scintillation vials with 10 mL of scintillation fluid, and the disintegrations/minute ( dpm ) counted with a $\beta$-counter.

## OBSERVATIONS

The ratio of dpm for each test group should be compared to the dpm for the control group. If the ratio equals or exceeds 3 for any test group, the concentration of test article used with that group may be considered to be sensitizing.

## Vitamin A Enhancement Test

This test is similar to the Mouse Ear Swelling Test in that test articles are applied topically to the abdomen, with a challenge application to the ears, followed by measurements of ear thickness. A principal difference is the use of mouse feed supplemented with vitamin A acetate. The purpose of the supplementation is to increase the reactivity of the immune system, thereby increasing the potential sensitization reaction.

ANIMALS
Male, 3 to 4-week old Balb/c mice should be maintained on a diet supplemented with vitamin A acetate. The diet may be prepared by mixing each kg of feed with 0.477 g of gelatinized vitamin A acetate. The feed mixture should be used within 3 weeks of preparation. Mice intended for use in sensitization studies should have been on the supplemented diet for at least 4 weeks. The mice at the time of the sensitization study should therefore be between 7 and 10 weeks old. The thickness of both ears of each animal should be measured and recorded at this time.

## TEST MATERIAL PREPARATION

Although, in theory, one could apply a solid test article to the dorsal surface of the ear of a mouse, in practice an extract of such an article should be used. See Biological Reactivity Tests, In Vivo $\langle 88\rangle$ for information on the extraction.

## PRELIMINARY TESTING

The maximally nonirritating dose and minimally irritating concentrations should be determined using separate groups of animals. This could be done as described for Preliminary Testing in the Mouse Ear Swelling Test.

## INDUCTION PHASE

The fur of the abdomen and thorax of 10 mice per group should be shaved. Then $100 \mu \mathrm{~L}$ of test article (at the minimally irritating concentration) should be applied to the test areas on days $0,2,4,7$, and 11 . Control animals receive 100 $\mu \mathrm{L}$ of vehicle alone on the same schedule.

## CHALLENGE PHASE

This phase should occur 4 days after the final application of the Induction Phase. Twenty-five $\mu \mathrm{L}$ of test article (at the maximally nonirritating concentration) should be applied to each ear of each animal in the test and control groups.

## OBSERVATIONS

Ear thickness for both ears of each animal should be recorded after 24 and 48 hours postchallenge. The measurements should be made with a caliper (a spring-loaded caliper is preferable). The percent increase in ear thickness should be calculated for each ear by subtracting the pretreatment measurement from the post-treatment measurement, dividing the result by the pretreatment measurement, then multiplying by 100 . The response of the test group versus the control group should be compared statistically. (The Mann-Whitney $U$ test could be used for the comparison.)

The results of individual animals should also be calculated. If an increase in ear thickness for an animal from the test group is at least $50 \%$ greater than the largest increase of a control animal, that is indicative of sensitization. As an overall evaluation, should the results of the study provide a significant result of the statistical test at $\mathrm{p}<0.01$ for the control versus test group comparisons, or if at least two test animals have ear thickness increases in excess of $50 \%$ of the maximum control thickness changes and the group comparison showed a $p<0.05$, sensitization is indicated for the test article. $\Delta U S P 28$

## Briefing

$\langle 1232\rangle$ Instrumentation for Analysis of High Purity Pharmaceutical Waters. This proposed new chapter is meant to complement Water for Pharmaceutical Purposes $\langle 1231\rangle$ and to serve as a resource for those involved in the production and analysis of the USP waters. On the basis of inquiries and comments received since the major water monograph revisions of 1996, the Pharmaceutical Water Expert Committee has decided that additional compendial information is necessary. This general information chapter is an attempt to meet this need. The Committee encourages public comments. Address comments to Frank Barletta in the Information Standards Division.
(PW: F. Barletta) RTS-40499-1

## Add the following:

## - $\langle 1232\rangle$ INSTRUMENTATION FOR ANALYSIS OF HIGH PURITY PHARMACEUTICAL WATERS

## INTRODUCTION

In the production of Purified Water and Water for Injection (WFI) the term "quality of water" is not rigorously defined, but it is generally accepted to mean "the concentration and type of impurities" found in the water. Advances in the science of water treatment have resulted in technologies that produce more water at lower cost and of higher quality. Consequently, the amount of impurities found in Purified Water and Water for Injection has decreased. The analytical methods have also improved to keep up with the improving water quality.

It would be impractical to describe all of the possible impurities because of the number of organic, inorganic, and ionic species that could enter a water system from the outside environment. The number of known chemicals is in the hundreds of thousands, and, theoretically, many could be found at a very low concentration in a water system. The nature of water treatment systems is such that very few unit operations are designed to selectively remove specific con-
taminants. There are notable exceptions such as water softeners that are effective at displacing calcium and magnesium with sodium to protect systems from scale. It becomes expensive and very impractical to identify all impurity species in a pharmaceutical water system. The analytical instrumentation required to measure alkaline metal and heavy metal impurities (by atomic absorption or ion chromatography) is expensive, and the technology is not commercially available for measurement of specific organics in the $\mu \mathrm{g} / \mathrm{L}(\mathrm{ppb})$ range.

The more practical approach is to categorize impurities according to various attributes such as chemical properties, physical properties, organic/inorganic, oxidizability, toxicity, etc. One practical method of categorizing the impurity species is a determination of the degree of ionic behavior of the chemical moiety. For example, $\mathrm{H}^{+}, \mathrm{OH}^{-}, \mathrm{Na}^{+}, \mathrm{Ca}^{2+}$, $\mathrm{Mg}^{2+}, \mathrm{HCO}_{3}^{-}, \mathrm{Cl}^{-}, \mathrm{HSO}_{4}^{-}$, and other ionic species are commonly found in pharmaceutical water systems. All of these ions have a physical property in common: namely, that they are charged species and, therefore, detectable by conductivity. The majority of species that would be nonionic are organic. These consist of low molecular weight alcohols, ketones, and organic acids that are not completely removed by water systems because of their size or polarity. A valuable method for detecting these organic species is the use of a test for total organic carbon (TOC).
Both conductivity and TOC have the advantage of quantifying these types of impurities in the aggregate with great sensitivity. The advantage is also a disadvantage as neither measurement can distinguish or measure individual impurities, only the aggregate.

Not all types of impurities fall into the ionic/non-ionic (conductive or TOC) category. Another class of impurity can be described as inorganic and nonionic (and therefore nonconductive). They include some dissolved metals, metal
oxides, other metal forms, and semimetals such as those that are silica-based. These species may be very weakly ionized and, therefore, would not be detectable by any conventional conductivity or TOC method. Particles also represent another class of impurity. These could be carbonaceous or sil-ica-based, but they are not normally detectable by conductivity or TOC because they are typically nonionic and exist at undetectable concentrations for TOC analysis. However, the presence of substantive concentrations of these types of impurities is unlikely if the water treatment system is effective.
The final significant category of impurities consists of microorganisms. Although microorganisms are carbonaceous material, the detectability by conductivity or TOC is not practical because their molecular concentrations are too low to be detected by these methods. Microorganisms deserve special note because they can grow and interfere with drug chemistry and cause harm to the patient if they are not controlled (see Water for Pharmaceutical Purposes $\langle 1231\rangle)$.
Until USP 23, Supplement 5 , the primary methods for ensuring the quality of bulk Purified Water and Water for Injection were a series of wet chemistry tests that were sensitive to ammonia, calcium, chloride, carbon dioxide, sulfate, and oxidizable substances. The tests for these six species were subjective, unreliable, and not predictive of the true quality of water. The quality of water is better described by its conductivity and TOC and the primary methods for verifying water quality have shifted to these measurements.

Neither conductivity nor TOC are specific to any of the ions or species listed above. TOC is considered a one-forone replacement for the Oxidizable Substances (potassium permanganate) test, while conductivity is a sensitive test for all ionic (i.e., conductive) species. Both methods have
the advantages of being quantitative, numerical, robust, available for use on-line or off-line, and useful for quality control.

## TOTAL ORGANIC CARBON (TOC)

Organic chemistry is the study of carbon-containing compounds. The fully oxidized form of carbon, carbon dioxide $\left(\mathrm{CO}_{2}\right)$, is inorganic. $\mathrm{CO}_{2}$ is mildly reactive with water, and it is usually detected by its concomitant compounds and ions: carbonic acid $\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)$, bicarbonate $\left(\mathrm{HCO}_{3}{ }^{-}\right)$, and carbonate $\left(\mathrm{CO}_{3}{ }^{2-}\right)$. These three species are the result of the dissolution of $\mathrm{CO}_{2}$ in water and subsequent acid dissociation; they are not included in the TOC definition. Our concern is the remaining carbonaceous species that are not completely oxidized. These are the organic compounds that provide a fuel source for microorganisms, sustain biofilm, and may adversely impact drug chemistry.

Organic carbon enters the water system from several locations. The usual source of TOC is from the municipal water supply or from private wells. In January, 2002, the Environmental Protection Agency began regulating TOC levels in municipalities serving a population of 10,000 or more. Source water TOC can vary anywhere from 1 to 10 mg of carbon per L. The primary source of this TOC is from the decomposition of plants and animals and subsequent runoff or leaching into the municipal feed water sources. The composition of these TOC products range from low molecular weight species such as urea to high molecular weight humic acids that give water an "iced tea" coloring. Other organic compounds found in water can be the direct result of industrial pollutants, pesticides, herbicides, and other man-made contaminants.

Other sources of TOC are the accidental introduction of TOC into the pharmaceutical water system and the degradation of water system components. The former is the result of
error, such as opening a wrong valve. The latter could be the breakdown of a plastic component in the water system or the presence of holes in the reverse osmosis (RO) membrane system. Regardless of the source, any of these TOC contaminants can be detrimental to the control of the water system.

Treatment methods to reduce TOC are discussed in Water for Pharmaceutical Purposes $\langle 1231\rangle$. In brief, various methods such as RO and filtration can reduce TOC concentration. Also, oxidizing agents such as chlorine and ozone can break up organic molecules. They are not, however, very selective and will attack nearly all organic molecules. The cleavage of large molecules creates smaller organic molecules that are easily digested and assimilated by microorganisms. Dead bacteria can also produce decomposition products called endotoxins that may produce a fever when injected into the body. The quantity of total organic carbon in pharmaceutical waters is of primary concern because it can enhance microorganism growth.

Volatile organic compounds are not a major contaminant in pharmaceutical water systems. Most contaminants are nonvolatile and are naturally occurring or anthropogenic organics. TOC measurements provide a single nonspecific measurement, detecting a broad spectrum of compounds without performing tests for individual contaminants.

## Laboratory TOC Technologies

TOC analysis was developed initially for the measurement of relatively high levels of TOC in water and waste water. Technological advances, however, have produced instruments that measure low levels of TOC in water down to sub-ppb levels, thus allowing for its application in the pharmaceutical industry. The principal TOC technologies are
based on the oxidation of organic carbon to $\mathrm{CO}_{2}$ and subsequent detection of the $\mathrm{CO}_{2}$ by either conductometric or photometric means.
Some water samples contain dissolved $\mathrm{CO}_{2}$ (and $\mathrm{HCO}_{3}{ }^{-}$ and $\mathrm{CO}_{3}{ }^{2-}$ ) at the outset of the analysis, so the inorganic carbon (IC) must be removed or measured as part of the analysis. For any oxidation technology, depending on the TOC and IC levels, removal of the dissolved $\mathrm{CO}_{2}$ is always an option. In order to achieve accurate measurement of TOC in some samples, it is necessary to minimize the contribution of IC to the total signal. If it is determined that IC background is detrimental to the sample measurement, then the IC can be purged from the water sample by vacuum, nitrogen sparging, or acid addition, depending on the technology. This should not be necessary unless the TOC is very low and the IC very high. In pharmaceutical bulk water supplies, IC concentrations are typically low, and removal is not required for accurate TOC results. The basic oxidation and detection techniques used in TOC equipment are described below; however, other combinations of technologies that are not described may also be in use.

Combustion Oxidation/Nondispersive Infrared Detection (NDIR)—This technology combination is most often configured for laboratory use. Combustion oxidation uses oxygen and high temperatures ( $>600^{\circ}$ ) and a catalyst such as platinum ( Pt ) to facilitate the oxidation and convert the organic compounds to $\mathrm{CO}_{2}$. This technique has demonstrated high oxidation efficiency for both dissolved and particulate organics. The catalyst, however, can become poisoned and cause low recovery. NDIR is very selective for $\mathrm{CO}_{2}$ in the presence of water vapor. After oxidation of the sample, the $\mathrm{CO}_{2}$ is delivered to the detection chamber by a carrier gas. The concentration of $\mathrm{CO}_{2}$ is directly proportional to the absorption response according to Beer's Law. As with any absorption spectrophotometric method, NDIR
is most sensitive at higher concentrations. Compared to other detectors, NDIR detectors can exhibit extended warm-up times at start-up. NDIR detectors typically require a comparatively higher calibration frequency.

Heated Persulfate Oxidation/NDIR Detection-Heated persulfate oxidation instruments generate hydroxyl radicals ( $\cdot \mathrm{OH}$ ) by heating the persulfate to $>95^{\circ}$. The hydroxyl radicals act as powerful oxidizing agents. The cation form of the persulfate and its concentration vary, with concentrations ranging from $2 \%$ to $15 \%$. Heated persulfate is typically combined with the previously described NDIR detection method to measure $\mathrm{CO}_{2}$. This technology combination is typically applied in laboratory instrument configurations. Heated persulfate is a very efficient oxidation method. Its main disadvantages are the volume of reagent required.

UV Oxidation/NDIR Detection—UV oxidation uses UV light to generate hydroxyl radicals from the photolysis of water. In some instruments, persulfate is added, which is activated by UV to increase the oxidative capacity. This technology combination is most commonly found in laboratory configurations. The natural spectral output of a low pressure Hg lamp generates light of wavelength 253.7 and 184.9 nm . The shorter wavelength generates the oxidizing radicals, while both wavelengths are efficient at cleaving bonds in large and small organic molecules. This combination provides an efficient oxidation and measurement system. UV oxidation methods are particularly well suited for lower TOC concentrations found in pharmaceutical waters. The main advantage is the oxidation efficiency at lower TOC concentrations. The disadvantages are that the UV Hg lamps must be periodically replaced and that, as previously described, the NDIR detector systems are complex.

UV/Persulfate Oxidation/Membrane Conductometric Detection-In this technology, $\mathrm{CO}_{2}$ is generated by UV radiation (as described above), and the dissolved $\mathrm{CO}_{2}$ passes
through a gas-permeable membrane to an on-board source of low conductivity water. The resulting increase in conductivity in this water is directly proportional to the $\mathrm{CO}_{2}$ produced from the UV oxidation. Persulfate is typically added to enhance oxidation at TOC concentrations greater than 1 ppm. This technology combination makes use of the high sensitivity that conductivity measurements have at low concentrations of $\mathrm{CO}_{2}$, and the membrane separation helps to eliminate the typical chemical interferences that can disrupt conductivity measurements.

## Sampling Techniques for Laboratory Analysis-Be-

cause compendial pharmaceutical waters have very low TOC (the USP limit is about $500 \mu \mathrm{~g}$ of carbon/L, but $<50$ $\mu \mathrm{g}$ of carbon/L, and lower, is more likely), pharmaceutical waters require the following special handling to have valid TOC measurements.

1. The water should be delivered from a hose or delivery receptacle in the same manner in which it is used in production.
2. The storage container may be any type that does not shed or leach TOC, and it must be scrupulously clean. Many plastic or polymeric containers are either unacceptable because of extractable TOC or they are too difficult to clean. Limited types of materials such as PTFE, PFA, and PVDF have found acceptance because of their low leach rates. Glass is an excellent material due to its negligible TOC leach rate and its cleanability. Cleaning of the glass according to Cleaning Glass Apparatus $\langle 1051\rangle$ is advised.
3. The container should be completely filled with the sample to keep the trapped air to a minimum. The container should be closed immediately to prevent atmospheric contamination.
4. The time between sampling and analysis should be kept to a minimum. If the samples are analyzed by an offsite laboratory, they should be refrigerated to minimize microbial growth.
5. The setting of the flow control valve should not be changed, and the sample bottle should not touch the port while taking the sample.
6. For compendial purposes, the water should be tested at a point that is equivalent to the quality of water used in production. This may require testing at several points, or at a location after the last-use point before the return to the tank in a recirculating system.

## On-Line TOC Technologies

The most common on-line TOC methods used in pharmaceutical applications employ UV oxidation and conductivity detection. These technologies are designed for exclusive use with low conductivity water supplies and with the device connected directly to the sample to eliminate exposure to the atmosphere. The low sample conductivity ensures an IC concentration so low that its removal is not necessary. No reagents are required because at TOC concentrations of 500 ppb or less, UV oxidation alone is usually sufficient for complete recovery.

UV oxidation can be applied on a fixed volume of sample or by irradiating a continuous stream to the UV source. Conductivity measurements are made during or immediately following the oxidation step. In one configuration, a gaspermeable membrane is used after the UV oxidation to separate $\mathrm{CO}_{2}$ from other potentially conductive oxidation by products.

The main advantages of on-line technologies are the benefit of continuous unattended measurement of TOC, the availability of continuous trending of the water system,
the ability to respond to a disturbance immediately, and the elimination of sample collection, handling, and transportation errors.

## Sampling Techniques for On-Line TOC Analysis-

On-line TOC analysis has the advantage of being able to provide data continuously and without the difficulties in sample handling that accompany off-line TOC measurements. Typically, clean tubing is attached to the water system and water flow is directed to the inlet of the TOC instrument. Appropriate care should be taken to eliminate dead-legs and subsequent backflow of the sample line when the instrument is not in use.

## Technology Summary

Some of the oxidation and detection techniques work in tandem and are ideally suited for Purified Water and Water for Injection. These methods have the necessary resolution and sensitivity to perform the basic TOC measurement functions. The main differences between the technologies are the capital costs, consumables (UV lamps, gases, reagents), and maintenance and labor (preparing reagents, replacing catalysts, installing gas generators), and suitability for laboratory or on-line analysis.

Detection limits will vary by technology, and the analysis method must be able to meet the System Suitability requirements and detect the levels of TOC prescribed in Total Organic Carbon $\langle 643\rangle$. IR-based detection methods involve a well-established technique that requires a large sample size, a purge gas, long warm-up times, and frequent calibration. These detection methods are well suited to high TOC concentrations and are not susceptible to interferences that may be found in water. UV/conductivity methods are best suited
for on-line process use in pharmaceutical waters, where the sensitivity of conductivity measurements is ideally suited to measuring the conductivity of $\mathrm{CO}_{2}$-containing solutions; the conductivity-based techniques are capable of a much lower limit of detection. The analysis time for each technology can vary from 0.5 to 30 minutes. Calibration requirements will also differ, varying from daily or weekly to annually. Calibration may be done by the user in-place or may require special attention by factory or trained personnel. Gases, chemicals, lamps, and other supplies will impact operating costs.

## CONDUCTIVITY

A conductivity measurement system is similar in concept to a TOC measurement system. A TOC analyzer cannot quantify individual organic species, only the aggregate carbon in the form of $\mathrm{CO}_{2}$. Likewise, a conductivity measurement does not distinguish between ions. It measures the total conductivity of charged ionic species.

A conductivity measurement is performed by measuring the AC resistance (conductance $=1 /$ resistance) between two electrodes of a known geometrical construction. The resistance of the fluid between the two electrodes will increase with electrode distance, $d$, and decrease with electrode area, $A$. To correct for this geometrical factor, the cell constant, $\phi$, of the sensor is equivalent to the distance between the electrodes divided by the area of the electrodes.

$$
\begin{equation*}
\varphi\left(\mathrm{cm}^{-1}\right)=\frac{\mathrm{d}}{\mathrm{~A}} \tag{1}
\end{equation*}
$$

The cell constant normalizes the resistance, $\Omega$, (or conductance, $S$, to eliminate the impact of the sensor geometry, thereby resulting in the familiar water quality measurement of resistivity, $\rho$ (or conductivity, $\kappa$ ). The equations that relate these measurements are the following:

$$
\begin{equation*}
\varphi(\Omega-\mathrm{cm})=\frac{\operatorname{resistance}(\Omega)}{\varphi\left(\mathrm{cm}^{-1}\right)} \tag{2}
\end{equation*}
$$

$$
\begin{gather*}
\kappa(\mathrm{S} / \mathrm{cm})=\text { conductance }(\mathrm{S}) \times \varphi\left(\mathrm{cm}^{-1}\right) \\
\kappa(\mathrm{S} / \mathrm{cm})=\frac{1}{\varphi(\Omega-\mathrm{cm})} \tag{4}
\end{gather*}
$$

A temperature device, such as a resistance temperature device (RTD) or thermistor, will be embedded in most conductivity sensors. The meter will measure the resistance of that device and convert it to a temperature according to its known temperature-resistance relationship.

The fundamental operation of conductivity measurement systems consists of measurement of the resistance between the electrodes, correction for the cell constant to get a conductivity or resistivity measurement, and then compensation for the raw measurement for temperature using an algorithm in the meter. In order to meet the requirements of Water Conductivity $\langle 645\rangle$, the temperature compensation feature is disabled, and the uncompensated measurement is used to determine water quality acceptance.

## Impact of Water Chemistry on Conductivity

Electrical conductivity of water is a measure of the ionfacilitated flow of current between two electrodes through the water. The fundamental equation to describe the conductivity is the following:

$$
\begin{equation*}
\kappa=10^{-3} \sum_{i}^{\substack{\text { all } \\ \text { ions }}} \Lambda_{i}^{\circ} \mathrm{C}_{\mathrm{i}} \tag{5}
\end{equation*}
$$

where $\kappa$ is the conductivity (Siemens $/ \mathrm{cm}$ ), $\Lambda_{\mathrm{i}}$ is the limiting molar conductivity of ion $i$ (Siemens- $\mathrm{cm}^{2} /$ mole) and $C_{i}$ is the concentration of ion $i$ (mole/L). The equation is summed over all ions present in the water. If the concentrations are expressed in molality (moles $/ \mathrm{kg}$ of water), then the equation is adjusted for the water density.

Water molecules dissociate into $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$according to the equation:

$$
\begin{equation*}
\mathrm{H}_{2} \mathrm{O} \rightleftharpoons\left[\mathrm{H}^{+}\right]+\left[\mathrm{OH}^{-}\right] \tag{6}
\end{equation*}
$$

and the extent of the reaction is determined by the dissociation constant, $K_{w}$.

$$
\begin{equation*}
K_{w}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.00 \times 10^{-14} \text { at } 25^{\circ} \tag{7}
\end{equation*}
$$

$$
\begin{equation*}
p K_{w}=-\log \left(K_{w}\right)=14 \text { at } 25^{\circ} \tag{8}
\end{equation*}
$$

In the absence of any other chemical species, electroneutrality and Equation 7 require that

$$
\begin{equation*}
\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{-}\right]=1 \times 10^{-7} \mathrm{~mole} / \mathrm{L} \tag{9}
\end{equation*}
$$

The limiting molar conductivity at $25^{\circ}$ of $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$are 349.8 and $198.6 \mathrm{~S}-\mathrm{cm}^{2} / \mathrm{mol}$, respectively. The resulting conductivity of pure water is $5.48 \times 10^{-8} \mathrm{~S} / \mathrm{cm}(0.0548 \mu \mathrm{~S} / \mathrm{cm})$. The resistivity is the multiplicative inverse (Equation 4) of the conductivity, or 18.2 M Megohm- $\mathrm{cm}(\mathrm{M} \Omega-\mathrm{cm})$.
At temperatures other than $25^{\circ}$ - the commonly used reference temperature-two phenomena directly impact the conductivity of pure water. First, the dissociation constant of water varies significantly over the range of $0^{\circ}$ to $100^{\circ}$. The value of $K_{w}$ changes by a factor of 400 , as the $p K_{w}$ is 14.9 at $0^{\circ}$ and 12.2 at $100^{\circ}$. The resulting change in $K_{w}$ causes a true increase in the ion concentrations as the temperature increases. The second effect is the temperature dependence of the ion mobility. The ion mobility is a measure of the ability of ions to conduct, which is directly related to each ion's limiting molar conductivity. The mobility of both ions increases by a factor of $\sim 3$ over the range of $0^{\circ}$ to $100^{\circ}$. The combination of these two effects causes the conductivity of pure water to increase from $0.0116 \mu \mathrm{~S} / \mathrm{cm}$ at $0^{\circ}$ to $0.777 \mu \mathrm{~S} / \mathrm{cm}$ at $100^{\circ}(86.1 \mathrm{M} \Omega-\mathrm{cm}$ to $1.29 \mathrm{M} \Omega-\mathrm{cm})$.

Though it is not unusual for some compendial water systems to produce pure water, most water treatment systems that produce Purified Water and Water for Injection have small amounts of impurities that pass through the water system. The impurities are usually simple alkali metal ions, possibly some lighter transition metal ions, and common counter ions such as $\mathrm{Cl}^{-}, \mathrm{SO}_{4}{ }^{2-}$, and $\mathrm{HCO}_{3}{ }^{-}$. In addition, some gases, most notably $\mathrm{CO}_{2}$, readily dissolve in water and react to form $\mathrm{H}^{+}$and $\mathrm{HCO}_{3}{ }^{-}$, predictably affecting conductivity and pH . Regardless of the ionic impurity, each has its own characteristic limiting molar conductivity. Thus the measured conductivity of the water in a pharmaceutical system is determined from Equation 5, after consideration of all ions present at their respective concentrations.

## Temperature Compensation

Temperature compensation is the adjustment of a chemical or physical measurement at any temperature to its value at a reference temperature, $25^{\circ}$ in this case. The purpose of the compensation is to provide a universal reference point so that measurements taken at different temperatures can be properly compared. For example, if the conductivity of the water system is $0.11 \mu \mathrm{~S} / \mathrm{cm}$ at $37^{\circ}$, but later in the day it is $0.13 \mu \mathrm{~S} / \mathrm{cm}$ at $40^{\circ}$, the increase can be the result of the natural increase in ion mobility due to temperature, or it could be the result of more impurities in the water. The benefit of temperature compensation is that it can distinguish natural changes from water quality changes.

Prior to the application of microprocessors, temperature compensation was performed either by "correcting the signal" with the addition of analog circuitry or by numerically adjusting postmeasurement. Temperature compensation is currently performed automatically by the chemically-based numerical algorithms in the instrumentation.

Temperature compensation for conductivity measurements of pure water is difficult to perform accurately. For almost all types of fluids except pure water, the dependence of the conductivity on temperature is, on the average, about $\sim 1.9 \%$ to $2.2 \%$ per degree over the entire $0^{\circ}$ to $100^{\circ}$ range. This linear compensation factor applies for most process fluids and drinking waters, because the conductivity is dominated by the ions that are not related to water dissociation. However, because of the low impurity levels found in Purified Water or Water for Injection systems, the chemical composition of the ions in water is primarily due to $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$, with smaller (or similar) amounts of other ions. The temperature dependence of the conductivity, therefore, becomes less predictable because of the temperature dependence of the water chemistry. For example, at $0^{\circ}$ the conductivity of pure water changes at a rate of $>7 \%$ per degree, while at $100^{\circ}$ the temperature dependence is $<2.5 \%$
per degree. As the impurity levels increase, the temperature dependence moderates until it reaches $\sim 2 \%$ per degree. The appropriate correction for temperature compensation varies and must be accounted for correctly, depending on the temperature and the impurity level. On-line process instrumentation performs this correction automatically, but the algorithms remain trade secrets.

As the chapter Water Conductivity $\langle 645\rangle$ was being developed in the early 1990s, it was established that the measurements would be made in a nontemperature-compensated mode to eliminate the variability that is found from one instrument manufacturer to another. This resulted in the table, Stage 1-Temperature and Conductivity Requirements in the chapter Water Conductivity $\langle 645\rangle$ that set conductivity limits that are temperature dependent. The table takes into account the natural increase in conductivity as a function of temperature, while ensuring that certain impurity levels are not exceeded.

## Conductivity Technologies

Conductivity Sensors-A conductivity sensor used in pharmaceutical water measurements typically consists of two concentric electrodes, separated by an inert electrical insulator, with a cell constant that is usually anywhere from 0.01 to $0.1 \mathrm{~cm}^{-1}$. For on-line measurements, the sensor should be inserted into the tee of a piping system. Sidestream measurements are possible, but direct immersion into the piping are less costly (i.e., no water loss with no risk to the water system). The electrode material should be compatible with the water system to prevent galvanic action between the water piping and the sensor. The insulator should be resistant to the water and to the processing conditions that may be present. The sensor design and geometry should be invariant to the high temperatures (up to steam sterilizable conditions at $131^{\circ}$ and 40 psia or higher), sanitization che-
micals, UV, pressure, and flow rates that the sensor might be exposed to. Any change in the geometric construction of the sensor will cause a change in the apparent measurement of the conductivity.

Stainless steel electrodes should be passivated, at a minimum, to reduce the possibility of corrosion or rouging. Passivation materials such as nitric acid, phosphoric acid, and citric acid are commonly used. Surface finishes having exposed surfaces with Roughness Average $\left(R_{a}\right)<10 \mu$ in (better than standard machine finishes) are readily attainable. The process connection to the water system can be any suitable connection type; however, a sanitary tri-clamp flange and gasket to provide a clean, tight seal between the sensor flange and water system are recommended. Welding of the electrodes to the flange should be clean and of pharmaceutical grade. Threaded process connections should be averted to eliminate deadlegs; however, this parameter has no impact on the conductivity measurement.

The electrode material and insulator for off-line measurements are not critical, provided they give accurate measurements. Environmental factors are not present. To make accurate measurements, platinum electrodes should be avoided because a process called platinization is required periodically to recondition the surface of the electrode. However, this process is not robust, and it is difficult to determine when platinization is necessary, except by alternative verification measurements. An adverse impact to measurement accuracy is also greatest at low conductivity. Common electrode materials include stainless steel, titanium, hastelloy, and graphite to a lesser extent. Titanium is widely used in the microelectronics industry because of its naturally passive surface and resistance to pure water. All of these electrode materials require low maintenance, if prop-
erly sanitized and cleaned. Repassivation of stainless steel electrodes may be needed if the material rouges or becomes scratched.

The concentric electrode design is not required, but it does result in mechanically rugged sensor construction that can withstand the pressures and flow changes in a water system. Also, the grounded shield design protects the sensor from any nearby surfaces that will impact the electric field and cause altered measurement in unshielded electrodes. Other subtle factors impacting sensor design and system accuracy are the electrode's macroscopic and microscopic properties. Large cell areas are preferable because this reduces the metal-water impedance that is formed at the electrode surface. Smaller cell areas can cause an undesirable increase in the measured cell resistance.

The two principal types of temperature devices are negative temperature coefficient (NTC) thermistors and 100 or 1000 platinum resistance temperature devices (RTDs). Both device types operate on the principle that their resistance changes in known and precise ways as a function of temperature. Both types are low in cost and have desirable electrical response characteristics. NTC thermistors have a very high, nonlinear sensitivity over a narrow temperature range, and their sensitivity drops markedly as the temperature increases. Platinum RTDs have a more linear response over a very wide dynamic range, and they are mechanically more robust than NTC thermistors. Repeatability of the resis-tance-temperature response for RTDs tends to be better than NTC thermistors.

Conductivity Instrumentation-The primary function of the conductivity meter is to make the AC resistance measurement, make the temperature measurement, and display the conductivity. The frequency of the AC measurement is critical to the accuracy of the measurement. At lower conductivity, lower measurement frequencies $(<200 \mathrm{~Hz}$ ) are uti-
lized to provide enough time to charge up the sensor to make an accurate measurement. At higher conductivity (nonpharmaceutical water), the AC measurement is made at a much higher frequency (up to $10,000 \mathrm{~Hz}$ ). High frequencies are required to reduce polarization (collection of ions) at the electrodes. If the AC frequency is too low and the ion concentration is too high, ions will collect at each electrode and disrupt the flow of current and subsequently disrupt the measurement. Cable capacitance and fluid capacitance also greatly impact the measurement accuracy, especially at the lowest conductivity; therefore, unique analog measurement systems are applied to make accurate measurements.

Most conductivity meters have multiple circuits to operate at multiple frequencies over a wide dynamic range. This operating frequency and range of the meter are executed internally and automatically by the meter. Older instruments and some hand-held meters may require manual adjustment of the operating range.

A meter may be placed as far as 100 meters away from the sensor, so the capability of transferring analog or digital signals over these distances necessitates the use of appropriate cable shielding. Also, the use of 3- and 4 -wire measurements is commonly applied to reduce the negative impact of leadwire resistance, especially for long cables.

Although temperature compensation is not intended in Water Conductivity $\langle 645\rangle$, temperature compensation is used by a pharmaceutical facility to monitor and control the water system, in which case accurate temperature measurement is critical. At $20^{\circ}$, a $1^{\circ}$ measurement error will result in a $5 \%$ error in the calculated compensated conductivity. At $80^{\circ}$, the same error will result in a $10 \%$ error in the calculated compensated conductivity. Accurate temperature calibration is necessary to ensure accurate measurements.

Other features found in on-line conductivity analyzers are multiple channel inputs, setpoint alarms, relay control, $0 / 4-20 \mathrm{~mA}$ output, digital output, and multiple types of measurements (conductivity, resistivity), multiple compensation options, and several units of expression (the common set of units is $\mathrm{S} / \mathrm{cm}$ or $\mu \mathrm{S} / \mathrm{cm}$, but there is a small growing trend toward displaying measurements in $\mathrm{S} / \mathrm{m}$ which is an SI unit). Another requirement in Water Conductivity $\langle 645\rangle$ is a display resolution of $0.1 \mu \mathrm{~S} / \mathrm{cm}$, though more resolution is typical.

## Conductivity System Calibration

When a complete conductivity system calibration is required, it should be performed in the following sequence. Calibrate the meter first, then the sensor afterwards. The sensor may be calibrated on the same meter or a different, calibrated meter.

Conductivity Meter Calibration-The purpose of this calibration is to verify and adjust, if necessary, the temperature measurement circuit and AC conductivity measurement circuit of the meter. There is no requirement for accuracy of the temperature circuit in general chapter Water Conductivity $\langle 645\rangle$, but an accuracy of $\pm 0.25^{\circ}$ is typical. Calibration is performed by removing the sensor from the meter and replacing the sensor with a precision resistor of known value. The resistor is a simulator of a specific temperature. Comparison of the simulated and measured temperature will result in an adjustment of the temperature measurement circuit. There should be a provision within the meter to adjust the circuit calibration for temperature.

The same procedure is done for the AC conductivity measurement circuit. Replace the sensor with another precision resistor. Compare the simulated and measured conductivity and adjust, if necessary. Due to the multiple AC measurement circuits in these meters, calibrate either all of the cir-
cuits or the circuit that is in use during normal operation. Specific details for selecting the resistor values and calibrating the meter are supplied by instrument manufacturers. The accuracy required in general chapter $\langle 645\rangle$ is $\pm 0.1 \mu \mathrm{~S} / \mathrm{cm}$. There should be a provision within the meter to adjust the circuit calibration for conductivity.

Conductivity Sensor Calibration-Calibration of the sensor is performed by accurately measuring the cell constant. Standard manufacturing practices can generate sensors with repeatable nominal cell constants, but typical tolerances can lead to variations up to $\pm 10 \%$. Calibration of the sensor in solutions of known, traceable conductivity is the only acceptable method.

The sources of primary standard solutions for cell constant calibration include the following:

- The preparation of ASTM solutions according to D1125 or D5391

## - NIST standard solutions

- Pure water with no impurities

Most commercial sensors are not calibrated in primary standard solutions, but they are calibrated in a solution whose conductivity is known by a secondary transfer conductivity standard. The secondary standard is determined by calibration in the primary standard solutions, usually in an ASTM standard solution(s), and this secondary sensor is used to calibrate commercial sensors.

This presents a dilemma for the pharmaceutical user because the primary standard solutions are all $>100 \mu \mathrm{~S} / \mathrm{cm}$, while the user is operating at $<5 \mu \mathrm{~S} / \mathrm{cm}$, and commonly at $<0.2 \mu \mathrm{~S} / \mathrm{cm}$. This problem is solved in one of two ways. First, if the conductivity measurement system (sensor and meter) has sufficient dynamic range and it is demonstrably accurate over the applicable range-from the calibration solution to the normal operating condition-then the sensor can be calibrated in the higher conductivity solution and
then used in the low conductivity pharmaceutical water. Another method is calibration of the sensor in a recirculating pure water system generated by a mixed-bed de-ionization loop. The conductivity of pure water as a function of temperature is well documented. With an accurate temperature measurement, the conductivity is accurately known and can be used as a primary reference in the normal operating range of the sensor and meter. This technique results in a sensor that is calibrated very accurately, but it is impractical for most end-users to execute themselves.

Calibration of sensors in standard solutions that are $<10$ $\mu \mathrm{S} / \mathrm{cm}$ is possible but has several nuances. Solutions in this conductivity range may be unstable, because of the intrusion of $\mathrm{CO}_{2}$ (from the air) into the solutions. Once the containers are opened, the $\mathrm{CO}_{2}$ reacts immediately with water to form carbonic acid, $\mathrm{H}_{2} \mathrm{CO}_{3}$. Carbonic acid weakly dissociates into $\mathrm{H}^{+}$and $\mathrm{HCO}_{3}^{-}$, and this will impact the conductivity by up to $1 \mu \mathrm{~S} / \mathrm{cm}$ unless preventive measures are taken. Another difficulty is the increased level of cleanliness that is needed to perform the calibration. If there is any residue on the sensor before immersion into the standard solution, the cleanliness and accuracy of the solution is compromised. The advantage of the high conductivity primary standard is that it can better tolerate trace impurities. The advantage of the pure water standard is that it never has impurities. In general chapter $\langle 695\rangle$, calibration accuracy of the cell constant is required to be $\pm 2 \%$, and this is readily achieved.

Frequency of Calibration-Water Conductivity $\langle 645\rangle$ makes no recommendation on the frequency of calibrating conductivity meters or sensors. The frequency should be based on historical data, system performance, and the manufacturer's recommendations. For conductivity meters, a 6month calibration cycle, or longer, is typical. For sensors, the materials, type of construction, and operating conditions can influence the calibration cycle. A sensor calibration cer-
tificate with a 6 -month to 1 -year expiration is typical. Ultimately, it is the amount of risk the user is willing to take that is the deciding factor. Documentation of all calibrations is vital for regulatory purposes.

During normal operation, calibration of robust conductivity sensors should not be required more than every 6 months to 1 year. Only mechanical or chemical disturbances of the sensor should impact the cell constant. For example, $0.1 \mathrm{~cm}^{-}$ ${ }^{1}$ sensors tend to be more robust than $0.01 \mathrm{~cm}^{-1}$ sensors because the higher cell constant sensors have greater spacing (d) between the electrodes than the lower cell constant sensors. As a result, minor mechanical disturbances have a greater impact on the lower cell constant sensors.

## Off-Line Conductivity Measurements

Care should be taken when conductivity measurements of Purified Water or Water for Injection are taken off-line, e.g., in a laboratory. If the water conductivity (measured on-line) is $<1 \mu \mathrm{~S} / \mathrm{cm}$, then virtually any measurement of that same water made in the laboratory will result in a higher conductivity. The immediate reaction of $\mathrm{CO}_{2}$ with the water will cause the formation of $\mathrm{H}_{2} \mathrm{CO}_{3}$ as described above, and cause the conductivity to rapidly and immediately increase. As a result, it is very difficult to correlate on-line measurements to laboratory measurements.

For example, a water system with filtration, reverse osmosis, and mixed-bed de-ionization may be producing Purified Water with a nominal quality of $0.055 \mu \mathrm{~S} / \mathrm{cm}(18 \mathrm{M} \Omega-\mathrm{cm})$ water consistently. When this water conductivity is measured in-line, the measurement may vary from 0.054 to $0.057 \mu \mathrm{~S} / \mathrm{cm}$. When the same water is transported into the laboratory, the conductivity may vary from 0.8 to $1.5 \mu \mathrm{~S} /$ cm . The conductivity increase will be due solely to the $\mathrm{CO}_{2}$. The increase in the variability in this off-line measurement will also be significant (almost $100 \%$ ), while the on-
line measurement varies about $5 \%$. The increased fluctuation is due to the variations in concentration of $\mathrm{CO}_{2}$ in the ambient area at the time. Pristine air will have a concentration of about $375 \mathrm{ppm} \mathrm{CO}_{2}$, but normal industrial conditions would have the $\mathrm{CO}_{2}$ concentration vary from 500 to 1200 ppm . The variability in the $\mathrm{CO}_{2}$ concentration is completely beyond the control of the analyst, but it grossly impacts the measurement and completely obscures any possible correlation of off-line with on-line measurements. $\Delta$ USP28

## REAGENTS, INDICATORS, AND SOLUTIONS

## Reagent Specifications

## BriEfing

1,5-Dimethyl-1,5-diazaundecamethylene polymethobromide (Polybrene). This new reagent is used in dissolving the chromogenic substrate for the amidolytic test in the Assay under the Antithrombin III Human monograph, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-37456-2

## Add the following:

© $\mathbf{1 , 5}$-Dimethyl-1,5-diazaundecamethylene polymethobromide (Polybrene), [28728-55-4]—This is a positively charged polymer. It is available as an off-white, crystalline solid or powder and is extremely hygroscopic. Use a suitable reagent grade. ${ }^{112}$ ©USP28

## Briefing

Sodium 1-Heptanesulfonate, USP 27 page 2710. It is proposed to clarify the name of this reagent by adding the synonym " 1 -Hexanesulfonic acid."
(HDQ: M. Marques) RTS-40477-1

## Change to read:

Sodium 1-Heptanesulfonate
© (1-Hexanesulfonic acid), $\triangle U S P 28$
$\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{NaO}_{3} \mathrm{~S}$ - $\mathbf{2 0 2 . 2 5}$-Use a suitable grade.

## BRIEFING

Sodium 1-Hexanesulfonate, USP 27 page 2710. It is proposed to clarify the name of this reagent by adding the synonym " 1 -Pentanesulfonic acid."
(HDQ: M. Marques) RTS-40489-1

## Change to read:

Sodium 1-Hexanesulfonate,
© (1-Pentanesulfonic acid), $\triangle U S P 28$
$\mathrm{C}_{6} \mathrm{H}_{13} \mathrm{NaO}_{3} \mathrm{~S}-\mathbf{1 8 8 . 2 2}$-Use a suitable grade.

## BriEfing

Thyroglobulin. This new reagent is used for determining the void volume of the sizing column in the test for Molecular weight distribution in the proposed monograph for Antithrombin III Human appearing elsewhere in this $P F$.
(BBP: R. Tirumalai) RTS-37456-3

## Add the following:

${ }^{\Delta}$ Thyroglobulin, [9010-34-8]-Available as a slightly beige, freeze-dried powder made from bovine or porcine thyroid gland having a molecular weight of approximately 670 kDa . Use a suitable grade. $\quad$ USP28

## BRIEFING

Wright's Stain. This new reagent is used for staining platelets in the Identification test in the proposed Platelets monograph, appearing elsewhere in this number of $P F$.
(BBP: R. Tirumalai) RTS-40379-1

## Add the following:

${ }^{\mathbf{\Delta}}$ Wright's Stain-A mixture of methylene blue, methylene azure, and the eosinates of both, available as a solid and as a solution in methanol. Use a suitable grade. [NOTE-If a solid is used, dissolve 6.0 g of Wright's stain powder (CAS\# 68988-92-1, dark green powder) and 0.6 g of Giemsa stain powder (CAS\# 51811-82-6, dark green to black powder or crystals) in 1000 mL of methanol. Stir overnight, and filter before use.] ${ }_{\mathbf{\Delta S P 2 8}}$

## Test Solutions

## BRIEFING

Test Solutions (TS), USP 27 page 2725, page 1905 of $P F 27(1)$ [Jan.-Feb. 2001], page 3117 of $P F$ 27(5) [Sept.-Oct. 2001], and page 1682 of PF 29(5) [Sept.-Oct. 2003]. For Folin-Ciocalteu Phenol TS, it is proposed to add instructions on how to prepare this test solution when it is used for Method 2 in the Total Protein Assay for protein determination (see Biotechnology-Derived ArticlesTests $\langle 1047\rangle$ ). In the absence of any adverse comments, this proposed revision will be implemented via the Second Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of April 1, 2004. For Hydroxylamine Hydrochloride TS, it is proposed to specify the solvent used in the preparation of the bromophenol blue solution.
(BPC: M. Marques) RTS-40655-1; 40479-1

## Add the following:

-Cupric Citrate TS—Dissolve 25 g of cupric sulfate, 50 g of citric acid, and 144 g of anhydrous sodium carbonate in water, and dilute with water to 1000 mL . $\quad$ IS (USP27)

## Add the following:

-Ferroin TS—Dissolve 0.7 g of ferrous sulfate and 1.76 g of $o$-phenanthroline monohydrochloride monohydrate in water, and dilute with water to 100 mL . 1 (USP27)

## Change to read:

Folin-Ciocalteu Phenol TS-Into a $1500-\mathrm{mL}$ flask introduce 100 g of sodium tungstate, 25 g of sodium molybdate, 700 mL of water, 50 mL of phosphoric acid, and 100 mL of hydrochloric acid. Reflux the mixture gently for about 10 hours, and add 150 g of lithium sulfate, 50 mL of water, and a few drops of bromine. Boil the mixture, without the condenser, for about 15 minutes, or until the excess bromine is expelled. Cool, dilute with water to 1 liter, and filter: the filtrate has no greenish tint. Before use, dilute 1 part of the filtrate with 1 part of water.

- When used for protein determination (i.e., Lowry assay), this reagent must be further diluted (1:5) with water. See Method 2 in Total Protein Assay under Biotechnology-Derived Articles—Tests $\langle 1047\rangle$ ••2

## Change to read:

Hydroxylamine Hydrochloride TS-Dissolve 3.5 g of hydroxylamine hydrochloride in 95 mL of 60 percent alcohol, and add 0.5 mL of bromophenol blue solution ( 1 in 1000 )
${ }^{\Delta}(1 \text { in } 1000 \text { of alcohol })_{\Delta U S P 28}$
and 0.5 N alcoholic potassium hydroxide until a greenish tint develops in the solution. Then add 60 percent alcohol to make 100 mL .

## Change to read:

Methyl Yellow TS-Dilute with aleohol a-commereially avait able stock solutionof methyl yellow in aleohel ${ }^{86}$ to obtain selution having a concentration of 0.10 mg per mL .

- Prepare a solution containing 0.10 mg per mL in alcohol.■2S (USP27)

## Add the following:

■Nickel Standard Solution TS——Dissole 4.78 g of nickel
(II) sulfate heptahydrate in water, and dilute with water to

1000 mL . Immediately prior to use, dilute 10.0 mL of the solution so obtained with water to 1000 mL . Suitable nickel standard solutions are also available commercially.■1S (USP27)

## Add the following:

■Perchloric Acid TS——Dilute 8.5 mL of perchloric acid with water to $100 \mathrm{~mL} . \mathbf{m 1 S}_{\text {(USP27) }}$

## BRIEFING

Reagent Footnotes, USP 27 page 2738, page 1133 of $P F$ 26(4) [July-Aug. 2000], page 3373 of $P F 27(6)$ [Nov.-Dec. 2001], page 266 of PF 29(1) [Jan.-Feb. 2003], page 508 of PF 29(2) [Mar.Apr. 2003], and page 1257 of $P F 29(4)$ [July-Aug. 2003]. Footnote 112 is added to identify the name under which $1,5-\mathrm{Di}-$ methyl-1,5-Diazaundecamethylene Polymethobromide is commercially available.
(HDQ: M. Marques) RTS-RTS—37456-2

## Add the following:

-112 Commercially available as Polybrene.』USP28

## Add the following:

${ }^{4}$ E-Asparagine: Asparagine: White crystals or a crystalline powder. Soluble in water; practically insoluble in alcohol and in ether. Its solutions are acid to litmus. It melts at about $234^{\circ} \cdot \mathbf{\Delta U S P 2 8}$

## Change to read:

Clemastine Fumarate: Colerless to faintly yellow, odorless, erystalline pow der.
${ }^{\Delta}$ White to off-white, odorless powder. $\Delta U S P 28$
Its solutions are acid to litmus. Very slightly soluble in water; slightly soluble in methanol; very slightly soluble in chloroform.

## Add the following:

${ }^{4}$ Fluconazole: White or almost white, crystalline powder. Freely soluble in methanol; soluble in alcohol and in acetone; sparingly soluble in isopropanol and in chloroform; slightly soluble in water; very slightly soluble in toluene. $\mathbf{\Delta U S P 2 8}$

## Add the following:

${ }^{\mathbf{4}}$ Losartan Potassium: White to off-white powder. Freely soluble in water; soluble in isopropyl alcohol; slightly soluble in acetonitrile. $\triangle$ USP28

## Add the following:

$\mathbf{\Delta Z}_{\mathbf{Z}}$-Phenoxyethanol: Phenoxyethanol: A colorless, slightly viscous liquid. Slightly soluble in water; miscible with acetone, with alcohol, and with glycerol; slightly soluble in peanut oil and in olive oil. NF category: Antimicrobial preservative. $\triangle$ USP28

## Add the following:

${ }^{4}$ Sumatriptan: White to yellowish white pale yellow powder. Freely soluble Very slightly soluble in water. IUSP28 $^{\text {I }}$

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

Triamterene and Hydrochlorothiazide Capsules-See PF Vol. 29 No. 3, page 672.
Triamterene and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 3, page 672.
Trichlorfon-See PF Vol. 26 No. 6, page 1576.
Trifluoperazine Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Triflupromazine Hydrochloride-See PF Vol. 29 No. 6, page 1994.
Triflupromazine Oral Suspension-See PF Vol. 29 No. 6, page 1994.

Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 5, page 1589.

Trimethoprim-See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate-See PF Vol. 29 No. 6, page 1995.
Trisulfapyrimidines Oral Suspension-See PF Vol. 29 No. 6, page 1996.

Tubocurarine Chloride-See PF Vol. 29 No. 6, page 1996.
Urea-See PF Vol. 29 No. 5, page 1589.
Urea C for Oral Solution-See PF Vol. 29 No. 2, page 441.
Urofollitropin-See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection-See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate-See PF Vol. 24 No. 3, page 6180.
Ursodiol-See PF Vol. 29 No. 1, page 128.
Ursodiol Capsules-See PF Vol. 29 No. 5, page 1589.
Valproic Acid-See PF Vol. 29 No. 3, page 673.
Valproic Acid Injection-See PF Vol. 26 No. 4, page 939.
Valsartan-See PF Vol. 29 No. 6, page 1996.
Valsartan Capsules-See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 6, page 2000.
Vasopressin-See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide-See PF Vol. 28 No. 6, page 1886.
Vecuronium Bromide for Injection-See PF Vol. 25 No. 4, page 8449
Verapamil Hydrochloride-See PF Vol. 29 No. 5, page 1598.
Verteporfin for Injection-See PF Vol. 29 No. 3, page 677.
Vitamin A-See PF Vol. 29 No. 6, page 2004.
Vitamin E-See PF Vol. 27 No. 5, page 3159.
Water for Hemodialysis-See PF Vol. 29 No. 3, page 680.

Water for Injection-See PF Vol. 29 No. 3, page 679.
Bacteriostatic Water for Injection-See PF Vol. 29 No. 4, page 1084.

Sterile Water for Inhalation-See PF Vol. 29 No. 4, page 1085.
Sterile Water for Injection-See PF Vol. 29 No. 4, page 1086.
Sterile Water for Irrigation-See PF Vol. 29 No. 4, page 1087.
Purified Water-See PF Vol. 29 No. 3, page 680.
Sterile Purified Water-See PF Vol. 29 No. 4, page 1088.
Xylazine-See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yttrium 90 Ibritumomab Tiuxetan Injection-See PF Vol. 29 No. 3, page 681 .
Zidovudine-See PF Vol. 29 No. 6, page 2006.
Zidovudine Oral Solution-See PF Vol. 29 No. 6, page 2006.
Zileuton-See PF Vol. 29 No. 6, page 2006.
Zinc Gluconate-See PF Vol. 29 No. 3, page 683.

## DIETARY SUPPLEMENTS

## MONOGRAPHS

Chaste Tree-See PF Vol. 29 No. 4, page 1264.
Powdered Chaste Tree-See PF Vol. 29 No. 4, page 1268.
Powdered Chaste Tree Extract-See PF Vol. 29 No. 4, page 1269.
Chondroitin Sulfate Sodium-See PF Vol. 29 No. 4, page 1270.
Chondroitin Sulfate Tablets-See PF Vol. 29 No. 3, page 692.

＜2022〉 Microbiological Procedures for Absence of Objectionable Microorganisms in Nutritional and Dietary Articles－See PF Vol． 29 No．1，page 287.
＜2023〉Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements－See PF Vol． 29 No．1，page 296.
$\langle 2040\rangle$ Disintegration and Dissolution of Nutritional Supplements－See PF Vol． 29 No．2，page 513.
＜2091〉 Uniformity of Dietary Supplement Intake Units－See PF Vol． 28 No．5，page 1549.

## REAGENTS，INDICATORS，AND SOLUTIONS

## Reagent Specifications

Acetaldehyde－See PF Vol． 29 No．4，page 1227.
2－Acetamidophenol－See PF Vol． 25 No．6，page 9107.
Acetyl Chloride－See PF Vol． 29 No．4，page 1228.
Agarose－See PF Vol． 27 No．6，page 3363.
Air－Nitrous Oxide Certified Standard－See PF Vol． 28 No．4，page 1234.

Albumin Bovine Serum－See PF Vol． 29 No．4，page 1228.
Alum－See PF Vol． 29 No．4，page 1228.
Alumina，Activated－See PF Vol． 29 No．4，page 1229.
4－Amino－3－hydroxy－1－naphthalenesulfonic Acid－See PF Vol． 29 No．4，page 1229.
Ammonia Detector Tube－See PF Vol． 29 No．4，page 1229.
Ammonia Water，Stronger－See PF Vol． 29 No．4，page 1229.
Ammonium Hydroxide－See PF Vol． 29 No．4，page 1229.
Ammonium Pyrrolidinedithiocarbamate－See PF Vol． 27 No．5， page 3115.
Anti－A Blood Grouping Reagent，Anti－B Blood Grouping Re－ agent，and Anti－A，B Blood Grouping Reagent－See PF Vol． 29 No．2，page 505.
Anti－D $\left(\mathrm{Rh}_{\mathrm{o}}\right)$ Reagent－See PF Vol． 29 No．2，page 505.
Anti－D Reagent－See PF Vol． 29 No．2，page 506.
Antihuman Globulin Reagent－See PF Vol． 29 No．2，page 506.
Antithrombin III for Amidolytic Test－See PF Vol． 29 No．1，page 264.

Arsenic Trioxide－See PF Vol． 29 No．4，page 1230.
Bacterial Alkaline Protease Preparation－See PF Vol． 28 No．2， page 552.
Barbituric Acid－See PF Vol． 29 No．1，page 265.
Benzil－See PF Vol． 28 No．4，page 1305.
Benzoic Acid－See PF Vol． 29 No．4，page 1230.
Blood Group $\mathrm{A}_{1}$ and Blood Group B Red Blood Cells－See PF Vol． 29 No．2，page 506.
7 Percent Bovine Serum Albumin Certified Standard－See PF Vol． 29 No．4，page 1230.
Branched Polymeric Sucrose－See PF Vol． 27 No．6，page 3363.
Bromelain－See PF Vol． 28 No．2，page 552.
1，4－Butanediol－See PF Vol 25 No．5，page 8747.
Butyl Acetate，Normal－See PF Vol． 29 No．4，page 1230.
Butyl Alcohol－See PF Vol． 29 No．4，page 1230.
Butyl Alcohol，Tertiary－See PF Vol． 29 No．4，page 1230.
$n$－Butylboronic Acid－See PF Vol． 29 No．4，page 1231.
Butyrolactone－See PF Vol． 22 No．6，page 3248.
Calcium Acetate－See PF Vol． 29 No．4，page 1231.

Calcium Carbonate－See PF Vol． 29 No．4，page 1231.
Calcium Chloride，Anhydrous－See PF Vol． 29 No．4，page 1231. dl－Camphene－See PF Vol． 28 No．6，page 1951.
Capric Acid－See PF Vol 25 No．5，page 8749.
Carbon Dioxide Detector Tube－See PF Vol． 29 No．4，page 1232.
Carbon Monoxide Detector Tube－See PF Vol． 29 No．4，page 1232.

Casein－See PF Vol． 29 No．4，page 1232.
Cation－Exchange Resin，Styrene－Divinylbenzene，Strongly Acidic－See PF Vol． 29 No．4，page 1232.
Ceric Ammonium Sulfate－See PF Vol． 29 No．4，page 1233.
Cesium Chloride－See PF Vol． 29 No．6，page 2054.
Chloramine T－See PF Vol． 29 No．4，page 1233.
Chlorine Detector Tube－See PF Vol． 29 No．4，page 1233.
p－Chloroaniline－See PF Vol． 29 No．4，page 1234.
Chlorobenzene－See PF Vol． 29 No．4，page 1234.
Chloroform，Alcohol－free－See PF Vol． 29 No．4，page 1234.
4－Chloro－1－naphthol－See PF Vol． 29 No．4，page 1234.
Chromatograhic Reagents－See PF Vol． 29 No．4，page 1234.
Chromotropic Acid－See PF Vol． 29 No．4，page 1235.
Cobaltous Acetate－See PF Vol． 29 No．4，page 1235.
Compactin－See PF Vol． 29 No．4，page 1235.
Coomassie Blue G－250 C－See PF Vol． 29 No．4，page 1235.
Cupric Chloride－See PF Vol． 29 No．4，page 1236.
Cyclohexylmethanol－See PF Vol． 28 No．3，page 849.
DEAE－Agarose－See PF Vol． 29 No．1，page 265.
Deoxyadenosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxycytidine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyguanosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyribonucleic Acid Polymerase－See PF Vol． 27 No．6，page 3365.

Deoxythymidine Triphosphate－See PF Vol． 27 No．6，page 3365.
Deuterated Methanol－See PF Vol． 29 No．6，page 2054.
Dextran，High Molecular Weight－See PF Vol． 29 No．4，page 1236.

Dibutylammonium Phosphate－See PF Vol． 26 No．4，page 1132.
Dichloroacetic Acid－See PF Vol． 29 No．4，page 1236.
Dicyclohexyl－See PF Vol． 28 No．3，page 849.
Dicyclohexyl Phthalate－See PF Vol． 26 No．2，page 504.
Diethylamine－See PF Vol． 29 No．4，page 1236.
Diethylpyrocarbonate－See PF Vol． 27 No．6，page 3365.
Diisobutylene－See PF Vol． 28 No．4，page 1305.
$\mathrm{N}, \mathrm{N}$－Dimethylformamide Diethyl Acetal－See PF Vol． 29 No．5， page 1681.
$N, N$－Dimethyldodecylamine－$N$－oxide－See PF Vol． 27 No．4，page 2837.

1，3－Dimethyl－2－imidazolidinone－See PF Vol． 29 No．4，page 1237.

Dimethyl Sulfoxide，Spectrophotometric Grade－See PF Vol． 29 No．4，page 1237.
3－（4，5－Dimethylthiazol－2－yl）－2，5－diphenyl Tetrazolium Bro－ mide－See PF Vol． 27 No．6，page 3365.
2，4－Dinitrofluorobenzene－See PF Vol． 29 No．4，page 1237.
Dioleoylglycerol－See PF Vol． 26 No．6，page 1622.
1，2－Dioleoyl－3－linoleoyl－rac－glycerol－See PF Vol． 28 No．3，page 849.

Disodium Arsenate－See PF Vol． 28 No．4，page 1305.
Disodium Chromotropate－See PF Vol． 29 No．4，page 1237.
1－Dodecanol－See PF Vol． 29 No．4，page 1238.
Dodecyl Lithium Sulfate－See PF Vol． 29 No．4，page 1238.
Drabkin＇s Reagent－See PF Vol． 29 No．2，page 507.
Eosin Y（Eosin Yellowish Y）－See PF Vol． 29 No．4，page 1238.
Escin－See PF Vol． 27 No．4，page 2837.
Ethidium Bromide－See PF Vol． 27 No．6，page 3366.
Ethylbenzene－See PF Vol． 28 No．3，page 850.
9－Fluorenylmethyl Chloroformate－See PF Vol． 25 No．5，page 8916.

Formamide，Anhydrous－See PF Vol． 27 No．5，page 3115.
$\beta$－Galactosidase Suspension－See PF Vol． 29 No．4，page 1238.
Glucose－See PF Vol． 28 No．3，page 850.
L－Glutamic Acid－See PF Vol． 27 No．6，page 3366.

L-Glutamine-See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate-See PF Vol. 27 No. 6, page 3366.
1-Heptadecanol-See PF Vol. 29 No. 4, page 1238.
Hexadecane-See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide-See PF Vol. 29 No. 1, page 265.
Hexokinase and Glucose-6-phosphate Dehydrogenase Suspen-sion-See PF Vol. 29 No. 4, page 1239.
L-Histidine Hydrochloride Monohydrate-See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide-See PF Vol. 28 No. 4, page 1305.
Horseradish Peroxidase Conjugated to Goat Anti-Mouse IgGSee PF Vol. 29 No. 4, page 1239.
Hydriotic Acid-See PF Vol. 29 No. 4, page 1239.
Hydrocodone Diol-See PF Vol. 28 No. 4, page 1306.
Hydrogen Sulfide Detector Tube-See PF Vol. 29 No. 4, page 1239.

4-Hydroxybenzoic Acid Isopropyl Ester—See PF Vol. 29 No. 4, page 1239.
IgG-Coated Red Cells-See PF Vol. 29 No. 2, page 507.
Imidazole-See PF Vol. 29 No. 4, page 1240.
Iodoethane-See PF Vol. 24 No. 6, page 7327.
Iron Wire-See PF Vol. 29 No. 4, page 1240.
4-Isobutylacetophenone-See PF Vol. 29 No. 4, page 1240.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isoflupredone Acetate-See PF Vol. 29 No. 4, page 1240.
Lactose-See PF Vol. 29 No. 4, page 1240.
Lanthanum Chloride-See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide-See PF Vol. 28 No. 3, page 851.
Lead Acetate Paper-See PF Vol. 29 No. 1, page 265.
Lead Perchlorate-See PF Vol. 29 No. 4, page 1241.
Linoleic Acid-See PF Vol. 27 No. 6, page 3367.
$\alpha$-Lipoic Acid-See PF Vol. 27 No. 6, page 3367.
Lithium Chloride-See PF Vol. 29 No. 4, page 1241.
Lithium Hydroxide-See PF Vol. 29 No. 4, page 1241.
Lithium Perchlorate-See PF Vol. 29 No. 4, page 1242.
Melamine-See PF Vol. 29 No. 6, page 2055.
Mercuric Nitrate-See PF Vol. 29 No. 4, page 1242.
Mercuric Sulfate-See PF Vol. 29 No. 4, page 1242.
Methenamine-See PF Vol. 29 No. 4, page 1243.
Methoxyethanol-See PF Vol. 29 No. 4, page 1243.
2-Methoxyethanol-See PF Vol. 29 No. 4, page 1243.
p-Methylaminophenol Sulfate-See PF Vol. 29 No. 4, page 1243.
Methyl Behenate-See PF Vol. 29 No. 4, page 1244.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride-See PF Vol. 25 No. 3, page 8280.
Methyl Chloroform-See PF Vol. 29 No. 4, page 1244.
Methyl Ethyl Ketone-See PF Vol. 29 No. 4, page 1244.
2-Methyl-5-nitroimidazole-See PF Vol. 25 No. 2, page 7804.
$N$-Methylpyrrolidine-See PF Vol. 29 No. 4, page 1245.
Methyl Yellow-See PF Vol. 29 No. 5, page 1682.
Monochloroacetic Acid-See PF Vol. 29 No. 4, page 1245.
Monoethanolamine-See PF Vol. 29 No. 4, page 1245.
Monooleoylglycerol-See PF Vol. 26 No. 6, page 1622.
2-Naphthyl Chloroformate-See PF Vol. 29 No. 4, page 1245.
Nickel(II) Sulfate Heptahydrate-See PF Vol. 27 No. 5, page 3116.
Nitric Oxide-Nitrogen Dioxide Detector Tube-See PF Vol. 29 No. 4, page 1246.
Nitromethane-See PF Vol. 29 No. 4, page 1246.
Nonylphenol Polyoxyethylene Ether-See PF Vol. 27 No. 6, page 3368.

Olefin Detector Tube-See PF Vol. 29 No. 4, page 1246.
Oligo-deoxythymidine-See PF Vol. 27 No. 6, page 3368.
Osmium Tetroxide-See PF Vol. 29 No. 4, page 1246.
Pentadecanoic Acid Methyl Ester-See PF Vol. 26 No. 6, page 1622.

Periodic Acid-See PF Vol. 29 No. 4, page 1247.
$o$-Phenanthroline Monohydrochloride Monohydrate-See PF Vol. 27 No. 1, page 1904.
Phenol Red, Sodium-See PF Vol. 27 No. 6, page 3368.
3-Phenoxybenzoic Acid-See PF Vol. 29 No. 4, page 1247.
2-Phenylacetamide-See PF Vol. 29 No. 4, page 1247.

Phenylglycine-See PF Vol. 29 No. 4, page 1247.
Phthalic Acid-See PF Vol. 29 No. 4, page 1248.
Polyoxyethylene (23) Lauryl Ether-See PF Vol. 29 No. 2, page 507.

Polyoxyethylene (20) Sorbitan Monolaurate-See PF Vol. 27 No. 6, page 3368.
Potassium Dichromate-See PF Vol. 29 No. 4, page 1248.
Potassium Phosphate, Monobasic-See PF Vol. 29 No. 4, page 1248.

Potassium Phosphate, Tribasic-See PF Vol. 29 No. 4, page 1248. n-Propyl Alcohol-See PF Vol. 29 No. 4, page 1248.
Protein Molecular Weight Standard-See PF Vol. 29 No. 4, page 1249.

Putrescine Dihydrochloride-See PF Vol. 27 No. 6, page 3369.
Pyridoxal 5-phosphate-See PF Vol. 29 No. 6, page 2055.
Red-Cell Lysing Agent-See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase-See PF Vol. 27 No. 6, page 3369.
Ribonuclease Inhibitor-See PF Vol. 27 No. 6, page 3369.
Sodium 1-Decanesulfonate-See PF Vol. 29 No. 4, page 1249.
Sodium Acetate-See PF Vol. 29 No. 4, page 1249.
Sodium Acetate, Anhydrous-See PF Vol. 29 No. 4, page 1249.
Sodium Arsenite, Twentieth-Molar ( 0.05 M) -See PF Vol. 29 No. 4, page 1250 .
Sodium Borate-See PF Vol. 29 No. 4, page 1250.
Sodium Bromide-See PF Vol. 29 No. 4, page 1250.
Sodium Dichromate-See PF Vol. 29 No. 4, page 1251.
Sodium Hydrogen Sulfate-See PF Vol. 29 No. 5, page 1682.
Sodium Iodate-See PF Vol. 27 No. 6, page 3369.
Sodium Oxalate-See PF Vol. 29 No. 4, page 1251.
Sodium Perchlorate-See PF Vol. 29 No. 4, page 1251.
Sodium Pyrophosphate-See PF Vol. 29 No. 4, page 1251.
Sodium Sulfate-See PF Vol. 29 No. 4, page 1252.
Sodium Tetraphenylborate-See PF Vol. 29 No. 4, page 1252.
Starch, Soluble, Purified-See PF Vol. 29 No. 4, page 1252.
Succinic Acid-See PF Vol. 29 No. 4, page 1253.
Sulfamic Acid-See PF Vol. 29 No. 4, page 1253.
Sulfur Dioxide Detector Tube-See PF Vol. 29 No. 4, page 1253.
Tannic Acid-See PF Vol. 29 No. 4, page 1253.
$2^{\prime}, 4^{\prime}, 5^{\prime}, 7^{\prime}$-Tetrabromofluorescein-See PF Vol. 29 No. 4, page 1254.

Tetrabutylammonium Bromide-See PF Vol. 29 No. 4, page 1254.
1,1,2,2-Tetrachloroethane-See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran-See PF Vol. 29 No. 4, page 1254.
Tetrahydrofuran, Stabilizer-Free-See PF Vol. 29 No. 4, page 1254.

Tetrahydro-2-furancarboxylic Acid—See PF Vol. 25 No. 5, page 8748.

N -(2-Tetrahydrofuroyl)piperazine-See PF Vol. 25 No. 5, page 8748.

Tetramethylammonium Bromide—See PF Vol. 29 No. 4, page 1255.

1,1,4,4-Tetraphenyl-1,3-butadiene-See PF Vol. 26 No. 6, page 1623.

Thiourea-See PF Vol. 29 No. 4, page 1255.
Thrombin Human-See PF Vol. 29 No. 6, page 2055.
Thymidine-See PF Vol. 27 No. 6, page 3369.
p-Toluenesulfonic Acid-See PF Vol. 29 No. 4, page 1255.
Trichlorotrifluoroethane-See PF Vol. 29 No. 4, page 1255.
Trioleoylglycerol-See PF Vol. 26 No. 6, page 1623.
Tropine-See PF Vol. 28 No. 4, page 1306.
L-Tyrosine Disodium-See PF Vol. 27 No. 6, page 3370.
Tuberculin, Purified Protein Derivative (Tuberculin PPD)-See PF Vol. 29 No. 5, page 1682.
Vinyl Acetate-See PF Vol. 21 No. 2, page 466.
2-Vinylpyridine-See PF Vol. 26 No. 2, page 504.
1-Vinyl-2-pyrrolidone-See PF Vol. 22 No. 6, page 3249.
Water Vapor Detector Tube-See PF Vol. 29 No. 4, page 1256.
$m$-Xylene-See PF Vol. 28 No. 6, page 1952.
Zinc Acetate-See PF Vol. 29 No. 4, page 1256.
Zinc Sulfate Heptahydrate-See PF Vol. 26 No. 2, page 504.

## Indicator Test Papers

Methyl Green-See PF Vol. 28 No. 4, page 1306.
Methyl Green-Iodomercurate Paper-See PF Vol. 28 No. 4, page 1306.

Nickel Standard Solution TS-_See PF Vol. 27 No. 5, page 3117.
Ninhydrin TS—See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

## Test Solutions

Cupric Citrate TS—See PF Vol. 27 No. 5, page 3117.
Ferroin TS-See PF Vol. 27 No. 1, page 1905.
Methyl Yellow TS-See PF Vol. 29 No. 5, page 1682.
Nickel Standard Solution TS-See PF Vol. 27 No. 5, page 3117.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

## Volumetric Solutions

Hydrochloric Acid, Alcoholic, Tenth-Molar (0.1 M)-See PF Vol. 28 No. 4, page 1235.
0.01 N Iodine VS-See PF Vol. 29 No. 3, page 812.

Lead Nitrate, Hundredth-Molar ( 0.01 M )-See PF Vol. 29 No. 4, page 1256.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 28 No. 4, page 1235.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N—See PF Vol. 29 No. 2, page 508.

## Reagent Footnotes

Reagent Footnotes-See PF Vol. 29 No. 4, pages 1257-1262.
Footnote 85 -See PF Vol. 26 No. 4, page 1133.
Footnote 87-See PF Vol. 26 No. 5, page 1383.
Footnote 99-See PF Vol. 27 No. 6, page 3374.
Footnote 100-See PF Vol. 27 No. 6, page 3374.
Footnote 101-See PF Vol. 27 No. 6, page 3374.
Footnote 102-See PF Vol. 27 No. 6, page 3374.
Footnote 103-See PF Vol. 28 No. 2, page 554.
Footnote 105-See PF Vol. 28 No. 6, page 1952.
Footnote 106-See PF Vol. 29 No. 1, page 266.
Footnote 107-See PF Vol. 29 No. 2, page 508.
Footnote 109-See PF Vol. 29 No. 2, page 508.
Footnote 110-See PF Vol. 29 No. 4, page 1262.
Footnote 111-See PF Vol. 29 No. 4, page 1262.

## HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps (Stages).

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In $P F$, this stage appears as OFFICIAL INQUIRY STAGE 4 in the Harmonization section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

## Stage 5: Consensus

## A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

## B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

## MONOGRAPHS (NF)

## BRIEFING

Hydroxypropyl Cellulose, $N F 22$ page 2877. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Hydroxypropyl Cellulose monograph. This is part of the process of international harmonization of monographs and general analytical methods of the European (EP), Japanese (JP), and United States (USP) pharmacopeias. The following draft monograph, which represents the USP-style Stage 4 draft, is based on an IPEC consensus prepared by the three International Pharmaceutical Excipients Councils (IPEC-America, IPEC-Japan, and IPEC-Europe).

Changes from existing $U S P-N F, E P$, and $J P$ monographs are justified by the following:
(1) Definition-A modification to the definition has been proposed. The second sentence should read, "It contains not less than 53.4 percent and not more than 80.5 percent of the hydroxypropoxy groups, calculated on the dried basis." The modification has been proposed to ensure solubility performance and to distinguish Hydroxypropyl Cellulose from Low-Substituted Hydroxypropyl Cellulose. A lower limit of hydroxypropoxy content is appropriate. The Japanese Pharmacopoeia, current lower limit of 53.4 was recommended.
(2) Packaging and storage - No change. This requirement is in the NF 19, the European Pharmacopoeia, and the Japanese Pharmacopoeia monographs.
(3) Labeling-A revision to the Labeling section has been proposed to delete the following statement: "The indicated viscosity may be in the form of a range encompassing $50 \%$ to $150 \%$ of the average value." The recommended statement, "Label it to indicate the nominal viscosity in an aqueous solution of stated concentration and temperature." is contained in both the European Pharmacopoeia and the NF 19 monographs. No requirement is found in the Japanese Pharmacopoeia.
(4) Identification-In order to make the Identification test more reliable, two new tests ( $C$ and $D$ ) have been proposed. Test $C$ is proposed because neither Methylcellulose nor Hydroxypropyl Methylcellulose are soluble in alcohol. Test $D$ (infrared spectroscopy) is listed as an alternative because it can also distinguish between Hydroxypropyl Cellulose, Low-Substituted Hydroxypropyl Cellulose, Methylcellulose, and Hydroxypropyl Methylcellulose.
(5) Viscosity-The proposed change is to specify an LV-type rotational viscometer with spindle and speed combinations for materials with labeled viscosity of 75 cP or higher. This viscosity measurement method is common to all manufacturers of Hydroxypropyl Cellulose at this time. However, different manufacturers currently use different measuring conditions, therefore the limit should be based on label claims that specify the conditions used for the measurements.
(6) pH - No change. The actual range in $N F 19$ is $5.0-8.0$, and in the European Pharmacopoeia it is $5.0-8.5$. In practice, no commercial material exists above a pH of 8.0.
(7) Loss on drying - The proposed recommendation is to change the drying time from 3 hours to 4 hours. Equilibrium Loss on drying is not reached in 3 hours, according to studies the IPEC have performed. According to the studies, there is no significant increase in weight after 4 hours.
(8) Residue on ignition-For harmonization, a total Residue on ignition limit of $0.8 \%$ is recommended, representing total ash ( $0.2 \%$ limit) and the total silica ( $0.6 \%$ limit). The corresponding European Pharmacopoeia Sulfated ash test limit is $1.6 \%$. The European Pharmacopoeia monograph also contains a separate Silica test, with a limit of $0.6 \%$. The limit for Residue on ignition is $0.5 \%$. The Japanese Pharmacopoeia monograph does not contain a separate test and limit for silica. The limit of $0.8 \%$ is appropriate to allow the addition of silica as a flow aid at current commercial levels, yet ensures that the material is of the appropriate quality. At a level of $0.8 \%$, porcelain or suitable glass crucibles should be satisfactory without going to the expense of platinum crucibles.
(9) Limit of silica-For harmonization, the Limit of silica test has been recommended for deletion. The three IPEC groups felt that a separate test is not necessary to determine the silica level. The total Residue on ignition limit is adequate to provide appropriate control, and the specific amount of silica allowed does not have to be limited beyond what would be detected by this method. However, any added anti-caking agents (such as silica) that are used should be identified on the label, and the label should show the target amount added.
(10) Heavy metals-The test is common to the NF 19 and European Pharmacopoeia monographs. The lower limit of $0.002 \%$ is recommended, thereby removing the need for a lead test. Another proposed revision is to perform Method III (Wet Digestion) from the general chapter 231 instead of Method II. Ignition of samples as done in Methods I and II has been shown to result in a loss of up to $50 \%$ (the studies were performed by IPEC) of the actual heavy metals content.
(11) Lead and Chloride-With the proposed revised Heavy metals limit of $0.002 \%$, it is recommended that the NF 19 Lead test not be included. The current European Pharmacopoeia and Japanese Pharmacopoeia monographs do not contain a Lead test. It is recommended that the Chloride test from the European Pharmacopoeia and the Japanese Pharmacopoeia not be included, based on the wide variation between the European Pharmacopoeia ( $0.5 \%$ ) and Japanese Pharmacopoeia ( $0.142 \%$ ) limits.
(12) Assay for hydroxypropoxy groups-No change. The chromic acid oxidation method from the $N F 19$ is preferred because of that method's accuracy. The gas chromatographic method (Ziessel GC method) described in the Japanese Pharmacopoeia is reported to have better reproducibility than the titration method, but gives consistently low results. The results obtained by the chromic acid oxidation method appear to be closer to the actual value than the results from the Ziessel GC method, and, therefore, this method is preferred by $U S P$ and $E P$. The $J P$ is reluctant to incorporate this method in their monograph because they currently do not use chromic acid in any of their monographs, and they want to avoid the use of hazardous materials such as chromic acid. Certainly the $U S P$ and $E P$ also agree with minimizing the use of hazardous reagents, whenever possible. However, in this case there are no other suitable methods available at this time that can give accurate results. Therefore, the use of chromic acid is justified and necessary.
(13) Glyoxal-Although there has been discussion concerning the need for a glyoxal requirement with certain other cellulose derivatives such as Hydroxyethylcellulose and Hydroxypropyl Methylcellulose due to multi-use equipment, the IPEC do not believe that there is any need for this requirement for Hy droxypropyl Cellulose. None of the commercial suppliers of Hydroxypropyl Cellulose currently use glyoxal in their manufacturing equipment. Therefore, there is no chance of residual glyoxal being present in Hydroxypropyl Cellulose.
(EMC: J. Lane) RTS-40440-1

## Add the following:

## Hydroxypropyl Cellulose

Cellulose, 2-hydroxypropyl ether [9004-64-2].
» Hydroxypropyl Cellulose is a partially substituted poly(hydroxypropyl) ether of cellulose. It contains not less than 53.4 percent and not more than 80.5 percent of hydroxypropoxy groups, calculated on the dried basis. It may contain suitable anticaking agents.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Hydroxypropyl Cellulose RS.

Labeling-Label it to indicate the nominal viscosity in an aqueous solution of stated concentration and temperature.

## Identification-

A: Dissolve 1 g of Hydroxypropyl Cellulose in 100 mL of water. Transfer 10 mL of this solution to a suitable container. Heat the solution to $45^{\circ}$ : the solution becomes cloudy or a flocculent precipitate is formed, and the turbidity or precipitate disappears on cooling.
B: Transfer 1 mL of the solution from Identification test $A$ to a glass plate, and allow the water to evaporate: a thin, self-sustaining film is formed.

C: To 1 g of Hydroxypropyl Cellulose, add 100 mL of $95 \%$ denatured alcohol, and dissolve. Allow to stand after stirring: a homogenous and viscous liquid is produced.

D: As an alternative to Identification test $C$, the infrared spectrum compares to that of USP Hydroxypropyl Cellulose RS.

Viscosity $\langle 911\rangle$ : not less than $50 \%$ and not more than $150 \%$ of the labeled claim; use an LV-type rotational viscometer with the spindle and speed combination for materials with labeled viscosity of 75 cP or higher.
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 8.0 for a $1 \%$ solution.
Loss on drying $\langle 731\rangle$-Dry it at $105^{\circ}$ for 4 hours: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.8 \%$ of the weight of test specimen taken for the ignition.

Heavy metals, Method III $\langle 231\rangle$ : 0.002\%.

## Assay for hydroxypropoxy groups-

Apparatus-The apparatus for hydroxypropoxy group determinations is shown diagrammatically in Figure 1. Figure 2 shows the boiling or reaction flask, consisting of a $125-\mathrm{mL}$ conical-bottom boiling flask modified to provide a thermocouple (or thermometer) well and an inlet with a $1.0-\mathrm{mm}$ capillary tip for nitrogen and water. It is fitted with a distillation head that leads to a condenser. The reaction flask shown in Figure 1 is immersed in an oil bath equipped with an electric heater capable of heating the bath at the desired rate and maintaining the temperature at $155^{\circ}$. The distillate is collected in a flask. [NOTE-The tube from the condenser to the flask must be below the surface of the liquid in the flask to ensure the capture of all of the acetic acid formed. See Figure 1.]

Fig. 1. Apparatus for hydroxypropoxy determination.

Fig. 2. Boiling flask.

Procedure-Transfer about 65 mg of Hydroxypropyl Cellulose, previously dried at $105^{\circ}$ for 1 hour and accurately weighed, into the reaction flask. Add 5 mL of water and swirl gently for 5 minutes. Add 10 mL of chromium trioxide solution ( 30 g in 70 mL ). Assemble the apparatus as shown in Figure 1 and Figure 2, and immerse the reaction flask in the oil bath, slightly above the level of the chromium trioxide solution. Start the condenser cooling water, and pass nitrogen gas through the flask at a rate of about 70 to 75 mL per minute. Raise the temperature of the oil bath to $155^{\circ}$ during a 30 -minute period, and maintain it at this temperature throughout the determination. [NOTE-Too rapid an initial rise in temperature results in high blank determinations.] Monitor the temperature of the reaction mixture in the reaction flask using a thermocouple or thermometer in a well, as shown in Figure 1 and Figure 2. When a reaction mixture temperature of $102 \pm 1^{\circ}$ is reached, add water through the water inlet until the reaction mixture temperature drops to $97 \pm 1^{\circ}$. Continue this $97^{\circ}$ to $102^{\circ}$ temperature cycle until 100 mL of distillate has been collected. Detach the condenser from the distillation head and wash with water, collecting the washings in the flask containing the distillate. Titrate the solution with 0.02 N sodium hydroxide VS to a pH of $7.0 \pm 0.1$, using an expanded-scale pH meter equipped with glass and calomel electrodes. Record the volume, $V$, of the 0.02 N sodium hydroxide used, then add 500 mg of sodium bicarbonate and 10 mL of 2 N sulfuric acid. After evolution of carbon dioxide has ceased, add 1 g of potassium iodide; insert the stopper in the flask; shake the mixture; and allow the solution to stand in the dark for 5 minutes. Titrate the liberated iodine with 0.02 N sodium thiosulfate VS to the sharp disappearance of the yellow iodine color, adding a few drops of starch TS to confirm the endpoint. Record the volume, $Y$, required. This titration, $Y \mathrm{~mL}$, multiplied by the empirical factor, $K$, appropriate to the particular ap-
paratus and reagents in use (see calculation below), gives the acid equivalent not caused by acetic acid. The acetic acid equivalent is $(V-K Y) \mathrm{mL}$ of 0.02 N sodium hydroxide.

Obtain the empirical factor, $K$, for the apparatus by performing a blank determination in which the Hydroxypropyl Cellulose is omitted. The acidity of the blank for a given apparatus and given reagents is in a fixed ratio to the oxidizing equivalent of the distillate in terms of sodium thiosulfate:

$$
K \text { factor }=\left(V_{B} \times N_{1}\right) /\left(Y_{B} \times N_{2}\right),
$$

in which $V_{B}$ is the volume, in mL , of 0.02 N sodium hydroxide required in the blank run; $N_{1}$ is the normality of the 0.02 N sodium hydroxide; $Y_{B}$ is the volume, in mL , of 0.02 N sodium thiosulfate required in the blank run; and $N_{2}$ is equal to the normality of the 0.02 N sodium thiosulfate.

Calculate the percentage of hydroxypropoxy groups $\left(-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}\right)$ by the formula:

$$
100\left(V_{A} N_{1}-K Y_{A} N_{2}\right)(0.079 / W)
$$

in which $V_{A}$ is the volume, in mL , of 0.02 N sodium hydroxide required for titration of the sample; $N_{1}$ is the normality of the 0.02 N sodium hydroxide; $K$ is the empirical factor; $Y_{A}$ is the volume, in mL , of 0.02 N sodium thiosulfate required for titration of the sample; $N_{2}$ is the normality of the 0.02 N sodium thiosulfate; and $W$ is the quantity, in g, of sample used. Each mL of 0.02 N sodium hydroxide is equivalent to 1.502 mg of hydroxypropoxy groups $\left(-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}\right)$.

The results obtained as a percentage of hydroxypropoxy content may be converted to terms of average molecular substitution of glucose units by means of the accompanying graph (see Figure 3).

Fig. 3. Graph for converting percentage of substitution, by weight, of hydroxypropoxy groups to molecular substitution per glucose unit.

## BRIEFING

Low-Substituted Hydroxypropyl Cellulose, NF 22 page 2879. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Low-Substituted Hydroxypropyl Cellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European (EP), Japanese (JP), and United States (USP) pharmacopeias. The following draft monograph, which represents the USP-style Stage 4 draft, is based on a IPEC consensus comments prepared by the three International Pharmaceutical Excipients Councils (IPEC-America, IPEC-Japan, and IPEC-Europe).

Changes from existing $U S P-N F, E P$, and $J P$ monographs are justified.
(1) In the opening paragraph (the definition)-No change. The content range is common to both the Japanese Pharmacopoeia and the NF 22 monographs. The European Pharmacopoeia does not contain a monograph for Low-Substituted Hydroxypropyl Cellulose.
(2) Packaging and storage - No change. This requirement is common to the NF 22 and the Japanese Pharmacopoeia monographs.
(3) Identification-The proposed change is to replace tests $A$ and $B$ with an IR test while retaining test $C$. The IR test is useful for discriminating Low-Substituted Hydroxypropyl Cellulose from Hydroxypropyl Cellulose which is identical in the chemical composition, but is different only in the substituent content.
(4) pH -It is recommended to include this test in the harmonized monograph. This test is in the Japanese Pharmacopoeia monograph and is provided in the Description and Solubility section of NF 22.
(5) Loss on drying - No change. The test and drying time are common to the NF 22 and the Japanese Pharmacopoeia monographs. The $N F$ limit is $5.0 \%$. The Japanese Pharmacopoeia limit is $6.0 \%$. The limit from NF 22 is recommended.
(6) Residue on ignition-For harmonization, a total Residue on ignition limit of $0.8 \%$ is recommended. Current limits in the $N F$ and Japanese Pharmacopoeia are $0.5 \%$ and $1.0 \%$, respectively. Actual products distributed in Japan sometimes have higher residue on ignition value than $0.5 \%$ (this is based on the process capability). It is proposed to define the ignition temperature as $800^{\circ} \pm 25^{\circ}$ of the USP condition so that the pertinent monographs in other pharmacopeias would specify it independent of their general test so as to avoid possible confusion.
(7) Heavy metals-No change. The test and limit are common to the NF 22 and Japanese Pharmacopoeia monographs. The NF 22 test and limit are recommended.
(8) Chloride-It is recommended to delete the Chloride test. Residue on ignition value of the raw material cellulose is very small (usually less than $0.1 \%$ ). It is considered that most of chloride in a product is composed of sodium chloride and that it is a major inorganic impurity. Then content of sodium chloride would reflect the Residue on ignition value. Therefore, IPEC thinks that it is not meaningful to provide an overlapping test of Chloride.
(9) Assay-No change. This test procedure is common to USP and JP.
(10) Glyoxal-Although there has been discussion concerning the need for a glyoxal requirement with certain other cellulose derivatives such as Hydroxyethylcellulose and Hydroxypropyl Methylcellulose due to multi-use equipment, we do not believe that there is any need for this requirement for Low-Substituted Hydroxypropyl Cellulose. No glyoxal is used in the manufacturing equipment used by any of the commercial suppliers of Low-Substituted Hydroxypropyl Cellulose at this time. Therefore, there is no chance of residual glyoxal being present in Low-Substituted Hydroxypropyl Cellulose.
(EMC: J. Lane) RTS-40439-1

## Add the following:

## Low-Substituted Hydroxypropyl Cellulose

» Low-Substituted Hydroxypropyl Cellulose is a low-substituted poly(hydroxypropyl) ether of cellulose. It contains not less than 5.0 percent and not more than 16.0 percent of hydroxypropoxy groups, calculated on the dried basis.

Packaging and storage-Preserve in tight containers.
USP Reference standard $\langle 11\rangle$ - USP Low-Substituted Hydroxypropyl Cellulose RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Shake thoroughly 0.1 g with 10 mL of water. Add 1 g of sodium hydroxide, and shake until it becomes homogeneous. Transfer 5 mL to a suitable container, add 10 mL of a mixture of acetone and methanol (4:1), and shake: a white, flocculent precipitate is formed.
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 7.5 , in a suspension obtained by shaking 1.0 g with 100 mL of water.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 1 hour: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.8 \%$.
Heavy metals, Method III $\langle 231\rangle: 0.001 \%$.
Assay-[Caution-Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps of the Assay preparation and the standard preparation in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]
Hydriodic acid-Use a reagent having a specific gravity of at least 1.69 , equivalent to $55 \% \mathrm{HI}$.

Internal standard solution-Transfer about 2.5 g of toluene, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask containing 10 mL of $o$-xylene, dilute with $o$-xylene to volume, and mix.

Standard preparation-Into a suitable serum vial weigh about 135 mg of adipic acid and 4.0 mL of Hydriodic acid, pipet 4 mL of Internal standard solution into the vial, and close the vial securely with a suitable septum stopper. Weigh the vial and contents accurately, add $30 \mu \mathrm{~L}$ of isopropyl iodide through the septum with a syringe, again weigh, and calculate the weight of isopropyl isopropyl iodide added, by difference. Shake, and allow the layers to separate.

Assay preparation-Transfer about 0.065 g of dried Low Substituted Hydroxypropyl Cellulose, accurately weighed, to a $5-\mathrm{mL}$ thick-walled reaction vial equipped with a pres-
sure-tight septum-type closure, add an amount of adipic acid equal to the weight of the test specimen, and pipet 2 mL of Internal standard solution into the vial. Cautiously pipet 2 mL of Hydriodic acid into the mixture, immediately cap the vial tightly, and weigh accurately. Continuously mix the contents of the vial while heating at $150^{\circ}$ for 60 minutes. Allow the vial to cool for about 45 minutes, and again weigh. If the weight loss is greater than 10 mg , discard the mixture, and prepare another Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The gas chromatograph is equipped with a thermal conductivity detector and a $4-\mathrm{mm} \times 1.8-\mathrm{m}$ glass column packed with $20 \%$ liquid phase G28 on 100 - to 120 -mesh support S1C that is not silanized. Helium is used as the carrier gas and the temperature of the column is maintained at $130^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 1.0, 1.6, and 3.6 for isopropyl iodide, toluene, and $o$-xylene, respectively; and the resolution, $R$, between toluene and isopropyl iodide is not less than 2.0.

Calibration-Inject about $2 \mu \mathrm{~L}$ of the upper layer of the Standard preparation into the gas chromatograph, and record the chromatogram. Calculate the relative response factor, $F_{l}$, of equal weights of toluene and isopropyl iodide taken by the formula:

$$
Q_{I} / R_{S I},
$$

in which $Q_{I}$ is the quantity ratio of isopropyl iodide to toluene in the Standard preparation; and $R_{S I}$ is the peak area ratio of isopropyl iodide to toluene obtained from the

## Standard preparation.

Procedure-Inject about $2 \mu \mathrm{~L}$ of the upper layer of the Assay preparation into the gas chromatograph, and record the chromatogram. Calculate the percentage of hydroxypro-
poxy $\left(-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}\right)$ in the Low Substituted Hydroxypropyl Cellulose taken by the formula:

$$
2(75 / 170) F_{I} R_{U I}\left(W_{T} / W_{U}\right)
$$

in which 75/170 is the ratio of the formula weights of hydroxypropoxy and isopropyl iodide; $F_{I}$ is defined under Ca libration; $R_{U I}$ is the ratio of the area of the isopropyl iodide peak to that of the toluene peak obtained from the Assay preparation; $W_{T}$ is the weight, in g , of toluene in the Internal standard solution; and $W_{U}$ is the weight, in g , of Low Substituted Hydroxypropyl Cellulose taken for the Assay.

## BRIEFING

Magnesium Stearate, $N F 22$ page 2889. The United States Pharmacopeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopeia for the international harmonization of the compendial standards for Magnesium Stearate. The text presented below represents the OFFICIAL INQUIRY STAGE 4 draft in the harmonization process, based in part on comments received in response to the CONSENSUS STAGE 5B draft. Because of significant changes in the tests for the Limit of cadmium, Limit of lead, and Limit of nickel, the draft has reverted to the OFFICIAL INQUIRY STAGE 4. It is proposed to correct erroneous matrix modifier solution preparations within the tests for the Limit of cadmium, Limit of lead, and Limit of nickel. Readers are therefore urged to review these late-stage proposals carefully and to respond to USP no later than February 29, 2004.

The differences between the revised STAGE 4 Harmonization draft for Magnesium Stearate and the previous STAGE 5A document include the following:

1. The revised OFFICIAL INQUIRY STAGE 4 draft represents a document in global format with no references to specific general chapters. Those references will be introduced at a later stage in the process.
2. Definition-The reference to edible sources has been removed and will be considered a specific local attribute for USP. USP will retain this section from the current $N F$ monograph.
3. Labeling-EP and JP request that this attribute be non-harmonized. USP agrees, and the revised STAGE 4R draft reflects this change. USP will retain this section from the current $N F$ monograph.
4. Packaging and storage-No change.
5. USP Reference standards-No change.
6. Identification-No change.
7. Acidity of alkalinity-No change.
8. Loss on drying - No change.
9. Limit of chloride-No change.
10. Limit of sulfate-No change.
11. Heavy metals-This test will be added as a specific local attribute for JP.
12. Limit of cadmium, Limit of lead, and Limit of nickel-The matrix modifiers were corrected and a statement was added to allow for different modifiers, depending on equipment manufacturers. Clarification was made to the test solution preparations to include milliliters as the measurement volume. JP will not stipulate these attributes.
13. Stearic acid and palmitic acid-No change.
14. Assay-No change.
15. Microbial limits - EP and JP request that this attribute be nonharmonized. USP agrees, and the STAGE 4 draft reflects this change. USP will retain this section from the current $N F$ monograph.
16. Specific surface area-EP requests that this attribute be nonharmonized. USP agrees, and the STAGE 4 draft reflects this change. USP will retain this section from the current $N F$ monograph.
17. Organic volatile impurities-This attribute will be considered a specific local attribute for USP. USP will retain this section from the current $N F$ monograph.
18. Characters-This attribute will be considered a specific local attribute for EP.
(EMC: J. Lane) RTS-40528-1

## Add the following:

## Magnesium Stearate

Octadecanoic acid, magnesium salt.
Magnesium stearate [557-04-0].
» Magnesium Stearate is a compound of magnesium with a mixture of solid organic acids and consists chiefly of variable proportions of magnesium stearate and magnesium palmitate. It contains not less than 4.0 percent and not more than 5.0 percent of Mg , calculated on the dried basis.

Packaging and storage-Preserve in tight containers.
USP Reference standards $\langle 11\rangle-U S P$ Palmitic Acid $R S$. USP Stearic Acid RS.

## Identification-

A: Mix 5.0 g with 50 mL of peroxide-free ether, 20 mL of diluted nitric acid, and 20 mL of water in a round-bottom flask. Connect the flask to a reflux condenser and reflux until dissolution is complete. Allow to cool, then transfer the con-
tents of the flask to a separator. Shake, allow the layers to separate, and transfer the aqueous layer to a flask. Extract the ether layer with two $4-\mathrm{mL}$ portions of water, and add these aqueous extracts to the main aqueous extract. Wash the aqueous extract with 15 mL of peroxide-free ether, transfer the aqueous extract to a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Retain this solution for the Limit of chloride and Limit of sulfate tests. A portion of this solution, in the presence of ammonium chloride yields no more than a slightly hazy precipitate when neutralized with ammonium carbonate TS, but on the subsequent addition of dibasic sodium phosphate TS, a white, crystalline precipitate, which is insoluable in 6 N ammonium hydroxide is formed.

B: The retention times of the peaks corresponding to stearic acid and palmitic acid in the chromatogram of the Test solution correspond to those in the chromatogram of the System suitability solution, as obtained in the test for Relative content of stearic acid and palmitic acid.

Acidity or alkalinity-Transfer 1.0 g to a $100-\mathrm{mL}$ beaker, add 20 mL of carbon dioxide-free water, boil on a steam bath for 1 minute with continuous shaking, cool, and filter. Add 0.05 mL of bromothymol blue TS to 10 mL of the filtrate: not more than 0.05 mL of 0.1 N hydrochloric acid or 0.1 N sodium hydroxide is required to change the color of the indicator.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ to constant weight: it loses not more than $6.0 \%$ of its weight.

Limit of chloride $\langle 221\rangle$ —A $10.0-\mathrm{mL}$ portion of the aqueous solution obtained in Identification test $A$ shows no more chloride than corresponds to 1.4 mL of 0.020 N hydrochloric acid (0.1\%).

Limit of sulfate $\langle 221\rangle$-To a 6.0 mL portion of the aqueous solution obtained in Identification test $A$, add water to make a total volume of 30 to 40 mL , and if necessary, neutralize
the solution with hydrochloric acid to litmus. Add 1 mL of 3 N hydrochloric acid, 3 mL of barium chloride TS, and sufficient water to make 50 mL . Mix and allow to stand for 10 minutes. Compare the turbidity, if any, with that produced in a solution containing 3.0 mL of 0.020 N sulfuric acid (1.0\%).

Limit of cadmium $\langle 231\rangle$ - [NOTE-For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strongacid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead, and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 minutes and rinse with deionized water.]
Matrix modifier solution-Prepare a solution in water containing 20 g of monobasic ammonium phosphate and 1 g of magnesium nitrate per 100 mL of solution. Alternatively, use an appropriate matrix modifier as recommended by the manufacturer of the graphite furnace atomic absorption (GFAA) spectrometer.
Standard solution-Transfer 82.5 mg of cadmium nitrate tetrahydrate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in water and dilute with water to volume, and mix. Pipet 1.0 mL of the resulting solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Pipet 1.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, add 25 mL of nitric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of $0.0030 \mu \mathrm{~g}$ of Cd per mL .

Test stock solution-Transfer about 100 mg of Magnesium Stearate, accurately weighed, to a suitable polytetrafluoroethylene (PTFE)-lined acid-digestion bomb, and add 2.5 mL of nitric acid. Close and seal the bomb according
to the manufacturer's operating instructions. [Caution: When using an acid-digestion bomb, be thoroughly familiar with the safety and operating instructions. Carefully follow the bomb manufacturer's instructions regarding care and maintenance of these acid-digestion bombs. Do not use metal jacketed bombs or liners that have been used with hydrochloric acid because of contamination from corrosion of the metal jacket by hydrochloric acid.] Heat the bomb in an oven at $170^{\circ}$ for 3 hours. Air cool the bomb slowly to room temperature as per the bomb manufacturer's instructions. Place the bomb in a hood, and open carefully as corrosive gases may be expelled. Dilute the residue with water to 10.0 mL in a volumetric flask.

Reagent blank-Transfer 25 mL nitric acid to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solutions-Pipet 1.0 mL of the Test stock solution into a $10-\mathrm{mL}$ volumetric flask, dilute with Reagent blank to volume, and mix. Prepare mixtures of this solution, the Standard solution, and the Reagent blank with the following proportional compositions, by volume (mL): 1.0/0/1.0, 1.0/ $0.5 / 0.5$, and $1.0 / 1.0 / 0$. Add $50 \mu \mathrm{~L}$ of Matrix modifier solution to each mixture, and mix. These Test solutions contain, respectively, $0,0.00075 \mu \mathrm{~g}$ per mL , and $0.0015 \mu \mathrm{~g}$ per mL of cadmium from the Standard solution. [NOTE-Retain the remaining Test stock solution for use in the tests for Limit of lead and Limit of nickel.]

Procedure-Concomitantly determine the absorbances of the Test solutions at the cadmium emission line at 228.8 nm with a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform and a cadmium hollow-cathode lamp. Use the Reagent blank to set the instrument to zero, and use the temperature programming recommended for Cd
by the GFAA manufacturer. Examples of temperature parameters for GFAA analysis of Cd are shown below:

|  |  |  | Atomiza- <br> tion |
| :--- | :--- | :--- | :--- |
|  | Drying | Ashing | Stage |
|  | Stage | Stage |  |
| Temperature | $110^{\circ}$ | $600^{\circ}$ | $1800^{\circ}$ |
| Ramp Time | 10 seconds | 10 seconds | 0 seconds |
| Hold Time | 20 seconds | 30 seconds | 5 seconds |

Plot the absorbances of the Test solutions versus their contents of cadmium, in $\mu \mathrm{g}$ per mL , as furnished by the Standard solution, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, $C$, in $\mu \mathrm{g}$ per mL , of cadmium in the Test solution containing 0 mL of the Standard solution. Calculate the content, in ppm, of Cd in the specimen taken by the formula:

$$
200,000(C / W)
$$

in which $W$ is the weight, in mg, of Magnesium Stearate taken to prepare the Test stock solution. Alternatively, the GFAA software can be used to calculate the Cd content of the sample. For either calculation, the correlation coefficient $(r)$ of the standard additions plot must be at least 0.995 , and the limit is 3 ppm .

Limit of lead-[NOTE-For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead,
and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 minutes, and rinse with deionized water.]

Matrix modifier solution -Prepare as directed for Matrix modifier solution under Limit of cadmium.

Standard solution-Dissolve 159.8 mg of lead nitrate in 100 mL of water to which 1 mL of nitric acid has been added, then dilute with water to 1000 mL . Prepare and store this solution in glass containers free from soluble lead salts. Transfer 10.0 mL to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a second $100-\mathrm{mL}$ volumetric flask, add 25 mL of nitric acid, dilute with water to volume, and mix. This solution contains $0.100 \mu \mathrm{~g}$ of lead per mL .

Test stock solution-Use a portion of the Test stock solution retained from the test for Limit of cadmium.
Reagent blank-Prepare as directed for Reagent blank under Limit of cadmium.

Test solutions-Prepare mixtures of the Test stock solution, the Standard solution and the Reagent Blank with the following proportional compositions, by volume (mL): $1.0 / 0 / 1.0,1.0 / 0.5 / 0.5$, and $1.0 / 1.0 / 0$. Add $50 \mu \mathrm{~L}$ of the Ma trix modifier solution to each mixture, and mix. These Test solutions contain, respectively, $0,0.025 \mu \mathrm{~g}$ per mL , and 0.05 $\mu \mathrm{g}$ per mL of lead from the Standard solution.
Procedure-Concomitantly determine the absorbances of the Test solutions at the lead emission line at 283.3 nm , with a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform and a lead hollow-cathode lamp. Use the Reagent blank to set the instrument to zero, and
use the temperature programming recommended for Pb by the GFAA manufacturer. Examples of temperature parameters for GFAA analysis of Pb are shown below:

|  |  |  | Atomiza- |
| :--- | :--- | :--- | :--- |
|  | Drying | Ashing | tion |
| Stage | Stage | Stage |  |
| Temperature | $110^{\circ}$ | $600^{\circ}$ | $1800^{\circ}$ |
| Ramp Time | 10 seconds | 10 seconds | 0 seconds |
| Hold Time | 20 seconds | 30 seconds | 5 seconds |

Plot the absorbances of the Test solutions versus their contents of lead, in $\mu \mathrm{g}$ per mL , as furnished by the Standard solution, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, $C$, in $\mu \mathrm{g}$ per mL , of lead in the Test solution containing 0 mL of the Standard solution. Calculate the content, in ppm, of Pb in the specimen taken by the formula:

$$
20,000(C / W)
$$

in which $W$ is the weight, in mg, of Magnesium Stearate taken to prepare the Test stock solution. Alternatively, the GFAA software can be used to calculate the Pb content of the sample. For either calculation, the correlation coefficient $(r)$ of the standard additions plot must be at least 0.995 , and the limit is 10 ppm .

Limit of nickel-[NOTE-For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead,
and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 minutes, and rinse with deionized water.]

Matrix modifier solution-Prepare as directed for Matrix modifier solution under Limit of cadmium.

Standard solution-Transfer 247.7 mg of nickel nitrate hexahydrate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in water and dilute with water to volume, and mix. Pipet 1.0 mL of the resulting solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Pipet 1.0 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, add 2.5 mL of nitric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of $0.050 \mu \mathrm{~g}$ of Ni per mL .

Test stock solution-Use a portion of the Test stock solution retained from the test for Limit of cadmium.
Reagent blank-Prepare as directed for Reagent blank under Limit of cadmium.

Test solutions-Prepare mixtures of the Test stock solution, the Standard solution and the Reagent Blank with the following proportional compositions, by volume (mL): $1.0 / 0 / 1.0,1.0 / 0.5 / 0.5$, and $1.0 / 1.0 / 0$. Add $50 \mu \mathrm{~L}$ of the Ma trix modifier solution to each mixture, and mix. These Test solutions contain, respectively, $0,0.0125 \mu \mathrm{~g}$ per mL , and $0.25 \mu \mathrm{~g}$ per mL of nickel from the Standard solution.
Procedure-Concomitantly determine the absorbances of the Test solutions at the nickel emission line at 232.0 nm , with a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform and a lead hollow-cathode lamp. Use the Reagent blank to set the instrument to zero, and use the temperature programming recommended for Ni
by the GFAA manufacturer. Examples of temperature parameters for GFAA analysis of Ni are shown below:

|  | Drying |  |  |
| :--- | :--- | :--- | :--- |
| Stage | Ashing |  |  |
| Stage | Stage |  |  |
| Temperature | $110^{\circ}$ | $600^{\circ}$ | $1800^{\circ}$ |
| Ramp Time | 10 seconds | 10 seconds | 0 seconds |
| Hold Time | 20 seconds | 30 seconds | 5 seconds |

Plot the absorbances of the Test solutions versus their contents of nickel, in $\mu \mathrm{g}$ per mL , as furnished by the Standard solution, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, $C$, in $g$ per mL , of nickel in the Test solution containing 0 mL of the Standard solution. Calculate the content, in ppm, of Ni in the specimen taken by the formula:

$$
20,000(C / W)
$$

in which $W$ is the weight, in mg , of Magnesium Stearate taken to prepare the Test stock solution. Alternatively, the GFAA software can be used to calculate the Ni content of the sample. For either calculation, the correlation coefficient $(r)$ of the standard additions plot must be at least 0.995 , and the limit is 5 ppm .

## Relative content of stearic acid and palmitic acid-

System suitability solution-Transfer about 50 mg each of USP Stearic Acid RS and USP Palmitic Acid RS to a small conical flask fitted with a suitable reflux condenser. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL , swirl to mix, and reflux for 10 minutes until the solids have dissolved. Add 4 mL of chromatographic $n$-heptane through the condenser,
and reflux for 10 minutes. Cool, add 20 mL of saturated sodium chloride solution, shake, and allow the layers to separate. Pass the $n$-heptane layer through 0.1 g of anhydrous sodium sulfate (previously washed with chromatographic $n$-heptane) into a suitable flask. Transfer 1.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, dilute with chromatographic $n$-heptane to volume, and mix.

Test solution-Transfer about 100 mg of Magnesium Stearate, accurately weighed, to a small conical flask fitted with a suitable reflux condenser, and proceed as directed for System suitability solution, beginning with "Add 5.0 mL of solution prepared by dissolving..."

Chromatographic system-(see Chromatography $\langle 621\rangle$ )-The gas chromatograph is equipped with a flameionization detector, maintained at about $260^{\circ}$, a splitless injection system, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused silica capillary column bonded with a $0.5-\mu \mathrm{m}$ layer of phase G16. The column temperature is maintained at $70^{\circ}$ for about 2 minutes after injection, then programmed to increase at the rate of $5^{\circ}$ per minute to $240^{\circ}$, and maintained at this temperature for 5 minutes. The injection port temperature is maintained at about $220^{\circ}$. The carrier gas is helium with a flow rate of about 2.4 mL per minute.
Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.86 for methyl palmitate and 1.0 for methyl stearate; the resolution, $R$, between the methyl palmitate and methyl stearate peaks is not less than 5.0; and the relative standard deviation of the peak area responses for the palmitate and stearate peaks for replicate injections is not greater than $6.0 \%$. The relative standard deviation of the peak area response ratio of the palmitate to stearate peaks from these replicate injections is not more than 1.0\%.

Procedure- Inject about $1 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak area responses for all of the fatty acid ester peaks in the chromatogram. Calculate the percentage of stearic acid in the fatty acid fraction of Magnesium Stearate taken by the formula:

$$
100 A / B
$$

in which $A$ is the area due to the methyl stearate peak, and $B$ is the sum of the areas of all of the fatty acid ester peaks in the chromatogram. Similarly, calculate the percentage of palmitic acid in the portion of Magnesium Stearate taken. The stearate peak comprises not less than $40 \%$, and the sum of the stearate and palmitate peaks is not less than $90 \%$ of the total area of all fatty acid ester peaks in the chromatogram.

## Assay-

Ammonium chloride pH 10 buffer solution-Dissolve 5.4 g of ammonium chloride in water, add 20 mL of ammonium hydroxide, and dilute with water to 100 mL .

Procedure-Transfer about 500 mg of Magnesium Stearate, accurately weighed, to a $250-\mathrm{mL}$ conical flask. Add 50 mL of a mixture of butyl alcohol and dehydrated alcohol (1:1), 5 mL of ammonium hydroxide, 3 mL of Ammonium chloride pH 10 buffer solution, 30.0 mL of 0.1 M edetate disodium VS, and 1 or 2 drops of eriochrome black TS, and mix. Heat at $45^{\circ}$ to $50^{\circ}$ until the solution is clear. Cool, and titrate the excess edetate disodium with 0.1 M zinc sulfate VS until the solution color changes from blue to violet. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M edetate disodium is equivalent to 2.431 mg of Mg .

## PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the Staff Directory to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

## Briefing

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How To Use $P F$ ), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.
PHARMACOPEIAL PREVIEWS ..... 347

## MONOGRAPHS (USP)

## BRIEFING

Pepsin. Because there is no existing USP monograph for this article, a new monograph is being previewed. The Definition is based in part on the 1965 NF 12 monograph. The Identification test is based on the ability of Pepsin to cleave the chromophore from an insoluble protein-dye complex. The Assay is based on a standard method for the quantitation of pepsin activity. Interested parties are encouraged to submit comments to USP headquaters for consideration by the Expert Committee on Biotechnology and Natural Therapeutics.
(BNT: I. DeVeau) RTS-40249-1

## Add the following:

## Pepsin

» Pepsin is prepared from the gastric mucosa of the domestic hog (Sus scrofa L.); animals used are suitable for human consumption. It contains gastric proteinases active in acid medium ( pH 1 to 5). It has an activity not less than 0.5 USP Pep$\sin$ Units per mg, calculated on the dried basis. One USP Unit of Pepsin activity is the activity that releases the equivalent of $1 \mu$ mole of tyrosine per minute under the conditions of the Assay.

Packaging and storage-Preserve in tight containers, protected from light, and store between $2^{\circ}$ and $8^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Pepsin RS. USP Hemoglobin Protease Substrate RS.

## Identification-

Dilute hydrochloric acid solution-Prepare as directed in the Assay.

Fibrin blue suspension-Suspend 30 mg of fibrin blue in 20 mL of Dilute hydrochloric acid solution. Shake before use.

Test solution-Dissolve a sufficient quantity of Pepsin, accurately weighed, in Dilute hydrochloric acid solution, to obtain a solution containing 10 USP Pepsin Units per mL . Adjust to $\mathrm{pH} 1.6 \pm 0.1$, if necessary.

Procedure-Add 1 mL of Test solution to 4 mL of the Fi brin blue suspension, mix and place in a water bath at $25^{\circ}$ with gentle shaking. Prepare a blank solution at the same time and in the same manner using 1 mL of water instead of the Test solution. Filter the suspensions after 15 minutes of incubation: the filtrate of the blank is colorless and the filtrate of the Test solution is blue.

Microbial limits $\langle 61\rangle$-Total viable aerobic count not more than 1000 CFU per g, the total combined molds and yeast count not more than 100 CFU per g , and it meets the requirements of the tests for absence of Escherichia coli and Salmonella species.

Loss on drying $\langle 731\rangle$-Dry at $60^{\circ}$ at 5 mm of mercury over phosphorus pentoxide for 4 hours: it loses not more than $5.0 \%$ of its weight.

## Assay-

Dilute hydrochloric acid solution-Dilute 30 mL of 1.0 M hydrochloric acid with water to 1000 mL , and adjust to a pH of $1.6 \pm 0.1$.

Hemoglobin solution-Dissolve 2 g of USP Hemoglobin Protease Substrate RS, accurately weighed, in 75 mL of Di lute hydrochloric acid solution. Adjust to a pH of $1.6 \pm 0.1$, bring to 100 mL with Dilute hydrochloric acid solution and dissolve 25 mg of thimerosal.
$4 \%$ Trichloroacetic acid solution-Prepare a $4.0 \%(\mathrm{w} / \mathrm{v})$ solution in water.

5\% Trichloroacetic acid solution-Prepare a $5.0 \%$ (w/v)
solution in water.

Sodium hydroxide solution-Prepare a solution containing $20 \%$ (w/v) sodium hydroxide.

TCA-washed filters-Wash a sufficient quantity of suitable, individual filters with $5 \%$ Trichloroacetic acid solution. Determine the suitability of the filter by washing with an additional 5 mL of $5 \%$ Trichloroacetic acid solution and collecting the filtrate. The UV absorbance of the filtrate, measured at 275 nm using unfiltered 5\% Trichloroacetic acid solution as the blank, is less than 0.04 . Rinse the filters with water, and air dry.

Standard preparation-Dissolve a sufficient quantity of USP Pepsin RS, accurately weighed, in Dilute hydrochloric acid solution to obtain a solution containing 0.5 USP Pepsin Units per mL . Before dilution to final volume, adjust to a pH of $1.6 \pm 0.1$, if necessary, using 1 M hydrochloric acid. [NOTE--Prepare not more than 15 minutes before use.]

Assay preparation-Dissolve a sufficient quantity of Pepsin, accurately weighed, in Dilute hydrochloric acid solution to obtain a solution containing 0.5 USP Pepsin Units per mL . Before dilution to final volume, adjust to a pH of $1.6 \pm 0.1$, if necessary, using 1 M hydrochloric acid. [NOTES-Use immediately. Avoid shaking and foaming during preparation of the Standard and Assay preparations.]

Procedure-Designate test tubes in duplicate $T, T_{\mathrm{b}}, S_{1}$, $S_{1 \mathrm{~b}}, S_{2}, S_{2 \mathrm{~b}}, S_{3}$, and $S_{3 \mathrm{~b}}$. Prepare a single blank test tube. Add 0.25 mL of Dilute hydrochloric acid solution to tubes $S_{2}, S_{2 \mathrm{~b}}, T$, and $T_{\mathrm{b}}$; add 0.5 mL of Dilute hydrochloric acid solution to tubes $S_{1}$ and $S_{1 \mathrm{~b}}$. Add 1.0 mL of Dilute hydrochloric acid solution to the blank test tube. To tubes $S_{1}$ and $S_{1 \mathrm{~b}}, S_{2}$ and $S_{2 \mathrm{~b}}$, and $S_{3}$ and $S_{3 \mathrm{~b}}$ add $0.5 \mathrm{~mL}, 0.75 \mathrm{~mL}$, and 1.0 mL , respectively, of the Standard preparation. Add 0.75 mL of the Assay preparation to tubes $T$ and $T_{\mathrm{b}}$. Add 10.0 mL of $4 \%$ Trichloroacetic acid solution to tubes $S_{1 \mathrm{~b}}, S_{2 \mathrm{~b}}, S_{3 \mathrm{~b}}, T_{\mathrm{b}}$, and the blank and mix by shaking. Heat the tubes and Hemoglobin solution in a $25^{\circ} \pm 0.1^{\circ}$ water bath
until temperature equilibrium. Mix 5.0 mL of Hemoglobin solution to the blank tube and tubes $S_{\mathrm{lb}}, S_{2 \mathrm{~b}}, S_{3 \mathrm{~b}}$, and $T_{\mathrm{b}}$. Add 5.0 mL of Hemoglobin solution successively and at intervals of 30 seconds to tubes $S_{1}, S_{2}, S_{3}$, and $T$. Mix immediately after each addition. Exactly 10 minutes after adding the Hemoglobin solution, stop the reaction by quickly mixing, at intervals of 30 seconds, 10.0 mL of $4 \%$ Trichloroacetic acid solution to tubes $S_{1}, S_{2}, S_{3}$, and $T$. Wait about 15 minutes and filter the contents of each tube twice through individual $T C A$-washed filters, discarding the first 5 mL . Place 3.0 mL of each filtrate into individual tubes and mix 20 mL of water. Add to each tube 1.0 mL of Sodium hydroxide solution and 1.0 mL of Folin-Ciocalteu phenol TS. After 15 minutes, and using the blank, measure the absorbance of solutions $S_{1}, S_{2}, S_{3}, S_{1 \mathrm{~b}}, S_{2 \mathrm{~b}}, S_{3 \mathrm{~b}}$, and $T$ at 540 nm . Correct the average absorbance values for the filtrates obtained from tubes $S_{1}, S_{2}$ and $S_{3}$ by subtracting the average values obtained for the filtrates from tubes $S_{1 \mathrm{~b}}, S_{2 \mathrm{~b}}$, and $S_{3 \mathrm{~b}}$, respectively. Calculate a calibration curve of the corrected absorbance values against volume of Standard preparation used. Determine the activity of Pepsin using the corrected absorbance for the Assay preparation together with the calibration curve and taking into account dilution factors.

## 〈11〉 USP Reference Standards

## Add the following:

USP Hemoglobin Protease Substrate RS. [To come.]

## Add the following:

USP Pepsin RS. [To come.]

## Description and Solubility

## Add the following:

Pepsin: A white or slightly yellow, crystalline or amorphous powder, hygroscopic. Soluble in water; practically insoluble in alcohol. The solution in water ( 1 in 50 ) is slightly acidic.

## GENERAL CHAPTERS

## General Information

## BRIEFING

<1092 $\rangle$ The Dissolution Procedure: Development and Validation. This new general information chapter previewed here is intended to address several issues. Aspects of method development are mentioned only superficially in the current general information chapter In Vitro and In Vivo Evaluation of Dosage Forms $\langle 1088\rangle$. This previewed chapter goes into greater detail and gives guidance to the analyst on developing meaningful dissolution methods. Similarly, the general information chapter Validation of Compendial Methods $\langle 1225\rangle$ only touches on the special considerations for validation of dissolution testing, whereas this previewed new chapter provides a typical detailed step-by-step approach for designing and validating a dissolution test. Lastly, the previewed chapter gives guidance to the analyst on validation and the use of new technologies and equipment in dissolution testing. This new informational chapter is loosely based on a stimuli article, "A New General Information Chapter on Dissolution" by Gray VA, Brown CK, Dressman JB, and Leeson LJ that appeared in PF 27(6) [Nov.Dec. 2001]. This article was revised on the basis of comments from industry, the FDA and other regulatory bodies, and the USP Expert Council and its Committees. Readers are encouraged to send their comments concerning the format and the contents of this previewed information chapter to William Brown.

## Add the following:

## 〈1092〉 THE DISSOLUTION PROCEDURE: DEVELOPMENT AND VALIDATION

The USP performance test is one test in a series of tests that form the dosage form's public specification (tests, procedures for the tests, acceptance criteria). To satisfy the performance test, USP provides three general test chapters Disintegration $\langle 701\rangle$, Dissolution $\langle 711\rangle$, and Drug Release $\langle 724\rangle$. These general chapters specify the conditions of the procedure. For dissolution, these include standards that specify the apparatus/agitation rate, medium, study design,
assay, and acceptance criteria. Overall the procedure yields data to allow an accept/reject decision relative to the acceptance criteria. Acceptance criteria are frequently based on a regulatory decision. This general information chapter provides recommendations on how to develop and validate a dissolution procedure.

## GENERAL COMMENTS

The dissolution procedure relies on an apparatus, a medium, and a study design chosen to be transferable and rugged and to yield acceptable data. A discriminating procedure yields data that distinguishes important differences in components and composition and/or method of manufacture between dosage forms. The value of dissolution as a quality control tool for predicting in vivo performance of a drug product is significantly enhanced if an in vitro-in vivo relationship (correlation or association) is established; but this relationship is not required (see FDA Guidances). Occasionally the in vitro dissolution test is found to be more sensitive and discriminating than the in vivo test. From a quality assurance point of view, a more discriminating dissolution method is preferred because the test will indicate possible changes in the quality of the product before in vivo performance is affected.

The discriminatory power of the dissolution method depends on the method's ability to detect changes in the drug product. Ideally, the dissolution test conditions would show discrimination for product changes that may affect biopharmaceutical product performance. However, unless an in vi-tro-in vivo correlation exists for the product, variations in dissolution behavior may or may not reflect variations in the product's in vivo performance. To determine if a dissolution method can show discrimination for product changes, the method should be challenged. There are several ways to challenge the discriminatory power of the method, but the
most common approach is to test formulations manufactured with different parameters. Manufacturing variables can come from many sources, e.g., the drug substance, the drug product's formulation, and/or the drug product's manufacturing process. For example, the ability of the method to detect changes in the drug substance can be evaluated by testing products with drug substances having different particle sizes, crystal habits, solvation, surface areas, or synthetic pathways. The method sensitivity to drug product formulation changes can be challenged by testing products with different amounts or ratios of excipients or by testing formulation changes, such as wet granulation versus dry blend, or intra- versus extra-granulation. The method sensitivity to manufacturing process variables such as lubrication blend time, compression force, addition order, drying methods, coating methods, and equipment capability or size can also be evaluated. As different formulations are made using some of the variables just mentioned; the dissolution data are examined. If the data show a measurable difference for the key variables, then the method may be considered a discriminating test for critical manufacturing variables.

With regard to stability, the dissolution test should appropriately reflect relevant changes in the biopharmaceutical performance caused by temperature, aging, humidity, and photosensitivity. A properly designed dissolution test does not generate highly variable dissolution results nor is it associated with significant analytical solution stability problems. If these issues arise, the dissolution test design should be evaluated and appropriately revised.

## APPARATUS/AGITATION

## Apparatus

The choice of apparatus is based on knowledge of the formulation design and on practical aspects of dosage form performance in the in vitro test system. Apparatus 1 or Ap-
paratus 2 (basket and paddle method, respectively, see Dissolution $\langle 711\rangle$ ) is often suitable, and an increase in the rotation frequency is sometimes advantageous, e.g., paddle at 75 rpm to 100 rpm . Apparatus 3 (reciprocating cylinder, see Drug Release $\langle 724\rangle$ ) has been found to be especially useful for bead-type modified-release dosage forms. Apparatus 4 (flow cell, see Drug Release $\langle 724\rangle$ ) may offer advantages for modified-release dosage forms that contain active ingredients with limited solubility. Apparatus 3 or Apparatus 4 may additionally have utility for soft gelatin capsules, bead products, suppositories, or poorly soluble drugs. Apparatus 5 (paddle over disk, see Drug Release $\langle 724\rangle$ ) and $A p$ paratus 6 (rotating cylinder, see Drug Release $\langle 724\rangle$ ) have been shown to be useful for evaluating and testing transdermal dosage forms. Apparatus 7 (reciprocating disk, see Drug Release $\langle 724\rangle$ ) has been shown to be suitable for nondisintegrating oral modified-release dosage forms and transdermal dosage forms.

Some changes that can be made to the apparatus, when necessary, are as follows:
Basket Mesh Size-A 40-mesh basket screen is used in most cases; however, other mesh sizes ( 10 and 20 mesh) may be used when the need is clearly documented by supporting data. In countries where available mesh sizes vary from the USP specified mesh value, basket material with the nearest metric dimension should be used. Care must be taken that baskets are uniform and meet the dimensions requirements specified under Dissolution $\langle 711\rangle$. If the basket screens become clogged during dissolution of capsule or tablet formulations, it may be advisable to switch to the paddle method.

Minipaddles-A minipaddle in combination with a 200mL vessel may be considered for low-dosage products.

Two- or Four-Liter Vessels-The increased volume made possible by using these vessels can assist in meeting sink conditions for poorly soluble drugs.

Other Apparatus-The rotating bottle or static tubes (jacketed stationary tubes enclosed with a water jacket and equipped with a magnetic stirrer) may also have utility for microspheres and implants.

The aforementioned minipaddle/basket, $200-\mathrm{mL}$ vessel, and rotating bottle are not official apparatus and may only be used in extraordinary conditions accompanied by documentation that they are superior to the standard equipment. There are also noncompendial flow-through cells that are modified for special dosage forms. These cells would also need to be justified.

## Sinkers <br> Detailed sinker descriptions and an explanation of why a

 sinker is used must be stated in the written procedure. When comparing different sinkers-or sinkers versus no sinker-a test should be run concurrently with each sinker. Each sinker type may be evaluated based on its ability to maintain the dosage at the bottom of the vessel without inhibiting drug release.Sinkers can significantly influence the dissolution profile of a drug. The use of sinkers, therefore, may be part of a case-by-case dissolution validation. The sinker design should be stated clearly in the method. When transferring the method, the sinkers should be duplicated as closely as possible in the next facility.

The use of sinkers may be required when using Apparatus 2. For tablets and capsules, sinkers can be used when the formulation floats-typically observed at the very beginning of a run-or to help center a dosage form under the paddle. For example, a sinker may also be useful for film-
coated tablets or soft gelatin capsules that stick to the vessel walls. As a guide, the following is a suggested procedure for making sinkers by hand.

Materials: 316 stainless steel wire, 0.032 inch/20 gauge; one set of cork borers \#1 to \#15.

| Capsule <br> Shell | Cork Bore | Length of Wire in inches (cm) | Diameter <br> Size <br> in inches <br> (cm) |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| 0 , elongated | \#4 | 4.72 (12) | 0.313 (0.8) |
| 1 and 2 | \#3 | 3.94 (10) | 0.275 (0.7) |
| 3 and 4 | \#2 | 3.15 (8) | 0.215 (0.55) |

Procedure-Cut the specified length of coil length wire around the specified bore of the appropriate size, and use small pliers to curve in the ends. In countries where normal values for wire diameters vary from the tabulated values, use wire with the nearest metric dimension.

There are commercially available sinkers that, if properly validated, may be used. The type of sinker should always be clearly defined in the procedure or test method. If the sinker is handmade, the sinker construction procedure instructions should be documented. If a commercial sinker is used, the vendor specifications should be defined.

## Agitation

For immediate-release products, the basket method (Apparatus 1 ) is routinely used for capsule or tablet formulations at an agitation speed of 50 to 100 rpm , although speeds up to 150 rpm have been used in USP monograph dissolution tests. The paddle method (Apparatus 2) is frequently used for tablet and capsule dosage forms at 50 or 75 rpm . Other agitation speeds and apparatus are acceptable
with justification. Documentation would include the data from the normally accepted apparatus and/or agitation speeds to illustrate that a variation is needed.

Selection of the agitation and other study design elements for modified-release dosage forms is similar to that for im-mediate-release products. When the apparatus has been appropriately calibrated, these elements should conform to the requirements and specifications given under Drug Release〈724〉.
Rates outside of 25 to 150 rpm are usually unacceptable because of inconsistency of the hydrodynamics below 25 rpm and of the turbulence above 150 rpm . Agitation rates between 25 rpm and 50 rpm are generally acceptable for suspensions. For dosage forms that exhibit coning (mounding) under the paddle at 50 rpm , the coning can be reduced by increasing paddle speed to 75 rpm , thus reducing the artifact and improving the data. If justified, 100 rpm may be used, especially for extended-release products. Decreasing or increasing the apparatus rotation speed may be justified if the profiles better reflect in vivo performance and/or the method results in better discrimination.

## MEDIUM

Physical and chemical data for the drug substance and dosage unit should be determined before selecting the dissolution medium. Two key properties of the drug are the solubility and solution state stability of the drug as a function of the pH value. When adjusting the composition of the medium to generate sink conditions, the influence of surfactants, pH value, and buffers on the solubility and stability of the drug should be evaluated. Key properties of the dosage unit that may affect the dissolution, enteric-coating, modified-release mechanism, and disintegration rate are hardness, friability, presence of solubility enhancers, and the presence of other excipients.

Selection of the dissolution medium is based, in part, on the solubility data and the dose range in order to ensure that sink conditions are met. The term sink conditions is defined as the volume of medium at least greater than three times that required to form a saturated solution of drug substance. A medium that fails to provide sink conditions may be justifiable if it is shown to be more discriminating or if it provides reliable data that otherwise can only be obtained with the addition of surfactants.

Using an aqueous-organic solvent mixture as a dissolution medium is discouraged; however, if an in vitro-in vivo relationship is demonstrated that cannot be accomplished with a pure aqueous medium, this type of medium may be acceptable.
Purified water is often used as the dissolution medium but is not ideal for several reasons: the quality of water can vary depending on the source of water; the pH value is inherently difficult to measure because the pH value can vary from day to day and may also change during the run depending on the active substance and excipients; and finally, the surface tension may also be variable and dependent on the excipients in the formulation. Despite these limitations, water is inexpensive, readily available, disposed of easily, ecologically acceptable, and suitable for products with a release rate independent of the pH value of the medium. Further, if water is named as the medium in an official test, it is not necessary to change to another medium unless there is a compelling reason.

The dissolution characteristics of an oral formulation are evaluated over the physiologic pH range of 1.2 to 6.8 (1.2 to 7.5 for modified-release formulations). During method development, it may be useful to measure the pH before and after a run to see if the pH changes during the test. Selection of the most appropriate conditions for routine testing is then
based on discriminatory capability, ruggedness, stability of the analyte in the test medium, and, where possible, relevance to in vivo performance.

Listed below are typical media for a dissolution test. Buffers and acids are prepared as directed for Buffer Solutions and Volumetric Solutions, respectively, under Reagents, Indicators, and Solutions. Simulated gastric fluid and simulated intestinal fluid are prepared as directed for Test Solutions under Reagents, Indicators, and Solutions. The following list is not exhaustive and not in order of preference:

Hydrochloric acid (typically between 0.1 and 0.001 N )
Acetate buffer (with a pH between 4.1 and $5.5 ; 0.05 \mathrm{M}$ ) Phosphate buffer (with a pH between 5.8 and 8.0; 0.05 M )

Purified water
Polysorbate 20, polysorbate 40, polysorbate 60, and polysorbate 80 solutions

Sodium lauryl sulfate solutions
Lauryldimethylamine oxide solutions
Cetrimide solutions
Bile salts solutions and/or lecithin
Combinations of surfactant and acids or buffers
Simulated gastric fluid with or without enzyme
Simulated intestinal fluid with or without enzyme
For very poorly soluble compounds, aqueous solutions may contain a percentage of a surfactant (e.g., sodium lauryl sulfate, polysorbate, or lauryldimethylamine oxide) that is used to enhance drug solubility. The need for surfactants and the concentrations used could be justified by showing profiles at several different concentrations. Surfactants can be used as either a wetting agent or, when the critical micelle
concentration is reached, to solubilize the drug substance. The molarity of the buffers and acids used can influence the solubilizing effect, and this should be evaluated.

The Biopharmaceutics Classification System describes the classification of compounds according to solubility and permeability. "Biorelevant medium" is a term used to describe a medium that has some relevance to the in vivo dissolution conditions for the compound. Choice of a biorelevant medium is based on a mechanistic approach that considers the absorption site, if known, and whether the rate-limiting step to absorption is the dissolution or permeability of the compound. In some cases, the biorelevant medium will be different from the test conditions chosen for the regulatory test, and the time points are also likely to be different. If the compound dissolves quickly in the stomach and is highly permeable, gastric emptying time may be the rate-limiting step to absorption. In this case, the dissolution test is to demonstrate that the drug is released quickly under typical gastric (acidic) conditions. On the other hand, if dissolution occurs primarily in the intestinal tract (e.g., for a poorly soluble, weak acid), a higher pH range (e.g., simulated intestinal fluid with a pH of 6.8 ) will be more appropriate. The "fed" and "fasted state" may also have significant effects on the absorption or solubility of a compound. Compositions of media that simulate the fed and fasted states can be found in the literature. These media reflect changes in the pH , bile concentrations, and osmolarity after meal intake, and, therefore, have a different composition than that of typical compendial media. They are primarily used to establish in vitro-in vivo correlations during formulation development and to assess potential food effects,but are not intended for quality control purposes. For

[^30]quality control purposes, the substitution of natural surfactants (bile components) with appropriate synthetic surfactants is permitted and encouraged because of the expense of the natural substances and the labor-intensive preparation of the biorelevant media.

The use of an enzyme in the dissolution medium is permitted (see Dissolution $\langle 711\rangle$ ) when dissolution failures occur due to pellicle formation with gelatin capsules or gelatin-coated products.

Normally for the basket and paddle apparatus, the volume of the dissolution medium is 500 mL to 1000 mL , with 900 mL as the most common volume. The volume can be raised to between 2 and 4 liters, depending on the concentration and sink conditions of the drug, but proper justification is expected.

The significance of deaeration of the medium may be determined: air bubbles can interfere with the test results, acting as a barrier to dissolution if present on the dosage unit or basket mesh; also, bubbles can cause particles to cling to the apparatus and vessel walls. On the other hand, bubbles on the dosage unit may increase the buoyancy and lead to an increase in the dissolution rate, or, decrease the dissolution rate by decreasing the available surface area. A deaeration method is described as a footnote in Dissolution $\langle 711\rangle$. Typical steps are to heat the medium, filter, and draw a vacuum for a short period of time. Other validated methods of deaeration are available and in routine use throughout the industry. Media containing surfactants are not usually deaerated because of excessive foaming. To determine if deaeration of the medium is necessary, dissolution run in nondeaerated medium versus deaerated medium should be performed.

## STUDY DESIGN

## Time Points

For immediate-release dosage forms, the duration of the procedure is typically 30 to 60 minutes, with a single time point specification that is adequate in most cases for Pharmacopeial purposes. Industrial and regulatory concepts of product comparability and performance may require additional time points, and this may also be a feature required for product registration or approval. Enough time points are to be selected to adequately characterize the ascending and plateau phases of the dissolution curve. According to the Biopharmaceutics Classification System referred to in several FDA guidances, highly soluble, highly permeable drugs formulated with rapidly dissolving products need not be subjected to a profile comparison if they can be shown to release $85 \%$ or more of the active drug substance within 15 minutes. For these types of products a one-point test will suffice. However, most products do not fall into this category. Dissolution profiles of immediate-release products not meeting the highly soluble/highly permeable/rapidly dissolving criteria typically show a gradual increase reaching between $85 \%$ and $100 \%$ at around 30 to 45 minutes. Thus, dissolution time points in the range from 15 (or 20), 30,45 , and 60 minutes are usual for most immediate-release product. Useful information may be obtained from other points, e.g., if dissolution is very rapid, 5 to 10 minutes to obtain more data or for slower-dissolving drugs, additional points after 60 minutes. Dissolution test times for compendial tests are usually then established on the basis of an evaluation of the dissolution profile data.
So-called infinity points can be useful during development studies. To obtain an infinity point, the paddle or basket speed is increased at the end of the run to at least 150 rpm for 30 to 60 minutes, after which time an additional sample is taken. Although there is no requirement for
$100 \%$ dissolution in the profile, the infinity point can provide data that may supplement content uniformity data and may provide useful information about the formulation characteristics during the initial development.

For an extended-release dosage form, at least three test time points are chosen to characterize the in vitro drug release profile for Pharmacopeial purposes. Additional sampling times may be required for drug approval purposes. An early time point, usually 1 to 2 hours, is chosen to show that there is little probability of dose dumping. An intermediate time point is chosen to define the in vitro release profile of the dosage form, and a final time point is chosen to show essentially complete release of the drug. Test times and specifications are usually established on the basis of an evaluation of drug release profile data. For products containing more than a single active ingredient, drug release is determined for each active ingredient. Extended-release specifications are addressed in the general information chapter In Vitro and In Vivo Evaluation of Dosage Forms 〈1088〉 as well as other sources. ${ }^{2}$

## Observations

Visual observations and recordings of the product dissolution and disintegration behavior are very useful because dissolution and disintegration patterns can be indicative of formulation or manufacturing process variables. To accomplish visual observation, proper lighting (with appropriate consideration of photodegradation) of the vessel contents and clear visibility in the bath is essential. Documenting observations by drawing sketches and taking photographs or videos is very instructive and helpful for those who are not able to observe the real time dissolution test. Observa-
tions are especially useful during method development and formulation optimization. Examples of typical observations include, but are not limited to, the following:

1. Uneven distribution of particles throughout the vessel, which could occur if particles cling to the sides of the vessels, if there is coning or mounding directly under the apparatus, if particles float at the surface of the medium, if film-coated tablets stick to the vessel, and/or if off-center mounds are formed;
2. Air bubbles on the inside of the vessel or on the apparatus or dosage unit. Sheen on the apparatus is also a sign of air bubbles. This observation would typically be made when assessing the need to deaerate the medium;
3. Dancing or spinning of the dosage unit, or the dosage unit being hit by the paddle;
4. Adhesion of particles to the paddle or inside of the basket, which may be observed upon removal of the stirring device at the end of the run;
5. Pellicles or analogous formations, such as a transparent sacs that are rubbery, swollen masses surrounding the capsule contents;
6. Presence of large floating particles or chunks of the dosage unit;
7. Observation of the disintegration rate (e.g., percent reduction in size of the dosage unit within a certain time frame);
8. For modified or enteric-coated products, complex disintegration of the coating, e.g., the partial opening and splitting apart (like a clamshell) or incomplete opening of the shell accompanied by the release of air bubbles and excipients.
[^31]
## Sampling

The disturbance of hydrodynamics of the vessel by sampling probes should be considered and adequate validation performed to ensure that the probes are not introducing a significant change in the dissolution rate.
Manual-Manual sampling uses plastic or glass syringes, a stainless steel cannula that is usually curved to allow for vessel sampling, a filter, and/or a filter holder. The sampling site must conform to specifications under Dissolution $\langle 711\rangle$.

Autosampling-Autosampling is a useful alternative to manual sampling, especially if the test includes several time points. However, since regulatory labs may perform the dissolution test using manual sampling, autosampling requires validation with manual sampling.

There are many brands of autosamplers, including semiand fully-automated systems. Routine performance checks, cleaning, and maintenance as described in the pertinent standard operating procedures or metrology documents are useful for reliable operation of these devices.

Some instruments are equipped with sampling through the basket or paddle shaft. Proper validation (e.g., demonstrated equivalence to results with the usual sampling procedure) may be required.

Manual versus automated validation can be done either one of two ways. When the drug dissolution results are not highly variable, two concurrent runs (same sampling intervals, $n=6$ ) using manual and automated sampling methods are compared using the criteria under Intermediate Precision. If the dissolution results are highly variable (i.e., the RSD is above $20 \%$ in time points at 10 minutes or earlier, and at or above $10 \%$ RSD in later time points), the analysis may be performed by pulling the sample from the vessel simultaneously by manual and automated sam-
pling methods for each time point. Note that the correction for the volume withdrawn from the medium is doubled in this case.

If the results are not acceptable for the manual sampling, a discard step may be required or the discard volume may be increased. For the autosampler, a longer priming time may be needed if unacceptable results are obtained. If these changes do not work, then a change to another filter type may be needed.

Other aspects of automated validation may include the carryover of residual drug, the effect of an in-residence probe (simultaneous sampling as mentioned above may not be suitable in this case), adsorption of drug, and cleaning and/or rinse cycles.

## Filters

Filtration of the dissolution samples is usually necessary to prevent undissolved drug particles from entering the analytical sample and further dissolving. Also, filtration removes insoluble excipients that may otherwise cause high background or turbidity. Prewetting of the filter with the medium is usually necessary.

Filters can be in-line or at the end of the sampling probe, or both. The pore size can range from $0.45 \mu \mathrm{~m}$ to $70 \mu \mathrm{~m}$. The usual types are depth, disk, or flow-through filters. However, if the excipient interference is high, if the filtrate has a cloudy appearance, or if the filter becomes clogged, an alternative type of filter or pore size should be evaluated.

Adsorption of the drug(s) onto the filter is also evaluated. If drug absorption occurs, it may be necessary to increase the amount of initial filtrate discarded. If results are still unsuitable, an alternative filter material may be sought.
Filter validation may be accomplished by preparing a $100 \%$ standard solution and a completely dissolved sample solution (e.g., prepared as a typical sample in a vessel or a
sample put in a beaker and stirred with a magnetic stirrer for 1 hour). The solutions are sampled ( $\mathrm{n}=3$ ) by both the selected autosampler and the manual technique. Both sampling techniques may use the same or equivalent type of filter. The autosampler is programmed for a typical sample pull, and the manual method withdraws an aliquot from the solutions. The standard solution results are compared to an unfiltered standard. The analyst may compare the sample solution results to the same sample solution unfiltered and centrifuged. For the filter to be acceptable for use, the results of the filtered portions are to approach (within $98 \%$ to $102 \%$ ) the original concentration of the unfiltered standard solution and the centrifuged sample solution.

## Centrifugation

Centrifugation of samples is not preferred, as dissolution can continue to occur, and there may be a concentration gradient in the supernatant. A possible exception might be compounds that adsorb to all common filters.

#### Abstract

\section*{ASSAY}

The usual assay for a dissolution sample is either by spectrophotometry or high-pressure liquid chromatography (HPLC). The preferred method of analysis is spectrophotometry because results can be obtained faster, the analysis is simpler, and fewer solvents are used. HPLC methods are used when there is significant interference from excipients or among drugs in the formulation and/or to improve analytical sensitivity. It may be useful to have data for the drug obtained with a stability-indicating assay (e.g., HPLC chromatograms) in the medium of choice, even if the primary assay is based on a spectrophotometric method.

The validation topics described in this section are typical but not all-inclusive. The acceptance criteria are guidelines only and may differ for some products. Other considerations

may be important for special dosage forms. The extent of validation depends on the phase of the product development. Full validation takes place at or just before Phase III clinical studies. For profile testing, validation studies may be necessary at each relevant time point. For products containing more than a single active ingredient, the dissolution method should be validated for each active ingredient.

## Specificity/Placebo Interference

The placebo consists of all the excipients and coatings (inks, sinker, and, when appropriate, the capsule shell) without the active ingredient. Placebo interference may be determined by weighing three samples each of the placebo blend, equal to or greater than the highest and lowest strength. Transfer the samples to separate vessels filled with dissolution medium at $37^{\circ}$. Stir for around 30 minutes to 1 hour at 150 rpm using the method apparatus. Observe whether the blend becomes wetted. Analyze and calculate the percent interference at each strength $(\mathrm{n}=3)$ by comparing it to the $100 \%$ standard of that strength (or optionally using the selected $Q$ value) by the formula:

$$
100 C\left(A_{P} / A_{S}\right)(V / L)
$$

in which $C$ is the concentration, in mg per mL , of the standard; $A_{P}$ and $A_{S}$ are the absorbances of the placebo and the standard, respectively; $V$ is the volume, in mL , of the medium; and $L$ is the label claim, in mg. The mean is determined, and the interference does not exceed $2 \%$.
NOTE-For extended-release products, a placebo version of the finished dosage form may be more appropriate to use than blends because this placebo formulation will release the various excipients in a manner more nearly reflecting the product than a simple blend of the excipients. The placebo formulation is necessary particularly if one of the released excipients does influence the baseline of the analytical method. For extended-release products, the interfer-
ence must be determined at each sampling point in the release profile. If the placebo interference exceeds $2 \%$, then HPLC analysis is needed; alternatively, another wavelength, algorithm analysis, or a baseline subtraction (correction factor) may be feasible.

## Spectrophotometric Analysis

Analyses may be performed with spectrophotometers that have diode array or variable wavelength detectors. Samples may be automatically introduced into the spectrophotometer using autosippers and flow cells. Routine performance checks, cleaning, and maintenance as described in the standard operating procedures or metrology documents are useful for reliable operation of these instruments. Flow cells ranging from 0.02 to 1 cm are typically used. Cell alignment and air bubbles could be sources of error. The smaller path length flow cells are used to avoid diluting the sample; however, acceptable linearity and standard error should be demonstrated.

During analysis, standard solutions are typically prepared and analyzed at just one concentration at $100 \%$ of the dosage strength (or the selected $Q$ value). During profile analysis, other concentrations may be useful. The recorded standards are aliquots from the same standard solution. A typical blank, standard, and sample may be analyzed in a sequence that brackets the sample with standards and blanks, especially at the beginning and end of the analysis. In most cases, the mean absorbance of the dissolution medium blank may not exceed $1 \%$ of the standard. Values higher than $1 \%$ must be evaluated on a case-by-case basis. The typical relative standard deviation (RSD) for UV analysis is usually $\leq 2 \%$.

The absorptivity is calculated by dividing the mean standard absorbance by the concentration, in mg per mL, divided by the flow-cell path length in cm . After enough
historical data is accumulated, an acceptable absorptivity range for the analyte (using the appropriate flow cell) may be determined. This value may be useful in troubleshooting aberrant data. Fiber optics as a sampling and determinative method, with proper validation, is an option.

Examine the UV spectrum of the drug in solution to select the wavelength for maximum absorbency. In some cases, there may be other wavelengths chosen, as with measuring degradants along with the intact drug substance.

## HPLC

For HPLC analysis, the compatibility of dissolution media and mobile phase may be examined, especially if large injector volumes (over $100 \mu \mathrm{~L}$ ) are needed. Samples are normally analyzed with HPLC using a spectrophotometric detector and an auto-injector. Single injections of each vessel time point with standards throughout the run constitute a typical run design. System suitability tests include, at a minimum, the retention time window and precision. Typically, the system suitability of an HPLC analysis is less than or equal to $2 \%$ RSD for five or six standard determinations. The standard level is typically at the $100 \%$ label claim level, especially for a single-point analysis.
Preparation of the placebo samples for the HPLC analysis is performed in the same way as the spectrophotometric analysis. Look for peaks eluting at the same retention time as the drug. If there are extraneous peaks, inject the standard solution, and compare retention times. If the retention times are too close, spike the placebo solution with the drug. Chromatograms may also be obtained over an extended run time using the blank (dissolution medium), standard, and sample solution to identify late eluters that may interfere with subsequent analyses.

If possible, the validation documentation may include overlaid representative chromatograms or spectra of blank dissolution medium, a filtered placebo solution, a standard solution, and a filtered dissolution sample. Absence of interfering peaks in the placebo chromatogram or lack of absorbance by the placebo at the analytical wavelength demonstrates specificity.

## Linearity and Range

Organic solvents may be used to enhance drug solubility for the preparation of the standard solutions; however, no more than $5 \%(\mathrm{v} / \mathrm{v})$ of organic solvent in the final solution should be used, unless validated.

Linearity and range are typically established by preparing five standard solutions of the drug, ranging in concentration from approximately $\pm 20 \%$ below the lowest expected concentration to $\pm 20 \%$ above the highest concentration during release from the specific dosage unit strength. As further dosage strengths are added, the same testing scheme applies, unless some concentrations have already been tested. For spectrophotometric analysis, this scheme may be altered if different flow-cell sizes are used.

All solutions are made from a common stock if possible. The diluted solutions may be read, at least, in duplicate (two test tubes of the same solution) with spectrophotometric analysis and two injections of the same solution in different vials for HPLC analysis. For the highest concentration, the absorbance values may not exceed the linearity limits of the instrument.

Linearity is typically calculated by using an appropriate least-squares regression program. Typically, a square of the correlation coefficient $\left(\mathrm{r}^{2} \geq 0.98\right)$ demonstrates linearity. In addition, the $y$-intercept must not be significantly different from zero at the $95 \%$ confidence limit.

## Accuracy/Recovery

For full validation, drug powder at $\pm 20 \%$ of the lowest expected concentration to $\pm 20 \%$ of the highest concentration during release from the specific dosage unit strength is typically used. A minimum of three concentration levels is evaluated. The capsule shell, coating blend, inks, and sinker are also added where appropriate. Each level is tested as $\mathrm{n}=$ 3. The amount of placebo blend weighed for each level is the same as the total excipient weight of each tablet or capsule for the dosage strength being validated. For Apparatus 1 and Apparatus 2, the mixture of excipients and drug powder may be tested according to the conditions specified in the method.

In cases of poor drug solubility, if feasible, the stock solution may be prepared by dissolving the drug substance in a small amount of organic solvent and diluting to the final concentration with dissolution medium. An amount of stock solution equivalent to the targeted label claim may be added to the vessel instead of drug powder. [NOTE-The solutions may be made in volumetric flasks instead of vessels.] The percentage of organic solvent should be minimized (ideally $\leq 5 \%$ of the final medium composition) as it may change the solubility of the excipients and bias the results.

The measured recovery is typically $95 \%$ to $105 \%$ of the weighed amounts. Bracketing or matrixing of multiple strengths may be useful.

A special case for validation is the acid stage (see $D e$ -layed-Release (Enteric-Coated) Articles-General Drug Release Standard under Drug Release $\langle 724\rangle$. The limit of not more than $10 \%$ should be validated. If the compound degrades in acid, the validation of the method is complicated but usually can be performed using the degradant, especially if $100 \%$ rapid degradation in-situ occurs.

## Precision

## REPEATABILITY

Repeatability is determined by replicate measurements of a standard solution. It can be measured by calculating the RSD of the multiple injections, by spectrophotometric readings for each standard solution, or from the accuracy or linearity data.

## INTERMEDIATE PRECISION

Intermediate precision may be evaluated to determine the effects of random events on the precision of the analytical procedure. The precision can be across the range of product strengths. Typical variations to study include days, analysts, and equipment. The use of an experimental matrix design is encouraged for evaluation of intermediate precision. If possible, the intermediate precision can be performed using a well-characterized lot of drug product of tight content uniformity. In cases where this well-characterized product is not available, placebo and active ingredient may be used to identify intermediate precision.
The dissolution profiles on the same sample (run twice, $\mathrm{n}=12$ ) may be run by at least two different analysts, with each analyst preparing the standard solutions and the medium. The analysts typically use different dissolution baths, spectrophotometers or HPLC equipment (including columns), and autosamplers and perform the test on different days. This procedure may not be necessary to perform for each strength; instead bracketing with high and low strengths may be acceptable.

Typical acceptance criteria for this type of precision are that the difference in the mean value between the dissolution results from the first analyst to the second analyst does not exceed an absolute $10 \%$ at time points with less than $85 \%$
dissolved and does not exceed $5 \%$ for those remaining time points above $85 \%$. Acceptance criteria may be product specific, and other statistical tests and limits may be used.

## Robustness

The evaluation of robustness may be considered during the development phase but more typically is done at the time of full validation. This assesses the impact of making small, deliberate changes to the dissolution conditions. Experiments to test for robustness can use $\mathrm{n}=3$ if the product exhibits normal variability and $\mathrm{n}=6$ for highly variable products (i.e., the RSD is above $20 \%$ in time points at 10 minutes or earlier, and $10 \%$ or above RSD in later time points).
One run each may be performed using $90 \%, 100 \%$, and $110 \%$ of the medium concentration (e.g., surfactant, w/v $\%$ ) in the method. For buffered media, runs of 0.5 pH units above and below the method pH can be performed. The buffer capacity may be varied by changing the total buffer concentration while keeping the relative amounts of each buffer component the same (see above for suitable variations).

HPLC includes variations of the mobile phase composition, flow rate, pH changes, and column type, brand, lot, or age. System suitability criteria assess acceptability of the method. For a more in-depth discussion of robustness and other validation topics for HPLC, refer to the general information chapter Validation of Compendial Methods $\langle 1225\rangle$. UV could include a variation of wavelength of $\pm 2 \mathrm{~nm}$, depending on the absorbance profile.

## Standard and Sample Solution Stability

The standard solution is stored under conditions that ensure stability. The stability of the standard is analyzed over a specified period of time, using a freshly prepared standard
solution at each time interval for comparison. The acceptable range for standard solution stability is typically between $98 \%$ and $102 \%$.

The sample solution is stored at room temperature in a glass test tube wrapped securely in paraffin or in a capped vial. The sample is analyzed over a specified period of time using the original sample solution response for comparison. The typical acceptable range for sample solution stability may be between $98 \%$ and $102 \%$ when compared to the initial analysis of the sample solutions. If the solution is not stable, aspects to consider could be temperature (refrigeration needed), light protection, or container material (plastic or glass).

The method may state that the standards and samples should be analyzed within the time period demonstrating acceptable standard and sample solution stability.

## ACCEPTANCE CRITERIA

Typical acceptance criteria for the amount of active ingredient dissolved, expressed as a percentage of the labeled content $(Q)$, are in the range of $75 \%$ to $80 \%$ dissolved. A $Q$ value in excess of $80 \%$ is not generally used because allowance should be made for assay and content uniformity ranges. ${ }^{3}$ Acceptance criteria including test times are usually established on the basis of an evaluation of the dissolution profile data.

High variability in results can make it difficult to identify trends or effects of formulation changes. Dissolution results may be considered highly variable if the RSD is greater than
$20 \%$ at timepoints 10 minutes or earlier and greater than $10 \% \mathrm{RSD}$ in later time points. The source of the variability could be investigated, when practical, and one should strive to reduce variability whenever possible. The two most likely causes are the formulation itself or mechanical artifacts associated with the test procedure (e.g., coning or tablets sticking to the vessel wall).

Occurrences such as those mentioned in the previous section on observations can be a strong indication that the dissolution test itself is creating variability. Any time the dosage contents do not disperse freely throughout the vessel in a uniform fashion, aberrant test results could occur. Depending on the problem, the usual remedies include changing the apparatus type, speed of agitation (flowrate), deaeration, consideration and/or examination of sinker type, or changing the composition of the medium. Modifications to apparatus may be useful, with proper justification and validation.

Many causes of variability can come from the formulation and manufacturing process. For example, poor content uniformity, process inconsistencies, a reaction taking place at different rates during dissolution, excipient interactions or interference, film coating, capsule shell aging, or hardening or softening of the dosage form as it ages may be sources of variability and interferences. During routine testing of the product, variability outside of the expected range should be investigated in terms of both analytical and formulation issues.

[^32]
## STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the In-Process Revision and Pharmacopeial Previews sections. Readers interested in submitting comments should see Instructions to Authors.
STIMULI TO THE REVISION PROCESS ..... 365
Instructions to Authors ..... 367

## Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to $U S P-N F$ revision will be considered for publication in the Pharmacopeial Forum under the section Stimuli to the Revision Process. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract-Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.
References-Consult a current copy of the Pharmacopeial Forum and the ACS Style Guide for assistance with reference style.

Copyright - Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.
Contact Person-When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions-Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft ${ }^{\circledR}$ Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be cameraready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Pharmacopeial Forum
Executive Secretariat, USP

Rockville, MD 20852

## NOMENCLATURE

This section includes supplements to the latest edition of the USP Dictionary of USAN and International Drug Names that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

## USP Dictionary of USAN and International Drug Names 2003 USP DICTIONARY SUPPLEMENT 5

IMPORTANT-Save this Supplement. This and all supplements appearing in $P F$ are needed to keep the 2003 edition of the USP Dictionary (USPD) up to date. The cumulative contents of the supplements to the current (2003) edition will be included in the next complete edition of the Dictionary.

## New United States Adopted Names (USAN)

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of $P F$ for other new USAN to supplement the Dictionary main volume.

Arformoterol Tartrate [2003] (ar for moe' ter ole).
$\mathrm{C}_{19} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{4} . \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} .494 .49$. (1) Formamide, $N$-[2-hydroxy-5-[(1R)-1-hydroxy-2-[[(1R)-2-(4-methoxyphenyl)-1-methy-lethyl]amino]ethyl]phenyl]-, $(2 R, 3 R)$-2,3-dihydroxybutanedioate (1:1) (salt); (2) (-)-N-[2-Hydroxy-5-[(1R)-1-hydroxy-2-[[(1R)-2-(4-methoxyphenyl)-1-methylethyl $]$ amino $]$ ethyl $]$ phenyl]formamide hydrogen $(2 R, 3 R)$-2,3-dihydroxybutanedioate (salt). CAS-200815-49-2. Anti-asthmatic and bronchodilator. (Sepracor, Canada)

Batabulin Sodium [2003] (bat a bue' lin). $\mathrm{C}_{13} \mathrm{H}_{6} \mathrm{~F}_{6} \mathrm{NNaO}_{3} \mathrm{~S}$. 393.24. (1) Benzenesulfonamide, 2,3,4,5,6-pentafluoro- N -(3-fluoro-4-methoxyphenyl)-, sodium salt; (2) Sodium 2,3,4,5,6-pentafluoro- $N$-(3-fluoro-4-methoxyphenyl)benzenesulfonamidate; (3) 2-Fluoro-1-methoxy-4-pentafluorophenylsulfonamidobenzene, sodium salt. CAS-195533-98-3. Treatment of various refractory cancers, including hepatocellular carcinoma, breast, colon and non-small cell lung cancer. (Tularik) $\diamond$ T138067-sodium

Lumiliximab [2003] (loo mil ix' i mab). Immunoglobulin G1, anti-(human immunoglobulin E receptor type II) (human-Macaca irus monoclonal IDEC-152 $\gamma 1$-chain), disulfide with hu-man-Macaca irus monoclonal IDEC-152 $\kappa$-chain, dimer. CAS-357613-86-6. Treatment of allergic asthma, allergic rhinitis, and chronic lymphocytic leukemia. (IDEC) $\triangleleft I D E C-152$

Miglustat [2003] (mi gloo' stat). $\mathrm{C}_{10} \mathrm{H}_{21} \mathrm{NO}_{4}$. 219.28. (1) 3,4,5Piperidinetriol, 1-butyl-2-(hydroxymethyl)-, $(2 R, 3 R, 4 R, 5 S)$-; (2) $(2 R, 3 R, 4 R, 5 S)$-1-Butyl-2-(hydroxymethyl)piperidine-3,4,5-triol. CAS-72599-27-0. INN; BAN. Treatment of glycolipid storage diseases. Zavesca (Lonza, Switzerland) $\diamond O G T$ 918

Mubritinib [2003] (mue bri tye' nib). $\mathrm{C}_{25} \mathrm{H}_{23} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{2}$. 468.47. (1) 1H-1,2,3-Triazole, 1-[4-[4-[[2-[(1E)-2-[4-(trifluoromethyl)-phenyl]ethenyl]-4-oxazolyl]methoxy]phenyl]butyl]-; (2) 1-[4-[4-[[2-[(E)-2-[4-(Trifluoromethyl)phenyl]ethenyl]oxazol-4-yl]methoxy]phenyl]butyl]-1H-1,2,3-triazole. CAS-366017-09-6. Treatment of cancer. (Takeda) $\diamond$ TAK-165

Parathyroid Hormone [2003] (par a thye' roid). Parathormone (human recombinant). Molecular weight is 9414 daltons. CAS-68893-82-3 [human]; CAS-345663-45-8 [human recombinant]; CAS-9002-64-6 [parathyroid]. USP XXI; MI. Treatment of osteoporosis, as an antiosteoporotic, in the treatment of bone and mineral disease and disorders, bone metabolism regulator, blood calcium regulator, and as a diagnostic aid (pseudohypoparathyroidism; hypocalcemia). (SynCo BV); Paroidin (Parke-Davis $\dagger$ ) $\triangleleft A L X 1-11$

Pixantrone [2003] (pix' an trone). $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{5} \mathrm{O}_{2}$. 325.37. (1) Benz $[g]$ isoquinoline-5,10-dione, 6,9 -bis [(2-aminoethyl)amino $]-;$ (2) 6,9-Bis[(2-aminoethyl)amino]benzo[ $g]$ isoquino-line-5,10-dione.CAS-144510-96-3. BAN. Anti-neoplastic. (Novuspharma SpA) $\diamond B B R 2778$

Razaxaban Hydrochloride [2003] (ra zax' a ban).
$\mathrm{C}_{24} \mathrm{H}_{20} \mathrm{~F}_{4} \mathrm{~N}_{8} \mathrm{O}_{2}$. HCl . 564.92. (1) 1 H -Pyrazole- 5 -carboxamide, 1-(3-amino-1,2-benzisoxazol-5-yl)- N -[4-[2-[(dimethylami-no)methyl]-1 H -imidazol-1-yl]-2-fluorophenyl]-3-[trifluoro-methyl)-, monohydrochloride; (2) 1-(3-Amino-1,2-benzisoxazol-5-yl)- N -[4-[2-[(dimethylamino)methyl $]-1 \mathrm{H}$ -imidazol-1-yl]-2-fluorophenyl]-3-(trifluoromethyl)-1H-pyra-zole-5-carboxamide monohydrochloride. CAS-405940-76-3. Anticoagulant; antithrombotic (Factor Xa inhibitor). (Bris-tol-Myers Squibb) $\diamond B M S$-561389

Revaprazan Hydrochloride [2003] (re va' pra zan).
$\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{FN}_{4}$.HCl. 398.90. (1) 2-Pyrimidinamine, 4-(3,4-dihy-dro-1-methyl-2( 1 H )-isoquinolinyl)- N -(4-fluorophenyl)-5,6-dimethyl-, monohydrochloride; (2) $N$-(4-Fluorophenyl)-5,6-dimethyl-4-[(1RS)-1-methyl-3,4-dihydroisoquinolin-2(1H)-yl]pyrimidin-2-amine monohydrochloride. CAS-178307-421. Treatment of peptic ulcer, gastric ulcer, duodenal ulcer, and GERD (acid pump antagonist). (Yuhan, Korea) $\diamond$ YH1885

Solabegron Hydrochloride [2003] (soe la beg' ron).
$\mathrm{C}_{23} \mathrm{H}_{23} \mathrm{ClN}_{2} \mathrm{O}_{3}$. HCl. 447.35. (1) [1,1'-Biphenyl $]$-3-carboxylic acid, $3^{\prime}-[[2-[[(2 R)-2-(3$-chlorophenyl)-2-hydroxyethyl]amino ]ethyl $]$ amino $]-$, hydrochloride; (2) 3'-[[2-[[(2R)-2-(3-Chlorophenyl)-2-hydroxyethyl] amino]ethyl]amino]biphenyl-3-carboxylic acid hydrochloride. CAS-451470-34-1. Antidiabetic ( $\beta 3$ adrenoreceptor agonist). (GlaxoSmithKline) $\checkmark G W 427353 B$

## Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

## Dextiopronin

## Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official United States Pharmacopeia or National Formulary. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the Federal Register of February 1988.

All who are concerned with the prescription, dispen-
sing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.
A formal procedure ${ }^{1}$ is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are sys-

[^33]tematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.
A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles ${ }^{2}$ and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.
Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

## Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event
that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

| Suggested INN | Category |
| :---: | :---: |
| Abatapcept | Treatment of juvenile arthritis and autoimmune disease |
| Accodopram Asaropride Asarotiamide | Treatment of functional dyspepsia |
| Alagebrax Chloride | Prevention and treatment of cardiovascular complications of aging, diabetes, and endstage renal disease ( $A G E$ crosslink breaker) |
| Amidostaurin Indolstatin Midostaurin Staurostatin | Antineoplastic |
| Belotecan Pamitecan Travitecan | Antineoplastic |
| Bivirumab Exbivirumab Libivirumab | Prevention of hepatitis $B$ virus reinfection in patients who have received liver transplantation for end-stage hepatitis $B$ infection, and for treatment of chronic hepatitis $B$ virus infection |
| Botadopa <br> Botagolide <br> Protaline <br> Protiamine <br> Protioline <br> Retadopa <br> Rotigotine | Antiparkinsonian |
| Cenalidomide | Treatment of multiple myeloma, myelodysplastic syndromes, solid tumors including glioma and metastatic melanoma, Crohn's disease, and congestive heart failure |

| Suggested INN | Category |  |
| :---: | :---: | :---: |
| Cerfluticasone | Corticosteroid for the treat- |  |
| Delfluticasone | ment of inflammatory condi- |  |
| Rafluticasone | tions such as asthma, allergy, and COPD |  |
| Dalipronil | Anti-parasitic |  |
| Fampronil |  |  |
| Zenapronil |  |  |
| Dasantafil | Treatment of erectile dysfunction |  |
| Delamcimod Acetate | Treatment of chemotherapyinduced diarrhea |  |
| Denufosol | Treatment of rhinitis, URI and lung disease, including Cystic Fibrosis. Also, retinal detachment and edema |  |
| Deuperison Deuperisone | Sodium-channel blocker; centrally acting muscle relaxant for the symptomatic treatment of spasticity and muscle spasm |  |
| Diphentrone <br> Disphenitrone <br> Disufenton <br> Phenitrone | Neuroprotectant agent used to treat ischemic stroke |  |
| Epelestat | Treatment of bronchopulmonary inflammatory damage, specifically Cystic Fibrosis |  |
| Fenobegron | Treatment of over-active blad- |  |
| Ritabegron | der and urinary incontinence |  |
| Ritobegron |  |  |
| Fidexaban | Direct, selective, reversible, small molecule inhibitor of Factor Xa (anticoagulant) |  |

| Suggested INN | Category | Suggested INN | Category |
| :---: | :---: | :---: | :---: |
| Gadodendrimer Gadodenterate Gadomer | Macro-molecular blood pool contrast agent for magnetic resonance imaging in adult patients | Prasugrel | Inhibition of platelet aggregation; platelet ADPP 2 Y12 antagonist |
| Gantacurium Chloride | Induce muscle paralysis as surgical adjunct; neuromuscular blocker | Radafaxine Ranolazine | Anti-depressant; treatment of anxiety disorders <br> Anti-anginal; anti-ischemic |
| Glucarpidase | Adjunctive treatment of patients at risk of methotrexate toxicity | Regadenoson | Adenosine $A_{2 A}$ agonist; use as an adjunctive pharmacologic agent in cardiac perfusion imaging studies |
| Ispredenosant | An adenosine $2_{A}$ receptor antagonist intended for use in the treatment of Parkinson's disease | Retazamulin | Pleuromutilin derivative; topical antibiotic for secondarily infected traumatic lesions and secondarily infected derma- |
| Lactofertide Alfa | Anti-infective (antimicrobial and antiviral); anti-inflammatory, antineoplastic | Rolimumab | toses or impetigo <br> Treatment of rheumatoid arthritis, uvetis, asthma and |
| Lanimostim | Antineoplastic; anti-infective growth factor that acts on both progenitor and mature cells of the macrophage line | Stefbaczumab | Crohn's disease <br> Treatment of Staphylococcus aureus infections |
| Lecozotan | Treatment of Alzheimer's disease | Stenavancin | Antibacterial agent active against gram-positive pathogens |
| Levtofisopam | Anxiolytic, treatment of autonomic instability | Succinbucol | Prevention of restenosis, progression of atherosclerosis, re- |
| Lontucirev (Replicating Adenovirus) | Treatment of multiple cancers (E1-B deleted adenovirus; replication competent therapeu- |  | duction of risk in patients at risk for cardiovascular disease |
|  | tic virus) | Tandutinib | Treatment of acute myelogenous leukemia |
| Mirotermin | Bone growth; tissue regenera- |  |  |
| Novotermin | tion | Trezdekincept Sudotox | Antineoplastic used to treat malignant glioma, including |
| Paliperidone <br> Paliperidone Palmitate | Treatment of schizophrenia |  | glioblastoma multiforme and anaplastic astrocytoma |
| Paritumumab | Antineoplastic; treatment of subjects with cancers whose tumors express $E G F$ receptors | Vestipitant | Anti-depressant; anti-anxiety; prevention of nausea and vomiting; used in the treatment of functional dyspepsia, irrita- |
| Pegcamotecan | Treatment of small cell lung cancer, and gastric adenocarci- |  | ble bowel syndrome and GERD |
| Perzinfotel | noma Treatment of neuropathic pain | Yttrium Y 90 Tacatuzumab | Tumor eradication via selective targeting of AFP-positive cancers by radiolabeled hAFP-31 |
| Plericixafor | Stem cell mobilization (CXCR4 receptor antagonist) |  |  |

## INDEX

This is a cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).
[Note—This index covers Vol. 30 No. 1, pp. 1-381]

## MONOGRAPHS

Acetaminophen and Aspirin Tablets (USP)
Tablets Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Phenylpropanolamine (USP)
Capsules Containing at Least Three of the FollowingAcetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Oral Powder Containing at Least Three of the FollowingAcetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Following-
Oral Solution Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Tablets Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Acetaminophen and Codeine Phosphate Capsules (USP)
Acetaminophen and Codeine Phosphate Oral Solution (USP)
Acetaminophen and Codeine Phosphate Oral Suspension (USP)
Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution (USP)
Acetaminophen and Diphenhydramine Citrate Tablets (USP)
Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets (USP) . . . . . . .
Acetaminophen Oral Solution (USP)
Acetaminophen Oral Suspension (USP)

## USP CATALOG

## New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

| Cat.No. | Description | Curr. <br> Lot | Price |
| :---: | :---: | :---: | :---: |
| 1002505 | Acesulfame Potassium (200 mg) | F0C136 | \$260 |
| 1012780 | Alendronate Sodium (200 mg) | F0B315 | \$156 |
| 1012939 | Allantoin (200 mg) | F0C169 | \$156 |
| 1019417 | Amifostine Disulfide (25 mg) | F0C152 | \$487 |
| 1028000 | Amitraz (200 mg) | F0C042 | \$156 |
| 1029953 | Ammonium Chloride (200 mg) | F0C134 | \$156 |
| 1043750 | Aspartame Acesulfame (200 mg) | F0C137 | \$156 |
| *1048619 | Benazepril Hydrochloride (125 mg) | F0C250 | \$156 |
| 1048620 | Benazepril Related Compound A ( 15 mg ) | F0C252 | \$487 |
| 1048630 | Benazepril Related Compound B ( 15 mg ) | F0C256 | \$487 |
| 1065618 | Betahistine Hydrochloride (200 mg) | F0C105 | \$156 |
| 1076363 | Brinzolamide (200 mg) | F0C034 | \$156 |
| 1076374 | Brinzolamide Related Compound A ( 50 mg ) | F0C033 | \$487 |
| 1076385 | Brinzolamide Related Compound B ( 50 mg ) | F0C035 | \$487 |
| *1078733 | Bupropion Hydrochloride (200 mg) | F0C123 | \$208 |
| 1097636 | Cefepime Hydrochloride (500 mg) | F0C063 | \$156 |
| 1097647 | Cefepime Hydrochloride System Suitability ( 25 mg ) | F0C095 | \$156 |
| 1103105 | Cetyl Palmitate (50 mg) | F0B241 | \$156 |
| *1111001 | Chlorhexidine (200 mg) | F0C306 | \$156 |
| *1111103 | Chlorhexidine Acetate (500 mg) | F0C281 | \$156 |
| 1133536 | Choline Bitartrate ( 200 mg ) | F0C057 | \$156 |
| 1133547 | Choline Chloride (200 mg) | F0C058 | \$156 |
| 1140247 | Clomipramine Hydrochloride ( 200 mg ) | F0C075 | \$156 |
| *1140349 | Clonazepam Related Compound C ( 25 mg ) | F0C340 | \$487 |
| *1140418 | Clonidine Related Compound A ( 25 mg ) | F0C373 | \$487 |
| 1142107 | Clozapine (100 mg) | F0C032 | \$260 |
| 1148500 | Copovidone ( 100 mg ) | F0C194 | \$156 |
| 1171900 | Desflurane ( 0.5 mL ) | F0C187 | \$156 |
| 1171910 | Desflurane Related Compound A ( 0.1 mL ) | F0C031 | \$487 |
| 1179708 | Dextran 40 (50 mg) | F0C247 | \$156 |
| 1179741 | Dextran 70 (50 mg) | F0C260 | \$156 |
| 1179854 | Dextran 4 Calibration (100 mg) | F0C002 | \$156 |
| 1179865 | Dextran 10 Calibration (100 mg) | F0C010 | \$156 |
| 1179876 | Dextran 40 Calibration (100 mg) | F0C011 | \$156 |
| 1179887 | Dextran 70 Calibration (100 mg) | F0C013 | \$156 |
| 1179898 | Dextran 250 Calibration (100 mg) | F0C039 | \$156 |
| 1204805 | Diloxanide Furoate (200 mg) | F0C026 | \$156 |
| 1213103 | Dinoprostone (50 mg) | F0C030 | \$1,525 |
| *1224959 | Dolasetron Mesylate (200 mg) | F0C319 | \$156 |
| *1224960 | Dolasetron Mesylate Related Compound A ( 25 mg ) | F0C321 | \$487 |
| 1225281 | Dorzolamide Hydrochloride ( 500 mg ) | F0C040 | \$156 |

| Cat.No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1225292 | Dorzolamide Hydrochloride Related Compound A ( 20 mg ) | F0C068 | \$487 |
| 1225419 | Doxazosin Mesylate ( $200 \mathrm{mg} \mathrm{)}$ | F0C079 | \$156 |
| *1234704 | Powdered Eleuthero Extract (1.5 g) | F0C291 | \$520 |
| 1234806 | Emedastine Difumarate ( 100 mg ) | F0C059 | \$156 |
| 1260012 | Ethinyl Estradiol Related Compound A ( 20 mg ) | F0B252 | \$487 |
| 1269458 | Fenoldopam Mesylate ( $200 \mathrm{mg} \mathrm{)}$ | F0C125 | \$156 |
| 1269469 | Fenoldopam Related Compound A ( 20 mg ) | F0C124 | \$487 |
| 1269470 | Fenoldopam Related Compound B $(20 \mathrm{mg})$ ( 20 mg ) | F0C126 | \$487 |
| 1273808 | Flumazenil ( 200 mg ) | F0C305 | \$780 |
| *1279837 | Fluoxetine Related Compound C ( 15 mg ) | F0C352 | \$487 |
| 1286060 | Formononetin ( 50 mg ) | F0C196 | \$520 |
| 1286366 | Fosphenytoin Sodium ( 250 mg ) | F0C156 | \$156 |
| 1287675 | Gadoversetamide ( $200 \mathrm{mg} \mathrm{)}$ | F0C172 | \$156 |
| 1287686 | Gadoversetamide Related Compound A ( 200 mg ) | F0C173 | \$487 |
| 1288306 | Ganciclovir (200 mg) | F0C287 | \$364 |
| *1288317 | Ganciclovir Related Compound A ( 15 mg ) | F0C288 | \$624 |
| 1288510 | Gemfibrozil Related Compound A ( 20 mg ) | F0C101 | \$487 |
| *1294207 | Glucosamine Hydrochloride ( 200 mg ) | F0C363 | \$156 |
| 1294976 | Glutamic Acid ( 200 mg ) | F0C069 | \$156 |
| 1295888 | Glycyrrhizic Acid (25 mg) | FOC006 | \$487 |
| 1315012 | Hydrocodone Bitartrate Related Compound A CII (70 mg) | F0C214 | \$513 |
| 1348907 | Isoflupredone Acetate ( $200 \mathrm{mg} \mathrm{)}$ | F0C109 | \$156 |
| 1355709 | Powdered Kava Extract (1 g) | F0C161 | \$260 |
| 1355753 | Kawain (200 mg) | F0C160 | \$208 |
| 1356020 | Ketamine Related Compound A ( 50 mg ) | F0C118 | \$487 |
| *1356836 | Lamivudine ( 200 mg ) | F0C361 | \$156 |
| 1356916 | Lansoprazole (200 mg) | F0B310 | \$156 |
| 1356927 | Lansoprazole Related Compound A ( 25 mg ) | F0B311 | \$487 |
| 1370906 | Lynestrenol ( 20 mg ) | F0B314 | \$203 |
| 1392454 | Meropenem ( 300 mg ) | F0C201 | \$182 |
| 1396309 | Metformin Hydrochloride (200 mg) | F0C209 | \$182 |
| 1396310 | Metformin Related Compound A ( 50 mg ) | F0C210 | \$487 |
| *1441232 | Metoprolol Related Compound A ( 20 mg ) | F0C343 | \$520 |
| *1441254 | Metoprolol Related Compound C ( 20 mg ) | F0C344 | \$520 |
| *1443850 | Powdered Milk Thistle Extract ( 250 mg ) | F0B321 | \$260 |
| 1443908 | Milrinone ( 500 mg ) | F0C050 | \$260 |
| 1443919 | Milrinone Related Compound A $(50 \mathrm{mg})$ | F0C051 | \$487 |
| 1449518 | Nabumetone (200 mg) | F0C072 | \$156 |
| 1471914 | Norgestimate (200 mg) | F0C086 | \$156 |
| 1478582 | Ondansetron Hydrochloride ( 300 mg ) | F0C222 | \$208 |
| 1478593 | Ondansetron Related Compound A ( 50 mg ) | F0C191 | \$487 |

## New Items at a Glance (Continued)

| Cat.No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1478618 | Ondansetron Related Compound C ( 50 mg ) | F0C251 | \$487 |
| 1478629 | Ondansetron Related Compound D ( 50 mg ) | F0C226 | \$487 |
| 1482207 | Oxaprozin (200 mg) | F0C115 | \$156 |
| 1483301 | Oxfendazole (200 mg) | F0C128 | \$156 |
| 1491332 | Paclitaxel ( 200 mg ) | F0C180 | \$1,508 |
| 1491343 | Paclitaxel Related Compound A (20 mg) | F0C179 | \$754 |
| 1491354 | Paclitaxel Related Compound B (20 mg) | F0C181 | \$754 |
| 1500251 | Paroxetine Related Compound D ( 15 mg ) | F0C228 | \$487 |
| 1535019 | Phenytoin Related Compound A ( 50 mg ) | F0C155 | \$487 |
| *1535020 | Phenytoin Related Compound B ( 50 mg ) | F0C157 | \$487 |
| 1546106 | Poloxalene (500 mg) | F0C009 | \$156 |
| 1593412 | Quinapril Related Compound A ( 50 mg ) | F0C114 | \$487 |
| 1593423 | Quinapril Related Compound B ( 50 mg ) | F0C116 | \$487 |
| *1596807 | Quinine Hydrochloride Dihydrate $(1 \mathrm{~g})$ | F0C108 | \$156 |
| 1598303 | Ramipril (200 mg) | F0C099 | \$156 |
| 1598314 | Ramipril Related Compound A ( 20 mg ) | F0C100 | \$487 |
| 1599500 | Powdered Red Clover Extract ( 500 mg ) | F0C188 | \$260 |
| *1604508 | Rimantadine Hydrochloride ( 300 mg ) | F0C266 | \$156 |
| 1610090 | Scopoletin (20 mg) | F0C329 | \$156 |
| 1612540 | Sevoflurane (1 mL) | F0C219 | \$156 |
| 1612550 | Sevoflurane Related Compound A ( 0.2 mL ) | F0C261 | \$487 |
| 1614669 | Sodium Starch Glycolate (400 mg) | F0C087 | \$156 |
| 1617408 | Sotalol Hydrochloride (300 mg) | F0C234 | \$182 |
| 1617419 | Sotalol Related Compound A ( 50 mg ) | F0C235 | \$487 |
| 1617420 | Sotalol Related Compound B ( 50 mg ) | F0C236 | \$487 |
| 1617430 | Sotalol Related Compound C ( 50 mg ) | F0C237 | \$487 |
| 1621507 | Stearoyl Polyoxyglycerides ( 100 mg ) | F0C286 | \$156 |
| 1642154 | Sumatriptan (50 mg) | F0C220 | \$208 |

| Cat.No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1642201 | Sumatriptan Succinate ( 200 mg ) | F0C231 | \$208 |
| 1642212 | Sumatriptan Succinate Related Compound A (15 mg) | F0C221 | \$624 |
| 1642223 | Sumatriptan Succinate Related Compound C ( 50 mg ) | F0C230 | \$624 |
| 1642700 | Tacrine Hydrochloride ( 500 mg ) | F0C119 | \$156 |
| 1643361 | Taurine ( 100 mg ) | F0C104 | \$156 |
| 1643452 | Terazosin Hydrochloride ( 200 mg ) | F0C244 | \$156 |
| 1643463 | Terazosin Related Compound A ( 50 mg ) | FOC245 | \$487 |
| 1643474 | Terazosin Related Compound B ( 50 mg ) | F0C218 | \$487 |
| 1643485 | Terazosin Related Compound C $(25 \mathrm{mg})$ | F0C257 | \$487 |
| 1652500 | Thalidomide ( 200 mg ) | F0C107 | \$182 |
| 1667290 | Tiamulin Fumarate ( $250 \mathrm{mg} \mathrm{)}$ | F0C327 | \$156 |
| *1667337 | $\begin{aligned} & \text { Tiamulin Related Compound A } \\ & (50 \mathrm{mg}) \end{aligned}$ | F0C328 | \$494 |
| 1667359 | Tiletamine Hydrochloride (200 mg) | F0C019 | \$156 |
| 1667520 | Tinidazole ( 200 mg ) | F0C093 | \$156 |
| 1667530 | Tinidazole Related Compound A ( 100 mg ) | F0C091 | \$487 |
| 1703805 | Tylosin (250 mg) | F0C008 | \$156 |
| 1706701 | Urea C $13(100 \mathrm{mg}$ ) | F0C078 | \$182 |
| 1708773 | Valsartan Related Compound A (20 mg) | F0C215 | \$624 |
| 1708795 | Valsartan Related Compound C ( 10 mg ) | F0C208 | \$624 |
| 1711461 | Verteporfin (200 mg) | F0C166 | \$156 |
| 1711472 | Verteporfin Related Compound A ( 50 mg ) | F0C167 | \$487 |
| 1714506 | Vinorelbine Tartrate (200 mg) | F0C243 | \$156 |
| 1714528 | Vinorelbine Related Compound A ( 25 mg ) | F0C242 | \$487 |
| 1717708 | Vitexin ( 30 mg ) | F0C142 | \$520 |
| 1724656 | Zileuton ( 150 mg ) | F0C062 | \$156 |
| 1724667 | Zileuton Related Compound A ( 50 mg ) | F0B316 | \$487 |
| 1724678 | Zileuton Related Compound B ( 50 mg ) | F0B313 | \$487 |
| 1724689 | Zileuton Related Compound C ( 50 mg ) | F0B299 | \$487 |

## USING AND ORDERING USP REFERENCE STANDARDS

## Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the United States Pharmacopeia-National Formulary (USP-NF). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the $U S P-N F$. The Reference Standards also lend themselves to many other applications, including measurements required to attain accurate and reproducible results in modern chromatographic and spectrophotometric methods.

## Rigorous Testing and Quality Control

USP Reference Standards are selected for their high purity, critical characteristics, and suitability for the intended purpose. Unless a USP Reference Standard label states a specific potency or content, the USP Reference Standard is taken as being $100 \%$ pure for the USP purposes for which it is provided.

Heterogeneous substances, of natural origin, are also designated "Reference Standards" where needed. Usually these are the counterparts of international standards.

USP Reference Standards are established through a process of rigorous testing, evaluation, and quality control (See page 6 for a process overview). They are independently tested in three or more laboratories-USP, FDA, and academic and industrial laboratories throughout the United States. The Reference Standards are released under the authority of USP's Board of Trustees, on the recommendation of the USP Reference Standards Expert Committee, which approves selection and suitability of each lot.

## Reference Standards Categories

USP offers more than 1,510 Reference Standards for pharmaceuticals, excipients, and dietary supplements. On pages 12-50 of this catalog, you'll find a full list of available USP and NF Reference Standards, with information updated through Nov. 2003. The list includes:

- Reference Standards required by the current official edition of $U S P-N F$.
- Reference Standards not required in the current $U S P-N F$, but for which sufficient demand remains.
- Reference Standards specified in the current edition of the Food Chemicals Codex (FCC).
- Authentic Substances (AS)—highly purified samples of chemicals, including substances of abuse, required by analytical, clinical, pharmaceutical, and research laboratories.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration (DEA) of the U.S. Department of Justice.

USP also collaborates with the World Health Organization in its program to provide international biological standards and chemical reference materials for antibiotics, biologicals, and chemotherapeutic agents. Some USP Reference Standards are standardized in terms of the corresponding international standards.

## Proper Use of USP Reference Standards

USP Reference Standards are provided primarily for quality control use in conducting the pharmacopeial assays and tests described in the $U S P-N F$. Neither Reference Standards nor Authentic Substances are intended for use as drugs, dietary supplements, or medical devices.

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Users of USP Reference Standards should refer to General Chapter $\langle 11\rangle$ in the $U S P-N F$ :

## Listing and directions in USP-NF

- Refer to the list of revisions, additions, and deletions of individual USP Reference Standards in USP 27-NF 22. Individual $U S P$ or $N F$ monographs specify the USP Reference Standard(s) required for assay and test procedures. The USP 27-NF 22 General Test Chapter $\langle 11\rangle$ USP Reference Standards provides additional information and instructions for proper use and storage. Note that if specific instructions for use appearing on the label of a USP Reference Standard differ from the instructions in Chapter $\langle 11\rangle$, the instructions on the label take precedence.
- Consult the cumulative updates to Reference Standards information provided in USP-NF Supplements and also in $U S P-N F$ Interim Revision Announcements, which are published in USP's bimonthly journal, Pharmacopeial Forum.

## Suitability for use

- The user must ascertain that the Reference Standards they are using are an official lot.
- The user must determine the suitability of Reference Standards for applications and uses not in the $U S P-N F$.

## USING AND ORDERING USP REFERENCE STANDARDS

## Storing

- Ensure that the USP Reference Standards are stored in their original stoppered containers, according to any special label directions, away from heat and humidity, and protected from light.

## Weighing

- Ensure that Reference Standard substances are accurately weighed-taking due account of relatively large errors potentially associated with weighing small masses-where it is directed that a standard solution or a standard preparation be prepared for a quantitative determination. See USP 27-NF 22 General Chapters $\langle 41\rangle$ Weights and Balances and $\langle 31\rangle$ Volumetric Apparatus, and USP-NF General Notices, for information regarding appropriate use of USP Reference Standards.

## Drying

- Use a clean and dry vessel, and not the original container, as the drying vessel where a USP Reference Standard is required to be dried before use.
- Make sure not to dry a specimen repeatedly at temperatures above 25 degrees.
- Follow any special drying requirements specified on the Reference Standards label or in specific sections of USP or NF monographs (note that any specific instructions on the label or in the monograph supersede the usual instructions in Procedures under Tests and Assays in USP-NF General Notices).
- Follow Method I under $U S P-N F$ General Chapter $\langle 921\rangle$ Water Determination where the titrimetric determination of water is required at the time a Reference Standard is to be used.
Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, users must titrate about 50 mg of the Reference Standard with a fourfold dilution of the reagent.

## ORDERING USP REFERENCE STANDARDS

## Four convenient ways to order

1. Phone: Call USP with your requirements: (800) 227-8772 from the U.S. or Canada and (301) 881-0666 from other countries. Please note that DEA controlled substances cannot be placed over the phone.

Hours of operation:
Monday-Friday
8:30AM-6:00PM

Fax: Fax your orders to (301) 816-8148.
Online: Order through the World Wide Web at
http://www.usp.org/products. Please note that DEA controlled substances cannot be ordered online.
Mail: Send all mail orders to:
U.S. Pharmacopeia

Customer Service Department
12601 Twinbrook Parkway
Rockville, MD 20852, USA

## Important Order/Policy Information

For fax and mail orders, please use the order form at the back of this catalog. Official purchase orders on company letterhead may also be used to order USP Reference Standards. The purchase orders must have billing and shipping addresses and should include the catalog number, the name of the official Reference Standard, and the number of units ordered. Lot numbers need not be specified on written purchase orders as USP only ships current official lots. Confirmation orders may be sent and must clearly be designated as such. The USP does not assume responsibility for duplication of orders not clearly marked as confirmation orders.

## Pricing

USP Reference Standards must be ordered in whole units. Please note that one unit may include several individual containers.

Reference Standards unit prices included in the product listings from pages $12-50$ of this catalog are effective until December 31, 2003. Please note that prices and package sizes are subject to change without notice.

## No Returns or Exchanges

USP Reference Standards may not be returned or exchanged for refund.

## Quantity Discounts

A 5\% discount is allowed for 5-24 units of any one Reference Standard in a single order, and a $10 \%$ discount for 25 or more units of any one Reference Standard in a single order. These discounts are subject to change without notice.

## Shipping

- Reference Standards orders can only be shipped to a street address and not to P.O. boxes.

## USING AND ORDERING USP REFERENCE STANDARDS

- Orders to the U.S. and Ontario, Canada are shipped via air courier of USP's choice at a charge of $\$ 11$ or via air courier of the customer's choice at an additional $\$ 25$ charge.
- Non-controlled substance orders to Canadian provinces other than Ontario are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Non-controlled substance orders to be shipped outside the U.S. and Canada are accepted directly by USP only when customs forms related to export are not required. They are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Shipping in cold pack can be done at customer request for an extra charge of \$25.
- Controlled substance orders to anywhere outside the U.S. are shipped via air courier of USP's choice with a charge of U.S. $\$ 220$.
- An additional shipping charge may be assessed for dangerous goods shipments.
- An additional shipping charge of $\$ 75$ will be assessed for rush/ same-day shipments.
- Customers may provide their shipping account numbers to have shipping charged directly.

## Payment

- Full payment in advance, in U.S. dollars, is required for all U.S. orders unless open account status has been granted by USP's Finance Department. To apply for open account status, an application can be requested by calling (301) 816-8177.
- Full payment in advance, in U.S. dollars, is required for all non-U.S. orders.
- Payment may be made by check, money orders, credit cards (VISA, MasterCard, American Express), and electronic wire transfer (please call (301) 816-8177 to get bank information for wire transfers). The customer is responsible for any bank fees and must include it in the payment. The customer is also responsible for any other fees such as customs duties, taxes, or tariffs.

## List Chemicals

The following Reference Standards are "List Chemicals": Dihydroergotamine Mesylate
*Ephedrine Sulfate
Ergonovine Maleate

[^35]Ergotamine Tartrate<br>Methylergonovine Maleate<br>Phenylpropanolamine Bitartrate<br>Phenylpropanolamine HCl<br>Pseudoephedrine HCl<br>Pseudoephedrine Sulfate

An organization in the United States seeking to purchase a List Chemical Reference Standard for resale to another customer must have a DEA registration (either a controlled substance or List Chemical registration). If an organization in the United States is purchasing the List Chemical Reference Standard for its own analytical use, it must provide USP with a letter on company letterhead describing the reason for the purchase.

## CONTROLLED DRUG SUBSTANCE ORDER

## DEA Requirements (U.S. Orders)

For all orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped within the U.S., a copy of the customer's current DEA Registration Certificate must be on file with USP. To order Schedule I and II standards, customers must submit, with their order forms or purchase orders, a DEA Form 222-C, properly completed. In addition, customers ordering DEA Schedules III and IV must provide appropriate DEA registration numbers for those schedules on their order forms or purchase orders.

## DEA Requirements (International Orders)

For all international controlled drug substance orders, please contact Julie Smith at (301) 816-8164 or foreigncontrols@ usp.org.

All orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped outside the U.S. must be accompanied by:

1. Full payment.
2. An import permit (in English or with an English translation attached) valid at least 6 months from the date of its receipt by USP Customer Service.
3. A statement of non-reexport and use for medical or scientific purposes (in English or with an English translation attached).
4. Purchase Order or Price Quote given by USP.

## USING AND ORDERING USP REFERENCE STANDARDS

On receiving the order, USP takes 2-3 business days to:

- Review all documents to make sure they are adequate and appropriate.
- Complete and legally approve the required DEA forms.
- Forward the forms to the DEA office to obtain the necessary Export Permits.

USP cannot ship items without an Export Permit. While it typically takes 6-10 weeks to get the permit from the DEA, USP has no control over the time in which permits are issued. On receiving the Export Permit, USP completes processing of the order in 1-3 days and ships out the materials through its freight forwarder.

Controlled substances (CI, CII, CIII, CIV, CV) shipped to an international address, including Canada, add $\$ 25$ per unit.

For controlled substance orders to be shipped to Mexico, in addition to the DEA processing period, an additional week is required to obtain a certificate from the Mexican Embassy, authorizing the shipment to enter the country. Customers will pay an additional $\$ 114$ to cover the fee charged by the Mexican Embassy per import permit.

## Back Orders

USP will ship a back-ordered item if that item becomes available within 30 days of the date the order is placed if there is a valid open P.O. or payment for the item. If the order is more than 30 days old when the item becomes available, the customer will receive a Notice of Availability (NOA), indicating that the item is available. Such items will be shipped only after USP receives written authorization by the customer. The order will be canceled if the Reference Standard does not become available within six months of the original order. NOAs not replied to within 45 days of generation will be cancelled, and the customer account will be credited appropriately.

Customers may send confirmation orders for back-ordered Reference Standards that subsequently become available. They must clearly designate the confirmation orders as such-USP is not responsible for duplication of orders not clearly designated.

## HOW TO READ PRODUCT LISTINGS

Column 1 (Catalog Number): Catalog number currently assigned to each Reference Standard and Authentic Substance. Please include this number in your orders.

Column 2 (Former Catalog Number): Catalog numbers assigned prior to July 2002. These numbers are provided for your convenience so you can easily cross-reference current numbers against your earlier orders.

Column 3 (Description): Product description as designated in $U S P-N F$, the product label, and / or the Drug Enforcement Administration Control Schedule, as applicable. The quantity of material per container follows the name in parentheses (all materials are in single containers unless otherwise specified).

Column 4 (Current Lot): Current lot designation of each official item being distributed as of the date of this catalog. If the current lot is blank, the item is not in distribution.

Column 5 (Change Code): Codes that identify any change in USP Reference Standards status or information since the Nov./Dec. 2003, official Catalog. Code interpretations are as follows:

| Change <br> Code | Interpretation |
| :---: | :--- |
| 1 | New Reference Standard |
| 2 | New lot |
| 3 | Change in package size or description |
| 4 | Correction of typographical error |
| 5 | New catalog number-use for all orders |
| 6 | Previous lot no longer official; only <br> current lot to be used |
| 7 | Valid use date of previous lot extended <br> 8 |
| Change in catalog number and / or name, <br> see cross-reference section |  |
| 9 | Discontinued |

Column 6 (Previous Lot/Valid Use Date): Identifies lots no longer being distributed. The indicated month and in parenthesis indicates the date (last day of the month) through which that lot was valid as an official USP Reference Standard. (e.g. "F-1 (06/ 00 )" means lot F-1 is no longer being distributed, but was considered official through June 30, 2000.)

Column 7 (CAS Number) ${ }^{*}$ : Chemical Abstracts Service number, when available, for USP Reference Standards and Authentic Substances. In case of mixtures, typically, the CAS number of the analyte of interest is listed.

Column 8 (Price) lists the price of the reference standard.

[^36]
## New Lots in Distribution

| Cat. <br> No. | Description | Curr. <br> Lot. | Change Code* | Previous Lot/Valid Use Date | $\begin{array}{\|l} \hline \text { CAS } \\ \text { No. } \\ \hline \end{array}$ | Price |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1048619 | Benazepril Hydrochloride ( 125 mg ) | F0C250 | 1 |  | [86541-74-4] | \$156 |
| 111001 | Chlorhexidine ( 200 mg ) | F0C306 | 1 |  | [55-56-1] | \$156 |
| 111103 | Chlorhexidine Acetate ( 500 mg ) | F0C281 | 1 |  | [56-95-1] | \$156 |
| 1140349 | Clonazepam Related Compound C (25 mg) (2-Bromo-2'-(2-chloroben-zoyl)-4'-nitroacetanilide) | F0C340 | 1 |  | n/f | \$487 |
| 1140418 | Clonidine Related Compound A (25 mg) (Acetylclonidine) | F0C373 | 1 |  | [54707-71-0] | \$487 |
| 1224959 | Dolasetron Mesylate ( $200 \mathrm{mg} \mathrm{)}$ | F0C319 | 1 |  | [115956-13-3] | \$156 |
| 1224960 | Dolasetron Mesylate Related Compound A ( 25 mg ) (Hexahydro-8-hydroxy-2,6-methano-2H-quinolizin-3(4H)-one hydrochloride) | F0C321 | 1 |  | n/f | \$487 |
| 1234704 | Powdered Eleuthero Extract (1.5 g) | F0C291 | 1 |  | [84696-12-5] | \$520 |
| 1279837 | Fluoxetine Related Compound C (15 mg) (N-Methyl-N-[3-phenyl-3-(4-trifluoromethyl-phenoxy)-propyl]-succinamic acid) | F0C352 | 1 |  | n/f | \$487 |
| 1288317 | Ganciclovir Related Compound A (15 mg) ((RS)-2-Amino-9-(2,3-dihy-droxy-propoxymethyl)-1,9-dihydro-purin-6-one) | F0C288 | 1 |  | n/f | \$624 |
| 1294207 | Glucosamine Hydrochloride ( 200 mg ) | F0C363 | 1 |  | [66-84-2] | \$156 |
| 1356836 | Lamivudine ( 200 mg ) | F0C361 | 1 |  | [134678-17-4] | \$156 |
| 1441232 | Metoprolol Related Compound A (20 mg) ((+/-)1-(ethylamino)-3-[4-(2-methoxyethyl)phenoxy]-propan-2-ol) | F0C343 | 1 |  | n/f | \$520 |
| 1441254 | Metoprolol Related Compound C (20 mg) ((+/-)4-[2-Hydroxy-3-(1-methylethyl)aminopropoxy]benzaldehyde) | F0C344 | 1 |  | n/f | \$520 |
| 1535020 | Phenytoin Related Compound B ( 50 mg ) (alpha-((aminocarbonyl)ami-no)-alpha-phenyl benzeneacetic acid) | F0C157 | 1 |  | [6802-95-5] | \$487 |
| 1604508 | Rimantadine Hydrochloride ( 300 mg ) | F0C266 | 1 |  | [1501-84-4] | \$156 |
| 1610090 | Scopoletin (20 mg) | F0C329 | 1 |  | [92-61-5] | \$156 |
| 1667290 | Tiamulin Fumarate ( 250 mg ) | F0C327 | 1 |  | [55297-96-6] | \$156 |
| 1667337 | Tiamulin Related Compound A (50 mg) (Tosyl pleuromutilin) | F0C328 | 1 |  | n/f | \$494 |
| 1019803 | Aminobenzoic Acid (200 mg) (p-aminobenzoic acid) | H1C083 | 2 | $\begin{array}{\|l} \hline H(10 / 04) \\ G(10 / 00) \\ \hline \end{array}$ | [150-13-0] | \$156 |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1619006 | Spironolactone ( 125 mg ) | J-1 |  |  | [52-01-7] | \$124 |
| 1619505 | Squalane ( 500 mg ) | G-1 |  |  | [111-01-3] | \$156 |
| 1620005 | Stanozolol CIII (200 mg) | F-3 |  | F-2 (02/01) | [10418-03-8] | \$207 |
| 1621008 | Stearic Acid ( 500 mg ) | J |  | I (10/01) | [57-11-4] | \$156 |
| 1621507 | Stearoyl Polyoxyglycerides (100 mg) | F0C286 |  |  | n/f | \$156 |
| 1622000 | Stearyl Alcohol ( 125 mg ) | H-1 |  | H (09/99) | [112-92-5] | \$124 |
| 1623003 | Streptomycin Sulfate ( $200 \mathrm{mg} \mathrm{)}$ | J0B195 |  | I (04/03) | [3810-74-0] | \$156 |
| 1623502 | Succinylcholine Chloride ( 500 mg ) | H |  |  | [71-27-2] | \$156 |
| 1623604 | Succinylmonocholine Chloride ( 150 mg ) | G |  | F-1 (02/01) | n/f | \$487 |
| 1623626 | Sucralose ( 400 mg ) | G0B028 |  | F (04/03) | [56038-13-2] | \$156 |
| 1623637 | Sucrose ( 100 mg ) | H0B002 |  | $\begin{aligned} & \text { G-1 (03/03) } \\ & \text { G (05/99) } \end{aligned}$ | [57-50-1] | \$156 |
| 1623648 | Sufentanil Citrate ClI (25 mg) | H0B208 |  | $\begin{aligned} & \text { G (05/03) } \\ & \text { F-1 (04/02) } \\ & F(09 / 99) \\ & \hline \end{aligned}$ | [60561-17-3] | \$207 |
| 1623670 | Sulbactam ( 250 mg ) | G |  | F-1 (05/00) | [68373-14-8] | \$156 |
| 1623681 | Sulconazole Nitrate ( 200 mg ) | F-1 |  | F (05/02) | [61318-91-0] | \$156 |
| 1623706 | Sulfabenzamide (200 mg) | G |  |  | [127-71-9] | \$156 |
| 1623808 | Sulfacetamide ( 300 mg ) | G-1 |  |  | [144-80-9] | \$156 |
| 1624006 | Sulfacetamide Sodium ( 500 mg ) | 11B318 | 2 | $\begin{array}{\|l\|} \hline \text { I (09/04) } \\ H(08 / 01) \\ \hline \end{array}$ | [6209-17-2] | \$156 |
| 1624505 | Sulfachlorpyridazine ( 200 mg ) | F |  |  | [80-32-0] | \$156 |
| 1625009 | Sulfadiazine ( 200 mg ) | J | 2,4 | $1(03 / 04)$ | [68-35-9] | \$156 |
| 1626001 | Sulfadimethoxine ( 200 mg ) | F-3 |  | F-2 (03/99) | [122-11-2] | \$156 |
| 1626500 | Sulfadoxine ( 200 mg ) | F-2 |  | F-1 (07/02) | [2447-57-6] | \$156 |
| 1628007 | Sulfamerazine ( 1 g ) | H |  |  | [127-79-7] | \$156 |
| 1629000 | Sulfamethazine (1 g) | G-3 |  |  | [57-68-1] | \$156 |
| 1630009 | Sulfamethizole (200 mg) | F-3 |  | F-2 (01/03) | [144-82-1] | \$156 |
| 1631001 | Sulfamethoxazole ( 200 mg ) | I-1 |  | I (04/02) | [723-46-6] | \$156 |
| 1631500 | Sulfamethoxazole N4-glucoside ( 25 mg ) | H |  | G (11/01) | n/f | \$487 |
| 1632004 | Sulfanilamide (5 g) | O0B047 |  | $\mathrm{N}(01 / 04)$ | [63-74-1] | \$156 |
| 1633007 | Sulfanilamide Melting Point Standard ( 500 mg ) (Approximately 165 degrees) | K0B133 |  | $\begin{aligned} & \hline \mathrm{J}-1(03 / 04) \\ & \mathrm{J}(09 / 99) \\ & \hline \end{aligned}$ | [63-74-1] | \$75 |
| 1633506 | Sulfanilic Acid ( 200 mg ) | G |  | F-2 (09/00) | [121-57-3] | \$487 |
| 1634000 | Sulfapyridine (200 mg) | IOB298 |  | H (07/04) | [144-83-2] | \$156 |
| 1635002 | Sulfapyridine Melting Point Standard (1 g) (Approximately 191 degrees) | J |  | I (07/00) | [144-83-2] | \$92 |
| 1635206 | Sulfaquinoxaline ( 200 mg ) | F0A005 |  |  | [59-40-5] | \$156 |
| 1636005 | Sulfasalazine ( 125 mg ) | G-2 |  | G-1 (06/99) | [599-79-1] | \$124 |
| 1636504 | Sulfathiazole ( 350 mg ) | H |  | G (08/00) | [72-14-0] | \$156 |
| 1637008 | Sulfinpyrazone ( 200 mg ) | G |  |  | [57-96-5] | \$156 |
| 1638000 | Sulfisoxazole (200 mg) | $J$ |  | I-1 (06/99) | [127-69-5] | \$156 |
| 1639003 | Sulfisoxazole Acetyl ( 200 mg ) | H-1 |  |  | [80-74-0] | \$156 |
| 1640002 | Sulfisoxazole Diolamine ( 500 mg ) | F |  |  | [4299-60-9] | \$156 |
| 1642008 | Sulindac ( 200 mg ) | H |  | G-1 (12/01) | [38194-50-2] | \$156 |
| 1642154 | Sumatriptan ( 50 mg ) | F0C220 |  |  | [103628-46-2] | \$208 |
| 1642201 | Sumatriptan Succinate ( 200 mg ) | F0C231 |  |  | [103628-48-4] | \$208 |
| 1642212 | Sumatriptan Succinate Related Compound A (15 mg) ([3-[2-(dimeth-ylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1H-indol-5-yl]methyl]-1H-indol-5-yl]-N-methylmethansulfonamide, succinate salt) | F0C221 |  |  | n/f | \$624 |

## USP Reference Standards and Authentic Substances

| Cat. No. | Description | Curr. <br> Lot. | Change Code* | Previous Lot/Valid Use Date | CAS <br> No. | Price |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1642223 | Sumatriptan Succinate Related Compound C ( 50 mg ) ([3-[2-(dimeth-ylamino)ethyl]-1-(hydroxymethyl)-1H-indol-5-yl]-N-methylmethanesulfonamide succinate salt) | F0C230 |  |  | n/f | \$624 |
| 1642507 | Suprofen (200 mg) | F |  |  | [40828-46-4] | \$156 |
| 1642700 | Tacrine Hydrochloride ( 500 mg ) | F0C119 |  |  | [1684-40-8] | \$156 |
| 1643000 | Talbutal CIII (250 mg) | F |  |  | [115-44-6] | \$207 |

http://www.usp.org
Pharmacopeial Forum is covered in Current Contents/Life Sciences and in the Science Citation Index (SCI), in International Pharmaceutical Abstracts, and in Current Awareness in Biological Sciences.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

## Moving?

Our subscribers' records and publication labels are computergenerated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, PF Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852. Fax: (301) 816-8148.

## STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through Pharmacopeial Forum $(P F)$, for the development of official pharmaceutical standards.

USP publishes Pharmacopeial Forum ( $P F$ ) bimonthly as the working vehicle of the USP Council of Experts. PF provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the United States Pharmacopeia and the National Formulary (USP-NF).
$P F$ includes the following:

1. Potential revisions-entirely new standards, revision ideas, and drafts not yet targeted for official adoption (Pharmacopeial Previews)
2. Proposed revisions - new or revised standards targeted for official adoption (In-Process Revision)
3. Adopted revisions-new or revised standards that become official and binding before the publication of the next $U S P$ NF or Supplement (Interim Revision Announcement)
USP welcomes comments and data on potential, proposed, or official standards. ${ }^{*}$ Comments, along with USP's responses, will be published either in PF Briefings, the Commentary section of $P F$, the Commentary section of Supplements to USP-NF, or the Commentary section of $U S P-N F$.
[^42]The chart below shows the public review and comment process and its relationship to standards development.

# Public Review and Comment Process for Standards Development 

Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

## HOW TO USE PF

This section provides descriptions of the various parts of $P F$. It also includes Committee Designations and the Staff Directory.

The contents of the different sections of $P F$ are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the Staff Directory) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

| Section | Content | How Readers Can Respond |
| :---: | :---: | :---: |
| Pharmacopeial <br> Previews <br> Early ideas for revisions | -Briefing: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: <br> - the controversial nature of an item; <br> - the application of new technologies that require further study; and <br> - articles produced by multiple sources. | Review drafts and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview. |
| In-Process Revision Revisions targeted for adoption | -Briefing: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see Standards Development). New or revised text is marked with symbols ( ${ }^{\square}$ or ) to specify the tentative earliest date on which the revision would be officially adopted. | Review material and send comments promptly to USP staff liaison (see the Staff Directory). Guidelines on how to comment are found at the end of the Policies and Announcements section. |
| Harmonization <br> Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally | - Briefing: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under Pharmacopeial Previews or under In-Process Revision, both separate sections of Harmonization. <br> -For In-Process Revision, new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted. | Review material and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview or In-Process Revision. |
| Interim Revision <br> Announcement <br> Adopted standards | Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ${ }^{\circ}$. | Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance. |

## Other Sections

## Committee Designations

Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

## Staff Directory

Names of all USP scientific staff liaisons with contact information.

## Policies and Announcements

- General scientific and policy issues affecting $U S P-N F$ standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

## Stimuli to the Revision Process

- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

## Nomenclature

- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the USP Dictionary of USAN and International Drug Names
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

## Index

Cumulative directory for the content of all issues of $P F$ beginning with $P F 30(1)$.

## Reference Standards Catalog

List of official USP Reference Standards specified in $U S P-N F$, along with availability and ordering information.

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

Update of chromatographic reagents based on the proposals published in this issue of $P F$.

## EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

| AER | Aerosols |
| :--- | :--- |
| AMB | Analytical Microbiology |
| BBP | Blood and Blood Products |
| BNA | Bioavailability and Nutrient Absorption |
| BNT | Biotechnology and Natural Therapeutics and Diagnostics |
| BPC | Biopharmaceutics |
| BST | Biostatistics |
| CRX | Compounding Pharmacy |
| DSB | Dietary Supplements-Botanicals |
| DSI | Dietary Supplements-Information |
| DSN | Dietary Supplements-Non-Botanicals |
| EMC | Excipient Monograph Content ${ }^{\dagger}$ |
| ESC | Excipients-Substances and Characterization ${ }^{\dagger}$ |
| ETM | Excipients-Test Methods |
| GCT | Gene Therapy, Cell Therapy, and Tissue Engineering |
| GTB | General Toxicity and Biocompatibility |
| NL | Nomenclature and Labeling |
| PA1 | Pharmaceutical Analysis 1 |
| PA2 | Pharmaceutical Analysis 2 |
| PA3 | Pharmaceutical Analysis 3 |
| PA4 | Pharmaceutical Analysis 4 |
| PA5 | Pharmaceutical Analysis 5 |
| PA6 | Pharmaceutical Analysis 6 |
| PA7 | Pharmaceutical Analysis 7-Antibiotics |
| PDF | Pharmaceutical Dosage Forms |
| PPC | Parenteral Products-Compounding and Preparation |
| PPI | Parenteral Products-Industrial |
| PSD | Packaging, Storage, and Distribution |
| PW | Pharmaceutical Waters |
| RMI | Radiopharmaceuticals and Medical Imaging |
| SMU | Safe Medication Use |
| VET | Veterinary Drugs |
| VVI | Vaccines, Virology, and Immunology |
|  |  |

[^43]
## STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

## POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on $U S P-N F$ standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

NOTICE OF REVISION PERTAINING TO THE PACKAGING AND STORAGE STATEMENTS FOR EXCIPIENT ARTICLES. Changes in the Packaging and Storage sections of the following excipient monographs will appear in Pharmacopeial Forum 30(3) [May-June 2004].

This will apply to the following new excipient monographs, which became official in USP27-NF22: Ammonium Sulfate, Candelilla Wax, Cetrimonium Bromide, Hydrogenated Cottonseed Oil, Tribasic Sodium Phosphate, Glyceryl Distearate, Glyceryl Monolinoleate, and Glyceryl Monooleate.

It will also apply to the following new and revised excipient monographs, which will become official in the First Supplement to USP27-NF22: Dibutyl Phthalate, Diethylene Glycol Stearates, Ethylene Glycol Stearates, Hydrogenated Soybean Oil, Hymetellose, Low-Substituted Carboxymethylcellulose Sodium, Medium-Chain Triglycerides, Polyisobutylene, Sodium Cetostearyl Sulfate, Sorbitol, Sorbitol Solution, Maltitol Solution, and Noncrystallizing Sorbitol Solution.

As well, it will apply to the following official excipient monographs for which revision proposals are currently presented in Pharmacopeial Forum: Pregelatinized Starch and Tapioca Starch.

Lastly, the Committee wishes to apply this principle to proposed new excipient monographs for which revision proposals are currently presented in Pharmacopeial Forum: Copovidone, Modified Starch, Pregelatinized Modified Starch, Maltose, Anhydrized Liquid Sorbitol, Phenolsulfonphthalein, and Hypromellose Acetate Succinate.
For more information, please contact Catherine Sheehan at 301-816-8262 or cxs@usp.org.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE USP-NF. We are pleased to announce the availability of the USP Guideline for Submitting Requests for Revision to the $U S P-N F$. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Barbara B. Hubert, Director, Pharmacopeial Education, BBH@usp.org, 301-816-8333, or Diana Lenahan, Program Associate, DPL@ usp.org, 301-816-8530. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2004

| Date | Name of course | Location |
| :---: | :---: | :---: |
| March 22 and 23 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| March 24 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| April 1 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| April 21 and 22 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| May 19 | Standards 100: Fundamentals of the Use of $U S P$ $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| May 20 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| June 10 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| July 19 and 20 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| August 10 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| August 11 | Standards 100: Fundamentals of the Use of $U S P$ $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| August 12 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| October 14 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| October 18 and 19 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| November 11 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| November 11 | Standards 100: Fundamentals of the Use of $U S P$ $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| November 12 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| November 12 | Fundamentals of Dissolution (Lecture) | USP Headquarters, Rockville, MD |
| December 2 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| December 8 | Standards 100: Fundamentals of the Use of $U S P$ $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| December 9 | Standards 101: Advanced Use of $U S P-N F$, General Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |

VISIT THE USP WEB SITE AT 〈http://www.usp.org〉. Various resources related to Pharmacopeial standards are presented, including highlights from $P F$.

## $\boldsymbol{U S P}-\boldsymbol{N F}$ AVAILABLE IN THREE ELECTRONIC

FORMATS. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats- CD , intranet, and online. The CD is ideal for single users who prefer to have $U S P-N F$ on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official $U S P-N F$ content. More information can be
obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

CHROMATOGRAPHIC REAGENTS NOW AVAILABLE. Chromatographic Reagents lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in Pharmacopeial Forum ( $P F$ ) since 1980. Chromatographic Reagents also helps to track which column reagents were used to validate methods that have become official and are included in $U S P-N F$. The branded column reagents list is updated bimonthly through Pharmacopeial Forum. Chromatographic Reagents can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European Pharmacopoeia Commission B.P. 907

F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division Pharmaceutical and Medical Safety Bureau Ministry of Health, Labour and Welfare, Japan Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a $P F$ should be submitted to the appropriate USP scientific staff liaison identified at the end of the Briefing accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the Staff Directory included in every $P F$.

Please note that $U S P-N F$ is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for USP 27-NF 22 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2003 | November 2003 | January 2004 |
| Supplement One | October 15, 2003 | February 2004 | April 2004 |
| Supplement Two | February 17, 2004 | June 2004 | August 2004 |

The publication and comment schedule for USP 28-NF 23 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2004 | November 2004 | January 2005 |
| Supplement One | October 15, 2004 | February 2005 | April 2005 |
| Supplement Two | February 17, 2005 | June 2005 | August 2005 |

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in Supplements to $U S P-N F$ (twice yearly). Between Supplements, official revisions are published in $P F$ in the Interim Revision Announcement; these revisions are also incorporated in the upcoming Supplement. The electronic version of $U S P-N F$ is updated as each Supplement becomes available and, therefore, contains all official text up to and including the contents of the latest Supplement.

Publication Schedules

| Publication | Publication Date | Official Date |
| :---: | :---: | :---: |
| $1{ }^{\text {st }}$ Supplement | Feb. 2004 | Apr. 1, 2004 |
| PF 30(2) [Mar.-Apr. 2004] | Mar. 2004 | Not Applicable |

## INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the $U S P-N F$ that become effective before the effective date of the next Supplement or that were not ready for adoption by the closing date for the upcoming Supplement. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.
Symbols-Interim revisions are shown with new text (if any) enclosed in circles, ${ }^{\bullet}$ new text $\boldsymbol{m}_{\bullet}$. Text enclosed in squares, $\boldsymbol{\square}_{\text {new }}$ text $_{\boldsymbol{\bullet}}$, has already been adopted in a Supplement. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ • or $\boldsymbol{m}^{\boldsymbol{\bullet}} \boldsymbol{\square}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the $I R A$ or Supplement in which the revision first appeared. For example, $\bullet 2$ indicates that the revision was officially adopted in the Second Interim Revision Announcement, and $\boldsymbol{m}_{2 \mathrm{~S}(\text { USP27) }}$ indicates that the revision was officially adopted in the Second Supplement to USP 27.

Errata-At the end of the Interim Revision Announcement section is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in $U S P-N F$. If necessary, this list will be updated with every issue of $P F$. This information will also be cumulative in the next available Supplement, and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

## New USP Reference Standards

The following USP Reference Standards, which were indicated in past Supplements to $U S P-N F$ as being not yet available, have since become available. Thus, the official date of each USP 27 or NF 22 standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Allantoin RS (March 1, 2004)
USP Amifostine Disulfide RS (March 1, 2004)
USP Ammonium Chloride RS (March 1, 2004)
USP Aspartame Acesulfame RS (March 1, 2004)
USP Benazepril Hydrochloride RS (July 1, 2004)
USP Benazepril Related Compound A RS (May 1, 2004)
USP Benazepril Related Compound B RS (May 1, 2004)
USP Bupropion Hydrochloride RS (March 1, 2004)
USP Cefpiramide RS (September 1, 2004)
USP Chlorhexidine RS (July 1, 2004)
USP Chlorhexidine Acetate RS (July 1, 2004)
USP Choline Chloride RS (March 1, 2004)
USP Clonazepam Related Compound C RS (July 1, 2004)
USP Clonidine RS (September 1, 2004)
USP Clonidine Related Compound A RS (September 1, 2004)
USP Copovidone RS (March 1, 2004)
USP Cyclandelate RS (September 1, 2004)
USP Desflurane RS (May 1, 2004)
USP Desflurane Related Compound A RS (March 1, 2004)
USP Dextran 40 RS (May 1, 2004)
USP Dextran 70 RS (May 1, 2004)
USP Dolasetron Mesylate RS (July 1, 2004)
USP Dolasetron Mesylate Related Compound A RS (July 1, 2004)
USP Doxazosin Mesylate RS (March 1, 2004)
USP Powdered Eleuthero Extract RS (July 1, 2004)
USP Fenoldopam Mesylate RS (March 1, 2004)
USP Fludarabine RS (September 1, 2004)
USP Flumazenil RS (May 1, 2004)
USP Fluoxetine Related Compound C RS (July 1, 2004)
USP Formononetin RS (March 1, 2004)
USP Fosphenytoin Sodium RS (March 1, 2004)
USP Gadoversetamide RS (March 1, 2004)
USP Gadoversetamide Related Compound A RS (March 1, 2004)
USP Ganciclovir RS (May 1, 2004)
USP Ganciclovir Related Compound A RS (July 1, 2004)
USP Glucosamine Hydrochloride RS (July 1, 2004)
USP Hydrocodone Bitartrate Related Compound A CII RS (March 1, 2004)
USP Isoflurane Related Compound A RS (September 1, 2004)
USP Isoflurane Related Compound B RS (September 1, 2004)
USP Powdered Kava Extract RS (March 1, 2004)
USP Kawain RS (March 1, 2004)
USP Lamivudine RS (July 1, 2004)
USP Loratadine RS (September 1, 2004)
USP Meropenem RS (March 1, 2004)
USP Metformin Hydrochloride RS (March 1, 2004)
USP Metformin Related Compound A RS (March 1, 2004)
USP Metoprolol Related Compound A RS (July 1, 2004)
USP Metoprolol Related Compound B RS (September 1, 2004)
USP Metoprolol Related Compound C RS (September 1, 2004)
USP Metoprolol Related Compound D RS (September 1, 2004)
USP Ondansetron Hydrochloride RS (March 1, 2004)
USP Ondansetron Related Compound A RS (March 1, 2004)
USP Ondansetron Related Compound C RS (March 1, 2004)
USP Ondansetron Related Compound D RS (March 1, 2004)
USP Oxfendazole RS (March 1, 2004)

USP Paclitaxel RS (March 1, 2004)
USP Paclitaxel Related Compound A RS (March 1, 2004)
USP Paclitaxel Related Compound B RS (March 1, 2004)
USP Paroxetine Related Compound D RS (May 1, 2004)
USP Phenytoin Related Compound A RS (March 1, 2004)
USP Phenytoin Related Compound B RS (July 1, 2004)
USP Quinine Hydrochloride Dihydrate RS (March 1, 2004)
USP Powdered Red Clover Extract RS (May 1, 2004)
USP Rimantidine Hydrochloride RS (July 1, 2004)
USP Scopoletin RS (July 1, 2004)
USP Sevoflurane RS (May 1, 2004)
USP Sevoflurane Related Compound A RS (May 1, 2004)
USP Sotalol Hydrochlride RS (July 1, 2004)
USP Sotalol Related Compound A RS (May 1, 2004)
USP Sotalol Related Compound B RS (May 1, 2004)
USP Sotalol Related Compound C RS (May 1, 2004)
USP Stearoyl Polyoxyglycerides RS (May 1, 2004)
USP Sumatriptan RS (March 1, 2004)
USP Sumatriptan Succinate RS (March 1, 2004)
USP Sumatriptan Succinate Related Compound A RS (March 1, 2004)

USP Sumatriptan Succinate Related Compound C RS (March 1, 2004)

USP Terazosin Hydrochloride RS (March 1, 2004)
USP Terazosin Related Compound A RS (March 1, 2004)
USP Terazosin Related Compound B RS (March 1, 2004)
USP Terazosin Related Compound C RS (March 1, 2004)
USP Tiamulin Fumarate RS (July 1, 2004)
USP Tiamulin Related Compound A RS (July 1, 2004)
USP Valsartan Related Compound A RS (March 1, 2004)
USP Valsartan Related Compound C RS (March 1, 2004)
USP Vecuronium Bromide RS (September 1, 2004)
USP Verteporfin RS (March 1, 2004)
USP Verteporfin Related Compound A RS (March 1, 2004)
USP Vinorelbin Related Compound A RS (March 1, 2004)
USP Vinorelbine Tartrate RS (May 1, 2004)
USP Vitexin RS (March 1, 2004)

The official dates of any USP 27 or NF 22 standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

[^45]USP Sargramostim RS
USP Sulisobenzone RS
USP $\Delta^{8}$-tetrahydrocannabinol RS
USP $\Delta^{9}$-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS

USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

## MONOGRAPHS (USP)

## Glucagon

## Change to read:

Assay-[NOTE-All buffers have a final pH of 7.4, unless otherwise indicated.]

HEPATOCYTE PREPARATION-
Calcium-free perfusion buffer with dextrose-Prepare a solution containing, in each $\mathrm{L}, 7.92 \mathrm{~g}$ of sodium chloride, 0.35 g of potassium chloride, 1.80 g of dextrose, 0.19 g of edetic acid, and 2.38 g of $N$-2-hydroxyethylpiperazine- $N^{\prime}-2$-ethanesulfonic acid. Oxygenate prior to circulation.

Collagenase buffer-Prepare a solution containing, in each L, 3.62 g of sodium chloride, 23.83 g of $N$-2-hydroxyethylpipera-zine- $N^{\prime}$-2-ethanesulfonic acid, 0.35 g of potassium chloride, 0.52 g of calcium chloride, and 1.8 g of dextrose. Adjust to a pH of 7.6, and oxygenate. Immediately before perfusion, dissolve a quantity of collagenase in this solution to obtain a concentration of $0.02 \%$ to $0.05 \%$.

Wash buffer-Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 0.19 g of edetic acid, 2.38 g of $N$-2-hydroxyethylpiperazine- $N^{\prime}$-2-ethanesulfonic acid, 0.22 g of calcium chloride, and 0.12 g of magnesium sulfate.

Incubation buffer-Prepare a solution containing, in each L, 6.19 g of sodium chloride, 0.35 g of potassium chloride, 0.22 g of calcium chloride, 0.12 g of magnesium sulfate, 0.16 g of monobasic potassium phosphate, 11.915 g of $N$-2-hydroxyethylpipera-zine- $N^{\prime}-2$-ethanesulfonic acid, and $1 \%$ bovine serum albumin (BSA). Adjust to a pH of 7.5 .

Test animals-Male Sprague-Dawley rats are maintained on a standard rat chow diet and freely given water. On the morning of the test, select a healthy rat weighing approximately 300 g , and administer 100 Units of Heparin Sodium subcutaneously.

Procedure - [NOTE-Conduct this procedure in the morning to ensure that the rat has optimal glycogen in its liver.] Anesthetize the rat with an appropriate anesthetic. Open the abdominal cavity, and isolate the portal vein. Insert an angiocatheter connected to a perfusion pump, and tie into the portal vein at the general location of the lienal branch. Start the perfusion ( 25 mL per minute) in situ with Calcium-free perfusion buffer with dextrose, equilibrated with oxygen, at a temperature of $37^{\circ}$. As the liver enlarges, cut the inferior vena cava to allow pressure equilibrium. [NOTE-About 300 mL of the perfusate is needed to clear the liver of red blood cells at a flow rate of 30 to 60 mL per minute.] Then circulate Collagenase buffer at a flow rate of 30 to 60 mL per minute for about $10 \mathrm{~min}-$ utes. The exact concentration of collagenase (within the range of $0.02 \%$ to $0.05 \%$ ) is determined empirically for each lot of enzyme. The concentration of collagenase is that necessary to consistently cause a breakdown of the liver about 10 minutes after initial entry of the Collagenase buffer into the liver. When the liver significantly increases in size, changes color and consistency, and starts to leak perfusate out of the lobes, change the system to the oxygenated prewarmed Wash buffer. About 100 mL of Wash buffer is needed to wash the liver of collagenase at a flow rate of 25 mL per minute. Surgically remove the liver from the animal and place in a prewarmed tray containing oxygenated Wash buffer $\left(37^{\circ}\right)$. Gently comb the liver with a stainless steel, fine-toothed comb to free the hepatocytes. Wash the hepatocytes with Wash buffer, and filter through cheesecloth (or a $150-\mu \mathrm{m}$ mesh polyethylene net) into a plastic beaker. Centrifuge the cell suspension for about 2 minutes at about $25 \times g$ to form a loosely packed pellet. Discard the supernatant, and resuspend the pellet in Wash buffer. Repeat the washing procedure twice for a total of three washes. Resuspend the final pellet in 100 to 200 mL of Incubation buffer depending on cell yield. [NOTE-If the Assay procedure is interrupted, cool the cells by collecting the cells in a beaker placed in ice. The cells are
washed with ice-cold Wash buffer, and stored on ice until ready for use. At that point the cells are pelleted once more, and resuspended in ice-cold Incubation buffer.]
Suitability- The concentrations of cells may vary due to the collagenase activity and the viability of the hepatocytes. To check cell viability and to determine viable cell concentration, dilute duplicate $100-\mu \mathrm{L}$ aliquots of cell suspension with $400 \mu \mathrm{~L}$ of Wash buffer and $500 \mu \mathrm{~L}$ of isotonic $0.4 \%$ trypan blue. The aliquots are counted in a hemocytometer. The cells are suspended in Incubation buffer to obtain a viable cell concentration of not less than $3 \times 10^{6}$ per mL . Count several distinct fields. [NOTE-Viable cells are those cells that exclude the trypan blue.]

NEGATIVE CONTROL SOLUTION-Prepare a solution containing $0.5 \%$ bis(trimethylsilyl)acetamide (BSA) in sterile water.

INCUBATION FLASKS-Use $25-\mathrm{mL}$ conical flasks, the bottoms of which have been heated and pushed inward to form a conically raised center.

STANDARD PREPARATIONS- ${ }^{\bullet}$ In duplicate, dissolve a suitable quantity of USP Glucagon RS, accurately measured, in 0.01 N hydrochloric acid or other suitable diluent to obtain a solution containing 1.0 USP Glucagon Unit per mL. $\bullet 2$ All dilutions thereafter are made using $0.5 \%$ BSA ( $\mathrm{w} / \mathrm{v}$ ) in water. Dilute accurately measured volumes of each solution with Negative control solution to obtain five concentrations-200, 100, 50, 25 and 12.5 micro-Units per $\mathrm{mL}-$ of each solution (Standard preparations). Pipet 0.2 mL of each Standard preparation into separate Incubation flasks. Pipet 0.2 mL of Negative control solution into each of two flasks (Negative control solution 1 and 2). Then add the hepatocytes into each of the twelve flasks.

ASSAY PREPARATIONS-Using accurately weighed quantities of Glucagon, proceed as directed for Standard preparations.

D-GLUCOSE DETERMINATION-
Standard stock solution-Transfer 2.0 g of USP Dextrose RS, accurately weighed, to a $200-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with saturated benzoic solution to volume.

Standard solutions-Transfer suitable quantities of Standard stock solution to three flasks, and dilute with saturated benzoic acid solution to obtain solutions having known concentrations of 0.5 , 1.0 , and 1.5 times the typical sample glucose concentration.

Potassium ferrocyanide solution-Dissolve 1.25 g of trihydrate potassium ferrocyanide in 125 mL of Sterile Water for Injection.

System suitability-Analyze the Potassium ferrocyanide solution, the Standard solutions, and five replicates of the middle Standard solution. Prepare a standard curve using the Standard solutions as directed for Procedure: the relative standard deviation of the standard curve is not more than $2.0 \%$; the response of the Potassium ferrocyanide solution is not more than 30 mg per L; and the relative standard deviation is not more than $2.0 \%$ for the replicate analyses of the middle Standard solution.

PROCEDURE-Dispense 5 mL of Hepatocyte preparation into the special incubation flasks in sequence from high glucagon concentration to low glucagon concentration alternating the Standard preparations with the Assay preparations. The flasks are swirled in an orbiting water bath at 125 rpm at $30^{\circ}$ for approximately 30 to 60 minutes. [NOTE-The exact incubation time must be determined to optimize the signal-to-noise ratio.] Following incubation place 0.5 to $1.0-\mathrm{mL}$ aliquots, in duplicate, from each incubation flask into labeled tubes, and centrifuge at $12,500 \times g$. Determine the percentage of glucose concentration in each flask's supernatant.

To conform to the linear range of the instrument being used, it may be necessary to adjust by dilution each of the preparations. Use a glucose analyzer that has demonstrated appropriate specificity, accuracy, precision, and linear response over the range of concentrations being determined. [NOTE-A suitable analyzer may use an immobilized, oxidase-enzyme membrane or jacket-generating hydrogen peroxide, which is then detected at the electrode.] Perform the glucose analysis in the following sequence: Negative control solution 1, Standard preparations, Assay preparations, and Negative control solution 2. Determine the percentage of glucose against the Negative control solution for each preparation.

CALCULATIONS-
Linearity test-Use an analysis of variance (ANOVA) with one sample assayed against a standard, and using two replicates each, construct a table (see Table 1). Compare the value of the ratio MSNL/MSRES ${ }_{1}$ to a critical value obtained from a table for an $F$ distribution with $m-2$ and $3 m-3$ degrees of freedom where $m$ is the number of dose levels for each preparation. If the ratio MSNL/MSRES does not indicate the presence of significant nonlinearity (ratio value is lower than the critical value), then proceed to the test for parallelism. If the ratio exceeds the critical value (significance level of 0.05 ), the nonlinearity is statistically significant and the test is repeated, discarding the results from either the highest or lowest dose of both the Standard preparations and the Assay preparations (four dose levels). If the ratio MSNL/MSRES does not indicate the presence of significant nonlinearity, then proceed to the test for parallelism.

Parallelism test-Compare the ratio MSNP/MSRES 2 to a critical value obtained from an $F$ distribution having 1 and $4 m-5$ degrees of freedom. If the ratio MSNP/MSRES ${ }_{2}$ does not indicate the presence of significant nonparallelism, then the assay is considered valid. Use the appropriate dose levels for the estimation of the relative potency.

Relative potency-Calculate the relative potency, $R$, of the Assay preparations as compared to the Standard preparations as follows.
(1) $X_{j}$ is defined as the $\log _{10}$ of the $j^{\text {th }}$ dose of the Standard preparations or the Assay preparations. The glucagon dose varies from 12.5 to $200 \times 10^{-6}$ USP Glucagon Units per mL. For ease in the subsequent calculations, these doses are respectively represented by 1 through 5 as shown in the table below.

| $j$ | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Dose | 12.5 | 25 | 50 | 100 | 200 |
| $X_{j}$ | 1.10 | 1.40 | 1.70 | 2.00 | 2.30 |

(2) To differentiate between the Standard preparations and the Assay preparations in the calculations, the subscript " $i$ " will be used with $i=1$ to designate the Standard preparations and $i=2$ to designate the Assay preparations. $Y_{i j k}$ will denote the glucose concentration associated with the $k^{\text {th }}$ replicate of the $j^{\text {th }}$ dose of the $i^{\text {th }}$ preparation. For example, $Y_{l j}$ is the glucose concentration associated with the $k^{\text {th }}$ replicate of the $j^{\text {th }}$ dose of the appropriate Standard preparation; $Y_{11 k}$ is the glucose concentration associated with the $k^{\text {th }}$ replicate of dose 1 of the Standard preparation and $Y_{21 k}$ would denote the glucose concentration associated with the $k^{\text {th }}$ replicate of dose 1 of the Assay preparation. Dose 1 represents a glucose dose of $12.5 \times 10^{-6}$ USP Glucagon Units per mL. Finally, $Y_{132}$ would represent the glucose concentration associated with the $2^{\text {nd }}$ replicate of dose 3 for the Standard preparation.
(3) $Y_{S}$ and $Y_{t}$ denote the average glucose concentrations for the Standard preparations and the Assay preparations, respectively.
(4) Calculate the least-squares slope estimate, $b$, for a linear regression relating the $Y_{i j k}$ 's to the $X_{j}$ 's as follows: $b=S_{x y} / S_{x x}$ with $S_{x y}$ and $S_{x x}$ calculated using the equations in Table 2.
(5) The $\log$ potency, $M$, is calculated using $M=-1\left[\left(Y_{S^{-}} Y_{t}\right) / b\right]$.
(6) $R=\operatorname{antilog}(M)$.
(7) Calculate the confidence limits (upper and lower) for the relative potency, $R$, using the value $s^{2}=\mathrm{MSRES}_{3}$ (see Table 1 and Table 2) as follows. Obtain $t$ from a table for a $t$ distribution having $4 m-4$ degrees of freedom. For the $95 \%$ limits, the $t$ values can be obtained from Table 9 under Design and Analysis of Biological Assays $\langle 111\rangle$.

NOTE-For confidence limits having other probability levels (i.e., $100(1-\mathrm{a}) \%$ ), the right tail $t$ critical value having a/2 area to its right is used.

Calculate $g=t^{2} S^{2} / b^{2} S_{x x}$

$$
\text { and } F=(t s / b) \sqrt{(1 / m)(1-g)+\left(M^{2} / S_{x x}\right)}
$$

and calculate

$$
M_{L}=(M-F) /(1-g)
$$

and

$$
M_{U}=(M+F) /(1-g)
$$

where $M$ is the $\log$ potency and $M_{L}$ and $M_{U}$ are the $\log$ potency lower and upper confidence limits. The lower and upper confidence limits for the relative potency, $R$, are given by

$$
R L=\operatorname{antilog}\left(M_{L}\right)
$$

$$
R U=\operatorname{antilog}\left(M_{U}\right)
$$

It meets the requirements if the potency is between 0.8 to 1.25 USP Glucagon Units per mg , and the confidence interval width at $P=$ 0.95 does not exceed $45 \%$ of the computed potency.

Table 1. ANOVA for the Rat Hepatocyte Assay for Glucagon

| Source | Degrees of <br> Freedom | SS (Sum of <br> Squares) | MS (Mean <br> Square) |
| :--- | :---: | :---: | :---: |
| Preparations | 1 | SSPREP | MSPREP |
| Replicates | 1 | SSREP | MSREP |
| Linear Slope | 1 | SSLIN | MSLIN |
| Residual $_{3}$ | $4 m-4$ | SSRES $_{3}$ | MSRES $_{3}$ |
| Nonparallelism $_{\text {Residual }_{2}}$ | 1 | SSNP $_{2}$ | MSNP |
| Nonlinearity $_{\text {Residual }_{1}}$ | $m-5$ | SSRES $_{2}$ | MSRES $_{2}$ |
| TOTAL $^{2 m-2}$ | SSNL $_{1}$ | MSNL $_{1}$ |  |

NOTES-This analysis pertains to one sample assayed against a standard, using two replicates each.

The number of dose levels for each preparation is denoted by $m$. Table 2 gives the equations for calculating the SS terms. In each row of the ANOVA table, the MS is obtained by dividing the SS term by the degrees of freedom.

Table 2. Equations for Calculating the Sums of Squares in the Analysis of Variance*

$$
\begin{aligned}
& \mathrm{Y}_{\mathrm{i} .}=\sum_{\mathrm{j} k} \mathrm{y}_{\mathrm{ijk}} \\

## Lithium Carbonate Extended-Release Tablets

## Change to read:

## Drug release $\langle 724\rangle$ -

TEST 1-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 1.

Medium: dilute hydrochloric acid (7 in 1000); 800 mL .
Apparatus 1: 100 rpm .
Times: $15,45,90$, and 120 minutes.
Procedure-At each Time, withdraw 8.0 mL of the solution under test, and pass through a filter having a $35-\mu \mathrm{m}$ or finer porosity. Using the filtrate as the Assay preparation, suitably diluted with Dissolution Medium if necessary, and using Dissolution Medium to prepare the Standard preparation, determine the amount of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ dissolved by employing a flame photometer, as directed in the Assay.
Tolerances-The percentages of the labeled amount of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ dissolved at the specified times conform to Acceptance Table 1.

| Time (minutes) | Amount dissolved |
| :---: | :--- |
| 15 | between $2 \%$ and $16 \%$ |
| 45 | between $25 \%$ and $45 \%$ |
| 90 | between $60 \%$ and $85 \%$ |
| 120 | not less than $85 \%$ |

TEST 2-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 2.

Apparatus and Procedure-Proceed as directed for Test 1.
Medium: water; 900 mL .
Times: 1,3 , and 7 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ dissolved at the specified times conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | not more than $40 \%$ |
| 3 | between $45 \%$ and $75 \%$ |
| 7 | not less than $70 \%$ |

TEST 3-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 3.

Medium: water; 250 mL .
Apparatus 3: 6 dips per minute, 20 -mesh top screen and 100 mesh bottom screen.

Procedure-Proceed as directed for Test 1.
Times and Tolerances-The percentages of the labeled amount of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ dissolved at the specified times conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $10 \%$ and $45 \%$ |
| 2 | between $25 \%$ and $75 \%$ |
| 6 | not less than $70 \%$ |

${ }^{\bullet}$ TEST 4-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 4.

Medium, Apparatus, Times, and Procedure-Proceed as directed for Test 1 .

[^46]Tolerances-The percentages of the labeled amount of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ dissolved at the specified times conform to Acceptance Table 1.

| Time (minutes) | Amount dissolved |
| :---: | :--- |
| 15 | between $2 \%$ and $16 \%$ |
| 45 | between $25 \%$ and $45 \%$ |
| 90 | between $60 \%$ and $85 \%$ |
| 120 | not less than $80 \%$ |

## Loratadine Oral Solution

## Change to read:

Packaging and storage-Preserve in tight containers, and store between $2^{\circ}$ and ${ }^{\circ} 25^{\circ} \cdot{ }^{\circ}$

## Mephobarbital Tablets

## Delete the following:

${ }^{\bullet}$ Dissolution $\langle 711\rangle$ -
Medium: pH 6.8 phosphate buffer (see under Buffer Solutions in the section Reagents, Indicators, and Solutions); 900 mL .

Apparatus 2: 75 rpm .
Time: 75 minutes.
Procedure-Determine the amount of $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$ dissolved by employing UV absorption at the wavelenth of maximum absorbance at about 242 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, in comparison with a Standard solution having a known concentration of USP Mephobarbital RS in the same Medium.

Tolerances-Not less than $70 \%(Q)$ of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$ is dissolved in 75 minutes. $\bullet 2$

## Nalidixic Acid Oral Suspension

## Change to read:

Assay-
Mobile phase-Prepare a solution of 784 mg of dibasic potassium phosphate in 325 mL of water. To this solution add a solution of 2.62 g of hexadecyltrimethylammonium bromide in 350 mL of methanol. To the combined solution add ${ }^{\bullet} 325 \mathrm{~mL}_{\bullet 2}$ of methanol, mix, filter, and degas. This solution has an apparent pH of about 10. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Prepare a solution of sulfanilic acid in Mobile phase containing about 0.8 mg per mL .

Standard preparation - Prepare a solution having a known concentration of about 0.18 mg per mL of USP Nalidixic Acid RS in methanol. Transfer 5.0 mL of this solution and 1.0 mL of Internal standard solution to a $25-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Assay preparation-Transfer an accurately measured volume of freshly mixed Oral Suspension, equivalent to about 150 mg of nalidixic acid, to a $500-\mathrm{mL}$ volumetric flask, add about 400 mL of methanol, and sonicate for about 30 minutes. Shake by mechanical means for about 30 minutes, sonicate again for about 30 minutes, dilute with methanol to volume, mix, and filter. Transfer 3.0 mL of the clear filtrate and 1.0 mL of Internal standard solution to a 25 mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for sulfanilic acid and 1.0 for nalidixic acid; the resolution, $R$, between sulfanilic acid and nalidixic acid is not less than 1 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{3}$ in each mL of the Oral Suspension taken by the formula:

$$
(12,500 / 3)(C / V)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Nalidixic Acid RS in the Standard preparation; $V$ is the volume, in mL , of Oral Suspension taken to prepare the Assay preparation; and $R_{U}$ and $R_{S}$ are the ratios of the peak areas for nalidixic acid and sulfanilic acid in the chromatograms obtained from the Assay preparation and the Standard preparation, respectively.

## Vitamin A

## Change to read:

## Identification-

A: To 1 mL of a chloroform solution of it containing the equivalent of approximately $6 \mu \mathrm{~g}$ of retinol, add 10 mL of antimony trichloride TS: a transient blue color appears at once.

B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ Test solution-
FOR LIQUID FORM OF VITAMIN A-Dissolve a volume equivalent to about 15,000 USP Units in chloroform to obtain 10 mL of solution.

FOR SOLID FORM OF VITAMIN A-Weigh a quantity equivalent to about 15,000 USP Units, place in a separator, add 75 mL of water, shake vigorously for 1 minute, extract with 10 mL of chloroform by shaking for 1 minute, and centrifuge to clarify the chloroform extract.

Standard solution-Dissolve the contents of $1^{\bullet}$ ampul $_{\bullet 2}$ of USP Vitamin A RS in chloroform to obtain 25.0 mL .

Developing solvent system: a mixture of cyclohexane and ether (4:1).

Procedure-Apply at the starting point of the chromatogram 0.015 mL of the Standard solution and 0.01 mL of the Test solution, and proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Allow the solvent front to move a distance of 10 cm , remove the plate, and air dry. Spray with phosphomolybdic acid TS: the blue-green spot formed is indicative of the presence of retinol. The approximate $R_{F}$ values of the predominant spots, corresponding to the different forms of retinol, are 0.1 for the alcohol form, 0.45 for the acetate, and 0.7 for the palmitate.

## ERRATA

Following is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in USP 27-NF 22. If necessary, this list will be updated with every issue of $P F$. This information will also be available as a cumulative table in the next available Supplement and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

| Page | Title | Section | Description |

## IN-PROCESS REVISION

This section contains proposals for adoption as official USP or NF standards (either proposed new standards or proposed revisions of current $U S P$ or $N F$ standards). These may be any of the following: (1) items that previously appeared under Pharmacopeial Previews and are now formally proposed as revisions; (2) proposed revisions placed directly under In-Process Revision; or (3) modifications of revisions previously proposed under In-Process Revision. Readers should review material in this section and provide comments to the staff liaison (use the Staff Directory to find the contact information). Information on how to comment is found in the Policies and Announcements section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

## BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How to Use $P F$ ), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, thus:

- new text.
if slated for an Interim Revision Announcement to USP 27-NF 22 (IRA), thus:
${ }^{\Delta_{n e w}}$ text $_{\mathbf{\Delta U S P 2 8}}$
if slated for $U S P 28-N F 23$, and thus:
-new text.
if slated for a Supplement to $U S P-N F$. The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ 。 or $\boldsymbol{\bullet}^{\boldsymbol{n}}$ or $^{\boldsymbol{\Delta}}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular IRA or Supplement or indicates the USP or NF as the publication where the revision will appear if approved. For example, $\bullet 2$ indicates that the revision is proposed for the Second Interim Revision Announcement, and $\boldsymbol{n}_{2 S}$ (USP 27) indicates that the proposed revision is slated for the Second Supplement to USP 27, and $\Delta_{\Delta S P 28}$ and $\Delta_{\Delta F 23}$ indicate that the revisions are proposed for USP 28 and $N F 23$, respectively.

Official Title Changes Where the specification "Monograph title change" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

## Briefing

General Notices and Requirements, $U S P 27$ page 3 and page 1823 of $P F 29(6)$ [Nov.-Dec. 2003]. It is proposed to include in the Labeling section of Preservation, Packaging, Storage, and Labeling a warning statement to be applied to the label of all herbs or botanicals intended for use as a dietary supplement.
(DSI: J. Salguero) RTS-40895-1

## Change to read:

## SIGNIFICANT FIGURES AND TOLERANCES

Where limits are expressed numerically herein, the upper and lower limits of a range include the two values themselves and all intermediate values, but no values outside the limits. The limits expressed in monograph definitions and tests, regardless of whether the values are expressed as percentages or as absolute numbers, are considered significant to the last digit shown.

Equivalence Statements in Titrimetric Procedures-The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, it is to be understood that the number of significant figures in the concentration of the titrant corresponds to the number of significant figures in the weight of the analyte. Blank corrections are to be made for all titrimetric assays where appropriate (see Titrimetry $\langle 541\rangle$ ).

Tolerances-The limits specified in the monographs for Pharmacopeial articles are established with a view to the use of these articles as drugs, nutritional or dietary supplements, or devices, except where it is indicated otherwise. The use of the molecular formula for the active ingredient(s) named in defining the required strength of a Pharmacopeial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute ( 100 percent) purity.

A dosage form shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. The tolerances and limits stated in the definitions in the monographs for Pharmacopeial articles allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. Where the minimum amount of a substance present in a nutritional or dietary supplement is required to be higher than the lower tolerance limit allowed for in the monograph because of applicable legal requirements, then the upper tolerance limit contained in the monograph shall be increased by a corresponding amount.

The specified tolerances are based upon such attributes of quality as might be expected to characterize an article produced from suitable raw materials under recognized principles of good manufacturing practice.

The existence of compendial limits or tolerances does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" the Pharmacopeial quality. Similarly, the fact that an article has been prepared to closer tolerances than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the Pharmacopeial requirements.

Interpretation of Requirements-Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated limits to determine whether there is conformance with compendial assay or test requirements. The ob-
served or calculated values usually will contain more significant figures than there are in the stated limit, and an observed or ealeut tated
$■_{\text {a reportable }}^{\mathbf{m}_{2 S}(U S P 27)}$ result is to be rounded off to the number of places that is in agreement with the limit expression by the following procedure. [NOTE-Limits, which are fixed numbers, are not rounded off.]
-Intermediate calculations (e.g., slope for linearity in Validation of Compendial Methods $\langle 1225\rangle$ ) may be rounded for reporting purposes, but the original value (not rounded) should be used for any additional required calculations. Rounding off should not be done until the final calculations for the reportable value have been completed. [NOTE-Limits, which are fixed numbers, are not rounded off.]

A reportable value is often a summary value for several individual determinations. It is the end result of a completed measurement method, as documented. It is the value compared with the acceptance criterion. In most cases, the reportable value is used as documentation for internal or external
users.m2S (USP27)
When rounding off is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5 , it is eliminated and the preceding digit is unchanged. If this digit is greater than 5 , it is eliminated and the preceding digit is increased by one. If this digit equals 5 , the 5 is eliminated and the preceding digit is increased by one.

| Illustration of Rounding Numerical Values <br> for Comparison with Requirements |  |  |  |
| :---: | :---: | :---: | :---: |
| Compendial | Unrounded | Rounded |  |
| Requirement | Value | Result | Conforms |
| Assay limit $\geq 98.0 \%$ | $97.96 \%$ | $98.0 \%$ | Yes |
|  | $97.92 \%$ | $97.9 \%$ | No |
|  | $97.95 \%$ | $98.0 \%$ | Yes |
| Assay limit $\leq 101.5 \%$ | $101.55 \%$ | $101.6 \%$ | No |
|  | $101.46 \%$ | $101.5 \%$ | Yes |
|  | $101.45 \%$ | $101.5 \%$ | Yes |
| Limit test $\leq 0.02 \%$ | $0.025 \%$ | $0.03 \%$ | No |
|  | $0.015 \%$ | $0.02 \%$ | Yes |
|  | $0.027 \%$ | $0.03 \%$ | No |
| Limit test $\leq 3 \mathrm{ppm}$ | $0.00035 \%$ | $0.0004 \%$ | No |
|  | $0.00025 \%$ | $0.0003 \%$ | Yes |
|  | $0.00028 \%$ | $0.0003 \%$ | Yes |

## GENERAL CHAPTERS

Each general chapter is assigned a number that appears in brackets adjacent to the chapter name (e.g., $\langle 621\rangle$ Chromatography). General chapters that inelude general requirements for tests and assays are numbered frem $\langle 1\rangle$ to $\langle 999\rangle$, chapters that are informa tional are numbered from $\langle 1000$ ) to $\langle 1999$ ), and chapters pertaining to nutritional supplements are numbered above- $\langle\mathcal{Z 0 0 \theta})$ :
－Articles recognized in this compendia must comply with the official standards and tests and assays in the General No－ tices，relevant monographs，and General Chapters numbered below 1000．General Chapters numbered above 1000 are considered to be interpretive and are intended to provide in－ formation on，give definition to，or describe a particular sub－ ject．They contain no official standards，tests，assays，or other mandatory requirements applicable to any pharmaco－ peial article unless specifically referenced in a monograph
or elsewhere in the Pharmacopeia．m2S（USP27）
The use of the general chapter numbers is encouraged for the identification and rapid access to general tests and information．It is especially helpful where monograph section headings and chap－ ter names are not the same（e．g．，Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ in a monograph refers to method $\langle 197 \mathrm{U}\rangle$ under general tests chapter〈197〉Spectrophotometric Identification Tests；Specific rotation $\langle 781 \mathrm{~S}\rangle$ in a monograph refers to method $\langle 781 \mathrm{~S}\rangle$ under general tests chapter $\langle 781\rangle$ Optical Rotation；and Calcium $\langle 191\rangle$ in a mono－ graph refers to the tests for Calcium under general tests chapter〈191〉 Identification Tests－General）．

## Change to read：

## TESTS AND ASSAYS

Apparatus－A specification for a definite size or type of con－ tainer or apparatus in a test or assay is given solely as a recommen－ dation．Where volumetric flasks or other exact measuring， weighing，or sorting devices are specified，this or other equipment of at least equivalent accuracy shall be employed．（See also Ther－ mometers $\langle 21\rangle$ ，Volumetric Apparatus $\langle 31\rangle$ ，and Weights and Bal－ ances $\langle 41\rangle$ ．）Where low－actinic or light－resistant containers are specified，clear containers that have been rendered opaque by ap－ plication of a suitable coating or wrapping may be used．

Where an instrument for physical measurement，such as a spec－ trophotometer，is specified in a test or assay by its distinctive name， another instrument of equivalent or greater sensitivity and accuracy may be used．In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used，solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure．

Where a particular brand or source of a material，instrument，or piece of equipment，or the name and address of a manufacturer or distributor，is mentioned（ordinarily in a footnote），this identifica－ tion is furnished solely for informational purposes as a matter of convenience，without implication of approval，endorsement，or cer－ tification．Items capable of equal or better performance may be used if these characteristics have been validated．

Where the use of a centrifuge is indicated，unless otherwise spe－ cified，the directions are predicated upon the use of apparatus hav－ ing an effective radius of about 20 cm （ 8 inches）and driven at a speed sufficient to clarify the supernatant layer within 15 minutes．

Unless otherwise specified，for chromatographic tubes and col－ umns the diameter specified refers to internal diameter（ID）；for other types of tubes and tubing the diameter specified refers to out－ side diameter（OD）．

Steam Bath－Where the use of a steam bath is directed，exposure to actively flowing steam or to another form of regulated heat，cor－ responding in temperature to that of flowing steam，may be used．

Water Bath－Where the use of a water bath is directed without qualification with respect to temperature，a bath of vigorously boil－ ing water is intended．

Foreign Substances and Impurities－Tests for the presence of foreign substances and impurities are provided to limit such sub－ stances to amounts that are unobjectionable under conditions in which the article is customarily employed（see also Impurities in Official Articles $\langle 1086\rangle$ ）．

While one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity，strength，quality， and purity，it is manifestly impossible to include in each mono－ graph a test for every impurity，contaminant，or adulterant that might be present，including microbial contamination．These may arise from a change in the source of material or from a change in the processing，or may be introduced from extraneous sources． Tests suitable for detecting such occurrences，the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice，should be employed in addition to the tests provided in the individual monograph．

Other Impurities－Official substances may be obtained from more than one process，and thus may contain impurities not con－ sidered during preparation of monograph assays or tests．Wherever a monograph includes a chromatographic assay or purity test based on chromatography，other than a test for erganic volatile impuri－ ties，
■residual solvents $_{\text {пn }_{2 S}}$（USP27）
and that monograph does not detect such an impurity，solvents ex－ cepted，the impurity shall have its amount and identity，where both are known，stated under the heading Other Impurity（ies）by the la－ beling（certificate of analysis）of the official substance．

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is $0.1 \%$ or greater． Tests suitable for detection and quantitating unlabeled impurities， when present as the result of process change or other identifiable， consistent occurrence，shall be submitted to the USP for inclusion in the individual monograph．Otherwise，the impurity shall be identified，preferably by name，and the amount listed under the heading Other Impurity（ies）in the labeling（certificate of analysis） of the official substance．The sum of all Other Impurities combined with the monograph－detected impurities does not exceed $2.0 \%$（see Ordinary Impurities $\langle 466\rangle$ ），unless otherwise stated in the mono－ graph．

Categories of drug substances excluded from Other Impurities requirements are fermentation products and semi－synthetics de－ rived therefrom，radiopharmaceuticals，biologics，biotechnology－ derived products，peptides，herbals，and crude products of animal or plant origin．Any substance known to be toxic must not be listed under Other Impurities．

■Residual Solvents－The requirements are stated in Or － ganic Volatile Impurities $\langle 467\rangle$ together with information in Impurities in Official Articles $\langle 1086\rangle$ ．Thus all drug sub－ stances，excipients，and products are subject to relevant con－ trol of residual solvents，even when no test is specified in the individual monograph．The requirements have been aligned with the ICH guideline on this topic．If solvents are used during production，they are of suitable quality．In addition， the toxicity and residual level of each solvent are taken into consideration，and the solvents are limited according to the
principles defined and the requirements specified in Organic Volatile Impurities $\langle 467\rangle$, using the general methods presented therein or other suitable methods.m2S (USP27)

Procedures-Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the utilization of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures utilized. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all of the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for assuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing process validation studies and from in-process controls may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not fewer than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets and is, in turn,
weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.
Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not fewer than a given number, usually 20 , of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the Assay procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for Loss on drying, or Water, or Loss on ignition, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for Loss on drying or Water, the expression "previously dried" without qualification signifies that the substance is to be dried as directed under Loss on drying or Water (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter USP Reference Standards $\langle 11\rangle$, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within $10 \%$ of the specified weight or volume. However, the weight or volume taken is accurately determined and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under Volumetric Apparatus $\langle 31\rangle$, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under Volumetric Apparatus $\langle 31\rangle$, may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as " 25.0 mL " and " 25.0 mg ," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under Volumetric Apparatus $\langle 31\rangle$ or under Weights and Balances $\langle 41\rangle$.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession. See also Use of Reference Standards under Spectrophotometry and Light-Scattering $\langle 851\rangle$.
Blank Determination-Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator-The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution-Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see Volumetric Apparatus $\langle 31\rangle$ ).

Drying to Constant Weight-The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration-Where it is directed to "filter," without further qualification, the intent is that the liquid be filtered through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests-The Pharmacopeial tests headed Identification are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight-The specification "ignite to constant weight" means that the ignition shall be continued, at 800 $\pm 25^{\circ}$ unless otherwise indicated, until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators-Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL , or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms-Logarithms used in the assays are to the base 10.
Microbial Strains-Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible-This term indicates a quantity not exceeding 0.50 mg.

Odor-Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, of either a freshly opened package of the article (for packages containing not more than 25 g ) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about $100-\mathrm{mL}$ capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements-The term "mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions-Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with Purified Water.

An expression such as " $(1$ in 10$)$ " means that 1 part by volume of a liquid is to be diluted with, or 1 part by weight of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts by volume.

An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under Volumetric Solutions in the section Reagents, Indicators, and Solutions, and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity-Unless otherwise stated, the specific gravity basis is $25^{\circ} / 25^{\circ}$, i.e., the ratio of the weight of a substance in air at $25^{\circ}$ to the weight of an equal volume of water at the same temperature.

Temperatures-Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at $25^{\circ}$. Where moderate heat is specified, any temperature not higher than $45^{\circ}\left(113^{\circ} \mathrm{F}\right)$ is indicated. See Storage Temperature under Preservation, Packaging, Storage, and Labeling for other definitions.

Time Limit-In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum-The term "in vacuum" denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water-Where water is called for in tests and assays, Purified Water is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide-free water," see the introduction to the section Reagents, Indicators, and Solutions. For High-purity Water see Containers $\langle 661\rangle$.

Water and Loss on Drying - Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading Water. Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading Loss on drying. However, Loss on drying is most often given as the heading where the loss in weight is known to represent residual volatile constituents including organic solvents as well as water.

Test Results, Statistics, and Standards-Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compliance with good manufacturing practices generally, are developed and followed to assure that the article will indeed comply with compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for Dissolution and Uniformity of dosage units, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by
the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.
-Where the Content Uniformity determinations have been made using the same procedure specified in the Assay, the average of all of the individual Content Uniformity determi-
nations may be used as the Assay value. 1 1s (USP27)
Description-Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table Description and Relative Solubility of USP and NF Articles in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility-The statements concerning solubilities given in the reference table Description and Relative Solubility of USP and NF Articles for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table. Soluble Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

|  | Parts of Solvent <br> Required for <br> Descriptive |
| :--- | :--- |
| 1 Part of Solute |  |
| Term | Less than 1 |
| Very soluble | From 1 to 10 |
| Freely soluble | From 10 to 30 |
| Soluble | From 30 to 100 |
| Sparingly soluble | From 100 to 1000 |
| Slightly soluble <br> Very slightly soluble <br> Practically insoluble, <br> or Insoluble | From 1000 to 10,000 |

## Change to read:

## PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers-The container is that which holds the article and is or may be in direct contact with the article. The immediate container is that which is in direct contact with the article at all times. The closure is a part of the container.

Prior to its being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The Pharmacopeial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

Tamper-Evident Packaging - The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the tamper-evident packaging and labeling requirements of the FDA where applicable.

Preferably, the immediate container and/or the outer container or protective packaging utilized by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

Light-Resistant Container (see Light Transmission under Containers $\langle 661\rangle$ )-A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to "protect from light" in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering prior to dispensing.

Well-Closed Container-A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container-A tight container protects the contents from contamination by extraneous liquids, solids, or vapors, from loss of the article, and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution, and is capable of tight re-closure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

NOTE-Where packaging and storage in a tight container or a well-closed container is specified in the individual monograph, the container utilized for an article when dispensed on prescription meets the requirements under Containers-Permeation $\langle 671\rangle$.

Hermetic Container-A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Unit Container-A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

Single-Dose Container (see also Containers for Injections under Injections $\langle 1\rangle$ )—A single-dose container is a single-unit container for articles intended for parenteral administration only. A singledose container is labeled as such. Examples of single-dose containers include pre-filled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Unit-Dose Container-A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

Unit-of-Use Container-A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

Multiple-Unit Container-A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Multiple-Dose Container (see also Containers for Injections under Injections $\langle 1\rangle$ )-A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

Storage Temperature and Humidity-Specific directions are stated in some monographs with respect to the temperatures and humidity at which Pharmacopeial articles shall be stored and distributed (including the shipment of articles to the consumer) when stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply (see also Stability under Pharmaceutical Dosage Forms $\langle 1151\rangle$ ). The conditions are defined by the following terms.

Freezer-A place in which the temperature is maintained thermostatically between $-25^{\circ}$ and $-10^{\circ}\left(-13^{\circ}\right.$ and $\left.14^{\circ} \mathrm{F}\right)$.

Cold-Any temperature not exceeding $8^{\circ}\left(46^{\circ} \mathrm{F}\right)$. A refrigerator is a cold place in which the temperature is maintained thermostatically between $2^{\circ}$ and $8^{\circ}\left(36^{\circ}\right.$ and $\left.46^{\circ} \mathrm{F}\right)$.

Cool-Any temperature between $8^{\circ}$ and $15^{\circ}\left(46^{\circ}\right.$ and $\left.59^{\circ} \mathrm{F}\right)$. An article for which storage in a cool place is directed may, alternatively, be stored and distributed in a refrigerator, unless otherwise specified by the individual monograph.

Room Temperature-The temperature prevailing in a working area.

Controlled Room Temperature-A temperature maintained thermostatically that encompasses the usual and customary working environment of $20^{\circ}$ to $25^{\circ}\left(68^{\circ}\right.$ to $\left.77^{\circ} \mathrm{F}\right)$; that results in a mean kinetic temperature calculated to be not more than $25^{\circ}$; and that allows for excursions between $15^{\circ}$ and $30^{\circ}\left(59^{\circ}\right.$ and $\left.86^{\circ} \mathrm{F}\right)$ that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to $40^{\circ}$ are permitted as long as they do not exceed 24 hours. Spikes above $40^{\circ}$ may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to $25^{\circ}$ ", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage tem-
perature that simulates the nonisothermal effects of storage temperature variations. (See also Stability under Pharmaceutical Dosage Forms $\langle 1151\rangle$.)

An article for which storage at Controlled room temperature is directed may, alternatively, be stored and distributed in a cool place, unless otherwise specified in the individual monograph or on the label.

Warm-Any temperature between $30^{\circ}$ and $40^{\circ}\left(86^{\circ}\right.$ and $\left.104^{\circ} \mathrm{F}\right)$.
Excessive Heat-Any temperature above $40^{\circ}\left(104{ }^{\circ} \mathrm{F}\right)$.
Protection from Freezing-Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Dry Place-The term "dry place" denotes a place that does not exceed $40 \%$ average relative humidity at Controlled Room Temperature or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to $45 \%$ relative humidity provided that the average value is $40 \%$ relative humidity.
Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.
${ }^{\triangle}$ Storage under Nonspecific Conditions-Where no specific directions or limitations are provided in the packaging and storage section of individual monographs or in the article's labeling, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Articles shall be protected from moisture, freezing, and excessive heat, and, where necessary, from light during shipping and distribution. Active pharmaceutical ingredients are exempt from this requirement. $\Delta U S P 27$

■Repackaging Instructions-Except where a drug product is packaged in a container intended to be dispensed directly to the patient, such as a unit-of-use or unit-dose container, the labeling shall contain directions specifying the types of containers suitable for repackaging the drug product so as to maintain its identity, strength, quality, and purity. Such directions shall be sufficient to allow a repackager or dispenser to select an adequate container and shall include a description of the composition of the container(s), e.g., glass, polyethylene, polyvinyl chloride, and any moisture vapor transmission rate characteristics required. The labeling shall also indicate whether or not the container is to afford light protection, and shall include any storage or shipping temperature restrictions to which the drug as repackaged shall be limited (see 21 CFR 201.100). $\quad$ 2S (USP27)

Labeling-The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in this Pharmacopeia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the Pharmacopeial requirements set forth for the articles.

Amount of Ingredient per Dosage Unit-The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Pharmacopeial articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in Deliverable Volume $\langle 698\rangle$. Pharmacopeial drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see Percentage Measurements), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each $5-\mathrm{mL}$ portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units (see also Units of Potency in these General Notices).

Use of Leading and Terminal Zeros-In order to help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg$]$ ). The quantity of active ingredient when expressed as a decimal number smaller than one shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg ]).

Labeling of Salts of Drugs-It is an established principle that Pharmacopeial articles shall have only one official name. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and $K$ for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids; but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

Labeling Vitamin-Containing Products-The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.
${ }^{\Delta}$ Labeling Botanical-Containing Products-The label of an herb or other botanical intended for use as a dietary supplement bears the statement, "If you are pregnant or nursing a baby, seek the advice of a health professional before using this product." ${ }_{\triangle U S P 28}$

Labeling Parenteral and Topical Preparations-The label of a preparation intended for parenteral or topical use states the names of all added substances (see Added Substances in these General Notices and Requirements, and see Labeling under Injections $\langle 1\rangle$ ), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

Labeling Electrolytes-The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

Labeling Alcohol-The content of alcohol in a liquid preparation shall be stated on the label as a percentage $(\mathrm{v} / \mathrm{v})$ of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Special Capsules and Tablets-The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used.

Expiration Date and Beyond-Use Date-The label of an official drug product, nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/89," "Exp. June 89," or "Expires 6/89"). [NOTE-For additional information and guidance, refer to the Nonprescription Drug Manufacturers Association's Voluntary Codes and Guidelines of the OTC Medicines Industry.]

The monographs for some preparations state how the expiration date that shall appear on the label is to be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the Pharmacopeial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article must not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the General Notices and Requirements of this Pharmacopeia. The be-yond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution prior to use, a suitable be-yond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the
expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) one year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be one year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturers container, whichever is earlier, unless stability data or the manufacturers labeling indicates otherwise.

The dispenser must maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than $25^{\circ}$. The plastic material used in packaging the dosage forms must afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records must be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

Pharmaceutical Compounding-The label on the container or package of an official compounded preparation shall bear a be-yond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, is to be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see Stability Criteria and Beyond-Use Dating under Stability of Compounded Preparations in the general tests chapter ${ }^{4}$ Pharmaceutical Compounding-Nonsterile Preparations $\left.\mathbf{A U S P 2 7}^{\langle 795\rangle}\right\rangle$ ).

## MONOGRAPHS (USP)

BRIEFING

Acyclovir, USP 27 page 47 and page 1833 of $P F 29$ (6) [Nov.Dec. 2003]; Acyclovir Capsules, USP 27 page 48 and page 602 of PF 29(3) [May-June 2003]; Acyclovir Oral Suspension, USP 27 page 49 and page 1833 of PF 29(6) [Nov.-Dec. 2003]; Acyclovir Tablets, $U S P 27$ page 50 and page 604 of $P F$ 29(3) [May-June 2003]. Some lots of USP Acyclovir RS may contain a small amount of guanine. Therefore, it is proposed to prepare a separate guanine standard solution to avoid interference from a potential guanine impurity in the Reference Standard. System suitability solutions have also been added to evaluate the resolution and precision requirements. In the absence of any significant adverse
comment, it is proposed to implement this revision via the Fourth Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of August 1, 2004.
(PA7b: B. Davani) RTS-40740-1

## Change to read:

Packaging and storage-Preserve in tight containers. Store-between $15^{\circ}$ and $25^{\circ}$. Protect from light and moisture.
-Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. - $\mathbf{n}_{2 S}$ (USP27)

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. $\quad$ 2S (USP27)

Change to read:
USP Reference standards $\langle 11\rangle-U S P$ Acyclovir $R S$.

- USP Endotoxin RS.■2S (USP27)

## Add the following:

-Other requirements-Where the label states that Acyclovir is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Acyclovir for Injection. Where the label states that Acyclovir must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Acy-
clovir for Injection.■2S (USP27)

## Assay and limit for guanine-

Mobile phase-Prepare a filtered and degassed solution of glacial acetic acid in water (1 in 1000). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

- System suitability preparation 1—Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 mg of each per mL .

System suitability preparation 2-Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per $\mathrm{mL} . \bullet 4$

Guanine standard preparation-Transfer about 8.75 mg of guanine, accurately weighed, to a $500-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix.
${ }^{\bullet}$ Transfer 2.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per mL .4

Standard preparation-Dissolve about 25 mg of USP Acyclovir RS, accurately weighed, in 5 mL of 0.1 N sodium hydroxide in a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution 2.0 mL of the G twan
$\bullet \bullet$
to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having knowneeneentrations of aben 0.1 mg of USP Acyelovir RS per mL and $0.7 \mu \mathrm{~g}$ of guanine per mL.
-a known concentration of about 0.1 mg of USP Acyclovir

## RS per mL. $\bullet 4$

Assay preparation-Dissolve about 100 mg of Acyclovir, accurately weighed, in 20 mL of 0.1 N sodium hydroxide in a $200-$ mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.2-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph
${ }^{\bullet}$ System suitability solution $1, \bullet$
and record the peak responses as directed for Procedure: the resolution, $R$, between acyclovir and guanine is not less than 2.0 ; the tailing factor for the analyte peak is not more than 2 ; and the relative standard deviation for replicate injections
${ }^{\bullet}$ for the acyclovir peak ${ }_{\bullet 4}$ is not more than $2.0 \%$.
${ }^{\bullet}$ Chromatograph System suitability preparation 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$. 4
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Stal
${ }^{\bullet}$ Guanine standard preparation. 4
and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in $\mu \mathrm{g}$, of guanine in the portion of Acyclovir taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of guanine in the Stand prention

- Guanine standard preparation; 4
and $r_{U}$ and $r_{S}$ are the peak responses due to guanine in the Assay preparation and the st,
- Guanine standard preparation, $\bullet 4$
respectively: not more than $0.7 \%$ of guanine is found. Calculate the quantity, in mg , of $\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{3}$ in the portion of Acyclovir taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Acyclovir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses due to acyclovir in the Assay preparation and the Standard preparation, respectively.

Briefing
Acyclovir Capsules, USP 27 page 48 and page 602 of PF 29(3) [May-June 2003]-See briefing under Acyclovir.

Assay-
Mobile phase-Prepare a filtered and degassed solution of 0.02 M acetic acid. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
-System suitability preparation 1-Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg of each per mL .

System suitability preparation 2-Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $2.0 \mu \mathrm{~g}$ per $\mathrm{mL} . \bullet 4$

Standard preparation-Dissolve an accurately weighed quantity of USP Acyclovir RS and guanine
$\bullet$
in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL . and 2.0 нes per mL , respective女.
$\bullet 4$
Assay preparation-Remove, as completely as possible, the contents of not fewer than 10 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of acyclovir, to a $100-\mathrm{mL}$ volumetric flask, dissolve in 10 mL of 0.1 N sodium hydroxide, dilute with water to volume, mix, and filter.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.2-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the fation,
-System suitability preparation 1,•4 and record the peak responses
${ }^{\bullet}$ for acyclovir ${ }^{4}$
as directed for Procedure: the relative retention times are about 0.6 for guanine and 1.0 for acyclovir; the resolution, $R$, between guanine and acyclovir is not less than 2.0; and the relative standard deviation for replicate injections
${ }^{\bullet}$ of acyclovir ${ }_{\bullet 4}$
is not more than $2.0 \%$.
${ }^{\bullet}$ Chromatograph the System suitability preparation 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg , of $\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{3}$ in the portion of Capsules taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Acyclovir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Acyclovir for Injection, USP 27 page 48 and page 602 of $P F$ 29(3) [May-June 2003]-See briefing under Acyclovir.

## Change to read:

## Chromatographic purity-

Solution A-Prepare a filtered and degassed mixture of 0.17 M acetic acid and methanol (125:8). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Solution B: methanol, filtered and degassed.
Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments to either solution as necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Dissolve suitable quantities of purine and USP Acyclovir RS in Solution $A$ to obtain a solution containing about $0.5 \mu \mathrm{~g}$ of each per mL .
©Acyclovir standard solution-Dissolve an accurately weighed quantity of USP Acyclovir RS in Solution $A$, and dilute quantitatively, and stepwise if necessary, with Solution $A$ to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ per mL .

Guanine solution-Dissolve about 25 mg of guanine, accurately weighed, in 50 mL of 0.1 N sodium hydroxide in a $500-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standerd solution
-Standard solution $1 \bullet 4$
-Transfer 5.0 mL of Acyclovir standard solution me 5.0 mL of Gtanine solution

- 4
to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix. $\triangle$ USP27
- Standard solution 2-Transfer 5.0 mL of Guanine solu-
tion to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix. 4
Test solution-Constitute and combine not less than 10 vials of Acyclovir for Injection. Transfer an accurately measured quantity, equivalent to about 100 mg of acyclovir, to a $200-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L 1 . The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-15$ | 100 | 0 | isocratic |
| $15-45$ | $100 \rightarrow 65$ | $0 \rightarrow 35$ | linear gradient |
| $45-46$ | $65 \rightarrow 100$ | $35 \rightarrow 0$ | linear gradient |
| $46-56$ | 100 | 0 | re-equilibration |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between purine and acyclovir is not less than 2.0. Chromatograph the Standard solution,
-Standard solution 1 and Standard solution $2 \bullet 4$ and record the peak responses as directed for Procedure: the rela tive
${ }^{\bullet}$ typicale4
retention times for guanine and acyclovir are about ${ }^{\boldsymbol{\Delta}} \boldsymbol{\theta}_{4_{\Delta U S P 27}}$ and 1.0 ,
$\bullet 5.8$ minutes and 14 minutes, $\bullet 4$
respectively; and the relative standard deviation $\boldsymbol{\Delta}$ of the acyclovir peak area and the guanine peak area $\mathbf{\Delta U S P 2 7}$ for replicate injections is not more than $1 \%$. $\mathbf{\Delta}$ USP27

Procedure Injeet a volume

(about $50 \mu \mathrm{~L}$ ) of $\mathbf{\Delta}^{\boldsymbol{\Delta}}$ the Standard solution and $\mathbf{\Delta U S P 2 7}$ the Test solution into the chromatograph, record the chromatogram, and measure the peak ${ }^{\mathbf{\wedge}}$ area $_{\mathbf{U S P}, 27}$ responses. ${ }^{\mathbf{\Delta}}$ Calculate the percentage of guanine in the Acyclovir for Injection by the formula:

$$
20,000(C / W)\left(r_{g} / r_{s g}\right)
$$

in which $C$ is the concentration, in $m g$ per mL , of guanine in the Standard solution; $W$ is the total weight, in mg , of acyclovir in the Test solution based on the label claim; $r_{g}$ is the peak response for guanine, if present, in the Test solution; and $r_{s g}$ is the peak response of guanine in the Standard solution: not more than $1.0 \%$ is
 rity in the $\mathbf{\Delta U S P 2 7}$ Acyclovir for Injection $\mathbf{\Delta u S P}^{\mathbf{\Delta}}$ by the formula:

$$
20,000(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Acyclovir RS in the Standard solution; $W$ is the $\mathbf{~ t o t a l} \mathbf{D}_{U S P} Z_{z}$ weight, $\mathbf{\Delta}_{\text {in }}$ $\mathrm{mg},_{\triangle U S P 27}$ of acyclovir $\Delta \triangle U S P 27$ in the Test solution based on the label claim; ${ }_{U S P 27} r_{i}$ is the peak response for each impurity; and $r_{S}$ is the peak response of acyclovir in the Standard solution: ${ }^{\mathbf{4}} \mathbf{\Delta}$ USP27 not more than $0.15 \%$ for any peak having a relative retention time
 more than $0.5 \%$ of any other individual impurity is found; and the total of all other impurities is not more than $1.0 \%$.

$\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O} \quad 325.13325 .12$
Phosphonic acid, (4-amino-1-hydroxybutylidene)bis-, monosodium salt, trihydrate.

Sodium trihydrogen (4-amino-1-hydroxybutylidene)diphosphonate, trihydrate [121268-17-5].

## » Alendronate Sodium contains not less than 99.0

 98.0 percent and not more than 101.0102 .0 percent of $\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2}, \cdots 3 \mathrm{H}_{2} \mathrm{O}$, calculated on the dried basis.Packaging and storage-Preserve in well-closed containers. Store between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Alendronate Sodium $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: It meets the requirements of the flame test for So-
dium $\langle 191\rangle$.
Loss on drying $\langle 731\rangle$ —Dry it at a pressure not exceeding 5 mm of mercury at $140^{\circ}$ to constant weight: it loses not less than $16.1 \%$ and not more than $17.1 \%$ of its weight.

Heavy metals, Method III $\langle 231\rangle$ : 0.001\%.

## Chromatographic purity-

Buffer solution-Transfer 5.88 g of sodium citrate dihydrate and 2.84 g of anhydrous dibasic sodium phosphate to a 2-L volumetric flask, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 8.0 , and pass the solution through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity.

[^47]mL. Prepare a solution in acetonitrile containing about 4 mg of 9-fluorenylmethyl chloroformate per mL. Prepare this solution fresh just prior to use.
Berate solution Dissolve 19.1 g of sodium berate in water in a 1 - liter volumetric flask, dilute with water to vol ume, and mix.

Biltent Dissolve 29.4 g of soditm citrate dihydrate in Water in a 1 liter volumetric flack, dilute with water to vol the, and mix.

Solution A-Prepare a filtered and degassed mixture ining 1700 mL of Buffer solution and 300 mL of acetonitrile (17:3).

Solution B-Prepare a filtered and degassed mixture aning 300 mL of Buffer solution and 700 mL of acetonitrile (3:7).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock solution-Transer 30 mg of USP
Alendrenate Soditm RS, aceurately weighed, to a 50 mL velumetric flask, dissolve in and dilute with Diluent to vol the, Prepare a solution of USP Alendronate Sodium RS in Diluent having a known concentration of about 0.6 mg per mL .

Standard solution-Transfer 5.0 mL of the Standard stock solution to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing 5 mL of Borate solution. and Add 5 mL of acetonitrile-Add and 5 mL of 9-Fluorenylmethyl chloroformate solution, and shake for 45 seconds. Allow to stand at room temperature for 30 minutes. Add 20 mL of methylene chloride, and shake vigorously for 1 minute. Centrifuge for 5 to 10 minutes, and use a portion of the clear upper aqueous layer.

Diluted standard solution-Dilute a portion of Standard stock solution with Diluent to obtain a solution having a known concentration of about $0.6 \mu \mathrm{~g}$ per mL . Using 5 mL of this solution, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Reagent blank-Using a $5.0-\mathrm{mL}$ portion of Diluent, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Test solution-Transfer about 30 mg of Alendronate Sodium, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. Using a $5.0-\mathrm{mL}$ volume of this solution, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $266-\mathrm{nm}$ detector and a $4.1-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L21. The flow rate is about $z 1.8 \mathrm{~mL}$ per minute. The column temperature is maintained at about $45^{\circ}$. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-15$ | $100 \rightarrow 50$ | $0 \rightarrow 50$ | linear gradient |
| $15-25$ | $50 \rightarrow 0$ | $50 \rightarrow 100$ | linear gradient |
| $25-27$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $27-32$ | 100 | 0 | isocratic |

Chromatograph the Standard solution and the Diluted standard solution, and record the peak responses as directed for Procedure: the tailing factor for the principal peak in the chromatogram of the Standard solution is not more than 2.0; and the peak at that locus in the chromatogram of the Diluted standard solution is detectable with a signal-tonoise ratio of not less than 3 .

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L})$ of the Test solution and the Reagent blank into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Disregard any peak corresponding to those obtained from the Reagent blank. Calculate the percentage of each impurity in the portion of Alendronate Sodium taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the area of each impurity peak, ether than the principal peak and peaks correspending in retention time to any observed in the chromategramobtained from the Reand and $r_{s}$ is the sum of all impurity peaks and the principal peak: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ total impurities is found.

## Assay-

Buffer solution-Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1-L volumetric flask, dilute with water to volume, mix, and adjust with phosphoric acid to a pH of 8.日.
Diluent-Dissolve 29.4 g of sodium citrate dihydrate in water in a 1-L volumetric flask, dilute with water to volume, and mix.
Borate solution-Dissolve 19.1 g of sodium borate in water in a 1-L volumetric flask, dilute with water to volume, and mix.

9-Fluorenylmethyl chloroformate solution-Transfer 25 me of 9 fluorenylmethyl chloreformate to a 50 mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare fresh just prior to use. [NOTE-This solution contains abeut 0.5 mg of 9 -flurenylmethyl chloroformate per mL. . Prepare a solution in acetonitrile containing about 0.5 mg of 9-fluorenylmethyl chloroformate per mL . Prepare this solution fresh just prior to use.

Mobile phase—Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (70:25:5). Make adjustments if necessary (see System Suitability under Chromatography (621〉).

Standard stock preparation-Transer 25 me of USP Alendronate Sodimm RS, aceurately weighed, to a 250 mL velumetric flask, dissolve in and dilute with Piltuent velume, and mix. Prepare a solution of USP Alendronate Sodium RS in Diluent having a known concentration of about 0.1 mg per mL . Calculate the concentration, $C_{S}$, of anhydrous alendronate sodium in this solution.
Standard preparation-Transfer 5.0 mL of this solution the Standard stock preparation to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing $5 . \theta \mathrm{mL}$ of Borate solution. Add 5.0 mL of 9-Fluorenylmethyl chloroformate solution, and shake for 30 seconds. Allow to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and shake vigorously for 1 minute. Centrifuge for 5 to 10 minutes. Use a portion of the clear upper aqueous layer.

Reagent blank—Using 55.0 mL of Diluent, proceed as directed for Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."
Assay stock preparation - Using Transfer about 25 mg of Alendronate Sodium, accurately weighed, for Stane to a $250-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.
Assay preparation-Using 5.0 mL of the Assay stock preparation, proceed as directed for the Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $266-\mathrm{nm}$ detector and a $4.1-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mathrm{mm}$ packing L21. The flow rate is about +1.2 mL per minute. The column temperature is maintained at about $35^{\circ}$. Chromatograph the Standard preparation, and record the peak
responses as directed for Procedure: the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $1.0 \% 2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation, Assay preparation, and Reagent blank into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2} \cdots-3 \mathrm{H}_{2} \mathrm{\theta}$ in the portion of Alendronate Sodium taken by the formula:

$$
\#\left(r_{5}+r_{s}\right),
$$

$$
D C_{S}\left(r_{U} / r_{S}\right)
$$

in whieh Wis the weight, in mis, of USP Alendrenate-Sodium RS taken to prepare the Standard preparation in which $D$ is the Dilution factor for the Assay stock preparation; $C_{S}$ is as defined under the Standard stock preparation; and $r_{U}$ and $r_{S}$ are the peak area responses for alendronic acid obtained from the Assay preparation and the Standard preparation, respectively. $\Delta$ USP28

## Briefing

Alendronic Acid Tablets, page 997 of PF 29(4) [July-Aug. 2003]. Comments were received that the HPLC method proposed in PF 28(3) lacked the sensitivity required to perform the Dissolution test for the $5-\mathrm{mg}$ Tablets. It was also reported that normal stability conditions for the product do not require monitoring phosphate. On the basis of these comments, the revision to the tests for Dissolution and Assay, and the new test for Limit of phosphate that were proposed in $P F$ 28(3) and the change to the USP designation of the chromatograpic reagent proposed in $P F$ 29(4) have been cancelled. The original proposal, previously published in $P F$ 28(1), is now presented with several changes. Also, tolerances
for weekly dosing tablets are being added to the Dissolution test. A labeling section is added accordingly.
(PA4: E. Gonikberg; BPC: M. Marques) RTS—39906-1; 39470-1; 40567-2

## Add the following:

## AAlendronate Sodium Tablets Alendronic Acid Tablets

## » Alendronate Sodizm Tablets contain Alendronic

 Acid Tablets contain an amount of Alendronate Sodium, equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of alendronatesodiam $\left(\mathrm{C}_{4} \mathrm{H}_{12}\right.$ $\left.\mathrm{NNaO}_{7} \mathrm{P}_{z} \cdot 3 \mathrm{H}_{z} \mathrm{O}\right)$. alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13}\right.$ $\mathrm{NO}_{7} \mathrm{P}_{2}$ ).Packaging and storage-Preserve in tight containers. Store at between $15^{\circ}$ and $30^{\circ}$.

Labeling-The labeling indicates weekly dosing where appropriate.

USP Reference standards $\langle 11\rangle$ —USP Alendronate Sodium RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 15 minutes.
Determine the amount of $\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}$ dissolved by employing the following method.

Buffer solution and Mobile phase-Prepare as directed in the Assay.
$0.05 \%$ 9-Fluorenylmethyl chloroformate solutionTransfer 100 mg of 9-fluorenylmethyl chloroformate to a $200-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix. This solution must be freshly prepared.

Borate buffer-Dissolve 6.2 g of boric acid in approximately 950 mL of water, adjust with 1 N sodium hydroxide to a pH of 9.0 , and dilute with water to 1 L .

Diluent-Transfer 176.4 g of sodium citrate dihydrate to a 1000-mL volumetric flask, dissolve in and dilute with Dissolution Medium to volume, and mix.

Standard stock solution-Dissolve an accurately weighed quantity of USP Alendronate Sodium RS in Dissolution Medium, and dilute quantitatively and stepwise, with the same solvent to obtain a solution having a known concentration corresponding to the concentration that would be obtained by dissolving 1 Tablet in 900 mL of the same Medium. Calculate the concentration, $C$, in mg per mL , of anhydrous alendronate sodium in this solution.

Standard solution-Transfer 5.0 mL of the Standard stock solution to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing 1.0 mL of Diluent and 5.0 mL of Borate buffer, and mix for about 3 minutes. Add 4.0 mL of 0.05\% 9-Fluorenylmethyl chloroformate solution, and agitate for about 30 seconds. Allow the solution to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 5 minutes. Use a portion of the clear upper aqueous layer.

Reagent blank-Using 5 mL of water, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Test solution-After 15 minutes, withdraw a portion of the solution under test, and centrifuge immediately. Using 5.0 mL of the clear supernatant, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Chromatographic system (see Chromatography $\langle 621\rangle$ )— Proceed as directed in the Assay. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution, the Test solution, and the Reagent blank into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ dissolved by the formula:

$$
827.1 C\left(r_{U} / r_{S}\right),
$$

in which $C$ is defined under the Standard stock solution; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Test solution and the Standard solution, respectively. [NOTE- 827.1 is the molecular weight conversion factor $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right.$ / $\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2}$ ) multiplied by the volume of the Medium $(900 \mathrm{~mL})$ ]
Tolerances-Not less than $80 \%(Q)$ of the labeled amount of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ is dissolved in 15 minutes. Tablets labeled for weekly dosing: not less than $75 \%(Q)$ of the labeled amount of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ is dissolved in 15 minutes

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

System suitability solution Prepare a-solution-of USP Alendrenate Sodium PS and sodium biphesphate in HPLC grade water containing 0.2 mg per mL and 0.1 mg per mL , respectively.

Standard preparation Prepare a solution of USP Alen drenate-Soditm PS in HPLC grade water having a known eoneentration of about 0.52 mg of alendronate sodium trihy drate per mL .
Assay preparation Weigh and finely powder not fewer than 20 - Tablets. Transfer an aceurately weighed pertion of the powder, equivalent to about 100 mg of alendronic acid, to a 250 mL volumetric flask, dissolve in HPLC grade water, senieate for 30 minttes, and shake for 10 minttes. Pilute with HPLC grade water to volume, and mix. Pass a pertion of this selution threugh a filter having a 0.45 -mmer finer porosity, and use the filtrate.

Chrematographic system (see Chromatography $\langle 624\rangle$ ) -
The liquid chromatograph is equipped with a 240 -nm detec for and a $4.1 \mathrm{~mm} \times 25-\mathrm{mm}$ columm that contains packing E53. L\#\# (see Chromatography $\langle 624\rangle$ ). The flow rate is about 1.6 mL per minte. Chremategraph the-System suit ability solution, and record the peak responses as-directed for Procedure: the resolution, $R$, between alendronate and phesphate is not less than 2.0; the tailing factor is net mere than 1.5 ; and the relative standard deviation for replieate in jections is net mere than $2.0 \%$.

Procedure Separately inject equal-volumes (about 100 HL) of the Standard preparation and the Assay preparation inte the chrematograph, record the ehromatograms, and meastre the respenses for the major peaks. Caleutate the quantity, in mg, of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ in the per tion of Tablets taken by the formala:

$$
250(249.10 / 325.12) C\left(F_{t}+r_{s}\right)
$$

in which 249.10 and 325.12 are the molecular weights of alendrenic acid and alendrenate-sedium trihydrate, respectively; $C$ is the concentration, in mg per mL , of alendrenate sedium trihydrate in the Standard preparation; and $r_{\text {t }}$ and $r_{s}$ are the peak respenses obtained from the - sssay preparation and the Standard preparation, respectively.

Diluent-Transfer 29.4 g of sodium citrate dihydrate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Buffer solution-Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0 , dilute with water to volume, and mix.
$0.1 \%$ 9-Fluorenylmethyl chloroformate solution-Transfer 250 mg of 9-fluorenylmethyl chloroformate to a 250mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare this solution fresh just prior to use.

Borate solution-Transfer 38.1 g of sodium borate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase_Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (75:20:5). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock preparation-Prepare a solution of USP
Alendronate Sodium RS in diluent containing 0.03 mg of anhydrous alendronate sodium per mL .

Standard preparation-Transfer 5.0 mL of the Standard stock preparation to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing 5 mL of Borate solution, and mix for about 3 minutes. Add 4 mL of $0.1 \%$ 9-Fluorenylmethyl chloroformate solution, and agitate for about 30 seconds. Allow the solution to stand at room temperature for $25 \mathrm{~min}-$
utes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 10 minutes. Use the clear upper aqueous layer.

Assay stock preparation-Transfer not fewer than 10 Tablets to a $1000-\mathrm{mL}$ volumetric flask. Add 500 mL of Diluent, shake by mechanical means for 30 minutes, and sonicate for 5 minutes. Dilute with Diluent to volume, mix, and centrifuge a portion of this solution. Quantitatively dilute a portion of the clear supernatant to a concentration in a range of 0.02 to 0.03 mg per mL .

Assay preparation-Using 5.0 mL of the Assay stock preparation, proceed as directed for Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Reagent blank-Using 5 mL of Diluent, proceed as directed for Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $266-\mathrm{nm}$ detector and a $4.1-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L21. The column is maintained at a constant temperature of about $35^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation, Assay preparation, and the Reagent blank into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ in the portion of Tablets taken by the formula:

$$
0.919 D C\left(r_{U} / r_{S}\right)
$$

in which $D$ is the dilution factor for the Assay stock preparation; $C$ is the concentration, in mg per mL , of anhydrous USP Alendronate Sodium RS in the Standard stock preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. [NOTE- 0.919 is the molecular weight conversion factor $\left.\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2} / \mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2}\right) \cdot\right]_{\Delta U S P 28}$

## BRIEFING

#### Abstract

Amphetamine Sulfate, USP 27 page 143; Dextroamphetamine Sulfate, USP 27 page 576. It is proposed to revise the concentration of triethylamine used to prepare the Buffer solution in the test for Chromatographic purity. This correction reflects the actual concentration used in the validation of the method.

(PA3: S. Salado) RTS-40699-1

## Change to read:

## Chromatographic purity-

Diluent-Dilute 3.12 mL of phosphoric acid with water to 1000 mL .
Buffer solution-Dissolve 2.16 g of sodium 1-octanesulfonate in 1000 mL of water, and add 1.0 mL of $0.1 \%$ triethylame (
${ }^{\Delta}$ triethylamine. $\triangle$ USP28
Mix, and adjust with phosphoric acid to a pH of 2.5 .
Mobile phase -Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (144:37:19). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Standard stock solution-Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in Diluent to obtain a solution having a known concentration of about 0.3 mg per mL .
Standard solution-Dilute an accurately measured volume of Standard stock solution in Diluent to obtain a solution having a known concentration of about 0.003 mg per mL .
Test solution-Transfer about 30 mg of Amphetamine Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of Diluent, sonicate for 5 minutes, dilute with Diluent to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard stock solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the amphetamine peak and any adjacent peak, if any, is not less than 1.5 .

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Amphetamine Sulfate taken by the formula:

$$
10,000(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Dextroamphetamine Sulfate RS in the Standard solution; $W$ is the weight, in mg , of Amphetamine Sulfate taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for amphetamine obtained from the Standard solution: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

## BRIEFING

Amphotericin B Lotion, USP 27 page 146. It is proposed to change the title of this monograph to Amphotericin B Topical Emulsion. Revisions are proposed by the Expert Committee on Nomenclature and Labeling to change the titles of twenty-two USP monographs from [DRUG] Lotion to [DRUG] Topical Emulsion or [DRUG] Topical Suspension, as appropriate. The change of terminology proposed for these older Lotion monograph titles is consistent with the nomenclature that has been applied over the past several years for terminology for new preparations that are administered externally, such as Topical Solution, Topical Aerosol, and Topical Powder. It follows the policy established by a former USP Drug Nomenclature Committee and continued in effect by the present Expert Committee on Nomenclature and Labeling, whereby these topical preparations are to be named in the general form [DRUG NAME][ROUTE OF ADMINISTRATION] [DOSAGE FORM], e.g., [Clindamycin Phosphate][Topical][Suspension]. The decision to move away from traditional Lotion terminology came about because the term Lotion does not have the meaning and is not as informative as the descriptive Topical Emulsion and Topical Suspension terminology.

Revisions are proposed for eleven USP monographs on other dosage forms in which references, currently made to Lotion monographs, would necessarily be changed concomitantly to ensure that reference is made to the correctly titled topical liquid dosage forms.

Revisions of the following monographs are proposed for publication in USP 28-NF 23, which is to become official January 1, 2005, but with July 1, 2007, designated as the official date for the name changes. Use of the revised names would be permitted as of January 1, 2005, the official date of $U S P 28-N F 23$, but use of the revised names would not become mandatory until July

1, 2007. The 30 -month postponement of the official date for the name changes is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the revised terminology.

## Add the following:

## AAmphotericin B Topical Emulsion <br> (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is Amphotericin B Lotion)

» Amphotericin B Topical Emulsion contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of amphotericin $B$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Amphotericin B RS.
Minimum fill $\langle 755\rangle$ : meets the requirements.
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 7.0.
Assay-Proceed as directed for amphotericin B under Anti-biotics-Microbial Assays $\langle 81\rangle$, dissolving a suitable accurately measured volume of Topical Emulsion quantitatively in sufficient dimethyl sulfoxide to give a convenient concentration. Dilute an accurately measured volume of this solution quantitatively with dimethyl sulfoxide to obtain a stock solution having a concentration of about $20 \mu \mathrm{~g}$ of amphotericin B per mL . Dilute an accurately measured volume of this stock solution quantitatively with Buffer No. 10 to obtain a Test Dilution having a concentration assumed to be equal to the median dose level of the Standard. $\Delta$ USP28
(Official July 1, 2007)

Anecortave Acetate; Anecortave Acetate Injectable Suspension. Because there are no existing USP monographs for this drug substance and drug product, new monographs are being proposed. The drug product has been granted Fast-Track Designation by the FDA as a treatment for Age-Related Macular Degeneration (AMD), the common cause of vision loss in elderly people. USP has given these monographs special consideration to ensure that quality public standards are available so that appropriate treatment is provided for persons affected by AMD. The drug product has not been approved by the FDA, therefore neither the API or product monographs will become official until approval has been granted by the agency. The liquid chromatographic procedure in the test for Related compounds and in the Assay is based on analyses performed with the Phenomenex Spherisorb brand of L1 column. The typical retention time for anecortave acetate is about 10.5 minutes.
(PA6: L. Evans) RTS-40612-1

|  | 3,20-dione |  |  |
| - | Any other individual impurity | - | 0.1 |
| - | Total Impurities | - | 0.7 |

## Assay-

Buffer—Add 1.0 mL of concentrated phosphoric acid to 1.0 L of water. Adjust with sodium hydroxide to a pH of 3.0 .

Mobile phase-Prepare a filtered and degassed mixture of Buffer and acetonitrile (57:43). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve about 5 mg of USP Anecortave Acetate RS, 4 mg of USP Hydrocortisone Acetate RS, and 3 mg of USP Anecortave Acetate Related Compound A RS into a $5.0-\mathrm{mL}$ volumetric flask, dilute with ethyl acetate to volume, and mix. Transfer 2.0 mL of this solution to a $25-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Standard preparation-Transfer about 25 mg of USP Anecortave Acetate RS, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask. Add 9 mL of ethyl acetate, sonicate for 5 minutes, and cool to room temperature. Dilute with ethyl acetate to volume, and mix. Transfer 2.0 mL into a $25-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to obtain a concentration of about 0.2 mg per mL .

Assay preparation-Prepare as directed for Standard preparation using anecortave acetate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $242-\mathrm{nm}$ detector and $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between hydrocortisone acetate and anecortave acetate is not less than 10 ; the resolution, $R$, between hydrocortisone acetate and anecortave acetate related compound A is not less than 2; the column efficiency determined for the anecortave acetate peak is not less than 3000 theoretical plates; the tailing factor for anecortave acetate is not more than 2.0 ; and the relative standard deviation for replicate injections of the Standard preparation is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{O}_{5}$ in the portion of Anecortave Acetate taken by the formula:

$$
125 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Anecortave Acetate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively._USP28

## Briefing

Anecortave Acetate Injectable Suspension-See briefing under Anecortave Acetate.
(PA6: L. Evans) RTS-40612-2

## Add the following:

## -Anecortave Acetate Injectable Suspension

## » Anecortave Acetate Injectable Suspension is a

 sterile suspension of Anecortave Acetate in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anecortave acetate $\left(\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{O}_{5}\right)$.Packaging and storage-Preserve in single dose-containers preferably of Type I glass. Avoid freezing.

Labeling-Label it to indicate that it is not recommended for intravenous use and that it is to be well shaken before use.

USP Reference standards $\langle 11\rangle — U S P$ Anecortave Acetate RS. USP Anecortave Acetate Related Compound A RS. USP Hydrocortisone Acetate RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

B: Thin-Layer Chromatographic Identification Test〈201〉—
Adsorbent: a $0.20-\mathrm{mm}$ layer of chromatographic silica gel mixture containing fluorescent indicator.

Test solution-Transfer a quantity of the Injectable Suspension, equivalent to about 10 mg of anecortave acetate, to a suitable flask, and extract with one $2.0-\mathrm{mL}$ portion of ethyl acetate. Use the extract as the Test solution.

Standard solution-Prepare a solution in chloroform containing 5.0 mg of USP Anecortave Acetate RS per mL.

Application volume: $2 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform and methanol (12:1).

Sterility $\langle 71\rangle$ — To come.]
Bacterial endotoxins $\langle 85\rangle$ - [To come.]
$\mathbf{p H}\langle 791\rangle$ : between 6.8 and 7.8.

## Particle size-

Carrier fluid-Heat Purified Water to $40^{\circ}$ to $50^{\circ}$, add 100 mg anecortave acetate per L while stirring, cool to room temperature while stirring, filter through a $0.2-\mu \mathrm{m}$ filter, and store in a clean, covered container.
Test preparation-Dilute several $\mu \mathrm{L}$ of Injectable Suspension with Carrier fluid to 25 mL .

Procedure-(see the Light Obscuration Particle Count Test under Particulate Matter in Injections $\langle 788\rangle$ )—Analyze the Test preparation using an electronic, liquid-borne particle counting system that employs a light obsuration sensor with a suitable sample feeding device. Not less than $95.0 \%$ of the particles are $\leq 10 \mu \mathrm{~m}$, not less than $99.50 \%$ are $\leq 25 \mu \mathrm{~m}$, not less than $99.95 \%$ are $\leq 50 \mu \mathrm{~m}$, and not less than $99.995 \%$ are $\leq 100 \mu \mathrm{~m}$.

## Related compounds-

Buffer, Mobile phase, System suitability solution and Chromatographic system-Proceed as directed in the Assay under Anecortave Acetate.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Procedure-[NOTE-Use peak areas where peak responses are indicated.] Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph. Measure the areas of the analyte peaks. Allow the elution to continue for about 10 to 15 min utes after the elution time of the anecortave acetate. Calculate the quantity, in mg , of the degradation products in each mL of the Injectable Suspension taken by the formula:

$$
50 \mathrm{C}\left(r_{U} / r_{S}\right) F
$$

in which $C$ is the concentration, in mg per mL , of anecortave acetate in the Standard solution; $r_{U}$ and $r_{S}$ are the degradation product peak responses obtained from the Test solution and the anecortave acetate peak response obtained from the Standard solution, respectively; and $F$ is the relative response factor for each individual degradation product ( 0.91 for $9(11)$-dehydrocortisol, and 1.00 for all other degradation products): not more than $0.7 \%$ of 9(11)-dehydrocortisol of the labeled amount of anecortave acetate is found; no other single impurity is more than $0.2 \%$; and the sum of all impurities found is not more than $1.5 \%$.

## Assay-

Buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system—Proceed as directed in the Assay under Anecortave Acetate.

Assay preparation-Transfer an accurately measured volume of Injectable Suspension, equivalent to about 10 mg of anecortave acetate, to a $50-\mathrm{mL}$ volumetric flask. Add 4.0 mL of ethyl acetate, followed by 40.0 mL of Mobile phase, sonicate for 5 minutes, cool to room temperature, dilute with Mobile phase to volume, and mix.

Procedure-Proceed as directed for Procedure in the $A s$ say under Anecortave Acetate. Calculate the quantity, in mg, of anecortave acetate $\left(\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{O}_{5}\right)$ in each mL of the Injectable Suspension taken by the formula:

$$
50(C / V)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of anecortave acetate in the Standard preparation; $V$ is the volume, in mL , of Injectable Suspension taken; and $r_{U}$ and $r_{S}$ are the anecortave acetate peak responses obtained from the Assay preparation and the Standard preparation, respectively._USP28

## BRIEFING

Arginine Hydrochloride, USP 27 page 167. It is proposed to add units of volume to clarify the concentration of the System suitability solution in the test for Chromatographic purity.
(PA6: L. Evans) RTS-40897-1

## Change to read:

Chromatographic purity-
Adsorbent: $0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution-Dissolve an accurately weighed quantity of Arginine Hydrochloride in water to obtain a solution having a concentration of 10 mg per mL .

Standard solution-Dissolve an accurately weighed quantity of USP Arginine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.05 mg per mL . [NOTE-This solution has a concentration equivalent to about $0.5 \%$ of that of the Test solution.]

System suitability solution-Prepare a solution in water containing 0.4 mg each of USP Arginine Hydrochloride RS and USP LLysine Hydrochloride RS

## ©per mL. $\quad$ USP28

Spray reagent-Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butyl alcohol and 2 N acetic acid (95:5).
Application volume: $5 \mu \mathrm{~L}$.
Developing solvent system-Prepare a mixture of isopropyl alcohol and ammonium hydroxide (70:30).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Dry the plate between $100^{\circ}$ and $105^{\circ}$ until the ammonia disappears completely. Spray with Spray reagent, and heat between $100^{\circ}$ and $105^{\circ}$ for about $15 \mathrm{~min}-$ utes. Examine the plate under white light. The chromatogram obtained from the System suitability solution exhibits two clearly separated spots. Any secondary spot in the chromatogram obtained
from the Test solution is not larger or more intense than the principal spot in the chromatogram obtained from the Standard solution: not more than $0.5 \%$ of any individual impurity is found; and not more than $2.0 \%$ of total impurities is found.

## Briefing

Atovaquone Oral Suspension, USP 27 page 187 and page 1846 of PF 29(6) [Nov.-Dec. 2003]. It is proposed to revise the test for Sedimentation to specify that the test applies only to oral suspension packaged in multiple-unit containers.
(PA7b: B. Davani) RTS-40504-1

Transfer 50 mL of well-mixed Oral Suspension to a glass-stoppered graduated cylinder, and allow to stand for 16 hours. Measure the volume, if any, of clear liquid observed in the cylinder: not more than 1 mL of clear liquid is found.

## Briefing

Atracurium Besylate Injection, USP 27 page 189 and page 1008 of PF 29(4) [July-Aug. 2003]. It is proposed to revise the Assay to correct the formula in the Procedure.
(PA3: S. Salado) RTS-40861-1

## Change to read:

Related compounds-
Buffer solution, Solution A, Solution B, Mobile phase, and Standard preparation-Proceed as directed in the Assay under Atracurium Besylate.

System suitability solution-Heat a portion of the Standard preparation at $90^{\circ}$ for 30 minutes, and chill immediately to about $5^{\circ}$.

Diluted standard preparation-Dilute a portion of the Standard preparation quantitatively, and stepwise if necessary, with Solution $A$ to obtain a solution having a known concentration of about 0.02 mg per mL .

Test preparation-Use the Assay preparation.
Chromatographic system-Prepare as directed for Chromatographic system in the Assay. Chromatograph the System suitability solution and the Diluted standard preparation, record the chromatograms, and measure the responses for the degradation products by comparing the peak responses of the System suitability solution to those of the Diluted standard preparation as directed for Procedure: the retention times relative to the atracurium besylate cis-cisisomer are about 0.22 for the acidic compound, 0.29 for laudanosine, 0.44 and 0.50 for the trans- and cis-isomers, respectively, of the hydroxy compound, and about 1.28 and 1.33 for the trans- and cis-isomers, respectively, of the monoacrylate.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Diluted standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the peak responses, except the peak due to benzenesulfonic acid occurring at a retention time of about 0.08 relative to the atracurium besylate cis-cis-isomer. Calculate the percentage of each impurity in the portion of Test preparation taken by the formula:

$$
100(C / M)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Atracurium Besylate RS in the Diluted standard preparation; $M$ is the concentration of atracurium besylate, in mg per mL , in the Test preparation; $r_{i}$ is the peak response for each impurity obtained from the Test preparation; and $r_{s}$ is the sum of the responses of all the peaks obtained from the Diluted standard preparation: not more than $6.0 \%$ of the acidic compound, not more than $6.0 \%$ of the combined cis- and trans-isomers of the hydroxy compound, not more than $3.0 \%$ of laudanosine, and not more than $3.0 \%$ of the combined cis- and trans-isomers of the monoacrylate, tand not mere than $0.5 \%$ of other known impurities
$\Delta^{4}$ and not more than $2.0 \%$ of other known impurities ${ }_{\triangle U S P 28}$ is found; not more than $0.1 \%$ of any other impurity is found; and not more than $15.0 \%$ of total impurities is found.

4 $\mathbf{\Delta S P 2 8}$

## Change to read:

Assay-
Buffer solution, Solution A, Solution B, Mobile phase, and Standard preparation-Proceed as directed in the Assay under Atracurium Besylate.

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 50 mg of atracurium besylate, to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains base-deactivated packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 80 | 20 | equilibration |
| $0-5$ | 80 | 20 | isocratic |
| $5-15$ | $80 \rightarrow 40$ | $20 \rightarrow 60$ | linear gradient |
| $15-25$ | 40 | 60 | isocratic |
| $25-30$ | $40 \rightarrow 0$ | $60 \rightarrow 100$ | linear gradient |

Chromatograph replicate injections of the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for the atracurium besylate trans-trans-isomer, 0.9 for the cis-trans-isomer, and 1.0 for the cis-cisisomer; the resolution, $R$, between the atracurium besylate trans-trans-isomer and the cis-trans-isomer and between the atracurium besylate cis-trans-isomer and the cis-cis-isomer is not less than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the three atracurium besylate isomer peaks. Calculate the quantity, in mg, of atracurium besylate $\left(\mathrm{C}_{65} \mathrm{H}_{82} \mathrm{~N}_{2} \mathrm{O}_{18} \mathrm{~S}_{2}\right)$ in each mL of the Injection taken by the formula:

$$
50(C / V) 10 C\left(+_{t}+r_{s}\right)
$$

$$
\Delta_{50}(\mathrm{C} / \mathrm{V})\left(r_{U} / r_{S}\right)_{, \mathbf{\Delta S P 2 8}}
$$

in which $C$ is the concentration, in mg per mL , of USP Atracurium Besylate RS in the Standard preparation; $V$ is the volume, in mL , of Injection taken for the Assay preparation; and $r_{U}$ and $r_{S}$ are the sums of the peak responses of the atracurium besylate trans-trans, trans-cis, and cis-cis-isomers obtained from the Assay preparation and the Standard preparation, respectively.

Briefing

Azithromycin, USP 27 page 198 and page 1417 of $P F$ 29(5) [Sept.-Oct. 2003]. On the basis of comments and data received, modification of the proposed test for Loss on drying of Azithromycin monohydrate is proposed. One comment noted that the proposed temperature range of $80^{\circ}$ to $130^{\circ}$ for the release of the monohydrate water is arbitrary, and that different thermogravimetric apparatuses could give different results. It is now proposed to define the temperature range based on a plot of the first derivatives of the thermogram, that is, the percent weight loss per minute of heating. The range is identified by observing the inflection points of the first derivative curve at about $70^{\circ}$ and $130^{\circ}$. The flow rate of nitrogen is changed from 100 mL per minute to a constant
rate of about 35 mL per minute. The lower flow rate is to assure better equilibrium of the sample and volatiles during heating and to yield better precision of results.

## Add the following:

${ }^{\Delta}$ Loss on drying (where it is labeled as Azithromycin monohydrate and has a Water content of between $4.0 \%$ and 6.5\%) (see Thermal Analysis $\langle 891\rangle$ )-[NOTE-The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity.] Determine the percentage of volatile substances by thermogravimetric analysis in an appropriately calibrated instrument, using about 10 mg of Azithromycin, accurately weighed. Heat the specimen at the rate of $10^{\circ}$ per minute between ambient temperature and $150^{\circ}$ in an atmosphere of nitrogen at a 100 mL per minnte. From the thermegram determine the aeet mulated loss in weight between ambient temperature and about $80^{\circ}$ on the plateat, and from $80^{\circ}$ to $130^{\circ}$ : it loses not more than $4.5 \%$ of its weight between ambient temperature and about $80^{\circ}$, and between 1.8\% and 2.6\% between $80^{\circ}$ and $130^{\circ}$. constant flow rate of about 35 mL per minute. From the thermogram plot the derivatives of the loss on drying (percent loss per minute), identify the inflection points of the two weight loss steps at about $70^{\circ}$ and $130^{\circ}$ : it loses not more than $4.5 \%$ of its weight between ambient temperature and the inflection point at about $70^{\circ}$, and between $1.8 \%$ and $2.6 \%$ between the inflection point at about $70^{\circ}$ and the inflection point at about $130^{\circ} \cdot \mathbf{\Delta U S P 2 8}$

BCG Live, page 1419 of $P F 29$ (5) [Sept.-Oct. 2003]. This proposed new monograph is being presented again with changes recommended by the monograph sponsor. It is proposed to revise the Definition to specify that the vaccine is to be used intravesically for immunotherapy. In the Packaging and storage section it is proposed to delete the specification for a particular type of container. Also, to be more inclusive of all marketed products, it is proposed to revise the tests for Identification, Virulent mycobacteria, Skin reactivity, and Potency.
(VVI: T. Morris) RTS-40859-1

## Add the following:

## $\triangle$ BCG Live

» BCG Live (intravesical) for immunotherapy is a freeze-dried preparation of attenuated live bacteria derived from a culture of Bacillus Calmette-Guérin (Mycobacterium bovis, var. BCG) and used intravesically in the treatment of carcinoma in situ and papilloma tumors of the urinary bladder. The bacteria are grown in a medium that does not contain substances known to cause toxic or allergic reactions in human beings or to cause the bacteria to become virulent for guinea pigs. The culture is harvested and formulated to contain one or more excipients. The freeze-dried preparation is reconstituted and further diluted aseptically with a sterile diluent for use. A reconstituted dose contains $1.0-19.2 \times 10^{8}$ colony-forming units (cfu). BCG Live does not contain a preservative.

Packaging and storage-Preserve in single-dose hermetic Type I glass eontainers and store at a temperature between $z^{\circ}$ and $8^{\circ}$ away from direet sumlight. Do not freeze. BCG

Live is sensitive to light and therefore must be preserved and stored where it is protected from direct light at a temperature between $2^{\circ}$ and $8^{\circ}$.

Expiration date-The product is stable for 1 year 3 years when stored between $2^{\circ}$ and $8^{\circ}$.

Labeling-Label it to indicate the dry weight of bacteria in a vial, cfu per dose, the storage conditions, the expiration date, and that it is not to be used after the expiration date given on the package. Label it to state that it should be protected from direct sunlight light and that it should be used immediately after reconstitution/dilution. Label it to indicate that it is "for intravesical use". "Renly."

## Identification-

Garbol fuchsin solution Transfer 10 g of basic fuchsim powder and 100 mL of aleohol to a $100-\mathrm{mL}$ bettle. Mix using a magnetic stir bar and a magnetic stirrer to dissolve. Transfer the solution to a 1-E Erlenmeyer flask. Adt 50 mE Of Liqueffed Phenel and 850 mL of water. Mix, and fiter. Stere at reom temperature. [NOTE The-solution is stable up to 3-menths when stored at ambient temperature. $]$

Aeid atcoltol solution Transfer 970 mL of alceheltoat 1-L bettle, adt 30 mL of hydrochtoric acid, and mix. Stere at reom temperature. [NOTE The solution is stable up-to-3 fonths when stered at ambient temperature.]

Methylene blut solution Transfer 4.5 g of methylene blue-ta 2 E Erlemmeyer flack, and add-450 mL aleohel. Add 150 mg of potassium hydroxide and 1500 mL of water to the flask. Mix until the solutes dissolve and filter. Store-at ambient temperature. [NOTE The-solution is-stable tp to 4 year when stered at ambient temperature.]

Standard suspension Use approved U.S. Reference
BCG Live.
Fest suppension Reconstitute the freez-dried BCG Live according to the manufacturer's instructions for human use with the diluent recommended by the manufacturer.

Negative control Use the dilthent recemmended by the manufacturer for reconstitution of BCG Live.

Procedtre Prepare a suitable bacteriologieal loop and flame it where it joins the handle until it is red hot. Allow the loop to cool down to room temperature without touching anything. Transfer a loep-full of each of the Standtard suts pension, Test suspension, and Negative eontrol on-separate slides. Wash the loop in a stream of water, flame it, and at low it to cooldown as described above in between the transfers. [NOTE-Altematively separate loops may be used for the transfer of different solutions.] Heat fix each-slide by passing it over a flame four times. [NOTE-Too much heat may cause the slide to break.] Flood the slides with the Catbol fuehsin solution, and heat them over a steam bath for about 5 minttes. [NOTE-Make-sure that the entire-slide-is eovered with the Carbol fuchsin solution throughout the staining procedtre.] Rinse the slides with water. Flood the slides with the Aeid aleohol selution until no more-coler eomes out and the stides are clear of stain visible to the naked eye (about 30 -secends). Rinse the slides theroughly with water and drain any exeess water frem the slides. Flood the slides with the Methylene blue solution for about 30 sec ends to 1 minute, and rinse them-with-water. Examine the slides under a mieroscope. Bacteria in the Standerd suspensign and the Test suspension stain red, and the negative contrel is celorless. The merphelegical chatacteristies of the stains from the Test suspension are similar to these from the Standard suspension.

BCG Live is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property. Alternatively, validated molecular biology techniques may be used.

General Safety—It meets the requirements as set forth for Safety Tests-Biologicals under Biological Reactivity Tests, In Vivo $\langle 88\rangle$, modified as follows. Guinea pigs are injected intraperitoneally with 3.0 mL of the reconstituted product.

Sterility $\langle 71\rangle$ —It meets the requirements when tested as directed for Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined.

## Virulent mycobacteria-

Test suspension-Reconstitute the freeze-dried BCG Live arding to as per the manufacturer's instructions for human use with the diluent recommended by the manufacturer, and dilute aseptically to about 5 ms per mL with sterile $0.9 \%$ chlimeride 2 mg per mL with sterile BCG diluent.

Procedure-Randomly select not fewer than six guinea pigs (male or female), of the same sex, each weighing 250 to 300 g . fijecech mimal with 1.0 mL of the Test suspen sion intramuseularly in the rear left internal thigh, and observe them for a period of 6 weeks. Note the number of animals that strvive at the end of the observation period, and then saerifice them. Perform autopsies of all animats post mortem to examine them for mieroseopic tubereutous infections, particularly at the popliteal and inguinal lymph nodes, limgs, as well as at the injection site. If the results are not conelusive, perform a histologieal-mamination for fowing the procedure described in Identification, except for the following: suitable tissue sections are used insted of the Fest suspension, no Standerd suspension is required, and the tubereulous infections are demenstrated by red stains in a blue background. [NOTE The blue color is due to the staining of the nenacid fast cells by methylene blue.] At the end of the observation period, not less than the thirds of the an imals survive, ho sign of tubereulosis is detected in animals that survive, as well as these that died; and the animals that surving. Inject each animal with a total of at
least 4 mg of the Test suspension intramuscularly or subcutaneously in the rear left internal thigh, and observe them for a period of 6 weeks. Note the number of animals that survive at the end of the observation period, and then sacrifice them. Perform autopsies of all animals postmortem to examine them for evidence of tuberculous infections, particularly at the popliteal and inguinal lymph nodes, liver, spleen, pancreas, and lungs as well as at the injection site. If any abnormalities are found, perform a histological examination using standard and Acid-Fast staining techniques to detect Acid-Fast organisms. The product complies with the test if none of the animals show signs of tuberculosis and not more than one-third of the animals die during the observation period.

## Skin reactivity-

## Test suspensions - Reenstitute the freezedried BCG

 Live according to the manufacturer's instruetions for human we with the diluent reeommended by the manufacturer. Dilute the solution further $1: 10,1: 100$, and $1: 1000$ aseptically using the diluent. Using the same diluent and the Test suspension prepared as directed for the test for Virulent mycobacteria, further dilute aseptically by making three serial tenfold dilutions.Procedure-Randomly select two guinea pigs (male or female), each weighing 250 to 300 g . Inject 0.1 mL of each of the four suspensions intradermally at different sites on the back of each animal. After 4 weeks, the animals are shaved so that the injection sites and any reactions are made clearly visible. The diameters of the reactions are measured, and the presence of necrosis or nodules noted. The reaction for the largest dose is between 4 and 10 mm and the smallest dose induces a nodule less than or equal to 4 mm . Each animal gains weight during the observation period.

## Tuberculin sensitivity-

Tuberculin solution-Use tuberculin, purified protein derivative, to prepare a solution containing 25 U.S. Tuberculin Units per 0.1 mL . Dilute aseptically, if necessary, with sterile $0.9 \%$ sodium chloride solution.

Procedure-Use the same animals on which the Skin reactivity test is performed. After the Skin reactivity test is completed, inject each animal intradermally on the back with 0.1 mL of the Tuberculin solution, and observe after 18 to 24 hours. An erythematous reaction of not less than 10 mm in diameter is measured on each animal.

Residual moisture: Meth $\mathrm{Ie}\langle(924\rangle \div$ Net more than $2.5 \%$. Not greater than the limit approved for the particular product, determined by a suitable validated method. Limits vary in accordance with the method.

Viability-Determine the potencies of BCG Live using not less than 5 containers before freeze-drying and an equal number of containers after freeze-drying, following the procedure described under Potency, except use the suspension before freeze-drying as is. The loss in viability due to freeze-drying is not more than $90 \%$.

## Potency-

Culture medium-Prepare the eulture medium as de-
seribed below: Dissolve, adjust the pH to 7.0 with a sodium hydroxide solution, and sterilize by filtration.

| Compenents | Weight |
| :---: | :---: |
|  | $5.0-\mathrm{g}$ |
| Asparagine | 5.0 - |
| Monobasic petassitm phosphate |  |
| Potassimm sulfate | 0.5-g |
|  | 1.5 F |
| Magnesitmm eitrate | 19.0-5 |
| Monesodium glatamate | 20.0 mL |
| Glycerin |  |

| Gempenents | Weight |
| :--- | :---: |
| Weter | $900.0-\mathrm{mL}$ |
| $5 \%$ aqueous solution | 100.0 mL |
| of albumin bovine-serum |  |

## Agar solution Transfer 1.5-g of agar to an- Erlenmeyer

flask and add 100 mL of water. Close the meuth airtight with a suitable cotton plug and attoclave at $120^{\circ}$ for 15 to 30 minutes. With the mouth tightly closed by the cotton plus, eool the solution to $-42^{\circ}$ and maintain in a water bath at $42^{\circ}$ untiluse.

Fest suspensions-Recenstitute net less than 5-entainers of the freeze dried BCG Live according to the manufac turer's instructions for human use with the diluent reeommended by the manufacturer.

Procedtre [NOTE-Work in a laminar flow biologieat safety cabinet under aseptic conditions.] Transfer 4.5 mL of the-Culture meditun to each of a series of $16 \mathrm{~mm}-*$ 125 mm serew eapped test tubes. Arrange the tubes in rows such that each row eontains 10 tubes. Mark the tubes from 1 t-10. Add $0.5-\mathrm{mL}$ of thoroughly mixed Test suspension from one container to the first test tube (Tube number 1) ef arow, mix, and transfer 0.5 mL to the next test tube (Tube number 2). Mix thereughly and transfer 0.5 mL to the next test tube (Tube number 3). Repent the procescof mixing and serially transferring to each consecutive tube and diseard 0.5 mL from the last test tube. Repeat the same process to serially dilute reconstituted vaceine from the-other containers sueh that the reconstituted vaccine from each container ean be diluted serially along separate rows. From-each row select the test tube that is expected to contain 10 to 50 efu, and the test tubes that have immediately higher and-immediately lower efu, and ineubate them-in a water bath at $42^{\circ}$ for about 10 mintutes. Add 0.5 mL of $A$ gat solt
tion to each test tube, mix thoroughly, transfer on a sterile $0.5 \%$ agar gel plate, and immediately spread the solution taiformly on the plate. Ineubate the plates at $35^{\circ}$ to $37^{\circ}$ for 3 to 4 weeks. For each container, count the number of eolenies on the plates that contain between 10 to 50-0f them and caleulate the-eftrin each-container.

Determine the number of viable units per mL by viable count on solid medium using a method suitable for the product to be examined. Alternatively, a validated biochemical method may be used. $\triangle U S P 28$

## BRIEFING

Benzoyl Peroxide Gel, USP 27 page 224. On the basis of numerous comments received, in the Chromatographic system under Related compounds, it is proposed to change the acceptance criteria for the resolution between methylparaben and benzoic acid in the chromatogram of the System suitability solution. The column dimensions and the gradient are also being modified to enhance this resolution.
(PA7b: B. Davani) RTS-40462-2

## Change to read:

## Related compounds-

Solution $A$-Prepare a filtered and degassed mixture of acetonitrile and glacial acetic acid (1000:1).

Solution B-Prepare a filtered and degassed mixture of water and glacial acetic acid (1000:1).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Prepare a solution in acetonitrile containing $100 \mu \mathrm{~g}$ of benzoic acid and $60 \mu \mathrm{~g}$ of methylparaben per mL.

Test preparation-Transfer an accurately weighed quantity of Gel, equivalent to about 100 mg of benzoyl peroxide, to a $50-$ mL volumetric flask, add 25 mL of acetonitrile, shake vigorously to disperse the specimen, sonicate for 5 minutes, dilute with acetonitrile to volume, mix, and filter.
Standard preparation A-Prepare a solution of benzoic acid in acetonitrile containing $500 \mu \mathrm{~g}$ per mL .

Standard preparation B-Prepare a solution of ethyl benzoate in acetonitrile containing $20 \mu \mathrm{~g}$ per mL .

Standard preparation $C$-Prepare a solution of benzaldehyde in acetonitrile containing $20 \mu \mathrm{~g}$ per mL .

Standard preparation D-Prepare a solution of hydrous benzoyl peroxide, previously subjected to the Assay under Hydrous Benzoyl Peroxide, in acetonitrile containing the equivalent of $40 \mu \mathrm{~g}$ of anhydrous benzoyl peroxide per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $235-\mathrm{nm}$ detector and a $3.9 \mathrm{~mm} \times 15 \mathrm{em}$
${ }^{\Delta} 4.6-\mathrm{mm} \times 25-\mathrm{cm}_{\Delta U S P 28}$
column containing packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| $\begin{gathered} \text { Time } \\ \text { (minutes) } \end{gathered}$ | Solution A (\%) | $\begin{gathered} \text { Solution B } \\ (\%) \\ \hline \end{gathered}$ | Elution |
| :---: | :---: | :---: | :---: |
| 0 | 18 | 82 | equilibration |
| -10 | $18 \rightarrow 60$ | $82 \rightarrow 40$ | linear gradient |
| $\begin{gathered} \Delta_{0}-20 \hat{\wedge}^{U S P} 28 \\ 10-22 \end{gathered}$ | 60 | 40 | isocratic |
| ${ }^{\mathbf{4}} \mathbf{2 0 - 3 0}{ }_{\text {^USP28 }}$ |  |  |  |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between benzoic acid and methylparaben is not less than 3.0 ;

## ${ }^{\Delta} 2.0 ;_{\mathbf{\Delta U S P 2 8}}$

and the tailing factors for the benzoic acid and methylparaben peaks are not more than 2.0.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparations and the Test preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The responses of any peaks obtained from the Test preparation corresponding to benzoic acid, ethyl benzoate, and benzaldehyde are not greater than those of the main peaks obtained from Standard preparation $A$ (25\%), Standard preparation B (1\%), and Standard preparation C (1\%), respectively; the response of any other impurity peak obtained from the Test preparation, other than the main benzoyl peroxide peak, any benzoic acid, ethyl benzoate, benzaldehyde, methylparaben, or propylparaben peak, and any solvent peak, is not more than that obtained from Standard preparation $D(2 \%)$; and the sum of the responses of all the impurity peaks, other than those of benzoic acid, ethyl benzoate, and benzaldehyde is not more than that obtained from Standard preparation $D(2 \%)$.

## BRIEFING

Benzoyl Peroxide Lotion, USP 27 page 225. It is proposed to change the title of this monograph to Benzoyl Peroxide Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40777-1

## Benzoyl Peroxide Lotion

(Current title—not to change until July 1, 2007) Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Benzoyl Peroxide Topical Emulsion

## Briefing

Benzoyl Peroxide Topical Emulsion-See briefing under Amphotericin $B$ Lotion.
(NL: C. Barnstein) RTS-40777-1

## Add the following:

## ©Benzoyl Peroxide Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Benzoyl Peroxide Lotion)
» Benzoyl Peroxide Topical Emulsion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{O}_{4}$.

Packaging and storage-Preserve in tight containers.

## Identification-

A: Dilute a quantity of Topical Emulsion with acetone to obtain a solution having a concentration of benzoyl peroxide equivalent to 10 mg per mL , and proceed with the solution so obtained as directed in the Identification test $A$ under Hydrous Benzoyl Peroxide, beginning with "Apply 5 $\mu \mathrm{L}$ of this solution." The solution responds to the test.

B: It responds to the Identification test under Benzoyl
Peroxide Gel.
$\mathbf{p H}\langle 791\rangle$ : between 2.8 and 6.6.

## Related compounds-

Solution A, Solution B, Mobile phase, Standard preparation A, Standard preparation B, Standard preparation C, Standard preparation D, Resolution solution, and Chromatographic system - Proceed as directed in the test for Related compounds under Benzoyl Peroxide Gel.

Test preparation-Transfer an accurately weighed quantity of Topical Emulsion, equivalent to about 100 mg of benzoyl peroxide, to a $50-\mathrm{mL}$ volumetric flask, add 25 mL of acetonitrile, shake vigorously to disperse the specimen, sonicate for 5 minutes, dilute with acetonitrile to volume, mix, and filter.

Procedure-Proceed with Topical Emulsion as directed for Procedure in the test for Related compounds under Benzoyl Peroxide Gel: it meets the limits stated.

## Assay-

Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Benzoyl Peroxide Gel.

Assay preparation-Prepare as directed for Assay preparation in the Assay under Benzoyl Peroxide Gel, using Topical Emulsion.

Procedure-Proceed as directed for Procedure in the Assay under Benzoyl Peroxide Gel. Calculate the quantity, in mg , of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{O}_{4}$ in the portion of Topical Emulsion taken by the formula:

$$
125 C\left(R_{U} / R_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of benzoyl peroxide in the Standard preparation, and $R_{U}$ and $R_{S}$ are the ratios of benzoyl peroxide peak response to ethyl benzoate peak response obtained from the Assay preparation and the Standard preparation, respectively. $\Delta$ USP28
(Official July 1, 2007)

## Briefing

Benzyl Benzoate Lotion, USP 27 page 227. It is proposed to change the title of this monograph to Benzyl Benzoate Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40778-1

BRIEFING

Benzyl Benzoate Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40778-1

## Add the following:

## ©Benzyl Benzoate Topical Emulsion

## (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is Benzyl Benzoate Lotion)

» Benzyl Benzoate Topical Emulsion contains not less than 26.0 percent and not more than 30.0 percent (w/w) of $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{2}$.

|  |  |
| :---: | :---: |
| Benzyl Benzoate . . . . . . . . . | 250 mL |
| Triethanolamine . . . . . . . . . | 5 g |
| Oleic Acid. . . . . . . . . . . . . | 20 g |
| Purified Water | 750 mL |
| To make about. . . . . . . . . . | 1000 mL |

Mix the Triethanolamine with the Oleic Acid, add the Benzyl Benzoate, and mix. Transfer the mixture to a suitable container of about 2000mL capacity, add 250 mL of Purified Water, and shake the mixture thoroughly. Finally add the remaining Purified Water, and again shake thoroughly.

Packaging and storage-Preserve in tight containers.
$\mathbf{p H}\langle 791\rangle$ : between 8.5 and 9.2.
Assay—Place about 5 g of Topical Emulsion, accurately weighed, in a conical flask. Add 25 mL of alcohol and 2 drops of phenolphthalein TS. Cool the solution to about $15^{\circ}$, and titrate quickly with 0.1 N sodium hydroxide to a slight pink color. Add 50.0 mL of 0.5 N alcoholic potassium hydroxide VS, connect the flask to a reflux condenser, and boil gently for 1 hour. Cool, promptly add phenolphthalein TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination (see Residual Titrations under Titrime$\operatorname{try}\langle 541\rangle$ ). Each mL of 0.5 N alcoholic potassium hydroxide is equivalent to 106.1 mg of $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{2 \cdot} \cdot \mathbf{\Delta S P P 2 8}$
(Official July 1, 2007)

Betamethasone Dipropionate Lotion, USP 27 page 236 and page 1430 of $P F 29(5)$ [Sept.-Oct. 2003]. It is proposed to change the title of this monograph to Betamethasone Dipropionate Topical Emulsion. See briefing under Amphotericin B Lotion.

Betamethasone Dipropionate Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40779-1

## Add the following:

## -Betamethasone Dipropionate Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Betamethasone Dipropionate Lotion)
» Betamethasone Dipropionate Topical Emulsion contains an amount of betamethasone dipropionate $\left(\mathrm{C}_{28} \mathrm{H}_{37} \mathrm{FO}_{7}\right)$ equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone $\left(\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{FO}_{5}\right)$.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. Protect from light and freezing.

USP Reference standards $\langle 11\rangle$ —USP Beclomethasone Dipropionate RS. USP Betamethasone Dipropionate RS.

Thin-layer chromatographic identification test $\langle 201\rangle$ -
Test solution-Transfer a quantity of Topical Emulsion, equivalent to about 0.6 mg of betamethasone dipropionate, to a $50-\mathrm{mL}$ vial. Add 10 mL of 0.1 N hydrochloric acid, then add 4 mL of chloroform. Disperse on a vortex mixer for about 1 minute, then shake vigorously for 10 minutes, and centrifuge at 2000 rpm for about 5 minutes. Transfer the chloroform layer to a suitable vial.

Standard solution: USP Betamethasone Dipropionate RS in chloroform containing $150 \mu \mathrm{~g}$ per mL .

Application volume: $40 \mu \mathrm{~L}$.

Developing solvent system: a mixture of chloroform and acetone (7:1).
Procedure-Proceed as directed in the chapter.
Minimum fill $\langle 755\rangle$ : meets the requirements.
Assay-
Mobile phase and Chromatographic system—Prepare as directed in the Assay under Betamethasone Dipropionate.
Internal standard solution-Prepare as directed in the Assay under Betamethasone Dipropionate, except to use chloroform as the solvent.

Standard preparation-Prepare as directed in the Assay under Betamethasone Dipropionate, except to use chloroform as the solvent. To 10.0 mL of 0.1 N hydrochloric acid in a capped $5-\mathrm{mL}$ centrifuge tube add 4.0 mL of the prepared solution, and treat this solution as follows. Cap, and shake vigorously for about 2 minutes, or disperse on a vortex mixer for about 1 minute. Centrifuge at 2500 rpm for about 3 minutes. Transfer the chloroform phase to a suitable vial. Evaporate the chloroform under a stream of nitrogen at a slightly elevated temperature to dryness. Cool the vial to room temperature, add 4.0 mL of methanol, and swirl to dissolve the residue.

Assay preparation-Transfer an accurately weighed quantity of Topical Emulsion, equivalent to about 1.2 mg of betamethasone dipropionate, to a capped $50-\mathrm{mL}$ centrifuge tube. Add 10.0 mL of 0.1 N hydrochloric acid, shake to disperse, then add 2.0 mL of Internal standard solution and 2.0 mL of chloroform. Proceed as directed under Standard preparation beginning with "Cap, and shake."

Procedure-Proceed as directed for Procedure in the $A s$ say under Betamethasone Dipropionate. Calculate the quantity, in mg , of betamethasone $\left(\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{FO}_{5}\right)$ in the portion of Topical Emulsion taken by the formula:
$(392.46 / 504.60)(4 C)\left(R_{U} / R_{S}\right)$,
in which 392.46 and 504.60 are the molecular weights of betamethasone and betamethasone dipropionate, respective$\mathrm{ly}, C$ is the concentration, in mg per mL , of USP Betamethasone Dipropionate RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the peak height ratios of the betamethasone dipropionate peak and the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{U S P 2 8}$
(Official July 1, 2007)

■Identifieation-Evaperate 25-mL of the Assay preparation, prepared as direeted in the $4 s$ scty on a steam bath-just to dryness, and dissolve the residue in 0.5 mb of alcohol. Proceed as directed for Itentificutest Bunder Betanethasone, begimning with " $A p p l y$ $10 \mu \mathrm{~L}$ of this solution." ${ }^{12 S}$ (USP27)

## Add the following:

-Thin-Layer Chromatographic Identification Test〈201〉—

Test solution-Evaporate 25 mL of the Assay preparation, prepared as directed in the Assay, on a steam bath just to dryness, and dissolve the residue in 0.5 mL of alcohol.

Developing solvent system: a mixture of chloroform and diethylamine (2:1).
Procedure-Proceed as directed in the chapter. Locate the spots by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear.■2S (USP27)

## BRIEFING

Betamethasone Valerate Lotion, USP 27 page 240. It is proposed to change the title of this monograph to Betamethasone Valerate Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40780-1

## Betamethasone Valerate Lotion

(Current title-not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Betamethasone Valerate Topical Emulsion

## Briefing

Betamethasone Valerate Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40780-1

## Add the following:

## $\triangle$ Betamethasone Valerate Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Betamethasone Valerate Lotion)
» Betamethasone Valerate Topical Emulsion contains an amount of Betamethasone Valerate $\left(\mathrm{C}_{27} \mathrm{H}_{37} \mathrm{FO}_{6}\right)$ equivalent to not less than 95.0 percent and not more than 115.0 percent of the labeled amount of betamethasone $\left(\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{FO}_{5}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Betamethasone Valerate $R S$.

Identification-Mix an amount of Topical Emulsion, equivalent to about 5 mg of betamethasone, with a mixture of methanol and chloroform (2:1) to make 10 mL . Apply 20 $\mu \mathrm{L}$ of this solution and $20 \mu \mathrm{~L}$ of a Standard solution of USP Betamethasone Valerate RS in a mixture of methanol and chloroform (2:1) containing 0.6 mg per mL to a suitable thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and ethyl acetate (1:1), until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. View the spots under UV light: the $R_{F}$ value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.

Minimum fill $\langle 755\rangle$ : meets the requirements.
$\mathbf{p H}\langle 791\rangle$ : between 4.0 and 6.0.

## Assay-

Mobile phase and Chromatographic system-Proceed as directed in the Assay under Betamethasone Valerate.

Internal standard solution-Transfer about 50 mg of beclomethasone dipropionate to a $25-\mathrm{mL}$ volumetric flask, add chloroform to volume, and mix.

Standard preparation-Transfer about 40 mg of USP Betamethasone Valerate RS, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, add chloroform to volume, and mix. Pipet 2 mL of this solution into a $50-\mathrm{mL}$ centrifuge tube, add 10 mL of 0.1 N hydrochloric acid, then add 2.0 mL of Internal standard solution. Insert the stopper into the tube, shake vigorously for about 2 minutes, and centrifuge to separate the phases. Using a syringe, transfer the lower, chloroform phase to a small stoppered vial. Evaporate the chloroform on a steam bath, at low heat, with the aid of a stream of nitrogen. Add 4.0 mL of a 1 in 1000 solution of glacial acetic acid in methanol, and swirl to dissolve the residue.

Assay preparation-Transfer an accurately weighed portion of Topical Emulsion, equivalent to about 2.5 mg of betamethasone, to a stoppered, $50-\mathrm{mL}$ centrifuge tube. Add 10.0 mL of 0.1 N hydrochloric acid, insert the stopper, and shake to disperse the specimen. Add 2.0 mL of chloroform and 2.0 mL of Internal standard solution, insert the stopper, and proceed as directed for Standard preparation, beginning with "shake vigorously for about 2 minutes."

Procedure-Proceed as directed for Procedure in the Assay under Betamethasone Valerate. Calculate the quantity, in mg , of betamethasone $\left(\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{FO}_{5}\right)$ in the portion of Topical Emulsion taken by the formula:

$$
(392.46 / 476.59)(4 C)\left(R_{U} / R_{S}\right),
$$

in which 392.46 and 476.59 are the molecular weights of betamethasone and betamethasone valerate, respectively; $C$ is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the peak response ratios obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{U S P P 2 8}$
(Official July 1, 2007)

## BRIEFING

Caffeine Injection, page 1992 of $P F$ 28(6) [Nov.-Dec. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with changes to In-Process Revision. It is proposed to change the name to Caffeine Citrate Injection to reflect the name of the registered product, to revise the Definition to specify that the solution is prepared with Water for Injection and does not contain any preservative, and to add a test for Color and clarity.
(PA3: S. Salado; NL: C. Barnstein) RTS-39923-4

## Add the following:

## -Caffeine Citrate Injection

## » Caffeine Citrate Injection is a sterile solution containing Citric Acid and an amount of Caffeine equivalent to Caffeine and citric acid in Water for Injection. It contains not less than 90.0 percent

and not more than 110.0 percent of the labeled amount of caffeine $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}\right)$. It contains no bacteriostat or other preservative.

Packaging and storage-Preserve in single-dose, tight containers of Type I glass, and store at a temperature between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle —$ USP Caffeine RS. USP
Endotoxin RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

B: It meets the requirements of the test for Citrate $\langle 191\rangle$.

C: Transfer about 4 g of potassium iodide to a $100-\mathrm{mL}$ volumetric flask. Add 10 mL of water, and shake until the potassium iodide is dissolved. Transfer 2 g of iodine to the volumetric flask, and shake until dissolved. Dilute with water to volume, and mix. Transfer 5 drops of the solution so obtained to a $25-\mathrm{mL}$ centrifuge tube containing 5.0 mL of the Injection, and mix. Add 0.5 mL of 2.0 M hydrochloric acid solution, and mix: a brown precipitate is produced that dissolves on neutralization with 0.5 mL of sodium hydroxide TS.

Color and clarity-Transfer a suitable portion of the Injection to a clear glass test tube, and visually examine the solution in a well-lighted area: the solution is colorless and free of haze, obvious turbidity, and precipitate.

Bacterial endotoxins $\langle 85\rangle$ : not more than 0.25 USP Endotoxin Unit per mg of caffeine.

Sterility $\langle 71\rangle$-It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.
$\mathbf{p H}\langle 791\rangle$ : between 4.2 and 5.2.
Particulate matter $\langle 788\rangle$ : not more than 150 particles are equal to or greater than $10 \mu \mathrm{~m}$ and not more than 25 particles are equal to or greater than $25 \mu \mathrm{~m}$.

## Related compounds-

Mobile phase and Theophylline solution-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.
System sensitivity solution-Transfer 2.5 mL of the Standard solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay. Chromatograph the System sensitivity solution, and record the peak responses as directed for Procedure: the theophylline peak produces a discernible peak response at its retention time.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any related compound in the portion of Injection taken by the formula:

$$
100 F\left(C_{S} / C_{W}\right)\left(r_{i} / r_{S}\right)
$$

in which $F$ is the relative response factor and is equal to 0.878 for theobromine at a relative retention time of about 0.4 , equal to 1.10 for paraxanthine at a relative retention time of about 0.6 , equal to 0.905 for theophylline at a relative retention time of about 0.7 , and equal to 1.0 for any other related compound; $C_{S}$ is the concentration, in mg per mL , of USP Caffeine RS in the Standard solution; $C_{W}$ is the caffeine concentration, in mg per mL , in the Test solution, as obtained in the Assay; $r_{i}$ is the individual peak response for each related compound obtained from the Test solution; and
$r_{S}$ is the caffeine peak response obtained from the Standard solution: not more than $0.10 \%$ of any individual related compound is found; and not more than $0.1 \%$ of total impurities is found.

Other requirements-It meets the requirements under Injections $\langle 1\rangle$.

## Assay-

Mobile phase-Prepare a mixture of 0.01 M sodium acetate, acetonitrile, and tetrahydrofuran (191:5:4). Adjust with glacial acetic acid to a pH of 4.5 , filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Theophylline solution-Dissolve an accurately weighed quantity of theophylline in water, and dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a concentration of about 0.02 mg per mL .

Standard preparation-Transfer about 5 mg of USP Caffeine RS, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask. Add 5 mL of the Theophylline solution, dissolve in and dilute with water to volume, and mix.

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 50 mg of caffeine, to a $250-\mathrm{mL}$ volumetric flask. Dilute with water to volume, mix, and filter through a polyvinylidene difluoride or equivalent membrane having a porosity of $0.45 \mu \mathrm{~m}$.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $275-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 150-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for theophylline and 1.0 for caffeine; the resolution, $R$, between theophylline and caffeine is not less than 6.0 ; the tailing factor, determined from the theo-
phylline and caffeine peaks, is not more than 2.0 ; and the relative standard deviation for replicate injections, determined from the caffeine peaks, is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the caffeine peak responses. Calculate the quantity, in mg , of caffeine $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}\right)$ in the volume of Injection taken by the formula:

$$
250 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Caffeine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. USP28 $^{\text {U }}$

## Briefing

Caffeine Oral Solution, page 1994 of $P F 28(6)$ [Nov.-Dec. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with changes to In-Process Revision. It is proposed to change the name to Caffeine Citrate Oral Solution to reflect the name of the registered product. It is also proposed to revise the Definition to specify that the solution does not contain any preservative.
(PA3: S. Salado; NL: C. Barnstein) RTS—39923-5

## Add the following:

## ${ }^{\Delta}$ Caffeine Citrate Oral Solution

## » Caffeine Citrate Oral Solution is a sterile aque-

 ous solution containing Citric Acid and an amount of Caffeine equivalent to Caffeine and citric acid. It contains not less than 90.0 percent and not morethan 110.0 percent of the labeled amount of caffeine $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}\right)$. It contains no bacteriostat or other preservative.

Packaging and storage-Preserve in single-dose, tight containers of Туpe I glass, and store at a temperature between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Caffeine RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

B: It meets the requirements of the test for Citrate $\langle 191\rangle$.

C: Transfer about 4 g of potassium iodide to a $100-\mathrm{mL}$ volumetric flask. Add 10 mL of water, and shake until the potassium iodide is dissolved. Transfer 2 g of iodine to the volumetric flask, and shake until dissolved. Dilute with water to volume, and mix. Transfer 5 drops of the solution so obtained to a $25-\mathrm{mL}$ centrifuge tube containing 5.0 mL of the Oral Solution, and mix. Add 0.5 mL of 2.0 M hydrochloric acid solution, and mix: a brown precipitate is produced that dissolves on neutralization with 0.5 mL of sodium hydroxide TS.

Sterility $\langle 71\rangle$-It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.
$\mathbf{p H}\langle 791\rangle$ : between 4.2 and 5.2.

## Related compounds-

Mobile phase and Theophylline solution-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

System sensitivity solution-Transfer 2.5 mL of the Standard solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

in which $C$ is the concentration, in mg per mL , of USP Caffeine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta}$ USP28

## BRIEFING

Calamine Lotion, USP 27 page 296. It is proposed to change the title of this monograph to Calamine Topical Suspension. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40781-1

## Calamine Lotion

(Current title-not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Calamine Topical Suspension

## BRIEFING

Phenolated Calamine Lotion, USP 27 page 296. It is proposed to change the title of this monograph to Phenolated Calamine Topical Suspension. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40782-1

## Phenolated Calamine Lotion

(Current title-not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007
(see Official Title Changes on the first page of InProcess Revision): See Phenolated Calamine Topical Suspension

## BRIEFING

Calamine Topical Suspension-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40781-1

## Add the following:

## ${ }^{\Delta}$ Calamine Topical Suspension

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Calamine Lotion)
» Prepare Calamine Topical Suspension as follows.

$$
\begin{aligned}
& \text { Calamine. . . . . . . . . . . . . . . . . . } 80 \mathrm{~g} \\
& \text { Zinc Oxide . . . . . . . . . . . . . . . . . } \quad 80 \mathrm{~g} \\
& \text { Glycerin . . . . . . . . . . . . . . . . . . . } 20 \mathrm{~mL} \\
& \text { Bentonite Magma . . . . . . . . . . . . } 250 \mathrm{~mL} \\
& \text { Calcium Hydroxide Topical Solu- } \\
& \text { tion, a sufficient quantity, to make } 1000 \mathrm{~mL}
\end{aligned}
$$

Dilute the Bentonite Magma with an equal volume of Calcium Hydroxide Topical Solution. Mix the powders intimately with the Glycerin and about 100 mL of the diluted magma, triturating until a smooth, uniform paste is formed. Gradu-
ally incorporate the remainder of the diluted magma. Finally add enough Calcium Hydroxide Topical Solution to make 1000 mL , and shake.

If a more viscous consistency in the Calamine Topical Suspension is desired, the quantity of Bentonite Magma may be increased to not more than 400 mL .

NOTE-Shake the Calamine Topical Suspension before dispensing.

Packaging and storage-Preserve in tight containers.
Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa. $\mathbf{\Delta S P P 2 8}$
(Official July 1, 2007)

## Briefing

Cephapirin Benzathine, USP 27 page 397; Cephapirin Benzathine Intramammary Infusion, USP 27 page 398; Cephapirin Sodium, USP 27 page 398; Cephapirin for Injection, USP 27 page 398; Cephapirin Sodium Intramammary Infusion, USP 27 page 399. It is proposed to replace the microbial-based Assay specified in the Cephapirin Benzathine, Cephapirin Benzathine Intramammary Infusion, and Cephapirin Sodium Intramammary Infusion, monographs with a new HPLC-based method. It is proposed to replace the official HPLC-based Assay specified in the Cephapirin Sodium monograph with this new HPLC-based method in the interest of consistency. The liquid chromatographic procedure in the Assay is based on analyses performed with the Perkin-Elmers RP-18 Newguard, 7- $\mu \mathrm{m} \mathrm{L1}$ brand guard column, and a Waters Novapak C18, 4- $\mu \mathrm{m}$ L1 brand analytical column. Because USP has not received validation data that indicate this new HPLC method is suitable for Cephapirin for Injection, it is proposed to revise the Assay of the monograph to specify the details for performing the Assay and removing the linkage to the Cephapirin Sodium monograph. Interested parties are encouraged to submit comments and to perform validation studies that would indicate whether the new HPLC method is suitable for Cephapirin for Injection.
(VET: I. DeVeau) RTS—39799-1; 40505-1

## Change to read:

Assay - Proe das direeted for Cephapirin mader Antibioties Mi erobial Asseays- $\langle 84\rangle$, preparing the Test Dilution as follows. Tramsfer about 150 mg of Cephapirin Benzathine, aceurately weighed, to a 100 mL volumetric flask, add 20 mL of 0.1 N hydrechloric acid, and swirl to dissolve. Dilute with Buffer No. 1 to volume, and mix. Pilute an aceurately measured volume of this stock solution with Buffer No. 1 to obtain a Test Dilution having an estimated concentration of $1.3 \mu \mathrm{~g}$ of eephapirin benzathine $(1.0 \mu \mathrm{~g}$ of cephapirin $)$ per mL.
${ }^{4}$ Solution A-Transfer about 26.2 mL of acetic acid and about 99.12 g of potassium acetate to a 4-L volumetric flask. Add 2000 mL of water, and mix to dissolve. Dilute with water to volume, and pass through a $0.45-\mu \mathrm{m}$ nylon filter.
Solution B: acetonitrile.
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments, if necessary (see System Suitability under Chromatography (621〉).

Extraction solution: a mixture of 400 mL of acetic acid and 600 mL of water.

Dilution buffer-Dissolve about 205 g of potassium acetate in about 800 mL of water. Adjust with acetic acid to a pH of 7.5 to 8.2. Dilute with water to 1000 mL , and pass through a $0.45-\mu \mathrm{m}$ nylon filter.
$10 \%$ Acetic acid solution-Add about 10.0 mL of acetic acid to a $100-\mathrm{mL}$ volumetric flask. Mix, and dilute with water to volume.

System suitability solution-Dissolve an accurately weighed quantity of USP Cephapirin Sodium RS in $10 \%$ Acetic acid solution to prepare a solution containing a known concentration of about 2.0 mg per mL . Heat the solution at $50^{\circ}$ for 12 to 18 hours.

Standard preparation-In duplicate, accurately weigh about 50 mg of USP Cephapirin Sodium RS, and transfer into a $25-\mathrm{mL}$ volumetric flask. Add about 2.5 mL of Extraction solution and about 15.0 mL of Dilution buffer, and agitate to dissolve. Add 7.0 mL of acetonitrile, and mix well. Allow the solution to return to room temperature, and dilute with water to volume.

Assay preparation-In duplicate, weigh about 60 mg of Cephapirin Benzathine, and transfer into a $25-\mathrm{mL}$ volumetric flask. Add about 2.5 mL of Extraction solution and 15.0 mL of Dilution buffer, and mix to dissolve. Add 7.0 mL of acetonitrile, and mix. Allow the flask to return to room temperature, and dilute with water to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $260-\mathrm{nm}$ detector, a $3.2-\mathrm{mm} \times 15-\mathrm{mm}$ guard column that contains $7-\mu \mathrm{m}$ packing L 1 and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ analytical column that contains $4-\mu \mathrm{m}$ packing L 1 . The flow rate is about 2.0 mL per minute, and the columns are heated to $40^{\circ}$. The chromatograph is programmed as follows.

| Time | Solution A |  |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| $0-6$ | 91.5 | 8.5 | isocratic |
| $6-10$ | $91.5 \rightarrow 80.0$ | $8.5 \rightarrow 20.0$ | linear |
| $10-12$ | 80.0 | 20.0 | isocratic |
| 12 | $80.0 \rightarrow 91.5$ | $20.0 \rightarrow 8.5$ | return to initial |
| $12-21$ | 91.5 | 8.5 | re-equilibration |

Chromatograph the System suitability solution and the Standard preparation, and record the peak heights and valleys as directed for Procedure. Using the results from the System suitability solution, calculate the percentage of the height of the valley taken by the formula:

$$
100\left(r_{V} / r_{i}\right)
$$

in which $r_{V}$ is the height of the valley between cephapirin and any impurity; and $r_{i}$ is the impurity peak height. The percentage of the height of the valley is not more than $25 \%$ for the impurity peaks adjacent to the cephapirin peak. [NOTE-The System suitability solution is acceptable as long as the cephapirin peak is larger than the two peaks on either side of the cephapirin peak. ] The relative standard deviation for replicate injections of the Standard preparation is not more than $3.0 \%$.

Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the duplicate Standard preparation and the duplicate Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in $\mu \mathrm{g}$, of $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~S}_{2}$ in each mg of Cephapirin Benzathine taken by the formula:

$$
P\left(W_{S} / W_{U}\right)\left(V_{U} / V_{S}\right)\left(r_{U} / r_{S}\right)
$$

in which $P$ is the assigned potency, in $\mu \mathrm{g}$ of cephapirin per mg , of USP Cephapirin Sodium RS; $W_{S}$ and $W_{U}$ are the quantities of USP Cephapirin Sodium RS and Cephapirin Benzathine, in mg, used to prepare the Standard prepara-
tion and Assay preparation, respectively; $V_{S}$ and $V_{U}$ are the final volumes, in mL, of the Standard preparation and Assay preparation, respectively; and $r_{U}$ and $r_{S}$ are the average peak areas of the cephapirin peaks obtained from the Assay preparation, and the Standard preparation, respectively. $\Delta$ USP28

## Briefing

Cephapirin Benzathine Intramammary Infusion, USP 27 page 398-See briefing under Cephapirin Benzathine.
(VET: I. DeVeau) RTS—39799-2; 40505-2

## Change to read:

Assay Proceed as directed for Cephapirin under Antibiotics_Mi erobial Assayis $\langle 84$, preparing the Test Dilution as follows. Weigh 1 syringe of Intramammary Infusion. Expel the content of the sy ringe into a large blender jar containing. 1 mL of polysorbate 80 and sufficient 0.1 N hydrechloric acid to yield a volume of 500.0 mL , and blend at low speed for about 5 minntes. Weigh the empy sy ringe, and determine the weight of the Intramammary Infusion added to the blender jar. Allow the blended suspension to stand for about 5 -minutes to degas, then-dilute an aceurately measured velume of this solution quantitatively with Buffer No. 1 to obtain a Test Dildtion having an estimated concentration assumed to be equal to the median dose level of the Standard.
$\triangle$ Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10\% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Cephapirin Benzathine.

Assay preparation-Express the entire contents of a syringe of the Intramammary Infusion into a centrifuge tube. For each mL of Intramammary Infusion, add $1.0 n$-heptane and 1.5 mL of Extraction solution, cap, and vortex at high speed for 5 minutes. Centrifuge for 5 minutes at a sufficient speed to break the emulsion. Remove the aqueous layer, and pass through a $0.45-\mu \mathrm{m}$ nylon filter, discarding the first 0.5
mL . Transfer 2.5 mL of the filtered aqueous phase into a $25-$ mL volumetric flask that contains a solution composed of 15.0 mL of Dilution buffer and 7.0 mL of acetonitrile. Add water to volume, and mix well to obtain a single phase.

Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the duplicate Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg , of cephapirin $\left(\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~S}_{2}\right)$ in each syringe of Intramammary Infusion taken by the formula:

$$
15 P W\left(V_{U} / V_{S}\right)\left(r_{U} / r_{S}\right),
$$

in which $P$ is the assigned potency, in $\mu \mathrm{g}$ cephapirin per mg , of USP Cephapirin Sodium RS; $W$ is the quantity of USP Cephapirin Sodium RS, in mg, used to prepare the Standard preparation; $V_{S}$ is the final volume, in mL , of the Standard preparation; $V_{U}$ is the entire volume of Intramammary Infusion, in mL , in one syringe; and $r_{U}$ and $r_{S}$ are the peak area and the average peak area of the cephapirin peaks obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$

## BRIEFING

Cephapirin for Injection, USP 27 page 398—See briefing under Cephapirin Benzathine.
(VET: I. DeVeau) RTS-39942-1

## Change to read:

## Assay-

Mobile phase, Resolution solution, Standerd pre paration, and Chromatographic system- Prepare as direeted in the Assely under Gephapirin Sodinal.
${ }^{\Delta}$ Mobile phase-Prepare a filtered and degassed mixture of water, dimethylformamide, glacial acetic acid, and 11.7 N potassium hydroxide (1834:160:4:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ). Increase the proportion of dimethylformamide to decrease the retention time of cephapirin.

Resolution solution-Prepare a solution of Cephapirin Sodium in pH 2.0 hydrochloric acid buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions) containing about 1 mg per mL . Place 10 mL of this solution in a test tube and heat at $95^{\circ}$ for 10 minutes, accurately timed. Promptly cool the tube in an ice water bath. Dilute 5 mL of the cooled solution with Mobile phase to obtain

## 50 mL of Resolution solution.

Standard preparation-Transfer about 21 mg of USP Cephapirin Sodium RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. This solution contains about 0.2 mg of cephapirin per

## mL . $\triangle$ USP28

Assay preparation 1 (where it is packaged for dispensing and is represented as being in a single-dose container)-Constitute Cephapirin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing the equivalent of about 0.2 mg of cephapirin per mL .

Assay preparation 2 (where the label states the quantity of cephapirin in a given volume of constituted solution)-Constitute Cephapirin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing the equivalent of about 0.2 mg of cephapirin per mL. [NOTE-Use the Standard preparation and the Assay preparation within 1 hour.]
©Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the cephapirin peak and the peak having a retention time of about 0.9 relative to that of cephapirin is not less

than 0.9. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for cephapirin lactone and 1.0 for cephapirin; the column efficiency determined from the cephapirin peak is not less than 1200 theoretical plates; the tailing factor for the cephapirin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$. | USP28 |
| :--- |

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the appropriate Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephapirin $\left(\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~S}_{2}\right)$ withdrawn from the container, or in the portion of constituted solution, taken by the formula:

$$
(L / D)(C P / 1000)\left(r_{U} / r_{S}\right),
$$

in which $L$ is the labeled quantity, in mg , of cephapirin in the sin-gle-dose container, or in the volume of constituted solution taken; $D$ is the concentration, in mg per mL , of cephapirin in Assay preparation 1 or in Assay preparation 2, on the basis of the labeled quantity in the container, or in the portion of constituted solution taken, respectively, and the extent of dilution; $C$ is the concentration, in mg per mL, of USP Cephapirin Sodium RS in the Standard preparation; $P$ is the potency, in $\mu \mathrm{g}$ of cephapirin per mg , of USP Cephapirin Sodium RS; and $r_{U}$ and $r_{S}$ are the cephapirin peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Briefing
Cephapirin Sodium, USP 27 page 398-See briefing under Cephapirin Benzathine.
(VET: I. DeVeau) RTS—39799-3; 40505-3

## Assay-

Mobile phase Prepare a fltered and degassed mix dimethylformamide, glacial acetic acid, and 11.7 N petassitum hy droxide (1834:160:4:2). Make adjustments-if neeessary (see-Syis tem Suitability under Chromatography $\langle 621\rangle$ ). Inerease the propertion of dimethylformamide to decrease the retention time of eephapirim.

Resolution-solution Prepare- a solution-of Cephapirin Sodium in pH 2.0 hydrochloric acid buffer (see Buffer Solutions in the see tion Reagents, Indicators, and Selutions) containing about 1 mg per mL . Place 10 mL of this solution in a test tube and heat at $95^{\circ}$ for 10 minutes, aeeurately timed. Promptly cool the tube-in an-iee water bath. Dilute-5 mL of the cooled solution with Mobite phase to-obtain $50-\mathrm{mL}$ of Resolution selution.

Standard preparation Transfer about 21 mg of USP Cephapir in Sodium RS, aceurately weighed, to a 100 mL volumetric flask, dilute with Mobile phase to volume, and mix. This solution con tins about 0.2 mg of cephapirin per mL .

Assay preparation Transfer about 42 mg of Cephapirin So dium, aceurately weighed, to a 200 mL volumetric flack, dilute with Mobile phase to volume, and mix. [NOTE-Use the Stateded preparan and the Assay preparation within 1 hour.]

Chromatographic system (see Chromatography $\langle 621$ ) ) The tiquid chromatograph is equipped with a 254 nm detector and a $4 \mathrm{~mm} \times 30 \mathrm{~cm}$ columa that contains packing L 1 . The flow rate is abeut 2 mL per minte. Chremategraph the Resolution solution, and record the peak responses as directed under Proedtre: the resolution, $R$, between the eephapirin peak and the peak having a retention time of about 0 ., relative to that of eephapirin is not less than 0.9 . Chromatograph the Steded preparation, and record the peak respenses as directed under Procedure: the column efficiency determined from the cephapirin peak is not less than 1200 theore tieal plates, the tailing factor for the eephapirin peak is not more than 2.0 , and the relative standard deviation for replieate injections is net mere han $2.0 \%$.

Proedure- Separately inject equal volumes (about 20- $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation int the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0 . 9 for eephapirin lactone and 1.0 for eephapirin. Caleulate the quantity, in Hg, of eephapirin $\left(\mathrm{C}_{42} \mathrm{H}_{47} \mathrm{~N}_{3} \Theta_{6} \mathrm{~S}_{2}\right)$ per mg of the-Cephapirin So ditm taken by the formula:

$$
200(C P / H)\left(+_{4}+T_{s}\right)
$$

in which $C$ is the eoneentration, in me per mL, of USP Cephapirim Sodium PS in the Standard preparation, $P$ is the peteney, in 4 of of eephapirim per mo, of USP Cephapirin Sodium $P S$, Wis the quan tity, in mo of Cephapirin Sodium takento prepare the Assty prepatation, and $r_{5}$ and $r_{s}$ are the eephapirin peak respenses obtained from the Assay preparation and the Standard preparation, respec tively.
$\triangle$ Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10\% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Cephapirin Benzathine.
Assay preparation-In duplicate, weigh about 50 mg of Cephapirin Sodium, and transfer into a $25-\mathrm{mL}$ volumetric flask. Add about 2.5 mL of Extraction solution and 15.0 mL of Dilution buffer, and mix to dissolve. Add 7.0 mL of acetonitrile, and mix. Allow the flask to return to room temperature, and dilute with water to volume.
Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the duplicate Standard preparation and the duplicate $A s$ say preparation into the chromatograph, record the chroma-
tograms, and measure the areas of the major peaks. Calculate the quantity, in $\mu \mathrm{g}$, of cephapirin $\left(\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~S}_{2}\right)$ in each mg of Cephapirin Sodium taken by the formula:

$$
P\left(W_{S} / W_{U}\right)\left(V_{U} / V_{S}\right)\left(r_{U} / r_{S}\right)
$$

in which $P$ is the assigned potency, in $\mu \mathrm{g}$ of cephapirin per mg , of USP Cephapirin Sodium RS; $W_{S}$ and $W_{U}$ are the quantities of USP Cephapirin Sodium RS and Cephapirin Sodium, in mg, used to prepare the Standard preparation and the Assay preparation, respectively; $V_{U}$ and $V_{S}$ are the final volumes, in mL, of the Assay preparation and the Standard preparation, respectively; and $r_{U}$ and $r_{S}$ are the average peak areas of the cephapirin peaks obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{U S P 2 8}$

## BRIEFING

Cephapirin Sodium Intramammary Infusion, USP 27 page 399-See briefing under Cephapirin Benzathine.
(VET: I. DeVeau) RTS-39799-4; 40505-4

## Change to read:

Assay-Proe das direeted for Cephapirin under Antibioties Mi erobiah Assayis $\langle 81\rangle$, preparing the Test Dilution as follows. Weigh 4 syring of Intramammary Infusion. Expel the contents of the sy ringe into a large blender jar containing 1 mL of polysorbate 80 and sufficient 0.1 N hydrochloric acid to yield a volume of 500.0 mL , and blend at low speed for about 5 minutes. Weigh the empty sy ringe, and determine the weight of the Intramammary Infusion added to the blender jar. Allow the blended suspension to stand for about 5 minutes to degas, then dilute an aceurately measured velume of this solution quantitatively with Buffer No. 1 to obtain a- Test Dilution having an estimated eoncentration assumed to be equal to the median dose level of the Standard.
${ }^{\wedge}$ Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10\% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Cephapirin Benzathine.

Assay preparation-Express the entire contents of a syringe of the Intramammary Infusion into a centrifuge tube. For each mL of Intramammary Infusion, add $1.0 n$-heptane and 1.0 mL of Extraction solution, cap, and vortex at high speed for 5 minutes. Centrifuge for 5 minutes at a sufficient speed to break the emulsion. Remove the aqueous layer, and pass through a $0.45-\mu \mathrm{m}$ nylon filter, discarding the first 0.5 mL . Transfer 2.5 mL of the filtered aqueous phase into a $25-$ mL volumetric flask that contains a solution composed of 15.0 mL of Dilution buffer and 7.0 mL of acetonitrile. Add water to volume, and mix well to obtain a single phase.

Procedure—Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the duplicate Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg , of cephapirin $\left(\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~S}_{2}\right)$ in each syringe of Intramammary Infusion taken by the formula:

$$
10 P W\left(V_{U} / V_{S}\right)\left(r_{U} / r_{S}\right)
$$

in which $P$ is the assigned potency, in $\mu \mathrm{g}$ cephapirin per mg , of USP Cephapirin Sodium RS; $W$ is the quantity of USP Cephapirin Sodium RS, in mg, used to prepare the Standard preparation; $V_{S}$ is the final volume, in mL , of the Standard preparation; $V_{U}$ is the entire volume of Intramammary Infusion, in mL , in one syringe; and $r_{U}$ and $r_{S}$ are the peak area and the average peak area of the cephapirin peaks obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ USP28

## Briefing

Ciprofloxacin Injection, USP 27 page 456. On the basis of information received, it is proposed to modify the Definition to accommodate potential equivalent formulations for this product.

Briefing
Clotrimazole Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40783-1

## Add the following:

## - Clotrimazole Topical Emulsion (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is Clotrimazole Lotion)

» Clotrimazole Topical Emulsion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clotrimazole $\left(\mathrm{C}_{22} \mathrm{H}_{17} \mathrm{ClN}_{2}\right)$.

Packaging and storage-Preserve in tight containers, at a temperature between $2^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$-USP Clotrimazole RS.
USP Clotrimazole Related Compound A RS.
Identification-The retention time of the major peak for clotrimazole in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 7.0.
Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.

Limit of clotrimazole related compound A-Using the chromatograms of the Assay preparation and the Standard preparation obtained as directed in the Assay, calculate the
percentage of clotrimazole related compound A in the portion of Topical Emulsion taken by the formula:

$$
2000(C / Q)\left(R_{U} / R_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Clotrimazole Related Compound A RS in the Standard preparation; $Q$ is the quantity, in mg , of clotrimazole $\left(\mathrm{C}_{22} \mathrm{H}_{17} \mathrm{ClN}_{2}\right)$ in the portion of Topical Emulsion taken; and $R_{U}$ and $R_{S}$ are the peak response ratios of clotrimazole related compound A to testosterone propionate obtained from the Assay preparation and the Standard preparation, respectively: not more than $5 \%$ is found.

## Assay-

Dibasic potassium phosphate solution-Dissolve 4.35 g of dibasic potassium phosphate in water to make 1000 mL .

Mobile phase-Prepare a mixture of methanol and Dibasic potassium phosphate solution (3:1), pass through a membrane filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and degas.

Internal standard solution-Prepare a solution of testosterone propionate in dehydrated alcohol having a concentration of about 0.07 mg per mL .

Clotrimazole standard stock solution-Transfer about 50 mg of USP Clotrimazole RS, accurately weighed, to a $25-$ mL volumetric flask, add dehydrated alcohol to volume, and mix.

Clotrimazole related compound A standard stock solu-tion-Prepare a solution of USP Clotrimazole Related Compound A RS in dehydrated alcohol having a known concentration of about 0.1 mg per mL .

Standard preparation-Mix 5.0 mL of Clotrimazole standard stock solution, 5.0 mL of Clotrimazole related compound A standard stock solution, and 10.0 mL of Internal standard solution.

Assay preparation-Accurately weigh a portion of freshly mixed Topical Emulsion, equivalent to about 10 mg of clotrimazole, and transfer to a screw-capped, $50-\mathrm{mL}$ centrifuge tube. Add 10.0 mL of Internal standard solution, place the cap on the tube, and heat at $50^{\circ}$ in a water bath for 5 minutes, with occasional shaking. Remove the tube from the bath, and shake vigorously for 5 minutes. Cool in a methanolice bath for 15 minutes, and promptly centrifuge. Transfer the supernatant to a test tube. Add 10.0 mL of dehydrated alcohol to the residue in the centrifuge tube, and repeat the extraction as directed above, beginning with "place the cap on the tube." Transfer the supernatant to the test tube containing the supernatant from the first extraction, mix, and use this solution as the Assay preparation.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $2.1-\mathrm{mm} \times 6-\mathrm{cm}$ guard column that contains $10-$ $\mu \mathrm{m}$ packing L 2 and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ analytical column that contains $10-\mu \mathrm{m}$ packing L 1 . The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for clotrimazole related compound A, 1.0 for clotrimazole, and 1.5 for testosterone propionate; the resolution, $R$, between clotrimazole related compound A and clotrimazole is not less than 1.2; the resolution, $R$, between clotrimazole and testosterone propionate is not less than 1.9; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the
quantity, in mg, of clotrimazole $\left(\mathrm{C}_{22} \mathrm{H}_{17} \mathrm{ClN}_{2}\right)$ in each g of Topical Emulsion taken by the formula:

$$
20(C / W)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Clotrimazole RS in the Standard preparation; $W$ is the weight, in g , of Topical Emulsion taken; and $R_{U}$ and $R_{S}$ are the peak response ratios of clotrimazole to testosterone propionate obtained from the Assay preparation and the Standard preparation, respectively. $\Delta U S P 28$
(Official July 1, 2007)

## BRIEFING

Demeclocycline Hydrochloride Tablets, USP 27 page 549 and page 625 of $P F 29(3)$ [May-June 2003]. It is proposed to revise the Loss on drying limit from not more than $2.0 \%$ to not more than $2 \%$. The $2 \%$ limit reflects the requirement specified consistently in the regulations of the U.S. Food and Drug Administration from its origin in 1974 ( 21 CFR 446.116a). This is a technical correction to reflect the original and longstanding specifications of the Food and Drug Administration.

## Change to read:

Chromatographic purity-
Diluent-Dilute 3.12 mL of phosphoric acid with water to 1000 mL .

Buffer solution-Dissolve 2.16 g of sodium 1-octanesulfonate in 1000 mL of water, and add 1.0 mL of $0.1 \%$ triethylamine solution (w).
${ }^{\Delta}$ triethylamine.
Mix, and adjust with phosphoric acid to a pH of 2.5 .
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (144:37:19). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard stock solution-Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in Diluent to obtain a solution having a known concentration of about 0.3 mg per mL .

Standard solution-Dilute an accurately measured volume of Standard stock solution in Diluent to obtain a solution having a known concentration of about 0.003 mg per mL .

Test solution-Transfer about 30 mg of Dextroamphetamine Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of Diluent, sonicate for 5 minutes, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard stock solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the dextroamphetamine peak and any adjacent peak is not less than 1.5.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dextroamphetamine Sulfate taken by the formula:

$$
10,000(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Dextroamphetamine Sulfate RS in the Standard solution; $W$ is the weight, in mg , of Dextroamphetamine Sulfate taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for amphetamine obtained from the Standard solution: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

## BRIEFING

Diclofenac Sodium Extended-Release Tablets, page 319 of PF 29(1) [Jan.-Feb. 2003]. This proposed new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded to In-Process Revision with the addition of a new Drug release test.
(BPC: M. Marques) RTS-37957-2

## Add the following:

## ©Diclofenac Sodium Extended-Release Tablets

## » Diclofenac Sodium Extended-Release Tablets

 contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diclofenac sodium $\left(\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}\right)$.Packaging and storage-Preserve in well-closed containers. Store at controlled room temperature, and protect from light.

USP Reference standards $\langle 11\rangle$ —USP Diclofenac Sodium

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -
Solvent system: methanol, toluene, glacial acetic acid (40:60:0.5).

Test solution-Finely powder not fewer than 10 Tablets. Accurately weigh a portion of the powder, equivalent to about 50 mg of diclofenac sodium, and transfer to a $25-$ mL volumetric flask. Add about 15 mL of methanol, sonicate for 10 minutes, shake by mechanical means for 10 min-
utes, dilute with methanol to volume, and mix. Centrifuge this solution, and use the clear supernatant as the Test solution.

Standard solution-Accurately weigh about 50 mg of USP Diclofenac Sodium RS into a $25-\mathrm{mL}$ volumetric flask. Add 10 mL of methanol, shake by mechanical means for 10 minutes, dilute with methanol to volume, and mix.

Drug release $\langle 724\rangle$ -
Medium: 0.05 M phosphate buffer, $\mathrm{pH} 7.5 ; 900 \mathrm{~mL}$
Apparatus 2: 50 rpm ; use wire sinkers.
Times: 1, 5, 10, 16, and 24 hours.
Procedure: Determine the amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Diclofenac Sodium RS in the same Medium.

Tolerances: The percentages of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ dissolved at the times specified conform to Acceptance Table 1 under Drug release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $15 \%$ and $35 \%$ |
| 5 | between $45 \%$ and $65 \%$ |
| 10 | between $65 \%$ and $85 \%$ |
| 16 | between $75 \%$ and $95 \%$ |
| 24 | not less than $80 \%$ |

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.
Assay-[NOTE—Protect the Assay preparation, Standard preparation, and System suitability solution from light.]

Diluent: a mixture of acetonitrile and water (43:57).
0.05 M Monobasic potassium phosphate buffer-Dissolve 6.8 g of monobasic potassium phosphate in 950 mL of water, adjust with dilute phosphoric acid or dilute potassium hydroxide solution to a pH of $4.0 \pm 0.05$, dilute with water to 1 liter, and mix.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, 0.05 M Monobasic potassium phosphate buffer, and tetrahydrofuran (43:57:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diclofenac related compound A solution-Dissolve an accurately weighed quantity of USP Diclofenac Related Compound A RS in Diluent, and quantitatively dilute with Diluent to obtain a solution having a known concentration of about $200 \mu \mathrm{~g}$ per mL .
Standard preparation-Dissolve an accurately weighed quantity of USP Diclofenac Sodium RS in Diluent, and quantitatively dilute with Diluent to obtain a solution having a known concentration of about $200 \mu \mathrm{~g}$ per mL .

System suitability solution-Transfer 10 mL of the Standard preparation and 5 mL of Diclofenac related compound A solution to a $20-\mathrm{mL}$ volumetric flask. Dilute with Diluent to volume, and mix.

Assay preparation-Powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of diclofenac sodium, to a $100-\mathrm{mL}$ volumetric flask, add about 50 mL of Diluent, sonicate for about 15 minutes, then shake by mechanical means for 15 minutes. Add a few drops of methanol to remove the foam, dilute with Diluent to volume, and mix. Transfer 10.0 mL of the supernatant to a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Inject $40 \mu \mathrm{~L}$ and chromatograph the System suitability solution,
and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for diclofenac related compound A and 1.0 for diclofenac; and the resolution, $R$, between the diclofenac peak and the diclofenac related compound A peak is not less than 2.0. Inject $20 \mu \mathrm{~L}$ and chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor of the diclofenac peak is not more than 2.0 ; and the relative standard deviation of the diclofenac peak for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg , of diclofenac sodium $\left(\mathrm{C}_{14} \mathrm{H}_{10}\right.$ $\mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ ) in the portion of Tablets taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $m g$ per $m L$, of USP Diclofenac Sodium RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the diclofenac peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ USP28

## Briefing

Diltiazem Hydrochloride Extended-Release Capsules, USP 27 page 625. It is proposed to add Drug Release Test 14 to this monograph because FDA recently approved an ANDA for this product. Because of difference in dissolution rates in vitro, the new product was approved with a Drug release test that differs from those currently official in the USP monograph.
(BPC: M. Marques) RTS-39543-1

## Drug release $\langle 724\rangle$ -

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS-
Test 1-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 1. Proceed as directed for Extended-Release Articles-General Drug Release Standard $\langle 724\rangle$.

Medium: water; 900 mL .
Apparatus 2: 100 rpm .
Times: 3, 9, and 12 hours.
Procedure-Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same Me dium.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2}$ $\mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to the Acceptance Table given.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 3 | between $10 \%$ and $25 \%$ |
| 9 | between $45 \%$ and $85 \%$ |
| 12 | not less than $70 \%$ |

## Acceptance Table

| Level | Number <br> Tested | Criteria |
| :---: | :---: | :---: | | No individual value lies outside each of |
| :--- |
| the stated ranges, and no individual value |
| is less than the stated amount at the final |
| test time. |

Test 4-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 4.

Medium, Apparatus, and Procedure-Proceed as directed under Test 1.

Times: 4, 8, 12, and 24 hours.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :---: |
| 4 | between $10 \%$ and $25 \%$ |
| 8 | between $35 \%$ and $60 \%$ |
| 12 | between $55 \%$ and $80 \%$ |
| 24 | not less than $80 \%$ |

Test 5-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 5.

Medium: 0.05 M phosphate buffer, $\mathrm{pH} 7.2 ; 900 \mathrm{~mL}$.
Apparatus 2: 50 rpm .
Procedure-Proceed as directed under Test 1.
Times: 1, 3, and 8 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to $A c$ ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | not more than $15 \%$ |
| 3 | between $45 \%$ and $70 \%$ |
| 8 | not less than $80 \%$ |

Test 10-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 10.

Medium: 0.05 M phosphate buffer, $\mathrm{pH} 6.5 ; 900 \mathrm{~mL}$. Prepare the buffer employing the following method. Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5 .

Apparatus 1: 100 rpm .
Procedure-Proceed as directed under Test 1.
Times: 1, 6, 9, and 24 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26}$ $\mathrm{N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | not more than $10 \%$ |
| 6 | between $10 \%$ and $30 \%$ |
| 9 | between $34 \%$ and $60 \%$ |
| 24 | not less than $80 \%$ |

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS-
Test 2-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 2.

Test 1 Medium, Apparatus, and Procedure-Proceed as directed under.

Times: $1,4,10$, and 15 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $5 \%$ and $20 \%$ |
| 4 | between $30 \%$ and $50 \%$ |
| 10 | between $70 \%$ and $90 \%$ |
| 15 | not less than $80 \%$ |

Test 3-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 3.

Medium: 0.1 N hydrochloric acid; 900 mL .
Apparatus 2: 100 rpm .
Times: 6, 12, 18, 24, and 30 hours.

Procedure—Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same Medium.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2}$ $\mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 6 | between $20 \%$ and $45 \%$ |
| 12 | between $25 \%$ and $50 \%$ |
| 18 | between $35 \%$ and $70 \%$ |
| 24 | not less than $70 \%$ |
| 30 | not less than $85 \%$ |

Test 6-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 6.

Medium and Procedure-Proceed as directed under Test 1.
Apparatus 1: 100 rpm .
Times: 2, 4, 8, 12, and 16 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2}$ $\mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | not more than $25 \%$ |
| 4 | between $25 \%$ and $50 \%$ |
| 8 | between $60 \%$ and $85 \%$ |
| 12 | not less than $70 \%$ |
| 16 | not less than $80 \%$ |

Test 7--If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 7.

Medium: pH 4.2 acetate buffer; 900 mL . Prepare the buffer by employing the following method. Transfer 115 mL of acetic acid to a 10 -liter volumetric flask, dilute with water to volume, and mix (Solution A). Transfer 165.4 g of anhydrous sodium acetate to a 10 -liter volumetric flask, dilute with water to volume, and mix (Solution B). Mix 4410 mL of Solution A with 1590 mL of Solution B. Adjust, if necessary, with the addition of Solution A or Solution B to a pH of $4.2 \pm 0.05$.

Apparatus 2: 100 rpm .
Times: 1, 4, 10, and 15 hours.
Procedure-Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration ofUSP Diltiazem Hydrochloride RS in the same Me dium.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2}$ $\mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | not more than $10 \%$ |
| 4 | between $15 \%$ and $35 \%$ |
| 10 | between $65 \%$ and $85 \%$ |
| 15 | not less than $80 \%$ |

Test 8-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 8.

Medium, Apparatus, and Procedure-Proceed as directed under Test 1.

Times: 1, 4, 10, and 15 hours.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $5 \%$ and $20 \%$ |
| 4 | between $30 \%$ and $50 \%$ |
| 10 | between $60 \%$ and $90 \%$ |
| 15 | not less than $80 \%$ |

Test 9-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 9.

NOTE-Perform the test separately in each of the two media.
Medium 1: 0.1 N hydrochloric acid; 900 mL .
Medium 2: simulated intestinal fluid TS, prepared without enzyme and adjusted to a pH of $7.5 \pm 0.1 ; 900 \mathrm{~mL}$.
Apparatus 2: 75 rpm .
Time for Medium 1: 2 hours.
Times for Medium 2: 2, 12, 18, and 24 hours.
Procedure-Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with the appropriate Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same Medium.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table 1.

| Time <br> (hours) | Amount dissolved <br> (Medium 1) | Amount dissolved <br> (Medium 2) |
| :---: | :---: | :--- |
| 2 | between $0 \%$ and $5 \%$ | between $20 \%$ and $45 \%$ |
| 12 |  | between $35 \%$ and $55 \%$ |
| 18 |  | not less than $60 \%$ |
| 24 |  | not less than $80 \%$ |

Test 11-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 11.

Medium, Apparatus, and Procedure-Proceed as directed under Test 3.

Times: 1, 6, 12, and 18 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | not more than $10 \%$ |
| 6 | between $30 \%$ and $40 \%$ |
| 12 | between $36 \%$ and $58 \%$ |
| 18 | not less than $85 \%$ |

Test 12-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 12. Proceed as directed for Extended-Release Articles-General Drug Release Standard〈724〉.

Medium and Procedure-Proceed as directed under Test 1. Apparatus 1: 100 rpm .
Times: 2, 8, 14, and 24 hours.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to $A c$ ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | not more than $20 \%$ |
| 8 | between $30 \%$ and $55 \%$ |
| 14 | not less than $65 \%$ |
| 24 | not less than $80 \%$ |

Test 13-If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 13. Proceed as directed for Extended-Release Articles-General Drug Release Standard $\langle 724\rangle$.

Medium and Procedure-Proceed as directed under Test 1.
Apparatus 1: 100 rpm .
Times: 2, 8, 14, and 24 hours.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to $A c$ ceptance Table 1 under Drug Release $\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | not more than $20 \%$ |
| 8 | between $30 \%$ and $55 \%$ |
| 14 | between $60 \%$ and $80 \%$ |
| 24 | not less than $80 \%$ |

${ }^{\Delta}$ Test 14 -If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 14. Proceed as directed for Extended-Release Articles-General Drug Release Standard under the general chapter Drug Release $\langle 724\rangle$.

Medium, Apparatus, Times, and Procedure—Proceed as directed under Test 3.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1 under Drug Release $\langle 724\rangle$.

## Change to read:

Limit of dorzolamide hydrochloride related compound AMobile phase-Prepare a filtered and degassed mixture of tertbutyl methyl ether, chromatographic $n$-heptane, acetonitrile, and water (63:35:2:0.2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Transfer about 18 mg of USP Dorzolamide Hydrochloride RS and 2 mg of USP Dorzolamide Hydrochloride Related Compound A RS, each accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, dissolve in 4 mL of 0.5 N ammonium hydroxide, add 4 mL of ethyl acetate, and mix. Separate the ethyl acetate layer, and transfer to a $15-\mathrm{mL}$ centrifuge tube. Add 4 mL of ethyl acetate to the aqueous layer, mix, separate the ethyl acetate layer, and combine it with the first extract. Evaporate the combined organic layers to dryness on a water bath maintained at $50^{\circ}$ under a stream of nitrogen. Dissolve the residue in 3 mL of acetonitrile, add 3 drops of (S)-(-)- $\alpha$-methylbenzyl isocyanate
${ }^{\boldsymbol{\Delta}}$ [NOTE-Discard the reagent if it is colored.],$_{\mathbf{A S P} 28}$ and allow to react for 5 minutes on a water bath maintained at $50^{\circ}$. under a stream of nitrogen. [NOTE-Diseard the solution if it is eotored.
AUSP28
Evaporate the mixture to dryness on a water bath maintained at $50^{\circ}$ under a stream of nitrogen. Dissolve the residue in 10 mL of a mixture of tert-butyl methyl ether, glacial acetic acid, and acetonitrile (87:10:3).

Test solution-Transfer about 20 mg of Dorzolamide Hydrochloride, accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, and proceed as directed for System suitability solution beginning with "dissolve in 4 mL ".

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the System suitability solution, and record the peak respenses
$\Delta_{\operatorname{areas}_{\mathbf{A S P}}{ }^{28}}$
as directed for Procedure: the relative retention times are about 1.0 for dorzolamide and 1.5 for dorzolamide hydrochloride related compound A ; the resolution, $R$, between dorzolamide and dorzolamide hydrochloride related compound A is not less than 4.0 ; the column efficiency
${ }^{\mathbf{\Delta}}$ for the dorzolamide hydrochloride peak $\mathbf{A U S P 2 8}$ is not less than 600
${ }^{4} 4000 \mathbf{A U S P 2 8}^{\text {U }}$
theoretical plates; the tailing factor is not more than 1.4 ; and the relative standard deviation for replicate injections determined from the dorzolamide peak is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the System suitability solution and the Test solution into the chromatograph, record the chromatograms, and measure the respenses for
$\Delta_{\text {areas of }}^{\text {AUSP28 }}$
the major peaks. Calculate the percentage of dorzolamide hydrochloride related compound A in the portion of Dorzolamide Hydrochloride taken by the formula:

$$
\epsilon 100\left(r_{i}+x_{s}\right)
$$

in which $C$ is the coneentration, in mg per mL, of USP Dorzola mide Hydrochloride Related Compernd $A$ PS in the System suit ability solution; andr, andrs are the peak responses of dorzolamide hydrochloride relatedempeund $A$ obtained frem the Test solution and the System sutitability solution, respectively: not more than $0.5 \%$ is found.

$$
\mathbf{\Delta} 100 r_{I}\left(r_{I}+r_{S}\right)
$$

in which $r_{I}$ is the peak area of dorzolamide hydrochloride related compound A obtained from the Test solution; and $r_{S}$ is the peak area of dorzolamide hydrochloride obtained from the Test solution: not more than $0.5 \%$ is found. ${ }_{\triangle U S P 28}$

## Drug release $\langle 724\rangle$ -

Mediun: $\mathrm{pH} 6.5,0.1 \mathrm{M}$ pherphate buffer with $1 \%$ of sodium tauryl sulfate; 500 mL . (Transfer 206 mL of 1 M sodium phesphate, 196 mL of 0.5 M sodium phosphate, and 50.0 g of sodium latryl sulfate to a 5000 ml volumetrie flack. Add approximately 4000 mL of water, and mix. If neeessary, adjust with $1-\mathrm{N}$ sodium hydroxide to a pH of 6.5 . Dilute with water to volume, and mix). Appatas 2: 50 fpm .
Finnes: 2, 6, and 10 hours.
Fest preparation Place each Tablet in a specially made quad rangular baske of stainless steel wire gatze, soldered in one of its upper, narrow sides to the end of a steel rod (see Figure 1). Place the tablet cover (C) in the horizental diagenal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by mens of two teflon nuts, 3.2 cm from the eenter of the vessel. Adjust he lower edge of the bottom of the baske to approximately

1 cm above the top of the paddle blade (see Figtre 2). Orient the targe side of the basket angentially to the flow stream with the tablet standing on its edge. Filter a 10 mL portion of the solution under test, obtained at each time interval, threugh a suitable filter.

Proedtre Determine the amount of $\mathrm{C}_{18} \mathrm{H}_{49} \mathrm{Cl}_{2} \mathrm{NO}_{4}$ dissolved as directed in the Assem, making any neeessary modifieations.
${ }^{\Delta}$ Medium: pH 6.5 phosphate buffer with $1 \%$ of sodium lauryl sulfate (Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M dibasic sodium phosphate anhydrous, and 50.0 g of sodium lauryl sulfate to a $5000-\mathrm{mL}$ volumetric flask. Add approximately 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5 . Dilute with water to volume, and mix well.); 500 mL .

Apparatus 2: 50 rpm .
Times: 2, 6, and 10 hours.
Buffer solution-Prepare as directed in the Assay.
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (2:2.5:1). Make adjustments if necessary (see System suitability under Chromatography $\langle 621\rangle$ ).

Standard stock solution-Dissolve an accurately weighed quantity of USP Felodipine RS in alcohol to obtain a solution having a known concentration of 0.25 mg per mL .

Standard solution-Dilute an accurately measured volume of the Standard stock solution, quantitatively and stepwise, if necessary, with Medium to obtain a solution having a known concentration of USP Felodipine RS equivalent to the concentration that would result from about $60 \%$ dissolution of a single Tablet in 500 mL of Medium.

Test solution-Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see Figure 1). Place the tablet cover in the horizontal diagonal
of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see Figure 2). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a $10-\mathrm{mL}$ portion of the solution under test, obtained at each time interval, through a suitable filter.

Chromatographic system-Proceed as directed in the Assay.
Procedure-Separately inject equal volumes ( $100 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg , of felodipine $\left(\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{Cl}_{2} \mathrm{NO}_{4}\right)$ dissolved in the Medium by the formula:

$$
C D\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Felodipine RS in the Standard solution; $D$ is the dilution factor used in preparing the Test solution; and $r_{U}$ and $\mathrm{r}_{S}$ are the felodipine peak areas obtained from the Test solution and the Standard solution, respectively. $\triangle$ USP28
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{ClNO}_{4}$ dissolved at the times specified conform to Acceptance Table 1
$\mathbf{\Delta u n d e r}^{\text {Drug Release }}\langle 724\rangle_{\cdot \mathbf{\Delta U S P 2 8}}$

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 2 | between $10 \%$ and $30 \%$ |
| 6 | between $42 \%$ and $68 \%$ |
| 10 | not less than $75 \%$ |

## NOTES

1. Rod and Basket with a Tablet cover placed in the horizontal diagonal of the basket.
2. Basket and Tablet cover material; stainless steel.
3. Basket gauze wire size: 8 mesh.

## BRIEFING

Fluorodopa F 18 Injection, $U S P 27$ page 817. It is proposed to specify the method to be used for determining Specific activity, add a new Reference Standard for unlabeled L-fluorodopa, revise the test for Radionuclidic identification, and change the upper limit for $p H$. It is also proposed to add a new HPLC method in the test for Radiochemical purity and a new test for Limit of organotin as a new alternative synthetic route for determining Chemical purity. In addition, editorial changes have been made in the test for Enantiomeric purity.
(RMI: A. Wilk) RTS-40877-1

## Change to read:

» Fluorodopa F 18 Injection is a sterile, isie
${ }^{\wedge}$ ⓊSP28
aqueous solution, suitable for intravenous administration of $6-\left[{ }^{18} \mathrm{~F}\right] f l u o r o l e v o d o p a ~ i n ~ w h i c h ~ a ~ p o r t i o n ~ o f ~ t h e ~$ molecules are labeled with radioactive ${ }^{18} \mathrm{~F}$ (see Radiopharmaceuticals for Positron Emission TomographyCompounding $\langle 823\rangle$ ). It contains not less than 90.0
percent and not more than 110.0 percent of the labeled amount of ${ }^{18} \mathrm{~F}$ expressed in MBq (or mCi ) per mL at the time indicated in the labeling. It may contain suitable preservatives and/or stabilizing agents.

## Change to read:

Specific activity mos lhan $3.7 \times 10^{3} \mathrm{MBq}(100$ mCi) per mmol.
${ }^{\Delta}$ Mobile phase, Standard solution, Test solution, and Chromatographic system-Proceed as directed in the test for Radiochemical purity.
Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration of L-fluorodopa found, in mg per mL , in the Injection by the formula:

$$
C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration of the Standard solution; and $r_{U}$ and $r_{S}$ are the peak responses of the Test solution and the Standard solution, respectively. Determine the concentration of fluorodopa F 18, in mCi per mL , as directed in the Assay for radioactivity. Calculate the Specific activity by dividing the result from the Assay (in mCi per mL ) by the concentration (in mg per mL ): it is not less than 0.463 mCi per mg of L-fluorodopa $\left(3.7 \times 10^{3} \mathrm{MBq}[100 \mathrm{mCi}]\right.$ per mmol). $\mathbf{\Delta U S P 2 8}$

Radiochemical purity-[nOTE—This article may be synthesized by different methods and processes and may, therefore, contain dif ferent impurities. It may be neeessary to use additional validated limit tests relevant to the symthetic procedure used to ensure radioehemieal purity of the final product.]

Mobile phase. Prepare a filtered and degassed mixture-of $83.5 \%$ of a solution containing 100 mM soditm phosphate, 2.6 mM - sodium $1-0 c t a n e s u l f o n a t e$, and 0.1 mM -detatedisodium and $16.5 \%$ of methanol. Careftlly adjust with phosphoric acid to apH of $3.3-0.2$. Retention times will valy drastically with sol vent pH . At pH 3.5 , the observed retention time is about 6.0 mmin utes. Make adjustments if necessary (see System Suitability under Chromatography (624)).

Fest preparation Use-Injection appropriately diluted with water, such that it provides a count rate of about $5 \times 10^{5}$ eounts per mintle.

Chromegran sistem (see-Chrematograhy $\langle 624\rangle$ ). The liquid chromatograph is equipped with a radioactivity detector and $a-4.6 \mathrm{~mm} \times 25 \mathrm{em}$ column that contains $5 \mathrm{\mu m}$ packing L4. The flow rate is about 1 mL per minute.

Procedure Inject about $50 \mu \mathrm{~L}$ of the Test preparation into the chromatograph, record the chromatogram, and measure the areas for all radionctivity peaks. The radionctivity recorded for the main peak at a retention time of about 6 minutes is not less than $95 \%$ of the radiactivity injected. Fer simultaneous analysis of chemienl purity, a variable wavelength UV detector, operating in the range of 260 to 290 nm , is coupled to the system.
${ }^{\Delta}$ Mobile phase-Prepare a filtered and degassed mixture of $0.1 \%$ acetic acid and methanol (97:3).

Standard solution-Dissolve an accurately weighed quantity of USP L-Fluorodopa RS in 10 mmol of pH 4.5 sodium acetate buffer and dilute quantitatively, and stepwise if necessary, with the same buffer to obtain a solution having a known concentration of about 0.1 mg per mL .
Test solution-Use the Injection diluted with water such that it provides a count rate of about $5 \times 10^{5}$ counts per minute.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $4.6-\mathrm{mm} \times 30$ cm column that contains packing L1, a radioactivity detector, and a variable wavelength UV detector operating in the range of 260 to 290 nm . The flow rate is about 0.8 mL per minute. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Prepare a mixture of the Test solution and the Standard solution and inject it (about $50 \mu \mathrm{~L}$ ) into the chromatograph, record the chromatograms, and measure the areas for both the radioactive and nonradioactive peaks. The ratio and injected volume may be adjusted to obtain suitable detection system sensitivity. The radioactivity of the major peak is not less than $90 \%$ of the total radioactivity measured, and no individual radiochemical impurity is more than $2 \%$. The retention time of the major peak in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution. [NOTE-The typical retention time for fluorodopa is about 6 minutes. Retention times are very sensitive to the pH of the solvent. $]_{\text {USP28 }}$

## Change to read:

Chemical purity-This article may be synthesized by different metheds and processes and, therefore, contains different impurities. It is neeessay to demenstrate the absence or lack of physio logienl effect of any umlabeled starting ingredients or by products formed during the reaction and reagent chemieats employed in the synthetic process that may be present, by the use of one or more validated limit tests using known analytical teehniques (see Proee dure in the test for Radiochemieal purity).
${ }^{\Delta}$ The methods and limits described in this section relate to potential impurities associated with commonly used methods of synthesis for Fluorodopa F 18 Injection. If methods of synthesis are used that may result in different impurities, the presence of unlabeled ingredients, reagents, and by-products specific to the process must be controlled and then potential for physiological or pharmacological effects must be considered.

LIMIT OF ORGANOTIN (to be determined if tin-containing starting materials or reagents are used in the synthesis)-

Mobile phase—Prepare a filtered and degassed $5 \mu \mathrm{~mol}$ solution of morin in a mixture of acetic acid, methanol, acetonitrile, and toluene (5:2:2:91).

Standard solution-Prepare a mixture of 10 mmol each of dimethyltin dibromide and trimethyltin bromide in alcohol.

## Test solution-Use the Injection.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a fluorescence detector (excitation at 420 nm and detection at 500 nm ) and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L32. The flow rate is about 1 mL per minute.

Procedure—Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. The volume of Injection in the Standard solution and the Test solution may be adjusted to obtain suitable detection system sensitivity. Calculate the concentration, in $\mu \mathrm{g}$ per mL , of dimethyltin and trimethyltin in the portion of Injection taken by the formula:

$$
C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the relevant organotin compound in the Standard solution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and the Standard solution, respectively: not more than 0.5
$\mu \mathrm{g}$ per mL of dimethyltin and trimethyltin is found. $\triangle$ USP28 LIMIT OF MERCURY (to be determined if mercury-containing starting materials or reagents are used in the synthesis)-[Cau-tion-Because of the toxic nature of mercury vapor, great care must be taken to avoid inhaling it. A bypass has been included in the system, therefore, either to vent the mercury vapor into an exhaust hood or pass the vapor through some absorbing media such as a solution containing equal volumes of 0.1 M potassium permanganate and dilute sulfuric acid (1 in 10).]

Apparatus-Use a flameless atomic absorption spectrophotometer for measuring radiation at 253.7 nm emitted by mercury vapor.
Stannous chloride suspension-Add 25 g of stannous chloride to 250 mL of 0.5 N sulfuric acid. This mixture is a suspension and is to be stirred continuously during use.

Sodium chloride-hydroxylamine hydrochloride solution-Dissolve 12 g of sodium chloride and 12 g of hydroxylamine hydrochloride in water, dilute with water to 100 mL , and mix.

Mercury stock solution-Dissolve 135.4 mg of mercuric chloride, accurately weighed, in 75 mL of water. Add 10 mL of nitric acid, dilute with water to 100.0 mL , and mix. Each mL of this solution contains 1 mg of mercury.

Mercury standard solution-Before using, make successive dilutions of the Mercury stock solution with water to obtain a Mercury standard solution containing $0.1 \mu \mathrm{~g}$ per mL .

Calibration-To six $300-\mathrm{mL}$, glass-stoppered bottles transfer, respectively, $0-$, $0.5-, 1.0-, 2.0-, 5.0-$, and $10.0-\mathrm{mL}$ aliquots of the Mercury standard solution containing $0 \mu \mathrm{~g}$ to $1.0 \mu \mathrm{~g}$ of mercury. To each bottle add water to make 100 mL , mix, and add 5 mL of sulfuric acid and 2.5 mL of nitric acid. Add 15 mL of potassium permanganate solution (1 in 20). Allow to stand for 15 minutes. Add 8 mL of potassium persulfate solution ( 1 in 20 ), and heat in a water bath at $95^{\circ}$ for 2 hours. Cool, and add 6 mL of Sodium chloride-hydroxylamine hydrochloride solution to reduce the excess permanganate. When the solution has been decolorized, wait for 30 seconds and add 5 mL of Stannous chloride suspension. Immediately attach the flask to the aeration apparatus to form a closed system. Allow the sample to stand without manual agitation. The circulating pump, previously adjusted to a rate of 1 L per minute, is allowed to run continuously. The absorbance will increase and reach a maximum within 30 seconds. As soon as the recorder pen levels off, in about 1 minute, open the bypass valve and continue the aeration until the absorbance returns to its minimum value. Close the bypass valve, remove the stopper and frit from the bottle, and continue the aeration. Plot a standard curve of the peak height versus micrograms of mercury.
Test preparation-Transfer 1.0 mL of Injection to a $300-\mathrm{mL}$, glass-stoppered bottle, and proceed as directed under Calibration, beginning with "To each bottle add water". Measure the absorbance of the solution, and determine the quantity, in $\mu \mathrm{g}$, of mercury in the Test preparation from the standard curve: not more than 0.5 $\mu \mathrm{g}$ is found.

## Change to read:

Enantiomeric purity-Inject a suitable volume of Injection into a high pressure liquid chromatograph equipped with a chiral ligand exehange $-4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ column that contains packing L32. The Mobile phase is a mixtare of 100 mM menebasic petassitum phesphate and 2 mM eupric sulfate ( $1: 1$ ) adjusted to a pH of 4.6 . The flow rate is abeut 1 mL per mintte. The eapacity facters, $k$, are 2.1 and 7.3 for the - and t isemers, respectively. The radionetivity of the-Lisomer is not less than-95\% of the total radiactivity mea stred.
${ }^{\Delta}$ Mobile phase-Prepare a filtered and degassed mixture of 100 mmol of monobasic potassium phosphate and 2 mmol of cupric sulfate (1:1). Adjust to a pH of 4.6. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Use the Standard solution as directed under Radiochemical purity.

Test solution-Use the Injection.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph as directed under Radiochemical purity is equipped with a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L32. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the capacity factors, $k^{\prime}$, for the D- and L-isomers are not less than 2.1 and 7.3, respectively.

Procedure-Prepare a mixture of the Test solution and the Standard solution, and inject it (about $50 \mu \mathrm{~L}$ ) into the chromatograph, record the chromatograms, and measure the areas for both the radioactive and nonradioactive peaks. The ratio and injected volume may be adjusted to obtain suitable detection system sensitivity. The radioactivity of the L-isomer is not less than $95 \%$. USPP28

## Briefing

Flurandrenolide Lotion, USP 27 page 832. It is proposed to change the title of this monograph to Flurandrenolide Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40784-1

## Flurandrenolide Lotion

(Current title—not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007
(see Official Title Changes on the first page of InProcess Revision):
See Flurandrenolide Topical Emulsion

## BRIEFING

Flurandrenolide Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40784-1

## Add the following:

## ©Flurandrenolide Topical Emulsion <br> (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is Flurandrenolide Lotion)

» Flurandrenolide Topical Emulsion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{24} \mathrm{H}_{33} \mathrm{FO}_{6}$.

Packaging and storage-Preserve in tight containers, protected from heat, light, and freezing.

USP Reference standards $\langle 11\rangle-U S P$ Flurandrenolide $R S$.

Identification-It responds to the Identification test under Flurandrenolide Cream.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.

Minimum fill $\langle 755\rangle$ : meets the requirements.
$\mathbf{p H}\langle 791\rangle$ : between 3.5 and 6.0, determined in a 1 in 10 dilution of the Topical Emulsion in water containing 0.30 mL of saturated potassium chloride solution per 100 mL .

Assay-
Methanolic sodium chloride, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system-Prepare as directed in the Assay under Flurandrenolide Cream.

Assay preparation-Transfer an accurately weighed portion of Topical Emulsion, calculated from the density to contain about $500 \mu \mathrm{~g}$ of flurandrenolide, to a separator. (Determine the density by taring a $100-\mathrm{mL}$ volumetric flask containing 50.0 mL of water, adding approximately 25 g of well-shaken Topical Emulsion, and again weighing, then carefully adjusting the contents of the volumetric flask with water from a buret to volume, and finally calculating the density taken by the formula:

$$
A / B
$$

in which $A$ is the weight, in g , of the Topical Emulsion taken; and $B$ is 50.0 mL minus the volume, in mL , of water necessary to adjust the contents of the volumetric flask to volume.) Proceed as directed for Assay preparation in the Assay under Flurandrenolide Cream, beginning with "Add 50 mL of hexane and 25 mL of Methanolic sodium chloride."

Procedure-Proceed as directed in the Assay under Flurandrenolide Cream. Calculate the quantity, in mg, of $\mathrm{C}_{24} \mathrm{H}_{33} \mathrm{FO}_{6}$ in each mL of the Topical Emulsion taken by the formula:
in which $C$ is the concentration, in mg per mL , of USP Flurandrenolide RS in the Standard preparation; $D$ is the density of the Topical Emulsion; $W$ is the weight, in g , of Topical Emulsion taken; and $R_{U}$ and $R_{S}$ are the peak response ratios obtained from the Assay preparation and the Standard preparation, respectively._USP28
(Official July 1, 2007)

## BRIEFING

Flurazepam Hydrochloride, USP 27 page 833. It is proposed to correct the Definition of the monograph to specify that the Assay limits apply on the anhydrous basis, not the dried basis.
(PA3: S. Salado) RTS-40839-1

## Change to read:

» Flurazepam Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{ClFN}_{3} \mathrm{O} \cdot 2 \mathrm{HCl}$, calculated on the dried
${ }^{\boldsymbol{\Delta}} \mathrm{anhydrous}_{\Delta U S P 28}$
basis.

## BRIEFING

Graftskin, page 1804 of PF 28(6) [Nov.-Dec. 2002]. On the basis of comments received, this proposed new monograph is being revised to clarify the use of the USP Graftskin Reference Photomicrographs in performing the test for Histological characterization. Furthermore, the system suitability requirements of the Gene expression profile test are being revised to be more descriptive. Comments on this proposed monograph are encouraged and should be directed to the attention of the USP Expert Committee on Gene Therapy, Cell Therapy, and Tissue Engineering.
(GCT: I. DeVeau) RTS-40842-1

$$
10 C(D / W)\left(R_{U} / R_{S}\right)
$$

## Add the following:

## ${ }^{\Delta}$ Graftskin

» Graftskin ${ }^{1}$ is a living, bilayered skin substitute derived from neonatal foreskins manufactured under Class 100 sterile conditions. The upper, epidermal layer is formed by human keratinocytes and has a well-differentiated stratum corneum. The inner, dermal layer is composed of human fibroblasts in a bovine Type I collagen lattice. Graftskin does not contain Langerhans cells, melanocytes, macrophages, lymphocytes, blood vessels, hair follicles, or any other epidermallyderived components. The fibroblast and keratinocyte cell banks from which Graftskin is derived test negative for human and animal viruses, retroviruses, bacteria, fungi, yeast, mycoplasma, and tumorigenicity. The cell banks are also tested for normal human karyology and isoenzymes. The fi-

[^48]nal product is tested for morphology, cell viability, and physical container integrity. Used tissue culture media are tested for mycoplasma and sterility. All materials derived from bovine sources originate from countries free of bovine spongiform encephalopathy.

Packaging and storage-Graftskin is aseptically packaged in a Class 100 environment in single-use containers that preserve cell viability and product integrity. Store at controlled room temperature for no longer than 5 days, and do not subject to freezing temperatures. The atmosphere within the package contains air enriched with $10 \%$ carbon dioxide. The device is translucent and off-white in color. The upper, or epidermal surface, is dull with small irregularities resulting from the cornification of keratinocytes, while the bottom surface is smooth and shiny in appearance. The device is packaged so that the dermal (glossy layer) is closest to the agarose-based nutrient medium. The packaging permits easy observation of the medium and provides ready access to the Graftskin when needed. The medium contains all of the required nutrients for the living cell components of Graftskin, plus an appropriate, nontoxic, pH -sensitive dye to indicate package breaches or microbial contamination. The medium should appear pink ( $\mathrm{pH} 6.8-7.7$ ) when compared to the enclosed pH color chart.

Labeling-Label it to indicate the dimensions of the enclosed Graftskin, the expiry date, required storage conditions, and the lot number. The label indicates that the enclosed Graftskin and surrounding medium are to be examined for signs of contamination or deterioration. The label also contains a pH color code to be used for determination of the acceptability of the pH of the Graftskin medium. The label cautions that Graftskin is not to be used if the package shows signs of damage or microbial contam-
ination. Label it to indicate that sterile techniques are to be used in handling Graftskin and that cytotoxic agents are not to be used. Label it to indicate the time frame for use after package opening.

USP Referenee-standards- $\langle H\rangle$-USP Graftskin Photomi erographs RS.

USP Authentic Visual References $\langle 11\rangle$ —USP Graftskin Reference Photomicrographs. [NOTE-These 10 photomicrographs represent examples of both passing and failing Graftskin units. They are specified to assist in ascertaining histological quality.]

## Histological characterization-

## SOLUTION PREPARATIONS-

2.0 M Monobasic potassium phosphate—Dissolve 13.61 g of anhydrous monobasic potassium phosphate in 50 mL of water.
2.0 M Dibasic potassium phosphate—Dissolve 17.42 g of anhydrous dibasic potassium phosphate in 50 mL of water.

Phosphate-buffered saline solution (pH 7.1-7.5)—Combine 3.6 mL of 2.0 M Monobasic potassium phosphate, 16.4 mL of 2.0 M Dibasic potassium phosphate, 8 g of sodium chloride, and 1 L of water. Mix thoroughly.
$0.3 \%$ Acid alcohol-To 100 mL of $70 \%$ alcohol, add 0.3 mL of hydrochloric acid, and mix.

Hematoxylin-alcohol solution-Dissolve 2.5 g of hematoxylin in 25.0 mL of dehydrated alcohol, with heating.

Potassium alum solution-Dissolve 50.0 g of potassium alum in 500 mL of water, with heating.

Hematoxylin staining solution-Mix Hematoxylin-alco-
hol solution and Potassium alum solution, and heat to boiling as rapidly as possible with constant stirring. Do not heat for more than 1 minute. Slowly add 0.185 g of sodium iodate, and reheat to a simmer until the solution becomes a deep purple. Remove from the heat, and quickly cool. Filter daily before use.

Bluing agent-Dissolve 200 mg of sodium bicarbonate and 40 mg of lithium carbonate in 63 mL of water and 37 mL of methanol, and mix.

Eosin solution-Dissolve 1 g of eosin Y in 100 mL of alcohol. Filter daily before use.
TISSUE PREPARATION-Remove three $2-\mathrm{cm}$ diameter circular sections from every $30 \mathrm{~cm}^{2}$ section of Graftskin (not less than $30 \%$ of the total unit area), using the appropriate size biopsy punch. Cut with a circular rocking motion to prevent crushing the tissue. Immerse the sections in 3.7\% dimethoxymethane for 30 minutes, using a gentle rocking motion. Remove the sections, and lay on a cutting surface, dermal side (glossy side) down. Cut an approximately 3 -mm wide strip through the center of the specimen, using a new, single-edged, razor blade. Place the strips in a histological microwave cassette, using suitable biopsy pads pre-moistened with Phosphate-buffered saline solution (pH 7.17.5) to hold the strips in place. Insert the cassette into a histological microwave processing rack, place the rack inside a suitable microwave container, and add sufficient Phosphatebuffered saline solution ( $\mathrm{pH} 7.1-7.5$ ) to completely cover the rack. Place the container in a microwave oven suitable for histological work ${ }^{2}$, and heat for 4 minutes at $55^{\circ}$. Remove the Phosphate-buffered saline solution ( $\mathrm{pH} 7.1-$ 7.5), and add enough dehydrated alcohol to completely cover the rack. Return the container to the microwave oven, and heat for 4 minutes at $67^{\circ}$. Remove the alcohol, and add enough dehydrated isopropyl alcohol to completely cover the rack. Return the container to the microwave oven, and heat for 4 minutes at $74^{\circ}$. Remove the isopropyl alcohol, and add enough suitable grade paraffin ${ }^{3}$ that has been melted and held at $84^{\circ}$ prior to use, to completely cover the rack. Return

[^49]the container to the microwave oven, and heat for 7 minutes at $84^{\circ}$. Remove the histological microwave cassette from the container and rack while the paraffin is still melted, and disassemble, discarding the biopsy pads. Fill preheated embedding molds with molten paraffin ${ }^{4}$ heated to $60^{\circ}$, and place on top of a preheated warming platform that is designed for histological work. Using forceps, remove the Graftskin specimens from the cassette, and place the specimens in individual molds. Orient the specimens in the molds to enable cutting of a cross or longitudinal section. Cool the paraffin by sliding the mold down the platform to its cool side until the paraffin has solidified. Maintain the specimen orientation with forceps during cooling, removing the forceps when the paraffin becomes translucent. Slide the paraffin block onto a histological cold plate to rapidly cool the block. Trim the paraffin block with a new single-edged razor blade to form a rectangle or slight trapezoid to within 5 mm of the tissue mass, if necessary. Cool the block at $4^{\circ}$ for 15 to 30 minutes, and clamp the paraffin block into the block holder of the microtome. Fill a histological tissue-flotation water bath with fresh water, add an appropriate amount of a suitable histological adhesive ${ }^{5}$, and heat to a temperature $5^{\circ}$ lower than the melting point of the paraffin. Properly mount the paraffin block into a microtome, adjusting as necessary. Set the microtome to make $5-\mu \mathrm{m}$ thick cuts with a blade angle of $5 \pm 2^{\circ}$. Insert into the knife holder a sharp stainless steel microtome knife that has been properly honed or a new disposable microtome knife, and cut a ribbon that contains 6 to 10 sections of Graftskin. Pick up the ribbon with forceps, and stretch it across the tissue-flotation water bath. Separate 2 to 3 adjacent sections from the ribbon on the water bath.

[^50]The selected sections should not be compressed, wrinkled, or scratched. Pick up the selected sections by dipping a microscope slide into the water bath under the floating sections, and gently lift the slide out of the water. Allow the mounted sections to air-dry completely, or dry the slide in a $60^{\circ}$ oven for 1 hour. The microscope slide with affixed tissue is sequentially immersed in 3 changes of a suitable histological, aliphatic xylene substitute ${ }^{6}$, 5 minutes per step, followed by two changes of dehydrated alcohol, 3 minutes per step. Sequentially immerse the slide in alcohol (for 3 minutes), running water rinse ( 3 minutes), Hematoxylin staining solution ( 6 minutes), running water rinse ( 7 min utes), $0.3 \%$ Acid alcohol ( 6 seconds), running water rinse ( 5 minutes), Bluing agent ( 1 second), running water rinse ( 5 minutes), Eosin solution ( 2 minutes), 2 changes of alcohol ( 3 minutes each step), 4 changes of dehydrated alcohol ( 3 minutes each step), and 4 changes of a suitable histological xylene substitute ( 3 minutes each step). Adjust the above immersion times as needed to suitably stain the tissue. Remove the slide from the last histological xylene substitute wash, and blot dry the back of the slide. Do not allow the tissue to dry. Affix a coverslip over the tissue, using a suitable coverslip mountant.
MICROSCOPIC SPECIFICATIONS-A light microscope with $4 \times, 10 \times, 20 \times$, and $40 \times$ objectives installed in a revolving nosepiece; a $10 \times$ widefield ocular with 19 to 10 mm per 100 microdisk reticle installed; and a $10 \times$ widefield ocular with grid reticle installed.

MICROSCOPIC AND MORPHOLOGICAL CHARACTERISTICSScore the 3 Graftskin sections for epidermal and dermal aspects using the light microscope. Slides from each of the sections taken should be evaluated. The aspect values for each section should be averaged $(n=3)$ to determine the

[^51]overall aspect score for the Graftskin unit. When examined microscopically, Graftskin shows a bilayered construct resembling the epidermal and dermal layers of human skin. Graftskin meets the following requirements for epidermat and dermal aspects of the deviee, using USP Graftskin Photomierographs RS of passing and failing articles for eomparisen. Using USP Graftskin Reference Photomicrographs of passing and failing articles for comparison, Graftskin meets the requirements for epidermal aspects, including epidermal coverage, epidermal development, and keratinocyte aspect, and meets the requirements for dermal aspects, including dermal matrix thickness, fibroblast density, and matrix aspect, as described below.

Epidermal aspects (see USP Graftskin Reference Photomicrograph 1 for an example of a passing unit)-

Epidermal coverage-Ninety-five percent or more of the dermal matrix present on the slide is covered with epidermal keratinocytes.

Epidermal development-Seventy percent or more of the Graftskin epithelium is composed of 3 distinct cell layers (see USP Graftskin Reference Photomicrograph 2 for an example of a failing unit). The basal cell layer of the epithelium is at least 1-cell thick, consisting of keratinocytes with a cuboidal-columnar shape (see USP Graftskin Reference Photomicrograph 3 for an example of a failing unit). The suprabasal layer is composed of stratified cells and is at least 5-cells thick. Suprabasal cells closest to the basal layer are cuboidal in shape; cells become progressively stratified the closer they are to the uppermost, squamous cell layer. The squamous cell layer on the apical surface is cornified and at least 1-cell thick (see USP Graftskin Reference Photomicrograph 4 for an example of a failing unit). The uppermost cell layer of the epithelium is analogous to the stratum corneum
of human skin and is composed of one or more rows of flat, scaly cells that are nonliving and keratinized (see USP Graftskin Reference Photomicrograph 5 for an example of a failing unit).

Keratinocyte aspect-Ninety-five percent or more of the basal keratinocytes have basophilic cytoplasm that have neither distinct vacuoles nor are necrotic (see USP Graftskin Reference Photomicrograph 6 for an example of a failing unit). Eighty percent or more of suprabasal cells (excluding those in the upper $20 \%$ of the cell layer closest to the squamous layer) have basophilic cytoplasm. Furthermore, these basophilic suprabasal cells do not have distinct vacuoles and are neither necrotic nor keratinized (see USP Graftskin Reference Photomicrographs 7 and 8 for examples of failing units).

Dermal Aspects (see USP Graftskin Reference Photomicrograph 1 for an example of a passing unit)-Five randomly selected fields per slide will be evaluated for dermal matrix thickness and fibroblast density. The 5 fields will be averaged to obtain the final value for each section.

Dermal matrix thickness-The Graftskin dermal layer is not less than $40-\mu \mathrm{m}$ thick and is composed of several rows of flat dermal cells.

Fibroblast density-The dermal matrix contains an average of at least 4 nonpyknotic nuclei present per microscopic field (field $=20$ grid squares of reticle when using the $10 \times$ widefield ocular and $40 \times$ objective).

Matrix aspect-At least $95 \%$ of the dermal matrix collagen stain uniformly with no large holes or inclusions present (see USP Graftskin Reference Photomicrographs 9 and 10 for examples of failing units).

## Gene expression profile-

RNA extraction solution-Use an aqueous phenol and guanidine isothiocyanate solution suitable for RNA extraction. ${ }^{7}$

DEPC-treated water-Add 0.2 mL of diethylpyrocarbonate (DEPC) to 100 mL of sterile purified water, shake vigorously, and allow to stand for at least 12 hours. Autoclave the resulting solution for 15 minutes, using the liquid cycle, to inactivate residual DEPC. Prepare fresh as needed.

5X Reaction buffer-Prepare a solution of potassium chloride, magnesium chloride, and tris(hydroxymethyl)aminomethane hydrochloride having concentrations of 375 $\mathrm{mM}, 15 \mathrm{mM}$, and 250 mM , respectively. Adjust to a pH of 8.3.

10X Reaction buffer-Prepare a solution of potassium chloride and tris(hydroxymethyl)aminomethane hydrochloride having concentrations of 500 mM and 100 mM , respectively. Adjust to a pH of 8.3.

Oligo-deoxythymidine solution-Prepare a 20 mM oligodeoxythymidine (primer length: 18) solution using a suitable buffer. ${ }^{8}$
$d N T P$ solution $I$-Using a suitable buffer ${ }^{8}$, prepare a solution of deoxyadenosine triphosphate, deoxyguanosine triphosphate, deoxycytidine triphosphate, and deoxythymidine triphosphate in which the concentration of each component is 10 mM .
$d N T P$ solution II-Prepare a solution, in water, of deoxyadenosine triphosphate, deoxyguanosine triphosphate, deoxycytidine triphosphate, and deoxythymidine triphosphate, in which the concentration of each component is 10 mM .

[^52]Ribonuclease inhibitor solution-Prepare a solution containing 40 units of ribonuclease inhibitor per mL of a suitable buffer. ${ }^{8}$

Reverse transcriptase solution-Prepare a solution containing 200 units of reverse transcriptase per $\mu \mathrm{L}$ of a solution of sodium chloride, edetate disodium, dithiothreitol, nonylphenol polyoxyethylene ether, glycerin, and tris(hydroxymethyl)aminomethane hydrochloride having concentrations of $0.1 \mathrm{M}, 0.1 \mathrm{M}, 1.0 \mathrm{M}, 0.01 \%, 50 \%$, and 200 mM , respectively. Adjust to a pH of 7.5 .

DNA primer pairs-Prepare individual $20 \mu \mathrm{M}$ solutions of the following DNA primer pairs ${ }^{9}$ using deoxyribonu-clease- and ribonuclease-free water.

DNA polymerase solution-Prepare a solution containing 5 units of deoxyribonucleic acid polymerase per mL of a solution of potassium chloride, edetate disodium, dithiothreitol, polyoxyethylene(20) sorbitan monolaurate, nonylphenol polyoxyethylene ether, glycerin, and tris(hydroxymethyl)aminomethane hydrochloride, having concentrations of $100 \mathrm{mM}, 0.1 \mathrm{mM}, 1 \mathrm{mM}, 0.5 \%, 0.5 \%$, $50 \%$, and 20 mM , respectively. Adjust to a pH of 8.0 .

RNA Extraction Procedure-Remove three 2-cm diameter circular sections from every $30 \mathrm{~cm}^{2}$ of Graftskin (not less than $30 \%$ of the total unit area), using the appropriate size biopsy punch. Transfer each piece of tissue to individual polypropylene microcentrifuge tubes. Add 1.0 mL of $R N A$ extraction solution to each tube, homogenize by repetitive pipetting, and incubate the samples for 5 minutes at room temperature. To each tube add 0.2 mL of chloroform, mix on a vortex mixer, and centrifuge at $12,000 \mathrm{~g}$ for 15 minutes at $2^{\circ}$ to $8^{\circ}$. Transfer the upper, aqueous phase to a second tube, add 0.5 mL of isopropanol, and incubate for 30 minutes to overnight at $-20^{\circ}$. Centrifuge at $12,000 \mathrm{~g}$ for 15 minutes, discard the supernatants by aspiration, and add $75 \%$ alcohol to each pellet. Mix the sample on a vortex mixer , centrifuge at $12,000 \mathrm{~g}$ for 2 minutes, and discard the
supernatants by aspiration without disturbing the RNA pellets. Recentrifuge at $12,000 \mathrm{~g}$ for 2 minutes, and remove the remaining supernatants with a small-volume $(20 \mu \mathrm{~L}$ or smaller capacity) micropipette. Air-dry the pellets for $5 \mathrm{~min}-$ utes at room temperature by keeping the microcentrifuge cap off, and resuspend each pellet in $50 \mu \mathrm{~L}$ of DEPC-treated water. Bring absorbance into linear range by diluting $5 \mu \mathrm{~L}$ of each suspension with $195 \mu \mathrm{~L}$ of DEPC-treated water. Transfer the samples to suitable quartz microplates or cuvettes and determine the absorbance of the RNA solution at wavelengths of 260 and 280 nm , using a spectrophotometer and DEPC-treated water as the blank. The ratio of the absorbance at 260 versus 280 nm should be greater than or equal to 1.65 . If this ratio is less than 1.65 , then mix the resuspended pellet by repetitive pipetting, and repeat the dilution step and absorbance measurement. If this fails to raise the absorbance ratio, then repeat the RNA extraction for that sample by adding 1 mL of $R N A$ extraction solution, and proceed as above beginning with "incubate the sample for 5 minutes at room temperature". Determine the concentration of RNA in $\mu \mathrm{g}$ per mL using the following equation:

## $40 A D$,

in which $A$ is the absorbance at 260 nm ; and $D$ is the dilution factor. Adjust the volume of the RNA solutions with additional DEPC-treated water to bring the concentration of RNA to about $80 \mu \mathrm{~g}$ per mL . If the absorbance at 260 nm is less than 0.05 , discard the sample, and repeat the RNA extraction on a fresh sample.

Synthesis of $c D N A-T o$ separate, individual thin-walled polymerase chain reaction (PCR) tubes add $12.5 \mu \mathrm{~L}$ of the RNA solution from samples 1, 2, and 3 (3 reaction tubes total). Add $1 \mu \mathrm{~L}$ of Oligo-deoxythymidine solution to each tube, and incubate at $72^{\circ}$ for 2 minutes to anneal the oligodeoxythymidine to the mRNA. Place the tubes in an ice
bath, and to each tube add $4 \mu \mathrm{~L}$ of $5 X$ Reaction buffer, $1 \mu \mathrm{~L}$ of $d N T P$ solution I, $0.5 \mu \mathrm{~L}$ of Ribonuclease inhibitor solution, and $1 \mu \mathrm{~L}$ of Reverse transcriptase solution. Incubate at $42^{\circ}$ for 1 hour to synthesize cDNA, and then incubate at $94^{\circ}$ for 5 minutes to inactivate the reverse transcriptase. To each tube add $80 \mu \mathrm{~L}$ of DEPC-treated water, and mix.

Polymerase chain reaction amplification of cDNA-For each of the five DNA primer pairs, label five individual centrifuge tubes ( 5 tubes total). Add the following to each centrifuge tube: $D E P C$-treated water, $135.8 \mu \mathrm{~L} ; d N T P$ solution II, $10.5 \mu \mathrm{~L}$; $10 X$ Reaction buffer, $21 \mu \mathrm{~L}$; the appropriate $5^{\prime}$ primer, $3.5 \mu \mathrm{~L}$; the appropriate $3^{\prime}$ primer, $3.5 \mu \mathrm{~L}$; and 25 mM magnesium chloride, $12.6 \mu \mathrm{~L}$. Close, mix on a vortex mixer, and pulse spin in a microcentrifuge. Add $2.1 \mu \mathrm{~L}$ of DNA polymerase solution to each centrifuge tube, and mix by repetitive pipetting. For each primer pair, transfer $27 \mu \mathrm{~L}$ of the resulting solution to five, thin-walled PCR tubes. There should be a total of 25 PCR tubes. Add the following to the PCR tubes of each primer set:

|  | PCR tube number |
| :--- | :--- |
| 1. | $3 \mu \mathrm{~L}$ Graftskin sample 1 cDNA |
| 2. | $3 \mu \mathrm{~L}$ Graftskin sample 2 cDNA |
| 3. | $3 \mu \mathrm{~L}$ Graftskin sample 3 cDNA |
| 4. | $3 \mu \mathrm{~L}$ cDNA positive control ${ }^{10}$ |
| 5. Negative | $3 \mu \mathrm{~L}$ DEPC-treated water |
| $\quad$ control |  |

${ }^{10}$ A suitable cDNA positive control can be obtained from BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303-4230.

Repeat for the remaining primer pairs. The positive control contains authentic cDNA of Transforming growth factor $\beta$, Interleukin- $1 \alpha$, Interleukin-4, Platelet-derived growth factor A, and Glyceraldehyde-3-phosphate dehydrogenase,
as appropriate for each primer set. Pulse spin the PCR tubes in a microcentrifuge to mix, and place the tubes in a single PCR thermal cycler. Cycling conditions are as follows.

| Melting temperature: | 94 degrees |
| :--- | :--- |
| Melting time: | 45 seconds |
| Anneal temperature: | 58 degrees |
| Anneal time: | 45 seconds |
| Elongation temperature: | 72 degrees |
| Elongation time: | 2 minutes |
| Number of cycles: | 30 |
| Final elongation <br> $\quad$ temperature: | 72 degrees |
| Final elongation time: | 2 minutes |

Terminate the PCR amplification by heating each tube to
$72^{\circ}$ for 7 minutes.

## ELECTROPHORESIS IDENTIFICATION-

Tris-boric acid buffer-Prepare a solution containing 89 mmoles of tris(hydroxymethyl) aminomethane, 89 mmoles of boric acid, and 2 mmoles of edetate disodium per L .

6X Loading buffer—Prepare a solution containing $15 \%$ of a branched polymeric sucrose ( 400 kDa ), $0.25 \%$ bromophenol blue, and $0.25 \%$ xylene cyanole FF.

Ethidium bromide solution-Prepare a solution of ethidium bromide in Tris-boric acid buffer having a concentration of 10 mg per mL .

Agarose gel-Prepare a horizontal $2 \%$ agarose ${ }^{11}$ gel in Tris-boric acid buffer. Once the gel is set, remove the comb, and place the gel into the electrophoresis chamber with the comb end of the gel situated closest to the cathode terminal. Fill the electrophoresis chamber with Tris-boric acid buffer until the buffer reaches 3 to 5 mm over the surface of the gel.

[^54]100-bp DNA ladder markers-Prepare a solution containing 10 DNA fragments covering the range of 100 to 1000 base pairs (bp) in 100-bp increments, with a total DNA content of approximately 100 ng per $\mu \mathrm{L}$ ( $15-20 \mathrm{ng}$ of DNA per band) in an appropriate buffer. ${ }^{12}$

Procedure-Dilute the 25 PCR samples prepared in the Polymerase chain reaction amplification of $c D N A$ with $6 X$ Loading buffer such that the final concentration of the buffer is one-sixth of its original concentration. Load $5 \mu \mathrm{~L}$ of the 100-bp DNA ladder markers in the first lane of the agarose gel. Load $10 \mu \mathrm{~L}$ of each PCR sample into each gel well, and attach the cathode to the terminal close to the loaded wells. Attach the anode to the terminal farthest from the loaded wells, and apply 120 V to the gel. Run the gel until the bromophenol blue is about two-thirds the length of the gel. Remove the gel from the electrophoresis apparatus, and place it in a tray containing enough Ethidium bromide solution to cover the gel. Slowly agitate the gel on a shaker table for 30 minutes. Completely remove the Ethidium bromide solution from the tray, add an equal amount of Tris-boric acid buffer, and slowly agitate the gel on a shaker table for 60 minutes. Place the gel on a 312 -nm UV light source, photograph the gel, and imspeet the image for bands. The analysis is censidered valid if the pesitive contrels show the apprepriately sized eDNA PCR products, and no-PCR produet bands appear in the negative controls. inspect the image for bands that have migrated from each individual well. If a band appears, it is verified for size in base pairs by comparing it to the lane for the $100-\mathrm{bp}$ DNA ladder marker. If a band appears and it is of the appropriate size, it is considered positive. The analysis is considered valid if the positive controls show the appropriately sized cDNA-PCR products, no PCR product bands appear in the negative controls, and all

[^55]bands are observed to be visually discrete. The lanes of the agarose gel that correspond to Graftskin show cDNA bands for Interleukin- $1 \alpha$ (expected PCR product band size of 491 base pairs, limit of detection not less than $9.6 \times 10^{-21}$ moles); Platelet-derived growth factor (expected PCR product band size of 304 base pairs, limit of detection not less than $1.5 \times 10^{-20}$ moles); Transforming growth factor- $\beta 1$ (expected PCR product band size of 161 base pairs, limit of detection not less than $1.5 \times 10^{-20}$ ) moles; and Glyceraldehyde-3-phosphate dehydrogenase (expected PCR product band size of 983 base pairs); but not Interleu-kin-4 (expected PCR product band size of 344 base pairs, limit of detection not less than $1.5 \times 10^{-22}$ moles). If one of the replicates tested yields results discordant with the other two replicates, repeat the assay, and accept only if all 3 replicates are concordant.

## Barrier integrity assessment-

Ham's F-12 tissue culture medium-Prepare a solution that contains the following:

| Component | mg per mL |
| :--- | :---: |
| L-Alanine | 8.91 |
| L-Arginine hydrochloride | 210.7 |
| L-Asparagine monohydrate | 15.01 |

| Thymidine | 0.337 |
|  | 0.727 |

| Component | mg per mL |
| :--- | :---: |
| Putrescine dihydrochloride | 0.161 |
| Sodium bicarbonate | 1176.0 |

Tritiated water: $2.0 \mu \mathrm{Ci} / \mathrm{mL}$ (see Radioactivity $\langle 821\rangle$ ).
Percutaneous absorption apparatus-Prepare the apparatus as described below. ${ }^{13}$

Six-well cell culture plate-The dimensions are inner diameter, about 35 mm ; depth, about 18 mm .

Cell culture well insert-Each well is a plastic cylinder with inner length, about 15 mm ; inner diameter, about 24 mm ; outer diameter, about 27 mm , with a flanged end extending about 4 mm from the outer diameter. The inner diameter opposite the flanged end is covered by a taut polycarbonate membrane having a porosity of $3 \mu \mathrm{~m}$. The flange should allow the Cell culture well insert to be suspended in the well of a Six-well cell culture plate, leaving a $3-\mathrm{mm}$ space between the bottom of the Cell culture well insert and the inner bottom surface of the Six-well cell culture plate.
Percutaneous absorption insert-Use a polytetrafluoroethylene cylinder having the following dimensions: length, about 20 mm ; inner diameter, about 20 mm ; outer diameter, about 23 mm with a flanged end extending about 3 mm from the outer diameter. Ten mm from the flanged end of the cylinder, the inner diameter begins to funnel such that the inner diameter at about 10 mm from the flanged end is about 20 mm , and the inner diameter at about 15 mm from the flanged end is about 8 mm . From about 15 mm to about 20 mm from the flanged end, the inner diameter remains at 8 mm . The

[^56]outer diameter of the cylinder remains constant at about 23 mm . The flanged end is considered to be the top of the component.

Silicon grease-Use high-vacuum silicon grease suitable for glass. ${ }^{14}$
Procedure-Fill each well of the Six-well cell culture plate with 1.5 mL of Ham's F-12 tissue culture medium. Remove two $2-\mathrm{cm}$ circular sections from every $30 \mathrm{~cm}^{2}$ of Graftskin (not less than $20 \%$ of the total unit area), using the appropriate size biopsy punch. Transfer each excised section to a separate Cell culture well insert, dermal side down on the polycarbonate membrane. Using forceps, gently smooth out the section to remove any wrinkles. Apply a narrow ring of Silicon grease to the underside of the Percutaneous absorption insert, and place the insert into the Cell culture well insert, grease side down, onto the epidermal surface of the Graftskin biopsy, with slight pressure to form a tight seal. Do not allow any grease to enter the $8-\mathrm{mm}$ diameter exposed area of the Graftskin surface. Place the Cell culture well insert containing the Percutaneous absorption insert into one of the wells of the Six-well cell culture plate containing 1.5 mL of Ham's F-12 tissue culture medium. Apply 1.0 mL of Tritiated water to the exposed surface of the Graftskin unit in the Percutaneous absorption insert, and incubate at ambient temperature for 6 hours. At the end of each hour, transfer the Cell culture well insert containing the Percutaneous absorption insert to a new well within the Six-well cell culture plate containing 1.5 mL of fresh Ham's F-12 tissue culture medium. After the 6-hour incubation, remove the Cell culture well insert. Remove a $0.5-\mathrm{mL}$ aliquot of Ham's F-12 tissue culture medium from each well of the Six-well cell culture plate, and transfer into individual scintillation vials. Dispense 0.5 mL of Tritiated

[^57]water to a separate scintillation vial as a control, to each scintillation vial add 4.5 mL of a suitable scintillation cocktail ${ }^{15}$, and gently mix. Place the scintillation vials into a liquid scintillation counter, and count the emissions in the tritium spectrum for 60 seconds. Average the counts for each of the six time points (punch average) and duplicate sections (unit average). Determine the percent penetration per hour by the formula:
$$
150\left(C_{S} / C_{C}\right)
$$
in which $C_{S}$ are the counts per minute of the $0.5-\mathrm{mL}$ aliquot of the Ham's F-12 tissue culture medium taken at the end of the incubation period; and $C_{C}$ are the counts per minute in the $0.5-\mathrm{mL}$ aliquot of Tritiated water. Not more than $1.97 \%$ penetration is found.

## Metabolic activity assessment-

Dulbecco's modified Eagle's tissue culture medium -Prepare a solution that contains the following components.

| Component | mg per L |
| :--- | :---: |
| Calcium chloride | 264.9 |
| Ferric nitrate, nonahydrate | 0.10 |
| Potassium chloride | 400.0 |
| Magnesium sulfate, heptahydrate | 200.0 |
| Sodium chloride | $6,400.0$ |
| Sodium bicarbonate | $3,700.0$ |
| Sodium phosphate, monobasic |  |
| $\quad$ (monohydrate) | 125.0 |
| Dextrose | $4,500.0$ |
| Phenol red | 15.0 |
| Sodium pyruvate | 110.0 |
| L-Arginine hydrochloride | 84.0 |
| L-Cystine | 48.0 |
| Aminoacetic acid | 30.0 |

${ }^{15}$ A suitable scintillation cocktail is Optiphase ${ }^{\circledR}$, Supermix ${ }^{\circledR}$, Perkin-Elmer Life Sciences, Inc., 549 Albany St., Boston, MA 02118.

| Component | mg per L |
| :--- | :---: |
| L-Histidine hydrochloride monohydrate | 42.0 |
| L-Isoleucine | 104.8 |
| L-Leucine | 104.8 |
| L-Lysine hydrochloride | 146.2 |
| L-Methionine | 30.0 |
| L-Phenylalanine | 66.0 |
| L-Serine | 42.0 |
| L-Threonine | 95.2 |
| L-Tryptophan | 16.0 |
| L-Tyrosine | 72.0 |

MTT solution-Dissolve 0.33 g of (3-(4,5-dimethylthia-zol-2yl)-2,5-diphenyl tetrazolium bromide in 1 L of Dulbecco's modified Eagle's tissue culture medium, with constant stirring. Pass the solution through a suitable size filter having a $0.2-\mu \mathrm{m}$ porosity.
0.04 N Acidified isopropyl alcohol-Add 3.45 mL of hydrochloric acid to 1 L of isopropyl alcohol, and mix thoroughly. Store at room temperature no longer than 6 months.

Procedure-Immerse the Graftskin in separate, $40.0-\mathrm{mL}$ portions of MTT solution, making sure that about 20 mL of MTT solution is under the test article, and 20 mL of MTT solution is on the surface. Take care not to produce any bubbles. Incubate for 3 hours at $37^{\circ}$, in an environment of air enriched with $10 \%$ carbon dioxide. After incubation, remove from the $37^{\circ}, 10 \%$ carbon dioxide-enriched air environment. Transfer the Graftskin to a suitable cutting surface, and, using an appropriate biopsy punch, remove three 8 -mm diameter circular sections from every $30 \mathrm{~cm}^{2}$ of Graftskin ( $5 \%$ of unit area). Transfer each punch to individual snap-top test tubes. Add 0.9 mL of 0.04 N Acidified isopropyl alcohol to each tube, making sure that the tissue is completely submerged. If not submerged, use forceps to place the sample into the 0.04 N Acidified isopropyl alcohol. Cap each tube tightly, place on an orbital shaker, and shake for 1 hour at a moderate setting. After 1 hour, remove the tubes from the orbital shaker, and mix each tube on a vortex mixer. Inspect the tubes to make sure that the tissue samples continue to be submerged. If not, use forceps or other device to resubmerge the tissues. Return the tubes to the orbital shaker, and continue to shake for an additional 1 hour. Remove the tubes from the orbital shaker, mix the tubes on a vortex mixer, and transfer a $0.2-\mathrm{mL}$ aliquot to a suitable 96 well flat bottom plate. Read the absorbance of each sample at 570 nm , using 0.2 mL of 0.04 N Acidified isopropyl alcohol as the blank. The average absorbance value is $\geq 0.237$. $\Delta U S P 28$

## Briefing

Helium, USP 27 page 903 and page 1121 of $P F$ 28(4) [JulyAug. 2002]. It is proposed to add a new USP Reference Standard and to revise the Assay to incorporate the new standard.
(AER: K. Zaidi) RTS-40629-4

## Add the following:

${ }^{\mathbf{4}}$ USP Reference standards $\langle 11\rangle —$ USP Air-Helium $R S_{.}{ }_{\text {USSP28 }}$

## Change to read:

Assay-Introduce a specimen of Helium into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70\% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of nitrogen and oxygen from Helium, although the nitrogen and oxygen may not be separated from each other. Use industrial grade helium (99.99\%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an air helium certified standard (see under Reagents in the sec tion Reagents, Indicators, and Solutions),
${ }^{\boldsymbol{4}}$ USP Air-Helium RS,
and indicates not more than $1.0 \%$ of air when compared to the peak response of the air helimmertified standare,
${ }^{\boldsymbol{\Delta}}$ USP Air-Helium RS,,$_{\text {aSP28 }}$
and not less than $99.0 \%$, by volume, of He.

## BRIEFING

Homatropine Hydrobomide, USP 27 page 911. It is proposed to replace the test for Melting range with a more specific test for Chromatographic purity. The Melting range information is being placed under Description and Solubility in the Reference Tables. The stability-indicating liquid chromatographic procedure in the test for Chromatographic purity is based on analyses performed with the GL Sciences Inertsil ODS-3 brand of L1 column. The typical retention time for homatropine is about 6.8 minutes. The thinlayer chromatographic procedure in the test for Limit of tropine is intended to quantify the tropine impurity not detected by the HPLC procedure and is based on analyses performed with the high performance silica gel $60 \mathrm{~F}_{254}$ plates. The $R_{F}$ values for homatropine and tropine are about 0.47 and 0.21 , respectively. It is also proposed to replace the titration procedure in the Assay with a more selective liquid chromatographic procedure, and to change the acceptance criteria in the Definition from "not less than 98.5 percent
and not more than 100.5 percent" to "not less than 98.0 percent and not more than 102.0 percent," which are typical for chromatographic procedures.
(PA4: E. Gonikberg) RTS-37240-1

## Change to read:

») Homatropine Hydrobromide contains net less than 98.5 pereent and not mere than 100.5 pereent

${ }^{4}$ Melting range $\langle 744\rangle \div$ been $214^{\circ}$ and $217^{\circ}$, with slight deem perition._USP28

## Add the following:

## ${ }^{\Delta}$ Limit of tropine-

Adsorbent: $0.2-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Diluent-Prepare a mixture of methanol and water (9:1).
Test solution-Transfer about 0.2 g of Homatropine Hydrobromide to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.
Standard solution-Dilute 0.5 mL of the Test solution
with Diluent to 100.0 mL .
Tropine reference solution-Prepare a solution of tropine having a concentration of about 0.4 mg per mL .
Application volume: $1 \mu \mathrm{~L}$.
Developing solvent system: a mixture of ethyl acetate, anhydrous formic acid, and water (67:16.5:16.5).

Procedure—Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$, applying the Test solution, the Standard solution, and the Tropine reference solution. Spray the plate with Dragendorff's reagent, followed by hydrogen peroxide TS, and immediately cover
with a glass plate of the same size. Examine the plate no later than 5 to 10 minutes after spraying. In the chromatogram obtained from the Test solution, identify the spot corresponding to the principal spot in the chromatogram of the Tropine reference solution: this spot is not more intense than the spot obtained from the Standard solution: not more than $0.5 \%$ of tropine is found. $\triangle$ USP28

## Add the following:

${ }^{\Delta}$ Chromatographic purity-
Buffer solution, Mobile phase, System suitability solution, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Procedure-Separately inject a volume (about $7 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Continue the elution for 2.2 times the retention time of the homatropine peak. Disregard the peak for the bromide ion, which appears close to the solvent peak. Calculate the percentage of each impurity in the portion of Homatropine Hydrobromide taken by the formula:

$$
100\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ and $r_{s}$ are the peak response for each impurity and the sum of all peak responses, respectively, obtained from the Test solution. In addition to not exceeding the lim-
its for each impurity in Table 1, not more than $0.1 \%$ of any other individual impurity is found; and not more than $1.0 \%$ of total impurities is found.

Table 1.

|  | Relative <br> Retention | Limit |
| :--- | :---: | :---: |
| Impurity | Time | $(\%)$ |
| Mandelic acid | 0.3 | 0.1 |
| Dihydrohomatropine | 0.9 | 0.5 |
| Scopolamine | 1.1 | 0.1 |
| Atropine | 1.9 | 0.1 |

## Change to read:

Assay-Dissolve about 400 mg of Hematropine Hydrebromide, aceurately weighed, im water to make 50.0 mL , and mix. Transfer 10.0 mL of this solution to a beaker, add 5 mL of 1 N sodium hy droxide, and heat the solution just to beiling. Add 10 mL of 1 N nitrie acid, add water to make 50 mL , and cool im an iee bath. Con emitantly add 5 mL of 1 N nitrie acid to seend 10.0 mL pertion of the solution of Hematropine Hydrobremide, add water to make 50 mL , and cool in an ice bath. Add 1 drop of nitrophenanthroline TS to each solution, and, while keeping the solutions cold, titrate with 0.05 N -eric ammonium nitrate $V S$ until the pink color is dis eharged. Each mL of the difference in volumes of 0.05 N ceric am monium nitrate required is equivalent to 8.907 mg of $\mathrm{G}_{16} \mathrm{H}_{24} \mathrm{NO}_{3}-\mathrm{HBr}$.
${ }^{\boldsymbol{4}}$ Buffer solution-Dissolve 6.8 g of monobasic potassium phosphate and 7.0 g of sodium 1-heptanesulfonate monohydrate in 1000 mL of water, adjust with 3 M phosphoric acid to a pH of 2.7 , and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and methanol (67:33).

Standard preparation-Dissolve an accurately weighed quantity of USP Homatropine Hydrobromide RS in Mobile phase to obtain a solution having a concentration of about 2 mg per mL .
System suitability solution-Prepare a solution of USP Scopolamine Hydrobromide RS having a concentration of about 0.1 mg per mL . Transfer 10 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add 0.5 mL of the Standard preparation, and dilute with Mobile phase to volume.

Test preparation-Transfer about 100 mg of Homatropine Hydrobromide, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.0 \%$. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution between homatropine and scopolamine peaks is not less than 1.5 .

Procedure-Separately inject equal volumes (about $7 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{3} \cdot \mathrm{HBr}$ in the portion of Homatropine Hydrobromide taken by the formula:

$$
50 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Homatropine Hydrobromide RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta S P 2 8}$

## » Hydrocortisone Acetate Topical Emulsion is

 Hydrocortisone Acetate in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{O}_{6}$.Packaging and storage-Preserve in tight containers.
USP Reference standards $\langle 11\rangle$-USP Hydrocortisone Acetate RS.

Identification-It responds to the Identification test under Hydrocortisone Acetate Ointment.

Minimum fill $\langle 755\rangle$ : meets the requirements.
Assay-
Mobile phase-Prepare a filtered and degassed solution containing butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Hydrocortisone Acetate RS in water-saturated chloroform to obtain a solution having a known concentration of about 0.10 mg per mL .

Assay preparation-Transfer an accurately weighed quantity of Topical Emulsion, equivalent to about 2.5 mg of hydrocortisone acetate, to a closable container. Add 25.0 mL of water-saturated chloroform and about 10 glass
beads. Securely close the container, and shake vigorously for approximately 15 minutes. Centrifuge, and use the clear, lower chloroform layer.

Procedure-Introduce equal volumes of the Assay preparation and the Standard preparation into a high-pressure liquid chromatograph fitted with a $254-\mathrm{nm}$ detector. Typically the apparatus is fitted with a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column containing packing L3 and operated at room temperature. Six replicate injections of the Standard preparation show a relative standard deviation of not more than $2.0 \%$. Calculate the quantity, in mg , of $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{O}_{6}$ in the portion of Topical Emulsion taken by the formula:

$$
25 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Hydrocortisone Acetate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the hydrocortisone acetate peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\triangle$ USP28

## Add the following:

## ©Hydrocortisone Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Hydrocortisone Lotion)
» Hydrocortisone Topical Emulsion is Hydrocortisone in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{O}_{5}$.

Packaging and storage-Preserve in tight containers.
USP Reference standards $\langle 11\rangle$-USP Hydrocortisone RS. Identification-Transfer a quantity of Topical Emulsion, equivalent to about 5 mg of hydrocortisone, to a separator containing 10 mL of methylene chloride, shake for 1 min ute, and allow the layers to separate. Filter the methylene chloride extract onto a suitable chromatographic column that has been packed with 2 g of activated magnesium silicate. Wash the column with 25 mL of methylene chloride with the aid of slight air pressure, discarding the washings, and elute the hydrocortisone with 10 mL of methanol. Using USP Hydrocortisone RS to prepare a Standard solution having a concentration of $500 \mu \mathrm{~g}$ per mL , and using as the solvent system a mixture of 180 volumes of chloroform, 15 volumes of methanol, and 1 volume of water, proceed as directed under Thin-layer Chromatographic Identification Test $\langle 201\rangle$.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.

Minimum fill $\langle 755\rangle$ : meets the requirements.

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of water, acetonitrile, and methanol (58:21:21). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Hydrocortisone RS in alcohol and dilute quantitatively, and stepwise if necessary, with alcohol to obtain a solution having a known concentration of about 0.1 mg per mL . Quantitatively dilute a known volume of the final solution with an equal volume of water to obtain the Standard preparation.

System suitability preparation-Dissolve about 5 mg of propylparaben in 100 mL of alcohol. Dilute 1 mL of this solution with the Standard preparation to 10 mL , and mix.
Assay preparation-In a tared, $100-\mathrm{mL}$ volumetric flask, weigh 100 mL of Topical Emulsion that previously has been shaken to ensure homogeneity, allow to stand until the entrapped air rises, and finally invert carefully just prior to transfer to the volumetric flask. Transfer an accurately weighed quantity of Topical Emulsion, freshly mixed but free from air bubbles, equivalent to about 10 mg of hydrocortisone, to a $40-\mathrm{mL}$ beaker, and add about 30 mL of alcohol. Warm gently until the Topical Emulsion is dispersed, and cool to room temperature. Quantitatively transfer the mixture, filter through a pledget of cotton previously moistened with alcohol to a $100-\mathrm{mL}$ volumetric flask, rinse the beaker with two $20-\mathrm{mL}$ portions of alcohol, and collect the washings in the same volumetric flask. Dilute with alcohol
to volume, and mix. Quantitatively dilute a known volume of this solution with an equal volume of water to obtain the Assay preparation.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation and the System suitability preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between the propylparaben and hydrocortisone peaks is not less than 2.0; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the analyte peak is not more than 1.2; and the relative standard deviation for replicate injections of the Standard preparation is not more than $3.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{O}_{5}$ in the portion of Topical Emulsion taken by the formula:

$$
200 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Hydrocortisone RS in the Standard preparation; and $r_{U}$ and the $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. From the observed weight of 100 mL of the Topical Emulsion, calculate the quantity of $\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{O}_{5}$ in each 100 mL . $\mathbf{\Delta S P 2 8}$
(Official July 1, 2007)

## Briefing

Hydroxyzine Hydrochloride Tablets, USP 27 page 945 and page 1903 of $P F 29(6)$ [Nov.-Dec. 2003]. It is proposed to reverse the order of the Dissolution tests: Test 1 will become Test 2, and Test 2 will become Test 1 . This modification is being proposed because the product that generated Dissolution Test 1 is discontinued in the U.S. market. Therefore, it is intended to eliminate the need for modifying the labeling for all generic products.
(BPC: M. Marques) RTS-40874-1

## Add the following:

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{21} \mathrm{H}_{27} \mathrm{ClN}_{2} \mathrm{O}_{2} \cdot 2 \mathrm{HCl}$ is dissolved in 45 minutes. $\triangle$ USP28

## BRIEFING

Indinavir Sulfate Capsules. This proposed new monograph replaces the one previously published in Pharmacopeial Previews (see page 1641 of PF 26(6) [Nov.-Dec. 2000]). On the basis of comments received, the specifications in the Definition and in the sections on Packaging and storage and Dissolution have been revised to reflect those in the NDA submission. Also, it is proposed
to employ an IR method in the test for Identification. The test for Chromatography purity and the Assay have also been revised for further clarification.
(PA7b: B. Davani) RTS-40598-1

## Add the following:

## ©Indinavir Sulfate Capsules

» Indinavir Sulfate Capsules contain an amount of Indinavir Sulfate equivalent to not less than 93.0 percent and not more than 105.0 percent of the labeled amount of $\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4}$.

Packaging and storage-Preserve in tight containers at $15^{\circ}$ to $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Indinavir $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$-The spectrum exhibits maxima at about $3.0-3.1,5.9,6.2$, and $13.6 \mu \mathrm{~m}$.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
pH 3.8 Citrate buffer-Transfer 21.0 g of citric acid to a $1000-\mathrm{mL}$ volumetric flask, and dissolve in about 980 mL of water. Adjust with $50 \%$ sodium hydroxide solution to a pH of $3.8 \pm 0.1$, and dilute with water to volume.

Medium: pH 3.8 Citrate buffer; 900 mL .
Apparatus 2: 50 rpm .
Time: 20 minutes.
Procedure-Determine the amount of indinavir $\left(\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4}\right)$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 260 nm on filtered portions of the solution under test, suitably di-
luted with Dissolution Medium, in comparison with a Standard solution having a known concentration of USP Indinavir RS in the same Medium.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4}$ is dissolved in 20 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements for Weight Variation.

## Chromatographic purity-

Mobile phase and Resolution solution-Proceed as directed in the Assay.
Standard solution-Prepare as directed for Standard preparation in the Assay.

Dilute standard solution-Dilute an accurately measured volume of the Standard solution with Mobile phase to obtain a solution having a known concentration of about 0.3 $\mu \mathrm{g}$ per mL .

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay. Chromatograph the Dilute standard solution, and record the peak responses as directed for Procedure: the signal-to-noise ratio of the major peak is not less than 10 .

Procedure-Inject a volume (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$
100 F\left(C_{S} / C_{J}\right)\left(r_{i} / r_{S}\right)
$$

in which $F$ is a response factor, and is equal to 0.93 for a peak, if present, at a retention time of 1.6 relative to indinavir, and equal to 1 for all other peaks; $C_{S}$ is the concentration, in mg per mL , of USP Indinavir RS in the Standard solution; $C_{I}$ is the concentration, in mg per mL , of indinavir in the Test solution; $r_{i}$ is the peak area for each impurity obtained from the Test solution; and $r_{S}$ is the peak area for
indinavir obtained from the Standard solution: not more than $1.5 \%$ of any individual impurity with a relative retention time of about 1.6 with respect to indinavir is found, not more than $0.1 \%$ of any other individual impurity is found, and not more than $2.5 \%$ of total impurities is found.

## Assay-

Citrate buffer-Transfer about 3.7 g of sodium citrate dihydrate and 1.6 g of citric acid to a $1000-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with water to volume. If necessary, adjust the resulting solution with 1 N sodium hydroxide or with phosphoric acid to a pH of $5.0 \pm 0.1$.

Mobile phase—Prepare a filtered and degassed mixture of Citrate buffer and acetonitrile (6:4).

Resolution solution-Transfer about 6 mg of USP Indinavir RS to a $20-\mathrm{mL}$ volumetric flask, and add 1 drop of 2 N hydrochloric acid to dissolve. Allow the solution to stand at room temperature for 1 hour, and then dilute with Mobile phase to volume.
Standard preparation-Dissolve an accurately weighed quantity of USP Indinavir RS in Mobile phase to obtain a solution having a concentration of about 0.3 mg per mL .
Assay preparation-Transfer not fewer than 10 Capsules, accurately counted, to a suitable volumetric flask. [NOTEThe target concentration is about 2 mg per mL .] Add a sufficient quantity of Mobile phase, and sonicate for 10 min utes with occasional shaking or until the capsule contents and shell are dispersed into small particles. Mix on a magnetic stirrer for 30 minutes or until dissolved. Cool the solution to room temperature, dilute with Mobile phase to volume, and mix. Quantitatively dilute a portion of this solution with Mobile phase to obtain a solution having a concentration of about 0.3 mg of indinavir per mL , and centrifuge.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $260-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak response as directed for Procedure: the capacity factor, $k^{\prime}$, for the major peak is not less than 2.0 ; the tailing factor is less than 1.4 ; and the relative standard deviation for 5 replicate injections is not more than $1.0 \%$. Chromatograph the Resolution solution, and record the peak response as directed for Procedure: the resolution, $R$, between the major peak and the peak at a relative retention time of about 1.6 is not less than 2 .

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of indinavir $\left(\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4}\right)$ in the portion of Capsules taken by the formula:

$$
D C\left(r_{U} / r_{S}\right)
$$

in which $D$ is the dilution factor for the Assay preparation; $C$ is the concentration, in mg per mL , of USP Indinavir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta}$ USP28

## Briefing

Isoproterenol Hydrochloride Injection, USP 27 page 1040. It is proposed to add storage conditions to the Packaging and storage section, in accordance with the current policies of the USP Packaging, Storage, and Distribution (PSD) Expert Committee.
(PA1: K. Russo; PSD: C. Okeke) RTS-40853-1

## Change to read:

Packaging and storage-Preserve in single-dose containers, preferably of Type I glass, protected from light.
${ }^{\boldsymbol{4}}$ Store at controlled room temperature. $\Delta$ USP28

## BRIEFING

Isradipine Capsules, page 1037 of $P F$ 29(4) [July-Aug. 2003]. It is proposed to add a Dissolution test to this monograph. Also the limit of total impurities in the Chrmatographic purity test is corrected.
(PA5: A. Wilk; BPC: M. Marques)
RTS-40548-1 ; 40820-1

## Add the following:

## ©Isradipine Capsules

» Isradipine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isradipine $\left(\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{5}\right)$.

Packaging and storage-Store in a tight container at controlled room temperature. Protect from light.

USP Reference standards $\langle 11\rangle$ —USP Isradipine RS. USP Isradipine Related Compound A RS.

## Identification-

A: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Medium: methanol.

Solution-Transfer the contents of 1 Capsule into a suitable volumetric flask, dissolve the contents in the Medium by mechanical shaking for 15 minutes, and dilute with Me dium to obtain a solution containing $25 \mu \mathrm{~g}$ of isradipine per mL .

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: $0.1 \%$ aqueous solution of lauryl dimethyl amine oxide (prepared by transfering 500 mL of deaerated water into the dissolution vessel, adding 1.65 mL of $30 \%$ lauryl dimethyl amine oxide, and mixing); 500 mL .

Apparatus 2: 50 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{5}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 328 nm on filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Isradipine RS in the same $M e$ dium.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{5}$ is dissolved in 45 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements. NOTE-Isradipine is light sensitive. Throughout the following procedures, protect test or assay specimens, the Reference Standards, and solutions containing them from unnecessary exposure to light. Use low-actinic glassware, unless otherwise directed.

## Chromatographic purity-

Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the test for Chromatographic purity under Isradipine.

Standard solution-Dissolve an accurately weighed quantity of USP Isradipine RS in Mobile phase, with the aid of sonication if necessary, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL . [NOTE-If necessary, use 1 mL of methanol per 20 mL of Mobile phase to dissolve the Reference Standard prior to diluting with Mobile phase.]

Test solution-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for all the peaks: the sum of all peak responses, other than that of isradipine, from the Test solution is not more than three four times the isradipine response obtained from the Standard solution (1.5\%); (2.0\%); and no single peak response is greater than that of the isradipine peak response obtained from the Standard solution ( $0.5 \%$ ).

## Assay-

Mobile phase, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Isradipine.

Assay preparation-Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix the combined contents. Transfer an accurately weighed quantity, equivalent to about 25 mg of isradipine, to a $100-\mathrm{mL}$ volumetric flask. Add 5.0 mL of methanol and 5.0 mL of Mobile phase, and sonicate at room temperature for 15 min utes. Shake for 15 minutes in a mechanical shaker. Dilute with Mobile phase to volume, mix, and filter, discarding the first 5 mL of the filtrate.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the responses for the major peaks. Calculate the quantity, in mg , of isradipine $\left(\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{5}\right)$ in the portion of Capsules taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Isradipine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the isradipine peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\Delta$ USP28

## Briefing

Lindane Lotion, USP 27 page 1094 and page 635 of PF 29(3) [May-June 2003]. It is proposed to change the title of this mongraph to Lindane Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40788-1

## Lindane Lotion

(Current title-not to change until July 1, 2007) Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):

(NL: C. Barnstein) RTS-40788-1

## Add the following:

## ©Lindane Topical Emulsion

## (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is Lindane Lotion)

» Lindane Topical Emulsion is Lindane in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the gamma isomer of lindane $\left(\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{Cl}_{6}\right)$.

Packaging and storage-Preserve in tight containers.
USP Reference standards $\langle 11\rangle$ —USP Lindane RS.
Identification-It responds to the Identification test under
Lindane Cream.
$\mathbf{p H}\langle 791\rangle$ : between 6.5 and 8.5.
Assay-Proceed as directed in the Assay under Lindane Cream, substituting "Topical Emulsion" for "Cream" throughout. $\triangle$ USP28
(Official July 1, 2007)

Briefing
Malathion Lotion, USP 27 page 1131. It is proposed to change the title of this monograph to Malathion Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40789-1

## Malathion Lotion

(Current title-not to change until July 1, 2007) Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Malathion Topical Emulsion

## BRIEFING

Malathion Topical Emulsion-See briefing under Amphoteri$\operatorname{cin} B$ Lotion.
(NL: C. Barnstein) RTS-40789-1

## Add the following:

## ©Malathion Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Malathion Lotion)
» Malathion Topical Emulsion is Malathion in a suitable isopropyl alcohol vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{10} \mathrm{H}_{19} \mathrm{O}_{6} \mathrm{PS}_{2}$.

Packaging and storage-Preserve in tight, glass containers.

Labeling-The labeling states the percentage ( $\mathrm{v} / \mathrm{v}$ ) of isopropyl alcohol in the Topical Emulsion.

USP Reference standards $\langle 11\rangle$ —USP Malathion $R S$.
Identification-The chromatogram of the Assay preparation obtained as directed in the Assay exhibits a major peak for malathion, the retention time of which corresponds to that exhibited in the chromatogram of the Standard preparation, both relative to the internal standard, obtained as directed in the Assay.

## Isopropyl alcohol content-

Internal standard solution-Mix 4 volumes of ethyl acetate and 1 volume of dehydrated alcohol.

Standard preparation-Transfer 2.0 mL of isopropyl alcohol and 5.0 mL of Internal standard solution to a 200mL volumetric flask, dilute with ethyl acetate to volume, and mix.

Test preparation-Transfer an accurately measured volume of Malathion Topical Emulsion, equivalent to about 2.0 mL of isopropyl alcohol, to a $200-\mathrm{mL}$ volumetric flask. Add 5.0 mL of Internal standard solution, dilute with ethyl acetate to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and contains a $2-\mathrm{mm} \times 1.8-\mathrm{m}$ glass column packed with 110- to 120 -mesh support S 2 . Maintain the temperature of the column, the injector port, and the detector block at $130^{\circ}, 200^{\circ}$, and $220^{\circ}$, respectively. Use dry nitrogen as the carrier gas at a flow rate of about 7 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation of the ratio of the isopropyl alcohol peak response to the internal standard peak response for replicate injections is not more than $2.0 \%$.

Procedure-[NOTE-Use peak areas where peak responses are indicated.] Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Test preparation into the gas chromatograph, record the chromato-
grams, and measure the responses for the major peaks. Calculate the percentage of isopropyl alcohol $\left(\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}\right)$ in the Topical Emulsion by the formula:

$$
(200 / V)\left(R_{U} / R_{S}\right)
$$

in which $V$ is the volume, in mL , of Topical Emulsion taken; and $R_{U}$ and $R_{S}$ are the ratios of the peak responses of isopropyl alcohol to internal standard obtained from the Test preparation and the Standard preparation, respectively: between $90 \%$ and $110 \%$ of the labeled amount of $\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}$ is found.

## Assay-

Solvent mixture-Mix 4 volumes of methyl ethyl ketone and 1 volume of $n$-hexane.

Internal standard solution-Prepare a solution of parathion in Solvent mixture containing about 2 mg per mL .

Standard preparation-Dissolve an accurately weighed quantity of USP Malathion RS in Solvent mixture to obtain a solution having a known concentration of about 2 mg per mL . Transfer 5.0 mL of this solution to a $25-\mathrm{mL}$ volumetric flask, add 5.0 mL of Internal standard solution, dilute with Solvent mixture to volume, and mix.

Assay preparation-Transfer an accurately measured volume of Topical Emulsion, equivalent to about 10 mg of malathion, to a $25-\mathrm{mL}$ volumetric flask, add 5.0 mL of Internal standard solution, dilute with Solvent mixture to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and contains a $2-\mathrm{mm} \times 1.8-\mathrm{m}$ glass column packed with $5 \%$ G6 liquid phase on 110 - to 120 -mesh support S1A. Maintain the temperature of the column, the injector port, and the detector block at $190^{\circ}, 230^{\circ}$, and $250^{\circ}$, respectively. Use dry nitrogen as the carrier gas at a flow rate of about 15 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure:
the relative retention times are 1.0 for malathion and about 1.3 for parathion; the resolution, $R$, between the malathion and parathion peaks is not less than 3.0 ; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the quantity, in mg , of malathion $\left(\mathrm{C}_{10} \mathrm{H}_{19} \mathrm{O}_{6} \mathrm{PS}_{2}\right)$ in each mL of the Topical Emulsion taken by the formula:

$$
25(C / V)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Malathion RS in the Standard preparation; $V$ is the volume, in mL , of Topical Emulsion taken; and $R_{U}$ and $R_{S}$ are the ratios of the peak responses of malathion to parathion obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{\Delta U S P 2 8}$
(Official July 1, 2007)

## BRIEFING

Mephobarbital Tablets, USP 27 page 1163. It is proposed to add a Dissolution test.
(BPC: M. Marques) RTS-40370-1

## Add the following:

${ }^{4}$ Dissolution $\langle 711\rangle$ -
Medium: a 1\% solution of 3-(dodecyldimethylammonio)propanesulfonate in pH 8.0 phosphate buffer (prepared by dissolving 10.0 g of 3-(dodecyldimethylammonio)propanesulfonate in 400 mL of warm water, and adding 250 mL of
0.2 M monobasic potassium phosphate and about 220 mL of 0.2 M sodium hydroxide; the solution is then cooled to room temperature, and adjusted with 0.2 M sodium hydroxide to a pH of 8.0 , followed by diluting with water to 1000 mL , mixing, and degassing.); 900 mL .

Apparatus 2: 75 rpm .
Time: 75 minutes.
Procedure-Determine the amount of $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 244 nm on portions of the solution under test passed through $0.45-\mu \mathrm{m}$ nylon filters, suitably diluted with Dissolution Medium, if necessary in comparison with a Standard solution having a known concentration of USP Mephobarbital RS in the same Medium.

Tolerances: not less than $70 \%(Q)$ of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$ is dissolved in 75 minutes. $\triangle$ USP28

## BRIEFING

Methylbenzethonium Chloride Lotion, USP 27 page 1207. It is proposed to change the title of this monograph to Methylbenzethonium Chloride Topical Emulsion. See briefing under Amphotericin $B$ Lotion.
(NL: C. Barnstein) RTS-40790-1

## Methylbenzethonium Chloride Lotion

(Current title—not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Methylbenzethonium Chloride Topical Emulsion

## Briefing

Methylbenzethonium Chloride Topical Emulsion-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40790-1

## Add the following:

## ©Methylbenzethonium Chloride Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Methylbenzethonium Chloride Lotion)
» Methylbenzethonium Chloride Topical Emulsion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{28} \mathrm{H}_{44} \mathrm{ClNO}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$.

Packaging and storage—Preserve in tight containers.
USP Reference standards $\langle 11\rangle$ —USP Docusate Sodium RS.

Identification-Suspend about 0.5 mL of Topical Emulsion in 20 mL of water, add 0.1 g of sodium carbonate, 1 mL of bromophenol blue TS, and 10 mL of chloroform, and shake the mixture: the chloroform layer is blue.
$\mathbf{p H}\langle 791\rangle$ : between 5.2 and 6.0.
Assay-
0.0001 N Docusate sodium—Dissolve an accurately weighed quantity of USP Docusate Sodium RS in isopropyl alcohol, and dilute quantitatively with isopropyl alcohol to obtain a solution having a concentration of 4.446 mg of anhydrous docusate sodium per mL. Store this solution in a tightly stoppered glass container. On the day of use, pipet 10 mL of this solution into a $1000-\mathrm{mL}$ volumetric flask, add water to volume, and mix to obtain a 0.0001 N solution.

Procedure-Transfer an accurately weighed portion of Topical Emulsion, equivalent to about 0.5 mg of methylbenzethonium chloride, to a glass-stoppered, $50-\mathrm{mL}$ cylinder. Add 5 mL of chloroform (freshly purified by shaking 100 mL with 10 g of silica gel, allowing to settle, and withdrawing the supernatant), 5 mL of phosphoric acid solution ( 1 in 10), and 1 mL of safranin $O$ solution ( $1 \mathrm{in} 20,000$ ). Titrate with 0.0001 N Docusate sodium until about 1 mL from the endpoint, then shake the stoppered tube vigorously for about 2 minutes, and continue the titration in $0.1-\mathrm{mL}$ increments, shaking vigorously after each addition, until a pink color appears in the chloroform layer. Perform a blank determination, and make any necessary correction. Each mL of 0.0001 N Docusate sodium is equivalent to $48.01 \mu \mathrm{~g}$ of $\mathrm{C}_{28} \mathrm{H}_{44} \mathrm{ClNO}_{2} \cdot \mathrm{H}_{2} \mathrm{O} \cdot \mathbf{\Delta U S P 2 8}$
(Official July 1, 2007)

Limit of $N$-(aminocarbonyl)- $N$-[([5-nitro-2-furanyl]methylene)aminolglycine (NF 250) and Assay-
pH 7.0 Phosphate buffer and Mobile phase-Prepare as directed in the Assay under Nitrofurantoin.

Internal standard solution-Dissolve about 13 mg of acetanilide in Mobile phase, dilute with Mobile phase to 200 mL , and mix.
Standard NF 250 preparation-Prepare a solution of USP N (amineearbenyl) $N[([5$ - nitre 2 ftranyl]methylene)amine $]$ glyeine RS-
${ }^{\boldsymbol{A}}$ USP Nitrofurantoin Related Compound $\mathrm{A} \mathrm{RS}_{\mathbf{\Delta U S P 2 8}}$ in Mobile phase to contain $125 \mu \mathrm{~g}$ per mL .

${ }^{\boldsymbol{\Delta}}$ [NOTE-USP Nitrofurantoin Related Compound A RS is $N$-(aminocarbonyl)- $N$-[([5-nitro-2-furanyl]methylene)amino]glycine.] |  |
| :---: |
| DSP28 |

Dilute 2.0 mL of this solution with Mobile phase to 100.0 mL , and mix.

Standard nitrofurantoin preparation-Transfer about 25 mg of USP Nitrofurantoin RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask with the aid of about 50 mL of dimethylformamide. Add 20 mL of water, cool to room temperature, and dilute with dimethylformamide to volume to obtain a Standard solution. Transfer a $4.0-\mathrm{mL}$ aliquot of this Standard solution to a glass-stoppered flask, add 15.0 mL of Internal standard solution, and mix.
Assay preparation-Transfer an accurately measured volume of freshly mixed Oral Suspension, equivalent to about 25 mg of nitrofurantoin, to a $100-\mathrm{mL}$ volumetric flask, add 20 mL of water to the flask, and mix. Add about 50 mL of dimethylformamide, and shake the flask for about 20 minutes. Cool to room temperature, and dilute with dimethylformamide to volume. Centrifuge a portion of the solution, and transfer a $4.0-\mathrm{mL}$ aliquot of the supernatant liquid to a glass-stoppered flask. Add 15.0 mL of Internal standard, and mix. Filter a portion of the solution through a $5-\mu \mathrm{m}$ pore size polytef filter, discarding the first few mL of the filtrate.

Test preparation-Transfer an accurately measured volume of the freshly mixed Oral Suspension, equivalent to 5 mg of nitrofurantoin, to a $100-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix. Centrifuge a portion of this solution. Filter a portion of the supernatant through a $5-\mu \mathrm{m}$ pore size polytef filter, discarding the first few mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )——The liquid chromatograph is equipped with both a $254-\mathrm{nm}$ detector and a $375-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. For the Assay, chromatograph the Standard nitrofurantoin preparation, adjusting the operating parameters so that the retention time of the nitrofurantoin peak is about 8 minutes and its peak height is about half full-scale: the relative standard deviation of the ratio of the peak responses in replicate injections is not more than $2.0 \%$, and the resolution, $R$, of the acetanilide and nitrofurantoin peaks is not less than 3.5. The flow rate is about 1.2 mL per minute. For the NF 250 test, adjust the operating parameters so that the NF 250 peak has a retention time of between 3 and 6 minutes and its height is about 0.1 full-scale. The flow rate is about 1.2 mL per minute.
Procedure for limit of $N$-(aminocarbonyl)-N-[([5-nitro-2-furanyl]methylene) amino]glycine-Inject separately equal volumes $(30 \mu \mathrm{~L}$ to $60 \mu \mathrm{~L})$ of Standard NF 250 preparation and the Test preparation into the chromatograph, and record the peak responses with the $375-\mathrm{nm}$ detector: the height of any peak appearing in the chromatogram of the Test preparation at a retention time corresponding to that of the main peak in the Standard NF 250 preparation is not greater than the height of the latter (5.0\%).

Procedure for assay-Inject equal volumes (about $15 \mu \mathrm{~L}$ ) of Standard nitrofurantoin preparation and the Assay preparation separately into the chromatograph, and record the peak responses with the $254-\mathrm{nm}$ detector. Calculate the quantity, in mg , of $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{~N}_{4} \mathrm{O}_{5}$ in each mL of the Oral Suspension taken by the formula:

$$
0.1(C / V)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Nitrofurantoin RS in the Standard solution; $V$ is the volume, in mL , of Oral Suspension taken; and $R_{U}$ and $R_{S}$ are the ratios of the peak responses of the nitrofurantoin to the internal standard obtained from the Assay preparation and the Standard nitrofurantoin preparation, respectively.

## Briefing

Nitrous Oxide, USP 27 page 1331. It is proposed to add new USP Reference Standards, which will affect the tests for Identification and the Assay.
(AER: K. Zaidi) RTS-40629-3

## Add the following:

${ }^{\wedge}$ USP Reference standards-USP Air-Helium RS. USP
Nitrous Oxide $R S_{\triangle U S P 28}$

## Change to read:

## Identification-

A: With the container temperatures the same and maintained between $15^{\circ}$ and $25^{\circ}$, concomitantly read the pressure of the Ni trous Oxide container and of a container of nitrous oxideentiffed standard (see under Reagents in the section Reagents, Indieaters, and Solutions).
${ }^{\Delta}$ USP Nitrous Oxide RS. $\qquad$
[NOTE-Do not use the nitrous-oxide entified sadad
${ }^{\boldsymbol{\Delta}}$ USP Nitrous Oxide RS ${ }_{\mathbf{\Delta U S P 2 8}}$
if it has been depleted to less than half of its full capacity.] The pressure of the Nitrous Oxide container is within 50 psi of that of the nitrous oxide certified standard.
${ }^{\triangle}$ USP Nitrous Oxide RS. $\triangle$ USP28
B: Pass $100 \pm 5 \mathrm{~mL}$ released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed (distinction from carbon dioxide).

C: Collect about 100 mL of the gas under test in a $100-\mathrm{mL}$ tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown (distinction from oxygen).
