# CHROMATOGRAPHIC REAGENTS USED IN $\boldsymbol{U S P} \boldsymbol{- N F}$ AND PHARMACOPEIAL FORUM 

This is an update based on the proposals published in this issue of $P F$.

## CHROMATOGRAPHIC REAGENTS

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

September-October 2004

| ACYCLOVIR |  |  |  | DSD Mgh \#890 |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | L1 | MicroBondapak C18 | Assay and Limit of . | Assay and limit of guanine. $25 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 10$ $\mu \mathrm{m}$, manufacturer Waters Corp. |
|  | BUPIVACAINE HYDROCHLORIDE |  |  | DSD Mgh \#10490 |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | S3 | Porapak Q | Residual solvents | $2 \mathrm{~m} \times 4 \mathrm{~mm}$. Manufacturer Waters Corp. |
|  | DALTEPARIN SODIUM |  |  | DSD Mgh \#21930 |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | L\#\# | Dowex 1X8 | Molar ratio of sulfate to carboxylate | $1.5 \mathrm{~cm} \times 2.5 \mathrm{~cm}$ 200-400 mesh. Fluka P/N 44462 |
| 30(5) | L\#\# | Dowex 50W2 | Molar ratio of sulfate to carboxylate | $1.5 \mathrm{~cm} \times 7.5 \mathrm{~cm} 100-200$ mesh. Fluka Cat $\# 44339$ |
|  | ETIDRONATE DISODIUM |  |  | DSD Mgh \#32350 |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | L23 | IC-Pak Anion | Assay | $15 \mathrm{~cm} \times 4.6 \mathrm{~mm}$, manufacturer Waters Corp. |
| 30(5) | L46 | Ion Pac AS11 | Phosphite | $25 \mathrm{~cm} \times 4.6 \mathrm{~mm}$, manufacturer Dionex. |
|  | FINASTERIDE TABLETS |  |  | DSD Mgh \#33182 |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | L11 | Zorbax SB Phenyl | Dissolution | $15 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$, manufacturer Agilent Technologies. |
|  | INSULIN |  | Type of Test | DSD Mgh \#40520 |
| 30(5) | L20 | Zorbax GF250 | Limit of . . . . . . . . | Limit of high molecular weight proteins, $25 \mathrm{~cm} \times$ 9.4 mm . Manufacturer Agilent technologies. |
|  | MODAFINIL |  |  | DSD Mgh \#54521 |
| PF | LGS\# | Reagent Brand | Type of Test | Comments |
| 30(5) | L1 | Inertsil ODS-2 | Assay and Related Compounds | $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}, 5$ : m, <br> $15 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$, manufacturer GL Science. |
|  | MODAFINIL TABLETS |  |  | DSD Mgh \#54523 |
| 30(5) | L1 | Inertsil ODS-2 | Assay and Related Compounds | $15 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$, manufacturer GL |
|  | PRILOCAINE |  |  | DSD Mgh \#68980 |
| 30(5) | L1 | Symmetry C-18 | Related compounds | $15 \mathrm{~cm} \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$, manufacturer Waters Corp. |
| 30(5) | L1 | Symmetry C-18 | Limit of . | Limit of prilocaine related compound A. $15 \mathrm{~cm} x$ $4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$, manufacturer Waters Corp. |
|  |  |  | 1 |  |

## CHROMATOGRAPHIC REAGENTS

|  | TAGATOSE |  |  | DSD Mgh \#937 |
| :---: | :---: | :---: | :---: | :---: |
| 30(5) | L19 | Aminex HPX-87C | Assay | $30 \mathrm{~cm} \times 7.8 \mathrm{~mm}, 9 \mu \mathrm{~m}$, manufacturer BIO RAD Laboratories. |

Pharmacopeial Forum is covered in Current Contents/Life Sciences and in the Science Citation Index (SCI), in International Pharmaceutical Abstracts, and in Current Awareness in Biological Sciences.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

[^336]
## STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through Pharmacopeial Forum $(P F)$, for the development of official pharmaceutical standards.

USP publishes Pharmacopeial Forum (PF) bimonthly as the working vehicle of the USP Council of Experts. PF provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the United States Pharmacopeia and the National Formulary (USP-NF).
$P F$ includes the following:

1. Potential revisions-entirely new standards, revision ideas, and drafts not yet targeted for official adoption (Pharmacopeial Previews)
2. Proposed revisions - new or revised standards targeted for official adoption (In-Process Revision)
3. Adopted revisions-new or revised standards that become official and binding before the publication of the next $U S P$ NF or Supplement (Interim Revision Announcement)
USP welcomes comments and data on potential, proposed, or official standards. ${ }^{*}$ Comments, along with USP's responses, will be published either in PF Briefings, the Commentary section of $P F$, the Commentary section of Supplements to USP-NF, or the Commentary section of $U S P-N F$.
[^337]The chart below shows the public review and comment process and its relationship to standards development.

# Public Review and Comment Process for Standards Development 

Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

## HOW TO USE PF

This section provides descriptions of the various parts of $P F$. It also includes Committee Designations and the Staff Directory.

The contents of the different sections of $P F$ are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the Staff Directory) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

| Section | Content | How Readers Can Respond |
| :---: | :---: | :---: |
| Pharmacopeial <br> Previews <br> Early ideas for revisions | -Briefing: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: <br> - the controversial nature of an item; <br> - the application of new technologies that require further study; and <br> - articles produced by multiple sources. | Review drafts and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview. |
| In-Process Revision Revisions targeted for adoption | -BriEfing: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see Standards Development). New or revised text is marked with symbols ( ${ }^{\square}$ or ) to specify the tentative earliest date on which the revision would be officially adopted. | Review material and send comments promptly to USP staff liaison (see the Staff Directory). Guidelines on how to comment are found at the end of the Policies and Announcements section. |
| Harmonization <br> Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally | -Briefing: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under Pharmacopeial Previews or under In-Process Revision, both separate sections of Harmonization. <br> -For In-Process Revision, new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted. | Review material and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview or In-Process Revision. |
| Interim Revision Announcement Adopted standards | Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ${ }^{\circ}$. | Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance. |

## Other Sections

## Committee Designations

Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

## Staff Directory

Names of all USP scientific staff liaisons with contact information.

## Policies and Announcements

- General scientific and policy issues affecting $U S P-N F$ standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

## Stimuli to the Revision Process

- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

## Nomenclature

- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the USP Dictionary of USAN and International Drug Names
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

## Index

Cumulative directory for the content of all issues of $P F$ beginning with $P F 30(1)$.

## Reference Standards Catalog

List of official USP Reference Standards specified in $U S P-N F$, along with availability and ordering information.

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

Update of chromatographic reagents based on the proposals published in this issue of $P F$.

## EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

| AER | Aerosols |
| :---: | :---: |
| AMB | Analytical Microbiology |
| BBP | Blood and Blood Products |
| BNA | Bioavailability and Nutrient Absorption |
| BNT | Biotechnology and Natural Therapeutics and Diagnostics |
| BPC | Biopharmaceutics |
| BST | Biostatistics |
| CRX | Compounding Pharmacy |
| DSB | Dietary Supplements-Botanicals |
| DSI | Dietary Supplements-Information |
| DSN | Dietary Supplements-Non-Botanicals |
| EMC | Excipient Monograph Content |
| ETM | Excipients-Test Methods |
| GCT | Gene Therapy, Cell Therapy, and Tissue Engineering |
| GTB | General Toxicity and Biocompatibility |
| NL | Nomenclature and Labeling |
| PA1 | Pharmaceutical Analysis 1 |
| PA2 | Pharmaceutical Analysis 2 |
| PA3 | Pharmaceutical Analysis 3 |
| PA4 | Pharmaceutical Analysis 4 |
| PA5 | Pharmaceutical Analysis 5 |
| PA6 | Pharmaceutical Analysis 6 |
| PA7 | Pharmaceutical Analysis 7-Antibiotics |
| PDF | Pharmaceutical Dosage Forms |
| PPC | Parenteral Products-Compounding and Preparation |
| PPI | Parenteral Products-Industrial |
| PSD | Packaging, Storage, and Distribution |
| PW | Pharmaceutical Waters |
| RMI | Radiopharmaceuticals and Medical Imaging |
| SMU | Safe Medication Use |
| VET | Veterinary Drugs |
| VVI | Vaccines, Virology, and Immunology |

[^338]
## STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

| STAFF | E-MAIL | PHONE | ASSIGNMENT |
| :--- | :--- | :--- | :--- |
| Clydewyn M. Anthony, <br> Senior Scientific Associate | cma@usp.org | $(301) 816-8139$ | Pharmaceutical Analysis 1 <br> (PA1) |

## POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on $U S P-N F$ standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

## In Memoriam

## Leonard C. Bailey, Ph.D.

Last summer the United States Pharmacopeia lost a strong contributor and friend-for 15 years Leonard C. Bailey, Ph.D., brought to USP both his considerable energy and commitment as a member of the Committee of Revision/Expert Committees.

Dr. Bailey was foremost an educator, but he had experience in the pharmaceutical industry and a strong background as a pharmacist. The latter experience stood him well in focusing the need for standards that were meaningful in the physician/pharmacist/patient interface.

Most distinctive were Dr. Bailey's commitment to objective science, his insistence on data in support of arguments, and his discounting of merely institutional arguments. His areas of service to USP were the Packaging and Stability and Chemistry Subcommittees and later the Packaging, Storage, and Distribution Expert Committee. He also chaired a USP Advisory Panel on Compendial Items Storage, Shipment, and Distribution and was a member of an NF XIV Special Advisory Panel on Nuclear Magnetic Resonance Spectroscopy.
He provided motivation for and contributed to Stimuli articles and new general chapters that recognized the changing scientific basis of pharmaceutical packaging and distribution. A notable contribution was his work helping establish the concept of mean kinetic temperature (MKT) and the method of calculating it, which are now part of the USP definition for General Chapter Controlled Room Temperature and Pharmaceutical Stability $\langle 1150\rangle$.
Dr. Bailey was widely published in the area of pharmaceutical analysis and control, and he also served as a referee for a number of well-known journals in the field. Dr. Bailey was a popular speaker and was frequently invited to make presentations at conferences and seminars. As an educator, he was regularly recognized for his contributions. As a major advisor or co-advisor to many students, he played a key role in their development, and as a testament to his influence, they are found throughout the pharmaceutical industry.

Leonard Bailey was both liked and respected by his coworkers, students, and other USP volunteers. Our memory of him is warm, and we are grateful for the opportunity to have known and worked with him.

## Some memories of Dr. Bailey by colleagues-

"Dr. Leonard Bailey, a colleague of mine for over 40 years, was an intelligent, kind, and empathetic man. As a professor, he set high standards and was respected by students. As a research scientist, he was innovative and thorough. In his work on the USP Expert Committee on Packaging, Storage, and Distribution, he was insightful and energetic, dealing with all issues in a manner designed to protect the public. I valued his thoughts and counsel always.

I am grateful for the privilege of knowing Leonard Bailey. I, like many others, miss him very much."
—Thomas Medwick

$$
* * *
$$

"As the liaison of the Committee, I have known and worked for Len for almost 10 years. He worked very hard on any project given to him, and he always made time to tackle difficult issues. When he wasn't sure, he took time to study the issue before dealing with it. He always stood by his conviction especially when data were involved. I remember his energy and desire to design a study approach for the shipping studies USP performed and to defend USP's position on MKT calculations. He was a nice, kind man, always willing to help, and easy going. I will miss him."
-Claudia Okeke
"I will miss Len Bailey. He not only was knowledgeable, clever and intelligent, but a good person, with a good heart and a great sense of humor. I remember him fondly, not only from my association with him from USP but also from my many years of working with him on various projects (along with Tom Medwick) from the New Jersey Pharmaceutical Quality Control Association while he was still active at Rutgers University."
-Herbert Letterman
"What I will always remember is Len's passion to see that the right things were done for the patient. He never forgot that it is the patient who ultimately matters, and I appreciated the enthusiasm he brought to our work. I will miss him."
-Robert H. Seevers
"USP lost a highly productive and reliable volunteer. Len was a true scientist who followed where the data and facts led. He had a large impact on the content of USP."
—Lee T. Grady
"It was a pleasure to work with Dr. Bailey and to have met him. USP and many, many others will miss his warm personality and competence."

> - Barry Coleman
"I worked with Len for many years and always appreciated his knowledge and his concern about doing the right things for the patient. I will miss him."
-Larry Paul
"Very sad news. I liked Len and respected his science a lot. I always thought of Len as the 'Father of MKT' at USP."
-David Newton
"Len was the epitome of what a professional pharmaceutical scientist should be. He brought to the workplace a perfect combination of good science, common sense, and professional concern for the ultimate beneficiary of the USP, the public. This is a great loss, and he will be missed by many."
-Edward M. Cohen

USAN COUNCIL SECRETARIAT REVISES USAN FEE-FOR-SERVICE CHARGES. A revised schedule of fee-for-service charges has been placed in effect as of January 1, 2004. The increased fees appear on the USAN submission forms that are provided under Appendix XI of the 2004 edition of the USP Dictionary of USAN and International Drug Names. This announcement will be important to inform those who are not yet using the revised 2004 edition of the changes in the USP Dictionary.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE USP-NF. We are pleased to announce the availability of the USP Guideline for Submitting Requests for Revision to the $U S P-N F$. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information
to aid submission of new monographs and revisions to existing monographs for Noncomplex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Laura A. McCurry, Manager, Pharmacopeial Education, lam@usp.org, 301-816-8285; Diana Lenahan, Program Associate, dpl@ usp.org, 301-816-8530; or visit the website at www.usp. org/education to register. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2004

| Date | Name of course | Location |
| :--- | :--- | :--- |
| November 11 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| November 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| November 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| November 12 | Fundamentals of Dissolution (Lecture) | USP Headquarters, Rockville, MD |
| December 2 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| December 8 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| December 9 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |

VISIT THE USP WEB SITE AT 〈http://www.usp.org〉. Various resources related to Pharmacopeial standards are presented, including highlights from $P F$.

## USP-NF AVAILABLE IN THREE ELECTRONIC

FORMATS. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats- $C D$, intranet, and online. The $C D$ is ideal for single users who prefer to have $U S P-N F$ on their
hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official $U S P-N F$ content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

CHROMATOGRAPHIC REAGENTS NOW AVAILABLE. Chromatographic Reagents lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in Pharmacopeial Forum ( $P F$ ) since 1980. Chromatographic Reagents also helps to track which column reagents were used to validate methods that have become official and are included in $U S P-N F$. The branded column reagents list is updated bimonthly through Pharmacopeial Forum. Chromatographic Reagents can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European Pharmacopoeia Commission B.P. 907

F 67029 Strasbourg Cedex 1
France

## NAKASHIMA Nobumasa

Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a $P F$ should be submitted to the appropriate USP scientific staff liaison identified at the end of the Briefing accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the Staff Directory included in every $P F$.

Please note that $U S P-N F$ is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for USP 27-NF 22 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2003 | November 2003 | January 2004 |
| Supplement One | October 15,2003 | February 2004 | April 2004 |
| Supplement Two | February 17,2004 | June 2004 | August 2004 |

The publication and comment schedule for USP $28-N F 23$ is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2004 | November 2004 | January 2005 |
| Supplement One | October 15, 2004 | February 2005 | April 2005 |
| Supplement Two | February 17,2005 | June 2005 | August 2005 |

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in Supplements to USP-NF (twice yearly). Between Supplements, official revisions are published in PF in the Interim Revision Announcement; these revisions are also incorporated in the upcoming Supplement. The electronic version of $U S P-N F$ is updated as each Supplement becomes available and, therefore, contains all official text up to and including the contents of the latest Supplement.

Publication Schedules

| Publication | Publication Date | Official Date |
| :---: | :---: | :---: |
| $1^{\text {st }}$ Supplement | Feb. 2004 | Apr. 1, 2004 |
| $P F 30(2)$ [Mar.-Apr. 2004] | Mar. 2004 | Not Applicable |
| $2^{\text {nd }} I R A$ [published in $\left.P F 30(2)\right]$ | Mar. 2004 | Apr. 1, 2004 |
| $P F 30(3)[$ May-June 2004] | May 2004 | Not Applicable |
| $3^{\text {rd }} I R A$ [published in $\left.P F 30(3)\right]$ | May 2004 | June 1, 2004 |
| $2^{\text {nd }}$ Supplement | June 2004 | Aug. 1, 2004 |
| $P F 30(4)[$ July-Aug. 2004] | July 2004 | Not Applicable |
| $4^{\text {th }} I R A$ [published in $\left.P F 30(4)\right]$ | July 2004 | Aug. 1, 2004 |
| $P F 30(5)$ [Sept.-Oct. 2004] | Sept. 2004 | Not Applicable |
| $5^{\text {th }} I R A$ [published in $\left.P F 30(5)\right]$ | Sept. 2004 | Oct. 1, 2004 |
| $P F 30(6)[$ Nov.-Dec. 2004] | Nov. 2004 | Not Applicable |
| $6^{\text {th }} I R A[$ published in $P F 30(6)]$ | Nov. 2004 | Dec. 1, 2004 |

## INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the $U S P-N F$ that become effective before the effective date of the next Supplement or that were not ready for adoption by the closing date for the upcoming Supplement. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.
Symbols-Interim revisions are shown with new text (if any) enclosed in circles, ${ }^{\bullet}$ new text ${ }_{\mathbf{0}}$. Text enclosed in squares, $\mathbf{■}^{\text {new }}$ text $\mathbf{n}$, has already been adopted in a Supplement. Where the symbols appear together with no enclosed text, such as $\bullet \bullet$ or $■$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the IRA or Supplement in which the revision first appeared. For example, $\bullet 2$ indicates that
 officially adopted in the Second Supplement to USP 27.

Errata-At the end of the Interim Revision Announcement section is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in $U S P-N F$. If necessary, this list will be updated with every issue of $P F$. This information will also be cumulative in the next available Supplement, and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

## New USP Reference Standards

The following USP Reference Standards, which were indicated in past Supplements to $U S P-N F$ as being not yet available, have since become available. Thus, the official date of each USP 27 or NF 22 standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of $U S F-N F$ users

USP Alcohol RS (May 1, 2005)
USP Alcohol Determination-Acetonitrile RS (March 1, 2005)
USP Alcohol Determination-Alcohol RS (March 1, 2005)
USP Amlodipine Besylate RS (May 1, 2005)
USP Ammonium Carbonate (AS)
USP Benazepril Related Compound C RS (January 1, 2005)
USP Positive Bioreaction RS (November 1, 2004)
USP Powdered Black Cohosh Extract RS (March 1, 2005)
USP Boric Acid (AS)

## NOTICE OF LIFTING OF POSTPONEMENT

In response to the request that USP reconsider the decision to postpone the official date of the revision to the Doxorubicin Hydrochloride monograph published in the First Supplement to USP-NF, the Noncomplex Actives and Excipients Executive Committee has considered this request and subsequently voted to lift the postponement. This action makes the revision to the Doxorubicin Hydrochloride monograph official as of September 7, 2004.

## Doxorubicin Hydrochloride

## Change to read:

Packaging and storage-Preserve in tight containers, ${ }^{\bullet}$ and store at controlled room temperature, except where it is labeled as amorphous, in which case it should be stored in the freezer. $\bullet_{6}$
${ }^{\bullet}$ (Official September 7, 2004) ${ }^{6}$

## Add the following:

${ }^{\bullet}$ Labeling-The amorphous form is so labeled. $\bullet_{6}$
${ }^{\bullet}$ (Official September 7, 2004) ${ }^{\bullet 6}$

## Change to read:

Crystallinity $\langle 695\rangle$ : meets the requirements, ${ }^{\bullet}$ except that where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions. $\bullet 6$
${ }^{\bullet}$ (Official September 7, 2004) ${ }^{\bullet} 6$

## MONOGRAPHS（USP）

## Loratadine Oral Solution

## Change to read：

Assay－
0．05 M Monobasic potassium phosphate solution－Transfer about 6.8 g of monobasic potassium phosphate，accurately weighed，to a 1－L volumetric flask，dissolve in and dilute with wa－ ter to volume，and mix．Adjust with phosphoric acid to a pH of $3.0 \pm 0.1$ ．

Mobile phase－Prepare a filtered and degassed mixture of 0．05 M Monobasic potassium phosphate solution and acetonitrile （7：3）．Make adjustments if necessary（see System Suitability under Chromatography $\langle 621\rangle$ ）．

Internal standard preparation－Dissolve an accurately weighed quantity of butylparaben in a mixture of water and acetonitrile （ $7: 3$ ），and dilute quantitatively，and stepwise if necessary，with a mixture of water and acetonitrile $(7: 3)$ to obtain a solution having a concentration of about 0.3 mg per mL ．

Standard stock preparation－Dissolve an accurately weighed quantity of USP Loratadine RS in acetonitrile，and dilute quantita－ tively，and stepwise if necessary，with acetonitrile to obtain a solu－ tion having a known concentration of about 1.0 mg per mL ．

Standard preparation－Transfer 5.0 mL of Internal standard preparation， 5.0 mL of Standard stock preparation，and 12 mL of water into a $50-\mathrm{mL}$ volumetric flask．Dilute with a mixture of water and acetonitrile $(7: 3)$ ，and mix．

Assay preparation－Transfer an accurately measured quantity of Oral Solution，equivalent to 5 mg of loratadine，into a $50-\mathrm{mL}$ vol－ umetric flask．Pipet 5.0 mL of Internal standard preparation into the flask，dilute with a mixture of water and acetonitrile $(7: 3)$ to volume，and mix．

Chromatographic system（see Chromatography $\langle 621\rangle$ ）－The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains ${ }^{\bullet} 10-\mu \mathrm{m}_{\bullet 6}$ packing L11． The flow rate is about 2 mL per minute．The column temperature is maintained between $20^{\circ}$ and $30^{\circ}$ ．Chromatograph the Standard preparation，and record the peak responses as directed for Proce－ dure：the relative retention times are about 0.78 for butylparaben and 1.0 for loratadine；the resolution，$R$ ，between loratadine and butylparaben is not less than 1．9；the tailing factor is not more than 1.6 for the loratadine and butylparaben peaks；and the relative stan－ dard deviation for replicate injections is not more than $2 \%$ ．

Procedure－Separately inject equal volumes（about $10 \mu \mathrm{~L}$ ）of the Standard preparation and the Assay preparation into the chro－ matograph，record the chromatograms，and measure the responses for the major peaks．Calculate the quantity，in mg of loratadine $\left(\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{ClN}_{2} \mathrm{O}_{2}\right)$ in the portion of Oral Solution taken by the formu－ la：

$$
50 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration，in mg per mL ，of USP Loratadine RS in the Standard preparation；and $R_{U}$ and $R_{S}$ are the ratios of loratadine to the internal standard peak responses obtained from the Assay preparation and the Standard preparation，respectively．

## IN-PROCESS REVISION

This section contains proposals for adoption as official $U S P$ or $N F$ standards (either proposed new standards or proposed revisions of current $U S P$ or $N F$ standards). These may be any of the following: (1) items that previously appeared under Pharmacopeial Previews and are now formally proposed as revisions, (2) proposed revisions placed directly under In-Process Revision, or (3) modifications of revisions previously proposed under In-Process Revision. Readers should review material in this section and provide comments to the staff liaison (use the Staff Directory to find the contact information). Information on how to comment is found in the Policies and Announcements section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

## BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How to Use PF), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:
${ }^{\bullet}$ new text.
if slated for an Interim Revision Announcement to USP 27-NF 22 (IRA);
$\Delta_{\text {new text }}^{\Delta U S P 28}{ }$
if slated for $U S P 28-N F 23$; and
$\square_{\text {new text }}$
if slated for a Supplement to $U S P-N F$. The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ 。 or $\boldsymbol{\bullet}^{\boldsymbol{n}}{ }^{\boldsymbol{\wedge}}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular IRA or Supplement or indicates the USP or NF as the publication where the revision will appear if approved. For example, $\bullet 2$ indicates that the revision is proposed for the Second Interim Revision Announcement, $\boldsymbol{\square} 2 \mathrm{~S}$ (USP 27) indicates that the proposed revision is slated for the Second Supplement to USP 27, and $\boldsymbol{\Delta U S P 2 8}$ and $\boldsymbol{\Delta N F 2 3}$ indicate that the revisions are proposed for USP 28 and $N F 23$, respectively.

Official Title Changes Where the specification "Monograph title change" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

## MONOGRAPHS (USP)

## Briefing

#### Abstract

Amifostine, USP 27 page 109 and page 52 of $P F 30(1)$ [Jan.Feb. 2004]; Amifostine for Injection, USP 27 page 110. On the basis of comments received, a new HPLC method is proposed for the Related compounds test and the Assay. Improved peak shape and resolution were observed. The tests were validated using the Ultrasphere C18 5- $\mu \mathrm{m}$ (Beckman-Coulter) brand of L1 column. Typical retention times in the Related compounds test are about 4.8 minutes for amifostine thiol and about 14 minutes for amifostine disulfide. The typical retention time for amifostine in the Assay is about 10 minutes.

(PA5: A. Wilk) RTS-41217-1

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. ${ }^{15}$ (USP28)

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Amifostine RS. USP Amifostine Thiol RS.

- USP Endotoxin RS. $\mathbf{I S ~}_{1 S}$ (USP28)

## Change to read:

Related compounds-
Mobile phase-Prepare-as-directed in the-Assat:

- Dissolve 1.0 mL of nonafluorobutane sulfonic acid in 1200 mL of HPLC grade water, add $400 \mu \mathrm{~L}$ of trifluoroacetic acid, and adjust with triethylamine to a pH of 2.5 . Prepare a degassed mixture of this solution and acetonitrile (68:32). $\mathbf{n}^{2 S}$ (USP28)

Blank solution-Transfer 12.5 mL of water to - 25 mL volumet rie flack, dilute with methaneltovelume, and mix.
-Use water. ${ }^{\text {n2S }}$ (USP28)
Standard thiol solution-Transfer about 7-mg
$-12.4 \mathrm{mg}_{\text {. }} 2 \mathrm{~S}$ (USP28
of USP Amifostine Thiol RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with hobile phase
$\square_{\text {water }}{ }^{2 S}$ (USP28)
to volume, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use.
-The solution is stable for 48 hours if maintained at about $5^{\circ}$.]

System suitability solution-Dissolve about 5.0 mg of USP Amifostine RS, accurately weighed, in 1 mL of Standard thiol solution, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use. The solution is stable
for 12 hours if maintained at about $5^{\circ}$.] ${ }_{\text {USS }}$ (USP28)
Test solution-Transfer about 150 mg
$-50 \mathrm{mg}_{\text {2S }}$ (USP28)
of Amifostine, accurately weighed, to a 10 mL

- $1-\mathrm{mL}_{\mathbf{2 S}}$ (USP28)
volumetric flask. Dissolve in 5.0 mL of water, dilute with methanet
$\square_{\text {and }}$ dilute with water ${ }_{\text {2S }}$ (USP28)
to volume, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use.
-The solution is stable for 48 hours if maintained at about $5^{\circ}$. $]_{\text {■ }}$ (USP28)

Chromatographic system (see Chromatography $\langle 621\rangle$ )-Prepare direeted in the Assay.
-The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $30^{\circ}$, and the temperature of the solutions to be injected is maintained at $2^{\circ}-8^{\circ}$. The flow rate is about 1.0 mL per minute. ${ }^{2 S}$ (USP28) Chromatograph the
-System suitability solution and the $\mathbf{N 2 S}^{\text {(USP28) }}$
Standard thiol solution, and record the peak responses as directed for Procedure:
-the resolution between the amifostine and amifostine thiol peaks is not less than 2.0 ; the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0; the capacity
factor, $k^{\prime}$, is more than 0.5 ; and ${ }_{\text {2S }}$ (USP28)
the relative standard deviation for replicate injections is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard thiol solution, the Test solution, and the Blank solution into the chromatograph, record the chromatograms, and mea-
sure the responses of all the peaks, excluding the peaks corresponding to those obtained from the Blank solution. Calculate the percentage of amifostine thiol in the portion of Amifostine taken by the formula:

$$
(134.24 / 207.17) 1000(C / W)\left(r_{U} / r_{S}\right)
$$

in which 134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; $C$ is the concentration, in mg per mL , of amifostine thiol dihydrochloride in the Standard thiol solution; $W$ is the weight, in mg , of Amifostine taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the amifostine thiol peak responses obtained from the Test solution and the Standard thiol solution, respectively. Calculate the percentage of each of the other impurities in the portion of Amifostine taken by the formula:

$$
100\left(r_{i} / r_{A}\right),
$$

in which $r_{i}$ and $r_{A}$ are the peak responses for each impurity and amifostine, respectively, obtained from the Test solution: not more than $0.1 \%$ of any individual impurity, excluding amifostine thiol, is found; and not more than $0.3 \%$ of total impurities, including amifostine thiol, is found.

## Add the following:

-Other requirements-Where the label states that Amifostine is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Amifostine for Injection. Where the label states that Amifostine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Am-
ifostine for Injection.■1S (USP28)

## Change to read:

■Standard thiol solution-Transfer about 40.1 mg of USP
Amifostine Thiol RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about $5^{\circ}$.]

Standard disulfide solution-Transfer about 18.6 mg of USP Amifostine Disulfide RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about $5^{\circ}$.]

System suitability solution-Dissolve about 5.0 mg of USP Amifostine RS, accurately weighed, in 1 mL of Standard thiol solution, and mix. [NOTE-Inject immediately after preparation, or refrigerate until use. The solution is stable for 12 hours if maintained at about $5^{\circ}$.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 247 nm , and a $4.6-\mathrm{mm}$ $\times 25-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $30^{\circ}$, and the temperature of so-
lutions to be injected is maintained at $2^{\circ}-8^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, the Standard disulfide solution, and the Standard thiol solution, and record the peak responses as directed for Procedure: the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0 ; the capacity factor, $k^{\prime}$, is more than 0.5 ; and the relative standard deviation for replicate injections is not more than $4.0 \%$. The column efficiency calculated for the amifostine disulfide peak is not less than 2000 theoretical plates; the tailing factor is not more than 4.5 ; the capacity factor, $k^{\prime}$, is more than 2.2 ; and the relative standard deviation for replicate injections is not more than $4.0 \%$. ${ }^{2 S}$ (USP28)
Procedure-Proceed as dirieeted in the for Related pounds under Amififostine.
-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard thiol solution, the Standard disulfide solution, the Test solution, and the Blank solution into the chromatograph, record the chromatograms, and measure the responses of all the peaks except the peaks corresponding to those obtained from the Blank solution. $\quad 2$ (USP28) Calculate the percentage of amifostine thiol in the portion of Amifostine for Injection taken by the formula:
$(134.24 / 207.17)(41.67 C)(\not+\downarrow+5)$,

$$
\boldsymbol{\bullet}(134.24 / 207.17) 1000(C / W)\left(r_{U} / r_{S}\right), \amalg 2 S(U S P 28)
$$

in which the-terms are as defmed therein.
-134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; $C$ is the concentration, in mg per mL , of amifostine thiol dihydrochloride in the Standard thiol solution; $W$ is the weight, in mg , of amifostine taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the amifostine thiol peak responses recorded at 220 nm , obtained from the Test solution and the Standard
thiol solution, respectively. Calculate the percentage of amifostine disulfide in the portion of Amifostine for Injection taken by the formula:
$(266.47 / 412.31)(10 C)\left(r_{U} / r_{S}\right)$,
in which 266.47 and 412.31 are the molecular weights of amifostine disulfide and amifostine disulfide tetrahydrochloride, respectively; $C$ is the concentration, in mg per mL, of USP Amifostine Disulfide RS in the Standard disulfide solution; and $r_{U}$ and $r_{S}$ are the peak responses recorded at 247 nm , obtained from the Test solution and the
Standard disulfide solution, respectively: not more than
$2.0 \%$ of total impurities, including amifostine thiol and am-
ifostine disulfide, is found. ${ }^{2 S}$ (USP28)
Calculate the percentage of each of the other impurities in the portion of Amifostine for Injection taken by the formula:

$$
100\left(r_{i} / r_{A}\right)
$$

in which $r_{i}$ and $r_{A}$ are the peak responses for each impurity and amifostine, respectively, obtained from the Test solution: not more than $0.1 \%$ of any individual impurity except amifostine thiol is found.

TEST 2
Mobile phase Dissolve 0.28 g of sodium 1 octanesulfenate in 700 mL of water. Adjust with trifluroracetic aeid to a pH-of 2.5 . Prepare a filtered and degassed mix ture of this solution and acetemitrile (7:3). Make adjustments if necessary (see-System-Sutabit ity under Chromatography $\langle 621\rangle$ ).

Standard disulfide seltion Transfer about 4.6 mg of USP Am ifestine-Disulfide RS, qeeurately weighed, to a 100 mL volumetrie flask. Dissolve in 70 mE of water, dilate-with acetenitrile to vol ume, and mix.

Test solution Transfer an aceurately weighed quantity of Am ifestine for Injection, equivalent to about 500 me of amifestine, to a -50 mL volumetric flask, dissolve-in-9 mL of water, dilute with water to veltame, and mix.

Chromatogituphie system (see-Chromatography $\langle 624\rangle$ ) The liquid chrematograph is equipped with a 247 nm detector and a $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ coltam that contains 5 Hm packing L1. The flow rate is about 1 mL per minute. Chromategraph the Standard disulfite solution, and record the peak respenses as directed for Procedure: the coltamnefficieney is not less than 1000 theoretical plates; the tailing factor for the amifestine disulfle peak is not more than 2.5; and the relative-standard deviation-for replieate-injections is net mere than $4.0 \%$.

Proedure Separately injeet equal volumes (about $10 \mu \mathrm{~L}$ ) -f the Standard disulfide selution and the Test solution into the chromatograph, record the ehromategrams, and measure the respenses for the amifestine disulfide peaks. Caleulate the pereentage of amt ifestine disulfide in the pertion of Amifostine for Injection taken by the formala:

$$
(266.47 / 412.31)(10 C)\left(r_{4}+r_{s}\right)
$$

in whieh 266.47 and 412.31 are the molecular weights of amifes-tine-disulfide and amifestine-disulfide-tetrahydrechleride, respee
tively; $C$ is the concentration, in mg per mL, of USP Amifortine Pisulfide RS in the Standetd disulfite solution; and $r_{t}$-and $r_{s}$-are the peak response obtained from the Test solution and the Stat dard disulfide solution, respectively: net more than $2.0 \%$ of totat impurities, ineluding amifostine thiol and amifostine disulfide, is fount.

## Briefing

Amoxicillin Tablets, USP 27 page 141. It is proposed to revise the Dissolution test to modify the Times and Tolerances in accordance with those approved by FDA.
(BPC: M. Marques) RTS-40246-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: water, 900 mL .
Apparatus 2: 75 rpm
Time: 9

- $30_{\text {■2S (USP28) }}$
minutes.
Determine the amount of $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~S}$ dissolved by employing the following method.
pH 5.0 Buffer-Dissolve 27.2 g of monobasic potassium phosphate in 3 L of water, adjust with a $45 \%(\mathrm{w} / \mathrm{w})$ solution of potassium hydroxide to a pH of $5.0 \pm 0.1$, dilute with water to obtain 4 L of solution, and mix.

Mobile phase-Prepare a mixture of pH 5.0 Buffer and acetonitrile ( $3900: 100$ ), and pass through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solution-Dissolve an accurately weighed quantity of USP Amoxicillin RS in $p H$ 5.0 Buffer to obtain a solution having a known concentration of about 0.05 mg per mL . Use this solution within 6 hours.

Test solution-Pass a portion of the solution under test through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity. Quantitatively dilute an accurately measured volume of the filtrate with water to obtain a solution having an estimated concentration of about 0.045 mg of amoxicillin per mL . Use this solution within 6 hours.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector, a 3.9 $\mathrm{mm} \times 30-\mathrm{cm}$ analytical column that contains packing L1, and a $2-\mathrm{mm} \times 2-\mathrm{cm}$ guard column that contains packing L2. The analytical column is maintained at a constant temperature of about $40 \pm 1^{\circ}$. The flow rate is about 0.7 mL per minute. Chromatograph the $\overline{S t a n d a r d}$ solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is between 1.1 and 2.8 ; the column efficiency is not less than 1700 theoretical plates; the tailing factor is not more than 2.5 ; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of amoxicillin $\left(\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~S}\right)$ dissolved by the formula:

$$
0.9 D C P\left(r_{U} / r_{S}\right)
$$

in which $D$ is the dilution factor used in preparing the Test solution; $C$ is the concentration, in mg per mL, of USP Amoxicillin RS in the Standard solution; $P$ is the stated content, in $\mu \mathrm{g}$ of amoxicillin $\left(\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~S}\right)$ per mg, of USP Amoxicillin RS; and $r_{U}$ and $r_{S}$ are the amoxicillin peak responses obtained from the Test solution and the Standard solution, respectively.

Tolerances-Not less than $80 \%$
-75\% ${ }^{\text {■ } 2 S}$ (USP28)
(Q) of the labeled amount of $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~S}$ is dissolved in $9 \theta$
-30 $\mathbf{n}_{2 S}$ (USP28)
minutes.
FOR PRODUCTS LABELED AS CHEWABLE TABLETS-Proceed as directed above.
-Time: 20 minutes.п2S (USP28)
Tolerances-Not less than $70 \%(Q)$ of the labeled amount of $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~S}$ is dissolved in 90
-20!2S (USP28) minutes.

■FOR VETERINARY PRODUCTS——Proceed as directed above, except to use Apparatus 2 at 100 rpm .п2S (USP28)

## Briefing

Brompheniramine Maleate Tablets, USP 27 page 272. It is proposed to specify the path length of the cuvette used in the Dissolution test.
(BPC: M. Marques) RTS-41779-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: water; 500 mL .
Apparatus 1: 100 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{BrN}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted with 3 N hydrochloric acid,

■using 5-cm cuvettes, $\boldsymbol{m}_{2 S}$ (USP28)
in comparison with a Standard solution having a known concentration of USP Brompheniramine Maleate RS in the same medium. Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{BrN}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ is dissolved in 45 minutes.

## Briefing

Budesonide. Because there is no existing USP monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedure in the Assay is based on analyses performed with the Symmetry brand of L1 column. The typical retention times are about 15.0 for the first eluted epimer of budesonide (epimer B) and about 16.0 for the second eluted epimer of budesonide (epimer A).
(PA1: C. Anthony) RTS-38281-1

## Add the following:

## - Budesonide

$\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{O}_{6} \quad 430.53$
Pregna-1,4-diene-3,20-dione, 16,17-butylidenebis(oxy)-
11,21-dihydroxy-, [11 $\beta, 16 \alpha(R)]$;
16 $\alpha, 17-[(S)$-Butylidenebis(oxy)]-11 $\beta, 21$-dihydroxypregna-1,4-diene-3,20-dione;
(RS)-11 $\beta, 16 \alpha, 17,21-T e t r a h y d r o x y p r e g n a-1,4-d i e n e-3,20-$ dione cyclic 16,17-acetal with butyraldehyde
[51372-29-3; 51372-28-2; 51333-22-3].
» Budesonide is a mixture of two epimeric forms, epimer A and epimer B. It contains not less than 44.0 percent and not more than 51.0 percent of epimer A, and the sum of both epimers is not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{O}_{6}$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards $\langle 11\rangle — U S P$ Budesonide RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Solution: $\quad 50 \mu \mathrm{~g}$ per mL .
Medium: methanol.
Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , and the total combined molds and yeast count does not exceed 100 cfu per g .

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ to constant weight. It loses not more than $0.3 \%$ of its weight.

Organic volatile impurities, Method $I\langle 467\rangle$ : meets the requirements.

## Limit of methanol-

Standard stock solution 1-Prepare a solution of about 50 mg per mL and 25 mg per mL , respectively, of methanol and methylene chloride in $\mathrm{N}, \mathrm{N}$-dimethylacetamide.

Standard stock solution 2-Transfer 10.0 mL of Standard stock solution 1 into a $100-\mathrm{mL}$ volumetric flask, and dilute with $N, N$-dimethylacetamide to volume.

Standard solution 1-Transfer 1.0 mL of Standard stock solution 2 into a $100-\mathrm{mL}$ volumetric flask, and dilute with $\mathrm{N}, \mathrm{N}$-dimethylacetamide to volume.

Standard solution 2-Transfer 2.0 mL of Standard stock solution 2 into a $100-\mathrm{mL}$ volumetric flask, and dilute with $\mathrm{N}, \mathrm{N}$-dimethylacetamide to volume.

Resolution solution-Transfer 1 mL of Standard stock solution 1 and 4 mL of $\mathrm{N}, \mathrm{N}$-dimethylacetamide into a $10-\mathrm{mL}$ headspace vial.

Test solution 1-Transfer about 0.5 g of Budesonide, accurately weighed, into a $10-\mathrm{mL}$ headspace vial, add 5.0 ml of $N, N$-dimethylacetamide, and seal.

Test solution 2-Transfer about 0.5 g of Budesonide, accurately weighed, into a $10-\mathrm{mL}$ headspace vial, add 5.0 ml of Standard solution 1, and seal.

Test solution 3-Transfer about 0.5 g of Budesonide, accurately weighed, into a $10-\mathrm{mL}$ headspace vial, add 5.0 ml of Standard solution 2, and seal.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused silica column bonded with a $0.5 \mu \mathrm{~m}$ layer of phase G43, and a split injection system. The carrier gas is helium; the linear flow velocity is about 30 cm per second; the equilibration time is 10 minutes; and the bath and valve/loop temperatures are maintained at $80^{\circ}$ and $85^{\circ}$, respectively. The chromatograph is programmed as follows. Initially the column temperature is equilibrated at $50^{\circ}$ for 6 minutes, then the temperature is increased at a rate of $30^{\circ}$ per minute to $220^{\circ}$, and is maintained at $220^{\circ}$ for 2 minutes. The injection port temperature is maintained at $250^{\circ}$, and the detector is maintained at $300^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between methanol and methylene chloride is not less than 5.0.

Procedure-Separately inject equal volumes (about 1 mL ) of the headspace of Test solution 1, 2, and 3 into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Plot the response for methanol in each test solution versus the quantity, in mg , of methanol in each test solution. Draw the straight line best fitting the three points, and extrapolate the line until it intersects the quantity-of-methanol axis. From the intercept, determine the quantity, in mg, of methanol in Test solution 1; not more than $0.1 \%$ is found.

## Limit of 21-acetate of budesonide-

Buffer solution-Proceed as directed in the Assay.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (55:45). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard solution-Prepare as directed for Standard preparation in the Assay.

Test solution-Prepare as directed for Assay preparation in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 3.1 for the first eluted epimer of 21-acetate of budesonide, about 3.2 for the second eluted epimer of 21acetate of budesonide, 1.0 for the first eluted epimer of budesonide (epimer B), and about 1.1 for the second eluted epimer of budesonide (epimer A); and the column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of the 21-acetate of budesonide in the portion of Budesonide taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the sum of the peak areas for the two epimers of 21-acetate of budesonide; and $r_{s}$ is the sum of the areas of the two budesonide peaks; not more than $0.1 \%$ of the $21-\mathrm{ac}-$ etate of budesonide is found.

## Limit of 11-ketobudesonide-

Buffer solution-Proceed as directed in the Assay.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and isopropanol (65:26:9). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Prepare as directed for Standard preparation in the Assay.

Test solution-Proceed as directed for Assay preparation in the Assay.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.73 and 0.78 , respectively, for the two epimers of 11-ketobudesonide, about 0.68 for 21-dehydrobudesonide, about 0.84 for 14,15-dehydrobudesonide, and 1.0 for the first eluted epimer of budesonide (epimer B); the resolution, $R$, between the first epimer of 11-ketobudesonide and 21-dehydrobudesonide is not less than 1.0 and between the second epimer of 11-ketobudesonide and 14,15 -dehydrobudesonide is not less than 1.2 ; and the column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of 11-ketobudesonide in the portion of Budesonide taken by the formula:

$$
100\left(r_{i} / r_{U}\right)
$$

in which $r_{i}$ is the sum of the areas of the two ketobudesonide peaks; and $r_{U}$ is the sum of the areas of the two budesonide peaks; not more than $0.2 \%$ of 11 -ketobudesonide is found.

## Related compounds-

Buffer solution and Mobile phase-Proceed as directed in the Assay.

Standard solution-Prepare as directed for Standard preparation in the Assay.

Test solution-Proceed as directed for Assay preparation in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency
is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure—Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Budesonide taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak area response for each impurity; and $r_{s}$ is the sum of the responses of all the peaks: the impurities meet the requirements listed in the table below.

| Compound Name | Relative <br> Retention Time | Limit $\%$ |
| :--- | :---: | :---: |
| $16 \alpha$-hydroxylprednoislone | 0.11 | 0.2 |
| D-homobudesonide | 0.36 | 0.1 |
| 21-dehydrobudesonide | 0.61 | 0.07 |
| 14,15 -dehydrobudesonide | 0.86 | 0.1 |
| Total specified impurities | - | 0.4 |
| Any other individual impurity | - | $<0.1$ |
| Total unspecified impurities | - | 0.4 |

## Assay-

Buffer solution-Dissolve 3.17 g of sodium dihydrogen phosphate in water, add 0.23 g of phosphoric acid, dilute with water to 1000 mL , and mix. The pH should be $3.2 \pm 0.1$.
Mobile phase—Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $68: 32$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard preparation-Dissolve an accurately weighed quantity of USP Budesonide RS in acetonitrile, and dilute quantitatively and stepwise, if necessary, with Buffer solution to obtain a solution having a known concentration of about 0.5 mg per mL . [NOTE-The solution should be protected from light].

Assay preparation-Transfer about 25 mg of Budesonide, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in 15 mL of acetonitrile, dilute with Buffer solution to volume, and mix. [NOTE-The solution should be protected from light.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )_
The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention time for epimer A is 1.1 with respect to epimer B ; the resolution, $R$, between the two budesonide epimer peaks is greater than 1.5 ; and the column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure—Separately inject equal volumes (about 20 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the quantity, in mg , of epimer $\mathrm{A}\left(\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{O}_{6}\right)$ in the portion of Budesonide taken by the formula:

$$
50 C\left[r_{U A} /\left(r_{S A}+r_{S B}\right)\right]
$$

in which $C$ is the concentration, in mg per mL , of USP Budesonide RS in the Standard preparation; $r_{U A}$ and $r_{S A}$ are the peak area responses for epimer A obtained from the Assay preparation and the Standard preparation, respectively; and $r_{S B}$ is the peak area response for epimer B obtained from the Assay preparation and the Standard preparation, respectively. Calculate the quantity, in mg , of budesonide $\left(\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{O}_{6}\right)$ in the portion of Budesonide taken by the formula:

$$
50 C\left[\left(r_{U A}+r_{U B}\right) /\left(r_{S A}+r_{S B}\right)\right]
$$

in which $r_{U B}$ is the peak area response of the epimer B obtained from the Assay preparation, and the other terms are as defined above.■2S (USP28)

## BRIEFING

Clorazepate Dipotassium, USP 27 page 489. It is proposed to replace the TLC Related compounds test with two HPLC procedures, that, according to the validation data received, are more sensitive and specific. The validation of the procedures was based on analyses performed with a $\mu$ Bondapak C18 brand of L1 column. For Test 1 , the typicl retention time of the internal standard is about 8 minutes and about 11 minutes for 7-chloro-1,3-dihydro-5-phe-nyl-2H-1,4-benzodiazepin-2-one. For Test 2, the typical retention time of 2-amino-5-chlorobenzophenone is about 11 minutes. In both methods, clorazepate dipotassium elutes in the solvent front.
(PA3: S. Salado) RTS-40998-1

Related compounds-[NOTE-Onee the selutions are prepared, they are unstable and should be used immediately.]

Piltting soldtion- Prepare a solution by dissolving 4 g of potassitm carbenate in 100 mL of water.
Standed solution - . Dissolve an aceurately weighed quantity ef USP Clerazepate Dipetassium-PS and dilute stepwise with $D i$ tuting solution to obtain a solution having a concentration of 0.1 mepermb.
Standard solution B. Transfer an aceurately weighed quantity of about 10 mg of USP 2 Amine- 5 chlorobenzophenene RS to a 100 mL volumetric flask, dissolve in acetone, dilute with ace to volume, and mix. Dilute 10.0 mL of this solution with ace tone to 50.0 mL .

Test solution Dissolve an aceurately weighed quantity of about 100 mg of Clorazepate Dipotassimm in 5.0 mL of $P$ ilhting solution.

Proeedure- Apply separately $5 \mu \mathrm{~L}$ of the Test solution and $5 \mu \mathrm{~L}$ of each Standed solution to a suitable thin layer chrematographie plate (see Chromagrap $\langle 624$ ) ) eoated with a- 0.25 mm layer of ehrematographic silie gel mixture. Allow the spets dry, and develop the chromatograms in a solvent system consisting of a mix tre of chloroform and acetone ( $85: 15$ ) until the solvent front has moved about three fourths of the length of the plate. Remove the plate from the developing chamber, matk the solvent fromt, and at fow the solvent to evaporate. Examine the plate under short wavelength UV light, and compare the intensities of any secondary spets observed in the chromatogram of the Test solution with these of the prineipal spets in the chromatograms of Staded solution A. No secendary spet frem the chremategram of the Test solution is larger or more intense than the principal spot obtained from-Standatd solution $4(0.5 \%)$. Suecessively spray the plate with a freshly prepared $1 \%$ solution of soditm nitrite in 1 N hydrochloric acid. Bry the plate in a current of air and spray with a $0.4 \%$ (w/v) solution of N ( 1 naphthyl) ethylenediamine dihyydrochloride in aleohol. Any violet colored spot present in the chromatogram of the Test solution is not greater in size or intensity than the principal spet
obtained from Standard solution $B(0.1 \%)$, and the sum of the in tensities of all secendary spets obtained by both vistalization tech niques from the Test solution correspends to not more than-1\%.
-TEST 1—
Phosphate buffer solution-Dissolve about 13.8 g of monobasic sodium phosphate in 500 mL of water, adjust with 2.5 N sodium hydroxide to a pH of 8.0 , and mix.

Mobile phase-Prepare a filtered and degassed mixture of water, acetonitrile, and Phosphate buffer solution (5:4:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Dissolve about 5 mL of 2,6dimethylaniline in 50 mL of hexane, and carefully add dropwise hydrochloric acid to precipitate the amine hydrochloride. Filter through a sintered-glass funnel, wash the solid precipitate with hexane, and allow the precipitate to dry. Transfer about 50 mg of the dried precipitate of 2,6-dimethylaniline hydrochloride to a $100-\mathrm{mL}$ volumetric flask, add 10.0 mL of Phosphate buffer solution and 40 mL of water, and dilute with acetonitrile to volume.

Standard solution-Dissolve an accurately weighed quantity of USP 7-Chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about $75 \mu \mathrm{~g}$ per mL . Transfer 4.0 mL of this solution to a $50-\mathrm{mL}$ conical flask, add 4.0 mL of 0.7 M potassium carbonate, 2.0 mL of Internal standard solution, and 15.0 mL of water. Insert a stopper, and mix.

Test solution-Transfer an accurately weighed quantity of about 50 mg of Clorazepate Dipotassium to a $50-\mathrm{mL}$ conical flask. Add 4.0 mL of 0.7 M potassium carbonate, and start stirring the solution. Add 2 mL of Internal standard solution and 19.0 mL of water. Stop stirring about 5 minutes after the addition of the 0.7 M potassium carbonate solution. [NOTEPrepare fresh immediately before each injection.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a 232 -nm detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention time for 2,6dimethylaniline is about 0.8 and 1.0 for 7-chloro-1,3-dihy-dro-5-phenyl-2H-1,4-benzodiazepin-2-one; the relative standard deviation of the peak area ratio of 7-chloro-1,3-di-hydro-5-phenyl-2 H -1,4-benzodiazepin-2-one to 2,6-dimethylaniline for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of 7-chloro-1,3-dihy-dro-5-phenyl-2H-1,4-benzodiazepin-2-one in the portion of Clorazepate Dipotassium taken by the formula:

$$
2500(C / W)\left(R_{i} / R_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP 7-Chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one RS in the Standard solution; $W$ is the weight, in mg , of Clorazepate Dipotassium taken to prepare the Test solution; $R_{i}$ is the peak area ratio of any impurity to 2,6-dimethylaniline obtained from the Test solution; and $R_{s}$ is the peak area ratio of 7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2one to 2,6-dimethylaniline obtained from the Standard solution: not more than $0.5 \%$ of 7 -chloro-1,3-dihydro-5-phenyl$2 \mathrm{H}-1,4$-benzodiazepin-2-one is found, and not more than $0.1 \%$ of any individual impurity is found.

TEST 2-
Diluent-Prepare a mixture of 0.001 N sodium hydroxide and acetonitrile $(1: 1)$.

Mobile phase-Prepare a filtered and degassed mixture of water, acetonitrile, and a 1 M solution of tetrabutylammonium hydroxide in methanol (110:90:1), adjust with phosphoric acid to a pH of 7.7, and mix. Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard solution-Dissolve an accurately weighed quantity of USP 2-Amino-5-chlorobenzophenone RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent, to obtain a solution having a known concentration of about 0.0026 mg per mL .
Test solution-Transfer about 300 mg of Clorazepate Dipotassium, accurately weighed, to a glass test tube. Add 10.0 mL of Diluent, and vigorously mix on a vortex mixer for about 90 seconds.[NOTE-Prepare fresh immediately before each injection.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $238-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation of the peak height for replicate injections is not more than $3.0 \%$.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Clorazepate Dipotassium taken formula:

$$
1000(C / W)\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP 2-Amino-5-chlorobenzophenone RS in the Standard solution; $W$ is the weight, in mg, of sample taken; $r_{i}$ is the peak height of each impurity obtained from the Test solution; and $r_{s}$ is the peak height of 2-amino-5-chlorobenzophenone obtained
from the Standard solution: not more than $0.1 \%$ of 7 -chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one is found, not more than $0.1 \%$ of any other individual impurity is found, and not more than $1.0 \%$ of total impurities in Test 1 and Test 2 is found. $\mathbf{Q S S}^{\text {S }}$ (USP28)

## BRIEFING

Clozapine, USP 27 page 498 and page 3053 of the First Supplement. It is proposed to revise the test for Chromatographic purity to include the chemical name corresponding to each approximate $R_{F}$ value specified in the Procedure.
(PA3: S. Salado) RTS-41679-1

## Change to read:

## Chromatographic purity-

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution-Dissolve an accurately weighed quantity of Clozapine in chloroform to obtain a solution containing 10.0 mg per mL .
Standard solutions-Dissolve an accurately weighed quantity of USP Clozapine RS in chloroform, and mix to obtain a solution having a known concentration of 0.1 mg per mL . Quantitatively dilute portions of this solution with chloroform to obtain the following solutions.

| Standard <br> solution | Dilution | Concentration <br> ( $\mu$ g of RS <br> per mL) | Percentage <br> $(\%$, for <br> comparison with <br> test specimen) |
| :---: | :---: | :---: | :---: |
| $A$ | 3 in 10 | 30 | 0.3 |
| $B$ | 1 in 5 | 20 | 0.2 |
| $C$ | 1 in 10 | 10 | 0.1 |
| $D$ | 1 in 20 | 5 | 0.05 |

Application volume: $20 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform and methanol (3:1).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution with those of the principal spots in the chromatograms of the Standard solutions: no spot from the chromatogram of the Test solution with an $R_{F}$ value of about $0.82,0.67$, or 0.10 .

■about 0.82 , corresponding to 1,4 -bis( 8 -chloro- $5 H$-diben-zo[b,e][1,4]diazepin-11-yl)piperazine; about 0.67 , corresponding to 8 -chloro-5,10-dihydro-11H-dibenzo[b, e][1,4]-diazepin-11-one; or about 0.10 , corresponding to 8 -chloro-
11-(1-piperazinyl)-5H-dibenzo[b,e][1,4]diazepine, $■ 25$ (USP28) is larger or more intense than that obtained from Standard solution B, Standard solution C, or Standard solution A, respectively; no other secondary spot from the chromatogram of the Test solution is larger or more intense than the principal spot obtained from Standard solution $C(0.1 \%)$; and the sum of the intensities of all secondary spots obtained from the Test solution corresponds to not more than $0.6 \%$.

## BRIEFING

Cyclandelate, page 1023 of $P F$ 29(4) [July-Aug. 2003]. On the basis of comments received, it is proposed to revise Identification test $A$ to make corrections in the Solution and the Medium.
(PA5: A. Wilk) RTS-41810-1

## Add the following:

## ©Cyclandelate

$\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{3} \quad 276.38$

## 3,3,5-Trimethylcyclohexanol $\alpha$-phenyl- $\alpha$-hydroxyacetate.

1,5-cis-3,3,5-Trimethylcyclohexyl 2-hydroxy-2-phenyl acetate [456-59-7].
» Cyclandelate contains not less than 98.0 percent of $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{3}$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers, and store below $40^{\circ}$, preferably between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle — U S P$ Cyclandelate $R S$.

## Identification-

A: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Solution: $0.5 \mu \mathrm{mg}$ per mL .
Medium: 95 percent alcohol. The solution exhibits absorption maxima between 250 and 254 nm , between 256 and 260 nm , and between 262 and 266 nm .
B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Test solution-Dissolve 10 mg of Cyclandelate in 1 mL of alcohol.

Application volume: $5 \mu \mathrm{~L}$.
Developing solvent system: a mixture of hexane, ethyl acetate, and glacial acetic acid ( $8: 2: 1$ ).

Loss on drying $\langle 731\rangle$ —Dry 1 g over silica gel for 24 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.

## Chromatographic purity-

Mobile phase and Chromatographic system-Prepare as directed in the Assay.

Test solution-Transfer about 100 mg of Cyclandelate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Standard solution-Pipet 3.0 mL of the Test solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Allow the chromatogram of the Test solution to run for a period of time that is about 3 times the
retention time of cyclandelate. The total area of all the peaks from the Test solution, other than the peak obtained from cyclandelate, is not greater than the peak area of cyclandelate obtained from the Standard solution: not more than $3.0 \%$ of total impurities is found.

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water ( $4: 1$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Resolution solution-Dissolve accurately weighed quantities of USP Cyclandelate RS and dicyclohexyl phthalate in Mobile phase to obtain a solution having known concentrations of about 0.2 mg per mL and 0.08 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Cyclandelate RS in Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL . Pipet 10.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Assay preparation-Transfer about 100 mg of Cyclandelate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Pipet 10.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $228-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between cyclandelate and dicyclohexyl phthalate is not less than 7. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{3}$ in the portion of Cyclandelate taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Cyclandelate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## BRIEFING

Diclofenac Sodium Delayed-Release Tablets, USP 27 page 596. It is proposed to make a correction in the Procedure in the test for Drug release to be in accordance with the validation report.
(BPC: M. Marques) RTS-40477-4

## Change to read:

Drug release, Method $B\langle 724\rangle$ -
ACID STAGE-
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 900 mL .
Apparatus 2 (paddles constructed of, or coated with, polytef being used): 50 rpm .

Procedure-At the end of 2 hours, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test in the Buffer stage. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 minutes. Determine the amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 2.0 mL

- $3.0 \mathrm{~mL}_{\mathbf{■} 2 \mathrm{~S}}$ (USP28)
of this solution to a second $100-\mathrm{mL}$ volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide ( $900: 20$ ) to volume, and mix. This Standard solution contains about $13.6 \mu \mathrm{~g}$ of USP Diclofenac Sodium RS per mL.
buffer stage-
pH 6.8 Phosphate buffer-Dissolve 76 g of tribasic sodium phosphate in water to obtain 1000 mL of solution. Mix 250 mL of this solution with 750 mL of 0.1 N hydrochloric acid, and, if necessary, adjust with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of $6.8 \pm 0.05$.
Medium: pH 6.8 Phosphate buffer; 900 mL .
Apparatus 2: 50 rpm .
Procedure-At the end of 45 minutes, determine the amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solutions under test, suitably diluted with Medium, in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a second $100-\mathrm{mL}$ volumetric flask, dilute with Medium, as obtained in the Buffer stage, to volume, and mix. This Standard solution contains about 0.02 mg of USP Diclofenac Sodium RS per mL .

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{Cl}_{2} \mathrm{NNaO}_{2}$ is dissolved.

Dimercaprol Injection, USP 27 page 632. It is proposed to add a test for Bacterial endotoxins to this monograph.
(PA4: E. Gonikberg; AMB: D. Porter) RTS-41570-1

## Add the following:

■USP Reference standards $\langle 11\rangle-U S P$ Endotoxin $R S_{\square}$ ■ (USP28)

## Add the following:

■Bacterial endotoxins $\langle 85\rangle$-It contains not more than 1 USP Endotoxin Unit per mg of dimercaprol.■2S (USP28)

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements $\mathbf{m}^{2 S}$ (USP27)
$\boldsymbol{\square}_{\text {with }}$ respect to diphenoxylate hydrochloride.■2S (USP28)

Doxepin Hydrochloride Capsules, USP 27 page 664. It is proposed to revise the Identification test, changing the GC system (which has a packed column that is difficult to find on the market) for the HPLC system described in the Assay.
(PA3: S. Salado) RTS-41586-01

## Change to read:

Identification-Transfer the contents of 2 Capsules to a suitable flask. Add about 30 mL of chloroform, and shake by mechanieal means for 30 minttes. Dilute with chlereform 1050 mL , and mix. Quickly flter a pertion of the solution threugh Whatman No. 4 fit ter paper, rejecting the first 15 mL of the filtrate. Pipet an aliquot of the filtered solution containing about 10 mg of doxepin into a-se parator. Add, if necessary, additional chloroform to bring the vol ume to 25 mL . Extract with 50 mL of 1 N sodium hydroxide, and drain the chloroform into another separator. Discard the sodium hydroxide washing. Wash the chloreform solution with $20-\mathrm{mL}$ of 1 N sodium hydroxide. Filter the chloroform layer through eotton into a 100 mL volumetric flack, extract the aqueous layer with 25 mL of chloreform, and add the chloreform layer to the volumetrie flask. Dilute with chloroform to volume, and mix. Inject a portion of the chloroform solution, equivalent to 0.5 Hg of doxepin, dilut ing the chloroform solution, if necessary, into a gas chromatograph equipped with a flame-ionization detector and a $-3.1 \mathrm{~m} \times 2 \mathrm{~mm}$
eolumn packed with 3\% eymmomethylphenyl silieone liquid phase en 80-10-110 mesh acid washed, silanized diatemaceous earth. The carrier gas is helium flowing at a rate of 30 mL per minute. The coltumn temperature is $220^{\circ}$, and the temperattre of the injec tion pert and the detector is $250^{\circ}$. The retention times obtained for the ( $Z$ ) and (E) isomer peaks in the chrematogram of the solution from the Capsules are the same as these obtained for a 20 mg spec imen of USP Doxepin Hydrochloride PS treat and chromatgraphed in a similar manner.
-The retention times for the major peaks for (E)- and (Z)isomers in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.■2S (USP28)

## Briefing

Enalapril Maleate and Hydrochlorothiazide Tablets, USP 27 page 703. It is proposed to make a correction in the procedure in the Dissolution test.
(BPC: M. Marques) RTS-41753-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 30 minutes.
Determine the amount of $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}_{5} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ dissolved, using filtered portions of the solution under test and following the Procedure for content uniformity of enalapril maleate, making any necessary volumetric adjustments, in comparison with a Standard solution of USP Enalapril Maleate RS having similar concentrations in the same medium.

Determine the amount of $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 320 nm and at 360 nm

- $\quad$ 2S (USP28)
in 1-cm cells, on filtered portions of the solution under test, suitably diluted with Medium, in comparison with a Standard solution having a known concentration of USP Hydrochlorothiazide RS dissolved in 20 mL of methanol and diluted with Medium.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of enalapril maleate $\left(\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}_{5} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}\right)$ and not less than $60 \%$ $(Q)$ of the labeled amount of hydrochlorothiazide $\left(\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}\right)$ are dissolved in 30 minutes.

BRIEFING

Ergotamine Tartrate and Caffeine Suppositories, USP 27 page 726; Ergotamine Tartrate and Caffeine Tablets, USP 27 page 727. It is proposed to replace the undefined term "fixed alkali" in Identification test $B$ with the name of the actual reagent used.
(PA3: S. Salado) RTS-41195-2

## Change to read:

Identification-Melt 1 Suppository in 10 mL of hot tartaric acid solution (1 in 100), and mix. Chill the mixture until the layer of oil has hardened, then filter, divide the filtrate into two parts, and use this filtrate for the following tests.

A: To one part of the filtrate add 10 mL of $p$-dimethylaminobenzaldehyde TS: a blue color develops (presence of ergotamine).

B: Transfer the remaining part of the filtrate to a small evaporating dish, evaporate on a steam bath to dryness, add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, and evaporate. Invert the dish over a vessel containing ammonium hydroxide: the residue acquires a purple color, which disappears upon the addition of a solution of fixed alkali
$\mathbf{- 1 ~}_{1} \mathrm{~N}$ sodium hydroxide ${ }_{\square 2 S}$ (USP28) (presence of caffeine).

## BRIEFING

Estradiol and Norethindrone Acetate Tablets. Because there is no existing USP monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedure is based on analyses performed with the Waters Symmetry C18 brand of L1 column.
(PA1: C. Anthony) RTS—39932-1

## Add the following:

## Estradiol and Norethindrone Acetate Tablets

» Estradiol and Norethindrone Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol $\left(\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norethindrone acetate $\left(\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{O}_{3}\right)$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Estradiol RS. USP
Estrone RS. USP Norethindrone Acetate RS.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Test solution-Place 2 Tablets into a $10-\mathrm{mL}$ vial, and add 0.2 mL of water. When the Tablets are partially disintegrated, add a few glass beads, and shake vigorously to disintegration. Add 4.0 mL of dehydrated alcohol, and shake. Centrifuge until the supernatant is clear before application to the plate.

Standard solution-Dissolve accurately weighed quantities, of USP Estradiol RS and USP Norethindrone Acetate RS in dehydrated alcohol to obtain a solution having known concentrations of 0.5 mg per mL and 0.25 mg per mL , respectively.

Application volume: $2 \mu \mathrm{~L}$.
Developing solvent solution: a mixture of chloroform and acetone ( $9: 1$ ).
Procedure-Proceed as directed in the chapter, using the Developing solvent system. After removal of the plate, mark the solvent front, and allow the solvent to evaporate. Place the plate on a heating plate at $100^{\circ}$ for 15 minutes. Allow the plate to cool, and then immerse it in a mixture of dehydrated alcohol and concentrated sulfuric acid (95:5). Place the plate on a piece of thick horizontal paper until it is almost dry. Heat the plate at $100^{\circ}$ until it has fully developed. Examine under UV light at 365 nm . The color and $R_{F}$ value of the principal spots obtained from the Test solution correspond to those obtained from the Standard solution.

B: The retention time and UV spectrum of the major peaks in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.

Microbial limits $\langle 61\rangle$ —The total aerobic microbial count does not exceed 1000 cfu per g , and the total combined molds and yeasts count does not exceed 100 cfu per g . The Tablets meet the requirements of the tests for the absence of Salmonella species and Escherichia coli.

Dissolution-[To come.]
Loss on drying $\langle 731\rangle$ —Dry about 1200 mg of finely powdered Tablets in a tared evaporating dish at a pressure not exceeding 25 mm of mercury at $60^{\circ}$ for 3 hours: it loses not more than $7.5 \%$ of its weight.

## Chromatographic purity-

Solution $A$-Prepare a mixture of water and tetrahydrofuran (200:1).

Solution $B$-Prepare a degassed solution of acetonitrile, water, and tetrahydrofuran ( $160: 40: 1$ ).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments, if necessary (see System Suitability under Chromatography (621〉).

Diluent-Prepare a mixture of water and dehydrated alcohol (1:1).

System suitability solution-Dissolve accurately weighed quantities of USP Estradiol RS, USP Norethindrone Acetate RS, and USP Estrone RS in Diluent to obtain a solution having known concentrations of about $240 \mu \mathrm{~g}$ per $\mathrm{mL}, 60 \mu \mathrm{~g}$ per mL , and $1 \mu \mathrm{~g}$ per mL , respectively.

Test solution-Accurately weigh and finely powder 20 Tablets. Transfer the equivalent of 12 Tablets to an appropriate flask, and dissolve in a known volume of Diluent to obtain a solution having known concentrations of estradiol and norethindrone acetate of about $240 \mu \mathrm{~g}$ per mL and $120 \mu \mathrm{~g}$ per mL , respectively. Filter the solution, if necessary.

Estradiol standard stock solution-Dissolve an accurately weighed quantity of USP Estradiol RS in alcohol to obtain a solution having a known concentration of estradiol of about $250 \mu \mathrm{~g}$ per mL .
Norethindrone acetate standard stock solution-Dissolve an accurately weighed quantity of USP Norethindrone Acetate RS in alcohol to obtain a solution having a known concentration of norethindrone acetate of about $150 \mu \mathrm{~g}$ per mL .

Standard solution-Combine $250 \mu \mathrm{~L}$ of Estradiol standard stock solution and $100 \mu \mathrm{~L}$ of Norethindrone acetate standard stock solution, and dilute with 50.0 mL of Diluent.

Chromatographic system-The liquid chromatograph is equipped with a dual wavelength detector ( 235 nm and 254 nm ) and a $3.9-\times 30-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L1. The flow rate is about 0.8 mL per minute. Program the chromatogram as follows.

| Time | Solution $A$ <br> (minutes) | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 80 | 20 | equilibration |
| $0-2$ | $80 \rightarrow 65$ | $20 \rightarrow 35$ | linear gradient |
| $2-35$ | $65 \rightarrow 20$ | $35 \rightarrow 80$ | linear gradient |
| $35-49$ | 20 | 80 | isocratic |
| $49-50$ | $20 \rightarrow 80$ | $80 \rightarrow 20$ | linear gradient |
| $50-60$ | 80 | 20 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.4 for estrone, about 3.0 for norethindrone acetate, and 1.0 for estradiol. The resolution, $R$, between estrone and estradiol is not less than 1.3, measured at 254 nm .

Procedure-Separately inject equal volumes (about 100 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any estradiol impurity in the portion of Tablets taken by the formula:

$$
100 F\left(C_{S} / C_{T}\right)\left(r_{i} / r_{s}\right)
$$

in which $F$ is the relative response factor of any estradiol impurity relative to estradiol; $C_{S}$ and $C_{T}$ are the concentrations of the Standard solution and the Test solution, respectively; $r_{i}$ is the peak area at 235 nm for each impurity obtained from the Test solution; and $r_{s}$ is the peak area at 235 nm obtained from the Standard solution. The Tablets meet the requirements given in Table 1.

Table 1

|  | Compound | Relative <br> retention time | Relative <br> response factor |
| :--- | :---: | :---: | :---: |
| 6- $\alpha$ Hydroxyl estradiol | about 0.47 | 1.0 | $(\%)$ |
| 6- $\beta$ Hydroxyl estradiol | about 0.51 | 1.0 | 0.1 |
| 6-Keto estradiol | about 0.62 | 1.0 | 0.1 |
| 16-Keto estradiol | about 0.65 | 1.0 | 0.1 |
| 6-Keto estrone | about 0.75 | 1.0 | 0.1 |
| $\beta$-Equilenol | about 0.88 | 0.04 | 0.1 |
| 6-Dehydro estradiol | about 0.95 | 1.0 | 0.1 |
| Estradiol | 1.0 | 1.0 | 0.1 |
| $\alpha$-Estradiol | about 1.06 | 1.0 | 0.1 |
| Estrone | about 1.17 | 1.0 | 0.1 |
| 4-Methyl estradiol | about 1.24 | 1.0 | 0.1 |

Not more than $0.1 \%$ of any other impurity is found, and not more than $1.0 \%$ of total impurities is found. Calculate the percentage of any norethindrone acetate related impurities in the portion of Tablets taken by the formula:

$$
100 F\left(C_{S} / C_{T}\right)\left(r_{i} / r_{S}\right),
$$

in which $F$ is the relative response factor of any norethindrone acetate related impurity relative to norethindrone acetate; $C_{S}$ and $C_{T}$ are the concentrations of the Standard solution and the Test solution, respectively; $r_{i}$ is the peak area at 254 nm for each impurity obtained from the Test solution; and $r_{s}$ is the peak area at 254 nm obtained from the Standard solution. The Tablets meet the requirements given in Table 2.

Table 2

| Compound | Relative <br> retention time | Relative <br> response factor | Limit <br> $(\%)$ |
| :--- | :---: | :---: | :---: |
| 6- $\beta$ Hydroxy-norethindrone acetate | about 0.58 | 1.0 | 0.05 |
| Norethindrone | about 0.66 | 1.0 | 0.05 |
| 6-Keto-norethindrone acetate | about 0.79 | 1.8 | 0.05 |
| 19-Nor-17-alpha-preg-4-ene-3,20-dione | about 0.90 | 1.0 | 0.05 |
| 6-Dehydro-norethindrone acetate | about 0.97 | 2.2 | 0.05 |
| Norethindrone acetate | about 1.0 | 1.0 | 0.05 |

Not more than $0.5 \%$ of any other impurity is found, and not more than $1.0 \%$ of total impurities is found.

Assay-
Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water ( $55: 45$ ) (see Chromatography $\langle 621\rangle$ ).
Diluent-Prepare a mixture of water and dehydrated alcohol (1:1).

Estrone standard stock solution-Transfer about 6.00 mg of USP Estrone RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, and dissolve in 10 mL of dehydrated alcohol. Dilute with dehydrated alcohol to volume, and mix.

Estradiol standard stock solution-Prepare a solution of USP Estradiol RS in dehydrated alcohol having a known concentration of 0.25 mg per mL .
Norethindrone acetate standard stock solution-Prepare a solution of USP Norethindrone Acetate RS in dehydrated alcohol having a known concentration of 0.15 mg per mL .
System suitability preparation—Transfer $800 \mu \mathrm{~L}$ of Estradiol standard stock solution, $600 \mu \mathrm{~L}$ of Norethindrone acetate standard stock solution, and $200 \mu \mathrm{~L}$ of Estrone standard stock solution to a suitable flask containing 10.0 mL of Diluent.

## Standard preparation-Prepare a solution of Estradiol

 standard stock solution and Norethindrone acetate standard stock solution in Diluent having an accurately known concentration of about $20 \mu \mathrm{~L}$ per ml and $10 \mu \mathrm{~L}$ per mL , respectively.Assay preparation—Add 12 Tablets into a measured amount of Diluent, to obtain a solution having an estradiol concentration of about $20 \mu \mathrm{~L}$ per mL and a norethindrone acetate concentration of about $10 \mu \mathrm{~L}$ per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a diode array detector and a $4.6-\times 150-\mathrm{mm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Perform an investigational run to determine the retention times for estradiol and norethindrone acetate. Thus, the absorption of estradiol at 280 nm and norethindrone acetate at 254 nm can be included in a single run by altering the wavelength. Chromatograph the System suitability preparation, and record the peak areas as directed for Procedure: the resolution, $R$, between estradiol and estrone acetate is not less than 1.8. Chromatograph the Standard preparation, and record the peak area as directed for Procedure: the relative standard deviation for replicate injections is not more than $3 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the estradiol and norethindrone acetate peaks. Calculate the quantity, in mg, of estradiol $\left(\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ in each of the Tablets taken by the formula:

$$
(V C / 12)\left(r_{U} / r_{S}\right)
$$

in which $V$ is the volume, in mL , of Diluent taken to prepare the Assay preparation; $C$ is the concentration, in mg per mL , of USP Estradiol RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. Calculate the quantity, in mg, of norethindrone acetate $\left(\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{O}_{3}\right)$ in each of the Tablets taken by the formula:

$$
(V C / 12)\left(r_{U} / r_{s}\right),
$$

in which $V$ is the volume, in mL , of Diluent used in the $A s$ say preparation; $C$ is the concentration, in mg per mL , of USP Norethindrone Acetate RS in the Standard prepara-
tion; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## Briefing

Ethacrynic Acid Tablets, USP 27 page 755. It is proposed to revise the Dissolution test to make a correction in the preparation of the Medium.
(BPC: M. Marques) RTS-41591-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.1 \mathrm{M}$ phosphate buffer, prepared by mixing 13.6 g of monobasic potassium phosphate and 96.2 mL of 0.1 N
-92.2 mL of $1 \mathrm{~N}_{\mathbf{\square} 2 \mathrm{~S}}$ (USP28)
sodium hydroxide with water to obtain 1000 mL of a solution having a pH of $8.0 \pm 0.05 ; 900 \mathrm{~mL}$.

Apparatus 2: 50 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{Cl}_{2} \mathrm{O}_{4}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 277 nm on filtered portions of the solution under test, suitably diluted with Medium, in comparison with a Standard solution having a known concentration of USP Ethacrynic Acid RS in the same medium.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{Cl}_{2} \mathrm{O}_{4}$ is dissolved in 45 minutes.

## BRIEFING

Famotidine for Oral Suspension. Because there is no existing USP monograph for this dosage form, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for Related compounds and the Assay is based on analyses performed with the Inertsil ODS-3 brand of L1 column. The typical retention time for the famotidine peak is about 14 minutes.
(PA4: E. Gonikberg; AMB: D. Porter; NL: C. Barnstein; PSD: C. Okeke) RTS-41090-1

## Add the following:

## ■Famotidine for Oral Suspension

» Famotidine for Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of famotidine $\left(\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{~N}_{7} \mathrm{O}_{2} \mathrm{~S}_{3}\right)$ when constituted as directed. It contains one or more suitable buffers, colors, diluents, flavors, and preservatives.

Packaging and storage-Preserve in tight containers, protected from light. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Famotidine RS.
Identification-The retention time of the famotidine peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, obtained as directed in the Assay.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count is not more than 100 cfu per $g$. The total combined molds and yeasts count is not more than 100 cfu per g . It meets the requirements of the tests for the absence of Salmonella species and Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ : between 6.5 and 7.5 , in the suspension constituted as directed in the labeling.

Uniformity of dosage units $\langle 905\rangle$ : meets the requirements for Content Uniformity.

## Related compounds-

Buffer Solution, Solution A, Solution B, and Diluent-Prepare as directed in the Assay.
Standard solution-Use the Standard preparation, prepared as directed in the Assay.

System suitability stock solution-Weigh approximately 16 mg of Famotidine into a $50-\mathrm{mL}$ volumetric flask, dissolve in 1.0 mL of 1 N hydrochloric acid, heat at $80^{\circ}$ for 30 minutes, and cool to room temperature. Add 2.0 mL of 1 N sodium hydroxide, heat at $80^{\circ}$ for 30 minutes, and cool to room temperature. Add 1.0 mL of 1 N hydrochloric acid to neutralize, and dilute with Diluent to volume.

System suitability solution-Weigh approximately 16 mg of Famotidine into a $50-\mathrm{mL}$ volumetric flask, add 10 mL of Diluent, and sonicate to dissolve. Add 5 drops of hydrogen peroxide solution, heat at $80^{\circ}$ for 15 minutes, and cool to room temperature. Add 20 mL of System suitability stock solution, and dilute with Diluent to volume.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay, with the following addition. Chromatograph the System suitability solution and identify the famotidine peak and the peaks due to impurities listed in Table 1. Record the peak responses as directed for Procedure: the resolution, $R$, between the famotidine peak and the impurity D peak is greater than 1.5 .

## Table 1

| Name | Approximate Relative <br> Retention Time |
| :---: | :---: |
| Impurity A ${ }^{1}$ | 0.3 |
| Impurity B $^{2}$ | 0.5 |
| Impurity C $^{3}$ | 0.7 |
| Impurity D ${ }^{4}$ | 1.2 |

[^340]Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percent, of the total of impurities C and D in the portion of Famotidine for Oral Suspension taken by the formula:

$$
625 C_{s}\left(r_{u} / r_{s}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Famotidine RS in the Standard solution; $r_{u}$ is the sum of the peak areas for impurities C and D obtained from the Test solution; and $r_{s}$ is the famotidine peak area obtained from the Standard solution: the total of impurities C and D is less than $2 \%$.

## Assay-

Buffer solution-Dissolve 13.6 g of sodium acetate trihydrate in 900 mL of water, adjust with glacial acetic acid to a pH of $6.0 \pm 0.1$, and dilute with water to 1 L .
Solution A-Prepare a mixture of Buffer solution and acetonitrile (93:7).

Solution B-Use acetonitrile.
Diluent-Dissolve 13.6 g of monobasic sodium phosphate in 900 mL of water, adjust with 1 M sodium hydroxide to a pH of $7.0 \pm 0.1$, and dilute with water to 1 L . Mix 930 mL of this solution with 70 mL of acetonitrile.

Standard preparation-Dissolve an accurately weighed quantity of USP Famotidine RS in Diluent to obtain a solution having a known concentration of about 0.16 mg per mL .

Assay preparation-Transfer to a $100-\mathrm{mL}$ volumetric flask an accurately measured portion of Famotidine for Oral Suspension, freshly mixed and free from air bubbles and constituted as directed in the labeling, equivalent to about 40 mg of famotidine, based on the labeled amount per mL
of the Suspension. Add 10 mL of methanol, sonicate for 5 minutes, add 70 mL of Diluent, sonicate for an additional 5 minutes, and dilute with Diluent to volume. Dilute 10.0 mL of this solution with Diluent to 25.0 mL , and filter.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $268-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $35^{\circ}$. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| Time (minutes) | Solution A <br> (\%) | Solution B (\%) | Elution |
| :---: | :---: | :---: | :---: |
| 0-15 | 100 | 0 | isocratic |
| 15-42 | $100 \rightarrow 52$ | $0 \rightarrow 48$ | linear gradient |
| 42-43 | $52 \rightarrow 100$ | $48 \rightarrow 0$ | linear gradient |
| 43-45 | 100 | 0 | isocratic |

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2 ; the column efficiency is greater than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of famotidine $\left(\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{~N}_{7} \mathrm{O}_{2} \mathrm{~S}_{3}\right)$ in the portion of Famotidine for Oral Suspension taken by the formula:

$$
C D\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Famotidine RS in the Standard preparation; $D$ is the dilution factor, in mL, for famotidine in the Assay preparation;
and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{D S S}^{2 S}$ (USP28)

## Briefing

Famotidine Tablets, USP 27 page 776 and page 3057 of the First Supplement. Several changes are proposed in the test for Related compounds and the Assay. The term "related compound" in Table 1 is replaced with the term "impurity" to emphasize that these compounds are not available as USP Reference Standards. It is also proposed to round the relative retention times to one decimal place. In addition, there are some minor changes in the preparation of the System suitability solution.
(PA4: E. Gonikberg) RTS-41800-1

## Assay-

- Buffer solution-Dissolve 13.6 g of sodium acetate trihydrate in 750 mL of water. Add 1 mL of triethylamine, adjust with glacial acetic acid to a pH of 6.0 , and dilute with water to 1 L .

Mobile phase-Prepare a mixture of Buffer solution and acetonitrile (93:7), mix, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Dissolve 6.8 g of monobasic potassium phosphate in 750 mL of water, adjust with 1 M potassium hydroxide to a pH of 6.0 , and dilute with water to 1 L .

System suitability stock solution-Transfer 10 mg of famotidine to a $50-\mathrm{mL}$ volumetric flask, add 1 mL of 0.1 N hydrochloric acid, heat at $80^{\circ}$ for 30 minutes, and cool to room temperature. Add 2 mL of 0.1 N sodium hydroxide, heat at $80^{\circ}$ for 30 minutes, cool to room temperature, and neutralize by adding 1 mL of 0.1 N hydrochloric acid. Dilute with Diluent to volume. Transfer 10 mL of this solution to a separate $50-\mathrm{mL}$ volumetric flask containing 5 mg of famotidine dissolved in 8 mL of methanol. Dilute with Diluent to volume.
-Transfer 25 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, and dilute with Diluent to volume. [NOTE-This solu-
tion is stable for up to 1 month.] $]_{\text {2S }}$ (USP28)
System suitability solution-Transfer abt 1 mL
■approximately 1 to $1.5 \mathrm{~mL}_{\text {2S (USP28) }}$
of the System suitability stock solution to a suitable container, add 4
mL of Diltent and

## - ${ }^{\text {2S }}$ (USP28)

1 drop of hydrogen peroxide solution, and mix well. [NOTE-Prepare fresh daily.]

Standard preparation-Transfer about 10 mg of USP Famotidine RS, accurately weighed, into a $100-\mathrm{mL}$ volumetric flask, add 20 mL of methanol, and sonicate for 5 minutes. Dilute with Diluent to volume, and mix.

Assay preparation-Transfer not fewer than 10 Tablets to a 1-L volumetric flask. Add 200 mL of Diluent, and swirl to erode the Tablets. Add 200 mL of methanol, and stir by mechanical means
at 300 rpm for 1 hour. Dilute with Diluent to volume, mix, and filter. Quantitatively dilute a portion of the clear filtrate with Diluent to obtain a solution containing about 0.1 mg of famotidine per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $275-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $40^{\circ}$. The flow rate is about 1.4 mL per minute. Chromatograph the System suitability solution, and identify the famotidine peak and the peaks due to impurities degra dation products

- $\quad$ 2S (USP28)
listed in Table 1. Record the peak responses as directed for Procedure: the resolution, $R$, between the fametidine related eompound E
$\boldsymbol{m i m p u r i t y}_{\mathrm{C}}^{\mathbf{m} 2 \mathrm{~S} \text { (USP28) }}$
and famotidine peaks is not less than 1.3; the resolution, $R$, between the famotidine and famotidine related compeund D
-impurity $^{\mathrm{D}_{\text {■S }}}{ }_{\text {(USP28) }}$
peaks is not less than 1.3; and the capacity factor, $k^{\prime}$, for the famotidine peak is not less than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is less than $2.0 \%$.

Procedure—Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of famotidine $\left(\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{~N}_{7} \mathrm{O}_{2} \mathrm{~S}_{3}\right)$ in each Tablet taken by the formula:

$$
C(D / N)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Famotidine RS in the Standard preparation; $D$ is the dilution factor used to prepare the Assay preparation; $N$ is the number of Tablets taken to prepare the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP27)

Fexofenadine Hydrochloride Tablets. Because there is no existing USP monograph for this drug product, a new monograph is proposed. The liquid chromatographic system used for the Related compounds and Assay procedures was validated using a Zorbax SB-phenyl brand of L11 column. Typical retention times on this system are 5.5 minutes and 8.8 minutes for fexofenadine and fexofenadine related compound A, respectively. The Dissolution test was validated using a Spherisorb ODS brand of L1 column. Typical retention times are about 3.1 minutes for fexofenadine.
(PA1: K. Russo; BPC: M. Marques; PSD: C. Okeke; NL: C. Barnstein) RTS-40720-1; 40720-2

## Add the following:

## Fexofenadine Hydrochloride Tablets

## » Fexofenadine Hydrochloride Tablets contain not

 less than 95.0 percent and not more than 105.0 percent of the labeled amount of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$.Packaging and storage-Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$-Weigh and finely powder a sufficient number of Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of fexofenadine hydrochloride, to a capped tube. Add 10 mL of a mixture of acetonitrile and methanol (10:1), and shake or mix on a vortex mixer the sample for 1 to 2 minutes to disperse the sample. Allow the solution to stand for 10 minutes or centrifuge for 2 to 3 minutes. Pass the liquid into
a $50-\mathrm{mL}$ beaker using a $0.45-\mu \mathrm{m}$ polytetrafluorethlyene syringe filter. Evaporate the solvent until about 0.5 mL remains using a nitrogen stream with gentle heating (do not exceed $75^{\circ}$ ). Add 5 mL of water and 5 drops of dilute hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for about 30 minutes. Filter the solution through a $10-$ to $15-\mu \mathrm{m}$ sintered-glass crucible. Dry the precipitate in an air oven for 1 hour at $105^{\circ}$. The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a potassium bromide dispersion of a similar preparation using USP Fexofenadine Hydrochoride RS. To prepare the reference standard potassium bromide dispersion, transfer about 60 mg of USP Fexofenadine Hydrochloride RS to a capped test tube and proceed as directed beginning with "Add 10 mL of a mixture of acetonitrile and methanol (10:1)."
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.001 \mathrm{~N}$ hydrochloric acid; 900 mL , deaerated.

Apparatus 2: 50 rpm .
Times: 10 and 30 minutes.
Procedure-Determine the percentages of the labeled amount of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$ dissolved by using the following method.
Buffer solution-Dissolve 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and 0.3 mL of concentrated phosphoric acid in 300 mL of water, and mix.
Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (7:3). Make adjustments if necessary (see System suitability under Chromatography〈621〉).

Standard solution-[NOTE-A small amount of methanol, not exceeding $0.5 \%$ of the total volume, can be used to dissolve fexofenadine hydrochloride.] Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in Medium to obtain a solution having a known concentration similar to that expected for the solution under test.

Resolution solution-[NOTE-A small amount of acetic acid, not exceeding $5 \%$ of the total volume, can be used to dissolve fexofenadine hydrochloride related compound A.] Dissolve an accurately weighed quantity of USP Fexofenadine Related Compound A RS in water to obtain a solution having a known concentration of about 0.44 mg per mL . Transfer 1.0 mL of this solution into a vial, add 40 mL of the Standard solution, and mix.

Test preparation-Use portions of the solution under test filtered through a $0.45-\mu \mathrm{m}$ glass fiber filter.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column containing packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Resolution solution as directed for Procedure: the resolution, $R$, between fexofenadine and fexofenadine related compound A is not less than 2.0. Chromatograph the Standard solution as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$

Procedure-Separately inject equal volumes (approximately 2 to $3 \mu \mathrm{~g}$ column load of fexofenadine hydrochloride) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine peaks. Calculate the quantity, in mg , of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$ dissolved in the Medium by the formula:

$$
C D\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard solution; D is the dilution factor used in preparing the Test preparation; and $r_{U}$ and $r_{S}$ are the fexofenadine peak areas obtained from the Test preparation and the Standard solution, respectively.

Tolerances-Not less than $60 \%(Q)$ of the labeled amount of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ is dissolved in 10 minutes; and not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Water, Method $I\langle 921\rangle$-Grind and finely powder a sufficient number of Tablets, and transfer about 250 mg of the powder to a titration vessel containing titration medium heated to $50^{\circ}$ : not more than $8.5 \%$.

## Related compounds-

Diluent and Mobile phase-Prepare as directed in the Assay.

Sensitivity solution—Dilute 4.0 mL of Standard stock preparation, prepared as directed in the Assay, with Mobile phase to 100 mL . Dilute 6.0 mL of this solution with Mobile phase to 100 mL .

Related compound solution-Dissolve an accurately weighed quantity of USP Fexofenadine Related Compound A RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.05 mg per mL .

Standard stock solution-Use the Standard stock preparation, prepared as directed in the Assay.

Standard solution-Dilute accurate volumes of the Related compound solution and the Standard stock solution with Mobile phase to obtain a solution having known concentrations of about 0.015 and 0.0045 mg per mL of fexofenadine hydrochloride and fexofenadine related compound A, respectively.

Test stock solution-Use the Assay stock preparation. Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed for Chromatographic system under Assay. Chromatograph the Sensitivity solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $6 \%$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.6 for fexofenadine related compound A , and 1.0 fexofenadine; the resolution, $R$, between fexofenadine and fexofenadine related compound A is not less than 7 ; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.4 \%$ and not more than $2.8 \%$ for fexofenadine and fexofenadine related compound A , respectively.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, the Test stock solution, and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of fexofenadine related compound A in the portion of Tablets taken by the formula:

$$
100 C D\left(r_{i} / r_{s}\right) / N L
$$

in which $C$ is the concentration, in mg per mL , of fexofenadine related compound A in the Standard solution; $D$ is the dilution factor for the preparation of the Test stock solution in $\mathrm{mL} ; r_{i}$ and $r_{s}$ are the peak area responses of fexofenadine related compound A in the Test stock solution and Standard solution, respectively; $N$ is the number of Tablets used to prepare the Test stock solution; and $L$ is the label claim, in mg per Tablet, of fexofenadine hydrochloride. Calculate the percentage of the decarboxylated degradant [(+)-4-[1-hy-
droxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]isopropylbenzene; the relative retention time is 6.7] in the portion of Tablets taken by the formula:

$$
100 C D\left(r_{i} / r_{s}\right) / N L F
$$

in which $C$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard solution; $D$ is the dilution factor for the preparation of the Test stock solution in mL ; $r_{i}$ is the peak area response of the decarboxylated degradant in the Test stock solution; $r_{s}$ is the peak area response of fexofenadine in the Standard solution; $N$ is the number of Tablets used to prepare the Test stock solution; $L$ is the label claim, in mg per Tablet, of fexofenadine hydrochloride; and $F$ is the relative response factor ( $F$ is 1.1) for the decarboxylated degradant ( $F$ is 1.0 for all other known and unknown impurities). Calculate the percentage of any other impurities in the portion of Tablets taken by the formula:

$$
100 r_{i} /\left(D r_{S}+r_{T}\right)
$$

in which $r_{i}$ is the individual peak area response for an individual unknown impurity in the Test stock solution; $D$ is the dilution factor, in mL , of the Test solution; $r_{s}$ is the peak area response for fexofenadine in the Test solution; and $r_{T}$ is the sum of the peak area responses of all unknown impurities in the Test stock solution: disregard any peak below $0.05 \%$; not more than $0.35 \%$ of fexofenadine related compound A is found; not more than $0.15 \%$ of the decarboxylated degradant is found; not more than $0.1 \%$ of any individual other impurity is found; not more than $0.15 \%$ total other impurities is found; and not more than $0.5 \%$ total impurities is found.

Assay-
Acid solution-Dilute 17 mL of glacial acetic acid with water to 1 L , and mix. Dilute 100 mL of this solution with water to 1 L .

Buffer solution-Dilute 15 mL of a solution containing acetonitrile and triethylamine $(1: 1)$ with Acid solution to 1 L. Adjust with phosphoric acid to a pH of 5.25 .
Diluent-Prepare a solution of acetonitrile and Acid solution (75:25).
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (64:36). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Standard stock preparation-Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.25 mg per mL .

Standard preparation-Dilute an accurate volume of the Standard stock preparation with Mobile phase to obtain a solution having a known concentration of about 0.015 mg per mL.
Assay stock preparation-Transfer a sufficient number of whole Tablets (not fewer than 10) to a suitable volumetric flask, add Acid solution (equivalent to about $20 \%$ of the total flask volume), and shake by mechanical means at a high speed for about 30 minutes or until the Tablets are fully disintegrated and finely dispersed. Add acetonitrile (equivalent to about $80 \%$ of the total flask volume), and shake by mechanical means for 60 minutes. Dilute with Diluent to volume, and mix. Pass a portion of this solution through a polytetrafluorethylene filter having a $0.45-\mu \mathrm{m}$ or finer porosity, and use the filtrate. Dilute quantitatively, and step-
wise if necessary, with Diluent to obtain a solution containing about 1.2 mg of fexofenadine hydrochloride per mL.

Assay preparation-Dilute an aliquot of the Assay stock preparation quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing about 0.018 mg of fexofenadine hydrochloride per mL .
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L11. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $35^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.4 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine peaks. Calculate the quantity, in mg per Tablet, of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$ in the portion of Tablets taken by the formula:

$$
C D\left(r_{U} / r_{S}\right) / N
$$

in which $C$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard preparation; $D$ is the dilution factor used for the Assay preparation; $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively; and $N$ is the number of Tablets used in the Assay prepara-
tion.■2S (USP28)

Fosinopril Sodium; Fosinopril Sodium Tablets; Fosinopril Sodium and Hydrochlorothiazide Tablets. Because there are no existing USP monographs for this drug substance and dosage forms, new monographs, based on validated methods of analysis, are being proposed. The liquid chromatographic procedures in the test for Related compounds and in the Assay are based on analyses performed with the Resolve Silica (Waters) $5-\mu \mathrm{m}$ brand of L3 packing for Test 1 and the Assay, SAX (Whatman) $5-\mu \mathrm{m}$ brand of L12 packing for Test 2, and BDS Hypersil Phenyl (Keystone Scientific) $5-\mu \mathrm{m}$ brand of L11 packing for Test 3. Typical retention times for fosinopril sodium are about 6, 7, and 9 minutes for Tests 1,2 , and 3 , respectively.
(PA5: A. Wilk) RTS-40844-1

## Add the following:

## ■Fosinopril Sodium

$\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P} \quad 585.64$
L-Proline, 4-cyclohexyl-1-[[[2-methyl-1-(1-oxopropoxy)-propoxy](4-phenylbutyl)phosphinyl]acetyl]-, sodium salt, $\left[1\left[S^{*}\left(R^{*}\right)\right], 2 \alpha, 4 \beta\right]$ -
(4S)-4-Cyclohexyl-1-[(R)-[(S)-1-hydroxy-2-methylpro-poxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt [88889-14-9].
» Fosinopril Sodium contains not less than 97.5 percent and not more than 102.0 percent of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fosinopril Sodium RS. USP Fosinopril Related Compound A RS. USP Fosinopril Related Compound B RS. USP Fosinopril Related Compound C RS. USP Fosinopril Related Compound D RS. USP Fosinopril Related Compound E RS. USP Fosinopril Related Compound F RS.

Identification-Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
Water, Method II $\langle 921\rangle$ : not more than $0.2 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.

## Related compounds-

TEST 1—
Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.

Test solution-Use the Assay preparation.
Procedure-Proceed as directed in the Assay, and measure the areas for each component in the chromatogram obtained, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentage of each individual related compound by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the response of any individual peak, other than the fosinopril sodium peak, and $r_{s}$ is the sum of the responses of all the peaks.

TEST 2-
Mobile phase-Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (4000:15:2). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

## Test solution-Use the Assay preparation.

Resolution solution-Transfer about 1 mg of each of USP Fosinopril Related Compound C RS and USP Fosinopril Related Compound D RS to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Standard solution to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L12. The column temperature is maintained at $45^{\circ}$. The flow rate is about 0.9 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the fosinopril sodium and the fosinopril related compound C peaks is not less than 1.5.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to two times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compounds C and D only by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak of fosinopril related compound C or D , and $r_{s}$ is the sum of the responses of all the peaks.
TEST 3-
Mobile phase-Prepare a degassed mixture of acetonitrile and $0.2 \%$ phosphoric acid ( $560: 440$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Transfer about 1 mg of each of USP Fosinopril Related Compound E RS and USP Fosinopril Related Compound F RS to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Mobile phase to volume, and mix.

Test solution-Transfer about 10 mg of Fosinopril Sodium, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L11. The column temperature is maintained at $45^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the fosinopril related compound F and the fosinopril sodium peaks is not less than 1.5.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compounds E and F only by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the response of the peak of fosinopril related compound E or F , and $r_{s}$ is the sum of the responses of all the peaks. In addition to not exceeding the limits for impurities in Table 1, not more than $0.1 \%$ of any other individual impurity is found, and not more than $1.5 \%$ of total impurities is found.

## Table 1

| Relative | Fosinopril Re- |  | Limit |
| :---: | :---: | :---: | :---: |
| Retention Time | lated |  | $(\%)$ |
|  | Compound | Test |  |
| 2.0 | $\mathrm{~A}^{1}$ | 1 | 0.3 |
| 0.7 | $\mathrm{~B}^{2}$ | 1 | 1.0 |
| 1.2 | $\mathrm{C}^{3}$ | 2 | 0.3 |
| 1.3 | $\mathrm{D}^{4}$ | 2 | 0.3 |
| 0.8 | $\mathrm{E}^{5}$ | 3 | 0.3 |
| 0.9 | $\mathrm{~F}^{6}$ | 3 | 0.3 |

${ }^{1}$ (4S)-4-Cyclohexyl-1-[(4-phenylbutyl)phosphinyl]acetyl-L-proline

${ }^{3}$ Mixture of (4S)-4-Cyclohexyl-1-[(S)-[(S)-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt and (4S)-4-Cyclohexyl-1[ $[(R)-[(R)$-1-hydroxy-2-methylpropoxy $]$ (4-phenylbutyl)pho-sphinyl]acetyl-L-proline propionate (ester), sodium salt
${ }^{4}$ (4R)-4-Cyclohexyl-1-[ $(R)-[(S)$-1-hydroxy-2-methylpro-poxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt
5 (4S)-4-Cyclohexyl-1-[(R)-[(S)-1-hydroxy-2-methylpro-poxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt
${ }^{6}$ (4S)-4-Cyclohexyl-1-[(R)-[(S)-1-hydroxy-ethoxy](4-phe-nylbutyl)phosphinyl]acetyl-L-proline propionate (ester)

Organic volatile impurities Method $I\langle 467\rangle$ : meets the requirements.

## Assay-

Mobile phase-Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (2000:10:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Transfer about 1 mg of each of USP Fosinopril Related Compound A RS and USP Fosinopril Related Compound B RS to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Mobile phase to volume, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS in Mobile phase to obtain a solution having a known concentration of about 0.10 mg per mL .

Assay preparation-Transfer about 25 mg of Fosinopril Sodium, accurately weighed, to a $250-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L3. The column temperature is maintained at $33^{\circ}$. The flow rate is about 1.2 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the fosinopril related compound B and the fosinopril sodium peaks is not less than 2.0 ; and the relative standard deviation of the fosinopril sodium peak response for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatogram, and measure the peak responses for the major peaks. Calculate the amount, in mg, of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$ in the portion of Fosinopril Sodium taken by the formula:

$$
250 C_{S}\left(r_{U} / r_{s}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Fosinopril Sodium RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard prepapration, respectively. $\boldsymbol{m}_{2}$ (USP28)

Briefing

Fosinopril Sodium Tablets-See briefing under Fosinopril Sodium. The chromatographic procedure in the Dissolution test was developed with the Apex C18 brand of L1 packing.
(PA5: A. Wilk; BPC: M. Marques) RTS-40844-2

## Add the following:

## ■Fosinopril Sodium Tablets

» Fosinopril Sodium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fosinopril sodium $\left(\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}\right)$.

Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fosinopril Sodium RS. USP Fosinopril Related Compound A RS. USP Fosinopril Related Compound G RS.

## Identification-

## A: Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ -

Test specimen-Transfer a portion of the finely powdered Tablets equivalent to about 25 mg of fosinopril sodium to a $100-\mathrm{mL}$ beaker containing 40 mL of water. Heat at $25^{\circ}$ for 5 minutes with stirring, and filter through a medium-porosity fritted-disc funnel. Centrifuge the filtrate at 2500 rpm for 30 minutes. Adjust the filtrate to a pH of 3 with phosphoric acid to precipitate the fosinopril, and filter through a fritted-disc funnel. Dissolve the precipitate by passing chloroform through the filter, and evaporate the chloroform solution
to dryness under a current of air. Proceed as directed, using the oily residue so obtained and a similarly prepared residue from 25 mg of USP Fosinopril Sodium RS.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: water; 900 mL .
Apparatus 2: 50 rpm .
Time: 30 minutes.
Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and $0.2 \%$ phosphoric acid ( $64: 36$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Prepare a solution in Mobile phase containing about 0.02 mg per mL of each of USP Fosinopril Sodium RS and USP Fosinopril Related Compound G RS.

Test solution-Use portions of the solution under test passed through a $1.2-\mu \mathrm{m}$ acrylic filter. [NOTE-Do not use glass filters.].

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column, maintained at $40^{\circ}$, that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 3 mL per minute. Chromatograph the Resolution solution and the Standard solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the fosinopril sodium peak and the fosinopril related compound G peak is not less than 1.7; and the relative standard deviation for replicate injections of the Standard solution is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of a filtered portion of the solution under test and a Standard solution having a known concentration of USP Fosino-
pril Sodium RS in the same medium, and record the chromatograms. Measure the responses for the major peaks, and calculate the amount of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$ dissolved.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$ is dissolved in 30 minutes.

Uniformity of dosage units: meet the requirements.

## Limit of related compound A-

Mobile phase, Diluent, and Chromatographic systemProceed as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Fosinopril Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL . Dilute with Diluent to obtain a solution having a final known concentration of 0.0025 mg per mL .

Test solution-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatogram, and measure the peak responses for the major peaks. Calculate the percentage of fosinopril related compound A in the portion of Tablets taken by the formula:

$$
1000 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the fosinopril related compound A in the Standard solution; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Test solution and the Standard solution, respectively. Not more than $4 \%$ is found.

## Assay-

Mobile phase-Prepare a degassed mixture of methanol and $0.2 \%$ phosphoric acid ( $78: 22$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Diluent-Prepare a mixture of 0.2 M urea solution and acetonitrile ( $80: 20$ ).

Resolution solution-Prepare a solution in Diluent containing $30 \mu \mathrm{~g}$ of USP Fosinopril Related Compound A RS and $70 \mu \mathrm{~g}$ of USP Fosinopril Sodium RS per mL.

Standard preparation-Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS to obtain a solution having a known concentration of about 0.1 mg per mL .
Assay preparation-Transfer not fewer than 10 Tablets to a $500-\mathrm{mL}$ volumetric flask, add 400 mL of Diluent, and stir for 40 minutes. Dilute with Diluent to volume, mix, and centrifuge. Quantitatively dilute an accurately measured volume ( $V_{S} \mathrm{~mL}$ ) of the clear supernatant with Diluent to obtain a solution ( $V_{A} \mathrm{~mL}$ ) containing about 0.1 mg of fosinopril sodium per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Resolution solution and the Standard preparation and record the peak responses as directed for Procedure: the relative retention time is 0.4 for related compound A , and 1.0 for fosinopril sodium; the resolution, $R$, between the fosinopril sodium and fosinopril related compound A peaks is not less than 2.0 ; and the relative standard deviation for replicate injections of the Standard preparation is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Continue the chromatography up to 1.5 times the retention time of the fosinopril sodium peak. Calculate the quantity, in mg , of fosi-
nopril sodium $\left(\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}\right)$ in the portion of Tablets taken by the formula:

$$
50 C\left(V_{A} / V_{S}\right)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fosinopril Sodium RS in the Standard preparation; $V_{A}$ is the volume, in mL , of the Assay preparation; $V_{S}$ is the volume, in mL , of supernatant taken for the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## BRIEFING

Fosinopril Sodium and Hydrochlorothiazide Tablets-See briefing under Fosinopril Sodium. The chromatographic procedure in the Dissolution test was developed with the Zorbax Stable Bond CN brand of L10 packing.
(PA5: A. Wilk; BPC: M. Marques) RTS-40844-3

## Add the following:

## ■Fosinopril Sodium and Hydrochlorothiazide Tablets

» Fosinopril Sodium and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount
of fosinopril sodium $\left(\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}\right)$ and of hydrochlorothiazide $\left(\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}\right)$.

Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle —$ USP Benzothiadiazine
Related Compound A RS. USP Fosinopril Sodium RS. USP Fosinopril Related Compound A RS. USP Fosinopril Related Compound H RS. USP Hydrochlorothiazide RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~F}\rangle-$
FOSINOPRIL SODIUM-Transfer a portion of the finely powdered Tablets, equivalent to about 25 mg of fosinopril sodium, to a $100-\mathrm{mL}$ beaker containing 40 mL of water, heat at $30^{\circ}$ for 5 minutes with stirring, and filter through a funnel having a medium-porosity fritted disk. Centrifuge the filtrate at 2500 rpm for 30 minutes. Adjust the filtrate with hydrochloric acid to a pH of 1 to precipitate the fosinopril, and filter through a fritted-disk funnel. Dissolve the precipitate by passing metyl iosobutyl ketone through the filter, and evaporate the filtrate to dryness under a stream of nitrogen. Proceed as directed, using the oily residue so obtained and a similarly prepared residue from 25 mg of USP Fosinopril Sodium RS.

HYDROCHLOROTHIAZIDE-Transfer a portion of the finely powdered Tablets, equivalent to about 37.5 mg of hydrochlorothiazide, to a $250-\mathrm{mL}$ beaker containing 120 mL of water, heat at $30^{\circ}$ for 5 minutes with stirring, and filter through a funnel having a medium-porosity fritted disk. Wash the precipitate with 60 mL of methylene chloride and glacial acetic acid ( $90: 10$ ) mixture, and discard the filtrate. Dissolve the precipitate by passing 10 mL of methyl isobutyl ketone through the filter, and evaporate the filtrate
to dryness under a stream of nitrogen. Proceed as directed, using the waxy residue so obtained and a similarly prepared residue from 37 mg of USP Hydrochlorothiazide RS.

B: The retention times of the fosinopril sodium and hydrochlorothiazide peaks in the chromatogram of the Assay preparation correspond to those of the Standard preparation, as obtained in the Assay for fosinopril sodium and Assay for hydrochlorothiazide, respectively.

Dissolution $\langle 711\rangle$ -
Medium: water, 900 mL .
Apparatus 2: 50 rpm .
Time: 30 minutes.
Mobile phase-Prepare a filtered and degassed mixture of 0.01 M monobasic potassium phosphate ( pH 3.0 ), methanol, and acetonitrile ( $45: 35: 20$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard stock solutions-Separately dissolve about 20 mg of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS accurately weighed in 6 mL of methanol, and dilute with water to obtain solutions (Standard stock solution $A$ and $B$ ) having known concentrations of about 0.1 mg per mL of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS, respectively.
Standard solution-Mix 25 mL of Standard stock solution B and $x 25 \mathrm{~mL}$ of Standard stock solution $A$, and dilute with water to $200 \mathrm{~mL}, x$ being the ratio of the respective labeled amounts, in mg , of fosinopril sodium to that of hydrochlorothiazide per Tablet.
Resolution solution-Transfer 5 mg of USP Fosinopril Related Compound H RS into a $100-\mathrm{mL}$ volumetric flask, and dissolve in 5 mL of methanol. Add 2.0 mL of Standard
stock solution B, dilute with methanol to volume, and mix.
Test solution-Use portions of the solution under test passed through a $1.2-\mu \mathrm{m}$ acrylic filter. [NOTE-Do not use glass filters.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a variable wavelength detector set at 210 nm and 272 nm and a $4.6-\mathrm{mm} \times$ $25-\mathrm{cm}$ column, maintained at $40^{\circ}$ that contains $5-\mu \mathrm{m}$ packing L10. The flow rate is about 1.3 mL per minute. With the detector set at 215 nm , chromatograph the Resolution solution and the Standard solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the fosinopril related compound H peak and hydrochlorothiazide peak is not less than 1.5 ; and the relative standard deviation for replicate injections of the Standard solution is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of a filtered portion of the solution under test and the Standard solution, and record the chromatograms with the detector set at 272 nm from 0 to 5 minutes and at 210 from 5 to 9 minutes, for hydrochlorothiazide and fosinopril sodium, respectively. Measure the responses for the major peaks, and calculate the amount of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$ and of $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}$ dissolved.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}$ and not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}$ are dissolved in 30 minutes.

Uniformity of dosage units: meet the requirements.

## Related compounds-

TEST 1—
Mobile phase, Diluent, and Chromatographic system-
Proceed as directed in the Assay for fosinopril sodium.

Standard solution-Dissolve an accurately weighed quantity of USP Fosinopril Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL . Dilute an aliquot ( 5 in 200) in Diluent to obtain a solution containing 0.0025 mg per mL .

Test solution-Use the Assay preparation, prepared as directed in the Assay for fosinopril sodium.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Disregard the peak for hydrochlorothiazide. Calculate the percentage of fosinopril related compound A in the portion of Tablets taken by the formula:

$$
20 C(D / L)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of fosinopril related compound A in the Standard solution; D is the volume, in mL , of the Test solution; $L$ is the labeled amount, in mg per Tablet, of fosinopril sodium; and $r_{U}$ and $r_{S}$ are the peak responses of fosinopril related compound A obtained from the Test solution and the Standard solution, respectively. Not more than $4 \%$ of fosinopril sodium related compound A is found. Calculate the percentage of any other impurity in the portion of Tablets taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses of all of the peaks: not more than $0.1 \%$ of any other individual impurity is found, and not more than $5.0 \%$ of total impurities is found.

TEST 2-
Mobile phase and Chromatographic system-Proceed as directed in the Assay for hydrochlorothiazide.

Standard solution-Dissolve an accurately weighed quantity of USP Benzothiadiazine Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.2 mg per mL . Dilute an aliquot ( 2 in 100) in Mobile phase to obtain a solution containing 0.004 mg per mL.

Test solution-Use the Assay preparation, prepared as directed in the Assay for hydrochlorothiazide.
Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Disregard the peak for fosinopril. Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken by the formula:

$$
20 C(D / L)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of benzothiadiazine related compound A in the Standard solution; D is the volume, in mL , of the Test solution; $L$ is the labeled amount, in mg per Tablet, of hydrochlorothiazide; and $r_{U}$ and $r_{s}$ are the peak responses of benzothiadiazine related compound A obtained from the Test solution and the Standard solution, respectively. Not more than $0.5 \%$ of benzothiadiazine related compound A is found.

## Assay for fosinopril sodium-

Mobile phase-Prepare a degassed mixture of methanol and $0.2 \%$ phosphoric acid $(75: 25)$. Make adjustments if necessary (see System Suitability under Chromatography (621〉).

Diluent: a mixture of 0.2 M urea and acetonitrile ( $80: 20$ ).

Resolution solution-Prepare a solution in Mobile phase having a known concentration of about 0.1 mg per mL of each of USP Fosinopril Related Compound A RS and USP Fosinopril Sodium RS.
Standard preparation-Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS in Diluent to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation-Place 5 Tablets in each of two 500mL volumetric flasks, add 400 mL of Diluent to each flask, shake for 45 minutes, dilute with Diluent to volume, and mix. Centrifuge a portion of the solution at 2000 rpm for 20 minutes. Mix equal volumes of the supernatant, accurately measured, and dilute, if necessary, to give an expected fosinopril sodium concentration of about 0.1 mg per mL.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a variable wavelength detector set at 215 nm and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Resolution solution and the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are 0.4 for related compound A and 1.0 for fosinopril sodium; the resolution, $R$, between the fosinopril sodium and fosinopril related compound A peaks is not less than 4.0; and the relative standard deviation for replicate injections of the Standard preparation is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the responses for the major peaks. Continue the chromatography up to 1.5 times the retention time of the fosinopril sodium peak. Calculate the quantity, in mg , of fosinopril sodium $\left(\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{NNaO}_{7} \mathrm{P}\right)$ in the portion of each Tablet taken by the formula:

$$
100(C D)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fosinopril Sodium RS in the Standard preparation; $D$ is the dilution factor of the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Assay for hydrochlorothiazide-

Mobile phase—Prepare a degassed mixture of $0.2 \%$ phosphoric acid and methanol ( $85: 15$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Resolution solution-Prepare a solution in Mobile phase having a known concentration of about $12.5 \mu \mathrm{~g}$ per mL of USP Hydrochlorothiazide RS and $10 \mu \mathrm{~g}$ per mL of USP Benzothiadiazine Related Compound A RS.
Standard preparation-Dissolve an accurately weighed quantity of USP Hydrochlorothiazide RS in Mobile phase to obtain a solution having a known concentration of about $12.5 \mu \mathrm{~g}$ per mL .

Assay preparation-Place 5 Tablets in each of two 500mL volumetric flasks, add 50 mL of water to each flask, and shake for 15 minutes to disintegrate the Tablets. Add about 350 mL of methanol, shake for 45 minutes, dilute with methanol to volume, and mix. Mix 5.0 mL of each supernatant and dilute with Mobile phase to 100 mL , and mix, to give an expected hydrochlorothiazide concentration of about $12.5 \mu \mathrm{~g}$ per mL . Centrifuge a portion of the solution at 2000 rpm for 20 minutes.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a variable wavelength detector set at 271 nm and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Resolution solution and the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are 0.7 for benzothiadiazine related compound A and 1.0 for hydrochlorothiazide; the resolution, $R$, between the hydrochlorothiazide and benzathiadiazine related compound A peaks is not less than 2.0; and the relative standard deviation for replicate injections of the Standard preparation is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Continue the chromatography up to 1.5 times the retention time of the hydrochlorothiazide peak. Calculate the quantity, in mg, of hydrochlorothiazide $\left(\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}_{2}\right)$ in the portion of each Tablet taken by the formula:

$$
100(C D)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Hydrochlorothiazide RS in the Standard preparation; $D$ is the dilution factor of the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ 2S (USP28)

## BRIEFING

Lansoprazole, USP 27 page 1068. On the basis of comments received, it is proposed to establish limits for individual impurities under the test for Chromatographic purity, and to lower the limit of total impurities from $1.0 \%$ to $0.6 \%$. Because Lansoprazole has limited stability in the sample diluent, it is proposed to specify that both Standard solution and Test solution should be injected within 10 minutes of preparation. It is also proposed to make changes in the Packaging and storage section.
(PA4: E. Gonikberg; PSD: C. Okeke) RTS-41341-1

## Change to read:

Packaging and storage-Preserve in wellelosed,
-tight, $_{\text {m }}$ (USP28)
light-resistant containers.
-Store at room temperature and protect from excessive heat. ${ }^{\text {2S }}$ (USP28)

## Change to read:

## Chromatographic purity-

Solution A: water.
Solution B-Prepare a filtered and degassed mixture of acetonitrile, water, and triethylamine ( $160: 40: 1$ ). Adjust with phosphoric acid to a pH of 7.0 .

Diluent-Prepare a mixture of Solution A and Solution B $(9: 1)$.
Blank solution-Prepare a mixture of Diluent and methanol (9:1).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-[NOTE-Prepare immediately before using.] Dissolve 5 mg each of USP Lansoprazole RS and USP Lansoprazole Related Compound A RS in 200 mL of methanol. Pipet 1 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

System suitability solution-Dissolve a suitable quantity of USP Lansoprazole Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL . Pipet 1 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Standard solution-
[ [NOTE-Inject within 10 minutes of preparation.] $]_{\text {2S (USP28) }}$ Dissolve an accurately weighed quantity of USP Lansoprazole RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about $25 \mu \mathrm{~g}$ per mL . Pipet 1 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.
-The final concentration of the Standard solution is about
$2.5 \mu \mathrm{~g}$ per mL . ${ }^{\text {2S }}$ (USP28)
Test solution-[NOTE-Prepare-immediately before using.
-Inject within 10 minutes of preparation.] ${ }_{\text {nes }}$ (USP28)
Transfer about 125 mg of Lansoprazole, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 1 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, and dilute with Diluent to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $285-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 0.8 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-40$ | $90 \rightarrow 20$ | $10 \rightarrow 80$ | linear gradient |
| $40-50$ | 20 | 80 | isocratic |
| $50-51$ | $20 \rightarrow 90$ | $80 \rightarrow 10$ | linear gradient |
| $51-60$ | 90 | 10 | isocratic |

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between lansoprazole and lansoprazole related compound A is not less than 6. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $3 \%$.

Procedure-Separately inject equal volumes (about $40 \mu \mathrm{~L}$ ) of the Blank solution, the Standard solution, and the Test solution into the chromatograph, record the chromatograms, and
-identify the lansoprazole peak and the peaks due to impurities listed in Table 1. ${ }^{2 S}$ (USP28)
Measure the areas for the major peaks, excluding the peaks obtained from the Blank solution. Calculate the percentage of each impurity in the portion of Lansoprazole taken by the formula:

$$
\begin{gathered}
50(C / H)\left(r_{i} / r_{s}\right), \\
\square 50(C F / W)\left(r_{i} / r_{S}\right), \square_{2 S}(U S P 28)
\end{gathered}
$$

in which

- $F$ is the relative response factor for each impurity peak (see

Table 1 for values); ${ }^{2 S}$ (USP28)
$C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Lansoprazole RS in the Standard solution; $W$ is the weight, in mg , of Lansoprazole taken for the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for lansoprazole obtained from the Standard solution: more than 4.0\% of obl impurities is found.
-In addition to not exceeding the limits for impurities in Ta ble 1 , not more than $0.6 \%$ of total impurities is found.

Table 1

| Approximate Relative <br> Retention Time | Relative Response Factor (F) |  |  |
| :---: | :---: | :--- | :---: |
| 1.1 | 1.22 | Lansoprazole related compound A | Limit (\%) |
| 0.8 | 0.76 | Impurity B | 0.4 |
| 1.2 | 1.27 | Impurity C | 0.1 |
| - | 1.00 | Other individual impurity | 0.1 |

## BRIEFING

Loratadine, page 3065 of the First Supplement and page 891 of PF 30(3) [May-June 2004]. It is proposed to revise the Labeling statement to indicate that it is necessary to state with which Related compounds test the article complies only if a test other than Test 1 is used.

## Add the following:

-Labeling-If a test for Related compounds other than Test 1 is used, then the labeling states with which Related compounds test the article complies. $\mathbf{m}$ 2S (USP28)

## Change to read:

## Related compounds-

$\square_{\text {NOTE-O }}$ On the basis of the synthetic route, perform either
Test 1 or Test 2. Test 2 is recommended if 4,8-dichloro-6,11-dihydro- $5 H$-benzo[5,6]cyclohepta[1,2-b]pyridin-11-one is a potential related compound.

## TEST 1——2S (USP28)

Mobile phase and Diluent-Prepare as directed in the Assay.
Standard stock solution-Prepare as directed for Standard preparation in the Assay.
Standard solution-Pipet 5.0 mL of Standard stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $0.8 \mu \mathrm{~g}$ per mL .

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The column temperature is maintained between $25^{\circ}$ and $35^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Test solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.79 for 4-(8-chloro-11-fluoro-6,11-dihydro$5 H$-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl and 1.0 for loratadine. Chromatograph the Standard solution, and record the peak area of the main peak as directed for Procedure: the relative standard deviation for replicate injections is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure all the peak areas in the Test solution and the area of the main peak in the Standard solution. Calculate the percentage of each impurity in the portion of Loratadine taken by the formula:

$$
10,000(C / F)\left(r_{i} / r_{S}\right) / W
$$

in which $C$ is the concentration, in mg per mL , of USP Loratadine RS in the Standard solution; $F$ is the relative response factor for each impurity, if known ( $F$ is 0.25 for 4-(8-chloro-11-fluoro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl); $r_{i}$ is the peak area response for each impurity in the Test solution; $r_{S}$ is the peak area response of loratadine in the Standard solution; and $W$ is the quantity, in mg , of Loratadine taken to prepare the Test solution: not more than $0.2 \%$ of 4-(8-chloro-11-fluoro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl is found; not more than $0.1 \%$ of any other individual impurity is found; and not more than $0.3 \%$ of total impurities is found.
${ }^{\text {© }}$ TEST $2-$
Solution A-Dissolve 0.96 g of 1-pentanesulfonic acid sodium salt in 900 mL of water. Adjust with phosphoric acid solution (1 in 10) to a pH of $3.00 \pm 0.05$, dilute with water to 1 L , filter, and degas.

Solution B-Use acetonitrile.
Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solution-Dissolve accurately weighed quantities of USP Loratadine RS, USP Loratadine Related Compound A RS, and USP Loratadine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 0.1 mg of each compound per mL . Transfer 1.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, add 2 mL of Solution $A$, dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.01 mg of each per mL.

Test solution-Transfer about 100 mg of Loratadine, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, and dissolve in 2 mL of methanol. Add 2 mL of Solution A, then dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column containing $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| Time <br> $(\mathrm{min})$ | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 75 | 25 | isocratic |
| $0-20$ | $75 \rightarrow 50$ | $25 \rightarrow 50$ | linear gradient |
| $20-30$ | $50 \rightarrow 40$ | $50 \rightarrow 60$ | linear gradient |
| $30-35$ | $40 \rightarrow 30$ | $60 \rightarrow 70$ | linear gradient |

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| $(\mathrm{min})$ | $(\%)$ | $(\%)$ | Elution |
| $35-45$ | 30 | 70 | isocratic |
| $45-50$ | $30 \rightarrow 75$ | $70 \rightarrow 25$ | step gradient |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times and response factors are as follows in the table below. The resolution, $R$, between loratadine related compound A and loratadine related compound $B$ is not less than 1.5 ; and the relative standard deviation of the loratadine peak response from replicate injections is not more than $10 \%$.

| Related Compound | Relative Retention Time with respect to Loratadine | Relative Response Factor $(F)$ with respect to Loratadine |
| :---: | :---: | :---: |
| Loratadine related compound A | 0.50 | 1.00 |
| Loratadine related compound B | 0.53 | 0.89 |
| 8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta-[1,2-b]pyridin-11-one | 0.70 | 0.60 |
| 8-Chloro-6,11-dihydro-11-[ $N$-methyl-4-piperidinyl]11-hydroxy-5 H -benzo[5,6]cyclohepta[1,2-b]pyridine | 0.75 | 0.46 |
| 4,8-Dichloro-6,11-dihydro-5 H -benzo[5,6]cyclohepta- <br> [1,2-b]pyridin-11-one | 1.23 | 0.92 |
| 8-Chloro-6,11-dihydro-11-[ $N$-ethoxy carbonyl-4-piperidinyl]-11-hydroxy-5 H -benzo[5,6]cyclohepta-[1,2-b]pyridine | 1.60 | 0.42 |
| 4,8-Dichloro-6,11-dihydro-11-[ $N$-ethoxy carbonyl-4-piperidylidene]-5 H -benzo[5,6]cyclohepta-[1,2-b]pyridine | 1.83 | 1.08 |
| Loratadine | 1.00 | 1.00 |

Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Loratadine taken by the formula:
in which $C_{s}$ is the concentration, in mg per mL , of USP Loratadine RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL of the Test solution; $F$ is the relative response factor as indicated in the table ( $F=1.0$ for unknown impurities); $r_{i}$ is the peak area response for the individual impurity in the Test solution; and $r_{s}$ is the peak response for loratadine in the Standard solution: not more than $0.1 \%$ of loratadine related compound A is found; not more than
$0.1 \%$ of loratadine related compound $B$ is found; less than $0.1 \%$ for each individual unknown impurity is found; and not more than $0.3 \%$ of total impurities is found.■2S (USP28)

## BRIEFING

Loratadine Oral Solution, page 3271 of the Second Supplement and page 1258 of $P F 30(4)$ [July-Aug. 2004]. It is proposed to revise the preparation of the Resolution solution in the test for Related compounds by adding a dilution step. This dilution is needed so that the resolution requirement can be met.
(PA1: K. Russo) RTS-41792-2

## Related compounds-

Mobile phase-Prepare a mixture of 15 mmol of sodium dodecyl sulfate in a mixture of water and acetonitrile ( $1: 1$ ). Adjust with phosphoric acid to a pH of $2.6 \pm 0.1$, filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of Mobile phase and water (2:1).
System suitability solution 1-Dissolve an accurately weighed quantity of USP Loratadine RS, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.002 mg per mL .

System suitability solution 2-Quantitatively transfer 5.0 mL of System suitability solution 1 into a suitable container, dilute with Diluent to 50 mL , and mix.

Resolution solution-Transfer an amount of Oral Solution, equivalent to 20 mg of loratadine, into a screw-cap glass container. Add 1 mL of $3 \%$ aqueous hydrogen peroxide, and mix. Cap, and heat at $65^{\circ}$ for 18 to 24 hours.

- Allow to cool to room temperature, then dilute 5 mL with

Diluent to 25 mL .■2S (USP28)
Test solution-Transfer an accurately measured volume of Oral Solution, equivalent to about 5 mg of loratadine, to a $25-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 2 mL per minute. The column temperature is maintained between $30^{\circ}$ and $40^{\circ}$. Chromatograph the Resolution solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.70 for ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11 H -benzo[5,6]cyclohepta[1,2-b]pyr-idin-11-ylidene]-1-piperidinecarboxylate, 0.84 for ethyl 4-[8-chlo-ro-5,6-dihydro-2-(hydroxymethyl)-11 H -benzo $[5,6]$ cyclohep-$\mathrm{ta}[1,2-b]$-pyridin-11-ylidene]-1-piperidinecarboxylate, and 1.0 for
loratadine; and the resolution, $R$, between loratadine and ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11H-benzo[5,6]cyclo-hepta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate is not less than 3.0. Chromatograph System suitability solution 1, and record the peak area response of the loratadine peak as directed for Procedure: the tailing factor is not less than 0.7 and not greater than 1.1. Chromatograph System suitability solution 2, and record the peak area response of the loratadine peak as directed for Procedure: the relative standard deviation for replicate injections of System suitability solution 2 is not more than $10 \%$.

Procedure-Inject about $50 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure all the peak area responses. Calculate the percentage of each individual related compound in the portion of Oral Solution taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the individual peak response of each related compound in the Test solution; and $r_{s}$ is sum of the responses of all the peaks, excluding excipient peaks: not more than $0.3 \%$ of ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11H-benzo[5,6]cy-clohepta[1,2-b]-pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than $0.3 \%$ of ethyl 4-[8-chloro-5,6-dihydro-2-(hy-droxymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yli-dene]-1-piperidinecarboxylate is found; not more than $0.2 \%$ of any other individual impurity is found; and the sum of all impurities is not more than $0.5 \%$.

## BRIEFING

Mangafodipir Trisodium, USP 27 page 1131, page 3272 of the Second Supplement, and page 1921 of $P F 29(6)$ [Nov.-Dec. 2003]. On the basis of comments received, storage conditions in the Packaging and storage section are corrected.
(PA5: A.Wilk; PSD: C. Okeke) RTS-40966-1

## Change to read:

Packaging and storage-Preserve in well-closed containers.

- Store at $25^{\circ}$, exeursiens permitted between $15^{\circ}$ and $30^{\circ}$
$\boldsymbol{m}_{\text {in }}$ a cold place. $\mathbf{m}_{2 \text { S }}$ (USP28) $\mathbf{m}^{2 S}$ (USP27)

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■2S (USP28)

## Add the following:

-Other requirements-Where the label states that Mangafodipir Trisodium is sterile, it meets the requirements under Sterility Tests $\langle 71\rangle \cdot \mathbf{m}^{2 S}$ (USP28)

## Briefing

Megestrol Acetate Oral Suspension, USP 27 page 1153. On the basis of comments received that some approved products could not meet the Tolerances in the current Dissolution test, it is proposed to replace this test with separate tests for each of the approved products. In the absence of any adverse comments, it is proposed to implement this revision via the Second Interim Revision Announcement pertaining to USP 28-NF 23, with an official date of April 1, 2005.
(BPC: M. Marques) RTS-41682-1; 41739-1

## Add the following:

${ }^{\bullet}$ Labeling-When more than one test for Dissolution is given, the labeling states the test used only if Test 1 is not used. ${ }^{2}$

## Change to read:

Dissolution $\langle 711\rangle-$
Mediun: $0.5 \%$ sodium laurylsulfate-in water; 900 mL . Apparatus 2: 50 rpm
Procedure [NOTE-Use-separate-syringe-for each vesse1.] Withdraw more than $10-\mathrm{mL}$ of the Oral Suspension using a 10 mL syringe with a long cannula. Remove air bubbles from the sy ringe. Adjust the volume to the 10 mL matk on the syringe, and remove the needle. Wipe the tip of the syringe, and aeeurately weigh (gross weight). Operate the apparatus, and rapidly dispense the Oralsuspensien to the side of the vessel at about half way from the bettem. Similarly dispense the-Oral Suspension-into other versels. Aceurately weigh each syringe after dispensing the sample (fare weight). Record sample weights. After completion of the dissolution, pass an aliquet through a filter having a 0.45 सm peresity, and dilute 2.0 mL of the filtrate to 50.0 mL with Dissolution Me dium to ebtain a selution having a concentration of abeut 18 Hg per mL . Determine the ameunt of $\mathrm{C}_{24} \mathrm{H}_{22} \Theta_{4}$-dissolved by employing WVabsorption at the wavelength of maximam absorbance at about 292 nm on fltered pertions of the selution under test, in compar isen with a Standard solution having a known-concentration of USP Megestrol Acetate-RS in the-same-Meditut.

Time: 20 minutes.
Foleranes: Not less than $75 \%$ (Q) of the labeled amount of $\mathrm{E}_{24} \mathrm{H}_{22} \Theta_{4}$-is dissolved in 20 minutes.
${ }^{\bullet}$ TEST $1-$
Medium: $\quad 0.5 \%$ sodium lauryl sulfate in water; 900 mL .
Apparatus 2: 25 rpm .
Time: 30 minutes.
Standard solution-Transfer about 45 mg , accurately weighed, of USP Megestrol Acetate RS to a $250-\mathrm{mL}$ volumetric flask, add about 12 mL of methanol, and put the flask in a warm water bath until the solid is dissolved. Dilute with Medium to volume. The final concentration is about $18 \mu \mathrm{~g}$ of megestrol acetate per mL .

Procedure-Transfer to the surface of the Medium in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 160 mg of megestrol acetate. Determine the amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm on filtered portions of the solution under test, in comparison with the Standard solution. Calculate the percentage of megestrol acetate $\left(\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}\right)$ released by the formula:

$$
\frac{A_{U} \times C_{S} \times 900 \times 100}{A_{S} \times V \times L C}
$$

in which $A_{U}$ and $A_{S}$ are the absorbances obtained from the Test solution and Standard solution, respectively; $C_{s}$ is the concentration, in mg per mL, of the Standard solution; $V$ is the sample volume, in mL , of Oral Suspension taken; 900 is the volume, in mL , of Medium; 100 is the conversion factor to percentage; and $L C$ is the label claim, in mg per mL .

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ is dissolved in 30 minutes.

TEST 2-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: $\quad 0.5 \%$ sodium lauryl sulfate in water; 900 mL .
Apparatus 2: 25 rpm .

Time: 30 minutes.
Standard solution-Transfer about 45 mg , accurately weighed, of USP Megestrol Acetate RS to a $250-\mathrm{mL}$ volumetric flask. Add about 5 mL of methanol, and mix. Dilute with Medium to volume. Transfer 10 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, and dilute with Medium to volume. The final concentration is about $18 \mu \mathrm{~g}$ per mL .

Test solution-[NOTE-Use a separate syringe for each vessel.] Withdraw more than 10 mL of the Oral Suspension using a $10-\mathrm{mL}$ syringe with a long cannula. Remove air bubbles from the syringe. Adjust the volume to the $10-\mathrm{mL}$ mark on the syringe, and remove the needle. Wipe the tip of the syringe, and accurately weigh (gross weight). Operate the apparatus, and rapidly dispense the Oral Suspension to the side of the vessel at about half way from the bottom. Similarly dispense the Oral Suspension into other vessels. Accurately weigh each syringe after dispensing the sample (tare weight). Record sample weights. After completion of the dissolution, pass an aliquot through a nylon filter having a $0.45-\mu \mathrm{m}$ porosity, and dilute 2.0 mL of the filtrate with Medium to 50.0 mL to obtain a solution having a theoretical concentration of about $18 \mu \mathrm{~g}$ per mL .

Procedure-Determine the amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm , using $0.5-\mathrm{cm}$ pathlength cuvettes, on the Test solution in comparison with the Standard solution. Calculate the percentage of megestrol acetate $\left(\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}\right)$ released by the formula:

$$
\frac{A_{U} \times C_{S} \times 900 \times d \times 100}{A_{S} \times W_{U} \times L C}
$$

in which $A_{U}$ and $A_{S}$ are the absorbances obtained from the Test solution and Standard solution, respectively; $C_{S}$ is the concentration, in mg per mL, of the Standard solution; $d$ is
the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL ; $W_{U}$ is the weight, in mg , of Oral Suspension taken; 900 is the volume, in mL, of Medium; 100 is the conversion factor to percentage; and $L C$ is the label claim, in mg per mL .

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ is dissolved in 30 minutes.

TEST 3-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 3 .

Medium: $\quad 0.5 \%$ sodium lauryl sulfate in degassed water; 900 mL . Use ultrapure sodium lauryl sulfate with an assay content of not less than $99.0 \%$.

Apparatus 2: 50 rpm .
Time: 30 minutes.
Determine the amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ dissolved employing the following method.

Mobile phase-Proceed as directed in the Assay.
Standard solution-Transfer about 11.5 mg , accurately weighed, of USP Megestrol Acetate RS to a $25-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume.
Test solution-Proceed as directed for Test 2, introducing the sample into the vessel over a 10 - to 15 -second time period (about 1 mL per second).
Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of megestrol acetate $\left(\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}\right)$ released by the formula:

$$
\frac{r_{U} \times C_{S} \times 900 \times d \times 100}{r_{S} \times W_{U} \times L C},
$$

in which $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and Standard solution, respectively; $C_{S}$ is the concentration, in mg per mL, of the Standard solution; $d$ is the density, in mg per mL , of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL ; $W_{U}$ is the weight, in mg , of Oral Suspension taken; 900 is the volume, in mL , of Medium; 100 is the conversion factor to percentage; and $L C$ is the label claim, in mg per mL .

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ is dissolved in 30 minutes. $\bullet 2$

## Briefing

Mepivacaine Hydrochloride Injection, USP 27 page 1164. It is proposed to revise the Chromatographic system in the Assay to clarify the solutions used to determine the system suitability parameters.
(PA1: K. Russo) RTS-41678-1

## Change to read:

## Assay-

pH 6.3 Phosphate buffer-Dissolve 3.40 g of monobasic potassium phosphate and 4.35 g of dibasic potassium phosphate in 1000 mL of water, and adjust, if necessary, with potassium hydroxide or phosphoric acid to a pH of 6.3.

Mobile phase-Prepare a filtered and degassed mixture of pH 6.3 Phosphate buffer and acetonitrile ( $65: 35$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability preparation-Dissolve suitable amounts of methylparaben and USP Mepivacaine Hydrochloride RS in an appropriate volume of Mobile phase to obtain a solution containing about 0.05 mg per mL and 1.0 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Mepivacaine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation-Transfer a volume of Injection, equivalent to about 100 mg of mepivacaine hydrochloride, to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $263-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25.0-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1.* The flow rate is about 1.0 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the relative retention times are about 1.4 for methylparaben and 1.0 for mepivacaine; the resolution, $R$, between methylparaben and mepivacaine is not less than 2.0 ; the capacity factor, $k^{\prime}$, for the mepivacaine peak is not less than 1.0 ; and the tailing factor for the mepivacaine peak is not more than 2.0.
-Chromatograph the Standard preparation, and record the
peak responses as directed for Procedure: $\quad$ 2S (USP28)
the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the mepivacaine peaks. Calculate the quantity, in mg, of mepivacaine hydrochloride $\left(\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}\right)$ in the volume of Injection taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Mepivacaine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Morantel Tartrate. Because there is no existing USP monograph for this article, a new monograph is being proposed. The Related compounds test is an HPLC procedure utilizing a $4.6-\mathrm{mm} \times$ $25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ L1 packing and a $226-\mathrm{nm}$ detector. The Assay is a titrimetric method with the test material being dissolved in anhydrous acetic acid and titrated with 0.1 N perchloric acid. Interested parties are encouraged to submit comments.
(VET: I. DeVeau) RTS-41471-1

[^341]
## Add the following:

## ■Morantel Tartrate

## $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{~S} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \quad 370.42$

Pyrimidine, 1,4,5,6-tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)ethenyl]-, $(E)-,\left[R-\left(R^{*}, R^{*}\right)\right]$-2,3-dihydroxybutanedioate ( $1: 1$ ).
(E)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)vinyl]pyrimidine tartrate (1:1). [26155-31-7].

Morantel [20574-50-9].
» Morantel Tartrate contains not less than 98.5 percent and not more than 101.5 percent of $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{~S} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$, calculated on the dried basis.

Packaging and storage-Preserve in well-closed, light-resistant containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label it to indicate it is for veterinary use only.
USP Reference standards $\langle 11\rangle$ —USP Morantel Tartrate RS.

Clarity and color of solution-Dissolve and dilute 0.25 g to 25.0 mL in carbon dioxide-free water. Solution is clear and yellow to greenish yellow in color.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: It meets the requirements of the test for Tartrate $\langle 191\rangle$.

C: The retention time of the morantel peak in the chromatogram of the Test solution corresponds to that in the chromatogram of Standard solution 1, as obtained in the test for Related compounds.

Melting temperature $\langle 741\rangle$ : $167^{\circ}$ to $172^{\circ}$.
$\mathbf{p H}\langle 791\rangle$ : between 2.8 and 3.2.
Solution: Dissolve and dilute 0.25 g to 25.0 mL in carbon dioxide-free water.

Loss on drying $\langle 731\rangle$ —Dry it at $100^{\circ}$ to $105^{\circ}$ to constant weight: it loses not more than $1.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ —not more than 20 ppm .
Related compounds-[NOTE-Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.]

Mobile phase-Mix 3.5 mL of triethylamine and 850 mL of water. Adjust with phosphoric acid to a pH of 2.5. Add 50 mL of tetrahydrofuran and 100 mL of methanol, and mix.

Tartrate solution-Prepare a solution containing about 0.15 mg tartaric acid per mL in Mobile phase.

Standard solution 1-Dissolve an accurately weighed quantity of USP Morantel Tartrate RS in Mobile phase to obtain a solution having a known concentration of about $5.0 \mu \mathrm{~g}$ per mL .

Standard solution 2-Dilute 2.0 mL of Standard solution $l$ to 100.0 mL with Mobile phase.

System suitability solution-Expose 10 mL of Standard solution 1 to daylight for 15 minutes before injection.
Test solution-Dissolve an accurately weighed quantity of Morantel Tartrate in Mobile phase to obtain a solution having a concentration of about 0.5 mg per mL .
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $226-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$
packing L1. The flow rate is about 0.75 mL per minute. Chromatograph the Tartrate solution, Standard solution 1, and System suitability solution, and record the peak areas as directed for Procedure: using the System suitability solution, the resolution between morantel and its preceding peak ( $(Z)$-isomer) is not less than 2.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Tartrate solution, Standard solution 1, Standard solution 2, and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Disregarding the tartrate peak and any peak in the chromatogram of the Test solution less than the area of the principal peak in the chromatogram of Standard solution 2, calculate the area percentage of each impurity, relative to morantel, in the portion of Morantel Tartrate taken by the formula:

$$
100\left(C_{S} / C_{U}\right)\left(r_{i} / r_{s}\right)
$$

in which $C_{S}$ and $C_{U}$ are the concentration of morantel tartrate, in mg per mL, of Standard solution 1 and Test solution, respectively; and $r_{i}$ and $r_{s}$ are the peak areas of each individual impurity and morantel obtained from the Test solution and Standard solution 1, respectively: not more than $0.5 \%$ of any individual impurity is found, and not more than $1 \%$ of total impurities is found.

## Assay-

Dissolve 0.280 g in 40 mL of anhydrous acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). One mL of 0.1 N perchloric acid is equivalent to 37.04 mg of $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{~S} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \cdot \mathbf{\bullet} 2 \mathrm{~S}$ (USP28)

Briefing

Nabumetone Tablets, USP 27 page 1268. It is proposed to clarify the instructions in the Procedure for the Dissolution test.
(BPC: M. Marques) RTS-41725-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: sodium lauryl sulfate solution (2 in 100); 900 mL . Apparatus 2: 50 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{O}_{2}$ dissolved by employing UV absorption

- from the difference between UV absorbances $_{\mathbf{m}_{2 S} \text { (USP28) }}$ at the wavelengths of maximum and minimum absorbance at about 270 nm and 296 nm , respectively, on filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Nabumetone RS in the same medium.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{O}_{2}$ is dissolved in 45 minutes.

## Briefing

Naltrexone Hydrochloride, USP 27 page 1277. In the test for Limit of total solvents, it is proposed to (1) revise the concentration of isopropyl alcohol in the Internal standard stock solution; (2) provide the concentration, in mg per mL , for the alcohol and methanol used to prepare the Standard solution; and (3) revise the formula for calculating the limit of solvents to reflect these changes. In addition, minor editorial style changes have been made.
(PA2: D. Bempong) RTS-41665-1

## Change to read:

Limit of total solvents-
Internal standard stock solution-Prepare a solution of isopropylaleohel, which has been tested and found to be free of methanol and aleohol, having a concentration of about 0.12 mg per mL.
-Transfer 6.0 mL of isopropyl alcohol to a $500-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. [NOTE--The isopropyl alcohol must be free of alcohol impurities.] $]_{\text {■S (USP28) }}$

Internal standard solution-Transfer 5.0 mL of the Internal standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution - Transfer 2.0 mL of anhydrous methaneland 2.0 mL of aleohel to a 100 mL volumetric flask, dilate with water volume, and mix.
-Prepare a solution of methanol and alcohol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ in water to obtain a solution having a known concentration
of about 16 mg of each per mL . ${ }^{2 \mathrm{~S}}$ (USP28)
Transfer 3.0 mL of this solution and 5.0 mL of Internal standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
Test solution-Transfer about 75 mg of Naltrexone Hydrochloride, accurately weighed, to a suitable container, add 5.0 mL of $I n$ ternal standard solution, and shake to dissolve.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The gas chromatograph is equipped with a flame-ionization detector and a $4-\mathrm{mm} \times 1.8$-m glass column packed with 80 - to $100-\mathrm{mesh}$ support S3. The column temperature is maintained at $150^{\circ}$, and the injection port and detector temperatures are maintained at $170^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.24 for methanol, 0.53 for alcohol, and 1.0 for isopropyl alcohol.
Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the gas chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentages of methanol and alcohol in the portion of Naltrexone Hydrochloride taken by the formula:

$$
(240 / H)\left(R_{t}+R_{s}\right)
$$

$$
\boldsymbol{\bullet} 100\left(C_{S} / C_{U}\right)\left(R_{U} / R_{S}\right), \mathbf{■}^{2 S}(U S P 28)
$$

in which $W$ is the weight, in mg, of Naltrexene Hydrechloride in the Test solution;

- $C_{S}$ is the concentration, in mg per mL , of methanol or alcohol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ in the Standard solution; $C_{U}$ is the concentration, in mg per mL, of Naltrexone Hydrochloride in the

Test solution; ${ }^{2 S}$ (USP28)
and $R_{U}$ and $R_{S}$ are the peak response ratios of methanol or alcohol to isopropyl alcohol obtained from the Test solution and the Standard solution, respectively. To the sum of the percentages of methanol and alcohol, add the percentage of water as determined in the test for Water: the sum of water and alcoholic solvents is not more than $5.0 \%$ for the anhydrous form, and not more than $11.0 \%$ for the dihydrate form.

## BRIEFING

Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment, USP 27 page 1353. It is proposed to revise the Assay for nystatin to replace the microbially based procedure with an HPLC method. This method is based on analysis performed with a $3.9 \mathrm{~mm} \times 15.0 \mathrm{~cm}$ Waters Nova-Pak brand of column that contains $4-\mu \mathrm{m}$ packing L1. Interested parties are encouraged to validate the analytical methods using other chromatographic columns and to submit comments to the USP Expert Committee on Veterinary Drugs (Standards).
(VET: I. DeVeau) RTS-41603-1; 41603-2

## Change to read:

Assay for nystatin-Preceed as directed for nystatim under Anti bieties Mierobial Assays $\langle 81\rangle$, blending a suitable, veeurately weighed pertion of Ointment in a high-speed blender for 3 to 5 minutes with a suffieient, aceurately measured volume of dimeth yformamide to give a convenient concentration. Dilute an ac eurately measured volume of the solution so obtained quantitatively with dimethylformamide to obtain a stock solution eontaining abeut 400 -USP Nystatin Units per mL. Dilute an aceurately measured volume of this stock solution quantitatively with Buffer No. 6 to obtain a Test Dilution having a concentration of nystatin assumed to be equal to the median dese level of the-Standaret.

- NOTE-Protect solutions that contain nystatin from ambi- $^{\text {n }}$ ent light.

Ammonium acetate buffer-Dissolve $10.8 \pm 1.0 \mathrm{~g}$ of ammonium acetate in 2500 mL of water. Adjust with acetic acid to a pH of $6.50 \pm 0.05$.

Mobile phase-Mix 2500 mL of Ammonium acetate buffer, 1000 mL of acetonitrile, and 500 mL of methanol. Pass through a $0.45-\mu \mathrm{m}$ nylon filter.
BHT solution-Weigh about 1.0 g of butylated hydroxytoluene, and transfer to a $1000-\mathrm{mL}$ volumetric flask. Dilute with methanol to volume, and mix well.

Standard preparation-In duplicate, dissolve an accurately weighed quantity of USP Nystatin RS in BHT solution to obtain a solution having a known concentration of about 5400 USP Nystatin Units per mL. Store in low-actinic glassware.

System suitability solution-Weigh about 50 mg of USP Nystatin RS, and transfer to a $50-\mathrm{mL}$ low-actinic volumetric flask. Add 0.5 mL of 0.01 N sodium hydroxide, and allow to sit for 1 minute. Add 5 mL of Ammonium acetate buffer. Add about 25 mL of methanol, and sonicate to dissolve. Dilute with methanol to volume, and store in low-actinic glassware.

Assay preparation-Thoroughly mix the Ointment prior to sampling. In duplicate, accurately weigh about 1.0 g of Ointment having a known density into a low-actinic sample bottle. Add 20.0 mL of BHT solution, and insert a polytefcoated magnetic stir bar having dimensions of about 12.7 $\mathrm{mm} \times 7.9 \mathrm{~mm}$. Clamp the bottles onto a suitable mixer mill, ${ }^{1}$ and mix for a minimum of 5 minutes at about 30 Hz. Centrifuge at about $1350 \times g$ for 5 minutes, or until the supernatant is clear. Transfer the supernatant to low-actinic glassware.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $304-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $40^{\circ}$, and the flow rate is about 2.0 mL per minute. [NOTE-Solutions containing nystatin should be stored at $8^{\circ}$ until they can be injected into the chromatograph.] Chromatograph the Standard preparation and the System suitability solution, and record the peak areas as directed for Procedure: using the System suitability solution, the relative retention times for the nystatin A1 and nystatin A2 peaks are about 1.0 and 1.4, respectively; the column efficiency, using the nystatin A1 peak, is not less than 1200 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $3.0 \%$. [NOTE-After the conclusion of the run, rinse the column

[^342]with a mixture of acetonitrile and water $(85: 15)$ until the baseline is stable, and store in this solution. At the beginning of the next run, rinse with Mobile phase until the baseline is stable.]

Procedure-Separately inject equal volumes (about 15 $\mu \mathrm{L}$ ) of the duplicate Standard preparation and Assay preparation into the chromatograph, record the chromatograms, and measure the peak areas for nystatin A1 and nystatin A2. Calculate the quantity, in USP Nystatin Units, of nystatin in the portion of Ointment taken by the formula:

$$
20\left(C_{S} / W_{U}\right)\left(r_{u} / r_{s}\right),
$$

in which $C_{s}$ is the concentration of USP Nystatin RS, in USP Nystatin Units per mL, of the Standard preparation; $W_{U}$ is the weight, in g, of Ointment taken to prepare the Assay preparation; and $r_{u}$ and $r_{s}$ are the average peak areas of the sum of nystatin A1 and nystatin A2 obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{D L S}^{2 S}$ (USP28)

## BRIEFING

Ondansetron; Ondansetron Orally Disintegrating Tablets. Because there is no existing USP monograph for this article, these new monographs are being proposed. The liquid chromatographic procedure in the Assay and in the tests for Limit of ondansetron related compound $D$ and Related compounds is based on analyses performed with a Sperisorb Cyano brand of $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}, 5.0$ $\mu \mathrm{m}$ L10 column. Typical retention times for ondansetron and ondansetron related compound A are about 8.2 minutes and $9.2 \mathrm{~min}-$ utes, respectively, in the Assay and the test for Related compounds. Typical retention times for ondansetron related compound C , ondansetron related compound D , and ondansetron are about $6.7 \mathrm{~min}-$ utes, 7.8 minutes and 20.0 minutes, respectively, in the test for Limit of ondansetron related compound D.
(PA3: S. Salado) RTS—41043-1; 41043-2; 41613-1; 41613-2

## Add the following:

## ■Ondansetron

$\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O} \quad 293.36$
4 H -Carbazol-4-one, 1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1 $H$-imidazol-1-yl)methyl]- $( \pm)$.
( $\pm$ )-2,3-Dihydro-9-methyl-3-[(2-methylimidazol-1-yl)-methyl]carbazol-4(1H)-one [99614-02-5].
» Ondansetron contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in light-resistant containers.

USP Reference standards $\langle 11\rangle-U S P$ Ondansetron $R S$. USP Ondansetron Related Compound C RS. USP Ondansetron Related Compound D RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak for ondansetron in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay

Water, Method Ia $\langle 921\rangle$ : not more than $3.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

Chloride $\langle 221\rangle$ — To 1-g of the substance under test, add 30 to 40 mL of water, and warm gently, if necessary, until no more dissolves. Mix well, and pass through a filter paper that gives a negative test for chloride. Add I mL of nitric acid and 1 mL of silver nitrate TS. Dilute with water to 50 mL . Mix well, and allow to stand for 5 minutes protected from direct sunlight: any turbidity formed is not greater than that produced in a similarly treated control solution containing 0.3 mL of 0.020 N hydrochloric acid ( $0.02 \%$ ).

## Limit of ondansetron related compound D-

Phosphate buffer-Dissolve about 2.72 g of potassium phosphate monobasic in 900 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4 , dilute to 1000 mL , and mix well.

Mobile phase-Prepare a filtered and degassed mixture of phosphate buffer and acetonitrile ( $80: 20$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solution-Dissolve an amount of USP Ondansetron Related Compound D RS in Mobile phase, and dilute stepwise with Mobile phase, to obtain a solution having a known concentration of about $0.4 \mu \mathrm{~g}$ per mL .
Resolution solution-Prepare a solution of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in Mobile phase having a known concentration of about $0.6 \mu \mathrm{~g}$ per mL and $1.0 \mu \mathrm{~g}$ per mL , respectively.
Test solution-Transfer about 50 mg of Ondansetron, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $328-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L10. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1.5 mL per minute. Chromatograph the Reso-
lution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for ondansetron related compound C and 1.0 for ondansetron related compound D ; the resolution, $R$, between ondansetron related compound C and ondansetron related compound D is not less than 1.5. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 8000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the ondansetron taken by the formula:

$$
10(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Ondansetron Related Compound D RS in the Standard solution; $W$ is the weight, in mg , of ondansetron taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses of ondansetron related compound $D$ obtained from the Test solution and the Standard solution, respectively: not more than $0.10 \%$ is found.

## Related compounds-

Phosphate buffer, Mobile phase, Resolution solution, Standard preparation, and Chromatographic system-Prepare as directed in the Assay.

Test solution-Use the Assay preparation prepared as directed in the Assay.

Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Ondansetron taken by the formula:

$$
100\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ is the peak area for each impurity; and $r_{s}$ is the sum of the areas of all the peaks: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found, including ondansetron related compound D. [NOTE-Disregard the peak corresponding to ondansetron related compound D at a relative retention time of about 0.4.]

Organic volatile impurities $\langle 467\rangle$ : meets the requirements.

Assay-
Phosphate buffer-Dissolve about 2.72 g of potassium phosphate monobasic in 900 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide, to a pH of 5.4 , dilute to 1000 mL , and mix.
Mobile phase-Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (52:48). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Prepare a solution of USP Ondansetron RS and USP Ondansetron Related Compound A RS in Mobile phase having a known concentration of about 0.09 mg per mL and 0.05 mg per mL , respectively.
Standard preparation-Dissolve an accurately weighed quantity of USP Ondansetron RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.090 mg per mL .

Assay preparation-Transfer about 45 mg of Ondansetron, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Pipet 5.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask.

Dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $216-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} 25-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $30^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.1 for ondansetron related compound A and 1.0 for ondansetron; the resolution, $R$, between ondansetron related compound $A$ and ondansetron is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the ondansetron peaks. Calculate the quantity, in mg, of $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}$ in the portion of Ondansetron taken by the formula:

$$
500 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ondansetron RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ 2S (USP28)

## BRIEFING

Ondansetron Orally Disintegrating Tablets-See briefing under Ondansetron.
(PA3: S. Salado) RTS-41043-2; 41613-2

## Add the following:

## ■Ondansetron Orally Disintegrating Tablets

## » Ondansetron Orally Disintegrating Tablets con-

 tain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ondansetron $\left(\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}\right)$.Packaging and storage-Preserve in light-resistant containers. Store at controlled room temperature

USP Reference standards $\langle 11\rangle$ —USP Ondansetron $R S$. USP Ondansetron Related Compound A RS. USP Ondansetron Related Compound D RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Disintegration-[To come.]
Dissolution $\langle 711\rangle$ - [To come.]
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Water, $\langle 921\rangle$ : not more than $4.0 \%$.

## Related compounds-

Phosphate buffer-Prepare as directed in the Assay.
Mobile phase-Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (8:2). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Ondansetron related compound D solution-Dissolve an amount of USP Ondansetron Related Compound D RS in acetonitrile, and dilute stepwise with Mobile phase, to obtain a solution having a known concentration of about 0.04 mg per mL .

2-Methylimidazole solution-Dissolve an amount of 2methylimidazole in acetonitrile, dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.04 mg per mL .

Standard stock solution-Dissolve an accurately weighed quantity of USP Ondansetron RS in acetonitrile, dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.04 mg per mL.

System suitability solution-Transfer 5.0 of each, Standard stock solution, 2-Methylimidazole solution, and Ondansetron related compound D solution, to a $100-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix.

Standard solution-Pipet 5.0 mL of the Standard Stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.
System sensitivity solution-Pipet 10.0 mL of the Standard solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Test solution-Transfer 10 Tablets to an appropriate volumetric flask so that the final concentration is about $400 \mu \mathrm{~g}$ of ondansetron per mL. Add Mobile phase to fill about $60 \%$
of the flask capacity. Shake by mechanical means for about 5 minutes, and dilute with Mobile phase to volume. Centrifuge a portion of this solution at 3000 rpm for 10 minutes. Use the supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $216-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are given in the Table 1; the resolution, $R$, between ondansetron and any adjacent peak is not less than 1.5 ; the column efficiency is not less than 8000 theoretical plates for ondansetron; and the tailing factor for the ondasetron peak is not more than 2.0. Chromatograph the System sensitivity solution, and record the peak responses as directed for Procedure: the signal-to-noise ratio for the ondansetron peak is not less than 15. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.
Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$
100(C / F)(V / D)\left(r_{i} / r_{\mathrm{s}}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ondansetron RS in the Standard solution; $F$ is the relative response factor for each impurity as described in Table 1; $V$ is the volume, in mL , of the volumetric flask used to prepare the Test solution; $D$ is the amount, in mg , of ondansetron in the sample based on the labeled amount and number of dis-
integrating tablet taken; $r_{i}$ is the peak area of any impurity in the Test solution; and $r_{s}$ is peak area of ondansetron in the Standard solution: it meets the requirements specified in Table 1. [NOTE-The run time is about 60 minutes.]

Table 1

|  | Relative <br> Retention <br> time | Relative <br> Response | Limit |
| :--- | :---: | :---: | :---: |
| Compound name | $(\%)$ |  |  |
| 2-Methylimidazol | 0.16 | 0.5 | 0.15 |

| Impurity |  |  |  |
| Total impurities | - | - | 0.5 |

## Assay-

## Diluent: $\quad 0.01 \mathrm{~N}$ hydrochloric acid

Phosphate buffer-Dissolve about 2.72 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4.

Mobile phase-Prepare a filtered and degassed mixture of phosphate buffer and acetonitrile ( $52: 48$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Ondansetron related compound A solution-Dissolve an amount of USP Ondansetron Related Compound A RS in Diluent, and dilute stepwise with Diluent, to obtain a solution having a known concentration of about 0.14 mg per mL .

Assay preparation concentrated-Transfer 10 Tablets to an appropriate volumetric flask so that the final concentration is about $400 \mu \mathrm{~g}$ of ondansetron per mL . Add Diluent to fill about $60 \%$ of the flask capacity. Shake by mechanical means for about 5 minutes, and dilute with Diluent to volume. Filter a portion of this solution through a $0.45-\mu \mathrm{m}$ polypropylene membrane, discarding the first 5 mL .
System suitability solution-Transfer 8.0 mL of ondansetron related compound A solution and 8.0 mL of the Assay preparation concentrated to a $50-\mathrm{mL}$ volumetric flask. Dilute with Diluent to volume, and mix.
Standard preparation-Dissolve an accurately weighed quantity of USP Ondansetron RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $40 \mu \mathrm{~g}$ per mL.

Assay preparation-Transfer 5.0 mL of the Assay preparation concentrated to a $50-\mathrm{mL}$ volumetric flask. Dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $216-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.1 for ondansetron related compound A , and 1.0 for ondansetron; the resolution, $R$, between ondansetron related compound A and ondansetron is not less than 1.5 ; and the tailing factor is not more than 2.0 for the ondansetron peak. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the ondansetron peaks. Calculate the quantity, in mg, of ondansetron $\left(\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}\right)$ in the portion of Tablets taken by the formula :

$$
(10 V) C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ondansetron RS in the Standard preparation; $V$ is the volume used to prepare the Assay preparation concentrated; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{m S S}^{2 S}$ (USP28)

## Briefing

Oxycodone Hydrochloride, USP 27 page 1375. It is proposed to revise the test for Limit of alcohol to provide the concentration, in mg per mL , of alcohol in the Standard solution. It is also proposed to reflect this change in the formula for calculating the limit of alcohol in the Procedure.
(PA2: D. Bempong) RTS-41437-1

## Change to read:

Limit of alcohol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ -
Internal standard stock solution-Transfer 6.0 mL of isopropyl alcohol to a $500-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. [NOTE-The isopropyl alcohol must be free of alcohol impurities.]

Internal standard solution-Transfer 5.0 mL of Internal standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution-Transfer 2 mL of aleohol to a 100 mL vol tmetric flask, dilute with water to volume, and mix.
-Prepare a solution of alcohol in water to obtain a solution having a known concentration of about 16 mg of alcohol
$\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ per mL . $\mathbf{m}^{2 S}$ (USP28)
Pipet 3.0 mL of this solution and 5.0 mL of the Internal standard stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solution-Transfer about 240 mg of Oxycodone Hydrochloride, accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, add 5.0 mL of Internal standard solution, and mix to dissolve.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a flame-ionization detector and a $4-\mathrm{mm} \times 1.8-\mathrm{m}$ glass column that is packed with $80-$ to 100 -mesh support S3, helium being used as the carrier gas. Prior to use, condition the column overnight at $235^{\circ}$ with a slow flow of carrier gas. The column is maintained at $150^{\circ}$, and the injection port and detector temperatures are maintained at $170^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the resolution, $R$, between isopropyl alcohol and alcohol is not less than 2; the tailing factor for alcohol is not more than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ in the portion of Oxycodone Hydrochloride taken by the formula:

$$
(240 / 4)\left(R_{4}+R_{s}\right)
$$

$$
\mathbf{\square} 100\left(C_{S} / C_{U}\right)\left(R_{U} / R_{S}\right), \llbracket 2 S(U S P 28)
$$

in which Wis the weight, in mg, of Oxyeodene Hydrochloride in the Test solution;

- $C_{S}$ is the concentration, in mg per mL, of alcohol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ in the Standard solution; $C_{U}$ is the concentration, in mg per mL , of oxycodone hydrochloride in the Test solu-
tion; 2 L (USP28)
and $R_{U}$ and $R_{S}$ are the ratios of the alcohol peak to the isopropyl alcohol peak obtained from the Test solution and the Standard solution, respectively. [NOTE The density of alcohol, 800 mg per mL , has been aecounted for in the ealeulations.]
-n2S (USP28)
Not more than $1.0 \%(\mathrm{w} / \mathrm{w})$ of alcohol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ is found.

Briefing

Phenylephrine Bitartrate, page 923 of $P F$ 30(3) [May-June 2004]. On the basis of comments received, it is proposed to make extensive revisions in the test for Chromatographic purity and also to revise the concentration of the Test solution in the test for Specific rotation.
(PA2: D. Bempong) RTS-41799-1

## Add the following:

## ■Phenylephrine Bitartrate

$\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \quad 317.3$
$R$-2-(Methylamino)-1-(3-hydroxyphenyl)ethanol, hydrogen tartrate.
(-)-1-(3-Hydroxyphenyl)-2-methylaminoethanol, hydrogen tartrate.
(-)-3 Hydroxy- $\alpha$-[(methylamino)methyl] benzenemethanol, hydrogen tartrate.
$1-m$-Hydroxy- $\alpha-[($ methylamino $)$ methyl $]$ benzyl alcohol, hydrogen tartrate [17162-39-0].
» Phenylephrine Bitartrate contains not less than 99.0 percent and not more than 100.5 percent of $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Norphenylephrine Hydrochloride RS. USP Phenylephrine Hydrochloride RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The alkaline filtrate from the test for Specific rotation responds positively to the test for Tartrate $\langle 191\rangle$.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-53^{\circ}$ and $-57^{\circ}$ for the prepared sample.
Test solution-Prepare a sample solution of about 24240 mg per mL in water. Make the solution slightly alkaline by adding concentrated ammonium hydroxide dropwise. Rub the wall of the vessel with a glass rod so that the base precipitates out. Filter the base under suction, wash with a little water and acetone, and dry at $105^{\circ}$ for 2 hours. Prepare and measure a 50 mg per mL solution of base precipitate in 1 M hydrochloric acid.
$\mathbf{p H}\langle 791\rangle$ : between 3.0 and 4.0 in $10 \% \mathrm{w} / \mathrm{v}$ aqueous solution.

Loss on drying $\langle 731\rangle$-Dry at $105^{\circ}$ to a constant weight: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Chromatographic purity-

Buffer solution-Dissolve 3.25 g of 1-octanesulfonic acid sodium salt monohydrate in 1 L of water. Adjust slowly with 3 M phosphoric acid to a pH of 2.8 .

Solution A-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (9:1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and Buffer solution $(9: 1)$.

Diluent-Prepare a mixture of Solution $A$ and Solution B (8:2).
System suitability solution-Dissolve accurately weighed quantities of USP Phenylephrine Hydrochloride RS, ner phenylephrine hydrochloride, 1 benzylphenylepherine base, and benzylphenylepherine hydrochloride and USP

Norphenylephrine Hydrochloride RS in Diluent, and dilute
quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.06 me per mL , 0.09 mg per mL, 0.07 mg per mL , and 0.05 mg per mL 1.0 mg per mL and $0.9 \mu \mathrm{~g}$ per mL , respectively.

Blank solution-Prepare a solution containing 0.8 mg per mL L $(+)$-tartaric acid in Diluent.

Test solution-Transfer 78 mg of Phenylephrine Bitartrate, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 5.5-\mathrm{cm}$ column that contains packing L1. The column temperature and injector temperature are maintained at $45 \pm 2^{\circ}$. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 93 | 7 | equilibration |
| $0-10$ | $93 \rightarrow 3070$ | $7 \rightarrow 7030$ | linear gradi- |
| $10-1810.1$ | $3070 \rightarrow 93$ | $70-30 \rightarrow 7$ | ent |
|  |  |  | ear gradient |
| $10.1-18$ | 93 | 7 | equilibration |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0 .9-for nerphenylephrine, about 1.0 for ( ) phenylephrine, about 1.2 for phenylephrone, about 2.9 for 1 benzylphenylepherine, and about 3.1 for benzylphenylepherine HCl , the resolution, $R$, between norphenylephrine and ( - )-phenylephrine is not less than 1.5 ; the tailing factor of $(-)$-phenylephrine is less than 1.8 ; and the relative standard deviation for replicate injections is not more than $6 \% 5 \%$.

Procedure-fnject $10 \mu \mathrm{~L}$ of Separately inject equal volumes (about $4 \mu \mathrm{~L}$ ) of the Blank solution and the Test solution into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Phenylephrine Bitartrate taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity, and $r_{s}$ is the sum of the responses of all the peaks: man Q.2\% of any individual impurity is found, and not more than 0.5\%) fotalimpurities is found-[NOTE-Examine the chromatogram of the Blank solution for peaks and disregard any corresponding peaks observed in the chromatogram of the Test solution.] The limits of impurities are specified in the accompanying table.

|  | Approximate <br> Relative Reten- <br> tion Time | Limit (\%) |
| :--- | :---: | :---: |
| Compound | 1.0 | - |
| Phenylephrine | 0.9 | 0.2 |
| Norphenylephrine | 1.2 | 0.1 |
| Phenylephrone | 2.9 | 0.2 |
| Benzylphenylephrine | 3.1 | 0.1 |
| Benzylphenyl- |  |  |
| $\quad$ ephrone |  | 0.2 |
| Individual unknown |  | 0.5 |
| $\quad$ impurity | - |  |
| Total impurity |  |  |

Assay—Transfer about 280 mg of Phenylephrine Bitartrate, accurately weighed, to a $100-\mathrm{mL}$ beaker, and dissolve by stirring in 60 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrical-
ly. Perform a blank determination (see Titrimetry $\langle 541\rangle$ ), and make the necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.73 mg of $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2}$.
$\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$. ${ }^{2 \mathrm{~S}}$ (USP28)

## Briefing

Phenytoin Sodium, USP 27 page 1480 and page 1967 of $P F$ 29(6) [Nov.-Dec. 2003]. Several changes are proposed to clarify and correct the System suitability parameters in the test for Related compounds and the Assay. A revision of the calculation formula for other impurities in the test for Related compounds is proposed to include the molecular weights.
(PA3: S. Salado) RTS-41190-1

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■1S (USP28)

USP Phenytoin RS. USP Phenytoin Related Compound A RS. USP Phenytoin Related Compound B RS.

## Change to read:

## Related compounds-

Mobile phase, Standard stock preparation, System suitability stock solution, and System suitability solution-Prepare as directed in the Assay.

Standard solution-Dissolve accurately weighed quantities of benzophenone, USP Phenytoin RS, USP Phenytoin Related Compound A RS, and USP Phenytoin Related Compound B RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having known concentrations of $0.5 \mu \mathrm{~g}$ per $\mathrm{mL}, 1 \mu \mathrm{~g}$ per $\mathrm{mL}, 9 \mu \mathrm{~g}$ per mL , and $9 \mu \mathrm{~g}$ per mL , respectively.

Test solution-Use the Assay stock preparation.
Chromatographic system - Proceed as directed in the Assay, except to enly use the Systen sutability solution to valuate the sys tem suitability requirements.

■inject the Standard solution instead of the Standard preparation: the relative standard deviation for replicate injec-
tions is not more than $5.0 \%$ for each compound. ${ }^{2 S}$ (USP28)
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of phenytoin related compound A, phenytoin related compound B , and benzophenone in the portion of Phenytoin Sodium taken by the formula:

$$
100(C / D)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the respective analyte in the Standard solution; $D$ is the concentration, in $\mu \mathrm{g}$ per mL , of Phenytoin Sodium in the Test solution; and $r_{i}$ and $r_{S}$ are the peak responses for phenytoin related compound A , phenytoin related compound B, or benzophenone obtained from the Test solution and the Standard solution, respectively: not more than $0.9 \%$ each of phenytoin related compound A and phenytoin related compound B is found, and not more than $0.1 \%$ of benzophenone is found. Calculate the percentage of every other impurity in the portion of Phenytoin Sodium taken by the formula:

$$
100(C D)\left(r_{i}+x_{s}\right)
$$

$$
\mathbf{■}_{100(274.25 / 252.27)(C / D)\left(r_{i} / r_{S}\right), \square_{2 S}(U S P 28)}
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Phenytoin RS in the Standard solution;
-274.25 and 252.27 are the molecular weights of phenytoin
sodium and phenytoin, respectively; $\boldsymbol{m}_{2 S}$ (USP28)
$r_{i}$ and $r_{S}$ are the peak responses of each impurity obtained from the Test solution and the Standard solution, respectively; and the other term is as defined above. Not more than $0.9 \%$ of total impurities is found, excluding benzophenone.

## Add the following:

-Other requirements-Where the label states that Phenytoin Sodium is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Phenytoin Sodium Injection. Where the label states that Phenytoin Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Phenytoin Sodium Injection.■1S (USP28)

tion.1S (USP28)

## BRIEFING

Ramipril, USP 27 page 1623 . On the basis of comments received, it is proposed to replace the titration method in the Assay with a stability-indicating HPLC procedure. The new procedure is based on analyses performed using a Kromasil 100 C-18 brand of column containing $3-\mu \mathrm{m}$ packing L1. The typical retention time for ramipril is about 13 minutes.
(PA5: A.Wilk) RTS-40611-1

## Change to read:

" Ramipril contains not less than 98.0 percent and not more than 101.0

- 102.0 $0_{\text {2s }}$ (USP28)
percent of $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{5}$, calculated on the dried basis.

## Change to read:

Assay Dissolve abeut 300 mg of Ramipril, aceurately weighed, in 25 mL of methanel, add 25 mL of water, and titrate with 0.1 N sodium hydroxide VS, determining the endpeint petentiometrieat y. Perform a blank determination, and make any neeessary correetion (see Titrimetty $\langle 544\rangle$ ). Each mL of 0.1 N soditum hydroxide is equivalent to 41.65 mg of $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5}$.
-Sodium dodecyl sulfate solution-Prepare a $1 \%$ solution of sodium dodecyl sulfate. Adjust with phosphoric acid to a pH of $2.4 \pm 0.1$, filter, and degas.

Mobile phase_Prepare a mixture of Sodium dodecyl sulfate solution and acetonitrile (55:45). Adjust with phosphoric acid to a pH of $2.75 \pm 0.1$, filter, and degas. Make adjustments if necessary (see System Suitability under

## Chromatography $\langle 621\rangle$ ).

System suitability preparation-Dissolve accurately weighed quantities of USP Ramipril RS and USP Ramipril Related Compound A RS in Mobile phase to obtain a solution having known concentrations of about 0.2 mg per mL and 0.01 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Ramipril RS in Mobile phase to obtain a solution having a known concentration of about 0.2 mg per mL .

Assay preparation-Transfer about 100 mg of Ramipril, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in about 10 mL of acetonitrile, dilute with Mobile phase to volume, and mix. Pipet about 10 mL of this stock solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.8 mL per minute. Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between ramipril and ramipril related compound A is not less than 2.0 ; the column efficiency determined from the ramipril peak is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections determined from the ramipril peak is not more than $1.0 \%$.

Procedure—Separately inject equal volumes (about 10 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg , of $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{5}$ in the portion of Ramipril taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ramipril RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## Briefing

Ranitidine Hydrochloride, USP 27 page 1624 and page 1569 of $P F$ 29(5) [Sept.-Oct. 2003]; Ranitidine Oral Solution, USP 27 page 1626. It is proposed to replace the thin-layer chromatographic procedure in the test for Chromatographic purity and the liquid chromatographic procedure in the Assay with a single liquid chromatographic method. This proposed new procedure is based on analyses performed with the Waters Xterra MS brand of L1 column. The typical retention time for ranitidine is about 6.5 minutes. The new method requires an additional reference standard, USP Ranitidine Resolution Mixture RS, which contains Ranitidine Hydrochloride and four related impurities.
(PA4: E. Gonikberg) RTS-40648-1

## Add the following:

## Chromatographic purity-

Fest solution-Prepare a solution in methanol containing 22.3 ms per mL of Ranitidine- Hydrochloride.

Standard solutions. Bissolve an aceurately weighed quantity of USP Ranitidine Hydrochloride RS in methanol, and dilute with methanol to obtain Standurd solution 4 , having a known concen tration of about 0.22 mg per mL . Dilute portions of Standard sotution 4 quantitatively with methanel to obtain Standurd solutions $B, C$, and $D$, having concentrations of 110,66 , and $11 \mu \mathrm{~s}$ per mL , respectively.

Resolution solution- Dissolve an aceurately weighed quantity ef USP Ranitidine Related Compernd $A$ PS in methanel to obtain a solution having a known concentration of about 1.27 mg per mL . Identification preparation Dissolve an aceurately weighed quantity of USP Renitidine Related Compound B-RS in methanel to obtain a solution having a known eoneentration of about 1 mg permb.

Proedure Separately apply $10 \mu \mathrm{~L}$ each of the Test solution, each of the Standerd solutions, and the Identification solution to a thin layer chrematographic plate (see-Chrematography $\langle 624\rangle$ ) eoated with a 0.25 mm layer of chromatographic siliea gel mixture. Separately apply an additional $10 \mu \mathrm{~L}$ of the Test solutionto the same plate, and on top of this applieation, apply $10 \mu \mathrm{~L}$ of the Re solution solution. Allow the spots to dry, and develop the chromat egrams in a solvent system consisting of a mixture of ethyl ace ate, isopropyl aleohol, ammenitm hydroxide, and water ( $25: 15: 5: 1$ ) until the solvent front has moved not less than 15 cm from the or igin. Remove the plate from the developing chamber, mark the sol vent front, and allow to air dry. Expose the plate to iodine vapors in a clesed chamber until the ehrematogram is fully revealed. Exam ine the plate, and compare the intensities of any secondary spets ebserved in the chromatogram of the Test solution with those of the prineipal spets in the chrematograms of Standerd solutions $A$, $B, C$, and $D$, and the Identification solution: the system suitability requirements are met if there is complete resolution between the primary spots in the chromatogram of the combined Test solution and Resolution solution, and if a spot is observed in the chromatogram of Standurd solution D. Any spot observed in the chrematogram of the Test solution at the $R_{L}$ value correspending to that of the prineipal spet produced by the Identifieation solution, is not greater in size or intensity than the principal spet obtained from Stand solution $B$, correspending to not more than $0.5 \%$; and no other spet in the chrematogram of the Test solution exceeds the size or intensity of the principal spot obtained from Standetrd solution $C(0.3 \%)$. The sum of the intensities of all seondary spets ebtained frem the Test solution correspends to not mere than $1.0 \%$.
-Diluent, Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.
Standard solution-Prepare as directed for Standard

Test solution-Prepare as directed for Assay preparation.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and identify the ranitidine peak and the peaks due to impurities and degradation products listed in the table below.

| Relative <br> Retention Time | Name |
| :---: | :--- |
| 0.14 | Ranitidine simple nitroacetamide |
| 0.21 | Ranitidine oxime |
| 0.45 | Ranitidine amino alcohol |
|  | hemifumarate |
| 0.57 | Ranitidine diamine hemifumarate ${ }^{1}$ |
| 0.64 | Ranitidine $S$-oxide ${ }^{2}$ |
| 0.72 | Ranitidine $N$-oxide |
| 0.84 | Ranitidine complex nitroacetamide |
| 1.36 | Ranitidine formaldehyde |
| 1.75 | Adduct ranitidine bis-compound ${ }^{3}$ |

[^343]Measure the responses for the major peaks, and calculate the percentage of each impurity in the portion of Ranitidine Hy drochloride taken by the formula:

$$
20,000 C / W\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of ranitidine hydrochloride in the Standard solution; $W$ is the weight, in mg , of Ranitidine Hydrochloride taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{s}$ is the ranitidine peak response obtained from the Standard solution: not more than $0.3 \%$ of
ranitidine bis-compound is found, not more than $0.1 \%$ of any other single impurity is found, and not more than $0.5 \%$ of total impurities is found. ${ }^{2 S}$ (USP28)

## Add the following:

-Other requirements-Where the label states that Ranitidine Hydrochloride is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Ranitidine Injection. Where the label states that Ranitidine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Ranitidine Injection.■1S (USP28)

## Change to read:

Assay-
Mebile phase Prepare afftered and degassed mixtare of meth anol and 0.1 M aqueous ammenium aeetate (85:15). Make adjust ments if neeessary (see-System Suitability under Chromatography $\langle 621\rangle$.

Standard preparation Dissolvean aceurately weighed quantity of USP Ranitidine-Hydrechloride-PS in Mebile phase to obtain a solution having a known concentration of about 0.112 mg (equiv alent to - 0.100 mg of ranitidine base) per mL .

System sutability solution Dissolve aeeurately weighed quant tities of USP Ranitidine Hydrechloride RS andUSP Ranitidine Retated Compeund C RS in Mebile phase to obtain a solution having known concentrations of about 0.112 mg per mL and 0.01 mg per mL , respectively.

Assay preparation Transfer about 112 mg of Ranitidine Hy drechloride, aceurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Bissolve in and dilute with Mobile phase to volume, and mix. Transfer 1.0 mL of this solution to a 10 mL velumetric flask, dilute with Mebile phase to volume, and mix.

Chromatographic system (see-Chromatography $\langle 624\rangle$ ) The liquid chromategraph is equipped with a 322 mm detector and a-4.6 $\mathrm{mm} \times 20-30 \mathrm{~cm}$ colum that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Systent suitabit ity solution, and record the peak respenses as directed for Proce dure: the resolution, $R$, between ranitidine hydrochloride and $N$ [2 [[[5-[(dimethylamine)methyl] 2 faramyl]methyl]sulfayl]ethyl] $A^{N}$ methyl 2 nitre-1,1 ethenediamine (ranitidine related compeund C) is net less than 1.5. Chremategraph the Standard preparation, andrecord the peak respenses as directed for Procedure: the tailing factor for the ranitidine hydrechloride peak is not more than 2.0 ; the column efficieney determined from the ranitidine hydrechleride peak is net less than 700 theoretieal plates; and the relative standard deviation for replieate-injections is net mere than 2\%

Procedure Separately inject equal volumes (about $10 \mu \mathrm{\mu L}$ ) of the-Standard preparation and the Asisaypreparation inte the ehremategraph, record the ehrematograms, and measure the areas for
the major peaks. Calculate the quantity, in mg, of $\mathrm{G}_{42} \mathrm{H}_{22} \mathrm{~N}_{4} \Theta_{3} \mathrm{~S} \cdot \mathrm{HCl}$ in the pertion of Ranitidine Hydrochleride tak en by the formmat:-

$$
1000 C\left(r_{t}+r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ranitidine Hydrechloride-RS in the Standerd preparation; and $x_{t}$ and $\Psi_{s}$ are the peak respenses obtained frem the Assay preparation and the standard prepariation, respectively.

- Phosphate buffer—Place approximately 1900 mL of water in a $2.0-\mathrm{L}$ volumetric flask, accurately add 6.8 mL of phosphoric acid, and mix. Accurately add 8.6 mL of $50 \%$ sodium hydroxide solution, and dilute with water to volume. If necessary, adjust with $50 \%$ sodium hydroxide solution or phosphoric acid to a pH of 7.1, and filter.
Solution A-Prepare a mixture of Phosphate buffer and acetonitrile ( $98: 2$ ).

Solution B-Prepare a mixture of Phosphate buffer and acetonitrile (78:22).
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluent-Use Solution A.
Standard preparation-Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in Diluent to obtain a solution having a known concentration of about 0.125 mg of ranitidine hydrochloride per mL .

Resolution solution-Dissolve an accurately weighed quantity of USP Ranitidine Resolution Mixture RS in Diluent to obtain a solution having a known concentration of about 0.003 mg of each related impurity per mL and about 0.13 mg of ranitidine hydrochloride per mL . [NOTE--USP Ranitidine Resolution Mixture RS contains ranitidine hydrochloride and four related impurities: ranitidine N -oxide, ranitidine complex nitroacetamide, ranitidine diamine hemifumarate, and ranitidine amino alcohol hemifumarate.]

Assay preparation-Transfer about 25 mg of Ranitidine Hydrochloride, accurately weighed, to a $200-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column containing $3.5-\mu \mathrm{m}$ packing L1 that is stable from pH 1 to 12 . The flow rate is about 1.5 mL per minute. The column temperature is maintained at $35^{\circ}$. The chromatograph is programmed as follows

| Time | Solution $A$ | Solution $B$ |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| $0-10$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $10-15$ | 0 | 100 | isocratic |
| $15-16$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $16-20$ | 100 | 0 | re-equilibration |

Chromatograph the Resolution solution, identify the peaks using the table of impurities and degradation products (found above), and record the peak responses as directed for Procedure: the resolution, $R$, between the peaks for ranitidine $N$-oxide and ranitidine complex nitroacetamide is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure—Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quan-
tity, in mg , of $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{~N}_{4} \mathrm{O}_{3} \mathrm{~S} \cdot \mathrm{HCl}$ in the portion of Ranitidine Hydrochloride taken by the formula:

$$
200 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ranitidine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.п2S (USP28)

## BRIEFING

Ranitidine Oral Solution, USP 27 page 1626. Comments were received that the HPLC method published in $P F 28$ (2) on page 360 did not separate all known impurities and degradation products of Ranitidine Hydrochloride. This proposal is now being canceled. The proposed new liquid chromatographic procedure is based on analyses performed with Waters Xterra MS brand of L1 column. The typical retention time for ranitidine is about 12 minutes. [NOTE-The HPLC method is different from the one proposed for Ranitidine Hydrochloride because of the need to separate the sweetener (saccharine).] In addition, the revision in the test for Chromatographic purity necessitates the deletion of Identification test $A$. It is also proposed to delete the test for Antimicrobial effectiveness testing. This test is a formulation development and stabil-ity-indicating test, not a release test; deletion of this test is consistent with other USP monographs for oral solutions. See also the briefing under Ranitidine Hydrochloride.

## Chromatographic purity-

Test preparation [NOTE-Apply a quantity of extractives from Oral Solution to the chromatographic plate so as to achieve anominal leading of 200 ug of ranitidine.] Transfer a weighed quantity of Oral Solution, equivalent to 10 mg of ranitidine, to a suitable syringe. Attach the tip of the syringe to the top of a cartridge $(11 \mathrm{~mm} \times 12 \mathrm{~mm})$ of velume 0.5 mL containing 0.4 g of an L 4 packing for high pressure liquid chrematography that has been previously prepared by passage of 10 mL of methanol followed by passage of 20 mL of 0.5 M ammenia solution. Add 2.0 mL of $\theta .5 \mathrm{M}$ ammenia solution to the syringe and foree the mixture slow ly through the cartridge. Repent with 2 further 3 - mL pertions of $\theta .5 \mathrm{M}$ ammonia solution. Discard all the liquid that has traversed the cartridge. Pass 5 mL of a mixture of 0.1 M hydrechloric acid and methanol ( $3: 1$ ) through the eartridge, and colleet the eluant in a clean round bettom, 25 mL flask. Repent this with another 5 mb pertion of the same eluting mixture and collect the eluant in the same flack. Evaporate the contents of the flask to dryness at a temperatre not exee ling $30^{\circ}$. Redissolve the residte in 1.0 mL of a mixture of methanol and water ( $50: 50$ ).

Standardpreparation-DissolveUSP Ranitidine Hydrochloride RS in a mixttre of methanol and water ( $50: 50$ ) to obtain a solution having a known concentration of $448 \mu \mathrm{~g}$ (equivalent to -400 $\mu \mathrm{g}$ of ranitidine) per mL. Dilute portions of this Standerd preparation quantitatively with the mixture of methanel and water ( $50: 50$ ) to obtain solutions having eoncentrations of 224 ug per mL (Diluted

 huted stand preparation E), respectively.

Resolation prepatation DissolveUSP Ranitidine-Related Gempound A RS, 5 [ [ ( 2 aminoethyl)thio]methyl] N,N dimethyl $Z$ furammethanamine, hemifumarate salt, in methanol to obtain a solution having a known coneentration of 1.27 mg per mL.

Proedure Apply separately $10 \mu \mathrm{~L}$ of the Standard prepara tion, the Diluted standed preparations ( $A, B, C, D$, and $E$ ) and $20 \mu \mathrm{~L}$ (superposition of $2 \times 10 \mu \mathrm{~L}$ ) of the Test preparation to a suitable thin layer chromatographic plate (see Chromatography $\langle 624\rangle$ )coat with a 0.25 mm layer of chromategraphic siliea gel mixture. In addition, apply separately a futher loading of 10 HL of the Test preparation to the same plate, and on top of this applieation, apply $10 \mu \mathrm{~L}$ of the Resolution preparation. Perform the chromagraphy as deseribed in Chromagraphic purity under Ranitidine Hydrochloride. Examine the plate and compare the in
tensities of any secondary spots observed in the chromatogram of the Test preparation with those of the principal spets in the chromatograms of the Standerd preparation and Diluted standard pre parations ( $A, B, C, D$, and $E$ ): the system suitability requirements are met when there is complete resolution between the primary spots of the Test preparation and the Resolution preparation and if aspet is observed in the chromatogram of Diluted stal prepatation $E$. The major secondary spet is not greater in size or inten sity than the prineipal spot produced by the Standard preparation $(2.0 \%)$, and no other secondary spot is greater in size-or intensity than the prineipal spot produced by Diluted standat prepatation A(1.0\%). The sum of the intensities of all secondary spets obtained frem the Test preparan correspends to not more than $5.0 \%$. fNOTE-Spots established as arising from other compenents in the formulation are to be ignored.]

- [NOTE-All solutions should be transferred into polypropylene HPLC vials for analysis.]

Mobile phase, Resolution solution, and Chromatographic
system-Proceed as directed in the Assay.
Standard solution-Prepare as directed for the Standard preparation in the Assay.

Test solution-Prepare as directed for the Assay preparation.

Procedure-Separately inject equal volumes (about 15 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and identify the ranitidine peak and the peaks due to impurities and degradation products listed in the table below.

| Relative <br> Retention Time |  |
| :---: | :--- |
| 0.11 | Ranitidine simple nitroacetamide |
| 0.17 | Ranitidine oxime |
| 0.55 | Ranitidine $N$-oxide |
| 0.60 | Ranitidine amino alcohol hemifumarate |
| 0.67 | Ranitidine diamine hemifumarate ${ }^{1}$ |
| 0.77 | Ranitidine $S$-oxide ${ }^{2}$ |
| 0.80 | Ranitidine complex nitroacetamide |
| 1.13 | Ranitidine formaldehyde |

Measure the responses for the major peaks, and calculate the percentage of each impurity in the portion of Oral Solution taken by the formula:

$$
50,000 C / W\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of ranitidine in the Standard solution; $W$ is the weight, in mg , of ranitidine in the Test solution, based on the label claim; $r_{i}$ is the peak response for each impurity, obtained from the Test solution; and $r_{s}$ is the ranitidine peak response obtained from the Standard solution. Disregard any peak corresponding to the excipients present in the formulation. [NOTE-Relative retention times for sodium saccharin, propylparaben, and butylparaben are approximately $0.43,1.52$, and 1.59 , respectively.] Not more than $1.0 \%$ of any single impurity is found; and not more than $3.0 \%$ of total impurities is found. ${ }^{2 S}$ (USP28)

Assay- [NOTE-Where peak respenses are indieated, use peak ar eas.]

Mebile phase, Standard prepatation, System stitability soltion, and Chrontatographic system Prepare as direetedin the Assay under Ranitidine Hydrochloride, the ehromatographic columa being fltted with a suitable pre coltmm alse containing packing L1.

Assay preparation Dilute an aceurately measured quantity of Oral Solution, quantitatively, and stepwise-if neeessary, with Me bile phase to-obtain a-selation having acencentration of 0.1 mg of ranitidine per mE .

Proedure Separately injeet an equal quantity (abeut $10 \mu \mathrm{H}$ ) of the-Standard preparation and the 4 sisat preparation into the ehrematograph, record the chromatograms, and measure the respenses for the major peaks. Calculate the quantity, in me, of $\mathrm{G}_{42} \mathrm{H}_{22} \mathrm{~N}_{4} \mathrm{O}_{3} \mathrm{~S}$ in the pertion of Oral Solution taken by the formula:-
$(314.40 / 350.86)(I / D)(C)\left(F_{t}+r_{s}\right)$,
in whieh 314.40 ant 350.86 are the meleeular weights of ranitidine and ranitidine hydrochloride respectively, $L$ is the labeled quantity of ranitidine in the-Oral Solation taken, $D$-is the-eoneentration, in my per mL, of ranitidine in the Assat preparation, on the basis of the labeled quantity and the extent of dilution, $C$ is the eoneentra tion, in mg per mL, of USP Renitidine-Hydrechleride-RS in the Standard preparation, and $r_{y}$ and $r_{s}$ are the peak respenses obfained from the Assay preparation and the Standard preparation, respectively.

- [NOTE-All solutions should be transferred into polypropylene HPLC vials for analysis.]

Carbonate buffer-Dissolve 16 g of anhydrous sodium carbonate in water to make 1 L , adjust with hydrochloric acid to a pH of 7.1, and filter.

Solution A-Prepare a mixture of water and Carbonate buffer ( $60: 40$ ). Adjust if necessary to a pH of $7.1 \pm 0.2$.
Solution B-Prepare a mixture of acetonitrile and Carbonate buffer ( $60: 40$ ). For each 1000 mL of Solution B, add 3.0 mL of hydrochloric acid, and mix thoroughly.

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.13 mg of ranitidine hydrochloride per mL . Calculate the concentration, $C$, in mg of ranitidine per mL , the molecular weights of ranitidine and ranitidine hydrochloride being 314.40 and 350.86 , respectively.

Resolution solution-Dissolve an accurately weighed quantity of USP Ranitidine Resolution Mixture RS in Diluent to obtain a solution having a known concentration of about 0.003 mg of each related impurity per mL and about 0.13 mg of ranitidine hydrochloride per mL . [NOTE-USP Ranitidine Resolution Mixture RS contains ranitidine hydrochloride and four related impurities: ranitidine $N$-oxide, ranitidine complex nitroacetamide, ranitidine diamine hemifumarate, and ranitidine amino alcohol hemifumarate.]
Assay preparation-Using "to contain" pipet, transfer the accurately measured volume of Oral Solution, equivalent to about 60 mg of ranitidine, based on the label claim, to a $500-\mathrm{mL}$ volumetric flask. Rinse the pipet with small portions of water, adding the rinsings to the flask, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column containing $3.5-\mu \mathrm{m}$ packing L1 that is stable from pH 1 to 12 . The flow rate is about 1.0 mL per minute. The column temperature is maintained at $40^{\circ}$. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| $0-12$ | $100 \rightarrow 70$ | $0 \rightarrow 30$ | linear gradient |
| $12-17$ | $70 \rightarrow 0$ | $30 \rightarrow 100$ | linear gradient |
| $17-21$ | 0 | 100 | isocratic |
| $21-21.1$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $21.1-25$ | 100 | 0 | re-equilibration |

Chromatograph the Resolution solution, identify the peaks using the table of impurities and degradation products (found above), and record the peak responses as directed for Procedure: the resolution, $R$, between the peaks for ranitidine diamine hemifumarate and ranitidine complex nitroacetamide is not less than 1.5 , and the resolution between the peaks for ranitidine $N$-oxide and ranitidine amino alcohol hemifumarate is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 15 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ranitidine $\left(\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{~N}_{4} \mathrm{O}_{3} \mathrm{~S}\right)$ in each mL of Oral Solution taken by the formula:
in which $C$ is the concentration, in mg per mL , of ranitidine in the Standard preparation; $V$ is the volume of Oral Solution taken to prepare the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## Briefing

Ropivacaine Hydrochloride. Because there is no existing USP monograph for this drug substance, a new monograph is being proposed. The reverse phase HPLC method used in the tests for Limit of ropivacaine related compound $A$ and Related compounds was validated using a Nova-pak C18 brand of L1 column. Ropivacaine related compound A (2,6-dimethylaniline) and ropivacaine elute at approximately 2.4 minutes and 5.4 minutes, respectively. The test for Enantiomeric purity is evaluated using a validated capillary electrophoresis procedure with UV detection. Ropivacaine ( $S$ enantiomer) and ropivacaine related compound B ( $R$ enantiomer) are separated using a fused silica column (Hewlett-Packard) and a run buffer containing 2,6-di- $O$-methyl- $\beta$-cyclodextrins; the migration times are approximately 24 and 25 minutes for the $R$ and $S$ enantiomers, respectively.
(PA1: K. Russo; AMB: D. Porter; PSD: C. Okeke; NL: C. Barnstein) RTS-40282-1; 40282-2; 40282-3; 40282-4; 41020-1; 41020-2

## Add the following:

## ■Ropivacaine Hydrochloride

$\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl} \cdot \mathrm{H}_{2} \mathrm{O} \quad 328.89$

$$
500(C / V)\left(r_{U} / r_{S}\right)
$$

(S)-(-)-1-Propyl-2', $6^{\prime}$-pipecoloxylidine hydrochloride monohydrate [132112-35-7].
» Ropivacaine Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of $\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in well-closed containers. Store at room temperature.

Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards $\langle 11\rangle$ —USP Bupivacaine Hydrochloride RS. USP Endotoxin RS. USP Ropivacaine Hydrochloride RS. USP Ropivacaine Related Compound A RS. USP Ropivacaine Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: A solution (1 in 100) responds to the test for Chloride $\langle 191\rangle$.

Bacterial endotoxins $\langle 85\rangle$-The level of bacterial endotoxins is such that the requirements under the relevant dosage form monograph(s) in which Ropivacaine Hydrochloride is used can be met. Where the label states that Ropivacaine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirements under the relevant dosage form monograph(s) in which Ropivacaine Hydrochloride is used can be met.

Color-Transfer an accurately weighed aliquot of Ropivacaine Hydrochloride, about 480 to 500 mg , into a $25-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with water to
volume. Pass the solution through a $5-\mu \mathrm{m}$ polyvinylidene filter (PVDF). Immediately measure the absorbance at 405 nm and at 436 nm , using a suitable spectrophotometer and a path length of 5 cm , and using water as the reference: the absorbance at 405 nm is not more than 0.030 , and the absorbance at 436 nm is not more than 0.025 .

## Clarity-

Hydrazine sulfate solution-Dissolve 1.0 g of hydrazine sulfate in water and dilute with water to 100 mL . Allow to stand 4 to 6 hours.

Hexamethylenetetramine solution-Transfer 2.5 g of hexamethylenetetramine to a $100-\mathrm{mL}$ glass-stoppered flask and dissolve in 25 mL of water. Do not dilute to volume.

Stock opalescence standard suspension-To the flask containing the Hexamethylenetetramine solution, add 25.0 mL of Hydrazine sulfate solution, mix, and allow to stand for 24 hours. This suspension is stable for up to 2 months when stored in a glass container free from surface defects. The suspension must not adhere to the flask and must be well mixed before use.

Opalescence standard suspension-Dilute 15.0 mL of the Stock opalescence standard suspension with water to 1000 mL . This suspension should be freshly prepared and may be stored for not more than 24 hours.

Reference suspension 1-Combine 5.0 mL of the Opalescence standard suspension and 95.0 mL of water. Shake before use.

Reference suspension 2-Combine 10.0 mL of the Opalescence standard suspension and 90.0 mL of water. Shake before use.

Test solution-Transfer about 480 to 500 mg of Ropivacaine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Procedure-Use identical tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm . The depth of the layer is 40 mm . Compare the solutions in diffused daylight 5 minutes after the preparation of Reference suspension 1 and Reference suspension 2, viewing vertically against a black background. The diffusion of light must be such that Reference suspension 1 can readily be distinguished from water, and Reference suspension 2 can readily be distinguished from Reference suspension 1. The Test solution is considered clear if its clarity is the same as that of water or if its opalescence is not more pronounced than that of Reference suspension 1.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ :
Solvent: Dissolve about 200 g of sodium hydroxide in water, and dilute with water to 1 L . Combine 20 mL of this solution and 300 mL of water in a 1-L volumetric flask. Dilute with alcohol to volume.

Test solution: 10 mg per mL , in Solvent.
Procedure: Obtain readings at 365 nm : between $-210^{\circ}$ and $-255^{\circ}$.
$\mathbf{p H}\langle 791\rangle$ : between 4.5 and 6.0, in a solution (1 in 100).
Water, Method Ia $\langle 921\rangle$ : between $5.0 \%$ and $6.0 \%$. Perform the determination on 0.0900 to 0.1100 g of sample.

## Heavy metals-

pH 3.5 Acetate Buffer and Standard Lead Solution-Prepare as directed under Heavy Metals $\langle 231\rangle$.

Dilute lead standard solution-Dilute 10.0 mL of the Standard Lead Solution with water to 100 mL . Each mL of Dilute lead standard solution contains the equivalent of $1 \mu \mathrm{~g}$ of lead.
0.25 M Sodium sulfide solution-Dissolve about 6.0 g of sodium sulfide in 40 g of glycerol, then dilute with water to 100 mL . Filter using a cotton pad and store in a glass container protected from light.

Test Preparation-Prepare as directed under Heavy Metals, Method II $\langle 231\rangle$, using 3.97 to 4.00 g of ropivacaine hydrochloride.

Standard solution-Combine 10.0 mL of the Dilute lead standard solution with 2 mL of the Test Preparation and 2 mL of pH 3.5 Acetate Buffer, and mix.
Test solution-Combine 12 mL of the Test Preparation with 2 mL of pH 3.5 Acetate Buffer and mix.
Blank-Combine 10 mL of water, 2 mL of pH 3.5 Acetate Buffer, and 2 mL of the Test Preparation.

Procedure-Transfer the Blank to a color-comparison tube. Transfer the Standard solution and the Test solution to individual color-comparison tubes each containing 1 drop of 0.25 M Sodium sulfide solution. After 1 minute, compare the colors, viewing downward over a white surface: the Standard solution shows a slight brown color compared to the Blank; and the Test solution is not darker than the Standard solution ( $0.001 \%$ ).

## Limit of ropivacaine related compound A-

Buffer solution, Mobile phase, System suitability solution, and Chromatographic system-Prepare as directed for Related compounds.

Standard solution-Dissolve an accurately weighed quantity of USP Ropivacaine Related Compound A RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $0.13 \mu \mathrm{~g}$ per mL .

Test solution-Transfer about 100 mg of Ropivacaine Hydrochloride, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks: the signal-to-noise ratio of
the principal peak in the Standard solution is at least 10; and the response for any peak corresponding to ropivacaine related compound A (2,6-dimethylaniline) in the chromatogram obtained from the Test solution is not greater than the response of the major peak in the chromatogram obtained from the Standard solution ( $10 \mu \mathrm{~g}$ per g ).

## Related compounds-

Buffer solution-Combine 1.3 mL of sodium phosphate monobasic solution ( 138 g per L ) and 32.5 mL of disodium hydrogen phosphate dihydrate solution ( 89 g per L), and dilute with water to 1 L . The pH of this solution is 8.0 . Make adjustments if necessary.

Mobile phase-Prepare a degassed mixture of Buffer solution and acetonitrile (50:50). Make adjustments if necessary (see System suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Dissolve accurately weighed quantities of USP Ropivacaine Hydrochloride RS and USP Bupivacaine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about $10 \mu \mathrm{~g}$ per mL of each compound.
Test solution-Transfer about 27.5 mg of Ropivacaine Hydrochloride, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Dilute test solution-Dilute 1.0 mL of the Test solution with Mobile phase to 100 mL . Dilute 1.0 mL of this solution with Mobile phase to 10 mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $240-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Check the stability of the baseline by injecting Mobile phase. Run the chromatogram for at least 15 minutes. Chromatograph the System suitability solution and the Dilute test solution,
and record the peak responses as directed for Procedure: the relative retention times are 1.6 for bupivacaine and 1.0 for ropivacaine; the resolution, $R$, between ropivacaine and bupivacaine is not less than 6 (from the System suitability solution); and the signal-to-noise ratio of ropivacaine is at least 10 (from the Dilute test solution).

Procedure-Inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the System suitability solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Ropivacaine Hydrochloride taken by the formula:

$$
100\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the peak response for each impurity obtained from the Test solution; and $r_{s}$ is the sum of all peak responses obtained from the Test solution: not more than $0.2 \%$ of bupivacaine is found, less than $0.1 \%$ for any other individual impurity is found, and not more than $0.5 \%$ of total impurities is found.

## Enantiomeric purity-

Background electrolyte solution-Transfer 9.31 to 10.29 g of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume. The pH is between 2.9 and 3.1. If necessary, adjust the pH with triethanolamine.

Run buffer-Prepare a solution containing approximately 13.3 mg of heptakis-(2,6-di- $O$-methyl)- $\beta$-cyclodextrin per mL of Background electrolyte solution. [NOTE-This solution is freshly prepared and passed through a $0.45-\mu \mathrm{m}$ filter.]
System suitability solution-Dissolve accurately weighed quantities of USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound B RS in water, and dilute
quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about $15 \mu \mathrm{~g}$ per mL of each compound.

Test solution-Transfer about 50 mg of Ropivacaine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with water.

Dilute test solution-Dilute 1.0 mL of the Test solution with water to 200 mL .

Capillary rinsing procedure-Use separate run buffer vials for capillary rinse and sample analysis. Rinse the capillary with water for 1 minute, with 0.1 N sodium hydroxide for 10 minutes, and with water for 3 minutes. If a new or dry capillary is being used, increase the sodium hydroxide rinse time to 30 minutes. Rinse the capillary between injections as follows: water for 1 minute, 0.1 N sodium hydroxide for 4 minutes, and water for 1 minute, then run buffer for 4 minutes. Rinse times are based on a rinse pressure of 1 bar.
System setup (see Capillary Electrophoresis $\langle 727\rangle$ )-The system is equipped with a $206-\mathrm{nm}$ detector and a $50-\mu \mathrm{m} \times$ $72-\mathrm{cm}$ fused silica column. The temperature is maintained at $30^{\circ}$. A voltage of $375 \mathrm{~V} / \mathrm{cm}$ is applied. The initial ramping is $500 \mathrm{~V} / \mathrm{s}$, positive polarity, and a resulting current of 40 to 45 $\mu \mathrm{A}$. Inject the Dilute test solution: the signal-to-noise ratio is at least 10. Inject the System suitability solution, and record the peak responses as directed for Procedure: the relative migration times are about 0.96 for ropivacaine related compound B ( $R$ enantiomer) and 1.0 for ropivacaine ( $S$ enantiomer); the resolution, $R$, between ropivacaine related compound B and ropivacaine is not less than 3.7. The analysis run time is about 30 minutes. If needed, increase the resolution by increasing the concentration of heptakis-(2,6-di- $O$-methyl)- $\beta$-cyclodextrin or by lowering the system temperature.

Procedure-Separately inject equal volumes of the Run buffer and of water to ensure there are no interfering peaks ( 50 mbar for 5.0 seconds followed by injection of Run buffer at 50 mbar for 1.0 second). Inject the Test solution into the electrophoresis system, record the electropherograms, and measure the peak responses for ropivacaine and ropivacaine related compound B . Calculate the percentage of ropivacaine related compound $B$ in the portion of Ropivacaine Hydrochloride taken by the formula:

$$
100\left(r_{R} / M_{R}\right) /\left(r_{s} / M_{s}\right),
$$

where $r_{R}$ is the peak response of ropivacaine related compound B obtained from the Test solution; $r_{s}$ is the peak response of ropivacaine obtained from the Test solution; and $M_{R}$ and $M_{S}$ are the migration times, in minutes, of ropivacaine related compound B and ropivacaine, respectively: not more than $0.5 \%$ ropivacaine related compound B is found.

System shutdown-After the analysis, rinse the capillary for 10 minutes with 0.1 N sodium hydroxide, then for 10 minutes with water. Dry the capillary before storage.

Other requirements-Where the label states that Ropivacaine Hydrochloride is sterile, it meets the requirements for Sterility Tests $\langle 71\rangle$ and Labeling under Injections $\langle 1\rangle$.

Assay-Dissolve an accurately weighed quantity of Ropivacaine Hydrochloride, approximately 1000 mg , in 10 mL of water and 40 mL of alcohol. Add 1.0 mL of 1 N hydrochloric acid, and titrate with 1 N sodium hydroxide VS. Two equivalence points are obtained; the difference in titrant volume corresponds to the amount of ropivacaine hydrochloride. Each mL of 1 N sodium hydroxide is equivalent to 310.9 mg of anhydrous ropivacaine hydrochloride $\left(\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}\right) \cdot{ }^{\mathbf{n} 2 \mathrm{~S}}$ (USPP28)

Sargramostim, USP 27 page 1674. It is proposed to make minor changes in the Definition to better describe the product.
(BNT: L. Callahan) RTS-41798-1

## Change to read:

» Sargramostim is a highly purified glycosylated protein consisting of 127 amine acids. It has the property to generate gramulocyte, macrophage, and mixed granulocyte macrephage colonies from hematepoietic progenitor cells found in bene marrow. It is produced by recombinant DNA synthesis in yeast culture, and
-Sargramostin is a single chain, glycosylated polypeptide of 127 amino acid residues expressed from Saccharomyces cerevisiae. The glycoprotein primarily consists of three molecular species having relative molecular weights of approximately $19,500,16,800$, and 15,500 due to different levels of glycosylation. Sargramostim has the property to generate granulocyte, macrophage, and mixed granulocyte macrophage colonies from hematopoietic progenitor cells found in bone marrow.
$\mathrm{It}_{\mathbf{n} 2 \mathrm{~S}(\text { USPP8) }}$
possesses the primary sequence of the natural form of granulocyte-macrophage colony-stimulating factor with a substitution in the amino acid residue at position 23 ( $\mathrm{Leu}_{23}$ in place of $\mathrm{Arg}_{23}$ ). It has a biological potency of not less than 73.0 percent and not more than 146.0 percent of the potency stated on the label, the potency being 5.6 million USP Sargramostim Units per mg of protein. The presence of host cell DNA and host cell protein impurities in Sargramostim is process-specific; the limits of these impurities are determined by validated methods.

BRIEFING

Sotalol Hydrochloride, USP 27 page 1716 and page 3084 of the First Supplement. It is proposed to correct the formulas in the test for Related compounds to express the value of the results in percent.
(PA5: A. Wilk) RTS-41775-1

## Change to read:

## Related compounds-

Mobile phase-Proceed as directed in the Assay.
Standard solution-Dissolve accurately weighed quantities of USP Sotalol Hydrochloride RS, USP Sotalol Related Compound A RS, USP Sotalol Related Compound B RS, and USP Sotalol Related Compound C RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having known concentrations of about $6 \mu \mathrm{~g}$ of each per mL .

Test solution-Transfer about 200 mg of Sotalol Hydrochloride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system-Prepare as directed in the Assay. Chromatograph the Standard solution, and record the peak heights as directed for Procedure: the relative retention times are about 0.65 for sotalol hydrochloride related compound B, 1.0 for sotalol hydrochloride, 1.2 for sotalol hydrochloride related compound A , and 1.4 for sotalol hydrochloride related compound C ; the resolution, $R$, between sotalol hydrochloride related compound A and sotalol hydrochloride is not less than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $25 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the heights for the major peaks. Calculate the percentage of each sotalol hydrochloride related compound in the portion of Sotalol Hydrochloride taken by the formula:

$$
\theta .1(C / H)\left(r_{i}, H_{s}\right),
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the appropriate USP Related Compound Reference Standard in the Standard solution; $W$ is the weight, in mg , of Sotalol Hydrochloride taken to prepare the Test solution; and $r_{i}$ and $r_{S}$ are the peak heights for the corresponding related compound obtained from the Test solu-
tion and the Standard solution, respectively. Calculate the percentage of other impurities in the portion of Sotalol Hydrochloride taken by the formula:

$$
\begin{gathered}
\theta .1(C / H)\left(r_{\ldots} \not r_{s}\right), \\
\mathbf{\bullet}_{10(C / W)\left(r_{s i} / r_{s}\right), \boldsymbol{m}_{2 S}(U S P 28)}
\end{gathered}
$$

in which $C$ is the concentration, in mg

## 

per mL, of USP Sotalol Hydrochloride RS in the Standard solution; $W$ is the weight, in mg , of Sotalol Hydrochloride taken to prepare the Test solution; $r_{s i}$ is the sum of the peak heights for all impurities, other than the related compounds, obtained from the Test solution; and $r_{S}$ is the peak height of sotalol obtained from the Standard solution. Not more than $0.3 \%$ each of sotalol hydrochloride related compound A and sotalol hydrochloride related compound B is found; not more than $0.4 \%$ of sotalol hydrochloride related compound C is found; not more than $0.3 \%$ of other impurities is found; and not more than $0.5 \%$ of total impurities is found.

## Briefing

Sufentanil Citrate Injection, USP 27 page 1731. It is proposed to add a note to the Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ test under Identification to clarify that in cases where sample dilution with Mobile phase is not required, Water for Injection is used as the medium for preparing the Standard solution.

$$
\text { (PA2: D. Bempong) } \quad \text { RTS-41675-1 }
$$

## Change to read:

## Identification-

A: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ -
Solution: $50 \mu \mathrm{~g}$ per mL.
Medium: Use Mobile phase prepared as directed in the Assay.

- [NOTE-For samples that do not require dilution to achieve $50 \mu \mathrm{~g}$ per mL , use Water for Injection as the medium for the Standard solution. $]_{\text {nes (USP28) }}$

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Briefing

Sumatriptan Nasal Spray, page 119 of $P F$ 29(1) [Jan.-Feb. 2003]. Several modifications are made to this proposed monograph to identify the compounds quantified, and to clarify the procedures used.
(PA3: S. Salado) RTS-39992-1

## Add the following:

## ■Sumatriptan Nasal Spray

» Sumatriptan Nasal Spray is an aqueous, buffered solution of Sumatriptan. It is supplied in a form suitable for nasal administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sumatriptan $\left(\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers, and store between $2^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ — USP Sumatriptan Succinate RS. USP Sumatriptan Succinate Related Compound A RS. USP Sumatriptan Succinate Related Compound B C RS.

USP Sumatriptan Succinate Related Impurities RS.
Identification, Infrared Absorption $\langle 197 \mathrm{M}\rangle$ -
Test specimen-To the contents of 1 vial of Nasal Spray add 1 mL of a saturated sodium chloride solution. Add 1 mL of a saturated solution of sodium carbonate, and shake vigorously for about 30 seconds. To the solution so obtained, add 2 mL of isopropyl alcohol, shake vigorously for about 30 seconds, and allow to stand until the phases separate. Transfer the organic phase to a suitable glass vial. Repeat the extraction with a second $2-\mathrm{mL}$ portion of isopropyl al-
cohol, and transfer the organic phase to the same vial. Evaporate the solution under a stream of nitrogen. Dry the residue in an oven at $100^{\circ}$ for 30 minutes, allow to cool to room temperature in a desiccator, and prepare a mull by the addition of 1 to 2 drops of mineral oil.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absene of Staphyloce atreus, Pseudomantas aeruginesta, and Bite Tolerant Organisms. The total aerobie mierobial 100 per mber The total aerobic microbial count does not exceed 100 cfu per mL , and it meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa in 1 mL .
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 6.0.
Deliverable volume-Test 10 vials separately. Weigh each vial before and after actuation, and calculate the individual volume delivered, in $\mu \mathrm{L}$, by the formula:

$$
\left(W_{1}-W_{2}\right) / D,
$$

in which $W_{1}$ and $W_{2}$ are the weights, in mg , of the individual vials before and after actuation, respectively; and $D$ is the density of the nasal solution. Calculate the mean volume delivered. The volume of each spray delivered is between 80 and $120 \mu \mathrm{~L}$, and the mean volume is between 90 and 110 $\mu \mathrm{L}$.

Limit of sumatriptan related compound A-
10M Ammanium acetate solution, Mobile phase, and
Chromatographie system- Proeed as directed in the test
for Limit of related eompruthd 4 under Sumathiptant.
10 M Ammonium acetate solution-Dissolve 77.1 g of ammonium acetate in 100 mL of water.

Mobile phase-Prepare a filtered and degassed mixture of methanol and 10 M Ammonium acetate solution (9:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Proceed as described in the Assay.
Standard solution-Dissolve an accurately weighed quantity of USP Sumatriptan Succinate Related Compound A RS in Mobile phase, Diluent and dilute quantitatively, and stepwise if necessary, with Mobile phase Diluent to obtain a solution having a known concentration of about 0.007 mg per mL (equivalent to about 0.005 mg per mL of $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2}$ ).
Test solution-Dissolve an appropriate volume of Nasal Spray in Diluent to obtain a solution having a concentration of about 1.0 mg of sumatriptan per mL .
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 20-\mathrm{cm}$ column that contains packing L3. The flow rate is about 2.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5 \%$.

Procedure-Proeed direeted in the test for Limit of retatemplan A minder Sumatriply inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of sumatriptan succinate related compound A in the portion of Nasal Spray taken by the formula:

$$
100(495.7 / 613.8)\left(C_{S} / C_{U}\right)\left(r_{U} / r_{s}\right)
$$

in which the terms are as defined therein. 495.7 and 613.8 are the molecular weights of sumatriptan related compound A and sumatriptan succinate related compound A, respectively; $C_{S}$ is the concentration, in mg per mL , of USP Sumatriptan Succinate Related Compound A RS in the Standard solution; $C_{U}$ is the concentration, in mg per mL , of sumatrip$\tan$ in the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses
for sumatriptan related compound A from the Test solution and the Standard solution, respectively: Not more than $1.5 \%$ is found.

## Chromatographic purity Related compounds-

Pilluent, Buffer solution, Mobile phase, Standerd prepa pation, System sulitability solution, and Chromatographie fystem- Prepare as directed in the Assay under Sumatimiptan.

Diluent-Proceed as directed in the Assay.
Buffer solution-Dissolve about 1.7 mL of dibutylamine, about 0.6 mL of phosphoric acid, and about 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide to a pH of about 7.5 , dilute with water to 1000 mL , and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $3: 1$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

System suitability solution-Dissolve accurately weighed quantities of USP Sumatriptan Succinate RS and USP Sumatriptan Succinate Related Compound C RS in Diluent to obtain a solution having known concentrations of about 1.4 mg per mL and 0.001 mg per mL , respectively.

Identification solution-Prepare a solution of USP Sumatriptan Succinate Related Impurities RS in Diluent having a concentration of about 3 mg per mL .
System suitability solution Dissolve aceurately weighed quantities of USP Sumatriptan Surecinate RS and USP St matriptan Stwecinate Related Compound B RS in Diltuent to obtain a solution having known coneentrations of about

## 4.4 mg per mL and 0.001 mg per mL , respectively.

Test solution-Dissolve an appropriate volume of Nasal Spray in Diluent to obtain a solution having a concentration of about 1.0 mg of sumatriptan per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 20-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for sumatriptan succinate related compound C and 1.0 for sumatriptan; and the resolution, $R$, between sumatriptan succinate related compound C and sumatriptan is not less than 1.5 . Chromatograph the Identification solution, and record the peak responses as directed for Procedure: identify the peaks according to Table 1.

Table 1

| Compound Name | Relative <br> Retention |
| :--- | :---: |
|  | Time |
| [3-[2-(Dimethylamino- $N$-oxide)ethyl]-1 $H$ - <br> indol-5-yl]- $N$-methylmethanesulfonamide | about 0.3 |
| [3-[2-(Methylamino)ethyl]-1 $H$-indol-5-yl]- | about 0.6 |
| $\quad N$-methylmethanesulfonamide |  |
| Sumatriptan succinate related compound C about 0.9 <br> Sumatriptan 1.0 <br> [3-[2-(Aminoethyl)-1H-indol-5-yl]- about 0.4 <br> $N$-methylmethanesulfonamide  |  |

Procedure-Proe as direct for Chron purityRelated empounds under Sumatriptam. Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all of the
peak responses. Calculate the percentage of each impurity in the portion of Nasal Spray taken by the formula:

$$
100 F_{i}\left(r_{i} / r_{s}\right)
$$

in which $F$ is the relative response factor, which is equal to 2.89 for any impurity with a 1 -[3-[2-dimethylamino)ethyl]-3-hydroxy-2-oxo-2,3-dihydro-1 H -indol-5-yl]- N -methylmethanesulfonamide that has a relative retention time of $0.46,4.55$ for any impurity with 3a-hydroxy-1,1-dimethyl-5-\{[methylamino)sulfonyl]methyl $\}-1,2,3,3 \mathrm{a}, 8,8 \mathrm{a}$, hexahydropyrrolo $[2,3-b]$ indol-1-ium that has a relative retention time of 0.64 , and 1.0 for all other impurities; ther terms are dine therein. $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses of all the peaks: not more than $1.5 \%$ of any impurity is found, and the total of all impurities, including the amount found in the test for Limit of sumatriptan related compound $A$, is not more than 4.0\%.

## Assay-

## Diluent, Buffer solution, Mebile phase, Systen suitability

solution, Standerd preparation, and Chromatographic syis tem- Proceed as directed in the Assay under Sumatriptan.

Diluent-Dissolve 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide to a pH of about 6.5 , and dilute with water to 1000 mL . Mix 750 mL of this solution with 250 mL of acetonitrile.

Buffer solution-Dissolve about 1.7 mL of dibutylamine, about 0.6 mL of phosphoric acid, and about 3.9 g of monobasic sodium phosphate dihydrate in water. Adjust with a solution of $50 \%(\mathrm{w} / \mathrm{v})$ sodium hydroxide to a pH of about 6.5 , dilute with water to 1000 mL , and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (3:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve accurately weighed quantities of USP Sumatriptan Succinate RS and USP Sumatriptan Succinate Related Compound C RS in Diluent to obtain a solution having known concentrations of about 0.14 mg per mL and 0.07 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Sumatriptan Succinate RS, and dissolve in Diluent to obtain a solution having a known concentration of about 0.14 mg per mL .

Assay preparation-Dissolve an appropriate volume of Nasal Spray in Diluent to obtain a solution having a known concentration of about 1.00 .1 mg of sumatriptan per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $282-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 20-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for sumatriptan succinate related compound C and 1.0 for sumatriptan; and the resolution, $R$, between sumatriptan succinate related compound C and sumatriptan is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

## Procedure -Proee directed in the Assa minder Stt

 Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and Assay preparation intothe chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount of suma$\operatorname{triptan}\left(\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}\right)$, in mg, in the portion of Nasal Spray taken by the formula:

$$
(295.4 / 413.5) C_{S} D\left(r_{U} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of sumatriptan succinate in the Standard preparation; $D$ is the dilution factor used in preparing the Assay preparation; and the other terms are as defined therein. ${ }^{2 S}$ (USP28)

## BRIEFING

Thioguanine, USP 27 page 1831. It is proposed to revise the Assay by replacing the current UV method with an HPLC method. This method has greater specificity and accuracy, and it also detects the guanine impurity; therefore, a test for Limit of guanine is being introduced. Finally, it is proposed that the specification ranges of the Assay and the test for Nitrogen content be increased to account for the guanine impurity. In the proposed procedures for the Assay and the test for Limit of guanine, the liquid chromatograph is equipped with a $248-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1.
(PA6: L. Evans) RTS-40236-1; 41766-1

## Change to read:

» Thioguanine is anhydrous or contains one-half molecule of water of hydration. It contains not less than 97.0
-96.0 $\mathbf{m}_{\text {2S (USP28) }}$
percent and not more than 100.5 percent of $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{5} \mathrm{~S}$, calculated on the dried basis.

## Change to read:

Nitrogen content-Determine the nitrogen content as directed under Nitrogen Determination, Method II $\langle 461\rangle$, using about 100 mg , accurately weighed. Each mL of 0.1 N sulfuric acid is equivalent to 1.401 mg of N . Not less than $40.6 \%$
$\mathbf{- 4 0 . 2}^{40} \mathbf{m}_{\text {2S }}$ (USP28)
and not more than $43.1 \%$, calculated on the dried basis, is found.

## Add the following:

## - Limit of guanine-

Mobile phase-Proceed as directed in the Assay.
Standard solution-Dissolve an accurately weighed quantity of guanine in 0.01 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg per mL . Pipet 1.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume to obtain a solution having a known concentration of $0.4 \mu \mathrm{~g}$ per mL .

Test solution-Transfer about 40 mg of Thioguanine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.01 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a 248 -nm detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.60 for guanine and 1.0 for thioguanine; the resolution, $R$, between guanine and thioguanine is not less than 3.0 ; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $5.0 \%$ for the guanine peak.

Procedure-Separately inject equal volumes (about 10
$\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
responses for the major peaks. Calculate the percentage of guanine in the portion of Thioguanine taken by the formula:

$$
100(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of guanine in the Standard solution; $W$ is the weight, in mg , of Thioguanine taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses of guanine obtained from the Test solution and the Standard solution, respectively: not more than $2.5 \%$ is found. ${ }^{2 S}$ (USP28)

## Change to read:

Assay-Transfer about 100 mg of Thiogtanine, previously dried and aceurately weighed, to a 100 mL velumetric flack, dissolve in a mixtre of 15 mL of water and 1.5 mL of 1 N sodium hydroxide, dilute with water to velume, and mix. Transfer 10.0 mL of this solution to second 100 mL velumetric flask, add- dilute hydrochlerie acid ( 1 in 100) to volume, and mix. Finally, transfer 5.0 mL of the last solution to a third $100-\mathrm{mL}$ volumetric flask, then add dilute hydrechloric acid ( 1 in 100) to volume, and mix. Concomitantly determine the absorbances of this solution and a solution of USP Thiogranime RS, in the same meditm, having a knownconcentration of about 5 ug per mL, in 1 cm cells at the wavelength of max imum absorbance at about 348 nm , with a suitable spectrophotometer, using dilute hydrochloric acid ( 1 in 100) as the blank. Calculate the quantity, in mg, of $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{5} \mathrm{~S}$ in the pertion of Thiog

$$
20 C\left(A_{t}+A_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL, of USP Thiogurnine PS in the Standard solution; and $A_{t}$ and $A_{s}$ are the absorbances of the solution from Thioguanine and the Standard-solution, respee tively.

- Phosphoric acid solution-Carefully add 1 mL of phosphoric acid to 99 mL of water, and mix.
Mobile phase-Prepare a filtered and degassed solution of 0.05 M monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 3.0. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Thioguanine RS in 0.01 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, to
obtain a solution having a known concentration of about 0.4 mg per mL . Pipet 10.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, and dilute with Phosphoric acid solution to volume to obtain a solution having a known concentration of 0.04 mg per mL .
Assay preparation-Transfer about 40 mg of Thioguanine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.01 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Phosphoric acid solution to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $248-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.60 for guanine and 1.0 for thioguanine, and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{5} \mathrm{~S}$ in the portion of Thioguanine taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Thioguanine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{2 S}$ (USP28)

Tolcapone, page 939 of PF 30(3) [May-June, 2004]. Several changes are proposed to indicate the actual experimental conditions used in the tests for Absorptivity and Related compounds.
(PA3: S. Salado) RTS-41735-1

## Add the following:

## -Tolcapone

$\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5} \quad 273.24$
Methanone, (3,4-dihydroxy-5-nitrophenyl)(4-methylphenyl).
3,4-Dihydroxy-4'-methyl-5-nitrobenzophenone [134308-13-7].

## Change to read:

» Tolcapone contains not less than 98.5 percent and not more than 101.5 percent of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$, calculated on the dried anhydrous $^{\mathbf{2 s}}$ (USP28) ${ }^{\text {and }}$ solvent-free basis.

Packaging and storage-Preserve in tight, light-resistant containers between $20^{\circ}$ and $25^{\circ}$.

USP Reference standards $\langle 11\rangle —$ USP Tolcapone RS. USP Tolcapone Related Compound A RS. USP Tolcapone Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Change to read:

## Absorptivity-

-Diluent-Dilute 100 mL of 1 N hydrochloric acid with dehydrated alcohol to 1000 mL . ${ }^{\text {2S }}$ (USP28)

Test preparation-Prepare a solution of Tolcapone having a concentration of 0.01 mg per mL in 0.1 Naleoholic hydroehloric - Diluent. $\boldsymbol{m}^{2 S}$ (USP28)
Procedure-Proceed as directed under Spectrophotometry and Light-Scattering $\langle 851\rangle$, and measure the absorbance: the maximum is between 265.2 and 269.3 , and the absorptivity is between 752.9-799.3-75.29 and 79.93. ${ }^{2 S}$ (USP28)

Water, Method $I\langle 921\rangle$ : not more than $0.1 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.

## Limit of residual solvents-

Alcohol stock solution-Transfer $6.3 \mu \mathrm{~L}$ of dehydrated alcohol, using a microsyringe, to a $50-\mathrm{mL}$ volumetric flask containing dimethylformamide, and mix.
Methylene chloride stock solution-Transfer $3.8 \mu \mathrm{~L}$ of methylene chloride, using a microsyringe, to a $50-\mathrm{mL}$ volumetric flask containing dimethylformamide, and mix.
Standard solution-Transfer 10.0 mL of Alcohol stock solution and 1.0 mL of Methylene chloride stock solution to a $50-\mathrm{mL}$ volumetric flask. Dilute with dimethylformamide to volume, and mix.

Test solution-Transfer about 200 mg of Tolcapone, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, add 7 mL of dimethylformamide, and sonicate to dissolve. Dilute with dimethylformamide to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused-silica column coated with $3.0-\mu \mathrm{m}$ G43 stationary phase, and a $0.53-\mathrm{mm} \times 5-\mathrm{m}$ fused silica column coated with $3.0-\mu \mathrm{m}$ G3 stationary phase. The carrier gas is helium, flowing at a rate of 5 mL per minute. The column temperature is maintained at $35^{\circ}$. The injection port and detector temperatures are maintained at $120^{\circ}$ and $260^{\circ}$, respectively. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention time is about 0.7 for alcohol and 1.0 for methylene chloride; and the relative standard deviation for replicate injections is not more than $10.0 \%$.
Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentages ( $\mathrm{w} / \mathrm{w}$ ) of alcohol and methylene chloride in the portion of Tolcapone taken by the formula:

$$
(1000 D)(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{L}$ per mL , of each solvent in the Standard solution; $D$ is the density, in mg per $\mu \mathrm{L}$, of each solvent at $20^{\circ}$; $W$ is the weight, in mg , of Tolcapone taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas of the appropriate analyte obtained from the Test solution and the Standard solution, respectively: not more than $0.25 \%$ of alcohol is found; and not more than $0.01 \%$ of methylene chloride is found. [NOTE-Condition the column at $220^{\circ}$ for 15 minutes after each injection.]

## Change to read:

## Related compounds-

TEST 1-
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic $5-\mu \mathrm{m}$ - $\mathbf{n} 2 S$ (USP28) , silica gel mixture with a suitable fluorescing substance (see Chromatography $\langle 621\rangle$ ).

Standard solution 1-Dissolve an accurately weighed portion of USP Tolcapone RS in chloroform, and dilute quantitatively, and stepwise if necessary, with chloroform to obtain a solution having a known concentration of 0.4 mg per mL .

Standard solution 2-Transfer 2.0 mL of Standard solution 1 to a $10-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Standard solution 3-Transfer 1.0 mL of Standard solution 1 to a $10-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Standard solution 4-Transfer 5.0 mL of Standard solution 3 to a $100-\mathrm{mL} \cdot 10-\mathrm{mL}^{\mathbf{\Omega}}{ }^{2 S}$ (USP28) , volumetric flask, dilute with chloroform to volume, and mix.

Test solution-Transfer about 200 mg of Tolcapone, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with chloroform to volume, and mix. [NOTE-Prepare this solution last and chromatograph immediately.]

Application volume: $10 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform, -anhydrous ${ }^{2 S}$ (USP28) formic acid, and ethyl acetate ( $83: 15: 2$ ).

Procedure-Apply the Test solution and each of the Standard solutions as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$ at about 4 cm from the lower edge of the plate. $\mathbf{M S}^{2 S}$ (USP28) Dry the plate in a current of
cold air, and view it under short-wavelength UV light. The $R_{F}$ values of analytes are as follows.

| Compound | $R_{F}$ |
| :--- | :---: |
| Tolcapone related compound A | about 0.2 |
| Tolcapone | about 0.5 |
| Tolcapone related compound B | about 0.7 |

Compare any spot at $R_{F}$ of 0.0 in the chromatogram obtained from the Test solution with the principal spot of Standard solution 2, Standard solution 3, and Standard solution 4, and obtain the approximate amount: not more than $0.1 \%$ of any impurity at $R_{F}$ of 0.0 is found. [NOTE-The $R_{F}$ of tolcapone related compound A and tolcapone related compound B are given just for reference. They are quantified in Test 2.]

TEST 2-
Diluent, System suitability solution, Mobile phase, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Tolcapone taken by the formula:

$$
(50,000 F)(C / W)\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard solution; $F$ is the relative response factor of the impurity according to the table below; $W$ is the weight, in mg , of Tolcapone, calculated on the sol-vent- and water-free basis, used to prepare the Test solution;
$r_{i}$ is the peak area for any impurity in the Test solution; and $r_{s}$ is the peak area for tolcapone in the Standard solution: the impurities meet the requirements given in the table below.

|  | Relative <br> Retention <br> Time | Relative <br> Response <br> Factor | Limit (\%) |
| :---: | :---: | :---: | :---: |
| Compound Name | about 0.6 | 1.14 | 0.1 |
| Tolcapone related <br> compound A | 1.0 | - | - |
| Tolcapone |  |  |  |
| Tolcapone related <br> compound B | 1.36 | 0.98 | 0.2 |
| Unknown impuri- <br> ties | - | 1.0 | 0.1 indi- <br> vidual, 0.2 <br> total un- <br> known |
| Total impurities | - | - | 0.5 |

## Assay-

Diluent-Prepare a mixture of methanol and acetonitrile (24:15).

System suitability solution-Dissolve an accurately weighed quantity of USP Tolcapone Related Compound A RS, USP Tolcapone RS, and USP Tolcapone Related Compound B RS in Diluent; and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ per $\mathrm{mL}, 5 \mu \mathrm{~g}$ per mL , and $10 \mu \mathrm{~g}$ per mL , respectively. Transfer 2.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add about 63 mL of Diluent, dilute with water to volume, and mix.
Mobile phase-Prepare a filtered and degassed mixture of methanol, 0.05 M monobasic potassium phosphate having a pH of $2.0 \pm 0.1$, and acetonitrile ( $8: 7: 5$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Tolcapone RS in Diluent; and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 1.0 mg per mL . Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, add about 27.5 mL of Diluent, dilute with water to volume, and mix.

Assay preparation-Transfer about 50 mg of Tolcapone, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, add about 27.5 mL of Diluent, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—
The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.6 for tolcapone related compound $\mathrm{A}, 1.0$ for tolcapone, and about 1.4 for tolcapone related compound B ; and the resolution, $R$, between tolcapone related compound B and tolcapone is not less than 4.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 20
$\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major tolcapone peaks. Calculate the quantity, in mg, of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$ in the portion of Tolcapone taken by the formula:

$$
500 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Triclosan, USP 27 page 1888. It is proposed to replace the reagents (4-chlorophenol; 2-4-dichlorophenol; 1,3,7-trichlorodiben-zo-p-dioxin; 2,8-dichlorodibenzo-p-dioxin; 2,8-dichlorodibenzofuran; 2,4,8-trichlorodibenzofuran) with the corresponding USP Reference Standards in the test for Limit of monochlorophenols and 2,4-dichlorophenol and in the test for Limit of 1,3,7-tri-chlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran.

## Change to read:

## Limit of monochlorophenols and 2,4-dichlorophenol-

Phosphate buffer-Transfer about 1.38 g of anhydrous monobasic sodium phosphate and about 1.42 g of dibasic sodium phosphate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and Phosphate buffer ( $1: 1$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Quantitatively dissolve accurately weighed quantities of 4 chlorophenel and 2,4-diehlorephenel
-USP Parachlorophenol RS and USP 2,4-Dichlorophenol
$\mathrm{RS}_{\mathbf{1} 2 \mathrm{~S} \text { (USP28) }}$
in acetonitrile, dilute with an equal volume of water, and mix. Transfer a portion of this solution to a suitable container, and dilute quantitatively, and stepwise if necessary, with a mixture of acetonitrile and water $(1: 1)$ to obtain a solution having known concentrations of about $0.5 \mu \mathrm{~g}$ of 4 -chlorophenel
$\square_{\text {parachlorophenol }}^{{ }_{\text {2S }}}$ (USP28)
and $0.1 \mu \mathrm{~g}$ of 2,4-dichlorophenol per mL .
Test solution-Transfer about 250 mg of Triclosan, accurately weighed, to a $25-\mathrm{mL}$ low-actinic volumetric flask, dissolve in 20 mL of acetonitrile, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a coulometric electrochemical detector with electrode 1 set at 0.45 V and electrode 2 set at 0.75 V , both having a positive (oxidative) polarity and a $4.6-\mathrm{mm}$ $\times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $9.0 \%$ for 2,4 -dichlorophenol.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. The peak responses for 4 chlorophenel
■parachlorophenolı2S (USP28)
and 2,4-dichlorophenol in the chromatogram of the Test solution are not greater than the corresponding peaks in the chromatogram of the Standard solution.

## Change to read:

Limit of 1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodiben-zofuran-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (70:30:0.1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Transfer aceurately weighed quantities of 2,8 diehlerodibenzofuran, and $2,4,8$ triehlorodibenzofuran to a volumetric flask, add accurately measured volumes of $1,3,7 \mathrm{tri}$ ehlorodibenzo $p$ dioxin and 2,8 dichlorodibenzo $p$ dioxin, and dissolve in methanol. Dilute quantitatively, and stepwise if neeessary, with methanel to obtain a solution having concentrations of about $0.5,1.0,0.5$, and $1.0 \mu \mathrm{k}$ per mL, respectively.

■■2S (USP28)
Test solution-Transfer about 2.0 g of Triclosan, accurately weighed, to a screw-capped centrifuge tube, add 5 mL of 2 N potassium hydroxide, and shake for 10 minutes to dissolve. Add 3 mL of $n$-hexane, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, add another 3 mL of $n$-hexane to the aqueous layer, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to the previous extract, discard the aqueous layer, add 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 min utes, and allow the phases to separate. Discard the aqueous layer, add another 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of methanol, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a 220 -nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Stand

## RS, ■2S (USP28) $^{\text {( }}$

and record the peak responses as directed for Procedure: the relative retention times are about 0.59 for 2,8-dichlorodibenzofuran, 0.71 for 2,8 -dichlorodibenzo- $p$-dioxin, 0.88 for $2,4,8$-trichlorodi-
benzofuran, and 1.0 for 1,3,7-trichlorodibenzo- $p$-dioxin; and the relative standard deviation for replicate injections is not more than $15.0 \%$, determined from the 2,8-dichlorodibenzo-p-dioxin peak.

Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. The peak response for 2,8 diehlorodibenzofuran, 2,8 diehlorodibenzo p-doxin, $2,4,8$ triehlorodibenzoftran, and $1,3,7$ triehlorodibenzo $p$ dioxin obtained frem the Test solt tion are not greater than the corresponding peaks obtained from the Standed solution
-Calculate the concentration of each analyte in the portion of Triclosan taken by the formula:

$$
(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the respective analyte in the USP Triclosan Related Compounds Mixture A RS; $W$ is the weight, in g , of Triclosan taken; and $r_{i}$ and $r_{S}$ are the peak responses for the respective analyte obtained from the Test solution and the USP Triclosan Related Compounds Mixture A RS, respectively: not more than 0.25 ppm of 2,8-dichlorodibenzofuran is found; not more than 0.5 ppm of 2,4,8-trichlorodibenzofuran is found; not more than 0.25 ppm of $1,3,7$-trichlorodibenzo- $p$-dioxin is found; and not more than 0.5 ppm of 2,8-dichlorodibenzo- $p$-dioxin is found.■2S (USP28)

BRIEFING

Vancomycin Hydrochloride, USP 27 page 1930. It is proposed to add a new test and acceptance criteria to monitor the amount of monodechlorovancomycin present in Vancomycin Hydrochloride. The liquid chromatographic procedures in the test for Limit of monodechlorovancomycin are based on analyses performed with the RP18 XTerra ${ }^{\text {tm }}$ brand of L1 column. In the test for Chromatographic purity, it is proposed to clarify the peak integration in the Procedure section. In addition, editorial style changes have made in the test for Chromatographic purity.
(PA7b: B. Davani) RTS-41790-1

USP Reference standards $\langle 11\rangle —$ USP Vancomycin Hydrochloride $R S$.

- USP Vancomycin B with Monodechlorovancomycin $R S$.

■2S (USP28)

## Change to read:

## Chromatographic purity-

Triethylamine buffer-Mix 4 mL of triethylamine and 2000 mL of water, and adjust with phosphoric acid to a pH of 3.2.

Solution A-Prepare a mixture of Triethylamine buffer, acetonitrile, and tetrahydrofuran (92:7:1), and degas briefly.

Solution B-Prepare a suitable mixture of Triethylamine buffer, acetonitrile, and tetrahydrofuran $(70: 29: 1)$, and degas briefly.

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see Chromatography $\langle 621\rangle$ ), changing the acetonitrile proportion in Solution A to obtain a retention time of 7.5 to 10.5 minutes for the main vancomycin peak.

Resolution solution-Prepare a solution of USP Vancomycin Hydrochloride RS in water containing 0.5 mg per mL , heat at $65^{\circ}$ for 48 hours, and allow to cool.

Test preparation A-Prepare a solution of Vancomycin Hydrochloride in Solution $A$ containing 10 mg per mL .

Test preparation B-Transfer 2.0 mL of Test preparation $A$ to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix. Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-12$ | 100 | 0 | isocratic |
| $12-20$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $20-22$ | 0 | 100 | isocratic |
| $22-23$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $23-30$ | 100 | 0 | isocratic |

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the elution order is resolution compound 1 , vancomycin B , and resolution compound 2 . The resolution, $R$, between resolution compound 1 and vancomycin B is not less than 3.0; and the column efficiency, calculated from the vancomycin B peak, is not less than 1500 theoretical plates. Resolution compound 2 is eluted at between 3 and 6 minutes after the start of the period when the percentage of Solution $B$ is increasing from $0 \%$ to $100 \%$.

Procedure-[NOTE-Where baseline separation is not achieved, peak areas are defined by vertical lines extended from the valleys between peaks to the baseline.
-The main component peak may include a fronting shoulder, which is attributed to monodechlorovancomycin. This shoulder should not be integrated separately.] $]_{\text {n2S }}$ (USP28) Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of Test preparation $A$ and Test preparation $B$ into the chromatograph, record the chromatograms, and measure the area responses for all of the peaks. [NOTE-Correct any peak observed in the chromatograms obtained from Test preparation $A$ and Test preparation $B$ by subtracting the
area response of any peak observed in the chromatogram of Solution $A$ at the corresponding elution time.] Calculate the percentage of vancomycin $B$ in the specimen tested by the formula:

$$
2500 r_{B} /\left(25 r_{B}+r_{A}\right)
$$

in which $r_{B}$ is the corrected area response of the main peak obtained in the chromatogram of Test preparation $B$; and $r_{A}$ is the sum of the corrected area responses of all the peaks, other than the main peak, in the chromatogram obtained from Test preparation A: not less than $80.0 \%$ of vancomycin B is found. Calculate the percentage of each other peak taken by the formula:

$$
100 r_{A i} /\left(25 r_{B}+r_{A}\right),
$$

in which $r_{A i}$ is the corrected area response of any individual peak, other than the main peak, obtained in the chromatogram of Test preparation A: not more than $9.0 \%$ of any peak other than the main peak is found.

## Add the following:

-Limit of monodechlorovancomycin-[NOTE-The System suitability solution, Working standard solution, and Test solution are to be refrigerated immediately after preparation and during analysis, using a refrigerated autosampler. The solutions are stable at refrigerated conditions for 4 days.]

Mobile phase-Prepare a filtered and degassed mixture in a 1-L volumetric flask that is initially half filled with water. Dissolve 2.2 g of 1-heptanesulfonic acid sodium salt, add 125 mL of acetonitrile and 10 mL of acetic acid, and dilute with water to volume, making adjustments if necessary (see System Suitability under Chromatography (621〉).
Rinse solution-Prepare a solution containing approximately $10 \%(\mathrm{v} / \mathrm{v})$ acetonitrile in water, to be used as the rinse solution for the needle and column.

System suitability solution-Dissolve an accurately weighed quantity of USP Vancomycin B with Monodechlorovancomycin RS that contains approximately 50 mg of vancomycin B in water in a $50-\mathrm{mL}$ volumetric flask to obtain a solution having a known concentration of about 1 mg of vancomycin B per mL.
Working standard solution-Transfer 5.0 mL of the System suitability solution to a $100-\mathrm{mL}$ volumetric flask, and dilute with water to volume. The final concentration is approximately 0.05 mg of vancomycin $B$ per mL .

Test solution-Transfer about 100 mg of Vancomycin Hydrochloride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

## Blank: water

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1 and is maintained at a constant temperature of about $60^{\circ}$. The flow rate is about 1.5 mL per minute. The autosampler cooler temperature is maintained at $5^{\circ}$. The Blank and Working standard solution run time is 90 minutes, and the System suitability solution and Test solution run time is 120 minutes. [NOTE-This test is sensitive to temperature changes. To preheat the Mobile phase, Working standard solution, and Test solution, a length of tubing of at least 3 feet should be placed preceding the column within the column heater.] Chromatograph the Blank and the System suitability solution. There should be no peaks in the Blank chromatogram that interfere with the vancomycin B and monodechlorovancomycin peaks. The retention time of the vancomycin B peak is between 32 and 42 minutes. The monodechlorovancomycin elutes at a retention time ratio of approximately 1.1 compared to 1.0 for the main component, vancomycin B. The retention time of the monodechlorovancomycin peak in the Test solution chromatogram must be within $\pm 3.0 \%$ of the mean retention time of the monodechlorovancomycin peaks in the chromatogram of the Working standard solution. The resolution, $R$, between vancomycin B and monodechlorovancomycin is not less than 1.9 , using the chromatogram from the System suitability solution; and the relative standard deviation for replicate injections of the Working standard solution is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Blank, System suitability solution, Working standard solution and Test solution into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of monodechlorovancomycin in the portion of Vancomycin Hydrochloride taken by the formula:

$$
0.1\left(W_{S} / W_{U}\right)\left(r_{U} / r_{S}\right) P
$$

in which $W_{s}$ is the weight, in mg, of the USP Vancomycin B with Monodechlorovancomycin RS in the Working standard solution; $W_{U}$ is the weight, in mg , of Vancomycin Hydrochloride taken to prepare the Test solution; $r_{U}$ is the peak area response of the monodechlorovancomycin peak in the Test solution; $r_{s}$ is the average peak area response of the vancomycin B peaks in the Working standard solution; and $P$ is the vancomycin B purity of the USP Vancomycin B with Monochlorovancomycin RS: not more than 4.7\% of monodechlorovancomycin is found. $\quad$ 2S (USP28)

## BRIEFING

Vecuronium Bromide, page 193 of $P F$ 30(1) [Jan.-Feb. 2004]. It is proposed to make minor changes to the Diluent in the Assay to minimize the degradation of Vecuronium Bromide. A Note is proposed to be added when preparing the Mobile phase in the test for Related compounds and when preparing Solution B in the Assay to prevent the loss of volatile components. An equilibration time is proposed in the test for Related compounds, and the chemical and IUPAC names for Vecuronium Bromide are added under the Procedure. In addition, editorial style changes have been made.
(PA3: R. Ravichandran) RTS-41189-1

## Add the following:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-16^{\circ}$ and $-20^{\circ}$, at $20^{\circ}$.
Test solution: 10 mg per mL , in dehydrated alcohol.
Bacterial endotoxins $\langle 85\rangle$ : not more than 10 USP Endotoxin Units per mg of vecuronium bromide.

Loss on drying $\langle 731\rangle$-Dry it at $80^{\circ}$ for 2 hemrs to constant weight: it loses not more than 2.0\% of its weight. Dry it at $105^{\circ}$ for two hours: it loses not more than $2.0 \% 2.5 \%$ of its weight.

## Related compounds-

Solution A, Solution B, Mobile phase, and Diluent Proeeed directed in the Assay.

System suitability solution Dissolve aceurately weighed quantities of USP Vecuronium Bromide RS and USP Vecuronium Bromide Related Compound $A$ RS in Diluen ob tain a solution having known concentrations of about 0.5 mg per mL and 0.4 mg per mL , respectively.

Fest solution Dissolve an aceurately weighed quantity of Veeuronium Bromide in Piltent obtain a solution having a concentration of about 4 my per mL.
Chromatographic system Prepare as directed in the As say. Chromatograph the System suitability solution, and re eord the peak respenses as directed for Proecture: the relative retention times are about 0.85 for vecuronitm bremide related compound $\Lambda$ and 1.0 for vecuronimm bromide; the resolution, $R$, between vectronitm bromide and veetrenium bremide related compend $\Lambda$ is not less than 5.0 ; the eolumn efficiency is not less than 5000 theoretieal plater; the tailing factors for vecuronimm bromide and vecuronium bromide related compeund $\Lambda$ are not more than 2.0 ; and the relative standard deviation for replieate injections is not more than 2.0\%

Procedure Inject a volume (about $20 \mu \mathrm{~L})$ of the Test so tution into the chromatograph, record the chromatogram, and measure the peak respenses. Caleulate the pereentage of any impurity in the pertion of Vecurenium Bromide taken by the formula:

$$
100(+,+7),
$$

in which + is the peak respense for each individual impurity, and $x$ is the sum of the respenses of all the peaks: not more than 2\% of total impurities is found.

## TEST 1-

Pragenderff's reagent Mix 850 mg of bismuth subnitrate with 40 mL of water and 10 mL of glacial acetic acid (Solution A). Dissolve 8 g of potassitum-iodide in 20 mL of water (Solution B). Mix Solution A and Solution B. Dilute 1.0 mL of the selution so obtained with 10 mL of $50 \%$ (v/ $V$ ) glacial acetic acid solution.
$5 \%-H y d r o g e n$ peroxide solution- Dilute about 16.6 mL of $30 \%$ hydrogen peroxide with water to 100 mL .

Sodiantiodide solution Dissolve 1.5 g of soditm-iodide in 50 mL of acetone.

Diltent Prepare a mixture of acetonitrile and chloroform ( $9: 1$ )

Adsorbent: 0.1 mm layer of ehrematographic $5-\mu \mathrm{m}$ - sit ien gel mixture (see-Chromatography $\langle 624\rangle$ ).

Fest solution Transfer about 50 mg of Vecuronium Bro mide, aceurately weighed, to a 5 - mL volumetric flask. Dis solve in and diltute with Diltent to volume, and mix.

Standard solution 1 Dissolve an aceurately weighed pertion of USP Vecuronium Bromide RS in Diluent, and dilete quantitatively, and-stepwise if neeessary, with Dilthent to-obtain a solution having a known concentration of 10 Hg per mL.

Standard solution 2 Dissolve aceurately weighed per tiens of USP Vecurenium Bromide Related Compeund D A RS, USP Vectrenitm Bremide-Related Compeund B RS, USP Vecuronium Bromide Related Compound E D RS, and USP Pancurenium Bromide RS in Diluent, and dilute quantitatively, and stepwise if neeessary, with Diluent to obtain a selution having known concentrations of about $20 \mu \mathrm{~g}$ per $\mathrm{mL}, 20 \mu \mathrm{~g}$ per $\mathrm{mL}, 20 \mu \mathrm{~g}$ per mL , and 10 нg per mL , respectively.

Application voltme: 10 mL .
Developing solvent system: a mixtare of Soditm iodide
solution, acetone, and methyl ethyl ketone $(5: 5: 1)$.
Procedtre-Proceed as directed for Thin-Layer Chromt tography under Chromatography $\langle 624\rangle$. Dry the plate for 2 minttes in a current of cold air, and spray it with $5 \%$ Hydrogen peroxide solution. Dry it in a current of air and then spray with Dragendorff's reagent. Repeat the procedure begimning with "spray it with $50 \%$ Hydregen peroxide solth tion'': the spet corresponding to the principal spot ebtained from Standard solution 1 is visible; the $R_{t}$ values Of analytes are as follows:

| Analyte | $R_{\text {F }}$ |
| :---: | :---: |
| pancurenitm bremide | about 0.25 |
| +ecurenitum bromide | about 0.50 |
| *ecurenitum bremide re |  |
| eompound D-A | about 0.70 |
| vecurenimm bromide re |  |
| eompound B | about 0.69 |
| vecurenitm bromide re |  |
| eompound ED | about 0.85 |
| Any spot in the chromatogram obtained from the Test solt |  |
| tim, except for the principal-spet, is not more intense than |  |
| the correspending spot in the chromatogram obtained from |  |
| Standerd solution 2: not more than 0.2\% each of vecure- |  |
| fitm bromide related compound D A, veeurenitum bromide |  |

related compeund $B$, and vecuronitum bromide relatedeompeund E $D$-is found; and not more than $0.1 \%$ of paneure nitum bremide is found. Any unknown spet obtained in the chromategram of the Test solution is not mere intense than the prineipal spet in the chromatogram obtained frem the Standard soltion 1: net more than 0.1\% of any individ wal unknown impurity is found.

## TEST 2

Pragenderff's reagent, Diluent, Test solution, and $5 \%$ Hy dregen perexide solution-Proceed as directed in Test 1.

Sodiun iodide solution 1 Dissolve 1.5 g of sodium io dide in 95 mL of isopropyl aleohol.

Sodith iodide solution 2 Proceed as directed for Soditan iodide solution in Test 1.

Adsorbent: 0.1 mm layer of chromatographic 5 - mm sit iea gel mixatre (see-Chromatography $\langle 624\rangle$ ).

Standerd solution Dissolve an aceurately weighed pertion of USP Vecuronium Bromide Related Compound C RS in Diltent to obtain a solution having a known concentration of 20 mg per mL .

Application voltate: $10 \mu \mathrm{~L}$.
Developing solvent systen 1: a mixture of Sodium io dide solttion 1 and water (95:5).

Peveloping solvent systen 2: a mixture of Soditan io dite solution 2, acetone, and methyl ethyl ketone (5:5:1).

Procedure Apply the Test solution on the right corner of
the plate at 1.5 cm frem each side. Introduce the plate inte the unsaturated developing ehamber containing Developing solvent system 1. Cover, and maintain the-system until the solvent front has moved to a point about 10 em above the initial applieation. Dry the plate in acurrent of cold air until the isepropyl aleohol odor disappears. Retate the plate- $90^{\circ}$, eensidering the side of the previous depesition of the Test solution as base. Apply the Standard solution at 1.5 cm from the base and at not less than 1.5 cm frem the line to which
the solvent front has moved previously. Introduce the plate inte the saturated developing chamber containing Developthg solvent system 2. Cover, and maintain the system until the solvent ascends to a peint about 8 cm above the initiat spets. Dry the plate for 2 mintes in actrrent of cold air, and spray it with $5 \%$ Hydrogen perexide solution. Dry it in a eurrent of cold air, and then spray with Dragendorff's reagent. Repent the procedure, starting from" spray it with 5\% Hydrogen peroxide solttion": the spot correspending to the prineipal-spet obtained from the-Standard solution is visible. Any spet in the chromatogram obtained from the Test solution is not more intense than the respective spet in the chromatogram obtained from the Standard solution: not more than $0.2 \%$ of vecuronium bromide related compound $C$ is found; and not more than $1.0 \%$ of total impurities is found, the results of Test 1 and Test 2 being added.

Cation suppressor regeneration solution: $\quad 0.02 \mathrm{M}$ tetrabutylammonium hydroxide.

Mobile phase—Mix 1500 mL of filtered water, 250 mL of filtered methanol, 45 mL of filtered tetrahydrofuran, and 1 mL of hydrochloric acid in a $2000-\mathrm{mL}$ volumetric flask. Leave at room temperature for few minutes, and dilute with water to volume. Mix, flter, and degas. [NOTE-Avoid evaporation of tetrahydrofuran during degassing.]

Standard solution-Dissolve an accurately weighed quantity of USP Vecuronium Bromide RS, USP Pancuronium Bromide RS, USP Vecuronium Bromide Related Compound A RS, USP Vecuronium Bromide Related Compound B RS, USP Vecuronium Bromide Related Compound C RS, and USP Vecuronium Bromide Related Compound F RS in 0.0025 N hydrochloric acid, and dilute quantitatively and stepwise if necessary, to obtain a solution having a known concentration of about $5 \mu \mathrm{~F} 0.005 \mathrm{mg}$ of each compound per mL .

Test solution-Transfer about 25 mg of Vecuronium Bromide, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask. dis solve Add 0.5 mL of acetonitrile, dilute with 0.0025 N hydrochloric acid to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid-ion chromatograph is equipped with a conductivity detector, a $4-\mathrm{mm}$ cation suppressor and a $4.6-\mathrm{mm} \times 25-$ cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The flow rate for the cation suppressor is about 2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are given in Table 1; the ratio of the height of the vecuronium bromide related compound A F peak to the height of the valley between the vecuronium bromide related compound A F peak and the pancuronium bromide peak is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $10.0 \%$ for each compound. [NOTE-The system may need equilibration for 4 hours.]

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each vecuronium bromide related compound in the portion of Vecuronium Bromide taken by the formula:

## $2.5(\mathrm{ClH})\left(\mathrm{F}_{4}+\mathrm{F}_{s}\right)$,

$$
2500(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\# \mathrm{mg}$ per mL , of the relevant USP Reference Standard in the Standard solution; $W$ is the weight, in mg , of Vecuronium Bromide taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas for the correspondent vecuronium bromide related compound obtained from the Test solution and Standard solu-
tion, respectively: the limits of impurities are specified in Table 1. [NOTE-Use the peak area of vecuronium bromide in the Standard solution as $r_{s}$ to calculate any unknown impurity.]

Table 1

| Compound | Relative |  |
| :---: | :---: | :---: |
|  | Retention Time | Limit \% |
| Pancuronium bromide | about 0.5 | 0.5 |
| Vecuronium bromide related compound $\mathrm{F}^{1}$ | about 0.6 | 0.5 |
| Vecuronium bromide related compound $\mathrm{C}^{2}$ | about 0.86 | 0.5 |
| Vecuronium bromide | 1.0 | - |
| Vecuronium bromide related compound $\mathrm{A}^{3}$ | about 2.0 | 0.3 |
| Vecuronium bromide related compound $\mathrm{B}^{4}$ | about 2.6 | 0.5 |
| Unknown | - | 0.1 |
| Total | - | 1.0 |

${ }^{1} 3$-deacetyl vecuronium bromide, (Piperidinium, 1[(2 $2,3 \alpha, 5 \alpha, 16 \beta, 17 \beta)$-17-acetyloxy-3-hydroxy-2-(1-piperi-dinyl)androstan-16-yl]-1-methyl bromide)
${ }^{2}$ 3,17- Bis deacetyl vecuronium bromide; (Piperidinium, 1$[(2 \beta, 3 \alpha, 5 \alpha, 16 \beta, 17 \beta)$-3,17-dihydroxy-2-(1-piperidinyl)an-drostan-16-yl]-1-methyl bromide)
${ }^{3}$ Dipiperidino diol diacetate; ( $3 \alpha, 17 \beta$-diacetyl-oxy- $2 \beta, 16 \beta$ -bispiperidinyl- $5 \alpha$-androstan)
${ }^{4}$ 17-deacetyl vecuronium bromide; (Piperidinium, 1[(2 $\beta, 3 \alpha, 5 \alpha, 16 \beta, 17 \beta)$-3-acetyloxy-17-hydroxy-2-(1-piperi-dinyl)androstan-16-yl]-1-methyl bromide)

## Assay-

Solution A-Transfer 8.0 g of sodium perchlorate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in 6.0 mL of water, dilute with acetonitrile to volume, mix, filter, and degas.

Solution B-Prepare a mixture of methanel and 25\% ammonium hydroxide antaning 0.03 M ammenium chloride (992:8) Transfer 3.2 g of ammonium chloride to a $2000-\mathrm{mL}$
volumetric flask, dissolve in 16 mL of ammonium hydroxide, dilute with methanol to volume, mix, filter, and degas. [NOTE-Avoid excessive degassing to prevent the loss of ammonium hydroxide.].

Mobile phase-Prepare a mitered mixe of Solution $A$ and Solution $B(3: 2)$. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluent-Pipet $10.0-1.0 \mathrm{~mL}$ of 1 M N hydrochloric acid into a $1000-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix.
Standard preparation-Dissolve an accurately weighed quantity of USP Vecuronium Bromide RS in Diluent to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation - Dissolve an aceuraty weighed
quantity of Vectronitm Bromide in Diluent to obtain a so
lution having a concentration of about 0.5 mg per mL .
Transfer about 50 mg of Vecuronium Bromide, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L3. The flow rate is about 0.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{34} \mathrm{H}_{57} \mathrm{BrN}_{2} \mathrm{O}_{4}$ in the portion of Vecuronium Bromide taken by the formula:

$$
\epsilon\left(x_{t}+x_{s}\right)
$$

$$
100 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Vecuronium Bromide RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP28)

## BRIEFING

Excipients, USP and NF Excipients, Listed by Category, NF 22 page 2809, page 3355 of the Second Supplement, and page 1659 of $P F 30(5)$ [Sept.-Oct. 2004]. It is proposed to add an introductory paragraph to the section Excipients, USP and NF Excipients, Listed by Category and to add a number of excipients to some of the following categories: Buffering Agent, Coating Agent, Emulsifying and/or Solubilizing Agent, Flavors and Perfumes, Ointment Base, Plasticizer, Solvent, Suspending and/or Viscosity-increasing Agent, Tablet Binder, Tablet Disintegrant, Tablet and/or Capsule Lubricant, Vehicle, and Wetting and/or Solubilizing Agent. It is also proposed to delete Ferric Oxide, Black from the Color section; to change Charcoal to Charcoal, Activated in the Sorbent section; and to replace Lactose with Lactose, Anhydrous and Lactose Monohydrate in the Tablet and/or Capsule Diluent section.
(EMC) RTS-41670-1

## Add the following:

-In the following reference table, the grouping of excipients by functional category is intended to summarize the most typically identified purpose that these excipients serve in drug product formulations. The list of substances included in each category is not comprehensive. The statement of
category is intended neither to limit in any way the choice or use of the substance nor to indicate that it has no other
utility.■2S (NF23)

| Eysteine-Hydrochloride- | 0.5-9 |
| Sodium-Chloride | 5.0 - |
| Soditm Acetate | 3.0 g |
| Agar | $0.5-8$ |
| Whater | 1000 mL |

Pissolve agar in water by heating to beiling, while stiming con tinmously. Adjust the pH if neeessary, and sterilize.
pH after sterilization: $6.8 \pm 0.2$.

## GOLUMBIA AGAR

| Pancreatic Digest of Casein | $10.0{ }^{-8}$ |
| :---: | :---: |
| Meat Peptic digest | 5.08 |
| Heart Pancreatic digest | 3.08 |
| Yeast Extract | 5.0 g |
| Gorn-Stareh | 1.085 |
| Sodium-Chloride | 5.08 |
| Agat | $15.0{ }^{\text {¢ }}$ |
| Water | 00 mL |

Pissolve agar in water by heating to beiling with entinteus stir ring. If neeessary, adjust the pH . Sterilize, and allow to eool to-45 $5-50^{\circ}$. Add gentamicin sulfate, equivalent about 20 mg of gen tamiein base, and pour into Petri dishes.
pH after sterilization: $7.3 \pm 0.2$.
Procedure Take equal pertions of the Test Preparation, heat one to $80^{\circ}$ for 10 minntes, and cool rapidly. Transfer 10 mL of each pertion to separate containers, each containing each 100 mL of Reinforeed Mediun for Clostridith, and ineubate under an aerobie conditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. After incubation subeulture each specimen-on-Columbich Medinn to which gentamicin has been added, and incubate under anaerobic conditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. Examine the plates, and interpret as follows: if no growth of Gram positive rods is detected, the test specimen meets the requirement for the absence of Clostridium species.

If growth oeeurs, subeulture each distinet colony on Columbiat Agar Medium, and separately ineubate in aerobie and in anaerebie eonditions at $35^{\circ}$ to $37^{\circ}$ for 48 hours. The oceurrence of only ant aerobic growth of Gram positive bacilli, giving a negative catalase reaction, indientes the presence of Clastridium sparegenes species. To perform the catalase test, transfer diseretecolonies to glass slides, and apply a drop of dilute hydrogen peroxide-solution:
the reaction is negative if no gas bubbles evolve. If the test speci men exhibits nene of these characteristics, it meets the requirement for the absence of Clostridinm-species. $\triangle$ USP28

${ }^{\mathbf{\Delta}} 30 \mathrm{mg}$ per $\mathrm{mL} . \mathbf{\Delta U S P 2 8}$
Standard solution 2-Dilute 1 mL of Standard solution 1 with water to 100 mL ,
© 50 mL , $\triangle$ USP28
and mix.
Stadad solution 3- Prepare a solution eontaining 1.0 gof phenol red TS in 100 mL water.
${ }^{\Delta}$ AUSP28
Test solution-Transfer 150 mg of Chondroitin Sulfate Sodium, accurately weighed, to a 50 mL
${ }^{\Delta} 5.0-\mathrm{mL}_{\mathbf{4}}{ }^{\text {USP28 }}$
volumetric flask, dissolve in and dilute with water to volume, and mix.

Procedure-Adhere a cellephane-shee the of a cooling plate of the electrophoretic equipment by means of some water dreps. Remove any air bubbles. Soak a eut $6 \times 12 \mathrm{~cm}$ cellulose nitrate gel having a $0.45 \mathrm{\mu m}$ porosity in 0.4 M Barium acelat buf fer, pH 5.0 for 5 minutes, and remove any excess solution between the filter paper and the cellulose strip. Apply $10 \mu \mathrm{\mu}$ each of Stan dated solution 1, Standard solution 2, Standard solution 3, and the Fest solution as bands to the gel near the athode. [NOTE-Back the eellophane sheet with a plastic shee for protection to prevent the gel from breaking; otherwise use a supported nitrocellulose membrane, and place it on top-of the eellophane-sheet.] Attach the strip to the support bridge of an electrophoresis chamber con taining 1 M Batiun etate buffer, pHI. 5.0 in each side of the eham ber. Ensure that each end of the strip is in contact with $1 M$ Bariumt teete buffer, pH 5.0. Conneet the electrodes, clese the cover, start the water circulation for gel cooling until the temperature of the plate is about $10^{\circ}$, and apply a 20 mA current at about 330 V for 1 hour. Switeh off the eutrient, disconneet the electrodes, remove the plastic sheet, and immerse the gel in the Staining reagent for 10 minutes. Wash with water to remove any unbound Staining re agent, and compare the bands: the electropherogramobtained from the Test solution exhibits a major band that is similar in pesition to the band obtained from Standard solution 1. The band obtained from Standurd solution - 3 remains red ( $\mathrm{p} H$ buffering eapacity), and the band correspending to Standed solution 2 is clearly visible
at a mobility similar to the band obtained from Standard solution 1. Any secendary band in the electropherogram of the Test solution is not more intense than the band obtained from Standerd solution -2. Net mere than $1 \%$ of any individual impurity is found.
${ }^{\Delta}$ Fill the chambers of an electrophoresis apparatus suitable for separations on cellulose acetate membranes ${ }^{1}$ (a small submarine gel chamber or one dedicated to membrane media) with 0.1 M Barium acetate buffer, pH 5.0. Soak a cellulose acetate membrane about 5 to $6 \mathrm{~cm} \times 12$ to 14 cm in 0.1 M Barium acetate buffer, pH 5.0 for 10 minutes, or until evenly wetted, then blot dry between two sheets of absorbent paper. Using an applicator ${ }^{2}$ suitable for electrophoresis, apply equal volumes (about $0.5 \mu \mathrm{~L}$ ) of the Test solution, Standard solution 1, and Standard solution 2 to the brighter side of the membrane, held in position in an appropriate applicator stand or on a separating bridge in the chamber. Ensure that both ends of the membrane are dipped at least 0.5 to 1.0 cm deep into the buffer chambers. Apply a constant 60 V (about 6 mA at the start) for 2 hours. [NOTE-Perform the application of solutions and voltage within 5 minutes, because further drying of the blotted paper reduces sensitivity.] Place the membrane in a plastic staining tray, and with the application side down, float or gently immerse in Staining reagent for 5 minutes. Then stir the solution gently for 1 minute. Remove the membrane, and destain in $5 \%$ acetic acid until the background clears. Compare the bands. The electropherogram obtained from the Test solution exhibits a major band that is identical in position to the band obtained from Standard solution 1. The band obtained from Standard solution 2 is clearly visible at a mobility similar to the band obtained from Standard solution 1. Any secondary band in the electropherogram of the Test solution is not

[^344]more intense than the band obtained from Standard solution 2. Not more than $2 \%$ of any individual impurity is found. Document the results by taking a picture within 15 minutes of completion of destaining. $\triangle$ USP28

## Change to read:

## Limit of protein-

${ }^{\wedge}$ Alkaline cupric tartaric reagent-Dissolve 200 mg of sodium tartrate dihydrate in 10 mL of water, and mark as Solution A. Dissolve 100 mg of cupric sulfate in 10 mL of water, and mark as $S o$ lution $B$. Dissolve 2.0 g of anhydrous sodium carbonate in 0.1 M sodium hydroxide, dilute with 0.1 M sodium hydroxide to 100 mL , and mark as Solution C. Mix well 1 mL of Solution $A$ and 1 mL of Solution B, and to the mixture slowly add 100 mL of Solution $C$ with stirring. Use within 24 hours, and discard afterwards. $\Delta$ USP27

Standard solution-Transfer an accurately measured volume of 7 percent bovine serum albumin certified standard to a suitable container, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about $35 \mu \mathrm{~g}$ per mL .

Test solution-Transfer an accurately weighed amount of Chondroitin Sulfate Sodium, equivalent to 60 mg of the dried substance, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Procedure—Add 2.0 mL of freshly prepared ${ }^{\mathbf{\Delta}}$ Alkaline cupric tartaric reagent ${ }_{\Delta S P 27}$ to test tubes containing 2.0 mL of water, 2.0 mL of the Test solution, or 2.0 mL of the Standard solution, and mix. After about 10 minutes, add 1.0 mL of Folin-Ciocalteu phenol TS,
${ }^{\boldsymbol{\Delta}}$ diluted with water (1:5) and $\boldsymbol{\Delta U S P 2 8}$ prepared immediately before use, to each test tube, and mix
©immediately and vigorously. $\quad$ USP28
After 30 minutes, measure the absorbance of each solution at 750 nm against the blank. The absorbance of the Test solution is not greater than the absorbance of the Standard solution: not more than $6.0 \%$ of proteins is found, calculated on the dried basis.

${ }^{4}$ found ${ }_{\triangle U S P 28}$
in the aliquot of the Test solution; and $W$ is the weight, in mg , of Chondroitin Sulfate Sodium taken to prepare the Test solution.

## Briefing

Chondroitin Sulfate Sodium Tablets, USP 27 page 1982, page 3093 of the First Supplement, and page 200 of PF 30(1) [Jan.-Feb. 2004]. The current label requires declaration of the species used to prepare the chondroitin sulfate sodium. The monograph allows preparation from bovine, avian, and porcine cartilages. A request to remove species declaration, based on the lack of validated tests to determine the origin, was received at USP. After consideration of the request, the committee decided to retain the declaration of the sources in the labeling section of the monograph with minor clarifying language. The current official monograph for Chondroitin Sulfate Sodium Tablets directs that the label state the content of chondroitin sulfate sodium on the dried basis, but also allows the label to state the content on the hydrous basis. Because prominence could be given to either the dried weight or the hydrous weight, leading to consumer confusion, it is proposed to modify the labeling statement by requiring declaration of the dried content on the front panel of the labels.
(DSB: G. Giancaspro) RTS-41084-1

## Change to read:

Labeling-Label it to indicate the species of the source from which the chondroitin used to prepare the Tablets was derived. PThe label states the content of chondroitin sulfate sodium on the dried basis; the correspending content of chondroitin-sulfate sodium on the hydrous basis may atso be-stated. .nys (fopen)
-Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis. $\quad$ 2S (USP28)

Dissolve in approximately 900 mL of water, and adjust with potassium hydroxide or phosphoric acid to a pH of $7.0 \pm 0.2$.
Dilute with water to 1 L , and mix thoroughly. $\mathbf{\Delta U S P 2 8}$ Standard solutions-Prepare as directed in the test for Content of $\boldsymbol{\Delta}_{\text {chondroitin sulfate sodium }}^{\mathbf{\Delta U S P 2 7}}$ under Chondroitin Sulfate Sodium.

Test solution-Weigh and finely powder not fewer than $20 \mathrm{Tab}-$ lets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of chondroitin sulfate sodium, to a $100-\mathrm{mL}$ volumetric flask, add 30 mL of water and 5 mL of pH 7.2 phes phate buffer solution (see Buffer Solutions under Solutions in the section Reagents, Indicators, and Solutions),
${ }^{\Delta} 60 \mathrm{~mL}$ of water, $\mathbf{\Delta}$ USP28
and shake to suspend the powder in solution. Sonicate in a $65^{\circ}$ water bath for 20 minutes. Remove from the bath, stir with a magnetie stirrer
$\Delta^{\text {or shake }}{ }_{\mathbf{\Delta} U S P 28}$
for 5 minutes, dilute with water to volume, and centrifuge
${ }^{\Delta}$ or pass through a suitable filter. $\Delta U S P 28$

Procedure-Separately transfer 5.0 mL of each Standard solution and the Test solution to separate titration vessels, and add about 30 mL of water
$\Delta_{25} \mathrm{~mL}$ of Diluent $_{\mathbf{\Delta U S P 2 8}}$
to each. Stir until a steady reading is obtained, using a phototrode to determine the endpoint turbidimetrically, at 420,550 , or 660 nm . Set the instrument to zero if
$\mathbf{\Delta i n}_{\mathbf{\Delta U S P 2 8}}$
absorbance is being menitored or to not less than 70\% if transmit
tance is used.
$\Delta_{\text {mode. }}$ USP28
From a linear regression equation calculated using the volumes of Cetylpyridinium chloride solution consumed and the mass, in mg , of USP Chondroitin Sulfate Sodium RS, determine the mass of chondroitin sulfate sodium in the aliquot of the Test solution taken. Calculate the amount, in mg , of chondroitin sulfate sodium in the portion of Tablets taken by the formula:

## 20M,

in which $M$ is the mass of Chondroitin Sulfate Sodium in the aliquot of the Test solution.

## BRIEFING

Glucosamine and Chondroitin Sulfate Sodium Tablets, USP 27 page 2012, page 3093 of the First Supplement, and page 201 of PF 30(1) [Jan.-Feb. 2004]-See briefing under Chondroitin Sulfate Sodium Tablets.

BRIEFING

Lycopene, page 574 of PF 30(2) [Mar.-Apr. 2004]. The Expert Committee has received new data on the isomer ratio of this article. Therefore, it is proposed to change the limits for other related compounds calculated as lycopene in the test for Content of all-E-lycopene, 5Z-lycopene, and related compounds under Procedure.
(DSB: G. Giancaspro) $\quad$ RTS-41813-1

## Add the following:

## ■ Lycopene

$\mathrm{C}_{40} \mathrm{H}_{56} \quad 536.88 \quad[502-65-8]$.
» Lycopene is a mixture of geometrical isomers of lycopene. It contains not less than 96.0 percent and not more than 101.0 percent of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers, under inert gas, and store in a cool place.

USP Reference standards $\langle 11\rangle$ —USP Lycopene RS.
Labeling-Label it to indicate whether the article is obtained from natural sources or is prepared synthetically. If obtained from natural sources, label it to indicate the natural source, including its Latin binomial.

## Identification-

A: Ultraviolet-Visible Absorption $\langle 197 \mathrm{U}\rangle-$
Spectral range: 300 to 700 nm .
Solution-Prepare as directed below for the Test solution in the test for Content of lycopene.

Ratio: $A_{476} / A_{508}$, between 1.10 and 1.14 .

B: The retention time of the major peak in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution, as obtained in the test for Content of all-E-lycopene, 5Z-lycopene, and related compounds.

Loss on drying $\langle 731\rangle$-Dry it in vacuum over phosphorus pentoxide at $40^{\circ}$ for 4 hours: it loses not more than $0.2 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$.
Heavy metals, Method II $\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per g.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## Content of all-E-lycopene, $5 Z$-lycopene, and related compounds- <br> Mobile phase-Prepare a filtered and degassed mixture of

 tert-butyl methyl ether, methanol, and tetrahydrofuran (784: $665: 74$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).Standard solution-Dissolve a suitable quantity of USP Lycopene RS in Mobile phase to obtain a solution containing about 2 mg per 100 mL .

Test solution-Transfer about 15 mg of Lycopene to a 25 mL volumetric flask, and dissolve in tetrahydrofuran containing 50 mg of butylated hydroxytoluene per L. Dilute with the same solvent to volume. Pipet 2 mL into a $50-$ mL volumetric flask, and add 8 mL tetrahydrofuran. Dilute with tert-butyl methyl ether to volume. Use this solution for injection.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $472-\mathrm{nm}$ detector, a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing

L61, and a second column connected in series containing 3$\mu \mathrm{m}$ packing L61. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.07 for 5Z-lycopene, and 1.0 for all- $E-l y-$ copene; the resolution, $R$, between all- $E$-lycopene and $5 Z-$ lycopene is not less than 1.0; the tailing factor is not less than 0.8 and not more than 2.0 ; and the relative standard deviation for replicate injections for the all- $E$-lycopene is not more than $2.0 \%$. [NOTE-New columns may require up to 30 injections before the system suitability requirements are met.]

Procedure-Inject about $10 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of related compounds in the portion of Lycopene taken by the formula:

$$
T\left(r_{s} / r_{T}\right)
$$

in which $T$ is the percentage of total lycopene isomers obtained in the test for Content of lycopene; $r_{s}$ is the sum of the responses of all peaks except the peak for all- $E$-lycopene and the peak for $5 Z$-lycopene; and $r_{T}$ is the total detected area. Not more than $7.0 \% 9.0 \%$ of other related compounds calculated as lycopene are found. Calculate the percentage of the $5 Z$-lycopene isomer in the portion of Lycopene taken by the formula:

$$
T\left(r_{s z} / r_{T}\right),
$$

in which $r_{s z}$ is the peak response for the 5Z-lycopene isomer, and the other terms are as described above. Not more than
$23.0 \%$ of the $5 Z$-lycopene isomer is found. Calculate the percentage of all- $E$-lycopene taken by the formula:

$$
T\left(r_{E} / r_{T}\right)
$$

in which $r_{E}$ is the peak response of the all- $E$-lycopene isomer, and the other terms are as described above. Not less than $70.0 \%$ of all- $E$-lycopene is found.

## Content of lycopene-

Test stock solution-Transfer about 25 mg of Lycopene to a $100-\mathrm{mL}$ volumetric flask, add about 25 mg of butylated hydroxytoluene and about 60 mL of methylene chloride, and sonicate to dissolve. Dilute with methylene chloride to volume.

Test solution-Transfer 2.0 mL of the Test stock solution to a $200-\mathrm{mL}$ volumetric flask, and dilute with cyclohexane to volume.

Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 476 nm , using cyclohexane as the blank. Calculate the percentage of $\mathrm{C}_{40} \mathrm{H}_{56}$ in the portion of Lycopene taken by the formula:

$$
1000 \mathrm{~A} / 331 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of Lycopene taken to prepare the Test stock solution; and 331 is the absorptivity of the pure lycopene in cyclohexane. $\quad$ 2S (USP28)

## Briefing

Lycopene Preparation, page 576 of PF 30(2) [Mar.-Apr. 2004]. The Expert Committee has received new data on the isomer ratio of this article. Therefore, it is proposed to change the limits for other related compounds calculated as lycopene and for the 5Z-lycopene isomer in the tests for Content of all-E-lycopene, 5Z-lycopene, and related compounds under Procedure. In addition, it is proposed to delete the test Residue on ignition and relax the limit for Water because the natures of different suitable carriers influence the results of these tests.
(DSB: G. Giancaspro) RTS-41813-2; 41198-2

## Add the following:

## ■Lycopene Preparation

» Lycopene Preparation is a combination of Lycopene with one or more inert substances and suitable antioxidants. It may be in a solid or oily liquid form. It contains not less than 95.0 percent and not more than 120 percent of the labeled amount of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers under inert gas. Store the oil preparations in a cool place and the solid preparations at controlled room temperature.

Labeling-Label it to state the name and content of added antioxidants and inert substances. Label it to indicate whether the article is prepared with lycopene from natural sources or with synthetic lycopene. If prepared with lycopene from natural sources, label it to indicate the natural source, including its Latin binomial.

USP Reference standards-USP Lycopene RS.
Identification, Ultraviolet-Visible Absorption $\langle 197 \mathrm{U}\rangle$ FOR OILY PREPARATIONS-

Spectral range: 300 to 700 nm .
Solution-Prepare as directed below for the Test solution in Content of lycopene (test for oily preparations).
Ratio: $A_{476} / A_{508}$ between 1.10 and 1.14 in cyclohexane. FOR SOLID PREPARATIONS-

Spectral range: 300 to 700 nm .
Solution-Prepare as directed below for the Test solution in Content of lycopene (test for solid preparations).

Ratio: $A_{472} / A_{504}$ between 1.09 and 1.13 in isopropyl alcohol.

Water, Method I $\langle 921\rangle$ : not more than $1.0 \% .8 .0 \%$.
Residue on ignition- $\langle 281$ ):- not more than $1.0 \%$.
Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Solvent-Use dimethylformamide.
Content of all-E-lycopene, 5Z-lycopene, and related compounds-
Mobile phase, Standard solution, and Chromatographic system-Proceed as directed for Content of all-E-lycopene, 5Z-lycopene, and related compounds under Lycopene.

Test solution for oil preparations-Transfer a quantity of oil preparation, equivalent to about 15 mg of lycopene, to a $25-\mathrm{mL}$ volumetric flask, and dissolve in tetrahydrofuran containing 50 mg of butylated hydroxytoluene per L. Dilute with the same solvent to volume. Pipet 2 mL into a $50-\mathrm{mL}$ volumetric flask, and add 8 mL of tetrahydrofuran. Dilute with tert-butyl methyl ether to volume. Use this solution for injection.

Test solution for solid preparations-Transfer a quantity of solid preparation, equivalent to 5 mg of lycopene, into a $250-\mathrm{mL}$ volumetric flask, and add about 60 units of bacterial alkaline protease preparation or another suitable enzyme
and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of water, place in an ultrasonic bath at $50^{\circ}$ for 10 minutes, and shake occasionally until the material is finely divided with no lumps. Add 5 mL of tetrahydrofuran and 40 mL of dehydrated alcohol, and place again for about 1 minute in the ultrasonic bath. Cool to room temperature, and dilute with tert-butyl methyl ether to volume. Shake vigorously. Allow the precipitate to settle, and filter the supernatant.

Procedure-Proceed as directed for Content of all-E-lycopene, 5Z-lycopene, and related compounds under Lycopene. Calculate the percentage of related compounds in the portion of Lycopene Preparation taken by the formula:

$$
r_{s} / r_{T}
$$

in which $r_{s}$ is the sum of the responses of all peaks except the peak for all-E-lycopene and the peak for 5Z-lycopene, and $r_{T}$ is the total detected area in the chromatogram: not more than $7.0 \% 14.0 \%$ of other related compounds calculated as lycopene is found. Calculate the percentage of 5Z-lycopene isomer in the portion of Lycopene Preparation taken by the formula:

$$
r_{5 z} / r_{T}
$$

in which $r_{5 z}$ is the peak response for the 5Z-lycopene isomer, and the other terms are as described above: not more than $23.0 \% 30.0 \% 23.0 \%$ of the $5 Z-$ lycopene isomer is found. Calculate the percentage of all- $E$-lycopene in the portion of Lycopene Preparation taken by the formula:

$$
r_{E} / r_{T}
$$

in which $r_{E}$ is the peak response of the all- $E$-lycopene isomer, and the other terms are as described above: not less than $70.0 \% 65.0 \%$ of all- $E$-lycopene is found.

## Content of lycopene-

## TEST FOR OILY PREPARATIONS-

Test stock solution-Transfer an accurately weighed quantity of Lycopene Preparation containing about 25 mg of lycopene to a $100-\mathrm{mL}$ volumetric flask, and add about 25 mg of butylated hydroxytoluene and about 60 mL of methylene chloride. Sonicate to dissolve, and dilute with methylene chloride to volume.

Test solution-Transfer 2.0 mL of the Test stock solution to a $200-\mathrm{mL}$ volumetric flask, and dilute with cyclohexane to volume.

Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 476 nm , using cyclohexane as the blank. Calculate the percentage of lycopene in the portion of Lycopene Preparation taken by the formula:

$$
1000 \mathrm{~A} / 331 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of the portion of Lycopene Preparation taken to prepare the Test stock solution; and 331 is the absorptivity of the pure lycopene in cyclohexane.

## TEST FOR SOLID PREPARATIONS-

Test stock solution-Transfer an accurately weighed quantity of Lycopene Preparation containing about 5 mg of lycopene into a $200-\mathrm{mL}$ volumetric flask. Add about 60 units of bacterial alkaline protease preparation or another suitable enzyme and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of diluted ammonium hydroxide ( 2 in 100). Incubate in a water bath (about $40^{\circ}$ ) until the matrix has dissolved (about 1 to 2 minutes), while rotating the flask to avoid having material stick to the glass surface. Add 5 mL of tetrahydrofuran, and shake until no colored precipitate remains. Add another portion of 2 mL of tetrahydrofuran. Add 40 mL of dehydrated alcohol, and shake until the mixture is
homogeneous. Add 100 mL of diethyl ether, and shake vigorously. Dilute with diethyl ether to volume, shake vigorously, and allow to stand until the solid has settled.

Test solution-Transfer 2.0 mL of the supernatant from the Test stock solution to a $25-\mathrm{mL}$ volumetric flask, and dilute with isopropyl alcohol to volume.
Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 472 nm , using isopropyl alcohol as the blank. Calculate the percentage of lycopene in the portion of Lycopene Preparation taken by the formula:

$$
250 \mathrm{~A} / 320 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of the portion of Lycopene Preparation taken to prepare the Test stock solution; and 320 is the absorptivity of the pure lycopene in isopropyl alcohol.■2S (USP28)

Briefing

Psyllium Husk, USP 27 page 1602. The tests for Heavy extraneous matter and Light extraneous matter are being proposed for revision to eliminate the use of the solvent carbon tetrachloride, a highly toxic solvent that is banned from many laboratories. Silicates (sand) account for much of the Heavy extraneous matter that is also detected by the test for Acid-insoluble ash, another test in this monograph. Based on that fact, the deletion of the test for Heavy extraneous matter is proposed. In the test for Light extraneous matter, the use of the solvent mixture of carbon tetrachloride and dichloroethylene is replaced by the use of the less hazardous solvent trichloroethylene, which has a similar specific gravity of 1.45. In addition, it is proposed to revise the limit for Light extraneous matter to represent the quality of the commercially available material. Changes in the Definition reflect the standard names in Herbs of Commerce 2nd Ed.
(DSB: G. Giancaspro) RTS-41674-1

## Change to read:

» Psyllium Husk is the cleaned, dried seed coat (epidermis) separated by winnowing and thrashing from the seeds of Plantago ovata Ferskal

## -Forssk., ${ }^{\text {2S }}$ (USP28)

known in commerce as Blond Psyllium or Indian Psyllium or Ispaghula, or from Plantago psyllium Limé or from Plantago indie Limé (Plantago arenaria Waldstein et Kitaibel)
-Plantago arenaria Waldst. \& Kit. (Plantago psyllium L.) ${ }^{25}$ (uSP28)
known in commerce as Spanish or French Psyllium (Fam. Plantaginaceae), in whole or in powdered form.

## Change to read:

Light extraneous matter-[NOTE-Perform this test in a wellventilated hood.] Pransfer 15.0 g to 250 mL separator. Addabout 90 mL of a liquid mixture of carbon tetrachloride and ethylene diehleride (about 2:1), having a specific gravity of 1.45 . Shake for 30 seconds, and allow to settle for 30 seconds. Repent the shaking and settling twice more. Drain all the material and liguid exeept the flanting layer. Add 25 mL of the liquid mixture, stirearefully, allow to settle, and drain as before. Repeat the washing of the floating layer twiee more, but use only 10 mL of the liquid mixture each time. Transfer the washed floating layer to a tared beaker, heat on a steam bath until the odor of the liquid no longer persists, dry at $40^{\circ}$ for 3 hours, allow to cool in a desicentor, and weigh: the limit is $15 \%$
-Transfer 99 to 101 g of Psyllium Husk, weighed to 0.1 g accuracy, to a $1000-\mathrm{mL}$ tall-form beaker. Add about 800 mL of trichloroethylene, previously adjusted to a temperature of $24^{\circ}$ to $26^{\circ}$, and maintain this temperature throughout the test. Stir the husk for about 5 seconds, and allow it to settle while protecting the surface from drafts in the hood.

Remove the floating material with a spoon made of 50-mesh screen, and transfer the material to a piece of filter paper in a dish. Stir the husk mixture again, allow it to settle, remove the floating material again, and combine it with the material on the paper. Repeat this procedure until no more material appears on the surface. Dry the removed material with the paper in a hood and then in an oven at $40^{\circ}$ for 3 hours. Cool to room temperature. Weigh the filter paper with the mate-
rial. Brush the material off the paper, weigh the paper, and then calculate the percent of light extraneous matter: no more than $5 \%$ is found. ${ }^{2 S}$ (USP28)

## Delete the following:

퓰 Heayy extraneous matter [NOTE Perform this test in a-wellventilated heod. Transfer 10.0 g to a 250 mL separater. Add abeut 80 mL of carben tetrachloride, and-shake for 1 minate. Allow te stand for 5 minutes. Drain inte atared 1000 mL beaker the nommt eilagineus material that sinks to the bettom, taking care not to drain any of the floating material. Heat in a hot air oven, at atemperature net exceeding $90^{\circ}$, until the odor of the liquid no longer persists, allow to cool in a desiceator, and weigh: the limit is $1.1 \%$ - 2 (USP28)

## MONOGRAPHS (NF)

BRIEFING

Acetyltributyl Citrate, $N F 22$ page 2816; Acetyltriethyl Citrate, NF 22 page 2817; Tributyl Citrate, NF 22 page 2948; Triethyl Citrate, NF 22 page 2949. In response to comments received regarding the unavailability of the temperature programmable injector required for the Assay, it is proposed to replace the temperature programmable injector in the Assay with a split injection system.
(EMC: D. Bempong) RTS-41597-4

## Change to read:

## Assay-

System suitability solution-Prepare a solution in toluene containing about 30 mg each of USP Acetyltributyl Citrate RS and USP Tributyl Citrate RS per mL.

Assay preparation-Transfer about 300 mg of Acetyltributyl Citrate, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with toluene to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with an eolumn, temperattreprogrammable injector,

- ${ }^{\text {2S }}$ (NF23)
a flame-ionization detector maintained at about $275^{\circ}$,
-a split injection system with a split ratio of about $30: 1$, (п2S (NF23)
and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ column bonded with a $0.5-\mu \mathrm{m}$ layer of phase G42. The column temperature is programmed to be maintained at about $80^{\circ}$ for 0.5 minute, then to increase to about $220^{\circ}$ at a rate of $20^{\circ}$ per minute, and to hold at about $220^{\circ}$ for $10 \mathrm{~min}-$ utes. The injection port temperature is programme be

■ ${ }^{\text {²S }}$ (NF23)
maintained at about $85^{\circ}$. for 0.5 minute, then increase to about $225^{\circ}$ at a rate of $20^{\circ}$ per minute, and to hold at about $225^{\circ}$ for 10 mintutes.

- $\quad$ 2S (NF23)

Helium is used as the carrier gas at a flow rate of about 2.3 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for tributyl citrate and 1.0 for acetyltributyl citrate; the resolution, $R$, between tributyl citrate and acetyltributyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$ determined from both the tributyl citrate and acetyltributyl citrate peaks, based on area percent calculation.

Procedure-Inject $1 \mu \mathrm{~L}$ of the Assay preparation into the chromatograph, record the chromatogram, and measure all of the peak areas, excluding the solvent peak. Calculate the percentage of $\mathrm{C}_{20} \mathrm{H}_{34} \mathrm{O}_{8}$ in the portion of Acetyltributyl Citrate taken by the formula:

$$
100(A / B)
$$

in which $A$ is the acetyltributyl citrate peak area response; and $B$ is the sum of the area responses of all the peaks.

BRIEFING

## Change to read:

## Assay-

System suitability solution-Prepare a solution in toluene containing about 30 mg each of USP Acetyltriethyl Citrate RS and USP Triethyl Citrate RS per mL.

Assay preparation-Transfer about 300 mg of Acetyltriethyl Citrate, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with toluene to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with en columm, programmable injector,
$\square_{\text {■2S (NF23) }}$
a flame-ionization detector maintained at about $275^{\circ}$,
■a split injection system with a split ratio of about $30: 1$, п2S (NF23)
and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ column bonded with a $0.5-\mu \mathrm{m}$ layer of phase G42. The column temperature is programmed to be maintained at about $80^{\circ}$ for 0.5 minute, then to increase to about $220^{\circ}$ at a rate of $20^{\circ}$ per minute, and to hold at about $220^{\circ}$ for $10 \mathrm{~min}-$ utes. The injection port temperature is programme be

- n $_{\text {2S }}$ (NF23)
maintained at about $85^{\circ}$. for 0.5 mintte, then in increase to about $225^{\circ}$ at a rate of $20^{\circ}$ per mintte, and to hold at about $225^{\circ}$ for 10 minters.
- $\quad$ 2S (NF23)

Helium is used as the carrier gas at a flow rate of about 2.3 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for triethyl citrate and 1.0 for acetyltriethyl citrate; the resolution, $R$, between triethyl citrate and acetyltriethyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$ determined from both the triethyl citrate and acetyltriethyl citrate peaks, based on area percent calculation.
Procedure-Inject $1 \mu \mathrm{~L}$ of the Assay preparation into the chromatograph, record the chromatogram, and measure all of the peak areas, excluding the solvent peak. Calculate the percentage of $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{8}$ in the portion of Acetyltriethyl Citrate taken by the formula:

$$
100(A / B)
$$

in which $A$ is the acetyltriethyl citrate peak area response; and $B$ is the sum of the area responses of all the peaks.

Briefing

Hypromellose Acetate Succinate, page 976 of PF 30(3) [MayJune 2004]. It is proposed to revise the Definition to indicate that the content of methoxy, hydroxypropoxy, acetyl, and succinoyl groups are determined on the dried basis. It is also proposed to revise the Identification test to include germanium crystal ATR tip as an alternative to diamond crystals, and also remove a requirement to prepare duplicate samples in the test for Limit of free acetic and succinic acids.
(EMC: D. Bempong) RTS-41804-1

## Add the following:

## -Hypromellose Acetate Succinate

Hydroxypropyl methylcellulose acetate succinate.
Cellulose, 2-hydroxypropyl methyl ether, acetate hydrogen butanedioate.

Cellulose, 2-hydroxypropyl methyl ether, acetate succinate [71138-97-1].
» Hypromellose Acetate Succinate is a mixture of acetic acid and monosuccinic acid esters of hydroxypropyl methylcellulose. When dried at $105^{\circ}$ for 1 hour, it It contains not less than 12.0 percent and not more than 28.0 percent of methoxy groups $\left(-\mathrm{OCH}_{3}\right)$, not less than 4.0 percent and not more than 23.0 percent of hydroxypropoxy groups ( $-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}$ ), not less than 2.0 percent and not more than 16.0 percent of acetyl groups $\left(-\mathrm{COCH}_{3}\right)$, and not less than 4.0 percent and not more than 28.0 percent of succinoyl groups ( $-\mathrm{COC}_{2} \mathrm{H}_{4} \mathrm{COOH}$ ), calculated on the dried basis.

Packaging and storage-Preserve in tight containers. Store at room temperature. Avoid excessive heat and freez ing. Protect from moisture. No storage requirements specified.

Labeling-Label it to indicate its nominal viscosity type.
USP Reference standards $\langle 11\rangle$ —USP Hypromellose Acetate Succinate RS.

Identification,-Infrated Absorption-(197K),on undried specimen. Infrared Absorption $\langle 197 \mathrm{~A}\rangle$ —Do not dry specimens. Use a Fourier transform infrared spectrometer fitted with a suitable accessory for single bounce attenuated total reflectance (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) with a diamond or germanium crystal. Acquire a background single-beam spectrum with a clean diamond or germanium crystal sampling plate in place. Place the sample on the diamond or germanium crystal sampling sur-
face with a microspatula or equivalent. For best results, the sample should cover the crystal surface under the pressure point tip. Using the pressure device, apply pressure to the sample, making sure the sample remains centered under the pressure tip. Acquire a single-beam spectrum of the sample, and make the necessary corrections for the background. Release the pressure device, and clear it from the sample area. Wipe the sample off the crystal and pressure device tip, and rinse both with acetone. The IR spectrum so obtained exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Hypromellose Acetate Succinate RS.

Viscosity $\langle 911\rangle$ -
Sodium hydroxide solution-Immediately before use, dissolve 4.3 g of sodium hydroxide in carbon dioxide-free water to make 1000 mL .

Procedure-To 2.00 g of Hypromellose Acetate Succinate, previously dried, add Sodium hydroxide solution to make 100.0 g , insert a stopper into the vessel, and dissolve by constant shaking for 30 minutes. Adjust the temperature of the solution to $20 \pm 0.1^{\circ}$, and determine the viscosity in a suitable viscosimeter, as directed for Procedure for Cellulose Derivatives under Viscosity $\langle 911\rangle$. Its viscosity is not less than $80 \%$ and not more than $120 \%$ of that stated on the label.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 1 hour: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.20 \%$, determined at $600 \pm 50^{\circ}$.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Limit of free strecinic acid-Transfer about 1.5 g of Hypromellose Acetate Suceinate, previously dried at $105^{\circ}$ for 4 hour and acemately weighed, to a separator, dissolve in

50 mL of a mixture of dehydrated aleohel and diehloremethane $(3: 2, v / v)$, add 75 mL of water with shaking, and then add 50 mL of hexane and 1 g of sodium chloride.

Shake well, and separate the lower water layer. Extract the ergenic layer with 50 mL of water, and combine the washing and the water layer. Add 3-drops of phenolphthaleinTS, and titrate with 0.1 N soditm hydroxide VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N soditm hydroxide-is equivalent 10 5.904 mg of $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{4}$ : not mere than $1.0 \%$ is found.

## Limit of free acetic and succinic acids-

Phosphoric acid solution-Transfer 1.0 mL of 1.25 M phosphoric acid into a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume.
0.02 M Phosphate buffer-Dissolve 5.44 g of monobasic potassium phosphate in 2 L of water.

Diluent-Adjust 0.02 M Phosphate buffer with 1 N sodium hydroxide to a pH of 7.5 .

Acetic acid stock solution-Add approximately 20 mL of water to a stoppered, $100-\mathrm{mL}$ volumetric flask, place the flask on a balance, and tare. Transfer 2.0 mL of the glacial acetic acid to the flask, and record the weight of the acid added. Fill the flask with water to volume. Transfer 6.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Succinic acid stock solution-Accurately weigh about 130 mg of succinic acid into a $100-\mathrm{mL}$ volumetric flask. Add about 50 mL of water, and swirl the contents until the succinic acid is fully dissolved. Fill the flask with water to volume.

Mobile phase-Adjust the 0.02 M Phosphate buffer to a pH of 2.8 by the dropwise addition of 6 M phosphoric acid. Filter through a $0.22-\mu \mathrm{m}$ nylon filter.

Standard solution-Transfer 4.0 mL of the Acetic acid stock solution into a $25-\mathrm{mL}$ volumetric flask. To the same flask, transfer 4.0 mL of the Succinic acid stock solution, dilute with Mobile phase to volume, and mix. Prepare this solution in duplicate.

Test solution-Accurately weigh about 102 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of Diluent to the vial, and stir the content for 2 hours. Then, transfer 4.0 mL of the Phosphoric acid solution to the same vial to bring the pH of the Test solution to 3 or less. Invert the vial several times to ensure complete mixing, centrifuge, and use the clear supernatant as the Test solution. Prepare this solution in duplieate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained between $20^{\circ}$ and $30^{\circ}$. The flow rate is about 1 mL per minute, and the run time is about 15 minutes. Chromatograph the first preparation of the Standard solution, and record the peak responses as directed for Procedure: the column efficiency, determined from the succinic acid peak, is not less than 8000 theoretical plates; the tailing factor of this peak is between 0.9 and 1.5; and the relative standard deviation for six replicate injections is not more than $2.0 \%$ for each peak. Chromatograph the second preparation of the Standard solution: the difference in peak areas between the two standard solutions for both acetic and succinic acid peaks does not exceed $2 \%$. [NOTE-After each run sequence, the column should be flushed first by $50 \%$ water and $50 \%$ acetonitrile for 60 minutes and then by $100 \%$ methanol for 60 minutes. The column should be stored in $100 \%$ methanol.]

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
peak areas corresponding to acetic and succinic acids. Calculate the percentage of free acetic acid, $A_{\text {free }}$, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
0.0768\left(W_{A} / W\right)\left(r_{U A} / r_{S A}\right)
$$

in which $W_{A}$ is the weight of glacial acetic acid, in mg, used to prepare the Acetic acid stock solution; $W$ is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the Test solution; and $r_{U A}$ and $r_{S A}$ are the peak responses for acetic acid obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of free succinic acid, $S_{\text {free }}$ in the Hypromellose Acetate Succinate taken by the formula:

$$
1.28\left(W_{s} / W\right)\left(r_{U S} / r_{s s}\right)
$$

in which $W_{S}$ is the weight of succinic acid, in mg, used to prepare the Succinic acid stock solution; $r_{U S}$ and $r_{s S}$ are the peak responses for succinic acid obtained from the Test solution and the Standard solution, respectively; and $W$ is as defined above: the sum of free acetic acid and free succinic acid found does not exceed $1.0 \%$.

## Content of acetyl and succinoyl groups-

Phosphoric acid solution, Acetic acid stock solution, Succinic acid stock solution, Mobile phase, Standard solution, and Chromatographic system-Proceed as directed in the test for Limit of free acetic and succinic acids.

Test solution-Accurately weigh about 12.4 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of 1.0 N sodium hydroxide to the vial, and stir the solution for 4 hours. Then, add 4.0 mL of 1.25 M phosphoric acid to the same vial to bring the pH of the solution to 3 or less.

Invert the test sample solution vial several times to ensure complete mixing, and filter through a $0.22-\mu \mathrm{m}$ filter. Use the clear filtrate as the Test solution.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas corresponding to acetic and succinic acids. Calculate the percentage of acetic acid, $A$, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
0.0768\left(W_{A} / W_{U}\right)\left(r_{U A} / r_{S A}\right)
$$

in which $W_{A}$ is the weight of acetic acid, in mg , used to prepare the Acetic acid stock solution; $W_{U}$ is the weight of Hypromellose Acetate Succinate, in mg , used to prepare the Test solution; and $r_{U A}$ and $r_{S A}$ are the peak responses for acetic acid obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of acetyl groups $\left(-\mathrm{COCH}_{3}\right)$ in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$
0.717\left(A-A_{\text {free }}\right)
$$

in which $A_{\text {free }}$ is the percentage of free acetic acid, as determined in the test for Limit of free acetic and succinic acids; and $A$ is as defined above. Calculate the percentage of succinic acid, $S$, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
1.28\left(W_{S} / W_{U}\right)\left(r_{U S} / r_{S S}\right)
$$

in which $W_{S}$ is the weight of succinic acid, in mg , used to prepare the Succinic acid stock solution; $W_{U}$ is as defined above; and $r_{U S}$ and $r_{S S}$ are the peak responses for succinic acid obtained from the Test solution and the Standard solution,
respectively. Calculate the percentage of succinoyl groups $\left(-\mathrm{COC}_{2} \mathrm{H}_{4} \mathrm{COOH}\right)$ in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$
0.856\left(S-S_{\text {free }}\right)
$$

in which $S$ is as defined above; and $S_{\text {free }}$ is the percentage of free succinic acid, as determined in the test for Limit of free acetic and succinic acids.

Content of methoxy and hydroxypropoxy groups-
[Gaution Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the Test solution and the Standard solution in aproperly functioning heөd. Specific safety practicestobefollowed are to be iden tified to the analyist performing this test.]

Hydriodic acid Use a reagent having a specifle gravity of at least 1.69 , equivalent to $55 \% \mathrm{HH}$

Imtermal stamdard solution Transfer about 2.5 giof tolut ene, aceurately weighed, to a $100-\mathrm{mL}$ voltametric flask con taining 10 mE of $\theta$-xylene, diltete with $\theta-x y l e n e$ to volume, and mix.

Standardsolution Inte a suitable serum vial weigh about 135 mg of adipie acid and 4.0 mL of Hydriodic acid, pipet 4 mL of Internal standard solntion inte the vial, andelose the vial-securely with a suitable septum stepper. Weigh ac eurately the vial and contents, add 30 世L-0f isopropyliodide łhrough the-septam with a-syringe, weigh again, and caleut late the weight of isopropyliodide added, by difference. Similarly, add 90 HE of methyliodide weigh again, and cat eutate the weight of methyl iodide added, by difference. Shake, and allow the layers to-separate.

Fest solution Transfer about 0.065 g of Hypromellese Acetate Suceinate, previeusly dried at $105^{\circ}$ for 1 hour and acetrately weighed, to a $5-\mathrm{mL}$ thiek walled reaction viat
equipped with a presstre-tight septum-ype-clestre, add an amount of adipic acid equal to the weight of the test specimen, and pipet 2 mL of Internal standard solution into the vial. Coutiously pipet 2 mL of Hydriodic acid into the mix ture, immediately eap the vial tightly, and weigh aceurately. Mix the contents of the vial continuousty while heating at $150^{\circ}$ for 60 mimutes. Allow the vial to cool for about 45 minutes, and weigh again. If the weight less is greater that 10-mg, diseard the mixture, and prepare anether Test preparation.

Chromatographic system The gas ehromategraph is equipped with a thermal conductivity detector and a-4 mm $* 1.8$ m glass columm packed with 20\% liquid phase- 628 on 100 to 120 mesh stuppert SIC that is not silanized. Helium is used as the carrier gas, and the temperature of the eolumn is maintained at $130^{\circ}$. Chrematograph the Standard solution, and record the peak respenses as directed for Pro eedure: the relative retention times of methyliodide, iseprepyliodide, toluene, ande-xylene are approximately $1.0,2.2$, 3.6, and 8.0, respectively; and theresolation, $R$, between the foltene and isopropyliodide peaks is net less than 2.0 .

Calibration Inject about 2 HL of the upper layer of the Standard selation inte the-gas chromatograph, and recert the ehromategrams. Caleulate the relative respense facter, $F_{4,}$ of equal weights of toluene and methyliodide taken by the formala:

$$
Q_{H}+R_{\text {sif }}
$$

in which $Q_{4}$ is the quantity ratio of methyliodide to toluene in the Standard solution, and $R_{\text {suf }}$ is the peak area ratio- of methyl iodide to toluene obtained from the Standard solutien. Similarly, caleulate the relative respense facter, $F_{q}$, of
equal weights of toltene and isopropyl iodide taken by the formula:-

$$
Q+R_{s}
$$

in which $Q_{2}$ is the quantity ratio of isepropyl iodide to tolu ene in the Standard solution, and $R_{\text {si }}$ is the peak area ratiof of isopropyl iodide to toltene obtained from the Standard sotution.

Procedtre Inject about $2 \mu \mathrm{~L}$ of the upper layer of the Fest solution inte the gas chromatograph, and record the ehromagrams. Caleulate the percentage of methoxy groups ( $\mathrm{OCH}_{3}$ ) in the pertion of Hypromellose Acetate Strecinate taken by the formula:-

$$
2(31 / 142) F_{\neq} R_{41}\left(H_{f}+W_{t}\right)
$$

in which $31 / 142$ is the ratio of the formma weights of the methoxy group and methyliodide; $F_{\text {a }}$ is-defined under Cat ibration; $R_{\text {mu }}$ is the ratio of the area of the methyl iodide peak to that of the tolmene peak obtained from the Test sothtion, $W_{f}$ is the weight, in g , of toltene used to prepare the Internal standard solution; and $\mathrm{H}_{4}$-is the weight, in g, of Hypromellose Acetate Stuecinate taken to prepare the Test solution. Similarly, caleulate the pereentage of hydroxyprepexy greups ( $\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}$ ) in the pertion of Hypremellose Acetate-Suceinate taken by the formula:-
in which $75 / 170$ is the ratio of the formala weights of the hydroxypropexy group and isopropyliodide; $F_{f}$ is defined tader Calibration; $R_{w}$ is the ratio of the area of the iseprepyl iodide peak to that of the toluene peak obtained from the Fest solution; $W_{7}$ is the weight, in g, of toltene used to prepare the Internal standerd solution; and $H_{+}$is the weight, in g, of Hypromellose Acetate Stucinate taken to prepare the Test solution.

Content of suceinoyl groups Transfer about 1g of Hypremellose Acetate-Suceinate, previously dried at 105º for 1 hour and aceurately weighed, to a conieal flask, dissolve in 50 mL of a mixture of alcohol, acetone, and water $(2: 2: 1, v / v)$, add 2 dreps of phenelphthalein TS, and titrate with 0.1 N soditm hydroxide VS. Perform a blank determination, and make any necessary corrections. Caleulate the percentage of surcineyl greups by the formula:-

$$
(1.0108 V / H) \quad 1.71205
$$

in which $V$ is the volume, in mL , of 0.1 N soditm hydroxide eonsumed after correction for the blank; $W$ is the weight, in g, of Hypromellose Acetate Succinate taken; and $S$ is the pereentage of free-strecinic acid found as directed in the test for Limit of free suceinic acid.

## Content of acetylgroups

Apparatus Use the apparatus illustrated in Figure 1.

$$
z(75 / 170) F R_{\Delta}\left(H_{t}+H_{t}\right)
$$

Figure 1: Apparatus for Determination of Content of Ace Groups

## Internal stad solution Transfer 1.0 mL of propionie

acid inte a $250-\mathrm{mL}$ volumetric flack, and dilute with Diltent to volume-

Piltent Use diluted phosphoric acid (1 in 5000).
Standard solution- Transfer about 100 mg of glacial acetic acid, aecurately weighed, into a $100-\mathrm{mL}$ volumetrie flask, and dilute with Diluent to volume. Transfer 15 mL Of this-selution to anether $100-\mathrm{mL}$ veltumetric flack, add 5.0 mL of the Internal standtard solution, and dilute-with

Biltent to voltame.

Test solution Transfer about 150 mg of Hypromellese Acetate-Stuecinate, previously dried at $105^{\circ}$ for 1 hour and aceurately weighed, to decompesition flask D , add 5 mL - of soditm hydroxide TS, dissolve by shaking, and decompose in a water bath at $60^{\circ}$ for 2 hours. After cooling, add 5 mL of diluted phesphoric acid ( 1 in 6 ), and immediately eonstruet the apparatus as shown in Figure 1. Dip the decomposition flask and steam generator B in the oil bath at $155^{\circ}$, while passing nitrogen from nitrogen induction fube H at a rate of 1 to 2 bubbles per seeond, continue the distillation at
the same temperature, andeollect the distillate in measuring eylinder $G$. Take 60 mL of the distillate, wash the inside of enndenser $F$ with 10 mL of water, combine the washing with the distillate in a 100 mL volumetric flask, add 5.0 mL of the Internal standard solution, and dilute with water to vol the.

Chromatographic system The gas chromatograph is equipped with a flame ionization detector and a-3-mm $-*$ Z-m glass coltmm packed with 60 - $0-80$ mesh support S2. The carrier gas is helitum, and the temperature of the coltamm is maintained at $180^{\circ}$. Adjust the flow rate so that the inter nal standard peak elutes in about 5 minutes. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the elution order is acetic acid, followed by the internal standard peak. The resolution, $R$, between these peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more that $2.0 \%$ for each of the peaks.

Procedure Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and meastre the respenses for the major peaks. Caleulate the ratio, $R_{t}$, of the area of the acetic acid peak to the area of the internat stan dard peak in the chrematogram obtained frem the Test sotttion, and similarly ealeulate the ratio, $R_{s}$, in the ehromatogram obtained frem the Standard solution. Cateu tate the percentage of ace groups ( $\mathrm{COCH}_{3}$ ) in the pertion of Hypromellose Acetate Suecinate taken by the formula:

$$
\left(R_{L}+R_{s}\right)\left(H_{s}+H\right) \times 0.15 \times 71.68
$$

in which $W_{s}$ is the weight, in mg , of glacial acetic acid used to prepare the Standard solution; Wis the weight, in mo, of the pertion of Hypromellose Acetate-Suecinate taken; and the other terms are as defined therein.

Content of methoxy and 2-hydroxypropoxy groups-[Caution-Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the Test solution and the Standard solution in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]

Hydriodic acid—Use a reagent having a specific gravity of at least 1.69 , equivalent to $55 \%$ hydrogen iodide.

Solution $A$-Prepare a mixture of water and methanol (90:10).

Solution B-Prepare a mixture of methanol and water (85: 15).

Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock solution-Transfer 2 mL of $o$-xylene into a stoppered, $10-\mathrm{mL}$ volumetric flask, place the flask on a balance, and tare. Add about $200 \mu \mathrm{~L}$ of methyl iodide, insert the stopper into the flask, and accurately weigh: the weight of methyl iodide is about 350 mg . Tare the flask again, add about $34 \mu \mathrm{~L}$ of isopropyl iodide, and accurately weigh the flask: the recorded weight of isopropyl iodide is about 50 mg. Dilute with $o$-xylene to volume, and mix.

Standard solution-Transfer about 85 mg of adipic acid into an $8-\mathrm{mL}$ vial (or other suitable container), add 2 mL of Hydriodic acid, and add 2.0 mL of the Standard stock solution. Shake and allow the phases to separate. Carefully transfer approximately 1.5 mL of the $o$-xylene (top) layer to a small vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of this solution into a 10 mL volumetric flask, and dilute with methanol to volume. [NOTE-This solution is stable for 8 hours at $5^{\circ}$.]

Test solution-Accurately weigh about 65 mg of Hypromellose Acetate Succinate into a $5-\mathrm{mL}$ reaction vial, add 2.0 mL of $o$-xylene and about 100 mg of adipic acid. Add 2.0 mL of Hydriodic acid, and close the vial tightly with a cap. [Caution-Use a cap that has a top safety relief valve, such as a Minniert valve, to prevent accidental explosion of the vial under high pressure when heated.] Weigh the vial before heating, and place the vial into a heating block at $150^{\circ}$. Shake the vial after 5 minutes and after 30 minutes of heating. Remove the vial from the heating block after 1 hour of heating, and cool. Weigh the vial. If the weight loss is greater than 10 mg , discard the mixture, and prepare another reaction solution. Carefully transfer approximately 1.5 mL of the top $o$-xylene layer into a small glass vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of this solution into a $10-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. [NOTE-This solution is stable for 8 hours at $5^{\circ}$.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A <br> (minutes) | Solution B $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 70 | 30 | equilibration |
| $0-8$ | $70 \rightarrow 40$ | $30 \rightarrow 60$ | linear gradient |
| $8-10$ | $40 \rightarrow 15$ | $60 \rightarrow 85$ | linear gradient |
| $10-17$ | 15 | 85 | isocratic |

[NOTE-These gradient elution times are established on an HPLC system with a dwell volume of approximately 2.0
mL . The injection time can be adjusted relative to the start of a run to accommodate the change in dwell volume from one HPLC system to another to achieve the separation described.] Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency, determined from the methyl iodide peak, is not less than 10,000 theoretical plates; the tailing factor of this peak is between 0.9 and 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$ for each peak.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas corresponding to methyl iodide and isopropyl iodide. Calculate the percentage of methoxy groups $\left(-\mathrm{OCH}_{3}\right)$ in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
4.38\left(W_{M} / W\right)\left(r_{U M} / r_{S M}\right)
$$

in which $W_{M}$ is the weight of methyl iodide, in mg, used to prepare the Standard stock solution; $W$ is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the Test solution; and $r_{U M}$ and $r_{S M}$ are the peak responses for methyl iodide obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of 2-hydroxypropoxy groups $\left(-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}\right)$ in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
8.84\left(W_{I} / W\right)\left(r_{U I} / r_{S I}\right)
$$

in which $W_{I}$ is the weight of isopropyl iodide, in mg, used to prepare the Standard stock solution; $r_{U I}$ and $r_{S I}$ are the peak responses for isopropyl iodide obtained from the

Test solution and the Standard solution,respectively; and $W$ is as defined above. $\quad$ 2S (NF23)

## BRIEFING

> Monoglyceride Citrate. Because there is no existing NF monograph for this excipient, a new monograph is being proposed. This new monograph is based on the Monoglyceride Citrate monograph in the Food Chemical Codex, 5th Edition, page 294 and the Joint FAO/WHO Expert Committee on Food Additives (JECFA) monograph published in FAO Food and Nutrition Paper, No. 52 (1992).
(EMC: D. Bempong; PSD: C. Okeke; NL: L. Paul) RTS-41365-1

## Add the following:

## -Monoglyceride Citrate

Citric acid ester of glyceryl monooleate [36291-32-4].
» Monoglyceride Citrate is a mixture of glyceryl monooleate and its citric acid monoester, manufactured by the reaction of glyceryl monooleate with citric acid under controlled conditions. It contains not less than 14.0 percent and not more than 17.0 percent total citric acid, calculated on the anhydrous basis.

Packaging and storage-Preserve in well-closed containers. No storage requirements specified.

USP Reference standards $\langle 11\rangle$ —USP Citric Acid RS.

## Identification-

A: Reflux 1 g of sample with 15 mL of 0.5 N potassium hydroxide solution in dehydrated alcohol for 1 hour. Add 15 mL of water, acidify with diluted hydrochloric acid (about 6 mL ). Oil drops or a white to yellowish-white solid is produced that is soluble in 5 mL of hexane. Remove the hexane layer, extract again with 5 mL of hexane and again remove the hexane layer. Keep the resulting aqueous layer for Identification tests $B$ and $C$.

B: Evaporate 1 mL of the aqueous layer resulting from Identification test $A$ in a porcelain dish. The residue meets the requirements of the test for Citrate $\langle 191\rangle$.
C: Transfer 5 mL of the aqueous layer resulting from Identification test $A$ into a test tube. Add excess calcium hydroxide as a powder, place in boiling water for 5 minutes, shaking several times, cool, and filter. Transfer one drop of the filtrate into a test tube and add about 50 mg of potassium hydrogen sulfate. On top of the test tube, place a filter paper moistened with a reagent for acrolein consisting of a mixture of a $5 \%$ nitroprusside solution in water and a $20 \%$ piperidine solution in water $(1: 1)$. Heat the test tube. If the filter paper turns blue, the presence of glycerin is indicated. The color changes to light red after addition of sodium hydroxide TS.

Acid value $\langle 401\rangle$ : between 70 and 100 .
Saponification value $\langle 401\rangle$ : between 260 and 265.
Water, Method $I\langle 921\rangle$ : not more than $0.2 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.3 \%$, about 1 g , accurately weighed, being used.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.

## Content of citric acid-

Standard preparation-Dissolve an accurately weighed quantity of USP Citric Acid RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $230 \mu \mathrm{~g}$ per mL .

Test preparation-Transfer about 150 mg of Monoglyceride Citrate, accurately weighed, into a saponification flask, add 50 mL of $4 \%$ potassium hydroxide solution in dehydrated alcohol, and reflux for 1 hour. Acidify the reaction mixture with hydrochloric acid to a pH of 2.8 to 3.2 , transfer into a $400-\mathrm{mL}$ beaker, and evaporate to dryness on a steam bath. Quantitatively transfer the contents of the beaker into a separator, using no more than 50 mL of water, and extract with three $50-\mathrm{mL}$ portions of petroleum ether, discarding the extracts. Transfer the water layer to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
Procedure—Pipet 2.0 mL each of the Standard preparation and of the Test preparation into separate $40-\mathrm{mL}$ graduated centrifuge tubes. Add 2 mL of a 1 in 2 sulfuric acid solution and 11 mL of water to each tube. Boil for 3 min utes, cool, and add 5 mL of bromine TS to each tube. Dilute to 20 mL , allow to stand for 10 minutes, and centrifuge. Transfer 4.0 mL of each solution into separate $19-\times 110-$ mm test tubes, add 1 mL of water, 0.5 mL of a 1 in 2 sulfuric acid solution, and 0.3 mL of 1 M potassium bromide, and shake. Add 0.3 mL of 1.5 N potassium permanganate, shake, and allow to stand for 2 minutes. Add 1 mL of a saturated solution of ferrous sulfate, shake, allow to stand for 2 minutes, and then dilute to 10 mL with water. Add 10.0 mL of $n$-hexane (previously washed with sulfuric acid, followed by a water wash, and then dried over anhydrous sodium sulfate), shake vigorously for 2 minutes, and centrifuge at low speed for 1 minute. Transfer 5.0 mL of the hexane extract into a $20-\times 145-\mathrm{mm}$ tube containing 10.0 mL of $4 \%$ sodi-
um sulfide solution, and briefly shake vigorously (three oscillations only). Centrifuge the mixture at low speed for 1 minute. Immediately determine the absorbance of each aqueous layer in a $1-\mathrm{cm}$ cell at 450 nm with a suitable spectrophotometer, using a reagent blank in the reference cell. Calculate the quantity, in mg, of citric acid in the Monoglyceride Citrate taken by the formula:

$$
0.1 C\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Citric Acid RS in the Standard preparation; and $A_{U}$ and $A_{S}$ are the absorbances obtained from the Test preparation and the Standard preparation, respectively.■2S (NF23)

## Briefing

Polyisobutylene, page 3175 of the First Supplement and page 1564 of the Fifth Interim Revision Announcement in PF 30(5) [Sept.-Oct. 2004]. On the basis of comments received indicating difficulties when performing the test for Molecular weight for me-dium- and high-molecular weight grades of Polyisobutylene, it is proposed to replace this test with a test for Viscosity that is based on the manufacturer's procedure and specifications. It is also proposed to revise the Definition and Labeling sections to include the use of stabilizers.
(EMC: E. Gonikberg) RTS-41791-1

## Change to read:

» Polyisobutylene is a synthetic polymer produced by the low-temperature polymerization of isobutylene in liquid ethylene, methylene chloride, or hexane, using an aluminum-chloride or boron-trifluoride catalyst.
-It may contain a suitable stabilizer..n2S (NF23)

## Change to read:

Labeling-Label it to indicate the neminal molecular weight and the solvent used in the polymerization process.
-range for intrinsic viscosity or the range for Staudinger Index, and the name and quantity of any added stabilizer. [nOTE-The Staudinger Index is equal to 100 times the intrinsic viscosity.] $]_{\text {2S (NF23) }}$

## Delete the following:

## -Moleeular weight-

Solven-Use diisobutylene.
Fest solution 1 Dissolve 1g of Polyisobutylene, acemrately weighed, in 95 mL of Solvent, filter into a 100 mL volumetric flack, dilute with Solvent to volume, and mix. Transfer 50.0 mL of the solution so obtained into a tared dish, evaperate on a steam bath for about 1 hour, and then complete the vaporation to dryness by heating in the waymoren at $70^{\circ}$ to constant weight. Caleulate the coneentration of Test solution-1.

Fest solution 2 Transfer 2.0 mL of Test soldtion 1 to a -50 mL volumetric flask, and dilute with Solvent to volume. Calculate the eoncentration of Test solution-2.

Fest solution 3- Transfer 5.0 mL of Test soldtion 1 to a -50 mL velumetric flask, and dilute with Solvent to volume. Caleulate the erneentration of Test solution-3.

Fest solution - Transfer 10.0 mL of Test solution 1 to 0.50 mL volumetric flask, and dilute with Solvent to volume. Caleulate the ementration of Test solution-4.

Procedure Using a Cannon Fenske, or equivalent viseometer, having dimensions such that the flow time is not less than 200 sec ends, measure the flow of the Solvent and of each of the four Test solutions at $20^{\circ}$. Caleulate the specific viseesity, $\mathrm{m}_{\boldsymbol{p}}$, of Test solut tion - by the formma:

$$
\left(t \pi_{4}\right)-1
$$

in which $t_{4}$ is the flow time, in seconds, of the Solvent; and $t$ is the flow time, in seconds, of Test solution 1. Caleulate the redured vis eosity of Test solution 1 by the formula:

$$
\#_{\ldots} d C
$$

in which $\mathrm{n}_{\boldsymbol{s}}$ is the speeifie viseosity, caleulated above; and $C$ is the eencentration, in s per $100-\mathrm{mL}$, of Test solution 1. Caleulate the speeific viseosity and the redueed viseosity of Test solutions 2, 3, and 4 in the same manner as Test solution 1.

Plot the redured viseosity of each solution against coneentration, and extrapolate to zero-concentration to obtain the intrinsic viseosity, [n]. Finally, caleulate the molecular weight of Polyisobutylene by the formula:-

$$
([\eta] / K)^{+\ldots,},
$$

in which $K$ is $3.60 \times 10^{-4}$ and is 0.64 .! 2 S (NF23)

## Add the following:

-Viscosity $\langle 911\rangle$ —
Solvent-Use isooctane.
Test solution-Prepare a solution of Polyisobutylene in the Solvent having a known concentration as indicated in Table 1. [NOTES--The solution must be homogeneous before testing. For the Polyisobutylene having a Staudinger Index
of 100 and higher, add the Solvent to the weighed material, and allow it to stand in an oven at $80^{\circ}$ for 12 to 24 hours. A heated mechanical shaker may be used to shorten the dissolution time; it is recommended to use a gentle shaker to avoid shearing the polymers. Take adequate precautions to prevent evaporation of the solvent.]

Table 1

| Staudinger Index ${ }^{1}$ | Concentration, $\mathrm{g} \mathrm{per} \mathrm{cm}^{3}$ |
| :---: | :---: |
| $25-60$ | 0.01 |
| $60-100$ | 0.005 |
| $100-350$ | 0.002 |
| $350-700$ | 0.001 |

${ }^{1}$ The Staudinger Index is equal to 100 times the intrinsic viscosity.

Procedure-Using a suitable Ubbelohde capillary viscosimeter having dimensions such that the flow time is not less than 200 seconds, immersed into a controlled temperature bath, measure the flow of the Solvent and of the Test solution at $20^{\circ}$. Repeat the procedure three times, and calculate the average. [NOTE-Before each measurement, let the solutions be temperature equilibrated for 10 minutes.]

Calculate the reduced viscosity $J$ by the formula:

$$
\left(t / t_{0}-1\right) / C,
$$

in which $t_{0}$ is the average flow time, in seconds, of the Solvent; $t$ is the average flow time, in seconds, of the Test solution; and $C$ is the concentration, in g per $\mathrm{cm}^{3}$, of the Test solution.

Calculate the Staudinger Index, $J_{0}$, by the formula:

$$
J /\left[1+0.31\left(t / t_{0}-1\right)\right],
$$

in which the terms are defined above: it is within the limits specified on the label. 2S $^{\text {S (NF23) }}$

Tributyl Citrate, NF page 2948—See briefing under Acetyltributyl Citrate.
(EMC: D. Bempong) RTS-41597-2

## Change to read:

## Assay-

System suitability solution-Prepare a solution in toluene containing about 30 mg each of USP Tributyl Citrate RS and USP Acetyltributyl Citrate RS per mL.

Assay preparation-Transfer about 300 mg of Tributyl Citrate, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with toluene to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with an on colmm, temperatreprogrammable injector,

- m2S (NF23)
a flame-ionization detector maintained at about $275^{\circ}$,
-a split injection system with a split ratio of about

## $30: 1$, ■ $^{\mathrm{S}}$ (NF23)

and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ column bonded with a $0.5-\mu \mathrm{m}$ layer of phase G42. The column temperature is programmed to be maintained at about $80^{\circ}$ for 0.5 minute, then to increase to about $220^{\circ}$ at a rate of $20^{\circ}$ per minute, and to hold at about $220^{\circ}$ for $10 \mathrm{~min}-$ utes. The injection port temperature is programmed be

maintained at about $85^{\circ}$. for 0.5 minute, then to increase to about
$225^{\circ}$ at a rate of $20^{\circ}$ per minute, and to hold at about $225^{\circ}$ for 10 minuter.

- $\quad$ 2S (NF23)

Helium is used as the carrier gas at a flow rate of about 2.3 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for tributyl citrate and 1.0 for acetyltributyl citrate; the resolution, $R$, between tributyl citrate and acetyltributyl citrate is not less than 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$ determined from both the tributyl citrate and acetyltributyl citrate peaks, based on area percent calculation.

Procedure-Inject $1 \mu \mathrm{~L}$ of the Assay preparation into the chromatograph, record the chromatogram, and measure all of the peak areas, excluding the solvent peak. Calculate the percentage of $\mathrm{C}_{18} \mathrm{H}_{32} \mathrm{O}_{7}$ in the portion of Tributyl Citrate taken by the formula:

$$
100(A / B)
$$

in which $A$ is the tributyl citrate peak area response; and $B$ is the sum of the area responses of all the peaks.

## INTRODUCTION

This chapter defines the terms and procedures used in chromatography and provides general information. Specific requirements for chromatographic tests and assays of

- procedures for $_{\text {■2S (USP28) }}$
drug substances and dosage forms, including adsorbent and developing solvents, are given in the individual monographs.

Chromatography is defined as a procedure by which solutes are separated by a dynamic differential migration process in a system consisting of two or more phases, one of which moves continuously in a given direction and in which the individual substances exhibit different mobilities by reason of differences in adsorption, partition, solubility, vapor pressure, molecular size, or ionic charge density. The individual substances thus ebtined
$■_{\text {separated }}^{\text {nis }}{ }_{\text {(USP28) }}$
can be identified or determined by analytical methods.
-procedures.m2S (USP28)
The general chromatographic technique requires that a solute undergo distribution between two phases, one of them fixed (stationary phase), the other moving (mobile phase). It is the mobile phase that transfers the solute through the medium until it eventually emerges separated from other solutes that are eluted earlier or later. Generally, the solute is transported through the separation medium by means of a flowing stream of a liquid or a gaseous solvent known as the "eluant." The stationary phase may act through adsorption, as in the case of adsorbents such as activated alumina ; silien gel, and ion exehange resins,
$\square_{\text {and silica gel, }}^{\boldsymbol{\square}}{ }_{2 S}$ (USP28)
or it may act by dissolving the solute, thus partitioning the latter between the stationary and mobile phases. In the latter process, a liquid coating held on an inert support serves as the stationary phase.
-In the latter process, a liquid coated onto an inert support, or chemically bonded onto silica gel, or directly onto the
wall of a fused silica capillary, serves as the stationary
phase.n2S (USP28)
Partitioning is the predominant mechanism of separation in gasliquid chromatography, paper chromatography, and forms of column chromatography
$■^{-a n d}$ thin-layer chromatography $\boldsymbol{m}_{2 S}$ (USP28)
designated as liquid-liquid ehremagraphy.

In practice, separations frequently result from a combination of adsorption and partitioning effects.
-Other separation principles include ion exchange, ion-pair formation, size exclusion, hydrophobic interaction, and chiral recognition. $\mathbf{m}_{2 S}$ (USP28)

The types of chromatography useful in qualitative and quantitative analysis that are employed in the $U S P$ tests and assays

■procedures $_{\mathbf{■ 2 S}}$ (USP28)
are column, gas, paper, thin-layer,
-(including high-performance thin-layer chromatogra-
phy), $\mathbf{m}_{2 S}$ (USP28)
and pressurized liquid chromatography (commonly called highpressure or high-performance liquid chromatography). Paper and thin-layer chromatography are ordinarily more useful for purposes of identification, because of their convenience and simplicity. Column chromatography offers a wider choice of stationary phases and is useful for the separation of individual compounds, in quantity, from mixtures. Beth gas chromatography and pressurized liquid chrematography require more elaberate apparatus and usually provide high resolution methods that will identify and quantitate very small ameunts of material.
-Modern high-performance thin-layer chromatography, gas chromatography, and pressurized liquid chromatography require more elaborate apparatus but usually provide high resolution and identify and quantitate very small amounts of material.п2S (USP28)

Use of Reference Substances in Identity Tests-In paper and thin-layer chromatography, the ratio of the distance (this distance being measured to the point of maximum intensity of the spot

traveled on the medium by a given compound to the distance traveled by the front of the mobile phase, from the point of application of the test substance, is designated as the $R_{F}$ value of the compound. The ratio between the distances traveled by a given compound and a reference substance is the $R_{R}$ value. $R_{F}$ values vary with the experimental conditions, and thus identification is best accomplished where an authentic specimen of the compound in question is used as a reference substance on the same chromatogram.

For this purpose, chromatograms are prepared by applying on the thin-layer adsorbent or on the paper in a straight line, parallel to the edge of the chromatographic plate or paper, solutions of the substance to be identified, the authentic specimen, and a mixture of nearly equal amounts of the substance to be identified and the authentic specimen. Each sample application contains approximately the same quantity by weight of material to be chromatographed. If
the substance to be identified and the authentic specimen are identical, all chromatograms agree in color and $R_{F}$ value and the mixed chromatogram yields a single spot; i.e., $R_{R}$ is 1.0 .

## Change to read:

## THIN-LAYER CHROMATOGRAPHY

In thin-layer chromatography, the adsorbent is a relatively thin, uniform layer of dry, finely powdered material applied to a glass, plastic, or metal sheet or plate, glass plates being most commonly employed. The coated plate can be considered an "open chromatographic column" and the separations achieved may be based upon adsorption, partition, or a combination of both effects, depending on the particular type of suppert,
$\square_{\text {stationary phase, }}$ [2S (USP28)
its preparation, and its use with different solvents. Thin-layer chromatography on ion-exchange films
-layers $_{\text {■2S (USP28) }}$
can be used for the fractionation of polar compounds. Presumptive identification can be effected by observation of spots

- or zones $_{\mathbf{1 2 S}}$ (USP28)
of identical $R_{F}$ value and about equal magnitude obtained, respectively, with an unknown and a reference sample chromatographed on the same plate. A visual comparison of the size of the spets
$\boldsymbol{-}_{\text {or intensity of the spots or zones }}^{\mathbf{m}_{2 S} \text { (USP28) }}$
may serve for semiquantitative estimation. Quantitative measurements are possible by means of densitometry, flurresence, and flurese senee quenching;
-(absorbance or fluorescence measurements), $\quad$ 2S (USP28)
or the spots may be carefully removed from the plate, followed by elution with a suitable solvent and spectrophotometric measurement. For two-dimensional thin-layer chromatography, the chromatographed plate is turned at a right angle and again chromatographed, usually in another chamber equilibrated with a different solvent system.

Apparatus-Acceptable apparatus and materials for thin-layer chromatography consist of the following.

Flat glass plates of convenient size, typieally $20 \mathrm{~cm} \times 20 \mathrm{~cm} .^{+}$
An aligning trayor a flat surface upon which to align and rest the plates during the applieation of the adserbent.

A starage rack to hold the prepared plates during drying and trampertation. The rack holding the plates should be kept in a desicenter or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The adsorbent consists of finely divided adsorbent materials, nomally 5 to $-40 \mu \mathrm{~m}$ in diameter, suitable for chromatography. It ean be applied direetly to the glass plate or ean be bended to the plate by means of plaster of paris (hydrated caleimm-sulfate) [at a ratio of $5 \%$ to $15 \%]$ or with stareh paste or other binders. The for mer will not yield as hard a surface as will the stareh, but it is net affected by strongly oxidizing spray reagents. The adsorbent may eontain fluereseing material to aid in the visualization of spets that absorb ultraviolet light.

A spreater, which, when moved over the glass plate, will apply a uniferm layer of adsorbent of desired thickness over the entire strface of the plate.

A developing chamber that can accommodate one or more plates and can be properly elosed and sealed as described under Ascend ing Chromatography. The chamber is fitted with a plate support rack that supports the plates, back to back, with the lid of the chamber in place.

A template (generally made of plastic) to aid in placing the test spets at deffinite intervals, to mark distanees as needed, and to aid im tabeling the plates.

A graduated micropipet capable of delivering $10 \mu \mathrm{~L}$ volumes. Total volumes of test and standard solutions are specified in the individual menegraph.

Areagent spratyer that willemit a finespray and will not itself be attacked by the reagent.

An ultraviolet light sottree suitable for observations with short $(254 \mathrm{~nm})$ and long $(360 \mathrm{~nm})$ UV wavelengths.

- A TLC or HPTLC plate. The chromatography is generally carried out using precoated plates or sheets (on glass, aluminum, or polyester support) of suitable size. It may be necessary to clean the plates prior to separation. This can be done by migration of, or immersion in, an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion, or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at $120^{\circ}$ for 20 minutes. The stationary phase of TLC plates has an average particle size of $10-15 \mu \mathrm{~m}$, and that of HPTLC plates an average particle size of $5 \mu \mathrm{~m}$. Commercial plates with a preadsorbant zone can be used if they are specified in a monograph. Sample applied to the preabsorbant region develops into sharp, narrow bands at the pre-absorbant-sorbent interface. Alternatively, flat glass plates of convenient size, typically $20 \mathrm{~cm} \times 20 \mathrm{~cm}$ can be coated as described under Preparation of Chromatographic Plates.

A suitable manual, semiautomatic, or automatic application device can be used to ensure proper positioning of the plate and proper transfer of the sample, with respect to volume and position, onto the plate. Alternatively, a template can be used to guide in manually placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates. For the proper application of the solutions, micropipets, microsyringes, or calibrated disposable capillaries are recommended.

[^345]For ascending development, a chromatographic chamber made of inert, transparent material and having the following specifications is used: a flat bottom or twin trough, a tightly fitted lid, and a size suitable for the plates. For horizontal development, the chamber is provided with a reservoir for the mobile phase, and it also contains a device for directing the mobile phase to the stationary phase.

Devices for transfer of reagents onto the plate by spraying, immersion, or exposure to vapor and devices to facilitate any necessary heating for visualization of the separated spots or zones.
A UV light source suitable for observations under short ( 254 nm ) and long ( 365 nm ) wavelength UV light.

A suitable device for documentation of the visualized chromatographic result.

Procedure-Apply the prescribed volume of the test solution and the standard solution in sufficiently small portions to obtain circular spots of 2 to 5 mm in diameter ( 1 to 2 mm on HPTLC plates) or bands of 10 to 20 mm by 1 to 2 mm ( 5 to 10 mm by 0.5 to 1 mm on HPTLC plates) at an appropriate distance from the lower edge-during chromatography the application position must be 3 mm (HPTLC) to 5 mm (TLC) above the level of the developing solvent - and from the sides of the plate. Apply the solutions on a line parallel to the lower edge of the plate with an interval of at least 10 mm ( 5 mm on HPTLC plates) between the centers of spots or 4 mm ( 2 mm on HPTLC plates) between the edges of bands, and allow to dry.

Ascending Development-Line at least one wall of the chromatographic chamber with filter paper. Pour into the chromatographic chamber a quantity of the mobile phase sufficient for the size of the chamber to give, after impregnation of the filter paper, a level of depth appropriate to the dimension of the plate used. For saturation of the chromato-
graphic chamber, close the lid, and allow the system to equilibrate. Unless otherwise indicated, the chromatographic separation is performed in a saturated chamber.

Place the plate in the chamber, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase, and close the chamber. The stationary phase faces the inside of the chamber. Remove the plate when the mobile phase has moved over the prescribed distance. Dry the plate, and visualize the chromatograms as prescribed. For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Horizontal Development-Introduce a sufficient quantity of the developing solvent into the reservoir of the chamber using a syringe or pipet. Place the plate horizontally in the chamber, connect the mobile phase direction device according to the manufacturer's instructions, and close the chamber. If prescribed, develop the plate starting simultaneously at both ends. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate, and visualize the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Detection-Observe the dry plate first under short-wavelength UV light ( 254 nm ) and then under long-wavelength UV light ( 365 nm ) or as stated in the monograph. If further directed, spray, immerse, or expose the plate to vapors of the specified reagent, heat the plate when required, observe, and compare the test chromatogram with the standard chromatogram. Document the plate after each observation. Measure and record the distance of each spot or zone from the point
of origin, and indicate for each spot or zone the wavelength under which it was observed. Determine the $R_{F}$ values for the principal spots or zones (see Glossary of Symbols).

Quantitative Measurement-Using appropriate instrumentation, substances separated by TLC and responding to ultraviolet-visible (UV-Vis) irradiation prior to or after derivatization can be determined directly on the plate. While moving the plate or the measuring device, the plate is examined by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate optical system. Substances containing radionuclides can be quantified in three ways: (1) directly by moving the plate alongside a suitable counter or vice versa; (2) by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter; or (3) by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail, and measuring the radioactivity using a liquid scintillation counter (see Radioactivity $\langle 821\rangle$ ).

The apparatus for direct quantitative measurement on the plate is a densitometer that is composed of a mechanical device to move the plate or the measuring device along the x axis and the $y$-axis, a recorder, a suitable integrator or a computer; and, for substances responding to UV-Vis irradiation, a photometer with a source of light, an optical device capable of generating monochromatic light, and a photo cell of adequate sensitivity, all of which are used for the measurement of reflectance. In the case where fluorescence is measured, a suitable filter is also required to prevent the light used for excitation from reaching the photo cell while permitting the emitted light or specific portions thereof to pass. The linearity range of the counting device must be verified.

For quantitative tests, it is necessary to apply to the plate not fewer than three standard solutions of the substance to be examined, the concentrations of which span the expected
value in the test solution (e.g., $80 \%, 100 \%$, and $120 \%$ ). Derivatize with the prescribed reagent, if necessary, and record the reflectance or fluorescence in the chromatograms obtained. Use the measured results for the calculation of the amount of substance in the test solution.

## Preparation of Chromatographic Plates-

## Apparatus-

Flat glass plates of convenient size, typically $20 \mathrm{~cm} \times 20$ cm .

An aligning tray or a flat surface upon which to align and rest the plates during the application of the adsorbent.

A storage rack to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The adsorbent consists of finely divided adsorbent materials, normally 5 to $40 \mu \mathrm{~m}$ in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of Paris (calcium sulfate hemihydrate [at a ratio of $5 \%$ to $15 \%$ ]) or with starch paste or other binders. The plaster of Paris will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb UV light.

A spreader, which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate. $\quad$ 2S (USP28)

Procedure-[note-In this procedure, use purified water that is obtained by distillation.] Clean the

- glass ${ }_{\text {2S }}$ (USP28)
plates scrupulously, as by immersion in chromie acideleansing mixture,
-using an appropriate cleaning solution (see Cleaning Glass Apparatus $\langle 1051\rangle$ ), $\boldsymbol{m}_{2 S}$ (USP28)
rinsing them with copious quantities of water until the water runs off the plates without leaving any visible water or oily spots, then dry. It is important that the plates be completely free from lint and dust when the adsorbent is applied.

Arrange the plate or plates on the aligning tray, place a $5-\times 20-$ cm plate adjacent to the front edge of the first square plate and another $5-\times 20-\mathrm{cm}$ plate adjacent to the rear edge of the last square, and secure all of the plates so that they will not slip during the application of the adsorbent. Position the spreader on the end plate opposite the raised end of the aligning tray. Mix 1 part of adsorbent with 2 parts of water (or in the ratio suggested by the supplier) by shaking vigorously for 30 seconds in a glass-stoppered conical flask, and transfer the slurry to the spreader. Usually 30 g of adsorbent and 60 mL of water are sufficient for five $20-\times 20-\mathrm{cm}$ plates. Complete the application of adsorbents using plaster of Paris binder within 2 minutes of the addition of the water, because thereafter the mixture begins to harden. Draw the spreader smoothly over the plates toward the raised end of the aligning tray, and remove the spreader when it is on the end plate next to the raised end of the aligning tray. (Wash away all traces of adsorbent from the spreader immediately after use.) Allow the plates to remain undisturbed for 5 minutes, then transfer the square plates, layer side up, to the storage rack, and dry at $105^{\circ}$ for 30 minutes. Preferably place the rack at an angle in the drying oven to prevent the condensation of moisture on the back sides of plates in the rack. When the plates are dry, allow them to cool to room temperature, and inspect the uniformity of the distribution and the texture of the adsorbent layer; transmitted light will show uniformity of distribution, and reflected light will show uniformity of texture. Store the satisfactory plates over silica gel in a suitable chamber.

Place fwe filter paper wieks, 18 cm in height and ws wide as the length of the developing chamber, into the chamber, add about 100 mL of the solvent (sufficient to have depth of 5 to 10 mm at the bettom of the chamber), seal the cover to the top of the chamber, and allow the system to equilibrate; it is essential that the wieks become completely wet. Altematively, the chamber may be com pletely lined with fllter paper. In either ease, assure that the filter paper dips into the solvent at the bettem of the chamber. Where Faper saturation of the chamber by these methods is undesirable, it is so indiented in the individual monograph.

Apply the test solution and the standard solution, as directed in the individual menegraph, at peints about 1.5 cm apart and about 2 em from the lower edge of the plate the lower edge is the first part over which the spreader moved in the applieation of the adsorbent layer), and allow to dry. Avoid physieal distubanee of the adsor bent during the spoting procedure (by the pipetor other applientor) or when handling the plates. The template will aid in determining the spot points and the 10 to 15 cm distance through which the solvent front should pass.

Place a mark $10 t 015 \mathrm{~cm}$ above the spet peint. Arrange the plate en the supporting rack (test spots toward the bottom), and intre duce the rack into the developing chamber. Allow the solvent in the chamber to reach the lower edge of the adsorbent, but do not allow the spot points to be immersed. Put the cover in place, and maintain the system until the solvent aseends to a peint 10.015 cm above the initial spots, this ustally requires about 15 minutes to 4 hour. Remove the plate frem the developing chamber, mark the solvent front, air dry the plates, and observe first mender short wavelength UV light ( 254 nm ) and then under long wavelength UV light $(360 \mathrm{~nm})$. Measure and record the distance of each spot from the point of origin, and indieate for each spe the wavelength under which it was observed. Determine the $R_{f}$ values for the principal spots (see Glossafy of Symbols). If further directed, spray the spots with the reagent specified, observe, and compare the test chromat egram with the standard ehrematogram.

## Contintrows Development Thin-Layyr Chromatography

In contrast to conventional thin layer chromatography, which is earried out in a closed tank, the continuous development or contintous flow technique allows the upper end of the plate to project through a slot in the cover of the developing chamber. When the developing solvent reaches the slot, continuous ovaporation-oceurs, producing a steady flow of solvent over the plate. In conventional thin layer chromatography, spot migration ceases when the solvent reaches the top of the plate, after which the spots simply enlarge by diffusion. In the continteus flow process, spet migratien contintes as long as the plate remains in the tank and the developing solvent is not exhatusted.

Development may be continued for several hours after the set vent reaches the top of the plate, to provide adequate migration of the spots. Usually spots of a standard solution, a test solution, and a mixture of equal amounts of test and standard solutions, are initially applied at a standard distanee from the base of the plate. Identity of the standard and test substances is confimed by their migrating equal distanees from the origin and by the observation that the two substanees applied as mixture-show no tendency to separate.

A major advantage of continuous development thin layer chromatography stems from the greater solvent selectivity for solvents of low solvent strength. Solvent strength refers to the property of a developing solvent that eauses solutes to migrate, and it is strongly influeneed by the polarity of the solvent. Inereasing the solvent strength by adding a more polar solvent eauses the $R_{r}$ value to in erease. Solvent selectivity refers to the ability of a solvent system to produce different $R_{L}$ values for closely related substances. In eonventional thin layer chromatography, a solvent system giving an $R_{f}$ value in the range of 0.3 to 0.7 , but with adequate selectivity to permit separation of the substanees being examined is usually selected. It is muth easier to find solvent systems producing adequate migration than to find those affording adequate selectivity.

Solvent systems of lower strength generally exhibit higher selec tivity, but are difficult to employ in conventional thin layer chromatography because they result in very little migration before the solvent reaches the top-of the plate. Migration may be increased, however, by repented drying and redevelopment of the plate or, more conveniently, by providing means for evaporation of solvent at the top of the plate, which results in continurus development. Two techniques are used: contintuous development and short bed eontintrous development thin layer chromatography.

An $R_{\text {L }}$ value cannet be measured in continurus development thin layer chrematography. Substances may be compared either by their migration distance over a fixed period of time or by comparisen with the migration of a standard substance applied to the plate.

## GONTINUOUS PEVEELOPMENT

Apparatus Acceptable apparatus and materials foricentinteus development thin layer chromatography are the same as those de seribedunder conventional Thin Lafyer Chrematography, exeeptas follows.

A developing chamber is used that consists of a rectangular tank, approximately $23 \mathrm{~cm} \times 23 \mathrm{~cm} \times 9 \mathrm{~cm}$, equipped with a glass solvent trough and a platform about 3.75 cm high to elevate the solvent trough above the base of the tank. The chamber is fitted with a cover having a $21 \times 6 \mathrm{em}$ slot in the front edge.

Procedure- Apply the standard solution, the test solution, and a mixture of equal amounts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the elevated empty solvent trough with the adsorbent en the underside of the leaning plate. The adsorbent rests against a piece of heavy (about 1 mm thiek) ${ }^{2}$ filter paper measuring $20 \mathrm{~cm}-x$

[^346]3 cm , folded lengthwise and placed over the front edge of the tank. Place the developing solvent in the trough; set the cover in place, and seal all openings except where the adsorbent contacts the paper wiek. The plate extends about 1 cm beyend the top of the tank. After the solvent reaches the top of the plate, allow development to continue for an appropriat time. Then remove and dry the plate, and detect the spets by suitable means.

## SHORT BED-CONTINUOUS DEVELOPMENT

A major advantage of the short bed technique derives from the fact that solvent velecity is inversely related to bed length. Since spet migration depends upen the total amount of solvent passing over the plate, the short bed permits useful migration to be ob fained in a reasonable time with solvent having very low solvent strength. Lower diffusion in solvents of low solvent strength produres smaller and more dense spots, which enhances both detect ability and diseernment of small differences in migration distance.

Apparatus Aceeptable apparatus and materials for short bed eontinuous development thin layer chromatography are the same as those described under conventional Thin Layer Chromatograt phy, except as follows.

A shallow developing ehamber ${ }^{3}$ approximately $22 \mathrm{~cm}-9-\mathrm{cm}$ $* 3 \mathrm{~cm}$, equipped with a cover plate and tight fittimg polytef wings that enable the chamber to be sealed against the plate, is used. The-
inside bettom of the chamber contains ridges that suppert the plate and allow it to be inserted at different angles, thereby varying the length of the plate contained within the tank.

Procedure-Apply the standard-solution, the test solution, and a mixtre of equal parts of the standard solution and the test solth tion to a line about 2 cm from the base of the plate. Place the plate in the developing chamber (adsorbent side up), and add the develeping solvent to the chamber. No paper wick is employed. After the solvent reaches the top of the plate, allow development to continue for an appropriate time. Then remove and dry the plate, and detect the spets by sutitable means.

## INTERPRETATION OF CHROMATOGRAMS

Figure 1 represents a typical chromatographic separation of two substances, 1 and 2, where $t_{1}$ and $t_{2}$ are the respective retention times; and $h, h / 2$, and $W_{h 2}$ are the height, the half-height, and the width at half-height, respectively, for peak $1 . W_{1}$ and $W_{2}$ are the respective widths of peaks 1 and 2 at the baseline. Air peaks are a feature of gas chromatograms and correspond to the solvent front in liquid chromatography.

[^347]

Fig. 1. Chromatographic separation of two substances

Chromatographic retention times are characteristic of the compounds they represent but are not unique. Coincidence of retention times of a test and a reference substance can be used as a feature in construction of an identity profile but is insufficient on its own to establish identity. Absolute retention times of a given compound vary from one chromatogram to the next. Comparisens are nermat
 eulated by the equation:-

where $t_{z}$ and $t_{4}$-are the retention times, measured from the point of injection, of the test and reference substances, respectively, deter mined under identical experimental conditions on the same col umn, and $t_{4}$.is the retention time of a nomretained substanee, such as methame in the ease of gas chrematography.

In this and the following expressions, the corresponding retention volumes or linear separations on the chromatogram, both of which are direetly propertienal to retention time, may be substitut
 may be estimated frem the retention times measured from the peint

-Due to the fact that most procedures do not need to identify an unretained peak, comparisons are normally made in terms of relative retention times $R_{r}$ :

$$
R_{r}=\frac{t_{2}}{t_{1}}
$$

where $t_{2}$ and $t_{l}$ are the retention times, measured from the point of injection, of the test and the reference substances, respectively, determined under indentical experimental conditions on the same column.
Other procedures may identify the peak position using the relative retention $r$ :

$$
r=\frac{t_{2}-t_{M}}{t_{1}-t_{M}}
$$

where $t_{M}$ is the retention time of a non-retained marker,
which needs to be defined in the procedure. $\quad$ 2S (USP28)
The number of theoretical plates, $N$, is a measure of column efficiency. For Gaussian peaks, it is calculated by the equation:

$$
N=16\left(\frac{t}{W}\right)^{2}, \square_{2 S(U S P 28)}
$$

where $t$ is the retention time of the substance and $W$ is the width of the peak at its base, obtained by extrapolating the relatively straight sides of the peak to the baseline. $\Pi_{\text {m }}$ is the peak width at half height, obtained directly by electronic integrators.

■-2S (USP28)
The value of $N$ depends upon the substance being chromatographed as well as the operating conditions such as mobile phase or carrier gas flow rates and temperature, the quality of the packing, the uniformity of the packing within the column and, for capillary columns, the thickness of the stationary phase film, and the internal diameter and length of the column.

The separation of two components in a mixture, the resolution, $R$, is determined by the equation:

$$
R=\frac{2\left(t_{2}-t_{1}\right)}{W_{2}+W_{1}}
$$

in which $t_{2}$ and $t_{1}$ are the retention times of the two components, and $W_{2}$ and $W_{1}$ are the corresponding widths at the bases of the peaks obtained by extrapolating the relatively straight sides of the peaks to the baseline.

Where electronic integrators are used, it may be convenient to determine the resolution, $R$, by the equation:

$$
R=\frac{2\left(t_{2}-t_{1}\right)}{1.70\left(W_{1, h / 2}+\mathrm{W}_{2, h / 2}\right)}
$$

and to determine the number of theoretical plates, $N$, by the equation:

$$
N=5.54\left(t / W_{h / 2}\right)^{2}
$$

$\square_{\text {where }} W_{h / 2}$ is the peak width at half-height, obtained direct-

## ly by electronic integrators. $\quad$ 2S (USP28)

However, in the event of dispute, only equations based on peak width at baseline are to be used.

Peak areas and peak heights are usually proportional to the quantity of compound eluting. These are commonly measured by electronic integrators but may be determined by more classical approaches. Peak areas are generally used but may be less accurate if peak interference occurs. For manual measurements, the chart should be run faster than usual, or a comparator should be used to measure the width at half-height and the width at the base of the peak, to minimize error in these measurements. For accurate quantitative work, the components to be measured should be separated from any interfering components. Peak tailing and fronting and the measurement of peaks on solvent tails are to be avoided.

Chromatographic purity tests for drug raw materials are sometimes based on the determination of peaks due to impurities, expressed as a percentage of the area due to the drug peak. It is preferable, however, to compare impurity peaks with those in the chromatogram of a standard at a similar concentration. The standard may be the drug itself at a level corresponding to, for example, $0.5 \%$ impurity, or in the case of toxic or signal impurities, a standard of the impurity itself.

## Change to read:

## SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the

- detection sensitivity, ${ }^{\text {2S }}$ (USP28)
resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.
-The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the Chromatographic purity or Related compounds tests by injecting a volume of a quantitation limit solution equal to that of the Test solution. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the Test solution at a $0.05 \%$ concentration level relative to the amount of drug substance in the Test solution for drug substances, and a $0.1 \%$ level relative to the amount of drug substance in the Test solution for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.m2S (USP28)

The resolution, $R$, [NOTE-All terms and symbols are defined in the Glossary of Symbols] is a function of the column efficiency, $N$, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, $S_{R}$, if the requirement is $2.0 \%$ or less; data from six replicate injections are used if the relative standard deviation requirement is more than $2.0 \%$.

The tailing factor, $T$, a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see Fig. 2). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

Fig. 2. Asymmetrical chromatographic peak
These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see Procedures under Tests and Assays in the General Notices). Adjustments of operating eonditions to meet system suit ability requirements may be neeessary.
-If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum speciffation variation that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when Referenee Standards suitable standards (including Reference Standards) are available for all amalytes compounds used in the suitability test and are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. The changes described below may require additional validation data unless the user can verify the suitability of the method under the new conditions. This verification consists of assessing the analytical performance characteristics that can be affected by the change (e.g., specificity, linearity, precision, accuracy) to ensure the adequacy of the method. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.
pH of Mobile Phase (HPLC)-The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within $\theta .2 \pm 0.2$ units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within $\pm 10 \%$, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC) The amount of the miner The following adjustment limits apply to minor components of the mobile phase (specified at $50 \%$ or less). The amount(s) of these component(s) can be adjusted by $\pm 30 \%$ relative. or $\pm 2 \%$ abselute (i.e., in relation to the total mobile phase), whichever is latger. However, the change in any component cannot exceed $\pm 10 \%$ absolute (i.e., in relation to the total mobile phase), nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

## Binary Mixtures-

SPECIFIED RATIO OF 50 : 50 - Thirty percent of 50 is $15 \%$ absolute, but this exceeds the maximum permitted change of $\pm 10 \%$ absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of $40: 60$ to $60: 40$.

SPECIFIED-RATЮ-OF-95:5_Thirty percent of 5-is $1.5 \%$ abse tate. Hetwever, beeause adjustmentsupto $+2 \%$ absolute are allowed, the ratio may be adjusted within the range of 93.7 $5-97: 3$

SPECIFIED RATIO OF 2 : 98 - Thirty percent of 2 is $0.6 \%$ absolute. In this case an absolute adjustment of $\pm 2 \%$ is net at lowed because it would reduce the amount of the first eempenent to zere. Therefore the maximum allowed adjustment is within the range of $1.4: 98.6$ to $2.6: 97.4$.

## Ternary Mixtures-

SPECIFIED RATIO OF $60: 35: 5$-For the second component, $30 \%$ of 35 is $10.5 \%$ absolute, which exceeds the maximum permitted change of $\pm 10 \%$ absolute in any component. Therefore the second component may be adjusted only within the range of $25 \%$ to $45 \%$ absolute. For the third component, $30 \%$ of 5 is $1.5 \%$ absolute. Since $\pm 2 \%$ absolete is permit ted and provides more flexibility, the third compenent may be adjusted within the range of $3 \%$ to $7 \%$ absolute. In all cases, a sufficient quantity of the first component is used to give a total of $100 \%$. Therefore, mixture ranges of $50: 45: 5$ to $70: 25: 5$ or $58: 35: 7$ to- $62: 35: 3$ $58.5: 35: 6.5$ to $61.5: 35: 3.5$ would meet the requirement.

## Detector Wavelength of UV-Visible Detector

 (HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, $\pm 3 \mathrm{~nm}$.Column Length (GC, HPLC): can be adjusted by as much as $70 \% \pm 70 \%$.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as $\pm 25 \% 50 \% . \pm 25 \%$ for HPLC and $\pm 50 \%$ for GC .

Film Thickness (Capillary GC): can be adjusted by as much as $-50 \%$ to $100 \%$.

Particle Size (HPLC): can be reduced by as much as $50 \%$.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as $\pm 50 \%$.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. It may be increased to as much as twice the volume specifled, provided there are ne adverse-ffects-on factors sueh as baseline, peak shapes, resolution, linearity, and retention times.

Column Temperature (HPLC): can be adjusted by as much as $\pm 20^{\circ} . \pm 10^{\circ}$. Column thermostating is recommended to improve control and reproducibility of retention time.

Golumn Oven Temperature (GC): can be adjusted by as much as $\pm 2 \%$, in terms of abselute temperature. $\pm 10 \%$.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to $\pm 20 \%$ is permitted.

## Gradient Elution (HPLC) The configuration of the

equipment employed may signifieantly alter the resolution, retention time, and relative retentions described in the meth od. Should this ocetr, it may be due to exeess-dwell time, which is the volume between the peint at which the weet
thants meet and the top-of the columm. 2 2S (USP28)
Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.

The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails
$\mathbf{■}_{\text {system suitability }} \mathbf{m}_{2 \text { S }}$ (USP28)
requirements are unacceptable.

## CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE-Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

## Packings

L1-Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L2-Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L3-Porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L4-Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L5-Alumina of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L6-Strong cation-exchange packing-sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L7-Octylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L8-An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support,

- 3 to $\mathbf{m}_{1 S}$ (USP28)
$10 \mu \mathrm{~m}$ in diameter.
L9- $10-\mu \mathrm{m}$ irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10-Nitrile groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L12-A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.
L13-Trimethylsilane chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L14-Silica gel $10 \mu \mathrm{~m}$ in diameter
■1 (USP28)
having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating,
-5 to $10 \mu \mathrm{~m}$ in diameter. $\quad$ 1S (USP28)
L15-Hexylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L16-Dimethylsilane chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L17-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to $11 \mu \mathrm{~m}$ in diameter.

L18-Amino and cyano groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L19-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about $9 \mu \mathrm{~m}$ in diameter.

L20-Dihydroxypropane groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L21-A rigid, spherical styrene-divinylbenzene copolymer, 5 to $10 \mu \mathrm{~m}$ in diameter.
L22-A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about $10 \mu \mathrm{~m}$ in size.

L23-An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about $10 \mu \mathrm{~m}$ in size.

L24-A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to $63 \mu \mathrm{~m}$ in diameter. ${ }^{5}$

L25-Packing having the capacity to separate compounds with a molecular weight range from 100-5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26-Butyl silane chemically bonded to totally porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

[^348]L27-Porous silica particles, 30 to $50 \mu \mathrm{~m}$ in diameter.
L28-A multifunctional support, which consists of a high purity, $100 \AA$, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C 8 functionality.

L29-Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, $5 \mu \mathrm{~m}$ in diameter with a pore volume of $80 \AA$.

L30-Ethyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L31-A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of $8.5-\mu \mathrm{m}$ macroporous particles having a pore size of $2000 \AA$ and consisting of ethylvinylbenzene cross-linked with $55 \%$ divinylbenzene.

L32-A chiral ligand-exchange packing-L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L33-Packing having the capacity to separate dextrans by molecular size over a range of 4000 to $500,000 \mathrm{Da}$. It is spherical, silica-based, and processed to provide pH stability. ${ }^{6}$

L34-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about $9 \mu \mathrm{~m}$ in diameter.

L35-A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of $150 \AA$.

L36-A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to $5-\mu \mathrm{m}$ aminopropyl silica.

L37-Packing having the capacity to separate proteins by molecular size over a range of 2,000 to $40,000 \mathrm{Da}$. It is a polymethacrylate gel.

L38-A methacrylate-based size-exclusion packing for watersoluble samples.

L39-A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40-Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to $20 \mu \mathrm{~m}$ in diameter.

L41-Immobilized $\alpha_{1}$-acid glycoprotein on spherical silica particles, $5 \mu \mathrm{~m}$ in diameter.

L42-Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, $5 \mu \mathrm{~m}$ in diameter.

L43-Pentafluorophenyl groups chemically bonded to silica particles $\square_{\text {by }}$ a propyl spacer, $\mathbf{m S}_{1 S}$ (USP27) 5 to $10 \mu \mathrm{~m}$ in diameter.

L44-A multifunctional support, which consists of a high purity, $60 \AA$, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45-Beta cyclodextrin bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L46-Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads,

■about $_{\square 15}$ (USP28)
$10 \mu \mathrm{~m}$ in diameter.
L47-High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, $8 \mu \mathrm{~m}$ in diameter. ${ }^{7}$
L48-Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, $15 \mu \mathrm{~m}$ in diameter.

[^349]L49-A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{8}$
L50-Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to $15 \mu \mathrm{~m}$ in diameter, and a surface area not less than $350 \mathrm{~m}^{2}$ per $g$. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene. ${ }^{9}$

L51-Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{10}$

L52-A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{11}$

L53-Weak cation-exchange resin consisting of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to 15 $\mu \mathrm{m}$ diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than $500 \mu \mathrm{Eq} /$ column. ${ }^{12}$

L54-A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 $\mu \mathrm{m}$ in diameter. ${ }^{13}$

## Phases

G1-Dimethylpolysiloxane oil.
G2-Dimethylpolysiloxane gum.
G3-50\% Phenyl-50\% methylpolysiloxane.
G4-Diethylene glycol succinate polyester.
G5-3-Cyanopropylpolysiloxane.
G6-Trifluoropropylmethylpolysiloxane.
G7-50\% 3-Cyanopropyl-50\% phenylmethylsilicone.
G8-80\% Bis(3-cyanopropyl)-20\% 3-cyanopropylphenylpoly-
siloxane (percentages refer to molar substitution).
G9-Methylvinylpolysiloxane.
G10-Polyamide formed by reacting a $\mathrm{C}_{36}$ dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of $1.00: 0.90: 0.20$.

G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13-Sorbitol.
G14-Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15-Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16-Polyethylene glycol compound (av. mol. wt. about 15,000 ). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.

[^351]G17-75\% Phenyl-25\% methylpolysiloxane.
G18-Polyalkylene glycol.
G19-25\% Phenyl-25\% cyanopropyl-50\% methylsilicone.
G20-Polyethylene glycol (av. mol. wt. of 380 to 420).
G21-Neopentyl glycol succinate.
G22-Bis(2-ethylhexyl) phthalate.
G23-Polyethylene glycol adipate.
G24-Diisodecyl phthalate.
G25-Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.

G26-25\% 2-Cyanoethyl-75\% methylpolysiloxane.
G27-5\% Phenyl-95\% methylpolysiloxane.
G28-25\% Phenyl-75\% methylpolysiloxane.
G29-3,3'-Thiodipropionitrile.
G30--Tetraethylene glycol dimethyl ether.
G31-Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.

G32-20\% Phenylmethyl-80\% dimethylpolysiloxane.
G33-20\% Carborane-80\% methylsilicone.
G34-Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35-A high molecular weight compound of a polyethylene
glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36-1\% Vinyl-5\% phenylmethylpolysiloxane.
G37-Polyimide.
G38-Phase G1 containing a small percentage of a tailing inhibitor. ${ }^{17}$

G39-Polyethylene glycol (av. mol. wt. about 1500).
G40-Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone ( $10 \%$ phenyl-substituted).
G42-35\% phenyl-65\% dimethylpolysiloxane (percentages refer to molar substitution).

G43-6\% cyanopropylphenyl-94\% dimethylpolysiloxane (percentages refer to molar substitution).

G44-2\% low molecular weight petrolatum hydrocarbon grease and $1 \%$ solution of potassium hydroxide.

G45-Divinylbenzene-ethylene glycol-dimethylacrylate.
G46-14\% Cyanopropylphenyl-86\% methylpolysiloxane.
G47-Polyethylene glycol (av. mol. wt. of about 8000).
G48-Highly polar, partially cross-linked cyanopolysiloxane.
G49_Proprietary derivatized phenyl groups on a polysiloxane backbene. ${ }^{+8}$
-G50 \#\# (Docosahexaenoic Acid)—Polyethylene glycol,
cross-linked (av. mol. wt. of more than 20,000). ${ }^{\mathrm{c}}$ 1S (USP28)
neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ${ }^{19}$ to mask surface silanol groups.

S1AB-The siliceous earth as described above is both acid- and base-washed. ${ }^{19}$

S1C-A support prepared from crushed firebrick and calcined or burned with a clay binder above $900^{\circ}$ with subsequent acidwash. It may be silanized.

S1NS-The siliceous earth is untreated.
S2-Styrene-divinylbenzene copolymer having a nominal surface area of less than $50 \mathrm{~m}^{2}$ per g and an average pore diameter of 0.3 to $0.4 \mu \mathrm{~m}$.

S3-Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to $600 \mathrm{~m}^{2}$ per $g$ and an average pore diameter of $0.0075 \mu \mathrm{~m}$.

S4-Styrene-divinylbenzene copolymer with aromatic - O and N groups, having a nominal surface area of 400 to $600 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0076 \mu \mathrm{~m}$.

S5-40- to $60-\mathrm{mesh}$, high-molecular weight tetrafluorethylene polymer.

S6-Styrene-divinylbenzene copolymer having a nominal surface area of 250 to $350 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0091 \mu \mathrm{~m}$.

S7-Graphitized carbon having a nominal surface area of $12 \mathrm{~m}^{2}$ per g .

S8-Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9-A porous polymer based on 2,6-diphenyl-p-phenylene oxide.

S10-A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g modified with small amounts of petrolatum and polyethylene glycol compound. ${ }^{20}$

S12-Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g .

## ■ $\langle 1072\rangle$ DISINFECTANTS AND ANTISEPTICS

## INTRODUCTION

A sound cleaning and sanitization program is needed $\ddagger$ prevent the mierobial contamination of Pharmacopeial artieles in controlled environments used for manufacture. for controlled environments used in the manufacture of pharmacopeial articles to prevent the microbial contamination of these articles. Sterile drug products may be contaminated via their pharmaceutical ingredients, process water, packaging components, manufacturing environment, processing equipment, and manufacturing operators. Current Good Manufacturing Practices (cGMPs) emphasize the size, design, construction, and location of buildings and construction materials, and the appropriate material flow to facilitate cleaning, maintenance, and proper operations for the manufacture of drug products. When disinfectants are used in a manufacturing environment, care must should be taken to prevent the drug product from becoming contaminated with chemical disinfectants as a result of the inherent toxicity of the disinfectants. The requirements for aseptic processing include readily cleanable floors, walls, and ceilings that have smooth and nonporous surfaces; particulate, temperature, and humidity controls; and cleaning and disinfecting procedures to produce and maintain aseptic conditions. The cleaning and sanitization program menst should achieve specified cleanliness standards, control microbial contamination of products, and be designed to prevent the chemical contamination of pharmaceutical ingredients,
product-contact surfaces and/or equipment, packaging materials, and ultimately the drug products. These principles also apply to nonsterile dosage forms where the microbial contamination is controlled by the selection of appropriate pharmaceutical ingredients, utilities, manufacturing environments, sound equipment cleaning procedures, products especially formulated to control water activity, inclusion of suitable preservatives, and product packaging design.
In addition to disinfectants, antiseptics are used to decontaminate human skin and exposed tissue and may be used by personnel prior to entering the manufacturing area. Chemical sterilants may be used to decontaminate surfaces in manufacturing and sterility testing areas. Furthermore, sterilants may be used for the sterilization of Pharmacopeial articles, and UV irradiation may be used as a surface sanitizer.

This general information chapter will discuss the selection of suitable chemical disinfectants and antiseptics; the demonstration of their bactericidal, fungicidal, and sporicidal efficacy; the application of disinfectants in the sterile pharmaceutical manufacturing area; and regulation and safety considerations. Biofilm formation and its relationship to disinfectants are outside the scope of this chapter. Additional information not covered in the chapter may be obtained from standard texts on disinfectants and antiseptics. ${ }^{1}$

## DEFINITIONS

Antiseptic-An agent that inhibits or destroys microorganisms on living tissue including skin, oral cavities, and open wounds.

[^354]Chemical Disinfectant-A chemical agent used on inanimate surfaces and objects to destroy infectious fungi, viruses, and bacteria, but not necessarily their spores. Sporicidal and antiviral agents are may be considered a special elasses class of disinfectants. Disinfectants are often categorized as high-level, intermediate-level and low-level by medically oriented groups based upon their efficacy against various microorganisms.

Cleaning Agent-An agent for the removal from facility and equipment surfaces of product residues that may inactivate sanitizing agents or harbor microorganisms.

Decontamination-The removal of microorganisms by disinfection or sterilization.

Disinfectant—A chemical or physical agent that destroys or removes vegetative forms of harmful microorganisms when applied to a surface.

Sanitizing Agent-An agent for reducing, on inanimate surfaces, the number of all forms of microbial life including fungi, viruses, and all forms of bacteria and their spores.

Sporicidal Agent-An agent that destroys bacterial and fungal spores when used in sufficient concentration for a specified contact time. It is expected to kill all vegetative microorganisms.

Sterilant—An agent that destroys all forms of microbial life including fungi, viruses, and all forms of bacteria and their spores. Sterilants are liquid or vapor-phase agents.

Microorganisms differ greatly in their resistance to disinfection agents. The order of resistance of clinically significant microorganisms to chemical disinfectants from most to least resistant is listed in Table 1.

Table 1. The Resistance of Some Clinically Important Microorganisms to Chemical Disinfectants (Listed in Order of Decreasing Resistance)

| Type of |  |
| :---: | :---: |
| Microorganisms | Examples |
| Bacterial spores | Bacillus subtilis and Clostridium |
|  | sporogenes |
| Mycobacteria | Myeobacteria <br> Mycobacterium <br> tuberculosis |
| Nonlipid-coated viruses | Poliovirus and rhinovirus |
| Fungi Fungal spores and vegetative molds and yeast | Trichophyton, Cryptococcus, and Candida spp. |
| Vegetative bacteria | Pseudomonas aeruginosa, <br> Staphylococcus aureus, and Salmonella spp. |
| Lipid-coated viruses | Herpes simplex virus, hepatitis B virus, and human immunodeficiency virus |

## CLASSIFICATION OF DISINFECTANTS

Chemical disinfectants are classified by their chemical type. This includes aldehydes, alcohols, halogens, peroxides, quaternary ammonium compounds, and phenolic compounds (see Table 2).

Table 2. General Classification of Antiseptics, Disinfectants, and Sporicidal Agents

| Chemical |  |  |
| :--- | :---: | :---: |
| Fype Entity | Classification | Example |
| Aldehydes | Sporicidal agent | $2 \%$ Glutaldehyde |
| Alcohols | General purpose | $70 \%$ Isopropyl |
|  | disinfectant, | alcohol, 70\% |
|  | antiseptic, <br> antiviral agent | alcohol |
|  |  |  |

Table 2. General Classification of Antiseptics, Disinfectants, and Sporicidal Agents (Continued)

| Chemical Type Entity | Classification | Example |
| :---: | :---: | :---: |
| Chlorine and sodium hypochlorite | Sporicidal agent | $0.5 \%$ Sodium hypochlorite |
| Phenolics | General purpose disinfectant | $500 \mu \mathrm{~g}$ per g <br> Chlorocresol, $500 \mu \mathrm{~g}$ per g chloroxylenol |
| Ozone | Sporicidal agent | 8\% Gas by weight |
| Hydrogen peroxide | Vapor phase sterilant, liquid sporicidal agent, antiseptic | $4 \mu \mathrm{~g}$ per $\mathrm{g} \mathrm{H}_{2} \mathrm{O}_{2}$ <br> vapor, $10 \%-25 \%$ <br> solution, 3\% <br> solution |
| Substituted diguanides | Antiseptic agent | 0.5\% Chlorhexidine gluconate |
| Peracetic acid | Liquid sterilant, vapor phase sterilant | $0.2 \%$ peracetic acid, $1 \mu \mathrm{~g}$ per g peracetic acid |
| Ethylene oxide | Vapor-phase sterilant | $600 \mu \mathrm{~g}$ per g ethylene oxide |

Table 2. General Classification of Antiseptics, Disinfectants, and Sporicidal Agents (Continued)

| Chemical |  |  |

| جype Entity | Classification | Example |
| Quaternary | General purpose | $200 \mu \mathrm{~g}$ per g |
| ammonium | disinfectant, | benzalkonium |
| compounds | antiseptic | chloride |
| $\beta$-Propiolac- | Sporicidal agent | $100 \mu \mathrm{~g}$ per g |
| tone |  | $\beta$-propiolactone |

The effectiveness of a disinfectant depends on its intrinsic biocidal activity, the concentration of the disinfectant, the contact time, the nature of the surface disinfected, the hardness of water used to dilute the disinfectant, the amount of organic materials present on the surface, and the type and the number of microorganisms present. Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the Environmental Protection Agency (EPA) registers chemical disinfectants marketed in the United States and requires manufacturers to supply product information on the use dilution, type of microorganisms killed, and the necessary contact time (Table 3). Certain liquid chemical sterilizers intended for use on critical or semicritical medical devices are defined and regulated by the U.S. Food and Drug Administration (FDA).

## SELECTION OF AN ANTISEPTIC FOR HAND AND SURGICAL SITE DISINFECTION

Hands and surgical sites are disinfected in a hospital setting to reduce the resident flora and to remove transient flora (e.g., Streptococcus pyogenes) and methicillin-resistant $S$. aureus and P. aeruginosa that have been implicated in hos-pital-associated infection. Use of antiseptics to disinfect hands has been shown to be more effective than soap and water in reducing the counts of bacteria on the skin; repeated antiseptic use further reduces these counts. These principles may be applied to clean-room operators in the pharmaceutical industry.

Common antiseptics include 4\% chlorhexidine, $10 \%$ propidine povidone-iodine, $3 \%$ hexachlorophene, $70 \%$ isopropyl alcohol, and $0.5 \%$ chlorhexidine in $95 \%$ ethanel alcohol.

## SELECTION OF A DISINFECTANT FOR USE IN A PHARMACEUTICAL MANUFACTURING

## ENVIRONMENT

When selecting a disinfectant for use in a pharmaceutical manufacturing area, the following points ment should be considered: the number and types of microorganisms to be controlled; the spectrum of activity of commercially available disinfectants; the reputation of the disinfectant supplier; the claims as a sterilant; the disinfectant or sanitizer supported by the EPA registrations; the concentration, application method, and contact time of the disinfectant; the nature of the surface material being disinfected and its compatibility with the disinfectant; the amount of organic compounds on the surface that may inactivate a disinfectant; the possible need to maintain a residual bactericidal activity of the disin-
fectant on the surface; the corrosiveness of the disinfectant to equipment with repeated application; the safety considerations for operators applying the disinfectant; the compatibility of the disinfectant with cleaning agents and other disinfectants; the planned disinfectant rotation; and the steps that need to be taken to avoid the contamination of pharmaceutical products by a disinfectant. ${ }^{2}$

## THEORETICAL DISCUSSION OF DISINFECTANT ACTIVITY

Plots of the $\log$ of the number of microorganisms per mL surviving in a disinfectant solution indicate that first-order kinetics can be applied as a rable gross approximation to the reduction in microbial count with respect to time. In practice, the plots show a more sigmoid curve with a slower initial reduction in numbers followed by an increasing rate with respect to time.

The rate constant, $K$, for the disinfection process can be calculated by the formula:

$$
(1 / t)\left(\log N_{\mathrm{o}} / N\right),
$$

in which $t$ is the time, in minutes, for the microbial count to be reduced from $N_{\mathrm{o}}$ to $N$; $N_{\mathrm{o}}$ is the initial number of organisms, in cfu per mL; and $N$ is the final number, in cfu per mL , of organisms.

As with a first-order chemical reaction, the same concentration of disinfectant reduces the number of organisms more rapidly at elevated temperatures. This can be ex-

[^355]pressed as a temperature, $T$, coefficient per $10^{\circ}$ rise in temperature, $Q_{10}$, calculated by the formula:

Time to decontamination at $T /$
Time to decontamination at $T$,
in which $T$ is $T^{\circ}-10$.
Further evidence that a first-order reaction is an inadequate description of disinfection is that the $Q_{10}$ values for chemical and enzyme reactions are 2 to 3 , while the common disinfectants phenol and alcohol have a $Q_{10}$ of 4 and 45 , respectively.

Critical to the successful employment of disinfectants is an understanding of the effect of disinfectant concentration on microbial reduction. A plot of the $\log$ of the time to reduce the microbial population in a standard inoculum to zero against the $\log$ of the disinfectant concentration is a straight line with the slope of the line termed the concentration exponent, $n$. The relationship can be expressed as follows:
$n=\left(\log\right.$ of the kill time at concentration $\left.C_{2}\right)-(\log$ of the kill time at concentration $\left.C_{1}\right) /\left(\log C_{1}-\log C_{2}\right)$,
in which $C_{1}$ and $C_{2}$, are the higher and lower disinfectant concentrations, respectively.

The wide differences in concentration exponents, $n$, have practical consequences in picking the use dilution of different disinfectants and in using dilution to neutralize a disinfectant in disinfectant-effectiveness testing and routine microbial monitoring of the manufacturing environment. For example, mercuric chloride has a concentration exponent of 1 , so a 3 -fold dilution will reduce the disinfectant activity by $3^{1}$ (or by one-third), while phenol with a concentration exponent of 6 will have a $3^{6}$ (or a 729 -fold) reduction in disinfectant activity. Disinfectants with a larger concen-
tration exponent or dilution coefficient rapidly lose activity when diluted. The concentration exponents for some disinfectants are listed in Table 3.

Table 3. Concentration Exponents of Common Antiseptics, Disinfectants, and Sterilants

| Disinfectant | Concentration Exponents |
| :--- | :---: |
| Hydrogen peroxide | 0.5 |
| Sodium hypochlorite | 0.5 |
| Mercuric chloride | 1 |
| Chlorhexidine | 2 |
| Formaldehyde | 1 |
| Ethan Alcohol | 9 |
| Phenol | 0.8 to 2.5 |
| Quaternary ammonium | 6.0 to 12.7 |
| $\quad$ compounds | 4 to 9.9 |
| Aliphatic alcohols |  |
| Phenolic compounds |  |

Another important consideration may be the pH of the disinfectant. Many disinfectants are more active in the ionized form, while others are more active in the nonionized form. The degree of ionization will depend on the $\mathrm{p} K_{\mathrm{a}}$ of the agent and the pH of the disinfection environment. For example, phenol, with a $\mathrm{p} K_{\mathrm{a}}$ of 10 , will be more effective at a pH below 7 where it is nonionized, while acetic acid will be more effective at a pH below 4 where it is ionized.

## MECHANISM OF DISINFECTANT ACTIVITY

Table 4 lists the sites and modes of action of some representative disinfectants.

Table 4. Mechanism of Disinfectant Activity Against Microbial Cells

| Target | Disinfectant |
| :---: | :---: |
| Cell wall | Formaldehyde, hypochlorite, and mercurials |
| Cytoplasmic membrane, action on membrane potential | Anilides and hexachlorophene |
| Membrane enzymes, action on electrontransport chain | Hexachlorophene |
| Action on ATP | Chlorhexidine and ethylene oxide |
| Action on enzymes with - SH groups | Ethylene oxide, glutaraldehyde, hydrogen peroxide, hypochlorite, iodine, and mercurials |
| Action on general membrane permeability | Alcohols, chlorhexidine, and quaternary ammonium compounds |
| Cell contents, general coagulation | Chlorhexidine, aldehydes, hexachlorophene, and quaternary ammonium compounds |
| Ribosomes | Hydrogen peroxide and mercurials |
| Nucleic acids | Hypochlorites |
| Thiol groups | Ethylene oxide, glutaraldehyde, hydrogen peroxide, hypochlorite, mercurials |
| Amino groups | Ethylene oxide, glutaraldehyde and hypochlorite |
| General oxidation | Ethylene oxide, glutaraldehyde, and hypochlorite |

## MICROBIAL RESISTANCE TO DISINFECTANTS

The development of microbial resistance to antibiotics is a well-described phenomenon. The development of microbial resistance to disinfectants is less likely, as disinfectants are more powerful biocidal agents than antibiotics and are applied in high concentrations against low populations of microorganisms usually not growing actively, so the selective pressure for the development of resistance is less profound. However, the most frequently isolated microorganisms from an environmental monitoring program may be periodically subjected to use dilution testing with the agents used in the disinfection program to confirm their susceptibility.

## DISINFECTANT CHALLENGE TESTING

Under FIFRA, the EPA requires companies that register public health antimicrobial pesticide products including disinfectants, sanitization agents, sporicidal agents, and sterilants to ensure the safety and effectiveness of their products before they are sold or distributed. Companies registering these products must address the chemical composition of their product, include toxicology data to document that their product is safe if used as directed on the label, include efficacy data to document their claims of effectiveness against specific organisms and to support the directions for use provided in the labeling, and provide labeling that reflects the required elements for safe and effective use. While these directions provide valuable information, they may not be helpful in terms of the products' use as disinfectants in a manufacturing environment.

In the United States, the official disinfectant testing methods are published by AOAC International ${ }^{3}$ and include the Phenol-Coefficient Test, Use-Dilution Method Test, Hand Surface Carrier Method and Sporicidal Carrier Test. A scientific study submitted for EPA review in support of disinfectant registration must be conducted at a laboratory facility that follows the Good Laboratory Practices (GLP) regulations ( 21 CFR 58). To demonstrate the efficacy of a disinfectant within a pharmaceutical manufacturing environment, it may be deemed necessary to conduct the following tests: (1) use-dilution tests (screening disinfectants for their efficacy at various concentrations and contact times against a wide range of standard test organisms and environmental isolates); (2) surface challenge tests (using standard test microorganisms and microorganisms that are typical environmental isolates, applying disinfectants to surfaces at the selected use concentration with a specified contact time, and determining the log reduction of the challenge microorganisms); and (3) a statistical comparison of the frequency of isolation and numbers of microorganisms isolated prior to and after the implementation of a new disinfectant. This is considered necessary because critical process steps like disinfection of aseptic processing areas, as required by GMP regulations, need to be validated, and the EPA registration requirements do not address how disinfectants are used in the pharmaceutical, biotechnology, and medical device industries. For the surface challenge tests, the test organisms are enumerated using swabs, surface rinse, or contact plate methods. Neutralizers that inactivate the disinfectants must should be included in either the diluent or microbiological media used for microbial enumeration or both (see Table 5).

[^356]Additional information on disinfectant neutralization may be found in Validation of Microbial Recovery from Pharmacopeial Articles $\langle 1227\rangle$.

Table 5. Neutralizing Agents for Common Disinfectants

| Disinfectant | Neutralizing Agent |
| :--- | :--- |
| Alcohols | Dilution or polysorbate 80 |
| Glutaraldehyde | Glycine and sodium <br> bisulfite |
| Sodium hypochlorite | Sodium thiosulfate |
| Chlorhexidine <br> Mercuric chloride and <br> other mercurials | Thioglycolic acid |
| Quaternary ammonium <br> compounds | Polysorbate 80 and lecithin |
| Phenolic compounds | Dilution or polysorbate 80 |
|  | and lecithin |

Universal neutralizer broths may be formulated to contain a range of neutralizing agents. For example, Đay Dey/Engley (D/E) broth contains $0.5 \%$ polysorbate $80,0.7 \%$ lecithin, $0.1 \%$ sodium thioglycolate, $0.6 \%$ sodium thiosulfate, $0.25 \%$ sodium bisulfite, $0.5 \%$ tryptone, $0.25 \%$ yeast extract, and $1.0 \%$ dextrose; letheen broth contains $0.5 \%$ polysorbate $80,0.07 \%$ lecithin, $1.0 \%$ peptamin, $0.5 \%$ beef extract, and $0.5 \%$ sodium chloride; and Tryptone-Azolectin-Tween (TAT) broth base + tween 20 contains $4.0 \%(\mathrm{v} / \mathrm{v})$ polysorbate $20,0.5 \%$ lecithin, and $2.0 \%$ tryptone.

In practice, sufficient organisms need to be inoculated on a 2 -inch $\times 2$-inch square of the surface being decontaminated, i.e., a coupon, to demonstrate at least a 2 (for bacterial spores) to 3 (for vegetative bacteria) log reduction during a predetermined contact time (i.e., 10 minutes over and above the recovery observed with a control disinfectant application). The efficacy of the neutralizers and their ability to
recover inoculated microorganisms from the material ment should be demonstrated during the use-dilution or surfacechallenge studies. Points to remember are that disinfectants are less effective against the higher numbers of microorganisms used in laboratory challenge tests than they are against the numbers that are found in clean rooms (see Microbiological Evaluation of Clean Rooms and Other Controlled Environments $\langle 1116\rangle$ ); that inocula from the $\log$ growth phase that are typically employed in laboratory tests are more resistant, with the exception of spores formed during the static phase, than those from a static or dying culture or stressed organisms in the environment; and that microorganisms may be physically removed during actual disinfectant application in the manufacturing area.
Fypieat Although not all inclusive, typical challenge organisms that may be employed are listed in Table 6.

Table 6. Typical Challenge Organisms

| AOAC Challenge | Typical Environmental |
| :---: | :---: |
| Organisms | Isolates |
| Bactericide: Escherichia coli, | Bactericide: Micrococcus |
| ATCC 11229; | luteus, S. epidermdis, |
| S. aureus, ATCC 6538; | Coynebacterium |
| P. aeruginosa, ATCC | jeikeium, P. vesiclaris |
| 15442 |  |
| Fungicide: C. albicans, | Fungicide: P. chryso- |
| ATCC 10231 or 2091; | genum, A. niger |
| Penicillium chrysogenum, |  |
| ATCC 11709; Aspergillus |  |
| niger, ATCC 16404 |  |
| Sporicide: B. subtilis, | Sporicide: B. sphaericus, |
| ATCC 19659 | B. thatrensis B. |
|  | thuringiensis |

Because a wide range of different materials of construction are used in clean rooms and other controlled areas, each material needs to be evaluated separately to validate the efficacy of a given disinfectant. Table 7 contains a list of common materials used in clean room construction.

Table 7. Typical Surfaces to be Decontaminated by Disinfectants in a Pharmaceutical Manufacturing Area

| Material | Application |
| :--- | :--- |
| Stainless steel 305 304L | Work surfaces, filling |
| and 316L grades | equipment, tanks, etc. |
| Glass | Windows and vessels |
| Plastic, vinyl | Curtains |
| Plastic, polycarbonate | Insulation coating |
| Lexan ${ }^{\circledR}$ (plexiglass) | Shields |
| Epoxyl coated gypsum | Walls and ceilings |
| Fiberglass reinforced | Wall paneling |
| $\quad$ plastic $^{\text {Tyvek }}{ }^{\circledR}$ |  |
| Terrazzo tiles | Equipment wraps |

## DISINFECTANTS IN A CLEANING AND SANITIZATION PROGRAM

The selection of suitable disinfectants and the verification of their effectiveness in surface challenge testing is critical in the development of a cleaning and sanitization program.

Issues associated with the successful implementation of such a program are the development of written procedures, staff training, the decisions on disinfectant rotation, institution of application methods and contact times, environmental monitoring to demonstrate efficacy, and personnel safety.

The cGMP 21 CFR 211.67, Equipment Cleaning and Maintenance, details the requirements for written procedures for cleaning, maintenance, and sanitization of pharmaceutical manufacturing equipment. These procedures must
should address the assignment of responsibility, establishment of schedules, details of cleaning operations, protection of clean equipment prior to use, inspection for cleanliness immediately prior to use, and maintenance of cleaning and sanitization records.

Involved staff require training in mierobiology, industry practices for cleaning and sanitization, safe handling of concentrated disinfeetants, the preparation and disposal of dis infectants, and the appropriate applieation methods. It must be emphasized that the preparation of the eorrect dilutions is eritical since many disinfectant failures are attributable to use of excessively diluted disinfectant solutions. Typically, disinfectants used in aseptic filling areas are diluted with Water for Injection and are prepared aseptically. Since it is theoretically possible for the selective presstre of the con tinmous use of a single disinfectant to result in the presence of disinfectant resistant mieroorganisms in a mantufacturing area, regulatory agencies advoeate the rotation of disinfec tants. Commen practices inelude the daily use of a phenolic empend and weekly use of a sperieidal agent or the rota tion of daily use of phenolic and quaternary ammonium empounds and weekly use of sporicidal agent. Other options may also be supported. Disinfectants applied on petent tial product contact suface are typieally removed with $70 \%$ aleohel wipes. The use of a sperieidal agent is frequently limited to weekly application, since they are com monly oxidizing agents and may corrode stainless steel equipment and degrade other materials used in facility construetion. Facilities must be periodieally cleaned to remove any disinfectant residues.

Staff involved in disinfection require training in microbiology, industry practices for cleaning and sanitization, safe handling of concentrated disinfectants, the preparation and disposal of disinfectants, and appropriate application methods. It should be emphasized that the preparation of the cor-
rect dilutions is critical because many disinfectant failures can be attributed to use of disinfectant solutions that are too dilute. Typically disinfectants used in aseptic processing and filling areas are diluted with Sterile Purified Water, and are prepared aseptically. Alternately, the disinfectant may be diluted with Purified Water, and then sterile filtered to eliminate microorganisms that may potentially persist in a disinfectant. Diluted disinfectants must have an assigned expiration dating justified by effectiveness studies.

Because it is theoretically possible that the selective pressure of the continuous use of a single disinfectant could result in the presence of disinfectant-resistant microorganisms in a manufacturing area, in some quarters the rotation of disinfectants has been advocated. However, the literature supports the belief that the exposure of low numbers of microorganisms on facility and equipment surfaces within a clean room where they are not actively proliferating will not result in the selective pressure that may be seen with the antibiotics. It is prudent to augment the daily use of a bactericidal disinfectant with weekly (or monthly) use of a sporicidal agent. The daily application of sporicidal agents is not generally favored because of their tendency to corrode equipment and because of the potential safety issues with chronic operator exposure. Other disinfection rotation schemes may be supported on the basis of a review of the historical environmental monitoring data. Disinfectants applied on potential product contact surfaces are typically removed with $70 \%$ alcohol wipes. The removal of residual disinfectants should be monitored for effectiveness as a precaution against the possibility of product contamination.

The greatest safety concerns are in the handling of concentrated disinfectants and the mixing of incompatible disinfectants. For example, concentrated sodium hypochlorite solutions (at a concentration of more than $5 \%$ ) are strong
oxidants and will decompose on heating, on contact with acids, and under the influence of light, producing toxic and corrosive gases including chlorine. In contrast, dilute solutions (at a concentration of less than $0.5 \%$ ) are not considered as hazardous. Under no circumstances should disinfectants of different concentrations be mixed. Material Safety Data Sheets for all the disinfectants used in a manufacturing area mest should be available to personnel handling these agents. Appropriate safety equipment such as face shields, safety glasses, gloves, and uniforms must be issued to personnel handling the disinfectant preparation, and personnel must be trained in the proper use of this equipment. Safety showers and eye wash stations must be situated in the work area where disinfectant solutions are

```

## BRIEFING

$\langle 1079\rangle$ Good Storage and Shipping Practices. The previous proposal that appeared on page 1612 of $P F 29(5)$ [Sept.-Oct. 2003] is hereby canceled and replaced with a new proposal for this general information chapter, which is intended to provide guidance to manufacturers, repackagers, distributors, shippers, and pharmacists on practices designed to maintain the integrity of pharmaceuticals during storage and shipment. Some sections of the previously proposed chapter Packaging, Storage, and Distribution of Pharmacopeial Articles $\langle 1141\rangle$, page 493 of PF 26(2) [Mar.-Apr. 2000] are incorporated into this current proposal. Additional information from $\langle 1141\rangle$ related to packaging can also be found in the proposed Good Packaging Practices $\langle 1177\rangle$, also appearing in this number of $P F$.
Other official chapters referred to in the text for this currently proposed chapter include Pharmaceutical Calculations in Prescription Compounding $\langle 1160\rangle$, Pharmaceutical Stability $\langle 1150\rangle$, a renamed section of Pharmaceutical Dosage Forms $\langle 1151\rangle$, and a proposed chapter Environmentally Sensitive Preparations $\langle 386\rangle$, PF 30(5) [Sept.-Oct. 2004]. Although cold-chain management is a timely topic, the PSD Expert Committee is awaiting industrial initiatives before including it in this currently proposed chapter, or it may be proposed as a separate new chapter. Because the text has undergone many edits and revisions, it is presented afresh here to facilitate review. Comments should be addressed to: Dr. Claudia Okeke, Department of Standards Development.

This Committee reports with great sadness the passing of Leonard Bailey, Ph.D., the driving force for this chapter (see Policies and Announcements).
(PSD: C. Okeke) RTS-41145-1

## Add the following:

## <1079 GOOD STORAGE AND SHIPPING PRACTICES

This general information chapter is intended to provide general guidance concerning storing, distributing, and shipping of Pharmacopeial preparations. It describes procedures to maintain proper storage environments for individual articles and to ensure a preparation's integrity, including its appearance, until it reaches the user. There is no change to any applicable requirements under Current Good Manufacturing Practices, approved labeling, state laws governing pharmacies, the USP General Notices and Requirements, or monographs. The section Preservation, Packaging, Storage, and Labeling under General Notices and Requirements provides definitions for storage conditions. All equipment used for recording, monitoring, and maintaining temperatures and humidity conditions should be calibrated on a regular basis. This calibration should be based on NIST or international standards (see Monitoring Devices-Time, Temperature, and Humidity $\langle 1118\rangle$ ). A Pharmacopeial preparation may follow several potential routes from the original manufacturer to the patient. Figure 1 documents present-day routes and the associated risks. These risks include exposure to temperature excursions, humidity, light, and oxygen. For a discussion of climates, stability, and mean kinetic temperature, see Pharmaceutical Stability $\langle 1150\rangle$. Temperature- or
humidity-sensitive articles are to be handled in accordance with General Notices and Environmentally Sensitive Preparations 〈386〉.

## PACKAGING AND STORAGE STATEMENT IN MONOGRAPHS

Most articles have storage conditions identified by their labeling. Otherwise, it is expected that the conditions for storing the article are specified in the monograph according to definitions provided by the General Notices and Requirements in the section Storage Temperature and Humidity under Preservation, Packaging, Storage, and Labeling. In cases where additional information on packaging and storage is desired, a specific statement can be provided in the Packaging and storage or the Labeling section of the individual monograph.

## STORAGE IN WAREHOUSES, PHARMACIES, TRUCKS, SHIPPING DOCKS, AND OTHER LOCATIONS

Pharmacopeial articles are to be stored in locations that adhere to conditions established by the manufacturer. Where the desired conditions are not established, use storage conditions described in the General Notices and Requirements or in the applicable monograph.

## Warehouses

Observation of the temperature variations in a warehouse should be made over a period of time to establish a meaningful temperature profile, including the temperature variations and conditions in the different parts of the warehouse. Such observations provide data and information as to where various products should and should not be stored.

## ESTABLISHING TEMPERATURE PROFILES

Temperature profiles can be compiled by using a suitable number of thermometers or other temperature recording instruments. They should be placed throughout the warehouse in divided sections and should record the maximum and minimum temperatures during a 24 -hour period for a total of three consecutive 24 -hour periods. The following factors, some of which may give rise to extreme temperatures, should be considered during the process of temperature profiling: the size of the space, location of space heaters, sunfacing walls, low ceilings or roofs, and geographic location of the warehouse. Temperature profiling for warehouses already in use should be done at known times of external temperature extremes, e.g., for a period of not less than 3 hours when air temperatures are higher than $25^{\circ}$ or less than $15^{\circ}$. Profiling should be conducted in both summer and winter. A mean kinetic temperature (MKT) should be obtained for any separate areas within the warehouse (see Pharmaceutical Calculations in Prescription Compounding $\langle 1160\rangle$ for samples of MKT calculations). The temperature profile report should provide recommendations for the use of each area and identification of any areas that are found unsuitable for storage of Pharmacopeial articles.

## CONTROLLED ROOM TEMPERATURE

The General Notices provide a definition for Controlled Room Temperature. A temperature profiling study should demonstrate suitability for storing Pharmacopeial articles in areas determined to be at room or controlled room temperature. A suitable number of temperature and humidity recording instruments should be installed to record temperatures and to provide temperature and humidity profiles. Temperature recording should be conducted to meet the recommendations for establishing mean kinetic temper-
ature and to comply with the warehouse's written procedures. These written procedures should have a reporting mechanism in place whereby a management tree is informed in the event that predefined high or low temperatures or humidity limits have been exceeded. Records can be reviewed as determined by the management system in accordance with established guidelines. Suitable training should be provided to persons who record temperatures, and proper quality accountability and tracking systems should be maintained.

## STORAGE AT "COOL," "COLD," "REFRIGERATOR," AND "FREEZING" CONDITIONS

The General Notices provide definitions for cool, cold, refrigerator, and freezer temperatures. A temperature profiling study can be used to establish suitable areas for storing Pharmacopeial articles designated to be stored under these conditions. Equipment used for storing Pharmacopeial articles at these low temperatures should be qualified according to written procedures provided by the management system. Recording devices can be installed within the equipment and used to enable both air and product temperatures to be recorded at regular intervals. The number and location of monitoring devices should be determined based on the result of the temperature profile. Temperature records should be examined at least once every 24 hours or as provided in the equipment protocol. Cool or cold conditions are moisture-condensing conditions. Humidity-monitoring devices should be used in cases where the repackaged Pharmacopeial article is humidity-sensitive or labeled to avoid moisture. Additionally, there can be installed temperaturemonitoring, and where necessary, humidity-monitoring alarm devices that have the capability of alerting personnel in the event that control is compromised. There should be protocols in place to address procedures for responding to
failed temperature and humidity ranges both for normal working hours and outside normal working hours. Temperature and humidity should be reviewed at the times designated by the established protocol. The calibration and functioning of all temperature and humidity monitoring devices, including alarms and other associated equipment, should be checked on an annual or semiannual basis. Regular maintenance protocols should be in place for refrigeration equipment. There should be written agreements in place for all maintenance and evaluation procedures, and this may include an emergency situation protocol.

## PERSONNEL TRAINING

Suitable training should be provided for personnel who handle Pharmacopeial articles with special storage temperature requirements. Personnel should know how to monitor temperatures and how to react to situations where adverse temperatures are identified. There should be written procedures in place such that the adverse temperatures are recorded and a report provided to the parties designated in the protocol.

## VALIDATION OF "COLD" EQUIPMENT OR STORES

Only climate control equipment for which a contractor has provided documentation to assure its suitability for temperature and humidity requirements should be considered for use in cold storage. Qualification procedures on a regular basis should be independently conducted on equipment in
cold stores to guarantee suitability and proper functioning. The procedure should demonstrate the temperature profile throughout the proposed equipment for both air and product temperatures when empty as well as when loaded. The procedure should also demonstrate the time taken for temperatures to exceed the maximum temperature in the event of a power failure. Qualification should consider thermal fluctuations that occur during stock replenishment and order removal. The results of the qualification should demonstrate the ability of the equipment to maintain the required temperature range in all areas, defining any zones which should not be used for storage such as those areas in close proximity to cooling coils, cold air streams from equipment ventilation, or doors. The variability of the system can be characterized by using the relative standard deviation. Thermal monitoring should establish that the system is rugged in that its temperature profile is consistent and reliable.

## DISTRIBUTION AND SHIPMENT OF PHARMACOPEIAL ARTICLES

As indicated in Figure 1, a drug can take a variety of paths from the manufacturer to the patient. In the simplest form of the distribution system, the manufacturer ships directly to the customer, such as a doctor's office, clinic, or hospital. However, more often, the article leaves the manufacturer's chain of control and enters a complex system of handoffs that involve the distribution chain to the patient.

## Drug Product Distribution

Figure 1

Figure 1. Drug product distribution.

Shippers and distributors are to follow the proper storage and shipping requirements as indicated by the manufacturer. For particular cases, such as shipment of vaccines or other special care products, manufacturers may require special shipping and storage conditions generally referred to as "cold-chain management". For example, manufacturers may attach temperature-monitoring devices and/or ship under specified controlled conditions to ensure that the desired temperature is maintained during distribution (see Monitoring Devices-Time, Temperature, and Humidity $\langle 1118\rangle$ ). Validated, available temperature- and/or humidity-monitor-
ing technologies can be used to monitor the overall environmental effect on compendial articles during shipment and distribution. In these cases, the shipping conditions of the package are recorded. In general, extreme temperature conditions (i.e., excessive heat, freezing) should be avoided. Distribution systems chosen to deliver pharmaceutical products from the manufacturer to the consumer should take into account basic operational parameters, including timeliness and accountability. The manufacturer's FDA-approved storage conditions, printed in the labeling of the product, should be observed carefully at each destination of the distribution
chain (see Figure 1), unless specifically instructed otherwise in the immediate label of a shipping container. This may be the case for certain pallet-sized shipping containers where the amount of refrigerant contained (e.g., dry ice, gel packs) is based on an anticipated exterior condition approximating controlled room temperature. In such cases, placing the shipping container in a refrigerator could lead to the product inside freezing, potentially affecting its quality. Items requiring special handling conditions will have those conditions clearly indicated in the labeling for the product. The Prescription Drug Marketing Act of 1987 and the ensuing regulations in 21 CFR Part 203, Prescription Drug Marketing, and Part 205, Guidelines for State Licensing of Wholesale Prescription Drug Distributors, provide the necessary regulations and guidance for several legs of the distribution chain for the prescription drug. The manufacturers and distributors should work together to establish proper distribution and product-handling requirements for the purpose of ensuring appropriate product maintenance in transit. Pharmacists and physicians should educate patients regarding proper storage of products to ensure product integrity at the patient level. Information that may be considered in determining the ability of pharmaceutical articles to maintain their Pharmacopeial requirements of identity, strength, quality, and purity through the distribution channel may include, but is not limited to the following: ICH stability studies, temperature cycling studies, stability shipping studies, ongoing regulatory stability commitment studies, market experience portfolio (i.e., product complaint files, historical product performance data, product development data), and product labeling commitments.

## Qualification Protocol

Operational and performance testing should be parts of a formal qualification protocol that may use controlled environments or actual field testing based on the projected transportation channel. These should reflect actual load configurations, conditions, and expected environmental extremes. Temperature and humidity monitors should be placed into the product or a representative thereof. Testing consists of consecutive replicate field transportation tests using typical loads, according to an established protocol.

## Physical Challenges

Most products are sufficiently robust to withstand distribution with minimal protection from routine, well-understood physical and environmental hazards. Several standard test methods are available for evaluating package performance factors under well-documented shock, vibration, and other transit elements. The American Society for Testing and Materials document, "Standard Practice for Performance Testing of Shipping Containers and Systems" (ASTM D4169-98), and the International Safe Transit Association's (ISTA) specifications have similar methods for evaluation of shipping performance for various types of transit modes such as less-than-truckload (LTL), small package, rail car, air freight, etc. From the manufacturer's perspective, these tests are very useful in evaluating the product and package durability and fragility. The tests are usually performed on shipping carton quantities of a specific stock keeping unit (SKU) as an unbroken whole. Fragility problems can be corrected with package modifications, which could include placing cotton or rayon coilers in bot-
tles or placing top and bottom pads in the shipping case to reduce package breakage. Not all protective packaging elements follow the SKU through the system.

Basic packaging principles are observed when separating the contents of the manufacturer's shipping container or pallet load into smaller quantities or when shipping mixed product loads. For example, glass containers are wrapped in a bubble wrap or other shock-absorbent material, and the void spaces are filled with dunnage (e.g., foam "peanuts," shredded or tightly crumpled paper, bubble wrap) to protect the contents from shifting and drop impact. Large-volume liquid containers may be bagged in plastic and kept isolated to prevent leakage to, or damage of, adjacent packages. "Skin packaging," a term describing a heat-shrink film that anchors the load to fiberboard and prevents load shift, can be an excellent method of protecting some products, but it may be inappropriate for heat-sensitive products. The shipping carton should have correct Edge Crush Test (ECT) characteristics for freight being shipped according to Item 222 of the National Motor Freight Classification and Rule 41 of the Uniform Freight Classification.

## Temperature Challenges

Shipping of temperature-sensitive articles requiring ther-
carrier type (e.g., small package carrier or integrator, freight forwarder, U.S. Postal Service). The shippers should know and understand the systems they use and should design the protective package accordingly. Storage temperature ranges may not be indicative of the allowable tolerances during shipping. Articles labeled for special storage conditions (between $2^{\circ}$ and $8^{\circ}$ ) vary widely in their tolerance of short-term exposure to heat and cold. Some, such as soft gelatin capsules and suppositories, carry specific upper limits on both shipping containers and SKUs. A temperature cycling study intended to identify those articles affected by multiple, short-term excursions beyond the storage temperature limits should be performed. These data provide wholesalers and distributors with clearer identification of those drug products that may require special handling during particular climate conditions.

## Materials

Two commonly used types of refrigerant are dry ice (frozen carbon dioxide gas) and wet ice (frozen water), which appears as crushed ice or in various refrigerant packs containing water mixtures with specific freezing points. Phasechange materials are also available for specialized needs. Refrigerant packs should have the correct freezing point and be cooled to the proper surface temperature prior to use. Articles harmed by accidental freezing may require a barrier between the refrigerant and the product or some other special packaging. Insulating materials commonly available include foil laminates, bubble pack, corrugated, fabricated, and molded expanded polystyrene (EPS) cartons, and fabricated or molded urethane foam cartons, with or without additional interior components. Recognized standard test methods for evaluating insulated containers are currently limited to ASTM D3103-92, Standard Test Method for Thermal Insulation Quality of Packages and a method
under development by ISTA. Neither one fully addresses all of the issues involved, but both include useful information on testing procedures. The tests should be modified based on the specific system adopted by the shipper. The manufacturer may be able to supply helpful data on specific articles and their requirements.

## SPECIAL HANDLING

Certain classes of Pharmacopeial articles may require special handling. Such articles include products classified as dangerous goods under the Department of Transportation (DOT), state, local, or carrier rules; or products classified as controlled substances by the Drug Enforcement Administration (DEA) or by individual states.

## Receipt of Pharmacopeial Articles

Upon arrival of Pharmacopeial articles to warehouse loading docks, premises, and other arrival areas, the Pharmacopeial articles are to be transferred to their manufacturerdesignated storage environment within 2 hours of receipt. Limitation of the time spent in the uncontrolled environments of the loading dock is important to ensure that the integrity of the preparation is maintained. This is particularly important for temperature-sensitive items. The delivery document should be reviewed at receiving sites to ensure that the Pharmacopeial articles have not been subjected to any delays during shipment that could result in exposure of the article to extremes of temperature, or to any other extreme or undesirable conditions. In addition, to the extent possible, the receiving personnel should ensure that the ruggedness requirements in shipment have been met. For Pharmacopeial articles requiring extreme caution, special handling, or refrigerator temperature storage conditions,
those who supply the articles (e.g., wholesalers and manufacturers) and delivery contractors should provide documented evidence to show that the required temperature range has been maintained during transportation. In the event that a deviation from the required temperature range has been observed during shipment of an article requiring such a shipping condition, the supplier or delivery contractors should document the temperature and the length of time the compendial article was not within the designated storage temperature. The pharmaceutical manufacturer may be contacted to determine the significance of unusual variances.

## Distribution or Shipping Vehicles

Vehicles used for shipping or distribution of Pharmacopeial articles designated for storage at controlled room temperature should be suitably equipped to ensure that the temperature excursions encountered are within those allowed under the definition of controlled room temperature. Steps should be taken so that extremes of temperature, whether above or below the specified temperatures, should not be encountered during delivery procedures.

## Vehicle Qualification

Where practical, suitable monitoring devices, as determined by the manufacturer and vehicle supplier, should be placed in different areas of the truck to establish a temperature profile of the truck over a 24 -hour period during a hot summer day, average high, and a cold winter day, average low, and during a normal or typical day. The derived temperature of the different parts of the truck may be used to determine the location on the truck where Pharmacopeial articles can be stored appropriately during shipping (see Monitoring Devices-Time, Temperature, and Humidity $\langle 1118\rangle$ ).

## Pharmaceutical Delivery Staff

As part of the contractual agreement between the delivery contractors and the manufacturers, the delivery staff should receive appropriate training to ensure that they are aware of the correct procedures to follow in maintaining products at the correct temperature. There may be written procedures that should be documented. In addition, the transportation personnel should have proper knowledge of the temperature profile of the vehicle to ensure proper placement of the Pharmacopeial articles in the vehicle. Pharmacopeial articles requiring special handling (e.g., refrigeration) or environmentally sensitive preparations should be transported in a suitably equipped vehicle to ensure that the articles are maintained at the correct temperature during distribution, shipping, and delivery and up to the point of receipt. Special arrangements should be made to inform receiving personnel, pharmacists, or other appropriate customers that the package includes articles with special storage and handling specifications and are to be transferred immediately to the appropriate storage location. The manufacturer, shipper, or delivery agency should provide appropriate evidence to show that the required temperature has been maintained throughout shipment and distribution.

## SHIPMENT FROM MANUFACTURER TO WHOLESALER

## Wholesaler

The wholesaler receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment without delay, as directed by the manufacturer, ideally within 2 hours of receipt. The wholesaler should examine the delivery documentation to ensure that the products have not been subject-
ed to any delays during shipping and distribution that could result in products being exposed to extreme temperatures (see also the previous section, Pharmaceutical Delivery Staff, for staff expectations). The vehicles used for shipping of Pharmacopeial articles to the wholesaler, especially products requiring storage at low temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. The receiving wholesaler staff should be informed that the articles are transferred to appropriate storage locations without delays. The vehicles used for shipping of Pharmacopeial articles requiring storage at room or controlled room temperatures should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, do not occur during delivery procedures. Warehouse staff may receive appropriate training to ensure that the correct procedures are followed to maintain required temperature conditions (see Pharmaceutical Delivery Staff). Where necessary, a monitoring device for temperature and/or humidity should be used during shipping and distribution.

## Compromised Temperature Conditions

A procedure should be in place in the warehouse to define the action that should be taken in the event of deviation from required storage conditions. Suitable records should be maintained to explain the reason for deviation and the resulting action that is taken. The product in question should then be placed in a quarantine status. Advice on the suitability of the product for use should be sought from the manufacturer or supplier of the product. The manufacturer's response should be documented prior to issuing the product to the customer, if that product is to be issued to the customer.

## SHIPMENT FROM MANUFACTURER OR <br> WHOLESALER TO PHARMACY

## Pharmacy

The pharmacy receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment without delay, as directed by the manufacturer, ideally within 2 hours of receipt. The pharmacy personnel should examine the delivery documentation to ensure that the products have not been subjected to any delays during shipping and distribution, which could result in the products being exposed to extreme temperatures (see also the section, Pharmaceutical Delivery Staff, for staff expectations). The vehicles used for shipping of Pharmacopeial articles to the pharmacy, especially products requiring storage at low temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. Receiving pharmacy staff should be informed that the articles are to be transferred to appropriate storage without delays. The vehicles used for shipping of Pharmacopeial articles requiring storage at room or controlled room temperatures should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, do not occur during delivery procedures. Pharmacy staff may receive appropriate training to ensure that the correct procedures are followed to maintain required temperature conditions (see Pharmaceutical Delivery Staff). Where necessary, a monitoring device for temperature and/or humidity may be used during shipping and distribution.

## Compromised Temperature Conditions

The pharmacy should maintain appropriate procedures to define action that should be taken in the event of deviation from the required storage conditions. Suitable records should be maintained to explain the reason for deviation and the resulting action taken (including whether the product is issued to the patient or customer). Advice on the suitability of the product for use as an acceptable drug article should be sought from the manufacturer or supplier of the product.

## SHIPMENT FROM PHARMACY TO PATIENT OR CUSTOMER

The pharmacy should provide an appropriate label on the package sent through air or surface routes so that the deliverer does not place the package in a mailbox exposed to extremes in temperature. In the event that no one is available to receive the package, the deliverer should return the package to the post office or service office, and store it in a cool or air-conditioned area until the patient can receive the medication. In the event that the package has not been delivered for more than 2 days, the package may be returned to the pharmacy (see Environmentally Sensitive Preparations $\langle 386\rangle$ ). For temperature-sensitive articles, it is important that proper arrangements be made to protect the drug from exposure to high temperatures, or in some cases, from freezing conditions. Such arrangements may include the following: insulating the packaging, or packaging with coolant included; overnight shipping; and pre-arranged pick-up. In such cases, the pharmacy should provide on the external package a statement of an acceptable period of delay for de-
livery. The patient or customer should examine the delivery documentation to ensure that the package has not been subjected to any unacceptable delays during shipping and distribution. The patient or customer receiving the pharmaceutical articles, either by mail, delivery vehicle from the pharmacy, or directly from the physician or pharmacy, should be advised that upon receipt the articles are to be transferred to appropriate storage conditions without delay, as directed by the pharmacy, ideally within 2 hours of receipt. The vehicle used for air or surface shipping and distribution of pharmaceutical packages to the patient or customer, especially those requiring low temperatures, should contain the article suitably packaged in containers that maintain the desired storage conditions until the article reaches the patient or customer. The vehicles used for shipping and distribution of pharmaceutical articles to patient or customer, especially those requiring storage at room or controlled room temperatures, should be suitably equipped during extreme temperature conditions such that the packages are not exposed to extremes of temperature either in winter or summer months. In the event that the vehicle is not adequately equipped with air conditioning or heating to protect the product, the time that the article is exposed to ambient conditions should be strictly limited, ideally not more than 2 hours. Where appropriate, a monitoring device may be used to ensure that required temperatures are maintained until the package reaches the patient or customer. If stability studies for the Pharmacopeial preparation indicate that it is particularly sensitive to environmental insults or if appropriate shipping safeguards described in this section are not feasible, then the preparation should be shipped by a different method whereby environmental control can be maintained.

## Compromised Temperature Conditions

There should be appropriate procedures in the pharmacy that ships the article to the patient or customer defining the action that should be taken in the event that a patient reports that there has been a deviation from required storage conditions for an article, including any environmentally sensitive preparations, prior to the point of receipt. Advice on the suitability of the product for use should be provided to the patient or customer after the manufacturer or supplier's advice has been sought by the pharmacy. If the patient is advised to use the article, such advice should be documented and noted appropriately by the pharmacy. Otherwise, appropriate arrangements should be made to promptly replace the suspect article. For mail order items, replacement from local pharmacies may be an option to ensure an uninterrupted supply of medication.

## RETURNS OF PHARMACEUTICAL ARTICLES FROM PATIENTS OR CUSTOMERS

The wholesaler, manufacturer, and pharmacy personnel should evaluate the validity of the request for return, and maintain an auditable account of the return receipt. For products in unopened manufacturer's containers that have been at variance during shipment, arrangement may be made to return the products to the manufacturer, wholesaler, or pharmacy preferably within 3 working days of receipt. The supplier may request records or written confirmation by the patient to show that the product was stored properly while in possession of the customer.

## STORAGE OF PHYSICIAN SAMPLES HANDLED

 BY SALES REPRESENTATIVES IN AUTOMOBILESStorage of physician samples by sales representatives is regulated under 21CFR 203.34(b)(4); each manufacturer or distributor is to have appropriate policies in place to ensure that proper storage is maintained. The following suggestions may be considered in response to this need and are of interest to practitioners who may observe actual practices. Automobile trunks or passenger cabins used for the storage and distribution of physician samples should be monitored to determine the temperature profile of the trunk or passenger cabin. Suitable monitoring devices as determined by the sales representative may be placed in different areas of the trunk or passenger cabin on a hot summer and a cold winter day. Measurements should also be made during typical 24-hour periods, and the derived temperature should be used for calculation of the mean kinetic temperature at which the sample is stored (see Pharmaceutical Calculations in Prescription Compounding $\langle 1160\rangle$ for examples of MKT calculations). If the Pharmacopeial article designated for storage requires storage at controlled room temperature, then suitable measures should be taken to maintain the sample within the allowable limits of the storage parameters. Environmentally-sensitive preparations should not be stored in automobile trunks or passenger cabins. Medications stored in automobile trunks or passenger cabins should be removed at the end of 3 days. Sales representatives should consider parking automobiles in shaded areas to avoid extreme heat during the summer and in garages to avoid freezing temperatures during the winter. The use of vouchers from the manufacturer that patients could use to obtain medication samples from participating pharmacies is an alternative way of providing drug samples.

## STORAGE OF DRUGS IN EMERGENCY MEDICAL

 SERVICES (EMS) VEHICLESSee Emergency Medical Services Vehicles and Ambu-lances-Storage of Preparations $\langle 1070\rangle$.

## STABILITY, STORAGE, AND LABELING

The design of stability studies of Pharmacopeial articles is based on knowledge of the behavior, properties, and stability of the drug substance and experience gained from clinical formulation studies. ${ }^{1}$ The length of the studies and the storage conditions for a Pharmacopeial article should be sufficient to cover storage, shipment, distribution, and subsequent use of a Pharmacopeial article. The data gathered from ICH accelerated testing or from testing at an ICH intermediate condition may be used to evaluate the effect of short-term excursions outside the label storage conditions such as those that might occur during shipping. See Pharmaceutical Stability $\langle 1150\rangle$.

## STATEMENTS/LABELING OF THE IMMEDIATE CONTAINERS OR PACKAGE INSERT

Storage statements should be based on the stability evaluations of the Pharmacopeial drug substances and in accordance with national and international requirements.

Room Temperature Storage Statements-For products with a storage statement reading, "Store at controlled room temperature," the labeling should read as follows on the package insert: "Store at $20^{\circ} \mathrm{C}$ to $25^{\circ} \mathrm{C}\left(68^{\circ} \mathrm{F}\right.$ to $\left.77^{\circ} \mathrm{F}\right)$, excursions permitted between $15^{\circ} \mathrm{C}$ and $30^{\circ} \mathrm{C}$ (between $59^{\circ} \mathrm{F}$ and $86^{\circ} \mathrm{F}$ ). Brief exposure to temperatures up to $40^{\circ} \mathrm{C}$

[^357]$\left(104^{\circ} \mathrm{F}\right)$ may be tolerated provided the mean kinetic temperature does not exceed $25^{\circ} \mathrm{C}\left(77^{\circ} \mathrm{F}\right)$; however, such exposure should be minimized."

On the immediate container label, the following may read for controlled room temperature (CRT): "Store at $20^{\circ} \mathrm{C}$ to $25^{\circ} \mathrm{C}\left(68^{\circ} \mathrm{F}\right.$ to $\left.77^{\circ} \mathrm{F}\right)$, excursions permitted between $15^{\circ} \mathrm{C}$ and $30^{\circ} \mathrm{C}$ (between $59^{\circ} \mathrm{F}$ and $86^{\circ} \mathrm{F}$ )."

Cool Storage Statement-The storage statement for labeling may be as follows: "Store in a cool place, $8^{\circ} \mathrm{C}$ to $15^{\circ} \mathrm{C}\left(46^{\circ} \mathrm{F}\right.$ to $\left.59^{\circ} \mathrm{F}\right) .{ }^{\prime \prime}$

Refrigerator Storage Statement-The storage statement for labeling may be as follows: "Store in a refrigerator, $2^{\circ} \mathrm{C}$ to $8^{\circ} \mathrm{C}\left(36^{\circ} \mathrm{F}\right.$ to $\left.46^{\circ} \mathrm{F}\right)$."

Freezer Storage Statement-The storage statement for labeling may be as follows: "Store in a freezer, $-25^{\circ} \mathrm{C}$ to $-10^{\circ} \mathrm{C}\left(-13^{\circ} \mathrm{F}\right.$ to $\left.14^{\circ} \mathrm{F}\right)$."

See the General Notices for all other applicable storage conditions, such as Storage Under Nonspecific Conditions and store in a Dry Place. Additional cautionary statements to protect the Pharmacopeial drug product from extreme temperature and humidity conditions may be included on the container label and package insert, as the manufacturer desires. ${ }^{\text {2S }}$ (USP28)

## BRIEFING

$\langle\mathbf{1 0 8 7}\rangle$ Intrinsic Dissolution, USP 27 page 2512. It is proposed to revise the current name and content of this general information chapter in order to accommodate the inclusion of a stationary disk dissolution method. Sections for Experimental Procedure and Data Analysis and Interpretation are also included.
(BPC: H. Pappa) RTS-21026-1

## Change to read:

## <1087 $\rangle$ INTRINSIC DISSOLUTION

## rotating disk and stationary DISK DISSOLUTION TESTING 

This chapter diseusses determination of the rate of intrinsic dissolution.

The measurement of intrinsic dissolution rates is a tool in the functionality and characterization of bulk drug substanees andexeipients. The intrinsie dissolution rate is defined as the dissolution rateof pure substance under the eondition of constant surface area. The dissolution rate and bieavailability of a drug substanee are influeneed by its solid-state properties: crystallinity, amorphism, polymorphism, hydration, solvation, particle size, and particle surface area. The measured intrinsic dissolution rate is dependent on these solid-state properties. The dissolution rate is also influeneed by extrinsic factors, such as hydrodynamies (e.g., test apparatus, and-disk rotation speedor fluid flow) and test conditions (e.g., temperature, fluid viseosity, pH , and buffer strength in the case of ionizable compernds). By expesing the surface are of a material to an appropriate dissolution medium while maintaining constamt temperature, stirring rate, and pH , the intrinsic dissolution rate ean be determined. Typieally the intrinsic dissolution is expressed in terms of me per minte per $\mathrm{cm}^{2}$ :
Apparatus A yppieal apparates-consists of a punch and die fabrieated out of hardened steel. The base of the die has three threaded holes for the attachment of a surface plate made of pol ished steel, providing a mirrer smouth base for the compacted pet tet. The die has a 0.1 em to 1.0 em diameter cavity into whieh is placed a meastred amernt of the material whese intrinsic dissolut tion rate is to be determined. The punch is then inserted in the die eavity and the test material is compressed with a benchtop tablet press. [NOTE-A hole threugh the head of the puneh allows insertion of the metal rod to facilitate removal from the die after the test.] A compacted pellet of the material is formed in the eavity with a single face of defined area expesed on the bettom of the die (see manying figute). The bettom of the die eavity is threaded so that at least $50 \%$ to $75 \%$ of the compacted pellet cam dissolve witheut its falling out of the die. The top of the die has a threaded shoulder that allows it to be attached to a holder. The holder is mounted on a laboratory stirring deviee, and the entire die, with the compacted pellet still in place, is immersed in the dis solution medium and rotated by the stirring deviee (see Dissolution $\langle 714\rangle$ ).

Test Preparation-Weigh the material to be testento a piece of tared weighing paper. Attach the surface plate to the underside of the die, and secure it with the three serews provided. Transfer the aceurately weighed portion of the materiat under test into the die eavity. Place the punch int the ehamber, and secure the metal plate on top of the assembly. Compress the powder on a hydraulic press for 1 minte at the minimum compression pressure necessary to form a nondisintegrating compacted pellet. Detach the surface plate, and serew the die with punch still in place inte the holder. Tighten securely. Remove all loose powder from the surface of the die by blowing compressed air or nitrogen.

Procedure Slide the die holder assembly into the dissolution test chuck, and tighten. Position the shaft in the spindle-so that when the tested head is lowered, the expesed surface of the com pacted pellet will be 3.8 cm from the bottom of the vessel. The disk assembly should be aligned to minimize wobble, and air bubbles should not be allowed to form on the compacted pellet or die sur face as this could alter fluid flow. [NOTE-Air bubbles may be avided by using an apparatus with a different configuration, sueh as a die holder that holds the compacted pellet in a fixed vertieal position with agitation provided by a paddle positioned 6 mm from the surface of the pellet.] Perform the analysis as directed in the individual menegraph. If possible, sink conditions should be maintained threughout the test. The data for the cumulative amount dis solved a ach time point should be corrected for sampling losses. To caleulate the intrinsic dissolution rate, plot the eumalative a mount of test specimen dissolved per unit area of the compacted pellet against time until $10 \%$ is dissolved. The emmulative amount dissolved per unit area is given by the cumulative amount dissolved at each time point divided by the surface area expesed $\left(0.5-\mathrm{cm}^{2}\right)$. Linear regression should then be performed on data peints up to and ineluding the time point beyond which-10\% is
dissolved. The intrinsic dissolution rate of the test specimen, in my per mintte per $\mathrm{em}^{2}$, is determined from the slope of the regres sion line.
-This chapter discusses the determination of dissolution rates from nondisintegrating compacts held in a fixed position in a tablet die of known dimensions. Compacts, as used here, are understood to be a nondisintegrating mass resulting from the compression of the material under test using appropriate pressure conditions. A single surface having specified physical dimensions is presented for dissolution. The determination of the rate of dissolution can be important during the course of the development of new chemical entities because it sometimes permits prediction of potential bioavailability problems and may also be useful to characterize compendial articles such as excipients or drug substances.

Dissolution rate is influenced by intrinsic solid-state properties such as crystalline state including polymorphs and solvates, as well as degree of noncrystallinity. In addition, there are numerous methods available for modifying the physicochemical properties of chemical entities such that their solubility and dissolution properties can be modified. Among these are co-precipitates and the use of racemates and enantiomeric mixtures. The effect of impurities associated with a material can also significantly alter its dissolution properties. It is also influenced by extrinsic factors such as surface area, hydrodynamics, and dissolution medium properties, including solvent (typically water), presence of surfactants, temperature, fluid viscosity, pH , buffer type, and buffer strength. Dissolution rate generally is expressed as the mass of solute appearing in the dissolution media per unit time (e.g., mass sec ${ }^{-1}$ ) while dissolution flux is expressed as the rate per unit area (e.g., mass $\mathrm{cm}^{-2} \mathrm{sec}^{-1}$ ). Reporting dissolution flux is preferred as it is normalized for surface area.

The rotating disk and stationary disk dissolution systems provide methodologies that are versatile enough to study the characteristics of compounds of pharmaceutical interest under a variety of test conditions. Characteristics common to both systems include the following:
(1) They are adaptable to use with standard dissolution testing stations, and both use a tablet die to hold the nondisintegrating compact during the dissolution test.
(2) They rely on being able to compress the test compound into a compact that does not flake or fall free during the dissolution test.
(3) A single surface of known geometry and physical dimension is presented for dissolution.
(4) The die is located at a fixed position in the vessel which decreases the variation from hydrodynamic conditions.

A difference between the two systems is the source of fluid flow over the dissolving surface. In the case of the rotating disk system, fluid flow is generated by the rotation of the die in a quiescent fluid while fluid flow is generated by a paddle or other stirring device for the stationary disk system.

## EXPERIMENTAL PROCEDURE

The procedure for carrying out dissolution studies with this type of equipment consists of preparing a nondisintegrating compact of material using a suitable compaction apparatus, placing the compact and surrounding die assembly in a suitable dissolution medium, subjecting the compact to the desired hydrodynamics near the compact surface, and measuring the amount of dissolved solute as a function of time.

Compacts are typically prepared using an apparatus that consists of a die, an upper punch, and a lower surface plate fabricated out of hardened steel or other material that allows the compression of material into a nondisintegrating compact. An alternative compaction apparatus consists of a die and two punches. Other configurations that achieve a nondisintegrating compact of constant surface area also may be used. The nondisintegrating compact typically has a diameter of 0.2 cm to 1.5 cm .

## Compact Preparation

Attach the smooth lower surface plate to the underside of the die, or alternatively, insert the lower punch using an appropriate clamping system. Accurately weigh a quantity of material necessary to achieve an acceptable compact and transfer to the die cavity. Place the upper punch into the die cavity and compress the powder on a hydraulic press at a compression pressure required to form a nondisintegrat-
ing compact that will remain in the die assembly for the length of the test. Compression for 1 minute at 15 MPa usually is sufficient for many organic crystalline compounds, but alternative compression conditions that avoid the formation of capillaries should be evaluated.

Changes in crystalline form may occur during compression, therefore confirmation of solid state form should be performed by powder X-ray diffraction or other similar technique. Remove the surface plate or lower punch. Remove loose powder from the surface of the compact and die by blowing compressed air or nitrogen over the surface.

## Dissolution Media

Dissolution may be run in the physiological pH range at $37^{\circ}$ to approximate in-vivo conditions. Whenever possible, it also is appropriate to perform the test under sink conditions. Dissolution media should be deaerated immediately prior to use to avoid air bubbles forming on the compact or die surface. ${ }^{1}$

Dissolution media temperature and pH must be controlled, especially when dealing with ionizable compounds and salts. In those cases, the dissolution rate may depend strongly on the pH , buffer species, and buffer concentration.

Where possible, testing should be carried out under the same conditions that are used to determine the intrinsic solubility of the solid state form being tested. A simplifying assumption in constant surface area dissolution testing is that the pH at the surface of the dissolving compact is the same as the pH of the bulk dissolution medium. For nonionizable compounds, this is relatively simple as no signifi-

[^358]cant pH dependence of dissolution rate is expected. For acids and bases, the solute can alter the pH at and near the surface of the compact as it dissolves. Under these conditions, the pH at the surface of the compact may be quite different from the bulk pH due to the self-buffering capacity of the solute. To assess intrinsic solubility, experimental conditions should be chosen to eliminate the effect of solute buffering, alteration of solution pH , and precipitation of other solid state forms at the surface of the compact. For weak acids, the pH of the dissolution media should be one to two pH units below the pKa of the dissolving species. For weak bases, the pH of the dissolution medium should be one to two pH units above the pKa of the dissolving species.

## Test Apparatus

## METHOD 1 (ROTATING DISK)

A typical apparatus (Figure 1) consists of a punch and die fabricated out of hardened steel. The base of the die has three threaded holes for the attachment of a surface plate made of polished steel, providing a mirror-smooth base for the compacted pellet. The die has a cavity into which is placed a measured amount of the material whose intrinsic dissolution rate is to be determined. The punch is then inserted in the die cavity and the test material is compressed with a hydraulic press. [NOTE-A hole through the head of the punch allows insertion of a metal rod to facilitate removal from the die after the test.] A compacted pellet of the material is formed in the cavity with a single face of defined area exposed on the bottom of the die.

Figure 1

The die assembly is then attached to a shaft constructed of an appropriate material (typically steel). The shaft holding the die assembly is positioned so that when the die assembly is lowered into the dissolution media (Figure 2), the exposed surface of the compact will be not less than 1.0 cm
from the bottom of the vessel and nominally in a horizontal position. The die assembly should be aligned to minimize wobble, and air bubbles should not be allowed to form on the compact or die surface.

Figure 2
A rotating disk speed of 300 rpm is recommended. Typical rotation speeds may range from 60 rpm to 500 rpm . The dissolution rate depends on the rotation speed used. This parameter should be selected in order to admit at least five sample points during the test, but excessive stirring speeds may create shear patterns on the surface of the dissolving material that could cause aberrant results (i.e., nonlinearity). Typically, the concentration of the test specimen is measured as a function of time, and the amount dissolved is then calculated. The sampling interval will be determined by the speed of the dissolution process. If samples are removed from the dissolution medium, the cumulative amount dissolved at each time point should be corrected for losses due to sampling.

## METHOD 2 (STATIONARY DISK)

The apparatus (Figure 3) consists of a steel punch, die, and a base plate. The die base has three holes for the attachment of the base plate. The three fixed screws on the base
plate are inserted through the three holes on the die and then fastened with three washers and nuts. The test material is placed into the die cavity. The punch is then inserted into the cavity and compressed, with the aid of a bench top press. The base plate is then disconnected from the die to expose a smooth compact pellet surface. A gasket is placed around the threaded shoulder of the die and a polypropylene cap is then screwed onto the threaded shoulder of the die.

Figure 3
The die assembly is then positioned at the bottom of a specially designed dissolution vessel with a flat bottom (Figure 4). The stirring unit (e.g., paddle) is positioned at an appropriate distance (typically 2.54 cm ) from the compact surface. The die assembly and stirring unit should be aligned to ensure consistent hydrodynamics, and air bubbles should not be present on the compact surface during testing. Alternative configurations may be utilized if adequate characterization and control of the hydrodynamics can be established.

Figure 4
The dissolution rate depends on the rotation speed and precise hydrodynamics that exist. Typically, the concentration of the test specimen is measured as a function of time and the amount dissolved then calculated. The sampling interval will be determined by the speed of the dissolution process (see Method 1). If samples are removed from the dissolution media, the cumulative amount dissolved at each time point should be corrected for losses due to sampling.

## DATA ANALYSIS AND INTERPRETATION

The dissolution rate is determined by plotting the cumulative amount of solute dissolved against time. Linear regression analysis is performed on data points in the initial linear region of the dissolution curve. The slope corresponds to the dissolution rate (mass sec${ }^{-1}$ ).

The amount versus time profiles may show significant curvature. When this occurs, it is important that only the initial linear portion of the profile is used to determine the dissolution rate. If curvature is observed, it may be valuable to assess the crystalline form of the compact by removing it from the media and examining it by powder X-ray diffraction or another similar technique to determine if the exposed surface area is changing.

The constant surface area dissolution rate is reported in units of mass sec ${ }^{-1}$ while the dissolution flux is reported in units of mass $\mathrm{cm}^{-2} \mathrm{sec}^{-1}$. Test conditions, typically a description of the apparatus, rotation speed, temperature, buffer species and strength, pH , and ionic strength should also be reported with the analyses. The dissolution flux is calculated by dividing the dissolution rate by the surface area of the compact.

Under ideal conditions, dissolution flux may be used to estimate solubility. When hydrodynamic conditions are well-defined, the appropriate hydrodynamic equations can be solved taking into account that dissolution is determined by both diffusive and convective components.

Ratios of the flux, measured under varying conditions of pH , stirring speeds, buffer species, buffer concentrations, or ionic strengths, yield values that are useful to determine the relative dependence of the normalized dissolution rate on these variables. These ratios are especially useful for ionizable solutes where the flux is strongly dependent on pH , buffer species, and buffer concentration. They are also useful to determine relative stirring speed dependence.
In both Method 1 and Method 2, the functional relationship between the experimental flux and the physicochemical characteristics of the drug (solubility and diffusion coefficient) as well as the convective components (stirring speed and kinematic viscosity of the medium) are known. Therefore, a comparison between the experimental and the calcu-
lated flux values can be made. It is also possible to use the experimental flux value to calculate the solubility of the compound when all other variables are known a priori. With a more complex analysis, it is useful to compare the pH at the dissolving surface of ionizable solute with the bulk pH , which is an important consideration when setting conditions for dissolution testing.

Upward curvature (positive second derivative) of the concentration versus time data is typically indicative of a systematic experimental problem. Possible problems include physical degradation of the compact by cracking, delaminating, or disintegration.

Downward (negative second derivative) curvature of the dissolution profile is often indicative of a transformation of the solid form of the compact at the surface or when saturation of the dissolution medium is inadvertently being approached. This often occurs when a less thermodynamically stable crystalline form converts to a more stable form. Examples include conversion from an amorphous form to a crystalline form or from an anhydrous form to a hydrate form, or the formation of a salt or a salt converting to the corresponding free acid or free base. $\mathbf{\omega S S}^{2 S}$ (USP28)

## BRIEFING

$\langle\mathbf{1 1 0 1}\rangle$ Medicine Dropper, USP 27 page 2559. The proposed revisions are intended to update and clarify this general information chapter.

for the preparation with which it is supplied should be employed. The volume error incurred in measuring any liquid by means of a calibrated dropper should not exceed $15 \%$ under normal use conditions.

## BRIEFING

〈1119〉 Near-Infrared Spectrophotometry, USP 27 page 2569 and page 3337 of the Second Supplement. The unavailability of NIST SRM 1920a NIR wavelength calibration standard has prompted the USP to establish an equivalent USP Near-Infrared Calibrator Reference Standard (see Test Details under Instrumentation in this general information chapter). Also, it is proposed to replace the NIST SRM 2034 with the recommended NIST SRM 2036 for transmission wavelength and NIR diffuse reflectance wavelength qualification because this standard contains a piece of sintered polytetrafluoroethylene (PTFE) that provides a nearly ideal diffuse reflector.

## INSTRUMENTATION

## Apparatus

All NIR measurements are based on passing light radiation through or into a sample and measuring the attenuation of the emerging (transmitted, scattered, or reflected) beam. There are a variety of spectrophotometers available based on different operating principles.

Some examples of currently available spectrophotometers are the following: filter and grating-based dispersive, acousto-optical tunable filter (AOTF), Fourier-transform (FT-NIR), and liquid crystal tunable filters (LCTF) systems. Silicon, lead sulfide, indium gallium arsenide and deuterated triglycine sulphate are commonly used detector materials. Conventional cuvette sample holders, fi-ber-optic probes, transmission dip cells, and spinning or traversing sample holders are some of the more common sampling arrangements.

The selection of the equipment should be based on the intended application, with particular attention being paid to the suitability of the sampling device for the type of sample to be analyzed.

## Near-Infrared Reflectance References

NIR references, by providing a known stable measurement against which other measurements can be compared, are used to eliminate instrumental variations that would affect the measurements.

Transmittance Mode-The measurement of transmittance is dependent on a background transmittance spectrum for its calculation. A transmittance reference can be air, an empty cell, a solvent blank, or in special cases, a reference sample.

Reflectance Mode-The measurement of reflectance is dependent on a background reflectance spectrum for its calculation. Most measurements are performed in single-beam instruments; the reflectance of a background reference is scanned to obtain a baseline, and then the reflectance of one or more analytical samples is measured. Common reflectance references are ceramic, perfluorinated polymers and gold; other suitable materials may be used. Only spectra measured against a background possessing the same optical properties can be directly compared with one another.

## Qualification of NIR Instruments

Elements of Qualification-The qualification of an NIR instrument can be divided into three elements:

- Installation Qualification (IQ)
- Operational Qualification (OQ)
- Performance Qualification (PQ)

Installation Qualification-The IQ requirements help ensure that the hardware and software are installed according to vendor and safety specifications at the desired location.

Operational Qualification-In operational qualification, the instrument's performance is controlled with respect to external certified standards to verify that the system operates within target specifications. The purpose of operational qualification is to ensure that an instrument is suitable for its intended application. Because there are so many different approaches to measuring NIR spectra, operational qualification with traceable external standards that can be used on any instrument is desired. The most important property of a reference material is its stability. For example, the commonly employed internal polystyrene-film reference may be subject to aging and attack by solvents and vapors in the laboratory environment. The use of external traceable reference standards does not imply the omission of the instrument's internal quality control procedures. Similiar to any spectrophotometric device, NIR instruments need to be qualified for both wavelength and photometric scale. Maximum and reduced light-flux noise tests are also included.

Performance Qualification-In performance qualification, a quality of fit to an initial scan or group of scans included in the operational qualification is employed. In such an analysis, it is as-
sumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best ones available. Comparisons of spectra taken over time on the identical reference standards form the basis for evaluating the long-term stability of an NIR measurement system. The objective is to ensure that no wavelength calibration shift or change in sensitivity occurs during ongoing analysis.

Previous operational qualification has shown that the equipment is acceptable for use; therefore, a single performance qualification standard can be used to reverify performance on a continuing basis. The user may have a method-specific reference sample to perform this kind of control, providing the sample is stable.

Test Details-The specific tests and how frequently they are performed for each level of qualification is dependent on the instrument and intended application.

Wavelength Uncertainty-Potential problems with internal calibration schemes are avoided by specifying appropriate independent external wavelength standards. For the reflectance mode, NHST SRM-1920a+

- USP Near-Infrared Calibrator $\mathrm{RS}^{1}{ }^{1}{ }^{2 S}$ (USP28) and NIST SRM $2035^{2}$ used in the transflectance mode are available. The nature and type of background reference standard must be specified. In transmittance measurements, NIST SRM 2035 rare earth oxide in glass standard, or Holmizm oxide solution NIST SRM 2034 ${ }^{3}$
- NIST SRM $2036^{3}{ }^{3}$ 2S (USP28)
are available. Alternative standards may be used with appropriate justification.

Take one spectrum (with the same spectral resolution used to obtain the certified value) and measure the position of at least three peaks to cover the entire available range. The acceptance limits for SRM 1920a are reported in Table 1.
${ }^{1}$ USP Near-Infrared Calibrator RS is a mixture of dysprosium, holmium, erbium, and talc and may be obtained from USP. "Accurate Wavelength Measurements of a Putative Standard for Near-Infrared Diffuse Reflection Spectrometry," by Tomas Isaksson, Husheng Yang, Gabor J. Kemeny, Richard S. Jackson, Qian Wang, M. Kathleen Alam, and Peter R. Griffiths (Department of Chemistry, University of Idaho, Moscow, Idaho 838442343, USA) Appl Spectrosc 2003, 57(2) 176-185. This reference material exhibits peaks in both the $700-$ to $1100-\mathrm{nm}$ and $1100-$ to $2500-\mathrm{nm}$ ranges.
${ }^{2}$ SRM 2035, a rare earth oxide in glass, is intended for transmission wavelength qualification and has been certified recently by NIST.
-This standard consists of samarium, ytterbium, holmium, and neodymium rare earth oxide (REO). $\begin{aligned} & \text { 2S } \\ & \text { (USP28) }\end{aligned}$
"Production and Verification of SRM 2035. Near Infrared Transmission Wavelength Standard", NIST Special Publication 1999, 260-102 (in preparation). This standard may be used in transflectance mode, but it is not currently certified for such use.
${ }^{3}$ Helmitm oxide-selution, NHST SRM 2034, (wavelength-standard frem $240-650 \mathrm{~mm})$ may be used eurrently in the 650 to -1100 nm regien at theugh bands are net certified in this region. "Holmium-Oxide-Solution wavelength Standard from 240-640 mm-SPM-2034", NBS Special Pub-am-Oxide in-Perchloric Acid" $J$ Rec. Natl Bur Stdc 1985-90(2) 115 125.
${ }^{3}$ SRM 2036, a rare earth oxide in glass, is intended for NIR diffuse reflectance wavelength qualification and is available from NIST. This standard also consists of samarium, ytterbium, holmium, and neodymium rare earth oxide (REO). In addition, SRM 2036 contains a piece of sintered polytetrafluoroethylene (PTFE) that provides a nearly ideal diffuse reflector.

Table 1. Recommended Near-IR Instrument Specifications ${ }^{\mathrm{a}}$

| Wavelength Uncertainty | SRM-1920a |
| :---: | :---: |
|  | -USP Near-Infrared Calibrator $\mathrm{RS}_{\mathbf{\bullet 2 S}}$ (USP28) peaks ${ }^{\text {b }}$ occur at 1261, 1681, and 1935 nm |
| Tolerances | $\pm 1 \mathrm{~nm}$ at 1200 nm or $\pm 8 \mathrm{~cm}^{-1}$ at $8300 \mathrm{~cm}^{-1}$ |
|  | $\pm 1 \mathrm{~nm}$ at 1600 nm or $\pm 4 \mathrm{~cm}^{-1}$ at $6250 \mathrm{~cm}^{-1}$ |
|  | $\pm 1.5 \mathrm{~nm}$ at 2000 nm or $\pm 4 \mathrm{~cm}^{-1}$ at $5000 \mathrm{~cm}^{-1}$ |
| Photometric Linearity | $A_{O B S}$ vs $A_{\text {REF }}$ at 1200,1600 , and $2000 \mathrm{~nm} ;{ }^{c}$ <br> slope $=1.0+0.05$; intercept $=0.0+0.05$ |
| Spectrophotometric Noise | measured for $100-\mathrm{nm}\left(300 \mathrm{~cm}^{-1}\right)$ segments between 1200 and 2200 nm ( 8300 and 4500 $\mathrm{cm}^{-1}$ ) |
| Average RMS for measurements at high-light flux | less than $0.3 \times 10^{-3} ;$ no RMS noise greater than $0.8 \times 10^{-3}$ |
| Average RMS for measurements at low-light flux | less than $1 \times 10^{-3}$; no RMS noise greater than $2.0 \times 10^{-3}$ |

${ }^{\text {a }}$ A maximum nominal instrument bandwidth of 10 nm at 2500 nm or $16 \mathrm{~cm}^{-1}$ at $4000 \mathrm{~cm}^{-1}$ is appropriate for most applications.
${ }^{\mathrm{b}}$ The nominal $1935-\mathrm{nm}$ peak is sensitive to instrument bandwidth. Use the wavelength value supplied with SRM 1920a

- USP Near-Infrared Calibrator RS ${ }_{\text {■2S (USP28) }}$.
at the appropriate instrument bandwidth to determine wavelength uncertainty.
${ }^{\mathrm{c}} A_{O B S}$ is the observed absorbance, and $A_{\text {REF }}$ is the tabulated absorbance of the reference reflectors at each of the three specified wavelengths.

Photometric Linearity-Verification of photometric linearity is demonstrated with a set of transmission standards of known relative transmittance or reflectance standards of known relative reflectance, usually expressed as percent transmittance or reflectance. For reflectance measurements, traceable carbon-doped polymer standards are available. Spectra obtained from reflectance standards are subject to variability as a result of the difference between the experimental conditions under which they were factory-calibrated and those under which they are subsequently put to use. Hence, the percent reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an "absolute" calibration for a given instrument. Provided that (1) the standards do not change chemically or physically, (2) the same reference background is used as was used to obtain the certified values, and (3) the instrument measures each standard under identical conditions (including precise sample positioning), the reproducibility of the photometric scale will be established over the range of standards used. Subsequent measurements on the identical set of standards give information on long-term stability. Use at least four reference standards in the range $10 \%$ to $90 \%$. [NOTE-A typical set of four reflectance references might be $10 \%, 20 \%, 40 \%$, and $80 \%$ with $1.0,0.7,0.4$, and 0.1 as their respective absorbances.] If the system is used for analytes with absorbances higher than 1.0 , add a $2 \%$ or a $5 \%$ standard, or both, to the set. The specifications are reported in Table 1.

Spectrophotometric Noise-NIR instrument software may include built-in procedures to automatically determine system noise and to provide a statistical report of noise or signal-to-noise ratio over its operating range. As previously discussed, it is desirable to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. If the qualification procedures in the NIR software do not comply with the contents of this chapter, it is recommended to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. The method involves measuring spectra of high- and low-
reflectance traceable reference materials. For transmittance modules there are no standards for the low-flux noise test at this time, so it is only possible to perform the high-flux noise test.

HIGH-FLUX NOISE-The instrument noise is evaluated at highlight flux by measuring reflectance or transmittance of the reference standard, with the reference material (e.g., $99 \%$, reflectance standard) acting as both the sample and the background reference. The analysis is performed by tabulating RMS noise levels in successive nominal $100-\mathrm{nm}\left(300 \mathrm{~cm}^{-1}\right)$ spectral segments across the instrument's range. The limits are reported in Table 1.

LOW-FLUX NOISE-The same procedure may be used with a low-er-reflectivity reference material (e.g., $10 \%$ reflectance standard) to determine system noise at reduced light flux. The source, optics, detector, and electronics make significant contributions to the noise under these conditions. The limits are reported in Table 1.

## BRIEFING

$\langle 1120\rangle$ Raman Spectrophotometry. A new general chapter, designated $\langle 1120\rangle$ Raman Spectrophotometry, is proposed. It is recognized that Raman spectrophotometry is being used in the pharmaceutical industry in a variety of settings, both as a laboratory and as a process-measuring tool. As such, in the production of pharmaceuticals, this technique has many potential uses for controlling product consistency, homogeneity, and final product quality. A chapter on Raman spectrophotometry is being added to provide general information on this technique, which may have application in certain cases as a manufacturing real-time control technique.

## Add the following:

## ■ $\langle 1120\rangle$ RAMAN SPECTROPHOTOMETRY

## INTRODUCTION

Raman spectroscopy shares many of the principles that apply to other spectroscopic measurements discussed in Spectrophotometry and Light-Scattering $\langle 851\rangle$. Raman is a vibrational spectroscopic technique and is therefore related to infrared (IR) and near-infrared (NIR) spectroscopy. The Raman effect itself arises as a result of a change in the polarizability of a molecular bond and is measured as inelastically scattered radiation.
A Raman spectrum is generated by exciting the sample of interest to a virtual state with a monochromatic source, typically a laser. Light elastically scattered (no change in wavelength) is known as Rayleigh scatter and is not of analytical interest. However, if the sample relaxes to a vibrational energy level differing from the initial state, the scattered radiation is shifted in energy. The shift is commensurate with the energy difference between the initial and final vibrational states. This "inelastically scattered" light is referred to as Raman scatter. Only about one in $10^{8}$ photons incident to the sample undergoes Raman scattering. If the Raman scattered photon is of lower energy, it is referred to as Stokes scattering. If it is of higher energy, it is referred to as antiStokes scattering. In practice, nearly all analytically useful Raman measurements make use of Stokes-shifted Raman scatter.

The appearance of a Raman spectrum is much like an absorption Fourier transform-IR (FT-IR) spectrum. The intensities, or the number of Raman photons counted, are plotted against the shifted energies. The $x$-axis is generally labeled "Raman Shift/cm ${ }^{-1}$ " or "Wavenumber/cm-1". The
shift position is usually expressed in frequency and represents the frequency of the peak relative to the laser frequency. The spectrum is interpreted in the same manner as the commensurate absorption FT-IR spectrum. The positions of the shift frequencies for a given bond in an analyte are similar to their respective absorption frequencies in an IR spectrum. However, the peaks emphasized in a Raman spectrum are often de-emphasized in an IR spectrum and viceversa. This is why the two spectroscopic techniques are often said to be complementary.

Raman spectroscopy is advantageous because quick and accurate measurements can often be made without destroying the sample (solid, semi-solid, liquid, or gas) and with minimal or no sample preparation. The signal is typically in the visible or near-IR (NIR) range, allowing efficient coupling to fiber optics. This also means that a signal can be obtained from any medium transparent to the laser, such as glass, plastics, or samples in aqueous media. From an instrumental point of view, modern systems are easy to use, provide fast analysis times (seconds to several minutes), and are reliable. The Raman spectrum contains information on fundamental vibrational modes of the sample that can yield both sample and process understanding. Finally, the analysis modeling may be simpler than that associated with other spectroscopic techniques. (Both univariate and multivariate methods and calibrations can be used).
In addition to normal Raman spectroscopy, there are a number of more specialized Raman techniques. These include resonance Raman (RR), surface-enhanced Raman spectroscopy (SERS), Raman optical activity (ROA), coherent anti-Stokes Raman spectroscopy (CARS), Raman gain or loss spectroscopy, and hyper-Raman spectroscopy. These techniques are not widely implemented currently, and are not addressed in this general information chapter.

## QUALITATIVE AND QUANTITATIVE RAMAN MEASUREMENTS

There are two general classes of commonly performed Raman measurements: qualitative and quantitative.

## Qualitative Raman Measurements

Qualitative Raman measurements yield accurate spectral information about the vibrational bands present in the sample. Because the Raman spectrum is specific for a given compound, qualitative Raman measurements may be used as a compendial ID test, as well as for structural elucidation.

## Quantitative Raman Measurements

Quantitative Raman measurements follow a relationship comparable to Beer's law:

$$
I_{V}=K L C I_{0}
$$

in which $I_{V}$ is the peak intensity at a given wavelength, $K$ represents instrument and sample constants, $L$ is the pathlength, $C$ is the molar concentration of a particular component in the sample, and $I_{0}$ is the laser intensity. In practice, path length is more accurately described as sampling volume, which is an instrumental variable described by the focus of the laser and the collection optics. From the equation, it is apparent that peak intensity is directly correlated to concentration. It is this relationship that is the basis for the majority of quantitative Raman applications.

## FACTORS AFFECTING QUANTITATION

## Sample-Based Factors

The most important sample-based factors are fluorescence, sample heating, and matrix absorption. Fluorescence is typically observed as a broad sloping background underlying the Raman spectrum. The effect on quantitation is therefore that of an unstable baseline and decreased sig-nal-to-noise ratio. The exact wavelength and intensity is dependent on the identity and concentration of the fluorescing material. Because fluorescence is generally a much more efficient process, even very minor amounts of fluorescent impurities can lead to significant Raman signal degradation. Fluorescence can be minimized by using longer wavelength excitation sources such as 785 nm or 1064 nm . However, the intensity of the Raman signal is proportional to $\nu^{-4}$, where $\nu$ is the excitation wavelength. The optimum sig-nal-to-noise ratio will be obtained by balancing fluorescence rejection, signal strength, and detector response.

Fluorescence in solids can also be mitigated by exposing the sample to the laser source for a period of time before measurement. This process is called photobleaching, and operates by degrading the highly absorbing species. Photobleaching is less effective in liquids, where the sample is mobile, or if the amount of fluorescent material is more than a trace.
Sample heating can cause a variety of issues, such as physical form change (melting), polymorph conversion, or sample burning. This is usually an issue for colored, highly absorbing species, or very small particles that have low heat transfer. The effects of sample heating are usually observable either as changes in the Raman spectrum over time or by visual inspection of the sample. Besides decreasing the laser flux, a variety of methods can be employed to diminish
heating, such as moving the sample or laser during the measurement or improving the heat transfer of the sample with thermal contact or liquid immersion.

Absorption of the Raman signal by the matrix can also occur. This problem is more prevalent with long wavelength FT-Raman systems where the Raman signal can overlap with a NIR overtone absorption. This effect will be dependent on the optics of the system as well as on the sample presentation. Associated with this effect is variability from scattering in solids as a result of packing and particle size differences. The magnitude of all of these effects, however, is typically less severe than in NIR because of the limited depth of penetration and the relatively narrower wavelength region sampled in Raman spectroscopy.

## Sampling Factors

Quantitative Raman spectroscopy differs from many other spectroscopic techniques in that it is a single beam measurement with no background. Careful instrument design and sampling can minimize this variation but not entirely remove it. Thus the absolute Raman signal intensity is very difficult to use for direct quantitation of an analyte. Among the potential sources of variation are changes in sample opacity, sample heterogeneity, changes in laser power at the sample, and changes in optical collection geometry or sample position. These effects can be minimized by sampling in a reproducible, representative manner.

Use of an internal reference is the most common and robust method of eliminating variations due to absolute intensity fluctuations. There are several choices for this approach. An internal standard can be deliberately added, and isolated peaks from this standard can be employed. In a solution, an isolated solvent band can be employed because the solvent will remain relatively unchanged from sample to sample. Also, in a formulation, an excipient peak can be used if it
is in substantial excess compared to the analyte. The entire spectrum can also be used as a reference, with the assumption that laser and sample orientation changes will affect the entire spectrum equally.

A second important sampling-based factor to consider is spectral contamination. Raman is a weak effect that can be masked by a number of external sources. Common contamination sources include sample holder artifacts (container or substrate) and ambient light. Typically, these issues can be identified and resolved by careful experimentation.

## APPARATUS

## Components

All modern Raman measurements involve irradiating a sample with a laser, collecting the scattered radiation, rejecting the Rayleigh scattered light, differentiating the Raman photons by wavelength, and detecting the resulting Raman spectrum. All commercial Raman instruments therefore share the following common features to perform these functions:

1. Excitation source (Laser)
2. Sampling device
3. Device to filter/reject light scattered at the laser wavelength
4. Wavelength processing unit
5. Detector and electronics

## EXCITATION SOURCE (LASER)

Table 1 identifies several common lasers used for pharmaceutical applications. UV lasers have also been used for specialized applications but have various drawbacks that severely limit their utility for general analytical measurements.

Table 1. Typical Lasers Used in Pharmaceutical Applications

| Laser $\lambda, \mathrm{nm}$ (nearest whole number) | Type | Typical Power at Laser | Wavelength Range, nm (Stokes Region, 100 $\mathrm{cm}^{-1}$ to $3000 \mathrm{~cm}^{-1}$ shift) | Comments |
| :---: | :---: | :---: | :---: | :---: |
| NIR Lasers |  |  |  |  |
| 1064 | Solid state (Nd:YAG) | Up to 3W | 1075-1563 | Commonly used in Fourier transform instruments |
| 785 | Diode | Up to 500 mW | 791-1027 | Most ubiquitous dispersive Raman laser |
| Visible Lasers |  |  |  |  |
| 488-632.8 | Ion gas and solid state frequency doubled lasers | Up to 1W | 488-781 | Fluorescence risks |

## SAMPLING DEVICE

A wide variety of sampling arrangements are possible, including direct optical interfaces, microscopes, fiber opticbased probes (either noncontact or immersion optics), and sample chambers (including specialty sample holders and automated sample changers). The sampling optics may also be designed to obtain the polarization-dependent Raman spectrum, which often contains additional information. Selection of the sampling device will often be dictated by the analyte. However, considerations such as sampling volume, speed of the measurement, laser safety, reproducibility of sample presentation, etc., should be evaluated to optimize the sampling device for any given application.

## FILTERING DEVICE

Scattered light at the laser wavelength (Rayleigh) is many orders of magnitude greater than the Raman signal and must be rejected prior to the detector. Notch filters are almost uni-
versally used for this purpose and provide excellent rejection and stability combined with small size. The traditional use of multistage monochromators for this purpose, although still viable, is now rare. In addition, various filters or physical barriers to shield the sample from external radiation sources (e.g., room lights, laser plasma lines) may be required depending on the collection geometry of the instrument.

## WAVELENGTH PROCESSING UNIT

The wavelength may be processed either by dispersion or interferometry (Fourier transform). The specific benefits and drawbacks of each of the dispersive designs compared to the FT instrument are beyond the scope of this chapter. Any properly qualified instruments should be suitable for qualitative measurements. However, care must be taken when selecting an instrument for quantitative measurements, as
dispersion and response linearity may not be uniform across the full spectral range (for example, when using an echelle spectrograph).

## DETECTOR

The silicon-based charge-coupled device (CCD) is the most common detector for dispersive instruments. The cooled array detector allows fast, full-spectrum measurements with low noise. It also has peak wavelength responsivity when matched to the commonly used $785-\mathrm{nm}$ diode laser. Fourier transform instruments typically use singlechannel germanium or indium-gallium-arsenide (InGaAs) detectors responsive in the NIR to match neodymium:yt-trium-aluminum-garnet (Nd:YAG) 1064-nm excitation.

## Calibration

Raman instrument calibration consists of three components: primary wavelength ( $x$-axis), laser wavelength, and intensity ( $y$-axis).

## PRIMARY WAVELENGTH (X-AXIS)

In the case of FT-Raman instruments, primary wave-length-axis calibration is maintained with an internal $\mathrm{He}-$ Ne laser. Most dispersive instruments utilize atomic emission lamps for primary wavelength-axis calibration. In all Raman systems suitable for analytical Raman measurements, the vendor will offer a procedure of $x$-axis calibration that can be performed by the user. For dispersive Raman instruments, a calibration based on multiple atomic emission lines is preferred. The validity of this calibration approach can be verified subsequent to laser wavelength calibration using a suitable Raman shift standard. For scanning disper-
sive instruments, calibration may need to be performed more frequently and precision in both a scanning and static operation mode may need to be verified. ${ }^{1}$

## LASER WAVELENGTH

Laser wavelength variation can impact both the wavelength precision and the photometric (intensity) precision of a given instrument. Even the most stable current lasers can vary slightly in their measured wavelength output. The laser wavelength must therefore be confirmed to assure that the Raman shift positions are accurate for both FT-Raman or dispersive Raman instruments. A reference Raman shift standard material such as those outlined in ASTM E1840-96(2002) ${ }^{1}$ or other suitably verified materials can be utilized for this purpose. [NOTE-Reliable Raman shift standard values for frequently used liquid and solid reagents, required for wavenumber calibration of Raman spectrometers, are provided in the ASTM Standard Guide cited. These values can be used in addition to the highly accurate and precise low-pressure arc lamp emission lines that are also available for use in Raman instrument calibration.] Spectrophotometric grade material can be purchased from appropriate suppliers for this use. Certain instruments may use an internal Raman standard separate from the primary optical path. External calibration devices exactly reproduce the optical path taken by the scattered radiation. [NOTEWhen chemical standards are used, care must be taken to avoid standard contamination and to confirm standard stability.]

Unless the instrument is of a continuous calibration type, the primary wavelength axis calibration should be performed, as per vendor procedures, just prior to measuring

[^359]the laser wavelength. For external calibration, the Raman shift standard should be placed at the sample location and measured using appropriate acquisition parameters. The peak center of a strong, well-resolved band in the spectral region of interest should be evaluated. The position can be assessed manually or with a suitable, valid peak-picking algorithm. The software provided by the vendor may measure the laser wavelength and adjust the laser wavelength appropriately so that this peak is at the proper position. If the vendor does not provide this functionality, the laser wavelength should be adjusted manually.

## INTENSITY (Y-AXIS)

Calibration of the photometric axis can be critical for successful quantitation using certain analytical methods (chemometrics) and method transfer between instruments. Both FT-Raman units and dispersive Raman units should undergo similar calibration procedures. The tolerance of photometric precision acceptable for a given measurement should be assessed during the method development stage.

To calibrate the photometric response of a Raman instrument, a broad-band emission source should be used. There are two accepted methods: Method $A$, which utilizes an NIST-traceable tungsten white light source ${ }^{2}$ (and is applicable to all common laser excitation wavelengths listed in Ta ble 1) and Method B, which utilizes NIST SRM 2241, ${ }^{3}$ a doped-glass fluorescence source that is currently available only for systems with $785-\mathrm{nm}$ nominal excitation.

[^360]Method A-The NIST-traceable source should be placed at the sample location with the laser off and the response of the detector measured (using parameters appropriate for the instrument). The output for the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user may accomplish the task using a source obtained from NIST and appropriate software. If using a manufacturer's method, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach.

Method B-The NIST SRM 2241 should be placed at the sample location. With the laser on, a spectrum of the SRM should be obtained (using parameters appropriate for the instrument). The output for the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user may accomplish the task using a source obtained from NIST and appropriate software. If using a manufacturer's method, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach. [NOTE-Meth$\operatorname{od} B$ is currently appropriate only for a system with $785-\mathrm{nm}$ laser excitation. NIST is currently producing other SRM
materials that will be wavelength-specific for 1064-, 632.8-, 532-, and 514-nm excitation (and available in the 20042006 timeframe).]

## EXTERNAL CALIBRATION

Detailed functional validation employing external reference standards is recommended to demonstrate instrumental suitability for laboratory instruments, even for instruments possessing an internal calibration approach. The use of external reference standards does not negate the need for internal quality control procedures; rather, it provides independent documentation of the fitness of the instrument to perform the specific analysis/purpose. For instruments installed in a process location or in a reactor where positioning of an external standard routinely is not possible, including those instruments possessing an internal calibration approach, periodic checking of the relative performance of an internal vs. external calibration approach should be made. The purpose of this test is to check for change in components that may not be included in the internal calibration method (process lens, fiber-optic probe, etc.), e.g., photometric calibration of the optical system.

## QUALIFICATION AND VERIFICATION OF RAMAN INSTRUMENTS

its intended application and, when requalified periodically, continues to function properly over extended time periods. When the device is used for a specific qualitative or quantitative analysis, regular performance verifications are made. Because there are many different approaches to measuring Raman spectra, instrument operational qualification and performance verification often employ external standards that can be used on any instrument. As with any spectrophotometric device, a Raman instrument needs to be qualified for both wavelength ( $x$-axis and shift from the excitation source) and photometric (intensity axis) precision.
In performance verification, a quality of fit to an initial scan or group of scans (often referred to in nonscanning instruments as an accumulation) included in the instrumental qualification can be employed. In such analysis, it is assumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best available spectra. Comparison of spectra taken over time on identical reference standards [either the original standard or identical new standards (if stability of the reference standards is a concern)] form the basis for evaluating the long-term stability of a Raman measurement system.

## Frequency of Testing

Instrumental qualification is performed at designated intervals or following a repair or significant optical reconfiguration, such as a laser replacement or changing excitation wavelengths. Full instrument requalification may not be necessary when changing between sampling accessories such as a microprobe, a sample compartment, or a fixed fiber-optic probe. Performance verification tests may be sufficient in these cases; instrument-specific guidance from the vendor on qualification requirements should be followed. Tests include wavelength ( $x$-axis and shift from the
excitation source) and photometric (intensity axis) precision. Instrument qualification tests require that specific ap-plication-dependent tolerances be met.

Performance verification is carried out on the instrument configured for the analytical measurements and is done more frequently than instrument qualification. Performance verification includes wavelength uncertainty and intensityscale precision. Wavelength precision and intensity-scale precision tests may be needed prior to any data collection on a given day. Performance is verified by matching the current spectra to those collected during the previous instrument qualification.

## Instrument Operational Qualification

It is important to note that the acceptance specifications given in both the Instrument Operational Qualification and Performance Qualification sections are applicable for general use; specifications for particular instruments and applications may vary depending on the analysis method used and the desired accuracy of the final result. ASTM standard reference materials are also specified, with the understanding that under some circumstances (specifically remote online applications) calibration using one of these materials may be impractical, and other suitably verified materials may be employed. At this juncture it is important to note that specific parameters such as spectrometer noise, limits of detection (LOD), limits of quantification (LOQ), and acceptable spectral bandwidth for any given application should be developed as part of the analytical method development. Specific values for tests such as spectrometer noise and bandwidth will be dependent on the instrument chosen and the purpose required. In view of this, specific instrument tests for these parameters are not dictated in this information chapter.

## WAVELENGTH (X-AXIS) PRECISION

It is important to ensure the precision of the wavelength axis via calibration to maintain the integrity of Raman peak positions. Wavelength calibration of a Raman spectrometer consists of two parts: primary wavelength axis and laser wavelength calibration. After calibrating both the primary wavelength axis and the laser wavelength, instrument wavelength uncertainty can be determined. This can be accomplished using a Raman shift standard such as the ASTM shift standards or other suitably verified material. Selection of a standard with bands present across the full Raman spectral range is recommended so that instrument wavelength uncertainty can be evaluated at multiple locations within the spectrum. The tolerance of wavelength precision that is required for a given measurement should be assessed during the method-development stage. [NOTE-For scanning dispersive instruments, calibration may need to be performed more frequently, and precision in both a scanning and static operation mode may need to be verified.]

## PHOTOMETRIC PRECISION

Laser variation in terms of the total emitted photons occurring between two measurements can give rise to changes in the photometric precision of the instrument. Unfortunately, it is very difficult to deconvolute changes in the photometric response associated with variations in the total emitted laser photons from the sample and sampling-induced perturbations. This is one of the reasons why absolute Raman measurements are strongly discouraged and why the photometric precision specification is set relatively loosely. The tolerance of photometric precision required for a given measurement should be assessed during the method-development stage.

## Performance Qualification

The objective of performance qualification is to ensure that the instrument is performing within specified limits with respect to wavelength precision, intensity axis precision, and sensitivity. In certain cases when the instrument has been set up for a specific measurement (for example, installed in a process reactor), it may no longer be possible or desirable to measure the wavelength and photometric (intensity) qualification reference standards identified above. Provided instrument operational qualification has shown that the equipment is fit for use, a single external performance verification standard can be used to reverify function on a continuing basis (for example, a routinely used process solvent signal, for both wavelength and photometric precision, following reactor cleaning). The performance verification standard should match the format of the samples in the current analysis as closely as possible and use similar spectral acquisition parameters. Quantitative measurements of an external performance verification standard spectrum checks both the wavelength ( $x$-axis and laser wavelength) and the photometric (intensity) precision. Favorable comparison of a series of performance verification spectra demonstrates proper continued operation of the instrument.

## WAVELENGTH PRECISION

The wavelength precision should be measured by collecting data for a single spectrum of the selected Raman shift standard for a period equal to that used in the photometric consistency test. Peak positions across the spectral range of interest are used to calculate precision. Performance is verified by matching the current peak position to those collected during the previous instrument qualification and should
not vary by more than $\pm 0.3 \mathrm{~cm}^{-1}$, although this specification may be adjusted according to the required accuracy of the measurement.

## PHOTOMETRIC CONSISTENCY

The photometric consistency should be measured by collecting data for a single spectrum of a suitably verified reference standard material for a specified time. The areas of a number of bands across the spectral range of interest should be calculated using an appropriate algorithm. The most intense band area is set to an intensity of 1 , and all other envelopes are normalized to this band. Performance is verified by matching the current band areas to their respective areas collected during the previous instrument qualification. The areas should vary by no more than $10 \%$, although this specification may be adjusted according to the required accuracy of the measurement.

## LASER POWER OUPUT PRECISION AND ACCURACY

This test is applicable only to Raman instruments with automatic, internal laser power meters. Instruments without laser power measurement should utilize a calibrated laser power meter from a reputable supplier. The laser output should be set on a representative output, dictated by the requirements of the analytical measurement and the laser power measured. The output should be measured and checked against the output measured at instrument qualification. The power (in milliwatts or watts) should vary by no more than $25 \%$ compared to the qualified level. If the power varies by more than this amount, the instrument should be serviced (as this variation may indicate, among other things, a gross misalignment of the system or the onset of failure of the laser).

For instruments with an automatic, internal laser power meter, the accuracy of the values generated from the internal power meter should be compared to a calibrated external laser power meter at an interval of not more than 12 months. The internally calculated value should be compared to that generated by the external power meter. Performance is verified by matching the current value to that generated during the previous instrument qualification. The manufacturer may provide software to facilitate this analysis. If the instrument design prevents the use of an external power meter, then the supplier should produce documentation to ensure the quality of the instrument and provide a recommended procedure for the above analysis to be accomplished during a scheduled service visit.

## METHOD VALIDATION

Validation of Raman methods will follow the same protocols described in Validation of Compendial Methods $\langle 1225\rangle$ in terms of accuracy, precision, etc. However, several of these criteria are affected by variables specific to Raman.

Fluorescence is the primary variable that can affect the suitability of a method. The presence of fluorescent impurities in samples can be quite variable and have little effect on the acceptability of a material. The method must be flexible enough to accommodate different sampling regimes that may be necessary to minimize the effects of these impurities.

Detector linearity must be confirmed over the range of possible signal levels. Fluorescence may drive the signal baseline higher than that used in the validation, in which case the fluorescence must be decreased, or the method validated to accommodate the higher fluorescence levels. This is also true for the precision, LOD, and LOQ of the method, as increased baseline noise will negatively impact all of these values. Because fluorescence may also affect quantita-
tion due to baseline shifts, confirmation of acceptable quantitation at different levels of photobleaching, when used, should also be obtained.

The impact of the laser on the sample must be determined. Visual inspection of the sample and qualitative inspection of the Raman spectrum for measurements with differing laser powers and exposure times will confirm that the sample is not being altered (other than by photobleaching). Specific variables to confirm in the spectrum are shifts in peak position, changes in peak intensity and band width, and unexpected changes in background intensity.

Method precision must also encompass sample position. The sample presentation is a critical factor for both solids and liquids, and must be either tightly controlled or accounted for in the calibration model. Sample position sensitivity can often be minimized by appropriate sample preparation or sample holder geometry, but will vary from instrument to instrument based on excitation and collection optical configuration.

## DEFINITION OF TERMS AND SYMBOLS

Calibration model is a mathematical expression to relate the response from an analytical instrument to the properties of samples.

Instrument bandwidth is a measure of the ability of a spectrometer to separate radiation of similar wavelengths.
Multiple linear regression is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. The distinguishing feature of this algorithm is the use of a limited number of independent variables. Linear-least-squares calculations are performed to establish a relationship between these independent variables and the properties of the samples.

Multivariate curve resolution (MCR) is a curve deconvolution technique that separates spectral components on the basis of their linear contributions to the overall spectrum.

Operational qualification is the process by which it is demonstrated and documented that the instrument performs according to specifications, and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, major repair, etc.

Partial least squares (PLS) is a calibration algorithm used to relate instrument responses to the properties of samples. The distinguishing feature of this algorithm is that, although similar to PCR, this algorithm includes data concerning the properties of the samples used for calibration in the calculation of the factors used to describe the instrument responses.

Performance qualification is the process of using one or more well-characterized and stable reference materials to verify consistent instrument performance. Qualification may employ the same or different standards for different performance characteristics.
Principal component analysis and regression (PCA and $P C R)$ is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. This algorithm, which expresses a set of independent variables as a linear combination of factors, is a method of relating those factors to the properties of the samples for which the independent variables were obtained.

Raman spectrum ${ }^{4}$ is a graph of the radiant energy, or number of photons, scattered by the sample through the indirect interaction between the molecular vibrations in the sample and monochromatic radiation of frequency much higher than that of the vibrations. The abscissa is usually the difference in wavenumber between the incident and scattered radiation.

[^361](Normal) Raman scattering ${ }^{4}$ is Raman scattering that occurs through the polarizability, not the hyper-polarizabilities, and is excited by radiation that is not in resonance with electronic transitions in the sample. The scattering, in fact, occurs through the derived polarizability tensors, i.e., through changes in the polarizability during the vibrations. Raman wavenumber shift ${ }^{4}$,
$\Delta \tilde{v}$
is the wavenumber of the exciting line minus the wavenumber of the scattered radiation. SI unit: $\mathrm{m}^{-1}$. Common unit: $\mathrm{cm}^{-1}=100 \mathrm{~m}^{-1}$.
$\Delta \tilde{v}$
is positive for Stokes scattering and negative for anti-Stokes scattering.

## APPENDIX: CHEMOMETRIC APPLICATIONS

 AND MODEL BUILDINGChemometrics can legitimately be used with Raman data to create models that can be used for qualitative and/or quantitative analysis.

## Data Pretreatments

Pretreatments are mathematical manipulations of the spectra performed prior to the primary modeling step. The goal of pretreatments is to reduce the amount of irrelevant information, eliminating it from the model prior to the application of the primary technique. There are several data pretreatments that are typically used for removal of baseline anomalies. These include multiplicative scatter correction
(MSC), standard normal variate (SNV), and derivatives. Pearson's method, an iterative approach to baseline decurvature, works well for the correction of some sets of data.

## Library Construction and Use

Raman libraries are often used for compound identification. The test material can be tentatively known to the user or not. Libraries used for the purpose of raw material, intermediate, or formulation identity confirmation are best constructed from real production materials. This is particularly prudent in light of the fact that materials differing in crystallinity or polymorphic constitution will yield varying Raman spectra. Raman libraries purchased from a third party should be used judiciously.

Qualitative algorithms vary, and the appropriate choice is application dependent. For simple identifications, correlation algorithms often work well. These algorithms can be based on a variety of mathematical manipulations. Principal component-based methods such as discriminant analysis can also be used for qualitative analysis.

## Quantitative Calibration Approach

Raman spectroscopy can be used for quantitative analysis both for in-line and off-line work. There are some unique aspects concerning the use of quantitative Raman spectra that should be noted.

## ALGORITHMS FOR QUANTITATION

As in the case of NIR spectroscopy (see Near-Infrared Spectrophotometry $\langle 1119\rangle$ ), multivariate methods may be used to model Raman data. However, univariate analyses are often appropriate because of the resolution of information that Raman affords.

Both peak areas and peak heights can appropriately be used for Raman quantitation when univariate models are employed. Peaks should be reasonably well resolved when this approach is employed. As described above, peak ratios, as a rule, should be employed to account for peak intensity changes not related to the analyte. The judicious choice for a reference band is critical in such cases. Multivariate methods are also viable for Raman quantitation.
Multivariate curve resolution (MCR), which attempts to deconvolute the spectral data as a linear sum of its contributions, is a particularly effective means of dealing with Raman data that exhibit substantial change. This algorithm can potentially isolate the contribution from the analyte of interest and quantify the level of this contribution from sample to sample. The method is often employed in a non-negative mode making the resulting factors potentially interpretable.
Principal components analysis (PCA) can be used similarly to MCR. The contribution of each component generated can be used to semiquantitatively estimate the level of the analyte. Related to PCA, principal component regression (PCR) can also be used. This provides an opportunity for reference data to be employed and is thus truly quantitative.
In many circumstances, multiple linear regression (MLR) can be very effective for Raman quantitation. MLR gives the user the capability of using denominator data points, which can be very useful for Raman data. As with other types of data, the ability to choose multiple numerators can also work synergistically in a quantitative analysis.
Partial least squares (PLS) regression remains one of the more popular choices for Raman quantitation. PLS uses the reference data to orient the factor generation. This can be very effective, especially for the quantitation of low-level analytes.

The choice of appropriate quantitation tools varies from project to project. Both pretreatment methods and quantitative algorithms should be chosen wisely according to the goals. If isolated analyte and reference bands are available, univariate models are often a good choice. If quantitative estimates are all that are necessary or the sample set is a closed set (no future predictions will be made), then MCR or PCA are good choices. For reasonably extensive data sets with available reference data, MLR, PCR, or PLS can be used.■2S (USP28)

## BRIEFING

〈1177〉 Good Packaging Practices, page 1630 of $P F$ 29(5) [Sept.-Oct. 2003]. This chapter, which appeared in In-Process Revision, is published again, with minor editorial changes, for public comment.
(PSD: C. Okeke) RTS-41087-2

## Add the following:

## ■ $\langle 1177\rangle$ GOOD PACKAGING PRACTICES

This chapter provides general guidance on packaging considerations for Pharmacopeial preparations that may be stored, transported, and distributed. It describes procedures that should be considered to ensure that proper packaging practices are maintained. It does not affect any applicable requirements under good manufacturing practices, state laws governing pharmacy, the USP General Notices and Requirements or monographs, or provisions under approved labeling.

Definitions for storage conditions and packaging are provided in Preservation, Packaging, Storage, and Labeling under General Notices and Requirements. All equipment used for recording, monitoring, and maintaining these temperature and humidity conditions should be calibrated on a regular basis. This calibration should be traceable to national or international standards (see also the general information chapter Monitoring Devices-Time, Temperature, and Humidity $\langle 1118\rangle$ ).

## CONTAINERS

The monograph packaging and storage statement specifies that the container (primary package) should meet the requirements under Containers $\langle 661\rangle$ and ContainersPermeation $\langle 671\rangle$, which include the stipulations for determining if a container is "tight" or "well-closed." In most cases, compendial preparations are expected to be packaged in "tight" containers, especially if the article is moisture sensitive. In addition, where necessary, the packaging component should protect the preparation from light, reactive gases, solvent loss, microbial contamination, etc. "Tight" and "well-closed" containers are clearly defined in General Notices and Requirements (see Containers under Preservation, Packaging, Storage, and Labeling), whereas testing protocol and moisture permeation limits to determine if the container meets either of these definitions can be found in Containers $\langle 661\rangle$ and Containers-Permeation $\langle 671\rangle$ for single-unit and multiple-unit containers.

A packaging system is composed of a container system with its closure. This system may include several layers of protection for the Pharmacopeial preparation along with any sealing devices, delivery devices, labeling, and package inserts. The General Notices section also provides definitions for types of packaging systems that contain and protect a Pharmacopeial preparation (e.g., single-unit containers,
unit-dose containers, etc.). Stability testing is conducted on the dosage forms packaged in the container-closure system proposed for marketing.

One type of permeation test for multiple-unit containers is described in Containers-Permeation $\langle 671\rangle$. This test is intended for drug products being dispensed on prescription in vials with a container-closure system. The results of the test reflect the water vapor permeation through the container and through the closure. Limits have been established to define whether a container for dispensing has tight or well-closed characteristics with regard to water vapor permeation. FDA recommends that manufacturers perform this test on the container-closure system, although it is not specified in USP. In this particular test, the inner seal of the manufacturer's container-closure system is removed prior to testing.

Single-unit containers for capsules and tablets under Con-tainers-Permeation $\langle 671\rangle$ are measured for water vapor permeation according to the criteria for the four classes of containers (classes A-D).

The $U S P$ recognizes several official container materials that can be selected on the basis of their properties. Most containers are made of glass or plastic. Glass containers must be evaluated for chemical resistance and light transmission (if indicated) as described in Containers $\langle 661\rangle$. In addition, injectable medication containers should be reviewed according to the section Packaging under Injections $\langle 1\rangle$. Elastomeric closures should be evaluated separately as described in Elastomeric Closures for Injection $\langle 381\rangle$. Plastic containers should be assessed using different criteria for the three types of plastics as described in the following sections under Containers $\langle 661\rangle$ : Polyethylene Containers (PE) for dry oral solid dosage forms, Polyethylene Terephthalate Bottles and Polyethylene Terephthalate G Bottles (PET, PETG) for liquid oral dosage forms, and Polypropylene Containers (PP) for dry solid and liquid oral dosage
forms. As articulated in these sections, plastics should undergo testing for light transmission (if appropriate), water vapor permeation (see also Containers-Permeation $\langle 671\rangle$ ), extraction physiochemical testing, and biological testing (see also Biological Reactivity Tests, In Vitro $\langle 87\rangle$ and Biological Reactivity Tests, In Vivo $\langle 88\rangle$ ). For example, testing water vapor permeation for a PE container is conducted by sealing the container with heat-sealed foil laminate and measuring the water permeation in a humid atmosphere. Given that water vapor does not permeate the foil laminate, this test assesses only the properties of the container. The level of protection provided by a packaging system marketed with a heat-sealed foil laminate inner seal (prior to removal of the foil) is approximated by this test. However, in the case of a PET bottle for liquid preparations, water vapor permeation testing is done by filling containers with water and measuring the water loss rate in a dry atmosphere. Additional testing may be required for certain pharmaceutical dosage forms as well.

The container-closure system for the storage or shipment of a bulk liquid drug substance is typically plastic, stainless steel, a glass-lined metal container, or an epoxy-lined metal container with a rugged, tamper-resistant closure. Qualification of the container-closure system for these types of preparations includes evaluation for solvent and gas permeation, light transmittance, closure integrity, ruggedness in shipment, protection against microbial contamination through the closure, and compatibility and safety of the packaging components as appropriate (see Containers $\langle 661\rangle$ ).
Other information on container-closure systems may be found in FDA's Guidance for Industry: Container Closure System for Packaging Human Drugs and Biologics, www.fda.gov.

## PACKAGING

Packaging for Pharmacopeial articles can be divided into categories according to terminology generally accepted by industry. As mentioned earlier, the General Notices section provides some definitions for different types of containers classified by their characteristics and uses. In addition, the ASTM Committee D10 on packaging publishes terminology, practices, test methods, specifications, guides, and classifications for testing and evaluating packaging (see ASTM D99695, "Standard Terminology of Packaging and Distribution Environments"). Under certain rules and guidelines (e.g., such as 49 CFR, Dangerous Goods, and others), however, alternate terminology is used for the components described below. For terminology pertaining to repackaging processes, refer to Packaging Practice-Repackaging a Single Solid Oral Drug Product into a Unit-Dose Container〈1146〉.

Primary Container-This container is in direct contact with the Pharmacopeial preparation. The purpose of a primary container, also referred to as an immediate container, is to protect the preparation from environmental hazards during storage and handling. In some cases, the primary container is also a specialized delivery system, such as an aerosol or a metered-dose dispenser (see Pharmaceutical Dosage Forms $\langle 1151\rangle$ ). For the majority of oral dosage forms, the primary container consists of a cap and a bottle or a blister or pouch package that can be made from many different materials, including glass, plastic, single or laminated flexible materials, and metal. All components of the primary container must meet the requirements under 21 CFR for direct food contact and, where applicable, the USP requirements under Containers $\langle 661\rangle$ and Con-tainers-Permeation $\langle 671\rangle$. A full description of the primary container is included under the "Container/Closure

System" section of the New Drug Application (NDA), Abbreviated New Drug Application (ANDA), or other classes of FDA submissions.

Critical Secondary Container-This container is not in direct contact with the article, but it provides essential product stability protection. For example, a primary container may be packed inside a critical secondary container such as a pouch to provide moisture, gas, light, or microbial protection not afforded by the primary container. A description of the critical secondary container is included under the "Container/Closure System" section of the NDA, ANDA, or other classes of FDA submissions.

Secondary Container-This container encloses one or more primary containers. A secondary container is not always present. If used, it is usually designed for the final market presentation. Secondary containers are often used simply to carry required labeling or to keep individual primary containers together with delivery systems or other add-on features. Secondary containers can also provide protection against damage in the handling and distribution system. The most common secondary container is the standard folding carton. Some products, such as syringes, may be placed in trays prior to packing in a carton. Secondary container materials are not included in the container and closure description and require neither stability studies nor prior approval when making a change in the materials used.

Additional Packaging-A wide variety of additional packaging, such as trays and display cartons, may be used to hold primary containers.

Unit of Sale-This may be an individual bottle, a carton containing one or more bottles, or a tray with multiple primary containers. A unit of sale may contain more than one item for individual sale. For example, a display tray may have multiples of a single article or a variety of related articles from a single manufacturer, each intended for individ-
ual sale. The individual item intended for sale is referred to as a stock-keeping-unit (SKU). SKUs are distinguished by a discrete National Drug Code (NDC). Over-the-counter (OTC) articles contain a Universal Product Code (UPC) for all SKUs. A prescription SKU may be intended for final consumer use and may not be repackaged by a pharmacy. Such packages, often called "unit of issue" or "unit of use," require child-resistant (CR) packaging as described under 16 CFR 1700, "Poison Prevention Packaging," except for packages exempted by the Consumer Product Safety Commission. The CR feature is typically incorporated by the manufacturer (see Packaging-Unit of Use $\langle 1136\rangle$ ). OTC articles are regulated under the same rule, but only if they contain certain active ingredients above specified limits. Any regulated product shipped via the United States Postal Service (USPS) must meet the USPS rules under 39 CFR 111.

Final Exterior Package-This is typically a corrugated fiberboard box (case) or a wrapper. The shipping case label is affixed to this outermost layer and incorporates all of the bar codes required by the National Wholesale Druggists' Association (NWDA). This final package is normally shipped on pallets to distribution centers, wholesalers, and other large-volume customers. The manufacturer may or may not intend that this package enter the small-packageshipping environment as an individual unit without further protection.

Especially with fiberboard boxes, relative humidity (RH) may have a negative effect on the compression strength of the box, causing loads to shift and potentially damage the article or the outer and inner packaging. Articles stored in refrigerators or freezers, which are environments with high RH, are prone to this type of damage when stacked. The problem may be exacerbated by carton design, stacking pat-
tern, or use of low edge-crush-test corrugated fiberboard. Computer programs are available to determine the acceptable stack height and patterns on the basis of carton weight, style, size, and material. If problems occur, the product manufacturer should be contacted. Source materials and reference information on corrugated fiberboard boxes can be found in the "Fiber Box Handbook" published by the Fiber Box Association.
A wholesaler or other reshipper should not assume that the package received from the manufacturer is suitable for reuse. Many packages are customized for very specific routes and modes of transportation and are not suitable for other applications. Like any other shipping container, insulated cartons and inner protective packaging can be damaged during transit, thus affecting package performance and possibly allowing damage to contents if reused.

## ENVIRONMENTAL ISSUES

Packaging materials are regulated by a variety of federal, state, and local rules. In general, most pharmaceutical packaging containers can be recycled within local programs. The use of recycled material in primary containers is governed by the FDA, but it is generally not allowed. Pharmaceutical manufacturers commonly follow the most current Coalition of Northeastern Governors' rules (e.g., Model Toxics in Packaging Legislation) regarding heavy metals in packaging and other environmental issues.
Certain classes of Pharmacopeial articles may require special handling. Such articles include products classified as (1) Dangerous Goods under the Department of Transportation (DOT), state, local, or carrier rules; (2) controlled drugs under the Drug Enforcement Administration (DEA); or (3) scheduled substances under state regulations.

## LABELING

The labeling of shipping containers by manufacturers must be in compliance with the pertinent sections of FDA and DOT rules.

Dangerous Goods-The labeling of shipments classified as Dangerous Goods, including all information on the bill of lading or airway bill, must follow the instructions provided by the DOT, the International Air Transport Association (IATA), and the carrier. The exterior package must carry all of the required standard symbols for the class of goods, and the shipping container must comply with the performance standards for the articles enclosed. The shipper of record is responsible for compliance with the Dangerous Goods requirements.

Controlled Substances-When Pharmacopeial preparations that contain DEA-scheduled controlled substances are distributed to a patient directly via the USPS, these articles must be marked and labeled in accordance with USPS Domestic Mail Manual, Regulation Article C023, Section 7.2.■2S (USP28)

## Briefing

$\langle 1178\rangle$ Good Repackaging Practices, page 1219 of $P F$ 29(4) [July-Aug. 2003]. This proposed general chapter is being revised to eliminate references to "prepackager" and to address comments received. Editorial revisions have also been made.
(PSD: C. Okeke) RTS-40651-1

## Add the following:

## - $\langle 1178\rangle$ GOOD REPACKAGING PRACTICES

This chapter is intended to provide guidance to those engaged in repackaging of drug products in accordance with 21 CFR 10.90. A pharmacist who repackages under the state law needs to apply (1) the principal information provided in the USP general information chapter Packaging PracticeRepackaging a Single Solid Oral Drug Product Into a UnitDose Container $\langle 1146\rangle$ and (2) other beyond-use date references in the Expiration Dating section under General Notices and Requirements.

This chapter provides information to any person who removes drugs from their original manufacturer's container and repacks them into a different container-closure system for resale or for distribution to hospitals or other pharmacies. It does not apply to repackaging of any radioactive drug products, including oral solids.

A repackager referred to here may also be a contract packager or a contract repackager., or antract prepackager. The words "repackager" and "repacker" are the same in this text and may be used interchangeably. These functions are beyond the regular practice of a pharmacist. A repackager or prepacker is required to register with the FDA and comply with current Good Manufacturing Practices (cGMPs) regulations in 21 CFR 210 and 211.

A repackager is expected to meet the requirements of packaging practice under 21 CFR 210 through 226. Because the packaging practice relates to packaging, processing, or holding a drug product intended for administration to humans or animals, the repackager is expected to comply with regulations such as those relating to the sections pertaining to quality control, personnel qualifications, building and fa-
cilities, equipment, production and process controls, packaging and labeling controls, laboratory controls, master production record, batch records and reprints, distribution records, storage control records, and complaint files.

## DEFINITIONS

For the purposes of this chapter repackager, contract packager, and contract repackager prepacker, and prepackager are defined as follows:

A REPACKAGER is one who purchases and removes a drug product from the manufacturer's market container or bulk dosage container and places the product into a different container for distribution for human or animal use. A repackager may or may not take ownership from the manufacturer. A repackager is engaged in the repackaging of drugs (see also Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container $\langle 1146\rangle$ for more definitions of a repackager).
A CONTRACT PACKAGER is one who is contracted by original drug manufacturers to package or repackage their product into a single- or multi-unit container chosen by the manufacturer. These containers should meet all the applicable requirements in this chapter, pertinent sections in general test chapters Containers $\langle 661\rangle$ and ContainersPermeation $\langle 671\rangle$, and comply with 21 CFR food additive requirements.

AN EQUIVALENT CONTAINER-CLOSURE SYSTEM refers to a container-closure system that yields the same, or better, moisture vapor transmission rate (MVTR), oxygen transmission, and light transmission as the original market container. These values may be determined by the repackager, or they may be obtained from the container-closure vendor for the specific container-closure system under consideration.

BEYOND-USE DATE (BUD) AND DISCARD-AFTER DATE are equivalent and are assigned using the criteria stated in the relevant section below.

EXPIRATION DATE is determined using stability studies and is not the same as beyond-use date or discard-after date.

## FACILITIES

The facility in which repackaging is practiced should be operated in conformity with cGMPs. The environmental conditions during the packaging and storage operation of the drug product should comply with the controlled room temperature (see General Notices), storage in a dry place, and other requirements as directed by the manufacturer or supplier, especially if the drug requires storage at special temperature and humidity conditions (see Good Storage and Shipping Practices $\langle 1079\rangle$ ).

## ACQUISITION PROCESS

The repackager is expected to perform appropriate analytical testing for all pertinent specifications, such as identity and strength of each active ingredient, and any other finished product tests to establish valid analytical data. The repackager is expected to maintain records of such analyses on a batch-by-batch basis for the repackaged product that is either transferred to the repackager by the manufacturer or independently maintained by the repackager.
"Bulk" in this text refers to the quantity of either drug product or dosage form. The following criteria should be considered by the repackager upon receipt of bulk prior to repackaging.
(a) The bulk article should be distributed to the repackager by the manufacturer in accordance with all regulatory requirements and accompanied by appropriate labeling and a valid expiration date. The repackager should also
receive Material Safety Data Sheets (MSDS), Certificates of Analysis, and sample market labeling, including inserts from the drug product manufacturer.
(b) The bulk article should be received intact and undamaged and in properly labeled containers with the Certificate of Analysis.
(c) The bulk article should undergo definitive organoleptic evaluations to confirm its identity (e.g., physical appearance, marking, color, and odor) and to confirm the labeling as described by the manufacturer.
(d) Records should be maintained to verify the identity and quantity of each shipment received and to verify the lot number and bar coded information for each article of the bulk shipment received. This record should also include the name of the manufacturer or supplier and its lot numbers and the date of receipt.
(e) The repackager should store and maintain the bulk under storage conditions specified by the manufacturer, and/or as directed under controlled room temperature (see General Notices).

## REPACKAGING PROCESS

The following criteria should be observed.
(a) The repackaging operations should be conducted under conditions that meet specified storage temperature definitions (see General Notices). Conditions of operation include maintenance of controlled room temperature in the area where the repackaging operation is conducted or other conditions as instructed by the manufacturer.
(b) The manufacturer should include, in the package insert or in other appropriate literature supplied to the repackager, the following information about the packaging: materials of construction of the market package, its

MVTR (see USP general chapter $\langle 671\rangle$ ), as well as oxygen transmission and light transmission characteristics in order to enable the repackager to properly select an equivalent container-closure system. If the repackager does not use a container-closure system equivalent to the manufacturer's market package, then the repackager must generate stability data for the drug product in the new container-closure system to justify the expiration date or BUP assigned.
(c) The repackaging containers are labeled with the same labeling information as the market label that is used by the manufacturer. The conditions on the labeling should meet those required under 21 CFR 201, 211.122, 211.125, and 211.130.
(d) Written procedures should be maintained to ensure that correct labels, labeling, and packaging materials are used for drug products.
(e) All requirements for repackaging of bulk products should meet 21 CFR 211.
(f) The packaging materials should meet the test requirements provided in 21 CFR in direet food additives or additives that have been approved as foodeontact sub staces. Semeral comply with 21 CFR food additives regulations and all applicable requirements in USP general chapters $\langle 661\rangle,\langle 671\rangle$, and $\langle 1146\rangle$.

## LABELING

A repackager should provide appropriate labeling of the product identical to the manufacturer's approved market container. All repackaged products should be labeled with an appropriate BUD in the absence of stability data, or with an expiration date in cases where suitable stability studies, determined in CFR 211.166 (for recommended conditions
see International Conference on Harmonization ICH Q1A Stability Testing of New Drug Substances and Products), have been performed on the product using the repackager's container. The expiration date will ensure that the products meet applicable standards of identity, strength, quality, and purity at the time of use.

## EXPIRATION DATE/BEYOND-USE DATE

## Expiration Date

Stability studies are performed on the drug product in the original manufacturer's containers to establish an expiration date. When a drug is repackaged into a different container, the product's expiration date is altered or interrupted.
(a) The repackager may perform stability studies on the repackaged products to establish an expiration date for the product based on scientific evaluation of the drug product in the container-closure system in which it is to be marketed.
(b) A repackager may use the manufacturer's original expiration date without additional stability testing if the drug product is repackaged into an equivalent contain-er-closure system that is at least as protective as, or more protective than, the original system and complies with criteria established for equivalency. Establishment of system equivalency means (1) that the requirements of USP general test chapters $\langle 661\rangle$ and $\langle 671\rangle$ are met and (2) that the specifications such as light transmission, seals, or desiccants associated with the original container-closure system, or special protective materials in which the drug product is marketed, are the same. Comparison of container-closure systems may be done through stress testing of the product after storage under exaggerated conditions of temperature and
humidity. If the repackager does not use a containerclosure system equivalent to the manufacturer's market package, then the repackager must generate stability data for the drug product in the new container-closure system to justify the expiration date or BUD assigned.
(c) A repackager should not use the equivalency contain-er-closure system criteria to repackage drug products where such products have been identified by the manufacturer to have stability problems or if the manufacturer specifically states that the product should not be repackaged using the equivalency container-closure system criteria. For example, "This product is labile (e.g., moisture sensitive) and therefore should be dispensed only in the original manufacturer's container". In this case, a repackager needs to demonstrate the stability of the drug product in the repackager's containerclosure system.
(d) Establishing the expiration date in the case listed in (c) is applicable for unit-dose containers, mul-tiple-unit containers, and unit-of-use container types.

## Beyond-Use Date or Discard-After Date

In the absence of stability data, where a repackager repackages a product into a unit-dose or multiple-unit container without conducting appropriate stability studies to support expiration dates used, the period of use of the product is limited by the BUD for the repackaged product, which must be less than the expiration date.

## UNIT-DOSE PACKAGING

For unit-dose packaging, the following criteria should be considered.
(1) The original bulk container of the drug product to be used for repackaging has not been previously opened.
(2) The contents of the original bulk drug product to be repackaged are repackaged at one time.
(3) The unit-dose container meets USP general test chapter $\langle 671\rangle$ testing requirements for either Class A or Class B containers.
(4) The unit-dose container meets or exceeds the manufacturer's specification for light resistance.
(5) The conditions of storage meet the storage specifications provided in the General Notices and as described in the labeling by the manufacturer of the bulk product. Where no specific storage conditions are specified, the product should be maintained at controlled room temperature and in a dry place during repackaging.
(6) The BUD used for the repackaged product does not exceed 6 months from the date of repackaging.
(7) The BUD does not exceed the manufacturer's expiration date.
(8) The BUD does not exceed $25 \%$ of the time between the date of repackaging and the expiration date shown on the manufacturer's bulk article container of the drug being repackaged.
(9) Documentation should be in place to show that the preceding criteria (items $1-8$ ) are met. Documentation to show the type of packaging material used and the testing for these materials is also kept on file.
(10) The repackager may not repackage if the manufacturer specifically states "Do not repackage." However, the repackager may affix the repackager's labeling if it is
in accordance with FDA requirements and in agreement with the manufacturer of the drug product.
(11) The repackager may not use the expiration date and BUD interchangeably because they imply the presence or absence of stability testing, respectively.

## MULTIPLE-UNIT PACKAGING

The General Notices define multiple-unit packaging as a package that contains more than one single-dosage unit. For multiple-unit packaging, the following criteria should be considered in assigning a BUD.
(1) The original bulk container of drug product to be used for repackaging has not been previously opened.
(2) The contents of the original bulk drug product to be packaged are repackaged at one time.
(3) The conditions of storage meet the storage specifications in the General Notices and as described in the labeling of the manufacturer's bulk product. Where no specific storage conditions are specified, the product should be maintained at controlled room temperature and in a dry place during repackaging.
(4) The type of container used for repackaging should be the same type used by the manufacturer as the market container, and the product container should comply with the requirements for containers as directed under USP general test chapters $\langle 661\rangle$ and $\langle 671\rangle$, as well as the requirements of 21 CFR for food additives, or the container should be composed of an approved food contact substance. For example, if the manufacturer packages in glass, the repackager should repackage in glass of the same type used by the manufacturer or in chemical-resistant glass containers.
(5) Where the original container is a material other than glass or high density polyethylene (HDPE), the repackager may use a container demonstrated to be equivalent to, or exceed, the protective properties of the manufacturer's multiple-unit market container when performing the applicable tests as described in USP general test chapters $\langle 661\rangle$ and $\langle 671\rangle$.
(6) Where the original container is polyethylene, the repackager may repackage in a chemical-resistant glass container or a polyethylene container. These containers should meet the appropriate tests and specifications in 21 CFR and USP general test chapters $\langle 661\rangle$ and $\langle 671\rangle$.
(7) The container meets or exceeds the test results of the manufacturer's multiple-unit market container for light transmission.
(8) The container meets or exceeds the manufacturer's container in special protective features: methods used to prevent leaching of container materials or the use of desiccants to maintain low moisture content. [NOTEDesiccants should always be packaged on top of the drug product.]
(9) The container meets or exceeds the manufacturer's container test results for "tight" as provided in USP general test chapters $\langle 661\rangle$ and $\langle 671\rangle$.
(10) For all products, if the repackager uses a container that is equivalent in MVTR to the manufacturer's container or one that has a higher barrier, then the BUD should be 12 months or the manufacturer's expiration date, whichever is less. (See USP general information chapter $\langle 1146\rangle$ for a description of low- and high-barrier packaging.)
(11) The repackager may not repackage the original bulk container of the drug product if the manufacturer specifically states "Do not repackage." However, the repackager may affix the repackager's labeling if this is in accordance with FDA requirements or the specifications of the drug product manufacturer.

## MINIMUM REQUIREMENTS

The following represents the minimum requirements a repackager must meet in order to engage in repackaging drugs from their original manufacturer's container.
(a) A repackager is expected to comply with cGMPs and 21 CFR 211.170(b) for retained samples of repackaged drug products. Any alteration or manipulation of the repackaging process should be documented in accordance with the requirements in 21 CFR 211.
(b) A repackager is expected to repack penicillins, or products such as penicillins, in facilities separate from those facilities used for drug products as described in 21 CFR 211.42 and 21 CFR 211.46.

## SHIPPING AND DISTRIBUTION

For products identified by the manufacturer as moistureand temperature-sensitive, the repackager must follow the specifications provided by the manufacturer during repackaging, shipping, and distribution.
(a) A repackager may not repackage a moisture- and tem-perature-sensitive product if the manufacturer so instructs, except if the repackager is only altering the labeling in accordance with FDA requirements.
(b) The repackaging container should show the equivalent of or be better in protective properties than the manufacturer's original container. For moisture-sensitive
products, a higher-barrier container should be used for repackaging.
(c) The repackager should have proper documentation in place to show the equivalency in protection of the container used.
(d) The storage and handling of the drug product should meet the conditions specifically instructed by the manufacturer of the product.
(e) The repackager should label the container "Contains moisture-sensitive product."

For all other products, the repackager should follow the same guidelines provided in Good Storage and Shipping Practices $\langle 1079\rangle$ that are applicable to a manufacturer. ${ }^{2 S}$ (USP28)

## Briefing

$\langle 1208\rangle$ Sterility Testing-Validation of Isolator Systems, USP 27 page 2613. The proposed revision of this general information chapter includes the replacement of references to sterilization with references to decontamination, thereby reflecting more accurately what is accomplished by treating the inside of an isolator with a process that eliminates viable bioburden. Other changes reflect the new ISO standards $14644-1,-2,-3$, and -7 .
(AMB: D. Porter) RTS-41772-1

## Change to read:

This chapter provides guidelines for the validation of isolator systems for use in sterility testing of compendial articles. [NOTE-In the context of this chapter, sterilized

■"decontaminated" ${ }^{\text {as (USP28) }}$
refers to an item or surface that has been subjected to a process that eliminates viable bioburden.]

Isolators-devices that create controlled environments in which to conduct Pharmacopeial sterility tests-have been used since the mid-1980s. An isolator is either sealed or supplied with air through a mierobial retentive
$\square^{-}$HEPA or better air $_{\text {■2S (USP28) }}$
filter and is able to be reproducibly sterilized. When closed, it uses enly sterilized interfaces or a specialized rapid transfer pert for the transfer of materials. When open, it allows the egress of materials threugh a define opening that has been designed and validated to preclude the entry of contamination. Isolaters are construeted of flexible plasties (such as polyrinyl chleride), rigid plasties, glass, Or stainless steel.
-decontaminated. Closed isolators, which are systems with no direct opening to the external environment, are normally used for sterility testing, although open isolators which allow the egress of materials through a defined opening that precludes the entry of contamination by means of air overpressure may be used. Closed isolators use only decontaminated interfaces or a rapid-transfer port for the transfer of materials. Isolators are constructed of flexible plastics (such as polyvinyl chloride), rigid plastics, glass, or stainless steel. 2 2S (USP28)

Isolator systems protect the test article and supplies from contamination during handling by essentially eliminating direct contact between the analyst and the test articles. All transfers of material into
-and out of ${ }_{\text {n2S }}$ (USP28)
the isolator are accomplished in an aseptic fashion while maintaining complete environmental separation. Aseptic manipulations within the isolator are made with half-suits, which are flexible components of the isolator wall that allow the operator a full range of motion within the isolator, or by gloves and sleeves. Operators are not required to wear special clean-room clothing for conducting sterility tests within isolators; standard laboratory clothing is adequate,

■although a pair of sterile gloves is frequently worn under the isolator gloves as an added precaution against contamination entering the isolator enclosure and for hygiene pur-
poses.m2S (USP28)
The interior of the isolator is treated with sporicidal chemicals that result in the elimination of all viable bioburden

- on exposed surfaces. $\quad$ 2S (USP28)

## Change to read:

## ISOLATOR DESIGN AND CONSTRUCTION

## Air Handling Systems

An isolator used for sterility testing is equipped with microbial retentive filters (HEPA filters
$\mathbf{- o r}$ better $_{\text {2S (USP28) }}$
are required). At rest, the isolator meets the particulate air-quality requirements for Class 100 area as defined in U.S. Federal Stan dard-209E

■an ISO Class 5 area as defined in ISO 14644-1 through $-3^{*}$ 2S (USP28)
(see Microbio
(see Microbiological Evaluation of Clean Rooms and Other Controlled Environments $\langle 1116\rangle$ ). However, the isolator need not meet Glass 100 conditions during operation, and ne requirements for air velocity or air exehange rate exist. The isolator system is leak proof, however, it is not generally impermeable to gas exchange with the strrounding environment.
-Class 5 conditions during an operation that may generate particulates, and no requirements for air velocity or air exchange rate exist. The isolator should be sealed well enough during decontamination that the dissemination of sporicidal vapors or gases into the surrounding environment is kept to
appropriately low levels.■2S (USP28)
When direct openings to the outside environment exist, constant air overpressure conditions maintain sterile conditions within the isolator.
-In general, both open and closed isolators are maintained at positive pressure relative to the surrounding environment,
and overpressures of 20 to 40 Pa are typical. $\quad$ 2S (USP28)
Airflow within isolators used for sterility testing is
■ither $_{\text {n2S (USP28) }}$
unidirectional or turbulent.

## Transfer Ports and Doors

Isolaters are attached to a "pass through" sterilizer to enable the direet transfer of sterile media, sterile dilution fluids, and-sterile supplies from the sterilizer into the isolater system. Specially designed rapid transfer perts or doers (RTPs) enable isolaters to be connected to one another, so that supplies ean be moved aseptically from one isolator to mother. Aseptic connections between two isolators or an isolator and a container can be made in unelassified enviremments using RTPs.
-Isolators may be attached to a "pass-through" decontaminator or transfer isolator to enable the direct transfer of sterile media, sterile dilution fluids, and sterile supplies from the decontaminator into the isolator system. Rapid transfer ports (RTPs) enable two isolators, i.e., the work station and transfer isolator, to be connected to one another, so that supplies can be moved aseptically from one isolator to another. Aseptic connections between two isolators or an isolator and an RTP-equipped container can be made in unclassified environments using RTPs.■2S (USP28)

[^362]The nonsterile surfaces of the RTP are connected using locking rings or flanges. A compressed gasket assembly provides an airtight seal, thereby preventing the ingress of microorganisms.

When the two RTP flanges are linked to form an airtight passage, a narrow band of gasket remains that could harbor microbial contamination. This exposed gasket is
$\square_{\text {should }} \mathrm{be}_{\text {п2S }}$ (USP28)
treated with a sporicidal agent immediately after the connection is made, and before materials are transferred through the RTP. Good aseptic technique is used when transferring materials and care is taken not to touch the gasket with the materials being transferred or with the gloved hands.

Preventive maintenance and lubrication of the gasket assemblies on the flanges is performed according to the RTP manufacturer's recommendations. The RTP gaskets are changed at the recommended frequency and periodically checked for damage, since cut or torn gaskets cannot make a truly airtight seal.

## Selection of a Location for the Isolator

Isolators for sterility testing need not be installed in a classified clean room, but it is important to place the isolator in an area that provides limited access to nonessential staff. The appropriate location provides adequate space around the isolator for moving transfer isolators, staging of materials, and general maintenance. No environmental monitoring of the surrounding room is required.

Temperature and humidity control in the room is important to operator safety and comfort and is critical for the effective utilization of certain sterilization-or

- $\quad$ 2S (USP28)
decontamination technologies. If an-isolater is directly in the flow path of an air supply grille, it could cool sections of the isolator's walls and result in condensation during vaper sterilization.
-n2S (USP28)
Uniform temperature conditions in the room are desirable when temperature-sensitive sterilization
-decontamination $_{\text {■2S (USP28) }}$ methods are employed.
- Care should be taken in locating the isolator so that cold spots are avoided that might result in excessive condensation when condensing vapors are used for decontamination. ${ }^{2 S}$ (USP28)

## Change to read:

## VALIDATION OF THE ISOLATOR SYSTEM

The isolator system must be validated before its use in sterility testing as part of a batch release procedure. To verify that the isolator system and all associated equipment are suitable for sterility tests, validation studies are performed in three phases: installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ). The following sections contain points to consider in the validation of isolator systems for sterility testing. The assignment of test functions to a particular phase of the validation program (i.e., IQ, OQ, and PQ) is not critical, as long as proper function of the isolator is demonstrated and documented before its use in compendial Assays.

## Installation Qualification (IQ)

The IQ phase includes a detailed description of the physical aspects of the system, such as the dimensions, internal configuration, and materials of construction. The unit layout is diagrammed with interfaces and transfer systems clearly and dimensionally indicated. Compliance with design specifications for utility services, such as air supply, vacuum, external exhaust, and temperature and humidity control, is verified. Other equipment used with the isolator system is also described in detail; if any revisions to design specifications are made, these are included. Equipment manuals and copies are catalogued and stored where they can be retrieved and reviewed. Compliance of drawings to design specifications is verified. All drawings and process and instrumentation diagrams are catalogued, stored, and are retrievable.

All documentation is reviewed to verify that it precisely reflects the key attributes of the installed system. This establishes a general benchmark for the isolator system's compliance with design specifications and installation requirements.

Potential process-control or equipment problems that could cause system failure during operation are identified and documented during failure-mode analysis and hazard analysis. The system is modified, if necessary, to minimize the risk of failure, and critical control point methods are established.

The results of the IQ are summarized in an Installation Qualification Report. The following documentation is suggested.

Equipment-The equipment is listed with its relevant design specifications. The IQ verifies that equipment meeting the appropriate design specifications was received and that it was installed according to the manufacturer's requirements.

Construction Materials-The construction materials of critical system components are checked for compliance with design specifications. The compatibility of the intended sterilization

- decontamination $_{\mathbf{m}_{2 S} \text { (USP28) }}$
method with the construction materials is verified.
Instruments-System instruments are listed with their calibration status.

Utility Specifications-All utilities required for operation-as defined in the operating manuals and process and instrumentation diagrams-are checked for availability and compliance with design specifications. Any connection between utility systems and the isolator system is inspected and conformance of these connections to specifications is verified.

Filter Certification-HEPA filters and other microbial retentive filters are tested and certified; copies of test results and certificates are included in the IQ summary. Purchase orders are reviewed and conformance of the air filtration system to specifications is verified.

Computer Software-All computer software associated with the isolator system is listed with its name, size, and file revision number. The master computer disks are checked for proper labeling and stored securely.

## Operational Qualification (OQ)

The OQ phase verifies that the isolator system operates in conformance to functional specifications.

Operational Performance Check-This test verifies that all alert and alarm functions comply with their functional specifications. The system's ability to comply with all set points and adjustable parameters is verified.

Isolator Integrity Check-The integrity of the isolator is maintained during all normal operating conditions. A leak test is performed to verify the compliance with the manufacturer's functional specifications and to ensure safety prior to charging the isolator with a sterilizing

- decontaminating sporicidal $_{\mathbf{m}_{2 S} \text { (USP28) }}$
chemical. To safeguard against adventitious contamination, isolators are operated at a positive pressure differential of about 20-40 Pa during normal operation. If constantorpressure is needed, va tidation studies must show that the
-Validation studies must show that the air pressure ${ }_{\text {nes }}$ (USP28) set point can be maintained and controlled during operation.

## Sterilization

■Decontamination ■2S (USP28)
Cycle Verification A sterilization eyele is performed to verify that all actual values conform to cyele steps and set points.

- A decontamination cycle that is the function of the decontamination equipment in concert with the isolator(s) is verified. $\mathbf{D S S}^{\text {S }}$ (USP28)

## Different sterilization

- decontamination ${ }_{\text {W2S (USP28) }}$
methods can be used to eliminate bioburden from isolator systems and supplies. Among the chemicals that have been used to treat isolators are peracetic acid, chlorine dioxide, ozone, and hydrogen peroxide; each has different requirements for exposure conditions and process control. It is critical to comply with the manufacturer's operational requirements for the selected sterilization
- decontamination ${ }_{\text {n2S }}$ (USP28).
method and to describe them in the functional specifications. Temperature and humidity control within the room is critical when hy drogen peroxide vaper is used in sterilization.

■ ${ }^{-1 S}$ (USP28)
The temperature inside the isolator is also important, particularly for hydrogen peroxide vapor sterilization
-decontamination, ${ }^{2 S}$ (USP28)
where it is critical to maintain the concentration
-relative to ${ }_{\text {■2S }}$ (USP28)
the condensation point. Some sterilization chemicals, such as chlorine dioxide and ozone, require the addition of moisture to the isolator prior to stilizan

- decontamination. 2SS (USPP8) $^{2}$

When elevated relative humidity is required, the ability to control it must be verified during OQ.
It is also important to verify the concentration and distribution of the sterilizing

- decontaminating ${ }_{\text {n2S }}$ (USP28)
chemical. When applied in gaseous or vapor form, the tien is measured using chemicalindicaters, spectrescepic metheds, or electrenic sensors. Distribution may atso be tested using chem iealindieaters.
- distribution may be evaluated using chemical indicators,
spectroscopic methods, or electronic sensors. $\mathbf{Q 2 S}^{\text {S }}$ (USP28)
[NOTE Chemical indieators provide qualitative, but not quantita-
tive, information.]
■ ${ }^{\text {n }}$ (USP28)
Gas and vapor sterilization
- decontamination $\mathbf{■ 2 S ~ ( U S P 2 8 ) ~}^{\text {( }}$
methods require fans in the isolator to distribute the chemical evenly. The location and orientation of these fans are adjusted to ensure optimum air distribution.
-If the isolator utilizes a recirculating unidirectional airflow system, distribution fans may not be required, but this should be evaluated on a case-by-case basis. $\quad$ 2S (USP28) Because shelving units, equipment, glove-and-sleeve assemblies, and half-suits have an impact on distribution patterns, distribution checks are done with the isolator fully loaded with equipment and supplies, and the setup of these units is defined and documented.

Many installations use smaller transfer isolators as portable surface sterilization

- decontamination $_{\text {ne }_{2 S}}{ }_{\text {(USP28) }}$
units. In these transfer isolators, test articles and supplies are treated chemically to eliminate bioburden before transfer through an RTP into the testing isolator. Its loading configuration is defined, and configuration drawings are reviewed and verified during the OQ. [NOTE-The sterilizing
- decontaminating $_{\text {M2S (USP28) }}$
chemicals used in isolators work on the surfaces of materials; therefore, any surface that is occluded will not be treated and could contain viable bioburden.
-Special precautions should be in place for treating surfaces known to be occluded with a sporicide if such surfaces may be revealed during the conduct of sterility tests.] $\mathbf{m}_{\text {2S (USP28) }}$

## Sterilization

- Decontamination ${ }_{\text {■2S }}$ (USP28)
agents need to be removed from the isolator after the exposure period, which is accomplished by a current of fresh air provided either by the sterilization
- decontamination $_{\text {® }_{2 S} \text { (USP28) }}$
equipment or by semether means
-utilizing the isolator air handling system. ${ }^{2 S}$ (USP28)
Aeration is accomplished either in an open loop, in which the gas is exhausted through a vent to the atmosphere, or in a closed loop, in which the chemical is removed and destroyed by the sterilization
- decontamination ${ }_{\text {■2S (USP28) }}$
equipment. The aeration system is checked; if an open-loop configuration is used, the external exhaust system's flow and safety are checked.

## Sterilization

-Decontamination ${ }_{\text {m2S }}$ (USP28)
Cycle Development - When the OQ is completed, serilizat

- decontamination $_{\mathbf{m}_{2 S} \text { (USP28) }}$
cycle development is performed to establish the parameters necessary for process control during routine sterilization
- decontamination $_{\text {■ }^{2 S} \text { (USP28) }}$
cycles. Any of the methods generally used in the industry for the validation of sterilization
- decontamination $_{\mathbf{m}_{2 S} \text { (USP28) }}$
processes-including bioburden-based,
- fractional cycle, $\mathbf{m}_{2 S}$ (USP28)
and overkill methods-are adequate. The sterilization
- decontamination $_{\mathbf{m}_{2 S}(\text { USP28) }}$
process is challenged with biological indicators (BIs). The spore population and resistance of the BIs to the serilization
- decontamination $_{\mathbf{m}_{2 S}(\text { USTP28) }}$
conditions being applied is
-are $_{\text {n2S }}$ (USP28)
known. Wherever possible, atre- $D$ value-is oblaned for the B system
-a D value or survivor curve for the BI system is estima-

## $\operatorname{ted}_{\mathbf{2 S}}$ (USP28)

(see Biological Indicators—Resistance Performance Tests $\langle 55\rangle$ ); it is acceptable to obtain the D value from the BI vendor. When it is impossible determine an aceurate $D$ walue and no means to ver ify the eoncentration of the sterilizing agent are available, the half eyele appreach to cyele development and verifieation is employed.
-n2S (USP28)

## Performance Qualifications (PQ)

The PQ phase verifies that the system is functioning in compliance with its operator requirement specifications. At the completion of the PQ phase, the efficacy of the sterilization

- decontamination ${ }_{\text {2S }}$ (USP28) cycle and, if appropriate, the adequacy of sterilizing
-decontaminating ${ }_{\text {n2S }}$ (USP28)
chemical venting are verified. All PQ data are adequately summarized, reviewed, and archived.
Cleaning Verification-In general, cleaning is not critical for sterility testing applications. However, residual products are a concern in multiproduct testing, particularly for aggressive antimicrobial agents, because these materials could interfere with the ability of subsequent tests to detect low levels of contamination in the product. Concerns about contamination with the product are heightened when it is an inherently antimicrobial powder, because powders are more readily disseminated. Cleaning to a level at which no visible contamination is present is adequate for sterility test isolator systems and is a suitable operator requirement specification. The cleaning method, frequency, equipment, and materials used to clean the isolator are documented.

## Sterilization

-Decontamination. ${ }_{\text {2S (USP28) }}$
Validation-The interior surfaces of the isolator, the equipment within the isolator, and the materials brought into the isolator are treated to eliminate all bioburden. The strilizan

- decontamination $_{\mathbf{Q 2 S}^{\text {(USP28) }}}$
of isolator surfaces, sterility testing supplies, and test articles is different from the sterilization
- decontamination $\mathbf{D V S S}_{\text {(USP28) }}$
of product contact parts or drug components used in product manufacturing. The methods used to sterilize
- decontaminate $_{\text {. } 2 \mathrm{~S}}$ (USP28)
an isolator may be able to achieve log reduction values of production overkill processes. This level of assurance of sterility eanmet be gutranteed over time.
$\square_{\text {of six }}$ logs or greater; however, this does not mean that an isolator enclosure and materials within that enclosure can be
maintained free of bioburden. $\mathbf{m}_{2 S}$ (USP28)
Upon completion of the sterilization
- decontamination $_{\text {m }_{2 S} \text { (USP28) }}$
process, asepsis within the isolator is maintained primarily by the air filtration system, by the appropriate materials transfer operations, and, most importantly, by the integrity of gloves,

■leeves, and half-suits $_{\mathbf{m}_{\text {2S }} \text { (USP28) }}$
used to conduct aseptic manipulations.
The sterilization

- decontamination $_{\text {■ } 2 \text { S (USP28) }}$
methods used to treat isolators, test articles, and sterility testing supplies are capable of reproducibly yielding a-six log kill
- greater than a three-log reduction $_{\mathbf{m}_{2 S} \text { (USP28) }}$
against an appropriate,
-m2S (USP28)
highly resistant biological indicators (see Biological Indicators for Sterilization $\langle 1035\rangle$ ), as verified by the fraction negative or total kill analysis methods. Total kill analysis studies are suitable for BIs with a population of $1 \theta^{4}$
$-10^{3}$ 2S (USP28)
spores per unit, while fraction negative studies are suitable for BIs with a population of $10^{5}$ or greater. A sufficient number of BIs are used to prove statistical reproducibility and adequate distribution of the sterilizing
- decontaminating $_{\text {■2S }}$ (USP28) .
agent. Particular attention is given to areas that pose problems relative to the concentration of the agent. A larger number of BIs are used
$\mathbf{m}_{\text {may }}$ be required ${ }_{\text {m2S (USP28) }}$
in isolators that are heavily loaded with equipment and materials. Also, when it is not pessible to use one or mere calibrated sensers to direetly meastre the concentration of the sterilizing agent, the placement of additional BIs is considered.

■ 2S (USP28)
The ability of the process to reproducibly deliver a six log

kill is confirmed in three consecutive validation studies.
The operator establishes a frequency for resterilization
$\square_{\text {re-decontamination }}^{\mathbf{m}_{2 S} \text { (USP28) }}$
of the isolator. The frequency may be as short as a few days or as long as several weeks, depending on the sterility maintenance effort (see Maintenance of Asepsis within the Isolator Environment).

## Change to read:

## PACKAGE INTEGRITY VERIFICATION

Some materials are adversely affected by sterilizing

- decontaminating $_{\text {■ }_{2 S}}$ (USP28) $^{\text {d }}$
agents, which can result in inhibition of microbial growth. Of concern are the penetration of sterilizing
- decontaminating $_{\text {■2S (USP28) }}$
agents into product containers; accessory supplies such as filter sets and tubing; or any material that could come in contact with product, media, or dilution fluids used in the sterility test. It is the responsibility of the operator to verify that containers, media, and supplies are unaffected by the reemmended sterilization
- decontamination $_{\text {■2S }}$ (USP28)
process. Screw-capped tubes, bottles, or vials sealed with rubber stoppers and crimp overseals have proven very resistant to the penetration of commonly used sterilizing
- decontaminating ${ }_{\text {as }}{ }^{2 S}$ (USP28)
agents. Wrapping materials in metal foil or placing them in a sealed container will prevent contact with the sterilizing
- decontaminating $_{\text {■2S (USP28) }}$
agent; however, these procedures may also result in some surfaces not being sterilized
- decontaminated. In some cases, the use of shorter duration decontamination cycles and reduced concentrations may be necessary to minimize penetration of decontaminating agents into the package or container. Cycles that provide a less than three-log kill of resistant BIs may be acceptable provided microbiological analysis of the environment proves that the isolator(s) are free of recoverable biobur-

## den.m2S (USP28)

In many cases, the operator will choose to treat the surfaces of product containers under test with the sterilizing

- decontaminating ${ }_{\text {men }}$ (USP28)
agent in order to minimize the likelihood of bioburden entering the isolator. It is the responsibility of the operator to demonstrate, via validation studies, that exposure of product containers to the ster illzing
- decontaminating $_{\mathbf{a}^{2 S} \text { (USP28) }}$
agent does not adversely affect the ability of the sterility test to detect low levels of contamination within these test articles. It is suggested that the ability of the package to resist contamination be examined using both chemical and microbiological test procedures. Bacteriostasis and fungistasis validation tests must be performed using actual test articles that have been exposed to all phases of the sterilization
- decontamination $_{\text {■2S }}$ (USP28)
process (see Sterility Tests $\langle 71\rangle$ ). This applies to medicinal device packages as well as pharmaceutical container and closure systems.

Validation studies determine whether both sterility test media and environmental control media meet the requirements for Growth Promotion Test of Aerobes, Anaerobes, and Fungi under Sterility Tests $\langle 71\rangle$.

## Change to read:

## MAINTENANCE OF ASEPSIS WITHIN THE ISOLATOR ENVIRONMENT

The ability of the isolator system to maintain an aseptic environment throughout the defined operational period must be validated. In addition, a microbiological monitoring program must be implemented to detect malfunctions of the isolator system or the presence of adventitious contamination within the isolator. Microbiological monitoring usually involves a routine sampling program, which may include, for instance, sampling following sterilization

- decontamination $_{\text {■2S (USTP28) }}$
on the first day of operation and sampling on the last day of the projected maintenance of asepsis period. Intermediat sampling is
-Periodic sampling throughout the use period can be $_{\text {m2S (USP28) }}$
performed to demonstrate maintenance of asepsis within the isolator.

The surfaces within the isolator can be monitored using either contact plates for flat surfaces or swabs for irregular surfaces. However, because media residues could impose a risk on isolator asepsis, these tests are generally best done at the end of the test period. If performed concurrently with testing, care is used to ensure that any residual medium is removed from isolator surfaces,

■and that those surfaces are carefully cleaned and disinfec-

## ted.■2S (USP28)

Active air samples and settling plates may be used, but they may not be sufficiently sensitive to detect the very low levels of contamination present within the isolator enclosure.

The most likely route

- A potential route ${ }_{\text {2S }}$ (USP28)
for contamination to enter the isolator is during the introduction of supplies and samples into the enclosure. Validating that all materials taken into the isolator enclosure are free of microbial contamination is critical, as is periodic inspection of gaskets to detect imperfections that could allow ingress of microorganisms. Gloves and half-suit assemblies are another tikely
$\square_{\text {potential }}^{\text {n2S (USP28) }}$
source of microbial contamination. Gloves are of particular concern because they are used to handle both sterility testing materials and test articles.
-Resistance to puncture and abrasion should be considered in the selection of gloves and sleeves. Hypalon materials are resistant to both chemical sporicides used in the decontamination of isolators and to punctures and are available in several thicknesses to provide adequate tactile feel through the gloves while maintaining their integrity.■2S (USP28)

Very small leaks in gloves are difficult to detect until the glove is stretched during use. There are several commercially available glove leak detectors; the operator ensures that the detectors test the glove under conditions as close as possible to actual use conditions. Microbiological tests are used to supplement or substitute physical tests. [NOTE-Standard "finger dab plates" may not be sensitive enough to detect low levels of contamination. Submer-
sion of the gloves in $0.1 \%$ peptone water followed by filtration of the diluent and plating on growth media can detect loss of integrity in the gloves that would otherwise go unnoticed.]

Continuous nonviable particulate monitoring within the isolator's enclosure is ideal, because it can quickly detect filter failure. A second choice is periodic monitoring using a portable particle counter. Sampling for particles must be done in a manner that poses no risk to the maintenance of asepsis within the isolator.

## Change to read:

## INTERPRETATION OF STERILITY TEST RESULTS

A sterility test resulting in a false positive in a properly functioning and validated isolator is very unlikely if bioburden is eliminated from the isolator interior with a high degree of assurance; if persenmel is not in diree contat with the work area, and if the integrity of the transfer perts is validated.
-if gloves, sleeves, and half-suits are free of leaks; and if the RTPs are functioning properly. $\mathrm{m}_{2 \text { S }}$ (USP28)
Nevertheless, isolators are mechanical devices and good aseptic techniques are still required. A decision to invalidate a false positive is made only after fully complying with the requirements of Observation and Interpretation of Results under Sterility Tests $\langle 71\rangle$.

## Change to read:

## TRAINING AND SAFETY

As with sterility testing conducted in conventional clean rooms, operators are trained in procedures that are specific to their isolator.
-Use of proper aseptic techniques is vital to the conduct of sterility tests in isolators, just as it is in clean rooms. Therefore, training in proper aseptic techniques is required for all sterility testing technicians.■2S (USP28)
All training sessions and the evaluation of the operator's performance are documented in the individual's training record. Training of all personnel in the appropriate safety procedures necessary for the operation and maintenance of the isolation system is imperative.

Personnel safety in the use of a sterilizing agent must be assessed. Material Safety Data Sheets, or equivalent documents, are available in the immediate area where the sterilizing
-decontaminating ■2S (USP28)
agent is being used. All storage and safety precautions are followed. An operational readiness inspection of the safety of the isolator and all associated equipment is performed and documented prior to placing the unit in service.

## Standard Dichlorophenol-Indophenol Solution

To 50 mg of 2,6-dichlorophenol-indophenol sodium that has been stored in a desiccator over soda lime add 50 mL of water containing 42 mg of sodium bicarbonate, shake vigorously, and when the dye is dissolved, add water to make 200 mL . Filter into an amber glass-stoppered bottle.
-Use within 3 days, and standardize immediately before

## USE.■1S (USP28)

Standardize the solution as follows.
Accurately weigh 50 mg of USP Ascorbic Acid RS, and transfer to a glass-stoppered, $50-\mathrm{mL}$ volumetric flask with the aid of a sufficient volume of metaphosphoric-acetic acids TS to make 50 mL . Immediately transfer 2 mL of the ascorbic acid solution to a $50-\mathrm{mL}$ conical flask containing 5 mL of the metaphosphoric-acetic acids TS, and titrate rapidly with the dichlorophenol-indophenol solution until a distinct rose-pink color persists for at least 5 seconds. Perform a blank titration by titrating 7 mL of the metaphosphoric-acetic acids TS plus a volume of water equal to the volume of the dichlorophenol solution used in titrating the ascorbic acid solution. Express the concentration of the standard solution in terms of its equivalent in mg of ascorbic acid.

## Change to read:

> Edetate Disodium, Twentieth-Molar $(\mathbf{0 . 0 5} \mathbf{~ M})$ $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{Na}_{2} \mathrm{O}_{8} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \mathbf{3 7 2 . 2 4}$
> 18.61 g in 1000 mL

Dissolve 18.6 g of edetate disodium in water to make 1000 mL , and standardize the solution as follows.

Accurately weigh about 200 mg of chelometric standard calcium carbonate, previously dried at $110^{\circ}$ for 2 hours and cooled in a desiccator, transfer to a $400-\mathrm{mL}$ beaker, add 10 mL of water, and swirl to form a slurry. Cover the beaker with a watch glass, and introduce 2 mL of diluted hydrochloric acid from a pipet inserted between the lip of the beaker and the edge of the watch glass. Swirl the contents of the beaker to dissolve the calcium carbonate. Wash down the sides of the beaker, the outer surface of the pipet, and the watch glass with water, and dilute with water to about 100 mL . While stirring the solution, preferably with a magnetic stirrer, add about 30 mL of the edetate disodium solution from a $50-\mathrm{mL}$ buret. Add 15 mL of sodium hydroxide TS and 300 mg of hydroxy naphthol blue, and continue the titration with the edetate disodium solution to a blue endpoint. Galeulate the molarity taken by the formula:
W/(100.09٪),
in which Wis the weight, in mg, of $\mathrm{CaCO}_{3}$ in the portion of caleimm earbenate taken, and $V$ is the volume, in mL, of edetate disoditm solution consumed.

## Change to read:

Perchloric Acid, Tenth-Normal ( 0.1 N ) (in Glacial Acetic Acid)

$$
\mathrm{HClO}_{4}, \mathbf{1 0 0 . 4 6}
$$

10.05 g in 1000 mL

NOTE-Where called for in the tests and assays, this volumetric solution is specified as " 0.1 N perchloric acid." Thus, where 0.1 N or other strength of this volumetric solution is specified, the solution in glacial acetic acid is to be used, unless the words "in dioxane" are stated. [See also Perchloric Acid, Tenth-Normal ( 0.1 N ) in Dioxane.]

Mix 8.5 mL of perchloric acid with 500 mL of glacial acetic acid and 21 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL . Alternatively, the solution may be prepared as follows. Mix 11 mL of 60 percent perchloric acid with 500 mL of glacial acetic acid and 30 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL .

Allow the prepared solution to stand for 1 day for the excess acetic anhydride to be combined, and determine the water content by Method I (see Water Determination $\langle 921\rangle$ ), except to use a test specimen of about 5 g of the 0.1 N perchloric acid that is expected to contain approximately 1 mg of water and the Reagent (see Reagent under Method Ia in Water Determination $\langle 921\rangle$ ) diluted such that 1 mL is equivalent to about 1 to 2 mg of water. If the water content exceeds $0.5 \%$, add more acetic anhydride. If the solution contains no titratable water, add sufficient water to obtain a content of between $0.02 \%$ and $0.5 \%$ of water. Allow the solution to stand for 1 day, and again titrate the water content. The solution so obtained contains between $0.02 \%$ and $0.5 \%$ of water, indicating freedom from acetic anhydride.

Standardize the solution as follows.
Accurately weigh about 700 mg of potassium biphthalate, previously crushed lightly and dried at $120^{\circ}$ for 2 hours, and dissolve it in 50 mL of glacial acetic acid in a $250-\mathrm{mL}$ flask. Add 2 drops of crystal violet TS, and titrate with the perchloric acid solution until the violet color changes to blue-green. Deduct the volume of the perchloric acid consumed by 50 mL of the glacial acetic acid. and caleulate the normality.

- $\quad 1$ (USP28)

Each 20.42 mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

$$
\mathrm{N}=\frac{\mathrm{g} \mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}}{0.20423 \times \mathrm{mL} \mathrm{HClO}_{4} \text { solution (corrected for the blank) }} \quad \begin{array}{|l|l}

Sodium Methoxide, Tenth-Normal ( $0.1 \mathbf{N}$ ) (in Toluene) $\mathrm{CH}_{3} \mathrm{ONa}, 54.02$
5.402 g in 1000 mL

Cool in ice-water 150 mL of methanol contained in a $1000-\mathrm{mL}$ volumetric flask, and add, in small portions, about 2.5 g of freshly cut sodium metal. When the metal has dissolved, add toluene to make 1000 mL , and mix. Store preferably in the reservoir of an automatic delivery buret suitably protected from carbon dioxide and moisture. Standardize the solution as follows.

Accurately weigh about 400 mg of primary standard benzoic acid, and dissolve in 80 mL of dimethylformamide in a flask. Add 3 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate with the sodium methoxide to a blue endpoint. Correct for the volume of the sodium methoxide solution consumed by 80 mL of the dimethylformamide. andealeulate the normality.
-■1S (USP28)
Each 12.21 mg of benzoic acid is equivalent to 1 mL of 0.1 N sodium methoxide.

$$
\mathrm{N}=\frac{\mathrm{mg} \text { benzoic acid }}{122.1 \times \mathrm{mL} \text { sodium methoxide }(\text { corrected for the blank) }} \square_{1 \mathrm{~S}(\text { USP28) }}
$$

addition of the methanol so that the vapors are condensed and do not escape through the top of the condenser. After addition of the methanol is complete, connect a drying tube to the top of the condenser, and allow the solution to cool. Transfer the solution to a 1-L volumetric flask, dilute with anhydrous methanol to volume, and mix. Standardize the solution as follows.

Accurately measure about 20 mL of freshly standardized 1 N hydrochloric acid VS into a $250-\mathrm{mL}$ conical flask, add 0.25 mL of phenolphthalein TS, and titrate with the sodium methoxide solution to the first appearance of a permanent pink color. Ealeulate the normality.

> Sodium Nitrite, Tenth-Molar $(\mathbf{0 . 1 ~ M})$
> $\mathrm{NaNO}_{2}, \mathbf{6 9 . 0 0}$
> 6.900 g in 1000 mL

Dissolve 7.5 g of sodium nitrite in water to make 1000 mL , and standardize the solution as follows.
Accurately weigh about 500 mg of USP Sulfanilamide RS, previously dried at $105^{\circ}$ for 3 hours, and transfer to a suitable beaker. Add 20 mL of hydrochloric acid and 50 mL of water, stir until dissolved, and cool to $15^{\circ}$. Maintaining the temperature at about $15^{\circ}$, titrate slowly with the sodium nitrite solution, placing the buret tip below the surface of the solution to preclude air oxidation of the sodium nitrite, and stir the solution gently with a magnetic stirrer, but avoid pulling a vortex of air beneath the surface. Use the indicator specified in the individual monograph, or, if a potentiometric procedure is specified, determine the endpoint electrometrically, using platinum-calomel or platinum-platinum electrodes. When the titration is within 1 mL of the endpoint, add the titrant in $0.1-\mathrm{mL}$ portions, and allow 1 minute between additions. Galeulate the melarity.

- $\quad$ 1S (USP28)

Each 17.22 mg of sulfanilamide is equivalent to 1 mL of 1000 M
$\square^{-} 0.1000 \mathrm{M}_{1 \mathrm{IS} \text { (USP28) }}$
sodium nitrite.

NOTES- (1) To eliminate any turbidity that may form following dilution with toluene, add methanol ( 25 to 30 mL usually suffices) until the solution is clear. (2) Restandardize the solution frequently.

## Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)

 $\mathrm{NaB}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{4}, \mathbf{3 4 2 . 2 2}$ 6.845 g in 1000 mLDissolve an amount of sodium tetraphenylboron, equivalent to 6.845 g of $\mathrm{NaB}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{4}$, in water to make 1000 mL , and standardize the solution as follows.

Pipet two $75-\mathrm{mL}$ portions of the solution into separate beakers, and to each add 1 mL of acetic acid and 25 mL of water. To each beaker add, slowly and with constant stirring, 25 mL of potassium biphthalate solution (1 in 20), and allow to stand for 2 hours. Filter one of the mixtures through a filtering crucible, and wash the precipitate with cold water. Transfer the precipitate to a container, add 50 mL of water, shake intermittently for 30 minutes, filter, and use the filtrate as the saturated potassium tetraphenylborate solution in the following standardization procedure. Filter the second mixture through a tared filtering crucible, and wash the precipitate with three $5-\mathrm{mL}$ portions of saturated potassium tetraphenylborate solution. Dry the precipitate at $105^{\circ}$ for 1 hour. Each g of potassium tetraphenylborate is equivalent to 955.1 mg of sodium tetraphenylboron. From the weight of sodimm tenaphenylboron obtained, eat eulate the molarity of the soditm tetraphenylboren solution.

Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)
$\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{NOH}, \mathbf{2 5 9 . 4 7}$
25.95 g in 1000 mL

Dissolve 40 g of tetra- $n$-butylammonium iodide in 90 mL of anhydrous methanol in a glass-stoppered flask. Place in an ice bath, add 20 g of powdered silver oxide, insert the stopper in the flask, and agitate vigorously for 60 minutes. Centrifuge a few mL , and test the supernatant for iodide (see Iodide $\langle 191\rangle$ ). If the test is positive, add an additional 2 g of silver oxide, and continue to allow to stand for 30 minutes with intermittent agitation. When all of the iodide has reacted, pass through a fine-porosity, sintered-glass funnel. Rinse the flask and the funnel with three $50-\mathrm{mL}$ portions of anhydrous toluene, adding the rinsings to the filtrate. Dilute with a mixture of three volumes of anhydrous toluene and 1 volume of anhydrous methanol to 1000 mL , and flush the solution for $10 \mathrm{~min}-$ utes with dry, carbon dioxide-free nitrogen. [NOTE-If necessary to obtain a clear solution, further small quantities of anhydrous methanol may be added.] Store in a reservoir protected from carbon dioxide and moisture, and discard after 60 days. Alternatively, the solution may be prepared by diluting a suitable volume of commercially available tetrabutylammonium hydroxide solution in methanol with a mixture of 4 volumes of anhydrous toluene and 1 volume of anhydrous methanol. [NOTE-If necessary to obtain a clear solution, further small quantities of methanol may be added.]

Standardize the solution on the day of use as follows. Dissolve about 400 mg of primary standard benzoic acid, accurately weighed, in 80 mL of dimethylformamide, add 3 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate to a blue endpoint with the tetrabutylammonium hydroxide solution, delivering the titrant from a buret equipped with a carbon dioxide absorption trap. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 12.21 mg of benzoic acid.

$$
\mathbf{■}^{\mathrm{N}}=\frac{\mathrm{mg} \text { benzoic acid }}{122.1 \times \mathrm{mL}\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{NOH}} \square_{1 \mathrm{~S}(\text { USP28) }}

Tetramethylammonium Bromide, Tenth-Molar (0.1 M) $\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NBr}, 154.05$
15.41 g in 1000 mL

Dissolve 15.41 g of tetramethylammonium bromide in water to make 1000 mL , and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a beaker, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS , and mix. Add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Galeulate the molarity.

## Change to read:

Tetramethylammonium Chloride, Tenth-Molar (0.1 M)
$\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NCl}, 109.60$
10.96 g in 1000 mL

Dissolve 10.96 g of tetramethylammonium chloride in water to make 1000 mL , and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a flask, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS , and mix. Add 5 mL of nitrobenzene and 2 mL of ferric ammonium sulfate TS, shake, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Ealeulate the melarity.

## Change to read:

Titanium Trichloride, Tenth-Normal (0.1 N) $\mathrm{TiCl}_{3}, \mathbf{1 5 4 . 2 3}$<br>15.42 g in 1000 mL

Add 75 mL of titanium trichloride solution (1 in 5) to 75 mL of hydrochloric acid, dilute to 1000 mL , and mix. Standardize the solution as follows, using the special titration apparatus described.

Apparatus-Store the titanium trichloride solution in the reservoir of a closed-system titration apparatus in an atmosphere of hydrogen.

Use a wide-mouth, $500-\mathrm{mL}$ conical flask as the titration vessel, and connect it by means of a tight-fitting rubber stopper to the titration buret, an inlet tube for carbon dioxide, and an exit tube. Arrange for mechanical stirring. All joints must be airtight. Arrange to have both the hydrogen and the carbon dioxide pass through wash bottles containing titanium trichloride solution (approximately 1 in 50 ) to remove any oxygen.

If the solution to be titrated is to be heated before or during titration, connect the titration flask with an upright reflux condenser through the rubber stopper.

Standardization-Place an accurately measured volume of about 40 mL of 0.1 N ferric ammonium sulfate VS in the titration flask, and pass in a rapid stream of carbon dioxide until all the air has been removed. Add the titanium trichloride solution from the buret until near the calculated endpoint (about 35 mL ), then add through the outlet tube 5 mL of ammonium thiocyanate TS , and continue the titration until the solution is colorless. Galeulate the nermality.

$$
■ \mathrm{~N}=\frac{\mathrm{mL} \mathrm{FeNH}_{4}\left(\mathrm{SO}_{4}\right)_{2} \times \mathrm{N} \mathrm{FeNH}_{4}\left(\mathrm{SO}_{4}\right)_{2}}{\mathrm{~mL} \mathrm{TiCl}_{3}} \llbracket 1 \mathrm{~S}(\text { USP28) }

(HDQ) RTS—39932-1; 40720-1; 40720-2; 40844-2; 40844-3

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the Packaging and storage requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

## Add the following:

-Budesonide: White to off-white, ordorless, crystalline powder. Freely soluble in chloroform; sparingly soluble in alcohol; practically insoluble in water and in heptane. ${ }^{2 S}$ (USP28)

## Change to read:

Calcium Carbonate: Fine, white, odorless, tasteless, microcrystalline powder. Is stable in air. Practically insoluble in water. Its solubility in water is increased by the presence of any ammonium salt or of carbon dioxide. The presence of any alkali hydroxide reduces its solubility. Insoluble in alcohol. Dissolves with effervescence in 1 N acetic acid, in 3 N hydrochloric acid, and in 2 N nitric acid.
-NF category: Tablet and/or capsule diluent. ${ }^{2 S}$ (USP28)

## Add the following:

-Carboxymethylcellulose Sodium 12: Colorless or white to off-white powder or granules. Is odorless. Water solubility depends on degree of substitution (easily dispersed in water at all temperatures, forming a clear, colloidal solution). Insoluble in acetone, in alcohol, in ether, and in toluene. NF category: Suspending and/or viscosity-increas-
ing agent. ${ }^{2 S}$ (USP28)

## Change to read:

Cellulose Acetate: Fine, white powder or free-flowing pellets. Available in a range of viscosities and acetyl contents. High viscosity, which reflects high molecular weight, decreases solubility slightly. High acetyl content cellulose acetates generally have more
limited solubility in commonly used organic solvents than low acetyl content cellulose acetates, but are more soluble in methylene chloride. All acetyl content cellulose acetates are insoluble in alcohol and in water; soluble in dioxane and in dimethylformamide. $N F$ category:

- Coating agent; ${ }^{\mathbf{n} 2 \text { S (USP28) }}$
polymer membrane.

## Change to read:

Chlorocresol: Colorless or practically colorless crystals or crystalline powder, having a characteristic, nontarry odor. Is volatile in steam. Slightly soluble in water and more soluble in hot water; very soluble in alcohol; soluble in ether, in terpenes, in fixed oils, and in solutions of alkali hydroxides.
-NF category: Antimicrobial preservative.■2S (USP28)

## Change to read:

Dextrin: Free-flowing, white, yellow, or brown powder. Its solubility in water varies; it is usually very soluble, but often contains an insoluble portion.

- NF category: Tablet binder; tablet and/or capsule diluent.■2S (USP28)

## Change to read:

Dextrose: Colorless crystals or white, crystalline or granular powder. Is odorless, and has a sweet taste. Freely soluble in water; very soluble in boiling water; soluble in boiling alcohol; slightly soluble in alcohol. NF category: Sweetening agent; tonicity agent;
$■_{\text {vehicle (flavored and/or sweetened). }}^{\boldsymbol{\square}}$ 2S (USP28)

## Change to read:

Dimethicone: A clear, colorless, and odorless liquid. Insoluble in water, in methanol, in alcohol, and in acetone; very slightly soluble in isopropyl alcohol; soluble in chlorinated hydrocarbons, in benzene, in toluene, in xylene, in $n$-hexane, in petroleum spirits, in ether, and in amyl acetate.

- NF category: Antifoaming agent; water repelling
agent.■2S (USP28)

## Change to read:

Edetate Calcium Disodium: White, crystalline granules or white, crystalline powder. Is odorless, is slightly hygroscopic, and has a faint, saline taste. Is stable in air. Freely soluble in water.
-NF category: Chelating agent; complexing agent.п2s (USP28)

## Change to read:

Edetate Disodium: White, crystalline powder. Soluble in water. NF category: Chelating agent;

## - complexing agent.п2S (USP28)

## Change to read:

-NF category: Humectant; solvent.п2S (USP28)

## Change to read:

Low-Substituted Hydroxypropyl Cellulose: White to yellowish white, practically odorless and tasteless, fibrous or granular powder. Is hygroscopic. Practically insoluble in alcohol and in ether. Dissolves in a solution of sodium hydroxide ( 1 in 10), and produces a viscous solution. Swells in water, in sodium carbonate TS, and in 2 N hydrochloric acid. The pH of the suspension, obtained by shaking 1.0 g with 100 mL of water, is between 5.0 and 7.5. NF category:Fablet disintegrant and/or tablet binder.
-Tablet binder; tablet disintegrant.■2S (USP28)

## Add the following:

■Lactitol: A white or light brown, ordorless crystal. Has a mild, sweet taste, and no aftertaste. NF category: Flavors and perfumes; tablet and/or capsule diluent.■2S (USP28)

## Add the following:

-Lansoprazole: White to brownish-white powder. Freely soluble in dimethylformamide; practically insoluble in water. Melts at about $166^{\circ}$, with decomposition.п2S (USP28)

## Change to read:

Maltodextrin: White, hygroscopic powder or granules. Freely soluble or readily dispersible in water; slightly soluble to insoluble in anhydrous alcohol. NF category: Coating agent;
$\square_{\text {Suspending and/or viscosity-increasing agent; }{ }^{\text {2S }} \text {.(USP28) }}$ tablet binder; tablet and/or capsule diluent. iseosity inereasing agent.

## Change to read:

Methylparaben Sodium: White, hygroscopic powder. Freely soluble in water; sparingly soluble in alcohol; insoluble in fixed oils.

- NF category: Antimicrobial preservative.■2S (USP28)

## Change to read:

Monoethanolamine: Clear, colorless, moderately viscous liquid, having a distinctly ammoniacal odor. Miscible with water, with acetone, with alcohol, with glycerin, and with chloroform. Immiscible with ether, with solvent hexane, and with fixed oils, although it dissolves many essential oils.

- NF category: Emulsifying and/or solubilizing agent.■2S (USP28)

## Add the following:

-Monoglyceride Citrate: Soft white to ivory-colored, waxy solid with a lard-like consistancy and bland odor. Dispersible in most common fat solvents and in alcohol; insoluble in water. $\quad$ 2S (USP28)

## Add the following:

-Morantel Tartrate: A white or pale yellow, crystalline powder. Very soluble in water and in alcohol; practically insoluble in ethyl acetate. $\quad$ 2S (USP28)

## Change to read:

Nonoxynol 9: Clear, colorless to light yellow, viscous liquid. Soluble in water, in alcohol, and in corn oil.
-NF category: Wetting and/or solubilizing agent.■2S (USP28)

## Change to read:

Octyldodecanol: Clear water-white, free-flowing liquid. Insoluble in water; soluble in alcohol and in ether.

- $N F$ category: Vehicle (oleaginous).■2S (USP28)

## Add the following:

-Ondansetron: White to off-white powder. Very soluble in acid solutions; sparingly soluble in water.■2S (USP28)

## Change to read:

Oxyquinoline Sulfate: Yellow powder. Melts at about $185^{\circ}$. Very soluble in water; freely soluble in methanol; slightly soluble in alcohol; practically insoluble in acetone and in ether.

- NF category: Complexing agent.■2S (USP28)

## Add the following:

-Peppermint Spirit: A clear, colorless liquid with a peppermint fragrance. Completely soluble in water; easily soluble in methanol and in diethyl ether. NF category: Flavors and perfumes.■2S (USP28)

## Change to read:

Peppermint Water: NF category: Flavered and/er sweened wehicle.

- Vehicle (flavored and/or sweetened)...n2S (USP28)

## Change to read:

Poloxamer: NF category: Emulsifying and/or solubilizing agent;
$\boldsymbol{m}_{\text {Wetting }}$ and/or solubilizing agent. $\mathbf{m}_{\text {2S }}$ (USP28)
Poloxamer 124: Colorless liquid, having a mild odor. When solidified, it melts at about $16^{\circ}$. Freely soluble in water, in alcohol, in isopropyl alcohol, in propylene glycol, and in xylene.

Poloxamer 188: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about $52^{\circ}$. Freely soluble in water and in alcohol.

Poloxamer 237: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about $49^{\circ}$. Freely soluble in water and in alcohol; sparingly soluble in isopropyl alcohol and in xylene.

Poloxamer 338: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about $57^{\circ}$. Freely soluble in water and in alcohol; sparingly soluble in propylene glycol.

Poloxamer 407: White, prilled or cast solid. Is odorless, or has a very mild odor. Melts at about $56^{\circ}$. Freely soluble in water, in alcohol, and in isopropyl alcohol.

## Change to read:

Polyethylene Oxide: Polyethylene oxide resins are high molecular weight polymers having the common structure:

$$
\left(-\mathrm{O}-\mathrm{CH}_{2} \mathrm{CH}_{2}-\right)_{n}
$$

in which $n$, the degree of polymerization, varies from about 2000 to over 100,000 . Polyethylene oxide, being a polyether, strongly hydrogen, bonds with water. It is nonionic and undergoes salting-out effects associated with neutral molecules in solutions of high dielectric media. Salting-out effects manifest themselves in depressing the upper temperature limit of solubility, and in reducing the viscosity of both dilute and concentrated solutions of the polymers. All molecular weight grades are powdered or granular solids. They are soluble in water but, because of the high solution viscosities obtained (see table), solutions over $1 \%$ in water may be difficult to prepare. The water solubility, hygroscopicity, solubility in organic solvents, and melting point do not vary in the specified molecular weight range. At room temperature polyethylene oxide is miscible with water in all proportions. At concentrations of about $20 \%$ polymer in water, the solutions are nontacky, reversible, elastic gels. At higher concentrations, the solutions are tough, elastic materials with the water acting as a plasticizer. Polyethylene oxide is also freely soluble in acetonitrile, in ethylene dichloride, in trichloroethylene, and in methylene chloride. Heating may be required to obtain solutions in many other organic solvents. It is insoluble in aliphatic hydrocarbons, in ethylene glycol, in diethylene glycol, and in glycerol.

- NF category: Suspending and/or viscosity-increasing agent; tablet binder. $\quad$ 2S (USP28)

| Approximate <br> Molecular Weight | Typical Solution Viscosity (cps), 25 ${ }^{\circ}$ |  |
| :---: | :---: | :---: |

| 900,000 | 15000 |  |
| $4,000,000$ |  | 3500 |
| $5,000,000$ |  | 5500 |

## Change to read:

Polyoxyl 10 Oleyl Ether: White, soft semisolid, or pale yellow liquid, having a bland odor. Soluble in water and in alcohol; dispersible in mineral oil and in propylene glycol, with possible separation on standing. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; ${ }^{\text {2S }}$ (USP28) wetting and/or solubilizing agent.

## Change to read:

Polyoxyl 20 Cetostearyl Ether: Cream-colored, waxy, unctuous mass, melting, when heated, to a clear brownish-yellow liquid. Soluble in water, in alcohol, and in acetone; insoluble in solvent hexane. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S (USP28) }}$ wetting and/or solubilizing agent.

## Change to read:

Polyoxyl 35 Castor Oil: Yellow, oily liquid, having a faint, characteristic odor and a somewhat bitter taste. Very soluble in water, producing a practically odorless and colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oils. NF category: Emulsifying and/or solubilizing agent;

- tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Polyoxyl 40 Hydrogenated Castor Oil: White to yellowish paste or pasty liquid, having a faint odor and slight taste. Very soluble in water, producing a practically tasteless, odorless, and colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oils. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Polyoxyl 40 Stearate: Waxy, white to light tan solid. Is odorless or has a faint, fat-like odor. Soluble in water, in alcohol, in ether, and in acetone; insoluble in mineral oil and in vegetable oils. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S }}$ (USP28) wetting and/or solubilizing agent.

## Change to read:

Polysorbate 20: Lemon to amber liquid having a faint characteristic odor. Soluble in water, in alcohol, in ethyl acetate, in methanol, and in dioxane; insoluble in mineral oil. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Polysorbate 40: Yellow liquid having a faint, characteristic odor. Soluble in water and in alcohol; insoluble in mineral oil and in vegetable oils. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; ${ }^{2 S}$ (USP28) wetting and/or solubilizing agent.

## Change to read:

Polysorbate 60: Lemon- to orange-colored, oily liquid or semi-gel having a faint, characteristic odor. Soluble in water, in ethyl acetate, and in toluene; insoluble in mineral oil and in vegetable oils. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Polysorbate 80: Lemon- to amber-colored, oily liquid having a faint, characteristic odor and a warm, somewhat bitter taste. Very soluble in water, producing an odorless and practically colorless solution; soluble in alcohol and in ethyl acetate; insoluble in mineral oil. NF category: Emulsifying and/or solubilizing agent;

- tablet and/or capsule lubricant; $\mathbf{m}_{2 S}$ (USP28)
wetting and/or solubilizing agent.

## Change to read:

Potassium Benzoate: White, odorless, or practically odorless, granular or crystalline powder. Is stable in air. Freely soluble in water; sparingly soluble in alcohol and somewhat more soluble in $90 \%$ alcohol.
-NF category: Antimicrobial preservative.■2S (USP28)

## Change to read:

Potassium Citrate: Transparent crystals or white, granular powder. Is odorless, has a cooling, saline taste, and is deliquescent when exposed to moist air. Freely soluble in water; almost insoluble in alcohol.

- NF category: Buffering agent.■2S (USP28)

## Change to read:

Propionic Acid: Oily liquid having a slight pungent, rancid odor. Miscible with water and with alcohol and various other organic solvents.
-NF category: Acidifying agent.■2S (USP28)

## Change to read:

Propylene Glycol Alginate: White to yellowish fibrous or granular powder. Practically odorless and tasteless. Soluble in water, in solutions of dilute organic acids, and, depending on the degree of esterification, in hydroalcoholic mixture containing up to $60 \%$ by weight of alcohol to form stable, viscous colloidal solutions at a pH of 3 .

■ NF category: Suspending and/or viscosity-increasing
agent.п2S (USP28)

## Change to read:

Propylparaben Sodium: White powder. Is odorless and hygroscopic. Freely soluble in water; sparingly soluble in alcohol; insoluble in fixed oils.
-NF category: Antimicrobial preservative.■2S (USP28)

## Add the following:

■Ropivacaine Hydrochloride: White, crystalline powder. Soluble in water.■2S (USP28)

## Change to read:

Simethicone: Translucent, gray, viscous fluid. Insoluble in water and in alcohol. The liquid phase is soluble in chloroform, in ether, and in benzene, but silicon dioxide remains as a residue in these solvents.

- NF category: Antifoaming agent; water repelling
agent.■2S (USP28)

## Change to read:

## Sodium Bisulfite:

-White, crystalline powder. Freely soluble in cold water and
in hot water; sparingly soluble in alcohol.■2S (USP28) NF category: Antioxidant.

## Change to read:

Sodium Lauryl Sulfate: Small, white or light yellow crystals having a slight, characteristic odor. Freely soluble in water, forming an opalescent solution. NF category: Emulsifying and/or solubilizing agent;

- tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Sodium Stearyl Fumarate: Fine, white powder. Slightly soluble in methanol; practically insoluble in water.

- NF category: Tablet and/or capsule lubricant.■2S (USP28)

## Change to read:

Sorbitan Monolaurate: Yellow to amber-colored oily liquid, having a bland, characteristic odor. Insoluble in water; soluble in mineral oil; slightly soluble in cottonseed oil and in ethyl acetate. NF category: Emulsifying and/or solubilizing agent;

- tablet and/or capsule lubricant; $\quad$ 2S (USP28) wetting and/or solubilizing agent.

## Change to read:

Sorbitan Monooleate: Viscous, yellow to amber-colored, oily liquid, having a bland, characteristic odor. Insoluble in water and in propylene glycol. Miscible with mineral and vegetable oils. $N F$ category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S }}$ (USP28) wetting and/or solubilizing agent.

## Change to read:

Sorbitan Monopalmitate: Cream-colored, waxy solid having a faint fatty odor. Insoluble in water; soluble in warm absolute alcohol; soluble, with haze, in warm peanut oil and in warm mineral oil. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S (USP28) }}$ wetting and/or solubilizing agent.

## Change to read:

Sorbitan Monostearate: Cream-colored to tan, hard, waxy solid, having a bland odor and taste. Insoluble in cold water and in acetone; dispersible in warm water; soluble, with haze, above $50^{\circ}$ in mineral oil and in ethyl acetate. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; ${ }^{\text {2S }}$ (USP28) wetting and/or solubilizing agent.

## Change to read:

Sorbitan Sesquioleate: Viscous, yellow to amber-colored, oily liquid. Insoluble in water and in propylene glycol; soluble in alcohol, in isopropyl alcohol, in cottonseed oil, and in mineral oil. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S (USP28) }}$
wetting and/or solubilizing agent.

## Change to read:

Sorbitan Trioleate: Yellow to amber-colored, oily liquid. Insoluble in water, in ethylene glycol, and in propylene glycol; soluble in methyl alcohol, in alcohol, in isopropyl alcohol, in corn oil, in cottonseed oil, and in mineral oil. NF category: Emulsifying and/or solubilizing agent;
-tablet and/or capsule lubricant; $\mathbf{m}_{2 \text { S (USP28) }}$ wetting and/or solubilizing agent.

## Change to read:

Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. NF category: Tablet and/or capsule diluent; tablet disintegrant;
-tablet and/or capsule lubricant.■2S (USP28)

## Change to read:

Purified Stearic Acid: Hard, white or faintly yellowish, somewhat glossy and crystalline solid, or white or yellowish-white powder. Its odor and taste are slight, suggesting tallow. Freely soluble in chloroform and in ether; soluble in alcohol; practically insoluble in water.
-NF category: Tablet and/or capsule lubricant.■2S (USP28)

## Change to read:

Sucrose: White, crystalline powder or lustrous, dry, colorless or white crystals. Very soluble in water; slightly soluble in alcohol; practically insoluble in dehydrated alcohol.
-NF category: Coating agent; sweetening agent; tablet and/ or capsule diluent. $\quad$ 2S (USP28)

## Change to read:

Sugar Spheres: Hard, brittle, free-flowing, spherical masses ranging generally in size from $10-$ to 60 -mesh. Usually white, but may be colored. Solubility in water varies according to the su-gar-to-starch ratio.
$\mathbf{■}^{-}$NF category: Vehicle (solid carrier).■2S (USP28)

## Change to read:

Syrup: NF category: Sweetening agent; tablet binder; fla vored and/or sweetened vehiele.
$■_{\text {vehicle }}$ (flavored and/or sweetened).п2S (USP28)

## Change to read:

## Tocopherol:

- Clear, colorless to yellow, yellowish-brown, or greenishyellow, viscous oil. Is odorless. Soluble in oils, in fats, in acetone, in alcohol, in chloroform, in ether, and in alcohol;
insoluble in water. $\quad$ 2S (USP28)
NF category: Antioxidant.

## Change to read:

Zein: White to yellow powder. Soluble in aqueous alcohols, in glycols, in ethylene glycol ethyl ether, in furfuryl alcohol, in tetrahydrofurfuryl alcohol, and in aqueous alkaline solutions of pH 11.5 or greater. Insoluble in water and in acetone; readily soluble in ace-tone-water mixtures between the limits of $60 \%$ and $80 \%$ of acetone by volume; insoluble in all anhydrous alcohols except methanol.

- NF category: Coating agent.■2S (USP28)

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

Sodium Thiosulfate-See PF Vol. 29 No. 5, page 1579.
Somatropin-See PF Vol. 30 No. 4, page 1295.
Somatropin for Injection-See PF Vol. 30 No. 4, page 1299.
Soybean Oil-See PF Vol. 30 No. 5, page 1648.
Spironolactone Oral Suspension-See PF Vol. 30 No. 3, page 929.
Spironolactone and Hydrochlorothiazide Oral Suspension-See PF Vol. 30 No. 3, page 930.
Stavudine-See PF Vol. 30 No. 3, page 932.
Stavudine Capsules-See PF Vol. 30 No. 3, page 934.
Stavudine for Oral Solution-See PF Vol. 30 No. 3, page 937.
Sufentanil Citrate-See PF Vol. 29 No. 6, page 1988.
Sulfadiazine Sodium-See PF Vol. 29 No. 6, page 1988.
Sulfamethoxazole-See PF Vol. 29 No. 6, page 1989.
Sulfisoxazole-See PF Vol. 30 No. 4, page 1301.
Sumatriptan-See PF Vol. 30 No. 1, page 184.
Sumatriptan Nasal Spray-See PF Vol. 29 No. 1, page 119.
Terbutaline Sulfate-See PF Vol. 29 No. 5, page 1585.
Terbutaline Sulfate Inhalation Aerosol—See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection-See PF Vol. 26 No. 3, page 756.
Terbutaline Sulfate Tablets-See PF Vol. 30 No. 1, page 188.
Testosterone-See PF Vol. 29 No. 5, page 1585.
Testosterone Enanthate-See PF Vol. 30 No. 5, page 1648.
Tetracaine Hydrochloride in Dextrose Injection-See PF Vol. 30 No. 5, page 1648.
Theophylline-See PF Vol. 29 No. 5, page 1586.
Theophylline in Dextrose Injection-See PF Vol. 30 No. 5, page 1649.

Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tab-lets-See PF Vol. 30 No. 1, page 189.
Thiabendazole Tablets-See PF Vol. 29 No. 6, page 1991.
Thiabendazole Chewable Tablets-See PF Vol. 29 No. 6, page 1991.

Thiacetarsamide-See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection-See PF Vol. 29 No. 1, page 127.

Thiamine Hydrochloride Tablets-See PF Vol. 30 No. 1, page 190.
Thiopental Sodium-See PF Vol. 29 No. 5, page 1586.
Thiothixene Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Tiagabine Hydrochloride-See PF Vol. 30 No. 5, page 1649.
Tiamulin Fumarate-See PF Vol. 30 No. 3, page 938.
Timolol Maleate Tablets-See PF Vol. 30 No. 1, page 191.
Titanium Dioxide-See PF Vol. 30 No. 4, page 1301.
Titanium Dioxide (new)-See PF Vol. 30 No. 4, page 1304.
Tobramycin Inhalation Solution-See PF Vol. 29 No. 2, page 438.
Tolazoline Hydrochloride-See PF Vol. 29 No. 5, page 1588.
Tolcapone-See PF Vol. 30 No. 3, page 939.
Tolcapone Tablets-See PF Vol. 30 No. 3, page 943.
Topiramate-See PF Vol. 30 No. 4, page 1307.
Triamcinolone Acetonide-See PF Vol. 30 No. 3, page 945.
Triamcinolone Acetonide Lotion-See PF Vol. 30 No. 2, page 538.
Triamcinolone Acetonide Topical Emulsion-See PF Vol. 30 No. 2, page 538 .
Trichlorfon-See PF Vol. 26 No. 6, page 1576.
Trifluoperazine Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Triflupromazine Hydrochloride-See PF Vol. 29 No. 6, page 1994.
Trimethobenzamide Hydrochloride-See PF Vol. 29 No. 5, page 1589.

Trimethoprim-See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate-See PF Vol. 29 No. 6, page 1995.
Tripelennamine Hydrochloride-See PF Vol. 30 No. 4, page 1312.
Triprolidine and Pseudoephedrine Hydrochlorides Tablets-See PF Vol. 30 No. 1, page 192.
Trolamine Salicylate-See PF Vol. 30 No. 4, page 1312.
Tubocurarine Chloride-See PF Vol. 29 No. 6, page 1996.
Urea C for Oral Solution-See PF Vol. 29 No. 2, page 441.
Urofollitropin-See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection-See PF Vol. 28 No. 6, page 1881.
Ursodiol-See PF Vol. 30 No. 4, page 1313.
Valrubicin-See PF Vol. 30 No. 3, page 946.
Valsartan-See PF Vol. 29 No. 6, page 1996.
Valsartan Capsules-See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 6, page 2000 .
Vancomycin Hydrochloride for Oral Solution-See PF Vol. 30 No. 1, page 193.
Vasopressin-See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide-See PF Vol. 30 No. 1, page 193.
Verapamil Hydrochloride-See PF Vol. 29 No. 5, page 1598.
Verteporfin-See PF Vol. 30 No. 3, page 947.
Vinorelbine Injection-See PF Vol. 30 No. 4, page 1314.
Vitamin E-See PF Vol. 27 No. 5, page 3159.
Water for Injection-See PF Vol. 30 No. 5, page 1650.
Bacteriostatic Water for Injection-See PF Vol. 30 No. 4, page 1315.

Sterile Water for Inhalation-See PF Vol. 30 No. 4, page 1316.
Sterile Water for Injection-See PF Vol. 30 No. 4, page 1316.
Pure Steam-See PF Vol. 30 No. 5, page 1651.
Purified Water-See PF Vol. 30 No. 4, page 1316.
Sterile Purified Water-See PF Vol. 30 No. 4, page 1317.
Water for Hemodialysis-See PF Vol. 30 No. 4, page 1317.
White Lotion-See PF Vol. 30 No. 2, page 538.
Small Intestinal Submucosa Wound Matrix—See PF Vol. 30 No. 5, page 1652 .
Xylazine-See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Zidovudine-See PF Vol. 29 No. 6, page 2006.
Zileuton-See PF Vol. 30 No. 3, page 948.
Zinc Gluconate-See PF Vol. 29 No. 3, page 683.
Zinc Sulfide Topical Suspension-See PF Vol. 30 No. 2, page 546.

## DIETARY SUPPLEMENTS

## MONOGRAPHS

Chaste Tree-See PF Vol. 30 No. 2, page 546.
Powdered Chaste Tree Extract-See PF Vol. 29 No. 4, page 1269.
Horse Chestnut-See PF Vol. 30 No. 2, page 550.
Powdered Horse Chestnut Extract-See PF Vol. 30 No. 2, page 550.

Choline Bitartrate-See PF Vol. 30 No. 3, page 950.
Choline Chloride-See PF Vol. 30 No. 3, page 951.
Chondroitin Sulfate Sodium-See PF Vol. 30 No. 1, page 197.
Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 200.

Chromium Picolinate Tablets-See PF Vol. 30 No. 5, page 1664.
Red Clover-See PF Vol. 30 No. 2, page 550.
Powdered Red Clover Extract-See PF Vol. 30 No. 2, page 552.
Black Cohosh-See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh-See PF Vol. 28 No. 5, page 1460.
Powdered Black Cohosh Extract-See PF Vol. 28 No. 5, page 1461.

Black Cohosh Tablets-See PF Vol. 28 No. 5, page 1462.
Cranberry Liquid Preparation-See PF Vol. 30 No. 3, page 951.
Echinacea angustifolia-See PF Vol. 30 No. 2, page 552.
Powdered Echinacea angustifolia Extract-See PF Vol. 30 No. 2, page 554.

Echinacea pallida-See PF Vol. 30 No. 2, page 555.
Powdered Echinacea pallida Extract—See PF Vol. 30 No. 2, page 556.

Echinacea purpurea Aerial Parts-See PF Vol. 30 No. 2, page 557.
Echinacea purpurea Root-See PF Vol. 30 No. 2, page 561.
Powdered Echinacea purpurea Extract-See PF Vol. 30 No. 2, page 561.
Eleuthero-See PF Vol. 26 No. 6, page 1596.
Fish Oil Rich in Omega-3 Acids-See PF Vol. 29 No. 4, page 1272.

Fish Oil Rich in Omega-3 Acids Capsules-See PF Vol. 29 No. 4, page 1278.
Ginger Capsules-See PF Vol. 28 No. 3, page 814.
Powdered Ginkgo Extract-See PF Vol. 27 No. 2, page 2233.
Ginkgo Capsules-See PF Vol. 27 No. 2, page 2238.
Ginkgo Tablets-See PF Vol. 27 No. 2, page 2240.
American Ginseng-See PF Vol. 30 No. 2, page 563.
American Ginseng Capsules-See PF Vol. 30 No. 2, page 565.
American Ginseng Tablets-See PF Vol. 30 No. 2, page 567.
Powdered American Ginseng-See PF Vol. 30 No. 2, page 564.
Powdered American Ginseng Extract-See PF Vol. 30 No. 2, page 564.

Asian Ginseng-See PF Vol. 30 No. 2, page 569.
Asian Ginseng Capsules-See PF Vol. 30 No. 2, page 571.
Asian Ginseng Tablets-See PF Vol. 30 No. 2, page 573.
Powdered Asian Ginseng-See PF Vol. 30 No. 2, page 570.
Powdered Asian Ginseng Extract-See PF Vol. 30 No. 2, page 570.

Glucosamine and Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 201.
Goldenseal-See PF Vol. 30 No. 3, page 952.
Powdered Goldenseal-See PF Vol. 30 No. 3, page 953.
Powdered Goldenseal Extract-See PF Vol. 30 No. 3, page 954.
Licorice-See PF Vol. 26 No. 5, page 1363.
Powdered Licorice Extract-See PF Vol. 30 No. 2, page 574.
Lutein-See PF Vol. 29 No. 2, page 470.
Lutein Preparation-See PF Vol. 29 No. 2, page 472.
Lycopene-See PF Vol. 30 No. 2, page 574.
Lycopene Preparation-See PF Vol. 30 No. 2, page 576.
Lycopene Tomato Extract-See PF Vol. 30 No. 2, page 578.
Lysine Hydrochloride Tablets-See PF Vol. 30 No. 5, page 1665.
Milk Thistle Capsules-See PF Vol. 29 No. 2, page 479.
Minerals Capsules-See PF Vol. 28 No. 5, page 1543.
Minerals Tablets-See PF Vol. 28 No. 5, page 1543.
Pygeum-See PF Vol. 30 No. 3, page 954.
Pygeum Capsules-See PF Vol. 30 No. 3, page 959.
Pygeum Extract-See PF Vol. 30 No. 3, page 956.
Pyridoxine Hydrochloride Injection-See PF Vol. 30 No. 2, page 583.

Powdered St. John's Wort Extract—See PF Vol. 30 No. 2, page 584.

Ubidecarenone Capsules-See PF Vol. 30 No. 1, page 202.
Valerian Capsules-See PF Vol. 27 No. 1, page 1825.
Oil- and Water-Soluble Vitamins Tablets-See PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Capsules-See PF Vol. 28 No. 5, page 1544.
Oil- and Water-Soluble Vitamins with Minerals Oral SolutionSee PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Tablets-See PF Vol. 30 No. 2, page 585.
Oil-Soluble Vitamins Tablets-See PF Vol. 28 No. 5, page 1547. Water-Soluble Vitamins Tablets-See PF Vol. 30 No. 2, page 587.
Water-Soluble Vitamins with Minerals Capsules-See PF Vol. 28 No. 5, page 1547.
Water-Soluble Vitamins with Minerals Tablets-See PF Vol. 30 No. 2, page 587.

## GENERAL CHAPTERS

## General Tests and Assays

## General Requirements for Tests and Assays

〈1〉 Injections－See PF Vol． 29 No．3，page 707.
〈11 ${ }^{\text {USP Reference Standards－See PF Vol．} 23 \text { No．6，page 5180；}}$ PF Vol． 24 No．5，page 6925；PF Vol． 26 No．3，page 793；PF Vol． 26 No．4，page 1101；PF Vol． 26 No．5，page 1369；PF Vol． 27 No．1，page 1832；PF Vol． 27 No．6，page 3348；PF Vol． 28 No．2，page 433；PF Vol． 28 No．3，page 839；PF Vol． 28 No．4，page 1224；PF Vol． 28 No．5，page 1468；PF Vol． 28 No．6，page 1913；PF Vol． 29 No．1，page 163；PF Vol． 29 No． 4，page 1137；PF Vol． 29 No．5，page 1601；PF Vol． 29 No．6， page 2022；PF Vol． 30 No．1，page 211；PF Vol． 30 No．2，page 613；PF Vol． 30 No．3，page 998；PF Vol． 30 No．4，page 1338； PF Vol． 30 No．5，page 1674.

## Apparatus for Tests and Assays

〈41〉Weights and Balances－See PF Vol． 30 No．3，page 999.

## Microbiological Tests

$\langle 55\rangle$ Biological Indicators－Resistance Performance Tests－See PF Vol． 30 No．1，page 212.

## Biological Tests and Assays

＜81〉 Antibiotics－Microbial Assays－See PF Vol． 30 No．3，page 1002.

〈121〉 Insulin Assays－See PF Vol． 30 No．5，page 1675.

## Chemical Tests and Assays

## LIMIT TESTS

＜231〉 Heavy Metals－See PF Vol． 30 No．3，page 1004.
〈267〉 Porosimetry by Mercury Intrusion－See PF Vol． 29 No．3， page 712.

## OTHER TESTS AND ASSAYS

〈301〉 Acid－Neutralizing Capacity－See PF Vol． 30 No．3，page 1006.

〈341〉 Antimicrobial Agents－Content－See PF Vol． 30 No．5， page 1678
〈381〉 Elastomeric Closures for Injections－See PF Vol． 30 No．1， page 220.
〈386〉 Environmentally Sensitive Preparations－See PF Vol． 30 No．5，page 1680
〈518〉 Solution Calorimetry－See PF Vol． 28 No．4，page 1299.
〈571 Vitamin A Assay－See PF Vol． 30 No．4，page 1340.

## Physical Tests and Determinations

$\langle 601\rangle$ Aerosols，Metered－Dose Inhalers，and Dry Powder Inha－ lers－See PF Vol． 30 No．4，page 1342.
〈611 $\rangle$ Alcohol Determination－See PF Vol． 30 No．4，page 1379.
621 Chromatography－See PF Vol． 30 No．5，page 1687.
$\langle 625\rangle$ Clarity and Degree of Opalescence of Liquids－See PF Vol． 26 No．6，page 1616.
$\langle 627\rangle$ Degree of Color of Liquids－See PF Vol． 26 No．6，page 1617.

〈643〉 Total Organic Carbon－See PF Vol． 30 No．5，page 1700.
645 Water Conductivity－See PF Vol． 30 No．4，page 1380.
（661）Containers－See PF Vol． 29 No．2，page 490.
2696）Crystallinity Determination by Solution Calorimetry－See PF Vol． 29 No．1，page 175.
〈711〉 Dissolution－－See PF Vol． 30 No．1，page 234.
＜730 Inductively Coupled Plasma（ICP）－See PF Vol． 30 No．3， page 1022.
$\langle 785\rangle$ Osmolality and Osmolarity－See PF Vol． 30 No．5，page 1702.

〈795〉 Pharmaceutical Compounding－Nonsterile Preparations－ See PF Vol． 29 No．1，page 179.
＜811）Powder Fineness－See PF Vol． 28 No．2，page 611.
823 ）Radiopharmaceuticals for Positron Emission Tomography－ Compounding－See PF Vol． 29 No．2，page 494.
＜851〉 Spectrophotometry and Light－Scattering－See PF Vol． 30 No．5，page 1703.

## General Information

Introduction－See PF Vol． 29 No．6，page 2039.
＜1010 $\rangle$ Analytical Data－Interpretation and Treatment－See PF Vol． 30 No．1，page 236.
〈1043〉 Ancillary Materials for Cell，Gene，and Tissue－Engineered Products－See PF Vol． 30 No．2，page 629.
＜1051〉 Cleaning Glass Apparatus－See PF Vol． 30 No．1，page 264.
＜1070〉 Emergency Medical Services Vehicles and Ambulances－ Storage of Preparations－See PF Vol． 30 No．5，page 1706.
＜1072〉 Disinfectants and Antiseptics－See PF Vol． 29 No．3，page 726.

〈1075〉 Good Compounding Practices－See PF Vol． 29 No．2，page 497.
＜1078〉 Good Manufacturing Practices for Bulk Pharmaceutical Excipients－See PF Vol． 28 No．5，page 1504.
$\langle 1079\rangle$ Good Storage and Shipping Practices－See PF Vol． 29 No． 5，page 1612.
〈1080 $\rangle$ Bulk Pharmaceutical Excipients－Certificate of Analy－ sis－See PF Vol． 28 No．5，page 1650.
〈1082〉 Genotoxicity Testing－See PF Vol． 30 No．1，page 264.
＜1111 Microbiological Attributes of Nonsterile Pharmaceutical Products－See PF Vol． 25 No．2，page 7785.
＜1112 $\rangle$ Application of Water Activity Determination to Nonsterile Pharmaceutical Products－See PF Vol． 30 No．5，page 1709.
〈1117〉 Microbiological Best Laboratory Practices－See PF Vol． 30 No．5，page 1713.
＜1118〉 Monitoring Devices－Time，Temperature，and Humidity－ See PF Vol． 29 No．1，page 206.
＜1136〉 Packaging－Unit of Use－See PF Vol． 30 No．5，page 1722.

〈1160〉 Pharmaceutical Calculations in Prescription Compound－ ing－See PF Vol． 29 No．1，page 224.
＜1174 $\rangle$ Powder Flow－See PF Vol． 28 No．2，page 618.
＜1177 Good Packaging Practices－See PF Vol． 29 No．5，page 1630.

〈1178〉 Good Repackaging Practices－See PF Vol． 29 No．4，page 1219.
＜1184〉 Sensitization Testing－See PF Vol． 30 No．1，page 289.
＜1206〉 Sterile Drug Products for Home Use－See PF Vol． 29 No． 3，page 750 ．
〈1211〉 Sterilization and Sterility Assurance of Compendial Arti－ cles－See PF Vol． 30 No．5，page 1729.
〈1216〉 Tablet Friability－See PF Vol． 30 No．5，page 1740.
＜1222 $\rangle$ Terminally Sterilized Pharmaceutical Products－Para－ metric Release－See PF Vol． 30 No．5，page 1741.
$\langle 1223\rangle$ Validation of Alternative Microbiological Methods－See PF Vol． 29 No．1，page 256.
$\langle 1225\rangle$ Validation of Compendial Methods－See PF Vol． 30 No．4， page 1382.
＜1230〉 Water for Health Applications－See PF Vol． 30 No．4，page 1388.

〈1231〉 Water for Pharmaceutical Purposes－See PF Vol． 30 No．5， page 1744 ．
＜1232〉 Instrumentation for Analysis of High Purity Pharmaceuti－ cal Waters－See PF Vol． 30 No．5，page 1806.
$\langle 1265\rangle$ Written Prescription Drug Information－Guidelines－See PF Vol． 30 No．3，page 1040.

## Dietary Supplements

＜2023〉 Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements－See PF Vol． 30 No．5，page 1818.
$\langle 2040\rangle$ Disintegration and Dissolution of Nutritional Supple－ ments－See PF Vol． 29 No．2，page 513
〈2091〉 Uniformity of Dietary Supplement Intake Units－See PF Vol． 28 No．5，page 1549.

## REAGENTS，INDICATORS，AND SOLUTIONS

## Reagent Specifications

Acetal－See PF Vol． 30 No．2，page 644.
Agarose－See PF Vol． 27 No．6，page 3363.
Air－Nitrous Oxide Certified Standard－See PF Vol． 28 No．4，page 1234.

Ammonium Hydroxide， 6 N—See PF Vol． 30 No．4，page 1389.
Ammonium Pyrrolidinedithiocarbamate－See PF Vol． 30 No．3， page 1043 ．
Anion－exchange Resin，Styrene－Divinylbenzene－See PF Vol． 30 No．3，page 1043.
Anti－A Blood Grouping Reagent，Anti－B Blood Grouping Re－ agent，and Anti－A，B Blood Grouping Reagent－See PF Vol． 29 No．2，page 505.
Anti－D（Rhor $)$ Reagent－See PF Vol． 29 No．2，page 505.
Anti－D Reagent－See PF Vol． 29 No．2，page 506.
Antihuman Globulin Reagent－See PF Vol． 29 No．2，page 506.
Antithrombin III for Amidolytic Test－See PF Vol． 29 No．1，page 264.

Bacterial Alkaline Protease Preparation－See PF Vol． 30 No．2， page 644.
Barbituric Acid－See PF Vol． 29 No．1，page 265.
Benzamidine Hydrochloride Hydrate－See PF Vol． 30 No．2，page 644.

Benzil－See PF Vol． 28 No．4，page 1305.
Blood Group $\mathrm{A}_{1}$ and Blood Group B Red Blood Cells－See PF Vol． 29 No．2，page 506.
Bovine Collagen－See PF Vol． 30 No．2，page 644.
Rat Tail Collagen－See PF Vol． 30 No．2，page 644.
Branched Polymeric Sucrose－See PF Vol． 27 No．6，page 3363.
Bromelain－See PF Vol． 28 No．2，page 552.
Bromofluoromethane－See PF Vol． 30 No．4，page 1389.
Calf Thymus DNA－See PF Vol． 30 No．4，page 1389.
dl－Camphene－See PF Vol． 28 No．6，page 1951.
Cation－exchange Resin，Styrene－Divinylbenzene－See PF Vol． 30 No．3，page 1043.
p－Chlorophenol－See PF Vol． 30 No．3，page 1044.
4－Chlorophenol－See PF Vol． 30 No．3，page 1045.
Chromotrope 2R－See PF Vol． 30 No．4，page 1390.
Citric Acid，Anhydrous－See PF Vol． 30 No．3，page 1044.
Collagen－See PF Vol． 30 No．4，page 1390.
Collagenase－See PF Vol． 30 No．4，page 1390.
Cyclohexylmethanol－See PF Vol． 30 No．2，page 644.
DEAE－Agarose－See PF Vol． 29 No．1，page 265.
Deoxyadenosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxycytidine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyguanosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyribonucleic Acid Polymerase－See PF Vol． 27 No．6，page 3365.

Deoxythymidine Triphosphate－See PF Vol． 27 No．6，page 3365.
Deuterated Methanol－See PF Vol． 29 No．6，page 2054.
Dicyclohexyl－See PF Vol． 30 No．2，page 645.
Dicyclohexyl Phthalate－See PF Vol． 26 No．2，page 504.
Diethylpyrocarbonate－See PF Vol． 27 No．6，page 3365.
Diisobutylene－See PF Vol． 28 No．4，page 1305.
1，5－Dimethyl－1，5－diazundecamethylene Polymethobromide－See PF Vol． 30 No．1，page 315.
N，N－Dimethylformamide Diethyl Acetal—See PF Vol． 29 No．5， page 1681.
$N, N$－Dimethyldodecylamine－$N$－oxide－See PF Vol． 27 No．4，page 2837.

1，9－Dimethyl－Methylene Blue－See PF Vol． 30 No．2，page 645.
Dimethyl Sulfoxide－See PF Vol． 30 No．3，page 1045.
3－（4，5－Dimethylthiazol－2－yl）－2，5－diphenyl Tetrazolium Bro－ mide－See PF Vol． 27 No．6，page 3365.
Dioleoylglycerol－See PF Vol． 26 No．6，page 1622.
1，2－Dioleoyl－3－linoleoyl－rac－glycerol－See PF Vol． 28 No．3，page 849.

Direct Red 80－See PF Vol． 30 No．4，page 1390.
Disodium Arsenate－See PF Vol． 28 No．4，page 1305.
3－（Dodecyldimethylammonio）propanesulfonate－See PF Vol． 30 No．2，page 645.
Drabkin＇s Reagent－See PF Vol． 29 No．2，page 507.
Escin－See PF Vol． 27 No．4，page 2837.
Ether，Peroxide－Free－See PF Vol． 30 No．4，page 1390.
Ethidium Bromide－See PF Vol． 27 No．6，page 3366.
Ethylbenzene－See PF Vol． 30 No．2，page 645.
Fast Green FCF－See PF Vol． 30 No．4，page 1391.
Fibroblast Growth Factor－2－See PF Vol． 30 No．2，page 645.
9－Fluorenylmethyl Chloroformate－See PF Vol． 25 No．5，page 8916.

Formamide，Anhydrous－See PF Vol． 27 No．5，page 3115.
Glucose－See PF Vol． 28 No．3，page 850.
L－Glutamic Acid—See PF Vol． 27 No．6，page 3366.
L－Glutamine－See PF Vol． 27 No．6，page 3366.
Guanidine Isothiocyanate－See PF Vol． 27 No．6，page 3366.
Hexadecane－See PF Vol． 28 No．4，page 1305.
Hexadimethrine Bromide－See PF Vol． 29 No．1，page 265.
Hexane，Solvent－See PF Vol． 30 No．3，page 1045.
Hexane，Solvent，Chromatographic－See PF Vol． 30 No．3，page 1046.

Hexanes－See PF Vol． 30 No．3，page 1046.
L－Histidine Hydrochloride Monohydrate－See PF Vol． 27 No．6， page 3366.
Homatropine Hydrobromide－See PF Vol． 28 No．4，page 1305.
Hydrocodone Diol－See PF Vol． 28 No．4，page 1306.
2＇－（4－Hydroxyphenyl）－5－（4－methyl－1－piperazinyl）－2，5＇－bi－1 $H$－ben－ zimidazole Trihydrochloride Pentahydrate－See PF Vol． 30 No．4，page 1391.
IgG－Coated Red Cells－See PF Vol． 29 No．2，page 507.
Iodine－See PF Vol． 30 No．4，page 1391.
Iodoethane－See PF Vol． 24 No．6，page 7327.
Isoferulic Acid－See PF Vol． 27 No．4，page 2837.
Isovaleric Acid－See PF Vol． 30 No．3，page 1046.
Lanthanum Chloride－See PF Vol． 29 No．2，page 507.
Lanthanum Oxide－See PF Vol． 28 No．3，page 851.
Lauryl Dimethyl Amine Oxide－See PF Vol． 30 No．2，page 645.
Linoleic Acid－See PF Vol． 27 No．6，page 3367.
$\alpha$－Lipoic Acid－See PF Vol． 27 No．6，page 3367.
Melamine－See PF Vol． 29 No．6，page 2055.
Methanol，Aldehyde－Free－See PF Vol． 30 No．2，page 646.
Methoxyphenylacetic Acid－See PF Vol． 30 No．3，page 1046.
Methylbenzothiazolone Hydrazone Hydrochloride－See PF Vol． 30 No．2，page 646.
3－Methyl－2－benzothiazolinone Hydrazone Hydrochloride－See PF Vol． 25 No．3，page 8280.
Methyl Iodide－See PF Vol． 30 No．3，page 1046.
4－Methylpentan－2－ol－See PF Vol． 30 No．2，page 646.
Methyl Sulfoxide－See PF Vol． 30 No．3，page 1047.
Methylene Blue－See PF Vol． 30 No．4，page 1391.
Monooleoylglycerol－See PF Vol． 26 No．6，page 1622.
Nonionic Wetting Agent－See PF Vol． 30 No．3，page 1047.
Nonylphenol Polyoxyethylene Ether－See PF Vol． 27 No．6，page 3368.

Octoxynol－See PF Vol． 30 No．4，page 1392.
Oligo－deoxythymidine－See PF Vol． 27 No．6，page 3368.
Oxygen－Helium Certified Standard－See PF Vol． 30 No．2，page 646.

Pentadecanoic Acid Methyl Ester—See PF Vol． 26 No．6，page 1622.

Phenol Red, Sodium-See PF Vol. 27 No. 6, page 3368.
Phenylmethylsulfonyl Fluoride-See PF Vol. 30 No. 2, page 647.
Piperazine-See PF Vol. 30 No. 5, page 1821.
Polyoxyethylene (23) Lauryl Ether-See PF Vol. 29 No. 2, page 507.

Polyoxyethylene (20) Sorbitan Monolaurate-See PF Vol. 27 No. 6, page 3368.
Propionaldehyde-See PF Vol. 30 No. 2, page 647.
Putrescine Dihydrochloride-See PF Vol. 27 No. 6, page 3369.
Red-Cell Lysing Agent-See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase-See PF Vol. 27 No. 6, page 3369.
Rhodamine 6G-See PF Vol. 30 No. 4, page 1392.
Ribonuclease Inhibitor-See PF Vol. 27 No. 6, page 3369.
Sodium Arsenite, Twentieth-Molar ( 0.05 M )-See PF Vol. 29 No. 4, page 1250.
Sodium 1-Heptanesulfonate-See PF Vol. 30 No. 3, page 1047.
Sodium 1-Heptanesulfonate Monohydrate-See PF Vol. 30 No. 2, page 647.
Sodium 1-Hexanesulfonate-See PF Vol. 30 No. 3, page 1048.
Sodium Hydrogen Sulfate-See PF Vol. 29 No. 5, page 1682.
Sodium Iodate-See PF Vol. 27 No. 6, page 3369.
Sodium Phosphate, Monobasic-See PF Vol. 30 No. 4, page 1392.
1,1,4,4-Tetraphenyl-1,3-butadiene-See PF Vol. 26 No. 6, page 1623.

Thrombin Human-See PF Vol. 29 No. 6, page 2055.
Thymidine-See PF Vol. 27 No. 6, page 3369.
Thyroglobulin-See PF Vol. 30 No. 1, page 316.
1,3,7-Trichlorodibenzo- $p$-dioxin-See PF Vol. 30 No. 4, page 1392.

Trioleoylglycerol-See PF Vol. 26 No. 6, page 1623.
Tritirachium Album Proteinase K—See PF Vol. 30 No. 2, page 647.

Tropic Acid—See PF Vol. 30 No. 3, page 1048.
Tropine-See PF Vol. 30 No. 2, page 647.
L-Tyrosine Disodium-See PF Vol. 27 No. 6, page 3370.
Tuberculin, Purified Protein Derivative (Tuberculin PPD)-See PF Vol. 29 No. 5, page 1682.
2-Vinylpyridine-See PF Vol. 26 No. 2, page 504.
Wright's Stain-See PF Vol. 30 No. 1, page 316.
Zinc Sulfate Heptahydrate-See PF Vol. 26 No. 2, page 504.

## Indicator Test Papers

Methyl Green-See PF Vol. 28 No. 4, page 1306.
Methyl Green-Iodomercurate Paper-See PF Vol. 28 No. 4, page 1306.

Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.
Ninhydrin TS-See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS-See PF Vol. 27 No. 1, page 1905.

## Test Solutions

Ammonia TS-See PF Vol. 30 No. 4, page 1392.
Folin-Ciocalteu Phenol TS-See PF Vol. 30 No. 1, page 316.
Hydroxylamine Hydrochloride TS-See PF Vol. 30 No. 4, page 1393.

Iodine and Potassium Iodide TS 1—See PF Vol. 30 No. 4, page 1393.

Iodine and Potassium Iodide TS 2—See PF Vol. 30 No. 4, page 1393.

Methyl Yellow TS-See PF Vol. 30 No. 4, page 1393.
Potassium Pyroantimonate TS-See PF Vol. 30 No. 4, page 1393.

## Volumetric Solutions

Ammonium Thiocyanate, Tenth-Normal ( 0.1 N )-See PF Vol. 30 No. 4, page 1393.
Bromine, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1393.

Ceric Ammonium Nitrate, Twentieth-Normal (0.05 N)—See PF Vol. 30 No. 4, page 1394.

Ceric Sulfate, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1394.

Cupric Nitrate, Tenth Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1394.

Standard Dichlorophenol-Indophenol Solution-See PF Vol. 30 No. 4, page 1394.
Edetate Disodium, Twentieth-Molar ( 0.05 M )—See PF Vol. 30 No. 4, page 1395 .
Ferric Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Ferrous Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Normal ( 1 N )—See PF Vol. 30 No. 4, page 1395.

Hydrochloric Acid, Half-Normal ( 0.5 N )—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Half-Normal ( 0.5 N ) in Methanol-See PF Vol. 30 No. 4, page 1396.
Hydrochloric Acid, Alcoholic, Tenth-Molar ( 0.1 M )—See PF Vol. 30 No. 4, page 1396.
Iodine, Tenth-Normal ( 0.1 N )-See PF Vol. 30 No. 4, page 1396.
Iodine, Hundredth-Normal ( 0.01 N )-See PF Vol. 30 No. 4, page 1396.

Lead Perchlorate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1396.
Lead Perchlorate, Hundredth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Fiftieth-Normal ( 0.02 N ) in Methanol-See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal ( 0.1 N ) in Toluene-See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal ( 0.1 N ) in ChlorobenzeneSee PF Vol. 30 No. 4, page 1397.
Mercuric Nitrate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1398.
Morpholine, Half-Normal ( 0.5 N ) in Methanol-See PF Vol. 30 No. 4, page 1398.
Oxalic Acid, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1398.

Perchloric Acid, Tenth-Normal ( 0.1 N ) (in Glacial Acetic Acid)See PF Vol. 30 No. 4, page 1398.
Perchloric Acid, Tenth-Normal ( 0.1 N ) in Dioxane-See PF Vol. 30 No. 4, page 1398.
Potassium Bromate, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1399.
Potassium Bromide-Bromate, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1399.
Potassium Dichromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Ferricyanide, Twentieth-Molar ( 0.05 M )—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Normal (1 N)—See PF Vol. 30 No. 4, page 1399.

Potassium Hydroxide, Alcoholic, Half-Normal ( 0.05 N )—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 30 No. 4, page 1400.
Potassium Hydroxide, Methanolic, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1400.
Potassium Permanganate, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1400 .
Silver Nitrate, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1400.

Sodium Hydroxide, Normal ( 1 N )—See PF Vol. 30 No. 4, page 1400.

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Tenth-Normal ( 0.1 N ) (in Toluene)-See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Half-Normal ( 0.5 N ) in Methanol-See PF Vol. 30 No. 4, page 1401.

Sodium Nitrite, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1401.

Sodium Tetraphenylboron, Fiftieth-Molar ( 0.02 M )-See PF Vol. 30 No. 4, page 1402.
Sodium Thiosulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Sulfuric Acid, Half-Normal $(0.5 \mathrm{~N})$ in Alcohol-See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N-See PF Vol. 30 No. 4, page 1403.

Tetramethylammonium Bromide, Tenth-Molar ( 0.1 M )—See PF Vol. 30 No. 4, page 1403.
Tetramethylammonium Chloride, Tenth-Molar ( 0.1 M )—See PF Vol. 30 No. 4, page 1403.
Titanium Trichloride, Tenth-Normal ( 0.1 N )—See PF Vol. 30 No. 4, page 1403.
Zinc Sulfate, Twentieth-Molar ( 0.05 M )-See PF Vol. 30 No. 4, page 1403.

## Reagent Footnotes

Reagent Footnotes-See PF Vol. 30 No. 2, pages 647-648.
Footnote 113-See PF Vol. 30 No. 2, page 648.
Footnote 114-See PF Vol. 30 No. 2, page 648.
Footnote 116-See PF Vol. 30 No. 2, page 648.

## HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps (Stages).

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In $P F$, this stage appears as OFFICIAL INQUIRY STAGE 4 in the Harmonization section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

## Stage 5: Consensus

## A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

## B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

## BRIEFING

〈776〉 Optical Microscopy，USP 27 page 2332 and page 606 of PF 28（2）［Mar．－Apr．2002］．The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this chapter．The revisions presented in this proposal represent the ADOPTION STAGE 6 draft and have been accepted by the members of the Pharmacopeial Discussion Group．The range of particle sizes to which this chapter should ap－ ply is modified to include all particles above $1 \mu \mathrm{~m}$ ．References to other USP general chapters are omitted，as they are not appropriate for a harmonized document．The reference to ASTM standards is replaced with a reference to the applicable ISO standards．The sec－ tion on Number of Particles to Characterize has been omitted，be－ cause the statistical parameters are not suited to this chapter，but may be incorporated into a general information chapter at another time．Other minor changes and editorial changes are included．
（ETM：J．Lane）RTS－41721－1

## Change to read：

## 〈776〉－OPTICAL MICROSCOPY

[^364]eroscopy is partieularly useful for characterizing particles that are net spherical．This method may alse serve as a base for the calibra tion of faster and more routine methods that may be developed．

Apparatus Use a mierescope that is stable and protected frem vibration．The mieroseope magniffention（product of the objective magnification，ocular magniffeation，and additional magnifying eompenents）must be sufficient to allow adequate characterization of the smallest particles to be classified in the test specimen．The greatest numerieal aperture of the objective should be sought for each magnification range．Polarized light may be used in conjunc tion with suitable analyzers and retardation plates．Coler filters of relatively narrow spectral transmission should be used with achre－ matic objectives and are preferable with apochromats and are re－ quired for appropriate color rendition in photomicrography． Gondensers corrected for at least spherieal aberration－should be used in the mieroscope substage and with the lamp．The numerical aperture of the substage condenser should mateh that of the objec tive under the conditions of use；this is affected by the actual ap exture of the condenser diaphragm and the presence of immersion eils．
Adjustment The precise alignment of all elements of the op－ tieal system and proper fousing are essential．The fousing of the elements should be done in accordance with the recommendations of the mierescope mantufacturer．Critieal axial alignment is reeom－ mended．

Hlumination A requirement for good illumination is a uni－ form and adjustable intensity of light over the entire field of view； Kohler illumination is preferred．With colored particles，choose the eolor of the filters used so as to control the contrast and detailof the image．
Vistal－Charaeterization－The magnifieation and numerical aperture should be sufficiently high to allow adequate resolution of the edges of the images of the particles to be characterized．De termine the actual magnification using a calibrated stage miereme－ ter to calibrate an ocular mieremeter．Errers can be minimized if the magnification is oufficient that the image of the partiele is at least 10 －ceular divisions．Each objective must be calibrated separately． To calibrate the ocular seale，the stage mierometer seale and the ecular seale should be aligned．In this way，a precis detemmination of the distane be weenoeular stag divisions ean be made．Severat different magnifications may be necessary to characterize materials having a wide particle size distribution．

Photographic Characterization－If particle size is to be deter－ mined by photographic methods，take care to ensure that the object is sharply foeused at the plane of the photographic emmlsion．De－ termine the aetual magniffeation by photographing a calibrated stage micrometer，using photographic film of sufficient speed，re solving power，and contrast．Expesure and proeessing should be identieal for photographs of beth the test specimen and the deter mination of magnifieation．The apparent size of a photographic im age is influenced by the exposure，development，and printing process as well as by the resolving power of the miereseope．

Preparation of the Mount The meunting medium will vary recording to the physieal properties of the test specimen．Suffl eient，but not excessive，contrast between the specimen and the mounting medimm is required to ensure adequate detailof the spec imen edge．The particles should rest in one plane and be adequately dispersed to distinguish individual particles of interest．Further more，the partieles must be representative of the distribution of siz es in the material and must not be altered during preparation of the mount．Care should be taken to ensure that this impertant require－ ment is met．Selection of the mounting medium must inelude a eemsideration of the analyte solubility．

Grystallinity Characterization－Therystallinity of amateriat may be characterized to determine complianee with the erystallin－ ity requirement where stated in the individual menegraph of a drug substance．Unless otherwise specified in the individual mone－ graph，mount a few particles of the specimen in mineral oil on a
elean glass slide. Examine the mixture using a polarizing mieroseope: the particles show birefringence (interference colors) and extinction positions when the mieroscope stage is revolved.

Limit Test of Partiele Size by Mieroseopy Unless otherwise specified in the individual menegraph, use the following method. Weigh a suitable quatity of the powder to be examined (for example, 10 to 100 mg ), and suspend it in 10 mL of a suitable medium in which the powder does not dissolve, adding, if necessary, a wetting agent. $A$ homogeneous suspension of particles ean be achieved by matching the density of the meditm and the particles, and by providing adequate agitation. Introduce a pertion of the hemegeneeus suspension int a suitable counting cell, and sean under a miero seope an are correspending to not less than $10 \mu$ go f the powder to be examined. Count all the particles having a maximum dimension greater than the preseribe size limit. The size limit and the permit ted number of particles exceeding the limit are stated in the monograph.

Number of Particles to-Characterize-The number of partieles characterized must be sufficient to ensure an acceptable level of uncertainty in the measured parameter. Suecessively higher magnification may be necessary to ensure proper dispersion of the specimen. An estimate of the number of particles, $n$, to be mea stred that will provide an aceeptable level of uneertainty in the mean particle diameter can be obtained frem the statistical theory of normal populations. For a sufficiently large population ( $n>30$ ), the uncertainty in the estimate for the mean particle diameter, $d$, is given in the formula:

in which $z_{\text {e correspends to }}$ the desired eonfidence coeffient ands is the standard deviation of the test specimen. For $n>30, z_{e}$ is about 1.96 at the $95 \%$ confidence level. Other confidence coeffleients can be obtained from reference books on statistics, and, if necessary, small population statisties ean be similarly applied. From this equation, it can be seen that the uneertainty in the mea stred diameter decreases as the number of particles increases. As an example, to obtain an uncertainty of $\pm 5 \mu \mathrm{~m}$ in a specimen that has a standard deviation of $20 \mathrm{\mu m}$ would require that 61 particles be aceurately measured.

An estimate of the uneertainty in the standard deviation of a specimen ean be obtained in a similar fashion. The standard devi ation of the population, $\sigma$, is estimated to lie in the interval:-
where $s$ is the standard deviation of the specimen, and $\chi_{*}{ }^{2}$ and $\chi_{*}{ }^{2}$ are the confidence coefficients obtained from the $\chi^{2}$-distribution. $\chi{ }^{2}$ - and $\chi_{t}{ }^{2}$ ean be obtained from standard statistics references or approximate by the following expressions at the-95\% ennfidence level where $x^{2}{ }^{2}$ and $x_{\Delta}{ }^{2}$ represent the 97.5 and 2.5 pereentile values, respectively:

In general, a larger sample must be aequired to obtain a good estimate of the standard deviation or distribution of the population. For the example population deseribed above, if the mean particle diameter was $50 \mu \mathrm{~m}$, only 61 particles would have to be measured tobtain an uncertainty of $10 \%$ in the diameter (e.g., $d-50 \pm 5$ $\mu \mathrm{m})$, but about 200 particles would have to be meastred to obtaina similar confidence of $\pm 10 \%$ in the standard deviation (e.g., $18.3<s<22.3)$.

For a material that conforms more closely to a log normal dis tribution, the logarithm of the individual particle diameters can be eomputed, and the mean and the standard deviation of the log partiele diameter directly substituted in the above quations. The antilogs correspend to the geometric mean and geometric standarde deviation, respectively.

Particle-SizeCharacterization-The meacurement of particle size varies in complexity depending on the shape of the partiele. For spherieal particles, size is defined by the diameter. For irregular particles, a variety of definitions of particle size exist. In seneral, for irregularly shaped particles, characterization of particle-size must also inelude information on the type of diameter measured as well as information on partiele shape. Several commenly used measurements of particle size are defined below (see Figute 1):

Fig. 1. Commenly used measurements of particle-size.

Feret's Diameter. The-distanee between-imaginary paralle 4 lines tangent to a randomly oriented particle and perpendicular to the ocular seale.

Matin's Bitameter. The diameter of the particle at the peint that divides a randomly oriented partiele into equal projected areas.

Projectar Dicmeter. The diameter of acirele that has the same projected area the particle.

Length The lengest dimension from edge to edge of a particle eriented parallel to the oeular seale-

Width The longest dimension of the particle measured at right angle to the length.

Partiele Shape-Characterization-For irregularly shaped par tieles, characterization of particle-size must also include informar tionen particle shape. The following defines some ommenly used descriptors of particle shape (see Figute 2):

Fig. 2. Commenly used descriptions of particle-shape.

Aeicultar Slender, needle like paricle of similar width and thickness.

Golumnat Leng, thin pariele with a width and thiekness that are greater than these of an acieular particle.

Flate Thin, flat particle of similar length and width.
Plate Flat particles of similar length and width but with greater thickness than flakes.
tath Long, thin, and blade like particle.

Equant Particles of similar length, width, and thickness; both eubical and spherieal particles are ineluded.

General-Observations A partiele is generally considered to be the smallest discrete unit. A particle may be a liequid or semisolid droplet; a single erystal or polyerystalline; amorphous or an as glomerate. Particles may be associated. This degree of association may be described by the following terms:

Lamellat Stacked plates.
Agspegate Mass of adhered parieles.

```
    Agglomerate Fused or cemented particles.
    Genglemerate Mixture of two or more types of particles.
Spherulite Radial-cluster.
Drusy Particle covered with tiny particles.
Particle condition may be deseribed by the following terms:
Edges Angular, reunded, smooth, sharp, fractured.
Optical Color (using proper color balaneing flters), tramspar
ent, translueent, opaque.
Defeets Oeelusions, imelusions.
Surface characteristies may be described as:
Gracked Partial-split, break, or fissure-
Smeoth Free of inregularities, reughness, or projections.
Poreus Having openings or passageways.
Rough Bumpy, uneven, not smooth.
Pitted Smallindentations.
```

## ■ $\langle 776\rangle$ OPTICAL MICROSCOPY

Optical microscopy for particle characterization can generally be applied to particles $1 \mu \mathrm{~m}$ and greater. The lower limit is imposed by the resolving power of the microscope. The upper limit is less definite and is determined by the increased difficulty associated with the characterization of larger particles. Various alternative techniques are available for particle characterization outside the applicable range of optical microscopy. Optical microscopy is particularly useful for characterizing particles that are not spherical. This method may also serve as a base for the calibration of faster and more routine methods that may be developed.

Apparatus-Use a microscope that is stable and protected from vibration. The microscope magnification (product of the objective magnification, ocular magnification, and additional magnifying components) must be sufficient to allow adequate characterization of the smallest particles to be classified in the test specimen. The greatest numerical aperture of the objective should be sought for each magnification range. Polarizing filters may be used in conjunction with suitable analyzers and retardation plates. Color filters of relatively narrow spectral transmission should be used with achromatic objectives, are preferable with apochromats, and are required for appropriate color rendition in
photomicrography. Condensers corrected at least for spherical aberration should be used in the microscope substage and with the lamp. The numerical aperture of the substage condenser should match that of the objective under the conditions of use and is affected by the actual aperture of the condenser diaphragm and by the presence of immersion oils.

Adjustment-The precise alignment of all elements of the optical system and proper focusing are essential. The focusing of the elements should be done in accordance with the recommendations of the microscope manufacturer. Critical axial alignment is recommended.

Illumination-A requirement for good illumination is a uniform and adjustable intensity of light over the entire field of view; Kohler illumination is preferred. With colored particles, choose the color of the filters used so as to control the contrast and detail of the image.

Visual Characterization-The magnification and numerical aperture should be sufficiently high to allow adequate resolution of the images of the particles to be characterized. Determine the actual magnification using a calibrated stage micrometer to calibrate an ocular micrometer. Errors can be minimized if the magnification is sufficient that the image of the particle is at least 10 ocular divisions. Each objective must be calibrated separately. To calibrate the ocular scale, the stage micrometer scale and the ocular scale should be aligned. In this way, a precise determination of the distance between ocular stage divisions can be made. Several different magnifications may be necessary to characterize materials having a wide particle size distribution.

Photographic Characterization-If particle size is to be determined by photographic methods, take care to ensure that the object is sharply focused at the plane of the photographic emulsion. Determine the actual magnification by photographing a calibrated stage micrometer, using photo-
graphic film of sufficient speed, resolving power, and contrast. Exposure and processing should be identical for photographs of both the test specimen and the determination of magnification. The apparent size of a photographic image is influenced by the exposure, development, and printing processes as well as by the resolving power of the microscope.

Preparation of the Mount-The mounting medium will vary according to the physical properties of the test specimen. Sufficient but not excessive contrast between the specimen and the mounting medium is required to ensure adequate detail of the specimen edge. The particles should rest in one plane and be adequately dispersed to distinguish individual particles of interest. Furthermore, the particles must be representative of the distribution of sizes in the material and must not be altered during preparation of the mount. Care should be taken to ensure that this important requirement is met. Selection of the mounting medium must include a consideration of the analyte solubility.

Crystallinity Characterization-The crystallinity of a material may be characterized to determine compliance with the crystallinity requirement where stated in the individual monograph of a drug substance. Unless otherwise specified in the individual monograph, mount a few particles of the specimen in mineral oil on a clean glass slide. Examine the mixture using a polarizing microscope: the particles show birefringence (interference colors) and extinction positions when the microscope stage is revolved.

Limit Test of Particle Size by Microscopy—Weigh a suitable quantity of the powder to be examined (for example, 10 to 100 mg ), and suspend it in 10 mL of a suitable medium in which the powder does not dissolve, adding, if necessary, a wetting agent. A homogeneous suspension of particles can be maintained by suspending the particles in a medium of similar or matching density and by providing adequate agitation. Introduce a portion of the homogeneous suspension into a suitable counting cell, and scan under a microscope an area corresponding to not less than $10 \mu \mathrm{~g}$ of the powder to be examined. Count all the particles having a maximum dimension greater than the prescribed size limit. The size limit and the permitted number of particles exceeding the limit are defined for each substance.

Particle Size Characterization-The measurement of particle size varies in complexity depending on the shape of the particle, and the number of particles characterized must be sufficient to ensure an acceptable level of uncertainty in the measured parameters. Additional information on particle size measurement, sample size, and data analysis is available, for example, in ISO 9276. For spherical particles, size is defined by the diameter. For irregular particles, a variety of definitions of particle size exist. In general, for irregularly shaped particles, characterization of particle size must also include information on the type of diameter measured as well as information on particle shape. Several commonly used measurements of particle size are defined below (see Figure 1):

Fig. 1. Commonly used measurements of particle size.

Feret's Diameter-The distance between imaginary parallel lines tangent to a randomly oriented particle and perpendicular to the ocular scale.

Martin's Diameter-The diameter of the particle at the point that divides a randomly oriented particle into two equal projected areas.

Projected area Diameter-The diameter of a circle that has the same projected area as the particle.

Length-The longest dimension from edge to edge of a particle oriented parallel to the ocular scale.

Width-The longest dimension of the particle measured at right angles to the length.

Particle Shape Characterization-For irregularly shaped particles, characterization of particle size must also include information on particle shape. The homogeneity of the powder should be checked using appropriate magnification. The following defines some commonly used descriptors of particle shape (see Figure 2):

Equant

Columnar

Plate

Fig. 2. Commonly used descriptions of particle shape.

Acicular-Slender, needle-like particle of similar width and thickness.

Columnar-Long, thin particle with a width and thickness that are greater than those of an acicular particle.

Flake-Thin, flat particle of similar length and width.
Plate-Flat particles of similar length and width but with greater thickness than flakes.

Lath-Long, thin, and blade-like particle.
Equant-Particles of similar length, width, and thickness; both cubical and spherical particles are included.

General Observations-A particle is generally considered to be the smallest discrete unit. A particle may be a liquid or semisolid droplet; a single crystal or polycrystalline; amorphous or an agglomerate. Particles may be associated. This degree of association may be described by the following terms:

Lamellar-Stacked plates.
Aggregate-Mass of adhered particles.

Agglomerate-Fused or cemented particles.
Conglomerate-Mixture of two or more types of particles.

Spherulite-Radial cluster.
Drusy-Particle covered with tiny particles.
Particle condition may be described by the following terms:

Edges-Angular, rounded, smooth, sharp, fractured.
Optical-Color (using proper color-balancing filters), transparent, translucent, opaque.

Defects-Occlusions, inclusions.
Surface characteristics may be described as:
Cracked-Partial split, break, or fissure.
Smooth-Free of irregularities, roughness, or projections.
Porous-Having openings or passageways.
Rough-Bumpy, uneven, not smooth.
Pitted-Small indentations.■2S (USP28)

## Briefing

<786〉 Particle Size Distribution Estimation by Analytical Sieving, USP 27 page 2335 and page 1581 of $P F 28(5)$ [Sept.Oct. 2002]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this chapter. The revisions presented in this proposal represents the ADOPTION STAGE 6 draft and have been accepted by the members of the Pharmacopeial Discussion Group. Major changes from the current USP General Chapter include the omission of the section on the Wet Sieving Method, because it is not adequate or practical for pharmaceutical powders. Other minor changes and editorial changes are included.
(ETM: J. Lane) RTS-41729-2

Change to read:

## 〈786) PARTICLE SIZE <br> DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING

Sieving is one of the oldest metheds of elassifying powders by particle size distribution. Sieving is most suitable where the major ity of the particles are larger than about $75 \mu \mathrm{~m}$, although it can be used for some powders having smaller particle sizes where the methed ean be validated. In pharmaceutical terms, sieving is usuat ly the methed of choiee for classifieation of the coarser grades of single powders. It is a partieularly attractive method in that pow ders are classiffed only on the basis of partiele-size, and in most eases the analysis can be carried out in the dry state-

Ameng the limitations of the sieving method are the need for an appreciable amount of sample (normally at least 25 g ) and diffient ty in sieving oily or other cohesive powders that tend to clog the
sieve openings. The method is essentially a dwo dimensional estimate of size because passage through the sieve aperture is frequent ly more dependent on maximum width and thiekness than on length.
This method is intended for estimation of the total partiele-size distribution of a single material. It is not intended for detemination of the propertion of partieles passing or retained on one-or two sieves.

Estimate the particle size distribution as described under Method I, unless otherwise specified in the individual menegraph. Method $I$ is the dry sieving method. Where diffieulty is experienced in reaching the endpeint (i.e., material doe not readily pass through the sieves) or when it is neeessary to use the finer end of the sieving fange (below $75 \mathrm{\mu m}$ ), Method II, which is a wet sieving technique, may be used; however, in the latter case serious consideration should be given to the use of an altemative partiele-sizing method.

Principles of Analytical-Sieving Analytical test sieves are eonstructed from a woven wire mesh, which is of simple weave that is assumed to give nearly square apertures and is sealed inte the base of an open cylindrieal container. The basic analytieal methed involves stacking the sieves on top of one another in as eending degrees of coarseness, and then placing the test powder on the top-sieve.

The nest of sieves is subjected to a standardized period of agitation, and then the weight of material retained on each sieve is ac eurately determined. The test gives the weight pereentage of powder in each sieve size range.

This sieving process for estimating the particle size distribution of a single pharmaentieal powder is generally intended for use where at least $80 \%$ of the partieles are larger than $75 \mu \mathrm{~m}$. The size parameter involved in determining particle size distribution by analytieal sieving is the length of the side fo the minimum square apexture through which the particle will pass.

## TEST SHEVES

Test sieves suitable for pharmacopeial tests conform to the most eurrent edition of International-Organization for Standardization Speciffeation ISO 3310-1: Test sieves Technieal requirements and Testing ${ }^{+}$(see Table 1). Unless otherwise speeified in the menograph, use these ISO sieves listed as principal sizes in Table 1.

${ }^{2}$ The-speeifieations for standard sieves in Eurepe, Japan, and the US are all identieal to ISO-3310-1: 2000(E). The-lists-of Eurepean-and Japanese-standard sieves are included for informational purpeses.

Sieves are selected to cover the entire range of particle-sizes present in the test specimen. This nest of sieves is completed by a well fitting collecting pan at its base and lidat its top. Use mierometers or millimeters in denoting test sieve openings. [NOTE-Mesh nembers are provided in the table for conversion purposes only.] Test sieves are made from stainless steel or, less preferably, from brass or other suitable nomreactive wire.

Galibration and recalibration of test sieves is in accordance with the most current dition of ISO-3310-1. Sieves sheuld be careftlly examined for gross distortions and fractures, especially at their sereen frame joints, before use. Sieves may be ealibrated optieally to estimate the average opening size, and opening variability, of the sieve mesh. Altematively, for the evaluation of the effective opening of test sieves in the size range of 212 to $850 \mu \mathrm{~m}$, Standard Glass Spheres are available frem the National Institute of Standards and Fechnology as Standard Reference Material 1018. Unless other wise speciffed in the individual menograph, perform the sieve anat ysis at controlled room temperature and a relative humidity beven 20\% and 70\%.

Eleaning Test Sieves. Ideally, test sieves should be cleanedusing only an air jet or a liquid stream. If some apertures remain blocked by test particles, careful gentle brushing may be used as a last resort. Washing sieves in hot water is not recemmended since the sieve an distort and rupture during heating and cooling. If it is neeessary to use water, it should be used at ambient temperature and the sieve dried by first using a volatile water miscible-solvent to remove the water and then a low pressure air jet to remove the solvent. This procedure should be carried out in a fume hood or eabinet hat conforms to local regulations.

Test Specimen-If the test specimen weight is not given in the monegraph for a particular material, use a test specimen having a weight be 25 and 100 or , depending on the bulk density of the material, and test sieves haring a 200 mm diameter. Determine the most appropriate weight for a given material by test sieving aceurately weighed specimens of different weights, sueh as 25,50, and 100 g, for the same time period on a mechanieal shaker. [NOTE-If the test results are similar for the 25 -g and 50 - s speei mens, but the 100 s specimen shows a lower percentage through the finest sieve, the 100 हु specimen size is to large.] Where only $a$ specimen of 10 to 25 g is available, smaller diameter test sieves eonforming to the same ISO mesh specifieations may be substitut ed, but the endpeint must be redetermined.

If the test material is prone to pieking up-or losing significant amounts of water with varying humidity, the test must be carried out in an appropriately controlled envirenment. Similarly, if the test material is known to develop an electrostatic charge, carefut observation must be made to ensure that such charging is net in flueneing the analysis. If both of the above effeets cannot be eliminated, an alternative partiele-sizing technique must be selected.

Agitation Methods Use a mechanieal device that imparts et ther a retating tap ( 200 to 300 horizontal revolutions and 140 to 300 taps per minute) or vibratory ( 1 to 2 mm amplitude) motion to the sieves as the reference method of agitating test sieves, unless etherwise stated in the individual menograph. Methods utilizing entrainment of the parieles in an air stream may also be used. The results must indieate the ype sieving method used.
Endpoint Determination-The test sieving analysis is eomplete when the weight on any of the test sieves does not change by more than $5 \%$ ( $10 \%$ in the ease 76 mm sieves) of the previ eus weight on that sieve. If less than $5 \%$ of the total specimen weight is present on a given sieve, the endpeint for that sieve is increase to a weight change of not more than $20 \%$ of the previous weight on that sieve.

If mere than 50\% of the total specimen weight is found on any ene-sieve, the test should be repeated, but with the addition to the sieve nest of the nex coarsest sieve to that carying the exeessive weight, i.e., addition of the ISO series sieve omitted from the USP series in Table 1. Fer example, if mere than 50\% of the spec imen weight is found on the $180 \mu \mathrm{~m}$ sieve, the ISO $212 \mu \mathrm{~m}$ sieve should be placed be ween the 180 Hm and 250 رm sieves in the sieve nest.

## SHEVING METHODS

Method I (Dry Sieving Methed). Tare ench test sieve the nearest 0.1 g. Place an aceurately weighed quantity of test speei menon the top (coarsest) sieve, and replace the lid. Agitate the nest of sieves for 5 minutes. Then carefully remove from the nest without loss of material. Reweigh each sieve, and determine the weight of material on each sieve. Determine the weight of materiat in the colleeting pan in a similar manner. Reassemble the nest of sieves, and agitate for 5 minetes. Remove and weigh each sieve as previously described. Repeat these steps untill the endpoint eriteria are met (see Endpoint Determination under Test Sieves). Upen emmpletion of the analysis, reeoncile the weights of material. Totat lesses must not exceed $5 \%$ of the weight of the original test spec imen.

Repent the analysis with a fresh specimen, but using a single sieving time equal to that of the combined times used above. Con frm that this sieving time conforms to the requirements for end point determination. When this endpoint has been validated for a speeific material, then a single fixed time of sieving may be used for future analyses, providing the partiele size distribution does not ehange-signifiently.

If there is evidence that the particles retained on any sieve are aggregater rather than single particles, the use of dry sieving is un likely to give good reproducibility, and Methed II should be een sidered as one preferred teehnique.

MethodH(Wet Sieving Method) Modify the lid and colleet ing pan of the sieve nest to permit addition of a liquident the sur face of the top sieve and collection of the liquid from the pan. Dry a sufficient quantity of the test material to constant weight at a tem-
perature that will not have a detrimental effect on the material, e.g., if it is a solvate. Select a liquid in which the test specimen is insol uble, and modify the sieving method as indicated below. Ther eughly disperse the dried test material in the liquid by gentle agitation, and perm this dispersion ont the top sieve. Rinse the dis persion equipment with fresh liquid, and add the rinsings to the top sieve. Feed the sieving liquid through a suitable pumping mechafism the nozzle(s) in the lid, and collect the sieving liguid from the pan in a stitable container. Continte the wet sieving process until the emerging liquid appears free of partieles.

Remove ach sieve from the sieve nest, and dry each sieve-to eonstant weight at the same temperature as that used above. Deter mine the weight of dried material on each sieve.

Air Jet and-Sonie Sifter Sieving Differentypes of commer eial equipment that use moving air eurrent are available for siev ing. A system that uses a single sieve at a time is referred to as air je sieving. It uses the same general sieving methodology as that described under Method $I$, but with a standardized air jet replacing the nermal agitation mechanism. It requires sequential analyses on individual sieves to provide a partiele size distribution. This teehnique is more suitable where only oversize or undersize fractions are needed.

In the senic sifting method, a nest of sieves is used, and the test specimen is carried in a vertically oseillating column of air that lifts the specimen and then carries it back against the mesh openings at a given number of pulses per mintte. The air jet sieving and sonie sieving methods may be usefut when the standard dry and wet siev ing techniqutes are ineapable of giving a meaningful analysis.

These methods are highly dependent upen proper dispersion of the powder in the air current. This requirement may be hard to a ehieve if the methed is used at the lower end of the sieving range (i.e., below $75 \mu \mathrm{~m}$ ), when the particles tend to be more cohesive, and especially if there is any tendency for the material to develep an electrostatic charge. In the latter ease an antistatic agent, such as silicen dioxide or alumintmoxide, may be added at the $0.5 \%$ (wh W) level to minimize this effect. For the above reasons endpoint determination is particularly eritieal, and it is very important to eonflim that the oversize material is in fact single particles and is not composed of aggregates.

## INTERPRETATION

The raw data metst include the weight of test specimen, the total sieving time, and the precise-sieving methodology, in addition to the weights on the individtal sieves and in the pan. It may beent venient to convert the raw data into a cemmative weight distribut tion, and if it is desired to express the distribution in terms of a eumulative weight undersize, the range of sieves used should in elude a sieve through which all the material passes. If there is evi dence on any of the test sieves that the material remaining on it is ermposed of aggregates formed during the sieving process, the a malysis is invalid.

## 〈786〉 PARTICLE SIZE <br> DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING

Sieving is one of the oldest methods of classifying powders and granules by particle size distribution. When using a woven sieve cloth, the sieving will essentially sort the particles by their intermediate size dimension (i.e., breadth or width). Mechanical sieving is most suitable where the majority of the particles are larger than about $75 \mu \mathrm{~m}$. For smaller particles, the light weight provides insufficient force during sieving to overcome the surface forces of cohesion and adhesion that cause the particles to stick to each other and to the sieve, and thus cause particles that would be expected to pass through the sieve to be retained. For such materials other means of agitation such as air-jet sieving or sonic sifting may be more appropriate. Nevertheless, sieving can sometimes be used for some powders or granules having median particle sizes smaller than $75 \mu \mathrm{~m}$ where the method can be validated. In pharmaceutical terms, sieving is usually the method of choice for classification of the coarser grades of single powders or granules. It is a particularly attractive method in that powders and granules are classified only on the basis of particle size, and in most cases the analysis can be carried out in the dry state.

Among the limitations of the sieving method are the need for an appreciable amount of sample (normally at least 25 g , depending on the density of the powder or granule, and the diameter of test sieves) and difficulty in sieving oily or other cohesive powders or granules that tend to clog the sieve openings. The method is essentially a two-dimensional estimate of size because passage through the sieve aperture is frequently more dependent on maximum width and thickness than on length.

This method is intended for estimation of the total particle size distribution of a single material. It is not intended for determination of the proportion of particles passing or retained on one or two sieves.

Estimate the particle size distribution as described under Dry Sieving Method, unless otherwise specified in the individual monograph. Where difficulty is experienced in reaching the endpoint (i.e., material does not readily pass through the sieves) or when it is necessary to use the finer end of the sieving range (below $75 \mu \mathrm{~m}$ ), serious consideration should be given to the use of an alternative particle-sizing method.

Sieving should be carried out under conditions that do not cause the test sample to gain or lose moisture. The relative humidity of the environment in which the sieving is carried out should be controlled to prevent moisture uptake or loss by the sample. In the absence of evidence to the contrary, analytical test sieving is normally carried at ambient humidity. Any special conditions that apply to a particular material should be detailed in the individual monograph.

Principles of Analytical Sieving-Analytical test sieves are constructed from a woven-wire mesh, which is of simple weave that is assumed to give nearly square apertures and is sealed into the base of an open cylindrical container. The
basic analytical method involves stacking the sieves on top of one another in ascending degrees of coarseness, and then placing the test powder on the top sieve.

The nest of sieves is subjected to a standardized period of agitation, and then the weight of material retained on each sieve is accurately determined. The test gives the weight percentage of powder in each sieve size range.

This sieving process for estimating the particle size distribution of a single pharmaceutical powder is generally intended for use where at least $80 \%$ of the particles are larger than $75 \mu \mathrm{~m}$. The size parameter involved in determining particle size distribution by analytical sieving is the length of the side of the minimum square aperture through which the particle will pass.

## TEST SIEVES

Test sieves suitable for pharmacopeial tests conform to the most current edition of International Organization for Standardization Specification ISO 3310-1: Test SievesTechnical Requirements and Testing (see Table 1). Unless otherwise specified in the monograph, use those ISO sieves listed as principal sizes in Table 1. Unless otherwise specified in the monograph, use those ISO sieves listed in Table 1 as recommended in the particular region.

Sieves are selected to cover the entire range of particle sizes present in the test specimen. A nest of sieves having a $\sqrt{2}$ progression of the area of the sieve openings is recommended. The nest of sieves is assembled with the coarsest screen at the top and the finest at the bottom. Use micrometers or millimeters in denoting test sieve openings. [NOTEMesh numbers are provided in the table for conversion purposes only.] Test sieves are made from stainless steel or, less preferably, from brass or other suitable nonreactive wire.

Calibration and recalibration of test sieves is in accordance with the most current edition of ISO 3310-1. Sieves should be carefully examined for gross distortions and fractures, especially at their screen frame joints, before use. Sieves may be calibrated optically to estimate the average opening size, and opening variability, of the sieve mesh. Alternatively, for the evaluation of the effective opening of test sieves in the size range of 212 to $850 \mu \mathrm{~m}$, Standard Glass Spheres are available. Unless otherwise specified in the individual monograph, perform the sieve analysis at controlled room temperature and at ambient relative humidity.

Cleaning Test Sieves-Ideally, test sieves should be cleaned using only an air jet or a liquid stream. If some apertures remain blocked by test particles, careful gentle brushing may be used as a last resort.

Test Specimen-If the test specimen weight is not given in the monograph for a particular material, use a test specimen having a weight between 25 and 100 g , depending on the bulk density of the material, and test sieves having a $200-\mathrm{mm}$ diameter. For $76-\mathrm{mm}$ sieves, the amount of material that can be accomodated is approximately $1 / 7$ th that which can be accommodated on a $200-\mathrm{mm}$ sieve. Determine the most appropriate weight for a given material by test sieving accurately weighed specimens of different weights, such as 25,50 , and 100 g , for the same time period on a mechanical shaker. [NOTE--If the test results are similar for the $25-\mathrm{g}$ and $50-\mathrm{g}$ specimens, but the $100-\mathrm{g}$ specimen shows a lower percentage through the finest sieve, the $100-\mathrm{g}$ specimen size is too large.] Where only a specimen of 10 to 25 g is available, smaller diameter test sieves conforming to the same mesh specifications may be substituted, but the endpoint must be re-determined. The use of test samples having a smaller mass (e.g. down to 5 g ) may be needed. For materials with low apparent particle density, or for materials mainly comprising particles with a highly iso-diametrical shape, specimen weights below 5 g for a $200-\mathrm{mm}$ screen may be necessary to avoid excessive blocking of the sieve. During validation of a particular sieve analysis method, it is expected that the problem of sieve blocking will have been addressed.

If the test material is prone to picking up or losing significant amounts of water with varying humidity, the test must be carried out in an appropriately controlled environment. Similarly, if the test material is known to develop an electrostatic charge, careful observation must be made to ensure that such charging is not influencing the analysis. An antistatic agent, such as colloidal silicon dioxide and/or aluminum oxide, may be added at a 0.5 percent $(\mathrm{m} / \mathrm{m})$ level to minimize this effect. If both of the above effects cannot be eliminated, an alternative particle-sizing technique must be selected.

Agitation Methods-Several different sieve and powder agitation devices are commercially available, all of which may be used to perform sieve analyses. However, the different methods of agitation may give different results for sieve analyses and endpoint determinations because of the different types and magnitude of the forces acting on the individual particles under test. Methods using mechanical agitation or electromagnetic agitation, and that can induce either a vertical oscillation or a horizontal circular motion, or tapping or a combination of both tapping and horizontal circular motion are available. Entrainment of the particles in an air stream may also be used. The results must indicate which agitation method was used and the agitation parameters used (if they can be varied), since changes in the agitation conditions will give different results for the sieve analysis and endpoint determinations, and may be sufficiently different to give a failing result under some circumstances.

Endpoint Determination-The test sieving analysis is complete when the weight on any of the test sieves does not change by more than $5 \%$ or $0.1 \mathrm{~g}(10 \%$ in the case of $76-\mathrm{mm}$ sieves) of the previous weight on that sieve. If less than $5 \%$ of the total specimen weight is present on a given
sieve, the endpoint for that sieve is increased to a weight change of not more than $20 \%$ of the previous weight on that sieve.

If more than $50 \%$ of the total specimen weight is found on any one sieve, unless this is indicated in the monograph, the test should be repeated, but with the addition to the sieve nest of a more coarse sieve intermediate between that carrying the excessive weight and the next coarsest sieve in the original nest, i.e., addition of the ISO series sieve omitted from the nest of sieves.

## SIEVING METHODS

## Mechanical Agitation

Dry Sieving Method-Tare each test sieve to the nearest 0.1 g . Place an accurately weighed quantity of test specimen on the top (coarsest) sieve, and replace the lid. Agitate the nest of sieves for 5 minutes. Then carefully remove each from the nest without loss of material. Reweigh each sieve, and determine the weight of material on each sieve. Determine the weight of material in the collecting pan in a similar manner. Reassemble the nest of sieves, and agitate for 5 minutes. Remove and weigh each sieve as previously described. Repeat these steps until the endpoint criteria are met (see Endpoint Determination under Test Sieves). Upon completion of the analysis, reconcile the weights of material. Total losses must not exceed $5 \%$ of the weight of the original test specimen.

Repeat the analysis with a fresh specimen, but using a single sieving time equal to that of the combined times used above. Confirm that this sieving time conforms to the requirements for endpoint determination. When this endpoint has been validated for a specific material, then a single fixed
time of sieving may be used for future analyses, providing the particle size distribution falls within normal variation.

If there is evidence that the particles retained on any sieve are aggregates rather than single particles, the use of mechanical dry sieving is unlikely to give good reproducibility, a different particle size analysis method should be used.

## Air Entrainment Methods

Air Jet and Sonic Sifter Sieving—Different types of commercial equipment that use a moving air current are available for sieving. A system that uses a single sieve at a time is referred to as air jet sieving. It uses the same general sieving methodology as that described under the Dry Sieving Method, but with a standardized air jet replacing the normal agitation mechanism. It requires sequential analyses on individual sieves starting with the finest sieve to obtain a particle size distribution. Air jet sieving often includes the use of finer test sieves than used in ordinary dry sieving. This technique is more suitable where only oversize or undersize fractions are needed.

In the sonic sifting method, a nest of sieves is used, and the test specimen is carried in a vertically oscillating column of air that lifts the specimen and then carries it back against the mesh openings at a given number of pulses per minute. It may be necessary to lower the sample amount to 5 g , when sonic sifting is employed.

The air jet sieving and sonic sieving methods may be useful for powders or granules when mechanical sieving techniques are incapable of giving a meaningful analysis.
These methods are highly dependent upon proper dispersion of the powder in the air current. This requirement may be hard to achieve if the method is used at the lower end of the sieving range (i.e., below $75 \mu \mathrm{~m}$ ), when the particles tend to be more cohesive, and especially if there is any tendency for the material to develop an electrostatic charge. For the above reasons endpoint determination is particularly critical, and it is very important to confirm that the oversize material comprises single particles and is not composed of aggregates.

## INTERPRETATION

The raw data must include the weight of test specimen, the total sieving time, and the precise sieving methodology and the set values for any variable parameters, in addition to the weights retained on the individual sieves and in the pan. It may be convenient to convert the raw data into a cumulative weight distribution, and if it is desired to express the distribution in terms of a cumulative weight undersize, the range of sieves used should include a sieve through which all the material passes. If there is evidence on any of the test sieves that the material remaining on it is composed of aggregates formed during the sieving process, the analysis is invalid. $\mathbf{m S S}_{\text {(USP28) }}$

## GENERAL CHAPTERS

## General Information

## BriEFING

〈1174〉 Powder Flow，page 618 of PF 28（2）［Mar．－Apr．2002］． The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this chapter．The revisions presented in this proposal represent the ADOPTION STAGE 6 draft and have been accepted by the members of the Pharmacopeial Discussion Group．Several modifi－ cations of the Stage 4 text are made．The text is modified to allow for use of density values to calculate the Compressibility Index and Hausner Ratio，where these may be available or more conveniently measured．ASTM standards are replaced with ISO standards to promote global harmonization．The Conclusions section is omit－ ted．Other minor changes and editorial changes are included．
（ETM：J．Lane）RTS－41729－1

## Add the following：

## 〈1174〉 POWDER FLOW

The widespread use of powders in the pharmaceutical in－ dustry has generated a variety of methods for characterizing powder flow．Not surprisingly，scores of references appear in the pharmaceutical literature，attempting to correlate the various measures of powder flow to manufacturing proper－ ties．The development of such a variety of test methods was inevitable；powder behavior is multifaceted and thus com－ plicates the effort to characterize powder flow．The purpose of this chapter is to review the methods for characterizing powder flow that have appeared most frequently in the phar－maceutical literature．In addition，while it is clear that no single and simple test method can adequately character－ ize the flow properties of pharmaceutical powders，this chapter proposes the standardization of test methods that may be valuable during pharmaceutical development．

Four commonly reported methods for testing powder flow are（1）angle of repose，（2）compressibility index or Hausner ratio，（3）flow rate through an orifice，and（4）shear cell．In addition，numerous variations of each of these basic meth－ ods are available．Given the number of test methods and var－ iations，standardizing the test methodology，where possible， would be advantageous．

With this goal in mind，the most frequently used methods are discussed below．Important experimental considerations are identified and recommendations are made regarding standardization of the methods．In general，any method of measuring powder flow should be practical，useful，repro－ ducible，sensitive，and yield meaningful results．It bears re－ peating that no one simple powder flow method will adequately or completely characterize the wide range of flow properties experienced in the pharmaceutical industry． An appropriate strategy may well be the use of multiple standardized test methods to characterize the various aspects of powder flow as needed by the pharmaceutical scientist．

## ANGLE OF REPOSE

The angle of repose has been used in several branches of science to characterize the flow properties of solids．Angle of repose is a characteristic related to interparticulate friction or resistance to movement between particles．Angle of re－ pose test results are reported to be very dependent upon the method used．Experimental difficulties arise as a result of segregation of material and consolidation or aeration of the powder as the cone is formed．Despite its difficulties， the method continues to be used in the pharmaceutical in－ dustry，and a number of examples demonstrating its value in predicting manufacturing problems appear in the litera－ ture．

The angle of repose is the constant, three-dimensional angle (relative to the horizontal base) assumed by a cone-like pile of material formed by any of several different methods (described briefly below).

## Basic Methods for Angle of Repose

A variety of angle of repose test methods are described in the literature. The most common methods for determining the static angle of repose can be classified on the basis of the following two important experimental variables:
(1) The height of the "funnel" through which the powder passes may be fixed relative to the base, or the height may be varied as the pile forms.
(2) The base upon which the pile forms may be of fixed diameter or the diameter of the powder cone may be allowed to vary as the pile forms.

## Variations in Angle of Repose Methods

In addition to the above methods, the following variations have been used to some extent in the pharmaceutical literature:

- Drained angle of repose is determined by allowing an excess quantity of material positioned above a fixed diameter base to "drain" from the container. Formation of a cone of powder on the fixed diameter base allows determination of the drained angle of repose.
- Dynamic angle of repose is determined by filling a cylinder (with a clear, flat cover on one end) and rotating it at a specified speed. The dynamic angle of repose is the angle (relative to the horizontal) formed by the flowing powder. The internal angle of kinetic friction is defined by the plane separating those particles sliding down the top layer of the powder and those particles that are rotating with the drum (with roughened surface).

## Angle of Repose General Scale of Flowability

Although there is some variation in the qualitative description of powder flow using the angle of repose, much of the pharmaceutical literature appears to be consistent with the classification by Carr*, which is shown in Table 1. There are examples in the literature of formulations with an angle of repose in the range of $40^{\circ}$ to $50^{\circ}$ that were manufactured satisfactorily. When the angle of repose exceeds $50^{\circ}$, the flow is rarely acceptable for manufacturing purposes.

Table 1. Flow Properties and Corresponding Angles of Repose ${ }^{*}$

| Flow Property | Angle of Repose (degrees) |
| :--- | :---: |
| Excellent | $25-30$ |
| Good | $31-35$ |
| Fair-aid not needed | $36-40$ |
| Passable-may hang up | $41-45$ |
| Poor-must agitate, vibrate | $46-55$ |
| Very poor | $56-65$ |
| Very, very poor | $>66$ |

## Experimental Considerations for Angle of Repose

Angle of repose is not an intrinsic property of the powder; i.e., it is very much dependent upon the method used to form the cone of powder. The following important considerations are raised in the existing literature:

- The peak of the cone of powder can be distorted by the impact of powder from above. By carefully building the powder cone, the distortion caused by impact can be minimized.
- The nature of the base upon which the powder cone is formed influences the angle of repose. It is recommended that the powder cone be formed on a "common

[^366]base," which can be achieved by forming the cone of powder on a layer of powder. This can be done by using a base of fixed diameter with a protruding outer edge to retain a layer of powder upon which the cone is formed.

## Recommended Procedure for Angle of Repose

Form the angle of repose on a fixed base with a retaining lip to retain a layer of powder on the base. The base should be free of vibration. Vary the height of the funnel to carefully build up a symmetrical cone of powder. Care should be taken to prevent vibration as the funnel is moved. The funnel height should be maintained approximately $2-4 \mathrm{~cm}$ from the top of the powder pile as it is being formed in order to minimize the impact of falling powder on the tip of the cone. If a symmetrical cone of powder cannot be successfully or reproducibly prepared, this method is not appropriate. Determine the angle of repose by measuring the height of the cone of powder and calculating the angle of repose, $\alpha$, from the following equation:

$$
\tan (\alpha)=\frac{\text { height }}{0.5 \text { base }}
$$

## COMPRESSIBILITY INDEX AND HAUSNER RATIO

In recent years the compressibility index and the closely related Hausner ratio have become the simple, fast, and popular methods of predicting powder flow characteristics. The compressibility index has been proposed as an indirect measure of bulk density, size and shape, surface area, moisture content, and cohesiveness of materials because all of these can influence the observed compressibility index. The com-
pressibility index and the Hausner ratio are determined by measuring both the bulk volume and the tapped volume of a powder.

## Basic Methods for Compressibiity Index and Hausner <br> Ratio

Although there are some variations in the method of determining the compressibility index and Hausner ratio, the basic procedure is to measure (1) the unsettled apparent volume, $V_{o}$, and (2) the final tapped volume, $V_{f}$, of the powder after tapping the material until no further volume changes occur. The compressibility index and the Hausner ratio are calculated as follows:

$$
\begin{aligned}
& \text { Compressibility Index }=100 \times\left(\frac{V_{o}-V_{f}}{V_{o}}\right) \\
& \text { Hausner Ratio }=\frac{V_{o}}{V_{f}}
\end{aligned}
$$

Alternatively, the compressibility index and Hausner ratio may be calculated using measured values for bulk density ( $\rho_{\text {bukk }}$ ) and tapped density ( $\rho_{\text {tapped }}$ ) as follows:

$$
\begin{aligned}
& \text { Compressibility Index }=100 \times\left(\frac{\rho_{\text {topped }}-\rho_{\text {bulk }}}{\rho_{\text {tupped }}}\right) \\
& \text { Hausner Ratio }=\left(\frac{\rho_{\text {topped }}}{\rho_{\text {bulk }}}\right)
\end{aligned}
$$

In a variation of these methods, the rate of consolidation is sometimes measured rather than, or in addition to, the change in volume that occurs on tapping. For the compressibility index and the Hausner ratio, the generally accepted scale of flowability is given in Table 2*.

Table 2. Scale of Flowability*

| Compressibility <br> Index (\%) | Flow Character | Hausner Ratio |
| :---: | :---: | :---: |
| $\leq 10$ | Excellent | $1.00-1.11$ |
| $11-15$ | Good | $1.12-1.18$ |
| $16-20$ | Fair | $1.19-1.25$ |
| $21-25$ | Passable | $1.26-1.34$ |
| $26-31$ | Poor | $1.35-1.45$ |
| $32-37$ | Very poor | $1.46-1.59$ |
| $>38$ | Very, very poor | $>1.60$ |

## Experimental Considerations for the Compressibility Index and Hausner Ratio

Compressibility index and Hausner ratio are not intrinsic properties of the powder; i.e., they depend on the methodology used. In the existing literature, there are discussions of the following important considerations affecting the determination of (1) the unsettled apparent volume, $V_{o}$, (2) the final tapped volume, $V_{f}$, (3) the bulk density, $\rho_{\text {bulk }}$, and (4) the tapped density, $\rho_{\text {tupped }}$ :

- The diameter of the cylinder used
- The number of times the powder is tapped to achieve the tapped density
- The mass of material used in the test
- Rotation of the sample during tapping

## Recommended Procedure for Compressibility Index and Hausner Ratio

Use a $250-\mathrm{mL}$ volumetric cylinder with a test sample weight of 100 grams. Smaller weights and volumes may be used, but variations in the method should be described with the results. An average of three determinations is recommended.

## FLOW THROUGH AN ORIFICE

The flow rate of a material depends upon many factors, some of which are particle-related and some related to the process. Monitoring the rate of flow of material through an orifice has been proposed as a better measure of powder flowability. Of particular significance is the utility of monitoring flow continuously because pulsating flow patterns have been observed even for free flowing materials. Changes in flow rate as the container empties can also be observed. Empirical equations relating flow rate to the diameter of the opening, particle size, and particle density have been determined. However, determining the flow rate through an orifice is useful only with free-flowing materials.
The flow rate through an orifice is generally measured as the mass per time flowing from any of a number of types of containers (cylinders, funnels, hoppers). Measurement of the flow rate can be in discrete increments or continuous.

## Basic Methods for Flow Through an Orifice

There are a variety of methods described in the literature.
The most common method for determining the flow rate through an orifice can be classified on the basis of three important experimental variables:
(1) The type of container used to contain the powder. Common containers are cylinders, funnels, and hoppers from production equipment.
(2) The size and shape of the orifice used. The orifice diameter and shape are critical factors in determining powder flow rate.
(3) The method of measuring powder flow rate. Flow rate can be measured continuously using an electronic balance with some sort of recording device (strip chart recorder, computer). It can also be measured in discrete samples (for example, the time it takes for 100 grams
of powder to pass through the orifice to the nearest tenth of a second or the amount of powder passing through the orifice in 10 seconds to the nearest tenth of a gram).

## Variations in Methods for Flow Through an Orifice

Either mass flow rate or volume flow rate can be determined. Mass flow rate is the easier of the methods, but it biases the results in favor of high-density materials. Because die fill is volumetric, determining volume flow rate may be preferable. A vibrator is occasionally attached to facilitate flow from the container; however, this appears to complicate interpretation of the results. A moving orifice device has been proposed to more closely simulate rotary press conditions. The minimum diameter orifice through which powder flows can also be identified.

## General Scale of Flowability for Flow Through an

 OrificeNo general scale is available because flow rate is critically dependent on the method used to measure it. Comparison between published results is difficult.

## Experimental Considerations for Flow Through an Orifice

Flow rate through an orifice is not an intrinsic property of the powder. It very much depends on the methodology used. Several important considerations affecting these methods are discussed in the existing literature:

- The diameter and shape of the orifice
- The type of container material (metal, glass, plastic)
- The diameter and height of the powder bed.

## Recommended Procedure for Flow Through an Orifice

Flow rate through an orifice can be used only for materials that have some capacity to flow. It is not useful for cohesive materials. Provided that the height of the powder bed (the "head" of the powder) is much greater than the diameter of the orifice, the flow rate is virtually independent of the powder head. Use a cylinder as the container because the cylinder material should have little effect on flow. This configuration results in flow rate being determined by the movement of powder over powder rather than powder along the wall of the container. Powder flow rate often increases when the height of the powder column is less than two times the diameter of the column. The orifice should be circular and the cylinder should be free of vibration. General guidelines for dimensions of the cylinder are as follows:

- Diameter of opening $>6$ times the diameter of the particles
- Diameter of the cylinder $>2$ times the diameter of the opening

Use of a hopper as the container may be appropriate and representative of flow in a production situation. It is not advisable to use a funnel, particularly one with a stem, because flow rate will be determined by the size and length of the stem as well as the friction between the stem and the powder. A truncated cone may be appropriate, but flow will be influenced by the powder-wall friction coefficient, making selection of an appropriate construction material an important consideration.

For the opening in the cylinder, use a flat-faced bottom plate with the option to vary orifice diameter to provide maximum flexibility and to better ensure a powder-overpowder flow pattern. Rate measurement can be either discrete or continuous. Continuous measurement using an electronic balance can more effectively detect momentary flow rate variations.

## SHEAR CELL METHODS

In an effort to put powder flow studies and hopper design on a more fundamental basis, a variety of powder shear testers and methods that permit more thorough and precisely defined assessment of powder flow properties have been developed. Shear cell methodology has been used extensively in the study of pharmaceutical materials. From these methods, a wide variety of parameters can be obtained, including the yield loci representing the shear stress-shear strain relationship, the angle of internal friction, the unconfined yield strength, the tensile strength, and a variety of derived parameters such as the flow factor and other flowability indices. Because of the ability to more precisely control experimental parameters, flow properties can also be determined as a function of consolidation load, time, and other environmental conditions. The methods have been successfully used to determine critical hopper and bin parameters.

## Basic Methods for Shear Cell

One type of shear cell is the cylindrical shear cell that is split horizontally, forming a shear plane between the lower stationary base and the upper moveable portion of the shear cell ring. After powder bed consolidation in the shear cell (using a well-defined procedure), the force necessary to shear the powder bed by moving the upper ring is determined. Annular shear cell designs offer some advantages over the cylindrical shear cell design, including the need
for less material. A disadvantage, however, is that because of its design, the powder bed is not sheared as uniformly; i.e., material on the outside of the annulus is sheared more than material in the inner region. A third type of shear cell (plate-type) consists of a thin sandwich of powder between a lower stationary rough surface and an upper rough surface that is moveable.

All of the shear cell methods have their advantages and disadvantages, but a detailed review is beyond the scope of this chapter. As with the other methods for characterizing power flow, many variations are described in the literature. A significant advantage of shear cell methodology in general is a greater degree of experimental control. The methodology is rather time-consuming and requires significant amounts of material and a well-trained operator.

## Recommendations for Shear Cell

The many existing shear cell configurations and test methods provide a wealth of data and can be used very effectively to characterize powder flow. They are also helpful in the design of equipment such as hoppers and bins. Because of the diversity of available equipment and experimental procedures, no specific recommendations regarding methodology are presented in this chapter. It is recommended that the results of powder flow characterization using shear cell methodology include a complete description of equipment and methodology used. $\mathbf{m S S}_{\text {(USP28) }}$

## PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the Staff Directory to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

## Briefing

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How To Use PF), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

## BRIEFING

#### Abstract

〈729〉 Globule Size Distribution in Lipid Injectable Emul－ sions．This proposed new general chapter is being previewed here to address the complex methods for analyzing globule size distri－ bution（see the Stimuli article，Examination of Selection of Light－ Scattering and Light－Obscuration Acceptance Criteria for Lipid Injectable Emulsions，in this issue of PF）．Importantly，the mean droplet size must be submicron in size，while the population of large－diameter fat globules，expressed as the percentage of fat greater than 5 micrometers（i．e．，PFAT5），must be kept at a mini－ mum to avoid obstruction of the microvasculature，particularly the capillaries of the lungs．Therefore，these two regions of the globule size distribution（mean droplet size and large－diameter tail）must be controlled within specified limits．

It is proposed that two methods be employed for testing．Method $I$ via classical（＂Mie＂）or dynamic light scattering will be designa－ ted for the mean diameter of the lipid droplets，and the range of the various droplet diameters distributed around the mean diameter， expressed as the standard deviation．Method II（light obscuration） will be designated for determining the amounts of fat globules comprising the large－diameter tail of the globule size distribution．

The publication of revised monographs for Lipid Injectable Emulsion and Egg Phospholipids（see page 401 of PF 29（2） ［Mar．－Apr．2003］）are forthcoming following the Expert Commit－ tee meeting in October 2004.

INJECTABLE EMULSIONS

## INTRODUCTION

Lipid injectable emulsions used in total parenteral nutri－ tion（TPN）therapy are sterile oil－in－water emulsions of soy－ bean oil，used to provide an ample supply of essential fatty acids，linoleic and linolenic，dispersed with the aid of an emulsifying agent in Water for Injection．Alternatively，soy－ bean oil can be mixed with other suitable oils（neutral trigly－ cerides），such as safflower oil，medium－chain triglycerides （MCT）derived from coconut or palm kernal oils，olive oil，or a marine oil，such as menhaden oil．The size of the lipid droplets is critical：because of mechanical filtration， larger－size fat globules（ $>5 \mu \mathrm{~m}$ ）can be trapped in the lungs． The essential size characteristics of a lipid injectable emul－ sion for intravenous use includes the mean diameter of the lipid droplets and the range of the various droplet diameters distributed around the mean diameter，expressed as the stan－ dard deviation．In particular，the amounts of fat globules comprising the large－diameter tail of the globule size distri－ bution are especially important with respect to infusion safe－ ty．These two regions of the globule size distribution（mean droplet size and large－diameter tail）must be controlled with－ in specified limits．

The two methods described below are used for determina－ tion of the mean lipid droplet diameter and the distribution of large－diameter globule sizes in Lipid Injectable Emulsion． These methods must be employed for testing，following the requirements specified in the limits summarized in Lipid In－ jectable Emulsion（to come）．Method I and Method II must
be validated. The methods described below to assess the quality of lipid injectable emulsions are to be performed in two stages.

## METHOD I—LIGHT-SCATTERING METHOD

For the determination of the mean droplet size of lipid injectable emulsions, either of two common light-scattering techniques may be employed: (1) dynamic light scattering (DLS), also known as photon correlation spectroscopy (PCS), or (2) classical light scattering, based on Mie scattering theory. The DLS, or PCS, technique is based on analyzing the rapid temporal fluctuations in the scattered light intensity that occur due to the random Brownian motion, or diffusion, of any particles, including lipid droplets, suspended in liquid. The intensity is measured at a given angle (usually $90^{\circ}$ ) by a suitable detector (e.g., photomultiplier tube), able to measure the rapidly fluctuating scattered light intensity produced by the suspended, diffusing droplets. These scattered intensity data are typically used to calculate the intensity autocorrelation function, which is a simple decaying exponential function in time for droplets of uniform size. A distribution of droplet sizes expresses itself by exponential functions of different decay times. The autocorrelation function generated by the scattered intensity data obtained from a given emulsion can be "inverted" by means of an appropriate deconvolution algorithm, in order to obtain the approximate distribution of intensity-weighted diffusion coefficients. From the latter, the distribution of smalldiameter droplets is calculated, using the Stokes-Einstein equation and the rules of classical (Mie) light scattering.
By contrast, classical light scattering based on Mie theory analyzes the spatial, rather than temporal, variation of the scattered light intensity, by measuring the latter as a function of the scattering angle, typically over a large range of detected angles. The temporal fluctuations in the scattering inten-
sity due to Brownian motion are averaged out in time for each angular measurement. This angular variation occurs as a consequence of the mutual interference of individual scattered waves arriving at the detector with different phases from different points within a given lipid droplet, as well as from different particles. The extent of the angular variation is significant whenever the droplet diameter is not small compared with the wavelength of the laser light (typically 635 nm ). Droplets of a given size and refractive index yield a unique curve of scattering intensity vs. angle. A distribution of droplet sizes gives rise to a final angular dependence that represents the superposition, or summation, of individual (different) intensity vs. angle curves. The measured angular dependence of the scattering intensity obtained from a given emulsion sample can be inverted by means of an appropriate deconvolution algorithm and Mie scattering theory, in order to obtain the approximate droplet size distribution.

Thus, light scattering, using either dynamic light scattering (i.e., temporal fluctuations due to droplet diffusion) or classical light scattering/Mie theory (i.e., average intensity vs. angle), can provide acceptable results for both the mean diameter and standard deviation of the droplet size distribution. For purposes of illustrating the method used in Method $I$, a dynamic light-scattering technique is described. For guidance regarding instruments employing classical Mietheory light scattering, see Light Diffraction Measurement of Particle Size $\langle 429\rangle$.

Apparatus-A suitable DLS/PCS instrument with or without the capability of automatic sample dilution is controlled by validated software and is used to perform the measurement with the scattering angle typically set at $90^{\circ}$. The intensity-weighted results (mean diameter and standard de-
viation) are reported, provided it is clearly stated which values are given and that the necessary parameter values required for all requisite calculations are also given.

Water-Pass distilled water through a filter having a 0.2 $\mu \mathrm{m}$ porosity, and degas by sonication, or use Sterile Water for Injection stored in a glass container.

Standard Preparation-To a pre-established volume of Water add an appropriate amount of concentrated suspension, containing NIST-traceable polystyrene latex standard particles or other suitable nanospheres. Gently mix the fluids to achieve a homogeneous suspension. The diluted suspension will be slightly turbid in appearance. If the DLS/ PCS instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe, with further dilution occurring automatically to optimize the droplet concentration for analysis. Alternatively, the sample would require greater manual dilution with Water (typically by at least a factor of 10 over the first dilution), and then this sample is instilled into a "drop-in" cuvette. The optimum dilution scheme that achieves the proper scattering intensity for the cuvette-based analysis will be determined by the instrument specifications. Thus, the concentration of latex in the final sample must be optimized for the DLS/PCS instrument used. This should be performed separately for three different size standards of approximately 100, 250, and 400 nm (triplicate analyses per size), and the corresponding results of intensity-weighted mean diameter and standard deviation should coincide with the expected values within acceptable errors.

Test Preparation-To a pre-established volume of Water add an appropriate volume of sample from the lipid injectable emulsion. Gently mix the fluids to achieve a homogeneous suspension. The diluted suspension will be slightly turbid in appearance. Gently mix the fluids. If the DLS/

PCS instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe. Further dilution of the sample then occurs automatically to optimize the droplet concentration for analysis, ensuring that it is not so high as to cause artifacts due to multiple scattering or interdroplet interactions. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution), and then this sample is instilled into a "drop-in" cuvette. The optimum dilution scheme that achieves the proper scattering intensity for the cuvette-based analysis will be determined by the instrument specifications. Thus, the concentration of lipid injectable emulsion in the final sample must be optimized for the DLS/PCS instrument used.

System Suitability-Using the Standard Preparation, measure the intensity-weighted mean particle diameter and the corresponding standard deviation. The system is suitable once the sample temperature has reached equilibration and the results have stabilized and triplicate mean droplet diameter measurements are obtained within $15 \%$ of each other. The coefficient of variation (CV) should not exceed $20 \%$ of the NIST-traceable mean droplet diameter. A larger CV value indicates that the latex microspheres are not suitable as a standard because they either inherently lack uniformity or have become agglomerated to an unacceptable extent. In this case, another standard latex suspension must be selected and tested.

Procedure and Interpretation-If the DLS/PCS instrument is equipped with an automatic dilution system, use a disposable syringe to load the Standard Preparation or Test Preparation. If no automatic dilution system is used, transfer the appropriately diluted preparation to a cuvette and place the cuvette in the spectrometer. Allow the sample to equilibrate to a preset controlled temperature close to ambi-
ent (between $20^{\circ}$ and $25^{\circ}$ as per the USP definition found in the General Notices under Preservation, Packaging, Storage, and Labeling). Set the instrument scattering angle to $90^{\circ}$, and carry out the measurements. As long as the chisquared ( $\chi^{2}$ ) goodness-of-fit parameter remains acceptably low (per instrument specifications), the results for the Test Preparation are acceptable. Excessive values of chi-squared parameter suggest that the droplet distribution is not normal and may indicate an unstable emulsion. The following in-tensity-weighted, mean droplet diameter (MDD) limits for lipid injectable emulsions of various concentrations must be met:

Concentration of Dispersed Phase (\% w/v)

|  | 10 | 20 | 30 |
| :---: | :---: | :---: | :---: |
| MDD (nm) | $<300$ | $<400$ | $<500$ |

## METHOD II-LIGHT OBSCURATION OR EXTINCTION METHOD

For determination of the extent of the large-diameter droplet tail ( $>5 \mu \mathrm{~m}$ ) of lipid injectable emulsions a light obscuration (LO) or light extinction (LE) method that employs a single-particle (globule) optical sizing (SPOS) technique is used. During application of the LE/SPOS technique, passage of a droplet through a thin optical sensing zone, results in blockage of a portion of the incident light beam, causing a momentary decrease in the light intensity reaching the "extinction" detector. The magnitude of this decrease in the signal is ideally proportional to the cross-sectional area of the droplet (assumed smaller than the sensing zone thickness), i.e., to the square of the droplet diameter. As long as the fat globule concentration is below the "coincidence limit" of the sensor (determined by the flow cell and optical design), only one globule at most will pass through the sensing zone at any given time, allowing it
to be counted and accurately sized (with less than $1 \%$ coincidence events). Both the coincidence limit and the optimal flow rate must be known for the LE/SPOS sensor used. Furthermore, it is prudent to perform the large-diameter measurements at a reduced emulsion concentration, such that the measurable droplet concentration (i.e., $>1.8 \mu \mathrm{~m}$ ) is only approximately $1 / 3$ of the nominal coincidence limit for the sensor utilized. The resulting single pulse heights are converted to droplet diameters using a standard calibration curve previously constructed from NIST-traceable monosized polystyrene microspheres of known diameters. For additional guidance in the use of the light obscuration methodology, see the general chapter Particulate Matter in Injections $\langle 788\rangle$.

Apparatus-A suitable light obscuration instrument with or without the capability of automatic sample dilution and controlled by a personal computer (PC) is used for the measurement. The number- and volume-weighted particle size distribution data are reported, provided it is clearly stated which values are given and that the necessary parameter values required for all necessary calculations are also given.

Water-Pass distilled water through a filter having a 0.2 $\mu \mathrm{m}$ porosity, and degas by sonication, or use Sterile Water for Injection stored in a glass container.

Standard Preparation-To a pre-established volume of Water add an appropriate amount of concentrated suspension, containing NIST-traceable polystyrene latex standard particles or other suitable microspheres. Gently mix the fluids to achieve a homogeneous suspension. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or Teflon ${ }^{\circledR}$ sample line. Further dilution of the sample then occurs automatically to optimize the particle concentration for analysis. Alternatively, the sample would require
greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container, such as a sterile Type I glass container prior to being passed through the sensor. In either case the final particle concentration is caused to lie below the coincidence limit of the sensor. The sizing and counting accuracy of the light obscuration instrument should be obtained using three different size standards of approximately $5 \mu \mathrm{~m}, 10 \mu \mathrm{~m}$, and $25 \mu \mathrm{~m}$ (triplicate analyses per size). The corresponding results for the mean diameter should coincide with the expected values, within a $10 \%$ acceptable error. In addition, the number of particle counts obtained per unit volume of diluted sample suspension should also agree, within a $10 \%$ acceptable error, of the concentration values certified in the documentation provided with each NIST-traceable size standard.

Test Preparation-To a pre-established volume of Water add an appropriate volume of sample from the lipid injectable emulsion. Gently mix the fluids to achieve a homogeneous suspension. The diluted emulsion will be slightly turbid in appearance. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or non-reactive ${ }^{*}$ Teflon ${ }^{\circledR}$ sample line. Further dilution then occurs automatically to optimize the droplet/globule concentration for analysis. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container such as a sterile Type I glass container. In either case the final droplet/globule concentration is caused to lie below the coincidence limit of the sensor.

[^367]System Suitability-Using the Standard Preparation, measure the number-weighted particle diameter and the corresponding standard deviation. The system is suitable once the sample has equilibrated and the results have stabilized and triplicate mean number-weighted particle diameter measurements are obtained within $10 \%$ of each other. The measured coefficient of variation (CV) for the number-weighted particle size distribution should not deviate by more than $25 \%$ from the CV value stipulated for the NIST-traceable standard. The latter value is usually very small, assuming nearly uniform-size standard particles. Therefore, in practice the measured CV value is usually considerably larger than this ideal value, being dictated instead by the resolution of the LE/SPOS sensor. The resolution of the sensor should be sufficiently good that the measured CV value not exceed $15 \%$ of the mean diameter of the NIST-traceable standard. A larger CV value indicates that the latex microspheres are not suitable as a standard because they either inherently lack uniformity or have become agglomerated to an unacceptable extent. In this case, another standard latex suspension must be selected and tested.

Procedure and Interpretation-If the light obscuration instrument is equipped with an automatic dilution system, use a disposable syringe or Teflon ${ }^{\circledR}$ sample line to load the Standard Preparation or Test Preparation. If no automatic dilution system is used, transfer the sample to an appropriate large-volume, clean container such as a sterile Type I glass vessel containing an appropriate volume of Water. Allow the sample and Water to mix thoroughly, to achieve a homogeneous suspension. Set the instrument threshold of detection at $1.8 \mu \mathrm{~m}$, extended to an upper limit of $50 \mu \mathrm{~m}$, and employ measurement times of 120, 180, and 240 seconds for each run of each replicate of the sample ( $n=3$ runs/sample). As long as the three measurements of the vol-ume-weighted percentage of fat greater than 5 micrometers
(PFAT5) for each sample fall within $10 \%$ of each other (irrespective of run time), the results for the Test Preparation are acceptable. Values exceeding this reproducibility tolerance suggest that the sample is either unstable or the dilution has not been optimized. The volume-weighted, large-diam-
eter fat globule limits of the dispersed phase, expressed as the percentage of fat residing in globules larger than $5 \mathrm{mi}-$ crometers (PFAT5), for a given lipid injectable emulsion must be less than $0.05 \%$.

## STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the In-Process Revision and Pharmacopeial Previews sections. Readers interested in submitting comments should see Instructions to Authors.

## Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to $U S P-N F$ revision will be considered for publication in the Pharmacopeial Forum under the section Stimuli to the Revision Process. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract-Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.
References-Consult a current copy of the Pharmacopeial Forum and the ACS Style Guide for assistance with reference style.

Copyright - Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.
Contact Person-When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions-Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft ${ }^{\mathbb{®}}$ Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be cameraready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

# Examination of Selection of Light-Scattering and Light-Obscuration Acceptance Criteria for Lipid Injectable Emulsions 

David F. Driscoll, Ph.D.*

#### Abstract

The optimum methods for determining the physicochemical stability of lipid injectable emulsions have been extensively debated. USP first approached the subject as a Pharmacopeial Preview in 1991 under a proposed General Chapter $\langle 728\rangle$ Globule Size Distribution in Intravenous Emulsions. Since that time, there have been three In-Process Revisions (1994, 1995, and 1998). The newly proposed Chapter $\langle 729\rangle$ (see General Chapter $\langle 729\rangle$ Globule Size Distribution in Lipid Injectable Emulsions, which appears elsewhere in this Pharmacopeial Forum) includes two methods of analysis for assessing the stability and subsequent safety of these complex dispersions. Method I, based on either classical Mie or dynamic light scattering, will be designated for determining the mean diameter of the lipid droplets and the approximate range of the various droplet diameters distributed around the mean diameter, expressed as the standard deviation. Method II, based on light obscuration, will be designated for counting and sizing the over-sized fat globules comprising the large-diameter tail in the upper portion of the droplet/globule size distribution. This article will review the history and use of lipid injectable emulsions, the proposed methods of characterization, and the rationale for their selection.

## INTRODUCTION

Lipid injectable emulsions have been used to varying degrees in patients for approximately 80 years. In the United States, largely through research conducted under the direction of Drs. Fredrick Stare and Robert Geyer at the Harvard School of Public Health (HSPH) in the 1950s, a number of clinical trials were undertaken using both phosphatide- and nonphosphatide-containing lipid injectable emulsions (1). Ultimately, a commercial product was introduced during that time under the brand name of Lipomul I.V., which underwent extensive clinical testing. It was a $15 \% \mathrm{w} / \mathrm{v}$ cottonseed oil-based emulsion stabilized by a mixture of natural (soybean lecithin) and synthetic (Pluronic F-68) emulsifying agents. Despite numerous attempts to make a safe product and after several clinical trials, studies were stopped in the early 1960s due to a high incidence of significant adverse effects referred to as "fat overload syndrome." This syndrome was characterized by fever, diffuse abdominal pain, liver damage, lipemic serum, fat accumulation in vital organs, and blood dyscrasias. Around that time, Dr. Arvid Wretlind, a guest researcher with Stare and Geyer in Boston (2) returned to Stockholm, Sweden, where he and coworkers developed a soybean oil-based lipid injectable emulsion using egg lecithin as a surfactant. During this time, they also realized that the dosing of lipid injectable emulsion, which proved safe in dogs but not humans, was flawed because it did not account for the differences in energy expenditure, which for dogs is approximately three times as high as for humans (3). Thus, the lipid doses first tested in dogs without

[^368]problems were similar to those eventually used in humans (3 $\mathrm{g} / \mathrm{kg} /$ day of body weight) and likely explained the differences in toxicity. Once equivalent doses were given to dogs $(9 \mathrm{~g} / \mathrm{kg} /$ day of body weight), the severe and sometimes fatal adverse reactions seen in humans were reproduced in the animal model. Hence, a "dog tolerance test" for lipid injectable emulsions could be used to screen acceptable vs. unacceptable formulations of lipid injectable emulsions and subsequently led to the development of the first safe formulation under the trade name of Intralipid. The safety differences seen between the emulsions tested then and even up to the time of Dr. Wretlind's publication reviewing the development of lipid injectable emulsions (1981) resulted in his observation: ". . it is not correct to speak of fat emulsions in general terms. The name of the product and its exact composition must always be stated."
Today, a number of lipid injectable emulsion dosage forms exist, and they are much safer and commonly prescribed as caloric supplements to patients who are temporarily or even permanently incapable of assimilating nutrients via the gastrointestinal tract. For example, in addition to soybean oil, other sources of triglycerides are also used, including, for example, safflower oil, olive oil, coconut oil, palm kernel oil, and menhaden oil, and they are available in concentrations of $10 \%, 20 \%$, and $30 \% \mathrm{w} / \mathrm{v}$ formulations. In nearly every case, however, soybean oil is included in combination with one or more of these oils in order to provide sufficient amounts of the essential fatty acids linoleic acid and linolenic acid. Intravenous nutrition is reserved for a selected group of patients, and lipid injectable emulsion has been one of the key nutrients routinely provided in the clinical setting for approximately the past 30 years. The $20 \% \mathrm{w} / \mathrm{v}$ parenteral emulsion is most common, and can be administered as a separate infusion in either its man-
ufacturer's container (e.g., $200-\mathrm{mL}$ sterile glass bottle for adults) or via an alternative infusion device (e.g., a sterile syringe for neonates). Lipid injectable emulsion can also be administered as an ingredient or additive in a total parenteral nutrition (TPN) admixture containing crystalline amino acids, dextrose, electrolytes, vitamins, and minerals. These latter formulations are widely known as all-in-one or total nutrient admixtures (TNA). When lipid injectable emulsions are used to compound TNAs, differences in stability have been observed. However, in most circumstances these differences are currently considered to be related to the physicochemical properties of the oil (4) rather than due to factors associated with the formulation of lipid injectable emulsion dosage forms.

At present, the major toxicity issues associated with the administration of lipid injectable emulsions can be classified into four categories. First, the composition of the commercial product may affect the tolerance and safety of the formulation. Specifically, the concentration of the emulsifier, in relation to the amounts of long-chain triglycerides, may be excessive. Historically, $12 \mathrm{~g} / \mathrm{L}$ of egg lecithin has been a standard amount used whether the final concentration of lipid is 10 or $20 \% \mathrm{w} / \mathrm{v}$. Clearly, the phospholipids-to-triglyceride ratio is much higher in the $10 \%$ formulation and, as such, the excess phospholipids form high amounts of lipo-some-like particles. In turn, these liposomal particles interfere with lipid and lipoprotein metabolism, which has been shown to cause delayed plasma clearance of triglycerides. Consequently, $10 \%$ lipid injectable emulsions containing $12 \mathrm{~g} / \mathrm{L}$ of egg lecithin are not recommended for use in susceptible patients, and this is particularly true in preterm infants receiving parenteral nutrition (5).

Second, the pH of the formulation should be at optimal levels that maintain stability. At present, the lipid injectable emulsion monograph states a pH range of $6.0-9.0$, which reflects the established range historically used by manufacturers. In this range, the negative charge imparted by phospholipids present in egg lecithin at the droplet surface is optimized for establishing electrostatic repulsion between droplets and therefore stability of the emulsion system. Lipid injectable emulsions formulated at a pH range below 6.0 (e.g., 4.5-6.4), have shown evidence of emulsion destabilization (i.e., coalescence) before their manufacturerassigned expiration dates ( 6 ) and have been found to be associated with cerebral fat embolism in animals (7).

Third, when lipid injectable emulsions are added to parenteral nutrition admixtures containing various amounts of crystalline amino acids, dextrose, electrolytes, vitamins, and minerals forming total nutrient admixtures (TNAs), some extemporaneous formulations have become very unstable (8). Although most TNAs are stable and the practice is widely applied, certain formulation additives or conditions (e.g., iron dextran, low-osmolality admixtures, etc.) can produce admixtures in which the growth of submicron droplets into very-large-diameter fat globules is greatly accelerated. When this occurs, evidence of fat embolization in the lungs (9) and livers (10) of laboratory animals has been reported, accompanied by evidence of oxidative stress in these or-
gans. So, clearly, large-diameter globule size limits must be assigned to distinguish between stable and unstable lipid injectable emulsions.
Finally, toxicities also have occurred as a result of excessively high infusion rates, particularly with long-chain triglycerides (LCT) that are rich in omega-6 fatty acids such as soybean oil, which may adversely accentuate prostaglan-din-induced changes in blood flow. This is especially significant in patients with Adult Respiratory Distress Syndrome (ARDS) $(11,12)$. In general, such LCT infusion rates in humans should not exceed $0.11 \mathrm{~g} / \mathrm{kg} / \mathrm{hour}$ in order to avoid clinical problems (13), which is an important consideration when lipid injectable emulsions are given as an intermittent infusion (i.e., during 12 hours or less).

## PHYSICOHEMICAL CHARACTERISTICS OF LIPID INJECTABLE EMULSIONS

Lipid injectable emulsions are colloidal dispersions. In general, a colloidal dispersion of an otherwise inhomogeneous system, for example, oil-in-water used for intravenous administration, has a population of droplet sizes (upon successful homogenization) that is generally smaller than one micrometer $(\mu \mathrm{m})$ in diameter $(d)$. Within this definition, such dispersions generally fall into one of two common emulsion classifications, namely (1) micro-emulsions (mean $d<0.1 \mu \mathrm{~m}$ ), or (2) mini-emulsions (mean $d<1.0$ $\mu \mathrm{m})$. Micro-emulsions are transparent, form spontaneously, and are thermodynamically stable. In contrast, mini-emulsions are turbid, require energy to be formed, and are thermodynamically unstable. Lipid injectable emulsions are sterile oil-in-water dispersions designed for intravenous administration and have mean droplet diameters between 200 and $500 \mathrm{~nm}(0.2-0.5 \mu \mathrm{~m})$. Consequently, they can be characterized as mini-emulsions and have a limited shelf life of between 18 and 24 months.

Lipid injectable emulsions are oil-in-water mixtures consisting of internal (oil) and external (water) phases; they are made miscible by an amphoteric surfactant. The oil phase consists of various triacylglycerols or triglycerides containing fatty acids ranging in length from 8 to 22 carbons ( $\mathrm{C}_{8}-$ $\mathrm{C}_{22}$ ). These include medium-chain triglycerides (MCTs) derived from coconut or palm kernel oils ( $\mathrm{C}_{8}$ and $\mathrm{C}_{10}$ ) and various long-chain triglycerides (LCTs) also derived from plant sources such as soybean, safflower, and/or olive oils ( $\mathrm{C}_{16}$ and $\mathrm{C}_{18}$ ) or from marine sources such as menhaden oil ( $\mathrm{C}_{20}$ and $\mathrm{C}_{22}$ ). The emulsions may consist of a single oil, such as soybean oil (most common), or a mixture of two or more oils such as soybean + safflower oil, soybean + olive oil, soybean + MCT oil, soybean + MCT + fish oil, etc. The surfactant or emulsifier for parenteral emulsions is egg lecithin that contains a mixture of phospholipids. The surfactant confers emulsion stability by coating the finely homogenized droplets with a tightly packed molecular film containing various electrically charged phospholipids present in egg lecithin, which include, for example, the glycerophospholipids phosphatidyl choline and phosphatidyl ethanolamine, as shown in Figure 1. Phospholipids are sim-
ilar to triacylglycerols ( $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$ ) except in the third position $\left(R_{3}\right)$, where the hydroxyl group is esterified to phosphoric acid, now phosphatidic acid, which, in turn, is esterified to an alcohol such as choline or ethanolamine. At or near physiologic pH , the polar phosphate head group is negatively charged. Consequently, because each phospholipidcoated droplet has a negatively charged surface, electrostatic repulsion between droplets occurs, preventing their aggregation by Van der Waals attractive forces and subsequent coalescence. Hence, a "safe" distance is now maintained between neighboring droplets by the presence of an interdroplet electrostatic potential energy barrier. Finally, the aqueous phase made from sterile water for injection comprises up to $90 \%$ of the emulsion volume, incrementally added during the manufacturing process to bring the formulation to its final intended volume. The major specification of the aqueous phase involves the maintenance of a sterile and pyrogen-free supply throughout the manufacturing process and subsequent shelf life of the product.

(Phosphatidate)

Commercial lipid injectable emulsions are currently available in the concentration range $10-30 \% \mathrm{w} / \mathrm{v}$ as oil-inwater dispersions, but the $30 \% \mathrm{w} / \mathrm{v}$ formulation is reserved for compounding-only (TNAs) purposes and is not intended for direct intravenous administration. All formulations are highly concentrated emulsions, considering their mean droplet sizes. For example, assuming a $20 \% \mathrm{w} / \mathrm{v}$ emulsion with a perfectly monodisperse population of droplets equaling $300 \mathrm{~nm}(0.3 \mu \mathrm{~m})$, there would be approximately $1.5 \times$ $10^{13}$ droplets per mL . In reality, assuming a normal or Gaussian distribution of droplets following homogenization, a range of sizes exists from $0.01 \mu \mathrm{~m}$, or even smaller, to 20 $\mu \mathrm{m}$ or larger (Figure 2). Obviously, stable lipid injectable emulsions must have infinitesimally small amounts of these very large fat globules in the upper portion of the globule size distribution population (i.e., large-diameter fat globules $>5 \mu \mathrm{~m}$ ), because this region is most pertinent with respect to stability and safety. These extreme outlier fat globules are generally located 3 to 5 standard deviations above the mean droplet diameter, but they nevertheless provide crucial information regarding the current quality and stability of the dispersed system. This point assumes critical importance with respect to the efficacy of the proposed methods for assessing the stability and safety of lipid injectable emulsions.

## STABILITY OF LIPID INJECTABLE EMULSIONS

For lipid injectable emulsions, the height of the potential energy barrier guarding against lipid droplet coalescence is optimized in the pH range of $6.0-9.0$. At lower pH values, the effectiveness of the barrier is compromised as the charge is reduced, becoming less negative and ultimately reaching zero at the isoelectric point of the charged phospholipids, i.e., $\mathrm{pH} \sim 3.2$ (14). As the pH falls, so too does the efficacy of the energy barrier, thereby fostering aggregation and coalescence of neighboring lipid droplets. The addition of other cations ( $\mathrm{Na}, \mathrm{K}, \mathrm{Ca}, \mathrm{Mg}, \mathrm{Fe}$, etc.) and the elevation of temperature are also consequential for the stability of lipid injectable emulsions, but these factors are mainly of significance when these formulations are used to compound a TNA. Disruption of this energy barrier by physical means (e.g., increasing temperature $>30^{\circ} \mathrm{C}$ ) or chemical means (e.g., decreasing $\mathrm{pH}<6.0$ ) can promote aggregation of lipid droplets, ultimately leading to their coalescence into very large fat globules. During the normal shelf life of a lipid injectable emulsion, the thermodynamically unstable dispersion will slowly begin to destabilize over time. The purpose of the proposed chapter and related monographs is to place acceptably safe limits on the allowable extent of these chemical and physical changes that can result in emulsion destabilization. The rate of destabilization is usually very slow and therefore barely noticeable during the shelf life of the normal product. Chemical changes resulting in measurable droplet/globule size increases over time include a decrease in pH in association with increased hydrolytic degradation of triglycerides and phospholipids (15) and the formation of free fatty acids and corresponding hydrogen ions. Current chemical specifications in the proposed lipid injectable emulsion monograph include a pH range of $6.0-9.0$ and a free fatty acid limit of 0.07 mEq per gram of oil present.

Physical evidence of emulsion instability over time must include measurable changes in the globule size distribution (GSD) indicative of coalescence. Two key regions in the distribution of oil droplet and/or globule sizes associated with the GSD have been identified in proposed chapter $\langle 729\rangle$, namely the mean droplet size and the concentration of over-size globules comprising the large-diameter tail. Current physical specifications for the mean droplet diameter limits depend on the final concentration of the oil phase of the emulsion (i.e., $\leq 0.3 \mu \mathrm{~m}$ for $10 \% ; \leq 0.4 \mu \mathrm{~m}$ for $20 \% ; \leq 0.5 \mu \mathrm{~m}$ for $30 \%$ ). Large-diameter tail limits, expressed as the volume-weighted percentage of fat residing in globules larger than 5 micrometers $\left(\mathrm{PFAT}_{5}\right)$, cannot exceed $0.05 \%$ of the total lipid present, irrespective of the final concentration of the emulsion. Importantly, measurable growth of the large-diameter fat globules is a significant and early warning of the onset of instability, whereas a measurable increase in the mean droplet size is indicative of obvious (i.e., late) global destruction of the entire emulsion system. Thus, the preselected $5-\mu \mathrm{m}$ threshold (i.e., $\mathrm{PFAT}_{5}<0.05 \%$ ) is an
important pharmaceutical limit representing a region of the particle or globule size distribution that has uniquely significant implications for stability and safety.

The $5-\mu \mathrm{m}$ threshold also has physiological importance. Intravenous infusion of a lipid injectable emulsion into the systemic circulation exposes it to the microvasculature, such as the capillary bed. This fact is potentially important because the diameter of the pulmonary capillaries is between 4 and $9 \mu \mathrm{~m}$, which means that the $5-\mu \mathrm{m}$ size threshold represents a dimension where occlusion by large fat globules may produce an embolic syndrome. The adverse consequences of occluding the microvasculature may have grave effects, especially for critically ill patients with major organ dysfunction (e.g., acute pulmonary failure requiring mechanical ventilation).

## PHYSICAL ANALYSIS OF LIPID INJECTABLE EMULSIONS

The newest In-Process Revision of Chapter $\langle 729\rangle$ Globule Size Distribution in Lipid Injectable Emulsions (published elsewhere in this issue of Pharmacopeial Forum) proposes a two-stage procedure analyzing: (1) the mean droplet diameter, and (2) the range of the various droplet diameters distributed in the extreme (outlier) population of large-diameter fat globules comprising the tail of the distribution.

## I. CHAPTER $\langle 728\rangle /\langle 729\rangle$ : PREVIOUS METHODS

USP has produced four previous versions of Chapter $\langle 729\rangle$ (formerly $\langle 728\rangle$ ) in 1991, 1994, 1995, and 1998. During this time, four droplet- or globule-sizing methods were suggested, including classical or dynamic light scattering, laser (Fraunhofer) diffraction, electrical zone sensing (EZS or Coulter Counter), and light obscuration or extinction. Light scattering (by either method) for meeting mean droplet size limits and light obscuration, or extinction, for meeting large-diameter fat globule $\left(\mathrm{PFAT}_{5}\right)$ limits have been selected as the reference methods in the most recent version of $\langle 729\rangle$. The EZS method is the electrical equivalent of light extinction because it counts particles or droplets as they pass individually through a small sensing zone. However, this method requires a supporting electrolyte solution to obtain the signal from which the particle or globule volume is obtained. The requirement for a supporting electrolyte, i.e., NaCl , to conduct EZS measurements may induce disruption of the stabilizing phospholipid emulsifier. The electrical field produced by the negative charges imparted upon the lipid droplet surfaces is screened by the added electrolyte ions, thereby permitting Van der Waals attractive forces between neighboring droplets to gain influence, promoting aggregation and eventual coalescence. This significant shortcoming, together with a susceptibility to frequent clogging and other disadvantages, has caused the EZS method to be dropped from the proposed chapter.

Laser diffraction methods for assessment of large-diameter fat globules, based on Fraunhofer diffraction (used alone or in conjunction with multi-angle classical Mie scattering) have also been eliminated from the proposed chapter. Significant problems have been demonstrated when laser diffraction (LD) instruments have been used to measure the adverse changes in the large-diameter population of fat globules found in lipid injectable emulsions. This became especially evident after a comparison study in which different LD instruments were challenged by known concentrations of $5-\mu \mathrm{m}$ latex spheres added to lipid injectable emulsions (16). Figure 3 shows the results of increasing latex concentrations plotted as the measured volume $\%$ vs. expected volume $\%$ obtained from the responses of three different LD instruments versus one light obscuration (LO) instrument. Clearly, the quantitative responses obtained from all three LD instruments were substantially inaccurate and highly nonlinear with respect to the known volume $\%$ amounts of added $5-\mu \mathrm{m}$ latex particles. For two of the LD instruments the reported volume $\%$ results significantly overstated the known values over most of the dynamic range investigated. The third LD instrument failed
to detect or quantify substantial concentrations of latex particles in the presence of the fat globule tails. This finding was not entirely surprising because ISO document 13320 specifies that the Fraunhofer approximation is valid only for relatively large particles with diameters at least 40 times the wavelength of the light source (17). At the typical laser wavelength used for LD measurements (e.g., $\sim 635 \mathrm{~nm}$ ), the minimum particle diameter measured should therefore be not smaller than $25 \mu \mathrm{~m}$, which misses the key large-diameter population of greatest interest (i.e., tail $>5 \mu \mathrm{~m}$ ) in the proposed Chapter $\langle 729\rangle$. In addition, there is the fundamental problem of limited sensitivity and resolution common to Fraunhoffer measurement. Because this is an ensemble technique, it requires the raw data obtained from particles/droplets of all sizes to be inverted by an appropriate algorithm. This process is known to be inherently ill conditioned (18) and therefore entirely unsuited to detection (quantitative or otherwise) of subtle changes in the oversize outlier tail of the globule size distribution. In contrast, the LO instrument yielded a linear response in every case because it constructed the distribution one particle or droplet at a time, requiring no inversion of the raw data.

Fig. 3. Laser diffraction (LD) vs. light obscuration (LO) in stable intravenous lipid emulsion spiked with increasing concentrations of latex spheres. Measured vs. theoretical regression plot.

## II. APPLICATION OF $\langle 729\rangle$ : CURRENT METHODS

## Method I. Light-Scattering Techniques

The use of light-scattering techniques for determination of submicron particle or droplet size distributions is widely acknowledged in a number of applications (19). Classical Mie, or "static" light scattering is based on the angular dependence of the average scattering intensity. Dynamic light scattering (DLS), also known as photon-correlation spectroscopy (PCS), is based on the temporal fluctuations due to particle/droplet Brownian motion or diffusion. These methods typically provide comparable results in determining the mean droplet size of lipid injectable emulsions. Light-scattering techniques are widely used in a variety of industries for determining mean particle or droplet diameters, and they are very useful for evaluating homogenization procedures in
achieving a desired end-point, i.e., average droplet size. As specified in the most recently proposed $\langle 729\rangle$, a not-to-exceed limit is assigned according to the final concentration of each lipid injectable emulsion dosage form. Table 1 shows the mean droplet sizes (MDS) of 16 different commercial lipid injectable emulsions. Techniques for the assessment of submicron populations of droplets typical of lipid injectable emulsions are well established, but as discussed in proposed Chapter $\langle 729\rangle$ these methods should be assessed beforehand using standard polystyrene calibrator spheres of uniform size to ensure that the peaks in the measured par-ticle-size distributions appear at the appropriate sizes. This assessment, of course, is only semiquantitative and therefore is designed to verify the proper functioning of the instrument in determining an accurate mean droplet size.

Although the mean droplet diameter is an imperative pharmacopeial limit, it is important to appreciate that en-semble-type methods such as classical Mie or dynamic light scattering, when used for determining the stability of lipid injectable emulsions, are in fact quantitatively insensitive to the consequential, and often subtle, changes in droplet size that occur in the large-diameter tail of the globule size distribution. The insensitivity of light-scattering methods for determining the instability of lipid injectable emulsions has been demonstrated previously $(8,20)$; thus arises the requirement for a second-stage analysis that forms the basis for Method II.

## Method II. Light Extinction with a Single-Particle Optical Sensing (LE/SPOS) Technique

Light obscuration or extinction is the reference method for detection of extraneous particles (e.g., dirt, fibers, glass, etc.) introduced during the production process for aqueousbased injectables; see Chapter $\langle 788\rangle$, where tolerance limits are set for particulate matter larger than 10 and $25 \mu \mathrm{~m}$ (21). Therefore, it is similarly reasonable to set limits for the concentration of large-diameter fat globules, which are the result of ongoing destabilization. Although such over-size fat globules are expected to coexist with normally distributed droplets following homogenization, their numbers should be very limited in a stable system. For emulsion-based injectables, a $5-\mu \mathrm{m}$ limit has been suggested not only for pathophysiological reasons (i.e., because this size approximates the internal diameter of capillaries where occlusion may occur) but also as an appropriate indicator of the stability of the emulsion system. It is also a size at which most currently available lipid injectable emulsions have small but measurable amounts of fat expressed as a percentage of the volume-weighted fat globules in a specified range, e.g., $d>5$ $\mu \mathrm{m}$, or $\mathrm{PFAT}_{5}$. For example, when measured by light ob-
scuration or extinction using a single-particle optical sensing (SPOS) technique, data can be reported as the number of particle counts as a function of the geometric mean diameter over a series of narrow channel widths (e.g., $<0.5 \mu \mathrm{~m}$ each) spanning the desired size range (e.g., $2-50 \mu \mathrm{~m}$ ). The $\mathrm{PFAT}_{5}$ data can be extracted by summing the volume-weighted channelized data in the large-diameter tail, $\Sigma(\# / \mathrm{mL} /$ channel $)\left(\pi d^{3} / 6\right)$ to test compliance within pharmacopeial limits. It has been shown that the $\mathrm{PFAT}_{5}$ for lipid injectable emulsions ranging in concentration from 10 to $30 \% \mathrm{w} / \mathrm{v}$ is universally less than $0.05 \%\left(\mathrm{PFAT}_{5}<0.05 \%\right)$. Table 1 also depicts the large-diameter globule concentrations (counts $/ \mathrm{mL}$ ) found in stable lipid injectable emulsions and the corresponding volume-weighted PFAT values for three different size thresholds. Thus, the $\mathrm{PFAT}_{5}$ level is an index or size threshold that reflects the state of the stability of the emulsion at any given time. Increases in $\mathrm{PFAT}_{5}$ above $0.05 \%$ indicate the onset of active or ongoing coalescence, demonstrating that the stability of the emulsion has clearly diminished.

Of equal importance, the $5-\mu \mathrm{m}$ limit has ramifications for the counting and sizing accuracy of light-obscuration or light-extinction methods. As with any analytical method, the use of optical-sizing methods to count and size largediameter fat globules in the tail of the distribution of droplets in lipid injectable emulsions has limits with respect to its accuracy and precision. Counting particles or droplets can be evaluated by using NIST-traceable calibrator number standards. This has been described previously with the LE/SPOS method, and the number of particles per mL was found to be within $10 \%$ of the expected concentration values based on the documentation provided with each standard, e.g., nominal sizes of 2, 5, 10, and $25 \mu \mathrm{~m}$ (16). These results are shown in Table 2.

Table 2. Results of numerical validation of the LE/SPOS instrument using NIST standard reference materials

| Nominal Size | Replicates | Theoretical | Measured | \% Error |
| :---: | :---: | :---: | :---: | :---: |
| $2 \mu \mathrm{~m}$ | 6 | $2.5 \times 10^{7}$ | $2.37 \pm 0.026 \times 10^{7}$ | $5.1 \pm 1.1$ |
| $5 \mu \mathrm{~m}$ | 6 | $1.0 \times 10^{7}$ | $1.09 \pm 0.001 \times 10^{7}$ | $9.4 \pm 0.1$ |
| $10 \mu \mathrm{~m}$ | 6 | $1.0 \times 10^{6}$ | $1.03 \pm 0.013 \times 10^{6}$ | $3.5 \pm 1.3$ |
| $25 \mu \mathrm{~m}$ | 6 | $3.0 \times 10^{5}$ | $3.00 \pm 0.023 \times 10^{5}$ | $0.5 \pm 0.5$ |

Sizing of particles or droplets can pose potentially serious problems related to the optical properties of the various materials. With LE/SPOS, the light-extinction data are influenced by two important physical variables: (1) the size of the individual particles or droplets being measured, and (2) the contrast of the calibrator spheres. The latter refers to the degree of mismatch between the refractive index of the particles or droplets and that of the surrounding liquid. These variables influence whether the signal produced by the optical extinction detector (i.e., the height of the pulse representing the momentary reduction in light intensity by a sized particle or globule) is appropriately quantified. In this regard, the robustness of the LE/SPOS method can be evaluated by examining the extent to which the difference between the refractive index of mono-sized, NIST-traceable polystyrene microspheres used to calibrate the instrument and the index of the fat droplets/globules affects the lightextinction signal-i.e., the decrease in light intensity caused by the passage of similarly sized lipid droplets through the sensing zone. A key question is, where in the droplet or globule size distribution does the difference in refractive index become significant? Alternatively, above what size is the difference no longer of significance? This can be addressed by investigating the extinction efficiency. The LE/ SPOS technique is based on the partial blockage, or extinction, of a monochromatic light beam traversing a flow cell when a particle or globule passes through a defined optical sensing zone or view volume. The efficiency or extent of completeness of the obscuration process is crucial to the final result. Errors potentially can occur when the light flux incident on the particle is incompletely blocked-i.e., when this fraction is less than that predicted ideally by twice the cross-sectional area of the particle ( $\pi d^{2} / 4$ for spheres). Consequently, the light that is refracted or scattered by particles of a given size is influenced by the refractive index of the material being investigated as well as that of the suspending fluid (typically water). This raises further the issues of the difference between the refractive index of the calibrator polystyrene spheres $(n=1.59)$ and that of the various oils used in injectable emulsions, e.g., soybean oil ( $\mathrm{n}=1.473$ ), safflower oil ( $n=1.462$ ), olive oil ( $n=1.468$ ), coconut oil ( $n=1.449$ ), or menhaden oil ( $n=1.465$ ) (22). The extinction efficiency, $Q$, and consequently, the light-obscuration or light-extinction results reported for lipid injectable emulsions are affected by this difference in refractive index.

The extinction efficiency provides a measure of the robustness of the LE/SPOS technique, because it addresses the error in the measured light-obscuration signal caused by differences in refractive index of the calibrating particles (typically polystyrene latex spheres) and that of the dispersed oil droplets (i.e., soybean oil, safflower oil, MCT oil, etc.). This effect is described by the extinction efficiency formula:

$$
Q(\mathrm{Ext})=2-(4 / \rho) \operatorname{SIN} \rho+\left(4 / \rho^{2}\right)(1-\operatorname{COS} \rho)
$$

$$
Q=C / G
$$

where:
$C=$ extinction cross section of particle ( $\propto$ extinction pulse height)
$G=$ physical (geometric) cross-sectional area of particle $=$ $\pi d^{2} / 4$
$C=Q^{*} G$; Limit of very large particles: $Q=2$ and therefore $C=2 * G$
$m_{l}=$ refractive index of particle; $m_{2}=$ refractive index of fluid; $m=m_{1} / m_{2}$;

$$
x=\pi d m_{2} / \lambda ; \rho=2 x\left(m_{1}\right)
$$

Figure 4 shows the results of the extinction efficiency formula outlined above as a function of particle size from 1.5 to $20 \mu \mathrm{~m}$ for polystyrene particles in water (Q-PSW), lipid droplets (soybean oil) in water (Q-LIPW), and their ratio (Q-LIPW/Q-PSW). Clearly, the dependence of light extinction on the contrast of the particles greatly diminishes above $5 \mu \mathrm{~m}$, so the extinction of light for the two different materials is nearly equivalent as the Q-ratio approaches unity, as shown in the figure. Thus, although differences in the refractive index between reference (calibrator) particles and sample droplets or globules are potentially important for particles or droplets smaller than $5 \mu \mathrm{~m}$, lipid droplets obscure light in a manner that is quantitatively similar to that of latex particles above this size. Consequently, the $5-\mu \mathrm{m}$ threshold used to meet pharmacopeial limits happens to be large enough that the differences in the refractive indices of the calibrating particles and the droplets/globules of interest do not seriously affect the results of the size-distribution measurement.

Fig. 4. Extinction efficiency calculations and theoretical plot.

## CONCLUSIONS

Lipid injectable emulsions are complex dosage forms. Proposed Chapter $\langle 729\rangle$ identifies two methods that must be applied in order to validate the quality, stability, and safety of these formulations. For manufacturing purposes, Method I uses light scattering in one form or another to address the semiquantitative endpoints of the homogenization process by setting limits for the mean droplet size of the emulsion, in accordance with the final concentration of the dispersed oil phase. For the clinically important large-diameter tail of the distribution of lipid injectable emulsions, a universal limit is proposed. This is based on previous work using light obscuration, or extinction, employing a singleparticle optical sensing (SPOS) technique. Application of this method provides important qualitative and quantitative information concerning the state of stability of the dispersion because growth in this region of the globule size distribution reflects coalescence, ultimately leading to phase separation and destruction of the emulsion system. The parameter indicated in Method II of this version of Chapter $\langle 729\rangle$ is reasonable and can be easily quantified using light obscuration or extinction technology.

#### Abstract

This Stimuli article gives an overview of FDA's Process Analytical Technology (PAT) initiative and presents the perspectives of industry and the U.S. Pharmacopeia. The authors outline the scope of PAT as a scientific, risk mitigationbased approach for process-centered quality control techniques within an alternative Pharmaceutical Manufacturing Practice (aPMP) environment. The authors discuss the various elements of the PAT initiative, explore USP's initial role in PAT, and highlight the key PAT concepts. Finally, this article presents a proposed list of terms that have been identified as members of a glossary for PAT analysis.

## INTRODUCTION

FDA defines Process Analytical Technology (PAT) as a system for designing, analyzing, and controlling manufacturing by means of timely measurements (i.e., during processing) of critical quality and performance attributes of raw and in-process materials and processes with the goal of ensuring final product quality (1). At its most basic level, PAT can be thought of as timely knowledge of critical measurements. The knowledge or information from these measurements can be used to understand and control processes. This concept can be further elaborated to include optimal applications of process analytical chemistry tools, feed-back/feed-forward process control strategies, information management tools, and product/process optimization strategies for the manufacture of pharmaceuticals. Several examples of the application of PAT techniques to pharmaceutical processes have been cited in the literature and range from the control of polymorphism, particle size and shape during API crystallization, moisture control in fluid-bed drying, to ID and assay during tableting (2-6).

A key document to understand PAT is FDA's Guidance for Industry, PAT-A Framework for Innovative Pharmaceutical Manufacturing and Quality Assurance, which creates a new framework for regulating drug manufacturing (7). The guidance suggests a shift from finished-product testing to in-process testing as a means to evaluate final product quality. FDA has focused on the assessment of drug product quality by shifting to a science-based risk-mitigation strategy. FDA suggests that the industry accomplish this shift by introducing innovative technologies and techniques as alternatives to current pharmaceutical manufacturing process controls in order to try to obtain mechanistic un-

[^369]derstanding and enhanced control of pharmaceutical processes. Implementation of PAT, it is postulated, may allow reduced production cycle times and improve pharmaceutical manufacturing efficiency.
Quality systems currently are rooted in current Good Manufacturing Practices (cGMP). Current GMPs seek to continually improve product quality by requiring manufacturers to follow written validated procedures (8). This approach ensures quality by testing the manufacturing process components from beginning to end with previously agreed-upon validated specifications. Although this approach has been proven to be valid, it is suggested that PAT principles in conjunction with cGMPs may improve final product quality. The testing-to-document-quality approach (cGMP) has its origin in the Federal Register of 14 February 1963, when the first regulations to establish criteria for cGMPs in the processing, packing, and holding of drugs were published (9).
The PAT initiative attempts to augment or enhance cGMPs by introducing additional scientific, engineering, chemical, and risk mitigation-based strategies to evaluate final product quality by real-time or near real-time control of pharmaceutical manufacturing via timely measurements during processing.

## BACKGROUND

PAT's beginnings extend as far back as 1993 to a symposium sponsored by AOAC International (10). In November 2001 Janet Woodcock, M.D., Director, Center for Drug Evaluation and Research (CDER), FDA, outlined the agency's PAT Initiative. It was promoted as an innovation in manufacturing process research and development that would achieve drug quality improvements in the U.S. pharmaceutical industry. The PAT subcommittee of the Advisory Committee for Pharmaceutical Science was established and
chaired by Ajaz Hussain, Ph.D., Deputy Director, CDER, Office of Pharmaceutical Sciences. This initiative was designed to address manufacturing-related productivity problems within the industry by encouraging process innovation in a regulatory risk-adverse industry.

On 3 September 2003, FDA published the (Draft) Guidance for Industry, PAT-A Framework for Innovative Pharmaceutical Manufacturing and Quality Assurance. Simply put, the PAT guidance is an invitation to drug manufacturers to voluntarily adopt scientific, risk-based strategies for employing alternative manufacturing strategies to increase process understanding in order to minimize process and product variability, which should result in an improvement in product quality.

Rather than relying on an empirical approach to learn and then optimize the manufacturing process, the manufacturer may chose to adopt design strategies for optimizing the
process from very early stages of conception through implementation via a design of experiment (DoE) approach. What follows from process design should logically result in a stable product with very low variability and high quality. This quality by design (QbD) (11) strategy has, as its central strategy, risk assessment tools at all levels of the design stages and especially during the placement, outfitting, and final implementation of process sensors for process fault detection (performance qualification). Risk assessment, used in conjunction with appropriate cGMPs, now can be used to determine probabilities and outcomes of manufacturing campaigns that should result in more efficient, productive, and compliant operations, along with predictable product performance attributes. These are the approaches suggested in the PAT draft guidance for effectively improving pharmaceutical manufacturing productivity. Figure 1 is a process map of a scientific, risk-based PAT approach.

Fig. 1. PAT process map

The scientific basis of PAT essentially resides in the pharmaceutical sciences, process chemistry, process engineering, process analytics (chemometrics and statistics), and process control. A central issue for pharmaceutical scientists is controlling critical product attributes that may be predictive of product performance. Identifying the right tests, whether in-process or post-production controls, for determining meaningful performance attributes, is the goal. Hussain (12) has pointed out that manufacturers currently rely on over-discriminating tests to determine if a particular process step results in a particular performance attribute. Such tests may be meaningless if the net variability in that particular process step is less than the potential range of results plus the error that could result from that particular test. PAT approaches attempt to relate meaningful measurement results based on the appropriately identified process critical control parameter(s) (PCCP) to meaningful product performance attribute(s).

## PAT AND THE GUIDANCE

FDA's Office of Pharmaceutical Sciences is exploring the qualitative and quantitative aspects of risk management (13) for integrated use in PAT programs (14). The office's Chemistry, Manufacturing, and Controls (CMC) Risk-Based Review Proposal states:

This proposal aims to carve out a list of drugs with little or low risk to focus more time on complex drugs that can have problems with product quality. The objective is to come up with a list of quality attributes and acceptance criteria for little or no risk drugs. This will result in guidance to industry with reduced information being submitted for review. An ANDA can be considered a CMC supplement where everything from manufacturing, suppliers, to manufacturing sites is changed. If a drug meets the list then the original NDA could be considered a truncated ANDA with information just like the annual report of the existing approved NDA.

This statement is significant because it reflects the agency's comments in the draft guidance with respect to implementing PAT. The draft guidance states:

Section 116 of the 1997 Food and Drug Administration Modernization Act amended the Food, Drug, and Cosmetic Act by adding section 506A (21 USC 356a), which provides requirements for making and reporting manufacturing changes to an approved application and for distributing a drug product made with such changes. We recommend that manufacturers continue to consider all relevant FDA guidance documents for recommendations on the information that should be submitted to support a given change. PAT implementation plans should be risk based. We [FDA] are proposing the following possible implementation options:

- PAT can be implemented under the facility's quality system; cGMP inspections by the Agency follow.
- PAT can be implemented following cGMP inspection by the PAT Team. The PAT Team can assist manufacturers with preoperational review of the PAT manufacturing facility and process (FDA Field Management Directive 135. http://www.fda. gov/ora/inspect_ref/fmd135a.html).

The recommendations in the inspection report can serve as a summary basis of final approval of the process and can be filed in the relevant application, when needed, and in facility databases within FDA.

- A supplement (CBE, CBE-30, or PAS) can be submitted to FDA prior to implementation and, if necessary, an inspection can be performed by a PAT Team or PAT-certified investigator before implementation.
- A comparability protocol can be submitted to the agency outlining PAT research, validation, and implementation strategies and timelines. (FDA issued a draft guidance for industry, Comparability ProtocolsChemistry, Manufacturing, and Controls Information. Once finalized, it will represent the agency's current thinking on this topic.)
- Following approval of this comparability protocol by the agency, one or a combination of these regulatory pathways can be adopted for implementation.

It should be noted that when certain PAT implementation plans neither affect the current process nor require a change in specifications, several options can be considered. Manufacturers should evaluate and discuss the most appropriate option for their situation.
Given FDA's intent to refocus its and industry's attention on emphasizing in-process testing for controlling product quality rather than post-manufacturing testing, a firm should consider a number of questions before embarking on a PAT implementation scheme:

1. What systems are suitable for PAT?
2. Process analysis and control is a shift from Quality Control of the finished product. How does one switch from the current Quality Control regulatory scheme of post-production testing to an analysis and control operation, which results in a true quality-built-in product?
3. What is meant by the phrase "timely measurement?" The pharmaceutical industry is predominantly a batch process industry - in this context what are appropriate timely measurements during processing?
4. Can batch processing be converted to continuousstream processes? Do they need to be?
5. How are critical process parameters determined and controlled?
6. How do current quality control measurements, which are designed to test the performance attributes of raw and in-process materials, predict the quality of the final product performance attributes?
7. Does in-process testing for critical quality parameters yield data that predict the final product performance attributes?
8. How are in-process performance attributes determined and measured?
9. What metrics will be used to demonstrate that a controlled process ensures acceptable final product quality?
10. What metrics will be used to assess that process perfor-mance-based specifications have been met?

These are just a few of the questions addressing the shift from a product-centered to a process-centered industry. However, the challenge to the agency and to industry will be to determine how industry will switch from a Quality Control orientation that emphasizes documented product quality via testing to a new perspective that centers on analysis and control, quality by design, and an on-going, feed-backward or feed-forward evaluation of critical process parameters and established performance-based specifications.

The agency's definition of PAT identifies the ideal or desired state of control. However, the guidance cannot supply, support, or even sanction specific approaches to PAT implementation because there is no "one shoe fits all" approach. And the agency does not want to interfere with industry innovation and thus does not want to be restrictive in its guidance. However, there are some in industry who desire more of an explanation to better understand the initiative. One way to appreciate just what the agency is asking from industry is to look at PAT from a more pragmatic perspective, one more fundamentally aligned with the agency's and the industry's primary responsibility to provide safe drugs to the public.

From this perspective, PAT is a quality system approach to setting up a regulatory strategy, more information about which can be found in CDER's Pharmaceutical cGMPs for the 21st Century-A Risk-Based Approach: Second Progress Report and Implementation Plan (15) and Final Report (16). PAT is only one element of a multicomponent major initiative concerning the regulation of drug product quality. Quality by design (QbD) is the central tenet of the Pharmaceutical cGMPs for the 21st Century, and PAT is how it can be realized. The key to thinking about PAT, then, is that quality becomes the means, not the end, to an enforcement strategy. PAT is the means to final product quality through improved process understanding.

## PAT AND QUALITY

In their book, What Is Total Quality Control?: The Japanese Way, Kaoru Ishikawa et al. (17), generally regarded as Japan's foremost authorities on the subject, define quality according to the Japanese Industrial Standard (JIS). They say:

Quality is a system of productive methods that economically produces quality goods or services meeting the requirements of consumers. Modern quality control utilizes statistical methods and is often called statistical quality control.

Ishikawa gives his own definition of quality:
To practice quality control is to develop, design, produce, and service a quality product that is most economical, most useful, and always satisfactory to the consumer.

To paraphrase Ishikawa, together these definitions for quality mean quality of a product. This can come about only when one realizes that everything done with respect to the final product is done with quality in mind from the very beginning. It is the difference between asking, "How can I make a tablet," versus "How can I make a quality tablet?" PAT offers the ability to achieve quality because it allows production to become a performance-based, quality-by-design endeavor with the ability to control quality rather than to hope for quality.

How all of this relates to improving enforcement strategy should become evident. Strategies for ensuring safety, purity, and efficacy by verifying product quality after processing have become costly and burdensome to the industry as well as to the agency. PAT introduces the ability to apply generally well-known principles from process chemistry, engineering, analysis and control, and pharmaceutical science within the six pharmaceutical business units: Manufacturing Controls, Sterile Product Controls, Packaging/Labeling Controls, Laboratory Controls, Active Pharmaceutical Ingredients (APIs), and Medical Devices Controls.
To explore the operational aspects of PAT, it is necessary to develop a functional definition for PAT. The Guidance definition is essentially a descriptive definition of PAT, and it attempts to describe the desired state of a fully engaged and optimized manufacturing process. It is appropriate, then, to ask the following questions about these descriptors:

1. What are appropriate design elements to be brought to bear on 21st century pharmaceutical manufacturing systems?
2. What systems of analysis are appropriate for determining the quality attributes of processed materials in a timely manner during processing?
3. Having selected and implemented the design, analysis, and control elements for a 21 st century pharmaceutical manufacturing system, how can one measure process analysis attributes and process control attributes in order to achieve optimal product performance?

The key elements of a functional definition of PAT include a clear description of the elements necessary for design, analysis, and control of an optimized pharmaceutical manufacturing system. A modern definition of process analytics is given by Kemeny (18):
... to maintain the desired state of product consistency by way of keeping the process composition steady at around the optimum physical and chemical conditions.

This, too, is a descriptive definition of the desired state resulting from optimized PAT, but with one important difference: The definition identifies process composition as an integral part of any pharmaceutical manufacturing process that must be considered in the choice of design specifications for placement, installation, and integration of processing equipment, analysis (of solids, liquids, sols, gels, slurries, gasses, etc.), and control (by proportional integral derivative [PID], statistical process control [SPC], digital control [DC], etc.).

Now it is possible to ask, what functional descriptors define the operations that are necessary to "... keeping the process composition steady at around the optimum physical and chemical conditions?" This question is essentially one of chemical engineering.

Lauffenburger (19) refers to the Four Ms of systems biology: measurement, mining, modeling, and manipulation: "Manipulation and measurement are on the experimental side. Mining and modeling are on the computational side." Lauffenburger borrowed the chemical engineering concept of Four Ms to help explain researching the mechanism of living systems. However, because the term evolved from chemical engineering principles, it may be a suitable functional descriptor for defining the operation of aPMP.

Lauffenburger states, "These Four Ms are part of an iterative process, beginning with manipulating the system. Once a system is perturbed, it is measured using a high-throughput, multivariate technology. The data are then mined to elucidate hypotheses that, when cast in terms of formal computational models, form the basis for a new manipulation of the system" (19). Data mining is a combination of pattern recognition coupled with statistical and database management tools to uncover hidden relationships in data. System manipulation refers to process analytical control tools that can be deployed to control a process by adjusting signals and impulses arising from the process. This explanation of the process used for biological processes really describes PAT in action and explains how to get to the desired state in the FDA definition of PAT.

Having identified the functional descriptors of PAT, it is now possible to fashion a working functional definition of PAT that places its operational components in context within the new pharmaceutical cGMPs for the 21st century. PAT can be functionally defined as the use of calibrated and automated systems for optimized processes for maintaining the desired state of product consistency by keeping the process composition steady at approximately the optimum physical and chemical conditions by data measurement and mining, modeling, and system manipulation.

Now that the PAT functional definition is established and we have a more basic understanding of PAT and its impact on the pharmaceutical process, it is important to realize that the same set of questions that was asked of the (Draft) PAT Guidance definition can also be asked of the functional definition. Clearly, the functional definition provides a specific tangible mechanism to achieve implementation. And based on the functional approach, one can actually identify when an optimal PAT manufacturing system is realized, and that is when the variability of the process critical control parameter (PCCP) can be identified as a predictor of both the process composition and the final product quality. One way of demonstrating the achievement of a causal link between a PCCP and a product attribute is to be able to express in mathematical terms the functions that relate process variability to a specific product.
The PAT Guidance attempts to achieve a mechanistic (or a mathematical) understanding of the impact of the manufacturing process on the process composition. For example, the guidance directs the user to: "develop mathematical relationships between product quality attributes and measurements of critical material and process attributes." A further development of the concept can be gleaned from an observation made by Luke V. Schneider when he describes systems biology narrowly as "mathematical modeling of biological systems" (19). In dealing with PAT systems for pharmaceutical manufacturing, we, too, are trying to develop appropriate mathematical models to describe how the process composition behaves and what effect it has on the outcome of the final product quality attribute we are interested in achieving. These efforts to understand the relationships between process and product attributes are vital because they lend insight and credibility to the mathematical concepts that must be developed for a full understanding of the correct implementation of a PAT-controlled process.
One of the unanswered questions for PAT is just how integration of PCCP with performance attributes of raw and in-process materials (process composition) will be achieved in order to obtain consistent final product quality. From the previous discussion, it appears that an approach should be to maintain the optimal physical and chemical state of the process composition so that a previously identified PCCP that has a causal link to a desired attribute will remain invariant or at least can be controlled over the range of the specified critical physical or chemical manufacturing steps that will be used to process the material. This does imply that integration will be best achieved by a multivariate approach using straightforward algebraic mathematics to compute

PCCP set points. The calibrated, automated approach turns out to be some iteration of well-known multivariate statistical process control (MSPC) tools that have a long history of acceptance in other manufacturing realms. However, it should not be interpreted to mean that the guidance or this article implies that all PAT applications will be complex or even multivariate. Defining the desired state for a particular product means one will have to identify what is known to have impact on product attributes, what is unknown, and what will come to be as recognized as unknowable in order to achieve control and understanding over a process. These initial steps may not need to rely on real-time control techniques or utilize complex multivariate mining or modeling techniques. But once enough information has been gathered from a process and its intended product, real process control, chemistry, engineering, and analysis can begin. Having achieved this level of understanding, one can began to think about implementing sophisticated multivariate statistical process control (MSPC) techniques to determine where and how to integrate these systems throughout the product life cycle.

MSPC will be applied to analytical tools that will most likely be used in PAT processes. These include but are not limited to: NIR, Raman, FTIR, UV/VIS, HPLC, GC, LC/ MS, titration, etc. Finally, a test method using one or more of the analytical tools in PAT will have to be qualified, and the qualification process most likely will involve instrument qualification, method development, method calibration, and method validation.

One possible way to think about the PAT approach with respect to all of its components in a practical way is illustrated in Figures $2 a$ and $2 b$. Figure $2 a$ relates all of the significant and practical pieces for implementing PAT previously explored in the guideline. Figure $2 b$ shows how one can integrate QbD , risk, Six Sigma, and the later calibration and validation method requirements into one holistic scheme utilizing the salient features from each and relating them together to accomplish a viable and workable PAT approach to a pharmaceutical manufacturing process.

## PHARMACOPEIAL ROLE IN PAT: USP PERSPECTIVE

It is incumbent upon USP to participate in the evolution of PAT and to remain engaged with the pharmaceutical industry. Some have suggested that USP is more relevant to the generic industry than to innovators, primarily because most $U S P-N F$ monographs involve off-patent dosage forms. Addressing PAT would make USP as important to innovators as to generic drug manufacturers. By defining the role of PAT in the pharmaceutical industry, USP could help create a legal and readily acceptable standard for assessing and verifying PAT methods suitability under actual conditions of use. As stated in the USP Mission and Preface of $U S P-N F$ : "Authoritative standards are recognized as representing 'scientific truth' at the time they are established and can be relied upon by their users. As science and technology evolve, so do USP and NF, which undergo continuous revision."

USP proposes to facilitate and complement the FDA framework for improving product quality in pharmaceutical manufacturing. USP will accomplish this by exploring, through its various Expert Committees and Project Teams, breakthrough technologies as they evolve in order to strengthen the scientific underpinnings of the risk-based de-cision-making strategies that FDA seeks to employ within the pharmaceutical industry.

Specifically, USP proposes to implement PAT standardssetting strategies by means of Project Team 18-Process Analytical Technologies (PAT) and to recommend solutions to relevant Expert Committees. For instance, proposed General Chapter $\langle 1073\rangle$ Effusivity [see PF 30(4)] was recommended to the Pharmaceutical Dosage Forms Committee, and proposed General Chapter $\langle 1120\rangle$ Raman Spectropho-
tometry was recommended to the PA6 Committee. Other proposed chapters or PAT project team activity underway and their respective Project Team 18 Work Groups include:

1. Working Group $1-\langle 1119\rangle$ Near-Infrared Spectrophotometry (In-Process Revision) USP 27-NF 22 Second Supplement
2. Working Group 2-Multivariate Analysis/Chemometrics
3. Working Group 3-Acoustics
4. Working Group 4-Study existing USP chapters for possible revision
5. Working Group 5-Terminology/Glossary
6. Working Group 6-Rapid Microbiological Methods Applications and Technologies
Industry has voiced some concerns about USP's approach to dealing with PAT issues. Following are some responses to these concerns.

## General Notices

It has been suggested that General Notices are a perceived barrier to the PAT initiative and require further clarification. However, the General Notices of the current USP allow the use of PAT approaches as an alternative for verifying product quality: "Compliance may be determined also by the use of alternative methods chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances." On this basis some manufacturing firms have accepted FDA's invitation to voluntarily adopt scientific, risk-based strategies for employing alternative manufacturing strategies to increase process understanding. In doing so, these firms are attempting to minimize process and product variability, which should result in an improvement in product quality. Less cited is the final sentence of
the paragraph of the General Notices'statement from which the quotation above is taken: "However, Pharmacopeial standards and procedures are interrelated; therefore, when a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive."

## PAT Chapter

USP has been asked several times to revise or clarify the General Notices regarding PAT or to create a high-level ( $>1000$ ) PAT Chapter. Given the scope and depth of the subject, we do not recommend that such a chapter be written, at least at this time. However, we do recommend making certain revisions to USP regarding aPMP. One such issue involves General Chapter $\langle 905\rangle$ Uniformity of Dosage Units. The specification, targeted to a singlet determination, is not useful for providing the appropriate criteria for a PAT method based on multiple measurements. Another urgent issue is providing appropriate analytical performance characteristics for PAT methods. Although the current General Chapter $\langle 1225\rangle$ Validation of Compendial Methods provides appropriate analytical performance characteristics, a statement or a separate general chapter would need to discuss the appropriate approaches to validate PAT methods. These are just a few of the important and relevant issues that USP should begin to address.

## PAT Technology Chapters

USP is in the process of developing chapters on modern analytical techniques. These techniques are currently implemented broadly in the industry or are under consideration by a significant proportion of manufacturers. For techniques that have broad acceptance, USP is simply working with industry to record the existing industry standards for these techniques. For techniques that show great promise for broad implementation, USP is developing chapters that are broad-based and informative without being prescriptive, thereby creating a tool kit for implementation by industry and ultimately easing the way to acceptance of the principles of PAT and, more importantly, increasing product quality.

## Chemometrics General Chapter

Chemometrics represents the extension of statistics to multivariate and very complex data sets. These mathematical techniques are critical to the successful application of many modern techniques both in the lab and in the PAT sense. This chapter will present a general overview of many of the better-understood and widely implemented techniques in use by industry. These techniques are used extensively in near-IR spectroscopy and have generated the following discussion points:

Although NIR is somewhat different from conventional analytical techniques so that validation is generally achieved by the assessment of specialized chemometric parameters,
these parameters can still be related to the fundamental validation characteristics required for any analytical method.
Data pretreatment often is a vital step in the chemometric analysis of NIR spectral data. It can be defined as the mathematical transformation of the NIR spectral data to enhance spectral features and/or remove or reduce unwanted sources of variation prior to the development of the calibration model. Calibration is the process of constructing a mathematical model to relate the response from an analytical instrument to the properties of samples. Many suitable chemometric algorithms for data pretreatment and calibration exist; the selection should be based on suitability for the intended use. Analysts can use any available data transform or algorithm that can be clearly defined in an exact mathematical expression and that gives suitable results.
The model for an NIR method is developed, stored, and applied in electronic form as part of an appropriate instrument/software package. When a model is transferred to another instrument, procedures and criteria must be applied to demonstrate that the model remains valid on the second instrument. In general, electronic model transfer is recommended only for another instrument of the same type and configuration. Several model transfer procedures exist and can be applied as appropriate. Procedures involve the use of various chemometric (mathematical and statistical) approaches with appropriate validation.

## PAT Equipment Calibration and Validation

Instrument calibration and validation represent the ongoing assurance that the measurements obtained from an instrument accurately and precisely represent the sample being analyzed. Calibration is independent of the analytical procedure and simply ensures that a signal obtained from a known standard is repeatable with time. The frequency and extent are typically not the responsibilities of USP but rather of the user. Validation is procedure and sample specific. Validation is the demonstration of the causal link between a measured value and a characteristic of the analyte. The extent of validation is variable and must be appropriate to the specific use. Therefore, USP typically has developed very broad descriptions of often-used evaluations. PAT is no different in terms of the need for validation, but it may differ in extent and frequency. A USP chapter should represent the standard evaluations that can be used in such a way that the industry can define which will be used and how they will be interpreted. Therefore, USP serves a valuable purpose by reconciling these standard approaches. Please note that USP is a living document that will be updated as necessary to ensure the applicability of the chapter and the standard.

## CONCLUSION

This Stimuli article has given an overview of FDA's PAT initiative and has reviewed several key documents associated with it, notably the Guidance for Industry, PAT-A Framework for Innovative Pharmaceutical Development,

Manufacturing, and Quality Assurance. As we have seen, the origins of PAT actually can be traced back through cGMP regulations. FDA's Office of Pharmaceutical Sciences has said that PAT implementation should be scientific and risk-based, and to these ends this article has reviewed 10 key questions that a firm should consider before embarking on a PAT implementation scheme. The ultimate goal of pharmaceutical manufacturing, and thus of PAT, is to ensure quality, so we have extensively reviewed the quality aspects of PAT implementation. This led to a discussion of the various roles that USP has played and will continue to play in the development of PAT. As a stan-dards-setting organization, USP already has demonstrated leadership by developing important chapters in key areas of concern to PAT. No less important, however, is the continuing thought leadership and innovation that USP's volunteer community will continue to contribute through the work of its project teams and expert committees.

## PAT KEY TERMS

Terminology for Process Analytical Technology
Objective of draft: to provide a list of terms for use in general chapters related to PAT.

A priori, adj -
Accepting Criteria, $\mathrm{n}-$.
Active, n -.
Active Pharmaceutical Ingredient (API), $n-$.
Alternating Least Squares, $\mathrm{n}-$.
Analyte, n -.
Analyze, v-.
At-Line, adj - .
Automated, adj -.
Automated Measurement, $\mathrm{n}-$.
Automated Systems, $\mathrm{n}-$.
Average Change Chart, $\mathrm{n}-$.
Batch, n -.
Batch-to-Batch, adj -.
Batch Processing, $\mathrm{n}-$.
Batch Run, n -.
Batchwise, adv -.
Best Practices, $\mathrm{n}-$.
Bilinear Model, n -.
Black Box Model, n -.
Calibration, n -.
Causal Relationship, $\mathrm{n}-$.
Channel, n -.
CGMPs, n -.
Computerized System, $\mathrm{n}-$.
Correlation, $\mathrm{n}-$.
Contamination, $\mathrm{n}-$.
Continuous Processing, $n-$.
Control, n -.
Correlation, $\mathrm{n}-$.
Critical, adj -
Critical Process Parameter, $\mathrm{n}-$.
Critical Quality Attribute, n-.
Critical Quality Parameter, $\mathrm{n}-$
Cross-contamination, $\mathrm{n}-$.
Curve Resolution, n -.
Data Mining, n -.
Decompose, v -.
Deconvolution, $\mathrm{n}-$.

Pharmacopeial Forum

# The Impact of Multiple-Unit Desiccating Containers for Prescription Packaging 

Peter Sagona, ${ }^{*}$ Jon Freedman, William Spano, and Robert Pangborn, Ph.D.

#### Abstract

Granular drying agents, referred to as desiccants, are often packaged with pharmaceuticals that are moisture sensitive. Many of these moisture-sensitive drugs are packaged in bulk quantities with desiccant and are delivered to pharmacies or prescription fulfillment groups. These drugs are then repackaged into smaller containers by pharmaciesoftentimes in a container without a desiccant. In 2003, CSP Technologies collaborated with USP's Packaging, Storage, and Distribution Expert Committee to study desiccant effects in commercially available multiple-unit pharmacy containers. Both well-closed and tightly closed containers were used in the study, as were desiccating containers. The objectives of this study were to determine the amount of moisture that entered each container and to compare the relative humidity maintained in desiccating and nondesiccating containers during a 90 -day prescription use life.

## INTRODUCTION

During the past several years, USP has been studying pharmacy containers and container-closure systems to maintain the stability of moisture-sensitive drugs throughout the prescription use life. It is understood that one important factor in maintaining the stability of moisture-sensitive drugs is to control the environment (i.e., the relative humidity) inside the container. Relative humidity ( RH ) is a measure of the moisture content in air. RH is described as a saturation percentage at a specified temperature- $100 \%$ RH is the point at which air is completely saturated.

Multiple-unit pharmacy containers are characterized as "tight" or "well-closed" by USP General Chapter $\langle 671\rangle$ Containers-Permeation guidelines based on the moisture leakage rate into the container. However, even a tightly closed container cannot remove moisture that has entered the container, particularly after an open/close cycle. Without a means for absorbing this moisture, the moisture content in the container rises, and the drug product becomes subjected to increased moisture. An ability to absorb the incoming moisture during the open/close cycle is needed to prevent the drug product from absorbing moisture.

Granular drying agents, referred to as desiccants, are often packaged with pharmaceutical drugs that are moisture sensitive. Many of these moisture-sensitive drugs are packaged in bulk quantities with desiccant and are delivered to pharmacies or prescription fulfillment groups. These drugs are then repackaged into smaller containers by pharma-cies-oftentimes in a container without a desiccant. A mul-tiple-unit pharmacy container may contain 100 or more unit doses and have a prescription use life of 90 days.

[^370]In 2003, CSP Technologies collaborated with USP's Packaging, Storage, and Distribution Expert Committee to study the effects of a desiccant in multiple-unit pharmacy containers. The study was conducted with commercially available pharmacy containers. Both well-closed and tightly closed containers were used in the study. Desiccating containers also were used. The objectives of this study were to determine the amount of moisture that entered each container and to compare the RH maintained in desiccating and nondesiccating containers during a 90 -day prescription use life.

## Test Protocol

Five different container types were used for the study:

1. Owens Illinois L-8 Container with SL-26 Screw-Loc closure-USP $\langle 671\rangle$ tightly closed.
2. Owens Illinois L-8 Container with CS-30 Snap Cap closure-USP $\langle 671\rangle$ well-closed.
3. Owens Illinois L-8 Container with SL-26 Screw-Loc closure, with a total of 6.0 grams of molecular sieve desiccant.
4. Owens Illinois L-8 Container with CS-30 Snap Cap closure, with a total of 6.0 grams of molecular sieve desiccant.
5. CSP Technologies M-3006-47 Activ-Vial with 8.0 grams of desiccant incorporated into the container inside wall.
All containers had a volume of approximately 31 cc .
A data logger was placed into each container and was used to record the temperature and RH inside each container during the test. The ambient conditions were $22^{\circ} \mathrm{C}$ and $10-$ $15 \%$ RH. One data logger suitable for use is a data logger manufactured by Hanwell Ltd., Hertford, UK, that monitors and records temperature and relative humidity (Figure 1). The RH logger is wireless and is specially designed to measure the RH inside small containers.

Fig. 1. Hanwell Hornet data logger

For each set of containers the RH was recorded for both the steady-state condition (referred to as the prescription-life condition) and the open/close condition (referred to as the use-life condition).

## Prescription-Life Condition

A set of containers was placed in an environmental chamber and was maintained at $30^{\circ} \mathrm{C}$ and $80 \% \mathrm{RH}$. The RH was recorded at regular intervals over a 90 -day period in each container type (the steady-state condition). A total of 30 containers of each type was used for a total of 150 containers.

## Use-Life Condition

A separate set of containers was set up to measure the amount of moisture that enters the container during use life. These containers were also placed in an environmental chamber maintained at $30^{\circ} \mathrm{C}$ and $80 \%$ RH. The RH was measured during a 90 -day use life during which the container was opened 3 times a day with a 1-minute opening interval. This occurred 5 days per week over the 90 -day testing period. A total of 30 containers of each type was used for a total of 150 containers.

At the completion of testing, the temperature and RH data from each logger were downloaded to a personal computer and evaluated using Hanwell's Z567 graphical software.

## Findings-Nondesiccating Containers

As can be seen in Figure 2, for containers without desiccant the RH inside the container increases rapidly from the initial condition of $10-15 \%$ RH. The results are similar in both the well-closed and tightly closed containers. The RH inside the container continued to increase over the prescription life and eventually equilibrated with the outside environment. The study found that the rise in RH was larger over the first 10 days. The containers reached a RH of $60 \%$ after 10 days in environmental conditions of $30^{\circ} \mathrm{C} / 80 \% \mathrm{RH}$ and a RH of $\sim 70 \%$ after 30 days. The RH continued to increase slowly until the RH inside the container reached $80 \%$. Based on the rapid increase in RH, the duration of the test was shortened to 30 days.
During open/close cycle testing, containers without desiccant immediately took on the relative humidity (RH) of the outside environment after the first opening. The RH remained at the $80 \%$ RH level over the entire use-life test.

Fig. 2. Temperature and relative humidity behavior of nondesiccating container (SL26-ND) in relation to time in days.

## Findings-Desiccating Containers

With respect to the prescription life condition, the RH in the containers was recorded over the testing period, initially defined as 90 days. The results indicate that all container
types with 6 grams of molecular sieve desiccant maintained a RH of $<5 \%$ over the period. The results are shown in Figure 3 and illustrate the effect of a desiccant on the RH inside the container.

Fig. 3. Temperature and percent RH observed in a container with desiccant (CSP-2D).

With respect to the use-life condition, the data loggers recorded the change in RH during the opening and closing of the containers. The containers with desiccant reestablished a low RH after each open/close cycle. On average, the RH in
the desiccated containers returned to $<5 \%$ within 20 minutes after the open/close cycle. Figure 4 illustrates the changes in RH during the open/close cycle.

Fig. 4. Percent RH maintained in desiccated pharmacy container (SL26-1D) during use-life conditions.

## Total Moisture into the Container

Again with reference to the prescription-life condition, the amount of moisture entering a container is based on:

1. the quality of the closure seal,
2. permeation rate of moisture through the container materials, and
3. the driving force within the container that has the potential to absorb moisture.
Containers used in the study were tested for moisture ingress (permeation) based on the USP $\langle 671\rangle$ test method. This method uses a calcium chloride desiccant inside the container as the driving force to maintain a moisture gradient with the ambient environment.

Based on the USP $\langle 671\rangle$ test, the moisture ingress rate for the well-closed container is $20 \mathrm{mg} /$ day, and the moisture ingress rate for the tightly closed container is $2 \mathrm{mg} /$ day.
Using nondesiccating containers, the incoming moisture is absorbed by the drug product. In desiccating containers, the desiccant absorbs the incoming moisture and not the product. Figure 5 compares the potential amount of moisture seen by the product over a 90 -day shelf life in containers with desiccant and without desiccant.

With reference to the use-life condition, over the 90-day period, the container was opened 3 times a day for 1-minute intervals. During each opening cycle the volume of air inside the container was exchanged with the ambient air. At the environmental conditions of $30^{\circ} \mathrm{C} / 80 \% \mathrm{RH}$, the amount of incoming moisture per opening (for a 31 -cc volume) is 7.2 mg .

Fig. 5. Moisture seen by product after 90 days (USP $\langle 671\rangle$ protocol).

Figure 6 compares the potential amount of moisture seen by the product over a 90 -day use life in containers with
desiccant and without desiccant.

Fig. 6. Moisture seen by product in nondesiccated and desiccated containers after 90 days under use-life conditions (USP $\langle 671\rangle$ protocol) .

The desiccating container directs moisture away from the product. Desiccants have a greater attraction for the incoming moisture and absorb the moisture before it reaches the pharmaceutical. Desiccants have the potential to dramatically reduce the amount of moisture seen by the drug.

## Desiccating Container Considerations

Desiccants are widely used in the primary packaging of pharmaceuticals. Desiccants are sold in single-unit sachets or canisters containing 1-3 grams of either silica gel or molecular sieve desiccant. Alternatively, desiccants are some-
times placed into a reservoir in the container lid. The container and the desiccating lid are 2 separate parts. All desiccants have a certain moisture capacity per unit mass of desiccant. Care must be taken to minimize the exposure of the desiccant to environmental moisture prior to packaging. For this reason desiccants are normally stored in a moisturetight package (e.g., a foil bag) prior to use. Often, a low-RH environment in the packaging area is used to ensure that the desiccant does not absorb moisture before packaging.
Desiccating containers are now commercially available with the desiccant incorporated into the inner walls of the container. The desiccant is blended into a plastic insert so that the granular desiccant is bound in the plastic and there is no separate desiccant component to manage. The con-
tainer may also incorporate a flip-top lid that protects the desiccant from absorbing environmental moisture prior to filling.

The amount of desiccant needed in the container is calculated based on:

1. the moisture leak rate into the container,
2. the storage- and use-life requirements, and
3. environmental conditions (temperature and RH ) during storage life and use life.
The manufacturers of pharmacy containers would be responsible for determining the amount of desiccant required in the container. The manufacturers will certify that the container meets the 90 -day desiccating requirements using an approved analytical method.

Nondesiccating pharmacy containers cost in the range of $\$ 0.08-0.12$ per unit depending on the container size. A desiccating container costs an additional $\$ 0.02-0.04$ per container, based on the amount (mass) of desiccant. The increased cost to use a desiccating container is relatively small compared to the protection offered to the prescription packaged.

The use of a desiccating container for a prescription is based primarily on the moisture sensitivity of the pharmaceutical; clearly, not all drugs require a desiccating con-
tainer. The pharmacist or prescription fulfillment center will decide whether to package a drug in a desiccating container based on the packaging requirements of the pharmaceutical product. Changes in pharmaceutical labeling may be necessary to instruct pharmacists in selecting the proper container for each pharmaceutical product.

## CONCLUSION

Desiccating containers provide a cost-effective means of protecting moisture-sensitive pharmaceuticals during the prescription use life. The key benefit of a desiccating container is the ability to absorb moisture that enters the container during an open/close cycle before the moisture is absorbed by the drug product. A desiccant may be included in the container using traditional methods (i.e., canister or sachets). Alternatively, currently available containers have the desiccant blended into the inner wall of the container. Suppliers of desiccating containers should provide certification that the container supports the USP container requirements for desiccating containers. Changes to the labeling requirements of pharmaceuticals may be necessary to identify which products require a desiccating container.

# Inductively Coupled Plasma-Optical Emission Spectroscopy as an Alternative to the Heavy Metals Test 

Martha Schenkenberger* and Nancy Lewen

#### Abstract

There has been growing concern regarding the use of the United States Pharmacopoeia (USP) test for Heavy Metals, Method II $\langle 231\rangle$. A recent publication (3) describes the use of inductively coupled plasma-mass spectrometry (ICPMS) as an alternative to the compendial heavy metals test. USP recognizes that the current method utilizes dated technology and has proposed that modern spectroscopic techniques be used to perform the heavy metals testing of pharmaceutical ingredients. A general chapter on plasma spectrochemistry was proposed in Pharmacopeial Forum (4).

This article describes the use of another spectroscopic technique, inductively coupled plasma-optical emission spectroscopy (ICP-OES), as an alternative to the compendial heavy metals test. ICP-OES offers many advantages over the compendial method. It is a rapid, multielement technique that can be used to assay for the following elements: antimony ( Sb ), arsenic (As), bismuth (Bi), cadmium (Cd), indium ( In ), lead ( Pb ), mercury ( Hg ), molybdenum (Mo), palladium ( Pd ), platinum ( Pt ), ruthenium $(\mathrm{Ru})$, selenium $(\mathrm{Se})$, silver $(\mathrm{Ag})$, and tin $(\mathrm{Sn})$. Other advantages to the use of this technique include the fact that only a small quantity of sample is required, and it provides element-specific results.

## INTRODUCTION

Recent publications $(1,2,3)$ have proposed the use of inductively coupled plasma-mass spectrometry (ICP-MS) as an alternative to the USP test for Heavy Metals, Method II $\langle 231\rangle$. Additionally, a general chapter on plasma spectrochemistry was proposed in Pharmacopeial Forum (4). As a result, the authors propose an inductively coupled plas-ma-optical emission spectroscopy (ICP-OES) method as a possible alternative to the compendial method in chapter $\langle 231\rangle$ for heavy metals. This method would provide ele-ment-specific quantitative results for the following elements: arsenic (As), cadmium (Cd), indium (In), tin (Sn), antimony $(\mathrm{Sb})$, lead $(\mathrm{Pb})$, bismuth $(\mathrm{Bi})$, silver $(\mathrm{Ag})$, mercury $(\mathrm{Hg})$, ruthenium $(\mathrm{Ru})$, and molybdenum (Mo). Platinum $(\mathrm{Pt})$, palladium $(\mathrm{Pd})$, and selenium $(\mathrm{Se})$ may also be determined because these elements either are frequently used as catalysts or are sufficiently toxic to warrant examination.

## EXPERIMENTAL PROCEDURE

Accurately prepare a $1 \%$ solution of sample dissolved in a suitable solvent in an acid-washed volumetric flask. (A suitable solvent is one that is capable of completely dissolving the solid sample and does not provide any analytical interferences when introduced into the ICP-OES instrument. Additionally, a suitable solvent should be relatively nonvolatile, such as deionized water, dilute nitric acid, dilute hydrochloric acid, or a solution of butoxyethanol and water [25:75].) If necessary, add an appropriate internal standard according to the guidelines detailed in the proposed general
chapter on plasma spectrochemistry in $P F$ (4). Prepare working standard solutions that contain 0.5 and $1.0 \mu \mathrm{~g} /$ mL each of $\mathrm{As}, \mathrm{Cd}, \mathrm{In}, \mathrm{Sb}, \mathrm{Pb}, \mathrm{Bi}, \mathrm{Hg}, \mathrm{Ru}, \mathrm{Mo}, \mathrm{Pt}, \mathrm{Pd}$, and, if necessary, an appropriate internal standard according to the guidelines detailed in the proposed general chapter on plasma spectrochemistry (4). Dilute to volume with the same solvent used to dissolve and dilute the sample. Prepare a second set of working standard solutions that contain 0.5 and $1.0 \mu \mathrm{~g} / \mathrm{mL}$ each of Se and Ag and, if necessary, an appropriate internal standard according to the guidelines detailed in the proposed general chapter on plasma spectrochemistry (4). Dilute to volume with the same solvent used to dissolve and dilute the sample.
Using either an axial or lateral ICP-OES instrument, select at least three wavelengths per analyte element. Follow the guidelines detailed in the proposed general chapter on plasma spectrochemistry in $P F$ (4) for calibration and analysis.

# Particulate Contaminants of Intravenous Medication and the Limits Set by USP General Chapter $\langle 788$ 〉 

Nrapendra Nath, ${ }^{*}$ Elizabeth McNeal, Donald Obenhuber, Branda Pillari, Lisa Shelton, Marla Stevens-Riley, and Neal Sweeney, Microbiology Team, Office of Generic Drugs, U.S. Food and Drug Administration

#### Abstract

The presence of foreign particulates in drug products is a function of the manufacturing process, and the limits on particulates are described in USP General Chapter $\langle 788\rangle$ Particulate Matter in Injections. Contamination of parenteral drugs with particulate matter, especially regarding intravenous or intrathecal injections, is potentially dangerous to the patient's health. Risks associated with the injection of particulates intravenously have been well documented.

Exhibit batch records for 406 lots in 295 drug applications for various injectable drugs from 1998 to 2002 were reviewed. Particulate counts for each lot were noted and analyzed statistically.

The mean counts for particles $\geq 25 \mu \mathrm{~m}$ were $15 \pm 43$ (mean $\pm 1 \mathrm{SD}$ ). The corresponding counts for $\geq 10 \mu \mathrm{~m}$ particles were $219 \pm 415$. Statistically significant differences in particulate contamination were observed between aseptically processed and terminally sterilized products and different types of containers (ampules, glass and plastic vials, and syringes) used to fill the drug products.

USP $\langle 788\rangle$ allows up to 6000 and 600 particles per container for $10 \mu \mathrm{~m}$ and $25 \mu \mathrm{~m}$ particulates, respectively. Based on our data it appears that the current limits are lenient and that the USP $\langle 788\rangle$ acceptance limits could be lowered.

## INTRODUCTION

It is well recognized that contaminating particles, viable or nonviable, are undesirable in sterile products intended for parenteral administration, especially those for intravenous or intrathecal injection. Harmful effects of particulate contamination are well documented both clinically and experimentally (1-11). Reducing and eliminating particulate contamination remains a goal for all sterile drug products; however, in practice, low levels of contamination with nonviable particulate remains inevitable. Improvements in manufacturing technologies have allowed better control in limiting these contaminants.

In order to control contaminants in drug products it is necessary to understand the source and the nature of these contaminants. It is well known that the type and nature of contamination depends on the manufacturing process. Various contaminants have been identified as rubber (from stoppers), glass (from vials), fiber (from uniforms), rust and metal (from machinery), silicon (from siliconization of stoppers), dust, and crystals. Other materials, such as plastic (from the molding process), also could contaminate the drug products (2, 12-16).

The methods of detection and the limits for nonviable particulate contamination in parenteral drugs are described in USP General Chapter $\langle 788\rangle$ Particulate Matter in Injections, and these limits serve as the de facto standards. USP

[^372]$\langle 788\rangle$ was first proposed in 1983, and it became official in USP XXI in 1986. According to a report by the Committee on Particulate Matter (17), particulate limits were based on data provided by FDA for 19 drug products, including small-volume parenteral (SVP) and large-volume parenteral (LVP) drug products, in which the combined mean particulate counts for $10-\mu \mathrm{m}$ particulates were reported to 59 ( $\pm 89$ ) particles per mL and the corresponding values for $25-\mu \mathrm{m}$ particulates were $13( \pm 27)$ per mL . Historical perspectives on particulate contamination limits incorporated in USP $\langle 788\rangle$ are described in commentaries (18, 19). We present data representing 110 different drugs manufactured by 51 different firms using a variety of manufacturing processes during a five-year period from 1998 to 2002. Data presented show that the limits specified in General Chapter $\langle 788\rangle$ could be significantly lowered without rejecting a large number of manufactured products. These lower limits would ensure that injectable drug products sold in the United States are of the highest quality that is reasonable.

## METHODS

In the five-year period from 1998 to 2002, the Office of Generic Drugs received and reviewed 295 Abbreviated New Drug Applications (ANDAs) for injectable drug products. The applications included drugs that were liquids, lyophilized, or sterile powder. Data for only SVPs ( $\leq 100 \mathrm{~mL} /$ container) are included in the analysis; LVPs ( $>100 \mathrm{~mL} /$ container) are excluded. It should be noted that particulates are expressed on a per-container basis in the case of SVPs and on a per-mL basis in the case of LVPs.

Exhibit batch records submitted in each of 295 ANDAs were reviewed, and the particulate counts for each lot were recorded from the Certificate of Analysis (COA) provided in the application. In most cases, the light-obscuration method was used to count particulates in the drug products; however, the specific nature of instruments used is not recorded and is not part of this analysis. If the COA did not contain numerical values for the particulate counts, then the particulate counts were obtained from the stability data. If the particulate counts were provided, they were noted and included in the analysis. The particulate data from stability studies reflected early test points only and did not represent counts at the end of the product shelf life.

In a few cases, when multiple values for the same lot were provided, e.g., when vials were tested from the beginning, middle, and end of a run, the highest value for the particulates (reflective of the worst-case scenario) were recorded and used in the analysis. In applications where data for more than one exhibition lot were provided, values for all lots were noted and analyzed. A total of 38 ANDAs were excluded either because the ANDAs were not available (13) or the particulate counts were not reported in the COA (25) or the stability data could not be included for a variety of reasons.

Overall, numerical counts for particulates were available for 228 out of 295 applications reviewed. Data for a total of 406 lots were available and entered into a Microsoft Excel spreadsheet for analysis. The analysis included calculation of the mean, standard deviation, standard error, distribution analysis, regression analysis, and $t$-Test.

## RESULTS AND DISCUSSION

## Basis of Data

Particulate data analyzed are derived from a total of 295 ANDAs received during a five-year period, 1998 to 2002, as summarized in Table 1. For generic drugs, several different firms may apply for the same drug and dosage form. Each generic drug application is required to include manufacturing batch records for a minimum of one batch representing not less than (NLT) $10 \%$ of the full production lot using the same or equivalent equipment and process as used in the manufacture of the full production lots. It should be noted that data analyzed here closely represent manufacturing conditions and reflect lots produced commercially.

Table 1 lists the number of different drugs applied for each year. The applications were submitted by 15 to 17 different applicants each year, and during a period of five years a total of 51 different applicants applied for a total of 110 different drugs. The firms included small and large companies, established as well as new firms, and included both domestic and foreign firms.

Table 1. Summary of database (1998-2002) used in the study

| Type | 1998 | 1999 | 2000 | 2001 | 2002 | Total |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of <br> ANDAs | 64 | 52 | 68 | 53 | 58 | 295 |
| Number of <br> Firms | 15 | 17 | 17 | 17 | 17 | $51^{*}$ |
| Number of <br> Drugs | 25 | 23 | 30 | 33 | 42 | $110^{* *}$ |
| Number of Lots by Dosage Form |  |  |  |  |  |  |
| Injection | 85 | 50 | 80 | 53 | 66 | 334 |

* The total represents the number of different applications during five years. The same applicant may repeat in different years. The applicant is not necessarily the manufacturer of the drug product.
** The total represents the number of different drug products during five years. The same drug may repeat in different years.
${ }^{\dagger}$ Flexible bags are almost always LVP; these are not included in the particulate analysis.
$\ddagger$ ANDAs for LVPs are not included in the present particulate analysis.
NOTE: USP General Chapter $\langle 1\rangle$ defines SVP as containers $\leq 100 \mathrm{~mL}$; for the present study we used this definition.

Particle contamination data for 406 lots of various drugs were derived from a total of 228 ANDAs, including 334 lots that were liquids and 72 lots that were either lyophilized or filled as sterile powder. All lots represented SVP dose forms ( $\leq 100 \mathrm{~mL} /$ container). Another 18 lots, representing LVP ( $>100 \mathrm{~mL} /$ container) are not included in the present data analysis.
Data for the number of lots, according to the type of container used to package the drug products, show that $87 \%$ ( 354 out of 406 ) were filled in glass vials. Data also show that $72 \%$ (294 out of 406 ) were manufactured using an aseptic process.

## Particulate Counts

The mean particulate counts over five years show consistency (Table 2). The mean counts for $\geq 25-\mu \mathrm{m}$ particulates were $11,14,16,15$, and 19 for five years from 1998 to 2002 , and the corresponding values for $\geq 10-\mu \mathrm{m}$ particulates were $214,194,274,153$, and 259 . The mean
particulate counts over the five-year period did not show statistically significant trend as indicated by their correlation coefficient ( $R^{2}$ ) values as shown in Table 7. Overall, the mean particulate counts for all 406 lots were $15 \pm 43$ (mean $\pm 1$ SD) for $\geq 25-\mu \mathrm{m}$ particles and $219 \pm 415$ for $\geq 10-\mu \mathrm{m}$ particles (Table 3).

Table 2. Particulate contamination in SVP lots 1998-2002

|  | 1998 |  | 1999 |  | 2000 |  | 2001 |  | 2002 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Lots | 97 |  | 68 |  | 99 |  | 64 |  | 78 |  |
| Particle Size $(\mu \mathrm{m})^{*}$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ |
| Mean* $^{*}$ | 11 | 214 | 14 | 194 | 16 | 274 | 15 | 153 | 19 | 259 |
| SD | 28 | 587 | 44 | 291 | 51 | 635 | 54 | 238 | 39 | 326 |
| Mean +3 SD | 96 | 1977 | 145 | 1067 | 170 | 2178 | 179 | 867 | 136 | 1236 |
| Maximum | 231 | 5188 | 297 | 1204 | 377 | 3856 | 418 | 1160 | 198 | 1892 |

* In SVP parenteral drugs USP $\langle 788\rangle$ allows NMT 600 particulate $(\geq 25 \mu \mathrm{~m}) /$ container and NMT 6000 particles $(\geq 10 \mu \mathrm{~m}) /$ container when using the light-obscuration method. Using the microscopic method, particulates allowed are NMT $300(\geq 25 \mu \mathrm{~m})$ and $3000(\geq 10 \mu \mathrm{~m})$ particles/container.
${ }_{* *}$ All particulate counts for SVPs reported here are based on counts per container.

It should be noted that the FDA data used by USP in 1983 to set particulate limits were based on combined data for SVP and LVP and were presented as counts per mL, although the current counts for SVP are based on counts per container; therefore, the two sets of values are not directly comparable.

## Dosage Form

A comparison of particulate contamination in drugs that are liquids (Injections) and those that are either lyophilized or filled as sterile powder (For Injection) is summarized in Table 3. The mean counts for $\geq 25-\mu \mathrm{m}$ particulate were $13 \pm$ 38 and $24 \pm 44$ among Injections and For Injections, respectively. The difference is statistically significant; i.e., the probability that the observation was by chance alone is $<0.05 \%$ ( $p<0.05$ ). Similarly, a significant difference ( $p<0.01$ ) is also observed for $\geq 10-\mu \mathrm{m}$ particulate contamination. In a Canadian study significantly higher particulate counts in powder-fill products were reported (14); however, lower particulate counts were reported in another study of 11 lots of cephalosporin filled as dry powder (20).

Table 3. Particulate contamination by dosage form

|  | All Lots | Injections | For Injection |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number <br> of Lots | 406 |  | 334 |  | 72 |  |
| Particle <br> $\quad$ Size $(\mu \mathrm{m})$ |  | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ |
| Mean | 15 | 219 | 13 | 181 | 24 | $\geq 10$ |
| SD | 43 | 415 | 38 | 384 | 44 | 401 |
| Mean <br> $\quad 3$ SD | 145 | 1465 | 128 | 1333 | 157 | 1579 |

The reason for these differences between dosage forms is not known, but it is possible that the excess particulates observed in For Injection drugs represent insoluble aggregates of undissolved product ingredients. However, the higher particulate counts could also be process-associated contamination resulting from the lyophilization process.

## Manufacturing Process

Contaminating particulates in the products manufactured using a terminal sterilization process were significantly lower $(p<0.01)$ than in products that were produced using an aseptic process, as shown in Table 4. It could be argued that at least one of the reasons for the higher particulate counts in aseptically produced drugs is that the filtration process contributes to the particulates in the filtrate. However, we know that many terminally sterilized products also include a filtration step in addition to the terminal sterilization process. Therefore, filtration is probably not a full explanation of the observation.

Table 4. Particulate contamination by sterilization process

|  | All Lots | Aseptic <br> Process | Terminal <br> Sterilization |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Number <br> $\quad$ of Lots | 406 |  | 294 |  | 112 |  |
| Particle <br> $\quad$ Size $(\mu \mathrm{m})$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ |
| Mean | 15 | 219 | 17 | 245 | 10 | 154 |
| SD | 43 | 415 | 45 | 438 | 24 | 289 |
| Mean <br> $\quad 3$ SD | 145 | 1465 | 153 | 1560 | 82 | 1021 |

## Container Types

A comparison of particulate contamination in drugs filled in glass vials and those filled in glass ampules shows that significantly lower ( $p<0.01$ ) counts of $\geq 25-\mu \mathrm{m}$ particulates were observed in ampules compared to glass vials; however, the difference for $\geq 10-\mu \mathrm{m}$ particulates was not statistically
significant (Table 5). A similar comparison between glass vials and plastic vials showed significantly lower contamination in plastic vials. The presence of a relatively low level of particulates in plastic compared to glass ampules has been reported previously $(21,22)$.

Table 5. Particulate contamination by container type

|  | Glass Vials |  | Ampules |  | Plastic Vials |  | Glass Syringes |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Lots | 354 |  |  | 23 |  |  | 7 |  |
| Particle Size $(\mu \mathrm{m})$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ | $\geq 25$ | $\geq 10$ |
| Mean | 16 | 226 | 6 | 185 | 5 | 59 | 5 | 111 |
| SD | 45 | 426 | 7 | 232 | 4 | 50 | 3 | 207 |
| Mean $\pm 3$ SD | 151 | 1504 | 27 | 881 | 17 | 209 | 14 | 732 |

The mean levels of particulates in 15 lots of glass syringes were 5 and 111 for $\geq 25-\mu \mathrm{m}$ and $\geq 10-\mu \mathrm{m}$ particulates, respectively. The level of contamination in syringes relative to glass vials was significantly lower; similarly lower particulate counts in sterile filled syringes have been previously reported (23).

## Particulate Distribution

Statistical analysis of particulate distribution among 406 lots is shown in Table 6. Data show that very large propor-
tions of lots are clustered toward the lowest range, $\leq 100$ particles per container; in fact, the largest number of lots reported zero counts. In the case of $\geq 10-\mu \mathrm{m}$ particulates, some tailing in distribution is observed, and it is more pronounced in applications submitted in 1999 and 2002. A histogram showing the relationship between the numbers of lots studied and the level for $\geq 10-\mu \mathrm{m}$ particulates is shown in Figure 1 and for $\geq 25-\mu \mathrm{m}$ particulates in Figure 2.

Table 6. Distribution of contaminating particles, all lots combined: 1998-2002

| Number of Particulates ( $\mu \mathrm{m}$ ) | 1998 |  | 1999 |  | 2000 |  | 2001 |  | 2002 |  | Cumulative |  |

Number of Particulates
Fig. 2. Counts for $\geq 25-\mu \mathrm{m}$ particulates in all lots combined

Table 7 summarizes mean particulate counts for each dosage form by the year of application. Analysis of the data for trends in particulate counts during the five-year period shows correlation coefficient ( $R^{2}$ ) values ranging from 0.00 to 0.85 for various categories; however, none is considered
statistically significant. The mean particulate counts for $\geq$ $25-\mu \mathrm{m}$ and $\geq 10-\mu \mathrm{m}$ particulates during the five-year study period for each of the dosage forms are shown graphically in Figures 3 and 4.

Table 7. Mean particulate counts by the year of application

Fig. 3. Counts for $\geq 25-\mu \mathrm{m}$ particulates by year and dosage form

Fig. 4. Counts for $10-\mu \mathrm{m}$ particulates by year and dosage form

For analysis and to identify lots with high counts, we assumed a cut-off based on a mean +3 SD, representing $99.7 \%$ of the population and that the occurrences of particulate contaminations were random. On the basis of these criteria, we identified eight lots that had counts of either $300 \geq 25$ $\mu \mathrm{m}$ or $1500 \geq 10-\mu \mathrm{m}$ particulates as shown in Table 8. These eight lots have little in common to suggest the cause of the observed high counts. Five different firms manufactured the lots. The lots included liquid as well as For Injection dosage
forms; most were filled in glass vials, but one lot was filled in glass ampules. Among the eight lots both aseptically filled and terminally sterilized lots are represented. Although most of the lots showed high counts for $\geq 10$ $\mu \mathrm{m}$ particulates, only one lot (\#5) showed relatively high counts for both $\geq 25-\mu \mathrm{m}$ and $\geq 10-\mu \mathrm{m}$ particulates. The lot (\#7) with the highest $\geq 25-\mu \mathrm{m}$ particle counts had relatively modest counts for $\geq 10-\mu \mathrm{m}$ particulates.

Table 8. High-count lots based on mean $\pm \mathbf{3}$ SD criterion (counts $>\mathbf{1 5 0 0}$ for $\geq \mathbf{1 0}-\mu \mathrm{m}$ particles or $>\mathbf{3 0 0}$ for $\geq \mathbf{2 5}-\mu \mathrm{m}$ particles)

** Values in parentheses represent numbers of SD from the particulates mean for all lots.

Our study provides a clear view of the actual capabilities of the current technologies. It should be noted that data presented in the study represent exhibit lots for nearly all ANDAs for injectable drugs presented to FDA during the five-year period; therefore, statistical values reported here represent true values for the exhibit lots without bias. In the case of sterile drug products, it is reasonable to assume that the processes used in the manufacture of the exhibit lots were essentially the same as used in the manufacture of fullscale production lots; therefore, the level of particulates in exhibit lots may be a reasonable reflection of particulate contamination in the full-scale production lots.

Data summarized in Table 8 show that if particulate contamination limits were based on mean +3 SD one would have identified eight lots as the outliers, including five in which particulate counts were greater than mean +6 SD . The manufacturers would have been prompted to identify the source of particulate contamination and improve the quality of their product by lowering contamination. It should be pointed out that the injury caused by the presence of nonviable particulate contamination in the injections is well documented in the scientific literature (1-11) and must be considered when limits for particulate contamination are determined. It should be recognized that the presence of any
foreign particulate matter in an injectable drug form is undesirable; however, a certain level of contamination is allowed, as represented by limits set in USP $\langle 788\rangle$, due to practical limitations of the manufacturing technologies.

## CONCLUSION

Data provided show that low particulate counts in the parenteral drugs currently produced are the norm across the manufacturing processes representing a variety of technologies and container types. To the best of our knowledge, this is the first publication analyzing data representing a broad spectrum of manufacturing processes.

Our study shows that the contaminating particulates in injectable drug products are significantly lower than currently allowed by USP General Chapter $\langle 788\rangle$ Particulate Matter in Injections. The lower particulate counts reported here indicate that the current manufacturing technologies are performing well. However, our data show that there is a wide gap between the actual particulate contamination present in the injectable drug products and the amount of contaminants allowed under the current limits in USP $\langle 788\rangle$. The mean counts for all lots combined were 15 (SD 43) and 219 (SD 415) for $25-\mu \mathrm{m}$ and $10-\mu \mathrm{m}$ size particulates, respectively. The difference between the mean counts and the USP limits represent more than 13 SD. In statistical terms, mean +3 SD represents $99.7 \%$ of the samples in a normal distribution; current limits could be lowered without significantly increasing lot rejection due to particulate contamination.

We hope that this Stimuli article will help generate discussion about the need and usefulness of tighter limits based on recent data, such as presented here, and perhaps additional studies could be performed to establish safe limits for particulate contamination without placing excessive burden on the industry.

## ACKNOWLEDGEMENT

The authors thank the staffs of the Document Rooms in the Office of Generic Drugs, the Central Document Room, and the Federal Records Center for their help in locating and providing jackets of various applications for this study.

# A Rapid and Simple Stability-Indicating HPLC Method for the Analysis of Valproic Acid in Divalproex Sodium Formulations 

Patrick N. Yat,' Isa Odidi, Amina Odidi, Raman Varatharajan, Shicheng Zhang, Fariba Pourhadi, and Ahmed Fayaiz

#### Abstract

A simple, selective, and rapid high-performance liquid chromatographic method for the analysis of valproic acid in divalproex sodium formulations was developed and validated. Sample preparation was in methanol and $0.5 \%$ sodium dodecyl sulfate ( $1: 9 \mathrm{v} / \mathrm{v}$ ) and resolved on a C8 column with UV detection at 215 nm . The mobile phase consisted of acetonitrile and 25 mM sodium dihydrogen phosphate buffer, $\mathrm{pH} 3.5(1: 1 \mathrm{v} / \mathrm{v})$ at a flow rate of $1.0 \mathrm{~mL} / \mathrm{min}$. Calibration curves were linear ( $r>0.9999$ ) over the concentration range of $5.01 \mu \mathrm{~g} / \mathrm{mL}-1002 \mu \mathrm{~g} / \mathrm{mL}$. The coefficients of variation (CVs) were $<2 \%$ for valproic acid recoveries at three concentration levels ( $70 \%, 100 \%$, and $130 \%$ ) of the finished product assay, and the intraday and interday precision CVs were $<2 \%$. Valproic acid retention times were generally about 5 min.

The quantitation limit for valproic acid related compound A was about 62 ng on the column. Mean recoveries of valproic acid related compound A spiked in drug substance and in drug product at about $0.5 \%$ of valproic acid assay concentrations were $82.1 \%$ and $107.7 \%$ in drug substance and drug product, respectively, with CVs $<15 \%$. The developed method gave good resolution between valproic acid and valproic acid related Compound A. Stability-indicating studies were performed on an HPLC system equipped with a photodiode-array detector. The drug was stable under acid, base, thermal, and UV conditions; however, additional peaks were observed with the sample treated under oxidative conditions. The method was specific and stability indicating and therefore could be employed as a more convenient and efficient option for the analysis of valproic acid and its related compounds in drug substance and formulations.

## BACKGROUND AND INTRODUCTION

Divalproex sodium, sodium hydrogen bis(2-propylpentanoate), is chemically composed of valproic acid and valproic acid sodium salt in a 1:1 molar ratio (Figure 1). Valproic acid is used as an anticonvulsant and mood stabilizer in the treatment of several seizures because of its wide spectrum of activity ( $1-3$ ). Several methods for the analysis of valproic acid in biological samples have been reported based on derivatization followed by HPLC analysis with fluorimetric detection (1-2, 4-6). Other reported methods involved LC-MS (7) and GC with electron-capture detection (8).

Fig. 1. Chemical structure of divalproex sodium
Application of compendial GC methods (9-10) for the analysis of valproic acid in drug substance and in finished formulations did not provide fast and high throughput.

[^373]Our analysis of valproic acid in finished formulation gave results of intraday and interday precision that showed coefficient of variations $>3 \%$ and $6 \%$, respectively, and sample preparations involving liquid-liquid extraction were lengthy and time consuming.

This article describes a simple HPLC method with UV detection for the quantification of valproic acid in drug substance, drug products, and dissolution samples, as well as application to related compounds. The developed method was validated under such parameters as linearity, recovery/accuracy, precision, ruggedness, robustness, specificity and selectivity, detection, and quantitation limits. The method is conveniently employed for the analysis of valproic acid in divalproex sodium delayed-release and extended-release formulations and in their respective dissolution samples, as well as monitoring related compounds in stability samples.

## EXPERIMENTAL

## Materials

USP Valproic Acid RS and USP Valproic Acid Related Compound A RS were purchased from the US Pharmacopeia (Rockville, MD, USA). Divalproex sodium API was obtained commercially from a reputable supplier (confidential information). AnalaR-grade sodium phosphate monobasic monohydrate, HPLC-grade acetonitrile, methanol, and 2-propanol (EM Science, Merck KGaA, Darmstadt, Germany) were purchased from VWR Canada. HPLC-grade
water, $o$-phosphoric acid, and sodium dodecyl sulfate (SDS) were purchased from Fischer Scientific Canada. Divalproex sodium finished drug products were formulated at our facilities, and reference products were acquired commercially.

## Instrumentation

The HPLC systems used were a Waters 2695 Separations Module equipped with a Waters 2487 dual wavelength absorbance detector for assay. A Waters solvent delivery pump (Model 600), a Waters 600E System controller, an auto injector (model 715), and a Waters 996 photodiode array detector (Waters Corporation, Milford MA, USA) were used for stress studies, along with an ERC model $3415 \alpha$ Solvent degasser. A $4.6 \times 150 \mathrm{~mm}$ Agilent Eclipse XDB Cg, $5-\mu \mathrm{m}$ column (Agilent Technologies, Palo Alto, CA, USA) was used with a mobile phase consisting of acetonitrile and 25 $\mathrm{mM} \mathrm{NaH} 2_{2} \mathrm{PO}_{4} \mathrm{pH} 3.5$ with $\mathrm{H}_{3} \mathrm{PO}_{4}(1: 1 \mathrm{v} / \mathrm{v})$ at a flow rate of $1.0 \mathrm{~mL} / \mathrm{min}$. The detector wavelength was set at 215 nm . Injection volume was $50 \mu \mathrm{~L}$ per injection, and the HPLC system equilibrated for about 30 min before the commencement of runs.

## Method

## Mobile phase

Dissolve 3.5 g of sodium phosphate monobasic monohydrate in 1000 mL of DI water. Mix well, and adjust with $o$-phosphoric acid to a pH of 3.5 . Transfer 500 mL of this solution into a 1-L volumetric flask, add 500 mL of acetonitrile, and mix well. Pass the solution through a $0.45-\mu \mathrm{m}$ nylon membrane filter, and degas before use.

## Standard Solutions

Standard Solution A-Accurately weigh about 50 mg of USP Valproic Acid RS into a $50-\mathrm{mL}$ volumetric flask. Add about 10 mL of methanol to dissolve; make up to volume with $0.5 \%$ SDS solution and mix well. Concentration of valproic acid is about $1 \mathrm{mg} / \mathrm{mL}$.

Standard Solution B-Weigh quantitatively USP Valproic Acid Related Compound A RS into a known volume of 2propanol so that the final concentration of related compound A is about $50 \mathrm{mg} / \mathrm{mL}$.

Working Standard (Resolution) Solution- Pipet 25.0 mL of Standard Solution $A$ into a $50-\mathrm{mL}$ volumetric flask. Using a Hamilton syringe, add $50 \mu \mathrm{~L}$ of Standard Solution B. Dilute with Mobile Phase to volume and mix well. Pass a portion of this solution through $0.45-\mu \mathrm{m}$ PVDF syringe filter (NOTE: a $0.45-\mu \mathrm{m}$ nylon filter failed the filter selection), discarding the first $1-2 \mathrm{~mL}$; collect the filtrate into an HPLC vial for analysis. The concentrations of valproic acid related compound A and valproic acid in the Working Standard (Resolution) Solution are about $50 \mu \mathrm{~g} / \mathrm{mL}$ and $500 \mu \mathrm{~g} / \mathrm{mL}$, respectively. Standard and Test Solutions are stable for at least 3 days at room temperature and at $4^{\circ} \mathrm{C}$. Valproic acid Standard Solution $B$ is stable for at least 2 weeks at $4{ }^{\circ} \mathrm{C}$.

## Test Solution

Weigh not fewer than twenty divalproex sodium 500 mg (valproic acid) tablets and grind into a fine powder. Place an amount equivalent to one tablet weight into each of three 1L volumetric flasks. Add 100 mL of methanol, and sonicate for about 5 min . Add about 800 mL of $0.5 \%$ SDS solution and sonicate for about 3 min . Dilute with more $0.5 \%$ SDS solution to volume and mix well. Pass a portion of this solution through a $0.45-\mu \mathrm{m}$ PVDF syringe filter, discard the first $1-2 \mathrm{~mL}$, and then collect into HPLC vial for analysis. The concentration of valproic acid in the Test preparation is about $0.5 \mathrm{mg} / \mathrm{mL}$.

## VALIDATION PROCEDURES

## System Suitability

The Resolution Solution was run at any one time for system suitability before sample analysis. Six consecutive injections of the Resolution Solution were performed and evaluated for repeatability, peak symmetry, plate count, and resolution. Typical system suitability results are summarized in Table 1.

Table 1. Summary of system suitability results for valproic acid

|  | Retention <br> Time of | Peak Area of <br> Valproic Acid <br> (AU) | USP Tailing |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Injection | Falproic <br> Acid (min.) | 880695 | 1.14 |  |  |
| Number | 5.15 | 881295 | 1.13 | USP Tangent | USP |

| Mean | 0.2 |  |  | 0.5 | 0.3 |
| \%CV |  |  |  |  |  |

## Linearity

The linearity of response for the method was determined by analyzing standard solutions of valproic acid Std 1-Std 10 in the concentration range of $2.506-1002.45 \mu \mathrm{~g} / \mathrm{mL}$ ( $\mathrm{Ta}-$ ble 2). The results show that the peak area responses are linear within the concentration range of the analysis. The correlation coefficient was $>0.9999$. Figure 2 is a linear curve of valproic acid.

Table 2. Linearity and range of valproic acid

## Accuracy/Recovery

Accuracy was studied by preparing samples of divalproex sodium 500 mg (valproic acid) finished product in triplicate at the $70 \%, 100 \%$, and $130 \%$ levels of the target valproic acid concentration and assaying them according to the procedure described in the Test preparation.

A typical chromatogram of Valproic acid Working Standard (Resolution) Solution is depicted in Figure 3. Figure 4 is a typical chromatogram of sample solution at the $100 \%$
level. The mean percent recovery ranged from $99.7 \%$ to $101.7 \%$ of the label claim of valproic acid at all levels of the recovery analysis, and the CV values for each level ranged from $0.4 \%$ to $0.6 \%$. The overall mean percent recovery was $100.4 \%$ of the label claim of valproic acid with an overall CV of $0.6 \%$ (Table 3).

* Results based on mean of three injections

## System Precision

System precision was evaluated by making six consecutive injections of the system suitability (Resolution) solution. The CVs of the retention times and of the peak areas of valproic acid from the six consecutive injections of the system suitability solution injected were $0.2 \%$ and $0.0 \%$, respectively (Table 1).

## Method Precision

A method precision study was performed to determine the reproducibility of the method. Six samples were prepared at the $100 \%$ level and assayed according to the procedure described in the Test preparation. The results of the precision study are summarized in Table 4. The mean valproic acid recovery was $100.3 \%$ of the label claim for valproic acid with a CV of $0.4 \%$.

Table 4. Summary results for valproic acid method precision

|  | Sample <br> Sample <br> Number | mmount <br> $(\mathrm{mg})$ | Theoretical <br> $(\mathrm{mg})$ | Measured <br> $(\mathrm{mg})$ |
| :---: | :---: | :---: | :---: | :---: |

[^374]
## Ruggedness

Ruggedness was performed by a second analyst on six sample solutions by following the same procedure for method precision on a separate day and using a different HPLC
system. The mean valproic acid recovery was $101.8 \%$ of the label claim for valproic acid with a CV of $0.2 \%$ (Table 5).

Table 5. Summary results for valproic acid ruggedness test

| Mean |  |  |  | 101.8 |
| \%CV |  |  |  | 0.2 |

* Results based on mean of three injections

## Robustness

Robustness studies were performed on method precision sample \#1 by making slight variations in flow rate, amount of acetonitrile, and buffer pH changes one at a time. Acceptable robustness results were defined as falling in the $98-102 \%$ range of the target conditions result. The results of the robustness study are summarized in Table 6.

Table 6. Summary results for valproic acid robustness

| test |  |  |  |

| Variation | $52 \%$ | 100.4 | 101.7 |

* Results based on mean of three injections

## Specificity and Selectivity

The specificity of the method was determined by running a blank solution followed by a placebo sample solution of
divalproex sodium formulation on an HPLC column for analysis. A typical chromatogram obtained from the placebo sample solution is shown in Figure 5.

Figure 5. A typical chromatogram obtained from divalproex sodium placebo sample solution

Selectivity was determined by performing forced degradation studies on divalproex sodium finished product and evaluating the peak purity of valproic acid from any resulting impurities from the stress treatment. Analysis of the peak purity was performed using PDA purity plots in which a purity angle, $P A$, of the valproic acid peak was generated against a threshold, TH, value. The peak is considered pure if the value is equal to or less than the threshold, $T H$, value. Table 7 is a summary of the purity angle and threshold values from the various stress condition studies performed on the finished formulation. Valproic acid peak separations and PDA spectral scans of the various forced degradation studies are shown in Figures 6-11.

Table 7. Summary results for valproic acid method forced degradation studies

| Parameter | Purity Measurement |  |

## Limit of Detection and Limit of Quantitation

Limit of detection (LOD) and limit of quantitation (LOQ) were evaluated based on valproic acid related compound A in which the peak responses were three times and ten times the baseline noise, respectively. These were estimated at 31 ng and 62 ng on the column, respectively. Valproic acid related compound A standard solutions were prepared and analyzed for linearity from the quantitation limit. The results show that the peak area responses are linear within the concentration range of $1.235-24.69 \mu \mathrm{~g} / \mathrm{mL}$ (Table 8). A linear curve for related compound A is depicted in Figure 12.

Table 8. Linearity, LOD, and LOQ of valproic acid related compound $A$

Valproic Acid Related Compound A Recovery in Drug Substance

Valproic acid related compound A was spiked at about the $0.5 \%$ level of the working concentration and analyzed at the $80-120 \%$ level of drug substance. The mean percent recov-
ery ranged from $80.7 \%$ to $84.8 \%$ of the spiked valproic acid related compound A level with an overall mean of $82.1 \%$ and CV of $3.4 \%$ (Table 9).

\end{array}
$$

## Any Individual Unknown Impurity Percent Content in Test Solution

Any individual unknown impurity percent present in each sample $=\left(r_{i} / r_{t}\right) \times 100 \%$, where:

| $r_{i}=$ | peak response of any individual unknown im- <br> purity, except solvent peak, from run of Test |
| :--- | :--- |
| $r_{t}=$ | preparation <br> sum of responses of all peaks in the chroma- <br> togram, excluding the solvent peak. |

## RESULTS AND DISCUSSION

The $\% \mathrm{CV}$ of the peak areas of valproic acid from the six consecutive injections of the system suitability solution injected was $0.0 \%$. The mean theoretical plate count based on USP tangent calculations for valproic acid peak from the six consecutive injections of the system suitability solution was 8821, and the resolution between valproic acid related compound A and valproic acid was 6.9 (Table 1).
Linearity was demonstrated between the peak response and concentration in the range from the quantitation limit of $2.506-1002.45 \mu \mathrm{~g} / \mathrm{mL}$, giving a correlation coefficient, $r^{2}$, of 1.0000 . This linear relationship with $r^{2}=1.0000$ was again demonstrated where the standard calibration curve ( $n=5$ ) ranged from $100.245 \mu \mathrm{~g} / \mathrm{mL}$ to $1002.45 \mu \mathrm{~g} /$
mL to include the assay concentration of about $500 \mathrm{ug} / \mathrm{mL}$. A linear calibration curve of valproic acid was constructed using the GC method (9) over the concentration range from
$34.2 \mu \mathrm{~g} / \mathrm{mL}$ to $546.4 \mu \mathrm{~g} / \mathrm{mL}$ and gave a correlation coefficient of $r^{2}=0.9968$. The linear curve of valproic acid by GC analysis is depicted in Figure 13.

Fig. 13. GC linear curve of valproic acid: concentration $34.2-546.4 \mu \mathrm{~g} / \mathrm{mL}$

Recovery of valproic acid from finished product was well within the acceptable range of $90.0-110.0 \%$ (9) with CV $<1.0 \%$ at all three concentration levels. The mean percent recovery ranged from $100.0 \%$, CV of $0.4 \%$ at the $70 \%$ level, to $101.1 \%$, CV of $0.6 \%$ at the $130 \%$ level. These recoveries and low CVs (Table 3) indicate the method's high degree of
accuracy. Assay run time was set at ten minutes because no extraneous peaks were observed beyond the retention time of valproic acid (Figure 4).

Recoveries of valproic acid using the pharmacopeial method (9) gave mean recovery of $100.8 \%$ with CV of $3.3 \%$ (Table 11). The intraday and interday precision CVs were in the range of about $3 \%-6 \%$ compared to the HPLC procedure of less than $1.0 \%$.

Table 11. Summary results for valproic acid GC recovery

|  |  | Valproic Acid |  | Recovery |
| :---: | :---: | :---: | :---: | :---: |
| Analysis Number | Sample Amount <br> $(\mathrm{mg})$ | Theoretical (mg) | Valproic Acid <br> Measured $(\mathrm{mg})$ |  |
| 1 | 88.45 | 54.81 | 56.63 | \%LC |
| 2 | 88.45 | 54.81 | 56.73 | 103.3 |
| 3 | 89.39 | 55.39 | 56.42 | 103.5 |
| 4 | 89.39 | 55.39 | 56.32 | 101.9 |
| 5 | 89.12 | 55.22 | 53.25 | 101.7 |
| 6 | 89.12 | 55.22 | 53.94 | 96.4 |
| Mean |  |  |  | 97.7 |
| \%CV |  |  | 100.8 |  |

The system precision expressed as CV was $0.2 \%$ for retention time and $0.0 \%$ for peak area (Table 1). Method precision CV based on label claim was $0.4 \%$ with a mean recovery of $100.3 \%$, indicating the accuracy of the method (Table 4).

Ruggedness evaluated by a second analyst using different equipment on a different day gave a mean valproic acid recovery of $101.8 \%$ and a CV of $0.2 \%$ (Table 5). Robustness parameters involving changes in pH of buffer solution and in the composition of organic content in the mobile phase gave results that were within the acceptable range of $\pm 2 \%$
of the target condition recovery. The flow rate at $1.1 \mathrm{~mL} / \mathrm{min}$ also met the acceptable range for target conditions; however, the $0.9 \mathrm{~mL} / \mathrm{min}$ flow rate failed this specification.

Selectivity was based on forced degradation of diva1proex sodium finished product and on evaluation of the peak purity of valproic acid from any resulting degradants from the stress treatment. Analysis of valproic acid peak purity was performed using Millennium32 software and evaluating the purity from PDA spectral scan. Valproic acid peaks from all stress studies had purity angles lower than their respec-
tive threshold values, indicating that the valproic acid peak was well resolved from any impurity resulting from the forced degradation studies.

Recoveries of valproic acid related compound A spike at twice the quantitation limit ( $0.5 \%$ of assay concentration) in the $80-120 \%$ level of drug substance gave an overall mean of $82.1 \%$ and CV of $3.4 \%$ (Table 9). Mean recoveries in the $70-130 \%$ level of drug product gave an overall mean of $107.7 \%$ and a CV of $12.2 \%$ (Table 10). The CV values are an indication of the accuracy in the recoveries of spiked valproic acid related compound $A$ when present in either drug substance or drug products.

There are no interfering peaks appearing on the chromatograms for both blank and placebo at the retention time of valproic acid; therefore, this method meets the acceptance criteria for specificity. Selectivity was demonstrated via forced degradation studies, indicating that the valproic acid peak was well resolved from any impurity resulting from the stress studies and thus establishing the stability-indicating capability of the method.

## CONCLUSION

This report summarizes the results of the method development and validation for the determination of valproic acid in divalproex sodium finished products by HPLC. Performance validation criteria for system suitability, linearity, specificity/selectivity, recovery/accuracy, precision, ruggedness, and robustness were all met. The limit of detection (LOD) and limit of quantitation (LOQ) for valproic acid related compound A as well as its recovery in drug substance and drug product were well established. This potential im-
purity was not found in divalproex sodium raw material; however, it was employed in system suitability studies and could be used in its quantitation or for any other unknown impurity that may result from any stress condition.

This simple, rapid, and specific validated HPLC method is sensitive, accurate, and reproducible; it offers a rapid alternative for the analysis of valproic acid in drug substance, drug products, and dissolution samples.

# Veterinary Application of In Vitro Dissolution Data and the Biopharmaceutics Classification System 

Marilyn N. Martinez,' Mark G. Papich," and Jim E. Riviere"

#### Abstract

The Biopharmaceutics Classification System (BCS) has been developed for human pharmaceutical compounds to predict oral drug absorption. A similar approach for evaluating in vitro data regarding dissolution, solubility, and permeability of veterinary oral dosage formulations has not been applied to predict oral absorption in animals. However, if reliable data can be generated, it may be possible to apply these principles to veterinary drugs. Before this can happen, obstacles must be overcome. Because of differences in anatomy and physiology between animals and people, extrapolations to veterinary drug formulations may not be applicable. Veterinary drug formulations also may differ in their size, excipient content, and use compared to human drug formulations. There is a clear need to examine the application of in vitro data regarding dissolution and permeability for product evaluation and regulatory decisions. This article and future scientific presentations will explore the potential for this application.

Upon resolution of these questions and following appropriate adjustments to testing methods for permeability, solubility, and dissolution assessments, we will be able to apply, with confidence, BCS principles to oral formulations intended for use in dogs. We believe that the extrapolation of BCS principles to oral formulations for use in canines will prove to be an extremely valuable contribution to veterinary medicine.

This Stimuli article on the potential applications of BCS to veterinary drugs was endorsed by the USP Veterinary Drugs Expert Committee. Reader comments about the suggested applications of in vitro solubility, permeability, dissolution data, and the BCS are invited. These comments should be directed to Ian F. DeVeau, Ph.D., at the Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790, telephone: 301.816.8178; fax: 301.816.8373; e-mail: ifd@usp.org.

## INTRODUCTION

The USP Veterinary Drugs Expert Committee (EC) formed an ad hoc committee to examine and make recommendations about in vitro dissolution and oral absorption of veterinary pharmaceutical compounds. The basis for this initiative has been the development of the Biopharmaceutics Classification System (BCS) for human pharmaceutical compounds. The BCS is one of the most significant tools recently developed to facilitate product development and regulatory decisions (1). By understanding a compound's solubility and permeability characteristics, pharmaceutical scientists can develop a mechanistic approach to predict the influence of variables such as food, formulation, dosing regimen, and disease on drug absorption from the gastrointestinal (GI) tract. By understanding the relationship between a drug's in vivo absorption profile and the in vitro solubility and dissolution characteristics, one can identify conditions under which the in vitro data could serve as a surrogate for in vivo bioequivalence testing. The correlation between in vitro data and in vivo absorption is abbreviated as IVIVC.

Pharmaceutical compounds can be grouped into one of the following categories:

[^376]CLASS I: High Solubility, High Permeability: generally very well absorbed compounds.
CLASS II: Low Solubility, High Permeability: exhibit dissolution rate-limited absorption.
CLASS III: High Solubility, Low Permeability: exhibit permeability-limited absorption.
CLASS IV: Low Solubility, Low Permeability: very poor oral bioavailability.
The rate of product dissolution may influence the resulting plasma concentration/time profile if the drug is Class II. However, for Class I or III drugs, other factors may influence drug absorption. For example, for Class I compounds (highly soluble, highly permeable) the rate of gastric emptying rather than product performance is the rate-limiting step in determining the bioavailability characteristics. For these formulations, marked difference in in vitro dissolution profiles may occur without any resulting differences detected in product bioavailability (2, 3, 4). Similarly, highly soluble, poorly permeable compounds (Class III) dissolve rapidly. However, in these cases, it is not the rate of drug dissolution that is usually rate-limiting but rather diffusion across biological membranes. Therefore, we can again assume that for Class III compounds, if dissolution is faster than the rate of gastric emptying then differences in product dissolution will not affect product bioavailability. For Class III compounds, as long as absorption occurs via linear processes, the absolute amount of drug absorbed can be increased with a higher dose (5).

On the other hand, for high-permeability, low-solubility compounds (Class II), the rate and extent of product dissolution will have a significant role in defining the resulting blood concentration/time profile (6). This may be attributable to problems associated with either particle size (termed dissolution-limited absorption) or drug solubility (termed solubility-limited absorption). When absorption is limited by solubility, particle size exerts minimal effect on the fraction of drug absorbed. In this situation, fraction of drug absorbed can be improved only by enhancing drug solubility. For example, solubility can be improved by including in the product formulation a surfactant or other excipient that may improve solubility. Conversely, for some compounds particle size also exerts a significant effect on absorption. In these cases, solubility is not a limiting factor, and improvement in the fraction of drug absorbed can be achieved by decreasing particle size, which increases surface area.

## FDA CURRENT USE OF BCS CONCEPTS

FDA's Center for Drug Evaluation and Research (CDER) has incorporated BCS concepts into several guidance documents, including several pertaining to scale-up and post-approval changes, as well as a guidance for the waiver of in vivo bioequivalence study requirements for high-solubil-ity/high-permeability drug products (Class I) based on in vitro dissolution data (7). To be granted a waiver of in vivo bioequivalence study requirements, CDER recommends that in vitro dissolution tests be conducted under the following conditions:

- The test apparatus should be USP Apparatus 1 at 100 rpm or Apparatus 2 at 50 rpm (8). Testing should be conducted in 900 mL of each of the following dissolution media: (1) 0.1 N HCl or Simulated Gastric Fluid USP without enzymes; (2) a pH 4.5 buffer; and (3) a pH 6.8 buffer or Simulated Intestinal Fluid USP without enzymes.
- For each formulation, a minimum of 12 dosage units should be evaluated and a dissolution profile generated. Two dissolution profiles are considered similar when the $f_{2}$ value is $\geq 50$.
- To allow the use of mean data, the coefficient of variation should not exceed $20 \%$ at the earlier time points (e.g., 10 minutes) or $10 \%$ at all other time points. If, under all dissolution conditions, both the test and reference products dissolve $85 \%$ or more within 15 minutes, profile comparisons are not necessary.

## Controlled-Release Dosage Forms

The absorption of controlled-release dosage forms is, by definition, dissolution rate-limited. Because drug permeability characteristics must be sufficiently high to ensure the presence of sink conditions within the GI tract, the appropriate candidates for these products are Class I or II compounds (9). Moreover, to develop an IVIVC for these
products, test procedures must account for the changing environments to which the oral dosage form will be exposed as it traverses the GI tract. These include:

- The impact of changes in fluid volume, surfactants, and motility patterns on product dissolution and drug solubility
- Regional anatomic differences in intestinal permeability and surface area
- Regional physiologic differences in intestinal metabolism and secretion.

## WHY CONSIDER VETERINARY APPLICATION OF BCS PRINCIPLES?

The scientific basis for drug classification in humans has been thoroughly tested, and the criteria for drug classification and biowaivers were shown to accurately predict product in vivo performance. Recently, Kassim et al. (10) developed BCS classifications for 325 medicines contained in the World Health Organization (WHO) Essential Drug List. Permeability was classified based on correlations of human intestinal permeability of 29 reference drugs with the estimated logarithm of the partition coefficient (Log P) or CLogP lipophilicity values. Metoprolol was chosen as the reference compound for permeability and $\log \mathrm{P}$ or Clog P . $\log \mathrm{P}$ and CLogP were linearly correlated ( $r^{2}=0.78$ ) for 104 drugs. A total of 53 (43.1\%) and 62 (50.4\%) drugs on the WHO list exhibited Log P and CLogP estimates, respectively, that were greater than or equal to the corresponding metoprolol value and were classified as high-permeability drugs.

Considering the economic constraints under which veterinary product development, regulation, and practice must function, the incorporation of BCS principles would be extremely beneficial to veterinary medicine. The cost of development of veterinary pharmaceutical formulations is very expensive compared to the financial return in a market that is comparatively smaller than the human market. The benefits of applying BCS principles to veterinary drug formulations would be felt by the drug sponsor with lower costs of development, and veterinarians and animal owners would benefit from greater availability of medications. Unfortunately, the extrapolation of these criteria to veterinary species is not straightforward. There remain numerous interspecies differences in GI physiology that may influence clear-cut interpretation of permeability classifications. In addition, unlike the situation for human medicine, body size (among breeds of dogs, for example) determines the dosage strength used in veterinary species. Tablet sizes in veterinary medicine tend to span a large range so that the drugs can be safely and conveniently administered. Thus, the use of a set volume of fluid and dosage strength for defining drug solubility may not be appropriate in veterinary medicine. Lastly, the current criteria used for defining a rapidly dissolving product may not be appropriate in animal species for which the GI transit rate can be markedly greater than that observed in humans.

The potential importance of these variables needs to be considered prior to using BCS concepts as a predictive tool in veterinary species. Nevertheless, there can be enormous value in having such a system available for classifying veterinary compounds. Upon considering the many veterinary species for which medications may be prescribed, the USP ad hoc committee agreed that the greatest benefit would derive from developing this tool for use in dogs, rather than considering all other species at this time.

## Limit the Analysis to Formulations for Dogs

From a regulatory perspective, addressing this question first in dogs will have the largest impact on the development and regulation of veterinary pharmaceuticals. Most oral veterinary solid drugs are developed for dogs. In addition, dogs are often included as one of the preclinical species in which drugs are tested prior to use in humans. Consequently, there is a wealth of information already generated in dogs due to their ease of handling and because they are one of the species traditionally used for preclinical drug development/toxicological evaluation. There are fewer oral drugs for cats. Many oral drugs for horses tend to be in a paste or granule formulation. Cattle medications are most often given by injection or are orally mixed in water or feed. Therefore, the practical approach is to initially limit our study to oral formulations for dogs.

It is our hope that by examining those aspects of solubility, permeability, and in vitro dissolution test criteria that may be different in dogs versus humans we can better understand how interspecies differences may influence drug classification. The aim of the ad hoc USP committee is to develop guidelines that may be used for dogs, and these guidelines may eventually be developed into a new USP General Chapter on evaluation of veterinary oral pharmaceutical formulations. As a follow-up to this process, we will ultimately strive to extend our findings to support drug classification in other animal species.

## BENEFITS DERIVED FROM ESTABLISHING THE BCS FOR DOGS

Numerous potential benefits could be derived by establishing BCS principles for facilitating the development and regulation of drugs and oral drug products for use in dogs. These include:

- Use in initial drug candidate selection
- Use in the development of product formulations
- Improvement of our understanding of drug products for which bioavailability may be different from that observed in humans (extralabel use) and those drugs that may have significant bioavailability problems when obtained from compounding pharmacies
- Regulatory applications:
- Waiver of Class I (and possibly Class III) compounds
- Help establish in vitro dissolution methods and specifications that have in vivo relevance and can
be used to determine conditions under which additional in vivo bioavailability study data may not be necessary (the development of in vivo/in vitro cor-relations-IVIVC).

## OBJECTIVES OF THIS USP INITIATIVE

The Veterinary Drug EC established this ad hoc USP committee with the mission to review the pertinent literature, examine original research, collect data on oral absorption of compounds in dogs, obtain public input, and possibly direct new research initiatives with the following goals in mind:

- To delineate ways in which in vivo dissolution and drug permeability can differ between humans and dogs.
- To develop a list of points to consider when developing in vitro dissolution methods intended to reflect potential formulation effects on product bioavailability in dogs.
- To explore the possibility of developing canine IVIVC and consider whether or not the criteria used to support waivers in human subjects is appropriate for supporting waivers of in vivo bioequivalence study requirements in dogs (particularly with regard to Class I and III compounds).
- Because of the recent interest in nonsteroidal anti-inflammatory drugs (NSAIDs) in canine veterinary practice, the criteria for these drugs should be examined even though they are considered Class II according to BCS review.
- To develop a list of excipients that can affect drug absorption in dogs. There may be excipients that can affect product bioavailability in a manner that may not be identified under in vitro test conditions. This list would be used to compare with a list of corresponding excipient effects recognized to occur in humans.
One of the first initiatives of the USP ad hoc committee will be to prepare a list of drugs for which data are available in dogs and classify them based on the model developed for compounds included on the WHO Essential Drug List (10). In this classification scheme, the following criteria will be considered:
- Is a related drug used under clinical practice conditions in dogs?
- Are there adequate data available to evaluate oral absorption in dogs?
- Is the drug approved within the U.S. for oral administration to dogs?
- Which of these human drug products may be subject to extralabel use in dogs?
- Are there differences in the dosage forms of these compounds when administered to humans versus dogs?
- Are there drugs that are frequently compounded from the human formulation for animal use by compounding pharmacies?

## PROBLEMS WITH INTERSPECIES EXTRAPOLATIONS

One of the obstacles to overcome in applying the BCS to formulations of compounds used in dogs is interspecies extrapolation. Drugs administered to people may cause different absorption profiles in dogs because of a variety of factors. Some comparisons of oral absorption of drugs in humans versus dogs have been reviewed (11, 12, 13). The differences in oral absorption between dogs and humans can be partially explained by differences in anatomy and physiology (11, 14, 15). Interspecies differences in drug bioavailability are most often the consequence of variables such as GI transit time, in vivo dissolution, presystemic metabolism, physicochemical interactions with gut contents, bacterial digestion, and site-specific differences in absorptive surface area. The diversity in GI anatomy and function reflects differences in dietary habits of the animals (16). For example, carnivores, such as dogs, possess a relatively simple colon but well-developed small intestine (long villi), which is consistent with a diet that is low in fiber but high in fat and protein. As a generalization, gastric emptying time influences the systemic appearance of rapidly dissolved, well-absorbed drugs.

## Differences in Gastric and Intestinal pH between Dogs and People

Dogs have lower basal acid secretion than do people (14, 11). The effect of food on gastric pH also differs across species. Generally, the gastric pH of fasted dogs is highly variable, ranging between 3 and 8 (17). In addition, a higher pH in the intestine of dogs by comparison with humans may result in better absorption of drugs that are weak bases, but this can be influenced by feeding. Following a meal, gastric acid secretion rates in dogs exceed those of humans and are slower to return to baseline. The postprandial gut pH in humans tends to exceed that observed in dogs due to the strong buffering action of the diet, returning to baseline values within approximately one hour (14).

A radiotelemetric technique (Heidelberg capsule) for monitoring canine GI function provided continuous pH profiles for baseline (fasted) and postprandial states (18). During a 6 -hour test period in 4 Beagles, the baseline (fasting) gastric pH ranged between 0.9 and 2.5 (first 30 minutes of testing). The postprandial gastric pH values varied between 0.5 and 3.5 (first 30 minutes of testing). Baseline duodenal pH values during the initial 5 minutes after gastric emptying varied from 4.5 to 7.5 . They varied between 4.5 to greater than 8.0 (during the initial 60 minutes following gastric emptying). The intestinal pH tended to increase linearly over the initial 60 -minute postprandial period. The mean gastric residence time of the capsule was 74 minutes in the fasted state (range 0 to 240 minutes), and postprandially the capsule remained in the stomach for the duration of the

6-hour observation period. This study highlights the variability in pH and gastric motility that can occur even within a single breed of dog.

In some cases, interspecies differences in product bioavailability are a result of dissimilarity in GI pH. Because dogs have higher basal intestinal pH and lower basal acid secretion in the stomach than do people, these differences appeared to be responsible for dissimilarities in the bioavailability of indomethacin (19), metronidazole (20), and cinnarizine (21). In other situations, pH dependence appears to be related to product formulation rather than the active compound, as was the case when the relative bioavailability of two formulations of L-735,524, an HIV protease inhibitor, was different when tested in rats versus dogs (22). Two extended-release formulations of theophylline developed for humans did not show an extended-release profile for dogs (23). The elimination half-life of theophylline in dogs was only slightly longer for extended-release oral formulations compared with the IV formulation, which would not be considered sufficient for extended release. Theophylline from these capsules and tablets was rapidly and completely absorbed and had to be administered every 12 hours in dogs to maintain therapeutic plasma concentrations. These studies were performed in unfed dogs, in which intestinal pH is higher than humans. It is possible that different findings would occur if there had been comparisons with fed dogs.

## Differences between Dogs and People in Gastric Emptying

Particle dispersion is important for optimizing in vivo dissolution characteristics of low-solubility or slowly dissolving dosage forms. In humans, particle density has been demonstrated to significantly impact gastric emptying time, with heavier particles (e.g., $2.8 \mathrm{~g} / \mathrm{cm}^{3}$ ) being retained longer than less-dense particles (e.g., $1.5 \mathrm{~g} / \mathrm{cm}^{3}$ ) (24).

As is the case for humans, particle size affects gastric emptying time in veterinary species. In dogs, very small particles (e.g., $1 \mathrm{~g} / \mathrm{cm}^{3}, 1.6 \mathrm{~mm}$ diameter) empty more rapidly than do particles whose diameter exceeded 2.4 mm (25). Particles greater than 7 mm were not emptied from the canine stomach until 6-8 hours after food intake during a late phase of digestion (26). When one compares the gastric emptying of fasted humans, dogs, and minipigs, the order in rate of gastric emptying is dogs $>$ humans $>$ minipigs (27). These differences are observed both with tablets (enteric coated aspirin, diameter $5.8 \mathrm{~mm}, 1.24 \mathrm{~g} / \mathrm{cm}^{3}$ and barium sulfate tablets, 6.0 mm diameter, $1.52 \mathrm{~g} / \mathrm{cm}^{3}$ ) and granules (diameters $=0.1 \mathrm{~mm}$, density $=1.17$ and 1.34 $\mathrm{g} / \mathrm{cm}^{3}$ respectively). Tablets empty more rapidly than do granules in dogs, but they are cleared at a similar rate in humans. For example, in dogs, the absorption of drug from granules continued to occur even after 10 hrs postdose. In contrast, peak concentrations in humans occurred within about 5 hours after administration.

Despite the faster gastric emptying observed for dogs versus humans in the fasted state, food appeared to result in a substantially greater delay in the emptying of large particles
(tablets) and pellets in dogs as compared to humans (28). These effects of particle size were demonstrated with aspirin tablets. When human-labeled enteric coated aspirin tablets were administered to dogs (29) the tablets were poorly digested and retained in the stomach. These tablets (diameter 13 mm ) were coated with phthalate, which prevented digestion of the tablets. If animals were fed, the enteric coated tablets were more likely to be retained in the stomach, which was demonstrated by comparing once-daily feeding to thrice-daily feeding. However, neither particle size nor prandial state affects the rate of intestinal transit (30, 24).

Density influences gastric emptying, and particles with densities closest to that of the gastric contents are emptied the fastest. Very light or very heavy particles emptied with greater difficulty. In part, the slower emptying of large particles may be due to retropulsion induced by gastric contraction. Similarly, viscosity affects the rate of gastric emptying, and time to emptying and the volume of gastric contents increase in accordance with the viscosity of the ingesta (31).

Although much attention has been given to the impact of particle size, luminal fluid volume is also a critical variable in determining the time for gastric emptying. Studying gastric emptying in dogs, Gupta and Robinson (32) demonstrated that fluid volume markedly affects the gastric emptying of particles, regardless of particle density. Greater fluid volumes tended to increase the initial rate of gastric transit, although the time for $100 \%$ emptying of particles was completed more rapidly at smaller fluid volumes. Thus, viscosity, fluid volume, and particle size are all critical variables for ensuring that particle dispersion will occur within the GI tract (32).

## Differences between Dogs and People Regarding Intestinal Drug Absorption

The majority of orally administered drugs are absorbed via passive transcellular transport (33). Transcellular transport generally occurs when the compound is un-ionized, although there are examples of ionized molecules that are absorbed via transcellular processes $(34,35)$. Molecular movement across biological membranes is complicated by differences in membrane polarity, hydrophobicity, and density along the gastrointestinal tract (30). Most drugs are absorbed in the small intestine, and little absorption occurs in the colon. In addition to cellular membrane barriers to drug diffusion, significant impedance is also affected by the components of the gastric and intestinal mucous layer such as phosphatidyl choline, cholesterol, and linoleic acid, which retard the diffusion of small lipophilic molecules such as propranolol and hydrocortisone (37). Small hydrophilic molecules such as mannitol appear to freely diffuse through this lipoid barrier. Mucous gel-forming components, such as mucin and DNA, exert far less negative effects on the diffusion of lipophilic molecules. However, they may serve to block the diffusion of peptides and proteins.

For passive diffusion mechanisms, whether a drug is absorbed via paracellular or transcellular mechanisms is determined by both physicochemical and physiological factors.

Although the primary determinant is usually related to the drug's properties, the physiological characteristics of the animal, such as membrane diffusion surface, diffusion distance, and membrane permeability also can play a key role. Lennernas (38) noted that changing certain physiological characteristics such as the effective permeability of the membrane ( $P_{e f f}$ ) or the time available for drug absorption (intestinal residence time) can alter the fraction of drug absorbed.
In addition to passive mechanisms, active transport is important to the absorption of several compounds. Beta-lactam antibiotics, such as amoxicillin, as well as other amino $\beta$ lactams, are absorbed in the proximal small intestine via a carrier-mediated system that can be saturated (39). The car-rier-mediated absorption system for aminopenicillins is most likely the dipeptide carrier system (40). Both active and passive transport mechanisms may occur simultaneously for the same molecule. A determination of which mechanism(s) has the dominant role tends to be compound specific and may not be well predicted by in vitro systems (33). Nevertheless, it must be remembered that even active transport mechanisms require that the drug penetrate the intestinal cells via the transcellular route.
Different intestinal length and transit can influence comparative interspecies drug absorption. Intestinal transit time influences the absorption of drugs with limited mucosal permeability, carrier-mediated uptake, drugs subject to intestinal degradation, or products whose dissolution is the rate-limiting step for systemic absorption (41, 42). Dogs have a shorter absolute intestine length and shorter intestinal length to body length ratio compared to people. Corresponding to a shorter intestinal length in dogs is a shorter gastrointestinal transit time compared to that of people (2 hours vs. 4 hours, respectively). The impact of interspecies differences in GI transit time was underscored by the failure of Beagle dogs to adequately model the human bioavailability of acetaminophen sustained-release tablets (42), griseofulvin tablets (43), valproic acid (44), and ampicillin (45).

Intestinal transit time can be a critical determinant of product bioavailability for dissolution rate-limited formulations. In this regard, marked interspecies differences are again observed. For example, when fluid or particulate markers are administered via intragastric administration, the percent of dose excreted in the feces from hrs 0 to 24 in dogs and mature swine are $55 \%$ and $7 \%$ for the fluid markers, respectively, and $40 \%$ and $2 \%$ for particulate markers, respectively (46). Some of this difference can be accounted for by differences in intestinal length between pigs and dogs. The ratio of body length to intestine length is $1: 14$ and $1: 6$ in pigs and dogs, respectively (46). (Ratios for humans are similar to those of pigs.) Sustained-release preparations (eroding matrix) of the lipophilic compound propylthiouracil demonstrate very poor bioavailability in dogs because of the very short GI transit time. Generally, the product will reach the canine colon ( $2-3$ hours) before having had an opportunity to dissolve (47). Accordingly, we can expect that a low-solubility compound or a product for-
mulated to provide slow dissolution characteristics will tend to exhibit a poorer bioavailability in the canine compared to the swine.

For Class III drugs, intestinal permeability rather than in vitro dissolution is the rate-limiting step in drug absorption. For compounds exhibiting permeability-limited absorption, dissolution rate is generally less important than the rate of intestinal transit. Therefore, some formulations of Class III and IV compounds can have markedly different dissolution rates without affecting the blood concentration/time profile $(48,49)$.

Dogs can compensate for the shorter intestinal length with longer intestinal villi, which provide more surface area for absorption. Because they possess greater surface area for diffusion compared to people, dogs actually absorb many drugs orally much better than do humans (12). The bioavailability of small hydrophilic compounds tends to be greater in species such as dogs where both pore diameter and surface area tend to exceed that in humans (11).

The crypts, villi, and microvillae are critical for increasing the GI surface area. Highly permeable drugs generally are absorbed upon contact with the intestinal membrane, and the majority of absorption occurs at the villus tip (50). Because the radial surface area does not markedly differ across species, we would expect there to be minimal (if any) differences in the absorption of highly permeable compounds across animal species. Therefore, there is an assumption that the basic composition of intestinal epithelial cells is relatively similar across species, and intestinal membrane permeability will be comparable across target animal species (51). However, significant interspecies differences in intestinal absorptive surfaces can result from differences in the size, number of pores, and shape of the intestinal villi $(14,50)$. In addition, dogs have higher bile salt secretion, which increases the solubility of some poorly water-soluble drugs.

Paracellular absorption (between cells) also can be important, and interspecies differences in this pathway should not be discounted. Paracellular diffusion involves both diffusion and a convective volume flow through water-filled intercellular channels whose diameter is approximately $3-10 \AA$ in humans (38). Accordingly, the size and number of paracellular spaces influence the intestinal absorption of most hydrophilic compounds. This, in turn, is affected by the mucosal surface area and by cellular density (52). In humans, the small intestinal surface area for paracellular absorption is approximately $0.01 \%$ of the total membrane surface area. For this reason, unless the molecule is extremely small (e.g., <200 Da), paracellular transport will have a minor role in drug absorption (33).

Greater paracellular transport observed in dogs may be attributable to either interspecies differences in pore diameter or a difference in the number of pores on the intestinal villi, the latter reflecting differences in the effective surface area across regions of the small intestine (53). This difference in surface area for paracellular absorption may
impact the relative bioavailability of small hydrophilic (low-permeability, high-solubility) compounds such as furosemide (54). There was also greater bioavailability of large molecular weight polyethylene glycol (PEG) in dogs compared to rats, which has been ascribed to the presence of larger and more frequent pores in the canine intestine (55).
Permeability is not necessarily constant throughout the GI tract. Although for some compounds drug absorption appears to be site independent (56), for others it is site dependent (57). When drug absorption is site dependent, the availability of dissolved drug at the absorption site can be a limiting factor in product bioavailability. Across species, the location in the intestinal tract where the free drug is presented can markedly influence product absorption. In people, amoxicillin (and possibly other $\beta$-lactam antibiotics) is preferentially absorbed in the duodenum and jejunum but poorly absorbed from the more distal regions of the small intestine (ileum), and no absorption occurs distal to the ileum from the various segments of the large intestine (57). Differences in site-specific drug metabolism are known to occur across animal species (58). This may be a reason why dicloxacillin, although not an aminopenicillin, demonstrates only poor oral availability in dogs ( $23 \%$ ) (59) but much higher oral availability in people ( $50-85 \%$ ).

## FACTORS THAT AFFECT THE BCS CLASSIFICATION

Although differences in canine versus human GI characteristics, as described in this article, will clearly influence interspecies differences in drug and drug product bioavailability, the question remains whether these differences will also influence the BCS classification of a compound. Current guidelines for in vitro dissolution of oral dosage forms used in humans specify a specific volume into which the drug is dissolved. This volume is meant to simulate the volume of the stomach (for example, 900 mL ). This volume needs to be rescaled for dogs. However, dog breeds obviously cover a wide range of sizes from small toy breeds to the giant breeds. Because the administered dosage strength for dogs is related to body weight, this leads to questions of whether or not gastric volume scales in proportion to body size. To date, there are no data available upon which to resolve this question.

## Defining the Test Conditions

Because there may be a need to use a smaller volume for in vitro dissolution testing of oral products for dogs, the solubility of the product may not be extrapolated directly from human data. This uncertainty leads to the potential need to reconsider the BCS definition of solubility when applied to oral products for dogs. Based on the USP definition, solubility is defined as the extent to which molecules from a solid are removed from its surface by a solvent (60):

Very soluble
Freely soluble
Soluble
Sparingly soluble
Slightly soluble
Very slightly soluble
Practically insoluble

Less than 1 part solvent needed to dissolve 1 part solute From 1 to 10 parts solvent needed to dissolve 1 part solute From 10 to 30 parts solvent needed to dissolve 1 part solute From 30 to 100 parts solvent needed to dissolve 1 part solute From 100 to 1,000 parts solvent needed to dissolve 1 part solute From 1,000 to 10,000 parts solvent needed to dissolve 1 part solute More than 10,000 parts solvent needed to dissolve 1 part solute

FDA's Center for Drug Evaluation and Research (CDER) uses somewhat different definitions of solubility (7). One of the questions to resolve for developing BCS concepts for formulations in dogs is whether a USP-like definition of solubility is more appropriate than the definition currently used by CDER. For example, which definition (above) corresponds to "highly soluble?"

Similarly, the question of the pH of the medium must be addressed. Currently, a highly soluble drug is expected to dissolve under all pH conditions. However, we recognize that there are species-specific differences in gastric and intestinal pH that may not only affect drug solubility but also the conditions under which in vitro testing should occur. As discussed previously in this article, pH conditions in the stomach and intestine vary tremendously in dogs and cannot be extrapolated from humans.

## OBJECTIVES OF THE USP COMMITTEE

The USP Veterinary Drugs Expert Committee formed the ad hoc committee to organize and facilitate gathering data and information that will address many of the questions presented above. This committee intends to hold a scientific meeting that will bring together experts from veterinary academia, the pharmaceutical industry, and FDA to share information. The goals of the meeting are multifold. First, we would like to obtain public comment on the value of this initiative to veterinary medicine. If there is agreement that this initiative will have a positive impact on the practice and development of pharmaceuticals intended for use in dogs, we will explore answers to the questions that need to be addressed, define potential research initiatives, and determine strategies for moving this initiative forward.

## SPECIFIC QUESTIONS TO ADDRESS

During this time for public comment, we will explore the following questions that must be resolved before BCS principles can be extrapolated to facilitating pharmaceutical decisions in dogs:

## Solubility

Currently CDER defines a highly soluble drug as one in which the highest dosage strength completely dissolves in 250 mL or less of aqueous buffer, $\mathrm{pH} 1-7.5$. This volume reflects the gastric fluid volume of a fasted human after consuming an oral dose with 8 oz of liquid.

- In veterinary species, is 250 mL an appropriate volume for evaluating solubility? This question is critical because it is impractical to expect animal owners to encourage their pets to drink a cup of water after swallowing an oral medication.
- What is the volume of the canine stomach ( $\mathrm{mL} / \mathrm{kg}$ ) , and does canine gastric volume vary linearly with body weight?
- Is the dissolution pH range specified for humans appropriate for the canine situation?

## Permeability

Can we simply extrapolate permeability classification across animal species, or are there sufficient data available to consider interspecies differences in both transcellular and paracellular pathways?

- Are there canine-specific in vitro systems available?
- In the CDER guidance, in some cases highly permeable drugs can be defined by a systemic availability $(F)$ of $>90 \%$. In dogs, however, there is a greater tendency for high first-pass drug loss by comparison with that observed in humans. Highly permeable drugs may still have poor systemic availability due to first-pass metabolism. Therefore, how can we readily assess highly permeable drugs under these circumstances?
- When tests are properly validated (7), animal in situ intestinal perfusion data can be used to support human permeability classifications for passively absorbed compounds. (Caution is expressed with regard to potential misclassification when efflux transporters are present.) Is it feasible to have similar systems validated for developing permeability classifications for dogs?

## Dissolution

Are the currently available in vitro dissolution specifications appropriate for pharmaceutical formulations administered to dogs?

- Consider the differences in gastric emptying time: Dogs tend to have more rapid gastric emptying than humans. The magnitude of this difference is a function of particle size. In contrast, in some cases food appears to have a more profound effect on inhibiting gastric emptying compared to humans. Therefore, what is an appropriate time frame for defining a rapidly dissolving compound in dogs? Currently, CDER guidance on biowaivers (7) states that dissolution must be $\geq 85 \%$ for both products to be considered rapidly dissolving. For slower dissolu-
tion, the $f_{2}$ criterion must be applied. Will this criterion adequately cover the dog?
- What is the potential impact of differences in ionic composition of GI fluids?
- What is the appropriate pH range? Canine fasted gastric pH is reported to range from 3 to 8 . In most human subjects, fasted gastric pH values range from 1 to 3 .
- What is the appropriate agitation speed of the apparatus?

## NOMENCLATURE

This section includes supplements to the latest edition of the USP Dictionary of USAN and International Drug Names that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

## USP Dictionary of USAN and International Drug Names 2004 USP DICTIONARY SUPPLEMENT 4

IMPORTANT-Save this Supplement. This and all supplements appearing in $P F$ are needed to keep the 2004 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2004) edition will be included in the next complete edition of the Dictionary.

## New United States Adopted Names (USAN)

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of $P F$ for other new USAN to supplement the Dictionary main volume.

Abatacept [2004] (ab a ta' sept). $\left(\mathrm{C}_{1965} \mathrm{H}_{3080} \mathrm{~N}_{479} \mathrm{O}_{695} \mathrm{~S}_{16}\right)$. 1-25Oncostatin $M$ (human precursor) fusion protein with CTLA-4 (antigen) (human) fusion protein with immunoglobulin G1 (human heavy chain fragment). Molecular weight is approximately 92,000 daltons ( 46,000 daltons per chain). CAS-332348-12-6. INN. Treatment of autoimmune diseases such as rheumatoid arthritis (selective co-stimulation modulator; binds to the $B 7$ family of molecules expressed on antigen-presenting cells $(A P C)$ ). *     - glycosylation sites

Avanafil [2004] (av an' a fil). $\mathrm{C}_{23} \mathrm{H}_{26} \mathrm{ClN}_{7} \mathrm{O}_{3}$. 483.95. (1) 5-Pyrimidinecarboxamide, 4-[[(3-chloro-4-methoxyphenyl)meth-yl]amino]-2-[(2S)-2-(hydroxymethyl)-1-pyrrolidinyl]- N -(2-pyrimidinylmethyl)-; (2) 4-[(3-Chloro-4-methoxybenzyl)amino ]-2-[(2S)-2-(hydroxymethyl)pyrrolidin-1-yl]- $N$-(pyrimi-din-2-ylmethyl)pyrimidine-5-carboxamide; (3) (S)-4-(3-Chloro-4-methoxybenzylamino)-2-(2-hydroxymethylpyrroli-din-1-yl)- $N$-pyrimidin-2-ylmethyl-5-pyrimidinecarboxamide. CAS-330784-47-9. Treatment of erectile dysfunction. (Tanabe Seiyaku) $\triangleleft T A-1790$

Bemotrizinol [2004] (be moe' trye zi nol). $\mathrm{C}_{38} \mathrm{H}_{49} \mathrm{~N}_{3} \mathrm{O}_{5}$. 627.80. (1) Phenol, $2,2^{\prime}$-[6-(4-methoxyphenyl)-1,3,5-triazine-2,4-diyl]bis[5-[(2-ethylhexyl)oxy]; (2) 2,2'-[6-(4-Methoxyphe-nyl)-1,3,5-triazine-2,4-diyl]bis[5-[(2-ethylhexyl)oxy]phe-nol].CAS-187393-00-6. UVA absorber (intended for use as a topical sunscreen). Tinosorb S (Ciba Specialty Chemicals) [Note-The International Nomenclature Cosmetic Ingredient Name (INCI) for bemotrizinol is bis-ethylhexyloxyphenol methoxyphenol triazine.] $\triangleleft B E M T$; FAT 70'884

Bisoctrizole [2004] (bis ok' trye zole). $\mathrm{C}_{41} \mathrm{H}_{50} \mathrm{~N}_{6} \mathrm{O}_{2}$. 658.90. (1) Phenol, 2, 2'-methylenebis[6-( 2 H -benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)-; (2) 2,2'-Methylenebis[6-(2H-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)phenol]. CAS-103597-45-1. UVA absorber (intended for use as a topical sunscreen). Tinosorb M (Ciba Specialty Chemicals) [NoteThe International Nomenclature Cosmetic Ingredient Name (INCI) for bisoctrizole is methylene bis-benzotriazolyl tetramethylbutylphenol.] $\diamond M B B T$; FAT 75 '634

Canfosfamide Hydrochloride [2004] (kan fos' fa mide). $\mathrm{C}_{26} \mathrm{H}_{40} \mathrm{Cl}_{4} \mathrm{~N}_{5} \mathrm{O}_{10} \mathrm{PS} . \mathrm{HCl}$ 823.93. (1) Glycine, $\mathrm{L}-\gamma$-glutamyl-3-[[2-[[bis[bis(2-chloroethyl)amino]phosphinyl]oxy]ethyl]sul-fonyl]-L-alanyl-2-phenyl-, monohydrochloride, $(2 R)-;$ (2) (2S)-2-Amino-5-[[(1R)-1-[[[2-[[bis[bis(2-chloroethyl)amino ]phosphinyl]oxy]ethyl]sulfonyl]methyl $]-2-[[(R)$-carboxy-phenylmethyl]amino]-2-oxoethyl]amino]-5-oxopentanoic acid monohydrochloride. CAS-439943-59-6. Antineoplastic (activated by glutathione S-transferase (GST P1-1)). Telcyta (Tanabe, Japan) $\diamond$ TLK286; TER286

Deferasirox [2004] (de fer' a sir ox). $\mathrm{C}_{21} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{4}$. 373.36. (1) Benzoic acid, 4-[3,5-bis(2-hydroxyphenyl)-1H-1,2,4-triazol-1-yl]-; (2) 4-[3,5-Bis(2-hydroxyphenyl)-1H-1,2,4-triazol-1yl]benzoic acid. CAS-201530-41-8. INN. Treatment of iron overload (iron chelator). (Novartis Pharma AG, Switzerland) $\checkmark I C L 670 A$

Etalocib [2004] (e tal' oh kib). $\mathrm{C}_{33} \mathrm{H}_{33} \mathrm{FO}_{6}$. 544.61. (1) Benzoic acid, 2-[3-[3-[(5-ethyl-4'-fluoro-2-hydroxy[1,1'-biphenyl]-4-yl)oxy]propoxy]-2-propylphenoxy]-; (2) 2-[3-[3-[(5-Ethyl-4'-fluoro-2-hydroxybiphenyl-4-yl)oxy]propoxy]-2-propylphenoxy]benzoic acid. CAS-161172-51-6. Antineoplastic (inhibits formation of 5-LO, LTB ${ }_{4}, L T C_{4}$, and thromboxane $B_{2}\left(T x B_{2}\right)$; activates PPAR $\gamma$ nuclear receptors). (Lilly) $\checkmark$ LY293111

Iboctadekin [2004] (ib ok' ta de' kin). $\mathrm{C}_{801} \mathrm{H}_{1264} \mathrm{~N}_{212} \mathrm{O}_{252} \mathrm{~S}_{10}$ 18,217.00. (1) Human interleukin-18 (recombinant, expressed in Escherichia coli); (2) Purified iboctadekin is a recombinant human cytokine, interleukin-18 (IL-18) belonging to the IL-1 family, also known as interferon- $\gamma$-inducing factor (IGIF), expressed in a nonpathenogenic strain of Escherichia coli. Iboctadekin, consisting of 157 amino acids, is formed in
vivo following the activation of proIL-18 by caspase-4 and consists of a single polypeptide chain that is not glycosylated. The protein contains four cysteine residues present as free sulfhydryl groups. CAS-479198-61-3. Treatment of disseminated solid tumors. (GlaxoSmithKline) $\diamond S B-485232$

## Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Helath Organization (WHO).

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested par-
ties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

## Proposed International Nonproprietary Names

The following 50 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in WHO Drug Information, Vol 18, No. 1, 2004.

Any comments or formal objections to the proposed names should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

| Proposed INN | Therapeutic Indication | Proposed INN | Therapeutic Indication |
| :---: | :---: | :---: | :---: |
| Adecatumumab | Immunomodulator | Omigapil | Neuroprotective agent |
| Arfomoterol | Bronchodilator | Paclitaxel Poliglumex | Antineoplastic |
| Banoxatrone | Antineoplastic | Parathyroid Hormone | Hormone |
| Batabulin | Antineoplastic | Pasireotide | Inhibition of growth hormone |
| Becampanel | AMPA receptor antagonist |  | release |
| Beminafil | Vasodilator | Pelitrexol | Antineoplastic |
| Binodenoson | Adenosine receptor A agonist | Pruvanserin | Serotonin receptor antagonist |
| Cetrolizumab Pegol | Immипитodulator | Ramelteon | Selective melatonin receptor |
| Ciluprevir | Antiviral (HCV) |  | agonist |
| Clazosentan | Endothelin receptor antagonist | Ranibizumab | Immипотodulator |
| Clofarabine | Antineoplastic | Razaxaban | Anticoagulant |
| Daglutril | Antihypertensive (neutral en- | Resequinil | Psychostimulant |
| Dextofisopam | dopeptidase inhibitor) Anxiolytic | Rivaroxaban | Blood-coagulation factor Xa inhibitor |
| Doranidazole | Radiosensitizing agent | Sabarubicin | Antineoplastic, antibiotic |
| Ecopladib | Cytosolic phospholipase $A_{2}$ inhibitor | Solabegron Tadekinig Alfa | Beta $_{3}$-adrenoreceptor agonist Anti-inflammatory |
| Emapunil | Mitochondrial benzodiazepine receptor agonist) | Tanaproget | Nonsteroidal progesterone receptor agonist |
| Enzastaurin | Antineoplastic | Taneptacogin Alfa | Anticoagulant |
| Eslicarbazepine | Anticonvulsant | Taprizosin | Alpha $1_{1}$-adrenoreceptor antago- |
| Esoxybutynin | Antispasmodic |  | nist |
| Imidafenacin | Muscarin receptor antagonist | Teduglutide | Gastrointestinal functions nor- |
| Lumiliximab | Immunomodulator |  | malizing agent |
| Maropitant | Neurokinin $N K_{1}$ receptor antagonist | Tocilizumab Uliprisnil | Immunomodulator <br> Progesterone receptor modula- |
| Mubritinib | Antineoplastic |  | tor |
| Muraglitazar | Antidiabetic | Urtoxazumab | Immunomodulator |
| Nebentan | Endothelin receptor antagonist | Valtorcitabine | Antiviral |
| Netupitant | Neurokinin $N K_{1}$ receptor antagonist | Vildagliptin Zanolimumab | Antidiabetic agent Immunomodulator |

## Recommended International Nonproprietary Names

The following 58 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or
descriptions and the molecular formulae, appears in WHO Drug Information, Vol 18, No. 1, 2004.

| Recommended INN | Recommended INN | Recommended INN | Recommended INN |
| :--- | :--- | :--- | :--- |
| Adargileukin Alfa | Edotecarin | Icofungipen | Pritumumab |
| Alamifovir | Edratide | Icrocaptide | Ralfinamide |
| Aprinocarsen | Elsilimomab | Iferanserin | Rebimastat |
| Belimumab | Elvucitabine | Istradefylline | Segesterone |
| Cantuzumab Mertansine | Epitumomab Cituxetan | Ixabepilone | Semapimod |
| Cimicoxib | Eptotermin Alfa | Ladostigil | Sufugolix |
| Dabuzalgron | Exatecan Alideximer | Lapatinib | Tacapenem |
| Dacinostat | Exenatide | Lomeguatrib | Tafluprost |
| Dalbavancin | Firocoxib | Odiparcil | Talizumab |
| Deligoparin Sodium | Fispemifene | Omiganan | Technetium (99mTc) Nitrido- |
|  |  | Pactimibe | Tesofensine |
| Desvenlafaxine | Fluorescein Lisicol | Patupilone | Tifenazoxide |
| Dibotermin Alfa | Freselestat | Pertuzumab | Tisocalcitate |
| Diquafosol | Galiximab | Ulifloxacin |  |
| Disermolide | Hemoglobin Raffimer |  | Varenicline |
| Edifolgide |  |  |  |

## Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official United States Pharmacopeia or National Formulary. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the Federal Register of February 1988.

All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.
A formal procedure ${ }^{1}$ is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are sys-
tematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles ${ }^{2}$ and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.
Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

## Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event
that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

| Suggested INN | Category |
| :--- | :--- |
| Cedratide | Treatment for systemic lupus <br> Edratide <br> Leptidematosus |
| Sletide | Treatment of malignant glioma, <br> including glioblastoma multi- <br> forme and anaplastic astrocy- <br> toma |
| Cintredekin Besudotox | Antibiotic |
| Dalbavancin | Treatment of rheumatoid ar- <br> thritis and psoriasis, cutaneous |
| T-cell lymphoma |  |

| Suggested INN | Category |
| :--- | :--- |
| Iloprost | Treatment of pulmonary arter- <br> ial hypertension |
| Itrapide | Management of obesity in dogs |
| Mertriapide |  |
| Mitrapide |  |
| Mitratapide | Triapide |
| Lipofuridine |  |
| Orafluridine |  |
| Orudine |  |

| Suggested INN | Category |
| :--- | :--- |
| Olmesartan | Treatment of glaucoma; ocular <br> hypertension therapeutic agent <br> (angiotensin II receptor antag- <br> onist) |
| Pentadol | Analgesic |
| Tapentadol | Reversal agent for neuromus- <br> cular blocking agents |
| Procarogammadex <br> Pronagammadex <br> Sugammadex | Antiviral, prodrug of ribavirin |
| Vabavirin |  |

## INDEX

This is a cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).
[Note-This index covers Vol. 30 No. 1, pp. 1-381, Vol. 30 No. 2, pp. 383-755, Vol. 30 No. 3, pp. 757-1114, Vol. 30 No. 4, pp. 1115-1530, Vol. 30 No. 5, pp. 1533-1939, Vol. 30 No. 6, pp. 1941-23287

GENERAL NOTICES AND REQUIREMENTS (USP)
Significant Figures and Tolerances (USP) . . . . . . . . . . . 424, 79
General Chapters (USP) . . . . . . . . . . . . . . . . . . . . . . 424, 795
Tests and Assays (USP) . . . . . . . . . . . . . . . . . . 425, 795, 1571
Preservation, Packaging, Storage, and Labeling (USP) 428, 798, 1574

## MONOGRAPHS

Acepromazine Maleate Injection (USP) . . . . . . . . . . . . . 1161
Acesulfame Potassium (NF)
591
Acetaminophen Oral Solution (USP) 40
Acetaminophen Oral Suspension (USP) . . . . . . . . . . . . 40, 1579
Acetaminophen Extended-Release Tablets (USP) . . . . . . . 1161
Acetaminophen and Aspirin Tablets (USP)
Tablets Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Phenylpropanolamine (USP) . . . . 42
Capsules Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Oral Powder Containing at Least Three of the Following-
Acetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
44

Oral Solution Containing at Least Three of the FollowingAcetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)44

Tablets Containing at Least Three of the FollowingAcetaminophen and Salts of Chlorpheniramine,
Dextromethorphan, and Pseudoephedrine (USP)
Acetaminophen and Codeine Phosphate Capsules (USP) . . . 45
Acetaminophen and Codeine Phosphate Oral Solution (USP)46

Acetaminophen and Codeine Phosphate Oral Suspension (USP)46

Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution (USP)
Acetaminophen and Diphenhydramine Citrate Tablets (USP)47
Acetaminophen, Diphenhydramine Hydrochloride, and
Pseudoephedrine Hydrochloride Tablets (USP) . . . . . . . 47

Acetaminophen and Pseudoephedrine Hydrochloride Tablets (USP)
48

Acetohydroxamic Acid (USP) . . . . . . . . . . . . . . . . . . . . $\quad 1579$
Acetohydroxamic Acid Tablets (USP) . . . . . . . . . . . . . 49
Acetyltributyl Citrate (NF) . . . . . . . . . . . . . . . . . . . . 2078
Acetyltriethyl Citrate (NF) . . . . . . . . . . . . . . . . . . . 2079
Acyclovir (USP) . . . . . . . . . . . . . . . . . . 431, 802, 1143, 1580
Acyclovir Capsules (USP) . . . . . . . . . . . . . . . . . . . . 432, 1143
Acyclovir for Injection (USP) . . . . . . . . . . . . . . . . . 433, 1144
Acyclovir Ointment (USP) . . . . . . . . . . . . . . . . . . . . 434, 1145
Acyclovir Oral Suspension (USP) . . . . . . . . . . . . . . . . 435, 1145
Acyclovir Tablets (USP) . . . . . . . . . . . . . . . . . . . . . 436, 1145
Adipic Acid (NF) . . . . . . . . . . . . . . . . . . . . . . . . . . . 593, 1322
Albendazole Oral Suspension (USP) . . . . . . . . . . . . . . 1163

Alprazolam Tablets (USP) . . . . . . . . . . . . . . . . . . . . 51, 1582
Amantadine Hydrochloride Capsules (USP) ..... 51
Amifostine (USP) ..... 52, 1974
Amifostine for Injection (USP) ..... 1976
Aminopentamide Sulfate (USP) ..... 1163
Aminosalicylate Sodium Tablets (USP) ..... 53
Ammonio Methacrylate Copolymer (NF) ..... 1666
Ammonium Sulfate (NF) ..... 966, 1563
Amoxicillin Capsules (USP) ..... 1583
Amoxicillin and Clavulanate Potassium for Oral Suspension (USP) ..... 53
Amoxicillin Tablets (USP) ..... 1977
Amphetamine Sulfate (USP) ..... 443, 807
Amphetamine Sulfate Tablets (USP) ..... 54
Amphotericin B Lotion (USP) ..... 444
Amphotericin B Topical Emulsion (USP) ..... 445
Ampicillin Capsules (USP) ..... 445
55
Ampicillin Tablets (USP) ..... 56
Anecortave Acetate (USP) ..... 445
Anecortave Acetate Injectable Suspension (USP) ..... 447
Anticoagulant Citrate Dextrose Solution (USP) ..... 1583
Antithrombin III Human (USP) ..... 56
Arginine Hydrochloride (USP) ..... 449
Ascorbic Acid Tablets (USP) ..... 60
L-Asparagine (NF) ..... 205
Aspartic Acid (USP) ..... 1163
Aspirin (USP) ..... 1164
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules (USP) ..... 60
Atovaquone Oral Suspension (USP) ..... 449
Atracurium Besylate Injection (USP) ..... 450, 808
Avobenzone (USP) ..... 1164
Azithromycin (USP) ..... 450
Aztreonam (USP) ..... 61
Baclofen Tablets (USP) ..... 61
BCG Live (USP) ..... 452
Benzocaine (USP) ..... 809
Benzoyl Peroxide Gel (USP) ..... 455, 1165
Benzoyl Peroxide Lotion (USP) ..... 456
Benzoyl Peroxide Topical Emulsion (USP) ..... 456
Benzyl Alcohol (NF) ..... 690
Benzyl Benzoate Lotion (USP) ..... 457
Benzyl Benzoate Topical Emulsion (USP) ..... 457
Betadex (NF) ..... 1323
Betahistine Hydrochloride (USP) ..... 1584
Betamethasone Dipropionate Lotion (USP) ..... 458
Betamethasone Dipropionate Topical Emulsion (USP) ..... 459
Betamethasone Sodium Phosphate (USP) ..... 1166
Betamethasone Oral Solution (USP) ..... 460
Betamethasone Syrup (USP) ..... 460
Betamethasone Tablets (USP) ..... 62
Betamethasone Valerate Lotion (USP) ..... 461
Betamethasone Valerate Topical Emulsion (USP) ..... 461
Bethanechol Chloride (USP) ..... 1586
Bethanechol Chloride Tablets (USP) ..... 1587
Bethanechol Chloride (USP erratum) ..... 1155
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal, or Plastic Carriers (USP) ..... 63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous
Modes of Sterilization, Liquid Spore Suspensions (USP) ..... 66
Bismuth Subsalicylate Oral Suspension (USP) ..... 1166
Bismuth Subsalicylate Tablets (USP) ..... 1167
Bisoprolol Fumarate (USP erratum) ..... 417
Bisoprolol Fumarate Tablets (USP) ..... 1588
Bisoprolol Fumarate and Hydrochlorothiazide Tablets
(USP erratum) ..... 1155
Red Blood Cells (USP) ..... 69
Whole Blood (USP) ..... 76
Bretylium Tosylate in Dextrose Injection (USP) ..... 1589
Brompheniramine Maleate and Pseudoephedrine Sulfate Oral
Solution (USP) ..... 79

## USP CATALOG

## New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

| Cat. <br> No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1005706 | Glacial Acetic Acid ( $1.5 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) (AS) | F0D002 | \$156 |
| 1012768 | Alcohol (1.2 mL/ampule; 5 ampules) | F0D030 | \$156 |
| 1012772 | Dehydrated Alcohol ( 1.2 mL /ampule; 5 ampules) | F0D031 | \$156 |
| 1012699 | Alcohol Determination-Acetonitrile ( $5 \mathrm{~mL} /$ ampule; 5 ampules) | F0C419 | \$156 |
| 1012688 | Alcohol Determination-Alcohol ( $5 \mathrm{~mL} /$ ampule; 5 ampules) | F0C399 | \$156 |
| 1029501 | Amlodipine Besylate ( 200 mg ) | F0D167 | \$156 |
| 1029942 | Ammonium Carbonate (2 g) (AS) | F0D102 | \$156 |
| 1048641 | Benazepril Related Compound C $(50 \mathrm{mg})$ | F0C425 | \$487 |
| 1071439 | Positive Bioreaction (3 strips; $10 \mathrm{~cm} \times 1$ cm) | F0D014 | \$325 |
| 1076206 | Powdered Black Cohosh Extract (1.5 g) | F0D086 | \$520 |
| 1076341 | Boric Acid (1 g) (AS) | F0D036 | \$200 |
| 1082708 | Butylated Hydroxytoluene ( 500 mg ) (AS) | F0D122 | \$156 |
| 1086334 | Calcium Acetate (1 g) (AS) | F0D156 | \$156 |
| 1086403 | Calcium Carbonate (1 g) (AS) | F0D099 | \$156 |
| 1086436 | Calcium Chloride (1 g) (AS) | F0D153 | \$156 |
| 1086855 | Calcium Hydroxide (1 g) (AS) | F0D168 | \$156 |
| 1087406 | Calcium Sulfate (1 g) (AS) | F0D236 | \$156 |
| 1087701 | Candelilla Wax (250 mg) | F0D123 | \$156 |
| 1091505 | $\begin{array}{\|l} \hline \begin{array}{l} \text { Caprylocaproyl Polyoxylglycerides } \\ (200 \mathrm{mg}) \end{array} \\ \hline \end{array}$ | F0C312 | \$175 |
| 1098118 | Cefpiramide ( 300 mg ) | F0C203 | \$156 |
| 1098027 | Cefpodoxime Proxetil ( 350 mg ) | F0C192 | \$156 |
| 1098322 | Cellaburate ( 350 mg ) (Cellulose Acetate Butyrate) | F0D220 | \$156 |
| 1105009 | Powdered Chaste Tree Extract (1.5 g) | F0C406 | \$520 |
| 1111307 | Chlorhexidine Related Compounds $(50 \mathrm{mg})$ | F0D017 | \$487 |
| 1115545 | Chlorogenic Acid ( 50 mg ) | F0C420 | \$156 |
| 1140393 | Clonidine ( 200 mg ) | F0C401 | \$156 |
| 1140418 | Clonidine Related Compound A $(25 \mathrm{mg})$ | F0C373 | \$487 |
| 1140429 | Clonidine Related Compound B ( 25 mg ) | F0C403 | \$487 |
| 1148806 | Corn Oil (1 g) (AS) | F0D181 | \$156 |
| 1150207 | Cottonseed Oil (1 g) (AS) | F0D173 | \$156 |
| 1152701 | Cyclandelate ( 200 mg ) | F0C384 | \$156 |
| 1187080 | Dibutyl Phthalate (200 mg) | F0D125 | \$156 |
| 1231728 | Powdered Echinacea Purpurea Extract (1 g) | F0D018 | \$520 |
| 1231706 | Powdered Echinacea Angustifolia <br> Extract (1 g) | F0D019 | \$520 |
| 1269414 | Fenbendazole Related Compound A ( 30 mg ) | F0D009 | \$487 |
| 1269425 | Fenbendazole Related Compound B ( 30 mg ) | F0D008 | \$487 |
| 1270355 | Ferrous Sulfate (1.5 g) (AS) | F0D196 | \$156 |
| 1272204 | Fludarabine Phosphate ( 300 mg ) | F0C374 | \$156 |

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1288463 | Gemcitabine Hydrochloride ( 200 mg ) | F0D037 | \$156 |
| 1305507 | 2E, 4E-Hexadienoic Acid Isobutylamide $(25 \mathrm{mg})$ | F0C353 | \$540 |
| 1311306 | Homopolymer Polypropylene (3 Strips) | F0C096 | \$156 |
| 1349014 | Isoflurane Related Compound A (0.1 mL ) | F0C232 | \$487 |
| 1349025 | Isoflurane Related Compound B (0.1 mL ) | F0C233 | \$487 |
| 1356698 | Lactase (200 mg) | F0D032 | \$156 |
| 1356847 | Lamivudine Resolution Mixture A $(10 \mathrm{mg})$ | F0D024 | \$487 |
| 1356950 | Lauroyl Polyoxylglycerides ( 500 mg ) (AS) | F0D020 | \$156 |
| 1358503 | Leuprolide Acetate (200 mg) | F0C430 | \$1,525 |
| 1367708 | Linoleoyl Polyoxylglycerides (100 mg) | F0C283 | \$156 |
| 1370270 | Loratadine ( 200 mg ) | F0C414 | \$260 |
| 1370280 | Loratadine Related Compound A ( 15 mg ) | F0D229 | \$487 |
| 1370291 | Loratadine Related Compound B ( 15 mg ) | F0D230 | \$487 |
| 1374248 | Magnesium Chloride (1 g) (AS) | F0D157 | \$156 |
| 1374260 | Magnesium Hydroxide (1 g) (AS) | F0D158 | \$156 |
| 1374361 | Magnesium Sulfate (1 g) (AS) | F0D160 | \$156 |
| 1375127 | Manganese Chloride (1 g) (AS) | F0D150 | \$156 |
| 1375149 | Manganese Sulfate (1 g) (AS) | F0D151 | \$156 |
| 1378012 | Medroxyprogesterone Acetate Related Compound A ( 25 mg ) | F0C427 | \$500 |
| 1434011 | Methylphenidate Hydrochloride Erythro Isomer Solution ClI ( 0.5 mL ) | F0C368 | \$560 |
| 1441243 | Metoprolol Related Compound B ( 50 mg ) | F0C377 | \$520 |
| 1441254 | Metoprolol Related Compound C ( 20 mg ) | F0C344 | \$520 |
| 1441265 | Metoprolol Related Compound D ( 50 mg ) | F0C378 | \$520 |
| 1441298 | Metoprolol Succinate ( 200 mg ) | F0C415 | \$156 |
| 1444279 | Mirtazapine ( 350 mg ) | F0D155 | \$800 |
| 1445211 | Mitoxantrone System Suitability Mixture ( 0.3 mg ) | F0D010 | \$500 |
| 1449530 | Nabumetone Related Compound A $(15 \mathrm{mg})$ | F0D165 | \$487 |
| 1457469 | Naratriptan Hydrochloride (125 mg) | F0C360 | \$208 |
| 1460703 | Nevirapine Anhydrous ( 100 mg ) | F0D159 | \$156 |
| 1460714 | Nevirapine Hemihydrate ( 100 mg ) | F0D034 | \$156 |
| 1460725 | Nevirapine Related Compound A $(15 \mathrm{mg})$ | F0D035 | \$487 |
| 1460736 | Nevirapine Related Compound B $(15 \mathrm{mg})$ | F0D033 | \$487 |
| 1478152 | Oleoyl Polyoxylglycerides (100 mg) | F0C313 | \$156 |
| 1478630 | Ondansetron Resolution Mixture ( 50 mg ) | F0D242 | \$487 |
| 1485125 | Oxybutynin Related Compound B ( 20 mg ) | F0D061 | \$487 |
| 1485136 | ```Oxybutynin Related Compound C (20 mg)``` | F0D062 | \$487 |
| 1492040 | Palm Oil (1 g) (AS) | F0D179 | \$156 |
| 1500262 | Paroxetine Related Compound E Mixture ( 25 mg ) | F0D225 | \$487 |
| 1500273 | Paroxetine Related Compound F $(10 \mathrm{mg})$ | F0D237 | \$487 |
| 1500284 | Paroxetine Related Compound G ( 10 mg ) | F0D110 | \$487 |

New Items at a Glance (Continued)

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1525707 | Phenothiazine ( 500 mg ) (AS) | F0D231 | \$156 |
| 1547925 | Polysorbate $20(2 \mathrm{~g})$ (AS) | F0D130 | \$156 |
| 1547936 | Polysorbate 40 (2 g) (AS) | F0D204 | \$156 |
| 1547947 | Polysorbate $60(2 \mathrm{~g})$ (AS) | F0D131 | \$156 |
| 1547969 | Polysorbate $80(2 \mathrm{~g})$ (AS) | F0D132 | \$156 |
| 1548101 | Potassium Benzoate (1 g) (AS) | F0D161 | \$156 |
| 1548134 | Potassium Bicarbonate (1 g) (AS) | F0D074 | \$156 |
| 1548167 | Potassium Carbonate (1 g) (AS) | F0D075 | \$156 |
| 1548190 | Potassium Chloride (1 g) (AS) | F0D127 | \$156 |
| 1548280 | Potassium Iodide (1 g) (AS) | F0D078 | \$156 |
| 1572208 | Propionic Acid ( $1.5 \mathrm{~mL} /$ ampule; 3 ampules) (AS) | F0D029 | \$156 |
| 1601102 | Residual Solvents Mixture - Class 1 ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C407 | \$156 |
| 1601146 | Residual Solvent Class 1 - Benzene ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C408 | \$156 |
| 1601168 | Residual Solvent Class 1 - Carbon Tetrachloride ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C409 | \$156 |
| 1601180 | Residual Solvent Class 1-1,2Dichloroethane ( $1.2 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) | F0C412 | \$156 |
| 1601204 | Residual Solvent Class 1-1,1Dichloroethene ( $1.2 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) | F0C411 | \$156 |
| 1601226 | Residual Solvent Class 1-1,1,1Trichloroethane ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C410 | \$156 |
| 1601281 | Residual Solvents Class 2 - Mixture A ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D051 | \$156 |
| 1601306 | Residual Solvent Class 2 - Mixture C ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D182 | \$156 |
| 1601340 | Residual Solvent Class 2 - Acetonitrile ( $1.2 \mathrm{~mL} / \mathrm{ampule} ; 3$ ampules) | F0D049 | \$156 |
| 1601361 | Residual Solvent Class 2 Chlorobenzene ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D048 | \$156 |
| 1601383 | Residual Solvent Class 2 - Chloroform ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D186 | \$156 |
| 1601408 | Residual Solvent Class 2 - Cyclohexane ( $1.2 \mathrm{~mL} / \mathrm{ampule} ; 3$ ampules) | F0D047 | \$156 |
| 1601420 | Residual Solvent Class 2-1,2Dichloroethene ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D040 | \$156 |
| 1601463 | Residual Solvent Class 2-1,2- <br> Dimethoxyethane ( $1.2 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) | F0D185 | \$156 |
| 1601485 | Residual Solvent Class 2 - $\mathrm{N}, \mathrm{N}$ Dimethylacetamide ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D169 | \$156 |
| 1601500 | Residual Solvent Class 2 - N,N- <br> Dimethylformamide ( $1.2 \mathrm{~mL} /$ ampule; <br> 3 ampules) | F0D189 | \$156 |
| 1601521 | Residual Solvent Class 2-1,4-Dioxane ( $1.2 \mathrm{~mL} / \mathrm{ampule} ; 3$ ampules) | F0D050 | \$156 |

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1601543 | Residual Solvent Class 2-2Ethoxyethanol ( $1.2 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) | F0D195 | \$156 |
| 1601565 | Residual Solvent Class 2 - Ethylene Glycol ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D191 | \$156 |
| 1601587 | Residual Solvent Class 2 - Formamide ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D188 | \$156 |
| 1601623 | Residual Solvent Class 2 - Methanol ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D045 | \$156 |
| 1601645 | Residual Solvent Class 2-2Methoxyethanol ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D194 | \$156 |
| 1601667 | Residual Solvent Class 2 - <br> Methylbutylketone ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D202 | \$156 |
| 1601689 | Residual Solvent Class 2 - <br> Methylcyclohexane ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D044 | \$156 |
| 1601441 | Residual Solvent Class 2 - Methylene Chloride ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D046 | \$156 |
| 1601703 | Residual Solvent Class 2 - NMethylpyrrolidone ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D183 | \$156 |
| 1601725 | Residual Solvent Class 2 - Nitromethane ( $1.2 \mathrm{~mL} / \mathrm{ampule} ; 3$ ampules) | F0D210 | \$156 |
| 1601747 | Residual Solvent Class 2 - Pyridine ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D215 | \$156 |
| 1601769 | Residual Solvent Class 2 - Sulfolane ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D187 | \$156 |
| 1601770 | Residual Solvent Class 2 Tetrahydrofuran ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D043 | \$156 |
| 1601780 | Residual Solvent Class 2 - Tetralin ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D228 | \$156 |
| 1601805 | Residual Solvent Class 2 - Toluene ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0D042 | \$156 |
| 1601827 | Residual Solvent Class 2 - <br> Trichloroethylene ( $1.2 \mathrm{~mL} / \mathrm{ampule}$; 3 ampules) | F0D221 | \$156 |
| 1601849 | Residual Solvent Class 2 - Xylenes ( $1.2 \mathrm{~mL} / \mathrm{ampule} ; 3$ ampules) | F0D041 | \$156 |
| 1613407 | Sodium Acetate (1 g) (AS) | F0D083 | \$156 |
| 1613757 | Sodium Carbonate Anhydrous (1 g) (AS) | F0D100 | \$156 |
| 1613859 | Sodium Citrate (1 g) (AS) | F0D172 | \$156 |
| 1614396 | Sodium Metabisulfite (1 g) (AS) | F0D111 | \$156 |
| 1614454 | Sodium Nitrite (1 g) (AS) | F0D117 | \$156 |
| 1614807 | Sodium Sulfate Anhydrous (1 g) (AS) | F0D112 | \$156 |
| 1615107 | Sodium Thiosulfate (1 g) (AS) | F0D178 | \$156 |
| 1667585 | Titanium Dioxide (1 g) (AS) | F0D079 | \$156 |
| 1708762 | Valsartan ( 350 mg ) | F0C147 | \$156 |
| 1711155 | Vecuronium Bromide ( 50 mg ) | F0C367 | \$156 |
| 1724747 | Zinc Oxide (2 g) (AS) | F0D170 | \$156 |
| 1724769 | Zinc Sulfate (1 g) (AS) | F0D133 | \$156 |

## ORDERING DIRECT FROM THE US PHARMACOPEIA

## Sending Your Order

## STEP \#1: PREPARE YOUR ORDER USING YOUR COMPANY'S PURCHASE ORDER, A USP ORDER FORM, OR A FORMAL USP PRICE QUOTE FROM CUSTOMER SERVICE,

- In all correspondence, refer to your Purchase Order number, your USP Customer Number, and/or USP Price Quote number.
- Purchase Order numbers are required for all credit term orders.

## STEP \#2: GIVE USP THE DELIVERY CONTACT NAME AND TELEPHONE NUMBER

- Having a specific recipient on your order will increase delivery speed.
- A contact name is required for all publications and subscriptions orders.
- Although not required, providing a contact email address will expedite communication of problems or issues with your order, especially internationally.

## STEP \#3: USE THE MOST EFFICIENT PAYMENT METHOD YOU CAN

1. Valid Visa, Master Card, or American Express
2. Credit terms with USP USP will extend an automatic credit limit of US\$2000 for all customers in USA and Canada. All others can apply for credit terms by sending an e-mail to our Accounting Department at em@usp.org or calling 301-881-0666 x 8177.
3. Check drawn on a USA Bank
(USP Rating: q q )
4. Wire transfer
(USP Rating: q )

Use only if necessary. If you must, please include your USP Quote number and/or customer number on the wire transmission information. Please fax a copy of your wire receipt and order to USP once the wire has been sent so we know to expect it.
Customers are responsible for paying all bank fees for wire transfers.
STEP \#4: SEND USP YOUR ORDER QUICKLY AND SECURELY

1. USP Store at http://store.usp.org. (USP Rating: q q q q q)

As soon as you click the "confirm and submit order" button, we have it, and you will get an immediate confirmation by email.
2. Telephone at 301-881-0666 or 800-227-8772. (USP Rating: q q q q ) Customer Service Rep will take your order M-F from 8:30 AM - 5:00 PM EST.
3. Fax to 301-816-8148. (USP Rating: q q q ) USP will confirm your order within one business day by return fax.
4. Mail to 12601 Twinbrook Pkwy, Rockville, MD 20852. (USP Rating: $q$ ) USP does not recommend ordering by mail when you require fast processing.

## USP Ordering and Return Policies

- USP Reference Standards may not be returned for refund or exchange.
- USP publications and subscription are returnable within 30 days from the date of invoicing. USP Electronic Subscriptions can be cancelled within 30 days of activation for a full refund minus shipping charges.
- Prices and package sizes are subject to change without notice. USP will honor all USP Price Quotes through the expiration date on the quote.
- Customers are financially responsible for duplicate orders in the following cases:
- Confirming orders not clearly marked as confirming that are sent to USP.
- Submitting the same order multiple times (i.e., via phone, fax, email, USP Store, mail, or any combination thereof.)
- Orders that are put on credit hold by USP due to either poor credit record with USP or exceeding the credit limit established by USP must be cleared by customers within 14 days. Otherwise, these orders are automatically cancelled and you must reorder.

## USP Backorder Fulfillment Policy

- USP will automatically ship any backorder that becomes available within 30 days of the order date.
- After 30 days, customers will get a Notice of Availability (NOA). Customers then have 45 days to respond to the notice or the order will be automatically cancelled.

## Problems, Concerns, or Technical Support

USP has a well trained staff for order and product support.

| Order Issues, Concerns, or Suggestions | Reference Standards Technical Service |

## Shipping

- USP does not ship any products to post office boxes. Please include a street address or your order will be returned to you.
- International customers are responsible for paying all customs duties, taxes, or tariffs levied for importation of USP products.
- Customers can request shipment on cold packs for an additional $\$ 25.00$ charge
- Customers can request special, guaranteed, same-day shipping for an additional $\$ 75.00$ charge.

## Shipping Carriers

USP uses DHL as the default shipping carrier because we have negotiated favorable shipping rates with DHL, which we pass on to our customers. However, we use alternative carriers for locations to which there is no DHL service, as listed below. Customers can choose their own carrier by giving USP their DHL, UPS, or FedEx account number when ordering.

| Location | Shipper | Products |
| :--- | :--- | :--- |
| Algeria | Commercial Carrier Door to Airport | All Products |
| Puerto Rico | FedEx | Reference Standards |
| Puerto Rico | UPS (Blue or Red Label) | Publications |

## Preferred carriers for dangerous goods

Reference Standards that have been classified as dangerous goods have specific requirements for shipping. Please consult the table below to find the preferred carrier for any order that contains a Reference Standard that has been classified as a dangerous good by the United Nations.

| DHL | FedEx International | UPS <br> (Blue or Red Label) | Commercial Carrier Door to Airport |
| :---: | :---: | :---: | :---: |
| Australia, Austria, Belgium, Bulgaria, China, Czech Republic, Denmark, Estonia, Ethiopia, Finland, France, Germany, Great Britain, Greece, Hong Kong, Hungary, Iceland, India, Iraq, Ireland, Italy, Japan, South Korea, Latvia, Libya, Lithuania, Luxembourg, Malaysia, Morocco, Netherlands, New Zealand, Norway, Philippines, Poland, Portugal, Singapore, Solvakia, Slovenia, Spain, Sweden, Switzerland, Taiwan, Thailand, Turkey, United States | United Arab Emirates, Armenia, Argentina, American Samoa, Bosnia \& Herzegovina, Barbados, Bangladesh, Benin, Bolivia, Canada, Costa Rica, Cyprus, Dominican Republic, Ecuador, Guam, Guyana, Honduras, Indonesia, Israel, Jamaica, Kenya, Kuwait, Sri Lanka, Moldova, Macedonia, Macau, Malta, Namibia, Oman, Panama, Pakistan, Palestinian Territory, Paraguay, Qatar, Saudi Arabia, Senegal, El Salvador, Trinidad \& Tobago, Ukraine, Uganda, Uruguay, Venezuela, Virgin Island (U.S.), Yemen, Yugoslavia, South Africa, Zimbabwe | Puerto Rico | Algeria, Brazil, Chile, Croatia, Colombia, Fiji, Guatemala, Egypt, Jordan, Lebanon, Mexico, Peru, Romania, Russia, |

## Special Instructions for International Customers

- Ordering direct from USP or an authorized distributor is the fastest method to get results: Using product resellers, such as book or chemical supply houses, can add up to eight weeks to your order fulfillment time. Typically, USP processes orders for all our customers in less than two business days. USP cannot control how long a reseller keeps your order before giving it to USP for processing or how long they hold the product before passing it along to you.
- Apply for credit terms with USP: Many international customers must prepay, because they have not applied for payment terms with USP. Having payment terms allows you to place orders using your company purchase order and pay once you get USP's invoice.
- If you must prepay, please use a valid credit card: Credit cards are the easiest payment method. Avoid checks or wire transfers, if possible.
- If you must prepay, get an Official USP Price Quote before ordering: Having an Official USP Price Quote allows you to arrange payment with the security of knowing the price will not change for 45 days. Also please reference the USP Quote number on all checks, wires, and/or credit card orders. This will improve accuracy and shorten order processing time.
- Customs Clearance: USP does not offer customs clearance services. We suggest that you arrange for a customs broker to facilitate clearance or allow DHL to clear customs for you. Customs clearance is often the longest part of your product delivery time. Customers are responsible for paying all customs duties, taxes, or tariffs levied for bringing USP products into your country.
- Language: USP has a diverse workforce. If you are having trouble communicating in English, please ask your customer service representative to find a USP employee who can translate. USP Customer Service has English and Spanish language capabilities on staff.
- Problems or Issues: USP has regional account managers who can support your product inquiries, technical questions, or needs for general information in addition to those listed above.

Dennis Hall - Senior International Account Manager - Europe

## CONTROLLED SUBSTANCE ORDERS - ITEMS REGULATED BY THE U.S. DRUG ENFORCEMENT ADMINISTRATION (DEA)

## DEA REQUIREMENTS FOR ORDERS SHIPPED WITHIN UNITED STATES

List Chemicals: Below is a list of Reference Standards categorized by the DEA as List Chemicals

| Catalog \# | Product Description |
| :--- | :--- |
| 1202005 | Dihydroergotamine Mesylate $(250 \mathrm{mg})$ |
| 1236007 | Ephedrine Sulfate $(200 \mathrm{mg})$ |
| 1240004 | Ergonovine Maleate $(100 \mathrm{mg})$ |
| 1241506 | Ergotamine Tartrate $(150 \mathrm{mg})$ |
| 1241550 | Ergotaminine $(100 \mathrm{mg})$ |
| 1430000 | Methylergonovine Maleate $(50 \mathrm{mg})$ |
| 1533909 | Phenylpropanolamine Bitartrate $(100 \mathrm{mg})$ |
| 1534005 | Phenylpropanolamine Hydrochloride $(250 \mathrm{mg})$ |
| 1581005 | Pseudoephedrine Hydrochloride $(125 \mathrm{mg})$ |
| 1581504 | Pseudoephedrine Sulfate $(200 \mathrm{mg})$ |

- The DEA requires that USP have on file one of the following to fulfill List Chemical Orders:
- Copy of Customers' current DEA Registration
- Letter on company letterhead stating the intended use of the list chemical for each order placed

DEA Schedule I and II: A list of all DEA Controlled Substances is found at the end of the USP Reference Standards product listing.

- The DEA requires the following for Schedule I and II orders:
- Orders in writing.
- Copy of Customers' current DEA Registration on file with USP
- DEA form 222-C, properly completed.

DEA Schedule III, IV, and V: A list of all DEA Controlled Substances is found at the end of the USP Reference Standards product listing.

- The DEA requires the following for Schedule III, IV, and V orders:
- Copy of Customers' current DEA Registration on file with USP

## DEA REQUIREMENTS FOR ORDERS SHIPPED OUTSIDE UNITED STATES

To facilitate efficient and correct ordering, please contact Julie Smith at (301) 816-8164 or Liz Eslinger at (301) 816-8626 or email foreigncontrols@usp.org.

## FEES AND ORDERING

1. Add $\$ 25.00$ to all unit prices for all DEA Controlled Substances and List Chemicals shipped outside the Untied States.
2. The shipping charge for all DEA Controlled Substances shipped outside the United States is $\$ 220.00$ per order.
3. Order for controlled substances to be shipped outside the United States must include the following:
a. Full payment (See Step \#3: Payment Methods above) or Purchase Order for customers with approved credit terms from USP.
b. An import permit (in English or with an English translation attached) valid for six months from the date of its receipt by USP Customer Service.
c. A statement of non-reexport and use for medical or scientific purposes (in English or with an English Translation attached).

USP cannot ship controlled substances outside the United States without an export permit. While it typically takes 6-10 weeks to get the permit from the DEA, USP has no control over the time in which permits are issued.

Upon receiving the Export Permit from the DEA, USP completes the order process and ships the order in 1-3 days via our controlled substance freight forwarder (Door-to-Airport).

## Special Instructions for Mexican Customers

In addition to the DEA processing period:

1. Add one week for USP to obtain a certificate from the Mexican Embassy authorizing the shipment to enter Mexico.
2. Customers must pay an additional $\$ 114$ to cover the cost of the fee charged by the Mexican Embassy for this certificate.

## CHROMATOGRAPHIC REAGENTS

## Chromatographic Reagents Used in USP-NF and <br> Pharmacopeial Forum

November-December 2004

    ${ }^{23}$ Available as IC-Pak C M/D from Waters Corp. (www.waters.com).

[^19]:    ${ }^{16}$ A suitable grade is available commercially as "SP2100/0.1\% Carbowax 1500 " from Supelco, Inc., Supelco Park, Bellefonte, PA 16823.
    ${ }^{17}$ A suitablegrade is avilablecommercially as "Opima-Delta_3" from Machery-Nagel, Ine., 215 River Vale Read, River Vale, NJ 07675.
    ${ }^{\mathrm{e}}$ A suitable grade is available commercially as Famewax from Restek.
    ${ }^{18}$ Unless otherwise specified in the individual monograph, silanized support is intended.

[^20]:    ${ }^{19}$ Commercially available as SP1500 on Carbopack B from Supelco.

[^21]:    ${ }^{1}$ Multiple measurements (or, equivalently, the experimental errors associated with the multiple measurements) are independent from one another when they can be assumed to represent a random sample from the population. In such a sample, the magnitude of one measurement is not influenced by, nor does it influence the magnitude of, any other measurement. Lack of independence implies the measurements are correlated over time or space. Consider the example of a 96 -well microtiter plate. Suppose that whenever the unknown causes that produce experimental error lead to a low result (negative error) when a sample is placed in the first column and these same causes would also lead to a low result for a sample placed in the second column, then the two resulting measurements would not be statistically independent. One way to avoid such possibilities would be to randomize the placement of the samples on the plate.

[^22]:    ${ }^{5}$ In general, the sample size required to compare the precision of two methods will be greater than that required to compare the accuracy of the methods.

[^23]:    ${ }^{7}$ This could be calculated using a computer spreadsheet. For example, in Microsoft ${ }^{\circledR}$ Excel the formula would be: FDIST((R/A)*FINV (alpha, $n-1, n-1$ ), $n-1, n-1$ ), where $R$ is the ratio of variances at which to determine power (e.g., $\mathrm{R}=1$, which was the value chosen in the power calculations provided in the above table) and A is the maximum ratio for acceptance (e.g., $\mathrm{A}=4$ ). Alpha is the significance level, typically 0.05 .

[^24]:    ${ }^{8}$ When testing equivalence, a $5 \%$ level test corresponds to a $90 \%$ confidence interval.

[^25]:    ${ }^{1}$ Sample mean is based on the 15 data points presented in Table 1.

[^26]:    * CIP 100; available from Steris Corporation, Mentor, Ohio, 44060-1824.

[^47]:    9-Fluorenylmethyl chloroformate solution-Transfer 200 me of 9 -flurenylmethyl chloreformate to a 50 mL volt metric flask, dilute with acetonitrile to volume, and mix. Prepare fresh just prior to use. [NOTE-This solution contains about 4 mg of 9 flurrenylmethyl chloroformate per

[^48]:    ${ }^{1}$ Four tests for Graftskin are specified: Histological characterization, Gene expression profile, Barrier integrity assessment, and Metabolic activity assessment. The histological examination of the 3-dimensional organotypic structure demonstrates control of the Graftskin manufacturing process and shows a bilayered construct with a dermal matrix, differentiated epidermis, and developed stratum corneum. Reference photomicrographs, representing examples of both passing and failing Graftskin units, are specified to assist in ascertaining quality. PCR analysis of the gene expression profile of a finished Graftskin unit demonstrates that its keratinocytes and fibroblasts are producing cytokines that have been documented to influence wound healing. The test also demonstrates cell purity. Graftskin is positive for the gene expression of Interleukin-1 $\alpha$, Platelet-derived growth factor, and Transforming growth factor- $\beta 1$. Graftskin is negative for the gene expression of Interleukin-4, which is produced neither by fibroblasts nor keratinocytes. Glyceral-dehyde-3-phosphate dehydrogenase is run with this assay as a housekeeping gene, and Graftskin is positive for the expression of this gene. The Barrier integrity assessment demonstrates the presence of a stratum corneum and the functionality of the epithelium in Graftskin. The purpose of the Metabolic activity assessment is to demonstrate cellular viability of the article.

[^49]:    ${ }^{2}$ A microwave oven suitable for histological preparation can be obtained from Energy Beam Sciences, Inc., 11 Bowles Road, P.O. Box 468, Agawam, MA.

[^170]:    $\langle 601\rangle$ Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers, USP 27 page 2253 and page 1176 of PF 29(4) [July-Aug. 2003]. The previously published revisions to this chapter, targeted for adoption in USP 28-NF 23, include the proposed title change to Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers and the addition of Delivered-Dose Uniformity testing for nasal sprays. The term "target-delivered dose" was introduced and defined as the mean, about which the variance of the delivered dose was to be determined and specified. Changes were also introduced to add a new instrument, the "Next Generation Pharmaceutical Impactor". Finally, the methods for determining aerodynamic size distributions with all impactors were revised to reflect the current state-of-the-art, and these methods were harmonized between the European Pharmacopoeia and the USP wherever possible. In the present revision the Aerosols Expert Committee is responding to requests from equipment manufacturers and industrial testing consortia to clarify the specifications for some of the apparatuses defined in the chapter while simultaneously making minor editorial corrections to the previously proposed version. It is also now pro-

[^171]:    ${ }^{2}$ A suitable cascade impactor is available as Model Mk II from Graseby the., 500 Techmelegy Ceumt, Smyma, GA, 30082 . Thermo-Electron, 27 Forge Parkway, Franklin, MA 02038.■1s (USP28) The im-pac tor is used without the preseparator. The inhaler is connected to theimpac tor via the induction port, atop the entrance cone shown in Figure 4. If an equivalent impactor is employed, the induction port in Figure $4 a$ should be used, although the entrance cone (Fig. 4b) should be replaced with one to fit the impactor in question. Note that the internal surfaces of the induction port (Fig. 4a) are designed to fit flush with their counterparts in the entrance cone (Fig. 4b). This design avoids aerosol capture at the junction of the two pipes.

[^172]:    ${ }^{3}$ The cascade impactor is available as the Model 160 Marple-Miller Impactor from MSP Corporation, Minneapolis, MN. The inhaler should be connected to the impactor via the induction port, shown in Fig. 4a.

    12S (USP28)

[^264]:    ${ }^{7}$ Radioactive Pharmaceutical Products-Because of rapid radioactive decay, it is not feasible to delay the release of some radioactive pharmaceutical products in order to complete sterility tests on them. In such cases, results of sterility tests provide only retrospective confirmatory evidence for sterility assurance, which therefore depends on the primary means established in the manufacturing and validation and certification procedures.

[^265]:    * The apparatus meeting these specifications is available from laboratory supply houses such as VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513, or from Erweka Instruments, Inc., 56 Quirk Road, Milford, CT 06460.

[^266]:    ${ }^{1} F_{0}$ is defined as the calculated equivalent microbial lethality at $121.1^{\circ}$ when using a biological indicator microorganism with a $D$ value of $1.0 \mathrm{mi}-$ nute and a Z value of $10.0^{\circ}$ in the product being sterilized.

[^267]:    Fig. 2 Water for phamacentical purpeses.

[^268]:    For additional guidance encerning mierobial water testing methodelogy, eonsult Standard Methods for the Examination of Water and Wastewnter 18th Edition, Ameriean Publie Health Association, Washingten DC, 20005.

[^269]:    ${ }^{1}$ A membrane filter with an absolute rating of $0.45 \mu \mathrm{~m}$ is generally considered preferable even though the cellular width of some of the bacteria in the sample may be narrower than this. The efficiency of the filtration process still allows the retention of a very high percentage of these smaller cells and is adequate for this application. Filters with smaller porosity ratings may be used if desired, but for a variety of reasons the ability of the retained cells to develop into visible colonies may be compromised, so count accuracy must be verified by a reference approach.
    ${ }^{2}$ When colony counts are low to undetectable using the indicated minimum sample volume, it is generally recognized that a larger sample volume should be tested in order to gain better assurance that the resulting colony count is more statistically representative. The sample volume to consider testing is dependent on the user's need to know (which is related to the established alert and action levels and the water system's microbial control capabilities) and the statistical reliability of the resulting colony count. In order to test a larger sample volume, it may be necessary to change testing techniques, e.g., changing from a pour plate to a membrane filtration approach. Nevertheless, in a very low to nil count scenario, a maximum sample volume of around 250 to 300 mL is usually considered a reasonable balance of sample collecting and processing ease and increased statistical reliability. However, when sample volumes larger than about 2 mL are needed, they can only be processed using the membrane filtration method.
    ${ }^{3}$ Also known as Standard Methods Agar, Standard Methods Plate Count Agar, or TGYA, this medium contains tryptone (pancreatic digest of casein), glucose and yeast extract.

[^270]:    Organic volatile impurities, Method $I T\langle 467\rangle$ : meets the requirements._NF23

[^274]:    ${ }^{2}$ The numerical division of General Chapters is somewhat artificial: Some below 1000 have little bearing or impact, and some that are above 1000 , if they are referenced in a monograph or adopted in legislation, can be enforceable.

[^275]:    ${ }^{3}$ Medicare authorizes payment for drugs and biologicals that cannot be self-administered and are furnished by a provider in the provider's office. Drugs and biologicals are defined as those included or approved for inclusion in USP-NF, the U.S. Homeopathic Pharmacopeia, or in New Drugs or Accepted Dental Remedies, or those approved by the hospital's pharmacy and drug therapeutics committee

[^276]:    ${ }^{4}$ The general topic was addressed at a satellite symposium during the 2003 annual meeting of the American Association of Pharmaceutical Scientists in Salt Lake City.
    ${ }^{5}$ Articles include excipients, drug substances, and dosage forms/products.
    ${ }^{6}$ The general approach was presented to the Council of Experts Executive Committee in December 2002. In response, the Executive Committee formed an ad hoc committee to consider the issue. The ad hoc committee met on two occasions, endorsed the general approach, and presented their conclusions to the Executive Committee in the July 2003 meeting. The ad hoc committee is listed in the authorship of this article.

[^277]:    ${ }^{7}$ T. Layloff et al., The FDA Regulatory Methods Validation Program and New and Abbreviated New Drug Applications, Pharm. Technol., 24(1) 2000, 30-42.
    ${ }^{8}$ Under Section 802 of the U.S. Food, Drug, \& Cosmetic Act, manufacturers are allowed to export drugs not approved in the U.S. to certain countries as long as the drugs are appropriately labeled and in compliance with that country's laws. These countries include Australia, Canada, Israel, Japan, New Zealand, Switzerland, Norway, South Africa, and European Union countries. USP could rely on decisions by these authorities to set certain acceptance criteria.
