For the 1-level assay with a standard curve, prepare dilutions representing 5 test levels of the Standard $\left(S_{1}\right.$ to $\left.S_{5}\right)$ and a single test level $\left(U_{3}\right)$ of each of up to 20 Unknowns corresponding to $S_{3}$ of the Standard. Prepare also an extra $S_{3}$ as a test of growth. Add 1 mL of each test dilution, except for Gramicidin, Thiostrepton, and Tylosin (use 0.10 mL ) to 3 tubes and 1 mL of antibiotic-free diluent to 6 tubes as controls. Distribute one complete set, including 2 tubes of controls, to a tube rack, intermingling them at random. Add 9.0 mL of inoculum, except for Thiostrepton (use 10.0 mL of inoculum), incubate, add 0.5 mL of dilute formaldehyde, and complete the assay as directed above. Determine the exact duration of incubation by observation of growth in the reference concentration (median dose) of the dilutions of the Standard $\left(S_{3}\right)$.

## Change to read:

## METHOD III

pH 3.5 Acetate Buffer-Prepare as directed under Method $I$.
Standard Preparation-Transfer a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask, and add a further volume of nitric acid equal to the incremental volume of nitric acid added to the Test Preparation. Heat the solution to the production of dense, white fumes, cool, cautiously add 10 mL of water and, if hydrogen peroxide was used in treating the Test Preparation, add a volume of 30 percent hydrogen peroxide equal to that used for the substance being tested, and boil gently to the production of dense, white fumes. Again cool, cautiously add 5 mL of water, mix, and boil gently to the production of dense, white fumes and to a volume of 2 to 3 mL . Cool, dilute cautiously
with a few mL of water, add 2.0 mL of Standard Lead Solution (20 $\mu \mathrm{g}$ of Pb ), and mix. Transfer to a $50-\mathrm{mL}$ color-comparison tube, rinse the flask with water, adding the rinsing to the tube until the volume is 25 mL , and mix.

## Test Preparation-

${ }^{\Delta}$ Unless otherwise indicated in the individual monograph, use a quantity, in $g$, of the substance to be tested as calculated by the formula:

$$
2.0 /(1000 L)
$$

in which $L$ is the Heavy metals limit, as a percentage. $\Delta$ USP28 If the substance is a solid-Transfer the
$\Delta_{\text {weighed }}^{\Delta U S P 28}$
quantity of the test substance specified in the individut menegraph

4 4 USP28
to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask. [NOTE-A $300-\mathrm{mL}$ flask may be used if the reaction foams excessively.] Clamp the flask at an angle of $45^{\circ}$, and add a sufficient quantity of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to moisten the substance thoroughly. Warm gently until the reaction commences, allow the reaction to subside, and add additional portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat, and boil gently until the solution darkens. Cool, add 2 mL of nitric acid, and heat again until the solution darkens. Continue the heating, followed by addition of nitric acid until no further darkening occurs, then heat strongly to the production of dense, white fumes. Cool, cautiously add 5 mL of water, boil gently to the production of dense, white fumes, and continue heating until the volume is reduced to a few mL . Cool, cautiously add 5 mL of water, and examine the color of the solution. If the color is yellow, cautiously add 1 mL of 30 percent hydrogen peroxide, and again evaporate to the production of dense, white fumes and a volume of 2 to 3 mL . If the solution is still yellow in color, repeat the addition of 5 mL of water and the peroxide treatment. Cool, dilute cautiously with a few mL of water, and rinse into a $50-\mathrm{mL}$ color-comparison tube, taking care that the combined volume does not exceed 25 mL .

If the substance is a liquid-Transfer the
$\Delta_{\text {weighed }}^{\Delta U S P 28}$
quantity of the test substance specified in the individut menegraph
$\Delta \Delta U S P 28$
to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask. [NOTE-A $300-\mathrm{mL}$ flask may be used if the reaction foams excessively.] Clamp the flask at an angle of $45^{\circ}$, and cautiously add a few mL of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid. Warm gently until the reaction commences, allow the reaction to subside, and proceed as directed for If the substance is a solid, beginning with "add additional portions of the same acid mixture.'
${ }^{\Delta}$ Monitor Preparation-Proceed with the digestion using the same amount of sample and the same procedure as directed in the Test Preparation until the step "Cool, dilute cautiously with a few mL of water." Add 2.0 mL of

Lead Standard Solution (20 $\mu \mathrm{g}$ of lead), and mix. Transfer to a $50-\mathrm{mL}$ color comparison tube, rinse the flask with water, adding the rinsing to the tube until the volume is 25 mL , and mix. $\triangle$ USP28

Procedure-Treat the Test Preparation, the Standard Preparation
${ }^{\boldsymbol{4}}$ and the Monitor Preparation $\boldsymbol{\Delta U S P 2 8}$ as follows: Adjust
${ }^{\Delta}$ Using a pH meter or short-range pH indicator paper as external indicator, adjust $_{\mathbf{\Delta U S P 2 8}}$
the solution to a pH between 3.0 and 4.0 , using shert range pH in dienter paper as extemal indieator,
© $\mathbf{A U S P 2 8}$
with ammonium hydroxide (a dilute ammonia solution may be used, if desired, as the specified range is approached), dilute with water to 40 mL , and mix.

To each tube add 2 mL of pH 3.5 Acetate Buffer, then add 1.2 mL of thioacetamide-glycerin base TS, dilute with water to 50 mL , mix, allow to stand for 2 minutes, and view downward over a white surface ${ }^{*}$ : the color of the Test Preparation is not darker than that of the Standard Preparation,
$\Delta_{\text {and }}$ the color of the Monitor Preparation is equal to or darker than that of the Standard Preparation. $\mathbf{\Delta U S P 2 8}$

## Change to read:

## INTRODUCTION

This chapter defines the terms and procedures used in chromatography and provides general information. Specific requirements for chromatographic ests and

## ${ }^{\text {a }}$ procedures for ${ }_{\Delta U S P 28}$

drug substances and dosage forms, including adsorbent and developing solvents, are given in the individual monographs.

Chromatography is defined as a procedure by which solutes are separated by a dynamic differential migration process in a system consisting of two or more phases, one of which moves continuously in a given direction and in which the individual substances
exhibit different mobilities by reason of differences in adsorption, partition, solubility, vapor pressure, molecular size, or ionic charge density. The individual substances thus ebtined
$\Delta_{\text {separated }}{ }_{\triangle U S P 28}$
can be identified or determined by analytical
© procedures. $\Delta$ USP28
The general chromatographic technique requires that a solute undergo distribution between two phases, one of them fixed (stationary phase), the other moving (mobile phase). It is the mobile phase that transfers the solute through the medium until it eventually emerges separated from other solutes that are eluted earlier or later. Generally, the solute is transported through the separation medium by means of a flowing stream of a liquid or a gaseous solvent known as the "eluant." The stationary phase may act through adsorption, as in the case of adsorbents such as activated alumina ; silice gel, and ion exehange resins,
$\Delta_{\text {and silica }}$ gel, $\mathbf{\Delta U S P 2 8}$
or it may act by dissolving the solute, thus partitioning the latter between the stationary and mobile phases. th the latter proeess, a tiquid coating held on an inert support serves as the stationary phase.
${ }^{\mathbf{\Delta}}$ In the latter process, a liquid coated onto an inert support, or chemically bonded onto silica gel, or directly onto the wall of a fused silica capillary, serves as the stationary phase. $\quad$ USP28
Partitioning is the predominant mechanism of separation in gas-liquid chromatography, paper chromatography, and forms of column chromatography
$\Delta_{\text {and thin-layer chromatography }}^{\mathbf{\Delta U S P 2 8}}$
designated as liquid-liquid ehrematography.
${ }^{\Delta}$ separation. $\Delta$ USP28
In practice, separations frequently result from a combination of adsorption and partitioning effects.
${ }^{\Delta}$ Other separation principles include ion exchange, ion pair formation, size exclusion, hydrophobic interaction, and
chiral recognition. $\Delta U S P 28$
The types of chromatography useful in qualitative and quantitative analysis that are employed in the $U S P$ tests and assays

are column, gas, paper, thin-layer,
© (including high-performance thin-layer chromatogra-
phy), $\Delta U S P 28$
and pressurized liquid chromatography (commonly called highpressure or high-performance liquid chromatography). Paper and thin-layer chromatography are ordinarily more useful for purposes of identification, because of their convenience and simplicity. Column chromatography offers a wider choice of stationary phases and is useful for the separation of individual compounds, in quantity, from mixtures. Both ehrematography and pressurized liquid chrematography require mere elaborate apparatus and usually provide high resolution methods that will identify and quantitate very small ameunts of material.
${ }^{\mathbf{4}}$ Modern high-performance thin-layer chromatography, gas chromatography, and pressurized liquid chromatography require more elaborate apparatus but usually provide high resolution and identify and quantitate very small amounts of material. $\triangle$ USP28

## Change to read:

Use of Reference Substances in Identity Tests-In paper and thin-layer chromatography, the ratio of the distance (this distance being measured to the point of maximum intensity of the spot
$\left.\Delta^{\text {or zone }}\right)_{\mathbf{\Delta S P 2 8}}$
traveled on the medium by a given compound to the distance traveled by the front of the mobile phase, from the point of application of the test substance, is designated as the $R_{F}$ value of the compound. The ratio between the distances traveled by a given compound and a reference substance is the $R_{R}$ value. $R_{F}$ values vary with the experimental conditions, and thus identification is best accomplished where an authentic specimen of the compound in question is used as a reference substance on the same chromatogram.

For this purpose, chromatograms are prepared by applying on the thin-layer adsorbent or on the paper in a straight line, parallel to the edge of the chromatographic plate or paper, solutions of the substance to be identified, the authentic specimen, and a mixture of nearly equal amounts of the substance to be identified and the authentic specimen. Each sample application contains approximately the same quantity by weight of material to be chromatographed. If the substance to be identified and the authentic specimen are identical, all chromatograms agree in color and $R_{F}$ value and the mixed chromatogram yields a single spot; i.e., $R_{R}$ is 1.0 .

## Change to read:

Location of Components-The spots
$\Delta^{\text {or }}$ zones $_{\Delta U S P 28}$
produced by paper or thin-layer chromatography may be located by the following: ( 1 ) direct inspection if the compounds are visible tader white or either shert wavelength $(254 \mathrm{~nm})$ or long wavelength ( 360 nm ) UV light, (2) inspection in white or UV light after treatment with reagents that will make the spets visible (reagents are most eonveniently applied with an atomizer), (3) use of a Gei ger Müller counter or attoradiographic teehniques in the case of the presence of radionctive substanees, of (4) evidence resulting from stimulation or inhibition of bacterial growth by the placing of removed portions of the adsorbent and substance on inoculated media.
© (1) direct inspection if the compounds are visible under white or either short-wavelength ( 254 nm , quenching of fluorescence of indicator) or long-wavelength ( 365 nm , self-fluorescence) UV light, (2) inspection in white or UV light after treatment (derivatization) with reagents that will make the substance visible (reagents are most conveniently applied by dipping the plate into the reagent solution or spraying such solution onto the plate with an atomizer),
(3) scanning the plate prior to or after derivatization at any desired wavelength (in absorption or fluorescence mode) using a scanning densitometer, (4) use of a Geiger-Müller counter or autoradiographic techniques in the case of the presence of radioactive substances, or (5) evidence resulting from biological activity (such as stimulation or inhibition of growth of microorganisms, bioluminescence, or biochemical reactions) by the placing of removed portions of the adsorbent and substance on inoculated media, or performing biochemical tests directly on the plate by covering the plate with, or dipping it into, a suspension of the biological test

## system. $\Delta$ USP28

In open-column chromatography, in pressurized liquid chromatography performed under conditions of constant flow rate, and in gas chromatography, the retention time, $t$, defined as the time elapsed between sample injection and appearance of the peak concentration of the eluted sample zone, may be used as a parameter of identification. Solutions of the substance to be identified or derivatives thereof, of the reference compound, and of a mixture of equal amounts of these two are chromatographed successively on the same column under the same chromatographic conditions. Only one peak should be observed for the mixture. The ratio of the retention times of the test substance, the reference compound, and a mixture of these, to the retention time of an internal standard is called the relative retention time $R_{R}$ and is also used frequently as a parameter of identification.
The deviations of $R_{R}, R_{F}$, or $t$ values measured for the test substance from the values obtained for the reference compound and mixture should not exceed the reliability estimates determined statistically from replicate assays of the reference compound.

Chromatographic identification by these methods under given conditions strongly indicates identity but does not constitute definitive identification. Coincidence of identity parameters under 3 to 6 different sets of chromatographic conditions (temperatures, column packings, adsorbents, eluants, developing solvents, various chemical derivatives, etc.) increases the probability that the test and reference substances are identical. However, many isomeric compounds cannot be separated. Specific and pertinent chemical, spectroscopic, or physicochemical identification of the eluted component combined with chromatographic identity is the most valid criterion of identification. For this purpose, the individual components separated by chromatography may be collected for further identification
$\Delta_{\text {or chato }}$ chromatographic separation may be combined with other analytical techniques. Some of those investigations (such as UV, IR, RAMAN, and MS) can also be made directly on the thin-layer chromatography plate. $\triangle$ USP28

## Change to read:

## THIN-LAYER CHROMATOGRAPHY

In thin-layer chromatography, the adsorbent is a relatively thin, uniform layer of dry, finely powdered material applied to a glass, plastic, or metal sheet or plate, glass plates being most commonly employed. The coated plate can be considered an "open chromatographic column" and the separations achieved may be based upon adsorption, partition, or a combination of both effects, depending on the particular type of stppert,
$\boldsymbol{\Delta}_{\text {stationary phase, }, \text { USP28 }}$
its preparation, and its use with different solvents. Thin-layer chromatography on ion-exchange films
$\Delta_{\text {layers }_{\triangle U S P 28}}$
can be used for the fractionation of polar compounds. Presumptive identification can be effected by observation of spots
$\Delta_{\text {or zones }}^{\triangle U S P 28}$
of identical $R_{F}$ value and about equal magnitude obtained, respectively, with an unknown and a reference sample chromatographed on the same plate. A visual comparison of the size of the
$\Delta^{\text {or intensity }}$ of the spots or zones $\mathbf{Z U S P 2 8}$
may serve for semiquantitative estimation. Quantitative measurements are possible by means of densitometry, fltwreseenee, and fluresene quenching;
© (absorbance or fluorescence measurements), $\mathbf{\Delta U S P 2 8}$ or the spots may be carefully removed from the plate, followed by elution with a suitable solvent and spectrophotometric measurement. For two-dimensional thin-layer chromatography, the chromatographed plate is turned at a right angle and again chromatographed, usually in another chamber equilibrated with a different solvent system.
Apparatus-Acceptable apparatus and materials for thin-layer chromatography consist of the following.

Flat glass plates of convenient size, ypieally $20 \mathrm{em} \times 20 \mathrm{~cm}^{+}$
An aligning trayor a flat surface upen whieh to align andrest the plates during the applieation of the adsorbent.

A storage rack to hold the prepared plates during drying and transpertation. The rack holding the plates sheuld be kept in a desiecator or be eapable of being sealed in order to proteet the plates from the envirenment after remeval frem the drying oven.

The adsorbent consists of fanely divided adsorbent materiats, formally $5 \mathrm{t}-40 \mathrm{~mm}$ in diameter, stitable for ehromatography. It ean be applied directly to the glass plate or can be bended to the plate by means of plaster of paris (hy drated caleium sulfate) [at a ratio of $5 \%$ to $15 \%$ or with stareh paste-or other binders. The for mer will net yield as hard a-surface as will the stareh, but it is net affected by strengly oxidizing spray reagents. The adsorbent may eentain fluereseing material to aid in the visualization of spets that abserb-ultravielet light.

A spreader, which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate.

Adeveloping ehamber that can aceommodateoneor more plates and can be properly clesed and sealed as described under Ascent ing Chramatography. The chamber is fitted with a plate suppert fack that supperts the plates, back to back, with the lid of the cham ber in place.

[^99]A template (generally made of plastic) to aid in placing the test spots at definite intervals, to mark distances as needed, and to aid in tabeling the plates.

A graduated mieropipe capable of delivering $10-\mu \mathrm{L}$ veltmes. Fotal volumes of test and standard solutions are specified in the individual menograph.

A reagent sprayer that willemit a fine spray and will net itself be attacked by the reagent.

An ultraviolet light source suitable for observations with short $(254 \mathrm{~nm})$ and long ( 360 nm ) UV wavelengths.
${ }^{\Delta} \mathrm{A}$ TLC or HPTLC plate. The chromatography is generally carried out using precoated plates or sheets (on glass, aluminum, or polyester support) of suitable size. It may be necessary to clean the plates prior to separation. This can be done by migration of, or immersion in, an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion, or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at $120^{\circ}$ for 20 minutes. The stationary phase of TLC plates has an average particle size of $10-15 \mu \mathrm{~m}$, and that of HPTLC plates an average particle size of $5 \mu \mathrm{~m}$. Alternatively flat glass plates of convenient size, typically 20 $\mathrm{cm} \times 20 \mathrm{~cm}$ can be coated as described under Preparation of Chromatographic Plates.

A suitable manual, semiautomatic, or automatic application device can be used to ensure proper positioning of the plate and proper transfer of the sample, with respect to volume and position, onto the plate. Alternatively, a template can be used to guide in manually placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates. For the proper application of the solutions, micropipets, microsyringes, or calibrated disposable capillaries are recommended.

For ascending development, a chromatographic chamber made of inert, transparent material and having the following specifications is used: a flat bottom or twin trough, a tightly fitted lid, and a size suitable for the plates. For horizontal development, the chamber is provided with a reservoir for the mobile phase, and it also contains a device for directing the mobile phase to the stationary phase.

Devices for transfer of reagents onto the plate by spraying, immersion, or exposure to vapor and devices to facilitate any necessary heating for visualization of the separated spots or zones.

A UV light source suitable for observations under short ( 254 nm ) and long ( 365 nm ) wavelength UV light.

A suitable device for documentation of the visualized chromatographic result.

Procedure-Apply the prescribed volume of the test solution and the standard solution in sufficiently small portions to obtain circular spots of 2 to 5 mm in diameter ( 1 to 2 mm on HPTLC plates) or bands of 10 to 20 mm by 1 to 2 mm ( 5 to 10 mm by 0.5 to 1 mm on HPTLC plates) at an appropriate distance from the lower edge-during chromatography the application position must be 3 mm (HPTLC) to 5 mm (TLC) above the level of the developing solvent-and from the sides of the plate. Apply the solutions on a line parallel to the lower edge of the plate with an interval of at least 10 mm ( 5 mm on HPTLC plates) between the centers of spots or 4 mm ( 2 mm on HPTLC plates) between the edges of bands, and allow to dry.

Ascending Development-Line at least one wall of the chromatographic chamber with filter paper. Pour into the chromatographic chamber a quantity of the mobile phase sufficient for the size of the chamber to give, after impregnation of the filter paper, a level of depth appropriate to the dimension of the plate used. For saturation of the chromatographic chamber, close the lid, and allow the system to equilibrate. Unless otherwise indicated, the chromatographic separation is performed in a saturated chamber.
Place the plate in the chamber, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase, and close the chamber. The stationary phase faces the inside of the chamber. Remove the plate when the mobile phase has moved over the prescribed
distance. Dry the plate, and visualize the chromatograms as prescribed. For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Horizontal Development-Introduce a sufficient quantity of the developing solvent into the reservoir of the chamber using a syringe or pipet. Place the plate horizontally in the chamber, connect the mobile phase direction device according to the manufacturer's instructions, and close the chamber. If prescribed, develop the plate starting simultaneously at both ends. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate, and visualize the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Detection-Observe the dry plate first under short-wavelength UV light ( 254 nm ) and then under long-wavelength UV light ( 365 nm ) or as stated in the monograph. If further directed, spray, immerse, or expose the plate to vapors of the specified reagent, heat the plate when required, observe, and compare the test chromatogram with the standard chromatogram. Document the plate after each observation. Measure and record the distance of each spot or zone from the point of origin, and indicate for each spot or zone the wavelength under which it was observed. Determine the $R_{F}$ values for the principal spots or zones (see Glossary of Symbols).

Quantitative Measurement-Using appropriate instrumentation, substances separated by TLC and responding to ultraviolet-visible (UV-Vis) irradiation prior to or after derivatization can be determined directly on the plate. While moving the plate or the measuring device, the plate is examined by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate
optical system. Substances containing radionuclides can be quantified in three ways: (1) directly by moving the plate alongside a suitable counter or vice versa; (2) by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter; or (3) by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail, and measuring the radioactivity using a liquid scintillation counter (see Radioactivity $\langle 821\rangle$ ).

The apparatus for direct quantitative measurement on the plate is a densitometer that is composed of a mechanical device to move the plate or the measuring device along the x axis and the $y$-axis, a recorder, a suitable integrator or a computer, and, for substances responding to UV-Vis irradiation, a photometer with a source of light, an optical device capable of generating monochromatic light, and a photo cell of adequate sensitivity, all of which are used for the measurement of reflectance. In the case where fluorescence is measured, a suitable filter is also required to prevent the light used for excitation from reaching the photo cell while permitting the emitted light or specific portions thereof to pass. The linearity range of the counting device must be verified.

For quantitative tests, it is necessary to apply to the plate not fewer than three standard solutions of the substance to be examined, the concentrations of which span the expected value in the test solution (e.g., $80 \%, 100 \%$, and $120 \%$ ). Derivatize with the prescribed reagent, if necessary, and record the reflectance or fluorescence in the chromatograms obtained. Use the measured results for the calculation of the amount of substance in the test solution.

Preparation of Chromatographic Plates-
Apparatus-
Flat glass plates of convenient size, typically $20 \mathrm{~cm} \times 20$ cm .

An aligning tray or a flat surface upon which to align and rest the plates during the application of the adsorbent.

A storage rack to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The adsorbent consists of finely divided adsorbent materials, normally 5 to $40 \mu \mathrm{~m}$ in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of Paris (calcium sulfate hemihydrate [at a ratio of $5 \%$ to $15 \%$ ]) or with starch paste or other binders. The plaster of Paris will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb UV light.

A spreader, which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate. $\triangle U S P 28$

Procedure-[NOTE-In this procedure, use purified water that is obtained by distillation.] Clean the
$\Delta_{\text {glass }}^{\triangle U S P 28}$
plates scrupulously, as by immersion in chremic acid cleansing mixtare,
«using an appropriate cleaning solution (see Cleaning Glass
Apparatus $\langle 1051\rangle$ ), $\mathbf{\Delta U S P 2 8}$
rinsing them with copious quantities of water until the water runs off the plates without leaving any visible water or oily spots, then dry. It is important that the plates be completely free from lint and dust when the adsorbent is applied.

Arrange the plate or plates on the aligning tray, place a $5-\times 20$ cm plate adjacent to the front edge of the first square plate and another $5-\times 20-\mathrm{cm}$ plate adjacent to the rear edge of the last square, and secure all of the plates so that they will not slip during the application of the adsorbent. Position the spreader on the end plate opposite the raised end of the aligning tray. Mix 1 part of adsorbent with 2 parts of water (or in the ratio suggested by the supplier) by shaking vigorously for 30 seconds in a glass-stoppered conical flask, and transfer the slurry to the spreader. Usually 30 g of adsorbent and 60 mL of water are sufficient for five $20-\times 20-\mathrm{cm}$ plates. Complete the application of adsorbents using plaster of Paris binder within 2 minutes of the addition of the water, because thereafter the mixture begins to harden. Draw the spreader smoothly over the plates toward the raised end of the aligning tray, and remove the spreader when it is on the end plate next to the raised end of the aligning tray. (Wash away all traces of adsorbent from the spreader
immediately after use.) Allow the plates to remain undisturbed for 5 minutes, then transfer the square plates, layer side up, to the storage rack, and dry at $105^{\circ}$ for 30 minutes. Preferably place the rack at an angle in the drying oven to prevent the condensation of moisture on the back sides of plates in the rack. When the plates are dry, allow them to cool to room temperature, and inspect the uniformity of the distribution and the texture of the adsorbent layer; transmitted light will show uniformity of distribution, and reflected light will show uniformity of texture. Store the satisfactory plates over silica gel in a suitable chamber.

Place fwo flter paper wieks, 18 cm in height and as wide as the length of the developing chamber, into the chamber, add about 100 mL of the solvent (sufficient to have depth of 5 to 10 mm at the bettom of the chamber), seal the cover to the top of the chamber, and allow the system to equilibrate; it is essential that the wieks become completely wet. Altematively, the chamber may be com pletely lined with filter paper. In either case, ascure that the filter paper dips int the solvent at the bettom of the chamber. Where rapor saturation of the chamber by these methods is undesirable, it is so indieated in the individual menegraph.

Apply the test selution and the standard solution, as direeted in the individual menograph, at peints about 1.5 cm apart and about 2 em from the lower edge of the plate (the lower edge is the first part over which the spreader moved in the upplication of the adsorbent layer), and allow to dry. Avoid physieal distubanee of the adsor bent during the spetting procedure (by the pipet or other applieator) er when handling the plates. The template will aid in determining the spot points and the $10-15 \mathrm{~cm}$ distanee through which the solvent fromt sheuld pass.

Place a mark 10 to 15 em abeve the spet peint. Arrange the plate en the supperting rack (test spets toward the bottom), and introduce the rack inte the developing chamber. Allow the solvent in the chamber to reach the lower edge of the adsorbent, but do not allow the spot peints to be immersed. Put the cover in place, and maintain the system until the solvent aseends to a peint 10 to 15 cm above the initial spots, this ustally requires about 15 minutes to 1 heur. Remeve the plate frem the develeping chamber, mark the solvent front, air dry the plates, and observe first under short wavelength UV light ( 254 nm ) and then under long wavelength UV light $(360 \mathrm{~nm})$. Measure and record the distance of each spot from the peint of origin, and indicate for each spet the wavelength under which it was observed. Determine the $R_{t}$ values for the principat spets (see Glessetfy of Sybels). If futher direeted, spray the spets with the reagent speeified, observe, and compare the test chromatogram with the standard chromatogram.

## Contintous Development Thin-Layer Chromatography

In contrast to conventional thin layer chrematography, whieh is earried out in a closed tank, the continuous development or contintous flow technique allows the upper end of the plate to project through a slot in the cover of the developing chamber. When the developing solvent reaches the slot, continteus evaporation oceurs, producing a steady flow of solvent over the plate. In conventional thin layer chromatography, spot migration cease when the solvent reaches the top of the plate, after which the spots simply enlarge by diffusion. In the continuous flow process, spot migration continues as long as the plate remains in the tank and the developing solvent is not exhatusted.

Pevelopment may be continted for several hours after the sol went reaches the top of the plate, to provide adequate migration of the spets. Usually spets of a standard solution, a test solution, and a mixture of equal amounts of test and standard solutions, are initially applied at a standard distance from the base of the plate. Identity of the standard and test substances is confirmed by their migrating equal distances from the origin and by the observation that the two substanees applied as a mixture show no tendency to separate.

A major advantage of contintous development thin layer chromatography stems from the greater solvent selectivity for solvents of low solvent strength. Solvent strength refers to the property of a developing solvent that eauses solutes to migrate, and it is strongly influeneed by the polarity of the solvent. Inereasing the solvent strength by adding a mere polar solvent causes the $R_{5}$ value to in erease. Solvent selectivity refers to the ability of a solvent system to produre different $R_{-}$- values for closely related-substances. In eonventional thin layer chromatography, a solvent system giving an $R_{f}$ value in the range of 0.3 to 0.7 , but with adequate selectivity to permit separation of the substanees being examined is usually selected. It is muth easier to find solvent systems producing adequate migration than to find these afferding adequate selectivity.

Solvent systems of lower strength generally exhibit higher selectivity, but are difficult to employ in conventional thin layer chromatography beeause they result in very little migration before the solvent reaches the top of the plate. Migration may be increased, however, by repented drying and redevelopment of the plate or, more conveniently, by providing means for eraporation of solvent at the top of the plate, which results in contintrous development. Two techniques are used: contintrous development and short bed eontinuous development thin layer chromatography.

An $R_{\mu}$ value cannot be measured in continurus development thin layer chromatography. Substances may be compared either by their migration distance over a fixed period of time or by com parisen with the migration of a standard substance applied to the plate.

## EONTINUOUS DEVELOPMENT

Apparatus. Aceeptable apparatus and materials for continteus development thin layer chromatography are the same as these de seribedunder conventional Thin Latyer Chromatography, exeeptas follows.

A developing chamber is used that consists of a rectangular tank, approximately $23 \mathrm{~cm} \times 23 \mathrm{~cm} \times 9 \mathrm{~cm}$, equipped with a glass solvent trough and a platform about 3.75 cm high to elevate the solvent trough above the base of the tank. The-chamber is fitted with a cover having a $21 \times 6 \mathrm{em}$ slat in the front edge.

Procedure Apply the standard solution, the test solution, and a mixture of equal amounts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the elevated empty solvent trough with the adsorbent on the underside of the leaning plate. The adsorbent rests against a piecof hery (about 1 mm thick) ${ }^{2}$ filter paper measuring $20 \mathrm{~cm} *$ 3 cm , folded lengthwise and placed over the front edgeof the tank. Place the developing solvent in the trough; set the cover in place, and seal all openingsexeept where the adsorbent contacts the paper wiek. The plate extends about 1 cm beyond the top of the tank.

After the solvent reaches the top of the plate, allow development tocontinue for an appropriate time. Then remove and dry the plate, and detect the spots by suitable means.

## SHORT BED-CONTINUOUS DEVELOPMENT

A major advantage of the short bed teehnique derives from the fact that solvent velocity is inversely related to bed length. Since spet migration depends upen the tolamount of solvent passing over the plate, the short bed permits useful migration to be obtained in a reasmable time with solvent having very low solvent strength. Lower diffusion in solvents of low solvent strength produrees smaller and more dense spots, which enhanees both detect ability and diseemment of small differences in migration distance.

Apparatus Acceptable apparatus and materials for shert bed eontinneus development thin layer chrematography are the same as these described under conventional Thin Layer Chrematograt phy, except as follows.

A shallow de eloping ehamber ${ }^{3}$ approximately $22 \mathrm{~cm}-9-\mathrm{cm}$ $* 3 \mathrm{~cm}$, equipped with a cover plate and tight fitting polytef wings that enable the chamber to be sealed against the plate, is used. The inside bettom of the chamber contains ridges that suppert the plate and allow it to be inserted at different angles, thereby warying the length of the plate eontained within the tank.
Proeedure-Apply the standard solution, the test solution, and a mixture of equal parts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the developing chamber (adsorbent side up), and add the devel eping solvent to the chamber. No paper wiek is employed. After the solvent reaches the top of the plate, allow development to con tince for an appropriate time. Then remove and dry the plate, and detect the spets by suritable means.
^USP28

## INTERPRETATION OF CHROMATOGRAMS

Figure 1 represents a typical chromatographic separation of two substances, 1 and 2, where $t_{1}$ and $t_{2}$ are the respective retention times; and $h, h / 2$, and $W_{h 2}$ are the height, the half-height, and the width at half-height, respectively, for peak 1. $W_{1}$ and $W_{2}$ are the respective widths of peaks 1 and 2 at the baseline. Air peaks are a feature of gas chromatograms and correspond to the solvent front in liquid chromatography.

[^100][^101]

Fig. 1. Chromatographic separation of two substances

Chromatographic retention times are characteristic of the compounds they represent but are not unique. Coincidence of retention times of a test and a reference substance can be used as a feature in construction of an identity profile but is insufficient on its own to establish identity. Absolute retention times of a given compound vary from one chromatogram to the next. Comparisons are normally made in terms of relative retention, *,
${ }^{\mathbf{4}}$ r, $\mathbf{\Delta}$ USP 28
which is calculated by the equation:

$$
r=\frac{t_{2}-t_{a}}{t_{1}-t_{a}}
$$

where $t_{2}$ and $t_{1}$ are the retention times, measured from the point of injection, of the test and reference substances, respectively, determined under identical experimental conditions on the same column, and $t_{a}$ is the retention time of a nonretained substance, such as methane in the case of gas chromatography.

In this and the following expressions, the corresponding retention volumes or linear separations on the chromatogram, both of which are directly proportional to retention time, may be substituted in the equations. Where the value of $t_{a}$ is small, $\mathbb{R}_{p}$
$\mathrm{m}_{1}$ 1S (USP28)
may be estimated from the retention times measured from the point of injection $\left(t_{2} t_{+}\right)$.

[^102]The number of theoretical plates, $N$, is a measure of column efficiency. For Gaussian peaks, it is calculated by the equation:

$$
N=16\left(\frac{t}{w}\right)^{2}, \mathbf{m}_{1 \mathrm{~S}(U S P 28)}
$$

where $t$ is the retention time of the substance and $W$ is the width of the peak at its base, obtained by extrapolating the relatively straight sides of the peak to the baseline. $\mathbb{H}_{\mu \sim}$ is the peak width at hatf height, obtained directly by electronic integrators.
-11 (USP28)
The value of $N$ depends upon the substance being chromatographed as well as the operating conditions such as mobile phase or carrier gas flow rates and temperature, the quality of the packing, the uniformity of the packing within the column and, for capillary columns, the thickness of the stationary phase film, and the internal diameter and length of the column.

The separation of two components in a mixture, the resolution, $R$, is determined by the equation:

$$
R=\frac{2\left(t_{2}-t_{1}\right)}{W_{2}+W_{1}}
$$

in which $t_{2}$ and $t_{1}$ are the retention times of the two components, and $W_{2}$ and $W_{1}$ are the corresponding widths at the bases of the peaks obtained by extrapolating the relatively straight sides of the peaks to the baseline.

Where electronic integrators are used, it may be convenient to determine the resolution, $R$, by the equation:

$$
R=\frac{2\left(t_{2}-t_{1}\right)}{1.70\left(W_{1, h} / 2+\mathrm{W}_{2, h / 2}\right)}
$$

and to determine the number of theoretical plates, $N$, by the equation:

$$
N=5.54\left(t / W_{h / 2}\right)^{2}
$$

$\square_{\text {where }} W_{h / 2}$ is the peak width at half-height, obtained di-
rectly by electronic integrators

- 1 S (USP28)

However, in the event of dispute, only equations based on peak width at baseline are to be used.

Peak areas and peak heights are usually proportional to the quantity of compound eluting. These are commonly measured by electronic integrators but may be determined by more classical approaches. Peak areas are generally used but may be less accurate if peak interference occurs. For manual measurements, the chart should be run faster than usual, or a comparator should be used to measure the width at half-height and the width at the base of the peak, to minimize error in these measurements. For accurate quantitative work, the components to be measured should be separated from any interfering components. Peak tailing and fronting and the measurement of peaks on solvent tails are to be avoided.

Chromatographic purity tests for drug raw materials are sometimes based on the determination of peaks due to impurities, expressed as a percentage of the area due to the drug peak. It is preferable, however, to compare impurity peaks with those in the chromatogram of a standard at a similar concentration. The standard may be the drug itself at a level corresponding to, for example, $0.5 \%$ impurity, or in the case of toxic or signal impurities, a standard of the impurity itself.

## SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the resolution and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

The resolution, $R$, [NOTE-All terms and symbols are defined in the Glossary of Symbols] is a function of column efficiency, $N$, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, $S_{R}$, if the requirement is $2.0 \%$ or less; data from six replicate injections are used if the relative standard deviation requirement is more than $2.0 \%$.

The tailing factor, $T$, a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see Fig. 2). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

Fig. 2. Asymmetrical chromatographic peak
These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see Procedures under Tests and Assays in the General Notices). Adjustments of operating eonditions to meet system suit ability requirements may be necessary.
${ }^{\mathbf{\Delta}}$ If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum specification that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when Reference-Standards suitable standards (including Reference Standards) are available for all ant lytes compounds used in the suitability test and are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.
pH of Mobile Phase (HPLC)-The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within $\pm 0.2 \pm 0.5$ units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within $\pm 10 \%$, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC)- The of the miner The following adjustment limits apply to minor components of the mobile phase (specified at 50\% or less). The amount(s) of these component(s) can be adjusted by $\pm 30 \%$ relative or $\pm 2 \%$ absolute (i.e., in relation to the total mobile phase), whichever is larger. However, the change in any component cannot exceed $\pm 10 \%$ absolute, nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

## Binary Mixtures-

SPECIFIED RATIO OF $50: 50$-Thirty percent of 50 is $15 \%$ absolute, but this exceeds the maximum permitted change of $\pm 10 \%$ absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of $40: 60$ to $60: 40$.

SPECIFIED RATIO OF 95:5-Thirty percent of 5 is $1.5 \%$ absolute. However, because adjustments up to $\pm 2 \%$ absolute are allowed, the ratio may be adjusted within the range of $93: 7$ to $97: 3$.

SPECIFIED RATIO OF 2 :98-Thirty percent of 2 is $0.6 \%$ absolute. In this case an absolute adjustment of $\pm 2 \%$ is not allowed because it would reduce the amount of the first component to zero. Therefore the maximum allowed adjustment is within the range of $1.4: 98.6$ to $2.6: 97.4$.

Ternary Mixtures-
SPECIFIED RATIO OF 60:35:5-For the second component, 30\% of 35 is $10.5 \%$ absolute, which exceeds the maximum permitted change of $\pm 10 \%$ absolute in any component. Therefore the second component may be adjusted only within the range of $25 \%$ to $45 \%$ absolute. For the third component, $30 \%$ of 5 is $1.5 \%$ absolute. Since $\pm 2 \%$ absolute is permitted and provides more flexibility, the third component may be adjusted within the range of $3 \%$ to $7 \%$ absolute. In all cases, a sufficient quantity of the first component is used to give a total of $100 \%$. Therefore, mixture ranges of $50: 45: 5$ to $70: 25: 5$ or $58: 35: 7$ to $62: 35: 3$ would meet the requirement.

## Betectar Wavelength of UV-Visible Detector

(HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, $\pm 3 \mathrm{~nm}$.

Column Length (GC, HPLC): can be adjusted by as much as $\pm 70 \% .-50 \%$ to $+100 \%$.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as $\pm 25 \% 50 \% . \pm 25 \%$ for HPLC and $\pm 50 \%$ for GC.

Film Thickness (Capillary GC): can be adjusted by as much as $-50 \%$ to $100 \%$.

Particle Size (HPLC): can be reduced by as much as $50 \%$.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as $\pm 50 \%$.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. It may be-inereased to as mueh as twiee the-volume-speeiffed, provided there are no adverse effects on factors such as baseline, peak shapes, resolution, linearity, and retention times.

Column Temperature (HPLC): can be adjusted by as much as $\pm 20^{\circ} . \pm 10^{\circ}$. Column thermostating is recommended to improve control and reproducibility of retention time.

Column Temperature (GC): can be adjusted by as much as $\pm 2 \%$, in terms of absolute temperature. $\pm 10 \%$.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to $\pm 20 \%$ is permitted.

Gradient Elution (HPLC)—The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column. UUSP $28^{\text {P }}$

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.
To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be
interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.

The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails
${ }^{\Delta}$ system suitability ${ }_{\Delta U S P 28}$
requirements are unacceptable.

## CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE-Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

## Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L2-Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L3-Porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L4-Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L5-Alumina of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L6-Strong cation-exchange packing-sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L7-Octylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L8-An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support,
-3 to $\mathbf{m}_{1 S}$ (USP28)
$10 \mu \mathrm{~m}$ in diameter.
L9- $10-\mu \mathrm{m}$ irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10-Nitrile groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L11-Phenyl groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L12-A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L13-Trimethylsilane chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L14-Silica gel $10 \mu \mathrm{~mm}$ in diameter
-1S (USP28)
having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating,
-5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{1 \mathrm{~S}}$ (USP28)
L15-Hexylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L16-Dimethylsilane chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L17-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to $11 \mu \mathrm{~m}$ in diameter.

L18-Amino and cyano groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L19-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about $9 \mu \mathrm{~m}$ in diameter.
L20-Dihydroxypropane groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L21-A rigid, spherical styrene-divinylbenzene copolymer, 5 to $10 \mu \mathrm{~m}$ in diameter.

L22-A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about $10 \mu \mathrm{~m}$ in size.

L23-An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about $10 \mu \mathrm{~m}$ in size.
L24-A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to $63 \mu \mathrm{~m}$ in diameter. ${ }^{5}$

L25-Packing having the capacity to separate compounds with a molecular weight range from 100-5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26-Butyl silane chemically bonded to totally porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L27-Porous silica particles, 30 to $50 \mu \mathrm{~m}$ in diameter.
L28-A multifunctional support, which consists of a high purity, $100 \AA$, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29-Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, $5 \mu \mathrm{~m}$ in diameter with a pore volume of $80 \AA$.

L30-Ethyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L31-A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of $8.5-\mu \mathrm{m}$ macroporous particles having a pore size of $2000 \AA$ and consisting of ethylvinylbenzene cross-linked with $55 \%$ divinylbenzene.

L32-A chiral ligand-exchange packing-L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

[^103]L33-Packing having the capacity to separate dextrans by molecular size over a range of 4000 to $500,000 \mathrm{Da}$. It is spherical, silica-based, and processed to provide pH stability. ${ }^{6}$

L34-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about $9 \mu \mathrm{~m}$ in diameter.

L35-A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of $150 \AA$.

L36-A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to $5-\mu \mathrm{m}$ aminopropyl silica.

L37-Packing having the capacity to separate proteins by molecular size over a range of 2,000 to $40,000 \mathrm{Da}$. It is a polymethacrylate gel.

L38-A methacrylate-based size-exclusion packing for watersoluble samples.

L39-A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40-Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to $20 \mu \mathrm{~m}$ in diameter.
L41-Immobilized $\alpha_{1}$-acid glycoprotein on spherical silica particles, $5 \mu \mathrm{~m}$ in diameter.

L42-Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, $5 \mu \mathrm{~m}$ in diameter.

L43-Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, ${ }^{1 S}$ (USP27) 5 to $10 \mu \mathrm{~m}$ in diameter.

L44-A multifunctional support, which consists of a high purity, $60 \AA$, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45-Beta cyclodextrin bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L46-Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads,
-about ${ }_{\text {1S }}$ (USP28)
$10 \mu \mathrm{~m}$ in diameter.
L47-High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, $8 \mu \mathrm{~m}$ in diameter. ${ }^{7}$

L48-Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, $15 \mu \mathrm{~m}$ in diameter.

L49-A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L50-Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to $15 \mu \mathrm{~m}$ in diameter, and a surface area not less than $350 \mathrm{~m}^{2}$ per $g$. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene. ${ }^{9}$

[^104]L51-Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{10}$

L52-A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{11}$

L53-Weak cation-exchange resin consisting of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to 15 $\mu \mathrm{m}$ diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than $500 \mu \mathrm{Eq} /$ column. ${ }^{12}$

L54-A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 $\mu \mathrm{m}$ in diameter. ${ }^{13}$
${ }^{\wedge}$ L55-A strong cation-exchange resin made of porous silica coated with polybutadiene-maleic acid copolymer, about $5 \mu \mathrm{~m}$ in diameter. ${ }^{14} \mathbf{\Delta U S P 2 7}$
${ }^{\mathbf{\Delta}}$ L56-Propyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{15} \mathbf{\Delta U S P 2 7}$
-L53 \#\# (Alendronic Acid Tablets, PRP-X100)—An an-ion-exchange resin consisting of a rigid, spherical styrenedivinylbenzene copolymer with trimethylammonium groups at a loading of about 2 mEq per $\mathrm{g}, 3$ to $20 \mu \mathrm{~m}$ in diameter. ${ }^{\text {a }}$ (USP27)
-L54 \#\# (Maltose, Aminex HPX-87N)—Strong cationexchange resin consisting of sulfonated cross-linked styr-ene-divinylbenzene copolymer in the sodium form, about
7 to $11 \mu \mathrm{~m}$ in diameter. ${ }^{\mathrm{b}}{ }^{2 S}$ (USP27)
${ }^{10}$ Available as Chiralpak AD from Chiral Technologies, Inc., 730
Springdale Prive, P.O. Box 564, Extm, PA 19341.

## Phases

G1-Dimethylpolysiloxane oil.
G2-Dimethylpolysiloxane gum.
G3-50\% Phenyl-50\% methylpolysiloxane.
G4-Diethylene glycol succinate polyester.
G5-3-Cyanopropylpolysiloxane.
G6-Trifluoropropylmethylpolysiloxane.
G7-50\% 3-Cyanopropyl-50\% phenylmethylsilicone.
G8-80\% Bis(3-cyanopropyl)-20\% 3-cyanopropylphenylpoly-
siloxane (percentages refer to molar substitution).
G9-Methylvinylpolysiloxane.
G10-Polyamide formed by reacting a $\mathrm{C}_{36}$ dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of $1.00: 0.90: 0.20$.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12-Phenyldiethanolamine succinate polyester.
G13-Sorbitol.
G14-Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15-Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16-Polyethylene glycol compound (av. mol. wt. about 15,000 ). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17-75\% Phenyl-25\% methylpolysiloxane.
G18-Polyalkylene glycol.
G19-25\% Phenyl-25\% cyanopropyl-50\% methylsilicone.
G20-Polyethylene glycol (av. mol. wt. of 380 to 420).
G21-Neopentyl glycol succinate.
G22-Bis(2-ethylhexyl) phthalate.
G23-Polyethylene glycol adipate.
G24-Diisodecyl phthalate.
G25-Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.

G26-25\% 2-Cyanoethyl-75\% methylpolysiloxane.
G27-5\% Phenyl-95\% methylpolysiloxane.
G28-25\% Phenyl-75\% methylpolysiloxane.
G29-3, $3^{\prime}$-Thiodipropionitrile.
G30-Tetraethylene glycol dimethyl ether.
G31-Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30 ); Nonoxynol 30 .
G32-20\% Phenylmethyl-80\% dimethylpolysiloxane.
G33-20\% Carborane-80\% methylsilicone.
G34-Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35-A high molecular weight compound of a polyethylene
glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36-1\% Vinyl-5\% phenylmethylpolysiloxane.
G37-Polyimide.
G38-Phase G1 containing a small percentage of a tailing inhibitor. ${ }^{16}$

G39—Polyethylene glycol (av. mol. wt. about 1500).
G40-Ethylene glycol adipate.
G41-Phenylmethyldimethylsilicone ( $10 \%$ phenyl-substituted).
G42-35\% phenyl-65\% dimethylpolysiloxane (percentages re-
fer to molar substitution).
G43-6\% cyanopropylphenyl-94\% dimethylpolysiloxane (percentages refer to molar substitution).
G44-2\% low molecular weight petrolatum hydrocarbon grease and $1 \%$ solution of potassium hydroxide.

G45-Divinylbenzene-ethylene glycol-dimethylacrylate.

[^106]G46－14\％Cyanopropylphenyl－86\％methylpolysiloxane．
G47－Polyethylene glycol（av．mol．wt．of about 8000）．
G48－Highly polar，partially cross－linked cyanopolysiloxane．
G49－Proprietary derivatized phenyl－groups on a pelysiloxane backbone．
－G50 \＃\＃（Docosahexaenoic Acid）—Polyethylene glycol， cross－linked（av．mol．wt．of more than 20，000）．${ }^{\mathrm{e}}{ }^{-}$ － 2 S （USP27）

## Supports

NOTE－Unless otherwise specified，mesh sizes of 80 to 100 or， alternatively， 100 to 120 are intended．

S1A－Siliceous earth for gas chromatography has been flux－cal－ cined by mixing diatomite with $\mathrm{Na}_{2} \mathrm{CO}_{3}$ flux and calcining above $900^{\circ}$ ．The siliceous earth is acid－washed，then water－washed until neutral，but not base－washed．The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ${ }^{18}$ to mask surface silanol groups．

S1AB－The siliceous earth as described above is both acid－and base－washed．${ }^{18}$

S1C－A support prepared from crushed firebrick and calcined or burned with a clay binder above $900^{\circ}$ with subsequent acid－ wash．It may be silanized．

S1NS－The siliceous earth is untreated．
S2－Styrene－divinylbenzene copolymer having a nominal sur－ face area of less than $50 \mathrm{~m}^{2}$ per g and an average pore diameter of 0.3 to $0.4 \mu \mathrm{~m}$ ．

S3－Copolymer of ethylvinylbenzene and divinylbenzene hav－ ing a nominal surface area of 500 to $600 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0075 \mu \mathrm{~m}$ ．

S4－Styrene－divinylbenzene copolymer with aromatic－ O and－ N groups，having a nominal surface area of 400 to $600 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0076 \mu \mathrm{~m}$ ．

S5－40－to 60－mesh，high－molecular weight tetrafluorethylene polymer．

S6－Styrene－divinylbenzene copolymer having a nominal sur－ face area of 250 to $350 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0091 \mu \mathrm{~m}$ ．

S7－Graphitized carbon having a nominal surface area of $12 \mathrm{~m}^{2}$ per g．

S8－Copolymer of 4－vinyl－pyridine and styrene－divinylben－ zene．

S9－A porous polymer based on 2，6－diphenyl－p－phenylene oxide．

S10－A highly polar cross－linked copolymer of acrylonitrite and divinylbenzene．

S11－Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g modified with small amounts of petrolatum and polyethy－ lene glycol compound．${ }^{19}$

S12－Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g ．

[^107]
## BRIEFING

〈730〉 Inductively Coupled Plasma，page 1922 of $P F$ 28（6） ［Nov．－Dec．2002］．On the basis of comments received，it is pro－ posed to revise this new general chapter under the new title＂Plas－ ma Spectrochemistry．＂This new chapter provides information supporting the use of a high－temperature source for subsequent ele－ mental analysis by atomic emission spectroscopy or by mass spec－ trometry．These techniques are used in the determination of multiple elements either sequentially or simultaneously，which can yield good general－purpose results for drug and excipient sub－ stances and dietary supplements．The incorporation of this pro－ posed new chapter will increase the assurance of quality of compendial articles by encouraging the use of this powerful analy－ tical technology for determination of inorganic impurities．USP＇s working group on Plasma Spectrochemistry arranged a roundtable discussion session at the 2004 Winter Conference on Plasma Spec－ trochemistry（January 2－10，2004，Ft．Lauderdale，Florida）and re－ ceived much input from the conference attendees．Currently there are no monographs in $U S P-N F$ using this technique．Plasma spec－ trochemistry could have a great impact on the testing of inorganic elements in the pharmaceutical industry in the future．

## Add the following：

## $\langle 730\rangle$ INDUCTIVELYCOUPLED PLASMA PLASMA SPECTROCHEMISTRY

## INTRODUCTION

This chapter provides general information and defines the terms and procedures used in element determinations by int duetively coupled plasma（ICP），either with detection by atemic emissions spectroseopy（ICP AES）or with detection by mass spectrometry（ICP MS）．Specific requirements for tests and assays of drug substances，nutritional supplements， and their correspending dosage forms are indieated within the－individutal menegraphs．

他 is a very high－temperature excitation souree that des－ olvates，vaporizes，atomizes，excites，andionizes atoms．ICP is used to excite analyte atoms for subsequent detection by atomic emission spectroseopy or to ionize atoms for detec
tion by mass spectremetry. Similar to the sample atomization required for flame and graphite farnace atomic abserption spectremetry, in ICP teehniques the sample is converted into an aeresel, which is then excited by the plasma-for subsequent detection. Single element detection and narrow linear ranges limit flame and graphite furnace atomic absorption spectrometers, although these are relatively inex pensive and adequately sensitive for some elements and analyses. ICP techniques can provide good general purpese procedures that may detect multiple-elements sequentially or simultaneously over an extended linear range and with greater sensitivity.

## APPARATUS

The compenents that make the ICP excitation souree include the sample nebulizer, plasma-suppert gas, the plasma toreh, and a magnetic freld produced from a radio fre quency generator. A peristaltic pump-continuously introduces sample solutions into the nebulizer where a sample aeresel is formed and carried into the excitation source by a stream of plasma-suppert gas. Argen is ypically used as the plasma suppert gas and may contain other modifiers. The plasma toreh consists of a series of concentric quartz tubes through which flows the sample aerosel/suppert gas mixture in the inner tube and through which flows an additional stream of support gas in the outer tube to cool the torch assembly. A radio frequency (RF) generator coil surrounds the toreh and produces an oseillating magnetic field which, in turn, sets up an oseillating eurrent in the ions and electrons of the suppert gas. In the induction coil of the RF generater, the energy transfer between the coil and the suppert gas creates a self-sustaining plasma. Collisions of the ions and electrons of the-stepport gas ionize and excite the analyte atoms in the high temperature plasma. The plasma

Operates at temperatures generally around $6,000-10,000 \mathrm{~K}$, such that essentially all covalent bends and analyte analyte interactions have been eliminated.

The uniform introduction of a sample solution containing the analyte atoms inte the nebulizer is critical to stable-sys-tem-operation and reproducible peak response. Peristaltic pumps that deliver a constant flow are crucial since the mag nittde of the peak respense is propertional to the amount of sample introduced inte the plasma per unit time. Sample-sefations may be assayed directly after appropriate dilution. Solid samples may require dissolution and predigestion with acombination of mineral acids and oxidants before analysis. Sample digestion and ignition proeedures similar to that deseribed for Arsenic $\langle 211\rangle$, Heary Metals $\langle 231\rangle$, and Residue On Ignition $\langle 284\rangle$ may be appropriate to clean up the sample matrix and for the removal of organic material. The sample preparation for analysis is then obtained from a quantitative dilution of the sample residue.

Alternative methods for introduction of selid or liquid samples into the plasma can be achieved by additional teehniques ineluding but not limited to laser ablation, graphite furnace, hydride generation, mierowave induction, and spark excitation. Eltents from-ion chrematographs and similar liquid chrematographic techniques can also be used to introduce a sample solution into the nebulizer.

## SAMPLE PREPARATHON

Appropriate sample preparation-is of vital impertance to the analysis procedure using ICP AES and ICP MS techniques. The introduction of various mineral acids for sample digestion and/or solution preparation may have signifieant impact on the analysis of the sample preparation. Depending en the detection mode and/or equipment configuration, sample adducts with these various acids or their deemposition products produced within the plasma may inerease the com-
plexity of the resulting emission and mass spectra. The in terference of various species of $S \Theta_{*}$ and their isotopes with Zn- determination by ICP MS as well as other interferences involving hydrochloric and phosphoric acids are well known. The impact of some potential interferences can be eliminated by appropriate optimization of operational parameters including support gas flow, sample flow, plasma temperature, RF power, extraction lens voltage, ete. The presence of high coneentrations of some-mineral acids in a sample preparation may also catuse an inerease in solution viscosity versus that of the standard preparation resulting in a decrease in the peak respenses due to decreased selution flow into the nebulizer. The use of an internal standard in the form of an additional element in each of the standard and sample preparations would be recommended under such eonditions for an aceurate determination of the peak respense ratio.

Sample solutions of atomic elements may be assayed directly after appropriate dilution. Solid organic samples re-quire-dissolution and/or predigestion with a combination Of mineral acids and oxidants, which may inelude hydregen peroxide, nitric acid, perchloric acid, hydrochloric acid, or sulfuric acid. Subsequent ignition may also be needed to remove carbenaceous material andelean up the-sample matrix prior to analysis to achieve-suitable-sensitivity. However, due to the volatility of some metals at high temperature, the ignition temperattre should not exceed $600^{\circ}$ and is ypieally performed at $500^{\circ} 550^{\circ}$ unless-speciffed in the indivi dual menegraph.

## DETECTHO TECHNYQUES

## ICPAtomic Emission-Spectroseopy

Atemic emission spectreseopy (AES, also called-Optient Emission-Spectroscopy or OES) is a-specialized branch-of spectroscopy shating many of the attributes with other spectroscopic measurements listed in the general chapter Spec trophetmetry and Light Scattering $\langle 851\rangle$. AES uses the quantitative measurement of the wavelength and intensity of the optical emission frem excited atoms to determine the identity of an analyte atom and its concentration. Upen excitation, an atom emits an array of different frequenciesof tight that is characteristic of the distinet energy transitions allowed for that element (See Table 1 for a list of primary and-some alternative analysis wavelengths for the most eommen elements analyzed by ICP AES. The-signifieant figures given for the wavelengths are to allow identifiention. The instrument vender may specify mere-signifieant figures in their operational procedures for a given emission line). The intensity of light emitted is generally propertional to the analyte concentration. It may be necessary to correct for the background signal from the plasmaemission or from matrix interference. Due to variations in atomization eff eieney, detector respense, and background signalcorrection, single peint standards are often not sutitable for quantitative analysis. As a result, sample concentration measurements are usually determined from a working curve ofknown standards in the concentration range of interest.

Since there are distinet transitions between atomic energy levels, emission lines have narrow bandwidths. All atems in a sample are-excited simultaneously, however, so samples eontaining multiple elements can lead to spectral overlap. Spectral separation of multiple emissions requires a high-resolution spectrometer. If there is evidence of spectral inter
ference, selection of an alternate wavelength may be justifred. Mathematical modeling to subtract the interfering sig fal as a background correction may also be performed.

An instrument that observes these emission lines in a-se quential manner can offer beth complete wavelength coverage and good resolution. However, when performing multielement analyses and seamning across the entire spectrum, the speed of analysis is reduced. Other instruments can si-
fattaneously detect the individutemission lines frem each atom by using a pelychromator with multiple detectors or solid state pixel detectors on a-single-chip. This ability to simultaneously detect multiple elements is a major advantage of AES compared to atomic absorption-spectroseopy but may have the disadvantage of incomplete wavelength eoverage.

Table 1. Primary and Some Alternative Analysis-Wavelengths for ICP AES

| Element | Primary wavelength, nm | Alternative wavelengths, nm |
| :---: | :---: | :---: |

| Titanimm, Ti | 334.9 | 336.4 |
| Vanadium, $V$ | 292.4 | 309.3, 310.2, 311.4 |
| Yittritm, Y | 371.0 | 324.2, 360.1 |
| Zine, Zn | 243.9 | 202.5, 206.2, 334.5 |

ICP AES detectors view the plasma either radially (sideen viewing) or axially (end-on viewing). Axial viewing of the plasma provides an-inereased and more-sensitive signal respense, however, in seme situations where background or sample interference is signifieant at the wavelength of inter est, radial viewing may yield mere reliable results. Because of the wide range of elemental concentration in some reat World samples and becatuse of complex matrix problems, there are many cases where the axial and radial configura tion for the plasma may not give equivalent results. Further sample dilution or changes in other operational conditions may be neeessary. Methods validated using an instrument with a radial configuration may not be completely transfer able to an instrument with an axial conflguration, and vice versa. Some ICP AES instruments have combined the axial and radial conflgurations into a single wnit. With such an int strument, the user has the ability to optimize the appropriate ennfiguration for the sample ype and/or suppression of petential interference. The viewing configuration of the plasma can be-interehanged using system-centrelled mirrers without the added expense of a separate instrument.

## ICP-Mass-Spectrometry

The utilization of mass spectremetry (MS) for the detection of atomic elements in conjunction with-ionization by ICP (ICP MS) shares many of the attributes listed in the general chapter Mass Spectrometry $\langle 736\rangle$.ICP MS is analegous to other sample introduction/detectiontechniques sueh as GC MS and LC MS. Gas phase ions are generated from the analyte atoms by the plasma. The analyte ions are then extracted frem the plasma and inte the mass spectremeter through sampling and skimmer cones. The mass spectrometer separates the ions in a magnetic freld by the difference in mass to charge (mte) ratio of the ionized atoms. Since all relatively stable atomic isotopes have atomic masses less than 240 , a mass spectremeter with sufficient resolution within this mass range is required. See Table 2 for a list of the primary and some alternative analysis isotopes for the most commen elements analyzed by ICP MS. The ion rese tetion power, $R$, of a mass-spectrometer is defined by the formula

$$
R=m / \Delta m,
$$

where $m$ is the ion mass of interest and $\Delta m$ is the difference in mass between resolvable peaks in a mass-spectrum.

Depending on the equipment configuration, sample ad duets with diluent acids or their decomposition products, oxides, and multiply charged element ions (see-Glossaty of Terms and Symbols) produced within the plasma may inerease the complexity of the resulting mass spectra. Interfer ences can be minimized by appropriate optimization of eperational parameters including suppert gas flow, sample flow, plasma temperature, RF power, extraction lens vol tage, ete., or through a background correction. The signift eance of the petential interference for the massion of interest may be evaluated from the nattral isetope ratio of the given element versus the observed isotope ratio for the
sample-element, as long as the sample has not originated from an enriched source. The evaluation of the isotope ratios may be used to determine appropriat background correc tion.

ICP-MS is generally mere-sensitive than ICP AES. The ability of a mass-spectrometer to menitor a single ion of a specific mass/charge ratio (SIM mode) is a major advantage of ICP MS when assaying for very low analyte concentra tiens or when elimination of matrix interference is required. Analyte can-often be detected at the parts per trillion (ppt) level utilizing ICP MS.

Table 2. Primary and Some Alternative Analysis Isotopes for ICP MS

| Element | Primary isotope, mle | Alternative isotope, mhe |
| :---: | :---: | :---: |
| Altmintm, Al | 27 | - |
| Antimeny, Sb | 124 | 123 |
| Arsenic, As | 75 | - |

## CALßRATHON AND-SYSTEM SUHABHHY

The wavelength aceuracy for $A$ AES detection or mass aceuracy for MS detection must be in accordance with the applicable operating procedures. The ICP instrument must be standardized for quantifieation at each use. System-suitabil ity tests are an integral part of all-user-standardized test methods and are used to verify that the aceuracy and reproducibility of the system are adequate for the analysis of sam ples to be performed. Evaluations of the system's suitability include reproducibility of repliente measurements of a-sin gle solution introduction, linearity of a standard curve, and stability of peak respense-over the analysis run time. The fests are based on the concept that the equipment, electrenies, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as a whele.

Standard solutions of element ions-should be aceurately prepared frem standard materials and titrated as apprepriate, or purehased commereially and used as received if the re perted titer is traceable to standardization against a primaty standard. Replieate readings of a-single-introduction of a standard preparation used in the assay or other standard se letion are compared to ascertain whether requirements-for precision are met.

Suitable linearity should be demenstrated throughout the range of test measurements to be performed. For quantita tive analyses, an appropriate blank solution and at least three standard preparations that bracket the expected range of the sample concentrations should be assayed and detector respense plotted as a function of analyte concentration. Regression analysis of this plot should be used to evaluate the linearity of detector respense in addition to consisteney ef solution introduction. A correlation coefficient not less than- 0.995 , or as indicated in the individual monograph, must be demenstrated for the working standard eurve. For
timit tests, an appropriate blank solution and singlestandard selution may be sufficient. To demenstrate the stability of the system over the analysis time-since initial standardization, a solution used in the initial standard curve must be reassayed as a cheek standard after the last test preparation in the-sample-set. The difference in peak respense-of the eheck standard from the initial value must not be more than $5 \%$, or as indieated in the individual menegraph. For assays where tight control of reproducibility is required, the use of an-internal-standard in the-standard preparations and test preparations may be necessary.

When utilizing mass spectrometric detection, additional system suitability is required to demenstrate that the flow of plasma support gas and ionization energies are appropri ate. Proper flow of plasma-support gas is necessary to achieve a residence time of the analyte within the plasmat such that dissociation of all atomic species has oceurred prior to detection. Proper ionization energies are necessary to achieve sufficient atomic ionization but to prevent multi-ply-chargedions. A control solution containing ceritm may be introduced to determine an acceptable flow rate of plas ma suppert gas. The flow rate is adjusted to achieve a resi dence time of the evium analyte within the plasma such that the ratio of CeO to Ce is less than $3.0 \%$. An appropriateenfrolsolation containing baritum ions may be introduced to determine acceptable ionization energy such that the ratio of $\mathrm{Ba}^{-+}+0 \mathrm{Ba}^{+}$is less than 3.0\%\%

The specification of definitive parameters in a menograph does net preclude the use of other suitable operating eonditions (see Procedures under Tests and Assays in the General Notices). Adjustments of operating conditions to meet sys-tem-suitability requirements may be neeessary. Unless Otherwise noted, system suitability parameters are measured from the analyte peak.

Replicate introductions of the standard preparation re quired to demonstrate system performance may be made be fore the introduction of samples or may be-interspersed among sample introductions. System suitability must be demonstrated throughout the run by introduction of an appropriate contrel preparation at appropriate-intervals. The eentrel preparation can be a standard preparation or a selution containing a known amount of analyte and any additional materiats useful in the control of the analyticat system. Whenever there is a signifieant change in equipment Or in a critieal reagent, suitability testing should be per formed before the introduction of additional samples. Ne sample analysis is aceeptable unless the requirements-of system suitability have been met. Sample analyses obtained while the-system faits-such requirements are invalid.

## PROCEDURE

Follow the procedure as directed in the individual menegraph for the detection mode and instrument parameters. Pue to slight differences in mantafacturer equipment eonfig urations, suggested vender default conditions including but net limited to plasma-suppert gas flow rate, auxiliary gas flow rate, RF Power, and sample flow rate for the ype-of analyses should be used and then adjusted to achieve the requirements of system suitability as specified in the menegraph and in this general chapter. Data collected from a single-sample introduction are treated as a single result. Data from wor three sequential readings from a single solution introduction of the apprepriate-standard or sample prepara-tions-should be averaged as a single result. Sample coneentrations are caleulated versus the working standard eurve generated by plotting the detector respense versus the coneentration of the analyte in the standard preparations.

Standard Addition Methed A usefultechnique for seme samples is the standard addition technique, in whieh a known concentration of the analyte element is added to the sample. When the detector response is plotted against the concentration of the added analyte element, and a linear regression line drawn through the data peints, the coneentration of analyte in the sample is the absolute value of theen tension of the regression line at the point where it crosses the eoncentration axis. This technique may prove to be useful in samples that show interferences from other elements that are present.

## GHOSSARY OF TERMS ANP-SYMBOLS

Axial viewing A configuration of the plasma for AES where the plasma is directed toward the-spectremeter optic path, alsocalled end-on viewing.
m The ion mass of interest.
Am The difference in mass between resolvable peaks in a-mass-spectrum.

Multiply-charged ions Atoms that, when-subjected to high ionization energies, can form doubly or triply charged ions ( $\mathrm{X}^{-- \text {-r }} \mathrm{X}^{-}$, ete.) steh that when detected by MS, the apparent mass will be $1 / 2$ or $\frac{1}{3}$ that of the atomic mass.

## Plasmatoreh A series of concentric quartz tubes-in

which the sample aeresel/suppert gas mixture flows threugh the inner tube; acooling gas flows through the outer tube to eool the toreh assembly.

Radial viewing A cenflguration of the plasma for AES where the plasma is directed orthogenal to the spectrometer eptic path, alse called side on viewing.
$R$ The resolution of a mass spectrometer defined by

## $R=m / \Delta m$.

Sample nebulizer. Used to form a consistent sample aerosol that mixes with the plasma support gas.

Sequential A type of detector configuration for AES where-discrete-emission lines are observed by seanning aeress the spectral range using a menechremator.

Simaltaneats A typeof detector configuration for AES where all selected emission lines are observed at the same time using a polychromator, offering inereased analysis speed for multi-element samples.

Suppert gas A gas stream, generally Ar, whieh carries the analyte inte the plasma.

User-standardization A correlation between a known analyte concentration and the corresponding detector respense for the system, determined at the time of sample ana lysis and used to determine the concentration of an analyte in a sample-solution.

Plasma-based instrumental techniques that are useful for pharmaceutical analyses fall into two major categories: those based on inductively coupled plasma, and those where a plasma is generated on the surface of the sample. Inductively coupled plasma (ICP) is a high-temperature excitation source that desolvates, vaporizes, atomizes, excites, and ionizes atoms. The excited analyte ions and atoms are subsequently detected by any of a variety of plasma-based spectrochemical means, including inductively coupled plas-ma-atomic emission spectroscopy (ICP-AES), also known as inductively coupled plasma-optical emission spectroscopy (ICP-OES) and inductively coupled plasma-mass spectrometry (ICP-MS). ICP-AES and ICP-MS may be used for either single- or multi-element analysis and provide good general-purpose procedures for either sequential or simultaneous analyses over an extended linear range with good sensitivity.

An emerging technique in plasma spectrochemistry is la-ser-induced breakdown spectroscopy (LIBS). In LIBS, a solid, liquid, or gas sample is heated directly by a pulsed laser,
and brought to a transient high-energy plasma state where the sample components are reduced to atoms, molecular fragments, and larger clusters. Emissions from the atoms and ions in the sample are collected typically using fiber optics and measured using an array detector such as a chargecoupled device (CCD). LIBS can be used for qualitative analysis or against a working standard curve for quantitative analysis. While LIBS is not currently in wide use by the pharmaceutical industry, LIBS is suited for at-line or on-line measurements in a production setting as well as in the laboratory. Because of its potential, it should be considered a viable technique for plasma spectrochemistry in the pharmaceutical laboratory. However, because LIBS is still an emerging technique, details will not be further discussed in this general chapter.

## SAMPLE PREPARATION

Sample preparation is critical to the success of plasmabased analysis, and it is the first step in performing any analysis via ICP-AES or ICP-MS. Plasma-based techniques are heavily dependent on sample transport into the plasma, and because ICP-AES and ICP-MS share the same sample introduction system, the means by which samples are prepared may be applicable to either technique. The most conventional means by which samples are introduced into the plasma is via solution nebulization. If solution nebulization is employed, solid samples must be dissolved in order to be presented into the plasma for analysis. Samples may be dissolved in any appropriate solvent. There is a strong preference for the use of aqueous or dilute nitric acid solutions, due to minimal interferences with these solvents, when compared to other solvent choices. Hydrogen peroxide, hydrochloric acid, sulfuric acid, perchloric acid, combinations of acids, or various concentrations of acids may all be used to dissolve the sample for analysis. Dilute hydrofluoric acid
may also be used, but great care must be taken to ensure the safety of the analyst, as well as to protect the equipment when using this acid. Additionally, alternative means of dissolving the sample may be employed. These include, but are not limited to, the use of dilute bases, straight or diluted organic solvents, combinations of acids or bases, or combinations of organic solvents.

When analyzing samples that are presented to the plasma via solution nebulization, it is important to consider the potential interferences that may arise from the solvent used. In all cases, when samples are to be analyzed using ICP-MS, use an appropriate internal standard. In cases where sample viscosity differs from the standard viscosity, matrix matching or an appropriate internal standard should also be used for ICP-AES analysis. In either event, the selection of an appropriate internal standard should consider the analyte in question, ionization energy, wavelengths or masses, and the nature of the sample matrix.

Where a sample is not found to be soluble in any acceptable solvent, a variety of digestion techniques may be employed. These include hot-plate digestion, or microwave assisted digestions, including open-vessel and closed-vessel digestions. The decision regarding the type of digestion technique to use is dependent on the nature of the sample being digested, as well as on the analytes of interest. Because some metals are volatile (e.g., mercury and selenium), open-vessel or hot-plate digestions are not appropriate for all analytes.

Use acids, bases, and hydrogen peroxide of ultra-high purity. Deionized water must be at least 18 megohm. Check diluents for interferences prior to their use in an analysis. Because it is not always possible to obtain organic solvents that are free of metals, use organic solvents of the highest quality possible with regard to metals contaminants.

## SAMPLE INTRODUCTION

There are two ways to introduce the sample into the nebulizer: using a peristaltic pump or by self-aspiration. The peristaltic pump is used to ensure that the flow rate of sample and standard solution to the nebulizer is the same irrespective of sample viscosity. In some cases, self-aspiration can be used, where a peristaltic pump is not required.

A wide variety of nebulizer types is available, including pneumatic (concentric and cross-flow), grid, and ultrasonic nebulizers. Micronebulizers, high efficiency nebulizers, direct injection high-efficiency nebulizers, and flow-injection nebulizers are also available. The selection of the nebulizer for a given analysis should consider the sample matrix, analyte, and sensitivity desired. Some nebulizers are better suited for use with solutions containing a high concentration of dissolved solids, while others are better-suited for use with organic solutions.

Once a sample leaves the nebulizer, it enters the spray chamber, which is designed to permit only the smallest droplets of sample into the plasma. The spray chamber functions to remove the larger sample droplets generated during the nebulization process, and as a result, typically only $1 \%$ to $2 \%$ of the sample aerosol reaches the ICP. As with nebulizers, there is more than one type of spray chamber available for use with ICP-AES or ICP-MS. Examples include the Scott double-pass spray chamber, as well as cyclonic spray chambers of various configurations. The spray chamber must be compatible with the sample and solvent and must equilibrate and washout in as short a time as possible. When selecting a spray chamber, the nature of the sample matrix, the desired sensitivity, and the analyte should be considered.

In addition to solution nebulization, it is possible to perform analyses using solid samples via laser ablation (LA). In such instances, the sample directly enters the torch. LA-ICP
and LA-ICP-MS are better-suited for qualitative analyses of pharmaceutical compounds, due to the difficulty in obtaining appropriate standards. Nonetheless, quantitative analyses may be performed if it can be demonstrated that the standards used are adequate. This must be demonstrated through appropriate method validation.

## STANDARD PREPARATION

Single- or multi-element standard solutions, whose concentrations are traceable to primary reference standards, such as those of the National Institute of Standards and Technology (NIST), may be purchased for use in the preparation of working standard solutions. Alternatively, standard solutions of elements may be accurately prepared from standard materials and their concentration determined independently, as appropriate. Where possible, standards, blanks, and sample solutions should be matrix matched to minimize matrix interference. In cases where matrix matching is not possible, an appropriate internal standard or the method of standard additions should be used for ICPAES. Standards and blank solutions to be used for ICPMS analysis should always contain an appropriate internal standard. In either event, the selection of an appropriate internal standard should consider the analyte in question, their ionization energies, their wavelengths or masses, and the nature of the sample matrix.

## ICP

The components that make up the ICP excitation source include the argon gas supply, torch, radio frequency (RF) induction coil, and RF generator. Argon gas is typically used in ICP, although other gases may also be used, depending on the instrumentation available. The use of gases other than argon is not common practice. The plasma torch consists of three concentric quartz tubes designated the inner, the in-
termediate, and the outer tube. The nebulizer gas flow helps to create a fine aerosol of the sample solution, and the sample is then carried through the inner tube of the torch and into the plasma. The intermediate tube carries the auxiliary gas. The auxiliary gas flow helps to lift the plasma off of the inner and intermediate tubes to prevent melting and the deposition of carbon and salts on the inner tube. The outer tube carries the plasma or coolant gas, which is used to form and sustain the plasma. The tangential flow of the coolant gas through the torch constricts the plasma and prevents the ICP from expanding to fill the outer tube, preventing the torch from melting. An RF induction coil, also called the load coil, surrounds the torch and produces an oscillating magnetic field which, in turn, sets up an oscillating current in the ions and electrons of the argon. In the load coil of the RF generator, the energy transfer between the coil and the argon creates a self-sustaining plasma. Collisions of the ions and electrons of the argon ionize and excite the analyte atoms in the high-temperature plasma. The plasma operates at temperatures of 6,000 to $10,000 \mathrm{~K}$, such that essentially all covalent bonds and analyte-to-analyte interactions have been eliminated.

## ICP-AES

An inductively coupled plasma may utilize either an optical or a mass spectral detection system. In the former case, ICP-AES, analyte detection is dependent on the emission wavelength of the analyte in question. Due to differences in technology, a wide variety of ICP-AES systems are available, each with different capabilities, as well as different advantages and disadvantages. Simultaneous systems are capable of analyzing multiple elements at the same time, thereby shortening analysis time. Sequential systems move from one wavelength to the next to perform analyses, and usually provide a larger number of analytical lines to choose
from. Charge-coupled devices and charge injection devices, with detectors on a chip, make it possible to combine the advantages of both simultaneous and sequential systems, providing the rapid analysis of the simultaneous units with a wider selection of analytical lines as found with sequential units.

In addition, the ICP can be oriented in either axial or radial (also called lateral) configurations. The torch is positioned horizontally in axial plasmas, and the sample is viewed "end on"; while it is positioned vertically in radial plasmas, and the sample is viewed from the side. Axial viewing of the plasma can provide a more sensitive signal response; however, in some situations where background or sample interference is significant at the wavelength of interest, radial viewing may yield more reliable results. Because of the wide range of elemental concentrations in some real world samples and because of complex matrix problems, there are many cases where radial is better than axial or visa versa. Methods validated using an instrument with a radial configuration may not be completely transferable to an instrument with an axial configuration, and vice versa.

Additionally, dual-view instrument systems are available, making it possible for the analyst to take advantage of either torch configuration. The selection of torch configuration is dependent on the sample matrix, analyte in question, analytical wavelength used, cost of instrumentation, required sensitivity, and type of instrumentation available in a given laboratory.

Regardless of torch configuration or detector technology, ICP-AES is a technique which provides a quantitative measurement of the optical emission from excited atoms or ions at specific wavelengths. These measurements are then used to determine the analyte concentration in a given sample. Upon excitation, an atom emits an array of different frequencies of light that is characteristic of the distinct energy
transition allowed for that element. The intensity of the light is generally proportional to the analyte concentration. It is necessary to correct for the background signal from the plasma. Sample concentration measurements are usually determined from a working curve of known standards in the concentration range of interest. It is, however, also possible to perform a single-point calibration under certain circumstances, such as with limit tests.

Since there are distinct transitions between atomic energy levels, emission lines have narrow bandwidths. Spectral separation of multiple emission lines requires a high-resolution spectrometer. The decision regarding which spectral line to measure should include an evaluation of potential spectral interferences. All atoms in a sample are excited simultaneously, however, so samples containing multiple elements can lead to spectral overlap. Spectral interference can also be caused by background emission from the sample or plasma. Modern ICP's usually have background correction available and a number of background correction techniques may be applied. Simple background correction typically involves measuring the background emission intensity at some point away from the main peak and subtracting this value from the total signal being measured. Mathematical modeling to subtract the interfering signal as a background correction may also be performed.

The selection of the analytical line is critical to the success of an analysis, regardless of torch configuration or detector type. Though some wavelengths are most often considered to be the primary analytical wavelengths, because there can be a tremendous variety of sample matrices, the selection of the analytical wavelength must be considered in the context of the sample matrix, the composition of the sample itself, the type of instrument being used, and the sensitivity required. Analysts might first choose to start with the wavelengths recommended by the manufac-
turer of their particular instrument and select alternate wavelengths based on manufacturer recommendations or published wavelength tables.

Forward power, gas flow rates, and torch position may all be optimized to provide the best signal. When organic solvents are used, it is often necessary to use a higher forward power setting than would be used for aqueous solutions, as well as a reduction in the nebulizer gas flow. When using organic solvents, it may also be necessary to bleed small amounts of oxygen into the torch to prevent carbon buildup in the torch.

## Calibration

The wavelength accuracy for ICP-AES detection must comply with the manufacturer's applicable operating procedures. The instrument must be standardized for quantification at time of use. Due to the inherent differences between the types of instruments available, there is no general "system suitability" procedure that may be employed. Tests recommended by the instrument manufacturer for a given ICP-AES instrument should be followed. These may include, but are not limited to, use of a multi-element wavelength calibration using a reference solution, internal mercury ( Hg ) calibration, and peak search. Perform system checks in accordance with the manufacturer's recommendations.

Because ICP-AES is a technique that is generally considered to be linear over a range of $10^{6}$ to $10^{8}$ orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a standard curve. It is possible to calibrate with a blank and a single standard once a method has been developed and is in routine use. For new methods, it is advisable that suitable linearity be demonstrated throughout the range of test measurements to be performed. An appropriate blank solution and standards that bracket the expected
range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration. However, it may not always be possible to analyze a bracketing standard when an analysis is performed at or near the detection limit. This is acceptable. The number and concentration of standard solutions used should be based on the analyte in question, the desired sensitivity, and the sample matrix. Use regression analysis of the standard plot to evaluate the linearity of detector response, and individual monographs may require criteria for the residual error of the regression line. Optimally, a correlation coefficient of not less than 0.99 , or as indicated in the individual monograph, should be demonstrated for the working standard curve. Here, too, however, the nature of the sample matrix, the analyte(s), the desired sensitivity, and the type of instrumentation available may dictate a poorer correlation coefficient than 0.99 . The analyst should use caution when proceeding with such an analysis, and should use additional working standards.

To demonstrate the stability of the system over the analysis time since initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals throughout the analysis of the sample set. Appropriate intervals may be as deemed adequate by the analyst, based on the analysis being performed. The reassayed standard should agree with its theoretical value to within $\pm 10 \%$ for single-element analyses when analytical wavelengths are between 200 and 500 nm , or concentrations are $>1 \mu \mathrm{~g}$ per mL . The reassayed standard should agree with its theoretical value to within $\pm 20 \%$ for multi-element analyses, when analytical wavelengths are $<200 \mathrm{~nm}$ or $>500 \mathrm{~nm}$, or at concentrations $<1 \mu \mathrm{~g}$ per mL . In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

## Procedure

Follow the procedure as directed in the individual monograph for the instrumental parameters. Due to differences in manufacturers' equipment configurations, the manufacturer's suggested default conditions may be used and modified as needed. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions, and adjustments of operating conditions may be necessary. Alternate conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Data collected from a single sample introduction are treated as a single result. This result may be the average of data collected from replicate sequential readings from a single solution introduction of the appropriate standard or sample preparations. Sample concentrations are calculated versus the working standard curve generated by plotting the detector response versus the concentration of the analyte in the standard preparations. This calculation is normally performed by the instrument.

The method of standard additions or internal standards may be employed for situations where matrix interferences would result in an inaccurate analyte determination. The method of standard additions involves adding a known concentration of the analyte element to the sample at several concentration levels. The instrument response is plotted against the concentration of the added analyte element, and a linear regression line is drawn through the data points. The absolute value of the $x$-intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

## ICP-MS

When an inductively coupled plasma utilizes a mass spectral detection system, the technique is referred to as inductively coupled plasma-mass spectrometry (ICP-MS). In
this technique, analyte detection is dependent on the masses of the various elemental components of a sample. ICP-MS is an elemental technique, whereby, due to the heat intensity of the plasma source, a sample is, theoretically, reduced to its ionic components. As is the case with ICP-AES, due to differences in technology, a wide variety of ICP-MS instrumentation systems are available.

The systems most commonly in use are quadrupole-based systems. Gaining in interest is time-of-flight ICP-MS. Although still not in widespread use, this approach may see greater use in the future. Additionally, high-resolution instruments are also available.

Regardless of instrument design or configuration, ICPMS is a technique that provides a quantitative measurement of the components of the sample. Ions are generated from the analyte atoms by the plasma. The analyte ions are then extracted from the plasma using the sampling cone. The skimmer cone, located behind the sampling cone "skims" the ions as they emerge from the sampling cone, where they are then passed into the mass spectrometer. The mass spectrometer separates the ions in a magnetic field according to their mass-to-charge ( $\mathrm{m} / \mathrm{z}$ ) ratios. The ICP-MS has a mass range up to 240 atomic mass units (amu). Depending on the equipment configuration, sample adducts with diluents or their decomposition products, oxides, and multiply-charged element ions produced within the plasma may increase the complexity of the resulting mass spectra. Interferences can be minimized by appropriate optimization of operational parameters, including gas flow (nebulizer, plasma, and auxiliary gas flow rates), sample flow, RF power, extraction lens voltage, etc., or through the use of collision or reaction cells, or cool plasma operation, if available on a given instrument. Unless a laboratory is generating or examining isotopes that are not naturally occurring, a list of naturally occurring isotopes will provide the analyst with acceptable isotopes for
analytical purposes. Additionally, tables of commonly found interferences and polyatomic isobaric interferences and correction factors may be used.

ICP-MS is generally more sensitive than ICP-AES. The ability of a mass spectrometer to monitor a single ion of a specific mass/charge ratio is a major advantage of ICP-MS for determination of very low analyte concentrations or when elimination of matrix inferences is required. Analytes can often be detected at the parts per trillion (ppt) level using ICP-MS.

The selection of the analytical mass to use is critical to the success of an analysis, regardless of instrument design. Though some masses are often considered to be the primary analytical masses, because there can be a tremendous variety of sample matrices, the recommendation of a specific mass for a given element is not possible. Selection of an analytical mass is always considered in the context of the sample matrix, the type of instrument being used, and the sensitivity required. Analysts might first choose to start with masses recommended by the manufacturer of their particular instrument and select alternate masses based on manufacturer's recommendations or published tables of naturally occurring isotopes.

Optimization of an ICP-MS method is also highly dependent on the plasma parameters and means of sample introduction. Forward power, gas flow rates, and torch position may all be optimized to provide the best signal. When organic solvents are used, it is often necessary to use a higher forward power setting than would be used for aqueous solutions and to reduce the nebulizer flow rate. Additionally, when using organic solvents, it may be necessary to titrate small amounts of oxygen into the auxiliary gas to prevent carbon build-up in the torch. The use of a platinum-tipped sampling or skimmer cone may also be required to reduce cone degradation with some organic solvents.

## Calibration

The mass spectral accuracy for ICP-MS detection must be in accordance with the applicable operating procedures. The instrument must be standardized for quantification at time of use. Due to the inherent differences between the types of instruments available, there is no general "system suitability" procedure that may be employed. Analysts should refer to the tests recommended by the instrument manufacturer for a given ICP-MS instrument. These may include, but are not limited to, tuning on a reference mass or masses, peak search, and mass calibration. Perform system checks recommended by the instrument manufacturer.

Because ICP-MS is a technique that is generally considered to be linear over a range of $10^{6}$ to $10^{8}$ orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a standard curve. It is common practice to calibrate with a blank and a single standard, once a method has been developed and is in routine use. For new methods, it is advisable that suitable linearity be demonstrated through the range of test measurements to be performed. An appropriate blank solution and standards that bracket the expected range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration. The number and concentration of standard solutions used should be based on the analyte in question, the desired sensitivity, and the sample matrix and should be left to the discretion of the analyst. Optimally, a correlation coefficient of not less than 0.99 , or as indicated in the individual monograph, should be demonstrated for the working standard curve. Here, too, however, the nature of the sample matrix, the analyte, the desired sensitivity, and the type of instrumentation available may dictate a poorer correlation coefficient than 0.99 . The analyst should use caution when proceeding with such an analysis and should use additional working standards.

To demonstrate the stability of the system over the analysis time since initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals through the analysis of the sample set. Appropriate intervals may be established as after every fifth or tenth sample, or as deemed adequate by the analyst, based on the analysis being performed. The reassayed standard should agree with its theoretical value to within $\pm 10 \%$ for single-element analyses when analytical masses are free of interferences and when concentrations are $>1 \mathrm{ng}$ per mL . The reassayed standard should agree with its theoretical value to within $\pm 20 \%$ for multi-elemental analyses, or when concentrations are $<1 \mathrm{ng}$ per mL . In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

## Procedure

Follow the procedure as directed in the individual monograph for the detection mode and instrument parameters. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions, and adjustments of operating conditions may be necessary. Alternate conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Due to differences in manufacturers' equipment configurations, the analyst may wish to begin with the manufacturer's suggested default conditions and modify them as needed. Data collected from a single sample introduction are treated as a single result. Data collected from replicate sequential readings from a single solution introduction of the appropriate standard or sample preparations should be averaged as a single result. Sample concentrations are calculated versus the working standard curve generated by plotting the detector
response versus the concentration of the analyte in the standard preparations. With modern instruments, this calculation is normally performed by the instrument. Data collected from two or three sequential readings from a single solution introduction of the appropriate standard or sample preparations is averaged as a single result. Sample concentrations are calculated versus the working standard curve generated by plotting the detector response versus the concentration of the analyte in the standard preparations. With modern instruments, this calculation is performed by the instrument.

The method of standard additions may be employed for situations where matrix interferences would result in an inaccurate analyte determination. This method involves adding a known concentration of the analyte element to the sample at several concentration levels. The instrument response is plotted against the concentration of the added analyte element and a linear regression line is drawn through the data points. The absolute value of the $x$-intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

## GLOSSARY

AUXILIARY GAS: The auxiliary gas is used to "lift" the plasma off of the surface of the torch, thereby preventing melting of the intermediate tube and the formation of carbon and salt deposits on the inner tube.

AXIAL VIEWING: A configuration of the plasma for AES where the plasma is directed toward the spectrometer optical path, also called "end-on."

COLLISION CELL: A design feature on ICP-MS instruments. Collision cells are used to eliminate or minimize interferences from argon and facilitate the analysis of elements that might be affected by those interferences.

COOLANT OR PLASMA GAS: The coolant gas is the main gas supply for the plasma.

COOL PLASMA: Plasma conditions used for ICP-MS that result in a plasma that is cooler than normally used for an analysis. This is achieved by using a lower forward power setting and is used to help minimize isotopic interferences caused by argon.

FORWARD POWER: The number of watts used to ignite and sustain the plasma during an analysis. Forward power requirements may vary, depending on sample matrix and analyte.
INTERNAL STANDARD: An element in an analysis added to or present in the same concentration in blanks, standards, and samples to act as an intensity reference for the analysis. An internal standard may be used for ICP-AES work and should always be used for quantitative ICP-MS analyses.

Lateral viewing: See also Radial viewing.
$m$ : The ion mass of interest.
mULTIPLY-CHARGED IONS: Atoms that, when subjected to high-ionization energies, can form doubly or triply charged ions $\left(\mathrm{X}^{++}\right.$or $\mathrm{X}^{+++}$, etc.) such that when detected by MS, the apparent mass will be $1 / 2$ or $\frac{1}{3}$ that of the atomic mass.

NEBULIZER: Used to form a consistent sample aerosol that mixes with the argon gas.
NEBULIZER GAS: One of three regions of argon gas flow in a torch. The nebulizer gas is used to help create a fine mist of the sample when using solution nebulization. This fine mist is then directed through the center tube of the torch and into the plasma.
plasma gas: See also Coolant gas.
RADIAL VIEWING: A configuration of the plasma for AES where the plasma is directed orthogonal to the spectrometer optic path, also called "side-on viewing." See also Lateral viewing.

REACTION CELL: Similar to collision cell. Designed to reduce or eliminate interferences.
SAMPLING CONE: A metal cone (usually nickel, aluminum, or platinum-tipped) with a small opening, through which ionized sample flows after leaving the plasma.

SEQUENTIAL: A type of detector configuration for AES where discrete emission lines are observed by scanning across the spectral range using a monochromator. SIMULTANEOUS: A type of detector configuration for AES where all selected emission lines are observed at the same time, using a polychromator, offering increased analysis speed for multi-element samples.

SKIMMER CONE: A metal cone, with an opening that is smaller than that of the sampling cone, through which ionized sample flows after leaving the sampling cone and prior to entering the vacuum region of an ICP-MS.

STANDARD ADDITIONS: A method used to determine the actual analyte concentration in a sample when viscosity effects may cause erroneous results.

TORCH: A series of three concentric quartz tubes in which the ICP is formed.

## GENERAL CHAPTERS

## General Information

## Briefing

$\langle 1265\rangle$ Written Prescription Drug Information-Guidelines, page 1224 of $P F 29(4)$ [July-Aug. 2003]. It is proposed to revise this general information chapter to include criteria from the "Keystone Action Plan" and related references to provide consistency with other regulatory requirements. Additional editorial revisions have been made to clarify the text.
(PSD: C. Okeke) RTS-39753-1

## Add the following:

## <1265 $\rangle$ WRITTEN PRESCRIPTION DRUG INFORMATION—GUIDELINES

The purpose of these guidelines-comprising format, content, and accessibility of prescription drug leaflets-is to help ensure that leaflets are useful. In this context, "useful" means that recipients receive, understand, and are motivated to apply written information about their medicines to achieve maximum benefit and minimize harm. Dispensers, prescribers, health-care providers who counsel patients about their medicines, and the patients themselves are intended to be the primary beneficiaries for these guidelines.

## CRITERIA

## (from the Keystone Action Plan ${ }^{1}$ )

Written prescription medicine information should be based on the following criteria:

1. Scientifically accurate,
2. Unbiased in content and tone,
3. Sufficiently specific and comprehensive,
4. Presented in an understandable and legible format that is readily comprehensible to consumers,
5. Timely and up-to-date, and
6. Useful.

## FORMAT GUIDELINES

1. Group all information from the same category, using brief, clear titles and bullets or subheadings as needed. Avoid symbols and subheadings not directly connected to the information they mark.
2. Be consistent in the placement and labeling of categories of information in all leaflets.
3. Provide information at the sixth-grade reading level or below, if possible (never above eighth-grade level). Do not exclude information to achieve a lower reading level.
4. Use simple, common, accurate terms (for example, use "noise in the ears", not "tinnitus").

[^108]5. Use direct language that avoids words with opposite meanings (for example, use "decrease blood pressure", not "increase low blood pressure effect").
6. Provide reasons for instructions (for example, "take with food to avoid upset stomach").
7. Emphasize the most important information. Clearly distinguish warnings from instructions or from other text that may be misinterpreted as warnings.
8. Accompany each pictogram, if used, with corresponding text placed close to the pictogram. Use the simplest pictograms possible. For pictograms intended to prompt patients to ask questions or inform health-care providers, add text such as "Tell Doctor" or "Ask Pharmacist".
9. Make text readable by using 12-point or larger type, both uppercase and lowercase letters, an easy-to-read font (for example, a sams serif font), and adequate space between lines and paragraphs. To call attention to important information, use a larger, boldface type.
10. Evaluate format by performing tests of readability, comprehension, memory, problem solving, and behavioral efficacy and intention, using representative samples of the target population.

## CONTENT GUIDELINES

1. Provide enough detail to facilitate correct use, achieve maximum benefit, and minimize harm, including a statement that identifies activities (such as driving or sunbathing) that the patient should avoid.
2. Write text that is unbiased in content and tone and scientifically accurate. The uses described should be consistent with FDA-approved labeling or otherwise permitted by FDA, or should appear in federally recog-
nized drug compendia. Distinguish unlabeled from labeled use. For labeled use, state the date on which-it was approved.
3. For drugs sold under a brand name, provide both brand and generic names and include a pronunciation guide for each.
4. Describe the drug and its dosage form. Include indications and contraindications, specific directions for use, what to do if a dose is missed, and what to do in the event of an overdose or poisoning.
5. Do not use abbreviations.
6. Indicate the intended type of benefit (for example, "cure", "prevention", "to help relieve symptoms"). Indicate how-and how soon-the patient should recognize the benefit and what to do if none is observed.
7. Give a balanced evaluation of risks and benefits.
8. List side effects, in order of severity, withestimated frequency and action to be taken if one or more oceur such as "serious," "most common," and other similar type groupings. It may not be appropriate to provide sufficient detail for the patient to be able to monitor serious or frequently eceuring common side effects. If ne-side effects are known, say-so. Provide guidance to consult the doctor or pharmacist, and indicate that all the side effects are not listed.
9. List drug drug, drug food, drug lab-test, and drug disease interations. If no such interactions are known, say so. If appropriate, include botanieats, dietary supplements, and over the-counter medieines, as well as other preseription medieines. If known, inelude estimated severity of interactions(mild, moderate, or severe). one-or most impertant interactions, as deseribed earlier. sufficiently specific and comprehensive information
that includes the provision of all important risk information. Patients should be advised to be sure to inform the provider about all the medicines they are taking.
10. Indicate the potential for therapeutic duplication if the drug is available under multiple names or over-thecounter, or if the active ingredient is contained in other products.
11. If known, include a statement concerning the safety of use in the presence of other conditions and during pregnancy or breast-feeding. Direct affected patients to discuss their condition with health-care providers. If the safety of use during pregnancy or breast-feeding has not been established, say so.
12. State whether safety and efficacy have been established in pediatric, geriatric, and other special populations. and, if so, for what Patients should be encouraged to discuss with their health-care provider any recommendations for dosage adjustment.
13. Illustrate information with diagrams when appropriate. Label the diagram components (for example, device parts) if they are not obvious. The words on the label should be prominently placed thereon with such conspicuousness and in such terms as to render them likely to be read and understood by the ordinary individual under customary conditions of purchase and use.
14. Include the following:
a. a warning to keep out of the reach of young
ehildren
b. a statement about the impertance of adhering
to-dosing instructions
e. a. A statement that the product is to be used only by the person for whom it was prescribed, \&. b. Storage information,
e. c. A completeness disclaimer advising the patient to discuss this issue with the health-care provider,
f. a direction to check the expiration or beyonduse date
15. The publisher of the leaflet and the date the leaflet was developed or revised,
h. e. Sources of in-depth information and answers to questions, and f. f. Other relevant general statements.
16. The patient should be advised about risks of developing dependence on, or tolerance to, the medications.

## ACCESSIBILITY GUIDELINES

1. Write text that is relevant to the intended use of the drug.
2. Design the leaflets to be easy to recognize, consistent in format, and easy to store and retrieve.
3. Supplement the leaflets with oral counseling of patients, including children, the elderly, and caregivers.
4. Include a statement asking the patient to reread the leaflet.
5. Distribute the leaflets with all prescription medicines to consumers (namely, persons independently responsible for any aspect of medicine use or for giving medicines to others).
6. Produce leaflets in Spanish, as win English; English, or other languages; and establish criteria for producing them in other languages and for special populations (for example, children, visually handicapped, etc.). [NOTE-Ideally, prescription drug information leaflets would be customized for the patient's condition and for other relevant information (for example, gender, age, or physical limitations), and would be
available in the patient's primary language. Currently, such customization is neither feasible nor practical, but it remains a goal. $]_{\square 1 S}$ (USP28)

## REAGENTS, INDICATORS, AND SOLUTIONS Reagent Specifications

## BRIEFING

Ammonium Pyrrolidinedithiocarbamate. This new reagent is used in the preparation of the Standard solutions and the Test solution in the test for Limit of lead under the proposed new monograph for Galactose, published in PF 30(2) [Mar.-Apr. 2004].
(HDQ: M. Marques) RTS-40995-1

## Add the following:

-Ammonium Pyrrolidinedithiocarbamate (1-pyrrolidinecarbodithioic acid, ammonium salt), $\mathrm{C}_{5} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{~S}_{2}$ 164.29 [5108-96-3]—Use a suitable grade. 1 (USP28)

## BRIEFING

Anion-exchange Resin, Styrene-Divinylbenzene. This new reagent is used in the test for Molar ratio of sulfate to carboxylate under Enoxaparin Sodium, which appeared in PF 29(6) [Nov.Dec. 2003].
(HDQ: M. Marques) RTS-41081-1

## Add the following:

-Anion-exchange Resin, Styrene-DivinylbenzeneStrongly basic, cross-linked resin containing quaternary ammonium groups and about $8 \%$ of divinylbenzene. It is available in the chloride form in the 50 - to 100 -, 100 - to 200-, and 200- to 400-mesh sizes. It can be converted to the hydroxide form by regeneration with a sodium hydroxide solution (5 in 100). Insoluble in water, in methanol, and in acetonitrile. Suitable for use in column chromatography.
[NOTE-A suitable resin is "Dowex 1 X 8 ", produced by Dow Chemical Co. (www.dow.com) and available through Sigma-Aldrich (www.sigma-aldrich.com).] $]_{\text {■S (USP28) }}$

## BRIEFING

Cation-Exchange Resin, Styrene Divinylbenzene USP 27 page 2674. It is proposed to revise the particle size ranges for this reagent used in the test for Molar ratio of sulfate to carboxylate under Enoxaparin Sodium, which appeared in PF 29(6) [Nov.Dec. 2003]. Minor editorial style changes have also been made.
(HDQ: M. Marques) RTS-41081-2

## Change to read:

Cation-Exchange Resin, Styrene-Divinylbenzene-A strongly acidic, cross-linked sulfonated resin containing about $2 \%$ of divinylbenzene. It consists of white to light tan colored beads which may be relatively free flowing.

- 1 (USP28)

It is available in the hydrogen form in the 25 , 50, 45 and 80 to 270 mesh sizes.
-50- to 100 -, 100 - to 200 -, and 200- to $400-$ mesh sizes.■1S (USP28)
It can be regenerated to the hydrogen form by treating with a hydrochloric acid solution (5 in 100). For satisfactory regeneration, a contact time of at least 30 minutes is required after which it must be washed free of excess acid. It is insoluble in water, methanol, and acetonitrile. Suitable for use in column chromatography.

Moisture content of fully regenerated and expanded resinTransfer 10 to 12 mL of the resin (as received) to a flask, and convert it completely to the hydrogen form by stirring with 150 mL of hydrochloric acid solution ( 5 in 100) for not less than 30 minutes. Decant the acid, and wash the resin in the same manner with water until the wash water is neutral to litmus ( pH 3.5 ).

Transfer 5 to 7 mL of the regenerated resin to a glass filtering crucible, and remove only the excess surface water by very careful suction filtration. Transfer the conditioned resin to a tared weighing bottle, and weigh. Dry in a vacuum oven at a pressure of 50 mm of mercury at $100^{\circ}$ to $105^{\circ}$ for 16 hours. Transfer from the vacuum oven to a desiccator, cool to room temperature, and weigh again. The loss in weight is between $75 \%$ and $83 \%$.

Total wet volume capacity-Transfer 3 to 5 mL of the regenerated, undried (See Moisture content above) resin to a $5-\mathrm{mL}$ graduated cylinder, and fill it with water. Remove any air bubbles from the resin bed with a stainless steel wire, and settle the resin to its minimum volume by tapping the graduated cylinder. Record the volume of the resin.

Transfer the resin to a $400-\mathrm{mL}$ beaker. Add about 5 g of sodium chloride, and titrate, stirring well, with 0.1 N sodium hydroxide to the blue end-point of bromothymol blue ( pH 7.0 ).

$$
(\text { net } \mathrm{mL} \mathrm{NaOH} \times N) /(\mathrm{mL} \text { of resin })=\mathrm{mEq} / \mathrm{mL}
$$

The total wet volume capacity of the resin is more than 0.6 mEq per mL .

Wet screen analysis-The purpose of this test is to properly identify the mesh size of the resin. To obtain an accurate screen analysis would require special apparatus and technique.

Add 150 mL of resin to 200 mL of water in an appropriate bottle, and allow it to stand at least 4 hours to completely swell the resin.

Transfer by means of a graduated cylinder 100 mL of settled and completely swollen resin to the top screen of a series of the designated U. S. Standard $20.3-\mathrm{cm}$ brass screens. Thoroughly wash the resin on each screen with a stream of water until the resin is completely classified, collecting the wash water in a suitable container. Wash the beads remaining on the respective screens back into the $100-\mathrm{mL}$ graduate, and record the volume of settled resin on each screen. At least $70 \%$ of the resin will be within the specific mesh size.

- [NOTE—A suitable resin is "Dowex 50WX2" produced by Dow Chemical Co. (www.dow.com) and also available through Sigma-Aldrich (www.sigma-aldrich. com).] $]_{\text {1S (USP28) }}$

## Briefing

## Briefing

p-Chlorophenol, USP 27 page 2676; 4-Chlorophenol, USP 27 page 2677. It is proposed to delete the entry for $p$-Chlorophenol because of its redundancy and to revise the entry for 4-Chlorophenol to reflect the specifications of products currently available on the market.
(HDQ: M. Marques) RTS-41153-1

## Delete the following:

 erystalline selid, having a characteristic oder. Sparingly soluble in water, very soluble-in aeetone, in benzene, in ether, and in methanel.
Assay Transfer about 200 me, aceurately weighed, to a 100 mL beaker, add 25 mL of water, swinl to dissolve, and cantiously add, dreprise, sufficient sodium hydrexide solution to ensure eधmplete selution of the specimen. Transfer the-selution to a glass stoppered, 500 mL flask, using water to rinse the beaker, and dilute with water to about 100 mL . Add 25.0 mL of 0.1 Npe fascium bromide bromate VS and 10 mL of hydrechleric acid, im mediately insent the stopper in the flask, and swirl vigorously for 2 t-3 minutes. Remove the-stopper, quiekly ade 5 mL of petassitm iodide selution ( 1 in 5), taking care to avoid loss of bromine, im mediately insert the-stopper in the flask, and shake theroughly for about 1 minute. Remove the-stopper, rinse-it and the neek of the flask with water, and then titrate with 0.1 N sodium thiosulfate VS , adding 3 mL of starch TS as the endpeint is appreached. Each mL of 0.1 N petassium bremide bromate consumed is equivalent to 6.43 ma of $\mathrm{C}_{6} \mathrm{H}_{5} \Theta \mathrm{Cl}$. Not less than $99 \%$ is fount.

Melting range $\langle 744\rangle$ - between $42^{\circ}$ and $44^{\circ}$.
Boiling range (Reagent test) Not less than-90\% distils between $218.5^{\circ}$ and $221.5^{\circ} \mathrm{M}$ 1S (USP28)

## Change to read:

Dimethyl Sulfoxide-See Methyl Sulfoxide.
-(Methyl Sulfoxide), $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{SO}-78.13-U s e ~ A C S ~ r e a g e n t ~$ grade methyl sulfoxide. 1 (USP28)

## Briefing

Hexane, Solvent, USP 27 page 2688. It is proposed to update the information regarding this reagent to reflect the product currently available on the market.
(HDQ: M. Marques) RTS-41114-2

## Change to read:

Hexane, Solvent (Petrolen Benzin; Petrotenn Ether)
-(Petroleum Benzin; Petroleum Ether, Ligroin) 1 (USP28)

- Clear, volatile liquid, having an ethereal or faint, petroleum-like odor. Practically insoluble in water; soluble in absolute alcohol. Miscible with ether, with chloroform, with benzene, and with most fixed and volatile oils.
Caution-It is dangerously flammable. Keep it away from flames and store in tight containers in a cool place.
Appertar Pour 100 mL , previendy well mixed in its original container, into 100 mL color compaisen tube, and eompare vith standard, in similar tube, containing 2 mb of platimme cobalt TS in similar wolume: the liequids are equally elear and free from suspended matter or sediment and when viewed aeress the eolumns by transmitted light, the test specimen is not darker in eolor than the standard.

Odor Its oder is not disagreeable or suggestive of mereaptans or thiophene.
Pistilling range (Rengent test) Distil $100 \mathrm{~mL}:$ none distils be low $30^{\circ}$ and not less than $100^{\circ}$ distils between $30^{\circ}$ and $60^{\circ}$.

Residte en evaporation- Evaporate $150 \mathrm{~mL}(100 \mathrm{~g})$ on a stemm bath, and dry at $105^{\circ}$ for 30 minutes: the residue weighs not more than $1 \mathrm{mg}(0.091 \%)$.

Acidity Shake 10 mL with 5 mL of water for 2 minttes, and allow the layers to separate: the water layer does not tarn blue lit mens red within 15 -seeonds.

Heary oils and fats Gradually pour 10 mL ont the center of a elean filter paper: there is no disagreeable odor and no greasy stain risible on the paper after it has stood for 30 minutes.

■Use ACS reagent grade Petroleum Ether.■1S (USP28)

## Briefing

Hexane, Solvent, Chromatographic, USP 27 page 2689. It is proposed to update the information regarding this reagent to reflect the product currently available on the market.
(HDQ: M. Marques) RTS-41113-1

## Change to read:

Hexane, Solvent, Chromatographic-It eomplies with the speeifications for Hexane, Solvent, and meets the requirements of the following additional test.

Speetral purity Measure in a 1 em cell at 300 nm, with a sui-table-spectrophemeter, against air as the blank: its absorbance is net mere than 0.08 .

- Use ACS HPLC reagent grade.■1S (USP28)

## Briefing

Hexanes (suitable for use in UV spectrophotometry), USP 27 page 2689 . It is proposed to update the information regarding this reagent to reflect the product currently available on the market.
(HDQ: M. Marques) RTS-41114-1

## Change to read:

Hexanes (suitable for use in UV spectrophotometry); usually a mixture of several isomers of hexane $\left(\mathrm{C}_{6} \mathrm{H}_{14}\right)$, predominantly $n$ hexane, and methylcyclopentane $\left(\mathrm{C}_{6} \mathrm{H}_{12}\right)$-Use ACS
$\boldsymbol{■}_{\text {spectrophotometric }}{ }_{\text {■1S (USP28) }}$
reagent grade.

## BRIEFING

Isovaleric Acid. This new reagent is used to prepare the Internal standard solution in the test for Acetyl and butyryl content under Cellaburate (Cellulose Acetate Butyrate), appearing on page 597 of PF 30(2) [Mar.-Apr. 2004].
(HDQ: M. Marques) RTS-41117-1

## Add the following:

-Isovaleric Acid (3-Methylbutanoic Acid, Isovalerianic Acid, Isopropylacetic Acid), $\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}_{2}-\mathbf{1 0 2 . 1 3}$ [503-74-2]
—Use a suitable grade.■1S (USP28)

## Briefing

Methoxyphenylacetic Acid. This new reagent is used in Identification test $B$ under Sodium Caprylate, which appears elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40974-1

## Add the following:

-Methoxyphenylacetic Acid ( $\alpha$-Methoxyphenylacetic Acid), $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3}-\mathbf{1 6 6 . 2}$ [1701-77-5]—Use a suitable grade.■1S (USP28)

## Briefing

Methyl Iodide, USP 27 page 2695. It is proposed to specify that ferric ammonium sulfate TS is to be used in the Assay for this reagent.
(HDQ: M. Marques) RTS-41083-3

## Change to read:

Methyl Iodide, $\mathrm{CH}_{3} \mathrm{I}-141.94$ - Colorless, heavy, transparent liquid. Slightly soluble in water. Miscible with alcohol, with ether, and with solvent hexane. Turns brown on exposure to light as a result of liberation of iodine.

Assay-Add 1 mL to a $100-\mathrm{mL}$ volumetric flask tared with 10 mL of alcohol. Weigh again, add alcohol to volume, and mix. Pipet 20 mL into a glass-stoppered flask, and add 50.0 mL of 0.1 N silver nitrate VS and 2 mL of nitric acid. Insert the stopper immediately, shake frequently during 2 hours, and allow to stand in the dark overnight. Shake again during 2 hours, then add 50 mL of water and 3 mL of ferric ammonium sulfate
-TS, $\quad$ 1S (USP28)
and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 14.19 mg of $\mathrm{CH}_{3} \mathrm{I}$ : not less than $98.5 \%$ is found.

Boiling range (Reagent test)-Distill 50 mL into a chilled, partly closed receiver: not less than 48 mL distills between $41.5^{\circ}$ and $43^{\circ}$.

Density: between 2.270 and 2.285 .
Residue on evaporation-Evaporate $4 \mathrm{~mL}(10 \mathrm{~g})$ on a steam bath, and dry the residue at $105^{\circ}$ for 1 hour: the residue weighs not more than $1 \mathrm{mg}(0.01 \%)$.

Acidity-Shake 3 mL with 5 mL of water for 30 seconds, and immediately draw off the lower layer: the aqueous layer is neutral to litmus, and when 1 mL of silver nitrate TS is added, it shows not more than a slight opalescence.

## BRIEFING

Methyl Sulfoxide, USP 27 page 2696. Because the use of the name "dimethyl sulfoxide" for methyl sulfoxide is being standardized throughout the $U S P-N F$, it is proposed to cross-reference the reagent methyl sulfoxide to dimethyl sulfoxide.
(HDQ: M. Marques) RTS-41082-8

## Change to read:

Methyl Sulfoxide (Pimethyl Sulfoxide), $\left(\mathrm{CH}_{2}\right)_{2} \mathrm{SO} \quad 78.13-$ Use ACS reagent grade.

- —See Dimethyl Sulfoxide.■1S (USP28)

## Briefing

Nonionic Wetting Agent. It is proposed to add this new reagent, which is used in the monographs for Ringer's Injection, Sodium Acetate Injection, and Chlorophyllin Copper Complex Sodium.
(HDQ: M. Marques) RTS-40997-1

## Add the following:

-Nonionic Wetting Agent-Use a suitable amphoteric surfactant.
[NOTE-A suitable grade is commercially available as Triton X-100 or Octoxynol 9.] $]_{\text {1S (USP28) }}$

## Briefing

Sodium 1-Heptanesulfonate, USP 27 page 2710 and page 315 of PF 30(1) [Jan.-Feb. 2004]; Sodium 1-Hexanesulfonate, USP 27 page 2710 and page 315 of $P F 30$ (1) [Jan. - Feb. 2004]. It is proposed to correct the previously proposed synonyms of these two reagents.
(HDQ: M. Marques) RTS-40980-1

## Change to read:

Sodium 1-Heptanesulfonate (1-Hexald),
-(1-Heptanesulfonic acid sodium salt) $\mathbf{1 S}_{1 \mathrm{~S}}$ (USP28) $\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{NaO}_{3} \mathrm{~S}-\mathbf{2 0 2 . 2 5}$ - Use a suitable grade.

## Briefing

Sodium 1-Hexanesulfonate, USP 27 page 2710 and page 315 of PF 30(1) [Jan.-Feb. 2004]-See briefing under Sodium 1-Heptanesulfonate.
(HDQ: M. Marques) RTS-40980-1

## Change to read:

Sodium 1-Hexanesulfonate, (1-Pentic
 $\mathrm{C}_{6} \mathrm{H}_{13} \mathrm{NaO}_{3} \mathrm{~S}-\mathbf{1 8 8 . 2 2}$-Use a suitable grade.

## Briefing

Tropic Acid. This new reagent is used to prepare the System suitability preparation in the Assays under Hyoscyamine Sulfate Elixir and Hyoscyamine Sulfate Tablets, which appear elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40539-5

## Add the following:

-Tropic Acid, $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3}-\mathbf{1 6 6 . 1 8}$ [529-64-6]—Use a sui-
table grade.■1S (USP28)

## Volumetric Solutions

## Briefing

Lead Perchlorate, Tenth-Molar ( 0.1 M ). This new reagent is used in the test for Content of sulfate under Indinavir Sulfate, which appears elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-41029-1

## Add the following:

■Lead Perchlorate, Tenth-Molar (0.1 M)

$\mathrm{Pb}\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}, 460.15$
46.01 g in 1000 mL

Dissolve 46 g of lead perchlorate in water, and dilute with water to 1000.0 mL . Accurately weigh about 150 mg of sodium sulfate, previously dried at $105^{\circ}$ for 4 hours, and dissolve in 50 mL of water. Add 50 mL of a mixture of water and formaldehyde (1:1), and stir for about 1 minute. Determine the end point potentiometrically using a lead ion selective electrode. Perform a blank determination, and make any necessary corrections. Each 14.204 mg of sodium sulfate is equivalent to 1 mL of 0.1 M lead perchlorate. $\boldsymbol{m}_{1 S}$ (USP28)

## REFERENCE TABLES

## BRIEFING

Container Specifications for Capsules and Tablets, USP 27 page 2741, page 3166 of the First Supplement, and page 648 of PF 30(2) [Mar.-Apr. 2004].
(HDQ) RTS—37249-3; 39849-2; 40185-2

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the Packaging and storage requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

| Container Specifications for Capsules and Tablets |  | Monograph Title | Container Specification |  |

## Briefing

Description and Relative Solubility of USP and NF Articles, USP 27 page 2747, page 3166 of the First Supplement, page 5310 of PF 23(6) [Nov.-Dec. 1997], page 7017 of PF 24(5) [Sept.-Oct. 1998], page 8282 of $P F 25(3)$ [May-June 1999], page 8589 of $P F$ 25(4) [July-Aug. 1999], page 8917 of $P F$ 25(5) [Sept.-Oct. 1999], page 9254 of $P F$ 25(6) [Nov.-Dec. 1999], page 837 of $P F$ 26(3) [May-June 2000], page 1135 of $P F$ 26(4) [July-Aug. 2000], page 1385 of $P F$ 26(5) [Sept.-Oct. 2000], page 1907 of $P F$ 27(1) [Jan.Feb. 2001], page 2281 of PF 27(2) [Mar.-Apr. 2001], page 2839 of $P F$ 27(4) [July-Aug. 2001], page 3374 of $P F$ 27(6) [Nov.-Dec. 2001], page 554 of $P F 28(2)$ [Mar.-Apr. 2002], page 1236 of $P F$ 28(4) [July-Aug. 2002], page 1542 of $P F 28(5)$ [Sept.-Oct. 2002], page 1953 of PF 28(6) [Nov.-Dec. 2002], page 266 of PF 29(1) [Jan.-Feb. 2003], page 509 of $P F$ 29(2) [Mar.-Apr. 2003], page 812 of $P F$ 29(3) [May-June 2003], page 1262 of $P F$ 29(4) [July-Aug. 2003], page 1684 of $P F 29(5)$ [Sept.-Oct. 2003], page 2057 of PF 29(6) [Nov.-Dec. 2003], page 317 of PF 30(1) [Jan.Feb. 2004]; and page 650 of $P F 30(2)$ [Mar.-Apr. 2004].
(HDQ) RTS-39849-4; 39860-1; 40185-1; 40241-1; 409081; 40947-1; 40951-1; 40973-1; 41011-1

## Change to read:

Glyceryl Monostearate: White, wax like selid or as white, wax like-beads-or flakes.
-White to yellowish wax-like solid; or white to yellowish wax-like beads, flakes, or powder. 1 (USP28)
Slight, agreeable, fatty odor and taste. Is affected by light. Dissolves in hot organic solvents such as alcohol, minerals or fixed oils, benzene, ether, and acetone. Insoluble in water, but it may be dispersed in hot water with the aid of a small amount of soap or other suitable surface-active agent. NF category: Emulsifying and/or solubilizing agent.

## Change to read:

## Malathion: Yellow deep brown liquid,

- Clear, colorless, or slightly yellowish liquid, ${ }^{1 S}$ (USP28) having a characteristic odor. Congeals at about $2.9^{\circ}$. Slightly soluble in water. Miscible with alcohols, with esters, with ketones, with ethers, with aromatic and alkylated aromatic hydrocarbons, and with vegetable oils.

## Add the following:

-Maltol: A white, crystalline powder having a characteristic caramel-butterscotch odor, suggestive of a fruity-strawberry aroma in dilute solution. One gram dissolves in about 82 mL of water, in 21 mL of alcohol, in 80 mL of glycerin, and in 28 mL of propylene glycol. NF category: Flavors and perfumes.■1S (USP28)

## Add the following:

-Mirtazapine: White to creamy white, crystalline powder. Freely soluble in methanol and in toluene; soluble in ethyl ether; sparingly soluble in $n$-hexane; practically insoluble in water. 1 IS (USP28)

## Add the following:

-Palmitic Acid: Hard, white, or faintly yellow, somewhat glossy crystalline solid, or white or yellowish white powder. It has a slight characteristic odor and taste. Soluble in alcohol, in ether, and in chloroform; practically insoluble in

## Add the following:

-Phenylephrine Bitartrate: White or almost white powder or colorless crystals. Freely soluble in water. 1 (USP28)

## Add the following:

-Sodium Caprylate: A white, crystalline powder. Very soluble or freely soluble in water; freely soluble in acetic acid; sparingly soluble in alcohol; practically insoluble in acetone.m (USP28)

## Add the following:

-Stavudine: White to off-white crystalline powder. Soluble in water, in dimethylacetamide, and in dimethyl sulfoxide; sparingly soluble in methanol, in ethanol, and in acetonitrile; slightly soluble in dichloromethane; insoluble in hexane. 1 (USP28)

## Add the following:

-Tolcapone: Yellow, fine powder or fine powder with lumps. Freely soluble in acetone and in tetrahydrofuran; soluble in methanol and in ethyl acetate; sparingly soluble in chloroform and in dichloromethane; insoluble in water and in $n$-hexane. $\quad$ 1S (USP28)

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

Urea C for Oral Solution-See PF Vol. 29 No. 2, page 441.
Urofollitropin-See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection-See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate-See PF Vol. 24 No. 3, page 6180.
Ursodiol-See PF Vol. 29 No. 1, page 128.
Ursodiol Capsules-See PF Vol. 29 No. 5, page 1589.
Valproic Acid Injection-See PF Vol. 26 No. 4, page 939.
Valsartan-See PF Vol. 29 No. 6, page 1996.
Valsartan Capsules-See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 6, page 2000.
Vancomycin Hydrochloride for Oral Solution-See PF Vol. 30 No. 1, page 193.
Vasopressin-See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide-See PF Vol. 30 No. 1, page 193.
Vecuronium Bromide for Injection-See PF Vol. 25 No. 4, page 8449.

Verapamil Hydrochloride-See PF Vol. 29 No. 5, page 1598.
Vitamin E-See PF Vol. 27 No. 5, page 3159.
White Lotion-See PF Vol. 30 No. 2, page 538.
Small Intestinal Submucosa Wound Matrix-See PF Vol. 30 No. 2, page 538.
Xylazine-See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Zidovudine-See PF Vol. 29 No. 6, page 2006.
Zidovudine Oral Solution-See PF Vol. 29 No. 6, page 2006.
Zileuton-See PF Vol. 29 No. 6, page 2006.
Zinc Gluconate-See PF Vol. 29 No. 3, page 683.
Zinc Sulfide Topical Suspension-See PF Vol. 30 No. 2, page 546.

## DIETARY SUPPLEMENTS

## MONOGRAPHS

Chaste Tree-See PF Vol. 30 No. 2, page 546.
Powdered Chaste Tree Extract-See PF Vol. 29 No. 4, page 1269.
Horse Chestnut-See PF Vol. 30 No. 2, page 550.
Powdered Horse Chestnut Extract-See PF Vol. 30 No. 2, page 550.
Chondroitin Sulfate Sodium-See PF Vol. 30 No. 1, page 197.
Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 200.
Red Clover-See PF Vol. 30 No. 2, page 550.
Powdered Red Clover Extract-See PF Vol. 30 No. 2, page 552.
Black Cohosh-See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh-See PF Vol. 28 No. 5, page 1460.

Powdered Black Cohosh Extract-See PF Vol. 28 No. 5, page 1461 .
Black Cohosh Tablets-See PF Vol. 28 No. 5, page 1462.
Docosahexaenoic Acid-See PF Vol. 26 No. 6, page 1648.
Docosahexaenoic Acid Capsules-See PF Vol. 26 No. 6, page 1651.
Docosahexaenoic Acid Oil—See PF Vol. 26 No. 6, page 1652.
Echinacea angustifolia-See PF Vol. 30 No. 2, page 552.
Powdered Echinacea angustifolia Extract-See PF Vol. 30 No. 2, page 554
Echinacea pallida-See PF Vol. 30 No. 2, page 555.
Powdered Echinacea pallida Extract-See PF Vol. 30 No. 2, page 556.

Echinacea purpurea Aerial Parts-See PF Vol. 30 No. 2, page 557. Echinacea purpurea Root-See PF Vol. 30 No. 2, page 561.
Powdered Echinacea purpurea Extract-See PF Vol. 30 No. 2, page 561.
Eleuthero-See PF Vol. 26 No. 6, page 1596.
Fish Oil Rich in Omega-3 Acids-See PF Vol. 29 No. 4, page 1272.
Fish Oil Rich in Omega-3 Acids Capsules-See PF Vol. 29 No. 4, page 1278.
Ginger Capsules-See PF Vol. 28 No. 3, page 814.
Powdered Ginkgo Extract-See PF Vol. 27 No. 2, page 2233.
Ginkgo Capsules-See PF Vol. 27 No. 2, page 2238.
Ginkgo Tablets-See PF Vol. 27 No. 2, page 2240.
American Ginseng-See PF Vol. 30 No. 2, page 563.
American Ginseng Capsules-See PF Vol. 30 No. 2, page 565.
American Ginseng Tablets-See PF Vol. 30 No. 2, page 567.
Powdered American Ginseng-See PF Vol. 30 No. 2, page 564.
Powdered American Ginseng Extract-See PF Vol. 30 No. 2, page 564.
Asian Ginseng-See PF Vol. 30 No. 2, page 569.
Asian Ginseng Capsules-See PF Vol. 30 No. 2, page 571.
Asian Ginseng Tablets-See PF Vol. 30 No. 2, page 573.
Powdered Asian Ginseng-See PF Vol. 30 No. 2, page 570.
Powdered Asian Ginseng Extract-See PF Vol. 30 No. 2, page 570 .
Glucosamine and Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 201.
Goldenseal-See PF Vol. 27 No. 2, page 2255.
Licorice-See PF Vol. 26 No. 5, page 1363.
Powdered Licorice Extract-See PF Vol. 30 No. 2, page 574.
Lutein-See PF Vol. 29 No. 2, page 470.
Lutein Preparation-See PF Vol. 29 No. 2, page 472.
Lycopene-See PF Vol. 30 No. 2, page 574.
Lycopene Preparation-See PF Vol. 30 No. 2, page 576.
Lycopene Tomato Extract-See PF Vol. 30 No. 2, page 578.
Milk Thistle Capsules-See PF Vol. 29 No. 2, page 479.
Minerals Capsules-See PF Vol. 28 No. 5, page 1543.
Minerals Tablets-See PF Vol. 28 No. 5, page 1543.
Pyridoxine Hydrochloride Injection-See PF Vol. 30 No. 2, page 583.
Powdered St. John's Wort Extract-See PF Vol. 30 No. 2, page 584.
Ubidecarenone Capsules-See PF Vol. 30 No. 1, page 202.
Valerian Capsules-See PF Vol. 27 No. 1, page 1825.
Oil- and Water-Soluble Vitamins Tablets-See PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Capsules-See PF Vol. 28 No. 5, page 1544.
Oil- and Water-Soluble Vitamins with Minerals Oral SolutionSee PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Tablets-See PF Vol. 30 No. 2, page 585.
Oil-Soluble Vitamins Tablets-See PF Vol. 28 No. 5, page 1547.

## GENERAL CHAPTERS

## General Tests and Assays

## General Requirements for Tests and Assays

〈1〉 Injections－See PF Vol． 29 No．3，page 707.
〈11〉 USP Reference Standards－See PF Vol． 23 No．6，page 5180； PF Vol． 24 No．5，page 6925；PF Vol． 25 No．5，page 8893；PF Vol． 26 No．1，page 218；PF Vol． 26 No．3，page 793；PF Vol． 26 No．4，page 1101；PF Vol． 26 No．5，page 1369；PF Vol． 27 No．1，page 1832；PF Vol． 27 No．2，page 2268；PF Vol． 27 No．4，page 2806；PF Vol． 27 No．6，page 3348；PF Vol． 28 No．2，page 433；PF Vol． 28 No．3，page 839；PF Vol． 28 No． 4，page 1224；PF Vol． 28 No．5，page 1468；PF Vol． 28 No．6， page 1913；PF Vol． 29 No．1，page 163；PF Vol． 29 No．2， page 483；PF Vol． 29 No．3，page 710；PF Vol． 29 No．4，page 1137；PF Vol． 29 No．5，page 1601；PF Vol． 29 No．6，page 2022；PF Vol． 30 No．1，page 211；PF Vol． 30 No．2，page 613.

## Microbiological Tests

〈55〉 Biological Indicators－Resistance Performance Tests－See PF Vol． 30 No．1，page 212.

## Chemical Tests and Assays

## LIMIT TESTS

＜231〉 Heavy Metals－See PF Vol． 30 No．2，page 614.
＜267 Porosimetry by Mercury Intrusion－See PF Vol． 29 No．3， page 712.
OTHER TESTS AND ASSAYS
〈381〉 Elastomeric Closures for Injections—See PF Vol． 30 No．1， page 220.
〈386〉 Environmentally Sensitive Preparations－See PF Vol． 29 No．4，page 1143.
$\langle 467\rangle$ Organic Volatile Impurities－See PF Vol． 29 No．4，page 1153.
$\langle 518\rangle$ Solution Calorimetry—See PF Vol． 28 No．4，page 1299.

## Physical Tests and Determinations

＜601＞Aerosols，Metered－Dose Inhalers，and Dry Powder Inha－ lers－See PF Vol． 29 No．4，page 1176.
〈611〉 Alcohol Determination－See PF Vol． 30 No．2，page 617.
（621）Chromatography－See PF Vol． 30 No．2，page 618.
4625 Clarity and Degree of Opalescence of Liquids－See PF Vol． 26 No．6，page 1616.
〈627〉 Degree of Color of Liquids－See PF Vol． 26 No．6，page 1617.

〈643〉 Total Organic Carbon－See PF Vol． 29 No．6，page 2026.
645 Water Conductivity－See PF Vol． 30 No．1，page 233.
661 Containers－See PF Vol． 29 No．2，page 490.
＜696 Crystallinity Determination by Solution Calorimetry－See PF Vol． 29 No．1，page 175.
〈698〉 Deliverable Volume－See PF Vol． 29 No．6，page 2029.
699 Density of Solids－See PF Vol． 28 No．2，page 603.
711）Dissolution－See PF Vol． 30 No．1，page 234.
＜730 Inductively Coupled Plasma（ICP）－See PF Vol． 28 No．6， page 1922.
$\langle 785\rangle$ Osmolarity－See PF Vol． 29 No．6，page 2033.
791 pH －See PF Vol． 29 No．6，page 2037.
＜795 Pharmaceutical Compounding－Nonsterile Preparations－ See PF Vol． 29 No．1，page 179.
＜811 ）Powder Fineness－See PF Vol． 28 No．2，page 611.
823）Radiopharmaceuticals for Positron Emission Tomography－ Compounding－See PF Vol． 29 No．2，page 494.
〈846〉 Specific Surface Area－See PF Vol． 28 No．2，page 612.
〈921）Water Determination－See PF Vol． 29 No．5，page 1610.

## General Information

Introduction－See PF Vol． 29 No．6，page 2039.
＜1010 Analytical Data－Interpretation and Treatment－See PF Vol． 30 No．1，page 236.
＜1043〉 Ancillary Materials for Cell，Gene，and Tissue－Engineered Products－See PF Vol． 30 No．2，page 629.
$\langle 1051\rangle$ Cleaning Glass Apparatus－See PF Vol． 30 No．1，page 264.

〈1072〉 Disinfectants and Antiseptics—See PF Vol． 29 No．3，page 726.

## REAGENTS, INDICATORS, AND SOLUTIONS

## Reagent Specifications

Acetal-See PF Vol. 30 No. 2, page 644.
2-Acetamidophenol-See PF Vol. 25 No. 6, page 9107.
Agarose-See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard-See PF Vol. 28 No. 4, page 1234.

Anti-A Blood Grouping Reagent, Anti-B Blood Grouping Reagent, and Anti-A,B Blood Grouping Reagent-See PF Vol. 29 No. 2, page 505.
Anti-D $\left(\mathrm{Rh}_{\mathrm{o}}\right)$ Reagent-See PF Vol. 29 No. 2, page 505.
Anti-D Reagent-See PF Vol. 29 No. 2, page 506.
Antihuman Globulin Reagent-See PF Vol. 29 No. 2, page 506.
Antithrombin III for Amidolytic Test-See PF Vol. 29 No. 1, page 264.

Bacterial Alkaline Protease Preparation-See PF Vol. 30 No. 2, page 644.
Barbituric Acid-See PF Vol. 29 No. 1, page 265.
Benzamidine Hydrochloride Hydrate-See PF Vol. 30 No. 2, page 644.

Benzil-See PF Vol. 28 No. 4, page 1305.
Blood Group $\mathrm{A}_{1}$ and Blood Group B Red Blood Cells-See PF Vol. 29 No. 2, page 506.
Bovine Collagen-See PF Vol. 30 No. 2, page 644.
Rat Tail Collagen-See PF Vol. 30 No. 2, page 644.
Branched Polymeric Sucrose-See PF Vol. 27 No. 6, page 3363.
Bromelain-See PF Vol. 28 No. 2, page 552.
1,4-Butanediol-See PF Vol 25 No. 5, page 8747.
Butyrolactone-See PF Vol. 22 No. 6, page 3248.
dl-Camphene-See PF Vol. 28 No. 6, page 1951.
Capric Acid-See PF Vol 25 No. 5, page 8749.
Cyclohexylmethanol-See PF Vol. 30 No. 2, page 644.
DEAE-Agarose-See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate-See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate-See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate-See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase-See PF Vol. 27 No. 6, page 3365.

Deoxythymidine Triphosphate-See PF Vol. 27 No. 6, page 3365.
Deuterated Methanol-See PF Vol. 29 No. 6, page 2054.
Dicyclohexyl-See PF Vol. 30 No. 2, page 645.
Dicyclohexyl Phthalate-See PF Vol. 26 No. 2, page 504.
Diethylpyrocarbonate-See PF Vol. 27 No. 6, page 3365.
Diisobutylene-See PF Vol. 28 No. 4, page 1305.
1,5-Dimethyl-1,5-diazundecamethylene Polymethobromide-See PF Vol. 30 No. 1, page 315.
$N, N$-Dimethylformamide Diethyl Acetal-See PF Vol. 29 No. 5, page 1681.
$N, N$-Dimethyldodecylamine- $N$-oxide-See PF Vol. 27 No. 4, page 2837.

1,9-Dimethyl-Methylene Blue-See PF Vol. 30 No. 2, page 645.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bro-mide-See PF Vol. 27 No. 6, page 3365.
Dioleoylglycerol-See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol-See PF Vol. 28 No. 3, page 849.

Disodium Arsenate-See PF Vol. 28 No. 4, page 1305.
3-(Dodecyldimethylammonio)propanesulfonate-See PF Vol. 30 No. 2, page 645.
Drabkin's Reagent-See PF Vol. 29 No. 2, page 507.
Escin-See PF Vol. 27 No. 4, page 2837.
Ethidium Bromide-See PF Vol. 27 No. 6, page 3366.
Ethylbenzene-See PF Vol. 30 No. 2, page 645.
Fibroblast Growth Factor-2-See PF Vol. 30 No. 2, page 645.
9-Fluorenylmethyl Chloroformate-See PF Vol. 25 No. 5, page 8916.

Formamide, Anhydrous-See PF Vol. 27 No. 5, page 3115.
Glucose-See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid-See PF Vol. 27 No. 6, page 3366.

L-Glutamine-See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate-See PF Vol. 27 No. 6, page 3366.
Hexadecane-See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide-See PF Vol. 29 No. 1, page 265.

Excipients, USP and NF Excipients, Listed by Category-See PF Vol. 29 No. 4, page 1088; PF Vol. 29 No. 6, page 2008; PF Vol. 30 No. 2, page 587.
GENERAL NOTICES AND REQUIREMENTS
"Official" and "Official Articles"-See PF Vol. 28 No. 1, page 88.

## NF MONOGRAPHS

Acesulfame Potassium-See PF Vol. 30 No. 2, page 591.
Adipic Acid-See PF Vol. 30 No. 2, page 593.
Alfadex-See PF Vol. 30 No. 1, page 202.
Ammonio Methacrylate Copolymer Dispersion-See PF Vol. 29 No. 6, page 2011.
Ammonium Sulfate-See PF Vol. 29 No. 1, page 136.
L-Asparagine-See PF Vol. 30 No. 1, page 205.
Aspartame Acesulfame-See PF Vol. 29 No. 2, page 453.
Benzyl Alcohol-See PF Vol. 29 No. 5, page 1598.
Betadex-See PF Vol. 30 No. 2, page 595.
Butylparaben-See PF Vol. 29 No. 5, page 1598.
Calcium Silicate-See PF Vol. 30 No. 2, page 595.
Candelilla Wax-See PF Vol. 29 No. 1, page 138.
Caprylocaproyl Macrogolglycerides-See PF Vol. 29 No. 3, page 688.

Carbomer 910-See PF Vol. 29 No. 6, page 2013.
Carbomer Homopolymer-See PF Vol. 29 No. 6, page 2013.
Carboxymethylcellulose Calcium-See PF Vol. 23 No. 6, page 5063.

Low-Substituted Carboxymethylcellulose Sodium-See PF Vol. 29 No. 4, page 1095.
Carboxymethylcellulose Sodium Suspension-See PF Vol. 25 No. 3, page 8088.
Cellulose Acetate Butyrate-See PF Vol. 30 No. 2, page 597.
Cetrimonium Bromide-See PF Vol. 29 No. 1, page 139.
Cocoa Butter-See PF Vol. 30 No. 1, page 207.
Copovidone-See PF Vol. 29 No. 4, page 1097.
Corn Syrup-See PF Vol. 28 No. 2, page 403.
Corn Syrup Solids-See PF Vol. 28 No. 6, page 1894.
High Fructose Corn Syrup-See PF Vol. 28 No. 2, page 408.
Cottonseed Oil, Hydrogenated-See PF Vol. 29 No. 1, page 141.
Croscarmellose Sodium-See PF Vol. 23 No. 3, page 4007.
Crospovidone-See PF Vol. 24 No. 1, page 5482.
Dimethicone-See PF Vol. 29 No. 1, page 142.
Ethylparaben-See PF Vol. 29 No. 5, page 1599.
Galactose-See PF Vol. 30 No. 2, page 600.
Glyceryl Distearate-See PF Vol. 29 No. 2, page 464.
Glyceryl Monolinoleate-See PF Vol. 29 No. 2, page 466.
Glyceryl Monooleate-See PF Vol. 29 No. 2, page 468.
Guar Gum-See PF Vol. 29 No. 6, page 2017.
Hydrogenated Soybean Oil-See PF Vol. 28 No. 5, page 1631.
Hymetellose-See PF Vol. 29 No. 4, page 1100.
Hypromellose Acetate Succinate-See PF Vol. 29 No. 4, page 1102.

Lauroyl Macrogolglycerides-See PF Vol. 26 No. 2, page 456.
Linoleoyl Macrogolglycerides-See PF Vol. 29 No. 3, page 700.
Magnesium Stearate-See PF Vol. 29 No. 6, page 2018.
Maleic Acid-See PF Vol. 30 No. 2, page 602.
Maltose-See PF Vol. 29 No. 4, page 1113.
Methacrylic Acid Copolymer Dispersion-See PF Vol. 29 No. 6, page 2018.
Methylparaben-See PF Vol. 29 No. 5 page 1599.
Mono- and Di-glycerides-See PF Vol. 29 No. 5, page 1600.
Nitrogen-See PF Vol. 30 No. 2, page 604.
Nitrogen 97 Percent-See PF Vol. 30 No. 2, page 605.
Oleoyl Macrogolglycerides-See PF Vol. 29 No. 3, page 701.
Compound Orange Spirit-See PF Vol. 28 No. 5, page 1466.
Phenolsulfonphthalein-See PF Vol. 29 No. 6, page 2018.
2-Phenoxyethanol-See PF Vol. 30 No. 1, page 207.
Poloxamer-See PF Vol. 29 No. 6, page 2020.
Polyoxyl Stearyl Ether-See PF Vol. 30 No. 2, page 605.
Propylene Glycol Monostearate-See PF Vol. 29 No. 2, page 479.
Propylparaben-See PF Vol. 29 No. 5, page 1600.
Sesame Oil-See PF Vol. 30 No. 2, page 608.
Sodium Cetostearyl Sulfate-See PF Vol. 29 No. 4, page 1122.
Sodium Stearyl Fumarate-See PF Vol. 30 No. 2, page 609.
Sodium Sulfite-See PF Vol. 30 No. 2, page 609.
Sodium Tartrate-See PF Vol. 30 No. 2, page 611.
Anhydrized Liquid Sorbitol-See PF Vol. 29 No. 4, page 1128.

Sorbitol Solution-See PF Vol. 28 No. 3, page 787.
Modified Starch-See PF Vol. 29 No. 4, page 1132.
Pregelatinized Starch-See PF Vol. 29 No. 5, page 1600.
Pregelatinized Modified Starch-See PF Vol. 29 No. 4, page 1133.
Tapioca Starch-See PF Vol. 29 No. 4, page 1134.
Stearic Acid-See PF Vol. 29 No. 2, page 480.
Purified Stearic Acid-See PF Vol. 29 No. 3, page 706.
Stearoyl Macrogolglycerides-See PF Vol. 29 No. 4, page 2021.
Stearyl Alcohol—See PF Vol. 29 No. 6, page 2021.

Succinic Acid-See PF Vol. 30 No. 2, page 612.
Sunflower Oil—See PF Vol. 27 No. 4, page 2803.
Tobramycin Inhalation Solution-See PF Vol. 28 No. 3, page 789.
Tolu Balsam Syrup-See PF Vol. 28 No. 5, page 1467.
Tolu Balsam Tincture-See PF Vol. 28 No. 5, page 1468. Tribasic Sodium Phosphate-See PF Vol. 29 No. 1, page 162. Xanthan Gum-See PF Vol. 29 No. 6, page 2021.

## HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps (Stages).

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In $P F$, this stage appears as OFFICIAL INQUIRY STAGE 4 in the Harmonization section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

## Stage 5: Consensus

## A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

## B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

## PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the Staff Directory to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

## Briefing

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How To Use PF), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

## Add the following:

## Cat's Claw

» Cat's Claw consists of the inner bark of the stems of Uncaria tomentosa (Willd.) DC (Fam. Rubiaceae). It contains not less than 0.3 percent

[^109]
#### Abstract

\section*{BRIEFING}

Cat's Claw; Powdered Cat's Claw; Powdered Cat's Claw Extract; Cat's Claw Capsules; Cat's Claw Tablets. Because there are no existing USP monographs for these articles, the following new monographs are being previewed. There are two species of South American Uncaria known as Cat's Claw: $U$. tomentosa and U. guianensis. Also, the bark from both the root and the stem is commercially used, but due to conservational issues the bark from the stem is recommended for commercial exploitation. In addition, there are two chemotypes described in the literature: the pentacyclic alkaloid type and the tetracyclic alkaloid type. (See Keplinger K., et al. Uncaria tomentosa (Willd.) DC. Ethnomedicinal use and new pharmacological, toxicological and botanical results. J Ethnopharmacol. 1998, 64(1), 23-34.) This monograph refers to the stem bark from U. tomentosa, with predominance of the pentacyclic alkaloid chemotype. The microscopic description of the bark is based on the following articles: Lindorf, H. Reconocimiento al microscopio de la corteza y el polvo farmacéutico de las "uñas de gato" (Uncaria guianensis y Uncaria tomentosa). Uncaria 2001: 85-91 (I Reunión Internacional del género Uncaria "uña de gato," Iquitos, Peru); and Gattuso M., et al. Morphoanatomical studies of Uncaria tomentosa and Uncaria guianensis bark and leaves. Phytomedicine, Vol. 11, 2004 (in Press). ${ }^{*}$ The procedure for determination of content of pentacyclic alkaloids was based on the following article: Ganzera M., et. al. Improved method for the determination of oxindole alkaloids in Uncaria tomentosa by high performance liquid chromatography. Planta Med. 2001, 67, 447-450. Data for the HPLC procedure were obtained using a Luna C18 brand column containing packing L1. Typical retention times are $9.5,12.0,14.0,19.7,20.0$, and 26.8 minutes for speciophylline, uncarine F , mitraphylline, isomitraphylline, pteropodine, and isopetropodine, respectively.

of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Packaging and storage-Preserve in tight, light-resistant containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards $\langle 11\rangle$ —USP Isopteropodine $R S$. USP Powdered Cat's Claw Extract RS.

Botanic characteristics-[NOTE-The pharmacopeial article is constituted only by the stem inner bark of $U$. tomentosa (Willd.) DC. Descriptions of other parts of the plant are given to aid in the collection of the right species. Compliance should be determined using the entire monograph and not only the botanical description.]

Macroscopic-Cat's Claw is a woody vine with a main stem up to 20 cm in diameter and 30 m long. The branches are obtusely quadrangular and generally puberulous. Stipules in the buds are densely tomentose in the upper side (difference with $U$. guianensis in which the stipules are glabrous) with the hairs, often with curved tips, meshed together and with the longer hairs of the leaf helping to connect the pair of stipules along the margins, but split when older (difference with $U$. guianensis in which the stipules separate early in the bud development). Thorns are straight to sickle-shaped, not spirally twisted (difference with $U$. guianensis), very pungent and woody, from 8 to 20 mm long and 3 to 6 mm wide. When recently cut, the color of the inner bark can be whitish gray, yellowish brown, or dark red, with longitudinal fissures and persistent rhytidome. The internal part has a slightly dusty fibrous and laminar texture
with a characteristic ferruginous dust and an extremely astringent taste. The terminal branches have a quadrangular section and yellowish green internal medulla.
Microscopic-The periderm with cork (phellem) is constituted by 6 to 8 rows of cells having walls evenly thickened, a compressed phellogen [NOTE-The periderm and phellogen should be absent in the pharmacopeial article], and a phelloderm with 1 to 7 rows of sclereids. The secondary cortex with concentric rings of fibers are separated by rings of parenchyma; rings of fibers are frequently interrupted by radial rows of parenchyma cells (predominately 1 cell broad) or narrow medullary rays (few cells broad), forming rectangular bundles of fibers in a regular network; in longitudinal view the fibers appear with numerous conspicuous pits; calcium oxalate microcrystals (sand-like) are abundant in the parenchyma, but usually absent as large polyhedral crystals or in the form of styloids with bifurcated endings, the latter forms typically present in the parenchyma of $U$. guianensis; a brown substance is dispersed in parenchyma cells; starch is abundant, granules are solitary (circular in outline, up to $10 \mu \mathrm{~m}$ in diameter) or compound (2 to 3 components up to $15 \mu \mathrm{~m}$ in diameter).

## Identification-

A: Thin Layer Chromatographic Identification Test〈201〉—

Test solution-Transfer about 1 g of the powdered Cat's Claw to a screw-capped centrifuge tube. Add 10 mL of methanol, and sonicate for 5 minutes, shaking occasionally. Heat the mixture in a water bath at $60^{\circ}$ for 15 minutes, cool, and filter. Apply $20 \mu \mathrm{~L}$ to the plate in bands that are 1 cm in length.

Standard solution-Transfer about 100 mg of USP Powdered Cat's Claw Extract RS to a screw-capped centrifuge tube. Add 10 mL of methanol, and sonicate for 5 minutes,
shaking occasionally. Heat in a water bath at $60^{\circ}$ for 15 min utes, cool, and filter. Apply $20 \mu \mathrm{~L}$ to the plate in bands that are 1 cm in length.

Developing solvent system-Prepare a solution of ethyl acetate and hexane ( $95: 5$ ).

Spray reagent $A$-Dissolve 0.85 g of basic bismuth nitrate in 10 mL of glacial acetic acid and 40 mL of water by heating. Filter if necessary (Solution A). Dissolve 8 g of potassium iodide in 30 mL of water (Solution B). Mix Solution A and Solution B (1:1) to obtain a stock solution. Dilute 1 mL of the stock solution with 2 mL of glacial acetic acid and 10 mL of water.

Spray reagent B-Use a $10 \%$ solution of sodium nitrite in water.

Procedure-Develop the chromatogram to a length of not less than 12 cm , and dry the plate in a current of air. Examine the plates under short UV light: the chromatogram obtained from the Test solution shows quenching zones that correspond in $R_{F}$ value to those for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine in the chromatogram obtained from the Standard solution. Other quenching zones of varying intensities may be observed in the chromatogram obtained from the Test solution.

Spray the plate with Spray reagent $A$ followed by Spray reagent $B$, and examine the plate under daylight: the chromatogram obtained from the Test solution shows orangebrown zones that correspond in color and $R_{F}$ value to those for speciophylline, pteropodine, and isopteropodine in the chromatogram obtained from the Standard solution. Other colored zones of varying intensities may be observed in the chromatogram obtained from the Test solution.
B: The chromatogram of the Test solution exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention
times that correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed $10^{5}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count is not more than $10^{3}$ per g.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 2 hours: it loses not more than $7.0 \%$.

Foreign organic matter $\langle 561\rangle$ : not more than $2.0 \%$.
Total ash $\langle 561\rangle$ : not more than $8.0 \%$.
Acid-insoluble ash $\langle 561\rangle$ : not more than $2.0 \%$.
Pesticide residues $\langle 561\rangle$ : meets the requirements.
Heavy metals, Method III $\langle 231\rangle$ : not more than $20 \mu \mathrm{~g}$ per $g$.

Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles-

Solution A-Prepare a filtered and degassed 10 mM pH 7.0 phosphate buffer by mixing 6 mL of 1 N sodium hydroxide, 10 mL of 1 M monobasic potassium phosphate, and sufficient water to make 1000 mL , and adjusting to a pH of $7.0 \pm 0.1$ by adding more of either solution.

Solution B-Use filtered and degassed acetonitrile.
Solution C-Prepare a filtered and degassed solution of methanol and glacial acetic acid (99:1).

Mobile phase-Use variable mixtures of Solution A, Solution B, and Solution C as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution 1-Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shaking for 1 minute. Dilute with methanol to obtain a solution having a known concentration of about 0.5 mg of the labeled amount of total oxindole alkaloids per mL. Pass through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity.

Standard solution 2-Dissolve an accurately weighed quantity of USP Isopteropodine RS in methanol. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL . Pass through a nylon filter having a 0.45 $\mu \mathrm{m}$ or finer porosity.

Test solution-Accurately weigh approximately 750 mg of ground Cat's Claw, and place in a $10-\mathrm{mL}$ centrifuge tube. Sonicate with 2.5 mL of methanol for 10 minutes. Centrifuge, and transfer this solution to a $10-\mathrm{mL}$ volumetric flask. Repeat the above extraction three additional times combining the extracts in the $10-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first part of the filtrate.
Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $245-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains endpacked $3-\mu \mathrm{m}$ packing L1. The flow rate is about 0.75 mL per minute. The chromatograph is programmed as follows.

| Time | Solution $A$ | Solution $B$ | Solution $C$ |  |
| :---: | :---: | :---: | :---: | :--- |
| $($ minutes $)$ | $(\%)$ | $(\%)$ | $(\%)$ | Elution |
| $0-17$ | 65 | 35 | 0 | isocratic |
| $17-22$ | $65 \rightarrow 50$ | $35 \rightarrow 50$ | 0 | linear gradient |
| $22-28$ | 50 | 50 | 0 | isocratic |
| $28-29$ | $50 \rightarrow 0$ | $50 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $29-34$ | 0 | 0 | 100 | isocratic |
| $34-39$ | $0 \rightarrow 65$ | $0 \rightarrow 35$ | $100 \rightarrow 0$ | linear gradient |
| $39-49$ | 65 | 35 | 0 | equilibration |

Inject into the chromatograph Standard solution 1, and record the peak responses as directed for Procedure: the chromatograms obtained are similar to the Reference Chromatogram provided with the USP Powdered Cat's Claw Extract RS; the tailing factor for isopteropodine is not more than 2.0 ; and the relative standard deviation for replicate injections of Standard solution 1 is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of Standard solution 1, Standard solution 2, and the Test solution into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine by comparison of the chromatogram of Standard solution 1 with that obtained from the Reference Chromatogram. Separately calculate the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophyllin, isorhynchophyllin, pteropodine, and isopteropodine in the portion of Cat's Claw taken by the formula:
in which $C$ is the concentration, in mg per mL , of USP Isopteropodine RS in Standard solution 2; $W$ is the weight, in g , of Cat's Claw taken to prepare the Test solution; $r_{U}$ is the peak response for each relevant alkaloid obtained from the Test solution; and $r_{s}$ is the peak response for isopteropodine obtained from Standard solution 2. Calculate the content of pentacyclic oxindole alkaloids by adding the percentages of speciophylline, uncarine F , mitraphylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the content of tetracyclic oxindole alkaloids by adding the individual percentages of rhynchophyllin and isorhynchophyllin: not more than 0.05 percent of tetracyclic oxindole alkaloids is found.

## $\langle 11\rangle$ USP Reference Standards <br> Add the following:

## USP Isopteropodine RS.

Add the following:

## USP Powdered Cat's Claw Extract RS.

$$
(C / W)\left(r_{U} / r_{s}\right),
$$

Briefing

Powdered Cat's Claw-See briefing under Cat's Claw.
(DSB: G. Giancaspro) RTS—33274-4

## Add the following:

## Powdered Cat's Claw

» Powdered Cat's Claw is Cat's Claw reduced to a powder or very fine powder. It contains not less than 0.3 percent of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Packaging and storage-Preserve in tight, light-resistant containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.

USP Reference standards $\langle 11\rangle$ —USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.

Botanic characteristics-Presence of fragments of cork and suberized cells, with cell walls evenly thickened. Presence of phelloderm sclereids. Fragments of fibers crossed by vascular rays are darkened due to the presence of sandlike calcium oxalate microcrystals. Solitary or two- to threecompound starch grains up to $15 \mu \mathrm{~m}$ in diameter. Absence of styloids, typically present in U. guianensis.

Other requirements-It meets the requirements of the tests for Identification, Microbial limits, Loss on drying, Total ash, Acid-insoluble ash, Pesticide residues, Heavy metals, and Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw.

## Briefing

Powdered Cat's Claw Extract-See briefing under Cat's Claw. (DSB: G. Giancaspro) RTS-33274-5

## Add the following:

## Powdered Cat's Claw Extract

» Powdered Cat's Claw Extract is prepared from Cat's Claw by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of plant material to extract is between $4: 1$ and $6: 1$. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. It may contain suitable added substances.

Packaging and storage-Preserve in tight, light-resistant containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of pentacyclic oxindole alkaloids, the extracting solvent or solvent mixture used for preparation, and the ratio of the starting crude plant material to Powdered Extract. It meets the requirements for Labeling under Botanical Extracts $\langle 565\rangle$.

USP Reference standards $\langle 11\rangle$ —USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.

## Identification-

A: Thin Layer Chromatographic Identification Test $\langle 201\rangle$ -
Standard solution, Developing solvent system, Spray reagent $A$, Spray reagent $B$, and Procedure-Proceed as directed for Thin-Layer Chromatographic Identification Test〈201〉 under Cat's Claw.

Test solution-Shake a quantity of Powdered Extract, equivalent to 25 mg of the labeled amount of pentacyclic oxindole alkaloids, in 20 mL of methanol. Allow to stand for 15 minutes before use.

B: The chromatogram of the Test solution exhibits peaks for speciophylline, uncarine $F$, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids. The sum of the peak area for the tetracyclic oxindole alkaloids rhynchophylline and isorhynchophylline is less than $25 \%$ of the total area detected for pentacyclic oxindole alkaloids.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed $10^{4}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count is not more than $10^{3}$ per $g$.

Loss on drying $\langle 731\rangle$ —Dry 1 g at $105^{\circ}$ for 2 hours: it loses not more than $10.0 \%$ of its weight.

Heavy metals, Method II $\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per g.

Organic volatile impurities, Method $V I\langle 467\rangle$ : meets the requirements.

## Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles-

Solution A, Solution B, Solution C, Mobile phase, Standard solution 1, Standard solution 2, and Chromatographic system-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles under Cat's Claw.

Test solution-Transfer an accurately weighed quantity of Powdered Extract, equivalent to about 5 mg of the labeled content of pentacyclic oxindole alkaloids, to a $10-\mathrm{mL}$ centrifuge tube. Add 2.5 mL of methanol, and sonicate for 10 minutes. Centrifuge, and transfer the supernatant to a $10-\mathrm{mL}$ volumetric flask. Repeat the above extraction three additional times combining the extracts in the $10-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first part of the filtrate. Centrifuge, or pass through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity.

Procedure-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw. Separately calculate the percentage of each relevant alkaloid in the portion of Powdered Extract taken by the formula:

$$
(C / W)\left(r_{U} / r_{S}\right)
$$

in which $W$ is the weight, in g , of Powdered Extract taken to prepare the Test solution; and the other terms are as defined therein. Calculate the percentage of pentacyclic oxindole alkaloids in the Powdered Extract taken by adding the individual percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the percentage of tetracyclic oxindole alkaloids in the Powdered Extract taken by adding the individual percentages of rhynchophylline and isorhynchophylline: not more than $25 \%$ of the labeled amount of pentacyclic oxindole alkaloids is found.

Other requirements-It meets the requirements for Residual Solvents and Pesticide Residues under Botanical Extracts $\langle 565\rangle$.

## Briefing

Cat's Claw Capsules-See briefing under Cat's Claw.
(DSB: G. Giancaspro) RTS—33274-2

## Add the following:

## Cat's Claw Capsules

» Cat's Claw Capsules contain Powdered Cat's Claw Extract. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

Packaging and storage-Preserve in tight, light-resistant containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. If prepared with Extract, the label also indicates the quantity, in mg, of Extract per Capsule and the content, in mg , of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

USP Reference standards $\langle 11\rangle$ —USP Isopteropodine $R S$. USP Powdered Cat's Claw Extract RS.

Identification-The chromatogram of the Test solution exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isrhynchophylline, is not more than $25 \%$ of the labeled amount of pentacyclic oxindole alkaloids.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed
$10^{4}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count is not more than $10^{3}$ per $g$.

Disintegration $\langle 2040\rangle$ : meet the requirements for disintegration of botanical dosage forms.

Weight variation $\langle 2091\rangle$ : meet the requirements.
Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids-
Solution A, Solution B, Solution C, Mobile phase, Standard solution 1, Standard solution 2, and Chromatographic system-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw.

Test solution-Weigh accurately the contents of not fewer than 20 Capsules, and pulverize, using a mortar and pestle. Transfer an accurately weighed quantity of the powder, equivalent to 20 mg of the labeled amount of pentacyclic oxindole alkaloids, to a $50-\mathrm{mL}$ centrifuge tube. Sonicate with 10 mL of methanol for 10 minutes. Centrifuge, and transfer this solution to a $50-\mathrm{mL}$ volumetric flask. Repeat the above extraction three additional times combining the extracts in the $50-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first part of the filtrate.

Procedure-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw. Calculate the content of each relevant alkaloid, in mg, in the portion of Capsules taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right)
$$

in which the terms are as defined therein. Calculate the content of total pentacyclic oxindole alkaloids by adding the individual contents of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the content of tetracyclic oxindole alkaloids by adding the individual contents of rhynchophylline and isorhynchophylline: not more than $25 \%$ of the labeled amount of pentacyclic oxindole alkaloids is found.

BRIEFING

Cat's Claw Tablets-See briefing under Cat's Claw.
(DSB: G. Giancaspro) RTS-33274-3

## Add the following:

## Cat's Claw Tablets

» Cat's Claw Tablets contain Powdered Cat's Claw Extract. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

Packaging and storage-Preserve in tight, light-resistant containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the article from which Tablets were prepared. The label also indicates the quantity, in mg, of Powdered Extract per Tablet. Label Tablets to indicate the content, in mg, of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

USP Reference standards $\langle 11\rangle$ —USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.

Identification-The chromatogram of the Test solution exhibits peaks for speciophylline, uncarine F , mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isrhynchophylline, is not more than $25 \%$ of the labeled amount of pentacyclic oxindole alkaloids.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed $10^{4}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count is not more than $10^{3}$ per $g$.

Disintegration $\langle 2040\rangle$ : meet the requirements for disintegration of botanical dosage forms.

Weight variation $\langle 2091\rangle$ : meet the requirements.

## Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids-

Solution A, Solution B, Solution C, Mobile phase, Standard solution 1, Standard solution 2, and Chromatographic system-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw.

Test solution-Weigh accurately not fewer than 20 Tablets, and pulverize, using a mortar and pestle. Transfer an accurately weighed quantity of the powder, equivalent to 20 mg of the labeled amount of pentacyclic oxindole alkaloids, to a $50-\mathrm{mL}$ centrifuge tube. Sonicate with 10 mL of methanol for 10 minutes. Centrifuge, and transfer this solution to a $50-\mathrm{mL}$ volumetric flask. Repeat the above extraction three additional times combining the extracts in the $50-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first part of the filtrate.

Procedure-Proceed as directed in the test for Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids under Cat's Claw. Calculate the content of each relevant alkaloid, in mg , in the portion of Tablets taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right),
$$

in which the terms are as defined therein. Calculate the content of total pentacyclic oxindole alkaloids by adding the individual contents of speciophylline, uncarine F , mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Calculate the content of tetracyclic oxindole alkaloids by adding the individual contents of rhynchophylline and isorhynchophylline: not more than $25 \%$ of the labeled amount of pentacyclic oxindole alkaloids is found.

## STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the In-Process Revision and Pharmacopeial Previews sections. Readers interested in submitting comments should see Instructions to Authors.
STIMULI TO THE REVISION PROCESS ..... \$\$
Instructions to Authors ..... \$\$\$

## Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to $U S P-N F$ revision will be considered for publication in the Pharmacopeial Forum under the section Stimuli to the Revision Process. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract-Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.
References-Consult a current copy of the Pharmacopeial Forum and the ACS Style Guide for assistance with reference style.

Copyright - Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.
Contact Person-When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions-Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft ${ }^{\circledR}$ Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be cameraready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

# Pepsin and Pancreatin Performance in the Dissolution of Crosslinked Gelatin Capsules from pH 1 to 8 

Jean Gallery, *ian-Hwa Han, and Chiramel Abraham

#### Abstract

The authors conducted a systematic study of the use of pepsin and pancreatin in dissolution of crosslinked gelatin capsules in order to understand the digestive performance ability of the enzymes across the pH range from 1 to 8 . The work presented here includes a description of the experimental design and controls, followed by actual dissolution profiles obtained with pepsin from pH 1 to 6.8 and pancreatin from pH 4 to 8 . The results generally agree with published activity curves for the enzymes and bring into question the appropriateness of the recommended pancreatin level set forth in USP $\langle 711\rangle$.

## INTRODUCTION

Since the publication of the two-tier dissolution testing stimuli article in 1998 (1) and its subsequent adoption in USP $\langle 711\rangle$, there has been discussion in industry about the enzyme and activity recommendations based on the pH of the medium. Much of this discussion has been anecdotal, but published proteolytic activity curves for pepsin ( 1 , 2) and pancreatin (trypsin and chymotrypsin components) $(1,2)$ confirm that peak pepsin activity occurs around pH 2 and peak pancreatin activity appears around pH 8 . Unfortunately, the proteolytic activity of these enzymes in the pH range of 5-6 is significantly less than the peak activity.

The intention of this study was to characterize the proteolytic activity of pepsin and pancreatin through actual dissolution testing on crosslinked capsules across the pH range in which a dissolution laboratory typically operates.

Table 1. Experimental plan

|  | Pepsin |  |  |  | Pancreatin |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Enzyme | No | Yes | No | Yes | No | Yes | No | Yes |
| pH | Control |  | Crosslinked |  | Control |  | Crosslinked |  |
| 1 | X | X | X | X |  |  |  |  |
| 4 | X | X | X | X | X | X | X | X |
| 6 | X | X | X | X | X | X | X | X |
| 6.8 | X | X | X | X | X | X | X | X |
| 8 |  |  |  |  | X | X | X | X |

Dissolution was performed in medium containing aqueous hydrochloric acid or phosphate buffers to achieve the specified pH . The enzymes were added at the level recommended in USP $\langle 711\rangle$. That is, pepsin was added to the medium at not more than 750,000 units per liter, and pancreatin

[^110]
## EXPERIMENTAL DESIGN AND CONTROLS

## Experimental Design

Tier 1 and Tier 2 (Tier $1+$ enzyme) dissolution profiles of crosslinked gelatin capsules across the pH range of 1 to 8 have been collected according to the experimental plan outlined in Table 1. Dissolution profiles of six capsules were collected at each test condition. Each profile presented graphically in this article represents a mean of 6 capsules tested. Crosslinking of substrate capsules was achieved by treatment with formaldehyde vapor. The control capsules were untreated.
was added at not more than 1750 units of proteolytic activity per liter. Enzymes were freshly purchased from Sigma-Aldrich, and the labeled activities (from certificates of analysis) were used to determine the amount of enzyme to weigh for the media preparations to provide the maximum allowed activity levels. Each medium was prepared immediately before use to minimize potential autolysis and subsequent activity loss over time.

## Substrate Capsules

The substrate capsules chosen for this study have a dissolution profile that is independent of pH across the range studied ( $\mathrm{pH} 1-8$ ). The chosen substrate capsules are soft gelatin capsules with a hydrophilic liquid fill (development product at Abbott Laboratories). The dissolution profiles in Figure 1 show that dissolution is rapid, and opening of the gelatin shell dictates the release profile. Capsule opening is faster at lower pH , but this is to be expected well below the isoelectric point ( pI ) of the gelatin.

Fig.1. Substrate capsule dissolution profiles (untreated, Tier 1).
In addition, the untreated substrate capsule dissolution profiles are not affected by the addition of pepsin or pancreatin, as shown in Figure 2.

Fig. 2. Substrate capsule dissolution profiles (untreated, Tier 2).

## Induced Crosslinking

The goal of the induced crosslinking was to prepare capsules that would not meet $Q=80 \%$ in 30 minutes under Tier 1 conditions but would meet the requirement under Tier 2 conditions (with enzyme). Crosslinking was induced by treatment with formaldehyde vapor in a manner similar to a process previously published (6). The capsules were placed on a tray inside a vacuum desiccator, and approximately $5 \mu \mathrm{~L}$ of formaldehyde was added to a separate dish inside the chamber. A vacuum was pulled briefly to increase
the vapor pressure of the formaldehyde, and the flask was left closed for a length of time for the crosslinking reaction to occur.
Residual formaldehyde vapor will remain in the gelatin shell and further crosslink the capsules after they are removed from the reaction chamber. For this reason, it was decided to standardize the exposure time so that capsules could be prepared immediately before testing in the different media. Figure 3 depicts the exposure selection process. The profiles were generated in 0.1 N HCl medium with pepsin at $\sim 750,000$ units per liter.

Fig. 3. Aldehyde exposure study ( 0.1 N HCl Tier 1, Tier 2 with pepsin).

A 2-hour exposure time was insufficient to cause a Tier 1 failure. However, crosslinking induced by overnight exposure ( 15.5 hours) was too severe for pepsin to overcome at the USP activity level. A 4-hour exposure provided the desired failure and allowed complete recovery with the digestive enzyme. This aldehyde exposure time was used to crosslink capsules for the study outlined in Table 1 above. The Tier 1 and Tier 2 capsules for each test condition were prepared and tested on the same day for direct comparability. Figure 4 demonstrates the reproducibility of the 4-hour crosslinking process for each experiment in Table 1.

Fig. 4. Tier 1 capsule profiles after 4 hours of aldehyde exposure
Figure 4 does show some variability in the degree of crosslinking, which is to be expected. However, with the exception of the pH 1 curve, all other profiles show approximately $60 \%$ or less released at 30 minutes. Although the higher solubility of gelatin at pH 1 again is apparent, the profile does not meet $Q$ of $80 \%$ at 30 minutes. There is no trend among the pH 4 to pH 8 Tier 1 profiles. One can observe variability at the same pH on different days.

## Results and Discussion

The Tier 1 and Tier 2 dissolution profiles of crosslinked capsules were carried out as described in Table 1. The profiles obtained with pepsin are presented in Figure 5, and the profiles obtained with pancreatin are presented in Figure 6.

The data in Figure 5 confirm the wide pH range of published pepsin activity (2). The enzyme easily overcomes the crosslinking at pH 4 , where the profile is equivalent to the uncrosslinked profile presented in Figure 1. The Tier 2 release in pH 1 is slightly reduced at 20 minutes compared to the uncrosslinked profile; however the $Q$ value of $80 \%$ is easily met at 30 minutes. This agrees with the published activity curve (2) that shows a somewhat lower activity at pH 1 than at pH 4 . It is clear that pepsin begins to suffer activity loss at pH 6 . The chosen $Q$ is met at 30 minutes, but the release at 20 minutes is only $\sim 40 \%$. This indicates a delay in capsule shell opening that could lead to a failure at 30 minutes for products that are not immediately solubilized. Pepsin is unable to overcome the crosslinking at pH 6.8 , where the activity of the enzyme is greatly reduced.
The pancreatin data in Figure 6 are more surprising. The lack of response at pH 4 is expected based on the published activity curves $(4,5)$. However, the reduced ability to overcome crosslinking from pH 6 to 8 was not expected. The pancreatin activity at pH 8 was barely sufficient to bring the 30 -minute release value above $80 \%$, which is shown in part by the large standard deviation obtained ( $87 \pm$ $14 \%$ ). The Tier 2 profile at pH 6.8 is somewhat better than at pH 8 insofar as all 6 capsules achieve complete release in 30 minutes. The activity at pH 6 is not sufficient to allow the $Q$ of $80 \%$ to be met at 30 minutes; however it is very close (79\%).
Pancreatin was not able to bring the profiles back to the uncrosslinked appearance at any of the pH values studied. Delayed capsule shell opening was observed at each pH . Considering these capsules were crosslinked to the same extent as those in the pepsin portion of the study, it appears that the pancreatin level allowed in General Chapter $\langle 711\rangle$ is set too low. This statement is supported by a confirmation of the labeled activity of the lot of pancreatin used in the study. The value determined by the monograph test was $98 \%$ of the labeled amount of proteolytic activity from the vendor certificate of analysis.

Fig. 5. Demonstration of pepsin activity: Tier 1 and Tier 2 dissolution profiles of crosslinked capsules from pH 1 to 6.8 .

Fig. 6. Demonstration of pancreatin activity: Tier 1 and Tier 2 dissolution profiles of crosslinked capsules from pH 4 to 8 .

Further studies were performed to find the level of pancreatin that would bring the Tier 2 profiles back to the same appearance as the uncrosslinked capsule profile. Figure 7 shows the profiles obtained at pH 8 (expected peak activity) using the USP recommended pancreatin level of $\sim 1750$ activity units/L, along with profiles obtained with $2 \times, 3 \times$, and $5 \times$ levels of pancreatin.

Fig. 7. Dissolution profiles at pH 8 with multiple levels of pancreatin.

The profiles in Figure 7 indicate that a three-fold increase in pancreatin is required to bring the profile back to an uncrosslinked appearance. There is improvement at the twofold level; however the standard deviation is nearly $20 \%$ at the 20 -minute time point. At the $3 \times$ level, the standard deviation at 20 minutes is $\sim 2 \%$.

## CONCLUSION

The data presented in this study confirm that pepsin has a wide pH range of useful digestion activity in the dissolution of crosslinked capsules. The pH range of pancreatin activity also agrees with published values. However, the level allowed for dissolution testing according to USP General Chapter $\langle 711\rangle$ is insufficient when compared to the response of pepsin on the same capsules. It has been determined that a
three-fold increase in pancreatin is required to achieve the same level of digestion of crosslinked gelatin in the dissolution bath when compared to pepsin. The original study published by the Gelatin Capsule Working Group (1) showed that this level of pepsin was biologically relevant, but a rigorous study was not performed to match the activity of the enzymes. Now that this systematic study has been performed, USP is encouraged to consider formally revising the recommended level of pancreatin proteolytic activity in General Chapter $\langle 711\rangle$ on Dissolution.

Significant delay in capsule shell opening can be very detrimental to products that are not immediately solubilized. If the contents require a certain time to dissolve after the shell is breached, then the profile could be delayed enough to cause unnecessary failure. Because many products require time to dissolve the drug inside of the capsule, matching the pancreatin level to the biorelevant pepsin level will remove an unnecessary burden for industry.

# Significant Digits and Rounding 

L. Torbeck

#### Abstract

This stimuli article on significant digits and rounding has been prepared in response to a need identified by the USP Biostatistics Expert Committee (BST). The clarification embodied in this text is intended as a preliminary presentation and is envisioned as part of a larger guidance on the reporting of measurement results. This is meant to be the initial presentation of material that may ultimately be included as a new general information chapter. The author is a member of BST and has received input on the content of this article from other committee members. Readers are invited to submit comments, suggested additions, changes, and revisions to the author.

## INTRODUCTION

In response to a need identified by the Biostatistics Expert Committee, this stimuli article on significant digits and rounding has been developed as part of a larger effort addressing the reporting of measurement results. This suggested approach is to be applied to all data collection activities and to all results generated by analytical laboratory testing or other means. Examples are provided.

The article clarifies and establishes standard practices for the following activities:

- reporting raw results;
- calculating intermediate results;
- using tabled values and spreadsheets;
- calculating analytical determinations;
- documenting reportable results; and
- defining procedures for rounding and determining the number of significant digits.
This approach also is recommended for application in other areas, such as manufacturing, where procedures may not currently exist. In some cases, this method may be superceded by specific standard operating procedures or monographs.

The procedures given here do not address analytical accuracy, precision, uncertainty estimates, or the statistical treatment of the results. The capability of an analytical method to provide sufficient accuracy and precision should be addressed during method development.

## RESPONSIBLE PARTIES

Within each testing setting, individual analysts, technicians, supervisors, group leaders, and reviewers are responsible for performing calculations, documenting, reviewing, and reporting results in accordance with the information given here. Supervisors and managers are further responsible for training and complying with this proposed procedure. The Information Technology department (or equivalent),

[^111]in conjunction with analysts or users, is responsible for recommending computer software that is not incompatible with this procedure.
The quality assurance department, quality control unit, or equivalent is responsible for resolving issues not specifically covered by this method or issues that conflict with software or external standards.

## USEFUL DEFINITIONS

The definitions that follow are not universal; rather, these definitions are for application in this suggested approach and related documents. The goal is to promote uniformity in the application of this suggested procedure.
Results may be numerical using the digits $0-9$, or they may be nonnumerical and may include words, colors, letters, and other nonnumerical symbols as the output of the instrument or the analytical method. Results may be as simple as a measurement with a ruler or as complex as NIR spectra. When recording numerical results, use a decimal point to separate any decimal fraction. If a value is less than one, a zero will precede the decimal point.
Raw results are the results or values displayed, printed, or manually recorded from a test method or an instrument. They may be the signal or instrument responses from the analyte or analytical property of interest that are captured, measured, and recorded manually, stored, displayed, or printed as a result of an analytical method or procedure. Examples include an absorbance value from a spectrophotometer or a peak area time slice from a chromatography data system. Note that in many instances the raw data accessible to the analyst will have fewer significant digits than the raw data used internally by the data-processing algorithms within the instrument or system. For this reason small discrepancies may arise when one compares internally generated intermediate results or analytical determinations with those calculated externally. Recognizing this is particularly important in validating software and/or verifying results generated during an audit.

Intermediate results are results or values derived from raw results to be used to calculate an analytical determination or a reportable result. For example, an intermediate result might be the average of a number of spectroscopic readings or the combination of individual peak areas from a set of samples or sample aliquots.

Analytical determinations are the results of the analytical measurement processes as described by the method and recorded in the laboratory notebook. They are calculated from predetermined documented combinations of raw results, metadata, tabled values, constants, and/or intermediate results. An analytical determination must contain no fewer significant digits than required by the specification criteria.

A reportable result is the end result or value of the complete measurement method and calculation procedure as documented in the official analytical procedure. It is derived from a predetermined number of analytical determinations that reflect the performance of the analytical method. It must be rounded to the same number of digits as in the specification criteria. If during development the specification criteria have not been defined, the reportable result should be rounded to the number of digits determined by a scientific consideration of the method precision and equipment characteristics. The reportable result is the official value reported out of the laboratory. Only the reportable result can be compared to the specification criteria. This comparison determines whether a sample is out of specification. It is possible to have more than one defined reportable result for the same set of raw results, intermediate results, or analytical determinations. Each is completely and independently defined and treated separately. For example, see Chapter $\langle 905\rangle$ Uniformity of Dosage Units.

Significant digits are the digits of a numerical result not including the zeros needed to locate the decimal point or the trailing zeros that function only as placeholders. Alternatively, they include those digits of a number beginning with the leftmost digit that is not zero and ending with the rightmost digit that is not zero or is a zero that is considered exact and not just a placeholder. The use of scientific notation with the correct number of significant digits is strongly recommended to avoid confusion. Counted numbers have an infinite number of significant digits. The word significant is used here as a synonym for meaningful and does not imply or relate to practical or statistical significance. See examples below.

Rounding a result approximates the true result to the appropriate number of significant digits according to the rounding rules. Double rounding within a single calculation to the final desired number of significant digits is never done. See examples below.

A specification is a document containing references to measurement and analytical test procedures and appropriate acceptance or rejection criteria that are numerical limits, ranges, nonnumerical results, or other criteria for the tests described.

Manual Recording occurs when results are calculated or documented by hand.

## PROCEDURES

## Reporting Raw Results

When raw results are not manually recorded before intermediate calculations are done, then all available digits are used. However, if raw results are manually recorded before intermediate calculations are done, then record the raw results with at least two more additional digits than are required by the specification criteria.

## Calculating Intermediate Results

If intermediate results are not manually recorded before analytical determinations are found, then all available digits are used and carried through the calculations. If intermediate results are manually recorded before the analytical determination is calculated, then the intermediate results are recorded with at least the number of digits in the raw results.
It is preferable to record standard deviations to no less than the same number of digits to the right of the decimal as the values from which they are based, maintaining two or more significant digits in these values.

## Calculating Analytical Determinations

Analytical determinations are calculated using intermediate results and tabled values. They are then rounded and recorded to a predetermined number of digits consistent with the calculations performed. This must be at least equal to the specification criteria if such criteria exist.
If there are fewer significant digits in the analytical determination than called for by the specification criteria, a valid determination cannot be made. In this case, the laboratory manager should be consulted for corrective action. (Unrounded analytical determinations are considered intermediate results.) This may also result in more significant digits than in the specification criteria. It is desirable to preserve this information for future investigations and analysis.

## Using Tabled Values and Spreadsheets

Tabled values from published scientific works or statistical tables are used with the number of significant digits as shown. Trailing zeros are considered significant. If the value is found while using a hand calculator or spreadsheet, then all the digits available are used.
For ease of use, linear interpolation can be used to find values between tabled values and used with the same number of digits as shown in the tabled values.

Published tables should be referenced. When there is a choice, $U S P-N F$, other compendia, publications from recognized standards-setting organizations, or government documents should be used and referenced.
Spreadsheets must not use the option of "precision as displayed" for any calculations.

## Rounding

Rounding is done by the five and up method. Unrounded analytical determinations are considered intermediate results. Rounding is only done once in calculating a reportable value from a data set, and it is always performed as the last step of calculation.

## Documenting Reportable Results

Reportable results are expressed by rounding the analytical determinations to the number of places that is in agreement with the specification criteria, if such criteria exist. This rounding is done before the comparison to the specification criteria.

A reportable result is the result used for official reports outside of the area generating the result. It is also the result used for any statistical calculations and/or analysis outside the area generating the result.

If specification criteria do not exist, the reportable result is documented to the number of digits in the analytical determination. Criteria in specifications are significant to the last digit shown. Reportable results are compared to the specification criteria, and a conclusion is made. An analytical determination may be used for more than one purpose. For example, LOD may be an element in determining another reportable value (perhaps a raw material assay) and also become a reportable value itself. For the raw material, all available significant digits are preserved and used to calculate the raw material assay. For LOD, the analytical determination would be rounded to agree with the LOD specification criteria and then reported.

Reportable results, by definition, cannot be averaged together in order to make quality assurance decisions affecting the acceptance or rejection of product. If, after the disposition of the product has been decided and documented and a single result is needed for a shipping Certificate of Analysis, then reportable results may be averaged and recorded for the Certificate of Analysis only.

## Documenting Digits

Note that the limits or values in specification criteria are fixed numbers and cannot be rounded off.

When one is rounding a sample size calculation, it is conservative and preferred to round any fraction up to the next whole number.

When one is rounding degrees of freedom (df), it is conservative and preferred to round any fraction down to the next whole number.

When rounding $p$ values, round to three digits to the right of the decimal.

Digits for $\ln (x)$ or $\log (x)$ are significant through the $n$-th place after the decimal point when $x$ has $n$ significant digits (ASTM E29).

The number of significant digits of $\epsilon^{x}$ or $10^{x}$ is equal to the place of the last significant digit in $x$ after the decimal (ASTM E29).

When changing units, keep the same number of significant digits, as in this example: $361 \mathrm{~mm}=36.1 \mathrm{~cm}=$ 0.361 m .

Positive values are rounded in the positive direction and negative values are rounded in the negative direction. For example, -1.689 if rounded to three significant digits is -1.69 , or -0.05 if rounded to one significant digit is -0.1 .
Some tests may give negative results. If, when appropriately rounded, the result is zero, the negative sign can be dropped. Optionally, the laboratory manager may elect to record $\pm$ zeros for trending and monitoring purposes.
For data such as percent recovery that are centered around 100, the calculated results will be treated, for significant digits purposes, as being at or above 100 . Values below 100 will carry as many digits to the right of the decimal as the values above 100 . Generically, this applies to data centered on a power of 10 .
Optionally, and for reporting of results, when there are six or more digits to the left of the decimal point, group the digits in threes and separate with commas. Optionally, when there are six or more digits to the right of the decimal point, group the digits in threes and separate by spaces. This is for convenience of reporting and not for analysis.

## Examples

## Rounding to Significant Digits

If a numerical result is determined to be 100.2 , its true value lies somewhere between $100.150 \quad 000 \rightarrow \infty$ and $100.249999 \rightarrow \infty$, given the rounding rule below.

| Examples of Significant Digits |  |  |
| :---: | :---: | :--- |
| Number | Significant <br> Digits | Notes |
| 102.4 | 4 |  |
| 102.44 | 5 |  |
| 0.00108 | 3 |  |
| 0.0010800 | 5 | The trailing zeros are not |
| $3.5 \times 10^{3}$ | 2 |  |
| $3.55 \times 10^{3}$ | 3 |  |
| $2800 \pm 50$ | 2,3 , or 4 | The trailing zeros may be <br> placeholders. |
| $0.060 \pm 0.005$ | 2 | The trailing zero is not a <br> placeholder. |
| $10 \pm 5$ | 1 or 2 |  |
| 38 counted | infinite |  |

Counted numbers, references standards, official targets, and standard conversions are assumed to have an infinite number of significant digits. For example, 38 as a count is considered to be $38.0000000 \rightarrow \infty$. Similarly, $60 \mathrm{mg} / \mathrm{mL}$ as a label claim is assumed to have an infinite number of significant digits. And $1 \mathrm{oz}=437.5$ grains exactly. For the ratio of two counted numbers, $100 / 3000=0.0333333 \rightarrow \infty$; report as many digits as needed for further calculations.

Fundamental constants and irrational numbers such as $\mathrm{e}=$ $2.718281 \ldots, \pi=3.141592 \ldots, \sqrt{ } 2=1.414213 \ldots$, and fractions such as $1 / 6=0.6666666 \ldots$ are used with sufficient digits to accommodate the other values in the calculation and should not be the limit on the number of significant digits in the result.

## Employing the Five and Up Rounding Rule

For the number to be rounded, identify one digit to the right of the last place that is in the specification criteria (lim$\mathrm{it})$. If this digit is four or less, it is dropped and the preceding digit is unchanged. If it is five or greater, it is dropped and the preceding digit is increased by one.

| Criteria | Calculation | Result |
| :---: | :---: | :---: |
| 95.0 to 105.0 | 97.47 | 97.5 |
|  | 97.44 | 97.4 |
|  | 97.45 | 97.5 |

Double rounding within a single calculation to the final desired number of significant digits is never permitted. Example:

| Calculation | First round | Second round |  |
| :---: | :---: | :--- | :--- |
| 100.345 | 100.35 | 100.4 | Incorrect |
| 100.345 | 100.3 |  | Correct |

Rounding up for a sample size calculation:

| Calculation | Result |
| :---: | :---: |
| 13.1 | 14 |
| 13.5 | 14 |
| 13.9 | 14 |

Rounding down for degrees of freedom (df) in a calculation:

| Calculation | Result |
| :---: | :---: |
| 13.1 | 13 |
| 13.5 | 13 |
| 13.9 | 13 |

Rounding $r$ from a calculation: Specification criteria: $r \geq 0.999$ :

| Calculation | Result |
| :---: | :--- |
| 0.99949 | 0.999 |
| 0.99950 | $1.000[0.99950]$ |
| 0.99988 | $1.000[0.99988]$ |

Report the analytical determination in brackets if the reportable result is $1.000 ; r$ is Pearson's correlation coefficient. Same rule for $r^{2}$, the coefficient of determination.

Rounding $p$ values to three digits to the right of the decimal:

| Calculation | Result |
| :---: | :---: |
| 0.0494 | 0.049 |
| 0.0495 | 0.050 |

Rounding for logarithms:

| Initial | Calculation | Result |
| :---: | :---: | :---: |
| $\ln (4.62)$ | 1.5303947 | 1.530 |

The result is to three places after the decimal because the number 4.62 has three significant digits.

Rounding for exponentials:

| Initial | Calculation | Result |
| :---: | :---: | :---: |
| $10^{2.875}$ | 749.8942 | 750 |

The result is to three significant digits because the value 2.875 has three digits to the right of the decimal.

The rounding rule can be generalized. Following are definitions by examples:

- Rounded to the nearest $0.01,16.385$ is 16.39 .
- Rounded to the nearest $0.1,13.95$ is 14.0.
- Rounded to the nearest $0.2,61.1$ is 61.2 .
- Rounded to the nearest $0.5,8.61$ is 8.5 .
- Rounded to the nearest $10 \mathrm{~s}, 8035$ is 8040 with the last zero a placeholder.
- Rounded to the nearest 50,8035 is 8050 with the last two zeros as placeholders.
Nonnumeric lists of acceptable categories are an analogy to rounding numeric results. For example, color categories could be defined as: white, off-white, light yellow, yellow, dark yellow. Only these categories would be used to report the results.

## Manually Recording Raw Results

As an example, a peak height is given as 8343.9867543. It is known to have only six significant digits. The analyst wishes to record a value in the laboratory notebook for ease of future calculations that contain more digits than six but fewer than the full number. It is appropriate to delete digits beyond the significant digits to, for example, 8343.9868. Optionally, all digits would be recorded and used.

The output of a digital meter is given as 0.956734576 3, but it is known that the instrument has only six significant digits. The value 0.95673458 could be manually recorded after deleting digits beyond the eighth place to the right of the decimal.

## Calculations

## UV Example:

Raw data as absorbances

| Standard Ab | 0.99021 |
| :--- | :---: |
| Sample Ab1 | 0.92672 |
| Sample Ab2 | 0.91594 |
| Standard Weight | 65.310 mg |

| Formula | $\mathrm{mg} / \mathrm{mL}=$ Sample $\mathrm{Ab} /$ Standard $\mathrm{Ab} \cdot$ Standard Wt mg |
| :--- | :--- |
| Sample 1 | $\mathrm{mg} / \mathrm{mL}=0.92672 / 0.99021 \cdot 65.310=61.12247220$ |
| Sample 2 | $\mathrm{mg} / \mathrm{mL}=0.91594 / 0.99021 \cdot 65.310=60.41146969$ |

The intermediate results are significant to at least five digits. However, if the results are to be manually recorded for further calculations, extra digits should be recorded.

Because 65.310 has five significant digits, and carrying two extra digits, the intermediate results can be reduced to seven digits as $61.12247 \mathrm{mg} / \mathrm{mL}$ and $60.41147 \mathrm{mg} / \mathrm{mL}$.

The analytical determination is the average of the intermediate results of the two samples: (61.12247 + 60.41147 ) $/ 2=60.766$ 97. This result, when rounded to five significant digits, is $60.767 \mathrm{mg} / \mathrm{mL}$.

The label claim is $60 \mathrm{mg} / \mathrm{mL}$. The $\%$ label claim $=$ $(60.767 \mathrm{mg} / \mathrm{mL}) /(60 \mathrm{mg} / \mathrm{mL})=101.27833$, which, when rounded to five significant digits, is $101.28 \%$. This is the analytical determination that is recorded in the laboratory notebook. (Note that the label claim of $60 \mathrm{mg} / \mathrm{mL}$ is assumed to have an infinite number of significant digits.)

The specification criterion is $98.0 \%$ to $102.0 \%$. A reportable value at or above 100 must be reported with four significant digits. Values below 100 are reported with the same number of digits to right of the decimal as the values at or above 100. In this example, the reportable value is $101.3 \%$ (noting that 101.27833 was rounded, not the analytical determination of 101.28 to avoid double rounding). Now compared to the criteria, the result passes.
Averages and standard deviations:
$\%$
100.8
100.1
99.9
101.0
99.6
99.5

|  | On the <br> Calculator | Analytical Determination |
| :--- | :--- | :---: |
| Average: | 100.15 | $100.2 \%$ |
| Std Dev: | 0.622093241 <br> (not calculated because the Std Dev is already <br> \%RSD <br>  <br> in \%) |  |
| Count | 6 |  |

Because there is no specification criterion, the reportable value is the analytical determination.

## Residue on Ignition Test:

Specification criterion: not more than (NMT) $0.1 \%$
Calculator display is 0.045881 from the calculation of the raw data.
This intermediate result could be recorded for further calculation by dropping two digits as 0.0458 (herein assuming two significant digits.)
The reportable result is found by rounding to agreement with the criteria as $0.0 \%$. The result passes.

## Comparison to Criteria

Criteria and limits, when shown numerically, are significant to the last digit shown. Upper and lower limits are inclusive. For example, limits of $95.0 \%$ to $105 \% .0$ include the values $95.0 \%$ and $105.0 \%$, so that values of 95.0 or $105.0 \%$ are a passing result.

Criteria and limits are assumed to allow for variability in raw materials, analytical testing, compounding, manufacturing, and for increases and decreases due to product instability. The reportable results as defined must meet the criteria as written. Additional compensation, guard bands, or adjustments for sources of variation are not permitted.

Analytical determinations with fewer significant digits or fewer digits to the right of the decimal than the criteria are inconclusive and may not be used to determine compliance with the specification criteria. The laboratory manager must resolve such issues, but the following summary table offers examples for guidance.

Table 1. Summary examples

| Compendial Requirement | Analytical <br> Determination | Reportable Value | Decision |
| :--- | :---: | :---: | :--- |
| Assay Limit $\leq 0.1 \%$ | $0.04 \%$ |  |  |
| Assay Limit $\leq 0.10 \%$ | $0.04 \%$ | $0.0 \%$ | Conforms |
| Assay Limit $\leq 0.10 \%$ | $0.1051 \%$ | $0.04 \%$ | Conforms |
| Assay Limit $\leq 0.10 \%$ | None detected | Invalid, not a number | Does not conform |
| Assay Limit $\leq 0.20 \%$ | $0.1 \%$ | Does not conform |  |
|  |  | Invalid, too few significant | Does not conform |
| Assay Limit $\leq 0.1 \%$ | $-0.02 \%$ | $0.0 \%$ |  |
| Assay Limit $\leq 0.5 \%$ | $-0.05 \%$ | $-0.1 \%$ | Conforms |
| Assay Limit $\geq 98.0 \%$ | $97.96 \%$ | $98.0 \%$ | Does not conform |
| Assay Limit $\geq 98.0 \%$ | $97.94 \%$ | $97.9 \%$ | Conforms |

| Powder is white | Off-white | Clear | Off-white |

## SUMMARY

Readers are invited to submit comments, proposed additions, changes, and revisions. References and examples for substantive changes are strongly suggested.

## ACKNOWLEDGMENTS

Thanks to the members of the USP Biostatistics Expert Committee for their assistance and substantial feedback. Thanks also to Russell Nelson, Dr. Chris Burgess, John Elvig, and Dr. Robert Kieffer for reading the article and for their valuable comments.

## NOMENCLATURE

This section includes supplements to the latest edition of the USP Dictionary of USAN and International Drug Names that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

## USP Dictionary of USAN and International Drug Names 2004 USP DICTIONARY SUPPLEMENT 1

IMPORTANT-Save this Supplement. This and all supplements appearing in $P F$ are needed to keep the 2004 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2004) edition will be included in the next complete edition of the Dictionary.

## New United States Adopted Names (USAN)

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of $P F$ for other new USAN to supplement the Dictionary main volume.

Ciluprevir [2004] (si loo pre' veer). $\mathrm{C}_{40} \mathrm{H}_{50} \mathrm{~N}_{6} \mathrm{O}_{8}$ S. 774.93. (1) Cyclopropa $[e]$ pyrrolo $[1,2-a][1,4]$ diazacyclopentadecine$14 \mathrm{a}(5 H)$-carboxylic acid, 6-[[(cyclopentyloxy)carbonyl]ami-no]-1,2,3,6,7,8,9,10,11,13a,14,15,16,16a-tetradecahydro-2-[[7-methoxy-2-[2-[(1-methylethyl)amino]-4-thiazolyl]-4-qui-nolinyl]oxy]-5,16-dioxo-, ( $2 R, 6 S, 12 Z, 13 \mathrm{a} S, 14 \mathrm{a} R, 16 \mathrm{aS})-;$ (2) (2R,6S,12Z,13aS,14aR,16aS)-6-[[(Cyclopentyloxy)carbony-1]amino]-2-[[7-methoxy-2-[2-[(1-methylethyl)amino]thiazol4 -yl]quinolin- 4 -yl]oxy] -5,16-dioxo- 1,2,3,6,7,8,9,10,11,13a, 14,15,16,16a-tetradecahydrocyclopropa[e]pyrrolo[1,2a] $[1,4]$ diazacyclopentadecine-14a(5H)-carboxylic acid. CAS-300832-84-2. Treatment of Hepatitis C infection. (Boehringer Ingelheim GmbH, Germany) $\triangleleft B I L N 2061$ ZW

Dextofisopam [2004] (dex toe fis' oh pam). $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4}$. 382.45 . (1) 5H-2,3-Benzodiazepine, 1-(3,4-dimethoxyphenyl)-5-ethyl-7,8-dimethoxy-4-methyl-, (5R)-; (2) (+)-(5R)-1-(3,4-Dimethoxyphenyl)-5-ethyl-7,8-dimethoxy-4-methyl-5H-2,3benzodiazepine. CAS-82059-50-5. Treatment of irritable bowel syndrome, Crohn's disease; anti-anxiety, anti-stress. (Novasep) $\diamond R$-tofisopam

Ecopladib [2004] (ek oh pla' dib). $\mathrm{C}_{39} \mathrm{H}_{33} \mathrm{Cl}_{3} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}$. 748.11. (1) Benzoic acid, 4-[2-[5-chloro-2-[2-[[[(3,4-dichlorophenyl)-methyl]sulfonyl]amino]ethyl]-1-(diphenylmethyl)-1 H -indol-3-yl]ethoxy]-; (2) 4-[2-[5-Chloro-2-[2-[[(3,4-dichloroben-zyl)sulfonyl]amino]ethyl]-1-(diphenylmethyl)-1 H -indol-3yl]ethoxy]benzoic acid. CAS-381683-92-7. Treatment of pain and symptomatic management of arthritis. (Wyeth) $\triangleleft P L A-$ 725

Maropitant Citrate [2004] (mar oh pit' ant). $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{~N}_{2} \mathrm{O}$.$\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} . \mathrm{H}_{2} \mathrm{O} .678 .81$. (1) 1-Azabicyclo[2.2.2]octan-3-amine, N -[[5-(1,1-dimethylethyl)-2-methoxyphenyl]methyl]-2-(di-phenylmethyl)-, ( $2 S, 3 S$ )-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1), monohydrate; (2) $(2 S, 3 S)-N-[5-(1,1-$ Dimethylethyl)-2-methoxybenzyl]-2-(diphenylmethyl)-1-azabicyclo[2.2.2]octan-3-amine 2-hydroxy-1,2,3-propanetricarboxylate (1:1), monohydrate. CAS-359875-09-5. Antiemetic. (Pfizer) $\diamond C J-11,972$

Micafungin Sodium [2004] (mi ka fun' gin). $\mathrm{C}_{56} \mathrm{H}_{70} \mathrm{~N}_{9} \mathrm{NaO}_{23} \mathrm{~S}$. 1292.30. [Micafungin is INN.] (1) Pneumocandin A0, 1$\left[(4 R, 5 R)-4,5-\right.$ dihydroxy- $N^{2}$-[4-[5-[4-(pentyloxy)phenyl]-3-isoxazolyl]benzoyl]-L-ornithine]-4-[(4S)-4-hydroxy-4-[4-hy-droxy-3-(sulfooxy)phenyl]-L-threonine]-, monosodium salt; (2) $5-[(1 S, 2 S)-2-[(2 R, 6 S, 9 S, 11 R, 12 R, 14 \mathrm{a} S, 15 S, 16 S, 20 S, 23-$ $S, 25 \mathrm{a} S)$-20-[(1R)-3-Amino-1-hydroxy-3-oxopropyl]-2,11,12,15-tetrahydroxy-6-[(1R)-1-hydroxyethyl]-16-methyl-

5,8,14,19,22,25-hexaoxo-9-[[4-[5-[4-(pentyloxy)phenyl]i-soxazol-3-yl]benzoyl]amino]tetracosahydro-1 H -dipyrrolo $\left[2,1-c: 2^{\prime}, 1^{\prime}-l\right][1,4,7,10,13,16]$ hexaazacyclohenicosin-23-yl]-1,2-dihydroxyethyl]-2-hydroxyphenyl sodium sulfate. CAS-208538-73-2; CAS-235114-32-6 [micafungin]. Treatment of Aspergillus and Candida fungal infections. Mycamine (Fujisawa) $\diamond F K 463$

Netoglitazone [2004] (net oh glit' a zone). $\mathrm{C}_{21} \mathrm{H}_{16} \mathrm{FNO}_{3} \mathrm{~S} .381 .42$. (1) 2,4-Thiazolidinedione, 5-[[6-[(2-fluorophenyl)methoxy]-2-naphthalenyl]methyl]-; (2) (5RS)-5-[[6-[(2-Fluorobenzy-1)oxy]-2-naphthyl]methyl]thiazolidine-2,4-dione.CAS-161600-01-7. INN. Antidiabetic; orally-administered insulin action enhancer to lower the plasma glucose in patients with non-insulin dependent diabetes mellitus (type 2). (Mitsubishi) $\checkmark M C C$ 555; RWJ-241947

Pelitrexol [2004] (pel' i trex ol). $\mathrm{C}_{20} \mathrm{H}_{25} \mathrm{~N}_{5} \mathrm{O}_{6} \mathrm{~S}$. 463.51. (1) LGlutamic acid, $N$-[[5-[2-[(6S)-2-amino-1,4,5,6,7,8-hexahy-dro-4-oxopyrido[ $2,3-d]$ pyrimidin-6-yl]ethyl]-4-methyl-2-thienyl]carbonyl]-; (2) (2S)-2-[[[5-[2-[(6S)-2-Amino-4-oxo-1,4,5,6,7,8-hexahydropyrido[2,3- $d$ ]pyrimidin-6-yl]ethyl]-4-methylthiophen-2-yl]carbonyl]amino]pentanedioic acid. CAS-446022-33-9. Antineoplastic (glycinamide ribonucleotide formyltransferase (GARFT) inhibitor). (Agouron) $\checkmark$ - $A$ G2037

Psyllium Hemicellulose [2004] (sil' i yum). Hemicellulose. CAS-9034-32-6. Laxation and cholesterol lowering. (Procter \& Gamble)

Ramelteon [2004] (ram el' tee on). $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{2}$. 259.35. (1) Propanamide, $N$-[2-[(8S)-1,6,7,8-tetrahydro- 2 H -indeno[5,4-b]fu-ran-8-yl]ethyl $]-;(2)(-)-N-[2-([(8 S)-1,6,7,8-T e t r a h y d r o-2 H-$ indeno[5,4-b]furan-8-yl]ethyl]propanamide. CAS-196597-26-9. Treatment of sleep disorders. (Takeda) $\diamond T A K-375$

Tanaproget [2004] (tan a pro' jet). $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{OS}$ 297.38. (1) 1 H -Pyrrole-2-carbonitrile, 5-(1,4-dihydro-4,4-dimethyl-2-thioxo-2H-3,1-benzoxazin-6-yl)-1-methyl-; (2) 5-(4,4-Dimethyl-2-
thioxo-1,4-dihydro-2H-3,1-benzoxazin-6-yl)-1-methyl-1 H -pyrrole-2-carbonitrile. CAS-304853-42-7. Oral contraception; nonsteroidal ligand for the progesterone receptor. (Wyeth) $\diamond N S P-989$

Teduglutide [2004] (te due' gloo tide). $\mathrm{C}_{164} \mathrm{H}_{252} \mathrm{~N}_{44} \mathrm{O}_{55} \mathrm{~S} .3752 .00$. (1) ALX 0600 (2-glycine-1-33-glucagon-like peptide II (human) ); (2) [2-Glycine]-1-33-glucagon-like peptide II (hu-
man). CAS-287714-30-1. Treatment of intestinal diseases characterized by chemical or surgical damage of the intestinal epithelium such as Short Bowel Syndrome (SBS) or damage to the intestinal epithelium due to disease (glucagonlike peptide-2 (GLP-2) analog). (NPS) $\diamond A L X 0600$

## Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official United States Pharmacopeia or National Formulary. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the Federal Register of February 1988.

All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.
A formal procedure ${ }^{1}$ is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all

## Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event
that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names'"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

## USP CATALOG

## New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1012939 | Allantoin (200 mg) | F0C169 | \$156 |
| 1048619 | Benazepril Hydrochloride ( 125 mg ) | F0C250 | \$156 |
| 1048620 | Benazepril Related Compound A ( 15 mg ) | F0C252 | \$487 |
| 1048630 | Benazepril Related Compound B ( 15 mg ) | F0C256 | \$487 |
| 1048641 | $\begin{aligned} & \text { Benazepril Related Compound C } \\ & (50 \mathrm{mg}) \end{aligned}$ | F0C425 | \$487 |
| 1071439 | Positive Bioreaction (3 strips; $10 \mathrm{~cm} \times 1$ cm ) | F0D014 | \$325 |
| 1098118 | Cefpiramide ( 300 mg ) | F0C203 | \$156 |
| 1105009 | Powdered Chaste Tree Extract (1.5 g) | F0C406 | \$520 |
| 1111001 | Chlorhexidine ( 200 mg ) | F0C306 | \$156 |
| 1111103 | Chlorhexidine Acetate ( 500 mg ) | F0C281 | \$156 |
| 1111307 | Chlorhexidine Related Compounds $(50 \mathrm{mg})$ | F0D017 | \$487 |
| 1115545 | Chlorogenic Acid ( 50 mg ) | F0C420 | \$156 |
| 1133547 | Choline Chloride ( 200 mg ) | F0C058 | \$156 |
| 1140247 | Clomipramine Hydrochloride ( 200 mg ) | F0C075 | \$156 |
| 1140349 | Clonazepam Related Compound C $(25 \mathrm{mg})$ | F0C340 | \$487 |
| 1140393 | Clonidine ( 200 mg ) | F0C401 | \$156 |
| 1140418 | Clonidine Related Compound A ( 25 mg ) | F0C373 | \$487 |
| 1140429 | Clonidine Related Compound B ( 25 mg ) | F0C403 | \$487 |
| 1148500 | Copovidone ( 100 mg ) | F0C194 | \$156 |
| 1152701 | Cyclandelate ( 200 mg ) | F0C384 | \$156 |
| 1171900 | Desflurane ( 0.5 mL ) | F0C187 | \$156 |
| 1171910 | Desflurane Related Compound A (0.1 mL ) | F0C031 | \$487 |
| 1179708 | Dextran 40 ( 50 mg ) | F0C247 | \$156 |
| 1179741 | Dextran 70 ( 50 mg ) | F0C260 | \$156 |
| 1224959 | Dolasetron Mesylate ( 200 mg ) | F0C319 | \$156 |
| 1224960 | Dolasetron Mesylate Related Compound A ( 25 mg ) | F0C321 | \$487 |
| 1225419 | Doxazosin Mesylate ( 200 mg ) | F0C079 | \$156 |
| 1231728 | Powdered Echinacea Purpurea Extract $(1 \mathrm{~g})$ | F0D018 | \$520 |
| 1231706 | Powdered Echinacea Angustifolia Extract (1 g) | F0D019 | \$520 |
| 1234704 | Powdered Eleuthero Extract (1.5 g) | F0C291 | \$520 |
| 1272204 | Fludarabine Phosphate ( 300 mg ) | F0C374 | \$156 |
| 1273808 | Flumazenil ( 200 mg ) | F0C305 | \$780 |
| 1279837 | Fluoxetine Related Compound C $(15 \mathrm{mg})$ | F0C352 | \$487 |
| 1286060 | Formononetin ( 50 mg ) | F0C196 | \$520 |
| 1287675 | Gadoversetamide ( 200 mg ) | F0C172 | \$156 |
| 1287686 | Gadoversetamide Related Compound A ( 200 mg ) | F0C173 | \$487 |
| 1288306 | Ganciclovir (200 mg) | F0C287 | \$364 |
| 1288317 | Ganciclovir Related Compound A ( 15 mg ) | F0C288 | \$624 |
| 1294207 | Glucosamine Hydrochloride (200 mg) | F0C363 | \$156 |

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1305507 | 2E, 4E-Hexadienoic Acid Isobutylamide ( 25 mg ) | F0C353 | \$540 |
| 1315012 | Hydrocodone Bitartrate Related Compound A CII (70 mg) | F0C214 | \$513 |
| 1349014 | Isoflurane Related Compound A (0.1 mL ) | F0C232 | \$487 |
| 1349025 | Isoflurane Related Compound B (0.1 mL ) | F0C233 | \$487 |
| 1355709 | Powdered Kava Extract (1 g) | F0C161 | \$260 |
| 1355753 | Kawain (200 mg) | F0C160 | \$208 |
| 1356836 | Lamivudine ( 200 mg ) | F0C361 | \$156 |
| 1370270 | Loratadine ( 200 mg ) | F0C414 | \$260 |
| 1378012 | Medroxyprogesterone Acetate Related Compound A ( 25 mg ) | F0C427 | \$500 |
| 1392454 | Meropenem ( 300 mg ) | F0C201 | \$182 |
| 1396309 | Metformin Hydrochloride ( 200 mg ) | F0C209 | \$182 |
| 1396310 | Metformin Related Compound A ( 50 mg ) | F0C210 | \$487 |
| 1434011 | Methylphenidate Hydrochloride Erythro Isomer Solution CII ( 0.5 mL ) | F0C368 | \$560 |
| 1441232 | Metoprolol Related Compound A ( 20 mg ) | F0C343 | \$520 |
| 1441243 | Metoprolol Related Compound B ( 50 mg ) | F0C377 | \$520 |
| 1441254 | $\begin{aligned} & \text { Metoprolol Related Compound C } \\ & (20 \mathrm{mg}) \end{aligned}$ | F0C344 | \$520 |
| 1441265 | Metoprolol Related Compound D ( 50 mg ) | F0C378 | \$520 |
| 1441298 | Metoprolol Succinate ( 200 mg ) | F0C415 | \$156 |
| 1445211 | Mitoxantrone System Suitability Mixture ( 0.3 mg ) | F0D010 | \$500 |
| 1457469 | Naratriptan Hydrochloride ( 125 mg ) | F0C360 | \$208 |
| 1478582 | Ondansetron Hydrochloride ( 300 mg ) | F0C222 | \$208 |
| 1478593 | Ondansetron Related Compound A $(50 \mathrm{mg})$ | F0C191 | \$487 |
| 1478618 | Ondansetron Related Compound C $(50 \mathrm{mg})$ | F0C251 | \$487 |
| 1478629 | Ondansetron Related Compound D ( 50 mg ) | F0C226 | \$487 |
| 1483301 | Oxfendazole ( 200 mg ) | F0C128 | \$156 |
| 1491332 | Paclitaxel ( 200 mg ) | F0C180 | \$1,508 |
| 1491343 | Paclitaxel Related Compound A ( 20 mg ) | F0C179 | \$754 |
| 1491354 | Paclitaxel Related Compound B ( 20 mg ) | F0C181 | \$754 |
| 1500251 | $\begin{aligned} & \text { Paroxetine Related Compound D } \\ & (15 \mathrm{mg}) \end{aligned}$ | F0C228 | \$487 |
| 1535020 | Phenytoin Related Compound B ( 50 mg ) | F0C157 | \$487 |
| 1596807 | Quinine Hydrochloride Dihydrate (1 g) | F0C108 | \$156 |
| 1599500 | Powdered Red Clover Extract (500 mg) | F0C188 | \$260 |
| 1601102 | Residual Solvent Mixture - Class 1 ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C407 | \$156 |
| 1601146 | Residual Solvent Class 1 - Benzene ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C408 | \$156 |
| 1601168 | Residual Solvent Class 1 - Carbon Tetrachloride ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C409 | \$156 |
| 1601180 | Residual Solvent Class 1-1,2Dichloroethane ( $1.2 \mathrm{~mL} /$ ampule; 3 ampules) | F0C412 | \$156 |

New Items at a Glance (Continued)

| Cat. <br> No. | Description | Curr. <br> Lot | Price |
| :--- | :--- | :--- | :--- |
| 1601204 | Residual Solvent Class 1 - 1,1- <br> Dichloroethene (1.2 mL/ampule; <br> a ampules) | F0C411 | $\$ 156$ |
| 1601226 | Residual Solvent Class 1-1,1,1- <br> Trichloroethane (1.2 mL/ampule; <br> 3 ampules) | F0C410 | $\$ 156$ |
| 1604508 | Rimantadine Hydrochloride (300 mg) | F0C266 | $\$ 156$ |

| 1711155 | Vecuronium Bromide (60 mg) | F0C367 | $\$ 156$ |
| 1711461 | Verteporfin (200 mg) | F0C166 | $\$ 156$ |
| 1714506 | Vinorelbine Tartrate (200 mg) | F0C243 | $\$ 156$ |
| 1714528 | Vinorelbine Related Compound A <br> $(25 \mathrm{mg})$ | F0C242 | $\$ 487$ |

## USING AND ORDERING USP REFERENCE STANDARDS

## Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the United States Pharmacopeia-National Formulary (USP-NF). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the $U S P-N F$. The Reference Standards also lend themselves to many other applications, including measurements required to attain accurate and reproducible results in modern chromatographic and spectrophotometric methods.

## Rigorous Testing and Quality Control

USP Reference Standards are selected for their high purity, critical characteristics, and suitability for the intended purpose. Unless a USP Reference Standard label states a specific potency or content, the USP Reference Standard is taken as being $100 \%$ pure for the USP purposes for which it is provided.

Heterogeneous substances, of natural origin, are also designated "Reference Standards" where needed. Usually these are the counterparts of international standards.

USP Reference Standards are established through a process of rigorous testing, evaluation, and quality control. They are independently tested in three or more laboratories-USP, FDA, and academic and industrial laboratories throughout the United States. The Reference Standards are released under the authority of USP's Board of Trustees, on the recommendation of the USP Reference Standards Expert Committee, which approves selection and suitability of each lot.

## Reference Standards Categories

USP offers more than 1,540 Reference Standards for pharmaceuticals, excipients, and dietary supplements. On pages 13-52 of this catalog, you'll find a full list of available USP and NF Reference Standards, with information updated through Dec. 2003. The list includes:

- Reference Standards required by the current official edition of $U S P-N F$.
- Reference Standards not required in the current $U S P-N F$, but for which sufficient demand remains.
- Reference Standards specified in the current edition of the Food Chemicals Codex (FCC).
- Authentic Substances (AS)—highly purified samples of chemicals, including substances of abuse, required by analytical, clinical, pharmaceutical, and research laboratories.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration (DEA) of the U.S. Department of Justice.

USP also collaborates with the World Health Organization in its program to provide international biological standards and chemical reference materials for antibiotics, biologicals, and chemotherapeutic agents. Some USP Reference Standards are standardized in terms of the corresponding international standards.

## Proper Use of USP Reference Standards

USP Reference Standards are provided primarily for quality control use in conducting the pharmacopeial assays and tests described in the $U S P-N F$. Neither Reference Standards nor Authentic Substances are intended for use as drugs, dietary supplements, or medical devices.

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Users of USP Reference Standards should refer to General Chapter $\langle 11\rangle$ in the $U S P-N F$ :

## Listing and directions in USP-NF

- Refer to the list of revisions, additions, and deletions of individual USP Reference Standards in USP 27-NF 22. Individual $U S P$ or $N F$ monographs specify the USP Reference Standard(s) required for assay and test procedures. The USP 27-NF 22 General Test Chapter $\langle 11\rangle$ USP Reference Standards provides additional information and instructions for proper use and storage. Note that if specific instructions for use appearing on the label of a USP Reference Standard differ from the instructions in Chapter $\langle 11\rangle$, the instructions on the label take precedence.
- Consult the cumulative updates to Reference Standards information provided in USP-NF Supplements and also in $U S P-N F$ Interim Revision Announcements, which are published in USP's bimonthly journal, Pharmacopeial Forum.

## Suitability for use

- The user must ascertain that the Reference Standards they are using are an official lot.
- The user must determine the suitability of Reference Standards for applications and uses not in the $U S P-N F$.

## USING AND ORDERING USP REFERENCE STANDARDS

## Storing

- Ensure that the USP Reference Standards are stored in their original stoppered containers, according to any special label directions, away from heat and humidity, and protected from light.

## Weighing

- Ensure that Reference Standard substances are accurately weighed-taking due account of relatively large errors potentially associated with weighing small masses-where it is directed that a standard solution or a standard preparation be prepared for a quantitative determination. See USP 27-NF 22 General Chapters $\langle 41\rangle$ Weights and Balances and $\langle 31\rangle$ Volumetric Apparatus, and USP-NF General Notices, for information regarding appropriate use of USP Reference Standards.

## Drying

- Use a clean and dry vessel, and not the original container, as the drying vessel where a USP Reference Standard is required to be dried before use.
- Make sure not to dry a specimen repeatedly at temperatures above 25 degrees.
- Follow any special drying requirements specified on the Reference Standards label or in specific sections of USP or NF monographs (note that any specific instructions on the label or in the monograph supersede the usual instructions in Procedures under Tests and Assays in USP-NF General Notices).
- Follow Method I under $U S P-N F$ General Chapter $\langle 921\rangle$ Water Determination where the titrimetric determination of water is required at the time a Reference Standard is to be used.
Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, users must titrate about 50 mg of the Reference Standard with a fourfold dilution of the reagent.

## ORDERING USP REFERENCE STANDARDS

## Four convenient ways to order

1. Phone: Call USP with your requirements: (800) 227-8772 from the U.S. or Canada and (301) 881-0666 from other countries. Please note that DEA controlled substances cannot be placed over the phone.

Hours of operation:
Monday-Friday
8:30AM-5:00PM

Fax: Fax your orders to (301) 816-8148.
Online: Order through the World Wide Web at http://store.usp.org. Please note that DEA controlled substances cannot be ordered online.
Mail: Send all mail orders to:
USP
Customer Service Department
12601 Twinbrook Parkway
Rockville, MD 20852, USA

## Important Order/Policy Information

For fax and mail orders, please use the order form at the back of this catalog. Official purchase orders on company letterhead may also be used to order USP Reference Standards. The purchase orders must have billing and shipping addresses and should include the catalog number, the name of the official Reference Standard, and the number of units ordered. Lot numbers need not be specified on written purchase orders as USP only ships current official lots. Confirmation orders may be sent and must clearly be designated as such. The USP does not assume responsibility for duplication of orders not clearly marked as confirmation orders.

## Pricing

USP Reference Standards must be ordered in whole units. Please note that one unit may include several individual containers.

Reference Standards unit prices included in the product listings from pages 13-52 of this catalog are effective until December 31, 2004. Please note that prices and package sizes are subject to change without notice.

## No Returns or Exchanges

USP Reference Standards may not be returned or exchanged for refund.

## Quantity Discounts

A 5\% discount is allowed for 5-24 units of any one Reference Standard in a single order, and a $10 \%$ discount for 25 or more units of any one Reference Standard in a single order. These discounts are subject to change without notice.

## Shipping

- Reference Standards orders can only be shipped to a street address and not to P.O. boxes.

## USING AND ORDERING USP REFERENCE STANDARDS

- Orders to the U.S. and Ontario, Canada are shipped via air courier of USP's choice at a charge of $\$ 11$ or via air courier of the customer's choice at an additional $\$ 25$ charge.
- Non-controlled substance orders to Canadian provinces other than Ontario are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Non-controlled substance orders to be shipped outside the U.S. and Canada are accepted directly by USP only when customs forms related to export are not required. They are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Shipping in cold pack can be done at customer request for an extra charge of $\$ 25$.
- Controlled substance orders to anywhere outside the U.S. are shipped via air courier of USP's choice with a charge of U.S. $\$ 220$.
- An additional shipping charge may be assessed for dangerous goods shipments.
- An additional shipping charge of $\$ 75$ will be assessed for rush/ same-day shipments.
- Customers may provide their shipping account numbers to have shipping charged directly.

## Payment

- Full payment in advance, in U.S. dollars, is required for all U.S. orders unless open account status has been granted by USP's Finance Department. To apply for open account status, an application can be requested by calling (301) 816-8177.
- Full payment in advance, in U.S. dollars, is required for all non-U.S. orders.
- Payment may be made by check, money orders, credit cards (VISA, MasterCard, American Express), and electronic wire transfer (please call (301) 816-8177 to get bank information for wire transfers). The customer is responsible for any bank fees and must include it in the payment. The customer is also responsible for any other fees such as customs duties, taxes, or tariffs.

## List Chemicals

The following Reference Standards are "List Chemicals": Dihydroergotamine Mesylate
*Ephedrine Sulfate
Ergonovine Maleate

[^113]Ergotamine Tartrate<br>Methylergonovine Maleate<br>Phenylpropanolamine Bitartrate<br>Phenylpropanolamine HCl<br>Pseudoephedrine HCl<br>Pseudoephedrine Sulfate

An organization in the United States seeking to purchase a List Chemical Reference Standard for resale to another customer must have a DEA registration (either a controlled substance or List Chemical registration). If an organization in the United States is purchasing the List Chemical Reference Standard for its own analytical use, it must provide USP with a letter on company letterhead describing the reason for the purchase.

## CONTROLLED DRUG SUBSTANCE ORDER

## DEA Requirements (U.S. Orders)

For all orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped within the U.S., a copy of the customer's current DEA Registration Certificate must be on file with USP. To order Schedule I and II standards, customers must submit, with their order forms or purchase orders, a DEA Form 222-C, properly completed. In addition, customers ordering DEA Schedules III and IV must provide appropriate DEA registration numbers for those schedules on their order forms or purchase orders.

## DEA Requirements (International Orders)

For all international controlled drug substance orders, please contact Julie Smith at (301) 816-8164 or foreigncontrols@ usp.org.

All orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped outside the U.S. must be accompanied by:

1. Full payment.
2. An import permit (in English or with an English translation attached) valid at least 6 months from the date of its receipt by USP Customer Service.
3. A statement of non-reexport and use for medical or scientific purposes (in English or with an English translation attached).
4. Purchase Order or Price Quote given by USP.

## USING AND ORDERING USP REFERENCE STANDARDS

On receiving the order, USP takes 2-3 business days to:

- Review all documents to make sure they are adequate and appropriate.
- Complete and legally approve the required DEA forms.
- Forward the forms to the DEA office to obtain the necessary Export Permits.

USP cannot ship items without an Export Permit. While it typically takes 6-10 weeks to get the permit from the DEA, USP has no control over the time in which permits are issued. On receiving the Export Permit, USP completes processing of the order in 1-3 days and ships out the materials through its freight forwarder.

Controlled substances (CI, CII, CIII, CIV, CV) and List Chemicals shipped to an international address, including Canada, add $\$ 25$ per unit.

For controlled substance orders to be shipped to Mexico, in addition to the DEA processing period, an additional week is required to obtain a certificate from the Mexican Embassy, authorizing the shipment to enter the country. Customers will pay an additional $\$ 114$ to cover the fee charged by the Mexican Embassy per import permit.

## Back Orders

USP will ship a back-ordered item if that item becomes available within 30 days of the date the order is placed if there is a valid open P.O. or payment for the item. If the order is more than 30 days old when the item becomes available, the customer will receive a Notice of Availability (NOA), indicating that the item is available. Such items will be shipped only after USP receives written authorization by the customer. The order will be canceled if the Reference Standard does not become available within six months of the original order. NOAs not replied to within 45 days of generation will be cancelled, and the customer account will be credited appropriately.

Customers may send confirmation orders for back-ordered Reference Standards that subsequently become available. They must clearly designate the confirmation orders as such-USP is not responsible for duplication of orders not clearly designated.

## HOW TO READ PRODUCT LISTINGS

Column 1 (Catalog Number): Catalog number currently assigned to each Reference Standard and Authentic Substance. Please include this number in your orders.

Column 2 (Description): Product description as designated in $U S P-N F$, the product label, and / or the Drug Enforcement Administration Control Schedule, as applicable. The quantity of material per container follows the name in parentheses (all materials are in single containers unless otherwise specified).

Column 3 (Current Lot): Current lot designation of each official item being distributed as of the date of this catalog. If the current lot is blank, the item is not in distribution.

Column 4 (Change Code): Codes that identify any change in USP Reference Standards status or information since the Jan./Feb. 2004, official Catalog. Code interpretations are as follows:

| Change <br> Code | Interpretation |
| :---: | :--- |
| 1 | New Reference Standard |
| 2 | New lot |
| 3 | Change in package size or description |
| 4 | Correction of typographical error |
| 5 | New catalog number-use for all orders |
| 6 | Previous lot no longer official; only <br> current lot to be used |
| 7 | Valid use date of previous lot extended <br> Change in catalog number and / or name, <br> 8 |
| 9 | see cross-reference section <br> Discontinued |

Column 5 (Previous Lot/Valid Use Date): Identifies lots no longer being distributed. The indicated month and in parenthesis indicates the date (last day of the month) through which that lot was valid as an official USP Reference Standard. (e.g. "F-1 (06/ 00 )" means lot F-1 is no longer being distributed, but was considered official through June 30, 2000.)

Column 6 (CAS Number)*: Chemical Abstracts Service number, when available, for USP Reference Standards and Authentic Substances. In case of mixtures, typically, the CAS number of the analyte of interest is listed.

Column 7 (Price) lists the price of the reference standard.

[^114]
## New Lots in Distribution

| Cat. <br> No. | Description | Curr. <br> Lot. | Change Code* | Previous Lot/Valid Use Date | $\begin{array}{\|l} \hline \text { CAS } \\ \text { No. } \\ \hline \end{array}$ | Price |

## USP Reference Standards and Authentic Substances

| Cat. <br> No. | Description | Curr. <br> Lot. | Change Code* | Previous Lot/Valid Use Date | CAS <br> No. | Price |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1000601 | Acebutolol Hydrochloride (125 mg) | F-1 |  |  | [34381-68-5] | \$156 |
| 1001003 | Acenocoumarol (200 mg) | F |  |  | [152-72-7] | \$156 |
| 1001502 | Acepromazine Maleate ( 250 mg ) | F-2 |  | F-1 (05/02) | [3598-37-6] | \$156 |
| 1002505 | Acesulfame Potassium ( 200 mg ) | F0C136 |  |  | [55589-62-3] | \$260 |
| 1003009 | Acetaminophen ( 400 mg ) | J-1 |  | $\begin{array}{\|l\|} \hline \text { J (05/02) } \\ \text { I (05/99) } \\ \hline \end{array}$ | [103-90-2] | \$124 |
| 1004001 | Acetanilide Melting Point Standard (500 mg) (Approximately 114 degrees) | M0A029 |  | $\begin{array}{\|l\|} \hline \mathrm{L}(06 / 04) \\ \mathrm{K}(02 / 00) \\ \hline \end{array}$ | [103-84-4] | \$75 |
| 1005004 | Acetazolamide (2 g) | J |  |  | [59-66-5] | \$156 |
| 1006007 | Acetohexamide ( 250 mg ) | H |  | G-1 (06/99) | [968-81-0] | \$156 |
| 1006506 | Acetohydroxamic Acid ( $200 \mathrm{mg} \mathrm{)}$ | F-1 |  | F (03/03) | [546-88-3] | \$156 |
| 1007000 | Acetophenazine Maleate ( 200 mg ) | F-1 |  |  | [5714-00-1] | \$156 |
| 1008002 | alpha-d-2-Acetoxy-4-dimethylamino-1,2-diphenyl-3-methylbutane ( 125 mg ) | G-3 |  |  | n/f | \$487 |
| 1008501 | Acetylcholine Chloride (200 mg) | G |  |  | [60-31-1] | \$156 |
| 1009005 | Acetylcysteine (200 mg) | H1B169 |  | H (01/04) | [616-91-1] | \$156 |
| 1009901 | Acetyltributyl Citrate ( 500 mg ) | G0C120 |  | F (05/04) | [77-90-7] | \$156 |
| 1009923 | Acetyltriethyl Citrate ( 500 mg ) | F-1 |  | F (05/02) | [77-89-4] | \$156 |
| 1012065 | Acyclovir (300 mg) | J0C149 |  | I (06/04) | [59277-89-3] | \$197 |
| 1012101 | Adenine ( 200 mg ) | G-1 |  | G (06/00) | [73-24-5] | \$156 |
| 1012123 | Adenosine ( 200 mg ) | G0C295 | 2 | $\begin{array}{\|l\|} \hline \text { F1B058 (01/05) } \\ \text { F (04/03) } \\ \hline \end{array}$ | [58-61-7] | \$156 |
| 1012145 | Agigenin (25 mg) | F |  |  | n/f | \$156 |
| 1012509 | L-Alanine ( 200 mg ) | F-2 |  | F-1 (04/01) | [56-41-7] | \$156 |
| 1012553 | Albendazole (200 mg) | G |  | F-1 (01/00) | [54965-21-8] | \$156 |
| 1012600 | Albuterol ( 200 mg ) | 1 |  | H (12/00) | [18559-94-9] | \$156 |
| 1012633 | Albuterol Sulfate ( $200 \mathrm{mg} \mathrm{)}$ | J |  | $1(04 / 00)$ | [51022-70-9] | \$156 |
| 1012757 | Alclometasone Dipropionate ( $300 \mathrm{mg} \mathrm{)}$ | H |  | G (01/00) | [66734-13-2] | \$156 |
| 1012780 | Alendronate Sodium (200 mg) | F0B315 |  |  | [121268-17-5] | \$156 |
| 1012906 | Alfentanil Hydrochloride CII ( 500 mg ) | F0B016 |  |  | [70879-28-6] | \$207 |
| 1012939 | Allantoin (200 mg) | F0C169 |  |  | [97-59-6] | \$156 |
| 1012950 | Alliin (25 mg) | F |  |  | [556-27-4] | \$1,525 |
| 1013002 | Allopurinol (250 mg) | J0C186 | 2 | $\begin{array}{\|l\|} \hline I-1(01 / 05) \\ I(07 / 02) \\ \hline \end{array}$ | [315-30-0] | \$156 |
| 1013024 | Allopurinol Related Compound A ( 50 mg ) (3-Amino-4-carboxamidopyrazole Hemisulfate) | G |  | $\begin{array}{\|l\|l\|} \hline \text { F-3 }(05 / 02) \\ \text { F-2 }(04 / 99) \\ \hline \end{array}$ | n/f | \$487 |
| 1013057 | S-Allyl-L-Cysteine ( 25 mg ) | F |  |  | n/f | \$487 |
| 1014005 | Alphaprodine Hydrochloride CII ( $250 \mathrm{mg} \mathrm{)}$ | F |  |  | [561-78-4] | \$207 |
| 1015008 | Alprazolam CIV (200 mg) | H |  |  | [28981-97-7] | \$207 |
| 1016000 | Alprostadil ( 25 mg ) | H |  |  | [745-65-3] | \$1,525 |
| 1017105 | Altretamine ( 500 mg ) | F |  |  | [645-05-6] | \$156 |
| 1017502 | Dried Aluminum Hydroxide Gel ( $200 \mathrm{mg} \mathrm{)}$ | F2B120 |  | F-1 (01/04) | [21645-51-2] | \$156 |
| 1018505 | Amantadine Hydrochloride ( $200 \mathrm{mg} \mathrm{)}$ | H |  | G (04/01) | [665-66-7] | \$156 |
| 1019202 | Amcinonide ( 200 mg ) | G0B260 |  | F-1 (03/04) | [51022-69-6] | \$156 |
| 1019417 | Amifostine Disulfide ( 25 mg ) | F0C152 |  |  | [112901-68-5] | \$487 |
| 1019508 | Amikacin (200 mg) | 1 |  | H (08/00) | [37517-28-5] | \$156 |
| 1019701 | Amiloride Hydrochloride ( 500 mg ) | H |  |  | [17440-83-4] | \$156 |
| 1019756 | Aminobenzoate Potassium (200 mg) | F-1 |  | F (06/01) | [138-84-1] | \$156 |
| 1019767 | Aminobenzoate Sodium (200 mg) | F |  |  | [55-06-6] | \$156 |

| Cat. No. | Description | Curr. Lot. | Change Code* | Previous Lot/Valid Use Date | $\begin{array}{\|l} \text { CAS } \\ \text { No. } \\ \hline \end{array}$ | Price |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1338801 | Indapamide (250 mg) | H |  | G (07/02) | [26807-65-8] | \$156 |
| 1339000 | Indigotindisulfonate Sodium ( 500 mg ) | H1B153 |  | H (06/03) | [860-22-0] | \$156 |
| 1340009 | Indocyanine Green (200 mg) | IOB045 |  | H (09/01) | [3599-32-4] | \$156 |
| 1341001 | Indomethacin (200 mg) | JOB165 |  | $\begin{array}{\|l\|} \hline \text { I (01/04) } \\ \mathrm{H}(05 / 99) \\ \hline \end{array}$ | [53-86-1] | \$156 |
| 1342004 | Insulin (100 mg) | H |  |  | [9004-10-8] | \$156 |
| 1342106 | Insulin Human (100 mg) | H1A031 |  | $\begin{aligned} & \hline \text { H }(11 / 02) \\ & \text { G }(04 / 00) \end{aligned}$ | [11061-68-0] | \$156 |
| 1342208 | Insulin (Beef) ( 100 mg ) | F |  |  | [11070-73-8] | \$156 |
| 1342300 | Insulin (Pork) (100 mg) | F |  |  | [12584-58-6] | \$156 |
| 1342503 | locetamic Acid ( 200 mg ) | F |  |  | [16034-77-8] | \$156 |
| 1343007 | lodipamide ( 200 mg ) | G | 4 |  | [606-17-7] | \$156 |
| 1343517 | lodixanol (200 mg) | FOB240 |  |  | [92339-11-2] | \$156 |
| 1343540 | lodixanol Related Compound C (25 mg) (5-Acetyl[3-[[3,5-bis[[2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]-2-hydroxy-propyl]amino]-N,N'-bis-(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide) | F0B236 |  |  | n/f | \$487 |
| 1343550 | lodixanol Related Compound D (50 mg) (5-[Acetyl(2-hydroxy-3-methyl-propyl)amino]-N,N'-bis(2,3-dihydroxypropyl)2,4,6-triiodo-1,3-benzenedicarboxamide) | F0B231 |  |  | [89797-00-2] | \$487 |
| 1343561 | lodixanol Related Compound E ( 25 mg ) ( $5-[[3-[[3-[[(2,3-$ Dihydoxypro-pyl)amino]carbonyl]-5-[[amino]carbonyl]-2,4,6-triiodophenyl](acetylimi-no)]-2-hydroxypropyl]-(acetylimino)]-N,N'-bis(2,3-dihydoxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide) | F0B229 |  |  | n/f | \$487 |
| 1344305 | o-lodohippuric Acid ( 100 mg ) | F |  |  | [147-58-0] | \$156 |
| 1344509 | Iodoquinol ( 100 mg ) | H |  | G (07/02) | [83-73-8] | \$156 |
| 1344600 | lohexol ( 100 mg ) | F-1 |  | F (01/99) | [66108-95-0] | \$124 |
| 1344622 | Iohexol Related Compound A (100 mg) (5-(acetylamino)-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide) | F-1 |  | F (10/01) | n/f | \$487 |
| 1344644 | lohexol Related Compound B ( 50 mg ) ( 5 -amino-N,N'-bis(2,3-dihydrox-ypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide) | F-1 |  | F (01/04) | [76801-93-9] | \$487 |
| 1344666 | lohexol Related Compound C (100 mg) (N,N'-bis(2,3-dihydroxypropyl)-5-nitro-1,3-benzenedicarboxamide) | F-1 |  | F (09/03) | n/f | \$156 |
| 1344702 | lopamidol (200 mg) | G |  |  | [60166-93-0] | \$156 |
| 1344724 | lopamidol Related Compound A (50 mg) (N,N'-Bis-(1,3-dihydroxy-2-propyl)-5-amino-2,4,6-triiodoiso-phthalamide) | G |  |  | [60166-98-5] | \$487 |
| 1344735 | lopamidol Related Compound B (100 mg) (5-Glycolamido-N,N'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodoisophthalamide) | F |  |  | n/f | \$487 |
| 1344804 | lopromide ( 400 mg ) | F |  |  | [73334-07-3] | \$156 |
| 1344826 | lopromide Related Compound A ( 50 mg ) ( 5 -Amino-N,N'-bis(2,3-dihy-droxypropyl)-2,4,6-triiodo-N-methyl-1,3-benzenedicarboxamide) | F |  |  | n/f | \$487 |
| 1344837 | lopromide Related Compound B ( 50 mg ) (5-(Acetylamino)-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-N-methyl-1,3-benzenedicarboxamide) | F |  |  | n/f | \$487 |
| 1345002 | lothalamic Acid (200 mg) | G |  |  | [2276-90-6] | \$156 |
| 1345104 | loversol (200 mg) | F |  |  | [87771-40-2] | \$156 |
| 1345115 | loversol Related Compound A (50 mg) (5-Amino-N,N'-bis(2,3-dihydrox-ypropyl)-2,4,6-triiodoisophthalamide) | F |  |  | [76801-93-9] | \$487 |
| 1345126 | loversol Related Compound B ( 50 mg ) (N,N'-bis(2,3-dihydroxypropyl)-5-[(N-(2-hydroxyethyl)-carbonyl)methoxy]-2,4,6-triiodoisophthalamide) | F |  |  | n/f | \$487 |
| 1345159 | loxaglic Acid (100 mg) | F |  |  | [59017-64-0] | \$156 |
| 1345206 | Ioxilan (400 mg) | F |  |  | [107793-72-6] | \$156 |

## Cross Reference List

| Former Cat. No. | Former Description/Cross Reference | Cat. No. | New Description |
| :---: | :---: | :---: | :---: |
| 53350-1 | alpha-Phenyl-2-piperidineacetic Acid Hydrochloride ( 50 mg ) (Limit Test) | 1434022 | Methylphenidate Related Compound A ( 50 mg ) (alpha-Phenyl-2-piperidineacetic Acid Hydrochloride) |
| 54500-1 | Plastic, Negative Control | 1546707 | Polyethylene, High Density (3 strips) |
| 61500-5 | Sodium Taurocholate (20 g) | 1071304 | Bile Salts (10 g) (Sodium Taurocholate) |
| 68800-9 | 3 -(3,4,6-Trihydroxyphenyl)-alanine (50 mg) (Limit Test) | 1361010 | Levodopa Related Compound A (50 mg) (3-(3,4,6-Trihydrox-yphenyl)-alanine) |
|  | Vitamin B1 Hydrochloride | 1656002 | Thiamine Hydrochloride ( 500 mg ) (Vitamin B1 Hydrochloride) |
|  | Vitamin B2 | 1603006 | Riboflavin ( 500 mg ) (Vitamin B2) |
|  | Vitamin B3 | 1462006 | Niacinamide ( 500 mg ) (Vitamin B3) |
|  | Vitamin B5 | 1087009 | Calcium Pantothenate (200 mg) (Vitamin B5) |
|  | Vitamin B6 | 1587001 | Pyridoxine Hydrochloride (200 mg) (Vitamin B6) |
|  | Vitamin B12 | 1152009 | Cyanocobalamin ( 1.5 g of mixture with mannitol; $10.7 \mathrm{mcg} / \mathrm{mg}$ of mixture) (Vitamin B12) |
|  | Vitamim Bc | 1286005 | Folic Acid (500 mg) (Vitamin M or Vitamin Bc) |
|  | Vitamin C | 1043003 | Ascorbic Acid (1 g) (Vitamin C) |
|  | Vitamin D2 | 1239005 | Ergocalciferol ( $150 \mathrm{mg} ; 30 \mathrm{mg} / \mathrm{ampule} ; 5$ ampules) (Vitamin D2) |
|  | Vitamin D3 | 1131009 | Cholecalciferol (30 mg/ampul; 5 ampuls) (Vitamin D3) |
|  | Vitamin E Alcohol | 1667600 | Alpha Tocopherol ( 250 mg ) (Vitamin E Alcohol) |
|  | Vitamin E Acetate | 1667701 | Alpha Tocopheryl Acetate ( 250 mg ) (Vitamin E Acetate) |
|  | Vitamin E Acid Succinate | 1667803 | Alpha Tocopheryl Acid Succinate ( 250 mg ) (Vitamin E Succinate) |
|  | Vitamin K1 | 1538006 | Phytonadione ( 500 mg ) (Vitamin K1) |
|  | Vitamin K3 | 1381006 | Menadione (200 mg) (Vitamin K3) |
|  | Vitamin M | 1286005 | Folic Acid ( 500 mg ) (Vitamin M or Vitamin Bc) |

Pharmacopeial Forum is covered in Current Contents/Life Sciences and in the Science Citation Index (SCI), in International Pharmaceutical Abstracts, and in Current Awareness in Biological Sciences.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

[^157]
## STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through Pharmacopeial Forum $(P F)$, for the development of official pharmaceutical standards.

USP publishes Pharmacopeial Forum ( $P F$ ) bimonthly as the working vehicle of the USP Council of Experts. PF provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the United States Pharmacopeia and the National Formulary (USP-NF).
$P F$ includes the following:

1. Potential revisions-entirely new standards, revision ideas, and drafts not yet targeted for official adoption (Pharmacopeial Previews)
2. Proposed revisions-new or revised standards targeted for official adoption (In-Process Revision)
3. Adopted revisions-new or revised standards that become official and binding before the publication of the next $U S P-$ NF or Supplement (Interim Revision Announcement)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in PF Briefings, the Commentary section of $P F$, the Commentary section of Supplements to USP-NF, or the Commentary section of $U S P-N F$.

[^158]The chart below shows the public review and comment process and its relationship to standards development.

# Public Review and Comment Process for Standards Development 

Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

## HOW TO USE PF

This section provides descriptions of the various parts of $P F$. It also includes Committee Designations and the Staff Directory.

The contents of the different sections of $P F$ are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the Staff Directory) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

# Proposed and Adopted Revisions 

| Section | Content | How Readers Can Respond |
| :---: | :---: | :---: |
| Pharmacopeial <br> Previews <br> Early ideas for revisions | -Briefing: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: <br> - the controversial nature of an item; <br> - the application of new technologies that require further study; and <br> - articles produced by multiple sources. | Review drafts and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview. |
| In-Process Revision Revisions targeted for adoption | -Briefing: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see Standards Development). New or revised text is marked with symbols ( ${ }^{\square}$ or ) to specify the tentative earliest date on which the revision would be officially adopted. | Review material and send comments promptly to USP staff liaison (see the Staff Directory). Guidelines on how to comment are found at the end of the Policies and Announcements section. |
| Harmonization <br> Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally | - Briefing: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under Pharmacopeial Previews or under In-Process Revision, both separate sections of Harmonization. <br> -For In-Process Revision, new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted. | Review material and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview or In-Process Revision. |
| Interim Revision <br> Announcement <br> Adopted standards | Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ${ }^{\circ}$. | Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance. |

## Other Sections

## Committee Designations

Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

## Staff Directory

Names of all USP scientific staff liaisons with contact information.

## Policies and Announcements

- General scientific and policy issues affecting $U S P-N F$ standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

## Stimuli to the Revision Process

- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

## Nomenclature

- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the USP Dictionary of USAN and International Drug Names
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

## Index

Cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).

## Reference Standards Catalog

List of official USP Reference Standards specified in $U S P-N F$, along with availability and ordering information.

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

Update of chromatographic reagents based on the proposals published in this issue of $P F$.

## EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

| AER | Aerosols |
| :---: | :---: |
| AMB | Analytical Microbiology |
| BBP | Blood and Blood Products |
| BNA | Bioavailability and Nutrient Absorption |
| BNT | Biotechnology and Natural Therapeutics and Diagnostics |
| BPC | Biopharmaceutics |
| BST | Biostatistics |
| CRX | Compounding Pharmacy |
| DSB | Dietary Supplements-Botanicals |
| DSI | Dietary Supplements-Information |
| DSN | Dietary Supplements-Non-Botanicals |
| EMC | Excipient Monograph Content |
| ETM | Excipients-Test Methods |
| GCT | Gene Therapy, Cell Therapy, and Tissue Engineering |
| GTB | General Toxicity and Biocompatibility |
| NL | Nomenclature and Labeling |
| PA1 | Pharmaceutical Analysis 1 |
| PA2 | Pharmaceutical Analysis 2 |
| PA3 | Pharmaceutical Analysis 3 |
| PA4 | Pharmaceutical Analysis 4 |
| PA5 | Pharmaceutical Analysis 5 |
| PA6 | Pharmaceutical Analysis 6 |
| PA7 | Pharmaceutical Analysis 7-Antibiotics |
| PDF | Pharmaceutical Dosage Forms |
| PPC | Parenteral Products-Compounding and Preparation |
| PPI | Parenteral Products-Industrial |
| PSD | Packaging, Storage, and Distribution |
| PW | Pharmaceutical Waters |
| RMI | Radiopharmaceuticals and Medical Imaging |
| SMU | Safe Medication Use |
| VET | Veterinary Drugs |
| VVI | Vaccines, Virology, and Immunology |

[^159]
## STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

| STAFF | E-MAIL | PHONE | ASSIGNMENT |
| :--- | :--- | :--- | :--- |
| Clydewyn M. Anthony, <br> Senior Scientific Associate | cma@usp.org | $(301) 816-8139$ | Pharmaceutical Analysis 1 <br> (PA1) |

## POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on $U S P-N F$ standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

USP TO HOLD FIRST ANNUAL SCIENTIFIC MEETING. MEETING FOCUSES ON PRODUCT AND PROCESS STANDARDS. The United States Pharmacopeia (USP) is pleased to announce that it will hold its first USP Annual Scientific Meeting at the Sheraton Woodbridge Place in Iselin, N.J. from Sept. 27 to 29, 2004. The new USP Annual Scientific Meeting, which replaces the organization's open conference format, will allow stakeholders the opportunity to learn about and discuss science topics that are the foundation of USP's standards-setting activities.
"We are creating one annual meeting to allow USP to address multiple topics and to allow more people to participate in USP's standards-setting activities," said Roger L. Williams, M.D., USP executive vice president and chief executive officer. "This one-stop approach allows stakeholders the opportunity to meet with USP at one time and in one convenient location."

Preliminary USP Annual Scientific Meeting topics to be presented are the following:

- Biologics and Biotechnology Products
- Chromatography
- Dissolution
- Excipients and Pharmaceutical Waters
- Making the $U S P-N F$ Work for You
- Microbiology
- Process Analytical Technology
- Specifications

In addition, USP will offer its Pharmacopeial Education courses on Analytical Method Validation, Basic Statistics and their Practical Applications to USP, Dissolution, Microbiology, and USP 100 and 101. These courses and the USP Annual Scientific Meeting session tracks will be approved for continuing pharmaceutical education units (CEUs). Attendees of the USP Annual Scientific Meeting also can learn about other USP initiatives and how to become involved in USP's processes through the various USP volunteer bodies.

The USP Annual Scientific Meeting is designed for $U S P-$ $N F$ and USP Reference Standards customers and other USP stakeholders including pharmaceutical scientists focusing on chemistry, microbiology, biologics and biotechnology, Process Analytical Technology, excipients, dissolution, and chromatography.

For further information about the USP Annual Scientific Meeting, please visit www.usp.org/conferences, or call 301-816-8226.

USAN COUNCIL SECRETARIAT REVISES USAN FEE-FOR-SERVICE CHARGES. A revised schedule of fee-for-service charges has been placed in effect as of January 1, 2004. The increased fees appear on the USAN submission forms that are provided under Appendix XI of the 2004 edition of the USP Dictionary of USAN and International Drug Names. This announcement will be important to inform users of the USP Dictionary who are not yet using the revised 2004 edition of the changes.

For further information please contact:
United States Adopted Names (USAN) Program
American Medical Association
515 North State Street
Chicago, IL 60610
Phone: 312-464-4046
Fax: 312-464-4028

## USP GUIDELINE FOR SUBMITTING REQUESTS

 FOR REVISION TO THE USP-NF. We are pleased to announce the availability of the USP Guideline for Submitting Requests for Revision to the USP-NF. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Laura A. McCurry, Manager, Pharmacopeial Education, lam@usp.org, 301-816-8285; Diana Lenahan, Program Associate, dpl@usp.
org, 301-816-8530; or visit the website at www.usp.org/ education to register. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2004

| Date | Name of course | Location |
| :--- | :--- | :--- |
| July 19 and 20 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| August 10 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| August 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ <br> and the Standards Development Process | USP Headquarters, Rockville, MD |
| August 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| October 14 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| October 18 and 19 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| November 11 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| November 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| November 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| November 12 | Fundamentals of Dissolution (Lecture) | USP Headquarters, Rockville, MD |
| December 2 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| December 8 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| December 9 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |

VISIT THE USP WEB SITE AT <http://www.usp.org $\rangle$. Various resources related to Pharmacopeial standards are presented, including highlights from $P F$.

## USP-NF AVAILABLE IN THREE ELECTRONIC

FORMATS. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats-CD, intranet, and online. The CD is ideal for single users who prefer to have $U S P-N F$ on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official $U S P-N F$ content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

## CHROMATOGRAPHIC REAGENTS NOW AVAILABLE.

 Chromatographic Reagents lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in Pharmacopeial Forum (PF) since1980. Chromatographic Reagents also helps to track which column reagents were used to validate methods that have become official and are included in $U S P-N F$. The branded column reagents list is updated bimonthly through Pharmacopeial Forum. Chromatographic Reagents can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907

F 67029 Strasbourg Cedex 1
France

## NAKASHIMA Nobumasa

Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that
has appeared in a $P F$ should be submitted to the appropriate USP scientific staff liaison identified at the end of the Briefing accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the Staff Directory included in every PF.

Please note that $U S P-N F$ is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for USP 27-NF 22 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2003 | November 2003 | January 2004 |
| Supplement One | October 15, 2003 | February 2004 | April 2004 |
| Supplement Two | February 17, 2004 | June 2004 | August 2004 |

The publication and comment schedule for USP $28-N F 23$ is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2004 | November 2004 | January 2005 |
| Supplement One | October 15, 2004 | February 2005 | April 2005 |
| Supplement Two | February 17, 2005 | June 2005 | August 2005 |

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in Supplements to $U S P-N F$ (twice yearly). Between Supplements, official revisions are published in $P F$ in the Interim Revision Announcement; these revisions are also incorporated in the upcoming Supplement. The electronic version of $U S P-N F$ is updated as each Supplement becomes available and, therefore, contains all official text up to and including the contents of the latest Supplement.

Publication Schedules

| Publication | Publication Date | Official Date |
| :---: | :---: | :---: |
| $1{ }^{\text {st }}$ Supplement | Feb. 2004 | Apr. 1, 2004 |

[^160]
## INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the $U S P-N F$ that become effective before the effective date of the next Supplement or that were not ready for adoption by the closing date for the upcoming Supplement. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.
Symbols-Interim revisions are shown with new text (if any) enclosed in circles, ${ }^{\bullet}$ new text $\boldsymbol{m}_{\bullet}$. Text enclosed in squares, $\boldsymbol{\square}_{\text {new }}$ text $_{\boldsymbol{\bullet}}$, has already been adopted in a Supplement. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ • or $\boldsymbol{m}^{\boldsymbol{\bullet}} \boldsymbol{\square}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the $I R A$ or Supplement in which the revision first appeared. For example, $\bullet 2$ indicates that the revision was officially adopted in the Second Interim Revision Announcement, and $\boldsymbol{m}_{2 \mathrm{~S}(\text { USP27) }}$ indicates that the revision was officially adopted in the Second Supplement to USP 27.

Errata-At the end of the Interim Revision Announcement section is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in $U S P-N F$. If necessary, this list will be updated with every issue of $P F$. This information will also be cumulative in the next available Supplement, and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

# FOURTH INTERIM REVISION ANNOUNCEMENT <br> to USP 27 and to NF 22 

By authority of the United States Pharmacopeial Convention, Inc. Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, Chair<br>USP Board of Trustees<br>Roger L. Williams, Executive Vice President and Chairman, USP Council of Experts<br>John W. Gasper, Director, Executive Secretariat

Official August 1, 2004.
Released July 1, 2004.

[^161]
## New USP Reference Standards

The following USP Reference Standards, which were indicated in past Supplements to $U S P-N F$ as being not yet available, have since become available. Thus, the official date of each USP 27 or NF 22 standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Benazepril Hydrochloride RS (July 1, 2004)
USP Benazepril Related Compound C RS (January 1, 2005)
USP Positive Bioreaction RS (November 1, 2004)
USP Cefpiramide RS (September 1, 2004)
USP Cefpodoxime Proxetil RS (January 1, 2005)
USP Powdered Chaste Tree Extract RS (November 1, 2004)
USP Chlorhexidine RS (July 1, 2004)
USP Chlorhexidine Acetate RS (July 1, 2004)
USP Chlorhexidine Related Compounds RS (November 1, 2004)
USP Chlorogenic Acid RS (November 1, 2004)
USP Clonazepam Related Compound C RS (July 1, 2004)
USP Clonidine RS (September 1, 2004)
USP Clonidine Related Compound A RS (September 1, 2004)
USP Clonidine Related Compound B RS (November 1, 2004)
USP Cyclandelate RS (September 1, 2004)
USP Dolasetron Mesylate RS (July 1, 2004)
USP Dolasetron Mesylate Related Compound A RS (July 1, 2004)
USP Powdered Echinacea purpurea Extract RS (November 1, 2004)

USP Powdered Eleuthero Extract RS (July 1, 2004)
USP Fenbendazole Related Compound A RS (January 1, 2005)
USP Fenbendazole Related Compound B RS (January 1, 2005)
USP Fludarabine RS (September 1, 2004)
USP Fluoxetine Related Compound C RS (July 1, 2004)
USP Ganciclovir Related Compound A RS (July 1, 2004)
USP Glucosamine Hydrochloride RS (July 1, 2004)
USP $2 E, 4 E$-Hexadienoic Acid Isobutylamide RS (November 1, 2004)

USP Homopolymer Polypropylene RS (January 1, 2005)
USP Isoflurane Related Compound A RS (September 1, 2004)
USP Isoflurane Related Compound B RS (September 1, 2004)
USP Lamivudine RS (July 1, 2004)
USP Lamivudine Resolution Mixture A RS (November 1, 2004)
USP Leuprolide Acetate RS (January 1, 2005)
USP Linoleoyl Polyoxylglycerides RS (January 1, 2005)
USP Loratadine RS (September 1, 2004)
USP Medroxyprogesterone Acetate Related Compound A RS (November 1, 2004)
USP Methylphenidate Hydrochloride Erythro Isomer Solution CII RS (November 1, 2004)
USP Metoprolol Related Compound A RS (July 1, 2004)
USP Metoprolol Related Compound B RS (September 1, 2004)
USP Metoprolol Related Compound C RS (September 1, 2004)
USP Metoprolol Related Compound D RS (September 1, 2004)
USP Metoprolol Succinate RS (November 1, 2004)
USP Mitoxantrone System Suitability Mixture RS (November 1, 2004)

USP Naratriptan Hydrochloride RS (November 1, 2004)
USP Nevirapine Hemihydrate RS (January 1, 2005)
USP Nevirapine Related Compound A RS (January 1, 2005)
USP Nevirapine Related Compound B RS (January 1, 2005)
USP Oxybutynin Related Compound B RS (January 1, 2005)
USP Oxybutynin Related Compound C RS (January 1, 2005)
USP Oleoyl Polyoxylglycerides RS (January 1, 2005)
USP Phenytoin Related Compound B RS (July 1, 2004)
USP Potassium Bicarbonate RS (January 1, 2005)
USP Residual Solvent Class 1 -Benzene RS (November 1, 2004)
USP Residual Solvent Class 1-1,2 Dichloroethane RS (November 1, 2004)

USP Residual Solvent Class 1-1,2 Dichloroethene RS (November 1, 2004)
USP Residual Solvent Class 1-Carbon Tetrachloride RS (November 1, 2004)
USP Residual Solvent Class 1-1,1,1-Trichloroethane RS (November 1, 2004)
USP Residual Solvent Class 2-Chlorobenzene RS (January 1, 2005)

USP Residual Solvent Class 2-1,4-Dioxane RS (January 1, 2005)
USP Residual Solvent Class 2-Methanol RS (January 1, 2005)
USP Residual Solvent Class 2-Methylene Chloride RS (January 1, 2005)
USP Residual Solvent Class 2-Tetrahydrofuran RS (January 1, 2005)

USP Residual Solvent Class 2-Toluene RS (January 1, 2005)
USP Residual Solvent Class 2-Xylenes RS (January 1, 2005)
USP Residual Solvent Mixture-Class 1 RS (November 1, 2004)
USP Rimantidine Hydrochloride RS (July 1, 2004)
USP Scopoletin RS (July 1, 2004)
USP Sotalol Hydrochloride RS (July 1, 2004)
USP Tiamulin Fumarate RS (July 1, 2004)
USP Tiamulin Related Compound A RS (July 1, 2004)
USP Valsartan RS (November 1, 2004)
USP Vecuronium Bromide RS (September 1, 2004)

The official dates of any USP 27 or NF 22 standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

USP Alteplase RS
USP Amiloxate RS
USP Bupropion Hydrochloride Related Compound A RS
USP Bupropion Hydrochloride Related Compound B RS
USP Bupropion Hydrochloride Related Compound C RS
USP Bupropion Hydrochloride Related Compound D RS
USP Bupropion Hydrochloride Related Compound E RS
USP Bupropion Hydrochloride Related Compound F RS
USP Cinoxate RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Enalapril Related Compound B RS
USP Enzacamene RS
USP Fludeoxyglucose RS
USP Ginseng Extract RS
USP Gonadorelin Hydrochloride RS
USP Hypericin RS
USP Lactase RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Ondansetron Related Compound B RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Sargramostim RS
USP Sulisobenzone RS
USP Terbutaline Related Compound A RS
USP $\Delta^{8}$-tetrahydrocannabinol RS
USP $\Delta^{9}$-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS
USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

## Assay and limit for guanine-

Mobile phase-Prepare a filtered and degassed solution of glacial acetic acid in water ( 1 in 1000). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
-System suitability solution 1-Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 mg of each per mL .

System suitability solution 2-Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per mL . $\bullet 4$

Guanine standard preparation-Transfer about 8.75 mg of guanine, accurately weighed, to a $500-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. ${ }^{\bullet}$ Transfer 2.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per $\mathrm{mL} .{ }^{4}$

Standard preparation-Dissolve about 25 mg of USP Acyclovir RS, accurately weighed, in 5 mL of 0.1 N sodium hydroxide in a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution ${ }^{\bullet}$ to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having ${ }^{\bullet}$ a known concentration of about 0.1 mg of USP Acyclovir RS per mL. $\bullet 4$

Assay preparation-Dissolve about 100 mg of Acyclovir, accurately weighed, in 20 mL of 0.1 N sodium hydroxide in a 200mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.2-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph ${ }^{\bullet}$ System suitability solution 1, $\bullet_{4}$ and record the peak responses as directed for Procedure: the resolution, $R$, between acyclovir and guanine is not less than 2.0 ; the tailing factor for the analyte peak is not more than 2 ; and the relative standard deviation for replicate injections ${ }^{\bullet}$ for the acyclovir peak ${ }_{04}$ is not more than $2.0 \%$. ${ }^{\circ}$ Chromatograph System suitability solution 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$. 4

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation, ${ }^{\bullet}$ Guanine standard preparation, $\bullet_{4}$ and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in $\mu \mathrm{g}$, of guanine in the portion of Acyclovir taken by the formula:
$1000 C\left(r_{U} / r_{S}\right)$,
in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of guanine in the ${ }^{\bullet}$ Guanine standard preparation; ${ }^{4}$ and $r_{U}$ and $r_{S}$ are the peak responses due to guanine in the Assay preparation and the ${ }^{\bullet}$ Guanine standard preparation, $\bullet 4$ respectively: not more than $0.7 \%$ of gua-
nine is found. Calculate the quantity, in mg , of $\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{3}$ in the portion of Acyclovir taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Acyclovir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses due to acyclovir in the Assay preparation and the Standard preparation, respectively.

## Acyclovir Capsules

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed solution of 0.02 M acetic acid. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
-System suitability preparation 1-Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg of each per mL .

System suitability preparation 2-Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $2.0 \mu \mathrm{~g}$ per mL. $\bullet 4$

Standard preparation-Dissolve an accurately weighed quantity of USP Acyclovir RS ${ }^{\bullet}{ }^{4}$ in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL . ${ }_{\bullet}^{\bullet}$
Assay preparation-Remove, as completely as possible, the contents of not fewer than 10 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of acyclovir, to a $100-\mathrm{mL}$ volumetric flask, dissolve in 10 mL of 0.1 N sodium hydroxide, dilute with water to volume, mix, and filter.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.2-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph ${ }^{8}$ System suitability preparation $1, \bullet_{4}$ and record the peak responses ${ }^{\bullet}$ for acyclovir ${ }_{\bullet}$ as directed for Procedure: the relative retention times are about 0.6 for guanine and 1.0 for acyclovir; the resolution, $R$, between guanine and acyclovir is not less than 2.0; and the relative standard deviation for replicate injections ${ }^{\bullet}$ of acyclovir ${ }_{\bullet 4}$ is not more than $2.0 \%$. ${ }^{\bullet}$ Chromatograph System suitability preparation 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \% . \bullet 4$
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg , of acyclovir $\left(\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{3}\right)$ in the portion of Capsules taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Acyclovir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Acyclovir for Injection

## Change to read:

## Chromatographic purity-

Solution A-Prepare a filtered and degassed mixture of 0.17 M acetic acid and methanol ( $125: 8$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Solution B: methanol, filtered and degassed.
Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments to either solution as necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve suitable quantities of purine and USP Acyclovir RS in Solution $A$ to obtain a solution containing about $0.5 \mu \mathrm{~g}$ of each per mL .
${ }^{\wedge}$ Acyclovir standard solution-Dissolve an accurately weighed quantity of USP Acyclovir RS in Solution A, and dilute quantitatively, and stepwise if necessary, with Solution $A$ to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ per mL .

Guanine solution-Dissolve about 25 mg of guanine, accurately weighed, in 50 mL of 0.1 N sodium hydroxide in a $500-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
${ }^{\bullet}$ Standard solution $1 \bullet$-Transfer 5.0 mL of Acyclovir standard solution $\bullet 4$ to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix.
-Standard solution 2-Transfer 5.0 mL of Guanine solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix. $\bullet 4$

Test solution-Constitute and combine not fewer than 10 vials of Acyclovir for Injection. Transfer an accurately measured quantity, equivalent to about 100 mg of acyclovir, to a $200-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a 254-nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-15$ | 100 | 0 | isocratic |
| $15-45$ | $100 \rightarrow 65$ | $0 \rightarrow 35$ | linear gradient |
| $45-46$ | $65 \rightarrow 100$ | $35 \rightarrow 0$ | linear gradient |
| $46-56$ | 100 | 0 | re-equilibration |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between purine and acyclovir is not less than 2.0. Chromatograph ${ }^{\bullet}$ Standard solution 1 and Standard solution 2,94 and record the peak responses as directed for Procedure: the typical ${ }^{4}$ retention times for guanine and acyclovir are about ${ }^{\bullet} 5.8$ minutes and 14 minutes, $\bullet 4$ respectively; and the relative standard deviation $\mathbf{N}^{\text {of }}$ of the acyclovir peak area and the guanine peak $\operatorname{area}_{\Delta U S P 27}$ for replicate injections is not more than $\mathbf{\Delta} 1 \%$. $\Delta$ USP2

Procedure-【Separately inject equal volumes ■1S (USP27) (about $50 \mu \mathrm{~L}$ ) of $\boldsymbol{\Delta}^{\boldsymbol{t}}$ the Standard solution and $\mathbf{\Delta U S P 2 7}$ the Test solution into the chromatograph, record the chromatograms, and measure the peak ${ }^{\boldsymbol{\Delta}} \operatorname{area}_{\mathbf{U S P 2 7}}$ responses. ${ }^{\boldsymbol{\wedge}}$ Calculate the percentage of guanine in the Acyclovir for Injection by the formula:

$$
20,000(C / W)\left(r_{g} / r_{s g}\right)
$$

in which $C$ is the concentration, in $m g$ per mL , of guanine in the Standard solution; $W$ is the total weight, in mg , of acyclovir in the Test solution based on the label claim; $r_{g}$ is the peak response for guanine, if present, in the Test solution; and $r_{s g}$ is the peak response of guanine in the Standard solution: not more than $1.0 \%$ is
 rity in the ${ }^{2}$ $\triangle U S P 27$ Acyclovir for Injection $\boldsymbol{\Delta}$ $\Delta U S P 27$ by the formula:

$$
20,000(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Acyclovir RS in the Standard solution; $W$ is the $\mathbf{}_{\text {total }}^{\mathbf{\Delta U S P} 2 Z}$ weight, ${ }^{\mathbf{\Delta}}$ in $\mathrm{mg}, \mathbf{\Delta U S P 2 7}$ of acyclovir $\mathbf{\Delta}_{\mathbf{\Delta S P 2 7}}$ in the Test solution ${ }^{\text {based on }}$ on the label claim; $\boldsymbol{\Delta U S P 2 7} r_{i}$ is the peak response for each impurity; and $r_{S}$ is the peak response of acyclovir in the Standard solution: $\mathbf{\lambda}_{\mathbf{\Delta S P} 27}$ not more than $0.15 \%$ for any peak having a relative retention time of about ${ }^{\boldsymbol{\Delta}} 0.7$ compared to the acyclovir peak ${ }_{\mathbf{\Delta} U S P 27}$ is found; not more than $0.5 \%$ of any other individual impurity is found; and the total of all other impurities is not more than $1.0 \%$.

## Methionine C 11 Injection

## Delete the following:

## Change to read:

» Methionine C 11 Injection is a sterile isotonic solution, suitable for intravenous administration of ${ }^{\bullet} \mathrm{L}\left[{ }^{11} \mathrm{C}\right]$ methionine, $\bullet 4$ in which a portion of the molecules are labeled with radioactive ${ }^{11} \mathrm{C}$. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ${ }^{11} \mathrm{C}$ expressed in MBq (or in mCi ) at the time indicated in the labeling. It may contain preservatives and stabilizers.

## Cellaburate

${ }^{\bullet}$ (Title for this new monograph—to become official January 1, 2010)

## NOTICE OF POSTPONEMENT

The following revisions to the Doxorubicin Hydrochloride monograph, which were published in the First Supplement to USP 27-NF 22 and originally meant to become official on April 1, 2004, have been postponed indefinitely. This postponement is to provide additional time to further evaluate the use of amorphous doxorubicin hydrochloride.
The Pharmaceutical Analysis 7 Expert Committee is presently reviewing comments received concerning these items. The USP intends to publish, if necessary, another proposed revision in a future issue of Pharmacopeial Forum for further public review and comment. The USP proposes going forward to official text for these revisions after the public comments have been considered.

## Doxorubicin Hydrochloride

## Change to read:

Packaging and storage-Preserve in tight containers, ${ }^{\bullet}$ and store at controlled room temperature, except where it is labeled as amorphous, in which case it should be stored in the freezer. $e_{4}$
${ }^{\bullet}$ (Postponed indefinitely) ${ }_{\bullet 4}$
Add the following:
${ }^{\bullet}$ Labeling-The amorphous form is so labeled. $\bullet 4$
${ }^{\bullet}$ (Postponed indefinitely) ${ }^{\bullet}$

## Change to read:

Crystallinity $\langle 695\rangle$ : meets the requirements, ${ }^{\bullet}$ except that where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions. $\bullet 4$
${ }^{\bullet}$ (Postponed indefnitely) $\bullet_{4}$

## NOTICE OF POSTPONEMENT

The following revisions to the Hydrocodone Bitartrate monograph, which were published in the First Supplement to USP 27-NF 22 and originally meant to become official on April 1, 2004, have been postponed indefinitely. The USP has postponed the official date for Ordinary impurities, Related compounds, and the Assay. This postponement is to accommodate the approved products on the market that cannot meet the requirement and is intended to provide sufficient time to evaluate different proposals via the regular revision process.

## Hydrocodone Bitartrate

## Delete the following:

${ }^{\bullet}$ Ordinary impurities $\langle 466\rangle$ -
Test solution: a mixture of methanol and water (1:1). Standard solution: a mixture of methanol and water (1:1).
Eluant: a mixture of hexanes, acetone, methanol, and ammonium hydroxide ( $60: 40: 20: 1.5$ ).

Visualization: 3, followed by overspraying with hydrogen peroxide TS. [NOTE-Cover the thin-layer chromatographic plate with a glass plate to slow fading of the spots. Exclude the origin spot, if present, from the determination of the total impurities.]
${ }^{\bullet}$ (Postponed indefinitely) ${ }^{4}$

## Add the following:

- Related compounds-[NOTE-For the test for Related compounds and in the Assay, dry both USP Hydrocodone Bitartrate RS and USP Dihydrocodeine Bitartrate RS under vacuum at $105^{\circ}$ for 2 hours. Immediately transfer the dried materials to a desiccator containing phosphorus pentoxide. Immediately weigh each dried material.]

Solution A, Solution B, Mobile phase, and Chromatographic system-Proceed as directed in the Assay.

Test solution-Use the Assay preparation
System suitability solution-Combine about 1.5 mg of USP Dihydrocodeine Bitartrate RS and 1.0 mL of the Standard preparation prepared for the Assay in a $200-\mathrm{mL}$ volumetric flask. Dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—Proceed as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.89 for dihydrocodeine and 1.0 for hydrocodone; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Test solution and the System suitability solution into the chromatograph, record the chromatograms, and measure the peak responses.

Calculate the percentage of dihydrocodeine bitartrate and any unknown impurities in the portion of Hydrocodone Bitartrate taken by the formula:

$$
10,000(C / W) F\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Hydrocodone Bitartrate RS in the System suitability solution; $W$ is the quantity, in mg , of Hydrocodone Bitartrate taken to prepare the Test solution; $F$ is the relative response factor and is equal to the values given in the following table; $r_{U}$ is the individual peak response of each impurity in the test solution; and $r_{S}$ is the response of hydrocodone bitartrate in the System suitability solution: not more than $0.5 \%$ of any individual impurity is found, and not more than $2.0 \%$ of total impurities is found.

| Hydrocodone Bitartrate <br> and <br> Related Compounds | Relative <br> Retention Time | Relative <br> Response <br> Factor |
| :--- | :---: | :---: |
| dihydrocodeine bitartrate <br> hydrocodone diol <br> bitartrate | 0.89 | 0.81 |
| hydrocodone bitartrate <br> dihydrothebainone <br> bitartrate | 0.92 | 0.76 |
| hydrocodone aldol dimer <br> bitartrate | 1.00 | 1.00 |
| 7-cyclohexenyl hydroco- <br> done bitartrate | 1.03 | 0.96 |
| benzophenone <br> other impurities | 1.50 | 1.00 |
| (Postponed indefinitely) $\bullet_{\bullet 4}{ }^{\bullet 4}$ |  |  |

## Change to read:

Assay- ${ }^{\bullet}$ [NOTE-See the Note in the test for Related compounds before performing the Assay.]

Solution A-Dissolve 5.75 g of monobasic ammonium phosphate in about 900 mL of water in a $1000-\mathrm{mL}$ volumetric flask, adjust with phosphoric acid to a pH of $3.0 \pm 0.1$, dilute with methanol to volume, and mix.
Solution $B$-Prepare a filtered and degassed mixture of methanol and water $(80: 20)$.

## NOTICE OF POSTPONEMENT (continued)

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS in Solution $A$ to obtain a solution having a known concentration of about 1.5 mg per mL .

Assay preparation-Transfer an accurately weighed quantity of previously dried Hydrocodone Bitartrate, equivalent to about 150 mg of hydrocodone bitartrate, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The column temperature is maintained at $60^{\circ}$. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibrium |
| $0-6$ | 100 | 0 | isocratic |
| $6-30$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $30-31$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg , of hydrocodone bitartrate $\left(\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{NO}_{3} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}\right)$ in the portion of Hydrocodone Bitartrate taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Hydrocodone Bitartrate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\bullet$

## GENERAL CHAPTERS

## General Information

## 〈1196〉 PHARMACOPEIAL HARMONIZATION

## Change to read:

## PDG WORKING PROCEDURES

## General

Harmonization may be carried out retrospectively for existing monographs or chapters or prospectively for new monographs or chapters.

The three pharmacopeias have a commitment to respect the agreed working procedures and the associated time deadlines as an essential part of the harmonization procedure.

Harmonization of pharmacopeial documents in the PDG occurs based on decisions of the expert bodies of each pharmacopeia. The PDG works transparently in many ways, but principally through the public notice and comment procedures of each pharmacopeia.

Where necessary, meetings of experts are held to identify potential solutions to difficult problems.

The specific stages of the PDG process involved in harmonization are described below.

## Stage 1: Identification

On the basis of an inquiry among its users, the PDG identifies subjects to be harmonized among PDG pharmacopeias and nominates a coordinating pharmacopeia for each subject.

The PDG distributes the work by consensus among the three pharmacopeias and strives for a balance in the distribution of assignments to coordinating pharmacopeias.

## Stage 2: Investigation

For a subject to be harmonized retrospectively, the coordinating pharmacopeia collects the information on the existing specifications in the three pharmacopeias, on the grades of products marketed, and on the potential analytical procedures.

The coordinating pharmacopeia prepares a draft monograph or chapter, accompanied by a report giving the rationale for the proposal with validation data.

Stage 2 ends with the proposal draft, which is mentioned in this procedure as a Stage 3 draft. The Stage 3 draft, accompanied by supporting comments or data that explain the reasons for each test procedure or limit proposed, is sent by the coordinating pharmacopeia to the secretariats of the other two PDG pharmacopeias.

## Stage 3: Proposal for Expert Committee Review

The three pharmacopeias forward the Stage 3 draft to their expert committee (through meetings or consultation by correspondence).

Comments by the experts resulting from this preliminary survey are sent to their respective pharmacopeial secretariat, preferably within 2 months. However, the comment period should not exceed 4 months. Within 2 months of receipt of the comments, the pharmacopeial secretariat should consolidate the comments and forward them to the coordinating pharmacopeia.

The coordinating pharmacopeia reviews the comments received and prepares a harmonized document (Stage 4 draft) accompanied by a commentary discussing comments received regarding the previous text and providing reasons for action taken in response to those comments.

The Stage 4 draft, as far as possible written in global style-a style easily understood by a variety of readers-together with the commentary, are sent to the secretariats of the other pharmacopeias (end of Stage 3).

## Stage 4: Official Inquiry

The Stage 4 draft and the commentary are published in the revision document of each pharmacopeia in a section entitled International Harmonization. The draft is published in its entirety.

The corresponding secretariats may have to add information essential to the understanding of the implementation of the texts (e.g., the addition of the description of an analytical procedure or of reagents that do not exist in the pharmacopeia) and a translation is added by the European and Japanese Pharmacopoeias. The style may be adapted to that of the pharmacopeia concerned or global style may be used. ${ }^{\bullet}$ A pharmacopeia can add additional text, either to amplify some of the requirements with additional information or because national requirements and compendial policy dictate that the addition is necessary. However, these must be a clear indication that this additional information is not part of the harmonized document. This will avoid additional text being included after the harmonization process is completed, but will allow interested parties to review a complete text. $\bullet_{4}$ The three pharmacopeias endeavor to publish the drafts simultaneously or as close together as possible.

Comments regarding this draft are sent by readers of the revision document to their respective pharmacopeial secretariat, preferably within 4 months, and at most within 6 months of its publication.

Each pharmacopeia analyzes the comments received and submits its consolidated comments to the coordinating pharmacopeia within 2 months of the end of the review/comment period.

The coordinating pharmacopeia reviews the comments received and prepares a draft harmonized document (Stage 5A draft), accompanied by a commentary discussing comments received regarding the previous text and providing reasons for action taken in response to those comments.

The Stage 5 A draft together with the commentary is sent to the
secretariats of the other two PDG pharmacopeias.

## Stage 5. Consensus

## 5A. PROVISIONAL

The Stage 5A draft is reviewed and commented on by the other two PDG pharmacopeias within 4 months of receipt. The three pharmacopeias shall do their utmost to reach full agreement at this stage to obtain a final consensus document.

If a consensus has not been reached, the coordinating pharmacopeia prepares a revised version (Stage $5 \mathrm{~A} / 2$ ), taking relevant, substantiated comments on the Stage 5A document from the two other pharmacopeias into consideration. The revised document (Stage $5 \mathrm{~A} / 2$ ), together with the commentary, are sent to the secre-
tariats of the other two PDG pharmacopeias. The revised document is reviewed and commented on by the other two PDG pharmacopeias, preferably within 2 months of receipt. This review/comment and revision process of the 5A document is repeated (Stage 5A/n) until the three PDG pharmacopeias reach a consensus or until the coordinating pharmacopeia considers that harmonization by attribute should be applied.

If the coordinating pharmacopeia considers certain attributes in the monograph or provisions in a general chapter (especially for retroactive harmonization) are such that it will not be possible to harmonize within a reasonable time period, harmonization by attribute will be applied. If harmonization by attribute is applied, a special cover page (see the table in the Appendix) indicating harmonization is included with the draft. The text contains ${ }^{\circ}$ harmonized attributes and provisions, and ${ }_{44}$ nonharmonized and local attributes are not included. ${ }^{\circ}$ The nonharmonized attributes are clearly indicated in the text as such. $\bullet 4$ The table is prepared as follows: if three pharmacopeias agree on the attribute, there will be a $(+)$ in all columns; if two pharmacopeias agree that the attribute should be included and have agreed on the method and limit, there will be a $(+)$ in the column for those two pharmacopeias, and a $(-)$ in the column for the pharmacopeia that will not stipulate the test.

For nonharmonized or local requirements, if three pharmacopeias agree that the attribute should be included, but have not come to agreement on the method and/or limit: state attribute under "nonharmonized attributes." If only one pharmacopeia will include an attribute: state under "local requirement."

If the Stage 5 A draft is substantially different from the Stage 4 draft, the PDG may decide that it should be published again in the revision documents; the draft then reverts technically to Stage 4 , revised.

## 5B. DRAFT SIGN-OFF

When ${ }^{\bullet}$ - agreement is reached, the 5 B draft is sent by the coordinating pharmacopeia to the other pharmacopeias no later than 4 weeks before a PDG meeting for final confirmation. The document is then presented for sign-off at the PDG meeting. ${ }^{\bullet}$ This document includes nonharmonized attributes clearly marked as such. $\bullet 4$

## Stage 6: •Regional Adoption and Implementation

NOTE-The last two stages of the implementation of the "harmonized" chapters and monographs take place independently according to the procedures established by each pharmacopeial organization.

## 6A. REGIONAL ADOPTION ${ }_{\bullet}$

The document is submitted for adoption to the organization responsible for each pharmacopeia. Each pharmacopeia incorporates the harmonized draft according to its own procedures. ${ }^{\bullet}$ Stylistic and editorial differences may occur. $\bullet 4$

Adopted texts are published by the three pharmacopeias in their supplements, or where applicable, in a new edition.

If necessary, the Stage 5B draft may be adopted with some amendments (local requirements) corresponding to a general policy in the national or regional (European) area. If a pharmacopeia includes a local attribute after the sign-off of a text, it will inform the PDG. ${ }^{\circ}$ It is, however, preferred to include the nonharmonized text in Stage 5B as an alert to the other pharmacopeias that there will be some differences in text in the final document. 04

Users of the pharmacopeias are appropriately informed of the harmonization status of monographs and general chapters. In the European Pharmacopoeia $(E P)$ and $U S P-N F$, for general chapters,
this is done via a preliminary paragraph. For the Japanese Pharmacopoeia ( $J P$ ), a notification is made by the MHLW, and information is given in a general chapter.

## ${ }^{\bullet}$ 6B. IMPLEMENTATION ${ }_{\bullet 4}$

The pharmacopeias will inform each other of the date of implementation in their particular region.

The date of implementation of a harmonized document varies in the three PDG regions depending on their legal requirements, need of translation, and publication schedules. Each pharmacopeia generally allows some period of time after publication for implementation to allow manufacturers and other users to achieve conformity. Harmonization is not achieved until the text becomes official in all three pharmacopeias.

## -Stage 7: Inter-Regional Implementation

When a harmonized text has become official in all three pharmacopeias, EP and USP publish a statement indicating the harmonization status of the text; JP publishes a statement to the same effect at Stage 6B. These statements are intended to promote regulatory acceptance of interchangeability of harmonized monographs and general chapters. $\bullet 4$

## Revision

The procedure for the revision of harmonized monographs and chapters is as follows.
The pharmacopeias participating in the PDG have agreed not to revise unilaterally any harmonized document (monograph or chapter) after sign-off or after publication.
A pharmacopeia requesting the revision of a monograph or chapter shall apply the following criteria for justification of the revision:

- Public health and safety reasons.
- Insufficient supply of pharmacopeial-quality product on the market.
- Specified analytical reagents or equipment are not available.
- New methods of preparation of products or reagents are not covered by the current monograph.
- Analytical procedures can be replaced by more appropriate, accurate, or precise procedures.
The PDG as a whole has to agree to initiate the revision. A coordinating pharmacopeia will be nominated. The coordinating pharmacopeia will prepare a Stage 3 draft, based on the validation of data provided by the pharmacopeia requesting the revision.

The PDG Working Procedures will then be followed. The revisions of a sign-off document prepared for this or other reasons are indicated as revision $1,2,3$, etc.

In case of health and safety issues, and whenever agreed to by the PDG, an accelerated procedure shall be applied (shortening and/or eliminating stages).

## Discussion

Harmonization of general chapters and monographs benefits manufacturers of pharmaceutical products intended for human use, regulatory agencies, and ultimately, practitioners and patients. Benefits are derived from (1) reduced development effort; (2) simplification of regulatory filings; and (3) reduced release testing.

Pharmacopeial harmonization amplifies the work of the ICH, particularly for Quality topics. While the PDG is not part of the ICH , the PDG periodically provides updates to the ICH Steering Committee, and in the past participated in a joint task force. This
task force focused on harmonization of general chapters considered important to the ICH harmonized document Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances (Q6A). USP also participates in the International Cooperation on Harmonization of Technical Requirements for Registration of Veterinary Products (VICH). As with the ICH, some of the quality guidelines developed in VICH depend upon harmonization of pharmacopeial general chapters. A major difference between the PDG and ICH/ VICHs is that the ICH/VICH guidelines generally are applicable only to ingredients and drug products not previously registered in an ICH/VICH region or nation, whereas the PDG harmonization applies to all marketed products in the applicable region or nation.

In the case of harmonization by attribute, nonharmonization or divergence will be indicated in $U S P-N F$ and $E P$ by the symbol $\leqslant$. For these nonharmonized attributes, reliance upon the individual pharmacopeia is required. A monograph or general chapter in one PDG pharmacopeia may unilaterally include additional local or national attributes that are not included in the corresponding text of the other pharmacopeias. Such text is not considered by the PDG to be a divergence from the PDG harmonized text.

As with other $U S P-N F$ revisions, draft harmonization texts are published for comment in Pharmacopeial Forum. Final harmonized official text in $U S P-N F$ is presented in the latest edition, Supplement, or Interim Revision Announcement. The current status of all harmonization projects appears in Table 1 and Table 2. These status tables will be updated in subsequent editions of $U S P-N F$ and its Supplements.

In the U.S., cases of noncompliance and/or dispute are resolved through performance of the official procedure in $U S P$ or $N F$. If the procedure and its acceptance criteria are harmonized in the PDG, then a manufacturer may follow the relevant compendial instructions in $U S P-N F, E P$, or $J P$.

## ${ }^{\wedge}$ Harmonized Monographs and Chapters

## HARMONIZED CHAPTERS

$\langle\mathbf{8 5}\rangle$ Bacterial Endotoxins Test-This chapter has been harmonized by PDG and published in the European Pharmacopoeia and in the Japanese Pharmacopoeia. Portions of the chapter that are not harmonized with the other two pharmacopeias are marked by the symbol . Footnotes 1, 2, and 4 are in the $U S P$ while they are not in the $E P$ or $J P$. These footnotes give additional information, such as the calculation of endotoxin limits for different classes of products (Footnote 4) or reference USP chapters (Footnote 2).

The USP Endotoxin Reference Standard is harmonized with the International Reference Standard for Endotoxin and the EP Endotoxin Reference Standard and indirectly harmonized with the JP Endotoxin Reference Standard that is indexed to the International Reference Standard. The result is that 1 USP Endotoxin Unit $=1$ International Endotoxin Unit = 1 EP Endotoxin Unit. $\Delta U S P 27$

## ERRATA

Following is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in USP 27-NF 22. If necessary, this list will be updated with every issue of $P F$. This information will also be available as a cumulative table in the next available Supplement and will appear in its corrected form in the next annual edition of USP-NF. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

## IN-PROCESS REVISION

This section contains proposals for adoption as official USP or NF standards (either proposed new standards or proposed revisions of current $U S P$ or $N F$ standards). These may be any of the following: (1) items that previously appeared under Pharmacopeial Previews and are now formally proposed as revisions; (2) proposed revisions placed directly under In-Process Revision; or (3) modifications of revisions previously proposed under In-Process Revision. Readers should review material in this section and provide comments to the staff liaison (use the Staff Directory to find the contact information). Information on how to comment is found in the Policies and Announcements section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

## BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How to Use PF), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:
${ }^{\bullet}$ new text ${ }^{\circ}$
if slated for an Interim Revision Announcement to USP 27-NF 22 (IRA);
$\Delta_{\text {new text }}^{\text {USPP28 }}$
if slated for USP $28-N F 23$; and
-new text.
if slated for a Supplement to $U S P-N F$. The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ 。 or $\boldsymbol{\bullet}^{\boldsymbol{\wedge}}$ or $^{\boldsymbol{\Delta}}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular IRA or Supplement or indicates the USP or NF as the publication where the revision will appear if approved. For example, $\bullet 2$ indicates that the revision is proposed for the Second Interim Revision Announcement, and $\mathbf{a S S}_{\text {(USP 27) }}$ indicates that the proposed revision is slated for the Second Supplement to USP 27, and $\Delta_{\triangle S P 28}$ and ${ }_{\Delta N F 23}$ indicate that the revisions are proposed for USP 28 and $N F 23$, respectively.

Official Title Changes Where the specification "Monograph title change" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

## MONOGRAPHS (USP)

BRIEFING

Acepromazine Maleate Injection, USP 27 page 15 and page 3037 of the First Supplement. It is proposed to add a test for Bacterial endotoxins.
(VET: I. DeVeau; AMB: D. Porter) RTS-41314-1

## Add the following:

■Bacterial endotoxins $\langle 85\rangle$ : not more than 4.5 USP Endotoxin Units per mg of acepromazine maleate.■1s (USP28)

BRIEFING

Acetaminophen Extended-Release Tablets. Because there is no existing $U S P$ monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the Assay is based on analyses performed with the Waters $\mu$ Bondapak ${ }^{\circledR} \mathrm{C} 18$ brand of L1 column.
(PA2: C. Anthony) RTS-40239-1

## Add the following:

## Acetaminophen Extended-Release Tablets

## » Acetaminophen Extended-Release Tablets con-

 tain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$.Packaging and storage-Preserve in tight containers.
Labeling-Where the Tablets are gelatin-coated, the label so states.

USP Reference standards $\langle 11\rangle$ —USP Acetaminophen $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ —Use a portion of powdered Tablets.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, obtained as directed in the Assay.

Drug release $\langle 724\rangle$ -
Medium: simulated gastric fluid TS (without enzyme); 900 mL .

Apparatus 2: 50 rpm .
Times: 15 minutes, 1 hour, and 3 hours.
Procedure-Determine the amount of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$ dissolved from UV absorbances at 243 nm using a filtered portion of the solution under test in comparison with a Standard solution having a known concentration of USP Acetaminophen RS in the same Medium.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$ dissolved at the times specified conform to Acceptance Table 1.

| Time | Amount dissolved |
| :---: | :--- |
| 15 minutes | between $45 \%$ and $65 \%$ |
| 1 hour | between $60 \%$ and $85 \%$ |
| 3 hours | not less than $85 \%$ |

## FOR GELATIN-COATED TABLETS-

Medium, Apparatus, and Procedure-Proceed as directed above.

Times: 30 minutes, 90 minutes, and 4 hours.
Tolerances-The percentage of the labeled amount of $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}$ dissolved at the times specified conform to Acceptance Table 2.

| Time | Amount dissolved |
| :---: | :--- |
| 30 minutes | between $40 \%$ and $60 \%$ |
| 90 minutes | between $55 \%$ and $85 \%$ |
| 4 hours | not less than $80 \%$ |

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Assay-

Mobile phase-Prepare a mixture of water and phosphoric acid ( $9: 1$ ). Combine 1 mL of this solution with a mixture of water and methanol ( $700: 300$ ). Filter, and degas. Make adjustments if necessary (see System Suitability under Chromatograph $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Acetaminophen RS in methanol, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.65 mg per mL .

Assay preparation-Transfer 10 Tablets into a $250-\mathrm{mL}$ volumetric flask containing 50 mL of water and a magnetic stir bar. Stir at least 30 minutes or until the coating has dissolved. Add 150 mL of methanol, and stir for 45 minutes. Tablet cores should be disintegrated at least 15 minutes prior to ending the stirring. Remove the magnetic stir bar and rinse into the flask with methanol. Dilute with methanol to volume, mix well, and centrifuge. Transfer 5 mL of the clear supernatant to a $200-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix well.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 3.0, and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetaminophen $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$ in each Tablet taken by the formula:

$$
1000 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Acetaminophen RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the acetaminophen peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Albendazole Oral Suspension, USP 27 page 54, page 3040 of the First Supplement, and page 991 of $P F$ 29(4) [July-Aug. 2003]. It was proposed in $P F 29(4)$ to change the specified labeling requirements from "Label it to indicate that it is for veterinary use only" to "Oral Suspension intended for veterinary use only is so labeled." This change was proposed to allow use of the Albendazole Oral Suspension monograph by manufacturers who distribute albendazole oral suspension that is approved for human use outside the United States. Comments received by USP indicate a concern that the labeling changes proposed in $P F$ 29(4) would create confusion, because Albendazole Oral Suspension has not been approved for human use in the United States. To prevent any possible confusion, it is now proposed to delete the Labeling specifications in the Albendazole Oral Suspension monograph. This would allow manufacturers to use the monograph for the albendazole oral suspension products that they distribute in countries where the appropriate authorities have given approval for human use. The proposal would also now have the labeling default to the specification of the governing regulatory authority for a given country.
(NL: W. Paul; VET: I. DeVeau) RTS-40621-2

## Delete the following:

Gabeling Label it to indient that it is for veterinary use only.
Oral-Suspension intended for veterinary use only is so labe

```
lec!1S (USP28)
```

## BRIEFING

Aminopentamide Sulfate, USP 27 page 122 and page 1844 of PF 29(6) [Nov.-Dec. 2003]. In the Assay, it is proposed to replace the solvent used to prepare the titrant to avoid the use of benzene.
(BPC: M. Marques) RTS-41333-1

## Change to read:

Labeling-Label it to indicate that it is for veterinary use only.
${ }^{\Delta}$ Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. $\Delta$ USP28

## Change to read:

USP Reference standards $\langle 11\rangle —$ USP Aminopentamide Sulfate $R S$.
${ }^{\Delta}$ USP Endotoxin RS. ■USP28

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Aminopentamide Sulfate is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Aminopentamide Sulfate Injection. Where the label states that Aminopentamide Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Aminopentamide

Sulfate Injection. $\mathbf{\Delta U S P 2 8}$

## Change to read:

Assay-Dissolve about 500 mg of Aminopentamide Sulfate, accurately weighed, in 100 mL of dimethylformamide in a suitable container. Add 5 drops of thymol blue TS, and titrate with 0.1 N lithium methoxide VS

ㅂin benzene
$\boldsymbol{m}_{\text {in toluene }} \mathbf{n}_{1 S}$ (USP28)
to a deep blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 19.72 mg of $\mathrm{C}_{19} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$.

## BRIEFING

Aspartic Acid, USP 27 page 170. On the basis of comments received, it is proposed to clarify the composition of the Standard solution in the test for Chromatographic purity.
(DSN: L. Evans) RTS-41194-1

## Change to read:

Chromatographic purity-
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

System suitability solution-Dissolve 10 mg each of USP Aspartic Acid RS and glutamic acid, each accurately weighed, in 2 mL of ammonia TS, dilute with water to 25.0 mL , and mix.

Test solution-Transfer 0.1 g of Aspartic Acid to a $10-\mathrm{mL}$ volumetric flask, dissolve in 2 mL of $17 \%$ ammonia solution (prepared by diluting ammonium hydroxide, 6 in 10), dilute with water to volume, and mix.

Standard solution-Transfer 5 mg of USP Aspartic Acid RS to a $100-\mathrm{mL}$ volumetric flask, dissolve in 2 mL of $17 \%$ ammonia solution (prepared by diluting ammonium hydroxide, 6 in 10), nitm hydroxide,

■11S (USP28)
dilute with water to volume, and mix.
Application volume: $5 \mu \mathrm{~L}$.
Developing solvent system: a mixture of butyl alcohol, glacial acetic acid, and water $(6: 2: 2)$.

Spray reagent-Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butyl alcohol and 2 N acetic acid (95:5).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$, except to dry the plate at $80^{\circ}$ for 30 minutes, spray with Spray reagent, and heat at $80^{\circ}$ for 30 minutes. Examine the plate under white light. The chromatogram obtained from the System suitability solution exhibits two clearly separated spots, and no secondary spot in the chromatogram of the Test solution is larger or more intense than the principal spot in the chromatogram of the Standard solution: not more than $0.5 \%$ of any individual impurity is found; and not more than $2.0 \%$ of total impurities is found.

## Briefing

Aspirin, USP 27 page 171. It is proposed to delete the incorrect chapter number, $\langle 211\rangle$, for Sulfate.
(PA2: C. Anthony) RTS-41283-1

## Change to read:

Sulfate $\langle z 14\rangle$
$\square_{\text {■1S (USP28) }}$
-Dissolve 6.0 g in 37 mL of acetone, and add 3 mL of water. Titrate potentiometrically with 0.02 M lead perchlorate, prepared by dissolving 9.20 g of lead perchlorate in water to make 1000 mL of solution, using a pH meter capable of a minimum reproducibility of $\pm 0.1 \mathrm{mV}$ (see $p H\langle 791\rangle$ ) and equipped with an electrode system consisting of a lead-specific electrode and a silver-silver chloride reference glass-sleeved electrode containing a solution of tetraethylammonium perchlorate in glacial acetic acid ( 1 in 44) (see Titrimetry $\langle 541\rangle$ ): not more than 1.25 mL of 0.02 M lead perchlorate is consumed $(0.04 \%)$. [NOTE-After use, rinse the lead-specific electrode with water, drain the reference electrode, flush with water, rinse with methanol, and allow to dry.]

## BRIEFING

Avobenzone, USP 27 page 194. It is proposed to revise the Chromatographic system in the Assay to include system suitability requirements.

$$
\text { (PA6: L. Evans) } \quad \text { RTS-41185-1 }
$$

## Change to read:

## Assay-

Standard preparation-Dilute an accurately measured quantity of USP Avobenzone RS in acetone, and dilute quantitatively, and stepwise if necessary, with acetone to obtain a solution having a known concentration of about 50 mg per mL .

Assay preparation-Transfer about 500 mg of Avobenzone, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a flame-ionization detector and a $0.32-\mathrm{mm} \times 25-\mathrm{m}$ fused silica capillary column coated with phase G1. The column temperature is maintained at about $200^{\circ}$ until the time of injection, then increased at a rate of $4^{\circ}$ per minute to $280^{\circ}$. The injection port temperature is maintained at $200^{\circ}$, and the detector temperature is maintained at about $280^{\circ}$. Helium is used as the carrier gas.
-Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between avobenzone and any adjacent peak is not less than 1.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. 1 IS (USP28)

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{3}$ in the portion of Avobenzone taken by the formula:

$$
10 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Avobenzone RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Benzoyl Peroxide Gel, USP 27 page 224 and page 455 of $P F$ 30(2) [Mar.-Apr. 2004]. It is proposed to revise the column dimensions in Chromatographic system in the Assay to be consistent with the original method. In addition, an editorial change has been made.
(PA7b: B. Davani) RTS-41307-1

## Change to read:

## Related compounds-

Solution A-Prepare a filtered and degassed mixture of acetonitrile and glacial acetic acid (1000:1).

Solution B-Prepare a filtered and degassed mixture of water and glacial acetic acid (1000:1).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Prepare a solution in acetonitrile containing $100 \mu \mathrm{~g}$ of benzoic acid and $60 \mu \mathrm{~g}$ of methylparaben per mL.

Test preparation-Transfer an accurately weighed quantity of Gel, equivalent to about 100 mg of benzoyl peroxide, to a $50-$ mL volumetric flask, add 25 mL of acetonitrile, shake vigorously to disperse the specimen, sonicate for 5 minutes, dilute with acetonitrile to volume, mix, and filter.

Standard preparation A-Prepare a solution of benzoic acid in acetonitrile containing $500 \mu \mathrm{~g}$ per mL .

Standard preparation B-Prepare a solution of ethyl benzoate in acetonitrile containing $20 \mu \mathrm{~g}$ per mL .

Standard preparation $C$-Prepare a solution of benzaldehyde in acetonitrile containing $20 \mu \mathrm{~g}$ per mL .

Standard preparation D-Prepare a solution of hydrous benzoyl peroxide, previously subjected to the Assay under Hydrous Benzoyl Peroxide, in acetonitrile containing the equivalent of $40 \mu \mathrm{~g}$ of anhydrous benzoyl peroxide per mL.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $235-\mathrm{nm}$ detector and a $3.9 \mathrm{~mm} \times 15 \mathrm{~cm}$
${ }^{\boldsymbol{\Delta}} 4.6-\mathrm{mm} \times 25-\mathrm{cm}_{\mathbf{\Delta} U S P 28}$
column containing packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| Time <br> $($ minutes $)$ | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :---: |
| 0 | 18 | 82 | equilibration |
| $0-10$ | $18 \rightarrow 60$ | $82 \rightarrow 40$ | linear gradient |
| $\mathbf{\Delta}_{0}-20_{\mathbf{\Delta} U S P 28}$ <br> $10-22$ | 60 | 40 | isocratic |
| $\mathbf{\Delta}_{20-30_{\mathbf{\Delta S P 2 8}}}$ |  |  |  |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between benzoic acid and methylparaben is not less than 3.0;

## ${ }^{-} 2.0 ;_{\mathbf{\Delta S P} 28}$

and the tailing factors for the benzoic acid and methylparaben peaks are not more than 2.0.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparations and the Test preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The responses of any peaks obtained from the Test preparation corresponding to benzoic acid, ethyl benzoate, and benzaldehyde are not greater than those of the main peaks obtained from Standard preparation A (25\%), Standard preparation B (1\%), and Standard preparation C (1\%), respectively; the response of any other impurity peak obtained from the Test preparation, other than the main benzoyl peroxide peak, any benzoic acid, ethyl benzoate, benzaldehyde, methylparaben, or propylparaben peak, and any solvent peak, is not more than that obtained from Standard preparation $D(2 \%)$; and the sum of the responses of all the impurity peaks, other than those of benzoic acid, ethyl benzoate, and benzaldehyde is not more than that obtained from Standard preparation $D(2 \%)$.

## Change to read:

## Assay-

Mobile phase-Prepare a solution of acetonitrile in water (about 5 in 10) such that the retention times for ethyl benzoate and benzoyl peroxide are about 7 and 14 minutes, respectively.

Internal standard solution-Dissolve ethyl benzoate in acetonitrile to obtain a solution having a concentration of about 3.6 mg per mL .

Standard preparation-Place a suitable quantity of hydrous benzoyl peroxide, recently subjected to the Assay under Hydrous Benzoyl Peroxide, in an accurately weighed conical flask fitted with a glass stopper, weigh again to obtain the weight of the specimen, and quantitatively dissolve in acetonitrile to obtain a solution containing a known concentration of about 0.8 mg of benzoyl peroxide per mL . Pipet 10 mL of this solution and 5 mL of Internal standard solution into a $25-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix. This Standard preparation contains about 0.32 mg of benzoyl peroxide per mL .

Assay preparation-Transfer an accurately weighed quantity of Gel, equivalent to about 40 mg of benzoyl peroxide, to a $50-\mathrm{mL}$ volumetric flask. Add 40 mL of acetonitrile, and shake until the material is thoroughly dispersed. Sonicate the mixture for $5 \mathrm{~min}-$ utes, dilute with acetonitrile to volume, mix, and filter. Pipet 10 mL of the filtrate and 5 mL of Internal standard solution into a $25-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a 4 mm
$\boxed{\square} .9-\mathrm{mm}_{\square 1 \mathrm{~S}}$ (USP28)
$\times 30-\mathrm{cm}$ stainless steet
■1S (USP28)
column that contains packing L 1 , and is operated at room temperature. The flow rate is about 1 mL per minute. Chromatograph three replicate injections of the Standard preparation, and record the peak responses as directed for Procedure: the lowest and highest peak response ratios $\left(R_{S}\right)$ agree within $2.0 \%$; the resolution, $R$, between ethyl benzoate and benzoyl peroxide is not less than 2.0 ; and the tailing factors for the ethyl benzoate and benzoyl peroxide peaks are not more than 2.0.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of benzoyl peroxide $\left(\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{O}_{4}\right)$ in the portion of Gel taken by the formula:

$$
125 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of benzoyl peroxide in the Standard preparation; and $R_{U}$ and $R_{S}$ are the peak response
ratios of benzoyl peroxide to ethyl benzoate obtained from the $A s$ say preparation and the Standard preparation, respectively.

## Briefing

Betamethasone Sodium Phosphate, USP 27 page 237. It is proposed to revise Identification test $B$ to update the text in accordance with the Thin-Layer Chromatographic Identification Test $\langle 201\rangle$.
(PA1: C. Anthony) RTS-41352-1

## Change to read:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Prepare a solution in methanol containing 1 mg per mL . Apply $10 \mu \mathrm{~L}$ of this solution and $10 \mu \mathrm{~L}$ of a solution of USP Be tamethasene Sodium Phosphate $R$ SS in methanol containing 1 mg per mL to a suitable thin layer chromatographic plate (see Chromatography ( 624 ) ) conted with -0.25 mm layer of chroma tographic silien gel. Allow the spots dry. Place 500 mL of butyl aleehol and 200 mL of dilute hydrochleric acid ( 1 in 12 ) in a sepa ratory funnel, and mix. Use the organie layer as the developing sol went. Develop the chromatogram in the developing solvent until the-solvent fromt has moved about three fourths of the length of the plate. Proee as directed in the Identification test under Beta methasone Cream, beginning with "Remove the plate."
-Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

$$
\text { Test solution: } \quad 1 \mathrm{mg} \text { per } \mathrm{mL} \text {. }
$$

Standard solution-Prepare a solution of USP Betamethasone Sodium Phosphate RS in methanol having a concentration of 1 mg per mL .

Developing solvent system—Place 500 mL of butyl alcohol and 200 mL of dilute hydrochloric acid (1 in 12) in a separatory funnel, and mix. Use the organic layer as the developing solvent.
Spray reagent: a mixture of sulfuric acid, methanol, and nitric acid ( $10: 10: 1$ ).

Procedure-Proceed as directed in the chapter except to spray the plate with Spray reagent, and heat at $105^{\circ}$ for 10 minutes.■1S (USP28)

C: Ignite it at $800^{\circ}$ (see Residue on Ignition $\langle 281\rangle$ ): the residue responds to the tests for Sodium $\langle 191\rangle$ and for Phosphate $\langle 191\rangle$.

## BRIEFING

Bismuth Subsalicylate Oral Suspension, page 627 of $P F$ 28(2) [Mar.-Apr. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision with changes to Packaging and storage.
(PA2: C. Anthony) RTS-40957-1

## Add the following:

## Bismuth Subsalicylate Oral Suspension

## » Bismuth Subsalicylate Oral Suspension is a sus-

 pension that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{BiO}_{4}$. It may contain one or more suitable buffers, coloring agents, flavors, preservatives, stabilizers, sweeteners, and suspending agents.Packaging and storage-Preserve in tight containers, and avoid freezing. Store between $15^{\circ}$ and $30^{\circ}$.

## Identification-

A: It responds to the tests for Bismuth $\langle 191\rangle$.
B: It meets the requirements of the tests for Salicylate $\langle 191\rangle$, after acidifying with nitric acid.
$\mathbf{p H}\langle 791\rangle$ : between 3.0 and 5.0.
Microbial limits $\langle 61\rangle$ —The total aerobic microbial count does not exceed 100 cfu per g, the combined yeast and mold count does not exceed 50 cfu per $g$, and it meets the requirements of the tests for absence of Escherichia coli and of Salmonella species.

## Assay-

Standard preparation—Transfer about 500 mg of bismuth metal, accurately weighed, into a $200-\mathrm{mL}$ volumetric flask, dissolve in 12 mL of nitric acid, and dilute with 0.01 N nitric acid to volume. Transfer 10.0 mL of this solution into a 500mL volumetric flask, and dilute with 1 N nitric acid to volume to obtain solution having a concentration of $50 \mu \mathrm{~g}$ of bismuth per mL.

Assay preparation-Transfer an accurately measured quantity of about 10 g of Oral Suspension, previously well-shaken in its original container to ensure homogeneity, to a $200-\mathrm{mL}$ volumetric flask. Add about 100 mL of 1 N nitric acid, mix, and dilute with 1 N nitric acid to volume. Mix well without shaking, and transfer 10.0 mL of this mixture into a $100-\mathrm{mL}$ volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge about 20 mL at 4500 rpm for at least 10 minutes.

Procedure-Transfer an accurately measured volume of the Assay preparation that contains about 0.9 mg of bismuth subsalicylate and 10 mL of the Standard preparation to separate $50-\mathrm{mL}$ volumetric flasks. Add 10.0 mL of $10 \%$ ascorbic acid solution and 25.0 mL of $20 \%$ potassium iodide solution into each volumetric flask, dilute with water to volume, and mix well. Concomitantly determine the absorbances of both solutions in $1.0-\mathrm{cm}$ cells at a wavelength of $463-\mathrm{nm}$ with a suitable spectrophotometer using the reagent blank to set the spectrophotometer. Calculate the
quantity, in mg , of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{BiO}_{4}$ in the portion of Oral Suspension taken by the formula:

$$
(362.11 / 208.98) 20(C / V)\left(A_{U} / A_{S}\right) \text {, }
$$

in which 362.11 and 208.98 are the molecular weights of bismuth subsalicylate and bismuth, respectively; $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of bismuth in the Standard preparation; $V$ is the volume, in mL , of the Assay preparation taken; and $A_{U}$ and $A_{S}$ are the absorbances of the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Bismuth Subsalicylate Tablets, page 1603 of PF 28(5) [Sept.Oct. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision with changes to Packaging and storage.
(PA2: C. Anthony) RTS-40960-1

## Add the following:

## ■Bismuth Subsalicylate Tablets

» Bismuth Subsalicylate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bismuth subsalicylate

Packaging and storage-Preserve in tight containers.
Store between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label chewable Tablets to indicate that they are to be chewed before swallowing.

## Identification-

A: It meets the requirements of the tests for Bismuth $\langle 191\rangle$.

B: After acidifying with nitric acid, it meets the requirements of the test for Salicylate $\langle 191\rangle$ with ferric chloride TS.

Assay-
Standard preparation-Transfer about 500 mg of bismuth, accurately weighed, to a $200-\mathrm{mL}$ volumetric flask, dissolve in 12 mL of nitric acid, and dilute with 0.01 N nitric acid to volume. Transfer 10.0 mL of the solution so obtained into a $500-\mathrm{mL}$ volumetric flask, and dilute with 1 N nitric acid to volume to obtain a concentration of $50 \mu \mathrm{~g}$ of bismuth per mL.

Assay preparation-Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 90 mg of bismuth subsalicylate, to a $200-\mathrm{mL}$ volumetric flask, add about 150 mL of 1 N nitric acid, and sonicate for 2 minutes. Dilute with 1 N nitric acid to volume. Transfer 20.0 mL of the solution so obtained to a $100-\mathrm{mL}$ volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge a portion at 4500 rpm for at least 10 minutes.

Procedure-Transfer 10.0 mL , accurately measured, of the Assay preparation and the Standard preparation to separate $50.0-\mathrm{mL}$ volumetric flasks. Add 10.0 mL of $10 \%$ ascorbic acid solution and 25.0 mL of $20 \%$ potassium iodide solution into each volumetric flask, and dilute with 1 N nitric acid to volume. Concomitantly determine the absorbance of the solutions at the wavelength of maximum absorbance at about 463 nm with a suitable spectrophotometer using the combined reagent solutions as the blank.

Calculate the quantity, in mg , of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{BiO}_{4}$ in the portion of Tablets taken by the formula:

$$
(362.11 / 208.98)(C)\left(A_{U} / A_{S}\right),
$$

in which 362.11 and 208.98 are the molecular weights of bismuth subsalicylate and bismuth, respectively; $C$ is the concentration, in $\mu \mathrm{mg}$ per mL , of bismuth in the Standard preparation; and $A_{U}$ and $A_{S}$ are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively. $\quad$ IS (USP28)

## BRIEFING

Caffeine, USP 27 page 295 and page 1852 of $P F 29(6)$ [Nov.Dec. 2003]. It is proposed to replace the undefined term "fixed alkali" in the Identification test $B$ with the name of the reagent used.
(PA3: S. Salado) RTS-41195-1

## Add the following:

${ }^{\mathbf{4}}$ Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. $\Delta$ USP28

## Change to read:

USP Reference standards $\langle 11\rangle$-USP Caffeine RS.
${ }^{\triangle}$ USP Endotoxin RS. $\mathbf{\Delta U S P 2 8}$

## Change to read:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Dissolve about 5 mg in 1 mL of hydrochloric acid in a porcelain dish, add 50 mg of potassium chlorate, and evaporate on a steam bath to dryness. Invert the dish over a vessel containing a
few drops of 6 N ammonium hydroxide: the residue acquires a purple color, which disappears upon the addition of a solution of a fixed alkali.
$\square_{1} \mathrm{~N}$ sodium hydroxide.■1S (USP28)

## Add the following:

${ }^{4}$ Other requirements-Where the label states that Caffeine is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Caffeine and Sodium Benzoate Injection. Where the label states that Caffeine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Caffeine and Sodium Benzoate Injection. $\triangle U S P 28$

## BRIEFING

Calcitonin Salmon; Calcitonin Salmon Injection; Calcitonin Salmon Nasal Solution. Because there are no existing USP monographs for this drug substance and its dosage forms, new monographs, based on validated methods of analysis, are being proposed. The liquid chromatographic procedure in the test for $R e$ lated peptides and related substances and in the Assay is based on analyses performed with the Nucleosil 100-5 C18 brand of L1 column. The typical retention time for calcitonin salmon is about 16 minutes. The liquid chromatographic procedure in the test for Limit of trifluoroacetic acid is based on analyses performed with the Dionex AS11 column. The typical retention times for chloride and trifluoroacetate are about 8 and 11 minutes, respectively. The gas chromatographic procedure in the test for Limit of residual solvents is based on analyses performed with the Restek Rtx-1 brand of G38 column. The approximate retention times for methanol, acetonitrile, dichloromethane, tert-butyl methyl ether, and dimethylformamide are about 5.1, 7.1, 9.3, 11.4, and 21.3 minutes, respectively. The test for Bioidentity used the Amersham cAMP Direct Biotrak EIA kit to quantify the amount of cAMP produced by stimulation.
(BNT: L. Callahan) RTS-34296-1

## Add the following:

## ■Calcitonin Salmon

```
CSNLSTCVLG KLSQELHKLQ TYPRTNTGSG TP
C
```

» Calcitonin Salmon is a synthetic polypeptide that has the same sequence as that of the hor-mone-regulating calcium metabolism secreted by the ultimobranchial gland of salmon. It lowers the calcium concentration in plasma of mammals by diminishing the rate of bone resorption. It contains not less than 90.0 percent and not more than 105.0 percent of calcitonin salmon, calculated on an acetic acid-free and dried basis.

NOTE-1 mg of acetic acid-free, anhydrous Calcitonin Salmon is equivalent to 6000 USP Calcitonin Salmon Units.

Packaging and storage-Preserve in tight containers.
Store protected from light in a refrigerator.
Labeling-The labeling states that the material is synthetic.
USP Reference standards $\langle\mathbf{1 1}\rangle$ —USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS ( $N$ -acetyl-cys ${ }^{1}$-calcitonin). USP Endotoxin RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, obtained as directed in the Assay.

B: The UV absorption spectrum of a $0.1 \%$ solution (based on free peptide) in 0.01 N hydrochloric acid exhibits a minima and a maxima at the same wavelengths as those of a similar solution of USP Calcitonin Salmon RS, concomitantly measured. The absorbance at approximately 275 nm (maxima) is about 0.40 to 0.55 , and the ratio of the absorbance at 275 nm (maxima) and 254 nm (minima) is between 1.6 and 2.5 .

Amino acid profile (see Amino Acid Analysis, Method 1, under Biotechnology-Derived Articles-Tests $\langle 1047\rangle$ )-

Internal standard solution-Prepare a 1 mM solution of $\gamma$-aminobutyric acid.
Standard amino acid solution-Prepare a mixture containing equimolar amounts of ammonia and the L form of lysine, histidine, arginine, aspartic acid, threonine, serine, proline, valine, glutamic acid, glycine, leucine, and tyrosine, together with half the equimolar amount of L-cystine, in 0.1 M hydrochloric acid. The final concentration is about 2.5 mM for each amino acid.

Standard solution-Transfer 5 mL of the Internal standard solution and 2 mL of the Standard amino acid solution into a $50-\mathrm{mL}$ volumetric flask, and dilute with 0.1 M hydrochloric acid to volume.

Test solution-Place about 1.5 mg of an accurately weighed quantity of Calcitonin Salmon into a heavy-wall ignition tube, add 1.0 mL of 6 N hydrochloric acid, allow to cool, immerse the lower half of the tube in a freezing mixture until the contents are frozen, evacuate to approximately $10 \mu \mathrm{M}$, purge with nitrogen (repeat the evacuation and nitrogen purge three times), and seal the tube while it is under a $10-\mu \mathrm{M}$ vacuum. Heat for 16 hours at $110^{\circ}$ to $115^{\circ}$ in an air oven. Cool, open the tube, dry in a vacuum desiccator, remove the contents, and allow to cool to room temperature.

Dissolve in 0.1 M hydrochloric acid, transfer to a $10-\mathrm{mL}$ volumetric flask, add 1 mL of Internal standard solution, and dilute with 0.1 M hydrochloric acid to volume.

Procedure-Standardize the amino acid analyzer, using the Standard solution. Inject the Test solution into the amino acid analyzer, and determine the relative proportion of amino acids.

Calculation of amino acid profile-Express the content of each amino acid in moles, using an internal standard calibration technique. Calculate the relative proportions of the amino acids by taking as equivalent to 1 the sum divided by 20 of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine, and lysine. For threonine and serine, perform the same calculation, and correct the concentrations for degradation by adding $5 \%$ and $10 \%$, respectively, to their indicated results. The requirements are met if the values fall within the following limits: aspartic acid, 1.8 to 2.2 ; glutamic acid, 2.7 to 3.3 ; proline, 1.7 to 2.3 ; glycine, 2.7 to 3.3 ; valine, 0.9 to 1.1 ; leucine, 4.5 to 5.3 ; histidine, 0.9 to 1.1 ; arginine, 0.9 to 1.1 ; lysine, 1.8 to 2.2; serine, 3.2 to 4.2 ; threonine, 4.2 to 5.2 ; tyrosine, 0.7 to 1.1; half cystine, 1.4 to 2.1 .

Bacterial endotoxins $\langle 85\rangle$-It contains not more than 1000 USP Endotoxin Units per mg of calcitonin salmon.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 100 cfu per g. It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.
$\mathbf{p H}\langle 791\rangle$ : between 4.0 and 6.0 in a $1 \%$ solution in carbon dioxide-free water.

Water, Method Ic $\langle 921\rangle$ : not more than $10 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.005 \%$.

Limit of trifluoroacetic acid- [NOTE-Use deionized, degassed water where water is indicated.]

Solution A: water.
Solution B: 0.005 N sodium hydroxide.
Solution C: 0.1 N sodium hydroxide.
Mobile phase-Use variable mixtures of Solution A, Solution B, and Solution C as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chloride stock standard solution-Dissolve an accurately weighed quantity of sodium chloride in water to obtain a solution having a concentration of the chloride ion of about 0.1 mg per mL .

Trifluoroacetic acid stock standard solution-Dissolve an accurately weighed quantity of trifluoroacetic acid in water to obtain a solution having a concentration of trifluoroacetic acid of about 0.1 mg per mL .
Resolution solution-Pipet 0.2 mL of Chloride stock standard solution and 0.5 mL of Trifluoroacetic acid stock standard solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution that contains $0.2 \mu \mathrm{~g}$ of chloride and $0.5 \mu \mathrm{~g}$ of trifluoroacetate per mL , respectively.
Standard solutions-Pipet $0.2 \mathrm{~mL}, 0.5 \mathrm{~mL}, 1.0 \mathrm{~mL}$, and 2.0 mL of Trifluoroacetic acid stock standard solution into ordered $100-\mathrm{mL}$ volumetric flasks. Dilute with water to volume and mix to obtain solutions that contain concentrations of about $0.2 \mu \mathrm{~g}, 0.5 \mu \mathrm{~g}, 1.0 \mu \mathrm{~g}$, and $2.0 \mu \mathrm{~g}$ of trifluoroacetate per mL , respectively.

Test solution-Transfer about 10 mg of Calcitonin Salmon, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The ion chromatograph is equipped with a conductivity detector, a 4-mm $\times 5-\mathrm{cm}$ anion-exchange guard column con-
taining packing L31, a $4-\mathrm{mm} \times 25-\mathrm{cm}$ anion-exchange analytical column containing packing L31, a high-capacity anion trap column in hydroxide form in the eluent line in front of the injection valve, and a micromembrane anion self-regenerating suppressor. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

| Time | Solution | Solution | Solution |  |
| :---: | :---: | :---: | :---: | :--- |
| (Minutes) | $A(\%)$ | $B(\%)$ | $C(\%)$ | Elution |
| $0-2$ | 90 | 10 | 0 | isocratic |
| $2-5$ | $90 \rightarrow 0$ | $10 \rightarrow 100$ | 0 | linear gradient |
| $5-15$ | 0 | $100 \rightarrow 65$ | $0 \rightarrow 35$ | linear gradient |
| $15-20$ | $0 \rightarrow 90$ | $65 \rightarrow 10$ | $35 \rightarrow 0$ | linear gradient |

Chromatograph the Resolution solution, and record the peak responses as directed for the Procedure: the resolution, $R$, between the chloride peak and the trifluoroacetic acid peak is not less than 3 ; and the relative standard deviation for replicate injections is not more than $5.0 \%$.

Procedure—Separately inject equal volumes (about 100 $\mu \mathrm{L}$ ) of each of the Standard solutions and the Test solution into the chromatograph, record the chromatograms, and measure the area of peak responses. Plot the response of the trifluoroacetic acid peak in the Standard solutions versus the concentration of trifluoroacetic acid, and draw the straight line best fitting the plotted points. From the graphs so obtained, determine a concentration value, $C$, in $\mu \mathrm{g}$ per mL for trifluoroacetic acid. Calculate the quantity, in ppm, for trifluoroacetic acid in Calcitonin Salmon by the formula:

$$
5000(C / W)
$$

in which $W$ is the weight in mg of Calcitonin Salmon taken to prepare the Test solution: not more than 200 ppm of trifluoroacetic acid is found.

## Limit of residual solvents-

Standard stock solution—Prepare a solution containing about $300 \mu \mathrm{~g}$ of methanol, $40 \mu \mathrm{~g}$ of acetonitrile, $60 \mu \mathrm{~g}$ of methylene chloride, $500 \mu \mathrm{~g}$ of tert-butyl methyl ether, and $90 \mu \mathrm{~g}$ of dimethylformamide per mL of methyl sulfoxide.

Standard solution-Transfer 5 mL of the Standard stock solution to a $25-\mathrm{mL}$ volumetric flask, and dilute with dimethyl sulfoxide to volume. Transfer 1 mL of the Standard solution to a $20-\mathrm{mL}$ headspace vial fitted with a septum and a crimp cap, and seal the vial.

Test solution 1-Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a $20-\mathrm{mL}$ headspace vial fitted with a septum and a crimp cap, add 1 mL of dimethyl sulfoxide, seal the vial, and mix.

Test solution 2-Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a $20-\mathrm{mL}$ headspace vial fitted with a septum and a crimp cap, add 1 mL of Standard solution, seal the vial, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a headspace injector and a flame-ionization detector and contains a $0.32-\mathrm{mm}$ $\times 60-\mathrm{m}$ fused silica column coated with a $1.0-\mu \mathrm{m}$ film of stationary phase G38. Nitrogen is used as the carrier gas, flowing at a rate of about 25 mL per minute. The column temperature is maintained at $45^{\circ}$ for 2 minutes, then increased at a rate of $10^{\circ}$ per minute to $75^{\circ}$, then increased at a rate of $5^{\circ}$ per minute to $170^{\circ}$ and maintained at $170^{\circ}$ for 3 minutes. The split injector temperature is maintained at about $200^{\circ}$, and the detector temperature is maintained at about $170^{\circ}$. The transfer loop and transfer line temperature is $170^{\circ}$, and the pressurize time is 0.5 minute. The Standard solution vial and the Test solutions 1 and 2 vials are maintained at about $90^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.55 for methanol, 0.76 for
acetonitrile, 1.0 for methylene chloride, 1.2 for tert-butyl methyl ether, and 2.3 for dimethylformamide; and the relative standard deviation, determined from peak areas for each peak, for six replicate injections is not more than $10 \%$.

Procedure-Separately inject equal volumes (about 1 mL ) of headspace from vials of Test solution 1 and Test solution 2 into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of methanol, acetonitrile, methylene chloride, tert-butyl methyl ether, and dimethylformamide in the Calcitonin Salmon taken by the formula:

$$
100\left(r_{T 1}\right)(C) /\left(r_{T 2}\right)\left(W_{T 1}\right)-\left(r_{T 1}\right)\left(W_{T 2}\right),
$$

in which $C$ is the concentration, in mg per mL , of the relevant analyte in the Standard solution; $W_{T 1}$ and $W_{T 2}$ are the weights, in mg, of Calcitonin Salmon taken to prepare Test solution 1 and Test solution 2, respectively; and $r_{T 1}$ and $r_{12}$ are the peak areas of the corresponding analyte obtained from Test solution 1 and Test solution 2, respectively: not more than $3000 \mu \mathrm{~g}$ of methanol, $400 \mu \mathrm{~g}$ of acetonitrile, $600 \mu \mathrm{~g}$ of methylene chloride, $5000 \mu \mathrm{~g}$ of tert-butyl methyl ether, and $900 \mu \mathrm{~g}$ of dimethylformamide per g of Calcitonin Salmon are found.

## Acetic acid content-

Internal standard stock solution-Mix 1 mL of dioxane with water to obtain 100 mL of solution.
Standard solution-Transfer approximately 100 mg of glacial acetic acid, accurately weighed, and 10 mL of Internal standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Test solution-Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, add 1 mL of Internal standard stock solution, dissolve in and dilute with water to volume, and mix.

Chromatographic system see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $2-\mathrm{mm} \times 3-\mathrm{m}$ glass column packed with $10 \%$ liquid phase G35, $1 \%$ phosphoric acid, on support S 1 A . Nitrogen is the carrier gas, flowing at a rate of about 30 mL per minute. The column is maintained at $70^{\circ}$ for 4 minutes, then increased at a rate of $8^{\circ}$ per minute to $120^{\circ}$, then maintained at $120^{\circ}$ for 4 minutes. The injection port and detector are maintained isothermally at temperatures of about $200^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the resolution, $R$, between dioxane and acetic acid is not less than 8 ; and the relative standard deviation for replicate injections is not more than 5.0\%.

Procedure-Separately inject equal volumes (about $4 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses of the major peaks. The retention times are about 3 minutes for acetic acid and 1 minute for dioxane. Calculate the percentage of acetic acid in the portion of Calcitonin Salmon taken by the formula:

$$
1000(C / W)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of acetic acid in the Standard solution; and $R_{U}$ and $R_{S}$ are the peak response ratios of acetic acid to dioxane obtained from the Test solution and the Standard solution, respectively: not less than $4.0 \%$ and not more than $15.0 \%$ is found.

## Bioidentity-

RPMI 1640 with L-glutamine-Prepare a mixture of the ingredients in the quantities shown in sufficient water to obtain 1 L of medium, and sterilize by filtration.

Calcium Nitrate
Potassium Chloride
100.00 mg
400.00 mg

| Thiamine Hydrochloride | 1 mg |
| :--- | :---: |
| Vitamin $\mathrm{B}_{12}$ | 0.005 mg |

Medium $A$ (growth medium)-Using aseptic technique, prepare the following tissue culture medium.

| RPMI 1640 with L-glutamine | 500 mL |
| :--- | ---: |
| Fetal bovine serum | 50 mL |
| 1 M HEPES | 5 mL |
| Penicillin/streptomycin solution |  |
| $\quad(10,000$ IU per mL $/ 10 \mathrm{mg}$ per mL$)$ | 5 mL |
| Human insulin | 10 IU |
| Hydrocortisone | 0.5 mg |

Medium $B$ (stimulation medium)-Dissolve 5 g of albumin bovine serum (BSA), in 500 mL of RPMI 1640 with $2 m M L$-glutamine.
$2 \%$ BSA solution-Dissolve 50 mg of albumin bovine serum in 25 mL of water. [NOTE-Use within 1 day.]

Formic acid/BSA solution-Add 25 mL of 0.1 M formic acid and 5 mL of $2 \%$ BSA solution to a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume. [NOTE-Use within 2 days.]

Trypsin-tetrasodium ethylenediaminetetraacetate (EDTA) solution-Prepare a sterile filtered solution containing $0.25 \%$ trypsin and 0.53 mM EDTA.

Dulbecco's phosphate buffered saline-Dissolve 8 g of sodium chloride, 1.15 g of dibasic sodium phosphate, 0.2 g of monobasic potassium phosphate, 0.2 g of potassium chloride, 0.1 g of calcium chloride, and 0.1 g of magnesium chloride in 1 L of water.

Standard stock solution-Dissolve an accurately weighed quantity of USP Calcitonin Salmon RS in Formic acid/BSA solution to obtain a solution having a known concentration of about $20 \mu \mathrm{~g}$ per mL .

Positive control solution-Quantitatively dilute the Standard stock solution with Medium B to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 1 ng per mL .

Negative control solution: Medium B.
Standard solution $A-$ Quantitatively dilute the Standard stock solution with Medium $B$ to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.1 ng per mL .

Standard solution B-Dilute Standard solution A quantitatively with Medium $B$ to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.033 ng per mL.

Standard solution C-Dilute Standard solution B quantitatively $(1: 2)$ with Medium $B$ to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.011 ng per mL .

Standard solution D-Dilute Standard solution C quantitatively ( $1: 2$ ) with Medium $B$ to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.0037 ng per mL.

Test stock solution-Dissolve an accurately weighed quantity of Calcitonin Salmon in Formic acid/BSA solution to obtain a solution having concentration of about $20 \mu \mathrm{~g}$ per mL .

Test solution $A$ - Quantitatively dilute the Test stock solution with Medium B to obtain a solution of Calcitonin Salmon having a concentration of 0.1 ng per mL .
Test solution $B$ - Quantitatively dilute Test solution $A$ with Medium $B(1: 2)$ to obtain a solution of Calcitonin Salmon having a concentration of 0.033 ng per mL .
Test solution $C$ - Quantitatively dilute Test solution $B$ with Medium $B(1: 2)$ to obtain a solution of Calcitonin Salmon having a concentration of 0.011 ng per mL .

Test solution $D$ - Quantitatively dilute Test solution $C$ with Medium $B(1: 2)$ to obtain a solution of Calcitonin Salmon having a concentration of 0.0037 ng per mL .

Cell culture preparation-Prepare cell culture of the human mammary tumor cell line T-47D. Cells are propagated using Medium $A$ at $37^{\circ}$ and $5 \%$ carbon dioxide. The medium is changed every 2 days, and cells are passaged every 5 to 9 days, using Trypsin-EDTA solution with a $1: 4$ subculture.

Cell suspension-For the test, use a cell culture that is 5 to 9 days old. Remove the cell culture medium from the flask by aspiration, add 10 mL of Dulbecco's phosphate buffered saline, and rock the culture flask to rinse the entire monolayer. Remove the liquid by aspiration, add 2 mL of Tryp-sin-EDTA solution, spread over the entire monolayer, allow to stand for 3 to 5 minutes, and add 10 mL of Medium $A$. Homogenize the cell suspension using a pipet, transfer to a $15-\mathrm{mL}$ polypropylene tube, centrifuge at about 220 g for 5 minutes, pour off the supernatant, and resuspend the cell pellet in 10 mL of Medium $A$. Count the cells, and adjust cell density to $2.5 \times 10^{4}$ cells per mL through dilution, using

## Medium $A$.

Procedure—Place $200 \mu \mathrm{~L}$ of the Cell suspension into each well of a 96-well culture plate (the tissue culture plate), and incubate for 18 to 24 hours at $37^{\circ}$ and $5 \%$ carbon dioxide. Fill each well of an empty round-bottomed 96-well culture plate (the prepared plate) with $150 \mu \mathrm{~L}$ of one of the following solutions: Positive control solution, Negative control solution, Standard solutions $A-D$, and Test solutions $A-$ $D$, so that each solution fills at least five wells on the prepared plate. After incubation, remove the culture medium from the tissue culture plate. Using an 8-channel or 12-channel pipet, rapidly transfer $100 \mu \mathrm{~L}$ of solution from each well of the prepared plate to each well of the tissue culture plate. Incubate for 15 minutes at ambient temperature, remove solution from each well, stop stimulation by immediately
adding an appropriate cell-lysis buffer, and quantitate cAMP, produced within the cells, using a validated kit. Perform the test three times, using three different 96-well culture plates. [NOTE-Some kits include a cell-lysis reagent and a sequestering agent for the cell-lysis reagent. The range of the test kit is between 0.05 ng and 10 ng per mL of cAMP.] Potency is determined by a 3 -dose, 6 -point paral-lel-line assay, using standard statistical methods. The calculation is carried out using both the lower three concentrations and the upper three concentrations. For the assay to be valid, the requirements for regression and parallelism must be met. If the requirements for validity are met to the same extent in both assessments (the lower and the higher assessments), the final result is determined from the concentration range that shows the higher value when the common slope is divided by the mean square error. The potency levels determined from all three performances of the test are homogeneous, and the confidence limits for all three determinations are between $64 \%$ and $156 \%$ of the calculated potency.

## Related peptides and other related substances-

Test solution-Prepare as directed for the Assay preparation in the Assay.

Solution A, Solution B, Mobile phase, Resolution solution, and Chromatographic system-Prepare as directed in the Assay.

Procedure-Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percentage of each peak observed in the chromatogram. Disregard any peaks due to the solvent and any peaks whose area is less than $0.1 \%$ of the principal peak. No peak other than the principal peak constitutes more than $3.0 \%$ of the total
area of all peaks. The sum of the area of all peaks apart from the principal peak is not greater than $5.0 \%$ of the area of all peaks.

Other requirements-Where the label states that Calcitonin Salmon is sterile, it meet the requirements for Sterility under Calcitonin Salmon Injection.

Assay-
Solution A-Dissolve 3.62 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, add 100 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5 , pass through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and degas.

Solution B—Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, add 600 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5 , pass through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and degas.

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability underChroamtography $\langle 621\rangle$ ).

Standard preparation-Transfer about 10.0 mg of USP Calcitonin Salmon RS, accurately weighed, into a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solution $A$ to volume, and mix.

Resolution solution-Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of Solution $A$, add 0.1 mL of the Standard preparation, and mix.

Assay preparation-Transfer about 10.0 mg of Calcitonin Salmon, accurately weighed, into a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solution $A$, to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing

L1. The column temperature is maintained at about $65^{\circ}$. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (Minutes) | $(\%)$ | $(\%)$ | Elution |
| $0-30$ | $72 \rightarrow 48$ | $28 \rightarrow 52$ | linear gradient |
| $30-32$ | $48 \rightarrow 72$ | $52 \rightarrow 28$ | linear gradient |
| $32-55$ | 72 | 28 | isocratic |

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.15 for calcitonin salmon related compound A and 1.0 for calcitonin salmon; the resolution, $R$, between calcitonin salmon related compound A and calcitonin salmon is not less than 3 ; the tailing factor is not more than 2.5 ; and the relative standard deviation for replicate injections is not more than $3 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the percentage of calcitonin salmon in the portion of Calcitonin Salmon taken by the formula:

$$
P\left(W_{s} / W_{U}\right)\left(r_{U} / r_{s}\right),
$$

in which $P$ is the percentage of calcitonin salmon in USP Calcitonin Salmon RS; $W_{S}$ is the weight, in mg , of USP Calcitonin Salmon RS used to prepare the Standard preparation; $W_{U}$ is the weight, in mg, of Calcitonin Salmon used to prepare the Assay preparation; and $r_{U}$ and $r_{s}$ are the main peak areas from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Calcitonin Salmon Injection-See briefing under Calcitonin Salmon.
(BNT: L. Callahan) RTS-41052-3

## Add the following:

## ■Calcitonin Salmon Injection

" Calcitonin Salmon Injection is a sterile solution of Calcitonin Salmon in a suitable diluent. Each mL of Calcitonin Salmon Injection possesses an activity of not less than 80 percent and not more than 110 percent of that stated on the label.

Packaging and storage-Preserve in single-dose or multi-ple-dose containers, preferably of Type I glass. Avoid freezing. Store in refrigerator.

Labeling-Label it to indicate the activity in USP Calcitonin Salmon Units per mL. The labeling states that the material is synthetic. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided.

USP Reference standards $\langle 11\rangle$ —USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS. USP Endotoxin RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Bacterial endotoxins $\langle 85\rangle$ - It contains not more than 0.625 USP Endotoxin Units per USP Calcitonin Salmon Unit.

Sterility $\langle 71\rangle$ —It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.
$\mathbf{p H}\langle 791\rangle$ : between 3.9 and 4.5.
Particulate matter $\langle 788\rangle$ : meets the requirements for small-volume injections.

Other requirements-It meets the requirements under $I n$ jections $\langle 1\rangle$.

Assay-
Solution A, Solution B, Mobile phase, and Chromatographic system-Prepare as directed in the Assay under Calcitonin Salmon.

Standard stock preparation-Transfer about 10.0 mg of USP Calcitonin Salmon RS, accurately weighed, into a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solution $A$ to volume, and mix.
Standard preparation-Transfer 1 mL of the Standard stock preparation into a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solution $A$ to volume, and mix.
Resolution solution-Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS and 0.4 mL of Solution $A$, add 0.1 mL of the Standard preparation, and mix. Take 0.1 mL of this solution, add 0.9 mL of Solution $A$, and mix.

Assay preparation-Use the solution from an undiluted injection vial.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in USP Calcitonin Salmon Units per mL, in the portion of Injection taken by the formula:

$$
C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration of the Standard preparation, in USP Calcitonin Salmon Units per mL; and $r_{U}$ and $r_{s}$ are the main peak areas from the Assay preparation and Standard preparation, respectively.■1S (USP28)

## Briefing

Calcitonin Salmon Nasal Solution-See briefing under Calcitonin Salmon.
(BNT: L. Callahan) RTS-41052-2

## Add the following:

## ■Calcitonin Salmon Nasal Solution

» Calcitonin Salmon Nasal Solution is a solution of Calcitonin Salmon in a suitable diluent. It contains suitable preservatives, and is packaged in a form suitable for nasal administration so that the required dosage can be controlled as required. Each mL of Calcitonin Salmon Nasal Solution possesses an activity of not less than 80 percent and not more than 110 percent of that stated on the label.

Packaging and storage-Preserve in containers suitable for spraying the contents into the nasal cavities in a controlled individualized dosage. Store unopened containers in a refrigerator, and opened containers at room temperature.

Labeling-Label it to indicate that it is for intranasal administration only. Label it to state that the origin is synthetic.

USP Reference standards $\langle 11\rangle —$ USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS.
$\mathbf{p H}\langle 791\rangle$ : between 3.5 and 4.5.
Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Microbial limits $\langle 61\rangle$ —The total aerobic microbial count does not exceed 100 cfu per g , and the total combined molds and yeast count does not exceed 50 cfu per g. It meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.

## Assay-

Solution A, Solution B, Mobile phase, Standard preparation, Resolution solution, and Chromatographic systemPrepare as directed in the Assay under Calcitonin Salmon Injection.

Diluent-Dissolve 0.75 g of sodium chloride, 0.2 g of sodium acetate, and 0.2 g of glacial acetic acid in 100 mL of water.

Assay preparation-Transfer 1 mL of Nasal Solution to a $10-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in USP Calcitonin Salmon Units per mL, in the Nasal Solution taken by the formula:

$$
10 C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration of the Standard preparation, in USP Calcitonin Salmon Units per mL; and $r_{U}$ and $r_{S}$ are the main peak areas from the Assay preparation and Standard preparation, respectively.■1S (USP28)

-Test solution-Dissolve 1.0 g of it in an $85 \%(\mathrm{v} / \mathrm{v})$ solution of dioxane in water, and dilute with the same diluent to 20 mL . Transfer 12 mL of this solution to a color-comparison tube.

Blank-Add 10 mL of an $85 \%(\mathrm{v} / \mathrm{v})$ solution of dioxane in water and 2 mL of the Test solution to a color-comparison tube.

Standard solution-Prepare using standard lead solution ( 1 ppm Pb ) obtained by diluting standard lead solution ( 100 ppm Pb ) with an $85 \%(\mathrm{v} / \mathrm{v})$ solution of dioxane in water. Add 10 mL of this solution ( 1 ppm Pb ) and 2 mL of the Test solution to a color-comparison tube. To each of the three tubes containing the Test solution, the Blank, and the Standard solution add 2 mL of pH 3.5 acetate buffer, mix, add 1.2 mL of thioacetamide-glycerin base TS, and mix. Compared to the Blank, the Standard solution shows a slight brown color. After 2 minutes, any brown color in the Test solution is not more intense than that in the Standard solution.■1S (USP28)

## Add the following:

-Related substances-
Solution A-Prepare a solution containing 4.76 g of monobasic potassium phosphate per L. Adjust to a pH of 4.4 with dilute phosphoric acid ( 1 in 10) or potassium hydroxide ( $45 \% \mathrm{w} / \mathrm{v}$ ). Pass this solution through a C18 filtration kit.

Solution B-Use acetonitrile.
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed under Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluting solution-Prepare a mixture of acetonitrile and water (50:50).

Standard solution A-Transfer about 75 mg of USP Clarithromycin RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, and dissolve in 25 mL of acetonitrile. Dilute with water to volume, and mix.
Standard solution B-Transfer 5.0 mL of Standard solution $A$ to a $100-\mathrm{mL}$ volumetric flask, dilute with Diluting solution to volume, and mix.

Standard solution C-Transfer 1.0 mL of Standard solution $B$ to a $10-\mathrm{mL}$ volumetric flask, dilute with Diluting solution to volume, and mix. This solution contains about 0.0075 mg of USP Clarithromycin RS per mL.

Standard solution D—Transfer about 15 mg of USP Clarithromycin Identity RS, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in 5.0 mL of acetonitrile, dilute with water to volume, and mix.

Test solution-Transfer about 75 mg of Clarithromycin, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in 25 mL of acetonitrile, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains packing L1 and is maintained at a constant temperature of about $40^{\circ}$. The flow rate is about 1.1 mL per minute. The chromatograph is programmed as follows.

Time $\quad$ Solution A $\quad$ Solution B

| (minutes) | $(\%)$ | $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0 \rightarrow 32$ | $75 \rightarrow 40$ | $25 \rightarrow 60$ | linear gradient |
| $32 \rightarrow 34$ | 40 | 60 | isocratic |
| $34 \rightarrow 36$ | $40 \rightarrow 75$ | $60 \rightarrow 25$ | linear gradient |
| $36 \rightarrow 42$ | 75 | 25 | isocratic |

Relative retention times with reference to clarithromycin (retention time $=$ about 11 minutes) include the following: impurity $\mathrm{I}=$ about 0.38 ; impurity $\mathrm{C}=$ about 0.89 ; impurity $\mathrm{F}=$ about 1.33 ; impurity $\mathrm{A}=$ about 0.42 ; impurity $\mathrm{D}=$ about 0.96 ; impurity $\mathrm{P}=$ about 1.35 ; impurity $\mathrm{J}=$ about 0.63 ; impurity $\mathrm{N}=$ about 1.15 ; impurity $\mathrm{K}=$ about 1.59 ; impurity L $=$ about 0.74 ; impurity $\mathrm{E}=$ about 1.27 ; impurity $\mathrm{G}=$ about 1.72 ; impurity $\mathrm{B}=$ about 0.79 ; impurity $0=$ about 1.38 ; impurity $\mathrm{H}=$ about 1.82 ; and mpurity $\mathrm{M}=$ about 0.81 .

System suitability-Chromatograph Standard solution B, and record the responses as directed for Procedure: the tailing factor for the main clarithromycin peak is not more than 1.7. Chromatograph Standard solution D, and record the responses as directed for Procedure: the peak-to-valley ratio ( $H_{P} / H_{V}$ ) of impurity D and clarithromycin is not less than 3.0, where $H_{P}$ is the height above the baseline of the peak due to impurity D ; and $H_{V}$ is the height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Diluting solution, Standard solution B, Standard solution D, Standard solution C, and the Test solution into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of each impurity in the Clarithromycin taken by the formula:

$$
50\left(C_{C} / W\right)\left(r_{i} F / r_{C}\right) P
$$

in which $C_{C}$ is the concentration, in mg per mL, of USP Clarithromycin RS in Standard solution C; $W$ is the weight, in mg , of Clarithromycin taken to prepare the Test solution; $r_{i}$ is the peak area response for any individual impurity observed in the chromatogram obtained from the Test solution; $F$ is 1.0, or the correction factor of 0.27 , and 0.15 applied to the responses for peaks at relative retention times in relation to that of clarithromycin of about 1.72 , and 1.82 , corresponding to related compound G and related compound H , respectively; $r_{C}$ is the peak area response of the main clarithromycin peak in the chromatogram obtained from Standard solution $C$; and $P$ is the purity of USP Clarithromycin RS taken to prepare Standard solution A. Not more than $1.0 \%$ of any single related compound is found, not more than four related compounds exceed the limit of $0.4 \%$, and the total of all related compounds is not more than $3.5 \%$. ${ }^{1 S}$ (USP28)

## Change to read:

Assay-
Mobile phase-Prepare a mixture of methanel and- 0.067 M menobasic potassimm phosphate $(650: 350)$, adjust with phespherie acid to a pH of 4.0 , filter through a filter having a peresity of 0.5 Hmor finer, and degas. Make adjustments if neeessay (see System Suitability under Chromatography (621)).
Standard preparation- Bissolve an aceurately weighedquantity of USP Clarithromyein PS quantitatively in methanel, shaking and senieating if nee ssary to assure dissolution, to obtain a stock solut tion having a known concentration of about $625 \mu$ g of elarithremy ein $\left(\mathrm{G}_{38} \mathrm{H}_{69} \mathrm{NO}_{+7}\right)$ per mL, taking intorecm the stated potency, in Hg per mg, of USP Clarithremyein RS. Transfer 10.0 mL of this stock solution to a 50 mL volumetric flask, dilute with Mobile phase to volume, and mix. Filter through a filter having a perosity ef $0.5 \mathrm{\mu m}$ or finer, and use the filtrate as the Standed preparation. This solution contains about $125 \mu \mathrm{~g}$ of elarithromycin $\left(\mathrm{C}_{22} \mathrm{H}_{60} \mathrm{NO}_{+3}\right)$ per mL .

Resolution solution-Prepare a solution of USP Clarithromyein Related Compound A RS in methanolcontaining about $625 \mu \mathrm{~g}$ per mL. Transfer 10 mL of this solution and 10 mL of the stock soltt tion used to prepare the Standed preparation to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Assay preparation Transfer about 65 mg of Clarithromyein, aecurately weighed, to a 100 mL volumetric flask, add 80 mL of methanol to dissolve, shaking and sonieating if necessary to assure dissolution. Dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 50 mL volumetric flack, dilute with Mobile phase volume, mix, and filter through a filter having a peresity of $0.5 \mathrm{\mu m}$ or finer. Use the filtrate as the Assey prepara tion.

Chramagraphie syistem (see-Chromatography $\langle 624$ ) (The tiquid chrematograph is equipped with a 210 nm detector, an op tional guard column that eontains packing L1, a $4.6 \mathrm{~mm} \times 15 \mathrm{~cm}$ column that contains packing $L 1$, and is maintained at a constant
temperature of about $50^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the responses as directed for Procedure: the relative retention times are about 0.75 for clarithromyein and 1.0 for clarithremyein related com pernd $\Lambda$, and the resolution, $R$, between the clarithremyein peak and the elarithremyein related compernd $\Lambda$ peak is not less than 2.0. Chromatograph the Standard preparation, and record the respenses as directed under Precedtre: the coltmmeifficiency, deter mined from the clarithromycin peak, is not less than 750 theoreticat plates when caleulated by the formula:-

$$
5.545\left(t / H_{1 \sim 2}\right)^{2}
$$

the tailing factor is not less than 0.9 and not more than 2 , and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Preedure - [NOTE—Use peak areas where peak respenses are indiented.] Separately inject equal volumes (about 20 to-50 $\mu \mathrm{L}$ ) of the Standerd preparation and the Assay preparation into the ehromatograph, record the chromatograms, and meastre the responses for the major peaks. Caleulate the quatity, in $\mu \mathrm{S}$, of $\mathrm{G}_{28} \mathrm{H}_{69} \mathrm{NO}_{4}$ in each me of the Clarithromycin taken by the formula:

$$
500(C / M A)\left(r_{+}+r_{s}\right),
$$

in which $C$ is the concentration, in us per mb , of elarithromyein $\left(\mathrm{C}_{25} \mathrm{H}_{60} \mathrm{NO}_{4}\right)$ in the Standed preparation, $M$ is the quantity, in me, of Clarithromycin taken to prepare the Assay preparation, and $r_{t}$ andrs are the elarithromyein peak respenses obtained from the -As saly preparation and the Stenderd preparation, respectively.

■Solution A, Solution B, Diluting solution, and Standard solution D—Proceed as directed in the test for Related substances.

Standard preparation-Use Standard solution A, prepared as directed in the test for Related substances.

Assay preparation-Use the Test solution, prepared as directed in the test for Related substances.

Chromatographic system—Proceed as directed in the test for Related substances. In addition, the relative standard deviation for replicate injections of the Standard preparation is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the percentage of $\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}$ in the portion of Clarithromycin taken by the formula:

$$
50\left(C_{S} / W\right)\left(r_{U} / r_{S}\right) P
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Clarithromycin RS in the Standard preparation; $W$ is the weight, in mg, of Clarithromycin taken to prepare the Assay preparation; $r_{U}$ and $r_{S}$ are the clarithromycin peak area responses obtained from the chromatograms of the Assay preparation and the Standard preparation, respectively; and $P$ is the purity of USP Clarithromycin RS taken to prepare the Standard preparation.■1S (USP28)

## BRIEFING

Clarithromycin Tablets, USP 27 page 463. Because of the proposed revision of the monograph for Clarithromycin, presented elsewhere in this issue of $P F$, to utilize a new liquid chromatographic test procedure for Related substances as a new Assay procedure, it is necessary to transfer to this monograph the details of the liquid chromatographic Assay that were previously included by reference. See also the briefing under Clarithromycin.
(PA7: W. Wright) RTS-40856-1

## Change to read:

Assay-
Mobile phase, Standard preparation, Resolution-solution, and Chromatographic syistem Proeeed as directed in the Assay under Clarithromacin.

- Mobile phase_Prepare a mixture of methanol and 0.067 M monobasic potassium phosphate ( $650: 350$ ), adjust with phosphoric acid to a pH of 4.0 , pass through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Quantitatively dissolve an accurately weighed quantity of USP Clarithromycin RS in methanol, shaking and sonicating if necessary to effect dissolution, to obtain a stock solution having a known concen-
tration of about $625 \mu$ g of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ per mL , taking into account the stated potency, in $\mu \mathrm{g}$ per mg , of USP Clarithromycin RS. Transfer 10.0 mL of this stock solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Pass through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and use the filtrate as the Standard preparation. This solution contains about $125 \mu \mathrm{~g}$ of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ per mL.

Resolution solution-Prepare a solution of USP Clarithromycin Related Compound A RS in methanol containing about $625 \mu \mathrm{~g}$ per mL . Transfer 10 mL of this solution and 10 mL of the stock solution used to prepare the Standard preparation to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. 1 (USP28)

Assay preparation-Finely powder an accurately counted number of Tablets, equivalent to about 2000 mg of clarithromycin, and with the aid of methanol quantitatively transfer the powder to a $500-\mathrm{mL}$ volumetric flask, add about 350 mL of methanol, and shake by mechanical means for 30 minutes. Dilute with methanol to volume, mix, and allow any insoluble matter to settle. Transfer 3.0 mL of the supernatant to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Pass a portion of this solution through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and use the filtrate as the Assay preparation.

## - Chromatographic system (see Chromatography

 $\langle 621\rangle$ )—The liquid chromatograph is equipped with a 210-nm detector, an optional guard column that contains packing L1, and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing LI. The chromatograph is maintained at a constant temperature of about $50^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the responses as directed for Procedure: the relative retention times are about 0.75 for clarithromycin and 1.0 for clarithromycin related compound A ; and the resolution, $R$, between the clarithromycin peak and the clarithromycin related compound A peak is not less than 2.0. Chromatograph the Standard preparation, and record the responses as directed for Procedure: the column efficiency, determined fromthe clarithromycin peak, is not less than 750 theoretical plates when calculated by the formula:

$$
5.545\left(t / W_{h_{2}}\right)^{2}
$$

the tailing factor is not less than 0.9 and not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. ${ }^{1 S}$ (USP28)

Proedtre Proeed as directedfor Proedtrein the Assay un
der. Clarithromyiein. Caleulate the quantity, in mer, of $\mathrm{C}_{30} \mathrm{H}_{60} \mathrm{NO}_{43}$ in the pertion of Tablets taken by the formata:

$$
(50 / 3)(C / N)\left(x_{t}++_{s}\right)
$$

in which $N$ is the namber of Tablets taken, and the-other terms are as defined therein.

- Procedure-Separately inject equal volumes (about 20 to $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ in each Tablet taken by the formula:

$$
(50 / 3)(C / N)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ in the Standard preparation; $N$ is the number of Tablets taken; and $r_{U}$ and $r_{S}$ are the clarithromycin peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Clarithromycin Extended-Release Tablets, page 1861 of $P F$ 29(6) [Nov.-Dec. 2003]. Because of the proposed revision of the Assay in the monograph for Clarithromycin, presented elsewhere in this issue of $P F$, and the proposed transfer of the details of that Assay to the monograph for Clarithromycin Tablets, it is proposed
to refer in this new monograph to the Assay in the revised monograph for Clarithromycin Tablets. Details of a proposed test for Drug release are also presented. It is also proposed to revise the acceptance criteria in the Definition and the temperature conditions and weight-loss limit in the test for Loss on drying to be consistent with the NDA submission. See also the briefing under Clarithromycin.
(BPC: M. Marques; PA7: W. Wright) RTS—39803-2; 40856-2

## Add the following:

## ■Clarithromycin Extended-Release Tablets

» Clarithromycin Extended-Release Tablets contain not less than 90.0 percent and not more than 145.0110 .0 percent of the labeled amount of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$.

Packaging and storage-Preserve in well-closed containers, protected from light. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Clarithromycin RS. USP Clarithromycin Related Compound A RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release $\langle 724\rangle$ [Tome].
Medium: $\quad 0.3 \mathrm{M}$ phosphate buffer, pH 6.0 (prepared by dissolving 816.5 g of monobasic potassium phosphate and 48 g of sodium hydroxide in about 4 L of water, mixing,
and diluting with water to 20 L . Adjust with either concentrated phosphoric acid or 1 N sodium hydroxide to a pH of $6.0 \pm 0.05$ ); 900 mL .

Apparatus 2: 75 rpm .
Times: 30, 45, 60, and 120 minutes.
Procedure-Determine the percentages of the labeled amount of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ dissolved using the following method.
Standard solutions-Prepare five solutions of USP Clarithromycin RS dissolved in acetonitrile and diluted in Me dium, with known concentrations over the range of about 60 to $600 \mu \mathrm{~g}$ per mL .

Test solution-Use portions of the solution under test passed through a $35-\mu \mathrm{m}$ polyethylene filter.
Chromatographic system-Proceed as directed in the Assay.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the five Standard solutions and the Test solution into the chromatograph, and measure the responses for the major peaks. Perform a linear regression analysis to generate a standard curve using the peak area of each Standard solution versus its concentration. Determine the amount of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ dissolved at each specified time interval, using the peak area of each Test solution and the linear regression statistics for the Standard solutions.

Tolerances-The percentages of the labeled amounts of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ dissolved at the times specified conform to the following Acceptance Table.

| Level | Time (minutes) | Amount dissolved (individual limits) | Amount dissolved (average limits) |
| :---: | :---: | :---: | :---: |
| $\mathrm{L}_{1}$ | 30 | not more than 65\% | - |
|  | 45 | between 55 and 85\% | - |
|  | 60 | not less than 75\% | - |
|  | 120 | not less than $85 \%$ | - |
| $\mathrm{L}_{2}$ | 30 | not more than $75 \%$ | not more than $65 \%$ |
|  | 45 | between $45 \%$ and $95 \%$ | between $55 \%$ and $85 \%$ |
|  | 60 | not less than $65 \%$ | not less than $75 \%$ |
|  | 120 | not less than $75 \%$ | not less than $85 \%$ |
| $L_{3}$ | 30 | not more than 2 tablets release more than $75 \%$, and no individual tablet releases more than $85 \%$ | not more than $65 \%$ |
|  | 45 | not more than 2 tablets are outside the range of $45 \%$ to $95 \%$, and no individual tablet is outside the range of $35 \%$ to $105 \%$ | between $55 \%$ and $85 \%$ |
|  | 60 | not more than 2 tablets release less than $65 \%$, and no individual tablet releases less than 55\% | not less than $75 \%$ |
|  | 120 | not more than 2 tablets release less than $75 \%$, and no individual tablet releases less than $65 \%$ | not less than $85 \%$ |

Loss on drying $\langle 731\rangle$ —Dry a portion of powdered Tablets in vacuum at a pressure not exceeding 5 mm of mercury at $60^{\circ} 110^{\circ}$ for 3 hours: it loses not more than $6.0 \% 5.0 \%$ of its weight.
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Assay-

Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay under Clathro myein Clarithromycin Tablets.

Standard preparation-Prepare as directed for Standard preparation in the Assay under Clatemern, exeept to dilute an aceurately meastred volume of the stock solution
quantitatively with Mobile phase tobain alution having a-known concentration of about 400 - g of clarithromyein $\left(\mathrm{G}_{38} \mathrm{H}_{69} \mathrm{NO}_{4}\right)$ per mb Clarithromycin Tablets.
Assay preparation-Finely powder an accurately counted number of Clarithromycin Extended-Release Tablets, equivalent to about 2000 mg of clarithromycin. With the aid of methanol quantitatively transfer the powder to a $500-\mathrm{mL}$ volumetric flask, add about 350 mL of methanol, and shake by mechanical means for 30 minutes. Dilute with methanol to volume, and mix. and allow any insoluble mat Sonicate for 30 minutes. Cool to room temperature, and allow to stand for at least 16 hours. Mix, and allow any insoluble matter to settle. Transfer 3.0 mL of the supernatant to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile
phase to volume, and mix. Pass a portion of this solution through a filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and use the filtrate as the Assay preparation.

Procedure-Proceed as directed for Procedure in the Assay under Clarithromycin Tablets. Calculate the quantity, in mg, of clarithromycin $\left(\mathrm{C}_{38} \mathrm{H}_{69} \mathrm{NO}_{13}\right)$ in each Extended-Release Tablet taken by the formula:

$$
(50 / 3)(C / N)\left(r_{U} / r_{s}\right)
$$

in which $N$ is the number of Tablets taken, and the other terms are as defined therein. 1 (USP28)

## Briefing

Cyclophosphamide Tablets, USP 27 page 528. It is proposed to replace the Disintegration test with a Dissolution test. The Dissolution test was validated using a Nova-Pak C18 brand of L1 packing. The retention time is about 5.2 minutes for cyclophosphamide.
(BPC: M. Marques) RTS-40880-1

Delete the following:
■Bisintegration- $\langle 701\rangle$ : 30 mintes, determined as directedur der Uneoted Tablets.■1S (USP28)

## Add the following:

- Dissolution $\langle 711\rangle$ —

Medium: water; 900 mL , deaerated.
Apparatus: 1: 100 rpm .
Time: 45 minutes.

Determine the amount of $\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{P}$ dissolved by employing the following method.

Mobile phase-Prepare a suitable filtered and degassed mixture of water and acetonitrile (7:3). Make adjustments if necesary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Cyclophosphamide RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration corresponding to that of the solution under test.

Test solution-Use portions of the solution under test passed through a $0.8-\mu \mathrm{m}$ filter.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—
The liquid chromatograph is equipped with a $195-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 , and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peak. Calculate the amount of cyclophosphamide $\left(\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{P}\right)$ dissolved by the formula:

$$
900 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Cyclophosphamide RS in the Standard solution; and $r_{U}$ and $r_{S}$ are the peak responses for cyclophosphamide obtained from the Test solution and Standard solution, respectively.
Tolerances-Not less than $75 \%(Q)$ of the labeled amount of cyclophosphamide $\left(\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{P}\right)$ is dissolved in 45 minutes.■1S (USP28)

## BRIEFING

Desflurane, USP 27 page 549 and page 93 of PF 30(1) [Jan.Feb. 2004]. It is proposed to revise the preparation instructions for the Internal standard solution in the Assay to indicate the final concentration of USP Halothane RS, rather than specifying a volume to be used.
(PA1: K. Russo) RTS-41211-1

## Change to read:

Packaging and storage-Preserve in tight, light-resistant containers.
${ }^{\triangle}$ Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.
Replace the cap securely after each use. $\Delta U S P 28$

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Desflurane RS. USP Desflurane Related Compound $A R S$.

USP Sodium Fluoride RS.

## Change to read:

```
Assay-
    Internal standard solution Tramsfer 2.0 mL of halethane
*USP Halethame RS_USP28
toa-100 mL volumetric flask, dilute-with p-xylene-volume, and
mix.
```

-Dilute an accurately measured volume of USP Halothane RS with $p$-xylene, and dilute quantitatively, and stepwise if necessary, with $p$-xylene to obtain a solution having a
known concentration of about $20 \mu \mathrm{~L}$ per mL . 1 IS (USP28)
Standard preparation-Transfer 1.0 mL of Internal standard solution to a $2.0-\mathrm{mL}$ septum-capped vial, cap, seal, and weigh accurately. Using a cold syringe, inject about $25 \mu \mathrm{~L}$ of USP Desflurane RS, previously cooled to $0^{\circ}$ to $5^{\circ}$, into the vial. Allow the vial to come to ambient temperature, accurately weigh it, and calculate the quantity, in mg, of USP Desflurane RS added.
Assay preparation-Transfer 1.0 mL of Internal standard solution to a $2.0-\mathrm{mL}$ septum-capped vial, cap, seal, and weigh accurately. Using a cold syringe, inject about $25 \mu \mathrm{~L}$ of Desflurane, previously cooled to $0^{\circ}$ to $5^{\circ}$, into the vial. Allow the vial to come to ambient temperature, accurately weigh it, and calculate the quantity, in mg, of Desflurane added.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The gas chromatograph is equipped with a flame-ionization detector and a $2.4-\mathrm{mm} \times 3.7-\mathrm{m}$ stainless steel column coated with polytef and packed with $10 \%$ phase G31 and $15 \%$ phase G18 on 80 - to 100 -mesh support S1A. Helium is used as the carrier gas at a flow rate of about 24 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is
maintained at about $80^{\circ}$ for 2.5 minutes, then increased at a rate of $2^{\circ}$ per minute, to $88^{\circ}$, maintained at $88^{\circ}$ for 3 minutes, then increased to $175^{\circ}$ at a rate of $70^{\circ}$ per minute, and maintained at $175^{\circ}$ for 4 minutes. The injection port temperature is maintained at about $200^{\circ}$, and the detector at about $250^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are 1.0 for desflurane and about 2.8 for halothane; the resolution, $R$, between the desflurane peak and the halothane peak is not less than 8 ; and the relative standard deviation for the ratios of the desflurane peak response to the halothane peak response obtained for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak area responses for the halothane and desflurane peaks. Calculate the percentage of $\mathrm{C}_{3} \mathrm{H}_{2} \mathrm{~F}_{6} \mathrm{O}$ in the Desflurane taken by the formula:

$$
100\left(W_{S} / W_{U}\right)\left(R_{U} / R_{S}\right)
$$

in which $W_{S}$ is the quantity, in mg, of USP Desflurane RS used to prepare the Standard preparation; $W_{U}$ is the quantity, in mg , of Desflurane used to prepare the Assay preparation; and $R_{U}$ and $R_{S}$ are the ratios of the peak area responses of desflurane to that of halothane obtained from the Assay preparation and the Standard preparation, respectively.

## BriEFING

Diethylstilbestrol Diphosphate Tablets, page 3385 of $P F$ 23(1) [Jan.-Feb. 1997]. This proposed new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded, with minor editorial revisions, to In-Process Revision.
(PA1: C. Anthony) RTS-41219-1

## Add the following:

## ■Diethylstilbestrol Diphosphate Tablets

» Diethylstilbestrol Diphosphate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diethylstilbestrol diphosphate $\left(\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{O}_{8} \mathrm{P}_{2}\right)$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Diethylstilbestrol RS. USP Diethylstilbestrol Diphosphate RS.

Identification-Weigh and finely powder not less than 20 Tablets. Prepare a filtered test solution of the powder in alcohol having a concentration of about 2.0 mg of diethylstilbestrol diphosphate per mL . Separately apply $10 \mu \mathrm{~L}$ of this solution and $10 \mu \mathrm{~L}$ of a Standard solution of USP Diethylstilbestrol Diphosphate RS in alcohol containing 2.0 mg per mL to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.5-\mathrm{mm}$ layer of chromatographic silica gel mixture. [NOTE-Protect the plate from light.] Allow the applications to dry, and develop the chromatogram in a solvent system consisting of methanol and water ( $1: 1$ ) until the solvent front has moved about threefourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, then spray the plate with a mixture of sulfuric acid and methanol ( $1: 1$ ), and allow to dry in an oven at $105^{\circ}$ : the $R_{F}$ value of the principal spot obtained from the test solution corresponds to that of the principal spot obtained from the Standard solution.

Disintegration $\langle 701\rangle$ : 30 minutes.
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Procedure for content uniformity-Transfer 1 Tablet to a $100-\mathrm{mL}$ volumetric flask, add 15 mL of methanol and 3 mL of 0.5 N sodium hydroxide, and stir until the Tablet is completely disintegrated. Dissolve in and dilute with water to volume, and filter, discarding the first 15 mL of filtrate. Transfer 4.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add 0.4 mL of 0.5 N sodium hydroxide, dilute with
water to volume, and mix to obtain the test solution. Transfer about 50 mg of USP Diethylstilbestrol Diphosphate RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask; add 5 mL of methanol and 2 mL of 0.5 N sodium hydroxide; dissolve in and dilute with water to volume; and mix. Transfer 5.0 mL of this solution to a $250-\mathrm{mL}$ volumetric flask, add 1 mL of 0.5 N sodium hydroxide, and dilute with water to volume to obtain the Standard solution. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 241 nm , with a suitable spectrophotometer, using a mixture of 0.4 mL of 0.5 N sodium hydroxide in 100 mL of water as the blank. Calculate the quantity, in mg, of $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{O}_{8} \mathrm{P}_{2}$ in the Tablet taken by the formula:

$$
25 T C\left(A_{U} / A_{S}\right)
$$

in which T is the labeled quantity, in mg , of diethylstilbestrol diphosphate in the Tablet; $C$ is the concentration, in $\mu \mathrm{g}$ per mL, of USP Diethylstilbestrol Diphosphate RS in the Standard solution; and $A_{U}$ and $A_{S}$ are the absorbances of the test solution and the Standard solution, respectively.

## Limit of free diethylstilbestrol-

Vanadyl sulfate solution-Transfer about 100 mg of vanadyl sulfate to a $200-\mathrm{mL}$ volumetric flask, dissolve in 20 mL of sulfuric acid, dilute with glacial acetic acid to volume, and mix.
Standard solution-Dissolve an accurately weighed quantity of USP Diethylstilbestrol RS in alcohol to obtain a solution having a known concentration of about 0.1 mg per mL . Transfer 5.0 mL of this solution to a suitable container, evaporate to dryness over a steam bath, and dissolve the residue in 10 mL of Vanadyl sulfate solution.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of diethylstilbestrol diphos-
phate, to a suitable container; add 15 mL of water and 2.5 mL of 1 N sodium hydroxide; stir for 5 minutes; and adjust with phosphoric acid to a pH of 8.0. Transfer this solution to a separator, and extract with four $20-\mathrm{mL}$ portions of ether, combining the ether extracts. Filter the combined extracts through a pledget of glass wool, evaporate over a steam bath to dryness, and dissolve the residue in 10 mL of Vanadyl sulfate solution.

Procedure-Heat the Standard solution and the Test solution over a steam bath for 1 hour, and cool to room temperature. Concomitantly determine the absorbance of each solution at the wavelength of maximum absorbance at about 520 nm with a suitable spectrophotometer, using Vanadyl sulfate solution as the blank. Calculate the quantity, in mg , of free diethylstilbestrol in the portion of powder taken by the formula:

$$
0.005 C\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Diethylstilbestrol RS in the Standard solution, and $A_{U}$ and $A_{s}$ are the absorbances of the Test solution and the Standard solution, respectively: not more than $0.35 \%$ is found.

## Limit of diethylstilbestrol monophosphate-

Vanadyl sulfate solution and Standard solution-Proceed as directed in the test for Limit of free diethylstilbestrol.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of diethylstilbestrol diphosphate, to a suitable container; add 15 mL of water and 2.5 mL of 1 N sodium hydroxide; stir for 5 minutes; and adjust with phosphoric acid to a pH of 2.2. Transfer this solution to a separator, and extract with four $20-\mathrm{mL}$ portions of ether,
combining the ether extracts. Filter through a pledget of glass wool, evaporate over a steam bath to dryness, and dissolve the residue in 10 mL of Vanadyl sulfate solution.

Procedure-Heat the Standard solution and the Test solution over a steam bath for 1 hour, and cool to room temperature. Concomitantly determine the absorbance of each solution at the wavelength of maximum absorbance at about 520 nm with a suitable spectrophotometer, using Vanadyl sulfate solution as the blank. Calculate the quantity, in mg , of diethylstilbestrol monophosphate in the portion of powder taken by the formula:

$$
1.298\left\{\left[(0.005 C)\left(A_{U} / A_{S}\right)\right]-F\right\},
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Diethylstilbestrol RS in the Standard solution; $A_{U}$ and $A_{S}$ are the absorbances of the Test solution and the Standard solution, respectively; and $F$ is the amount, in mg , of free diethylstilbestrol found in the test for Limit of free diethylstilbestrol: not more than $2.0 \%$ is found.

Assay-Weigh and finely powder not less than 20 Tablets. Transfer a portion of the powder, equivalent to about 100 mg of diethylstilbestrol diphosphate, to a $250-\mathrm{mL}$ volumetric flask; add 25 mL of alcohol and 5 mL of 1 N sodium hydroxide; dilute with water to volume; mix; and filter. Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Similarly prepare a Standard solution of USP Diethylstilbestrol Diphosphate RS having a known concentration of about $20 \mu \mathrm{~g}$ per mL . Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 241 nm with a suitable spectrophotometer, using Vanadyl sulfate solution, prepared as directed in the test for Limit
of free diethylstilbestrol, as the blank. Calculate the quantity, in mg, of diethylstilbestrol diphosphate $\left(\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{O}_{8} \mathrm{P}_{2}\right)$ in the Tablets taken by the formula:

$$
5 C\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Diethylstilbestrol RS in the Standard solution, and $A_{U}$ and $A_{s}$ are the absorbances of the solution from the Tablets and the Standard solution, respectively. $\quad$ 1S (USP28)

Dimenhydrinate Oral Solution, USP 27 page 629; Dimenhydrinate Syrup, $U S P 27$ page 630; Dimenhydrinate Tablets, $U S P$ 27 page 630. The revisions in these monographs are intended to clarify the calculation in the tests for Content of 8-chlorotheophylline.
(PA4: E. Gonikberg) RTS-41329-1

## Dimenhydrinate Oral Solution

(Monograph under this new title-to become official June 1, 2005)
(Current monograph title is Dimenhydrinate Syrup)

## Change to read:

## Content of 8-chlorotheophylline-

Ammonium bicarbonate solution, Diluent, Solution A, Solution B, Mobile phase, Internal standard solution, and Chromatographic system-Proceed as directed in the Assay under Dimenhydrinate Tablets.

Standard solution-Prepare as directed for Standard preparation in the Assay under Dimenhydrinate Tablets.

Test solution-Prepare as directed for Assay preparation in the Assay.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per mL , of 8 -chlorotheophylline $\left(\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{ClN}_{4} \mathrm{O}_{2}\right)$ in the portion of Oral Solution taken by the formula:

$$
(214.61 / 469.96)(0.05 W)\left(R_{U} / R_{S}\right)
$$

in which 214.61 and 469.96 are the molecular weights of 8 -chlorotheophylline and dimenhydrinate, respectively; $W$ is the weight, in mg, of USP Dimenhydrinate RS in the Standard solution; and $R_{U}$ and $R_{S}$ are peak area ratios of 8-chlorotheophylline to the internal standard obtained from the Test solution and the Standard solution, respectively. An amount of 8 -chlorotheophylline that is between $43.4 \%$ and $47.9 \%$ of the amount of dimenhydrinate

- $_{\text {obtained }}$ in the Assay $_{1 S}$ (USP28)
is found.

Briefing

Ensulizole, USP 27 page 706. It is proposed to revise the Assay to include the formula to be used in the calculation.
(BPC: M. Marques) RTS-41309-1

## Change to read:

Assay-Transfer about 1200 mg of Ensulizole, accurately weighed, to a $300-\mathrm{mL}$ iodine flask, and dissolve by stirring in 25 mL of 0.5 N sodium hydroxide. Add phenolphthalein TS, and titrate the excess with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sodium hydroxide is equivalent to 137.15 mg of $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}$.
${ }^{\square}$ Calculate the percentage of $\mathrm{C}_{13} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}$ in the portion of Ensulizole taken by the formula:

$$
\frac{\left[\left(V_{\mathrm{NaOH}} \times T_{\mathrm{NaOH}}\right)-\left(V_{\mathrm{HCl}} \times T_{H C l}\right)\right] \times 0.5 \times 274.30 \times 100}{W \times L O D \times 10}
$$

in which $V_{\text {Naö }}$ is the volume, in mL , of 0.5 N sodium hydroxide added; $T_{\text {NaOH }}$ is the titer of the 0.5 N sodium hydroxide; $V_{H C I}$ is the volume, in mL , of 0.5 N hydrochloric acid used; $T_{H C l}$ is the titer of 0.5 N hydrochloric acid; $W$ is the weight, in g , of Ensulizole taken; and $L O D$ is the percentage of loss on drying, as determined in the test for Loss on drying.-1S (USP28)

Epinephrine Nasal Solution, USP 27 page 711; Epinephryl Borate Ophthalmic Solution, USP 27 page 714. It is proposed to revise the Assay to change the name of the iodine and potassium iodide TS to iodine and potassium iodide TS 1, a change proposed in the section Reagents, Indicators, and Solutions in this issue of $P F$.
(BPC: M. Marques) RTS-41175-4

## Change to read:

Assay-Pipet 30 mL of Nasal Solution into a $125-\mathrm{mL}$ separator, add 25 mL of chloroform, shake vigorously for 1 minute, allow the liquids to separate, and discard the chloroform. Wash twice more with chloroform, separating and discarding the lower layer as completely as possible each time. Rinse the stopper and mouth of the separator with a few drops of water. Add 0.2 mL of starch TS, then while swirling the separator add iodine and potassium iodide TS

## $\square^{-T S} 1_{1 S}$ (USP28)

dropwise until the blue color formed persists, and immediately add just sufficient 0.1 N sodium thiosulfate to discharge the blue color. [NOTE-Proceed with the assay from this point without delay.]

Add to the liquid in the separator 2.10 g of sodium bicarbonate, preventing it from coming in contact with the mouth of the separator, and swirl until most of the bicarbonate has dissolved. By means of a $1-\mathrm{mL}$ syringe that is not fitted with a needle, rapidly inject 1.0 mL of acetic anhydride directly into the contents of the separator. Immediately insert the stopper in the separator, and shake vigorously until the evolution of carbon dioxide has ceased ( 7 to 10 minutes), releasing the pressure as necessary through the stopcock. Allow to stand for 5 minutes, and extract the solution with six $25-\mathrm{mL}$ portions of chloroform, filtering each extract through a small pledget of cotton, previously washed with chloroform, into a beaker.

Evaporate the combined chloroform extracts on a steam bath in a current of air to about 3 mL , transfer the residue by means of small portions of chloroform to a tared $50-\mathrm{mL}$ beaker, and heat again to evaporate the solvent completely. Heat further at $105^{\circ}$ for $30 \mathrm{~min}-$ utes, cool in a desiccator, and weigh the residue of triacetylepinephrine. Add 5.0 mL of chloroform, cover the beaker, gently swirl the contents until the residue has completely dissolved, and determine the specific rotation, $R$, using a $200-\mathrm{mm}$ semimicro polarimeter tube.

Calculate the quantity, in mg , of $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{3}$ in the volume of Na sal Solution taken by the formula:

$$
(183.20 / 309.32)(W)(0.5+0.5 R / 93)
$$

in which 183.20 and 309.32 are the molecular weights of epinephrine and triacetylepinephrine, respectively; and $W$ is the weight, in mg , and $R$ is the specific rotation (in degrees, without regard to the sign), of the isolated triacetylepinephrine.

Briefing

Epinephryl Borate Ophthalmic Solution, USP 27 page 714See briefing under Epinephrine Nasal Solution.
(BPC: M. Marques) $\quad$ RTS $-41175-3$

## Change to read:

Assay-Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 100 mg of epinephrine, to a $250-$ mL separator. Dilute with water to 30 mL , and adjust with dilute hydrochloric acid ( 1 in 12 ) to a pH of $4.0 \pm 0.2$. Add 25 mL of carbon tetrachloride, shake vigorously for 1 minute, allow the phases to separate, and discard the carbon tetrachloride washing. In the same manner, wash with two additional $25-\mathrm{mL}$ portions of carbon tetrachloride, and discard the washings. Rinse the stopper and the mouth of the separator with 2 to 3 mL of water such that the rinsings enter the separator and combine with the solution under assay. Add 0.2 mL of starch TS, and, while swirling the separator, add iodine and potassium iodide TS
-TS 1n1S (USP28)
dropwise until the blue color persists. Immediately add a volume of 0.1 N sodium thiosulfate just sufficient to discharge the blue color. [NOTE-Proceed with the assay from this point without delay.]

Add 2.10 g of sodium bicarbonate through a dry powder funnel to prevent the powder from coming in contact with the mouth of the separator, and swirl to dissolve most of the solid. By means of a syringe fitted with a suitable pipet, rapidly inject 1.0 mL of acetic anhydride directly into the contents of the separator. Swirl the unstoppered separator gently for 3 minutes to allow carbon dioxide to escape. Insert the stopper, and shake gently until the evolution of carbon dioxide has ceased ( 7 to 10 minutes), releasing the pressure through the stopcock as necessary. Allow to stand for 5 minutes. Extract with six $25-\mathrm{mL}$ portions of chloroform, shaking for $1 \mathrm{~min}-$ ute each time, filtering each extract through a small pledget of chloroform-saturated cotton and collecting the extracts in a 400mL beaker. Add several glass beads, and evaporate on a steam bath to about 3 mL . With the aid of 15 to 20 mL of chloroform, transfer the residue to a tared $50-\mathrm{mL}$ beaker, and evaporate on the steam bath to dryness. Dry the residue at $105^{\circ}$ for 30 minutes, cool in a desiccator, and weigh the triacetylepinephrine so obtained. Transfer 10.0 mL of chloroform to the beaker, and gently swirl to dissolve the residue, dislodging the semisolid residue from the glass surface, if necessary, with a small metal spatula. Determine the angular rotation of the solution in a $100-\mathrm{mm}$ polarimeter tube.

Calculate the quantity, in mg, of epinephrine $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{3}\right)$ in the volume of Ophthalmic Solution taken by the formula:

$$
(183.20 / 309.32)(W)(0.5+0.5 R / 93)
$$

in which 183.20 and 309.32 are the molecular weights of epinephrine and triacetylepinephrine, respectively; $W$ is the weight, in mg , of the isolated triacetylepinephrine; and $R$ is the specific rotation, in degrees, of the triacetylepinephrine solution.

## Briefing

Ergoloid Mesylates Tablets, USP 27 page 721, page 3056 of the First Supplement, and page 1477 of PF 29(5) [Sept.-Oct. 2003]; Ergoloid Mesylates Sublingual Tablets; Ergotamine Tartrate Tablets, USP 27 page 725; Ergotamine Tartrate Sublingual Tablets; Nitroglycerin Tablets, USP 27 page 1330; Nitroglycerin Sublingual Tablets. Revisions that are proposed are intended to subdivide the standards of the existing monograph on Ergoloid Mesylates Tablets by replacing the current monograph with two separate monographs, the titles of which are proposed by the Expert Committee on Nomenclature and Labeling to be Ergoloid Mesylates Tablets and Ergoloid Mesylates Sublingual Tablets. The standards of the revised Ergoloid Mesylates Tablets monograph would be those taken from the present monograph that are applicable to tablets that are to be swallowed intact. The "Tablets" term is used with the understanding that the article is an immediaterelease dosage form but, in accordance with existing nomenclature policy, the term "Immediate-Release" is not included in the name. The standards of the new Ergoloid Mesylates Sublingual Tablets monograph would be those taken from the present monograph that are applicable to tablets that are not to be swallowed intact but are meant to be administered for sublingual delivery of the drug, and the proposed title is in the general form [DRUG] [ROUTE OF ADMINISTRATION][DOSAGE FORM]. The Expert Committee on Nomenclature and Labeling considers that the term "Sublingual" appearing prominently in the product name will represent a significant improvement in that the consumer will be provided with the assurance that the product will be used properly to achieve the benefit of the medication. The standards encompassed within the two proposed monographs are the same as those currently combined within the single monograph on Ergoloid Mesylates Tablets.

The revisions are proposed for publication in the First Supplement to USP 28-NF 23, which is to become official April 1, 2005, but with October 1, 2006, designated as the official date for the name revisions. The 18 -month postponement of the official date for the name changes would be intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the revised terminology.

Revisions are similarly proposed in this number of $P F$, to replace the present monograph on Ergotamine Tartrate Tablets with separate monographs under the names Ergotamine Tartrate Tablets and Ergotamine Tartrate Sublingual Tablets, and to change the title of the monograph on Nitroglycerin Tablets to Nitroglycerin Sublingual Tablets.
(PA3: S. Salado; NL: C. Barnstein) RTS-40684-3

## Ergoloid Mesylates Tablets

(Monograph to be deleted as of October 1, 2006)

## Change to read:

Packaging and storage-Preserve in tight, light-resistant containers.

- Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.■1S (USP28)

## Change to read:

Dissolution $\langle 711\rangle$ (for Tablets intended to be swallowed)Medium: water; 500 mL .
Apparatus 2: 50 rpm , the distance between the paddle blade and the inside bottom of the vessel being maintained at $4.5 \pm 0.2$ cm during the test.
Time: 30 minutes.

- Determine the amount of ergoloid mesylates dissolved
using the following procedure. $\quad$ 2S (USP27)
Mobile phase-Prepare as directed in the Assay.
Standard solution-Dissolve an accurately weighed quantity of USP Ergoloid Mesylates RS in water to obtain a solution having a known concentration of about $50 \mu \mathrm{~g}$ per mL . Transfer 4 mL of this solution for every 0.5 mg of ergoloid mesylates contained in the Tablets to a $200-\mathrm{mL}$ volumetric flask, add 1 mL of 0.1 N hydrochloric acid and 100 mL of water, mix, and dilute with water to volume.

Test solution-Transfer a $20-\mathrm{mL}$ portion of the solution under test to a suitable container, add $100 \mu \mathrm{~L}$ of 0.1 N hydrochloric acid, and mix.

Chromatographic system-Proceed as directed in the Assay except that the sum of the relative standard deviation values for the four ergoloid mesylates peaks for replicate injections is not more than 3.0\%.

Procedure-Separately inject equal volumes (about $200-\mathrm{Ht}$

- $500 \mu \mathrm{~L})_{\text {m }}{ }^{\text {S (USP27) }}$
of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of ergoloid mesylates as directed in the Assay.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of ergoloid mesylates is dissolved in 30 minutes.

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed solution containing a mixture of water, acetonitrile, and triethylamine (700:300:9). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Transfer about 113 mg of papaverine hydrochloride to a 1-L flask. Add a mixture of 0.01 M tartaric acid and acetonitrile ( $2: 1$ ) to volume, and mix.

Standard preparation-Transfer about 33 mg of USP Ergoloid Mesylates RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Internal standard solution to volume, and mix. Use a freshly prepared solution.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of Ergoloid Mesylates to a $50-\mathrm{mL}$ centrifuge tube. Add 15.0 mL of Internal standard solution, insert the stopper into the tube, and shake for about 15 minutes. Centrifuge, filter if necessary, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a 3.9 mm

$\times 15-\mathrm{cm}$ column that contains packing L1. - [NOTE-Use an L1 column capable of handling pH values greater than 11.] [1S (USP27) The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency determined for the dihydro-$\beta$-ergocryptine mesylate peak is not less than 1000 theoretical plates; the tailing factor for dihydro- $\beta$-ergocryptine mesylate is not more than 2.0 ; the resolution, $R$, between the dihydro- $\alpha$-ergocryptine mesylate and dihydroergocristine mesylate is not less than 2.0; the resolution, $R$, between dihydroergocristine and dihydro-$\beta$-ergocryptine is not less than 2.0 ; and the relative standard deviation of the ratio of the sum of the four peaks to the internal standard for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The order of elution is papaverine, dihydroergocornine, dihydro- $\alpha$-ergocryptine, dihydroergocristine, and dihy-dro- $\beta$-ergocryptine. Calculate the quantity, in mg , of ergoloid mesylates in the portion of Tablets taken by the formula:

$$
15 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ergoloid Mesylates RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the sums of the ratios of responses of the four major peaks to the response of the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively. Calculate the percentage of each of the individual alkaloids taken by the formula:

$$
100 R_{i}(M W) \mathrm{yi} / \Sigma\left[R_{i}(M W)_{i}\right]
$$

where $R_{i}$ is the peak response ratio of the individual alkaloid to the internal standard; $(M W)_{i}$ is the molecular weight of the individual alkaloid; and $\Sigma\left[R_{i}(M W)_{i}\right]$ is the summation of the products of peak response ratios and molecular weights for the four alkaloids.

BRIEFING

Ergoloid Mesylates Tablets—See briefing under Ergoloid Mesylates Tablets.
(PA3: S. Salado; NL: C. Barnstein) RTS-40684-3

## Add the following:

## ■Ergoloid Mesylates Tablets

(Monograph with nomenclature related changes-to become official October 1, 2006)
» Ergoloid Mesylates Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ergoloid mesylates, consisting of not less than 30.3 percent and not more then 36.3 percent of the methanesulfonate salt of each of the individual alkaloids (dihydroergocristine, dihydroergocornine, and dihydroergocryptine). The ratio of alpha- to beta-dihydroergocryptine mesylate is not less than 1.5:1.0 and not more than $2.5: 1.0$.

Packaging and storage-Preserve in tight, light-resistant containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label the Tablets to indicate that they are intended for swallowing intact.

USP Reference standards $\langle 11\rangle$ —USP Ergoloid Mesylates $R S$.

Identification-Mix a small amount of powdered Tablets, equivalent to about 5 mg of ergoloid mesylates, with 5 mL of water and 5 mL of a mixture of equal volumes of glacial acetic acid and sulfuric acid, and add 1 drop of freshly prepared ferric chloride solution (1 in 20): a violet-blue color develops within 5 minutes.

Dissolution $\langle 711\rangle$ -
Medium: water; 500 mL .
Apparatus 2: 50 rpm , the distance between the paddle
blade and the inside bottom of the vessel being maintained
at $4.5 \pm 0.2 \mathrm{~cm}$ during the test.
Time: 30 minutes.
Determine the amount of ergoloid mesylates dissolved using the following procedure.
Mobile phase-Prepare as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Ergoloid Mesylates RS in water to obtain a solution having a known concentration of about $50 \mu \mathrm{~g}$ per mL . Transfer 4 mL of this solution for every 0.5 mg of ergoloid mesylates contained in the Tablets to a $200-\mathrm{mL}$ volumetric flask, add 1 mL of 0.1 N hydrochloric acid and 100 mL of water, mix, and dilute with water to volume.

Test solution-Transfer a $20-\mathrm{mL}$ portion of the solution under test to a suitable container, add $100 \mu \mathrm{~L}$ of 0.1 N hydrochloric acid, and mix.

Chromatographic system-Proceed as directed in the $A s$ say except that the sum of the relative standard deviation values for the four ergoloid mesylates peaks for replicate injections is not more than $3.0 \%$.

Procedure-Separately inject equal volumes (about 500 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of ergoloid mesylates as directed in the Assay.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of ergoloid mesylates is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Assay-

Mobile phase-Prepare a filtered and degassed solution containing a mixture of water, acetonitrile, and triethylamine (700:300:9). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Transfer about 113 mg of papaverine hydrochloride to a 1-L flask. Add a mixture of 0.01 M tartaric acid and acetonitrile $(2: 1)$ to volume, and mix.

Standard preparation-Transfer about 33 mg of USP Ergoloid Mesylates RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Internal standard solution to volume, and mix. Use a freshly prepared solution.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of ergoloid mesylates to a $50-\mathrm{mL}$ centrifuge tube. Add 15.0 mL of Internal standard solution, insert the stopper into the tube, and shake for about 15 minutes. Centrifuge, filter if necessary, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. [NOTE-Use an L1 column capable of handling pH values greater than 11.] The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency determined for the dihydro- $\beta$-ergocryptine mesylate peak is not less than 1000 theoretical plates; the tailing factor for dihydro- $\beta$-ergocryptine mesylate is not more than 2.0 ; the resolution, $R$, between dihydro- $\alpha$-ergocryptine mesylate and dihydroergocristine mesylate is not less than 2.0 ; the resolution, $R$, between dihydroergocristine and dihydro- $\beta$-ergocryptine is not less than 2.0 ; and the relative standard deviation of the ratio of the sum of the four peaks to the internal standard for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The order of elution is papaverine, dihydroergocornine, dihydro- $\alpha$-ergo-
cryptine, dihydroergocristine, and dihydro- $\beta$-ergocryptine. Calculate the quantity, in mg , of ergoloid mesylates in the portion of Tablets taken by the formula:

$$
15 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ergoloid Mesylates RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the sums of the ratios of responses of the four major peaks to the response of the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively. Calculate the percentage of each of the individual alkaloids taken by the formula:

$$
100 R_{i}(M W) \mathrm{yi} / \Sigma\left[R_{i}(M W)_{i}\right],
$$

in which $R_{i}$ is the peak response ratio of the individual alkaloid to the internal standard; $(M W)_{i}$ is the molecular weight of the individual alkaloid; and $\Sigma\left[R_{i}(M W)_{i}\right]$ is the summation of the products of peak response ratios and molecular weights for the four alkaloids.■1S (USP28)

## BRIEFING

Ergotamine Tartrate Tablets-See briefing under Ergoloid Mesylates Tablets.
(PA3: S. Salado; NL: C. Barnstein) RTS-41094-1

## Add the following:

## ■Ergotamine Tartrate Tablets

(Monograph with nomenclature related changes-to become official October 1, 2006)

## » Ergotamine Tartrate Tablets contain not less

 than 90.0 percent and not more than 110.0 percent of the labeled amount of $\left(\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{5} \mathrm{O}_{5}\right)_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$.Packaging and storage-Preserve in well-closed, light-resistant containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label the Tablets to indicate that they are intended for swallowing intact.

USP Reference standards $\langle 11\rangle$ —USP Ergotamine Tartrate $R S$.

Identification-Triturate a quantity of finely powdered Tablets, equivalent to about 5 mg of ergotamine tartrate, with 10 mL of solvent hexane for a few minutes, allow to settle, and discard the solvent hexane extract. Add to the residue 10 mL of chloroform saturated with ammonia (prepared by shaking chloroform with ammonium hydroxide, then drawing off the chloroform layer), triturate for a few minutes, filter, and evaporate the filtrate on a steam bath to dryness. Dissolve the residue in a mixture of 4 mL of glacial acetic acid and 4 mL of ethyl acetate. To 1 mL of this solution add slowly, with continuous agitation and cooling, 1 mL of sulfuric acid: a blue color with a red tinge develops. Add 0.1 mL of ferric chloride TS, previously diluted with an equal volume of water: the red tinge becomes less apparent and the blue color more pronounced.

## Dissolution $\langle 711\rangle$

Medium: $\quad$ tartaric acid solution (1 in 100); 1000 mL .
Apparatus 2: 75 rpm.
Time: 30 minutes.
Procedure-Determine the amount of $\left(\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{5}\right)_{2}$. $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$ dissolved from fluorescence intensities, using the maximum excitation wavelength at about 327 nm and the maximum emission wavelength at about 427 nm , of filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Ergotamine Tartrate RS in the same Medium.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\left(\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{5}\right)_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Assay-
Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and 0.01 M monobasic potassium phosphate ( $55: 45$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Transfer about 40 mg of ergonovine maleate to a $250-\mathrm{mL}$ volumetric flask, add a mixture of acetonitrile and water $(55: 45)$ to volume, and mix.

Standard preparation-Transfer about 10 mg of USP Ergotamine Tartrate RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, add a mixture of acetonitrile and water ( $55: 45$ ) to volume, and mix. Transfer 5.0 mL of this solution to a $50-$ mL volumetric flask, add 5.0 mL of Internal standard solution, dilute with the mixture of acetonitrile and water ( $55: 45$ ) to volume, and mix to obtain a solution having a known concentration of about 0.02 mg of USP Ergotamine Tartrate RS per mL.

Assay preparation-Transfer a number of whole Tablets, equivalent to about 10 mg of ergotamine tartrate, to a $500-$ mL volumetric flask. Add 50.0 mL of Internal standard solution, 300 mL of a mixture of acetonitrile and water ( $55: 45$ ), and sonicate for about 10 minutes. Dilute with the mixture of acetonitrile and water $(55: 45)$ to volume, and mix. Filter through a $0.45-\mu \mathrm{m}$ membrane disk, discarding the first 25 mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph
the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for ergonovine maleate and 1.0 for ergotamine tartrate; the resolution, $R$, between the analyte and internal standard peaks is not less than 3.0 ; the column efficiency determined from the analyte peak is not less than 3000 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{5} \mathrm{O}_{5}\right)_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$ in the portion of Ergotamine Tartrate Tablets taken by the formula:

$$
500 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ergotamine Tartrate RS in the Standard preparation, and $R_{U}$ and $R_{S}$ are the peak response ratios obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)
(Official October 1, 2006)

## Briefing

Ergotamine Tartrate Sublingual Tablets—See briefing under Ergoloid Mesylates Tablets.
(PA3: S. Salado; NL: C. Barnstein) RTS-41094-2

## Add the following:

## ■Ergotamine Tartrate Sublingual Tablets <br> (Monograph under this new title-to become official October 1, 2006)

» Ergotamine Tartrate Sublingual Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\left(\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{5} \mathrm{O}_{5}\right)_{2}$. $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$.

Packaging and storage-Preserve in well-closed, light-resistant containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label Tablets to indicate that they are intended for sublingual administration.

USP Reference standards $\langle 11\rangle$ —USP Ergotamine Tartrate RS.

Identification-Triturate a quantity of finely powdered Sublingual Tablets, equivalent to about 5 mg of ergotamine tartrate, with 10 mL of solvent hexane for a few minutes, allow to settle, and discard the solvent hexane extract. Add to the residue 10 mL of chloroform saturated with ammonia (prepared by shaking chloroform with ammonium hydroxide, then drawing off the chloroform layer), triturate for a few minutes, filter, and evaporate the filtrate on a steam bath to dryness. ## BRIEFING

Estradiol Transdermal System, page 9080 of $P F 25(6)$ [Nov.Dec. 1999]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision. In addition, minor editorial changes have been made.
(PA1: C. Anthony) RTS-40960-1

## Add the following:

## ■ Estradiol Transdermal System

» Estradiol Transdermal System contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol $\left(\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}\right)$.

Packaging and storage-Preserve in hermetic, light-resistant, unit-dose pouches.

USP Reference standards $\langle 11\rangle —$ USP Estradiol RS.
Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release $\langle 724\rangle$ -
FOR PRODUCTS LABELED FOR DOSING EVERY 84 HOURS-
Medium: water; 900 mL .
Apparatus 5: 50 rpm .
Times: 24, 48, and 96 hours.
Determine the amount of $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}$ released by employing the following method.
Mobile phase-Prepare a filtered and degassed mixture of water and acetonitrile ( $3: 2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solutions-Dissolve an accurately weighed quantity of USP Estradiol RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about $9 \mu \mathrm{~g}$ per mL . Dilute this solution with water to obtain additional solutions having known concentrations of about $0.9,0.45$, and $0.045 \mu \mathrm{~g}$ per mL .

Test solution-At each sampling time interval, withdraw a
$10-\mathrm{mL}$ aliquot of the solution under test.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a fluorometric detector, set at an excitation wavelength of 220 nm and an emission wavelength set at 270 nm , and a $4.6-\mathrm{mm} \times 3-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $40^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solutions, and record the peak responses as directed for Procedure: the tailing factor is between 0.9 and 2.5 ; and the relative standard deviation for replicate injections of the $0.45 \mu \mathrm{~g}$ per mL Standard solution is not more than $3.0 \%$.

Procedure—Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solutions and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Plot the peak responses of the Standard solutions versus concentration, in $\mu \mathrm{g}$ per mL , of estradiol. From the graph so obtained determine the amount, in $\mu \mathrm{g}$ per mL , of $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}$ released.

Tolerances-The amounts of $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}$ released, as percentages of the labeled amount of the dose absorbed in vivo at the times specified, conform to Acceptance Table 4.

| Time (hours) | Amount dissolved |
| :---: | :---: |
| 24 | between $2.4 \%$ and $26.4 \%$ |
| 48 | between $4.8 \%$ and $52.0 \%$ |
| 96 | between $10.0 \%$ and $85.0 \%$ |

Uniformity of dosage units $\langle 905\rangle$ : meets the requirements.

## Alcohol content-

Diluent-Prepare a mixture of acetonitrile and water (1:1).
Internal standard solution-Pipet 4.0 mL of dehydrated methanol into a $100-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Standard solution-Accurately weigh, by difference, about 1.6 mL of dehydrated alcohol into a tared $50-\mathrm{mL}$ volumetric flask containing about 15 mL of water. Dilute with Diluent to volume, and mix. Pipet 10.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Pipet 25.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, add 5.0 mL of Internal standard solution, dilute with water to volume, and mix.

Test solutions-Prepare as directed in the Assay for Assay preparations, with the following changes. Pipet 25.0 mL of each solution into individual $50-\mathrm{mL}$ volumetric flasks. Add 5.0 mL of Internal standard solution, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The gas chromatograph is equipped with a flame-ionization detector and a $2-\mathrm{mm} \times 2$-m glass column that contains support S2. The carrier gas is helium, flowing at a rate of 30 mL per minute. The column temperature is $100^{\circ}$. The injection port temperature and the detector temperature are maintained at $200^{\circ}$. Chromatograph the Standard solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.4 for the internal standard and about 1.0 for alcohol; and the relative standard deviation for replicate injections, determined from the ratios of alcohol peak areas to those of the internal standard, is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the Standard solution and each of the Test solutions into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount of alcohol, in mg, in each Transdermal System taken by the formula:

$$
160 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of dehydrated alcohol in the Standard solution; and $R_{U}$ and $R_{S}$ are the ratios of the peak responses of alcohol to the internal standard obtained from the Test solutions and the Standard solution, respectively. Calculate the average amount of alcohol in the Test solution taken: between $80 \%$ and $120 \%$ of the labeled amount of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is found.

## Assay-

Diluent-Prepare a mixture of acetonitrile and water (1:1).

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water ( $55: 45$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Estradiol RS in Diluent. Dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparations-Cut 10 Transdermal Systems into pieces, keeping the pieces from each system separate. Remove the protective liners, if any, from the strips and discard. Transfer the pieces of each system into separate stoppered flasks of suitable size, and add an accurately measured volume of Diluent to each flask to obtain solutions having a concentration of about 0.1 mg of estradiol per mL . Shake by mechanical means for about 3 hours, and sonicate for 15 minutes.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $35^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Standard
preparation, and record the peak responses as directed for Procedure: the tailing factor is between 0.9 and 1.6 ; and the relative standard deviation for replicate injections is not more than $2.5 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparations into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of estradiol $\left(\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ in each Transdermal System taken by the formula:

$$
V C\left(r_{U} / r_{s}\right)
$$

in which $V$ is the volume, in mL , of Diluent used to prepare the Assay preparation; $C$ is the concentration, in mg per mL , of USP Estradiol RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. Calculate the average quantity, in mg , of estradiol in each Transdermal System. Use the individual assays to determine the Uniformity of dosage units. $\mathbf{I S}^{15}$ (USP28)

Briefing

Etodolac Extended-Release Tablets, page 320 of PF 29(1) [Jan.-Feb. 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision.
(PA2: C. Anthony) RTS-40961-1

## Add the following:

## ■Etodolac Extended-Release Tablets

» Etodolac Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etodolac $\left(\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO}_{3}\right)$.

Packaging and storage-Preserve in well-closed containers. Store at controlled room temperature, protected from light.

USP Reference standards $\langle 11\rangle$ —USP Etodolac RS. USP Etodolac Related Compound A RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Bissolution- $\langle 74\rangle$ : [Toceme.]
Drug release $\langle 724\rangle$ -
Medium: $\quad 0.05 \mathrm{M}$ phosphate buffer, $\mathrm{pH} 7.4 ; 1000 \mathrm{~mL}$.
Apparatus 2: 75 rpm , with sinker.
Times: $3,6,10$, and 16 hours.
Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO}_{3}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 279 nm on filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Etodolac RS in the same Medium. Use Medium as the blank.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO}_{3}$ dissolved at the times specified conform to $A c$ ceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :---: |
| 3 | between $15 \%$ and $40 \%$ |
| 6 | between $35 \%$ and $70 \%$ |
| 10 | between $60 \%$ and $95 \%$ |
| 16 | not less than $80 \%$ |

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Chromatographic purity-

Diluent, Mobile phase, and System suitability solutionProceed as directed in the Assay.
Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system-Prepare as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, $R$, between etodolac related compound A and etodolac is not less than 2.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:
in which $r_{i}$ is the peak area for each impurity; and $r_{s}$ is the sum of the areas of all the peaks: not more than $0.2 \%$ of any individual impurity is found; and not more $0.75 \%$ of total impurities is found.

## Assay-

## Diluent: acetonitrile.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, water, and phosphoric acid (500:500:0.25). Make adjustments if necessary (see System Suitability under Chromatography (621〉).

System suitability solution-Dissolve accurately weighed quantities of USP Etodolac RS and USP Etodolac Related Compound A RS in Diluent, and quantitatively dilute with Diluent to obtain a solution having known concentrations of about 0.48 mg per mL and 0.05 mg per mL , respectively.

Standard preparation-Dissolve an accurately weighed quantity of USP Etodolac RS in Diluent, and quantitatively dilute with Diluent to obtain a solution having a known concentration of about 0.6 mg per mL .

Assay preparation-[NOTE—Do not finely powder Tablets.] Weigh and powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 600 mg of etodolac, to a $200-\mathrm{mL}$ volumetric flask. Add about 100 mL of Diluent, mix, and then shake for 40 minutes by mechanical means. Dilute with Diluent to volume, and mix. Pass through a filter having a $0.45-$ $\mu \mathrm{m}$ porosity, discarding the first 3 mL of the filtrate. Transfer 2.0 mL of the filtrate to a $10-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $274-\mathrm{nm}$ detector, a $4.0-\mathrm{mm} \times 4.0-\mathrm{cm}$ guard column that contains $5-\mu \mathrm{m}$ packing L1, and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains 5 $\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record
the peak responses as directed for Procedure: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, $R$, between etodolac related compound A and etodolac is not less than 2.5; and the tailing factor is not more than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of etodolac $\left(\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO}_{3}\right)$ in the portion of Tablets taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Etodolac RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Fenbendazole. Because there is no existing $U S P-N F$ monograph for this article, a new monograph is being proposed. In the test for Related compounds, the liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The retention time for fenbendazole is about 19 minutes. USP has received data indicating that a Hewlett Packard Zorbax SB, C-18 column is suitable for use. The four USP Reference Standards specified in the monograph for use in the test for Related compounds are currently available through USP. In the Assay, a titrimetric procedure in which Fenbendazole is dissolved
in acetic acid and titrated with 0.1 N perchloric acid is used. Interested parties are encouraged to submit their comments to USP for evaluation.
(VET: I. DeVeau) RTS-41050-1

## Add the following:

## ■Fenbendazole

$\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S} \quad 299.35$

Carbamic acid, [5-(phenylthio)-1 H -benzimidazol-2-yl]-, methyl ester.

Methyl 5-(phenylthio)-2-benzimidazolecarbamate [43210-67-9].
» Fenbendazole contains not less than 98.0 percent and not more than 101.0 percent of $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}$, calculated on the dried basis.

Packaging and storage-Preserve in well-closed, light-resistant containers, and store at $25^{\circ}$; excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-Label it to indicate that it is for veterinary use only.

USP Reference standards $\langle 11\rangle$ —USP Fenbendazole $R S$. USP Fenbendazole Related Compound A RS. USP Fenbendazole Related Compound B RS. USP Mebendazole RS.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Loss on drying $\langle 731\rangle$ —Dry it at $100^{\circ}$ to $105^{\circ}$ for 3 hours: it loses not more than $1.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.3 \%$.
Heavy metals, Method II $\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per g.

## Related compounds-

Solution A-Prepare a mixture of water, methanol, and acetic acid ( $70: 30: 1$ ).

Solution B-Prepare a mixture of methanol, water, and acetic acid ( $70: 30: 1$ ).

Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system.

Hydrochloric methanol-Prepare a mixture of methanol and hydrochloric acid (99:1).

Standard solution 1-Dissolve an accurately weighed quantity of USP Fenbendazole RS in Hydrochloric methanol to obtain a solution having a known concentration of about 5 mg per mL . Dilute 1.0 mL of this solution with methanol to 200.0 mL . Dilute 5.0 mL of this solution with Hydrochloric methanol to 10.0 mL . This solution contains about 0.0125 mg of USP Fenbendazole RS per mL.

Standard solution 2-Dissolve an accurately weighed quantity of USP Fenbendazole Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL . Dilute 1.0 mL of this solution with Hydrochloric methanol to 10.0 mL , and mix.
Standard solution 3-Dissolve an accurately weighed quantity of USP Fenbendazole Related Compound B RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL . Dilute 1.0 mL of this solution with Hydrochloric methanol to 10.0 mL , and mix.

Resolution solution-Dissolve 10.0 mg of USP Fenbendazole RS and 10.0 mg of USP Mebendazole RS in 100.0 mL of methanol. Dilute 1.0 mL of this solution with Hydrochloric methanol to 10.0 mL , and mix.
Test solution-Dissolve 50.0 mg of Fenbendazole in 10.0 mL of Hydrochloric methanol.

Chromatographic system (see Chromatography $\langle 621\rangle$ The liquid chromatograph is equipped with a 280 -nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-10$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $10-40$ | 0 | 100 | isocratic |
| $40-50$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |

Chromatograph the Resolution solution, and record the peak area responses as directed for Procedure: the retention time for fenbendazole is about 19 minutes; the relative retention time for mebendazole is about 0.85 and 1.0 for fenbendazole; and the resolution, $R$, between mebendazole and fenbendazole is not less than 1.5. Chromatograph Standard solution 2 and Standard solution 3, and record the peak area responses as directed for Procedure: the relative retention times are about 0.25 for fenbendazole related compound A and 0.65 for fenbendazole related compound B.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of Standard solution 1, Standard solution 2, Standard solution 3, and the Test solution into the chromatograph, record the chromatograms, and measure the area responses for all of the peaks. Calculate the percentages of fenbendazole related compound A and of fenbendazole related compound B in the portion of Fenbendazole taken by the formula:

$$
0.1(C / W)\left(r_{i} / r_{s i}\right),
$$

in which $C$ is the concentration, in mg per mL, of USP Fenbendazole Related Compound A RS or USP Fenbendazole Related Compound B RS in Standard solution 2 or Standard solution 3, as appropriate; $W$ is the weight, in mg, of Fenbendazole taken to prepare the Test solution; $r_{i}$ is the peak area response of the relevant related compound obtained from the Test solution; and $r_{S i}$ is the peak area response of the relevant related compound obtained from Standard solution 2 or Standard solution 3, as appropriate. Not more than $0.5 \%$ of either related compound is found. Calculate the percentage of any other impurity in the portion of Fenbendazole taken by the formula:

$$
0.1(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Fenbendazole RS in Standard solution 1; $W$ is as defined above; $r_{i}$ is the peak area response of any impurity other than fenbendazole related compound A or fenbendazole related compound B obtained from the Test solution; and $r_{s}$ is the peak area response of the main peak in the chromatogram obtained from Standard solution 1. Disregard any impurity peak with a response that is less than one-fifth that of $r_{s}$. Not more than $0.5 \%$ of any other impurity is found. The sum of all impurities found, including fenbendazole related compound A and fenbendazole related compound B , is not more than $1 \%$.

Assay—Dissolve about 200 mg of Fenbendazole, accurately weighed, in 30 mL of glacial acetic acid, warming if necessary to effect solution. Cool, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 29.94 mg of $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}$.■1S (USP28)

## Briefing

Fexofenadine Hydrochloride, page 841 of PF 30(3) [MayJune 2004]. It is proposed to revise the Packaging and storage statement by adding a recommended storage temperature. In addition, minor editorial style changes have been made.
(PA1: K. Russo; PSD: C. Okeke) RTS-41227-1

## Add the following:

## ■Fexofenadine Hydrochloride

$\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl} \quad 538.13538 .12$

Benzeneacetic acid, 4-[1-hydroxy-4-[4-(hydroxydiphenyl-methyl)-1-piperidinyl]butyl]- $\alpha, \alpha$-dimethyl-, hydrochloride, $( \pm)$ -
( $\pm$ )-p-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)piperidi-no]butyl]- $\alpha$-methylhydratropic acid, hydrochloride [138452-21-8].
» Fexofenadine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in well-clesed, lightresistant containers. Preserve in tight well-closed, light-resistant containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle — U S P$ Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS. USP Fexofenadine Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Bissolve 30 mg of Ferefenadine Hydrechloride in 2
mL of methanol, add 30 mL of water, and acidify with nitric acid: meets the requirements of the test for Chloride $\langle 194\rangle=$
The retention time of the fexofenadine peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

C: Differential scanning calorimetry $\langle 891\rangle$-Accurately weigh 2 to 6 mg of Fexofenadine Hydrochloride into an aluminum pan, and crimp the pan, using a suitable sample press. Analyze the sample from $25^{\circ}$ to $225^{\circ}$ at $10^{\circ}$ per minute. The sample exhibits a single endotherm $190^{\circ}$ between $193^{\circ}$ and $199^{\circ}$. [NOTE-The pan can be sealed hermetically, provided a pinhole is punched into the lid so that the sample can degas during heating.]
Water, Method Ic $\langle 921\rangle$ : not more than $0.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.
Specific surface area, Method II $\langle 846\rangle$-Outgas a portion of Fexofenadine Hydrochloride, 0.2 to 0.5 g , using helium flow for 1 hour at $100^{\circ}$ or vacuum for 1 hour at $100^{\circ}$. Test the sample, using gas sorption: between 2.5 and $5.0 \mathrm{~m}^{2}$ per g is found.

## Limit of fexofenadine related compound B-

Ammonium acetate buffer solution-Add 2.3 mL of glacial acetic acid to 2000 mL of water. Adjust with 6 N ammonium hydroxide to a pH of $4.0 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of Ammonium acetate buffer solution and acetonitrile (80:20). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Add about 1.2 mg of USP Fexofenadine Related Compound B RS, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix. Transfer 2.0 mL of the solution so obtained into a $100-\mathrm{mL}$ volumetric flask; add about 25 mg of USP Fexofenadine Hydrochloride RS, accurately weighed; dilute with Mobile phase to volume; and mix.
Standard solution-Dilute the System suitability solution quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $2.5 \mu \mathrm{~g}$ of USP Fexofenadine Hydrochloride RS per mL.

Test solution-Dissolve an accurately weighed quantity of Fexofenadine Hydrochloride in Mobile phase to obtain a solution having a concentration of about 0.25 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 45-\mathrm{em} 25-\mathrm{cm}$ column that contains packing L45. The column is maintained at room temperature. The flow rate is about 0.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the retention time for fexofenadine is between 15 and 23 minutes; the relative retention times are about 0.7 for fexofenadine related compound B and 1.0 for fexofenadine; and the resolution, $R$, between fexofenadine and fexofenadine related compound $B$ is not less than 1.5 3.0.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure the
peak areas. Calculate the percentage of fexofenadine related compound B in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
1.25\left(r_{U} / r_{s}\right)
$$

in which 1.25 is the response factor for fexofenadine related compound B relative to fexofenadine, $r_{U}$ is the peak response for fexofenadine related compound B obtained from the Test solution, and $r_{s}$ is the peak response for fexofenadine obtained from the Standard solution: not more than $0.1 \%$ is found.

## Related compounds-

Phosphate-perchlorate buffer, Diluting solution, Mobile phase, fystem and Chromatographic system-Prepare as directed in the Assay.

Standard solution Dissolve an aceurately weighed quantity of USP Fexofenadine-Related Compound A RS in Diluting solution to obtain a selution having a known eencentration of about 0.5 mg per mL. Dilute with Mobite phase quantitatively, and stepwise if necessary, to obtain a solution having a known concentrat + ion of about 0.005 mg per mL.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Reference solution-Use the Assay preparation, prepared as directed in the Assay.
Test solution-Use the Assay stock preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution, the Standard solution, the Reference solution, and Mobile phase (used as the blank) into the chromatograph; record the chromatograms; and measure the peak areas, excluding the peaks corresponding to those obtained from the Mobile phase. Calculate the entity, in
me, percentage of fexofenadine related compound A in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
\begin{gathered}
50 C\left(r_{i} \not+r_{s}\right), \\
100\left(C_{S} / C_{T}\right)\left(r_{U} / r_{S}\right),
\end{gathered}
$$

in which $C_{S}$ is the concentration, in mg per mL, of USP Fexofenadine Related Compound A RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of fexofenadine in the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses for fexofenadine related compound A obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of decarboxylated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperi-dinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
(100 / 1.1)\left(C_{S} / C_{T}\right)\left(r_{U} / r_{S}\right),
$$

in which $C_{S}$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL, of fexofenadine in the Test solution; $r_{U}$ is the peak response of the decarboxylated degradant obtained from the Test solution; $r_{s}$ is the peak response of fexofenadine obtained from the Standard solution; and 1.1 is the response factor for the decarboxylated degradant relative to fexofenadine. Galeulate the per eentage of other impurities in the portion of Fex efenadine Hydrochloride aken by the formmar-
in which + is the peak respense for each impurity obtained from the Test solution; and $x_{s}$ is the peak respense for fex ofenadine from the Test Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
100\left(C_{S} / C_{T}\right)\left(r_{i} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of fexofenadine in the Reference solution; $C_{T}$ is the concentration, in mg per mL , of fexofenadine in the Test solution; $r_{i}$ is the peak response for any other impurity obtained from the Test solution; and $r_{s}$ is the peak response of fexofenadine obtained from the Reference solution: ferofenadine related compernd $\Lambda$ is found; and not more than $0.45 \%$ of impurities is fotment not more than $0.18 \%$ of fexofenadine related compound A is found, not more than $0.15 \%$ of decarboxylated degradant is found, not more than $0.1 \%$ of any other unknown impurity is found, not more than $0.2 \%$ total other unknown impurities is and not more than $0.3 \% 0.30 \%$ of total impurities is found.

Content of chloride—Dissolve about 300 mg of Fexofenadine Hydrochloride, accurately weighed, in 50 mL of methanol. Titrate with 0.1 N silver nitrate VS, and determine the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N silver nitrate VS is equivalent to 3.545 mg of chloride: not less than $6.45 \%$ and not more than $6.75 \%$ of chloride is found, calculated on an anhydrous basis.

## Assay-

Phosphate-perchlorate buffer-Dissolve 6.64 g of monobasic sodium phosphate and 0.84 g of sodium perchlorate in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Diluting solution-Prepare a mixture of acetonitrile and Phosphate-perchlorate buffer (50:50).

Mobile phase-Prepare a filtered and degassed mixture of Phosphate-perchlorate buffer and acetonitrile (65:35). Add 3 mL of triethylamine per L , and mix. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Sysem suitability preard preparation-
Prepare a solution of USP Fexofenadine Hydrochloride RS and USP Fexofenadine Related Compound A RS in Mobile phase having known concentrations of about 0.06 mg per mL and 0.005 mg per mL , respectively.

Standard preparation Dissolve an aceurately weighed
quantity of USP Fexefenadine-Hydrechloride-RS in Dilut-
ing solution to obtain a solution having a known concentrat tion of about 0.5 mg per mL . Dilute quantitatively, and stepwise if necessary, with Mebile phase to-0btain aconcentration of 0.06 mg of USP Fexefenadine Hydrochloride RS per mE.
Assay stock preparation-Transfer about 50 mg of Fexofenadine Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with Diluting solution to volume to obtain a solution having a concentration of about 1.0 mg of fexofenadine hydrochloride per mL .

Assay preparation-Transfer 3.0 mL of Assay stock preparation to a $50-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume to obtain a solution having a concentration of about 0.06 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L11. The column is maintained at room temperature. The flow rate is about 1.5 mL per minute. Chromatograph the Sys Standard preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between fexofenadine and fexofenadine related compound A is not less than 10 ; the tailing factor is
not more than 2.0 ; and the relative standard deviations for replicate injections determined from fexofenadine and fexofenadine related compound A are not more than $2.0 \%$ and $3.0 \%$, respectively.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
833.3 C\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Fexofenadine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for fexofenadine obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

BRIEFING

Cryopreserved Human Fibroblast-Derived Dermal Substitute; Human Fibroblast-Derived Temporary Skin Substitute. Because there are no existing $U S P-N F$ monographs for these articles, new monographs are being proposed. Cryopreserved Human Fibroblast-Derived Dermal Substitute and Human Fibroblast-Derived Temporary Skin Substitute are monolayer biologically derived wound dressings, the cells of which are derived from neonatal foreskins. Cryopreserved Human Fibroblast-Derived Dermal Substitute is composed of material entirely of animal and human origin (except for the polyglactin matrix) and is metabolically active at the time of application. Human Fibroblast-Derived Temporary Skin Substitute includes nylon and silicone components in addition to the material of human and animal origin; it is metabolically inactive at the time of application. Six tests are proposed for both articles: Sterility, Bacterial endotoxins, Histological characterization, Metabolic activity assessment, DNA content, and Total collagen content. Histological characterization is divided into three subtests: general histology, collagen distribution, and fibronectin distribution; reference photomicrographs representing pas-
sing units are specified to assist the analyst in ascertaining quality. Interested parties are encouraged to submit their comments to USP for evaluation.
(GCT: I. DeVeau) RTS-40948-2; 41012-1

## Add the following:

## -Cryopreserved Human FibroblastDerived Dermal Substitute

» Cryopreserved Human Fibroblast-Derived Dermal Substitute is a living monolayer skin substitute derived from neonatal foreskins. It is composed of fibroblasts, an extracellular matrix, and a bioabsorbable scaffold. Human fibroblasts are seeded onto a bioabsorbable, nonantigenic and nonpyrogenic mesh scaffold composed of polyglactin, a copolymer of glycolide and lactide. The fibroblasts proliferate to fill the interstices of this scaffold to create a three-dimensional human dermal substitute that secretes human dermal collagen, matrix proteins, growth factors, and cytokines. Cryopreserved Human Fibroblast-Derived Dermal Substitute does not contain macrophages, lymphocytes, blood vessels, hair follicles, muscle fibers, or keratin. The fibroblast-cell banks, from which Cryopreserved Human Fibroblast-Derived Dermal Substitute is derived, test negative for human and animal viruses and retroviruses and are also tested for normal cell morphology, human karyology, and isoenzymes. Maternal blood sera are tested for evidence of infection with human
immunodeficiency virus types 1 and 2 , hepatitis $B$ and $C$ viruses, syphilis, and human T-lymphotropic virus type 1 and are found negative for the purpose of donor selection. Cryopreserved Human Fibroblast-Derived Dermal Substitute is manufactured with sterile components under aseptic conditions within the final package. Reagents used in the manufacture of Cryopreserved Human Fibroblast-Derived Dermal Substitute are tested and found free of viruses, retroviruses, endotoxins, and mycoplasma before use. All materials derived from bovine sources originate from countries free of bovine spongiform encephalopathy. During subsequent screening of the fibroblast cell strain at various stages in the manufacturing process, testing for these same viruses, as well as Epstein-Barr virus and human T-lymphotropic virus type 2 , is carried out and found to be negative. The final product tests negative for the presence of mycoplasma.

Packaging and storage-Cryopreserved Human Fibro-blast-Derived Dermal Substitute is aseptically packaged and supplied frozen in a clear ethyl vinyl acetate bag containing one piece of approximately $5 \mathrm{~cm} \times 7.5 \mathrm{~cm}$ for a single application. The solution within the bag is a salinebased cryoprotectant supplemented with $10 \%$ dimethyl sulfoxide and bovine serum to facilitate long-term storage. An aluminum-plastic foil envelope surrounds the bag for its protection. Cryopreserved Human Fibroblast-Derived Dermal Substitute should be stored at $-75 \pm 10^{\circ}$ for no longer than 6 months.

Labeling-The label indicates the dimensions of the Cryopreserved Human Fibroblast-Derived Dermal Substitute material enclosed. It contains the expiry date, required storage conditions, and the lot number. The label cautions that Cryopreserved Human Fibroblast-Derived Dermal Substitute is not to be used if the package shows signs of damage. Additional labeling requirements include instructions on the proper thawing and handling of Cryopreserved Human Fibroblast-Derived Dermal Substitute, the timeframe for use after package opening, and a statement that cytotoxic agents are not to be used.

USP Reference standards $\langle 11\rangle$ —USP Endotoxin $R S$.
USP Authentic Visual References $\langle 11\rangle$ —USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs. [NOTE-These three photomicrographs represent examples of passing units. They are specified to assist in ascertaining histological quality.]

Sterility $\langle 71\rangle$ : meets the requirements.
Test solution-Thaw Cryopreserved Human FibroblastDerived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to a temperature of $34^{\circ}$ to $37^{\circ}$ for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Perform the test on 20 mL of the cryopreservative.

Bacterial endotoxins $\langle 85\rangle$ —Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to a temperature of $34^{\circ}$ to $37^{\circ}$ for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Remove the unit from the ethyl vinyl acetate bag, and immerse in 25 mL of LAL Reagent Water. Extract for 60 minutes at $37^{\circ}$ with shaking on an orbital shaker set at 125 revolutions
per minute. Remove a 4-mL aliquot of the extract for testing: it contains not more than 0.5 USP Endotoxin Unit per mL .

## Histological characterization-

BUFFERED FORMALIN-Prepare a solution containing 10\% $(\mathrm{w} / \mathrm{v})$ formaldehyde solution and $1.0 \%$ to $1.5 \%$ methanol in a suitable buffer, adjusted to a pH of 6.8 to 7.2. ${ }^{1}$
PREPARATION OF TISSUE FOR STAINING-Cut Cryopreserved Human Fibroblast-Derived Dermal Substitute into $3-\mathrm{mm} \times 3-\mathrm{mm}$ sections. Place three sections into suitable histological tissue cassettes, ${ }^{2}$ and insert the cassettes into suitable histological cassette basket(s). ${ }^{3}$ At a temperature of $40^{\circ}$, sequentially immerse the histological cassette basket(s) in separate solutions of Buffered formalin (2 hours), two changes of $80 \%$ alcohol ( 30 minutes per step), alcohol ( 30 minutes), three changes of dehydrated alcohol ( 30 minutes per step), suitable histological xylene substitute (30 minutes), ${ }^{4}$ and two changes of suitable xylene substitute ( 30 minutes per step). Immerse the histological cassette bas$\operatorname{ket}(\mathrm{s})$ into molten paraffin ${ }^{5}$ that is at a temperature of $60^{\circ}$ for 30 minutes. Remove the cassette basket(s), and immerse in a fresh container of molten paraffin ( $60^{\circ}$ ) for 60 minutes. Remove the histological tissue cassette from the container and basket, and disassemble. Fill preheated embedding molds with molten paraffin heated to $56^{\circ}$ to $60^{\circ}$, and place on top of a preheated warming platform that is designed for histology work. Transfer Cryopreserved Human Fibroblast-

[^162]Derived Dermal Substitute specimens from the cassettes using forceps, and place specimens into individual molds. Orient the specimens in molds so as to cut cross sections. Cool the paraffin by sliding the mold down the platform to its cool side until the paraffin has solidified. Maintain specimen orientation with forceps during cooling, removing the forceps when the paraffin becomes translucent. Slide the paraffin block onto a histological cold plate to rapidly cool the block. Trim the paraffin block with a new single-edged razor blade to form a rectangle or slight trapezoid to within 5 mm of the tissue mass, if necessary. Cool the block at $4^{\circ}$ for 15 to 30 minutes. Clamp the tissue block into the block holder of the microtome. Fill a histological tissue flotation water bath with fresh water, add an appropriate amount of a suitable histological adhesive, ${ }^{6}$ and heat to $5^{\circ}$ less than the melting point of the paraffin. Properly mount and adjust the tissue and paraffin block into a microtome. Set the microtome to make cuts 5 microns thick with a blade angle of $5 \pm 2^{\circ}$. Insert a sharp stainless steel microtome knife that has been properly honed or a new disposable microtome knife into the knife holder. Cut a ribbon that contains 6 to 10 sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute. Pick up the ribbon with forceps, and stretch it across the tissue flotation water bath. Separate 2 to 3 adjacent sections from the ribbon on the water bath. The selected sections should not be compressed, wrinkled, or scratched. Pick up the selected sections by dipping a microscope slide into the water bath under the floating sections, and gently lift the slide out of the water. For each staining procedure, prepare three slides from each of the three starting Cryopreserved Human Fibroblast-Derived

[^163]Dermal Substitute $3-\mathrm{mm} \times 3-\mathrm{mm}$ sections. Allow the mounted sections to air-dry completely, or dry the slide in a $60^{\circ}$ oven for 1 hour.

HEMATOXYLIN-EOSIN STAINING-
Hematoxylin-alcohol solution-Dissolve 2.5 g of hematoxylin in 25.0 mL of dehydrated alcohol with heating.

Potassium alum solution-Dissolve 50.0 g of potassium alum in 500 mL of water with heating.

Hematoxylin staining solution-Mix Hematoxylin-alcohol solution and Potassium alum solution. Bring to a boil as rapidly as possible with constant stirring. Do not heat for more than 1 minute. Slowly add 0.185 g of sodium iodate. Reheat to a simmer until the solution becomes a deep purple. Remove from heat, and quickly cool. Filter daily before use.
$10 \%$ Acid alcohol—Add 5.0 mL of hydrochloric acid to 495 mL of $70 \%$ alcohol.

Eosin solution-Dissolve 1 g of eosin Y in 100 mL of alcohol. Filter daily before use.

Procedure-The microscope slide with affixed tissue, as prepared in Preparation of tissue for staining, is sequentially immersed in three changes of a suitable histological, aliphatic xylene substitute ( 2 minutes per step), three changes of dehydrated alcohol ( 1 minute per step), alcohol (20 seconds), running tap water rinse ( 1 minute), Hematoxylin staining solution ( 4 to 5 minutes), running tap water rinse ( 1 minute), $10 \%$ Acid alcohol ( 15 seconds), running tap water rinse ( 1 minute), a suitable bluing reagent ${ }^{7}$ (20 to 30 seconds), running tap water rinse ( 1 minute), alcohol (20 seconds), Eosin solution (10 to 20 seconds, until a red-dish-brown color is obtained in the tissue), three changes of dehydrated alcohol ( 10 seconds per step), and three changes of a suitable histological xylene substitute ( 10 seconds per step). Adjust the above immersion times as needed to suit-

[^164]ably stain the tissue. Remove the slide from the last histological xylene substitute wash, and blot dry the back of the slide. Do not allow the tissue to dry. Affix a coverslip over the tissue using a coverslip mountant. Using USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrograph 1 for comparison, the test article shows a polyglactin scaffold mesh and a secreted col-lagen-based matrix; the tissue contains normal human fibroblast distributed throughout the secreted matrix and resembles normal human papillary dermis. Fibroblasts appear elongated and spindle-shaped. The tissue, which is about $100-$ to $300-\mu \mathrm{m}$ thick, contains about 106 cells per $\mathrm{cm}^{2}$.

## COLLAGEN STAINING-

Bouins's solution-Mix 75.0 mL of $1.22 \%$ picric acid solution, 25.0 L of dimethoxymethane, and 5.0 L of acetic acid.

Weigert's iron hematoxylin solution $A$-Dissolve 1.0 g of hematoxylin in 100.0 mL of alcohol.

Weigert's iron hematoxylin solution B—Mix 4.0 mL of $29 \%$ ferric chloride, 95.0 mL of water, and 1.0 mL of hydrochloric acid.

Weigert's iron hematoxylin working solution-Mix equal volumes of Weigert's iron hematoxylin solution $A$ and Weigert's iron hematoxylin solution $B$. Pass the solution through a filter having a porosity of $0.45-\mu \mathrm{m}$. Prepare fresh as needed.

Gomori's trichrome solution-Mix 1.0 mL of acetic acid and 100 mL of water. Dissolve 0.6 g of chromotrope 2R, 0.3 g of Fast Green FCF, and 0.6 g of phosphotungstic acid.
$1 \%$ Acetic acid—Mix 1.0 mL of acetic acid and 100 mL of water.

Procedure-The microscope slide with affixed tissue, as prepared in Preparation of tissue for staining is sequentially immersed in three changes of a suitable histological, alipha-
tic xylene substitute ( 2 minutes per step), three changes of dehydrated alcohol ( 1 minute per step), alcohol ( 20 seconds), and running tap water rinse ( 1 minute). Immerse the slide in Bouins's solution, and place in a $42^{\circ}$ water bath for 1 hour. Rinse the slide in water for 10 seconds. Sequentially immerse the slide in Weigert's iron hematoxylin working solution ( 10 minutes) and running tap water rinse (10 minutes). Rinse the slide in water for 10 seconds, and immerse in Gomori's trichrome solution ( 3 to 5 minutes). Rinse the slide in $1 \%$ Acetic acid for 20 seconds. Sequentially immerse the slide in three changes of alcohol ( 10 seconds per step) and three changes of a suitable histological, aliphatic xylene substitute ( 10 seconds per step). Affix a coverslip over the tissue using a suitable coverslip mountant. Nuclei will stain black; cytoplasm, keratin, and muscle fibers will stain red; and collagen and mucin will stain blue. Using USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrograph 2 for comparison, the tissue contains normal human fibroblast distributed throughout the secreted matrix and resembles normal human papillary; dermis, muscle fibers, and keratin are absent.

DISTRIBUTION OF FIBRONECTIN-
Tris-saline buffer-Prepare a solution containing 0.1 M tris(hydroxymethyl)aminomethane hydrochloride and 0.15 M sodium chloride, adjusted to a pH of 7.8 .
$3 \%$ Hydrogen peroxide-Mix 30 mL of hydrogen peroxide in water or methanol.

Diaminobenzidine solution-Use a suitable solution. ${ }^{8}$
Hematoxylin staining solution-Prepare as directed for Hematoxylin-eosin staining.

[^165]Procedure-The microscope slide with affixed tissue as prepared in Preparation of tissue for staining is dried either overnight at $37^{\circ}$ or for 1 hour at $60^{\circ}$. The microscope slide with affixed tissue as prepared in Preparation of tissue for staining is sequentially immersed in three changes of a suitable histological, aliphatic xylene substitute ( 2 minutes per step), three changes of dehydrated alcohol ( 1 minute per step), alcohol (20 seconds), and running tap water rinse (1 minute). Sequentially immerse the slide in Tris-saline buffer (10 minutes), $3 \%$ Hydrogen peroxide ( 30 minutes), three changes of Tris-saline buffer ( 1 minute per step), a suitable normal rabbit serum ${ }^{9}$ ( 30 minutes), water ( 5 minutes), and three changes of Tris-saline buffer ( 1 minute per step). Incubate the slide with a suitable solution of rabbit anti-human fibronectin antibody, ${ }^{10}$ diluted using a suitable antibody diluent ${ }^{11}$ to an antibody titer of $21.0 \pm 2.1 \mathrm{mg}$ per L for 1 (hour. Sequentially immerse the slide in water ( 5 minutes) and three changes of Tris-saline buffer (1 minute per step). Place enough drops of a biotinylated goat anti-rabbit antibody solution ${ }^{12}$ to cover the tissue section, and incubate for 30 minutes. Sequentially immerse the slide in water (5 minutes) and three changes of Tris-saline buffer (1 minute per step). Place enough drops of a streptavidin conjugated horseradish peroxidase solution ${ }^{13}$ to cover the tissue section, and incubate for 30 minutes. Sequentially immerse the slide in water ( 5 minutes) and three changes of Tris-saline buffer ( 1 minute per step). Incubate the slide with Dia-

[^166]minobenzidine solution for 1 to 5 minutes, until a suitable difference in staining is seen by comparison with a control in which the fibronectin (primary) antibody is omitted. Sequentially immerse the slide in water (1 minute), Hematoxylin staining solution ( 4 to 5 minutes), and water ( 1 minute). Do not allow the tissue to dry. Affix a coverslip over the tissue using a low-viscosity, aqueous, synthetic-resin coverslip mountant. Using USP Cryopreserved Human FibroblastDerived Dermal Substitute Reference Photomicrograph 3 for comparison, fibronectin is found colocalizing with the collagen fibers. The intensity of staining may vary from region to region of the slide.

## Metabolic activity assessment-

DPBS solution A-Dissolve 1.32 g of calcium chloride and 1.21 g of magnesium sulfate heptahydrate in 2 L of water.
DPBS solution B-Dissolve 80.0 g of sodium chloride; 2.0 g of potassium chloride; 11.5 g of dibasic sodium phosphate; 2.0 g of monobasic potassium phosphate; 10.0 g of glucose; 0.36 g of sodium phosphate; 0.5 g of streptomycin sulfate; and 1,000,000 USP Units of penicillin G sodium in 8 L water.

DPBS working solution-Mix DPBS solution B with DPBS solution $A(8: 2)$. Pass the solution through a filter having a porosity of $0.22 \mu \mathrm{~m}$.
Dulbecco's modified Eagle's tissue culture medium-Prepare a solution that contains the following components:

| Component | mg per L |
| :--- | :---: |
| Calcium chloride | 264.9 |
| Ferric nitrate nonahydrate | 0.10 |
| Potassium chloride | 400.0 |
| Magnesium sulfate heptahydrate | 200.0 |
| Sodium chloride | $6,400.0$ |
| Sodium bicarbonate | $3,700.0$ |

| Component | mg per L |
| :--- | :---: |
| Sodium phosphate, monobasic |  |
| (monohydrate) | 125.0 |
| Dextrose | $4,500.0$ |
| Phenol red | 15.0 |
| Sodium pyruvate | 110.0 |
| L-Arginine hydrochloride | 84.0 |
| L-Cystine | 48.0 |
| Aminoacetic acid | 30.0 |
| L-Histidine hydrochloride monohydrate | 42.0 |
| L-Isoleucine | 104.8 |
| L-Leucine | 104.8 |
| L-Lysine hydrochloride | 146.2 |
| L-Methionine | 30.0 |
| L-Phenylalanine | 66.0 |
| L-Serine | 42.0 |
| L-Threonine | 95.2 |
| L-Tryptophan | 16.0 |
| L-Tyrosine | 72.0 |
| L-Valine | 93.6 |
| D-Calcium pantothenate | 4.0 |
| Choline chloride | 4.0 |
| Folic acid | 4.0 |
| Inositol | 7.0 |
| Nicotinamide | 4.0 |
| Pyridoxine hydrochloride | 4.0 |
| Thiamine hydrochloride | 0.40 |
|  | 4.0 |

L-Glutamine solution-Prepare a $100-\mathrm{mL}$ solution containing 2.92 g of L -glutamine.

Sodium pyruvate solution-Prepare $100-\mathrm{mL}$ of a solution containing 1.10 g of sodium pyruvate.

Antibiotic-antimycotic solution-Prepare 100 mL of a solution containing 0.85 g of sodium chloride, 10,000 USP Units of penicillin G sodium, $10,000 \mu \mathrm{~g}$ of streptomycin (base), and $25 \mu \mathrm{~g}$ of amphotericin B.

Assay stock medium - Mix 1000 mL of Dulbecco's modified Eagle's tissue culture medium, 10 mL of $L$-Glutamine solution, 10 mL of Sodium pyruvate solution, 10 mL of Antibiotic-antimycotic solution, and 20 mL of fetal bovine serum. ${ }^{14}$

MTT-assay solution-Dissolve 0.50 g of 3 -(4,5-di-methylthiazol-2yl)-2,5-diphenyl tetrazolium bromide in 1 L of Assay stock medium, using constant stirring. Sterilize the solution by passing it through a suitable filter having a porosity of $0.2 \mu \mathrm{~m}$.
MTT formazan stock solution-Prepare a solution containing $100 \mu \mathrm{~g}$ of 1-(4,5-dimethylthiazol-2-yl)-3,5-diphenylformazan per mL of isopropyl alcohol.

MTT formazan calibration solutions-Prepare solutions containing the following five MTT formazan concentrations: $15 \mu \mathrm{~g}$ per $\mathrm{mL}, 30 \mu \mathrm{~g}$ per $\mathrm{mL}, 45 \mu \mathrm{~g}$ per $\mathrm{mL}, 60 \mu \mathrm{~g}$ per mL , and $75 \mu \mathrm{~g}$ per mL of MTT formazan, using MTT formazan stock solution and diluting with isopropyl alcohol.

Procedure-Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between $34^{\circ}$ and $37^{\circ}$ for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fi-broblast-Derived Dermal Substitute unit. Cut three $11-\mathrm{mm}$ $\times 11-\mathrm{mm}$ sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute, and immerse the sections into separate, $3.0-\mathrm{mL}$ portions of MTT-assay solution. Incubate for 2 hours at $37 \pm 2^{\circ}$ in a $3 \%$ to $7 \% \mathrm{CO}^{2}$-air environment with shaking on an orbital shaker at 150 to 200 rpm . After incu-

[^167]bation remove from the $37^{\circ}, 3 \%$ to $7 \% \mathrm{CO}^{2}$-air environment. Remove the MTT-assay solution, and rinse twice with DPBS working solution. Immerse the Cryopreserved Human Fibroblast-Derived Dermal Substitute in 2 mL of isopropyl alcohol, and incubate at ambient temperature for 1 hour with shaking on an orbital shaker at approximately 125 rpm . Transfer $200-\mu \mathrm{L}$ aliquots of the five MTT formazan calibration solutions, in triplicate, and $200-\mu \mathrm{L}$ aliquots of the three isopropyl alcohol extracts of Cryopreserved Human Fibroblast-Derived Dermal Substitute to a suitable 96well flat-bottom plate. Read the absorbance of each aliquot at 540 nm , using $200 \mu \mathrm{~L}$ of isopropyl alcohol as the blank. Plot the responses of the MTT formazan calibration solutions versus concentration, in $\mu \mathrm{g}$ of MTT formazan per mL , and calculate the regression line using the least-squares method; the test is considered valid if the regression line has a square of the correlation coefficient not less than 0.95 : the absorbance value of individual, thawed, Cryopreserved Human Fibroblast-Derived Dermal Substitute sections is between 0.30 and 0.86 .

## DNA content-

Cell culture water-Use sterile water containing not more than 0.005 USP Endotoxin Unit per mL.

DNA extraction buffer-Transfer about 850 mL of Cell culture water to a sterile, 1-L graduated container. Dissolve 12.110 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 3.802 g of edetate disodium, 23.380 g of sodium chloride, and 0.080 g of sodium dodecyl sulfate, with stirring. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 7.0. Dilute with Cell culture water to 1 L .

Proteinase K solution-Prepare a solution of Tritirachium album proteinase K in 10 mM of 2-amino-2-hydroxy-methyl-1,3-propanediol, adjusted to a pH of 7.5 , having an activity of 600 units per $\mathrm{mL} .{ }^{15}$

Working DNA extraction buffer-Add 1.22 mL of Proteinase $K$ solution to 38.78 mL of DNA extraction buffer, and mix.

Dilution buffer-Transfer 850 mL of Cell culture water to a sterile, 1-L graduated container. Add 1.211 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 3.802 g of edetate disodium, and 5.844 g of sodium chloride, with stirring. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 7.0. Dilute with Cell culture water to 1 L .

DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution-Prepare a solution containing 8.00 g of sodium chloride, 1.15 g of dibasic sodium phosphate (anhydrous), 0.20 g of potassium chloride, and 0.20 g of monobasic potassium phosphate per L .

Calf thymus DNA solution-Prepare a solution containing 1 mg of calf thymus DNA per mL of DPBS without $\mathrm{Ca}^{++}$, $\mathrm{Mg}^{++}$solution, mixing thoroughly for 12 to 24 hours at ambient temperature. Dilute the resulting solution with $D P B S$ without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution to prepare a solution containing $50 \mu \mathrm{~g}$ of calf thymus DNA per mL , mixing thoroughly on a vortex mixer for 10 minutes.

Calf thymus DNA calibration solutions-Prepare four calibration solutions containing $5 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per $\mathrm{mL}, 15$ $\mu \mathrm{g}$ per mL , and $20 \mu \mathrm{~g}$ per mL of calf thymus DNA, using Calf thymus DNA solution and diluting with DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution.
DNA staining solution—Prepare a solution containing 0.5 $\mu \mathrm{g}$ of 2'-(4-hydroxyphenyl)-5-(4-methyl-1-piperazinyl)-2,5'-bi-1H-benzimidazole trihydrochloride pentahydrate per mL of Dilution buffer. Store in low-actinic glassware.

[^168]Procedure-Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between $34^{\circ}$ and $37^{\circ}$ for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fi-broblast-Derived Dermal Substitute unit. Cut three $11-\mathrm{mm}$ $\times 11-\mathrm{mm}$ sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute. To each of three microcentrifuge tubes add 1 mL of DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution. Immerse a single Cryopreserved Human Fibroblast-Derived Dermal Substitute $11-\mathrm{mm} \times 11-\mathrm{mm}$ section into each microcentrifuge tube to remove the cryopreservative. Aspirate the DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution from each tube, and replace with 1 mL of Working DNA extraction buffer, making sure that each Cryopreserved Human Fibroblast-Derived Dermal Substitute is completely submerged in the extraction buffer. Incubate the samples in a $56^{\circ}$ to $60^{\circ}$ water bath for 4 to 18 hours. Sonicate for 10 to 15 seconds using an ultrasonic cell disrupter to achieve complete cellular disruption of the tissue and to mix the contents of the tube. Centrifuge the microcentrifuge tubes at 12,000 to 15,000 $\times g$ to pellet non-DNA material. Transfer three $50-\mu \mathrm{L}$ aliquots of each sample supernatant to individual wells of a 96well black plate suitable for performing fluorescent analysis.
Transfer triplicate $50-\mu \mathrm{L}$ aliquots of each of the Calf thymus DNA calibration solutions to the 96 -well plate, as well as a $50-\mu \mathrm{L}$ aliquot of DPBS working solution for the blank. Add $150 \mu \mathrm{~L}$ of $D N A$ staining solution to all wells containing the tissue samples, Calf thymus DNA calibration solutions, and the blank. Cover with aluminum foil, and place in a dark cabinet for 30 to 45 minutes at $15^{\circ}$ to $30^{\circ}$. Read the fluorescence of each well, using an excitation wavelength of 355 nm and an emission wavelength of 460 nm , blanking against the DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution well. Plot the responses of the Calf thymus DNA calibration solutions
versus concentration, in $\mu \mathrm{g}$ of calf thymus DNA per mL, and calculate the regression line using the least-squares method. The test is considered valid if the $\% C V$ of the replicate values is less than $15 \%$, the slope is between 4.48 and 6.27 , the $y$-intercept is between -2.04 and 3.65 , and the square of the correlation coefficient is not less than 0.990 . From the regression line so obtained, determine the amount of DNA, in $\mu \mathrm{g}$ per $11-\mathrm{mm} \times 11-\mathrm{mm}$ sample: the amount of DNA of individual Cryopreserved Human Fibroblast-Derived Dermal Substitute $11-\mathrm{mm} \times 11-\mathrm{mm}$ section is between 6 and $15 \mu \mathrm{~g}$.

## Total collagen content-

DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution-Proceed as directed for DNA content.

DPBS with $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution-Prepare a solution containing 8.00 g of sodium chloride, 1.15 g of dibasic sodium phosphate (anhydrous), 0.20 g of potassium chloride, 0.20 g of monobasic potassium phosphate, 0.10 g of magnesium chloride hexahydrate, and 0.10 g of calcium chloride (anhydrous) per L.

Collagenase extraction solution-Prepare a solution of Clostridium histolyticum collagenase, type 2, in DPBS with $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution having an activity of at least 250 units per mL .
$2 \%$ Acetic acid solution-Mix 10 mL of acetic acid with 490 mL of water.

Collagen stock standard solution-Prepare a solution having a concentration of 2 mg of collagen, type I , per mL of $2 \%$ Acetic acid solution.

Collagen calibration standards-Cut polyglactin mesh ${ }^{16}$ into seventeen $11-\mathrm{mm} \times 11-\mathrm{mm}$ squares, and place one square into 17 individual wells of a 24 -well plate. Each well of the 24 -well plate has a surface area of about $220 \mathrm{~mm}^{2}$ and

[^169]a volume of about 3.5 mL . In quadruplicate, prepare wells containing $0.050 \mathrm{mg}, 0.100 \mathrm{mg}, 0.200 \mathrm{mg}$, and 0.400 mg of collagen by adding $25 \mathrm{~mL}, 50 \mathrm{~mL}$, 100 mL , and 200 mL , respectively, of the Collagen stock standard solution. The remaining well to which no Collagen stock standard solution has been added is used as the blank. Allow the wells to air dry.

Sirius red solution-Dissolve 0.5 g of Direct Red 80 in 500 mL of saturated picric acid.

1\% (p-tert-Octylphenoxy)polyethoxyethanol solutionMix 10 mL of (p-tert-octylphenoxy)polyethoxyethanol in 990 mL of DPBS with $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution.

Procedure-Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between $34^{\circ}$ and $37^{\circ}$ for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fi-broblast-Derived Dermal Substitute unit. Cut three $11-\mathrm{mm}$ $\times 11-\mathrm{mm}$ sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute. Place each test section into separate wells of a 24 -well plate. Add $200 \mu \mathrm{~L}$ of $1 \%$ (p-tertOctylphenoxy)polyethoxyethanol solution to each sample. Shake on a rotating platform shaker at 100 to 150 rpm for 60 to 70 minutes at room temperature. Aspirate off the $1 \%$ (p-tert-Octylphenoxy)polyethoxyethanol solution, and rinse three times with 2 mL of DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution. Transfer each of the collagen standards to individual wells of the 24 -well plate. Add 0.5 mL of Sirius red solution to each test sample and collagen standards. Shake on a rotating platform shaker at 100 to 150 rpm for 60 minutes at room temperature. Aspirate off the Sirius red solution from each well. Rinse each well twice with 2 mL of $\operatorname{DPBS}$ without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution. Add an additional 2 mL of $D P B S$ without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution to each well, and allow to stand for 2 minutes. Aspirate off the DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$
solution, and rinse twice more with 2 mL of $D P B S$ without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution. Aspirate off all traces of DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution. Add 0.5 mL of Collagenase extraction solution to each well containing the Collagen calibration standards. Add 2.0 mL of Collagenase extraction solution to each well containing test samples. Rotate the plate on an orbital rotator at about 150 rpm for 90 minutes at $37^{\circ}$. Transfer $200 \mu \mathrm{~L}$ from each well, and transfer to a suitable 96 -well flat-bottom plate. Read the absorbance of each aliquot at 540 nm . Dilute the Cryopreserved Human Fibroblast-Derived Dermal Substitute sample preparation further with DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution if the absorbance is greater than the absorbance of the highest of the Collagen calibration standards. Plot the responses of the Collagen calibration standards versus the amount, in mg of collagen, and calculate the regression line using the least-squares method. The test is considered valid if the slope is between 3.00 and 5.00 and the square of the correlation coefficient is greater than or equal to 0.950 . Determine the mg of collagen per Cryopreserved Human Fibroblast-Derived Dermal Substitute section from the regression line and using the following equation:

$$
C C_{S R}=D f \times A \times S C_{S R},
$$

in which $C C_{S R}$ is the collagen content of the piece, in $\mathrm{mg} ; D f$ is the dilution factor (normally 4, unless the sample had to be further diluted); $A$ is the absorbance at 540 nm ; and $S C_{S R}$ is the slope of the regression line of the standards calculated above. The test is considered valid if the slope of the regression line is between 3.00 and 5.00 and has a square of the correlation coefficient greater than 0.950 : the amount of collagen in individual Cryopreserved Human Fibroblast-Derived Dermal Substitute $11-\mathrm{mm} \times 11-\mathrm{mm}$ samples is between 0.40 and $2.0 \mathrm{mg} \cdot \mathbf{1 S}$ (USP28)

## Add the following:

## ©Human Fibroblast-Derived Temporary Skin Substitute

» Human Fibroblast-Derived Temporary Skin Substitute is a nonliving monolayer skin substitute derived from neonatal foreskins. It is composed of fibroblasts, an extracellular matrix, and a nylon mesh bonded to a transparent, semipermeable silicone membrane. Human fibroblasts are seeded onto the nylon mesh. The fibroblasts proliferate within the nylon mesh and secrete human dermal collagen, matrix proteins, growth factors, and cytokines. Following freezing, no cellular metabolic activity remains; however, the tissue matrix and bound growth factors remain. Human Fibroblast-Derived Temporary Skin Substitute does not contain macrophages, lymphocytes, blood vessels, hair follicles, muscle fibers, or keratin. The fibroblast-cell banks, from which Human Fibroblast-Derived Temporary Skin Substitute is derived, test negative for human and animal viruses and retroviruses and are also tested for normal cell morphology, human karyology,
and isoenzymes. Maternal blood sera are tested for evidence of infection with human immunodeficiency virus types 1 and 2 , hepatitis B and C viruses, syphilis, and human T-lymphotropic virus type 1 and is found negative for the purpose of donor selection. Reagents used in the manufacture of Human Fibroblast-Derived Temporary Skin Substitute are tested and found free from viruses, retroviruses, endotoxins, and mycoplasma before use. Human Fibroblast-Derived Temporary Skin Substitute is manufactured with sterile components under aseptic conditions within the final package. All materials derived from bovine sources originate from countries free of bovine spongiform encephalopathy. During subsequent screening of the fibroblast cell strain at various stages in the manufacturing process, testing for these same viruses, as well as Epstein-Barr virus and human T-lymphotropic virus type 2 , is carried out and found to be negative. The final product tests negative for the presence of mycoplasma.

Packaging and storage-Human Fibroblast-Derived Temporary Skin Substitute is aseptically packaged and supplied frozen in a clear plastic cassette containing two, approximately $12.5-\mathrm{cm} \times 19-\mathrm{cm}$, units. The solution within the cassette is a phosphate-buffered cryoprotectant solution used to facilitate long-term storage. A clear plastic bag surrounds the cassette for its protection. Human Fibroblast-Derived Temporary Skin Substitute should be stored at a temperature of $-70^{\circ}$ to $-20^{\circ}$ for no longer than 18 months. Labeling-The label indicates the dimensions of the Human Fibroblast-Derived Temporary Skin Substitute material enclosed. It contains the expiry date, required storage con-
ditions, and the lot number. The label cautions that Human Fibroblast-Derived Temporary Skin Substitute is not to be used if the package shows signs of damage. Additional labeling requirements include instructions on the proper thawing and handling of Human Fibroblast-Derived Temporary Skin Substitute and the time frame for use after package opening.

USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS.
USP Authentic Visual References $\langle 11\rangle$ —USP Human Fi-broblast-Derived Skin Substitute Reference Photomicrographs. These three photomicrographs represent examples of passing units, prepared as directed in Hematoxylin-eosin staining, Collagen staining, and Distribution of fibronectin. They are specified to assist in ascertaining histological quality. The fibroblasts are embedded in an extracellular matrix that they have secreted (USP Human Fibroblast-Derived Skin Substitute Reference Photomicrograph 1). The collagen (USP Human Fibroblast-Derived Skin Substitute Reference Photomicrograph 2) and fibronectin (USP Human Fibroblast-Derived Skin Substitute Reference Photomicrograph 3) are to be found throughout the extracellular matrix. The nylon fibers (yellow in USP Human Fibro-blast-Derived Skin Substitute Reference Photomicrograph 1) and the silicone backing (grey in USP Human Fibro-blast-Derived Skin Substitute Reference Photomicrograph 1) are frequently visible although easily lost during processing. However, at this magnification, the presence of these components is the only visible difference between the Cryopreserved Human Fibroblast-Derived Dermal Substitute and the Human Fibroblast-Derived Temporary Skin Substitute. Sterility tests $\langle 71\rangle$ : meets the requirements.

Test solution-Thaw Human Fibroblast-Derived Temporary Skin Substitute by placing the tissue, still in its polycarbonate cassette contained in a plastic covering bag, in a water bath heated to a maximum of $37^{\circ}$ for 15 to 20 minutes
until no visible ice remains in the cassette. The minimum amount of water in the water bath is 2 L per Human Fibro-blast-Derived Temporary Skin Substitute unit. Perform the test on 20 mL of the cryopreservative.

Bacterial endotoxins $\langle 85\rangle$-Thaw Human Fibroblast-Derived Temporary Skin Substitute by placing the tissue, still in its polycarbonate cassette contained in a plastic covering bag, in a water bath heated to a maximum of $37^{\circ}$ for 15 to 20 minutes until no visible ice remains in the cassette. The minimum amount of water in the water bath is 2 L per Hu man Fibroblast-Derived Temporary Skin Substitute unit. Remove the unit from the polycarbonate cassette, and immerse in 25 mL of LAL Reagent Water. Extract for 60 min utes at $37^{\circ}$ with shaking on an orbital shaker set at 125 revolutions per minute. Remove a $4-\mathrm{mL}$ aliquot of the extract for testing: it contains not more than 0.5 USP Endotoxin Unit per mL.

## Histological characterization-

Buffered formalin and Preparation of tissue for stainingProceed as directed in the test for Histological characterization under Cryopreserved Human Fibroblast-Derived Dermal Substitute, substituting Human Fibroblast-Derived Temporary Skin Substitute for Cryopreserved Human Fi-broblast-Derived Dermal Substitute. The fibroblasts appear elongated and spindle shaped. The tissue contains about $10^{6}$ cells per $\mathrm{cm}^{2}$ and about 500 cells per mm along the section.

## HEMATOXYLIN-EOSIN STAINING-

Hematoxylin-alcohol solution, Hematoxylin staining solution, 10\% Acid alcohol, Eosin solution, and Proce-dure-Proceed as directed for Hematoxylin-eosin staining in the test for Histological characterization under Cryopreserved Human Fibroblast-Derived Dermal Substitute. Using USP Human Fibroblast-Derived Skin Substitute Reference Photomicrograph 1 (hematoxylin-eosin stained) for comparison, the nylon-scaffold mesh, silicone membrane,
and secreted collagen-based matrix are present and the tissue contains normal human fibroblast distributed throughout the secreted matrix and resembles normal human papillary dermis.

## COLLAGEN STAINING-

Bouins's solution, Weigert's iron hematoxylin working solution, Gomori's trichrome solution, 1\% Acetic acid, and Procedure-Proceed as directed for Collagen staining in the test for Histological characterization under Cryopreserved Human Fibroblast-Derived Dermal Substitute. Using USP Human Fibroblast-Derived Skin Reference Photomicrograph 2 for comparison, collagen is found throughout the extracellular matrix in a manner indistinguishable from Cryopreserved Human Fibroblast-Derived Dermal Substitute.

## DISTRIBUTION OF FIBRONECTIN-

Tris-saline buffer, 3\% Hydrogen peroxide, Diaminobenzidine solution, Hematoxylin staining solution, and Proce-dure-Proceed as directed for Distribution of fibronectin in the test for Histological characterization under Cryopreserved Human Fibroblast-Derived Dermal Substitute. Using USP Human Fibroblast-Derived Skin Substitute Reference Photomicrograph 3 (diaminobenzidine-hematoxylin stained) for comparison, fibronectin binds to collagen and is found throughout the extracellular matrix in a manner indistinguishable from Cryopreserved Human Fi-broblast-Derived Dermal Substitute.

## Metabolic activity assessment-

DPBS working solution, Assay stock medium, MTT-assay solution, MTT formazan calibration solutions, and Proce-dure-Proceed as directed in the test for Metabolic activity assessment under Cryopreserved Human Fibroblast-Derived Dermal Substitute, substituting Human Fibroblast-Derived Temporary Skin Substitute for Cryopreserved Human

Fibroblast-Derived Dermal Substitute: the absorbance value of individual Human Fibroblast-Derived Temporary Skin Substitute sections at 540 nm is less than 0.1 .

## DNA content-

Cell culture water, Working DNA extraction buffer, Dilution buffer, DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution, Calf thymus DNA calibration solutions, DNA staining solution, and Procedure-Proceed as directed in the test for DNA content under Cryopreserved Human Fibroblast-Derived Dermal Substitute, substituting Human Fibroblast-Derived Temporary Skin Substitute for Cryopreserved Human FibroblastDerived Dermal Substitute. The amount of DNA in individual Human Fibroblast-Derived Temporary Skin Substitute $11-\mathrm{mm} \times 11-\mathrm{mm}$ sections is between 6 and $14 \mu \mathrm{~g}$.

## Total collagen content-

DPBS without $\mathrm{Ca}^{++}, \mathrm{Mg}^{++}$solution, DPBS with $\mathrm{Ca}^{++}$, $\mathrm{Mg}^{++}$solution, Collagenase extraction solution, $2 \%$ Acetic acid solution, Collagen calibration standards, Sirius red solution, 1\% (p-tert-Octylphenoxy)polyethoxyethanol solution, and Procedure-Proceed as directed in the test for Total collagen content under Cryopreserved Human Fibroblast-Derived Dermal Substitute, substituting Human Fibroblast-Derived Temporary Skin Substitute for Cryopreserved Human Fibroblast-Derived Dermal Substitute: the amount of collagen in individual Human Fibroblast-Derived Temporary Skin Substitute $11-\mathrm{mm} \times 11-\mathrm{mm}$ samples is between 0.50 and 4.0 mg .■1S (USP28)

## Briefing

Flumazenil, page 1480 of $P F 29(5)$ [Sept.-Oct. 2003]. It is proposed to modify the Identification test $B$ by substituting an HPLC method for the TLC method, using the same data obtained in the Assay. Test 1 and Test 2 under Related compounds, and also the

Assay, are changed to include a validated method that uses just one reference standard and identifies a number of different products of synthesis. The validation work was performed using an Intersil ODS-2 brand of L1 packing. In a typical chromatogram, the retention time of Flumazenil is about 11 minutes. It is proposed to replace the test for Water, Method 1, with a test for Loss on drying, because this substance is not hygroscopic. It is also proposed to replace the test for Limit of alcohol and methylene chloride with a test for Organic volatile impurities, Method IV, which is more general in nature and not process-specific.
(PA3: S. Salado) RTS-40739-1

## Add the following:

## ■Flumazenil

$\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{FN}_{3} \mathrm{O}_{3} \quad 303.3$

4H-Imidazo[1,5- $\alpha][1,4]$ benzodiazepine-3-carboxylic acid, 8-fluoro-5,6-dihydro-5-methyl-6-oxo-, ethyl ester.
Ethyl 8-fluoro-5,6-dihydro-5-methyl-6-oxo-4H-imidazo $[1,5-\alpha][1,4]$ benzodiazepine-3-carboxylate [78755-81-4].
» Flumazenil contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{FN}_{3} \mathrm{O}_{3}$, calculated on the anhydrous dried basis.

Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Flumazenil $R S$.
USP Flamtzenil Related Competnd A RS. USP Flantazenit
Related Compernd BRS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Thin Layer Chromatographic Identificaion Test $\langle z 01\rangle$ —

Biluent, Adsorbent, Test solution, Standerd solution 1, Application whane, and Developing solvent system-Proeeed as directed for Related commends Test 1.

B: The retention time of the major peak for flumazenil in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Melting range, Class Ia $\langle 741\rangle$ : between $198^{\circ}$ and $202^{\circ}$.
Bacterial endotoxins $\langle 85\rangle$ - It contains not more than 25.0 USP Endotoxin Units per mg of Flumazenil.

$$
\text { Water, Methed } I\langle 924\rangle \div \text { net mere than } 0.5 \%
$$

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.

## Related compounds-

TEST 1-
Ninhydrin solution-Dissolve 0.5 g of ninhydrin in 90 mL of alcohol, and add 10 mL of glacial acetic acid.

Diluent-Prepare a mixture of alcohol and chloroform (1:1).

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture (see Chromatography $\langle 621\rangle$ ).

Test solution-Transfer about 250 mg of Flumazenil, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume, and mix.

Standated solution 1 Dissolve an aceurately weighed pertion of USP Flumazenil PS in Diltent, and dilute quantitatively, and stepwise if necessary, with Diltent to obtain a solution having a known concentration of about 50 mg per mL.

Standard solution $\geq 1$-Prepare a solution of USP Flumazenil RS USP Flumazenil Related Compound A RS, USP Flumazenil Related Compound B RS, and $N, N$-dimethylformamide diethyl acetal in Diluent having known concentrations of about 0.5 mg per $\mathrm{mL}-0.5 \mathrm{mg}$ per mL , abt 0.5 mg per mL , and about $0.6 \mu \mathrm{~L}$ per mL , respectively.

Standard solution 子2-Dilute 2.0 mL of Standard solution 1 with Diluent to 10.0 mL .
Stand solution- Dilute 1.0 mL of Stand solution
$z$ with Diltent to 10.0 mL .
Standard solution 5- Dilute 0.5 mL of Standard solution
2with Diluent to 10.0 mL .
Application volume: $10 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform, glacial acetic acid, alcohol, and water ( $75: 15: 7.5: 2.5$ ).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Dry the plate for 10 minutes in a current of cold air, and view under short-wavelength UV light. Spray the plate with Ninhydrin solution, and heat at $105^{\circ}$ for 15 minutes. The $R_{F}$ values of analytes are as follows.

| Compound | $R_{F}$ | Detection |
| :---: | :---: | :---: |
| Flumazenil | about 0.8 | UV |
| Flumazenil related eompound B | about 0.7 | UV |
| Flumazenil related eompound $A$ | about 0.1 | UV |
| $N, N$-Dimethylformamide diethyl acetal | about 0.04 | Ninhydrin |

Any spot at an $R_{F}$ value corresponding to $N, N$-dimethylformamide diethyl acetal in the chromatogram obtained from the Test solution is not more intense than the corresponding
spot in the chromatogram obtained from Standard solution 3 2: not more than $0.2 \%$ is found. Compare any unspecified spot in the chromatogram of the Test solution with the spet for flumazenil obtained in the chromatograms of Standard solution 3, Stallat solution 4, and Standerd solution-5, when riewed under UV light. Repert the approximate level of each of the unknown impurities: not more than $0.2 \%$ of any unknown impurity is found; and not more than 0.5\% of totalunknown impurities is found. [NOTE-Use the spots for flumazenill related compound $\Lambda$ and flumazenil relatedcompound B in the chromatograms of Standard solution - 3, Standend solution - and Standed solution 5 as references only. They are quantified in Test 2.3

TEST 2
Biluted phosphoric acid pH 2.0, Mobile phase, System suitability solution, and Chromatographic system-Proceed as directed in the Assay.
Standard solution Use the Standard preparation deseribed in the Assay.

Fest solution-Use the Assay preparation deseribed in the Assay.

Procedure Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Staldard solution and Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Caleulate the pereentage of any impurity in the pertion of Flumazenil taken by the formula:

$$
(10,000 F)(C / H)\left(r_{i},+s\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Flt mazenil $R S$ in the Stadeded soltion; $F$ is the relative response factor of the impurity according to the table below; Wis the weight, in mg, of Flumazenil, on the anhydrous bu sis, used to prepare theTest solution; ris the peak area for
any impurity in the Test solution; and s is the peak area for $^{\text {is }}$ flumazenil in the Standard solution: the impurities meet the requirements given in the table below.

| Compound name | Relative retention time | Relative <br> Respense <br> Factor | Limit (\%) |
| :---: | :---: | :---: | :---: |
| Flumazenil related eompernd $A$ | about 0.23 | Q.9 | 0.2 |
| Flumazenil related empernd B | about 0.45 | $\theta .9$ | 0.3 |
| Flumazenil | 1.0 | - | - |
| Unknown-impurities | - | 1.0 | $\theta .2$ |
| Totat | - | - | 0.5 |

TEST 2-
Diluted phosphoric acid, pH 2.0, Mobile phase, System suitability solution, Assay preparation, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Flumazenil RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL .

Test solution-Transfer about 25.0 mg of Flumazenil, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for at least three times the retention time of flumazenil peak, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Flumazenil taken by the formula:

$$
2500(C / W)(1 / F)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Flumazenil RS in the Standard solution; $F$ is the relative response factor according to the Table below; $W$ is the weight, in mg , of Flumazenil, on the dried basis, used to prepare the Test solution; $r_{i}$ is the peak area for any impurity in the Test solution; and $r_{s}$ is the peak area for flumazenil in the Standard solution: the impurities meet the requirements given in the Table below.

| Compound name | Relative <br> retention <br> time | Relative <br> Response <br> Factor | Limit <br> (\%) |
| :---: | :---: | :---: | :---: |
| Flumazenil related compound A | about 0.4 | 1.1 | 0.2 |
| 7-Fluoro-4-methyl-3,4-dihydro-2,5H-1,4-benzodiazepine-2,5-dione | about 0.5 | 1.5 | 0.2 |
| Ethyl 5,6-dihydro-5-methyl-6-oxo-4H-imidazo- <br> $[1,5-\alpha][1,4]$ benzodiazepine-3-carboxilate | about 0.7 | 1.3 | 0.2 |
| Flumazenil related compound B | about 0.8 | 1.1 | 0.2 |
| Flumazenil | 1.0 | - | - |

|  | Relative | Relative |  |
| :--- | :---: | :---: | :---: |
| Compound | retention | Response | Limit |
| name | time | Factor | $(\%)$ |
| Ethyl 8-chloro-5,6-dihydro-5-methyl-6-oxo-4H- |  |  |  |
| imidazo-[1,5- $\alpha[1,4]$ benzodiazepine-3-carboxilate about 2.2 1.1 | 0.2 |  |  |
| Any individual unknown impurity | - | 1.0 | 0.1 |
| Total |  |  |  |

## Limit of aleohol and methylene chloride-

Standard solution Prepare a solution in dimethylsulfox ide containing $100 \mu \mathrm{~g}$ per mL of dehydrated alcohel and 4 Hg per mL of methylenechloride. Transfer 1 mL of this selution to a $20-\mathrm{mL}$ gas chrematographic headspace viat, and eap-immediately.

Fest solution Transfer about 100 mg of Flumazenil, aceurately weighed, to a $20-\mathrm{mL}$ gas chrematographic head space vial, add $1.0-\mathrm{mL}$ of dimethyl-sulfexide, eap immediately, and swirl.

Chromatographic system (see Chromatography $\langle 624$ ) The gas chromatograph is equipped with a headspace injec for and a flame ionization detector, a $0.32 \mathrm{~mm} \times 30 \mathrm{~m}$ fused siliea capillary column bonded with a 1.8 - $m$ layer of phase-G43, and a split injection system. The carrier gas is helium, flowing at a rate of about 1.7 mL per mintte, and the total flow rate is about 40 mL per minute. The chromato graph is programmed as follows. Initially the temperature of the coltmm is maintained at about $40^{\circ}$ for 20 mintutes, then the temperature is inereased at a rate of $35^{\circ}$ per mintete to $240^{\circ}$, and maintained at $240^{\circ}$ for 20 minutes. The injection pert temperature is maintained at about $140^{\circ}$, and the detec for is maintained at about $260^{\circ}$. The Standerd solttion and the Test solttion are maintained at about $90^{\circ}$, and the needle and transfer temperatures are maintained at about $140^{\circ}$. Chromatograph the Standard solttion, and record the peak
respenses as directed for Procedure: the elution order is at eohol and methylene chloride; the resolution, $R$, between at eohol and methylene chloride is not less than 3.0; and the relative-standard deviation of consecutive injections is net more that $10.0 \%$.

Procedure Using a heated, gas tight syringe, separately inject equal volumes (about 1 mL ) of the headspace of the Standerd solution and the Test solution into the chromategraph, record the ehromatograms, and measure the peak areas. Calculate the percentage of alcohol and methylene ehloride in the pertion of Flamazenil taken by the formmat:

$$
100(C / H)\left(r_{4}+\Psi_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of the relevant analyte in the Standeted solution; W is the weight, in mg, of Flumazenil taken to prepare the Test solution; and $f_{\&}$-and $x_{s}$ are the peak areas of the correspending analyte obtained from the Test solution and the Standard solution, respectively: not more than $0.1 \%$ of alcohel and not more than $0.001 \%$ of methylene chloride is found.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Solvent: dimethyl sulfoxide.

Assay-
Piluted phosphoric acid, pH 2.0. Adjust 800-mL of Water with phespheric acid to pH $2.0 \pm 0.05$.

Mebile phase Prepare a filtered and degassed mixtare of Piltul phosphoric acid, pH 2.0 and acetonitrile (80:20). Make adjustments if neeessary (see-System Suitability under Chromatography $\langle 621$ ) .

Standard preparation Dissolve an aceurately weighed quantity of USP Flumazenil PS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known-concentration of about $\theta .1$ mg per mL .

Systen suitability solution- Dissolve appropriate quantities of USP Fltmazenil Related Compennd A RS and USP Flumazenil Related Compound B RS in the Standard prepafation, and dilute quantitatively, and stepwise if necessaty, with Standard preparation to obtain a solution having known concentrations of each of about $0.2 \mu$ 上 per mL . Assay preparation Transfer about 10.0 mg of Flumaze fil, aceurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobite phase to volume, and mix. Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chrematograph is equipped with a 230 -nm detec for and a $4.6-\mathrm{mm} \times 15$-m coltumn that contains packing E7. The flow rate is about 1.5 mL per minte. Chremategraph the System stuitability solution, and record the peak respenses as directed for Procedure: the relative retention times are about 0.23 for flumazenil related compound $A$, about 0.45 for flumazenil related compound $B$, and 1.0 for flumazenil; the resolution, $R$, between flumazenil related eompernd $B$ and flumazenil is net less than 3.0 ; and the tait ing factor is net more than 1.5 for the flumazenil peak. Chrematograph the Standard prepatiation, and record the peak respenses as directed for Procedure: the relative standard deviation for replieate injections is not more than $2.0 \%$.

Procdure Separately inject equal volumes (about 25 HL) of the Standard preparation and the 1 ssay preparation into the ehrematograph, record the chrematograms, and measure the area for the flumazenil peaks. Calculate the quantity, in mg, of $\mathrm{C}_{45} \mathrm{H}_{44} \mathrm{FN}_{3} \mathrm{O}_{3}$ in the pertion of Flumazenit taken by the formula:

$$
100 C\left(r_{4} \not 廾_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Flu mazenil RS in the Statedted preparation; and + and $\Psi_{s}$ are the peak areas obtained from the $A$ ssay preparation and the Standared preparation, respeetively.

Diluted phosphoric acid, pH 2.0—Adjust 800 mL of water with phosphoric acid to a pH of $2.0 \pm 0.05$.

Mobile phase—Prepare a filtered and degassed mixture of Diluted phosphoric acid, pH 2.0 , methanol, and tetrahydrofuran ( $80: 13: 7$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve appropriate quantities of chlordiazepoxide and USP Flumazenil RS in Mobile phase, and dilute stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $6.4 \mu \mathrm{~g}$ per mL of each compound.

Standard preparation-Dissolve an accurately weighed quantity of USP Flumazenil RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation-Transfer about 25.0 mg of Flumazenil, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromato-
graph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.82 for chlordiazepoxide and 1.0 for flumazenil; the resolution, $R$, between chlordiazepoxide and flumazenil is not less than 2.0 ; the column efficiency is not less than 1500 theoretical plates for the flumazenil peak and the tailing factor is not more than 1.5 for the flumazenil peak. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the flumazenil peaks. Calculate the quantity, in mg , of $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{FN}_{3} \mathrm{O}_{3}$ in the portion of Flumazenil taken by the formula:

$$
25 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Flumazenil RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively.■IS (USP28)

## BRIEFING

Flurazepam Hydrochloride, USP 27 page 833 and page 490 of PF 30(2) [Mar.-Apr. 2004]. It is proposed not to chromatograph replicate injections of the System suitability solution in Chromatographic system in the test for Related compounds. No relative standard deviation is required for the System suitability solution.

## Change to read:

» Flurazepam Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{ClFN}_{3} \mathrm{O} \cdot 2 \mathrm{HCl}$, calculated on the tried
$\boldsymbol{\Delta}^{\text {anhhydrous }}{ }_{\triangle U S P 28}$
basis.

## Change to read:

## Related compounds-

Mobile phase-Prepare a filtered and degassed mixture of methanol and $1 \%$ ammonium acetate ( $80: 20$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve accurately weighed quantities of USP Flurazepam Related Compound C RS and USP Flurazepam Related Compound F RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about $2 \mu \mathrm{~g}$ per mL for each component. Prepare fresh daily.

Test solution-Transfer about 50 mg of Flurazepam Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, add methanol to volume, and mix. [NOTE-Prepare this solution just prior to use.]

System suitability solution-Dissolve accurately weighed quantities of USP Flurazepam Hydrochloride RS and 2-amino-5-chlorobenzophenone in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration in each mL of about $150 \mu \mathrm{~g}$ of USP Flurazepam Hydrochloride RS and about $60 \mu \mathrm{~g}$ of 2-amino-5-chlorobenzophenone.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $239-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph of

## ■11S (USP28)

the System suitability solution, and record the peak responses as directed under Procedure: the resolution, $R$, between 2-amino-5chlorobenzophenone and flurazepam is not less than 2. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed under Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percentage, of flurazepam related compound C and flurazepam related compound F in the portion of Flurazepam Hydrochloride taken by the formula:

$$
2.5(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Flurazepam Related Compound C RS or USP Flurazepam Related Compound F RS in the Standard solution; $W$ is the weight, in mg, of Flurazepam Hydrochloride taken; and $r_{U}$ and $r_{S}$ are the peak responses for the related compounds obtained from the Test solution and the Standard solution, respectively. The limit is not more than $0.1 \%$ of flurazepam related compound C and not more than $0.1 \%$ of flurazepam related compound $F$.

## Briefing

Fluticasone Propionate. Because there is no existing USP monograph for this drug substance, the following new monograph is being proposed. The liquid chromatographic procedures in the test for Related compounds and in the Assay are based on analyses performed with the Spherisorb ODSI brand of L1 column.
(AER: K. Zaidi) RTS-40414-1

## Add the following:

## ■Fluticasone Propionate

$\mathrm{C}_{25} \mathrm{H}_{31} \mathrm{~F}_{3} \mathrm{O}_{5} \mathrm{~S} \quad 500.57$

Androsta-1,4-diene-17-carbothioic acid, 6,9-difluoro-11-hydroxy-16-methyl-3-oxo-17-(1-oxopropoxy-, ( $6 \alpha$, $11 \beta, 16 \alpha, 17 \alpha$ )-S-(fluoromethyl) ester.
$S$-(Fluoromethyl) $6 \alpha, 9$-difluoro-11 $\beta, 17$-dihydroxy-16 $\alpha$ -methyl-3-oxoandrosta-1,4-diene-17 $\beta$-carbothioate, 17-
propionate [80474-14-2].
» Fluticasone Propionate contains not less than 98.0 percent and not more than 100.5 percent of $\mathrm{C}_{25} \mathrm{H}_{31} \mathrm{~F}_{3} \mathrm{O}_{5} \mathrm{~S}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers, and store at a temperature not exceeding $30^{\circ}$.

Labeling-Fluticasone Propionate in the form of microcrystals is so labeled.

USP Reference standards $\langle 11\rangle$ —USP Fluticasone Propionate RS. USP Fluticasone Propionate System Suitability Mixture RS. USP Fluticasone Propionate Resolution Mixture RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+32^{\circ}$ and $+36^{\circ}(t=$ $20^{\circ}$ ), calculated on the anhydrous, solvent-free basis.

Test solution: $0.5 \%(\mathrm{w} / \mathrm{v})$ of Fluticasone Propionate in dichloromethane ( 0.5 g in 100 mL ).

Water, Method I $\langle 921\rangle$ : not more than $0.2 \%(\mathrm{w} / \mathrm{w})$.

## Related compounds-

Solution A-Mix 0.5 mL of phosphoric acid in 1000 mL of acetonitrile.

Solution B-Mix 0.5 mL of phosphoric acid in 1000 mL of methanol.

Solution C-Mix 0.5 mL of phosphoric acid in 1000 mL of water.

Mobile phase-Use variable mixtures of Solution A, Solution B, and Solution C, as directed under Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Transfer approximately 2.0 mg of USP Fluticasone Propionate System Suitability Mixture RS to 5 mL of Solution $A$, and sonicate to dissolve. Add 5 mL of Solution $C$, and mix.

Test solution-Transfer approximately 2.0 mg of Fluticasone Propionate to 5 mL of Solution $A$, and sonicate to dissolve. Add 5 mL of Solution $C$, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $239-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $40^{\circ}$. The chromatograph is programmed as follows: Chromatograph the

System suitability solution, and measure the peak responses as directed for Procedure: the resolution, $R$, between fluticasone propionate related compound $B$ and fluticasone propionate related compound $C$ is not less than 0.6 ; the resolution between fluticasone propionate related compound D and fluticasone propionate is not less than 1.5 ; the relative retention times and limits are as provided in Ta ble 1.

## Bromofluoromethane content-

Standard stock solution-Transfer about $20 \mu \mathrm{~L}$ of bromofluoromethane to 10 mL of dimethylformamide, and mix. Dilute $10 \mu \mathrm{~L}$ of this solution with 1 mL of dimethylformamide ( $0.002 \% \mathrm{v} / \mathrm{v}$ ).

Standard solution-Dilute $10 \mu$ L of Standard stock solution with 1 mL of dimethylformamide, and mix ( $0.00002 \%$ $\mathrm{v} / \mathrm{v})$.

Test solution-Dissolve 200 mg of Fluticasone Propionate in 1.0 mL of dimethylformamide.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with an electron-capture detector, a $0.32-\mathrm{mm} \times 25-\mathrm{m}$ capillary column coated with a $5-\mu \mathrm{m}$ film of phase G27, and a split injection system. The carrier gas is nitrogen, flowing at a rate of about 2.8 mL per minute. The make-up gas is nitrogen, flowing at a rate of 30 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at $40^{\circ}$ for 3.5 minutes, then the temperature is increased at the rate of $30^{\circ}$ per minute to $200^{\circ}$, and maintained at $200^{\circ}$ for 10 minutes. The split injector ( $70: 1$ ) is maintained at a temperature of $85^{\circ}$, and the detec-
tor temperature is maintained at $250^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure.

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, and measure the responses for the bromofluoromethane peaks. The intensity of bromofluoromethane peak in the chromatogram of the Test solution is less than the intensity of bromofluoromethane peak in the chromatogram of the Standard solution.

## Acetone content-

Internal standard solution-Prepare a $0.05 \%$ (v/v) solution of tetrahydrofuran in dimethylformamide.

Standard solution-Prepare $0.05 \%(\mathrm{v} / \mathrm{v})$ of acetone in Internal standard solution.

Test solution-Dissolve an accurately weighed quantity of Fluticasone Propionate in Internal standard solution to obtain a solution having a known concentration of about 50 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 25-\mathrm{m}$ column coated with a 2 $\mu \mathrm{m}$ film of phase G15. The carrier gas is nitrogen or helium, flowing at a rate of about 5.5 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at $60^{\circ}$ for 3.5 minutes, then the temperature is increased at the rate of $30^{\circ}$ per minute to $180^{\circ}$, and maintained at $180^{\circ}$ for 3 minutes. The splitless injector temperature is maintained at $150^{\circ}$, and the detector temperature is maintained at $250^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.

Procedure-Separately inject equal volumes (about 0.1 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, and record the peak responses. Calculate the percentage of acetone $(\% \mathrm{w} / \mathrm{w})$ in the portion of Fluticasone Propionate taken by the formula:

$$
0.05 \mathrm{D} / C\left(R_{U} / R_{S}\right)
$$

in which $D$ is the density of acetone at $20^{\circ}$; $C$ is the concentration, in g per mL , of fluticasone propionate in the Test solution; and $R_{U}$ and $R_{S}$ are the ratios of the acetone peak response to the tetrahydrofuran peak response obtained from the Test solution and the Standard solution, respectively: not more than $1.0(\% \mathrm{w} / \mathrm{w})$ is found.

## Assay-

0.01 M Monobasic ammonium phosphate buffer, pH 3.5Dissolve 11.5 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of $3.5 \pm 0.05$, and mix.

Mobile phase-Prepare a filtered and degassed mixture of methanol, 0.01 M Monobasic ammonium phosphate buffer, pH 3.5, and acetonitrile ( $50: 35: 15$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Resolution solution-Dissolve approximately 2.0 mg of USP Fluticasone Propionate Resolution Mixture RS in 50 mL of Mobile phase.

Standard preparation-Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg per mL .

Assay preparation-Dissolve an accurately weighed quantity of Fluticasone Propionate in Mobile phase, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentration of about 0.04 mg per mL.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $239-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Resolution solution and the Standard preparation, and record the peak areas as directed for Procedure: the relative retention times are about 1.10 for fluticasone propionate related compound D and 1.0 for fluticasone propionate; the resolution, $R$, between fluticasone propionate and fluticasone propionate related compound D is not less than 1.5 ; and the relative standard deviation for replicate injections is not more than $2 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{25} \mathrm{H}_{31} \mathrm{~F}_{3} \mathrm{O}_{5} \mathrm{~S}$ in the portion of Fluticasone Propionate taken by the formula:

$$
C V\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration of USP Fluticasone Propionate RS, in mg per mL, in the Standard preparation; $V$ is the volume, in mL, of the Assay preparation, and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Fluvastatin Sodium, page 8420 of $P F$ 25(4) [July-Aug. 1999]; Fluvastatin Capsules, page 8423 of $P F$ 25(4) [July-Aug. 1999]. These new monographs, which previously appeared in Pharmacopeial Previews, are now forwarded with major changes to In-Process Revision. The previously proposed tests for Chromatographic purity and the Assay are being cancelled and replaced with updated methods. The separate test for Limit of 3-hydroxy-5-keto-fluvastatin is also being cancelled; this test is now performed as a part of the test for Chromatographic purity. The liquid chromatographic procedures in the tests for Chromatographic purity and the Assay are based on analyses performed with the Keystone Hypersil ODS brand of L1 column. The typical retention time for the fluvastatin peak is about 5.3 minutes for the Fluvastatin Sodium procedure and 5.4 minutes for the Fluvastatin Capsules. It is proposed to add a storage statement to the Packaging and storage section, to revise the Reference standards section, and to add a clarification to Identification test $C$.

## Add the following:

## Fluvastatin Sodium

$\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{FNNaO}_{4} \quad 433.46$

6-Heptenoic acid, 7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1H-indol-2-yl]-3,5-dihydroxy-, monosodium salt, $\left[R^{*}, S^{*}-(E)\right]-( \pm)$.

Sodium ( $\pm$ )-( $3 R^{*}, 5 S^{*}, 6 E$ )-7-[3-( $p$-fluorophenyl)-1-isopro-pylindol-2-yl]-3,5-dihydroxy-6-heptenoate
[93957-55-2].
» Fluvastatin Sodium contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{FNNaO}_{4}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers, protected from moisture. Store between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Fluvastatin Sodium RS. USP Fhavastan Soditm Anti-Isomer RS. USP Fluvastatin Related Compound A RS. USP Fluvastatin Related Compound B RS. USP Fluvastatin for System Suitability RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$.
C: A solution ( 0.2 in 1 ) meets the requirements of the flame test for Sodium $\langle 191\rangle$.
$\mathbf{p H}\langle 791\rangle$ : between 8.0 and 10.0, in a solution ( 1 in 100), the test being performed immediately after preparation.

Water, Method $I\langle 921\rangle$ : not more than $4.0 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.
Chromatographic purity-[NOTE-Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]
Solution A, Solution B, and Mobile phase-Proceed as directed in the Assay.
System suitability stock solution-Prepare a solution in a mixture of methanol and acetonitrile $(3: 2)$ containing about 0.1 mg of USP Fluvastatin Related Compound A RS and about 0.1 mg of USP Fluvastatin Related Compound B RS per mL.

System suitability solution-Transfer about 50 mg of USP
Fluvastatin for System Suitability RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in 35 mL of Solution B. Add 5.0 mL of System suitability stock solution into the flask, dilute with Solution $A$ to volume, and mix. [NOTE-The System suitability stock solution and the System suitability solution are stable for up to 6 months if stored in refrigerator.]
Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system-Proceed as directed in the Assay, except use the liquid chromatograph equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 305 nm and at 365 nm . Chromatograph the System suitability solution, and record the peak responses at 305 nm as directed for Procedure. Identify the peaks corresponding to fluvastatin, fluvastatin anti-isomer, fluvastatin hydroxydiene, and fluvastatin $t$-butyl ester. The resolution, $R$, between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.6 ; the column efficiency is not less than 700 theoretical plates for the fluvastatin peak; and the tailing factor is not more than 3.0. Chromatograph the Standard solution, and record the peak responses at 305 nm as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms at 305 nm and 365 nm , identify the impurities listed in Table 1, and mea-
sure the peak responses. [NOTE-3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of 365 nm , and all other compounds are monitored at 305 nm .] Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Fluvastatin Sodium taken by the formula:

$$
100 F\left(C_{S} / C_{T}\right)\left(r_{i(305)} / r_{S(305)}\right)
$$

in which $F$ is the relative response factor as listed in Table 1 [NOTE-Use $F$ equal to 1.0 for unknown impurities]; $C_{S}$ is the concentration, in mg per mL , of USP Fluvastatin Sodium RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of Fluvastatin Sodium in the Test solution; $r_{i(305)}$ is the peak response at 305 nm for each impurity obtained from the Test solution; and $r_{s(305)}$ is the peak response at 305 nm for the fluvastatin peak, obtained from the Standard solution.
Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Fluvastatin Sodium taken by the formula:

$$
100 F\left(C_{S} / C_{T}\right)\left(r_{i(365)} / r_{S(365)}\right)
$$

in which $F, C_{S}$, and $C_{T}$ are defined above; $r_{i(365)}$ is the peak response at 365 nm for 3-hydroxy-5-keto fluvastatin, obtained from the Test solution; and $r_{s(365)}$ is the peak response at 365 nm for the fluvastatin peak, obtained from the Standard solution. In addition to not exceeding the limits for each impurity in Table 1, not more than $0.1 \%$ of any other individual impurity is found; and not more than $1.0 \%$ of total impurities is found.

Table 1

|  | Relative | Relative |  |
| :---: | :---: | :---: | :---: |
| Name | Retention <br> Response | Resp | Factor (F) | Limit (\%)

${ }_{2}$ At 365 nm

## Assay-

Solution A-Add 20 mL of $25 \%$ aqueous tetramethylammonium hydroxide solution to 880 mL of water. Adjust with about 2.3 mL of phosphoric acid to a pH of $7.2 \pm 0.2$. Add 100 mL of a mixture of methanol and acetonitrile (3:2), mix, and filter.

Solution B—Add 20 mL of $25 \%$ aqueous tetramethylammonium hydroxide solution and 80 mL of water to 900 mL of a mixture of methanol and acetonitrile ( $3: 2$ ). Adjust with about 2.3 mL of phosphoric acid to a pH of $7.2 \pm 0.2$, mix, and filter. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system.

System suitability preparation-Transfer an accurately weighed quantity of USP Fluvastatin for System Suitability RS to a suitable volumetric flask, dissolve first in Solution B, using $40 \%$ of the final volume, then dilute with Solution $A$ to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of fluvastatin sodium per mL .
Standard preparation-Transfer an accurately weighed quantity of USP Fluvastatin Sodium RS to a suitable volumetric flask, dissolve first in Solution B, using 40\% of the final volume, then dilute with Solution $A$ to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of fluvastatin sodium per mL .
Assay preparation-Transfer about 25 mg of Fluvastatin Sodium, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dissolve in 20 mL of Solution B, dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $305-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 3.0 mL per minute, and the column temperature is maintained at $35^{\circ}$. The chromatograph is programmed as follows. [NOTE-Adjust the start time of the gradient step and the equilibration time for each instrument.]

Time $\quad$ Solution A Solution B

| (minutes) | $(\%)$ | $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0--6$ | 60 | 40 | isocratic |
| $6-20$ | $60 \rightarrow 18$ | $40 \rightarrow 82$ | linear gradient |
| $20-20.1$ | $18 \rightarrow 60$ | $82 \rightarrow 40$ | linear gradient |
| $20.1-25.1$ | 60 | 40 | equilibration |

Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for fluvastatin and 1.2 for fluvastatin anti-isomer; the resolution, $R$, between the flu-
vastatin anti-isomer peak and the fluvastatin peak is not less than 1.6 ; the column efficiency is not less than 700 theoretical plates for the fluvastatin peak; and the tailing factor is not more than 3.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the fluvastatin peaks. Calculate the quantity, in mg, of $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{FNNaO}_{4}$ in the portion of Fluvastatin Sodium taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fluvastatin Sodium RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the fluvastatin peak responses obtained from the Assay preparation and the Standard preparation, respectively..1S (USP28)

## Add the following:

## ■ Fluvastatin Capsules

## » Fluvastatin Capsules contain an amount of Flu-

 vastatin Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluvastatin $\left(\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{FN} \Theta_{4}\right)$ $\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{FNO}_{4}$.Packaging and storage-Preserve in tight, light-resistant containers, protected from moisture and from light. Store in a cool place or at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fluvastatin Sodium RS. USP Flu In As USP Fluvastatin for System Suitability RS. USP Fluvastatin Related Compound A RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

B: A solution ( 0.2 in 1 ) meets the requirements of the flame test for Sodium $\langle 191\rangle$.

Dissolution $\langle 711\rangle$ -
Medium: water; 500 mL .
Apparatus 2: 50 rpm , sinkers not used.
Time: 30 minutes.
Determine the amount of $\epsilon_{24} \mathrm{H}_{26} \mathrm{FNO}_{4} \mathrm{C}_{24} \mathrm{H}_{26} \mathrm{FNO}_{4}$ dissolved by employing the following method.

Buffer solution-Dissolve about 1.534 g of monobasic ammonium phosphate in about 800 mL of water, and adjust with phosphoric acid or ammonium hydroxide to a pH of 3.5.

Mobile phase-Prepare a filtered and degassed mixture of methanol and Buffer solution (7:3).
Standard solution-[NOTE-A volume of methanol, not exceeding $2 \%$ of the final volume of solution, may be used to aid in dissolving the USP Reference Standard.] Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in Medium to obtain a solution having a known concentration of fluvastatin corresponding to that obtained when 1 Capsule is dissolved in 500 mL of solvent.

Test solution-Withdraw $20-\mathrm{mL}$ portions of liquid under test from each vessel, and pass through a suitable filter, discarding the first 2 mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $235-\mathrm{nm}$ detector, a suitable $7-\mu \mathrm{m}$ guard column that contains packing L1, and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \% 1.5 \%$.
Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the fluvastatin peaks. From the measured peak areas, calculate the quantity of $\epsilon_{24} \mathrm{H}_{25} \mathrm{FNO}_{4} \mathrm{C}_{24} \mathrm{H}_{26} \mathrm{FNO}_{4}$ dissolved.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\epsilon_{26} \mathrm{H}_{25} \mathrm{FNO}_{4} \mathrm{C}_{24} \mathrm{H}_{26} \mathrm{FNO}_{4}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements, the Chromatographic system being prepared as directed for the Dissolution test.

Chromatographic purity-[NOTE-Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

Solution A, Solution B, Mobile phase, and Diluent-Proceed as directed in the Assay.

System suitability stock solution-Prepare a solution in methanol containing about 0.1 mg of USP Fluvastatin Related Compound A RS per mL.
System suitability solution-Transfer about 50 mg of USP Fluvastatin for System Suitability RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in 35 mL of methanol. Add 5.0 mL of System suitability stock solution into the flask, dilute with Diluent to volume, and mix. [NOTE-The System suitability stock solution and the System suitability solution are stable for up to 6 months if stored in refrigerator.]

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system-Proceed as directed in the Assay, except use the liquid chromatograph equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 305 nm and at 365 nm . Chromatograph the System suitability solution, and record the peak responses at 305 nm as directed for Procedure. Identify the peaks corresponding to fluvastatin, fluvastatin anti-isomer, and fluvastatin hydroxydiene. Chromatograph the System suitability solution, and record the peak responses at 305 nm as directed for Procedure: the resolution, $R$, between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.4; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms at 305 nm and 365 nm , identify the impurities listed in Table 1, and measure the peak responses. [NOTE-3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of 365 nm , and all
other compounds are monitored at 305 nm .] Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Capsules taken by the formula:

$$
100 F(411.48 / 433.46)\left(C_{S} / C_{T}\right)\left(r_{i(305)} / r_{S(305)}\right)
$$

in which $F$ is the relative response factor as listed in Table 1 [NOTE-Use $F$ equal to 1.0 for unknown impurities]; 411.48 and 433.46 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; $C_{S}$ is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of fluvastatin in the Test solution, based on the label claim; $r_{i(305)}$ is the peak response at 305 nm for each impurity obtained from the Test solution; and $r_{S(305)}$ is the peak response at 305 nm for the fluvastatin peak, obtained from the Standard solution.

Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Capsules taken by the formula:

$$
100 F(411.48 / 433.46)\left(C_{S} / C_{T}\right)\left(r_{i(365)} / r_{S(365)}\right)
$$

in which $F, C_{S}$, and $C_{T}$ are defined above; $r_{i(365)}$ is the peak response at 365 nm for 3-hydroxy-5-keto fluvastatin, obtained from the Test solution; and $r_{S(365)}$ is the peak response at 365 nm for the fluvastatin peak, obtained from the Standard solution. In addition to not exceeding the limits for each impurity in Table 1, not more than $0.5 \%$ of any unknown impurity is found; not more than $1.5 \%$ of total unknown impurities is found; and not more than $4.0 \%$ of total impurities is found.

Table 1

|  | Relative <br> Retention <br> Name | Relative <br> Response |  |
| :---: | :---: | :---: | :---: |
| Fluvastatin anti- <br> isomer | 1.2 | 1.0 | 1.5 |
| Factor $(F)$ | Limit (\%) |  |  |
| 3-Hydroxy-5-keto <br> fluvastatin | 1.6 | $0.037^{1}$ | 1.0 |
| Fluvastatin hydroxy- <br> diene |  |  |  |
| Fluvastatin short <br> chain aldehyde | 2.2 | 1.1 | 1.0 |

## Assay-

pH 7.2 Buffer—Prepare a solution containing 40 mL of $25 \%$ aqueous tetramethylammonium hydroxide in 1 L of water, and adjust with approximately 4.5 mL of phosphoric acid to a pH of $7.2 \pm 0.2$.

Methanol-acetonitrile mixture-Prepare a mixture of methanol and acetonitrile $(3: 2)$.

Solution A-Prepare a filtered and degassed mixture of pH 7.2 Buffer and Methanol-acetonitrile mixture (87.5: 12.5).

Solution B-Prepare a filtered and degassed mixture of Methanol-acetonitrile mixture and pH 7.2 Buffer (87.5 : 12.5).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system.
Diluent-Prepare a mixture of $p H$ 7.2 Buffer and Metha-nol-acetonitrile mixture (54:46).

System suitability preparation-Dissolve an accurately weighed quantity of USP Fluvastatin for System Suitability RS in Diluent to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL .

Standard preparation-Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in Diluent to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL.

Assay stock preparation-Transfer the contents and the empty shells of 10 Capsules to a $200-\mathrm{mL}$ glass-stoppered flask. Add 100.0 mL of methanol, and stir with magnetic or mechanical stirrer for 45 minutes. Centrifuge a portion of this solution at 4000 rpm for 20 minutes.

Assay preparation-Quantitatively transfer an amount of the Assay stock preparation, containing 20.0 mg of fluvastatin based on the label claim, to a $50-\mathrm{mL}$ volumetric flask, and dilute with Diluent to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $305-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing Ll. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows. [NOTE-Adjust the start time of the gradient step and the equilibration time for each instrument.]

Time $\quad$ Solution $A$ Solution $B$

| (minutes) | $(\%)$ | $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-6$ | 54 | 46 | isocratic |
| $6-17$ | $54 \rightarrow 17$ | $46 \rightarrow 83$ | linear gradient |
| $17-20$ | 17 | 83 | isocratic |
| $20-20.1$ | $17 \rightarrow 54$ | $83 \rightarrow 46$ | linear gradient |
| $20.1-26.1$ | 54 | 46 | equilibration |

Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the retention time of the fluvastatin peak is about 5.4 minutes; the
relative retention times are about 1.0 for fluvastatin and 1.2 for fluvastatin anti-isomer; the resolution, $R$, between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.4 ; and the relative standard deviation for replicate injections is not more than $1.5 \%$. [NOTE-If the retention time of the fluvastatin peak exceeds 5.7 minutes, adjust the isocratic step accordingly, so that both fluvastatin peak and anti-isomer peak elute within the isocratic region.]
Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the fluvastatin peaks. Calculate the quantity, in mg , of fluvastatin $\left(\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{FNO}_{4}\right)$ in the portion of Capsules taken by the formula:

$$
5000(411.48 / 433.46)(C / V)\left(r_{U} / r_{s}\right)
$$

in which 411.48 and 433.46 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; $V$ is the volume, in mL, of the Assay stock preparation taken to prepare the Assay preparation; $C$ is the concentration, in mg per mL , of USP Fluvastatin Sodium RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the fluvastatin peak responses obtained from the Assay preparation and the Standard preparation, respectively. 1 (USP28)

## BRIEFING

Fluvoxamine Maleate; Fluvoxamine Maleate Tablets. Because there are no existing USP monographs for this drug substance and dosage form, new monographs are being presented. The liquid chromatographic procedure in the test for Chromato-
graphic purity and in the Assay is based on analyses performed with a Waters Symmetry column. The typical retention time for fluvoxamine maleate is about 8 minutes.
(PA3: S. Salado) RTS-40316-5

## Add the following:

## ■Fluvoxamine Maleate

» Fluvoxamine Maleate contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{15} \mathrm{H}_{21} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$, calculated on the dried basis.

Packaging and storage-Preserve in well-closed, light-resistant containers. Store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fluvoxamine Maleate $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Melting temperature $\langle 741\rangle$ : between $121^{\circ}$ and $123^{\circ}$.
Loss on drying $\langle 731\rangle$ —Dry it in vacuum at $80^{\circ}$ for 2 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Maleic acid—Transfer about 800.0 mg of Fluvoxamine Maleate, accurately weighed, to a $250-\mathrm{mL}$ conical flask containing 50 mL of water. Titrate with 0.1 N sodium hydroxide VS, using 0.5 mL of phenolphthalein TS as the indicator. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N sodium hydroxide VS is equivalent to 5.805 mg of maleic acid $\left(\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}\right)$. Between $26.0 \%$ and $27.5 \%$ of maleic acid is found.

Heavy metals, Method II 〈231〉: 0.001\%.

## Related compounds-

Buffer solution, Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.

Identification solution-Dissolve a quantity of maleic acid in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.35 mg per mL .

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay stock preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, Test solution, and the Identification solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of impurities in the portion of Fluvoxamine Maleate taken by the formula:

$$
5000(C / W) F\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Fluvoxamine Maleate RS in the Standard solution; $W$ is the weight, in mg , of fluvoxamine maleate used to prepare the Test solution; $F$ is the response factor of each impurity as given in Table 1; $r_{i}$ is the individual peak area of each im-
purity in the Test solution; and $r_{s}$ is the peak area of fluvoxamine maleate in the Standard solution. The limits of impurities are specified in Table 1. [NOTE-Disregard any peak due to maleic acid or the reagent blank.]

Table 1

| Compound name | Relative retention time | Response <br> Factor | Limit <br> (\%) |
| :---: | :---: | :---: | :---: |
| Maleic acid | about 0.19 | - | - |
| 5-Methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(E)-O-[2-[(2-succinyl)amino]ethyl]oxime | about 0.50 | 1.0 | 0.3 |
| 5-Methoxy-4'-(trifluoromethyl) valerophenone ( $E$ )-O-(2-aminoethyl)aminoethyl oxime maleate | about 0.67 | 1.4 | 0.2 |
| $Z$-isomer | about 0.79 | 1.0 | 0.5 |
| Fluvoxamine | 1.0 | - | - |
| 4'-(Trifluoromethyl)valerophenone $(E)$ - $O$ - 2-(2-amino ethyl)aminoethyl oxime maleate | about 1.18 | 1.0 | 0.2 |
| (E)-O-2-(2-Aminoethyl)-4-(trifluoromethyl)- $\alpha$-phenylacetophenone oxime maleate | about 1.74 | 1.0 | 0.2 |
| 4'-(Trifluoromethyl)valerophenone $(E)-O$-(2-aminoethyl) oxime maleate | about 2.00 | 1.0 | 0.2 |
| 5-Methoxy-4'-(trifluoromethyl) valerophenone oxime | about 3.45 | 0.6 | 0.2 |
| 5-Methoxy-4'-(trifluoromethyl) valerophenone ketone | about 4.2 | 0.3 | 0.2 |
| Unknown impurities | - | 1.0 | 0.1 |
| Total | - | - | 1.5 |

Organic volatile impurities, Method $I\langle 467\rangle$ : meets the requirements.

Assay-
Buffer solution-Dissolve about 5 g of 1-pentanesulfonic acid sodium salt and 0.7 g of monobasic potassium phosphate in 620 mL of water. Adjust with phosphoric acid to a pH of $3.00 \pm 0.05$.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (62:38). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Resolution solution-Transfer about 6 mg of Fluvoxamine Maleate to a $50-\mathrm{mL}$ volumetric flask. Heat the sample at $120^{\circ}$ for 10 minutes. Cool down to room temperature, and add 3.0 mL of 0.1 N hydrochloric acid. Heat the solution in a water bath for 10 minutes. Cool down to room temperature,
add 50 mg of Fluvoxamine Maleate, and dissolve in 25 mL of Mobile phase. Dilute with Mobile phase to volume, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Fluvoxamine Maleate RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.05 mg per mL .
Assay stock preparation-Transfer an accurately weighed quantity of about 50 mg of Fluvoxamine Maleate to a $50-$ mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Assay preparation—Transfer 5.0 mL of the Assay stock preparation to a $100-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $234-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1.7 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.2 for maleic acid, 0.5 for 5-methoxy-1-[4-(trifluoromethyl)phe-nyl]-1-pentanone-(E)-O-[2-[(2-succinyl)amino]ethyl]oxime, 0.8 for the $Z$-isomer, and 1.0 for fluvoxamine maleate; the resolution, $R$, between the $Z$-isomer and fluvoxamine maleate is not less than 3.0 and not less than 5.0 between 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-( $E$ )-$O$-[2-[(2-succinyl)amino]ethyl]oxime and the $Z$-isomer. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the fluvoxamine maleate peaks. Calculate the quantity, in mg, of $\mathrm{C}_{15} \mathrm{H}_{21} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ in the portion of Fluvoxamine Maleate taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fluvoxamine Maleate RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ IS (USP28)

## Briefing

Fluvoxamine Maleate Tablets-See briefing under Fluvoxamine Maleate.
(PA3: S. Salado) RTS-40316-1

## Add the following:

## ■ Fluvoxamine Maleate Tablets

» Fluvoxamine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluvoxamine maleate $\left(\mathrm{C}_{15} \mathrm{H}_{21} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}\right)$.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Fluvoxamine Maleate $R S$.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ - [To come].
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Related compounds-

Buffer solution, Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.

Identification solution-Dissolve a quantity of maleic acid in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a concentration of about 0.35 mg per mL .

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay stock preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, the Test solution, and the Identification solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of impurities in the portion of Tablets taken by the formula:

$$
100(C / D) F\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Fluvoxamine Maleate RS in the Standard solution; $D$ is the expected concentration, in mg per mL , of fluvoxamine maleate taking into account the labeled amount and the amount of sample taken to prepare the Test solution; $F$ is the response factor of each impurity as given in Table $1 ; r_{i}$ is the individual peak area of each impurity in the Test solution; and $r_{s}$ is the peak area of fluvoxamine maleate in the Standard solution. The limits of impurities are specified in Table 1. [NOTE-Disregard any peak due to maleic acid or to the reagent blank.]

Table 1

| Compound name | Relative retention time | Response <br> Factor | Limit \% |
| :---: | :---: | :---: | :---: |
| Maleic acid | about 0.19 | - | - |
| 5-Methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone( $E$ )-O-[2-[(2-succinyl)amino]ethyl]oxime | about 0.50 | 1.0 | 0.8 |

| 5-Methoxy-4'-(trifluoromethyl)valerophenone ketone | about 4.2 | 0.3 | 0.2 |
| Unknown impurities | - | 1.0 | 0.1 |
| Total | - | - | 1.8 |

## Assay-

Buffer solution-Dissolve approximately 5 g of 1-pentanesulfonic acid sodium salt and 0.7 g of monobasic potassium phosphate in 620 mL of water. Adjust with phosphoric acid to a pH of $3.00 \pm 0.05$.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $62: 38$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Resolution solution-Transfer approximately 6 mg of fluvoxamine maleate to a $50-\mathrm{mL}$ volumetric flask. Heat the sample at $120^{\circ}$ for 10 minutes. Cool down to room temperature, and add 3.0 mL of 0.1 N hydrochloric acid. Heat the solution in a water bath for 10 minutes. Cool down to room temperature, add 50 mg of fluvoxamine maleate, and dissolve in 25 mL Mobile phase. Dilute with Mobile phase to volume, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Fluvoxamine Maleate RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.05 mg per mL .
Assay stock preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of fluvoxamine maleate, to a $500-\mathrm{mL}$ volumetric flask, add about 250 mL of Mobile phase, sonicate for about 15 minutes, shake by mechanical means for about 15 minutes, dilute with Mobile phase to volume, and mix. Centrifuge a portion of this solution for 10 minutes.

Assay preparation-Transfer 5.0 mL of the supernatant from the Assay stock preparation to a $100-\mathrm{mL}$ volumetric flask. Pass a portion of this solution through a filter having a $45-\mu \mathrm{m}$ or finer porosity, and use the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $234-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1.7 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.19 for maleic acid, 0.5 for 5-methoxy-1-[4-(trifluoromethyl)phe-nyl]-1-pentanone-(E)-O-[2-[(2-succinyl)amino]ethyl]oxime, 0.79 for the $Z$-isomer, and 1.0 for fluvoxamine maleate; and the resolution, $R$, between the $Z$-isomer and fluvoxamine maleate is not less than 2.0 and not less that 5.0 between 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone- $(E)-O-[2-[(2$-succinyl)amino]ethyl]oxime and the $Z$-isomer. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the fluvoxamine maleate peaks. Calculate the quantity, in mg , of fluvoxamine maleate $\left(\mathrm{C}_{15} \mathrm{H}_{21} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}\right)$ in the portion of Tablets taken by the formula:

$$
10,000 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Fluvoxamine Maleate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Gemcitabine for Injection, page 3061 of the First Supplement. A revision is proposed in the test for Clarity of solution to replace $\tau$, tau with NTU to describe the turbidity measurement.
(PA6: L. Evans) RTS-41353-1

## Change to read:

Clarity of solution-Dissolve it in the solvent and at the concentration recommended in the labeling: not more than $10 \tau$
$\mathbf{- 1 0}_{10} \mathrm{NTU}_{1 \mathrm{~S}}$ (USP28)
(see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ), determined by ratio turbidimetry within 15 minutes of reconstitution, corrected for a diluent blank.

## BRIEFING

Gemfibrozil Capsules, USP 27 page 858. It is proposed to clarify the instructions for the preparation of the Medium in the test for Dissolution.
(BPC: M. Marques) RTS-41150-1

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.2 \mathrm{M} \mathrm{pH} 7.5$ phosphate buffer prepared as direed under Solutions in the section Reagents, Indicator's, and Solutions, exeept that 0.8 M menobasic petassitm phesphate-solution and 0.8 M sodium hydroxide solution are used;
-by dissolving 545 g of monobasic potassium phosphate in 5 L of water, adding 131 g of sodium hydroxide, diluting with water to about 19.5 L , and mixing well. Adjust with either 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 7.5 , and dilute with water to 20 L ; ${ }_{\text {1S }}$ (USP28) 900 mL .

Apparatus 2: 50 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with 1 N sodium hydroxide, in comparison with a Standard solution obtained as follows. Prepare a Standard stock
solution of USP Gemfibrozil RS having a known concentration of about 0.33 mg per mL in Dissolution Medium. [NOTE-Initially dissolve the USP Reference Standard in an amount of methanol not to exceed $1 \%$ of the volume of the Standard stock solution.] Quantitatively dilute the Standard stock solution with 1 N sodium hydroxide to obtain a Standard solution having a concentration estimated to correspond to that of the filtered and diluted solution under test.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}$ is dissolved in 45 minutes.

## BRIEFING

Gemfibrozil Tablets, USP 27 page 859. On the basis of comments received, it is proposed to clarify the instructions for the preparation of the Medium in the test for Dissolution.
(BPC: M. Marques) RTS-41143-1

## Change to read:

## Dissolution $\langle 711\rangle$ -

Medium: $\quad 0.2 \mathrm{M} \mathrm{pH} 7.5$ phosphate buffer prepared as direet under Buffer Solutions in the seetion Reagents, Indicutors, and So tutions, exeept that 0.8 M menobasie petassium phesphate selution and 0.8 M sodium hydroxide solution are used;
-by dissolving 545 g of monobasic potassium phosphate in 5 L of water, adding 131 g of sodium hydroxide, diluting with water to about 19.5 L , and mixing well. Adjust with either 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 7.5 , and dilute with water to 20 L ; ${ }_{1 S}$ (USP28) 900 mL .
Apparatus 2: 50 rpm .
Time: 30 minutes.
Procedure-Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with 1 N sodium hydroxide, in comparison with a Standard solution obtained as follows. Prepare a Standard stock solution of USP Gemfibrozil RS having a known concentration of about 0.33 mg per mL in Dissolution Medium. [nOTE-Initially dissolve the USP Reference Standard in an amount of methanol not to exceed $1 \%$ of the volume of the Standard stock solution.] Quantitatively dilute the Standard stock solution with 1 N sodium hydroxide to obtain a Standard solution having a concentration estimated to correspond to that of the filtered and diluted solution under test.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}$ is dissolved in 30 minutes.

## Briefing

Glimepiride, page 1891 of PF 29(6) [Nov.-Dec. 2003]. On the basis of comments received, this monograph is being revised. It is proposed to change acceptance criteria in the Definition in compliance with an FDA-approved submission. It is proposed to replace the gas chromatographic procedure in the test for Water with a titrimetric Karl Fisher procedure. Several alternative columns are being proposed for the liquid chromatographic procedure in the test for Limit of cis-isomer. The analyses could also be performed with $4.6-\mathrm{mm} \times 15-\mathrm{cm}, 4.6-\mathrm{mm} \times 25-\mathrm{cm}, 4-\mathrm{mm} \times 12.5-\mathrm{cm}$, or $4-\mathrm{mm}$ $\times 25-\mathrm{cm}$ LiChrospher Diol or LiChrosorb Diol columns containing packing L20; it may be necessary to adjust the flow rate accordingly. Some changes are also being proposed for Related compounds and the Assay. In addition, minor editorial changes have been made.
(PA4: E. Gonikberg) RTS-41258-1

## Add the following:

## Glimepiride

$\mathrm{C}_{24} \mathrm{H}_{34} \mathrm{~N}_{4} \mathrm{O}_{5} \mathrm{~S} \quad 490.62$

1 H -Pyrrole-1-carboxamide, 3-ethyl-2,5-dihydro-4-methyl-$N-[2-[4-[[[[(4-$ methylcyclohexyl)amino]carbonyl]ami-no]sulfonyl]phenyl]ethyl]-2-oxo-, trans-.

1-[[p-[2-(3-Ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxa-mido)ethyl]phenyl]sulfonyl]-3-(trans-4-methylcyclohexyl)urea [93479-97-1].
» Glimepiride contains not less than 97.098 .0 percent and not more than 102.0 percent of $\mathrm{C}_{24} \mathrm{H}_{34} \mathrm{~N}_{4} \mathrm{O}_{5} \mathrm{~S}$, calculated on the anhydrous basis.

Packaging and storage-Store in well-closed containers, at a temperature not exceeding $25^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Glimepiride $R S$. USP Glimepiride Related Compound A RS. USP Glimepiride Related Compound B RS. USP Glimepiride Related Compound C RS. USP Glimepiride Related Compound D $R S$.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Water, Method Ic $\langle 921\rangle$ -
Diluent Use dimethylformamide dried over a molecular sieve ( 2 mm ; pere-size: 0.4 nm ).

Standerd solution Transfer about 100.0 mg of water, aceurately weighed, inte a -100 mL volumetric flask containing the Diltent, dilute with Diltent to volume, and mix.

Blank solution Use the Diluent.
Fest solution Dissolve about 50 mg of Glimepiride, aceurately weighed, in 1.0 -ml of Diluent.

Chrematographic system (see Chromatography $\langle 624\rangle$ ) -
The ges chromatograph is equipped with a thermal condtetivity detector, a $0.32 \mathrm{~mm} \times 30 \mathrm{~m}$ fused silicacoltmment fainimg bended phase G43-in a $1.8 \mathrm{\mu m}$ film thickness, and a splitless injection system. The carrier ges is helitm flowing at a rate of about 2.2 mL per mintute. The temperature of the coltumn is maintained at $80^{\circ}$, the injection port temperature is maintained at $200^{\circ}$, and the detector is maintained at $250^{\circ}$. Ghrematograph the Standard solution, and record the peak respenses as directed for Procedtre: the resolution, $R$, beween the water peak and the air peak is not less than 2.0; and the relative standard deviation for replieate injections is net more than 10\%. [NOTE-The appreximate-retention times for air, water, and dimethylformamide are about 1.6, 1.8 , and 5.5 minutes, respectively.

Procedure Separately inject equal volumes (about $1 \mu \mathrm{H}$ ) of the Blank solution, the Standard solution, and the Test solution int the gas chromatograph, record the chromate-
grams, and measure the peak respenses. Caleulate the pereentage of water in the pertion of Glimepiride taken by the fermata:

$$
\left(r_{f}-r_{B}\right)\left(\left(r_{s}-r_{b}\right)\left(H_{s}+H_{t}\right)\right.
$$

in which $r_{B}, r_{7}$, and $r_{s}$ are the peak respenses obtained from the Blank solution, the Test solution, and the Standurd soltution, respectively; $H_{s}$ is the weight, in mg, of water taken to prepare the Standetrd solution; and $-W_{t}$ is the weight, in me, ef Glimepiride taken to prepare the Test solution. The water eentent is not mere than $0.5 \%$ Dissolve about 0.25 g of Glimepiride, accurately weighed, in dimethylformamide previously dried over a molecular sieve ( 2 mm , pore size 0.4 nm ), and dilute with the same solvent to 5.0 mL . Use 1.0 mL of the solution. Perform a blank determination, using 1.0 mL of the solvent.

Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Limit of cis-isomer (glimepiride related compound A)-
Mobile phase-Transfer 100 mL of isopropyl alcohol into a 1 -L volumetric flask, add 1 mL of glacial acetic acid, dilute with hexane to volume, filter, and degas.

System suitability stock solution—Dissolve about 1 mg of USP Glimepiride Related Compound A RS in 1 mL of methylene chloride. Add 3 mL of Mobile phase, and mix.

System suitability solution-Transfer about 10 mg of USP Glimepiride RS to a $20-\mathrm{mL}$ volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with Mobile phase to volume, and mix. Transfer 5 mL of this solution to a separate flask, add $50 \mu \mathrm{~L}$ of the System suitability stock solution, and mix.

Test solution-Transfer about 10 mg of Glimepiride to a $20-\mathrm{mL}$ volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $228-\mathrm{nm}$ detector and a $3-\mathrm{mm} \times 15-\mathrm{cm}$ column containing $5-\mu \mathrm{m}$ packing L20. The flow rate is about 0.5 mL per minute. [NOTE-The analyses could also be performed with $4.6-\mathrm{mm} \times 15-\mathrm{cm}$, $4.6-\mathrm{mm} \times 25-\mathrm{cm}, 4-\mathrm{mm} \times 12.5-\mathrm{cm}$, or $4-\mathrm{mm} \times 25-\mathrm{cm}$ columns containing packing L20. It is recommended that the flow rate be adjusted to about 1.1 mL per minute for a $4.6-\mathrm{mm}$ column and to about 0.8 mL per minute for a 4.0 mm column.] Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are 1.0 for glimepiride and not more than 0.9 for the glimepiride cis-isomer, and the signal-to-noise ratio of the glimepiride $c i s$-isomer peak is not less than 15 .

Procedure-Inject about $10 \mu \mathrm{~L}$ of the Test solution into the chromatograph, and measure the peak areas for the glimepiride $c i s$-isomer and glimepiride. Calculate the percentage of glimepiride $c i s$-isomer in the portion of Glimepiride taken by the formula:

$$
100 r_{c i s} /\left(r_{c i s}+r_{G}\right),
$$

in which $r_{c i s}$ and $r_{G}$ are the peak areas for the glimepiride cisisomer and glimepiride, respectively: not more than $0.8 \%$ of the glimepiride $c i s$-isomer is found.

## Related compounds-

Mobile phase, Diluent, System suitability solution, and Chromatographic system—Prepare as directed in the Assay. Test solution-Use the Assay preparation.
Diluted test solution 1-Dilute 5.0 mL of the Test solution with Diluent to 100.0 mL . Dilute 5.0 mL of the solution obtained with Diluent to 50.0 mL . This solution contains about 0.001 mg of glimepiride per mL .

Diluted test solution 2-Dilute 1.0 mL of Diluted test solution 1 with Diluent to 10.0 mL .

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution and Diluted test solutions 1 and 2 into the chromatograph, record the chromatograms, and measure the peak response for glimepiride obtained from Diluted test solution 1 and the responses for all other peaks, except the glimepiride peak, obtained from the Test solution. Disregard any peak with an area less than that of the glimepiride peak in the chromatogram obtained from Diluted test solution 2. Continue the elution for 2.5 times the retention time of the glimepiride peak. Calculate the percentage of each related compound (see Table 1) and any unknown impurity in the portion of Glimepiride taken by the formula:

$$
100\left(C_{S} / C_{T}\right)\left(r_{i} / r_{s}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of glimepiride in Diluted test solution 1; $C_{T}$ is the concentration, in mg per mL, of glimepiride in the Test solution; $r_{i}$ is the peak response for each individual peak obtained from the Test solution; and $r_{s}$ is the glimepiride peak obtained from Diluted test solution 1. In addition to not exceeding the limits for each impurity in Table 1, not more than $0.1 \%$ of any ether unspecified individual impurity is found; and not more than $0.5 \%$ of total impurities, excluding glimepiride related compound $B$, is found.

## Table 1

| Name | Relative |  |
| :---: | :---: | :---: |
|  | Retention <br> Time | Limit <br> $(\%)$ |
| ${\text { Glimepiride related compound } \mathrm{B}^{1}}$ | 0.2 | 0.4 |
| Glimepiride related compound $\mathrm{C}^{2}$ | 0.3 | 0.1 |
| Glimepiride related compound $\mathrm{D}^{3}$ | 1.1 | 0.2 |

${ }_{2}^{1}$ Glimepiride-sulfonamide
${ }_{3}$ Glimepiride-urethane

Assay-
Mobile phase—Dissolve 0.5 g of monobasic sodium phosphate in 500 mL of water. Adjust with phosphoric acid to a pH of 2.1 to 2.7 , and add in mixtare of 500 mL of wand 500 mL of acetonitrile. Adjust with phesphorie acidte a pH Of 2.5 to 3.5.

Diluent-Prepare a mixture of acetonitrile and water (4:1).

Standard preparation-Dissolve an accurately weighed quantity of USP Glimepiride RS in Diluent to obtain a solution having a known concentration of about 0.2 mg per mL . System suitability solution-Prepare a solution in Diluent containing 0.1 mg each of USP Glimepiride Related Compound B RS, USP Glimepiride Related Compound C RS, and USP Glimepiride Related Compound D RS per mL. Dilute 1 mL of this solution with the Standard preparation to 50 mL .
Assay preparation-Transfer about 20.0 mg of Glimepiride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. [NOTE-Keep the Assay preparation at a temperature not exceeding $12^{\circ}$, and store it no longer than 15 hours.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $228-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and identify the glimepiride peak and the peaks due to the related compounds listed in Table 1. Record the peak responses as directed for Procedure: the resolution, $R$, between glimepiride related compound B and glimepiride related compound C is not less than 4.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the percentage of $\mathrm{C}_{24} \mathrm{H}_{34} \mathrm{~N}_{4} \mathrm{O}_{5} \mathrm{~S}$ in the portion of Glimepiride taken by the formula:

$$
10,000(C / W)[100 /(100-L)]\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Glimepiride RS in the Standard preparation; $W$ is the weight, in mg, of Glimepiride taken to prepare the Assay preparation; $L$ is the percentage of water as determined in the test for Water; and $r_{U}$ and $r_{S}$ are the peak responses for the glimepiride obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Gonadorelin Acetate. Because there is no existing $U S P-N F$ monograph for this article, a new monograph is being proposed. The Related compounds test consists of two HPLC methods to ensure that all impurities are resolved from the main peak of the article: in System 1, the liquid chromatograph is equipped with a 220 nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. In System 2, the liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. USP has received data indicating that YMC ODS-A, C-18 columns are suitable for use in both System 1 and System 2. The Assay is based on an amino acid analysis procedure. Interested parties are encouraged to submit their comments to USP for evaluation.
(BNT: I. DeVeau) RTS-40507-1; 40682-1

## Add the following:

## ■Gonadorelin Acetate

5-0XOP H W S Y GLR P G $\cdot x \mathrm{CH}_{3} \mathrm{COOH} \quad \cdot y \mathrm{H}_{2} \mathrm{O}$
$\mathrm{C}_{55} \mathrm{H}_{75} \mathrm{~N}_{17} \mathrm{O}_{13} \cdot x \mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2} \cdot y \mathrm{H}_{2} \mathrm{O} \quad 1182.3$

Luteinizing hormone-releasing factor acetate (salt) hydrate.

$$
\begin{aligned}
& \text { Glp-His-Trp-Ser-Tyr-Gly-Leu-Arg-Pro-Gly-NH2 } \\
& x \mathrm{NH}_{3} \mathrm{COOH} \quad[52699-48-6 ; 33515-09-2] .
\end{aligned}
$$

» Gonadorelin Acetate is a synthetic polypeptide hormone having the property of stimulating the release of the luteinizing hormone from the hypothalamus. It contains not less than 80 percent by weight of $\mathrm{C}_{55} \mathrm{H}_{75} \mathrm{~N}_{17} \mathrm{O}_{13}$, the remainder being acetic acid and water.

NOTE-Gonadorelin Acetate is extremely hygroscopic. Protect from exposure to moisture, and store in a desiccator.

Packaging and storage-Preserve in tight, well-sealed containers, protected from moisture. Store between $-25^{\circ}$ and $-10^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Gonadorelin Acetate RS. USP Gonadorelin Acetate Related Compound A RS.

## Identification-

A: The monoisotopic mass by Mass Spectrometry $\langle 736\rangle$ is $1181.6 \pm 1$ mass units.

B: The retention time of the major peak in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution, as obtained in the test for Related compounds.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-54^{\circ}$ and $-66^{\circ}$, at $20^{\circ}$, calculated with reference to the peptide content determined in the Assay.

Test solution: 10 mg per mL , in $1 \%(\mathrm{v} / \mathrm{v})$ acetic acid.
Water, Method Ic $\langle 921\rangle$ : not more than $7.0 \%$, determined by directly introducing not less than 2 mg of the solid substance into the titrator.

Limit of fluoride-[NOTE-Use polypropylene vessels for preparation of solutions and standards.]

Standard solutions-Prepare a series of calibration standards containing $10,1,0.1$, and 0.05 ppm fluoride dissolved in an ionic strength adjustment buffer suitable for the electrode in use ( pH about 5).
Test solution-Dissolve between 3 and 5 mg of Gonadorelin Acetate in 1.375 mL of the same buffer as that used for the preparation of the Standard solutions.
Procedure-Using a fluoride ion-selective electrode connected to a $\mathrm{pH} /$ ion meter, measure the potential of each Standard solution, and plot the response versus the logarithm of the concentration. Determine the regression line using the least squares method. The test is considered valid if the slope of the curve is in the range of -54 to -60 mV per decade and the regression curve has a square of the correlation coefficient, $r^{2}$, not less than 0.995 . From the calibration curve and the concentration of the Test solution, determine the amount of fluoride in the sample: not more than $0.1 \%$ (w/w) is found.

## Acetic acid and trifluoroacetic acid-

Solution A-To 900 mL of water add 7.0 mL of phosphoric acid and 5.0 mL of concentrated ammonia. Mix, and dilute with water to 1000 mL , pass through a $0.45-\mu \mathrm{m}$ filter, and degas. Add 20 mL of methanol, mix, and degas for an additional 2 minutes.

Solution B-Prepare a degassed mixture of acetonitrile and water $(1: 1)$.

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Dilute 5.0 mL of phosphoric acid with water to 1000 mL , and mix thoroughly.

Trifluoroacetic acid stock solution-Add about 50 mL of water to a $100-\mathrm{mL}$ volumetric flask with a stopper. Tare the stoppered flask on an analytical balance until there is no further significant drift in the reading. Carefully add 670 $\mu \mathrm{L}$ of trifluoroacetic acid to the flask, stopper immediately, and weigh. Dilute with water to volume.

Standard solutions-Accurately weigh out 150, 75, and 10 mg of sodium acetate trihydrate into three separate $100-\mathrm{mL}$ volumetric flasks. Add $10 \mathrm{~mL}, 2 \mathrm{~mL}$, and 100 $\mu \mathrm{L}$, respectively, of the Trifluoroacetic acid stock solution to the flasks, and dilute each with Diluent to the $100-\mathrm{mL}$ mark. Calculate the concentration, in mg per mL , of acetic acid in each Standard solution using the following equation:

$$
0.00434 W_{A},
$$

in which $W_{A}$ is the weight, in mg , of sodium acetate trihydrate taken. Calculate the concentration, in mg per mL, of trifluoroacetic acid in each Standard solution using the following equation:

$$
0.0001\left(W_{T} V\right)
$$

in which $W_{T}$ is the weight, in mg , of trifluoroacetic acid used for preparation of the Trifluoroacetic acid stock solution; and $V$ is the volume, in mL , of Trifluoroacetic acid stock solution used to prepare the Standard solution.

Test solution-Prepare duplicate samples by accurately weighing out two separate aliquots of about 4.0 mg of Gonadorelin Acetate and dissolving each with 1 mL of the Diluent.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column containing $5-\mu \mathrm{m}$ packing L1. The flow rate is approximately 1.5 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $\%$ | $\%$ | Elution |
| $0-5$ | 100 | 0 | isocratic |
| $5-6$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear |
| $6-14$ | 0 | 100 | isocratic |
| $14-15$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | return to initial |
| $15-25$ | 100 | 0 | re-equilibration |

Chromatograph the Standard solutions, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates for the trifluoroacetic acid peak and not less than 10,000 for the acetic acid peak; and the relative standard deviation for six replicate injections of the most concentrated Standard solution is not more than $2.0 \%$.

Procedure-Inject in duplicate equal volumes (about 20 $\mu \mathrm{L}$ ) of each of the Standard solutions followed by the duplicate Test solutions. Plot the peak areas of each of the components in the Standard solutions versus concentration, in mg per mL , and determine the regression line using the least squares method. The test is considered valid if the regression curves for both acetic acid and trifluoroacetic acid have a square of the correlation coefficient, $r^{2}$, not less than 0.995 . From the resulting graph, determine the percentages of acetic acid and trifluoroacetic acid in the Test solution: between $8 \%$ and $12.5 \%$ of acetic acid is found, and not more than $0.25 \%$ of trifluoroacetic acid is found.

## Related compounds-

Standard solution-Dissolve an accurately weighed quantity of USP Gonadorelin Acetate RS in water to obtain a solution having a known concentration of about 0.5 mg per mL .

System suitability solution—Dissolve an accurately weighed quantity of USP Gonadorelin Acetate Related Compound A RS in water to obtain a solution having a known concentration of about 0.5 mg per mL . Mix equal volumes of this solution and the Standard solution.

Test solution-Dissolve an accurately weighed quantity of Gonadorelin Acetate in water to obtain a solution having a known concentration of about 0.5 mg per mL .

## SYSTEM 1-

Solvent 1 -Mix 1 mL of trifluoroacetic acid with 1 L of water. Pass through a $0.45-\mu \mathrm{m}$ filter, and degas.

Solvent 2-Mix 1 mL of trifluoroacetic acid with 1 L of acetonitrile.
Solution A-Prepare a mixture of Solvent 1 and Solvent 2 (95:5).
Solution B-Prepare a mixture of Solvent 2 and Solvent 1 ( $60: 40$ ).

Chromatographic system (see Chromatography $\langle 621\rangle$ )The HPLC is equipped with a $220-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is approximately 1.5 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| 0 | 91 | 9 | initial |
| $0-25$ | $91 \rightarrow 45$ | $9 \rightarrow 55$ | linear |
| 25 | $45 \rightarrow 91$ | $55 \rightarrow 9$ | return to initial |
| $25-30$ | 91 | 9 | re-equilibrium |

SYSTEM 2-
Mobile phase—Add 47 mL of phosphoric acid and 55 mL of triethylamine to 4 L of water, and adjust with phosphoric acid or triethylamine to a pH of 2.5 , as appropriate. Pass through a $0.45-\mu \mathrm{m}$ filter, and degas. Add acetonitrile to obtain a $13 \%(\mathrm{v} / \mathrm{v})$ concentration of acetonitrile.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The HPLC is equipped with a $215-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 10-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is approximately 1.5 mL per minute using isocratic elution and having a run time of 50 minutes.
Using both System 1 and System 2 chromatograph the Standard solution, and record the peak responses as directed for Procedure. The Standard solution is used only to identify the gonadorelin acetate peak. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between gonadorelin acetate and gonadorelin acetate related compound A is not less than 2.0 ; the column efficiency is not less than 75,000 theoretical plates for System 1 and not less than 3000 theoretical plates for System 2; the tailing factor is not more than 2.0 for both System 1 and System 2; and the relative standard deviation for five replicate injections is not more than $2.0 \%$.

Procedure-Inject equal volumes (about $20 \mu \mathrm{~L}$ ) of each of the Standard solution, the System suitability solution, and the Test solution, followed by a co-injection of the Test solution with the Standard solution, into both System 1 and System 2. Include blank injections between the different solutions. Integrate all peaks in order to obtain a baseline similar to that in the blank chromatograms, disregarding any peaks due to the solvent, counter-ion, and baseline artifacts. Using peak areas, and including all peaks greater than $0.05 \%$, calculate the percentage of each impurity in the por-
tion of Gonadorelin Acetate taken: not more than 1\% of any single impurity is found, and not more than $2 \%$ of total impurities is found.

Amino acid analysis-Proceed as directed in the Assay. Express the content of each amino acid in $\mu$ moles, and calculate the total number of $\mu$ moles of Gonadorelin Acetate in the test sample as directed in the Assay. By dividing the number of $\mu$ moles of each amino acid by the total number of $\mu$ moles of Gonadorelin Acetate in the test sample, the relative proportions of amino acids are found: serine, 0.7 to 1.05; glutamic acid, 0.95 to 1.05 ; proline, 0.95 to 1.05 ; glycine, 1.9 to 2.1 ; leucine, 0.9 to 1.1 ; tyrosine, 0.7 to 1.05 ; histidine, 0.95 to 1.05 ; and arginine, 0.95 to 1.05 . Isoleucine and lysine are absent; not more than traces of other amino acids except tryptophan are detected.

Assay-Examine by means of an amino acid analyzer using Method 1-Postcolumn Ninhydrin Detection under Biotech-nology-Derived Articles-Tests $\langle 1047\rangle$. Standardize the instrument with a mixture containing equal molar per volume amounts (except for L-cystine which is half the molar amount) of glycine and the L-form of the following amino acids: lysine, threonine, alanine, leucine, histidine, serine, valine, tyrosine, arginine, glutamic acid, methionine, phenylalanine, aspartic acid, proline, isoleucine, tryptophan, and cystine.
Assay preparation (see Protein Hydrolysis, Method 1 $\langle 1047\rangle$ )—Accurately weigh out between 0.4 and 1.0 mg of Gonadorelin Acetate in glass ampuls. Add a minimum of 1.0 mL of Hydrolysis Solution containing $4 \%$ phenol, freeze the sample ampul, and flame seal under vacuum. Hydrolyze at $110^{\circ}$ for about 22 hours. After hydrolysis, dry the test sample under vacuum to remove any residual acid. To the ampul add 2 mL of a buffer solution that is suitable for the amino acid analyzer, and pass through a filter having a $0.45-\mu \mathrm{m}$ porosity.

Procedure-Prepare a co-injection of the Standard solution and the test sample. Inject a suitable volume into the amino acid analyzer, and record and measure the responses for each amino acid peak. Express the content of each amino acid in $\mu$ moles. The total number of $\mu$ moles of gonadorelin acetate in the test sample is calculated by summing the number of $\mu$ moles for glutamic acid, proline, glycine, leucine, tyrosine, histidine, and arginine, and dividing by eight. Calculate the percentage of $\mathrm{C}_{55} \mathrm{H}_{75} \mathrm{~N}_{17} \mathrm{O}_{13}$ in the portion of Gonadorelin Acetate taken by the formula:
118.23(N/W),
in which $N$ is the total number of $\mu$ moles of gonadorelin acetate; and $W$ is the weight of the sample in mg. $\quad$ IS (USP28)

## BRIEFING

Hydromorphone Hydrochloride, USP 27 page 935 and page 1900 of $P F 29(6)$ [Nov.-Dec. 2003]. It is proposed to revise the test for Ordinary impurities to include the word "immediate" in the Visualization section to emphasize the importance of timely exposure of the TLC plate to iodine vapors.
(PA2: C. Anthony) RTS-41349-1

## Change to read:

Packaging and storage-Preserve in tight, light-resistant containers.
-Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. 2 (USP27)

## Add the following:

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. ${ }^{15}$ (USP28)

## Change to read:

USP Reference standards $\langle 11\rangle$ -
■USP Endotoxin RS. ${ }^{\text {1S (USP28) }}$
USP Hydromorphone Hydrochloride RS.

## Change to read:

Ordinary impurities $\langle 466\rangle$ -
Test solution: water.
Standard solution: water.
Eluant: a mixture of methylene chloride, methanol, and ammonium hydroxide ( $80: 20: 1$ ).

■immediate $_{\text {■1S (USP28) }}$
exposure of the plate to iodine vapors for about 30 minutes.

## Add the following:

■Other requirements-Where the label states that Hydromorphone Hydrochloride is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Hydromorphone Hydrochloride Injection. Where the label states that Hydromorphone Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Hydromorphone Hydrochloride Injection.■1S (USP28)

BRIEFING

Isoflurane, USP 27 page 1030 and page 1912 of $P F$ 29(6) [Nov.-Dec. 2003]. It is proposed to expand the Note in the Related compounds test to cover the analysis of multiple samples using this procedure. In addition, editorial style changes have been made.
(PA1: K. Russo) RTS-41104-1

## Change to read:

Packaging and storage-Preserve in tight containers.
${ }^{\square}$ Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ} \cdot$ [2S (USP27)

## Change to read:

## Related compounds-

$\square_{\text {NOTE-The Internal standard solution }}$ and the Standard solution are prepared using the same Isoflurane that is under test. ■If multiple lots or samples of Isoflurane are under test, one sample may be selected for the Internal standard solution and the Standard solution. An appropriate blank correction should be made when determining the percentages of impurities in the other lots or samples. $\quad 1 \mathrm{SS}$ (USP28) $\mathbf{m}^{2 S}$ (USP27)
Internal standard solution-Transfer about 1 g of normal butyl acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dilute with Isoflurane to volume, and mix.
Standard solution-To 95 mL of Isoflurane in a $100-\mathrm{mL}$ volumetric flask, add $10.0 \mu \mathrm{~L}$ of USP Isoflurane Related Compound A RS, $7.0 \mu \mathrm{~L}$ of USP Isoflurane Related Compound B RS, $10.0 \mu \mathrm{~L}$ of acetone, and $250 \mu$ L of Internal standard solution, dilute with Isoflurane to volume, and mix. It contains $0.01 \%$ of isoflurane related compound A, $0.007 \%$ of isoflurane related compound B, and $0.01 \%$ of acetone.
Test solution-To 20.0 mL of Isoflurane add $50.0 \mu \mathrm{~L}$ of Internal standard solution, and mix. It contains about $0.0025 \%(\mathrm{w} / \mathrm{v})$ of normal butyl acetate.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a flame-ionization detector and a $2.4-\mathrm{mm} \times 3.7-\mathrm{m}$ nickel or stainless steel column packed with $10 \%$ phase G31 and $15 \%$ phase G18 on 60 - to 80 -mesh sodium hydroxide-washed support S1C. Helium is used as the carrier gas at a flow rate of about 25 mL per minute. The column temperature is programmed for 7 minutes at $65^{\circ}$, then increases to $110^{\circ}$ at a rate of $4{ }^{\circ}$ per minute. The injection port temperature is maintained at about $150^{\circ}$ and the detector temperature is maintained at about $200^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor for the normal butyl acetate peak is not more than 1.5 ; and the relative standard deviation of the ratio of the response of the acetone peak to the response of the normal butyl acetate peak for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $3 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for 40 minutes, and measure the responses for all the peaks. Separately calculate the percentages of acetone, isoflurane related compound A , and isoflurane related compound B in the portion of Isoflurane taken by the formula:

$$
P\left[R_{U} /\left(R_{S}-R_{U}\right)\right]
$$

in which $P$ is the percentage of the relevant analyte in the Standard solution; and $R_{U}$ and $R_{S}$ are the peak response ratios obtained from the Test solution and the Standard solution, respectively: not more than $0.01 \%$ of acetone, not more than $0.01 \%$ of isoflurane related compound A , and not more than $0.007 \%$ of isoflurane related compound $B$ are found. Calculate the percentage of any other individual impurity by the formula:

$$
P\left[R_{i} /\left(R_{S}-R_{i}\right)\right]
$$

in which $P$ is the percentage of isoflurane related compound B in the Standard solution; $R_{i}$ is the peak response ratio of any individual impurity to the internal standard obtained from the Test solution; and $R_{S}$ is the peak response ratio of isoflurane related compound B to the internal standard obtained from the Standard solution: not more than $0.003 \%$ of any other individual impurity is found.

## BRIEFING

Ketoconazole Tablets, USP 27 page 1057. It is proposed to delete the test for Disintegration and to replace it with a test for Dissolution.
(BPC: M. Marques) RTS-41228-1

## Delete the following:

- Disintegration- $\langle 704\rangle$ : 10 minutes.■1S (USP28)

## Add the following:

■Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 900 mL .
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure-Determine the amount of $\mathrm{C}_{26} \mathrm{H}_{28} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{4}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on portions of the solution under test passed through a $0.45-\mu \mathrm{m}$ filter and
suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Ketoconazole RS in the same Medium.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{26} \mathrm{H}_{28} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{4}$ is dissolved in 30 minutes. $\quad$ 1S (USP28)

## BRIEFING

Lidocaine Hydrochloride, USP 27 page 1087. It is proposed to revise the Chromatographic system in the Assay to clarify that the temperature of the column, and not the entire HPLC system, is controlled. Minor editorial revisions are also made.
(PA1: K. Russo) RTS-41279-2

## Change to read:

## Assay-

Mobile phase-Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40 . Mix about 4 volumes of this solution with 1 volume of acetonitrile, such that the retention time of lidocaine is about 4 to 6 minutes. Pass through a membrane filter having a $1-\mu \mathrm{m}$ or finer porosity, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve about 85 mg of USP Lidocaine RS, accurately weighed, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a $50-\mathrm{mL}$ volumetric flask, dilute with Mo bile phase to volume, and mix to obtain a Standard preparation having a known concentration of about 1.7 mg of lidocaine per mL .

Assay preparation-Transfer about 100 mg of Lidocaine Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.
Resolution preparation-Prepare a solution of methylparaben in Mobile phase containing about $220 \mu \mathrm{~g}$ per mL . Mix 2 mL of this solution and 20 mL of the Standard preparation.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. is oper ated at a emperature between $20^{\circ}$ and $25^{\circ}$, maintained at $\pm 1.0^{\circ}$ of the selected temperature.
-The column temperature is maintained between $20^{\circ}$ and
$25^{\circ}, \pm 1.0^{\circ}$ of the selected temperature. $\quad 1$ (USP28)
The flow rate is about 1.5 mL per minute. Chromatograph about 20 $\mu \mathrm{L}$ of the Resolution preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between the lidocaine and methylparaben peaks is not less than 3.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}$ in the portion of Lidocaine Hydrochloride taken by the formula:

$$
(270.80 / 234.34)(50 C)\left(r_{U} / r_{S}\right)
$$

in which 270.80 and 234.34 are the molecular weights of lidocaine hydrochloride and lidocaine, respectively; $C$ is the concentration, in mg per mL , of USP Lidocaine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the lidocaine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

BriEfing

Lidocaine Hydrochloride and Epinephrine Injection, USP 27 page 1089. It is proposed to revise the Chromatographic system in the Assay for lidocaine hydrochloride and the Assay for epinephrine to clarify that the temperature of the column, and not the entire HPLC system, is controlled.
(PA1: K. Russo) RTS-41279-3

## Change to read:

## Assay for lidocaine hydrochloride-

Mobile phase-Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40 . Mix about 4 volumes of this solution with 1 volume of acetonitrile, such that the retention time of lidocaine is about 4 to 6 minutes. Pass through a membrane filter having a $1-\mu \mathrm{m}$ or finer porosity, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve about 85 mg of USP Lidocaine RS, accurately weighed, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a $50-\mathrm{mL}$ volumetric flask, dilute with Mo bile phase to volume, and mix to obtain a Standard preparation having a known concentration of about 1.7 mg of lidocaine per mL .

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 100 mg of lidocaine hydrochloride, to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Resolution preparation-Prepare a solution of methylparaben in Mobile phase containing about $220 \mu \mathrm{~g}$ per mL . Mix 2 mL of this solution and 20 mL of the Standard preparation.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. and is oper ated at a temperare berween $20^{\circ}$ and $25^{\circ}$ maintained at $\pm 1.0^{\circ}$ of the selected temperature.
-The column temperature is maintained between $20^{\circ}$ and
$25^{\circ}, \pm 1.0^{\circ}$ of the selected temperature. $\quad$ IS (USP28)

The flow rate is about 1.5 mL per minute. Chromatograph about 20 $\mu \mathrm{L}$ of the Resolution preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between lidocaine and methylparaben is not less than 3.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of lidocaine hydrochloride $\left(\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}\right)$ in each mL of the Injection taken by the formula:

$$
(270.80 / 234.34)(50)(C / V)\left(r_{U} / r_{S}\right)
$$

in which 270.80 and 234.34 are the molecular weights of lidocaine hydrochloride and lidocaine, respectively; $C$ is the concentration, in mg per mL , of USP Lidocaine RS in the Standard preparation; $V$ is the volume, in mL , of Injection taken; and $r_{U}$ and $r_{S}$ are the lidocaine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Change to read:

## Assay for epinephrine-

Mobile phase-Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40 . Dissolve 1.1 g of sodium 1-heptanesulfonate in this solution, add 1.0 mL of 0.1 M edetate disodium, and mix. Mix about 9 volumes of this solution with 1 volume of methanol, such that the retention time of epinephrine is about 4 to 6 minutes. Pass through a membrane filter having a $1-\mu \mathrm{m}$ or finer porosity, and degas.

Standard preparation-Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in Mobile phase to obtain a solution having a known concentration of about $9 \mu \mathrm{~g}$ of epinephrine bitartrate per mL . Pipet 10 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix to obtain a Standard preparation having a known concentration of about 1.8 $\mu \mathrm{g}$ of epinephrine bitartrate per mL .

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about $50 \mu \mathrm{~g}$ of epinephrine, to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is fitted with a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ stainless steel column packed with packing L1 and is equipped with an electrochemical detector held at a potential of +650 mV , a controller capable of regulating the background current, and a suitable recorder. and it is operated at a temperature between $20^{\circ}$ and $25^{\circ}$ maintained at $\pm 1.0^{\circ}$ of the selected temperattre.
-The column temperature is maintained between $20^{\circ}$ and
$25^{\circ}, \pm 1.0^{\circ}$ of the selected temperature. 1 IS (USP28)
The flow rate is about 1 mL per minute. Chromatograph the Standard preparation as directed for Procedure: the relative standard deviation of the peak responses of successive injections of the Standard preparation is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that satisfactory chromatography and peak responses are obtained. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in $\mu \mathrm{g}$, of epinephrine $\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{3}\right)$ in each mL of the Injection taken by the formula:
$(183.21 / 333.30)(50)(C / V)\left(r_{U} / r_{S}\right)$,
in which 183.21 and 333.30 are the molecular weights of epinephrine and epinephrine bitartrate, respectively; $C$ is the concentration,
in $\mu \mathrm{g}$ per mL , of USP Epinephrine Bitartrate RS in the Standard preparation; $V$ is the volume, in mL , of Injection taken; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Briefing

Loratadine Oral Solution, page 3066 of the First Supplement. It is proposed to change the particle size of the packing used in the Assay from $5 \mu \mathrm{~m}$ to $10 \mu \mathrm{~m}$. The reverse phase HPLC procedure was validated using a $10-\mu \mathrm{m} \mu$ Bondapak brand of L11 column. It is proposed to implement this revision via the Sixth Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of December 1, 2004.
(PA1: K. Russo) RTS-41163-1

## Change to read:

## Assay-

0.05 M Monobasic potassium phosphate solution-Transfer about 6.8 g of monobasic potassium phosphate, accurately weighed, to a $1-\mathrm{L}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of $3.0 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of 0.05 M Monobasic potassium phosphate solution and acetonitrile (7:3). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard preparation-Dissolve an accurately weighed quantity of butylparaben in a mixture of water and acetonitrile (7:3), and dilute quantitatively, and stepwise if necessary, with a mixture of water and acetonitrile $(7: 3)$ to obtain a solution having a concentration of about 0.3 mg per mL .

Standard stock peparation-Dissolve an accurately weighed quantity of USP Loratadine RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL .

Standard preparation-Transfer 5.0 mL of Internal standard preparation, 5.0 mL of Standard stock preparation, and 12 mL of water into a $50-\mathrm{mL}$ volumetric flask. Dilute with a mixture of water and acetonitrile (7:3), and mix.

Assay preparation-Transfer an accurately measured quantity of Oral Solution, equivalent to 5 mg of loratadine, into a $50-\mathrm{mL}$ volumetric flask. Pipet 5.0 mL of Internal standard preparation into the flask, dilute with a mixture of water and acetonitrile $(7: 3)$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a 254-nm detector and a $4-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains $5 \mu \mathrm{~m}$

## ${ }^{\bullet} 10-\mu \mathrm{m}$.

packing ${ }^{\text {L }} 11$. The flow rate is about 2 mL per minute. The column temperature is maintained between $20^{\circ}$ and $30^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.78 for
butylparaben and 1.0 for loratadine; the resolution, $R$, between loratadine and butylparaben is not less than 1.9 ; the tailing factor is not more than 1.6 for the loratadine and butylparaben peaks; and the relative standard deviation for replicate injections is not more than $2 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg of loratadine $\left(\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{ClN}_{2} \mathrm{O}_{2}\right)$ in the portion of Oral Solution taken by the formula:

$$
50 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Loratadine RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the ratios of loratadine to the internal standard peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Mafenide Acetate, USP 27 page 1113; Mafenide Acetate for Topical Solution, $U S P 27$ page 1114. In accordance with the implemented name change for the Reference Standard, it is proposed to change USP 4-Formylbenzenesulfonamide RS to USP Mafenide Related Compound A RS. The test for Chromatographic purity, which has been editorially restyled, is also affected by this revision.
(PA7b: B. Davani) RTS-41315-1

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Mafenide Acetate RS. USP 4 Formylbenzenesulfonamide $R S$

## Change to read:

## Chromatographic purity-

Standard solutions-Dissolve USP Mafenide Acetate RS in methanol, mix to obtain Standard solution $A$ having a known concentration of $500 \mu \mathrm{~g}$ per mL , dissolve USP 4 Fermylbenzenesulfonamide RS

- USP Mafenide Related Compound $\mathrm{A} \mathrm{RS}_{\mathbf{n S S}_{\text {(USP28) }}}$ in methanol, and mix to obtain Standard solution $D$ having a known concentration of $500 \mu \mathrm{~g}$ per mL .
- [NOTE-USP Mafenide Related Compound A RS is 4-formylbenzenesulfonamide.] $\boldsymbol{\square}^{1 S}$ (USP28)

Quantitatively dilute portions of these solutions with methanol to obtain Standard solutions having the following compositions:

| Standard <br> solution | Dilution | Concentration <br> ( $\mu \mathrm{g}$ RS per mL ) | Percentage <br> (\%, for comparison <br> with test specimen) |
| :---: | :---: | :---: | :---: |
| $A$ | (undiluted) | 500 | 1.0 |
| $B$ | 5 in 10 | 250 | 0.5 |
| $C$ | 1 in 5 | 100 | 0.2 |
| $D$ | (undiluted) | 500 | 1.0 |
| $E$ | 5 in 10 | 250 | 0.5 |
| $F$ | 1 in 5 | 100 | 0.2 |

Test solution-Dissolve an accurately weighed quantity of Mafenide Acetate in methanol to obtain a solution containing 50 mg per mL .

Identification solution-Quantitatively dilute a portion of the Test solution with methanol to obtain a solution containing 500 $\mu \mathrm{g}$ per mL .

Ninhydrin solution-Dissolve 300 mg of ninhydrin in 100 mL of butyl alcohol, add 3 mL of glacial acetic acid, and mix.

Procedure-Apply separately $5 \mu \mathrm{~L}$ of the Test solution, $5 \mu \mathrm{~L}$ of the Identification solution, and $5 \mu \mathrm{~L}$ of each Standard solution to a suitable thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, methanol, and isopropylamine ( $77: 20: 3$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm, circulating air. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution at the $R_{F}$ value corresponding to those of the principal spots in the chromatograms of Standard solutions D, E, and F. Spray the plate with the Ninhydrin solution, heat the plate at $105^{\circ}$ for 5 minutes, and examine the plate. Compare the intensities of any secondary spots observed in the chromatogram of the Test solution to those of the principal spots in the chromatograms of Standard solutions $A, B$, and $C$. No secondary spot, observed by both visualizations, from the chromatogram of the Test solution is larger or more intense than the principal spots obtained from Standard solution B (0.5\%) and Standard solution $E(0.5 \%)$, and the sum of the intensities of all secondary spots obtained from the Test solution corresponds to not more than $1.0 \%$.

## Chromatographic purity-

Ion-pairing solution and Mobile phase-Proceed as directed in the Assay.

Concentrated standard solution-Prepare a solution of USP - 4 Fermylbenzenesulfonamide RS

■USP Mafenide Related Compound A RS. ${ }^{15}$ (USP28) in Mobile phase having a known concentration of about $25 \mu \mathrm{~g}$ per mL .

- [NOTE-USP Mafenide Related Compound A RS is 4-for-
mylbenzenesulfonamide.] $]_{1 S}$ (USP28)
Working standard solution-Pipet 10.0 mL of Concentrated standard solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Mo bile phase to volume, and mix.
System suitability solution-Transfer about 10 mg of USP Mafenide Acetate RS, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, and dissolve by sonication in about 2 mL of Mobile phase. Pipet 4.0 mL of Concentrated standard solution into the same flask, dilute with Mobile phase to volume, and mix.

Standard solution-Pipet 10.0 mL of Working standard solution into a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Test solution-Use the Assay preparation.
Chromatographic system-Prepare as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between mafenide acetate and 4-9rmylbenzenesulfonamide
${ }^{-}$USP Mafenide Related Compound $\mathrm{A} \mathrm{RS}_{\text {(1S (USP28) }}$ is not less than 3.0; and the tailing factor is not more than 2.0. Chromatograph the Working standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: adjust the integration parameters so that the response is between $5 \%$ and $15 \%$ of full-scale deflection.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Mobile phase, the Working standard solution, and the Test solution into the chromatograph, allowing the Test solution to elute for a period of not less than three times the retention time of mafenide acetate; record the chromatograms, and measure the responses for the major peaks, disregarding the peaks corresponding to those obtained from the Mobile phase. Calculate the percentage of each impurity in the portion of the constituted Topical Solution taken by the formula:

$$
100 C\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP 4 Fermybenzenesulfenamide $\operatorname{RS}$
${ }^{\text {■USP Mafenide Related Compound }} \mathrm{A} \mathrm{RS}_{\mathbf{■ 1 S}^{(U S P 28)}}$
in the Working standard solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response of 4 -formylbenzenesulfonamide
$\boldsymbol{■}_{\text {mafenide related compound }} \mathrm{A}_{\boldsymbol{\square} 1 \mathrm{~S}}$ (USP28)
obtained from the Working standard solution: not more than $0.5 \%$ of any individual impurity is found; and not more than $1.0 \%$ of total impurities is found.

## BRIEFING

Mefloquine Hydrochloride, page 1527 of $P F$ 29(5) [Sept.-Oct. 2003]. On the basis of comments received, the following revisions in the test for Related compounds are proposed: the concentrations of the components in the System suitability solution are adjusted to obtain the same concentrations as the corresponding components in the Test solution; a new resolution requirement for column qualification in the Chromatographic system is specified; in the Procedure, the flow rate is adjusted to be consistent with that used in the Chromatographic system, and an impurity previously identified by relative retention time is now identified by its chemical name. In addition, the description for this drug substance, in Description and Solubility in the Reference Tables, is modified to include its existence in the polymorphic forms.
(PA7b: B. Davani) RTS-408661-1

## Add the following:

## ■Mefloquine Hydrochloride

$\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~F}_{6} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl} \quad 414.77$

4-Quinolinemethanol, $\alpha$-2-piperidinyl-2,8-bis(trifluoro-methyl)-, monohydrochloride, $\left(R^{*}, S^{*}\right)-( \pm)$ -

DL-erythro- $\alpha$-2-Piperidyl-2,8-bis(trifluoromethyl)-4-quinolinemethanol monohydrochloride [51773-92-3].
» Mefloquine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~F}_{6} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers. Store between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$-USP Mefloquine Hydrochloride RS. USP Mefloquine Related Compound A RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: It responds to the tests for Chloride $\langle 191\rangle$.
Specific rotation $\langle 781\rangle$ : between $-0.2^{\circ}$ and $+0.2^{\circ}$. Use a solution prepared by dissolving about 2.5 g in methanol, and dilute with methanol to 50.0 mL .

Water, Method $I\langle 921\rangle$ : not more than $3.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.

## Related compounds-

Mobile phase-Dissolve 1 g of tetraheptylammonium bromide in a mixture of methanol, 1.5 g per L solution of sodium hydrogen sulfate, and acetonitrile ( $1: 2: 2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Transfer about 8 mg of USP Mefloquine Hydrochloride RS and 8 mg 4 mg of quiUSP Mefloquine Related Compound A RS to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. [NOTE-Mefloquine related compound A is threo-mefloquine.] Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Test solution-Transfer about 0.10 g of Mefloquine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Diluted test solution-Transfer 1.0 mL of the Test solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Transfer 1.0 mL of this solution to a $20-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector, a $4-\mathrm{mm} \times 2.5-\mathrm{cm}$ precolumn, and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column, both containing $5-\mu \mathrm{m}$ packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.5 for quinidine and 1.0 for mefloquine; the resolution, $R$, between the quinidine mefloquine related compound A peak and the mefloquine peak is not less than $8.5 ; 2.0$; and the relative standard deviation for replicate injections is not more than 3\%. 2.0\%.

Procedure-Equilibrate the column with Mobile phase at a flow rate of about 2 mL 0.8 mL per minute for about 30 minutes. Inject $20 \mu \mathrm{~L}$ of Diluted test solution. Adjust the sensitivity of the system so that the height of the major peak is at least $50 \%$ of the full scale of the recorder. Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Test solution and Diluted test solution into the chromatograph, record the chromatogram for a time that is 10 times the retention time of the main peak, and measure the responses of all peaks, excluding the main peak and any other peak producing a response of less than 0.2 times $(0.02 \%)$ of the main peak in chromatogram of the Diluted test solution. The response of the mefloquine related compound A peak in the Test solution with a relative retention time of about 0.7 ,
with reference to the main peak, is not more than twice the area of the main peak in the chromatogram of the Diluted test solution $(0.2 \%)$. The response of any other individual peak, other than the main peak in the chromatogram of the Test solution, is not greater than that of the main peak in the chromatogram of the Diluted test solution (0.1\%); and the sum of the responses of any such peaks in the chromatogram of the Test solution is not greater than five times the response of the main peak in the chromatogram of the Diluted test solution ( $0.5 \%$ ).

Assay-Dissolve about 0.35 g , accurately weighed, in 15 mL of anhydrous formic acid, and add 40 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, and determine the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.48 mg of $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~F}_{6} \mathrm{~N}_{2} \mathrm{O} \cdot \mathrm{HCl}_{\text {. }}$ (US (USP28)

## BRIEFING

Mercaptopurine Tablets, USP 27 page 1169 and page 1049 of PF 29(4) [July-Aug. 2003]. It is proposed to add a Dissolution Test 2 to this monograph because FDA recently approved a new generic version of this product that is bioequivalent to the Reference Listed Drug but requires different Tolerances.
(BPC: M. Marques) RTS-41273-1

## Add the following:

-Labeling-When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used. 1 (USP28)

## Delete the following:

${ }^{\mathbf{A}}$ Pisintegration- $\langle 704\rangle \div 30$ minutes._USP28

## Add the following:

${ }^{4}$ Dissolution $\langle 711\rangle$ -
$\mathbf{■}_{\text {TEST 1-■1S (USP28) }}$
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 900 mL .
Apparatus 2: 50 rpm.
Time: 60 minutes.
Determine the amount of mercaptopurine $\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{~S}\right)$ dissolved by employing the following method.

Mobile phase_Prepare a filtered and degassed solution of $0.1 \%$ acetic acid in water. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 2.5 mL per minute. Chromatograph replicate injections of the Standard solution prepared as described below for Procedure, and record the peak responses as directed for Procedure: the retention time for mercaptopurine is not less than 4 minutes, and the relative standard deviation is not more than $2.0 \%$.

Procedure—Inject a volume (about $10 \mu \mathrm{~L}$ ) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{~S}$ dissolved in comparison with a Standard solution having a known concentration of USP Mercaptopurine RS in the same Medium and similarly chromatographed.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{~S}$ is dissolved in 60 minutes.
$\mathbf{■}_{\text {TEST }}$ 2—If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium, Apparatus, Chromatographic system, and Procedure—Proceed as directed for Test 1.

Time: 120 minutes.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{~S}$ is dissolved in 120 minutes.■1S (USP28) $\triangle$ USP28

## BRIEFING

Mesoridazine Besylate, USP 27 page 1176 and page 1925 of PF 29(6) [Nov.-Dec. 2003]. It is proposed to modify the Visualization procedure in the test for Ordinary impurities to enhance the detection of the lowest standard concentration and the possible impurities found.
(PA3: S. Salado) RTS-40172-1

## Add the following:

## Related compounds-

TEST 1-
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.
Test solution-Dissolve an accurately weighed quantity of Metoprolol Succinate in methanol to obtain a solution containing 50 mg per mL .
Standard solution-Dilute the Test solution quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of 0.1 mg per mL .

Application volume: $\quad 10 \mu \mathrm{~L}$.
Developing solvent system: a mixture of ethyl acetate and methanol ( $80: 20$ ).
Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Place two $50-\mathrm{mL}$ beakers, each containing 30 mL of ammonium hydroxide, on the bottom of a chromatographic chamber that is lined with filter paper and contains the Developing solvent system, and allow to equilibrate for 1 hour. Position the plate in the chromatographic chamber, and develop the chromatogram until the solvent front has moved about two-thirds of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry the plate for 3 hours in a current of warm air. Place the plate in a chamber containing iodine vapor, and allow to react for at least 15 hours. Compare the intensities of the brown spots appearing on the chromatogram: any secondary spot obtained from the Test solution is not more intense than the corresponding spot obtained from the Standard solution. Not more than $0.2 \%$ is found.

TEST 2-
Sodium dodecyl sulfate solution, Mobile phase, and Resolution solution-Prepare as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Metoprolol Succinate RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $1.0 \mu \mathrm{~g}$ per mL .

Test solution-Transfer about 50 mg of Metoprolol Succinate, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—Prepare as directed in the Assay. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between metoprolol related compound A and metoprolol related compound B is not less than 1.5; and the resolution, $R$, between metoprolol related compound B and metoprolol related compound C is not less than 2.5. [NOTE-The relative retention times are about 0.6 for metoprolol related compound $\mathrm{C}, 0.7$ for metoprolol related compound $\mathrm{B}, 0.8$ for metoprolol related compound A, 1.0 for metoprolol, and 5.0 and 5.2 for the two diastereomers of metoprolol related compound D.] Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.

Procedure-Inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Metoprolol Succinate taken by the formula:

$$
\begin{gathered}
\left(G_{s}+\epsilon_{q}\right)\left(r_{i}+r_{s}\right), \\
-100\left(C_{S} / C_{T}\right)\left(r_{i} / r_{S}\right),,_{\text {1S }} \text { (USP28) }
\end{gathered}
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Metoprolol Succinate RS in the Standard solution; $C_{T}$ is the concentration of metoprolol succinate in the Test solution; $r_{i}$ is the individual peak response of related impurities; and $r_{S}$ is the peak response obtained from the Standard solution: not more than $0.1 \%$ of any single impurity is found, and not more than $0.5 \%$ of total impurities is found. [NOTE-The sum of the peak responses for the two diastereomers of metoprolol related compound D is used in the above calculation to report the amount of metoprolol related compound D.]

Naproxen Delayed-Release Tablets. Because there is no existing $U S P$ monograph for this dosage form, a new monograph is being proposed. The stability-indicating liquid chromatographic procedure in the Assay is based on analyses performed with the Beckman Ultrasphere ODS C18 brand of L1 column. The typical retention time for naproxen is about 9.0 minutes.
(PA2: C. Anthony) RTS-38696-1

## Add the following:

## Naproxen Delayed-Release Tablets

## » Naproxen Delayed-Release Tablets contain not

less than 90.0 percent and not more than 110.0 percent of the labeled amount of naproxen $\left(\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}\right)$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Naproxen $R S$.

## Identification-

A: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ -
Test solution-Use the solution under test as obtained in the Buffer stage of the Drug release test.
Standard solution-Use the Standard solution prepared as directed in the Buffer stage of the Drug release test.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release, Method $B\langle 724\rangle$ -
ACID STAGE-
Acid stage medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 1000 mL .
Apparatus 2: 50 rpm.
Time: 2 hours.
Procedure-Determine the amount of $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 332 nm on filtered portions of the solution under test, suitably diluted with Acid stage medium, if necessary, in comparison with a Standard solution having a known concentration of USP Naproxen RS in the same Medium.

Tolerances-Not more than $10 \%$ of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}$ is dissolved in 2 hours.

## BUFFER STAGE-

Buffer stage medium: $\quad 0.2 \mathrm{M}$ phosphate buffer, pH 6.8 ; 1000 mL .

Apparatus 2: 50 rpm.
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 332 nm on filtered portions of the solution under test, suitably diluted with Buffer stage medium, if necessary, in comparison with a Standard solution having a known concentration of USP Naproxen RS in the same Medium.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}$ is dissolved in 45 minutes.

Uniformity of dosage units $\langle\mathbf{9 0 5}\rangle$ : meets the requirements.

## PROCEDURE FOR CONTENT UNIFORMITY-

Mobile phase, Diluent A, Diluent B, and Chromatographic system-Proceed as directed in the Assay.
Standard solution-Transfer about 12.5 mg of USP Naproxen RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent $A$ to volume, and mix well. Transfer $10-\mathrm{mL}$ of this solution to a $25-\mathrm{mL}$ volumetric flask, dilute with Diluent $B$ to volume, and mix

Test solution-Transfer 1 Tablet to a $200-\mathrm{mL}$ volumetric flask, and add about 140 mL of Diluent B. Shake by mechanical means for 15 minutes, sonicate for 15 minutes, dilute with Diluent $B$ to volume, and mix. Pass a portion of this solution through a $0.45-\mu \mathrm{m}$ filter, pipet 2.0 mL of the filtrate for a $500-\mathrm{mg}$ tablet and $2.5-\mathrm{mL}$ for a $375-\mathrm{mg}$ tablet into a $50-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume.

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of $1 \%$ acetic acid solution and acetonitrile (11:9).

Diluent $A$-Use acetonitrile and water (9:1).
Diluent $B$-Use acetonitrile and water ( $1: 1$ ).
Standard stock preparation-Transfer about 12.5 mg of USP Naproxen RS, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent $A$ to volume, and mix.

Standard preparation-Accurately transfer 10.0 mL of the Standard stock preparation into a $50-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume.

Assay preparation-Weigh and powder 20 Tablets. Accurately weigh an amount of the powder, equivalent to about 250 mg of naproxen, into a $100-\mathrm{mL}$ volumetric flask, and add about 70 mL of Diluent $B$. Shake by mechanical means for 15 minutes, sonicate for 15 minutes, dilute with Diluent $B$ to volume, and mix. Pass this solution through a $0.45-\mu \mathrm{m}$ filter, transfer 2.0 mL of the filtrate into a $50-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor of the naproxen peak is not more than 1.5 , and the relative standard deviation for replicate injections of the Standard preparation is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the naproxen peak. Calculate
the quantity, in mg , of naproxen $\left(\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{3}\right)$ in the portion of Tablets taken by the formula:

$$
2500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Naproxen RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the

Standard preparation, respectively.■1S (USP28)

## Briefing

Naratriptan Hydrochloride, page 3071 of the First Supplement; Naratriptan Tablets, page 3072 of the First Supplement and page 1540 of $P F 29(5)$ [Sept.-Oct. 2003]. The following changes are proposed: replacing USP Naratriptan Related Compound A RS and USP Naratriptan Related Compound B RS by USP Naratriptan Resolution Mixture RS; an adjustment in the gradient profile under Chromatographic system in the Chromatographic purity test; and listing the names of impurities that are currently referred to only by relative retention times in the table under Procedure in the Chromatographic purity test.

## Chromatographic purity-

0.05 M Ammonium phosphate buffer and Resolution solutionPrepare as directed in the test for Chromatographic purity under Naratriptan Hydrochloride.

Solution A-Use filtered and degassed 0.05 M Ammonium phosphate buffer.

Solution B-Use filtered and degassed acetonitrile.
Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Test solution-Transfer 5 Tablets into a suitable amber flask. Add 20.0 mL of 0.1 N sodium hydroxide, and allow to stand for 10 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add 30.0 mL of 0.05 M Ammonium phosphate buffer,
and mix well. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a 0.2 \#\#
$\square_{0.45-\mu m_{12 S}}$ (USP27)
porosity, discarding the first 3 mL of the filtrate.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $225-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4 \mu \mathrm{~m}$
$\square_{\text {ne2s (USP27) }}$
packing L1. The column temperature is maintained at $40^{\circ}$. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| $\begin{gathered} \text { Time } \\ \text { (minutes) } \\ \hline \end{gathered}$ | Solution A (\%) | Solution B (\%) | Elution |
| :---: | :---: | :---: | :---: |
| 0-35.0 | $97 \rightarrow 80$ | $3 \rightarrow 20$ | linear gradient |
| 35.0-40.0 | 80 | 20 | isocratic |
| 40.0-40.4 | $80 \rightarrow 97$ | $20 \rightarrow 3$ | linear gradient |
| $\begin{array}{r} \mathbf{m}_{41.0}^{1 \mathrm{~m}} \mathrm{mS}_{4}(\mathrm{USP28)} \\ 40.4 \end{array}$ | 97 | 3 | re-equilibration |
| $\mathbf{\square}_{41.0-51.0}^{\mathbf{1}_{\text {1S }}}$ (USP28) |  |  |  |

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.07 for matripan related compeund $B$
-2-[3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1 H -indol-
$5-\mathrm{yl}]$ ethanesulfonic acid methylamide (naratriptan related
compound B) ${ }_{1 \mathrm{IS}(U S P 28)}$
and 1.0 for naratriptan; and the resolution, $R$, between naratriptan and naratriptan related compound B is not less than 1.5 .

Procedure-Inject a volume (equivalent to about $5 \mu \mathrm{~g}$ of naratriptan hydrochloride) of the Test solution into the chromatograph, record the chromatogram, and measure the areas for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$
100\left(r_{i} / F\right) /\left[r_{N}+\Sigma\left(r_{i} / F\right)\right]
$$

in which $F$ is the relative response factor (see the accompanying table for values) for each impurity; $r_{i}$ is the peak response for each impurity; and $r_{N}$ is the naratriptan peak response (see the accompanying table for limits).

| Relativeretention <br> time | Relative respense- <br> factor $(F)$ | Limit $(\%)$ |
| :---: | :---: | :---: |
| 1.07 | 0.6 | $\theta .2$ |
| 1.26 | 0.6 | 0.2 |
| 1.33 | 0.4 | $\theta .3$ |
| 1.44 | 0.6 | $\theta .2$ |
| 1.62 | 0.5 | $\theta .2$ |

In addition to not exceeding the limits listed in the accompanying table, not more than $0.2 \%$ of any other individual impurity is found; and not more than $1.5 \%$ of total impurities is found.

| Compound Name | Relative <br> Retention Time | Relative Response <br> Factor $(F)$ | Limit (\%) |
| :---: | :---: | :---: | :---: |
| 2-[3-(1-Methyl-1,2,3,6-tetrahydropyridin-4-yl)-1 H -indol- <br> 5-yl]ethanesulphonic acid methylamide | About 1.07 | 0.6 | 0.2 |
| 2,2-Bis-[3-(1-methylpiperidin-4-yl)-1 H -indol-5-yl] ethanesulphonic acid methylamide | About 1.26 | 0.6 | 0.2 |
| 1-Methyl-4-[5-(2-methylsulphamoyl-ethyl)-1 H -indol-3-yl]-pyridinium chloride | About 1.33 | 0.4 | 0.3 |
| 2-[3-(1-methylpiperidin-4-yl)-5-(2-methylsulphamoyl-ethyl)-indol-1-yl]ethanesulphonic acid methylamide | About 1.44 | 0.6 | 0.2 |
| 4-[1,5-Bis-(2-methylsulphamoyl-ethyl)-1 H -indol-3-yl]-1methylpyridinium chloride | About 1.62 | 0.5 | 0.2 |

## Assay-

0.01 M Triethylamine phosphate buffer, Mobile phase, and Resolution solution-Prepare as directed in the Assay under Naratriptan Hydrochloride.

Standard preparation-Dissolve an accurately weighed quantity of USP Naratriptan Hydrochloride RS in 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 0.2 mg per mL . Dilute an accurately measured volume of this solution in 0.01 M Triethylamine phosphate buffer to obtain a solution having a known concentration of about $20 \mu \mathrm{~g}$ per mL .

Assay preparation-Transfer 5 Tablets into an amber $250-\mathrm{mL}$ volumetric flask, add 30 mL of 0.1 N sodium hydroxide, and shake on a wrist-action shaker for at least 30 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add about 170 mL of 0.01 M Triethylamine phosphate buffer, and mix well. Allow to cool to room temperature, dilute with 0.01 M Triethylamine phosphate buffer to volume, and mix. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a $0.2 \mu \mathrm{~m}$
${ }^{\bullet} 0.45-\mu \mathrm{m}_{\text {■2S (USP27) }}$
porosity, discarding the first 3 mL of the filtrate.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $224-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$
$\mathrm{m}^{5-\mu \mathrm{m}_{\text {2S }}}$ (USP27)
packing L11. The flow rate is about 1.3 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for naratriptan related compernd $A$,

■3-(1-methylpiperidin-4-yl)-1 H -indole (naratriptan related compound A), ■1S (USP28)
1.0 for naratriptan, and 1.1 for naratriptan related compound $B$; and the resolution, $R$, between naratriptan related compound A and naratriptan and between naratriptan related compound $B$ and naratrip-
tan is not less than 1.5. Chromatograph the Standard preparation, record the chromatogram, and measure the peak response as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (equivalent to about $1 \mu \mathrm{~g}$ of naratriptan hydrochloride) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of naratriptan $\left(\mathrm{C}_{17} \mathrm{H}_{25} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}\right)$ in the portion of Tablets taken by the formula:

$$
(335.47 / 371.93) 100(C / D)\left(r_{U} / r_{S}\right)
$$

in which 335.47 and 371.93 are the molecular weights of naratrip$\tan$ and naratriptan hydrochloride, respectively; $C$ is the concentration, in mg per mL , of USP Naratriptan Hydrochloride RS in the Standard preparation; $D$ is the concentration, in mg per mL , of naratriptan in the Assay preparation, based upon the labeled quantity of naratriptan in the portion of Tablets taken and the extent of dilution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Briefing

Nifedipine Extended-Release Tablets, USP 27 page 1321 and page 1542 of $P F 29(5)$ [Sept.-Oct. 2003]. It is proposed to revise Drug release Test 1 to clarify the instructions for performing the
test. It is also proposed to specify the volume of the Medium to be used in Phase 1 of Drug release Test 3. In addition, minor editorial style changes have been made.
(BPC: M. Marques) RTS-41015-1

## Change to read:

Drug release $\langle 724\rangle$ -
Test 1: If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 1.

Medium: water; 50 mL .
Apparatus 7:
$\square 15$ to 30 cycles per minute. $\mathbf{m}_{1 S}$ (USP28)
Do not use the reciprocating disk, but use a $25-\mathrm{cm}$ plexiglas rod, the perimeter of the Tablets being affixed to the rod with a waterinsoluble glue. The solution containers are $25-\mathrm{mm}$ test tubes, 150 to 200 mm in length, and the water bath is maintained at $37 \pm 0.5^{\circ}$.

- At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50

```
mL of fresh Medium. 1 l (USP28)
Times: \(\quad 4,12\),and 24 hetris.
Times: 4, 12, and 24 hours.
```

$\mathbf{\square}$ 8, 12, 16, 20, and 24 hours.■1S (USP28)
Diluting solution 1: a mixture of methanol and acetonitrile (1:1).

Piluting solution 2. a mixture of Diluting solution 1 and water (1:1).

- Diluting solution: a mixture of methanol and water (1:1).n1S (USP28)

Standard solutions-Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in 50 mL of Pill,
$\boldsymbol{m}_{\text {methanol, }} \mathbf{■ 1 S}_{\text {(USP28) }}$
dilute with water to volume, and mix to obtain a Standard stock solution. Quantitatively dilute this Standard stock solution with $\mathrm{Bi}_{\mathrm{i}}$ tuting solution 2 to obtain solutions having known concentrations ef 0.01 mg per $\mathrm{mL}, 0.05 \mathrm{mg}$ per mL , and 0.20 mg per mL that are used at 4 hours, 12 heurs, and 24 hours, respectively.
known concentrations.
Test solution-Use portions of the solution under test, passed through a $0.4-\mu \mathrm{m}$ filter, suitably diluted with methanol, and stepwise, if necessary, with Diluting solution to obtain a final mixture consisting of equal parts of methanol and water.■1S (USP28)

Procedure- [NOTE-For the 4 hour time period, filter, determine the absorbance at 456 nm , and use this determination to correct for excipient interference at the other time periods.] Determine the amount of $\mathrm{C}_{4} \mathrm{H}_{48} \mathrm{~N}_{2} \mathrm{O}_{6}$ released at ach 4 hour interval by employ ing UV absorption at the wavelength of maximman abserbance at about 338 mm , in 0.5 cm cells. Use test solutions that are suitably diluted, if neeessary, with Diluting solution 1 and water to obtain a final mixture of water, methanol, and acetonitrile ( $2: 1: 1$ ) in eomparison with the appropriate Standard solution, using Diluting solu 2 as the blank.
-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released in the Test solution at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm , in $0.5-\mathrm{cm}$ cells. [NOTE-For the 4 -hour time period, determine the absorbance at 456 nm , and use this determination to correct for excipient interference.] $\mathbf{1 I S}_{\text {(USP28) }}$

Tolerances-The cumulative percentages of the labeled amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$, released in vivo and dissolved at the times specified, conform to Acceptance Table 1.

| Fime (hours) | Amount dissolved |
| :---: | :--- |
| 4 | betw $5 \%$ and $17 \%$ |
| 12 | ben $43 \%$ and $80 \%$ |
| 24 |  |

-

| 12 | between $43 \%$ and $80 \%$ |
| 16 | - |
| 20 | not less than $80 \%$ |

* The amount dissolved is expressed in terms of the labeled tablet strength
rather than in terms of the labeled total contents. 1 S (USP28)

Test 2: If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 2.

Buffer concentrate-Transfer 330.9 g of dibasic sodium phosphate and 38 g of citric acid to a 1-L volumetric flask, add water to dissolve, add 10 mL of phosphoric acid, dilute with water to volume, and mix.

Medium-Mix 125.0 mL of Buffer concentrate and 1 L of $10 \%$ sodium lauryl sulfate solution, and dilute to 10 L . Adjust if necessary to a pH of $6.8 ; 900 \mathrm{~mL}$.

Apparatus 2: 50 rpm ,
$\boldsymbol{m}_{\text {with }}$ sinkers (see Figure 1).■2S (USP27)

Fig. 1 (printed with permission of the Japanese Pharmacopoeia)
Times: 3, 6, and 12 hours.
Determine the amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$ dissolved by employing the following method.

Mobile phase - Prepare a filtered and degassed mixture of acetonitrile and water ( $70: 30$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Nifedipine RS in methanol to obtain a solution having a known concentration of about 1.11 mg per mL . Dilute quantitatively and stepwise with Medium to obtain a solution having a known concentration of 0.1 mg per mL .

Chromatographic system-The liquid chromatograph is equipped with a $350-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 125-\mathrm{mm}$ column that contains $3-\mu \mathrm{m}$ packing L 1 . The flow rate is about 1.5 mL per minute. The column is maintained at about $40^{\circ}$. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of filtered portions of the Standard solution and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$ dissolved.

Tolerances-The percentages of the labeled amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$ released in vivo and dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 3 | between $10 \%$ and $30 \%$ |
| 6 | between $40 \%$ and $65 \%$ |
| 12 | not less than $80 \%$ |

Test 3: If the product complies with this test, the labeling indicates that it meets USP Drug Release Test 3.
FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE-
Phase 1:
Medium: $\quad 0.05 \mathrm{M}$ phosphate buffer, pH 7.5 ;
■00 mL.■1S (USP28)
Apparatus 2: 100
Apparatus 2: 100 rpm .
Time: 1 hour.
Standard solution-Prepare a solution in Medium having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding $10 \%$ of the final volume, can be used to help solubilize nifedipine.

Procedure-[NOTE-After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the Medium for Phase
2.] Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released in Phase 1 from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the Standard solution, using the Medium as the blank.

Phase 2:
Medium: $\quad 0.5 \%$ sodium lauryl sulfate in simulated gastric fluid without enzyme, $\mathrm{pH} 1.2 ; 900 \mathrm{~mL}$.

Apparatus 2: 100 rpm.
Times: 1, 4, 8, and 12 hours.
Standard solution-Prepare a solution in Medium having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding $10 \%$ of the final volume, can be used to help solubilize nifedipine.

Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released in Phase 2 from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the Standard solution, using Medium as the blank.

Tolerances-The cumulative percentages of the labeled amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$, released in vivo and dissolved at the times specified, conform to Acceptance Table 1.

| Time (hours) | Amount dissolved $^{*}$ |
| :---: | :--- |
| 1 | not more than $30 \%$ |
| 4 | between $30 \%$ and $55 \%$ |
| 8 | not less than $60 \%$ |
| 12 | not less than $80 \%$ |

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from Phase 1 to the amount dissolved at each time point in Phase 2.

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE-
Phase 1:
Medium: $\quad 0.05 \mathrm{M}$ phosphate buffer, pH 7.5 ;
■ 900 mL . ${ }^{1 \mathrm{~S}}$ (USP28)
Apparatus 2: 100 rpm .
Time: 25 minutes.
Standard solution-Prepare a solution in Medium having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding $10 \%$ of the final volume, can be used to help solubilize nifedipine.

Procedure-[NOTE-After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the Medium for Phase 2.] Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released in Phase 1 from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the Standard solution, using the Medium as the blank.

Phase 2:
Medium: $\quad 0.5 \%$ sodium lauryl sulfate in simulated gastric fluid without enzyme, $\mathrm{pH} 1.2 ; 900 \mathrm{~mL}$.

Apparatus 2: 100 rpm .
Times: $1,4,8$, and 12 hours.
Standard solution-Prepare a solution in Medium having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding $10 \%$ of the final volume, can be used to help solubilize nifedipine.

Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released in Phase 2 from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the Standard solution, using Medium as the blank.

Tolerances-The cumulative percentages of the labeled amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$, released in vivo and dissolved at the times specified, conform to Acceptance Table 1.

| Time (hours) | Amount dissolved $^{*}$ |
| :---: | :--- |
| 1 | not more than $30 \%$ |
| 4 | between $40 \%$ and $70 \%$ |
| 8 | not less than $70 \%$ |
| 12 | not less than $80 \%$ |

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from Phase 1 to the amount dissolved at each time point in Phase 2.

Test 4: If the product complies with this test, the labeling indicates that the product meets USP Drug Release Test 4.

Medium: $\quad 0.5 \%$ sodium lauryl sulfate in simulated gastric fluid without enzyme, $\mathrm{pH} 1.2 ; 900 \mathrm{~mL}$.

Apparatus 2: 100 rpm .
Times: 1, 4, and 12 hours.
Standard solution-Prepare a solution in Medium having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL for Tablets labeled to contain 60 mg , and of about 0.034 mg of USP Nifedipine RS per mL for Tablets labeled to contain 30 mg . If necessary, a volume of methanol, not exceeding $10 \%$ of the final volume, can be used to help solubilize nifedipine.

Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ released from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the Standard solution, using the Medium as the blank.

Tolerances-The cumulative percentages of the labeled amount of nifedipine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}\right)$, released at the times specified, conform to Acceptance Table 1.

$\qquad$
$\rightarrow+$
posed is in the general form [DRUG][ROUTE OF ADMINISTRATION][DOSAGE FORM] to indicate by the title that the tablets are intended for sublingual use. The Expert Committee on Nomenclature and Labeling considers that the term "Sublingual" appearing prominently in the product name will represent a significant improvement in that the consumer will be provided with the assurance that, along with the labeling statement indicating that the tablets are for sublingual use, the product will be used properly to achieve the benefit of the medication.

The revisions are proposed for publication in the First Supplement to USP 28-NF 23, which is to become official April 1, 2005, but with October 1, 2006, designated as the official date for the name change. The eighteen-month postponement of the official date for the name change would be intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the revised terminology.
(NL: C. Barnstein) RTS-41140-1

## Nitroglycerin Tablets

(Current title-not to change until October 1, 2006)
Monograph title change-to become official October 1, 2006
(see Official Title Changes on the first page of In-Process Revision):

## Briefing

Nitroglycerin Sublingual Tablets-See briefing under Nitroglycerin Tablets.
(NL: C. Barnstein) RTS-41140-1

## Add the following:

## ■ Nitroglycerin Sublingual Tablets

## (Monograph under this new title-to become official October 1, 2006) <br> (Current monograph title is Nitroglycerin Tablets)

BRIEFING

Nitroglycerin Tablets, USP 27 page 1330; Nitroglycerin Sublingual Tablets. A revision is proposed by the Expert Committee on Nomenclature and Labeling to change the title of this monograph to Nitroglycerin Sublingual Tablets. The title that is pro-
» Nitroglycerin Sublingual Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of nitroglycerin $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{9}\right)$.

Packaging and storage-Preserve in tight containers, preferably of glass, at controlled room temperature. Each container holds not more than 100 Sublingual Tablets.

Labeling-The labeling indicates that the Sublingual Tablets are for sublingual use, and the label directs that the Sublingual Tablets be dispensed in the original, unopened container, labeled with the following statement directed to the patient. "Warning: To prevent loss of potency, keep these tablets in the original container or in a supplemental nitroglycerin container specifically labeled as being suitable for Nitroglycerin Sublingual Tablets. Close tightly immediately after each use."

USP Reference standards $\langle 11\rangle$ —USP Diluted Nitroglycerin $R S$.

## Identification-

## A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ —

Test solution-Transfer an amount of finely powdered Sublingual Tablets, equivalent to about 1 mg of nitroglycerin, to a glass-stoppered vessel, add 1 mL of acetone, shake by mechanical means for 30 minutes, and filter.

Standard solution: 1 mg per mL , in acetone.
Developing solvent system: a mixture of toluene, ethyl acetate, and glacial acetic acid ( $16: 4: 1$ ).

Procedure-Proceed as directed in the chapter. Spray with a solution of diphenylamine in methanol (1 in 100), and irradiate the plate with short- and long-wavelength UV light for about 10 minutes.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Disintegration $\langle 701\rangle$ : 2 minutes, determined as set forth for Sublingual Tablets.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY-
Mobile phase, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Diluted Nitroglycerin.

Test preparation-Transfer 1 Sublingual Tablet to a suitable container, and dissolve in and dilute with Mobile phase to obtain a solution containing about 0.075 mg of nitroglycerin per mL .
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of nitroglycerin $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{9}\right)$ in the portion of Sublingual Tablets taken by the formula:

$$
V C\left(r_{U} / r_{s}\right)
$$

in which $V$ is the volume, in mL, of Mobile phase used to prepare the Test preparation; $C$ is the concentration, in mg per mL, of USP Diluted Nitroglycerin RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for nitroglycerin obtained from the Test preparation and the Standard preparation, respectively. The content of each of the 10 Sublingual Tablets is within the range of $75.0 \%$ and $135.0 \%$ of the labeled claim. If the content of not more than 1 Sublingual Tablet is outside the range of $75.0 \%$ and
$135.0 \%$ and if the content of none of the Sublingual Tablets is outside the range of $60.0 \%$ and $150.0 \%$, test 20 additional units. The requirements are met if the content of each of the additional 20 units falls within the range of $75.0 \%$ and $135.0 \%$ of the labeled claim.

## Assay-

Mobile phase, Standard preparation, and Chromatographic system-Prepare as directed in the Assay under Di-

## luted Nitroglycerin.

Assay preparation-Dissolve not fewer than 20 Sublingual Tablets in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing about 0.075 mg per mL of nitroglycerin.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of nitroglycerin $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{9}\right)$ per Sublingual Tablet taken by the formula:

$$
100 /(T D C)\left(r_{U} / r_{s}\right)
$$

in which $T$ is the number of Sublingual Tablets taken; $D$ is the dilution factor of the Assay preparation; $C$ is the concentration, in mg per mL, of USP Diluted Nitroglycerin RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for nitroglycerin obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)
(Official October 1, 2006)

## BRIEFING

Ofloxacin, USP 27 page 1355 and page 1940 of PF 29(6) [Nov.-Dec. 2003]. On the basis of new information and supporting data received, it is proposed to specify the HPLC column temperature and to modify the precision of the procedure in the test for Related compounds.
(PA7b: B. Davani) RTS-40955-1

## Change to read:

Packaging and storage-Preserve in well-closed containers, protected from light.
-Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and
$30^{\circ}$. 2 (USP27)

## Add the following:

${ }^{\boldsymbol{4}}$ Labeling-Where it is intended for use in preparing injectable dosage forms or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. $\triangle$ USP28

## Change to read:

USP Reference standards $\langle 11\rangle$-USP Ofloxacin RS.

## Delete the following:

-Chromatographic purity-
Mobile phase Dissolve 27.2 g of menebasic petassium phesphate in 1000 mL of water, adjust with phosphoric aeid to a pH of 2.4, and mix. Prepare a fitered and degassed mixture-of this solution and acetonitrile (90:10). Make adjustments if neeessary (see System-Suitability under Chromatography $\langle 624\rangle$ ).

Systemt suitability standard soltution Dissolve an aceurately weighed quantity of USP Ofloxacin PS in methanel to obtain a solution having a known concentration of about $1.0 \mu$ g per mL .

Fest selution Quantitatively dissolve an aceurately weighed quantity of Oflexacin in methanel to obtain a selation containings abeut 1.0 mg per mL.

Chrematographic syistem (see-Chrematography $\langle 621\rangle$ ) The tiquid chromatograph is equipped with a 294 mm detector and a $4.6 \mathrm{~mm} \times 10 \mathrm{em}$ column that contains packing L 1 . The flow rate is about 2 ml per minute. Chrematograph the System suitability standard solution, and record the peak responses as directed for Procedtre: the evlumm effeieney, determined from the ofloxacin peak, is net less than 1400 theoretical plates when ealeulated by the formula:

$$
5.545\left(t_{\mu}+H_{12}\right)^{2}
$$

and the relative-standard deviation for replieate-injections is net mere than $2.0 \%$

Procedure Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram for a period of time that is 2.5 times the retention time of the main ofloxacin peak, and measure the areas for all the peaks, exeept to disregard the sot rent peak. Caleulate the pereentage of desfluoroofloxacin in the pertion of Ofloxain taken by the formula:-

$$
100\left(1.13 x_{4}+7\right)
$$

in whieh 1.13-is the respense facter of desflureofloxacin relative to that of ofloxacin; ris the area for the desfltoroofloxacin peak, if $^{\text {is }}$ present, at a retention time of about 0.56 relative to that of oflox rein; and $r$ is the total area of the peaks, except for the solvent peak: not more than $0.2 \%$ is found. Caleulate the percentage of each other impurity with an area greater than that of the ofloxacin peak in the chromatogram of the System suitability standard sotut tien-obtained under. Chromatographic system, by the formata:-
$100(+\div+7)$,
in which $r$,is the peak area for an-individualimpurity; and $x$ is the tetal area of the peaks in the ehremategram obtained frem the Test solution, exeept for the solvent peak: not more than $0.3 \%$ of any individual impurity is found; and the sum-of allimpurities found is net mere than $0.5 \%$. 1 S (USP28)

## Add the following:

-Related compounds-
Diluent-Prepare a mixture of water and acetonitrile (6:1).

Mobile phase-Dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchlorate in 1300 mL of water, adjust with phosphoric acid to a pH of 2.2 , and mix. Prepare a filtered and degassed mixture of this solution and 240 mL of acetonitrile. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Transfer 10.0 mg of USP Ofloxacin Related Compound A RS and 10.0 mg of USP Ofloxacin RS to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. Dilute 10.0 mL of this solution with Diluent to 50.0 mL . Dilute 1.0 mL of this solution with Diluent to 50.0 mL .

Standard solution-Quantitatively dissolve an accurately weighed quantity of USP Ofloxacin RS in Diluent to obtain a solution that contains 0.0004 mg per mL of ofloxacin.

Test solution-Quantitatively dissolve an accurately weighed quantity of Ofloxacin in Diluent to obtain a solution containing about 0.2 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a 294 -nm detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $45^{\circ}$. The flow rate is about 0.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution between ofloxacin and ofloxacin related compound A is not less than 2.0; and the relative standard deviation for replicate injections is not more than 5.0\%. 3.0\%.

Procedure-Inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatogram for a period of time that is about 2.5 times the retention time of the ofloxacin peak, and measure the areas for all of the peaks except the solvent peak. Calculate the percentage of each impurity with an area greater than 0.1 times the average area of the ofloxacin peak obtained from the Standard solution by the formula:

$$
100\left(C / C_{T}\right)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Ofloxacin RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of ofloxacin in the Test solution; $r_{i}$ is the peak area for an individual impurity; and $r_{s}$ is the average area of the ofloxacin peak obtained from the Standard solution: not more than $0.3 \%$ of any individual impurity is found; and the sum of all impurities found is not more than $0.5 \%$. 1 S (USP28)

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Ofloxacin is sterile, it meets the requirements under Sterility Tests
$\langle 71\rangle . \mathbf{\Delta U S P 2 8}$

## BRIEFING

Oxybutynin Chloride Extended-Release Tablets, page 525 of PF 30(2) [Mar.-Apr. 2004]. It is proposed to add a test for Drug release to this new monograph. In addition, minor editorial style changes have been made.
(BPC: M. Marques; PA4: E. Gonikberg) RTS-40034-1

## Add the following:

## ©Oxybutynin Chloride ExtendedRelease Tablets

» Oxybutynin Chloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxybutynin chloride $\left(\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}\right)$.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. USP Reference standards $\langle 11\rangle$ —USP Oxybutynin Chloride RS. USP Oxybutynin Related Compound $A R S$.

## Identification-

A: Infrared Absorption $\langle 197\rangle$ -
Test specimen-Add a quantity of finely powdered Tablets, equivalent to about 15 mg of oxybutynin chloride, to 5 mL of water per Tablet. Mix for 1 minute. Adjust with 0.1 N sodium hydroxide to a pH between 7 and 8 . Extract the solution twice with 10 mL of ether. Combine and evaporate the ether extract, and dry under vacuum over silica gel for at least 30 minutes. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.

Standard specimen-Dissolve 15 mg of USP Oxybutynin Chloride RS in 5 mL of water. Proceed as directed for the Test specimen, beginning with "Adjust with".
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release $\langle 724\rangle$ -
Medium: simulated gastric fluid without enzymes; 50 mL .

Apparatus 7: 30 cycles per minute; 2 to 3 cm amplitude.

Times: 4,10 , and 24 hours.
Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}$ dissolved by employing the following method.
0.035 M Phosphate buffer, pH 2.2-Dissolve about 4.83 g of monobasic sodium phosphate in 1000 mL of water, add 2.3 mL of triethylamine, and adjust with phosphoric acid to a pH of $2.2 \pm 0.2$.

Acidified water-To 1 L of water add phosphoric acid dropwise to a pH of 3.5 , and mix well.
Standard stock solutions-Dissolve accurately weighed quantities of USP Oxybutynin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain solutions having known concentrations of about 250, 300 , and $350 \mu \mathrm{~g}$ per mL .
Standard solutions-Prepare a series of dilutions of the Standard stock solutions in acidified water having final concentrations similar to those expected in the Test solution.

Test solution-Use portions of the solution under test. If the solution is cloudy, centrifuge at 2000 rpm for 10 minutes, and use the supernatant.

Mobile phase-Prepare a suitable filtered and degassed mixture of 0.035 M Phosphate buffer, pH 2.2 and acetonitrile ( $65: 35$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Use a medium range standard solution of USP Oxybutynin Chloride RS.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 5-\mathrm{cm}$ column that contains packing L11. The flow rate is about 1.5 mL per minute. The column temperature is maintained at about $35^{\circ}$. Chromatograph the System suitability solution, and record the chromatogram as directed for Procedure: the tailing factor is greater than 0.5 and less than 2.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solutions and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Construct a calibration curve by plotting the peak response versus concentration of the Standard solutions. A weighing factor, $1 / \mathrm{x}$, is applied to the regression line of the calibration curve to enhance the accuracy of the low standard concentrations. Determine the amount of $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}$ dissolved in each interval from a linear regression analysis of the calibration curve.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 4 | not more than $20 \%$ |
| 10 | between $34.5 \%$ and $59.5 \%$ |
| 24 | not less than $80 \%$ |

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Related compounds-

Mobile phase, Diluent, Preparation medium, Impurity stock solution, and System suitability solution-Proceed as directed in the Assay.

Impurity standard solution-Dilute the Impurity stock solution with Diluent to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ of phenylcyclohexylglycolic acid (oxybutynin related compound A) per mL .

Test solution- Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a 220 -nm detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the Impurity standard solution, and record the peak responses as directed for Procedure: the tailing factor is greater than 0.75 and not more than 2.5 for the phenylcyclohexylglycolic acid peak. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, $R$, between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5; and the relative standard deviation of peak area responses for six replicate injections of System suitability solution is not more than $3 \%$ for each compound.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Impurity standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$
C\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of phenylcyclohexylglycolic acid in the Impurity standard solution; and $r_{U}$ and $r_{S}$ are the peak responses for each impurity obtained
from the Test solution and the Impurity standard solution, respectively. Disregard any peak less than $0.1 \%$ : not more than $1 \%$ of phenylcyclohexylglycolic acid is found, and not more than $2 \%$ of total impurities is found.

## Assay-

Mobile phase_Prepare a mixture of water, acetonitrile, and triethylamine (65:35:0.15). Adjust with phosphoric acid to a pH of 3.9 , degas, and filter.

Diluent-Use water adjusted with phosphoric acid to a pH of 3.5 .

Preparation medium—Prepare a solution of methanol and acetonitrile (1:1).

Impurity stock solution-Dissolve an accurately weighed quantity of USP Oxybutynin Related Compound A RS in acetonitrile to obtain a solution having a known concentration of about 0.11 mg of phenylcyclohexylglycolic acid per mL . [NOTE-Oxybutynin related compound A is phenylcyclohexylglycolic acid.]

Standard stock preparation-Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in acetonitrile to obtain a solution having a known concentration of about 0.37 mg per mL .

System suitability solution-Transfer 10 mL of the Standard stock preparation and 1 mL of the Impurity stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Standard preparation-Dilute the Standard stock preparation with Diluent to obtain a solution having a known concentration of about 0.1 mg per mL .

## Assay preparation-

FOR TABLETS THAT CONTAIN 5 MG OF OXYBUTYNIN CHLO-RIDE-Place 10 Tablets in a $500-\mathrm{mL}$ volumetric flask, add 150 mL of Preparation medium, and stir overnight or until dissolved. Dilute with Diluent to volume. Mix thoroughly, centrifuge, and use the clear supernatant.

FOR TABLETS THAT CONTAIN 10 MG OF OXYBUTYNIN CHLORIDE OR MORE—Place 10 Tablets in a $1000-\mathrm{mL}$ volumetric flask, add 300 mL of Preparation medium, and stir overnight or until dissolved. Dilute with Diluent to volume. If necessary, make a further dilution with Diluent to obtain a solution having a final concentration equivalent to 0.1 mg per mL of oxybutynin chloride. Mix thoroughly, centrifuge, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is greater than 0.75 and not more than 2.5. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, $R$, between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5 ; and the relative standard deviation of peak area responses for six replicate injections of System suitability solution is not more than $3 \%$ for each compound.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of oxybutynin chloride $\left(\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}\right)$ in the portion of Tablets taken by the formula:

$$
C V D\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of oxybutynin chloride in the Standard preparation; $V$ is the volume, in mL , of the Assay preparation; $D$ is the dilution factor; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Paclitaxel, USP 27 page 1394 and page 1947 of $P F$ 29(6) [Nov.-Dec. 2003]. It is proposed to revise the test for Related compounds to add two new impurities under Test 1, paclitaxel C and N methylpaclitaxel C, at limits of not more than $0.1 \%$ each, and to add Test 3 for materials produced by fermentation. Materials meeting this specification will require labeling to indicate it meets the requirements for USP Related compounds Test 3, which will also require a new reference standard, USP Paclitaxel Related Compound C. Thus it is also proposed to revise the USP Reference standards section to add USP Paclitaxel Related Compound C. The liquid chromatographic procedure described in Test 3 is based on analyses performed with a YMC brand of L1 column. The proposed revision published in PF 29(6) under Test 1 to increase the combined limits of celphalomannine and $2^{\prime \prime}, 3^{\prime \prime}$-dihydrocephalomannine from $0.5 \%$ to $0.8 \%$ is being canceled.
(PA6: L. Evans) RTS—39513-2; 39513-4; 39513-5; 41147-1

## Change to read:

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS. USP Paclitaxel RS. USP Paclitaxel Related Compound A RS. USP Paclitaxel Related Compound B RS.

## Change to read:

## Related compounds-

TEST 1 (for material labeled as isolated from natural sources)-If the material complies with this test, the labeling indicates that it meets USP Related compounds Test 1.

Diluent-Prepare as directed in the Assay.
Solution A-Prepare filtered and degassed acetonitrile.
Solution B-Prepare filtered and degassed water.
Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve accurately weighed quantities of USP Paclitaxel Related Compound A RS and USP Paclitaxel Related Compound B RS in methanol to obtain a solution
having known concentrations of about $10 \mu \mathrm{~g}$ of each per mL . Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.
Standard solution-Dissolve, with the aid of sonication, an accurately weighed quantity of USP Paclitaxel RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ per mL .

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $227-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L43. The flow rate is about 2.6 mL per minute. The column temperature is maintained at $30^{\circ}$. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-35$ | 35 | 65 | isocratic |
| $35-60$ | $35 \rightarrow 80$ | $65 \rightarrow 20$ | linear gradient |
| $60-70$ | $80 \rightarrow 35$ | $20 \rightarrow 65$ | linear gradient |
| $70-80$ | 35 | 65 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.78 for paclitaxel related compound A and 0.86 for paclitaxel related compound B (relative to the retention time for paclitaxel obtained from the Test solution); and the resolution, $R$, between paclitaxel related compound A and paclitaxel related compound B is not less than 1.0. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Inject a volume (about $15 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$
100 F\left(r_{i} / r_{U}\right)
$$

in which $F$ is the relative response factor for each impurity peak (see Table 1 for values); $r_{i}$ is the peak area for each individual impurity; and $r_{U}$ is the peak area for paclitaxel. In addition to not exceeding the limits for paclitaxel related impurities in Table 1, not more than $0.1 \%$ of any other single impurity is found; and not more than $2.0 \%$ of total impurities is found.

Table 1

| Name | Relative Retention Time | Relative Response Factor (F) | Limit (\%) |
| :---: | :---: | :---: | :---: |
| Baccatin III | 0.24 | 1.29 | 0.2 |
| 10-Deacetylpaclitaxel | 0.53 | 1.00 | 0.5 |
| 7-Xylosylpaclitaxel | 0.57 | 1.00 | 0.2 |
| Cephalomannine (paclitaxel related compound A) | 0.78 | 1.26 | $\mathrm{a}_{1}{ }^{1}$ |
| $2^{\prime \prime}, 3^{\prime \prime}$-Dihydrocephalo- | 0.78 | 1.26 | $\mathrm{a}_{2}{ }^{1}$ |
| 10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B) | 0.86 | 1.00 | 0.5 |
| Benzyl analog ${ }^{3}$ | 1.10 | 1.00 | $\mathrm{b}_{1}{ }^{2}$ |
| ■(paclitaxel related |  |  |  |
| compound C) $\mathbf{\| 1 S ~}^{\text {(USP28) }}$ |  |  |  |

Table 1 (Continued)

| Name | Relative Retention Time | Relative Response Factor (F) | Limit (\%) |
| :---: | :---: | :---: | :---: |
| 3",4"-Dehydropaclitaxel C | 1.10 | 1.00 | $\mathrm{b}_{2}{ }^{2}$ |
| -Paclitaxel C | 1.27 | 1.67 | 0.1 [1S (USP28) |
| 7-Epicephalomannine | 1.40 | 1.00 | 0.3 |
| 7-Epipaclitaxel | 1.85 | 1.00 | 0.5 |
| - $N$-Methylpaclitaxel C | 2.36 | 1.67 | 0.1 ■1S (USP28) |

${ }^{1}$ Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of $\mathrm{a}_{1}$ and $\mathrm{a}_{2}$ is not more than $0.5 \%$.
${ }_{2}$ Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of $b_{1}$ and $b_{2}$ is not more than $0.5 \%$.
${ }^{3}$ The following chemical name is assigned to the related compound, benzyl analog: Baccatin III 13 -ester with ( $2 R, 3 S$ )-2-hydroxy-3-phenyl-3-(2-phenylacetylamino)propanoic acid.

TEST 2 (for material labeled as produced by a semi-synthetic pro-cess)-If the material complies with this test, the labeling indicates that it meets USP Related compounds Test 2.

Diluent-Use acetonitrile.
Solution A-Use a filtered and degassed mixture of water and acetonitrile $(3: 2)$.
Solution B-Use filtered and degassed acetonitrile.
Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve accurately weighed quantities of USP Paclitaxel RS and USP Paclitaxel Related Compound B RS in Diluent, using shaking and sonication if necessary, to obtain a solution having known concentrations of about 0.96 mg and 0.008 mg per mL , respectively.

Test solution-Transfer about 10 mg of Paclitaxel, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, using shaking and sonication if necessary, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $227-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at $35^{\circ}$. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-20$ | 100 | 0 | isocratic |
| $20-60$ | $100 \rightarrow 10$ | $0 \rightarrow 90$ | linear gradient |
| $60-62$ | $10 \rightarrow 100$ | $90 \rightarrow 0$ | linear gradient |
| $62-70$ | 100 | 0 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.94 for paclitaxel related compound B and 1.0 for paclitaxel ; the resolution, $R$, between paclitaxel related compound B and paclitaxel is not less than 1.2; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $15 \mu \mathrm{~L}$ ) of the Diluent and the Test solution into the chromatograph, record the chromatograms, and measure the areas for all of the peaks. Disregard any peaks due to the Diluent. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$
100 F\left(r_{i} / r_{s}\right)
$$

in which $F$ is the relative response factor for each impurity (see Table 2 for values); $r_{i}$ is the peak area for each impurity obtained from the Test solution; and $r_{s}$ is the sum of the areas of all the peaks obtained from the Test solution. In addition to not exceeding the limits for paclitaxel related impurities in Table 2, not more than $0.1 \%$ of any other single impurity is found; and not more than $2.0 \%$ of total impurities is found.

Table 2

| Name | Relative Retention Time | Relative <br> Response <br> factor (F) | $\begin{gathered} \text { Limit } \\ (\%) \\ \hline \end{gathered}$ |
| :---: | :---: | :---: | :---: |
| 10-Deacetylbaccatin III | 0.11 | 1.24 | 0.1 |
| Baccatin III | 0.20 | 1.29 | 0.2 |
| Photodegradant ${ }^{2}$ | 0.42 | 1.39 | 0.1 |
| 10-Deacetylpaclitaxel | 0.47 | 1.00 | 0.5 |
| 2-Debenzoylpaclitaxel 2-pentenoate | 0.80 | 1.00 | 0.7 |
| Oxetane ring opened, acetyl and benzoyl ${ }^{2}$ | $0.92{ }^{1}$ | 1.00 | $x_{1}$ |
| 10-Acetoacetylpaclitaxel | $0.92{ }^{1}$ | 1.00 | $x_{2}$ |
| 10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B) | $0.94{ }^{1}$ | 1.00 | $x_{3}$ |
| 7-Epipaclitaxel | 1.37 | 1.00 | 0.4 |
| 10,13-Bissidechainpaclitaxel ${ }^{2}$ | 1.45 | 1.00 | 0.5 |
| 7-Acetylpaclitaxel | 1.54 | 1.00 | 0.6 |
| 13-Tes-baccatin III | 1.80 | 1.75 | 0.1 |
| 7-Tes-paclitaxel | 2.14 | 1.00 | 0.3 |

${ }^{1}$ Resolution may be incomplete for these peaks depending upon the relative amounts present; the sum of $x_{1}, x_{2}$, and $x_{3}$ is not more than $0.4 \%$.
${ }^{2}$ The following chemical names are assigned to the related compounds Photodegradant, Oxetane ring opened, acetyl and benzoyl, and 10,13-Bissidechainpaclitaxel:

Photodegradant
$\frac{(1 R, 2 R, 4 S, 5 S, 7 R, 10 S, 11 R, 12 S, 13 S, 15 S, 16 S)-2,10-d i a c e t y l o x y-5,13-d i-~}{\text { P }}$ hydroxy-4,16,17,17-tetramethyl-8-oxa-3-oxo-12-phenylcarbonyloxypentacyclo[11.3.1.0 $\left.0^{1,11} \cdot 0^{4,11} \cdot 0^{7,10}\right]$ heptadec-15-yl

Baccatin III 13-ester with ( $2 R, 3 S$ )-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid, 10 -ester with ( $2 S, 3 S$ )-2-hydroxy-3-phenyl-3(phenylcarbonylamino)propanoic acid

- TEST 3 (for material labeled as produced by a plant fermentation process)-If the material complies with this test, the labeling indicates that it meets USP Related compounds
Test 3.

Solution A-Prepare a filtered and degassed mixture of water and acetonitrile ( $3: 2$ ).

Solution B-Prepare filtered and degassed acetonitrile.
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve an accurately weighed quantity of USP Paclitaxel RS and USP Paclitaxel Related Compound C RS in acetonitrile to obtain a solution having known concentrations for each Reference Standard of about 1 mg per mL . Sonicate if necessary.
Standard solution-Dissolve an accurately weighed quantity of USP Paclitaxel RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL .

Test solution-Transfer about 10 mg of Paclitaxel, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask. Dissolve in acetonitrile, using sonication if necessary, dilute with acetonitrile to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $227-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L 1 . The flow rate is about 1.2 mL per minute. The column temperature is maintained at $35^{\circ}$. The chromatograph is programmed as follows.

| Time | Solution A |  |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | Solution B <br> $(\%)$ | Elution |
| $0-28$ | 100 | 0 | isocratic |
| $28-33$ | $100 \rightarrow 98$ | $0 \rightarrow 2$ | linear |
| $33-58$ | $98 \rightarrow 10$ | $2 \rightarrow 90$ | linear |
| $58-60$ | 10 | 90 | isocratic |
| $60-63$ | $10 \rightarrow 100$ | $90 \rightarrow 0$ | linear |
| $63-70$ | 100 | 0 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for the Procedure: the resolution, $R$, between paclitaxel and paclitaxel related compound C is not less than 1.8. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Inject a volume (about $12 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$
100 F\left(r_{i} / r_{s}\right),
$$

in which $F$ is the relative response factor for each impurity; $r_{\mathrm{i}}$ is the peak area for each impurity; and $r_{\mathrm{s}}$ is the sum of the areas of all the peaks obtained from the Test solution. In addition to not exceeding the limits for paclitaxel related impurities in Table 3, not more than $0.1 \%$ of any other single impurity is found, and not more than $2.0 \%$ of total impurities is found.

${ }^{1}$ The following chemical names are assigned to the related compounds Propyl analog, sec-Butyl analog, $n$-Butyl analog, and Pentyl analog:

## Propyl analog

Baccatin III 13-ester with ( $2 R, 3 S$ )-2-hydroxy-3-phenyl-3(propanoylamino)propanoic acid.

## sec-Butyl analog

Baccatin III 13-ester with ( $2 S, 3 S$ )-2-hydroxy-3-(2-methylbutanoylamino)-3-phenylpropanoic acid.
$n$-Butyl analog
Baccatin III 13-ester with ( $2 S, 3 S$ )-3-(butanoylamino)-2-hydroxy-3-phenylpropanoic acid.

## Pentyl analog

Baccatin III 13-ester with ( $2 R, 3 S$ )-2-hydroxy-3-(penta-noylamino)-3-phenylpropanoic acid. 1 IS (USP28)

Paroxetine Hydrochloride, page 911 of $P F$ 30(3) [May-June 2004]. On the basis of experimental data received, it is proposed to change the tailing factor for paroxetine related compound C in the test for Limit of related compound C. Because absolute alcohol is the grade of reagent used, it is also proposed to specify its use in the preparation of Mobile phase and Diluent.
(PA3: S. Salado) RTS-41164-1

## Add the following:

■ Paroxetine Hydrochloride

$\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl} \quad 365.83$
Piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-
fluorophenyl)-, hydrochloride, (3S-trans)-.
(-)-(3S,4R)-4-(p-Fluorophenyl)-3-[(3,4-methylenedioxy)phenoxy]methyl]piperidine hydrochloride
[78246-49-8].
Hemihydrate 374.83 [GAS
" Paroxetine Hydrochloride is anhydrous or contains one-half molecule of water of hydration. It contains not less than 98.5 percent and not more than 102.0 percent of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$, calculated on the anhydrous and solvent-free basis.

## Change to read:

Packaging and storage-Preserve the anhydrous form in tight containers. Preserve the hemihydrate form in wellclosed containers. Store ben $15^{\circ}$ and $30^{\circ}-$ Store at controlled room temperature. 1 IS (USP28)

Labeling-Label it to indicate whether it is the anhydrous or the hemihydrate form. Label it to indicate with which impurity tests the article complies.

USP Reference standards $\langle 11\rangle$ —USP Paroxetine Hydrochloride RS. USP Paroxetine Related Compound A RS. USP Paroxetine Related Compound B RS. USP Paroxetine Related Compound C RS. USP Parane Related Com D RS. USP Paroxetine Related Compound E RS. USP Paroxetine Related Compound F RS. USP Paroxetine Related Compound G RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$ -
Test specimen-Dissolve a suitable portion of Paroxetine Hydrochloride in a solution of water in isopropyl alcohol (1 in 10), heat to $70^{\circ}$ to dissolve, recrystallize, enduse the residee. and dry the residue under vacuum at $50^{\circ}$ for 3 hours.

Standard specimen: a similar preparation of USP Paroxetine Hydrochloride RS.

B: A solution (1 in 100) in a mixture of methanol and water ( $1: 1$ ) meets the requirements of the test for Chloride $\langle 191\rangle$.

Melting range, Class $I\langle 741\rangle \div$ between $115^{\circ}$ and $126^{\circ}$ for the anhydrous form; [T0 come for the anhydrous form] be tween $141^{\circ}$ and $145^{\circ}$ for the hemihydrate form.

## Change to read:

Limil of stereoisomers Limit of related compound C-
Mobile phase Prepare a flltered and degassed mixture of 0.5 M sodium chloride and methanol ( $4: 1$ ). Make adjust ments if neeessayy (see System Suitability under Chwoma -graphy (621) ).
0.05M Phesplate buffer solution Dissolve 8.7 g of dibasic petassium phosphate in 1000 mL of water, and adjust with phosphorie acid to a pH of 6.5 .

Mebile phate Prepare a filtered and degassed mixtare of 6.05 M Phesphate buffer solution and acetonitrile (92:8). Make adjustments if neeessary (see-System-Suitability under Chremategraphy (624)-.

Systen suitability solution Transfer about 5-mg of USP
Paroxetine Hydrochloride Related Compound C RS and about 5 mg of USP Paroxetine-Hydrochloride-RS, ac etrately weighed, to a $10-\mathrm{mL}$ volumetric flack. Dissolve in 1 mL of methand, dilate with Mobile phase to volume, and mix.

Standardsolution- Dissolve an aceurately weighed quantity of USP Paroxetine-Related Compound C RS and USP Paroxetine Hydrechloride RS in methanol, the voltume of the solvent not exceeding $20 \%$ of the final solution vol tume, and dilute quantitatively with 0.5 M - sodium chloride to obtain a solution having a known concentration of about Q.01 mg of each USP Reference Standard per mL. If stepwise dilution is necessary, diltte with Mobile phase instead.

Fest solution Transfer about 100 mg of Parozetine Hydrochloride, aceurately weighed, to a $100-\mathrm{mL}$ volumetrie flask, dissolve in $20-\mathrm{mL}$ of methanol, dilute with $0.5 \mathrm{M}-\mathrm{se}-$ ditum chleride to velume, and mix.

Chromatographie system (see-Chromatography $\langle 624\rangle$ )
The liquid chromatograph is equipped with a 295 -nm detecfor and a 4 mm $\times 10$ em column that contains packing L41. The flow rate is about 0.5 mL per minute. Chrematograph the-Standtad Systen suitability solution, and record the peak respenses as directed for Procedure: the relative retention times are about 0.56 for paroxetine related compound $G$ and 1.0 for parexetine; the reselution, $R$, between parexetine related compennd $C$ and paroxetine is not less than 1.8; the column efficiency determined from the related compound $G$
peak is not less than 230 theoretical plates; the tailing factor for the paroxetine related compeund $C$ peak is not more than 1.6; and the relative standard deviation for replieate injec tions is net more than $2.0 \%$.

Procedtre Separately inject equal volumes Inject a vol ume (about $10 \mu \mathrm{~L})$ of the Standard solution and the Test solution into the chromatograph, record the chromatogram, and measure all of the peak responses. Caleulate the per eentage of paroxetine related compound $C$ in the pertion ef Paroxetine Hydrochloride taken by the formula:

$$
10(C / H)\left(r_{4}+r_{s}\right),
$$

$$
100(+\neq+
$$

in which $C$ is the concentration, in $\mu$ g per mL , of USP Par exetine-Related Compound C RS in the Standard solution; Wis the quantity, in mg, of Parexetine Hydrochloride in the Fest solution; and $r_{\text {}}$-and $r_{\text {s }}$ are the peak respenses for par oxetine related compound Cobtained from the Test solution and the Standard solution, respectively. in which-i; is the peak response for paroxetine related compound $C$, and $r$, is the sum of the respenses of all of the peaks: not more that $0.1 \%$ is found.

LMMIT OF RELATED-COMPOUND-D-
Phesphate buffer Prepare a 0.05 M menobasic sodium phesphate solution in water, adjust with phespheric acid to a pH Of 3.0 , and mix.

Mebile phase Prepare a filtered and degassed mixtare of Phesphate buffer and acetonitrile (3:2). Make adjustments if neeessary (see System Stuitability under Chrematography $\langle 624\rangle$.
Standard solution- Dissolve aceurately weighed quantities of USP Paroxetine Related Compound D-RS and USP

Paroxetine Hydrochloride-RS in water, and dilute quantita-
tively, and stepwise if necessary, with water to obtain a solut tion having known concentrations of about 0.1 and 1.0 mg per mL , respectively.

Fest solution Transfer about 100 mg of Parozetine Hydrechleride, aceurately weighed, to a $50-\mathrm{mL}$ voltmetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )_ The liquid chromatograph is equipped with a 295 nm- detec for and a $4.6-\mathrm{mm} \times 25-\mathrm{em}$ coltumn that contains packing Ł13. The flow rate is about 1 mL per minute. Chremategraph the Standerd solution, and record the peak respenses as directed for Procedtre: the relative retention times are about 1.2 for paroxetine related compound $D$ and 1.0 for paroxetine; the resolution, $R$, between paroxetine related eompound $D$-and paroxetine is not less than 2.2; the columm efficieney determined frem the parexetine related compeund D peak is not less than- 4000 theoretical plates; the tailing factor for the related compound $D$ peak is not more than 1.8 ; and the relative standard deviation for replicate in jections is net more than $2.5 \%$.

Proecdure Separately inject equal volumes (about 10 HL) of the Standard solution and the Test solution into the ehromatograph, record the chromatograms, and measure the respenses for the major peaks. Caleulate the pereentage of paroxetine related compound $D$ in the portion of Paroxetine Hydrechloride taken by the formula:-

$$
5(C / H)\left(r_{t}+F_{s}\right)
$$

in which $C$ is the concentration, in $\mu$ g per mL, of USP Paroxetine Related Compound D-RS in the Standard solution; $W$ is the quantity, in mg, of Paroxetine Hydrochloride in the Test solution; and $r_{\text {}}$-and $r_{s}$ are the peak respenses for par exetine related compeund D-obtained from the Test solution
and the Standard solttion, respectively: the sum of the per
eentages found in the Limit of related eompound $C$ and the Limit of related eomapent $D$ tests is not more than $0.1 \%$.

Mobile phase-Prepare a mixture of $n$-hexane, $\square_{\text {abso- }}$ lute $_{1 S}$ (USP28) alcohol, water, and trifluoroacetic acid ( $900: 100: 2: 2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent: $\quad$ a mixture of $\mathbf{m a b s o l u t e}^{\mathbf{1 S ~}_{\text {(USP28) }}}$ alcohol and $n$ hexane ( $1: 1$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Related Compound C RS, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 1 mg per mL.

Test solution-Transfer about 125 mg of Paroxetine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

System suitability solution-Dilute known volumes of the Test solution and the Standard solution with Diluent to obtain a solution having known concentrations of about 0.1 mg per mL of each of USP Paroxetine Hydrechloride RS Paroxetine Hydrochloride and of USP Paroxetine Related Compound C RS.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing E49. L51. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at $30^{\circ}$. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times for paroxetine and paroxetine related compound C are 1.0 and about 0.6 , respectively; the resolution, $R$, between paroxetine and paroxetine related compound C is not less than 2.0; and the tailing factor for paroxetine related
compound C is not greater than $2.0 \cdot \mathbf{m}^{2.5}$. 1 IS (USP28) Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$ for the paroxetine related compound C .

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound C in the portion of Paroxetine Hydrochloride taken by the formula:

$$
10,000(C / H)\left(+,+f_{s}\right)
$$

$$
2500(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Related Compound C RS in the Standard solution, $W$ is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; and $r_{i}$ and $r_{s}$ are the peak areas for paroxetine related compound C in the Test solution and the Standard solution, respectively: not more than of $0.1 \%$ of paroxetine related compound C is found.

## Change to read:

Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydro-pyridine-

Solution A-Prepare a filtered and degassed mixture of acetonitrile and trifluoroacetic acid (1000:1).

Solution B-Prepare a filtered and degassed mixture of water and trifluoroacetic acid (1000:1).

Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Related Compound E RS in a mixture of Solution $B$ and Solution $A(7: 3)$, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 1-methyl-4-( $p$-fluorophenyl)-1,2,3,6-tetrahydropyridine of about 0.2100 ng per mL. $\mathbf{D O}_{2} 20$ ng per mL. 1 (USP28)

Test solution-Transfer about 20 mg of Paroxetine Hydrochloride, accurately weighed, to a suitable flask, add 1.0 mL of a mixture of Solution $B$ and Solution $A(7: 3)$, and shake to dissolve.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a tandem mass spectrophotometric detector, monitoring the mass-to-charge ratio of 44 arising from the fragmentation of mass-to-charge ratio of 192 , and a $2.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains base-deactivated packing L1. The flow rate is about 0.15 mL per minute. The collision-induced disassociation sector is filled with sufficient argon gas to produce -20 eV collisions. Adjust the argon gas pressure as necessary. The chromatograph is programmed as follows.

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the signal-to-noise ratio for the analyte response at a mass-to-charge ratio of 44 is not less than 5 ; and the relative standard deviation for replicate injections is not more than $5.0 \%$. [NOTE-A large peak due to paroxetine is observed at about 10 minutes in this system. Divert the flow of eluate from the mass spectrometer at about 10 minutes after injection.]
Procedure-Separately inject equal volumes (about 100 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in pg ng, of 1-methyl-4-( $p$-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$
C I\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Related Compound E RS in the Standard solution; I is the amount, in ng, of 1-methyl-4-( $p$-fluorophenyl)-1,2,3,6-tetrahydropyridine in each mg of USP Paroxetine Related Compound E RS in the Standard solution; and $r_{U}$ and $r_{s}$ are the peak responses for 1-methyl-4-( $p$-fluorophe-nyl)-1,2,3,6-tetrahydropyridine obtained from the Test solution and the Standard solution, respectively: not more than 200 pg 100 ng 20 ng is found ( $0.0001 \%$ ).

Chromatographic purity-[NOTE-Perform all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to their material.]

TEST 1-
Solution A—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180:20:1).

Solution B-Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180:20:1).
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent: a mixture of water and tetrahydrofuran ( $9: 1$ ). Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL.

System suitability solution-Dissolve, by sonication if necessary, suitable quantities of USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS in a mixture of water and tetrahydroftran ( $9: 1$ ) Diluent to obtain a solution having known concentrations of about 0.01 mg of each USP Reference Standard per mL.

Test solution-Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in 20 mL of mixttre of water and tetrahydroftran $(9: 1)$, Diluent, sonicate, dilute with a mixture of and etrahydrefan (9:1) Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $285-\mathrm{nm}$ detector eapable of menitering at 263 and 295 mm and a $4.6-\mathrm{mm}$ $\times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at $40^{\circ}$. The chromatograph is programmed as follows.

| Time (minutes) | Solution 4 <br> (\%) | Solution $B$ <br> (\%) | Elution |
| :---: | :---: | :---: | :---: |
| $\theta$ | 80 | 20 | equilibration (for |
|  |  |  | 10 minutes) |
| -0-30 | 80 | 20 | iseratie |
| 30-50 | $80 \rightarrow 20$ | $20 \rightarrow 80$ | linear gradient |
| -50-nd | 20 | 80 | isocratic |

Chromatograph the System sulitability solution, and reeord the peak responses as directed for Procedtre: the resolution, $R$, between paroxetine related eompound $\Lambda$ and paroxetine related compound $B$ is not less than 1.5 ; the column effir eieney determined from the parovetine related compound A peak is not less than 10,000 theoretient plates; the tailing factor for the paroxetine related compound $\Lambda$ peak is not more than 1.2 ; and the relative standard deviation for replieate injections is not more than $1.0 \%$.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 80 | 20 | equilibration |
| $0-30$ | 80 | 20 | isocratic |
| $30-50$ | $80 \rightarrow 20$ | $20 \rightarrow 80$ | linear gradient |
| $50-60$ | 20 | 80 | isocratic |
| $60-70$ | $20 \rightarrow 80$ | $80 \rightarrow 20$ | linear gradient |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.1 for paroxetine related compound B , and 1.0 for paroxetine related compound A ; the resolution, $R$, between paroxetine related compound A and paroxetine related compound $B$ is not less than 2.0 ; the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0; Ghromatograph the Stated solt tion, and record the peak respenses as directed for Proce-
dute: and the relative standard deviation for replicate injections is not more than $2.0 \%$ for paroxetine related compound A.

Procedure Inject a volume (about 20- 2 L ) of the Test seltion inte the chromatograph, recerd the chromategram, and meastre all of the peak respenses at beth 263 and 295 nm. Caleulate the percentage of each impurity in the pertion of Paroxetine Hydrochloride taken by the formula:

$$
100\left(r_{i}+r_{4}\right)
$$

in whieh $r$ is the peak respense for each impurity; andris the-stm of the respenses of all of the peaks: net mere-that $0.1 \% 0$ of any individualimpurity is found, and not more than

## $0.5 \%$ of totalimpurities is fount.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, Test solution, and Diluent into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$
2500(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Hydrochloride RS in the Standard solution; $W$ is the weight, in mg , of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; $r_{U}$ is the peak area of each impurity in the Test solution, excluding the peaks obtained in the chromatogram of the Diluent; and $r_{s}$ is the peak area of paroxetine obtained in the Standard solution: not more than of $0.5 \% 0.3 \%$ of any peak at a retention time of paroxetine related compound $B$ is found; not more that $0.1 \%$ of any other individual impurity is found; and not more than $1.0 \%$ of total impurities is found.

TEST 2-
Phosphate buffer-Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A—Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (98:2).
Solution B—Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (6:4).

Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent: a mixture of Phosphate buffer and acetonitrile (9:1).
Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having known concentrations of about $4 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per mL , and $4 \mu \mathrm{~g}$ per mL , respectively.

Identification solution-Dissolve an accurately weighed quantity of Paroxetine Hydrochloride, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in Diluent to obtain a solution having known concentrations of about 2 mg per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per mL , and 4 $\mu \mathrm{g}$ per mL , respectively.

Test solution-Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-5$ | 100 | 0 | isocratic |
| $5-70$ | $100 \rightarrow 40$ | $0 \rightarrow 60$ | linear gradient |
| $70-90$ | $40 \rightarrow 0$ | $60 \rightarrow 100$ | linear gradient |
| $90-95$ | 0 | 100 | isocratic |
| $95-95.1$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $95.1-110$ | 100 | 0 | re-equilibration |

Chromatograph the Identification solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.91 for paroxetine related compound $B$, about 0.96 for paroxetine related compound $\mathrm{F}, 1.0$ for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $10.0 \%$ for the paroxetine related compound B , paroxetine related compound F , paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B, paroxetine related compound F , and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$
5000(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the appropriate USP Reference Standard in the Standard solution; $W$ is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; and $r_{i}$ and $r_{s}$ are the peak areas for the corresponding impurity in the Test solution and the Standard solution, respectively: not more than of $0.5 \%$ of paroxetine related compound B is found; not more than $0.2 \%$ of paroxetine related compound F is found; and not more than $0.2 \%$ of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$
5000(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the USP Paroxetine Hydrochloride RS in the Standard solution; $W$ is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; $r_{i}$ is the peak area for any unknown impurity in the Test solution; and $r_{S}$ is the peak area of paroxetine in the Standard solution: not more than of $0.1 \%$ of any single unknown impurity is found, and not more than $1.0 \%$ of total impurities is found.

Organic volatile impurities, Method $V\langle 467\rangle$ : meets the requirements.

## Assay-

Acetate buffer-Prepare a 0.05 M solution of ammonium acetate in water, adjust with glacial acetic acid to a pH of 4.5, mix, and filter.

Mobile phase—Prepare a filtered and degassed mixture of Acetate buffer, acetonitrile, and triethylamine ( $60: 40: 1$ ). Adjust with glacial acetic acid to a pH of 5.5. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve suitable quantities of USP Paroxetine Related Compound B RS and USP Paroxetine Hydrochloride RS in water to obtain a solution having known concentrations of about 0.5 mg of each USP Reference Standard per mL.
Standard preparation-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation-Transfer about 50 mg of Paroxetine Hydrochloride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L13. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for paroxetine related compound B and 1.0 for paroxetine; the resolution, $R$, between paroxetine related compound $B$ and paroxetine is not less than 2.0 ; the column efficiency determined from the paroxetine peak is not less than 3000 theoretical plates; the tailing factor for the paroxetine peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the
quantity, in mg, of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$ in the portion of Paroxetine Hydrochloride taken by the formula:

$$
100 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP27)

## Briefing

Phenylethyl Alcohol, USP 27 page 1474. On the basis of comments received regarding the performance of the current Identification test, specifically that it is tedious, nonspecific, and outdated, it is proposed to delete the current test and replace it with a spectrophotometric identification test employing Infrared Absorption〈197F〉. It is also proposed to add a new Reference Standard, USP Phenylethyl Alcohol RS, to be used in the Identification test.
(EMC: C. Sheehan) RTS-40996-1

## Identification,

A: Infrafed Absorption- $\langle 197 \mathrm{~K}\rangle$ :
B: Ultravidet Absorption- $\langle 197 U\rangle$ -
Solution: 100 нg per mL.
Meditm: 0.1 N hydrechleric acid.
C: Dissolve 0.5 g of Phenyltoloxamine-Dihydrogen
Gitrate in 15 mL of het water, add a slight excess of 5 M sedium hydroxide, filter, and add 2 N hydrechloric acid untill the filtrate is neutral to litmus paper: the solution meets the-requirements of the test for Citrate $\langle 194\rangle$ : Infrared $A b$ sorption $\langle 197 \mathrm{~K}\rangle$.

Melting range, Class $1 a\langle 741\rangle$ : between $137^{\circ}$ and $143^{\circ}$. $\mathbf{p H}\langle 791\rangle$ : between 3.2 and 4.2, in a solution (1 in 100).

Loss on drying $\langle 731\rangle$ ——Dry it in vacuum at $80^{\circ}$ for 3 hours: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method $I\langle 231\rangle: \quad 20 \mu \mathrm{~g}$ per g .

## Related compounds-

Resolution solution-In a separatory funnel dissolve about 10 mg each of USP Phenyltoloxamine Pihydregen Citrate RS and USP Phenyltoloxamine Dihydrogen Citrate Related Compound A RS, accurately weighed, in 50 mL of water. Add 5 mL of ammonium hydroxide, and extract with three $10-\mathrm{mL}$ portions of ethylether methylene chloride. Combine the extracts, dry the solution over anhydrous sodium sulfate, and gently evaporate to dryness. Dissolve the residue in 20 mL of ehloreform methylene chloride.

Test solution-In a separatory funnel dissolve about 800 mg 400 mg of Phenyltoloxamine Pihydrogen Citrate, accurately weighed, in 50 mL of water. Proceed as directed for Resolution solution, beginning with "Add 5 mL of ammonium hydroxide."

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a $0.32-\mathrm{mm} \times 25-\mathrm{m}$
column coated with a $0.45-\mu \mathrm{m}$ film of phase G27. The carrier gas is helium, flowing at a rate of about 29 cm per second, with a split flow rate of about 25 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at $190^{\circ}$ for 3 minutes, then the temperature is increased at a rate of $4^{\circ}$ per minute to $240^{\circ}$ and maintained at $240^{\circ}$ for 8 minutes. The injection port and the detector temperatures are maintained at $280^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution,
$R$, between phenyltoloxamine and phenyltoloxamine dihydrege related compound A is not less than 2.0 1.5.

Procedure-Inject a volume (about $1 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Phenyltoloxamine Pihydregen Citrate taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response of each impurity; and $r_{s}$ is the sum of the responses of all the peaks, excluding the solvent peaks: not more than $0.2 \%$ of phenyltoloxamine dihy droge related compound A , not more than $0.1 \%$ of any other individual impurity, is fomd; and not more than $1.0 \%$ of total impurities is found.

Organic volatile impurities, Method $1\langle 467\rangle$ : meets the requirements.

Assay-Dissolve about 0.5 g of Phenyltoloxamine Dihy droen Citrate, accurately weighed, in 80 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N perchloric acid is equivalent to 44.75 mg of $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{NO} \cdot \mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} \cdot \mathbf{\Delta U S P 2 8}$

## BRIEFING

Povidone, USP 27 page 1529, page 3078 of the First Supplement, and page 1968 of PF 29(6) [Nov.-Dec. 2003]. On the basis of comments received indicating difficulties in obtaining columns with the dimensions specified in the liquid chromatographic procedure in the test for Vinylpyrrolidinone, it is proposed to include a note suggesting several alternative columns. The analysis can also be performed with a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ Waters Symmetry Shield RP8 analytical column and with $4.0-\mathrm{mm} \times 30-\mathrm{mm}$ Nucleosil $120-5-\mathrm{C} 8$ and $4.6-\mathrm{mm} \times 30-\mathrm{mm}$ Zorbax Ace C-8 guard columns. In addition, minor editorial style changes have been made.
(EMC: C. Sheehan) RTS-41321-1

## Change to read:

Vinylpyrrolidinone- Dissolve-10.0g of Povidene-in $80-\mathrm{mL}$ of water, add 1.0 g of sodium reetate, and titrate with -0.10 N iodine until the coler of iodine no lenger fales. Add an additional 3.0 mL of 0.10 N iodine, allow to stand for 10 minntes, and titrate the exeess iodine with 0.10 N sodium thiosulfate, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination (see-Residual Titrations under Titrintry (544)), using the same total volume of 0.10 N iodine, aceurately measured, as was used for titrating the specimen: not more tham 3.6 mL of 0.10 N iodine is consumed, correspending to not more than $0.2 \%$ of vinylpyrretidinene.

- Mobile phase-Prepare a mixture of water and methanol ( $80: 20$ ).

Resolution solution-Transfer 10 mg of vinylpyrrolidinone and 500 mg of vinyl acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume. Transfer 1.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Standard solution-Transfer an accurately weighed quantity of 50 mg of vinylpyrrolidinone to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix. Transfer $1.0-\mathrm{mL}$ of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.
Test solution-Transfer an accurately weighed quantity of about 250 mg of Povidone to a $10-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $235-\mathrm{nm}$ detector, a $4.0-\mathrm{mm} \times 2.5-\mathrm{cm}$ guard column containing packing L7, and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ analytical column containing 5$\mu \mathrm{m}$ packing L7. - [NOTE-The analysis can also be performed with $4.0-\mathrm{mm} \times 30-\mathrm{mm}$ and $4.6-\mathrm{mm} \times 30-\mathrm{mm}$ guard columns containing packing L7 and with a $4.6-\mathrm{mm}$ $\times 25-\mathrm{cm}$ analytical column containing $5-\mu \mathrm{m}$ packing L7.] 1S (USP28) The column temperature is maintained at about $40^{\circ}$. Adjust the flow rate so that the retention time of vinylpyrrolidinone is about 10 minutes. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between vinylpyrrolidinone and vinyl acetate is not less than 2.0. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separetely inject equal volumes (about 50 $\mu \mathrm{L}$ ) each of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the vinylpyrrolidinone peak. [NOTE-If necessary, after each injection of the Test solution, wash the polymeric material of Povidone from the guard column by passing the Mobile phase through the column backwards for about 30 minutes at the same flow rate.] Calculate the percentage of vinylpyrrolidinone in the sample taken by the formula:

$$
1000(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of vinylpyrrolidinone in the Standard solution; $W$ is the weight, in mg, of Povidone taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses for vinylpyrrolidinone obtained from the Test solution and Standard solution, respectively: not more than $0.001 \%$ is found. ${ }^{2 S}$ (USP27)

BRIEFING

Ringer's and Dextrose Injection, USP 27 page 1657. It is proposed to revise the Labeling statement by removing the warning regarding lactic acidosis because this product does not contain a source of lactate.
(PA1: K. Russo; NL: C. Barnstein) RTS-41099-1

## Change to read:

Labeling-The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL , the label alternatively may state the total osmolar concentration in mOsmol per mL . The label includes alse the warning "Not for use in the treatment of lactic acidosis.".

■1S (USP28)

Briefing

Simethicone, USP 27 page 1689 and page 184 of PF 30(1) [Jan.-Feb. 2004]. It is proposed to replace the Infrared Absorption $\langle 197 \mathrm{~S}\rangle$ test under Identification with the Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ test, which is based on a comparison of the IR spectra of Simethicone and USP Simethicone $R S$ as neat films between salt plates. The addition of the Note proposed in a previous $P F$ is now being canceled.

» Somatropin is a protein hormone consisting of 191 amino acid residues, and its structure corresponds to the major component of the growth hormone extracted from human pituitary glands. It is produced as a lyophilized powder or bulk solution by methods based on recombinant DNA technology. When prepared as a lyophilized powder, it contains not less than $910 \mu \mathrm{~g}$ of somatropin per mg , calculated on the anhydrous basis. When prepared as a bulk solution, it contains not less than $910 \mu \mathrm{~g}$ of somatropin per mg of total protein. The presence of host-cell DNA and host-cell protein impurities in Somatropin is process specificthe limits of these impurities are determined by validated methods. Manufacturers must demonstrate a correlation between the Assay and a validated and approved growth-promotion based bioassay. It may contain excipients. [NOTE-One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

Packaging and storage-Preserve in tight containers, and store between $-10^{\circ}$ and $-25^{\circ}$.

Labeling-The labeling states that the material is of recombinant DNA origin.

USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS. USP Somatropin RS.

## Identification-

A: Proceed as directed in the test for Chromatographic purity, except to prepare a Standard solution by reconstituting a vial of USP Somatropin RS with the Diluent to obtain a solution having a known concentration of about 2.0 mg per mL. Chromatograph the Standard solution and the Test solution as directed for Procedure: the retention time of the somatropin peak in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution.

B: Peptide Mapping (see Biotechnology-Derived Articles—Tests $\langle 1047\rangle$ )-
Solution A-Prepare a filtered and degassed solution of trifluoroacetic acid in water ( 1 in $1000, \mathrm{v} / \mathrm{v}$ ).

Solution B-Transfer 100 mL of water to a $1000-\mathrm{mL}$ volumetric flask, add 1 mL of trifluoroacetic acid, dilute with acetonitrile to volume, and mix.

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments to either solution as necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Tris buffer-Prepare a 0.05 M solution of tris(hydroxymethyl)aminomethane (Tris), and adjust with hydrochloric acid to a pH of 7.5.

Trypsin solution-Prepare a solution containing 1 mg of trypsin per mL of Tris buffer, and mix. Store in a freezer, if necessary.

Standard solution-Prepare a solution containing 2.0 mg of USP Somatropin RS per mL of the Tris buffer, and mix. Add 1 mL of this solution to a suitable tube, and add $30 \mu \mathrm{~L}$
of Trypsin solution. Cap the tube, and place it in a water bath at $37^{\circ}$ for 4 hours. [NOTE-If this solution is not injected immediately, store it in a freezer.]

Test solution-Prepare a solution containing 2.0 mg of Somatropin per mL of Tris buffer, and mix. Add 1 mL of this solution to a suitable tube, and add $30 \mu \mathrm{~L}$ of Trypsin solution. Cap the tube, and place it in a water bath at $37^{\circ}$ for 4 hours. [NOTE-If this solution is not injected immediately, store it in a freezer.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is 1 mL per minute, and the column temperature is maintained at $30^{\circ}$. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0 \rightarrow 20$ | $100 \rightarrow 80$ | $0 \rightarrow 20$ | linear gradient |
| $20 \rightarrow 40$ | $80 \rightarrow 75$ | $20 \rightarrow 25$ | linear gradient |
| $40 \rightarrow 65$ | $75 \rightarrow 50$ | $25 \rightarrow 50$ | linear gradient |
| $65 \rightarrow 70$ | $50 \rightarrow 20$ | $50 \rightarrow 80$ | linear gradient |
| $70 \rightarrow 71$ | $20 \rightarrow 100$ | $80 \rightarrow 0$ | linear gradient |
| $71 \rightarrow 86$ | 100 | 0 | isocratic, re-equili- |
|  |  |  | bration |

Procedure-[NOTE-Condition the chromatographic system by running a blank gradient program prior to injecting the digests.] Separately inject equal volumes (about $100 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution, and record the chromatograms: the chromatographic profile of the Test solution is similar to that of the Standard solution.

Bioidentity-[NOTE-The Bioidentity test may be performed either on the Somatropin bulk drug substance or on the finished pharmaceutical product.]

Buffer solution-Prepare a solution of 0.1 M ammonium bicarbonate, and adjust with sodium hydroxide to a pH of 8.0.

Standard solutions - Transfer aceurately weighed quantiReconstitute the USP Somatropin RS, and dissolve in and dilute quantitatively with Buffer solution to obtain solutions having known concentrations between 10 and $100 \mu \mathrm{~g}$ per mL .
Test solutions-Transfer aceurately weighed amounts of
Semern, Prepare a solution of Somatropin, and dissolve in and dilute quantitatively with Buffer solution to obtain solutions having concentrations similar to those of the Standard solutions. [NOTE-Do not agitate while mixing; swirl gently.]

## Control solution-Use the Buffer solution.

Test animals-Select an appropriate number of only female or only male Sprague Dawley rats hypophysectomized at 25 to 30 days of age. After hypophysectomization, feed the rats on rat chow and $5 \%$ dextrose water for at least 72 hours. After 72 hours, feed the rats on rat chow and filtered and deionized water adjusted with 1 N hydrochloric acid to a pH of $3.0 \pm 0.25$. Weigh the rats when they are 37 to 44 days old, and retain only healthy rats. Reweigh the remaining rats 7 days later, and use only those rats that are in good health and have not gained or lost more than $10 \%$ of their body weight in the previous 7 -day period.

Procedure - Randomly divide the rats into control, standard, and test groups, each group containing approximately 10 rats. Each day for 10 days inject subcutaneously 0.1 mL of the Control solution, Standard solutions, and Test solutions to the control, standard, and test groups, respectively. Record the body weight of each animal at the start of the test and at approximately 18 hours following the $10^{\text {th }}$ injection. Determine the change in body weight for each rat during the 10-day period, and compute the potency of the Test solution
relative to that of the Standard solution using appropriate statistical analysis. Calculate the mean potency in USP Somatropin Units per mg: not less than 2 USP Somatropin Units per mg is found. Using appropriate statistical methods, calculate the width, $L$, of a $95 \%$ confidence interval for the estimated logarithm of the relative potency: $L$ is not more than 0.40 , which corresponds to confidence limits between $63 \%$ and $158 \%$ of the calculated potency. If $L$ is more than 0.40 , repeat the test until the results from two or more tests, combined by appropriate statistical methods, meet this criterion.
Microbial limits $\langle 61\rangle$ —The total aerobic microbial count does not exceed 300 cfu per g , the test being performed on about 0.2 to 0.3 g of powder, accurately weighed.

Bacterial endotoxins $\langle 85\rangle$-It contains not more than 10 USP Endotoxin Units per mg.

Water, Method Ic $\langle 921\rangle$ : not more than $10 \%$, when prepared as a lyophilized powder.

## Chromatographic purity-

Diluent-Prepare a solution of 0.05 M Tris in water, and adjust with hydrochloric acid to a pH of 7.5 .

Mobile phase-Degas the Diluent, mix with n-propyl alcohol ( $71: 29, \mathrm{v} / \mathrm{v}$ ), and filter. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Resolution solution-Prepare a solution of 2.0 mg of Somatropin per mL of the Diluent, pass through a filter to sterilize or add sodium azide to a final concentration of $0.01 \%$, and allow to stand at room temperature for 24 hours. [NOTE--Use within 48 hours after preparation, or store the solution in a refrigerator until ready to use.]
Test solution-Prepare a solution of 2.0 mg of Somatropin per mL of the Diluent immediately before use. [NOTEMaintain the solutions between $2^{\circ}$ and $8^{\circ}$, and use within 24 hours. If an automatic injector is used, maintain the temperature between $2^{\circ}$ and $8^{\circ}$.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L26 and is maintained at $45^{\circ}$. The flow rate is about 0.5 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the tailing factor of the somatropin peak (major peak) is between 0.9 and 1.8 ; and the resolution, $R$, between somatropin and its adjacent peak is not less than 1.0.

Procedure Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution, record the chromatograms, and
meactre the are the major peak. Inject about $20 \mu \mathrm{~L}$ of the Test solution, record the chromatograms, and measure the peak responses. Calculate the percentage of impurities in the portion of Somatropin taken by the formula:

$$
100 A_{I} /\left(A_{I}+A_{S}\right)
$$

in which $A_{I}$ is the sum of the responses of all peaks other than the somatropin peak (major peak) and disregarding any peak due to the solvent; and $A_{S}$ is the response of the somatropin peak: not more than $6.0 \%$ of total impurities is found.

## Limit of high molecular weight proteins-

Phosphate buffer, Mobile phase, Diluent, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.

Test solution-Prepare as directed for the Assay preparation in the Assay.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution, record the chromatogram, and measure the areas of the main peak and of the peaks eluting prior to the main peak, excluding the solvent peaks. Calculate the percentage of high mo-
lecular weight proteins in the portion of Somatropin taken by the formula:

$$
100 A_{H} /\left(A_{H}+A_{M}\right),
$$

in which $A_{H}$ is the sum of the areas of the high molecular weight peaks, and $A_{M}$ is the area of the monomer peak in the chromatogram of the Test solution: not more than $4 \%$ of high molecular weight proteins is found.

Total protein (see Spectrophotometry and Light-Scattering〈851〉)-

Phosphate buffer-Prepare a 0.025 M solution of monobasic potassium phosphate in water, and adjust with sodium hydroxide to a pH of 7.0.

Test solution-Dissolve an accurately weighed quantity of Somatropin in Phosphate buffer to obtain a solution having an absorbance value between 0.5 and 1.0 at the wavelength of maximum absorbance at about 280 nm .

Procedure-Determine the absorbance of the Test solution using a spectrophotometric cell of path length $1-\mathrm{cm}$, at the wavelength of maximum absorbance at around 280 nm and at 320 nm , using Phosphate buffer as the blank. Calculate the protein content, in mg , in the portion of Somatropin taken by the formula:

$$
V\left(A_{\max }-A_{320}\right) / 0.82
$$

in which $V$ is the volume of the Test solution; and $A_{\text {max }}$ and $A_{320}$ are the absorbance values of the Test solution at the wavelength of maximum absorbance and at 320 nm , respectively.

## Assay-

Phosphate buffer - Prepare a 0.063 M solution of menebasic petassimm phesphate in water, and adjust with sodium hydroxide Dissolve 5.18 g of dibasic sodium phosphate and
3.65 g of monobasic sodium phosphate in 950 mL of water, adjust with phosphoric acid to a pH of 7.0 , and dilute with water to 1000 mL .

Mobile phase-Prepare a filtered and degassed mixture of the Phosphate buffer and isopropyl alcohol (97:3, v/v). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare 0.025 M solution by dissolving monebasie potassium phosphate in water and adjusting with so dium hydroxide pH of 7.0. Prepare a mixture of water and Phosphate buffer (1.5:1).
Resolution solution-Place 1 vial of USP Somatropin RS in an oven at $50^{\circ}$ for 12 to 24 hours. Remove from the oven, and dissolve the contents of the vial in Diluent to obtain a solution having a known concentration of about 1 mg per mL with the content of the dimer between $1 \%$ and $2 \%$.

## Standard preparation-Reconstitute a vial of USP Soma-

 tropin RS with the Diluent to obtain a solution having a known concentration of about 1.0 mg per mL .Assay preparation-Dissolve an accurately weighed quantity of Somatropin in Diluent, or dilute a bulk solution of Somatropin with Diluent, to obtain a solution having a concentration of about 1 mg per mL . [NOTE-If necessary, the amount of protein in solution can be determined by the test for Total protein.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector and a $7.8-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L33 and is maintained at ambient temperature. The flow rate is 0.6 mL per minute. Chromatograph the Resolution solution as directed for Procedure: the resolution, $R$, (determined as the ratio of the valley height, between the dimer and the monomer, and the dimer peak height) is not more than 0.4 ; and the tailing factor of the monomer peak (major peak) is not more than 1.7.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the the Standard preparation and the Assay preparation, record the chromatograms for not less than twice the retention time of the somatropin monomer peak (major peak), and measure the peak responses for the monomer. Calculate the quantity of somatropin, in $\mu \mathrm{g}$ per mg, of totat protein, by the formula:-

$$
P\left(G_{s}+\mathrm{C}_{\downarrow}\right)\left(r_{\llcorner }+r_{s}\right),
$$

in which $P$ is the quantity of somatropin, in $\mu$ per mg, of USP Somatropin RS; $G_{s}$ and $G_{t}$ are the total protein concen trations, in mg per mL, of the Standard preparation and the Assy prepatan, respectively; concentration, in mg per mL , of somatropin in the Assay preparation by the formula:

$$
C_{S}\left(r_{U} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of USP Somatropin RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses of the monomer in the Assay preparation and the Standard preparation, respectively.nis (USP28)

## Briefing

Somatropin for Injection, page 1983 of $P F 29(6)$ [Nov.-Dec. 2003]. It is proposed to add a test for Bioidentity to provide flexibility in testing and potentially to reduce the extent of animal testing. The test for Bioidentity need not be performed if the bulk substance used was tested and meets the requirements. It is also proposed to modify the Assay to take into account the labeling of the USP Somatropin RS.
(BNT: L. Callahan) $\quad$ RTS-41180-2

## Add the following:

## ■Somatropin for Injection

» Somatropin for Injection is a sterile, lyophilized mixture of Somatropin with one or more suitable buffering and stabilizing agents. It contains not less than 89.0 percent and not more than 110.0 percent of the amount of somatropin stated on the label. [NOTE-One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

Packaging and storage-Preserve in tight containers, and store between $2^{\circ}$ and $8^{\circ}$.

Labeling-The labeling states that the material is of recombinant DNA origin.

USP Reference standards $\langle 11\rangle —$ USP Endotoxin RS. USP Somatropin RS.

Identification-It meets the requirements for Identification test $A$ under Somatropin.

Bioidentity-[NOTE-If the bulk material is used to prepare Somatropin for Injection was tested and meets the requirements, it is not necessary to perform this test.] It meets the requirements for Bioidentity under Somatropin.

Bacterial endotoxins $\langle 85\rangle$-It contains not more than 20 USP Endotoxin Units per mg of somatropin.

Sterility $\langle 71\rangle$-It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

Chromatographic purity-Proceed as directed for the Chromatographic purity test under Somatropin: not more than $12 \%$ of total impurities is found.

Limit of high molecular weight proteins-Proceed as directed in the test for Limit of high molecular weight proteins under Somatropin, except to use the Assay preparation as the Test solution: not more than $6 \%$ of high molecular weight proteins is found.

## Assay-

Phosphate buffer, Mobile phase, Diluent, Resolution solution, Standard preparation, and Chromatographic systemProceed as directed in the Assay under Somatropin.

Assay preparation-Dissolve the contents of a suitable number of containers in Diluent to obtain a concentration of 1 mg of somatropin per mL .

Procedure-Proceed as directed under Somatropin. Calculate the quantity of somatropin, in mg of somatropin per wial container, by the formula:

$$
\left(P G_{s}+1000\right)(N / N)\left(r_{t}+r_{s}\right)
$$

$$
C(V / N)\left(r_{U} / r_{s}\right)
$$

in which $P$ is the quantity of somatropin, in ug per me, of USP Somatropin PS; $\epsilon_{S}$ is the concentration, in mg per mL, of the-Stated prepatiation; in which $C$ is the concentration, in mg per mL , of USP Somatropin RS in the Standard preparation; $V$ is the total volume of the Assay preparation; $N$ is the number of viats containers used to obtain the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses of the monomer in the Assay preparation and the Standard preparation, respectively.mis (USP28)

## BRIEFING

Sulfisoxazole, USP 27 page 1755. It is proposed to revise the Assay to specify the solvent used to prepare the titrant.
(HDQ: M. Marques) RTS-41337-1

## Change to read:

Assay_Place about 800 mg of Sulfisoxazole, accurately weighed, in a $250-\mathrm{mL}$ conical flask, add 50 mL of dimethylformamide, shake thoroughly to dissolve the solid, add 5 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate with 0.1 N lithium methoxide
$\boldsymbol{m}_{\text {in }}$ toluene $_{\mathbf{m}_{1 S} \text { (USP28) }}$
VS to a blue endpoint, taking precautions against absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 26.73 mg of $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$.

BRIEFING

Titanium Dioxide, USP 27 page 1854. It is proposed to revise this monograph by dividing it into two separate monographs, as recommended by the USP Excipient Monograph Content Expert Committee, and IPEC Americas: Titanium Dioxide monograph for color-additive grade material and a proposed new USP Titanium Dioxide monograph (nomenclature title change to come) for UV-attenuation grade material. The current official USP monograph allows both color-additive grade and UV-attenuation grade titanium dioxide, which have quite different applications and requirements. The issues pertaining to the two materials can be more appropriately addressed in two separate monographs. See also briefing under Titanium Dioxide [N\&L to come] under General Monographs in this number of $P F$.

This will also facilitate the process of international harmonization of the color additive grade monograph, the Japanese Pharmacopoeia being the coordinating pharmacopoeia for Titanium Dioxide.

This proposed USP monograph for the color-additive grade is very similar to the older $U S P$ version before the UV-attenuation grade was allowed. This proposal also takes into consideration the U.S. FDA 21 CFR and FCC standards regarding Titanium Dioxide and also allows both anatase and rutile crystal structures. Also included are the Assay and the limit tests for Lead, Antimony, and Mercury, based on the harmonization draft proposal. Interested parties are urged to comment. Proposed changes from the current USP monograph include the following:

1. Definition-A change to the upper acceptance criterion is based on the harmonization draft proposal. Limit for added substances has been included. Reference to attenuation grade
material is deleted. The [NOTE] has been deleted and tests have been included for Lead, Antimony, and Mercury, based on the harmonization draft proposal.
2. Packaging and storage-A storage statement to include the phrase "No storage requirements specified" is added.
3. Labeling-Additional information is presented as to crystalline structure. Reference to attenuation grade material is deleted.
4. Identification-No change.
5. Loss on drying - No change.
6. Loss on ignition-Reference to attenuation grade material is deleted.
7. Water-soluble substances-A platinum crucible is specified for final heating. "A dull red heat" is replaced with " 650 " for the ignition temperature.
8. Acid-soluble substances-A platinum crucible is specified for final heating.. "A dull red heat" is replaced with " 650 " for the ignition temperature.
9. Arsenic-No change.
10. Organic volatile impurities-Deleted, based on information that no organic solvents are used in the manufacture of the article of commerce.
11. Limit of lead-Test is added, based on the harmonization draft proposal.
12. Limit of antimony - Test is added, based on the harmonization draft proposal.
13. Limit of mercury-Test is added, based on the harmonization draft proposal.
14. Assay-The current reduction/titration (Jones-Reductor) test is problematic and outdated. A new test is proposed, based on the harmonization draft proposal.
(EMC: C. Sheehan) RTS-41222-1

## Change to read:

H-Titanium Diexide contains not less than 99.0 pereent and not more than 100.5 percent of $\mathrm{TiO}_{z}$, calculated on the dried basis. If labeled as attemuation grade, then Ti tanium Diexide contains net less than 99.0 percent and not more than 100.5 percent of $\mathrm{TiO}_{2}$, ealeulated on the ignited basis. Attentation grade material may contain suitable-coatings, stabilizers, and treatments to assist formalation.

NOTE-If labeled as attentration grade, then all tests and assays are-condurted on uncoated, untreated material. For UV attentation grade, the test for Losf on drying does not apply. The FDA requires the content of lead to be not mere than 10 ppm , that of antimeny to be not more than 2 ppm , and that of mereury to be net mere than 1 ppm (21 CFR 73.1575).

■» Titanium Dioxide contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{TiO}_{2}$, calculated on the dried basis, after correcting for any suitable additives present in the $\mathrm{TiO}_{2}$. It may contain up to 2.0 percent (either sin-
gly or combined) of suitable additives, whether a diluent, dispersant, particle coating, stabilizer, or treatment to assist formulation. ${ }^{1 S}$ (USP28)

## Change to read:

Packaging and storage-Preserve in well-closed containers.
$\boldsymbol{m}^{\text {n }}$ No storage requirements specified.■1S (USP28)

## Change to read:

Labeling-If intended for UV attentation, the material must be la beled as attentation grade. If intended for UV attentation, and any added eoatings, stabilizers, of treatments are used, the labeling shall inelude the name and amount of the additives.

■Label as to crystalline structure (anatase or rutile). The labeling indicates the name and percentage, to at least one decimal place (w/w), of added substances present.■1s (USP28)

## Change to read:

Loss on ignition $\langle 733\rangle$-Ignite 2 g , previously dried and accurately weighed, at $800 \pm 25^{\circ}$ to constant weight: it loses not more than $0.5 \%$ of its weight. If tabeled as antention grade, ignite 4 g of tituium dioxide, aceurately weighed, at $800 \pm 25^{\circ}$ to eon stant weight: it loses not more than $13 \%$ of its weight.

$\boldsymbol{m}_{\text {■ }}$ (USP28)

## Change to read:

Water-soluble substances-Suspend 4.0 g in 50 mL of water, mix, and allow to stand overnight. Transfer to a $200-\mathrm{mL}$ volumetric flask, add 2 mL of ammonium chloride TS, and mix. If the Titanium Dioxide does not settle, add another $2-\mathrm{mL}$ portion of ammonium chloride TS. Allow the suspension to settle, dilute with water to volume, mix, and filter through a double thickness of fine-porosity filter paper, discarding the first 10 mL of the filtrate. Collect 100 mL of the clear filtrate, transfer to a tared platinum dish, evaporate on a hot plate to dryness, and ignite at a dull red hat
$\square_{\text {in }}$ a platinum crucible at $650^{\circ}$ (US (USP28)
to constant weight: the residue weighs not more than 5 mg (0.25\%).

## Change to read:

Acid-soluble substances-Suspend 5.0 g in 100 mL of 0.5 N hydrochloric acid, and heat on a steam bath for 30 minutes, with occasional stirring. Filter through an appropriate filter medium until clear. Wash with three $10-\mathrm{mL}$ portions of 0.5 N hydrochloric acid. Evaporate the combined filtrate and washings to dryness, and ignite at addll red heat
$\square_{\text {in }}$ a platinum crucible at $650^{\circ}$ (US (USP28)
to constant weight: the residue weighs not more than 25 mg (0.5\%).

## Add the following:

## -Limit of lead-

Blank solution-Place 10 mL of the dilute hydrochloric acid (1 in 20) in a $100-\mathrm{mL}$ beaker. Add 2 mL of dilute acetic acid (1 in 20), dilute with water to 50 mL , and mix.

Standard solution-Pipet 2.0 mL of Standard Lead Solution, (see Special Reagents section under Heavy Metals $\langle 231\rangle$ ) into a $100-\mathrm{mL}$ beaker, add 2 mL of dilute acetic acid (1 in 20), dilute with water to 50 mL , and mix.

Test stock solution-Transfer about 10 g of Titanium Dioxide, accurately weighed, into a $250-\mathrm{mL}$ beaker, and add 50 mL of dilute hydrochloric acid (1 in 20). Cover the beaker with a watch glass, boil gently for 15 minutes, and centrifuge to precipitate the insoluble residue. Pass through a filter, and collect the filtrate. Wash the beaker used and the residue three times with $10-\mathrm{mL}$ portions of boiling water, passing each washing through the original filter paper and combining these washings with the above filtrate. Wash the filter paper with a 10 - to $15-\mathrm{mL}$ portion of boiling water, combine these washings with the previous washings and filtrate, cool, dilute with water to 100 mL , and mix to obtain the Test stock solution. [NOTE-Save portions of this Test stock solution for use in the tests for Limit of antimony and Limit of mercury.]

Test solution-Transfer 20 mL of the Test stock solution to a $100-\mathrm{mL}$ beaker, add 1 drop of phenolphthalein TS, and add dropwise, ammonia TS until the solution becomes slightly pink. Add 2 mL of dilute acetic acid ( 1 in 20 ), dilute with water to 50 mL , and mix.

Procedure-Concomitantly determine the absorbances of the Standard solution and the Test solution at the lead emission line of 283.3 nm with an atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) equipped with a lead hallow-cathode lamp and an air-acetylene flame, using the Blank solution to set the in-
strument to zero. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 10 ppm).■1S (USP28)

## Add the following:

-Limit of antimony-
Standard antimony stock solution-Transfer 1.874 g of antimony trichloride, accurately weighed, into a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.3 N hydrochloric acid to volume, and mix.

Standard antimony solution-[NOTE-Prepare this solution immediately before use.] Pipet 1 mL of Standard antimony stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with 0.3 N hydrochloric acid to volume, and mix.

Standard solution-Transfer 2.0 mL of the Standard antimony solution into a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 1 in 20) to volume, and mix. This solution contains the equivalent of $0.2 \mu \mathrm{~g}$ of antimony per mL .

Blank solution-Use dilute hydrochloric acid (1 in 20).
Test solution-Use the Test stock solution, obtained as directed in the test for Limit of lead.

Procedure-Concomitantly determine the absorbance of equal volumes (about 20 mL ) of the Standard solution and the Test solution at the antimony emission line of 283.3 nm , with a suitable graphite furnace atomic absorption spectrophotometer (see Spectrophotometry and LightScattering $\langle 851\rangle$ ) equipped with an antimony hallow-cathode lamp, using the Blank solution to set the instrument to zero and maintaining the drying temperature of the furnace at $110^{\circ}$, the ashing temperature at $600^{\circ}$, and the atomization temperature at $2100^{\circ}$. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 2 ppm ).■1S (USP28)

## Add the following:

## -Limit of mercury-

Mercury stock solution-Transfer 135.4 mg of mercuric chloride, previously dried in a desiccator over silica gel for 6 hours and accurately weighed, to a $1000-\mathrm{mL}$ volumetric flask, add 10 mL of diluted nitric acid, swirl to dissolve, dilute with water to volume, and mix.

Standard mercury solution-[NOTE-Prepare immediately before use.] Transfer $10-\mathrm{mL}$ of the Mercury stock solution to a $100-\mathrm{mL}$ volumetric flask, add 1 mL of diluted nitric acid, dilute with water to volume, and mix. Transfer 10 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add 1 mL of diluted nitric acid, dilute with water to volume, and mix. This Standard mercury solution contains the equivalent of $1.0 \mu \mathrm{~g}$ of mercury per mL.
Stannous chloride-sulfuric acid solution-Dissolve 10 g of stannous chloride in diluted sulfuric acid (3 in 200) to make 100 mL .

Blank solution-Use dilute hydrochloric acid (1 in 40).
Standard solution-Transfer 5.0 mL of the Standard mercury solution into a $50-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 1 in 40) to volume, and mix.

Test solution-Use the Test stock solution, obtained as directed in the test for Limit of lead.
Procedure-Treat the Standard solution and the Test solution similarly as follows. Place 20 mL of the solution in an atomic absorption spectrophotometer sample bottle, add 10 mL of Stannous chloride-sulfuric acid solution, and immediately connect the sample bottle to an atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) equipped with a mercury hallow-cathode lamp. Circulate air through the system to introduce any vaporized mercury into the absorption cell, and determine the absorbance of the solution under test at mercury emission line of 253.7 nm after the recorder reading has risen rapidly
and becomes constant. Use the Blank solution to set the instrument to zero. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 1 $\mathrm{ppm})$.■1S (USP28)

Earganic volatile imptrities, Meth $H$, 467 ): meets the requirements.als (USP28)

## Change to read:

Assay-Acetrately weigh abeut 300 me of Titanitm Dioxide, transfer to a 250 mL beaker, and add 20 mL of sulfuric acid and 7 to 8 g of ammonium sulfate. Mix, heat on a hot plate until fumes of sulfur trioxide appear, and continue heating over a strong flame until solution is complete or it is apparent that the undissolved resi due is siliceous matter. Cool, cautiously dilute with 100 mL of water, stir, heat carefully to boiling while-stimring, and allow the insoluble matter to settle. Filter, transfer the entire residue to the filter, and wash thereughly with cold 2 N sulfurie acid. Dilute the filtrate with water $10-200 \mathrm{~mL}$, and eatiously add about 10 mL of ammonitm hydroxide.

Prepare a zine amalgam column in a 25 cm Jones reductor tube, placing a pledge of glass wool in the bettom of the tube, and filling the constricted pertion of the tube with zine amalgam prepared as follows. Add 20 -to 30 mesh zine to mereuric chloride solution. ( 1 in 50), using about 100 mL of the solution for each 100 g of zine, and after about 10 minutes, deean the solution from the zine, then wash the zine by deeantation. Wash the zine amalgameolumm with 100 mL pertions of 2 N sulfuric acid until 100 mL of the washing does not decolorize 1 drop of 0.1 N petassimm permanganate.

Place 50 mL of ferric ammenitm sulfate TS in a 1000 mL sue tion flask, and add 0.1 N potassium permanganate untilla a faint pink coler persists for 5 minutes. Attach the Jones reductor tube to the neek of the flask, and pass 50 mL of 2 N sulfurie acid through the reductor at a rate of about 30 mL per mintute. Pass the prepared titanimm solution through the reductor at the same rate, and follow with 100 mL each of 2 N sulfuric acid and of water. During these eperations, keep the reductor filled with solution or water above the upper level of the amalgam. Taking preeations against the admis sion of atmospheric oxygen, gradually release the-suetion, wash down the outlet tube of the reductor and the sides of the receiver, and titrate immediately with 0.1 N potassimm permanganate VS. Perform ablank detemination, substifuting 200 mL of 2 N sulfurie acid for the assay solution, and make any necessary correction. Each mL of 0.1 N potassitm permanganate-is equivalent to 7.988 mg of $\mathrm{TiO}_{2}=$

- Accurately weigh about 150 mg of previously dried Titanium Dioxide, transfer to a $500-\mathrm{mL}$ conical flask, add 5 mL of water, and shake until a homogeneous, milky suspension is obtained. Add 30 mL of sulfuric acid and 12 g of ammonium sulfate, and mix. Initially heat gently, then heat strongly until a clear solution is obtained. Cool, cautiously add 120 mL of water and 40 mL of hydrochloric acid, and shake. Add 3 g of aluminum metal, and immediately insert a rubber stopper fitted with a U-shaped glass tube while im-
mersing the other end of the U-tube into a saturated solution of sodium bicarbonate contained in a $500-\mathrm{mL}$ wide-mouth bottle, and generate hydrogen. Allow to stand for a few minutes after the aluminum metal has dissolved completely to produce a transparent purple solution. Cool to below $50^{\circ}$ in running water, and remove the rubber stopper carrying the U-tube. Add 3 mL of a saturated potassium thiocyanate solution as an indicator, and immediately titrate with 0.2 N ferric ammonium sulfate VS until a faint brown color that persists for 30 seconds is obtained. Perform a blank determination (see Titrimetry $\langle 541\rangle$ ), and make any necessary correction. Each mL of 0.2 N ferric ammonium sulfate is equivalent to 7.988 mg of $\mathrm{TiO}_{2} \cdot \mathbf{1 S}$ (USP28)

## Briefing

Titanium Dioxide.This new USP monograph, with a nomenclature title proposal forthcoming, is being proposed for UV-attenuation grade Titanium Dioxide to support the proposed division of the current USP monograph into two separate monographs: a USP monograph for color-additive grade material and a USP monograph for UV-attenuation grade material. See also the briefing under Titanium Dioxide. Interested parties are urged to submit comments.

The proposed new monograph for the attenuation-grade material includes the following changes from the current official monograph:

1. Definition-Limits of added substances have been included. The [NOTE] has been deleted and tests have been included for Lead, Antimony, and Mercury.
2. Packaging and storage-Change to tight containers.
3. Labeling - Reference to UV attenuation and attenuation grade removed. Additional information is presented as to crystalline structure.
4. Identification-No change.
5. Loss on drying - This test does not apply.
6. Loss on ignition - No change. Reference to color grade is deleted.
7. Water-soluble substances-A platinum crucible is specified for final heating. "A dull red heat" is replaced with " $650^{\circ}$ " for the ignition temperature.
8. Acid-soluble substances-A platinum crucible is specified for final heating. "A dull red heat" is replaced with " $650^{\circ}$ " for the ignition temperature.
9. Arsenic-No change.
10. Organic volatile impurities-No change.
11. Limit of lead-Test is added to monitor this impurity.
12. Limit of antimony-Test is added to monitor this impurity.
13. Limit of mercury-Test is added to monitor this impurity.
14. Assay-The current reduction/titration (Jones-Reductor) test is problematic and outdated. A new test is proposed.
(PA6: L. Evans; NL: W.L. Paul) RTS-41223-1

## Add the following:

## ■Titanium Dioxide*

## *Nomenclature title change to come.

$\mathrm{TiO}_{2} \quad 79.87$

Titanium oxide $\left(\mathrm{TiO}_{2}\right)$.

Titanium oxide $\left(\mathrm{TiO}_{2}\right)$ [13463-67-7].
» Titanium Dioxide ${ }^{*}$ contains not less than 99.0 percent and not more than 100.5 percent of $\mathrm{TiO}_{2}$, calculated on the ignited basis, after correcting for any additives remaining. It may contain up to 13.0 percent (singly or combined) of suitable additives, whether a diluent, dispersant, particle coating, stabilizer, or treatment to assist formulation.

Packaging and storage-Preserve in tight containers.
Labeling-Label as to crystalline structure (anatase or rutile). The labeling indicates the name and percentage, to at least one decimal place ( $\mathrm{w} / \mathrm{w}$ ), of added substances present. Identification-Add 5 mL of sulfuric acid to 500 mg , and heat gently. After fumes of sulfur trioxide appear, continue heating for a minimum of 10 seconds. Cool the suspension, and cautiously dilute with water to 100 mL . Pass through a
filter, and add a few drops of hydrogen peroxide TS to 5 mL of the clear filtrate: a yellow-red to orange-red color develops immediately.

Loss on ignition $\langle 733\rangle$-Ignite 4 g , accurately weighed, at $800 \pm 25^{\circ}$ to constant weight: it loses not more than $13 \%$ of its weight.

Water-soluble substances-Suspend 4.0 g in 50 mL of water, mix, and allow to stand overnight. Transfer to a $200-\mathrm{mL}$ volumetric flask, add 2 mL of ammonium chloride TS, and mix. If the Titanium Dioxide* does not settle, add another $2-\mathrm{mL}$ portion of ammonium chloride TS. Allow the suspension to settle, dilute with water to volume, mix, and pass through a double thickness of fine-porosity filter paper, discarding the first 10 mL of the filtrate. Collect 100 mL of the clear filtrate, transfer to a tared platinum dish, evaporate on a hot plate to dryness, and ignite at $650^{\circ}$ in a platinum crucible to constant weight: the residue weighs not more than $5 \mathrm{mg}(0.25 \%)$.

Acid-soluble substances-Suspend 5.0 g in 100 mL of 0.5 N hydrochloric acid, and heat on a steam bath for 30 minutes, with occasional stirring. Pass through an appropriate filter medium until clear. Wash with three $10-\mathrm{mL}$ portions of 0.5 N hydrochloric acid. Evaporate the combined filtrate and washings to dryness, and ignite at $650^{\circ}$ in a platinum crucible to constant weight: the residue weighs not more than 25 mg ( $0.5 \%$ ).

Arsenic, Method $I\langle 211\rangle$ —Prepare the Test Preparation as follows. Add 3.0 g to a $250-\mathrm{mL}$ conical flask fitted with a thermometer and a vapor outlet. Add 50 mL of water, 500 mg of hydrazine sulfate, 500 mg of potassium bromide, 20 g of sodium chloride, and 25 mL of sulfuric acid. Arrange to collect the evolved vapors in 52 mL of water contained in the arsine generator flask, then heat the test specimen to $90^{\circ}$, and maintain the temperature at $90^{\circ}$ to $100^{\circ}$ for 15 minutes. Add 3 mL of hydrochloric acid to the solution in the genera-
tor flask: the resulting solution meets the requirements of the test, the addition of 20 mL of 7 N sulfuric acid specified under Procedure being omitted. The limit is 1 ppm .

## Limit of lead-

Blank solution-Place 10 mL of the dilute hydrochloric acid (1 in 20 ) in a $100-\mathrm{mL}$ beaker. Add 2 mL of dilute acetic acid (1 in 20), dilute with water to 50 mL , and mix.

Standard solution-Pipet 2.0 mL of Standard Lead Solution, (see Special Reagents section under Heavy Metals $\langle 231\rangle$ ) into a $100-\mathrm{mL}$ beaker, add 2 mL of dilute acetic acid (1 in 20), dilute with water to 50 mL , and mix.
Test stock solution-Transfer about 10 g of Titanium Dioxide ${ }^{*}$, accurately weighed, into a $250-\mathrm{mL}$ beaker, and add 50 mL of dilute hydrochloric acid ( 1 in 20). Cover the beaker with a watch glass, boil gently for 15 minutes, and centrifuge to precipitate the insoluble residue. Pass through a filter, and collect the filtrate. Wash the beaker used and the residue three times with $10-\mathrm{mL}$ portions of boiling water, passing each washing through the original filter paper and combining these washings with the above filtrate. Wash the filter paper with a $10-$ to $15-\mathrm{mL}$ portion of boiling water, combine these washings with the previous washings and the filtrate, cool, dilute with water to 100 mL , and mix to obtain the Test stock solution. [NOTE-Save portions of this Test stock solution for use in the tests for Limit of antimony and Limit of mercury.]
Test solution-Transfer 20 mL of the Test stock solution to a $100-\mathrm{mL}$ beaker, add 1 drop of phenolphthalein TS, and add, dropwise, ammonia TS until the solution becomes slightly pink. Add 2 mL of dilute acetic acid (1 in 20), dilute with water to 50 mL , and mix.

Procedure-Concomitantly determine the absorbance of the Standard solution and the Test solution at the lead emission line of 283.3 nm with an atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering
$\langle 851\rangle$ ) equipped with a lead hallow-cathode lamp and an air-acetylene flame, using the Blank solution to set the instrument to zero. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 10 ppm).

## Limit of antimony-

Standard antimony stock solution-Transfer 1.874 g of antimony trichloride, accurately weighed, into a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.3 N hydrochloric acid to volume, and mix.

Standard antimony solution-[NOTE-Prepare this solution immediately before use.] Pipet 1 mL of Standard antimony stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with 0.3 N hydrochloric acid to volume, and mix.

Standard solution-Transfer 2.0 mL of the Standard antimony solution into a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 1 in 20) to volume, and mix. This solution contains the equivalent of $0.2 \mu \mathrm{~g}$ of antimony per mL .

Blank solution-Use dilute hydrochloric acid (1 in 20).
Test solution-Use the Test stock solution, obtained as directed in the test for Limit of lead.

Procedure-Concomitantly determine the absorbance of equal volumes (about 20 mL ) of the Standard solution and the Test solution at the antimony emission line of 283.3 nm , with a suitable graphite furnace atomic absorption spectrophotometer (see Spectrophotometry and LightScattering $\langle 851\rangle$ ) equipped with an antimony hallow-cathode lamp, using the Blank solution to set the instrument to zero and maintaining the drying temperature of the furnace at $110^{\circ}$, the ashing temperature at $600^{\circ}$, and the atomization temperature at $2100^{\circ}$. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 2 ppm ).

## Limit of mercury-

Mercury stock solution-Transfer 135.4 mg of mercuric chloride, previously dried in a desiccator over silica gel for 6 hours and accurately weighed, to a $1000-\mathrm{mL}$ volumetric flask, add 10 mL of diluted nitric acid, swirl to dissolve, dilute with water to volume, and mix.

Standard mercury solution-[NOTE—Prepare immediately before use.] Transfer 10 mL of Mercury stock solution to a $100-\mathrm{mL}$ volumetric flask, add 1 mL of diluted nitric acid, dilute with water to volume, and mix. Transfer 10 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add 1 mL of diluted nitric acid, dilute with water to volume, and mix. This Standard mercury solution contains the equivalent of $1.0 \mu \mathrm{~g}$ of mercury per mL .
Stannous chloride-sulfuric acid solution-Dissolve 10 g of stannous chloride in diluted sulfuric acid (3 in 200) to make 100 mL .

Blank solution-Use dilute hydrochloric acid (1 in 40).
Standard solution-Transfer 5.0 mL of the Standard mercury solution into a $50-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid (1in 40) to volume, and mix.

Test solution-Use the Test stock solution, obtained as directed in the test for Limit of lead.

Procedure-Treat the Standard solution and the Test solution similarly as follows. Place 20 mL of the solution in an atomic absorption spectrophotometer sample bottle, add 10 mL of Stannous chloride-sulfuric acid solution, and immediately connect the sample bottle to an atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) equipped with a mercury hallow-cathode lamp. Circulate air through the system to introduce any vaporized mercury into the absorption cell, and determine the absorbance of the solution under test at the mercury emission line of 253.7 nm after the recorder reading has risen rapidly and becomes constant. Use the Blank solution to
set the instrument to zero. The absorbance of the Test solution is not greater than that of the Standard solution (not more than 1 ppm ).

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Assay—Accurately weigh about 150 mg of Titanium Dioxide ${ }^{*}$, previously ignited, transfer to a $500-\mathrm{mL}$ conical flask, add 5 mL of water, and shake until a homogeneous, milky suspension is obtained. Add 30 mL of sulfuric acid and 12 g of ammonium sulfate, and mix. Initially heat gently, then heat strongly until a clear solution is obtained. Cool, cautiously add 120 mL of water and 40 mL of hydrochloric acid, and shake. Add 3 g of aluminum metal, and immediately insert a rubber stopper fitted with a U-shaped glass tube while immersing the other end of the U-tube into a saturated solution of sodium bicarbonate contained in a $500-$ mL wide-mouth bottle, and generate hydrogen. Allow to stand for a few minutes after the aluminum metal has dissolved completely to produce a transparent purple solution. Cool to below $50^{\circ}$ in running water, and remove the rubber stopper carrying the U-tube. Add 3 mL of a saturated potassium thiocyanate solution as an indicator, and immediately titrate with 0.2 N ferric ammonium sulfate VS until a faint brown color that persists for 30 seconds is obtained. Perform a blank determination (see Titrimetry $\langle 541\rangle$ ), and make any necessary correction. Each mL of 0.2 N ferric ammonium sulfate is equivalent to 7.988 mg of $\mathrm{TiO}_{2 \cdot} \cdot \mathbf{■ S}^{1 \mathrm{~S}}$ (USP28)

## Briefing

Topiramate, page 533 of PF 29(2) [Jan.-Feb. 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with changes to In-Process Revision. It is proposed to add a test for Limit of sulfamate and sulfate because
it has been reported that these two ions are possible products of degradation. The analytical method for the test for Limit of sulfamate and sulfate was validated using the IonPac AS11-HC brand of L46 column and the IonPac AG11 brand of L46 guard column. Typical retention times are about 3.3 minutes and about $12.7 \mathrm{~min}-$ utes for the sulfamate and sulfate peaks, respectively. It is also proposed to indicate the use of peak areas in the test for Related compounds and in the Assay. In addition, minor editorial style changes have been made.
(PA3: S. Salado) RTS-40645-1; 40020-5

## Add the following:

## ©Topiramate

$\mathrm{C}_{12} \mathrm{H}_{21} \mathrm{NO}_{8} \mathrm{~S} \quad 339.36$
$\beta$-D-Fructopyranose, 2,3:4,5-bis- $O$-(1-methylethylidene)-, sulfamate.
$2,3: 4,5-\mathrm{Di}-O$-isopropylidene- $\beta$-D-fructopyranose sulfamate [97240-79-4].
» Topiramate contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{12} \mathrm{H}_{21} \mathrm{NO}_{8} \mathrm{~S}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Topiramate $R S$.
USP Topiramate Related Compound A RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-29^{\circ}$ and $-35^{\circ}$, measured at $20^{\circ}$.

Test solution: 4 mg per mL , in methanol.
Water, Method $I\langle 921\rangle$ : not more than $0.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$.

## Related compounds-

Mobile phase-Proceed as directed in the Assay.
NOTE-Prepare all solutions fresh before use.
System suitability solution-Transfer about 3 mg of USP Topiramate Related Compound A RS, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Test solution to volume, and mix.
Test solution-Transfer about 1 g of Topiramate, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, and dissolve in Mobile phase with the aid of sonication. Cool to room temperature, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—
The liquid chromatograph is equipped with a refractive index detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The column and the detector temperatures are maintained at $55^{\circ}$. The flow rate is about 0.6 mL per minute. Chromatograph the System suitability solution, and record the peak reseas areas directed for Procedure: the relative retention times are about 0.9 for topiramate related compound A and 1.0 for topiramate; the resolution, $R$, between topiramate related compound A and topiramate is not less than 1.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Inject a volume (about $50 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak areas. Record the chromatogram for a period of time equivalent to not less than five times the retention time of the topiramate peak. Calculate the percentage of fructose in the portion of Topiramate taken by the formula:

$$
100(1 / F)\left(r_{U} / r_{s}\right),
$$

in which $F$ is the relative response factor and is equal to 1.2 ; $r_{U}$ is the area of any peak at a relative retention time of about 0.45 ; and $r_{S}$ is the sum of the areas of all the peaks. Calculate the percentage of each impurity in the portion of Topiramate taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak area for each impurity; and $r_{s}$ is the sum of the areas of all the peaks: not more than $0.3 \%$ of fructose is found; not more than $0.3 \%$ of topiramate related compound A is found; not more than $0.1 \%$ of any other individual impurity is found; and not more than $0.5 \%$ of total impurities is found. [NOTE-Discard any peak due to solvents.]

## Limit of sulfamate and sulfate-

Diluent-Prepare a mixture of high-purity water and acetonitrile ( $80: 20$ ).

Solution A-Transfer about 4 g . of sodium hydroxide to a $1000-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with High-Purity Water (see Reagents in Chemical Resis-tance-Glass Containers under Containers $\langle 661\rangle$ ) to volume, filter, and degas.

Solution B-Use filtered and degassed High-Purity Water.

Solution C-Dilute 50 mL of Solution $A$ to $100-\mathrm{mL}$ with High-Purity Water, filter, and degas.

Mobile phase-Use variable mixtures of Solution A, Solution B, and Solution C as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Sulfamic acid stock solution-Transfer about 60 mg , accurately weighed, of sulfamic acid to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume.

Sulfate stock solution-Transfer about 90.7 mg , accurately weighed, of potassium sulfate to a $100-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume.

Standard solution-Transfer 3.0 mL each of Sulfamic acid stock solution and Sulfate stock solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.>

Test solution-Transfer about 100 mg , accurately weighed, of Topiramate to a $10-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with High-Purity Water to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a conductivity detector, a $4.0-\mathrm{mm} \times 5-\mathrm{cm}$ guard column that contains packing L46 and a $4.0-\times 25-\mathrm{cm}$ column that contains packing L46. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows. Chromatograph the Standard solution, and record the peak areas as directed for Procedure: the relative retention time is 1.0 for the sulfate peak and about 0.27 for the sulfamate peak; and the relative standard deviation for replicate injections is not more than $2.0 \%$ for both the sulfate and sulfamate peaks.

| Time | Solution $A$ | Solution $B$ | Solution $C$ |  |
| :---: | :---: | :---: | :---: | :--- |
| $($ minutes $)$ | $(\%)$ | $(\%)$ | $(\%)$ | Elution |
| 0 | 0 | 95 | 5 | equilibration |
| $0-7.0$ | 0 | 95 | 5 | isocratic |
| $7.0-15.0$ | $0 \rightarrow 20$ | $95 \rightarrow 0$ | $5 \rightarrow 80$ | linear gradient |
| $15.0-20.0$ | 20 | 0 | 80 | isocratic |
| $20.0-20.1$ | $20 \rightarrow 0$ | $0 \rightarrow 95$ | $80 \rightarrow 5$ | linear gradient |
| $20.1-25.0$ | 0 | 95 | 5 | re-equilibration |

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas for the sulfate and sulfamate peaks. Calculate the percentage of sulfate and sulfamate in the portion of Topiramate taken by the formula:

$$
1000 F(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of potassium sulfate or sulfamic acid in the Standard solution; $F$ is the correction factor and is equal to 0.551 for sulfate and 0.989 for sulfamate; $W$ is the weight, in mg, of Topiramate taken; and $r_{i}$ and $r_{s}$ are the peak areas of the sulfate or sulfamate ion obtained from the Test solution and the Standard solution, respectively: not more that $0.10 \%$ of sulfate ion is found; and not more than $0.10 \%$ of sulfamate ion is found.

## Limit of residual solvents-

Standard stock solution-Dilute accurately measured volumes of acetone, isopropyl alcohol, acetonitrile, methylene chloride, $n$-hexane, ethyl acetate, and pyridine in dimethylformamide to obtain a solution having known concentrations, in $\mu \mathrm{L}$ per mL , of about $3.0,3.2,0.24,0.20,0.22$, 2.8 , and 0.01 , respectively.

Standard solution-Transfer 10.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dimethylformamide to volume, and mix. Transfer 5 mL to a $20-\mathrm{mL}$ headspace vial, and crimp immediately.

Blank solution-Use dimethylformamide.
Test solution-Transfer about 0.25 g of Topiramate to a $20-\mathrm{mL}$ headspace vial. Add 5.0 mL of dimethylformamide, and crimp immediately.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a $0.53-\mathrm{mm} \times 75-\mathrm{m}$ capillary column, the internal wall of which is coated with a $0.3-\mu \mathrm{m}$ film of liquid phase G43. The column temperature is programmed according to Table 1 .

Table 1. Column Temperature Program

|  |  |  | Temperature <br> Incease |
| :---: | :---: | :---: | :---: |
|  | Initial | Final | Increas <br> Temperature <br> (minutes) |
| $\left({ }^{\circ}\right)$ | Temperature <br> $\left({ }^{\circ}\right)$ | minute) |  |
| $0-12$ | 50 | 50 | isothermal |
| $12-22$ | 50 | 150 | 10 |
| $22-27$ | 150 | 150 | isothermal |
| $27-28.3$ | 150 | 230 | 60 |
| $28.3-33.3$ | 230 | 230 | isothermal |

The injection port temperature is maintained at $150^{\circ}$; the headspace sampler temperature is maintained at $80^{\circ}$; and the detector temperature is maintained at $250^{\circ}$. Nitrogen is used as the carrier gas at a flow rate of about 5 mL per minute and a split flow rate of about 15 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the retention time for pyridine is about 21 minutes; the relative retention times are about 0.4 for acetone, about 0.46 for isopropyl alcohol, about 0.49 for acetonitrile, about 0.51 for methylene chloride, about 0.58 for $n$-hexane, about 0.71 for ethyl acetate, and 1.0 for pyridine; the resolution, $R$, between adjacent peaks is not less than 1.0; and the relative standard deviation for consecutive injections of the Standard solution for all analytes is not less than $15.0 \%$. Chromatograph the Blank solution, and record the peak responses as directed for Procedure: there are no interfering peaks due to dimethylformamide.

Procedure-Inject a volume (about 1 mL of the headspace, using a heated gas-tight syringe) of the Standard solution and the Test solution into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each solvent per $g$ of Topiramate taken by the formula:

$$
500\left(C D_{U} / W\right)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mL per mL , of each solvent in the Standard solution; $D_{U}$ is the density, in mg per mL , of each solvent; $W$ is the weight, in mg , of Topiramate taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas of the corresponding analyte obtained from the Test solution and the Standard solution, respectively. Not more than $0.50 \%, 0.50 \%, 0.04 \%, 0.05 \%, 0.029 \%, 0.05 \%$, and
$0.02 \%$, (w/w) of acetone, isopropyl alcohol, acetonitrile, methylene chloride, $n$-hexane, ethyl acetate, and pyridine, respectively, is found.

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water ( $1: 1$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Topiramate RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 2.0 mg per mL .

Assay preparation-Transfer about 50 mg of Topiramate, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with Mobile phase to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a refractive index detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 0.6 mL per minute. The detector and column temperatures are maintained at $50^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{12} \mathrm{H}_{21} \mathrm{NO}_{8} \mathrm{~S}$ in the portion of Topiramate taken by the formula:

$$
25 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Topiramate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak resens areas obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Tripelennamine Hydrochloride, USP 27 page 1906. It is proposed to change the upper assay limit in the Definition from 100.5 percent to 102.0 percent so that it reflects the precision of the HPLC procedure and is consistent with other drug substances. It is proposed to revise the formula in the Assay to take into consideration the concentration of the Assay preparation and to specify that the calculation of the quantity is in percentage rather than in mg .
(PA1: K. Russo) RTS-40747-1

## Change to read:

» Tripelennamine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent
$\square_{102.0}$ percent $_{\text {1S (USP28) }}$
of $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{~N}_{3} \cdot \mathrm{HCl}$, calculated on the dried basis.

## Change to read:

## Assay-

Ion-pair solution-Prepare a 29 mM sodium 1-octanesulfonate solution.

Mobile phase-Transfer 530 mL of methanol to a suitable container, add 1.0 mL of $\mathrm{N}, \mathrm{N}$-dimethyloctylamine, and mix thoroughly. Add 430 mL of the Ion-pair solution, mix, and adjust with phosphoric acid to a pH of 3.0. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Benzaldehyde solution-Transfer 1.0 mL of benzaldehyde to a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix. Transfer 5.0 mL of the solution so obtained to a $100-$ mL volumetric flask, dilute with Mobile phase to volume, and mix.

System suitability preparation-Transfer about 50 mg of 2-benzylaminopyridine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add 10 mL of methanol, sonicate to dissolve, dilute with Mo bile phase to volume, and mix. Transfer 5.0 mL of the solution so obtained to a $100-\mathrm{mL}$ volumetric flask, add 5.0 mL of Benzaldehyde solution, dilute with Mobile phase to volume, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Tripelennamine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation-Transfer about 50 mg of Tripelennamine Hydrochloride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $242-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at $35^{\circ}$. [NOTE-New columns are conditioned with Mobile phase overnight before the initial use and may be reconditioned, as necessary, thereafter.] Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.75 for benzaldehyde and 1.0 for 2-benzylaminopyridine; and the resolution, $R$, between benzaldehyde and 2-benzylaminopyridine is not less than 3.5 . Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 10,000 theoretical plates; and the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg

■percentage, ${ }^{\text {1s }}$ (USP28)
of $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{~N}_{3} \cdot \mathrm{HCl}$ in the portion of Tripelennamine Hydrochloride taken by the formula:

$$
100 C\left(r_{t}+r_{s}\right)^{2}
$$

$$
\boldsymbol{\square} 100 C_{S}\left(r_{U} / r_{S}\right) / C_{U ■ 1 \mathrm{~S}(U S P 28)}
$$

in which $\epsilon$
${ }^{-} C_{U}$ and $C_{S ■ 1 S}$ (USP28) are the concentrations, in mg per mL , of
the Assay preparation and of ${ }_{1 \mathrm{~m}}$ (USP28)
USP Tripelennamine Hydrochloride RS in the Standard preparation, respectively; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Trolamine Salicylate, USP 27 page 1912. It is proposed to revise the Identification test to specify that the test solution and the Standard solution contain equivalent concentrations of salicylic
acid. It is also proposed to revise the Assay to clarify that the Assay preparation and the Standard preparation contain equivalent concentrations of salicylic acid.
(PA2: D. Bempong) RTS-41297-1

## Change to read:

Identification, Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ -
Solution: 1 mg per mL , in $0.1-\mathrm{cm}$ cells.
-The test solution and the Standard solution contain the equivalent of 1 mg of salicylic acid per mL .■1S (USP28) Medium: methanol.
Absorptivities do not differ by more than $1.0 \%$.

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of water and acetonitrile $(7: 3)$. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Salicylic Acid RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about $48 \mu \mathrm{~g}$ per mL .

Assay preparation-Transfer a portion of Trolamine Salicylate, equivalent to about 300 mg of $\mathrm{G}_{43} \mathrm{H}_{2+} \mathrm{NO}_{6}$

accurately weighed, to a $250-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Transfer 2 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )——The liquid chromatograph is equipped with a $308-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at $30^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 8000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{NO}_{6}$ in the portion of Trolamine Salicylate taken by the formula:

$$
100\left(r_{U} / r_{S}\right)
$$

in which $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Briefing

Ursodiol, USP 27 page 1923. It is proposed to clarify the requirements in the test for Related compounds by specifying the limits for chenodiol and for lithocholic acid.
(PA4: E. Gonikberg) RTS-41331-1

## Change to read:

## Related compounds-

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel.
Solvent-Prepare a mixture of acetone and water $(9: 1)$.
Standard solution 1-Prepare a solution of chenodiol in Solvent containing $600 \mu \mathrm{~g}$ per mL .
Standard solution 2-Prepare a solution of lithocholic acid in Solvent containing $20 \mu \mathrm{~g}$ per mL .

Test solution-Prepare a solution of Ursodiol in Solvent containing 40 mg per mL .

Diluted test solution-Quantitatively dilute 1 mL of the Test solution with Solvent to obtain a solution having a concentration of $40 \mu \mathrm{~g}$ per mL .
Developing solvent system: a mixture of chloroform, glacial acetic acid, and water ( $85: 15: 0.5$ )

Spray reagent: phosphomolybdic acid TS.
Procedure-Separately apply $10 \mu \mathrm{~L}$ each of Standard solution 1, Standard solution 2, the Test solution, and the Diluted test solution to a thin-layer chromatographic plate (see Thin Layer Chromatography under Chromatography $\langle 621\rangle$ ), and proceed as directed in the chapter, allowing the solvent front to move about threefourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate. Spray the plate with phosphomolybdic acid TS, dry at $105^{\circ}$ for 5 minutes, and examine the plate: any secondary spot in the chromatogram of the Test solution having the same $R_{F}$ value as the principal spot from Standard solution 1 is not greater in size or intensity than that obtained from Standard solution 1:
$\square_{\text {not }}$ more than $1.5 \%$ of chenodiol is found. $\quad$ 1S (USP28) No secondary spot observed in the chromatogram of the Test solution having the same $R_{F}$ value as the principal spot from Standard solution 2 is greater in size or intensity than that obtained from Standard solution 2:
$\square_{\text {not }}$ more than $0.05 \%$ of lithocholic acid is found.■1S (USP28) No ${ }^{\text {other }} \mathbf{A U S P 2 7}$ secondary spot observed in the chromatogram of the Test Solution is greater in size or intensity than the principal spot obtained from the Diluted test solution: not more than $0.1 \%$
$\square_{\text {of }}$ any other impurity $\mathbf{m}_{1 S}$ (USP28)
is found.

## BRIEFING

Vinorelbine Injection. Because there is no existing USP monograph for this dosage form, a new monograph, based on validation data received, is being proposed. The liquid chromatographic procedure in the Assay and the test for Related compounds is based on analyses performed with a Delta-Pak C18 brand of L1 column. The typical retention times observed are about 10.8 minutes for the photodegradation product, 13.5 minutes for vinorelbine, and 16.2 minutes for vinorelbine related compound A .
(PA6: L. Evans; AMB: D. Porter; PSD: C. Okeke; NL: C. Barnstein) RTS—39915-1; 39915-2

## Add the following:

## ■Vinorelbine Injection

»Vinorelbine Injection is a sterile solution of Vinorelbine Tartrate in Water for Injection. It contains not less than 92.5 percent and not more than 105.0 percent of the labeled amount of $\mathrm{C}_{45} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{O}_{8}$.

Caution-Handle Vinorelbine Injection with great care since it is a potent cytotoxic agent.

Packaging and storage-Preserve in single-dose Containers for Injections as described under Injections $\langle 1\rangle$, preferably of Type I glass, protected from light. Store in a refrigerator.

USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS. USP Vinorelbine Related Compound A RS. USP Vinorelbine Tartrate $R S$.

Clarity and color of solution-The solution of Injection ( 10 mg per mL ) is clear. The absorbance of a solution of Injection, determined in a $1-\mathrm{cm}$ cell at 420 nm , with a suitable spectrophotometer, using water as the blank, is not greater than 0.060 .

Identification-The retention time and the UV spectrum of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Bacterial endotoxins $\langle 85\rangle$-It contains not more than 3.0 USP Endotoxin units per mg of vinorelbine.

Sterility $\langle 71\rangle$ —It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.
$\mathbf{p H}\langle 791\rangle$ : between 3.3 and 3.8.
Particulate matter $\langle 788\rangle$ : meets the requirements for small-volume injections.

## Related compounds-

Mobile phase, System suitability solution, Standard solution, Diluted standard solution-Proceed as directed in the test for Related compounds under Vinorelbine Tartrate.

Chromatographic system-Proceed as directed in the Assay.

Test solution-Dilute a portion of Injection with Mobile phase to obtain a solution containing 1.0 mg of vinorelbine per mL.

Procedure_Proceed as directed for Procedure in the test for Related compounds under Vinorelbine Tartrate. Not more than $1.0 \%$ of the photodegradation product is found; not more than $0.3 \%$ of vinorelbine related compound A is
found; not more than $0.2 \%$ of any other individual impurity is found; and the sum of all impurities, excluding any peaks that are below the limit of quantitation $(0.02 \%)$, is not more than $2.0 \%$.

Other requirements-It meets the requirements under Injections $\langle 1\rangle$.

## Assay-

Phosphate buffer, Mobile phase, and System suitability solution-Proceed as directed in the test for Related compounds under Vinorelbine Tartrate.

Standard preparation-Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in water to obtain a solution having a known concentration of about 0.10 mg of vinorelbine (base) per mL.

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 10 mg of vinorelbine, to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a diode-array detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The column temperature is maintained at $40^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and about 1.2 for vinorelbine related compound A ; and the relative retention between vinorelbine tartrate and vinorelbine is not less than 1.1.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine peaks, using a
diode-array detector. Calculate the quantity, in mg , of vinorelbine $\left(\mathrm{C}_{45} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{O}_{8}\right)$ in each mL of the Injection taken by the formula:

$$
C(L / D)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Vinorelbine RS in the Standard preparation; $L$ is the labeled quantity, in mg , of vinorelbine in each mL of Injection taken; $D$ is the concentration, in mg per mL , of vinorelbine in the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses at 267 nm obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Bacteriostatic Water for Injection, USP 27 page 1949 and page 3087 of the First Supplement; Sterile Water for Inhalation, USP 27 page 1950 and page 3087 of the First Supplement; Sterile Water for Injection, USP 27 page 1950 and page 3088 of the First Supplement; Water for Hemodialysis, page 3089 of the First Supplement. A revision is proposed in the test for Bacterial endotoxins to harmonize the text with that found in the European Pharmacopoeia and to be consistent with the language in the general chapter Bacterial Endotoxins Test $\langle 85\rangle$.
(PW: F. Barletta; AMB: D. Porter) RTS-41256-3

intent of the Definition in this monograph is to prevent the use of waste or sewer water; to prevent the use of recycling waste or nonpotable water; and to prevent the use of drinking water that does not meet some basic minimum acceptable norm. This proposal extends the minimum acceptable norms to those specified by the WHO.
(PW: F. Barletta) RTS-41213-1

## Change to read:

» Purified Water is water obtained by a suitable process. It is prepared from water complying with the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or comparable regulations of the European Union, Japan,

## $\square_{\text {or the World Health Organization's Guidelines }}$

## for Drinking Water Quality.n.1S (USP28)

It contains no added substance.
NOTE-Purified Water is intended for use as an ingredient of official preparations and in tests and assays unless otherwise specified (see Water in Ingredients and Processes and in Tests and Assays under General Notices and Requirements). Where used for sterile dosage forms, other than for parenteral administration, process the article to meet the requirements under Sterility Tests $\langle 71\rangle$, or first render the Purified Water sterile and thereafter protect it from microbial contamination. Do not use Purified Water in preparations intended for parenteral administration. For such purposes use Water for Injection, Bacteriostatic Water for Injection, or Sterile Water for Injection. The tests for Total organic carbon and Conductivity apply to Purified Water produced on site for use as an ingredient of official preparations and in tests and assays. Purified Water packaged in bulk for commercial use elsewhere meets the requirements of all of the tests under Sterile Purified Water, except Labeling and Sterility $\langle 71\rangle$.

Purified Water, USP 27 page 1950 and page 3089 of the First Supplement; Water for Injection, USP 27 page 1949 and page 3087 of the First Supplement. As a result of discussions during and subsequent to the March 3, 2004 meeting of the Pharmaceutical Waters Expert Committee, it is proposed to revise the Definition to include drinking water that meets the WHO guidelines. The

## BRIEFING

Sterile Purified Water, USP 27 page 1950, page 3089 of the First Supplement, and page 947 of PF 30(3) [May-June 2004]. It is proposed to clarify the preparation of the control in the test for Chloride.
(PW: F. Barletta) RTS-41288-1

## Change to read:

Ammonia-For containers having a fill volume of less than 50 mL , dilute 50 mL of it with 50 mL of High-Purity Water (see Reagents under Containers $\langle 661\rangle$ ), and use this dilution as the test solution; where the fill volume is 50 mL or more, use 100 mL of it as the test solution. To 100 mL of the test solution add 2 mL of alkaline mercuric-potassium iodide TS: any yellow color produced immediately is not darker than that of a control containing $30 \mu \mathrm{~g}$ of added ammonia : ffrmished by adding 1.76 mL of 1.0 N amme nitm hydroxide) (1s (uspoz)
-(furnished by adding 1 mL of the final solution prepared by diluting 3.0 mL of ammonia TS with High-Purity Water to $100 \mathrm{~mL} ; 1.0 \mathrm{~mL}$ of this solution is further diluted to 100 $\mathrm{mL})_{15}$ (USP28)
in 100 mL of High -Purity Water. This corresponds to a limit of 0.6 mg per L for containers having a fill volume of less than 50 mL and 0.3 mg per L where the fill volume is 50 mL or more.

## Change to read:

Chloride-To 20 mL in a color-comparison tube add 5 drops of nitric acid and 1 mL of silver nitrate TS, and gently mix: any turbidity formed within 10 minutes is not greater than that produced in a similarly treated control consisting of 20 mL of

MONOGRAPHS (NF)

BRIEFING

#### Abstract

Adipic Acid, page 593 of $P F$ 30(2) [Mar.-Apr. 2004]. It is proposed to add a USP Reference standards $\langle 11\rangle$ section to this monograph. (EMC: K. Russo) RTS-41311-1

## Add the following:

## -Adipic Acid

$\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4} \quad 146.1$
Hexanedioic acid.

1,4-Butanedicarboxylic acid [124-04-9].
» Adipic Acid contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4}$, calculated on the dried basis.

Packaging and storage-Store in tight containers.

## Add the following:

-USP Reference standards $\langle 11\rangle —$ USP Adipic Acid
$R S$.n| (NF23)
Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Melting range $\langle 741\rangle$ : between $151^{\circ}$ and $154^{\circ}$.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ to constant weight: it loses not more than $0.2 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Limit of nitrates-

Standard stock solution-Dissolve about 815 mg of potassium nitrate in 500 mL of water, and mix.

Standard solution-Dilute 1 mL of the Standard stock solution with water to 10 mL , and mix. Dilute 1 mL of this solution with water to 50 mL to obtain a solution containing 2 ppm of nitrate. Use 1.5 mL of this solution, and proceed as directed for Procedure, beginning with "add 2 mL of concentrated ammonia".

Test solution-Transfer 5 g of Adipic Acid to a $50-\mathrm{mL}$ volumetric flask. Dissolve in water, with heating, and dilute with water to volume. Allow to cool and crystallize, then pass through a sintered-glass filter. Wash the filter with water, and collect the filtrate and washings until a volume of 50 mL is obtained. [NOTE-This solution is to be used in the tests for Chloride, Sulfate, Iron, and Heavy metals.]

Procedure-To 1.0 mL of the Test solution add 2 mL of concentrated ammonia, 0.5 mL of manganese sulfate solution (1 in 100), 1 mL of sulfanilamide solution (1 in 100), and dilute with water to 20 mL . Add 100 mg of zinc powder, and cool in an ice bath for 30 minutes, shaking periodically. Filter 10 mL of the solution, and cool in an ice bath, then add 2.5 mL of hydrochloric acid and 1 mL of a naphthylethylenediamine dihydrochloride solution (1 in 100). Allow to stand at room temperature for 15 minutes: the color of the Test solution is not darker than a concomitantly prepared Standard solution; and the limit is $0.003 \%$. The test is invalid if a concomitantly prepared blank solution (prepared using 1 mL of water instead of 1 mL of the Test solution) is darker than a solution containing 2 mg of potassium permanganate per L .

Chloride $\langle 221\rangle$ —A 5-mL portion of the Test solution from the test for Limit of nitrates shows no more chloride than a corresponding $0.14-\mathrm{mL}$ portion of 0.020 N hydrochloric acid: the limit is $0.02 \%$.

Sulfate $\langle 221\rangle$-A $5-\mathrm{mL}$ portion of the Test solution from the test for Limit of nitrates shows no more sulfate than a corresponding $0.26-\mathrm{mL}$ portion of 0.020 N sulfuric acid: the limit is $0.05 \%$.

Iron $\langle 241\rangle$-Use a $10-\mathrm{mL}$ portion of the Test solution from the test for Limit of nitrates: the limit is $0.001 \%$.

Heavy metals, Method $I\langle 231\rangle: \quad 0.001 \%$.
Assay-Dissolve 60 mg of Adipic Acid in 50 mL of water.
Add 0.2 mL of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a permanent pale pink endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 7.31 mg of $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4 \cdot \boldsymbol{\Delta} N F 23}$

## BriEFING

Betadex, NF 22 page 2831 and page 595 of PF 30(2) [Mar.Apr. 2004]; Sodium Starch Glycolate, $N F 22$ page 2933. It is proposed to revise the Identification section to change the name of the iodine and potassium iodide TS to iodine and potassium iodide TS 1, which appears in the section Reagents, Indicators, and Solutions in this issue of PF. See also the Harmonization section of this $P F$ for the proposed revision of the monograph for Sodium Starch Glycolate.
(BPC: M. Marques) $\quad$ RTS-41175-2

## Change to read:

» Betadex is a nonreducing cyclic compound composed of seven alpha-(1-4) linked D-glucopyranosyl units. It contains not less than 98.0 percent and not more than 101.0

- $102.0_{\Delta N F 23}$
percent of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{7}$, calculated on the anhydrous basis.

## Change to read:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ : on undried specimen.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

C: Prepare a test solution in water containing 15 mg per mL . Separately apply $2 \mu \mathrm{~L}$ each of the test solution and a Standard solution of USP Beta Cyclodextrin RS in water containing 5 mg per mL to a suitable thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of chromatographic silica gel. Allow the applications to dry, and develop the chromatogram in a solvent system consisting of a mixture of $n$-propyl alcohol, water, ethyl acetate, and ammonium hydroxide ( $6: 3: 1: 1$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with iodine and potassium iodide TS
-1:-1S (NF23)
the $R_{F}$ value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

D: Mix 0.2 g with 2 mL of iodine TS, warm in a water bath to dissolve the test specimen, and allow to stand at room temperature: a yellow-brown precipitate is formed.

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water ( $65: 35$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Dissolve 2.0 g of glycerol in water contained in a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Pass through a $0.45-\mu \mathrm{m}$ membrane filter. Use fresh, or store in a freezer, thaw in hot water, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Beta Cyclodextrin RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 10 mg per mL . Use fresh, or store in a freezer, thaw in hot water, and mix. Mix 1.0 mL of this solution with 1.0 mL of Internal standard solution.

System suitability preparation-Prepare a solution in water containing about 5 mg per mL each of USP Alpha Cyclodextrin RS and USP Beta Cyclodextrin RS. Pass through a $0.45-\mu \mathrm{m}$ membrane filter.

Assay preparation-Transfer about 1 g of Betadex, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Pass this solution through a $0.45-\mu \mathrm{m}$ membrane filter. Mix 1.0 mL with 1.0 mL of Internal standard solution.

Chromatographic system (see Chromatography. $\langle 621\rangle$ )-The liquid chromatograph is equipped with a refractive index detector that is maintaned at constant temperature of $25^{\circ}$, a $4.6 \mathrm{~mm}-*$ 25 cm column that contains $10 \mu \mathrm{~mm}$ packing L 8 , and a guard col thm that contains packing $\mathrm{L8}$. The columms are maintained at a mL per minute.
${ }^{\Delta}$ The chromatograph is equipped with a refractive index detector, a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L8, and a guard column that contains packing L8. The columns and, if necessary, the detector are maintained at a constant temperature of about $25 \pm 2^{\circ}$, and the flow rate is about 2.0 mL per minute. If the detector or the columns are operated at a temperature other than $25 \pm 2^{\circ}$, the system also must be shown to meet all system suitability require-
ments. $\Delta N F 23$
Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the alpha cyclodextrin and beta cyclodextrin peaks exhibit baseline separation, the relative retention times being about 0.8 and 1.0 , respectively; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{7}$ in the portion of Betadex taken by the formula:

$$
100 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of anhydrous beta cyclodextrin in the Standard preparation, as determined from the concentration of USP Beta Cyclodextrin RS, corrected for moisture content by a titrimetric water determination; and $R_{U}$ and $R_{S}$ are the peak response ratios of the beta cyclodextrin peak to the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Caprylocaproyl Polyoxylglycerides, page 688 of $P F$ 29(3) [May-June 2003]. It is proposed to adopt Caprylocaproyl Polyoxylglycerides as the title of this proposed new monograph. A monograph on this excipient first appeared in Pharmacopeial Previews in PF 24(5) [Sept.-Oct. 1998] and under In-Process Revision in PF 28(4) [July-Aug. 2002] with the name Caprylocaproyl Macrogolglycerides and, subsequently, under In-Process Revision in PF 29(3) [May-June 2003] with the name Caprylocaproyl Polyoxylglycerides. The use of the prefix "Polyoxyl-" instead of "Macro-gol-" is consistent with terminology used in the United States, particularly in the titles of other monographs on excipients. The name "Polyethylene Glycol" and the "Polyoxyl-" designation for esters and ethers formed with polyethylene glycol and organic acids and alcohols or polyols replace the "Macrogol" name that is used for polyethylene glycol in some locations outside the United States.

Caprylocaproyl Polyoxylglycerides is proposed by the Expert Committee on Nomenclature and Labeling to be the title of the monograph for this excipient, which is proposed for inclusion in the First Supplement to USP 28-NF 23, but with an official date
of April 1, 2010, which is sixty months later than the April 1, 2005, official date of the First Supplement to USP 28-NF 23. The 60month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, and for practitioners, consumers, and regulatory agencies to become familiar with the terminology.

Also, on the basis of comments received, changes are proposed to improve the procedure and visualization of results obtained in the Thin-Layer Chromatographic Identification Test procedure (Identification test $B$ ). Comparison is specified with Rhodamine 6G, which replaces reagent Rhodamine B; and visualization to compare developed spots obtained from the Test solution and a Standard solution replaces the designation of approximate numerical $R_{F}$ values for components of the polyoxylglycerides.
(EMC: C. Sheehan; NL: C. Barnstein) RTS-41339-1

## Add the following:

## ■Caprylocaproyl Macrogolglycerides Polyoxylglycerides

(Monograph under this new title-to become official April 1, 2010)
(Currently, there is no official NF monograph for this article)

## » Caprylocaproyl Macrogolglyeerides Polyoxyl-

 glycerides are mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of maerogols polyethylene glycols with a mean relative molecular weight between 200 and 400 . They are produced by partial alcoholysis of medium-chain triglycerides with macregel, polyethylene glycol, by esterification of glycerol and maergel polyethylene glycol with caprylic acid and capric acid, or as a mixture of glycerol esters and ethylene oxide condensate with caprylic acid and capric acid. The average molecular weight is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value.Packaging and storage-Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

Labeling-Label it to indicate the average nominal molecular weight of esters as part of the official title. The label also indicates the nominal hydroxyl value and saponification value.

USP Reference standards $\langle 11\rangle$ —USP Caprylocaproyl Macrogolgherides Polyoxylglycerides RS.

## Identification-

A: - 197 K$\rangle$ Infrared Absorption $\langle 197 \mathrm{~F}\rangle$.
B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -
Test solution: $\quad 0.05 \mathrm{~g}$ per mL , prepared by dissolving 1.0 g of Caprylocaproyl Macergerides Polyoxylglycerides in methylene chloride, and diluting with methylene chloride to 20 mL .

Developing solvent system: a mixture of ether and solvent hexane ( $7: 3$ ).

Procedure-Proceed as directed in the chapter (except for Caprylocaproyl Polyglycerides apply $50 \mu \mathrm{~L}$ of the Test solution and $50 \mu \mathrm{~L}$ of the Standard solution). Then spray the plate with reagent solution, prepared by dissolving 0.01 g of rhodamine B in 100 mL of aleohel, and examine the plate tuder UV light at 365 nm : the chromatogram of the Test solution exhibits a spot comesponding to triglyeerides at an $R_{\mu}$ value of about 0.9 and spets at $R_{\mu}$ value of about $0.7,0.6,0.1$, and 0 correspending to 1,3 -diglyeerides, 1,2 diglyeerides, menoglyeerides, and esters of macrogols, polyethylene glyeols, respectively. rhodamine 6 G in 100 mL of isopropyl alcohol, and examine the plate under UV light at 365 nm : the $R_{F}$ values of the principle spots obtained from the Test solution correspond to those obtained from the Standard solution.

Acid value $\langle 401\rangle$ : not more than 2.0 , determined on a $2.0-\mathrm{g}$ specimen.

Hydroxyl value $\langle 401\rangle$-The hydroxyl value, between 170 and 205, does not differ by more than 20 units from the nominal value, when determined on a $1.0-\mathrm{g}$ specimen, accurately weighed.
Iodine value $\langle 401\rangle$ : not more than 2.0.
Peroxide value $\langle 401\rangle$ : not more than 6.0, determined on a $2.0-\mathrm{g}$ specimen.

Saponification value $\langle 401\rangle$-The saponification value, between 85 and 105 , does not differ by more than 10 units from the nominal value, determined on a $2.0-\mathrm{g}$ specimen.

Fatty acid composition $\langle 401\rangle$ : between $50 \%$ and $80 \%$ of caprylic acid is found; not more than $2.0 \%$ of caproic acid is found; between $20 \%$ and $50 \%$ of capric acid is found; not more than $3.0 \%$ of lauric acid is found; and not more than $1.0 \%$ of myristic acid is found.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Total ash $\langle 561\rangle$ : not more than $0.1 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.
Limit of free ethylene oxide and dioxane-
Caution-Ethylene oxide is toxic and flammable. Prepare all solutions in a well-ventilated hood. The operator must protect hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between $4^{\circ}$ and $8^{\circ}$.

NOTE-Perform all determinations three times.
Ethylene oxide stock solution-Into a dry, clean test tube, cooled in a mixture of 1 part of sodium chloride and 3 parts of crushed ice, introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test
tube. Using a glass syringe, previously cooled to $-10^{\circ}$, transfer about $300 \mu \mathrm{~L}$ of liquid ethylene oxide, equivalent to about 0.25 g , to 50 mL of polyethylene glycol 200 . Determine the absorbed quantity of ethylene oxide by weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL , and mix. This is the Ethylene oxide stock solution.

Transfer 10.0 mL of magnesium chloride solution, prepared by adding 5 g of magnesium chloride to 10 mL of alcohol, to a volumetric flask. Add 20.0 mL of 0.1 M alcoholic hydrochloric acid VS. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of Ethylene oxide stock solution, accurately measured, to the flask, and allow to stand for 30 minutes. Titrate with 0.1 M alcoholic potassium hydroxide VS, determining the endpoint potentiometrically. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of Ethylene oxide stock solution, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide, in mg per g , in the Ethylene oxide stock solution.
Ethylene oxide solution-Quantitatively dilute a volume of Ethylene oxide stock solution, accurately measured, with polyethylene glycol 200 to obtain a solution containing about $50 \mu \mathrm{~g}$ of ethylene oxide per g . Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution having a known concentration of about $10 \mu \mathrm{~g}$ of ethylene oxide per mL . [NOTE-Prepare immediately before use.]

Dioxane stock solution-Dissolve about 1.00 g of dioxane, accurately weighed, in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 1.0 mg per mL .

Dioxane solution-Quantitatively dilute a volume of the Dioxane stock solution, accurately measured, with water to obtain a solution having a known concentration of about 0.5 mg of dioxane per mL .

Standard solution 1-Transfer about 1.0 g of the substance under test, accurately weighed, to a $10-\mathrm{mL}$ vial, and add 1.0 mL of $\mathrm{N}, \mathrm{N}$-dimethylacetamide, 0.1 mL of Ethylene oxide solution, and 0.1 mL of Dioxane solution. Close the vial, and mix to obtain a homogenous solution. Allow to stand at $90^{\circ}$ for 45 minutes.

Standard solution 2-Transfer 0.1 mL of Ethylene oxide solution to a $10-\mathrm{mL}$ vial, add 0.1 mL of a freshly prepared solution of acetaldehyde, containing about 10 mg of acetaldehyde per L, and add 0.1 mL of Dioxane solution. Close the vial, and mix to obtain a homogenous solution.

Test solution-Transfer about 1.0 g of the substance under test, accurately weighed, to a $10-\mathrm{mL}$ vial, and add 1.0 mL of $\mathrm{N}, \mathrm{N}$-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogenous solution. Allow to stand at $90^{\circ}$ for 45 minutes.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-[NOTE-Headspace apparatus that automatically transfers a measured amount of headspace may be used.] The gas chromatograph is equipped with a flame-ionization detector and contains a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ glass or quartz capillary column bonded with a $1.0-\mu \mathrm{m}$ layer of phase G1. The carrier gas is helium, flowing at a rate of about 1 mL per minute. The detector and injection port temperatures are maintained at $250^{\circ}$ and $150^{\circ}$, respectively. The column temperature is programmed as follows. Initially it is maintained at $50^{\circ}$ for 5 minutes after injection, then increased to $180^{\circ}$ at a rate of $5^{\circ}$ per minute, further increased to $230^{\circ}$ at a rate of $30^{\circ}$ per minute, and maintained at this temperature for 5 minutes. Chromatograph the gaseous phase of Standard solution 2, and record the peak responses as directed for

Procedure, adjusting the sensitivity of the system so that the peak heights of the two principal peaks in the chromatogram are not less than $15 \%$ of the full scale of the recorder: the relative retention times are about 0.94 for acetaldehyde and 1.0 for ethylene oxide; the resolution, $R$, between acetaldehyde and ethylene oxide is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $15.0 \%$.

Procedure-Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes (about 1 mL ) of the gaseous headspace of Standard solution 1 and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses: the mean areas of the ethylene oxide and dioxane peaks in the chromatogram obtained from the Test solution are not greater than half the mean areas of the corresponding peaks in the chromatogram obtained from Standard solution 1, equivalent to about $1 \mu \mathrm{~g}$ of ethylene oxide per g and $50 \mu \mathrm{~g}$ of dioxane per g. Calculate the concentration of ethylene oxide, in $\mu \mathrm{g}$ per g , in the test specimen taken by the formula:

$$
C r_{U} /\left(r_{S} M_{U}-r_{U} M_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of ethylene oxide in Standard solution 1; $r_{U}$ and $r_{S}$ are the peak responses of ethylene oxide obtained from the Test solution and Standard solution 1, respectively; and $\mathrm{M}_{U}$ and $\mathrm{M}_{s}$ are the quantities, in g , of the substance under test taken to prepare the Test solution and Standard solution 1, respectively: not more than $1 \mu \mathrm{~g}$ per g is found. Calculate the concentration of dioxane, in $\mu \mathrm{g}$ per g , in the test specimen taken by the formula:
in which $C_{D}$ is the concentration, in $\mu \mathrm{g}$, of dioxane in Standard solution 1; $d_{U}$ and $d_{S}$ are the peak responses of dioxane obtained from the Test solution and Standard solution 1, respectively; and $\mathrm{M}_{U}$ and $\mathrm{M}_{s}$ are as defined above: not more than $10 \mu \mathrm{~g}$ per g is found.

Limit of free glycerol-Dissolve 1.20 g of the substance under test in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of periodic acid solution, prepared by dissolving 150 mg of periodic acid in 25 mL of water. Shake, and allow to stand for 30 minutes. Add 40 mL of potassium iodide solution, prepared by dissolving 3 g of potassium iodide in 40 mL of water, and allow to stand for 1 minute. Add 1 mL of starch TS, and titrate the liberated iodine with 0.1 M sodium thiosulfate. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 M sodium thiosulfate is equivalent to 2.3 mg of glycerol: not more than $5.0 \%$ is found. 1 S (NF23)

## BRIEFING

Carbomer 940, $N F 22$ page 2838. It is proposed to revise the immersion depth in the test for Viscosity.
(EMC: C. Sheehan) RTS-41306-1

## Change to read:

Viscosity—Proceed as directed in the test for Viscosity under Carbomer $934 P$, except to use a spindle having a shaft 0.32 cm in diameter, the distance from the top of the shaft to the lower tip of the shaft being 5.04 cm , and the immersion depth being 0.95 cm
$\square^{5.6} \mathrm{~cm}_{1 \mathrm{~S}(\mathrm{NF} 23)}$
(No. 7 spindle). The viscosity is between 40,000 and 60,000 centipoises.

## BRIEFING

Gellan Gum, page 3172 of the First Supplement. On the basis of the stability information received, it is proposed to revise the Packaging and storage section for this excipient.
(EMC: E. Gonikberg; PSD: C. Okeke) RTS-41272-1

## Change to read:

Packaging and storage-Preserve in well-closed containers, protect from moisture. Store in a cool, dry place.

■and store at room temperature.■1S (NF23)

## BRIEFING

Linoleoyl Polyoxylglycerides, page 700 of $P F$ 29(3) [MayJune 2003]. It is proposed to adopt Linoleoyl Polyoxylglycerides as the title of this proposed new monograph. A monograph on this excipient first appeared in Pharmacopeial Previews in PF 24(5) [Sept.-Oct. 1998] and in In-Process Revision in PF 26(2) [Mar.Apr. 2000] and PF 28(4) [July-Aug. 2002] under the name Linoleoyl Macrogolglycerides and, subsequently, in In-Process Revision in PF 29(3) [May-June 2003] with the name Linoleoyl Polyoxylglycerides. See also briefing under Caprylocaproyl Polyoxylglycerides.
(EMC: C. Sheehan; NL: C. Barnstein) RTS-41339-2

## Add the following:

## ■Linoleoyl Maerogolglyeerides Polyoxylglycerides

(Monograph under this new title-to become official April 1, 2010)
(Currently, there is no official NF monograph for this article)
» Linoleoyl Maerogely ides are mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of macrogels polyethylene glycols with a mean relative molecular weight between 300 and 400 . They are produced by partial alcoholysis of unsaturated oils, mainly containing triglycerides of linoleic acid, with macrogel, polyethylene glycol, by esterification of glycerol and maerol polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the unsaturated oils. The average molecular weight is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value.

Packaging and storage-Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

Labeling-Label it to indicate the average nominal molecular weight of esters as part of the official title.

USP Reference standards $\langle 11\rangle$ —USP Linoleoyl golslides Polyoxylglycerides RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~F}\rangle$.
B: It meets the requirements for Identification test $B$ under Caprylocaproyl Macrogolglyeerides Polyoxylglycerides.

Acid value $\langle 401\rangle$ : not more than 2.0, determined on a $2.0-$ g specimen.

Hydroxyl value $\langle 401\rangle$ : between 45 and 65, determined on a $1.0-\mathrm{g}$ specimen, accurately weighed.

Iodine value $\langle 401\rangle$ : between 90 and 110.
Peroxide value $\langle 401\rangle$ : not more than 12.0, determined on a $2.0-\mathrm{g}$ specimen.

Saponification value $\langle 401\rangle$ : between 150 and 170 , determined on a $2.0-\mathrm{g}$ specimen.

Fatty acid composition $\langle 401\rangle$ : between $4 \%$ and $20 \%$ of palmitic acid is found; not more than $6 \%$ of stearic acid is found; not more than $1.0 \%$ each of arachidic acid and eicosenoic acid is found; between $20 \%$ and $35 \%$ of oleic acid is found; between $50 \%$ and $65 \%$ of linoleic acid is found; and not more than $2 \%$ of linolenic acid is found.

Refractive index $\langle 831\rangle$ : between 1.465 and 1.475 at $20^{\circ}$. Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Total ash $\langle 561\rangle$ : not more than $0.1 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Limit of free ethylene oxide and dioxane-Proceed as directed in the test for Limit of free ethylene oxide and dioxane under Caprylocaproyl Magolglyerdes Polyoxylglycerides: not more than $1 \mu \mathrm{~g}$ of ethylene oxide per g is found; and not more than $10 \mu \mathrm{~g}$ of dioxane per g is found.

Limit of free glycerol-Proceed as directed in the test for Limit of free glycerol under Caprylocaproyl MacrogolglyPolyoxylglycerides: not more than $5.0 \%$ is found. 1 (NF23)

Briefing

Mono- and Di-glycerides, NF 22 page 2897 and page 1600 of PF 29(5) [Sept.-Oct. 2003]. It is proposed to revise the Chromatographic system in the Assay for monoglycerides by adding a note which provides an alternative to the $60-\mathrm{cm}$ column.
(EMC: K. Russo) RTS-41260-1

## Change to read:

Iodine value $\langle 401\rangle$ : not less than $90.0 \%$ and not more than $110.0 \%$ of the value indicated in the labeling.
$\square$ If the value stated in the labeling is less than 10 , the Iodine value is not more than 10.■2S (NF22)

## Change to read:

## Assay for monoglycerides-

Mobile phase-Use filtered and degassed tetrahydrofuran. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Assay preparation-Transfer about 200 mg of Mono- and Diglycerides, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with tetrahydrofuran to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a refractive index detector and a $7-\mathrm{mm} \times 60-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L21 ( $100 \AA$ ). The flow rate is about 1 mL per minute. The column and detector temperatures are maintained at $40^{\circ}$.
■ [NOTE—Two or three $7.5-\mathrm{mm} \times 30-\mathrm{cm}$ L21 columns may be used in place of one $60-\mathrm{cm}$ column provided that system suitability requirements are met. $]_{\text {IS }}$ (NF23)
Chromatograph the Assay preparation, and
Chromatograph the Assay preparation, and record the peak responses as directed for Procedure. the relative retention times are about 1.0 for glycerin, 0.86 for moneglycerides, 0.81 for diglycer ides, and 0.77 for triglyeerides; and
-The order of elution is triglycerides, diglycerides, monoglycerides, and glycerin. 2 2S (NF22)
The relative standard deviation for replicate injections determined from the monoglycerides peak is not more than $1.0 \%$.
Procedure-Inject a volume (about $40 \mu \mathrm{~L}$ ) of the Assay preparation into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of monoglycerides in the portion of Mono- and Di-glycerides taken by the formula:

$$
100\left(r_{U} / r_{S}\right)
$$

in which $r_{U}$ is the peak response for monoglycerides; and $r_{S}$ is the sum of the responses of all the peaks, except the solvent peak.

Briefing

Oleoyl Polyoxylglycerides, page 701 of $P F$ 29(3) [May-June 2003]. It is proposed to adopt Oleoyl Polyoxylglycerides as the title of this proposed new monograph. A monograph on this excipient first appeared in Pharmacopeial Previews in PF 24(5) [Sept.Oct. 1998] and under In-Process Revision in PF 26(2) [Mar.-Apr. 2000] and $P F$ 28(4) [July-Aug. 2002] with the name Oleoyl Macrogolglycerides and, subsequently, under In-Process Revision in PF 29(3) [May-June 2003] with the name Oleoyl Polyoxylglycerides. Limit of free ethylene oxide and dioxane-Proceed as directed in the test for Limit of free ethylene oxide and dioxane under Caprylocaproyl Polyoxylglycerides: not more than $1 \mu \mathrm{~g}$ of ethylene oxide per g is found; and not more than $10 \mu \mathrm{~g}$ of dioxane per g is found.

Limit of free glycerol-Proceed as directed in the test for Limit of free glycerol under Caprylocaproyl Polyoxylglycerides: not more than $5.0 \%$ is found.■1S (NF23)

## Briefing

Polydecene, page 1284 of $P F$ 28(4) [July-Aug. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision. It is also proposed to revise the limits for the content of decene oligomers that appear in the table in the Definition to include polydecene supplied by other manufacturers.
(EMC: D. Bempong) RTS—39281-1

## Add the following:

## ■Polydecene

$\mathrm{C}_{30 \leq n \leq 70} \mathrm{H}_{2 n+2}$
1-Decene, homopolymer, hydrogenated [68037-01-4].
» Polydecene is a mixture of saturated, synthetic hydrocarbons in the range $\mathrm{C}_{30} \mathrm{H}_{62}$ through $\mathrm{C}_{70} \mathrm{H}_{142}$ made from direct oligomerization of 1-de-
cene ( $\mathrm{C}_{10}$ alpha olefin). The oligomer mixture may be distilled to fractions of the desired viscosity and hydrogenated to reach saturation or may be hydrogenated to reach saturation and then distilled to the desired viscosity. The requirements for specific gravity, viscosity, and content of decene oligomer differ for the various types of polydecene, as set forth in the accompanying table. Polydecene may contain a suitable stabilizer.

|  | Specific Gravity | Viscosity (eentipeises centistokes) | Content of Decene Oligomer (\%) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Type | Range | Range | $\mathrm{C}_{30} \mathrm{H}_{62}$ | $\mathrm{C}_{40} \mathrm{H}_{82}$ | $\mathrm{C}_{50} \mathrm{H}_{102}$ | $\mathrm{C}_{60} \mathrm{H}_{122}$ | $\mathrm{C}_{70} \mathrm{H}_{142}$ |
| Light polydecene | 0.814-0.819 | 16.0-20.0 | $\begin{aligned} & 70-86 \\ & 70-93 \end{aligned}$ | $\begin{array}{r} 12-25 \\ 5-25 \end{array}$ | 0-5 | $0-1$ | $0-1$ |
| Medium <br> polyde- <br> cene | 0.823-0.827 | 28.0-34.0 | $\begin{aligned} & 13-37 \\ & 13-40 \end{aligned}$ | 35-70 | 9-25 | 0-7 | 0-2 |
| Heavy polydecene | 0.828-0.832 | 40.0-52.0 | 3-15 | $\begin{aligned} & 25-40 \\ & 25-55 \end{aligned}$ | 25-40 | 13-28 | 0-10 |

Packaging and storage-Preserve in tight containers.
Labeling-Label it to indicate, as part of the official title, the Polydecene type, and label it to indicate the name and concentration of any added stabilizer.

Identification-The chromatogram of the Test solution obtained from the test for Content of decene oligomer exhibits major peaks for trimers, tetramers, pentamers, hexamers,
and possibly heptamers. The decene oligomer content is within the range given in the table above for the labeled type of polydecene.

Specific gravity $\langle 841\rangle$ : meets the requirements of the specific gravity range specified in the accompanying table, for the labeled type, determined at $20^{\circ}$.

Viscosity $\langle 911\rangle$ : meets the requirements of the viscosity range specified in the accompanying table for the labeled type, determined using a capillary viscosimeter giving a flow time of not less than 200 seconds, in a liquid bath maintained at $40.0^{\circ}$.

Readily carbonizable substances $\langle 271\rangle$ —Transfer 5 mL of Polydecene to a glass-stoppered test tube previously treated to remove organic matter (see Cleaning Glass Apparatus $\langle 1051\rangle$ ), add 5 mL of sulfuric acid TS , and heat in a boiling water bath for 30 seconds. Quickly remove the test tube, and, while holding the stopper in place, shake three times in a vertically reciprocating cycle with an amplitude of about 13 cm . Repeat this procedure every 30 seconds for 10 minutes. Do not keep the test tube out of the water bath any longer than 3 seconds for each shaking cycle. Remove the test tube from the water bath, and let it cool for about 20 minutes to room temperature: the oil phase may turn hazy, but remains colorless; the interface between the two layers is free from solids; and the acid layer does not become darker than the standard color produced by overlaying 5 mL of Matching Fluid E (see Color and Achromicity $\langle 631\rangle$ ) with 5 mL of Polydecene in a similar test tube.

Limit of nickel-[To come.]

## Limit of short-chain hydrocarbons-

Test solution, System suitability solution, Chromatographic system, and Procedure-Proceed as directed in the test for Content of decene oligomer. Calculate the percentage of each of the short-chain hydrocarbons present by the formula:

$$
100\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the response of any peak obtained from a hydrocarbon smaller than a trimer but different from the solvent peak; and $r_{s}$ is the sum of the responses of all the peaks in the chromatogram, excluding the solvent peak: not more than $2.5 \%$ of total short-chain hydrocarbons is found.

## Content of decene oligomer-

Test solution-Dissolve about 0.1 mL of Polydecene in about 10 mL of pentane.

System suitability solution-Dissolve accurately weighed quantities of hexadecane, squalane, and tetradecane in pentane to obtain a solution having known concentrations of about 10 mg per $\mathrm{mL}, 10 \mathrm{mg}$ per mL , and 1 mg per mL , respectively.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The gas chromatograph is equipped with a flame-ionization detector and a $0.52-\mathrm{mm} \times 16-\mathrm{m}$ fused-silica capillary column coated with $0.1-\mathrm{mm}$ stationary phase G2. The carrier gas is helium, flowing at a rate of about 10 mL per minute. The chromatograph is programmed as follows. Initially, the column is maintained at a temperature of $35^{\circ}$, then immediately after injection, the temperature is increased at a rate of $5^{\circ}$ per minute to a temperature of $50^{\circ}$, then increased to $170^{\circ}$ at a rate of $12^{\circ}$ per minute, then increased from $170^{\circ}$ to $310^{\circ}$ at a rate of $10^{\circ}$ per minute, and maintained at $310^{\circ}$ for 18 minutes. The injection port temperature is maintained isothermally at about $35^{\circ}$, and the detector temperature is maintained isothermally at about $320^{\circ}$. Chromatograph the System suitability solution, and record the responses as directed for Procedure: the retention time for squalane is about 18 minutes; the relative retention times are about 0.5 for tetradecane, 0.6 for hexadecane and, 1.0 for squalane; the resolution, $R$, between tetradecane and hexadecane is not less than 10 ; and the relative standard deviation for replicate injections for each peak is not more than $2.0 \%$.
Procedure-Inject a volume (about $2 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the areas for the major peaks. The pentamer oligomer has a retention time of about 23 minutes. The trimer, tetramer, pentamer, hexamer, and heptamer oligomers, if present, have relative retention times of about $0.7,0.9$,
$1.0,1.1$, and 1.3 , respectively. Calculate the percentage of each oligomer present by the formula:

$$
100\left(r_{o} / r_{s}\right)
$$

in which $r_{o}$ is the response of each oligomer; and $r_{s}$ is the sum of the responses of all the peaks in the chromatogram, excluding the solvent peak: the decene oligomer content is within the limits specified in the accompanying table. ${ }^{1 S}$ (NF23)

Briefing

Modified Starch, page 995 of PF 30(3) [May-June 2004]. On the basis of comments received, this new monograph is being presented again with additional changes. It is proposed to include the Botanic characteristics under the Identification test section to be consistent with the harmonization effort for the Corn Starch, Wheat Starch, and Potato Starch monographs. Botanic characteristics will be referred to as Identification test $A$. It is also proposed to change the Loss on drying limit for Tapioca starch from not more than $15 \%$ to not more than $18 \%$ to be consistent with EU Food Law dir. 2000/63/EC. In addition, it is proposed to increase the Residue on ignition limit from $0.5 \%$ to $1.5 \%$ on the basis of comments received that some treatments require the addition of salts that are very difficult to remove.
(EMC: C. Sheehan) RTS-41322-1

## Add the following:

## ■Modified Starch

» Modified Starch is Starch modified by chemical means. Food Starch may be acid-modified, bleached, oxidized, esterified, or etherified, or treated enzymatically to change the functional properties (21 CFR 172.892).

## Packaging and storage-Preserve Store in well-elosed

 entainers at emperatures ranging from $0^{\circ}$ to $55^{\circ}$. Preserve in well-closed containers. No storage requirements specified.
## Botanic characteristies

Eorn stareh Polygonal, rounded or spheroidal granules up to about $35 \mu \mathrm{~m}$ in diameter and ustally having a cireular or several rayed central cleft.

Fapioa stareh Spherieal granules with one truneated side, typieally 5 - $0-35 \mathrm{~mm}$ in diameter and ustally having a cireular or several rayed central cleft.

Potatostareh Irregularly shaped, ovoid, or pear shaped granules, usually 30 to $100 \mathrm{\mu m}$ in size but oceasionally ex eeeding $100 \mathrm{\mu m}$; or rounded, 10 to $35 \mathrm{\mu m}$ in size. There are eceasional cempernd grantles having two four compenents. The ovoid and pear shaped granules have an ec eentric hilum, and the rounded granules have aceentric or slightly eceentric hiltum. All grantles show clearly visible eoncentric striations.

Wheat starch-Large and small gramules, usually 10 to-60 fmim diameter. The central hiltum and striations are-visible er barely visible.

## Identification-

A: Corn starch: polygonal, rounded, or spheroidal granules up to about $35 \mu \mathrm{~m}$ in diameter and usually having a circular or several-rayed central cleft.
Tapioca starch: spherical granules with one truncated side, typically 5 to $35 \mu \mathrm{~m}$ in diameter and usually having a circular or several-rayed central cleft.
Potato starch: irregularly shaped, ovoid, or pearshaped granules, usually 30 to $100 \mu \mathrm{~m}$ in size but occasionally exceeding $100 \mu \mathrm{~m}$; or rounded, 10 to $35 \mu \mathrm{~m}$ in size. There are occasional compound granules having two to four components. The ovoid and pear-shaped granules have an
eccentric hilum, and the rounded granules have accentric or slightly eccentric hilum. All granules show clearly visible concentric striations.

Wheat starch: large and small granules, usually 10 to $60 \mu \mathrm{~m}$ in diameter. The central hilum and striations are visible or barely visible.

A B: Prepare a smooth mixture of 1 g of Modified Starch with 2 mL of cold water, stir into 15 mL of boiling Whater, boil gently for 2 minntes, and cool to room tempera tre: the product is elear. Prepare a $2 \%(\mathrm{w} / \mathrm{w})$ sodium hydroxide solution. Weigh 0.6 g of Modified Starch, and transfer to a $25-\mathrm{mL}$ glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vigorously to evenly disperse the starch. Add 10 g of $2 \%$ sodium hydroxide solution, cap, and shake vigorously for 1 minute to create a smooth mixture. Evaluate within 1 minute. The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.

B: C: A water slurry of the Modified Starch is colored reddish violet orange-red to deep blue by iodine TS.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed 1000 cfu per g ; the total combined molds and yeasts count does not exceed 100 cfu per $g$.
$\mathbf{p H}\langle 791\rangle$ —Weigh $20.0 \pm 0.1 \mathrm{~g}$ of Modified Starch, transfer to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Stir using a magnetic stirrer at a moderate rate for about 5 minutes, and determine the pH to the nearest 0.1 unit: between 4.5 and 8.0. 3.0 and 9.0.

Loss on drying $\langle 731\rangle$ —Dry it at $120^{\circ}$ for 4 hours. it loses mere the it inght. Corn starch and Wheat starch: Tat not more than 15.0\%; Tapioca starch: not more than 18.0\%; and Potato starch: not more than $21.0 \%$.

Residue on ignition $\langle 281\rangle$ : not more than $0.5 \% 1.5 \%$, a test specimen of $2.0 \pm 0.1 \mathrm{~g}$ being used.

Iron $\langle 241\rangle$ : $0.002 \%$, the Test Preparation being prepared as follows. Dissolve the residue obtained in the test for Residue on ignition in 8 mL of hydrochloric acid with the aid of gentle heating. Dilute with water to 100 mL in a volumetric flask, and mix. Dilute 25 mL of this solution with water to $47 \pm 1 \mathrm{~mL}$.

Oxidizing substances-To 5-Modified Stareh add 20 mL of a mixttre of methanol and water ( $1: 1$ ), then add 4 mL of 6 N acetic acid, and stir until a homogeneous suspension is btained. Add 0.5 mL of a freshly prepared saturated solution of potassium iodide, mix, and allow to stand for 5 minttes: no distinet blue, brown, or purple color is ob served. Transfer 4.0 g to a glass-stoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 12.6 mL of 0.002 N sodium thiosulfate is required ( $180 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ): not more than $0.018 \%$ of oxidizing substances is found.

Limit of sulfur dioxide-Mix $20.0 \pm 0.1 \mathrm{~g}$ of Modified Starch with 200 mL of $5 \%$ alcohol until a smooth suspension is obtained, and vacuum filter through paper (Whatman No. 1 or equivalent). To 100 mL of the filtrate add 3 mL of starch TS, and titrate with 0.10 N iodine to the first perma-
nent blue color. Not more than 2.7 mL is consumed: not more than $0.008 \% 0.005 \%$ of sulfur dioxide is found.■1S (NF23)

BRIEFING

Tapioca Starch, NF 22 page 2940, page 3181 of the First Supplement, and page 998 of $P F$ 30(3) [May-June 2004]. It is proposed to modify this monograph to align it with the proposed monographs for Corn Starch, Potato Starch, and Wheat Starch. It is proposed to move the test for Botanic characteristics under the new Identification test $A$ and to add a new test solution, Iodine and potassium iodide TS 2, under the revised Identification test $C$.

## Identification-

A: Suspend 1 gof Tapioca Stareh in 50 mL of water, beil for 4
minute, and eool: a thin, cloudy mueilage is formed.
B: To 10 mL of the murilage obtained in Identifieation test $A$ add 0.04 mL each of iodine and potassium iodide $T S$ : a reddish violet to dark blue color is produced, which disappears on heating and reappears on cooling.

■ A: Examine Tapioca Starch under a microscope, using not less than $20 \times$ magnification and using glycerin as the mounting agent: it appears as spherical granules with one truncated side, typically having a 5 - to $35-\mu \mathrm{m}$ diameter and having circular or several-rayed central clefts.

B: Suspend 1 g of Tapioca Starch in 50 mL of water, boil for 1 minute, and cool: a thin, cloudy mucilage is formed.

C: To 1 mL of the mucilage obtained in Identification test $B$ add 0.05 mL of iodine and potassium iodide TS 2 : an orange-red to dark blue color is produced, which disappears on heating. $\quad$ IS (NF23)

## BRIEFING

Stearoyl Polyoxylglycerides, page 1135 of $P F$ 29(4) [JulyAug. 2003]. It is proposed to adopt Stearoyl Polyoxylglycerides as the title of this proposed new monograph. A monograph on this excipient first appeared in Pharmacopeial Previews in PF 24(5) [Sept.-Oct. 1998] and under In-Process Revision in PF 26(2) [Mar.-Apr. 2000] and PF 28(4) [July-Aug. 2002] with the name Stearoyl Macrogolglycerides and, subsequently, under In-Process Revision in PF 29(4) [July-Aug. 2003] under the name Stearoyl Polyoxylglycerides. See also the briefing under Caprylocaproyl Polyoxylglycerides.
(EMC: C. Sheehan; NL: C. Barnstein) RTS-41339-4

## Add the following:

## ■Stearoyl Macrogolglyeerides Polyoxylglycerides

(Monograph under this new title-to become official April 1, 2010)
(Currently, there is no official NF monograph for this article)

## » Stearoyl Macregelglycerides Polyoxylglycerides are mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of macregels polyethylene glycols with a nominal mean relative molecular weight between 300

and 4000 . They are produced by partial alcoholysis of saturated oils, mainly containing triglycerides of stearic acid, with macrol, polyethylene glycol, by esterification of glycerol and merer polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the hydrogenated oils. The Hydroxyl Value does not differ by more than 15 units from the nominal value, and the Saponification Value does not differ by more than 10 units from the nominal value. The average molecular weight is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value.

Packaging and storage-Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

Labeling-Label it to indicate the average nominal molecular weight of esters as part of the official title. The label also indicates the Hydroxyl Value and the Saponification Value.

USP Reference standards $\langle 11\rangle$ —USP Stearoyl Margor shler Polyoxylglycerides RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: It meets the requirements for Identification test $B$ under Caprylocaproyl Magolglyerides Polyoxylglycerides.

Acid value $\langle 401\rangle$ : not more than 2.0, determined on a $2.0-\mathrm{g}$ specimen.

Hydroxyl value $\langle 401\rangle$-The Hydroxyl Value, between 25 and 56 , does not differ by more than 15 units from the nominal value, determined on a $1.0-\mathrm{g}$ specimen, accurately weighed.

Iodine value $\langle 401\rangle$ : not more than 2.0.
Peroxide value $\langle 401\rangle$ : not more than 6.0, determined on a $2.0-\mathrm{g}$ specimen.

Saponification value $\langle 401\rangle$-The Saponification Value, between 67 and 112, does not differ by more than 10 units from the nominal value, determined on a $2.0-\mathrm{g}$ specimen.

Fatty acid composition $\langle 401\rangle$ : not more than $5.0 \%$ each of lauric acid and myristic acid is found; between $40.0 \%$ and $50.0 \%$ of palmitic acid is found; and between $48.0 \%$ and $58.0 \%$ of stearic acid is found.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Total ash $\langle 561\rangle$ : not more than $0.2 \%$, determined on a $1.0-\mathrm{g}$ specimen.

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.
Limit of free ethylene oxide and dioxane-Proceed as directed in the test for Limit of free ethylene oxide and dioxane under Caprylocaproyl Molyoxylglycerides: not more than $1 \mu \mathrm{~g}$ of ethylene oxide per g is found; and not more than $10 \mu \mathrm{~g}$ of dioxane per g is found.

Limit of free glycerol-Proceed as directed in the test for Limit of free glycerol under Caprylocaproyl Macrogoly Polyoxylglycerides: not more than $5.0 \%$ is found. 1 S (NF23)

## OTHER TESTS AND ASSAYS

BRIEFING
$\langle 571\rangle$ Vitamin A Assay, USP 27 page 2247. It is proposed to revise this general chapter by adding the Chromatographic Method as an alternative assay method. The liquid chromatographic procedure is based on analyses performed with the Zorbax brand of L8 column.
(DSN: L. Evans) RTS-41059-1

## Change to read:

## ■ CHEMICAL METHOD $_{\text {■ } 1 \mathrm{~S}(U S P 28)}$

The following procedure is provided for the determination of vitamin A as an ingredient of Pharmacopeial preparations. It conforms to that which was adopted in 1956 for international use by the International Union of Pure and Applied Chemistry.

Complete the assay promptly, and exercise care throughout the procedure to keep to a minimum the exposure to actinic light and to atmospheric oxygen and other oxidizing agents, preferably, by the use of low-actinic glassware and an atmosphere of an inert gas.

## Special Reagents-

ETHER-Use ethyl ether, and use it within 24 hours after opening the container.

ISOPROPYL ALCOHOL-Use spectrophotometric-grade isopropyl alcohol (see Isopropyl Alcohol under Reagent Specifications in the section Reagents, Indicators, and Solutions).

Procedure-Accurately weigh, count, or measure a portion of the test specimen expected to contain the equivalent of not less than 0.15 mg of retinol but containing not more than 1 g of fat. If in the form of capsules, tablets, or other solid, so that it cannot be saponified efficiently by the ensuing instructions, reflux the portion taken in 10 mL of water on a steam bath for about 10 minutes, crush the remaining solid with a blunt glass rod, and warm for about $5 \mathrm{~min}-$ utes longer.

Transfer to a suitable borosilicate glass flask, and add 30 mL of alcohol, followed by 3 mL of potassium hydroxide solution ( 9 in 10). Reflux in an all-borosilicate glass apparatus for 30 minutes. Cool the solution, add 30 mL of water, and transfer to a conical separator. Add 4 g of finely powdered sodium sulfate decahydrate. Extract by shaking with one $150-\mathrm{mL}$ portion of ether for 2 minutes, and then, if an emulsion forms, with three $25-\mathrm{mL}$ portions of ether. Combine the ether extracts, if necessary, and wash by swirling gently with 50 mL of water. Repeat the washing more vigorously with three additional $50-\mathrm{mL}$ portions of water. Transfer the washed ether extract to a $250-\mathrm{mL}$ volumetric flask, add ether to volume, and mix.

Evaporate a $25.0-\mathrm{mL}$ portion of the ether extract to about 5 mL . Without applying heat and with the aid of a stream of inert gas or vacuum, continue the evaporation to about 3 mL . Dissolve the residue in sufficient isopropyl alcohol to give an expected concentration of the equivalent to $3 \mu \mathrm{~g}$ to $5 \mu \mathrm{~g}$ of vitamin A per mL or such that it will give an absorbance in the range 0.5 to 0.8 at 325 nm . Determine the absorbances of the resulting solution at the wavelengths $310 \mathrm{~nm}, 325 \mathrm{~nm}$, and 334 nm , with a suitable spectrophotometer fitted with matched quartz cells, using isopropyl alcohol as the blank.

WHEN TOCOPHEROL IS PRESENT-Transfer to a suitable borosilicate glass flask a test specimen, accurately measured, or not less than 5 previously crushed capsules or tablets. Reflux in an all-borosilicate glass apparatus with 30 mL of alcohol and 3 mL of potassium hydroxide solution ( 9 in 10) for 30 minutes. Add through the condenser 2.0 g of citric acid monohydrate, washing the walls of the condenser with 10 mL of water. Cool, and transfer the solution to a conical separator with the aid of 20 mL of water. Add 4 g of finely powdered sodium sulfate decahydrate. Extract with one 150mL portion of ether and then, if an emulsion forms, with three 25mL portions of ether. Combine the ether extracts, if necessary, and wash by swirling gently with 50 mL of water. Repeat the washing more vigorously with three additional $50-\mathrm{mL}$ portions of water. Transfer the washed ether extract to a $250-\mathrm{mL}$ volumetric flask, and add ether to volume. Transfer a $100.0-\mathrm{mL}$ aliquot of the resulting ether solution to a conical separator, and wash once with 50 mL of potassium hydroxide solution ( 1 in 33), using alcohol, if necessary, to break any emulsion that forms. Wash by swirling gently
with 50 mL of water. Repeat the washing more vigorously with three additional $50-\mathrm{mL}$ portions of water. Transfer the washed ether extract to a $100-\mathrm{mL}$ volumetric flask, add ether to volume, and mix.

Evaporate a $50.0-\mathrm{mL}$ aliquot of the ether solution of the unsaponifiable extract to about 5 mL . Without applying heat and with the aid of a stream of inert gas or vacuum, remove the residual ether. Dissolve the residue in 50.0 mL of isopropyl alcohol.

Hydrogenated portion-Pipet 15.0 mL of the isopropyl alcohol solution into a $50-\mathrm{mL}$ centrifuge tube, add approximately 200 mg of palladium catalyst, stir with a glass rod, and hydrogenate for 10 minutes in a Hydrogenator such as is described in the Alpha Tocopherol Assay $\langle 551\rangle$, using isopropyl alcohol in the blank tube. Add about 300 mg of chromatographic siliceous earth, stir with a glass rod, and immediately centrifuge until the solution is clear.

Test a $1-\mathrm{mL}$ aliquot of the solution by removing the solvent by evaporation, dissolving the residue in 1 mL of chloroform, and adding 10 mL of phosphomolybdic acid TS: no detectable bluegreen color appears. [NOTE-If a blue-green color appears, repeat the hydrogenation for a longer time period, or with a new lot of catalyst.]

Into two separate flasks pipet equal volumes of the Hydrogenated portion and the untreated isopropyl alcohol solution, respectively, and add sufficient isopropyl alcohol to give an expected concentration of vitamin A equivalent to $3 \mu \mathrm{~g}$ to $5 \mu \mathrm{~g}$ per mL . Determine the absorbances of the untreated solution against the solution from the Hydrogenated portion as a blank, at the wavelengths $310 \mathrm{~nm}, 325 \mathrm{~nm}$, and 334 nm , with a suitable spectrophotometer fitted with matched quartz cells.

Calculation-Calculate the vitamin A content as follows:

$$
\text { Content }(\text { in } \mathrm{mg})=0.549 A_{325} / L C
$$

in which $A_{325}$ is the observed absorbance at $325 \mathrm{~nm} ; L$ is the length, in cm , of the absorption cell; and $C$ is the amount of test specimen expressed as g , capsule, or tablet in each 100 mL of the final isopropyl alcohol solution, provided that $A_{325}$ has a value not less than $\left[A_{325}\right] / 1.030$ and not more than $\left[A_{325}\right] / 0.970$, where $\left[A_{325}\right]$ is the corrected absorbance at 325 nm and is given by the equation:

$$
\left[A_{325}\right]=6.815 A_{325}-2.555 A_{310}-4.260 A_{334}
$$

in which $A$ designates the absorbance at the wavelength indicated by the subscript.

Where $\left[A_{325}\right]$ has a value less than $A_{325} / 1.030$, apply the following equation:

$$
\text { Content }(\text { in } \mathrm{mg})=0.549\left[A_{325}\right] / L C
$$

in which the values are as defined herein. Each mg of vitamin A (alcohol) represents 3333 USP Units of vitamin A.

Confidence Interval-The range of the limits of error, indicating the extent of discrepancy to be expected in the results of different laboratories at $P=0.05$, is approximately $\pm 8 \%$.

## Add the following:

## ■CHROMATOGRAPHIC METHOD

The following pressurized liquid chromatographic procedure is provided for the determination of Vitamin A. Where the use of vitamin A ester (retinyl acetate or retinyl palmi-
tate) is specified in the following procedure, use the chemical form present in the raw material. Use low-actinic glassware throughout this procedure

USP Reference Standards $\langle 11\rangle$ - [NOTE-Use USP Vita$\min A R S$, all-trans retinyl acetate, for assaying pharmaceutical dosage forms that are labeled to contain retinol or vitamin A ester (retinyl acetate or retinyl palmitate).]

Mobile Phase-Use $n$-hexane.
System Suitability Preparation-Dissolve an accurately weighed quantity of retinyl palmitate and USP Vitamin A RS in $n$-hexane to obtain a solution containing about $7.5 \mu \mathrm{~g}$ per mL of each.

Standard Preparation-Dissolve an accurately weighed quantity of USP Vitamin A RS in $n$-hexane, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about $15 \mu$ g of retinyl acetate per mL.

Assay Preparation-Transfer about 15 mg of vitamin A ester (retinyl acetate or retinyl palmitate), accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with $n$-hexane to volume, and mix. Pipet 5.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with $n$-hexane to volume, and mix.

Chromatographic System (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $325-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L8. The flow rate is about 1 mL per minute. Chromatograph the System Suitability Preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between retinyl acetate and retinyl palmitate is not less than 10 ; and the relative standard deviation for replicate injections is not more than $3.0 \%$.

Procedure-Separately inject equal volumes (about 40 $\mu \mathrm{L}$ ) of the Standard Preparation and the Assay Preparation into the chromatograph, record the chromatograms, and
measure the responses for retinyl acetate obtained from the Standard Preparation and the peak area for retinyl acetate or retinyl palmitate in the chromatogram of the Assay Preparation. Calculate the quantity, in mg , of vitamin A as the retinol equivalent $\left(\mathrm{C}_{20} \mathrm{H}_{30} \mathrm{O}\right)$ in the portion of vitamin A taken by the formula:

$$
0.872 C D\left(r_{U} / r_{S}\right)
$$

in which 0.872 is the factor used to convert retinyl acetate, obtained from USP Vitamin A RS to its retinol equivalent; $C$ is the concentration, in mg per mL, of USP Vitamin A RS in the Standard Preparation; $D$ is the dilution factor, in mL , for the Assay Preparation; and $r_{U}$ and $r_{S}$ are the peak responses of the retinyl ester obtained from the Assay Preparation and the Standard Preparation, respectively. [NOTEThe molar responses of retinyl acetate and retinyl palmitate are equivalent.] ${ }_{\text {IS (USP28) }}$

## Physical Tests and Determination

## BRIEFING

[^170]posed to add critical engineering dimensions to the USP description of the Andersen Mk II cascade impactor (Apparatus 1 and 3) and remove ambiguities from the specifications for other equipment items, thereby easing their manufacture.
(AER: K. Zaidi) RTS-41343-1

## Change to read:

〈601〉 AEROSOLS,

##  <br> METERED-DOSE INHALERS, AND DRY POWDER INHALERS

## Change to read:

This general chapter contains test methods for propellants, pressurized topical aerosols,
${ }^{\Delta}$ nasal sprays, $\mathbf{n}$ USP28
metered-dose inhalers, and propellant-free dry powder inhalers used to aerosolize, or to aerosolize and meter, doses of powders for inhalation. Apply these methods, where indicated, in the testing of the appropriate dosage forms.

## Change to read:

## TOPICAL AEROSOLS

${ }^{\Delta}$ The following tests are applicable to topical aerosols containing drug, in suspension or solution, packaged under pressure, and released upon activation of an appropriate valve system. $\Delta U S P 28$

## Delivery Rate and Delivered Amount

Only perform these tests on containers fitted with continuous valves.

Delivery Rate-Select not less than four aerosol containers, shake, if the label includes this directive, remove the caps and covers, and actuate each valve for 2 to 3 seconds. Weigh each container accurately, and immerse in a constant-temperature bath until the internal pressure is equilibrated at a temperature of $25^{\circ}$ as determined by constancy of internal pressure as directed under the Pressure Test below. Remove the containers from the bath, remove excess moisture by blotting with a paper towel, shake, if the label includes this directive, actuate each valve for 5.0 seconds (accurately timed by use of a stopwatch), and weigh each container again. Return the containers to the constant-temperature bath,
and repeat the foregoing procedure three times for each container. Calculate the average Delivery Rate, in $g$ per second, for each container.

Delivered Amount-Return the containers to the constant-temperature bath, continuing to deliver 5 second actuations to waste, until each container is exhausted. [NOTE-Ensure that sufficient time is allowed between each actuation to avoid significant canister cooling.] Calculate the total weight loss from each container. This is the Delivered Amount.

## Pressure Test

Only perform this test on topical aerosols fitted with continuous valves.

Select not less than four aerosol containers, remove the caps and covers, and immerse in a constant-temperature bath until the internal pressure is constant at a temperature of $25^{\circ}$. Remove the containers from the bath, shake, and remove the actuator and water, if any, from the valve stem. Place each container in an upright position, and determine the pressure in each container by placing a calibrated pressure gauge on the valve stem, holding firmly, and actuating the valve so that it is fully open. The gauge is of a calibration approximating the expected pressure and is fitted with an adapter appropriate for the particular valve stem dimensions. Read the pressure directly from the gauge.

## Minimum Fill

Topical aerosols meet the requirements for aerosols under Minimum Fill $\langle 755\rangle$.

## Leakage Test

Only perform this test on topical aerosols fitted with continuous valves.

Select 12 aerosol containers, and record the date and time to the nearest half hour. Weigh each container to the nearest mg , and record the weight, in mg, of each as $W_{1}$. Allow the containers to stand in an upright position at a temperature of $25.0 \pm 2.0^{\circ}$ for not less than 3 days, and again weigh each container, recording the weight, in mg , of each as $W_{2}$ and recording the date and time to the nearest half hour. Determine the time, $T$, in hours, during which the containers were under test. Calculate the leakage rate, in mg per year, of each container taken by the formula:

$$
(365)(24 / T)\left(W_{1}-W_{2}\right)
$$

Where plastic-coated glass aerosol containers are tested, dry the containers in a desiccator for 12 to 18 hours, and allow them to stand in a constant-humidity environment for 24 hours prior to determining the initial weight as indicated above. Conduct the test under the same constant-humidity conditions. Empty the contents of each container tested by employing any safe technique (e.g., chill to reduce the internal pressure, remove the valve, and pour). Remove any residual contents by rinsing with suitable solvents, then rinse with a few portions of methanol. Retain as a unit the container, the valve, and all associated parts, and heat them at $100^{\circ}$ for 5 minutes. Cool, weigh, record the weight as $W_{3}$, and determine the net fill weight $\left(W_{1}-W_{3}\right)$ for each container tested. [NOTE-If the average net fill weight has been determined previously, that value may be used in place of the value $\left(W_{1}-W_{3}\right)$ above.] The requirements are met if the average leakage rate per year for the 12 containers is not more than $3.5 \%$ of the net fill weight, and none of the containers leaks more than $5.0 \%$ of the net fill weight per year. If 1 container leaks more than $5.0 \%$ per year, and if none of the containers leaks more than $7.0 \%$ per year, determine the leakage rate of an additional 24 containers as direct-
ed herein. Not more than 2 of the 36 containers leak more than $5.0 \%$ of the net fill weight per year, and none of the 36 containers leaks more than $7.0 \%$ of the net fill weight per year. Where the net fill weight is less than 15 g and the label bears an expiration date, the requirements are met if the average leakage rate of the 12 containers is not more than 525 mg per year and none of the containers leaks more than 750 mg per year. If 1 container leaks more than 750 mg per year, but not more than 1.1 g per year, determine the leakage rate of an additional 24 containers as directed herein. Not more than 2 of the 36 containers leak more than 750 mg per year, and none of the 36 containers leaks more than 1.1 g per year. This test is in addition to the customary in-line leak testing of each container.

## Fotal" ${ }_{\text {1S }}^{1 S}$ (USP28) ${ }^{\text {Number of Discharges per Container }}$

Only perform this test on topical aerosols fitted with dose-metering valves, at the same time as, and on the same containers used for, the test for Uniformity of Desage Units- $\langle 905\rangle$. Determine the tal
-Delivered-Dose Uniformity. Determine the $\mathbf{1}_{1 \mathrm{~S}}$ (USP28) number of discharges or deliveries by counting the number of priming discharges plus those used in determining the spray contents, and continue to fire er diseharge until the entainer or inhaler is emply
$\square_{\text {until the label claim number of discharges. } \quad \text { 1S (USP28) }}$
The requirements are met if all the containers or inhalers tested contain not less than the number of discharges stated on the label.

## Delivered Dose Uniformity

The test for Delivered Dose Uniformity is required for topical aerosols fitted with dose-metering valves. For collection of the minimum dose, proceed as directed in the test for Delivered Dose Uniformity under Metered-Dose Inhalers and Dry Powder Inhalers, as described below, except to modify the dose sampling apparatus so that it is capable of quantitatively capturing the delivered dose from the preparation being tested. Unless otherwise stated in the individual monograph, apply the acceptance criteria for Me -tered-Dose Inhalers and Dry Powder Inhalers as described below.

## Add the following:

## ${ }^{\wedge}$ NASAL SPRAYS

The following test is applicable to nasal sprays, formulated as aqueous suspensions or solutions of drug, presented in multi-dose containers and fitted with dose-metering valves. In all cases, and for all tests, prepare and test the nasal spray as directed on the label and the instructions for use.

## Delivered-Dose Uniformity

Unless otherwise directed in the individual monograph, the drug content of the minimum delivered doses (minimum number of sprays per nostril as described on the label, or instructions for use) collected at the beginning of unit life (after priming as described on the label, or instructions for use) and at the label claim number of metered sprays, from each of 10 separate containers, must meet the following acceptance criteria: not more than 2 of the 20 doses are outside the range of $80 \%$ to $120 \%$ of label claim, and none are outside the range of $75 \%$ to $125 \%$ of label claim, while the mean for each of the beginning and end doses falls within the range of $85 \%$ to $115 \%$ of label claim. If 3 to 6 doses of the 20 doses collected are outside of $80 \%$ to $120 \%$ of the label claim, but none are outside of $75 \%$ to $125 \%$ of label claim, and the means for each of the beginning and end doses fall within $85 \%$ to $115 \%$ of label claim, select 20 additional containers for second-tier testing. For second-tier testing, the requirements are met if not more than 6 of the 60 doses collected are outside the range of $80 \%$ to $120 \%$ of label claim, none are outside the range of $75 \%$ to $125 \%$ of label claim, and the means for each of the beginning and end doses fall within the range of $85 \%$ to $115 \%$ of label claim.

SAMPLING FOR DELIVERED-DOSE UNIFORMITY OF METEREDDOSE NASAL SPRAYS

General Sampling Procedure-To ensure reproducible in-vitro dose collection, it is recommended that a mechanical means of actuating the pump assembly be employed to deliver doses for collection. The mechanical actuation procedure should have adequate controls for the critical mechanical actuation parameters (e.g., actuation force, actuation speed, stroke length, rest periods, etc.). The test must be performed on units that have been primed according to the patient-use instructions. The test unit should be actuated
in a vertical or near vertical, valve-up, position. The two doses collected at the beginning and end of the container life should be the dose immediately following priming and the dose corresponding to the last label claim number of doses from the container.

For suspension products, the delivered dose should be delivered into a suitable container (e.g., scintillation vial) in which quantitative transfer from the container under test can be accomplished. A validated analytical method is employed to determine the amount of drug in each delivered dose, and data are reported as a percent of label claim. For solution products, the delivered dose can be determined gravimetrically from the weight of the delivered dose, and the concentration and density of the fill solution of the product under test. $\triangle$ USP28

## Change to read:

## METERED-DOSE INHALERS AND DRY POWDER INHALERS

The following tests are applicable to metered-dose inhalers that are formulated as suspensions or solutions of active drug in propellants and dry powder inhalers presented as single or multidose units. The following test methods are specific to the aforementioned inhalers and may require modification when testing alternative inhalation technologies (for example, breath-actuated metereddose inhalers, or dose-metering nebulizers). However, Pharmacopeial requirements for all dose-metering inhalation dosage forms require determination of the delivered dose and Aerodynamic Size Distribution. In all cases, and for all tests, prepare and test the inhaler as directed by the label and the instructions for use. When these directions are not provided by the product manufacturer, follow the precise dose discharge directions included in the tests below.

## Delivered-Dose Uniformity

The test for Delivered Dese Uniformity is required for inhalers (e.g., metered dose inhalers or dry powder inhalers) containing drug formalation (e.g., solution, suspension, or pewder) either in reserveirs or im premetered desage units and for drug formatations packaged in reserveirs or in premetered dosage units where these eentainers are labeled for use with a named inhalation deviee. (For inhalations packaged in premetered dosage units, see also Unifor mityof Desage Units $\langle 905\rangle \rightarrow$.

Unless otherwise directed in the individualmonegraph, the drug eentent of the minimum delivered dese from-each of 10 separate eontainers is determined in aceordance with the procedure deseribed below.

Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if not less than 9 of the 10 dese are between $75 \%$ and $125 \%$ of the labelclaim and nene is eutside the range $65 \%$ to $135 \%$ f the label claim. If the eontents of not more than thre doses are outside the range of $75 \%$ to $125 \%$ of the labelelaim, but within the range of $65 \%$ to $135 \%$ of the label elaim, select 20 additional containers, and follow the preseribed procedure for analyzing one minimum dose from each. The requirements are met if not mere than three results, out of the 30 val Hes, lie outside the range of $75 \%$ 10 $125 \%$ flabelclaim and none is outside the range of $65 \%$ to $135 \%$ of the label claim.

- The test for Delivered-Dose Uniformity is required for inhalers (e.g., metered-dose inhalers or dry powder inhalers) containing drug formulation (e.g., solution, suspension, or powder) either in reservoirs or in premetered dosage units, and for drug formulations packaged in reservoirs or in premetered dosage units where these containers are labeled for use with a named inhalation device. (For inhalations packaged in premetered dosage units, see also Uniformity of Dosage Units $\langle 905\rangle$.) Note that the target-delivered dose is the expected mean drug content for a large number of delivered doses collected from many inhalers of the chosen product. In many cases, its value may depend upon the manner in which the test for delivered dose is performed. For metered-dose inhalers, the target-delivered dose is specified by the label claim, unless otherwise specified in the individual monograph. For dry powder inhalers, where the label claim is usually the packaged or metered-dose of drug, the target-delivered dose is specified in the individual monograph and is usually less than the label claim. Its value reflects the expected mean drug content for a large number of delivered doses collected from the product, using the method specified in the monograph.

Unless otherwise directed in the individual monograph, the drug content of the minimum delivered dose from each of 10 separate containers is determined in accordance with the procedure described below.
Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if not less than 9 of the 10 doses are between $75 \%$ and $125 \%$ of the specified target-delivered dose and none is outside the range
of $65 \%$ to $135 \%$ of the specified target-delivered dose. If the contents of not more than 3 doses are outside the range of $75 \%$ to $125 \%$ of the specified target-delivered dose, but within the range of $65 \%$ to $135 \%$ of the specified target-delivered dose, select 20 additional containers, and follow the prescribed procedure for analyzing 1 minimum dose from each. The requirements are met if not more than 3 results, out of the 30 values, lie outside the range of $75 \%$ to $125 \%$ of the specified target-delivered dose, and none is outside the range of $65 \%$ to $135 \%$ of the specified target-delivered dose. $\quad$ USP28

## SAMPLING THE DELIVERED DOSE FROM METERED-DOSE INHALERS

To determine the content of active ingredient in the discharged spray from a metered-dose inhaler, use the sampling apparatus described below, using a flow rate of 28.3 L of air per minute $( \pm 5 \%)$, unless otherwise stated in the individual monograph.

Apparatus A-The apparatus (see Fig. 1) consists of a filter support base with an open-mesh filter support, such as a stainless steel screen, a collection tube that is clamped or screwed to the fil-
ter support base, and a mouthpiece adapter to ensure an airtight seal between the collection tube and the mouthpiece. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the sample collection tube
-opening of the inhaler mouthpiece is flush with the front face or $2.5-\mathrm{mm}$ indented shoulder in the sample collection
tube, as appropriate. IS (USP28)
The vacuum connector is connected to a system comprising a vacuum source, flow regulator, and flowmeter. The source should be capable of pulling air through the complete assembly, including the filter and the inhaler to be tested, at the desired flow rate. When testing metered-dose inhalers, air should be drawn continuously through the system to avoid loss of drug into the atmosphere. The filter support base is designed to accommodate $25-\mathrm{mm}$ diameter filter disks. At the airflow being used, the sample collection tube and the filter disk must be capable of quantitatively collecting the Delivered Dose. The filter disk and other materials used in the construction of the apparatus must be compatible with the drug and the solvents that are used to extract the drug from the filter. One end of the collection tube is designed to hold the filter disk tightly against the filter support base. When assembled, the joints between the components of the apparatus are airtight so that when a vacuum is applied to the base of the filter, all of the air drawn through the collection device passes through the inhaler.

Fig. 1. Sampling apparatus for pressurized metered-dose inhalers.

Procedure-Prepare the inhaler for use according to the label instructions. Unless otherwise specified in the individual monograph, with the vacuum pump running, ensuring an airflow rate through the inhaler of 28.3 L of air per minute ( $\pm 5 \%$ ), discharge the minimum recommended dose into the apparatus through the mouthpiece adapter by depressing the valve for a duration sufficient to ensure that the dose has been completely discharged. Detach the inhaler from Apparatus $A$, and disconnect the vacuum. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent.

## SAMPLING THE DELIVERED DOSE FROM DRY POWDER INHALERS

To determine the content of active ingredient emitted from the mouthpiece of a dry powder inhaler, use Apparatus B (see Fig. 2). This apparatus is capable of sampling the emitted doses at a variety of airflow rates.

Fig. 2. Apparatus B: Smppling apparatus for dry pouder inhaters. (See Table 1 for compenent specifieations.)

Fig. 2. Apparatus B: Sampling apparatus for dry powder inhalers. (See Table 1 for component specifications.)

${ }^{\text {h }}$ Flow Coefficient, as defined by ISA S75.02 "Control valve capacity test procedure" in Standards and Recommended Practices for Instrumentation and Control, 10th ed., Vol. 2, 1989. Published by Instrument Society of America, 67 Alexander Drive, P.O. Box 1227, Research Triangle Park, NC 27709, U.S.A.

Apparatus B-The apparatus is similar to that described in Fig. 1 for testing metered-dose inhalers. In this case, however, the filter and collection tube have a larger internal diameter to accommodate $47-\mathrm{mm}$ diameter filter disks. This feature enables dosage collection at higher airflow rates-up to 100 L of air per minute-when necessary. A mouthpiece adapter ensures an airtight seal between the collection tube and the mouthpiece of the dry powder inhaler being tested. The mouthpiece adapter must ensure that the tip of the inhaler mouthpiece is flush with the open end of the sample collection tube. Tubing connectors, if they are used, should have an internal diameter greater than or equal to 8 mm to preclude their own internal diameters from creating significant airflow resistance. A vacuum pump with excess capacity must be selected in order to draw air, at the designated volumetric flow rate, through both the sampling apparatus and the inhaler simultaneously. A timer-controlled, low resistance, solenoid-operated, two-way valve is interposed between the vacuum pump and the flow-control valve to control the duration of flow. This type of valve enables 4.0 liters of air $( \pm 5 \%)$ to be withdrawn from the mouthpiece of the inhaler at the designated flow rate. Flow control is achieved by ensuring that critical (sonic) flow occurs in the flow-control valve (absolute pressure ratio $\mathrm{P} 3 / \mathrm{P} 2 \leq 0.5$ under conditions of steady-state flow).

Procedure-Operate the apparatus at an airflow rate, $Q^{2}$
^AUSP28
which produces a pressure drop of $4 \mathrm{kPa}\left(40.8 \mathrm{~cm} \mathrm{H}_{2} \mathrm{O}\right)$ over the inhaler to be tested, and a duration, $\mathcal{F}$,
© $\Delta$ USP28
consistent with the withdrawal of 4 L of air from the mouthpiece of the inhaler. [NOTE If $Q$ and $T$ are defined otherwise in the monegraph, use values of $Q$ and $T$ that are within $5 \%$ of those values. Betermine the value of $Q$ ]
${ }^{\boldsymbol{\Delta}}$ [NOTE-If the flow rate and duration are defined otherwise in the monograph, adjust the system to within $5 \%$ of those values.] Determine the test flow rate $\mathbf{\Delta U S P 2 8}$
using Apparatus $B$ as follows. Insert an inhaler into the mouthpiece adapter to ensure an airtight seal. In cases where the drug packaging modifies the inhaler's resistance to airflow, use a loaded, drugfree inhaler (with previously emptied packaging). In other cases, use an unloaded (drug free) inhaler. Connect one port of a differential pressure transducer to the pressure tap, P1, and leave the other open to the atmosphere. Switch on the pump, and open the two-way solenoid valve. Adjust the flow-control valve until the pressure drop across the inhaler is $4.0 \mathrm{kPa}\left(40.8 \mathrm{~cm} \mathrm{H}_{2} \mathrm{O}\right)$. Ensure that critical (sonic) flow occurs in the flow-control valve by determining the individual values for absolute pressure, P 2 and P 3 , so that their ratio $\mathrm{P} 3 / \mathrm{P} 2$ is less than or equal to 0.5 . If this criterion cannot be achieved, it is likely that the vacuum pump is worn or of insufficient capacity. Critical (sonic) flow conditions in the flowcontrol valve are required in order to ensure that the volumetric airflow is unaffected by pump fluetuations and miner changes in airflow resistanee at the inhaler intet.
${ }^{\boldsymbol{\Delta}}$ drawn from the mouthpiece is unaffected by pump fluctuations and changes in airflow resistance of the inhaler. $\mathbf{U S P 2}$. ${ }^{2}$ Remove the inhaler from the mouthpiece adapter and, without disturbing the flow-control valve, measure the airflow rate, $Q$, neeting a flowneter
$\Delta_{\text {drawn }}$ from the mouthpiece, $Q_{\text {out }}$, by connecting a flowmeter to the mouthpiece adaptor in an airtight fashion. Use a flowmeter $\mathbf{A}_{\mathbf{U S P 2 8}}$
calibrated for the volumetric flow leaving the meter the mouthpiece adapter in an airtight fashion
${ }^{\boldsymbol{\Delta}}$ in an airtight fashion IS (USP28) to directly determine $Q_{\text {out }}$ or, if such a meter is unobtainable, calculate the volumetric flow leaving the meter ( $Q_{\text {out }}$ ) using the ideal gas law. For example, for a meter calibrated for the entering volumetric flow ( $Q_{i n}$ ), use the formula:

$$
Q_{\text {out }}=Q_{\text {in }} P_{0} /\left(P_{0}-\Delta P\right),
$$

where $P_{0}$ is the atmospheric pressure and $\Delta \mathrm{P}$ is the pressure drop over the meter. $\triangle$ USP28
If the flow rate is greater than 100 L of air per minute, adjust the flow-control valve until $Q$
${ }^{\wedge} Q_{\text {out }} \mathbf{\Delta U S P 2 8}$
equals 100 L per minute; otherwise, record the value of $\Theta$
${ }^{\Delta} Q_{\text {our }, \mathbf{\Delta} U S P 28}$
and leave the flow-control valve undisturbed. Define the test flow duration, $T=240$
${ }^{\boldsymbol{\Delta}} T=240 / Q_{\text {out }}, \boldsymbol{\Delta}$ USP28
in seconds, so that a volume of 4.0 L of air $( \pm 5 \%)$ is withdrawn from the inhaler during the withdrawal of the test dese
$\Delta^{\text {at }}$ the test flow rate $Q_{\text {our }} \mathbf{\Delta U S P 2 8}$
and adjust the timer controlling the operation of the two-way solenoid valve accordingly. Prime or load the inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the solenoid valve closed, insert the inhaler mouthpiece horizontally into the mouthpiece adapter. Discharge the powder into the sampling apparatus by activating the timer controlling the solenoid valve and withdrawing 4.0 L of air from the inhaler at the previously defined airflow rate. If the labeled instructions so direct, repeat the operation so as to simulate the use of the inhaler by the patient (e.g., inhale two or three times, if necessary, to empty the capsule). Repeat the whole operation $n-1$ times be-, ginning with the text, "Prime or load the inhaler with powder,", where $n$ is the number of times defined in the labeling as the minimum recommended dose. Detach the dry powder inhaler from the sampling apparatus, and disconnect the vacuum tubing, D. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent. Where specified in individual monographs, perform this test under conditions of controlled temperature and humidity.

## Delivered-Dose Uniformity over the Entire Contents

The test for Delivered-Dose Uniformity over the Entire Contents is required for inhalers (e.g., metered-dose inhalers or dry powder inhalers) containing multiple doses of drug formulation (e.g., solution, suspension, or dry powder) either in reservoirs or in premetered dosage units (e.g., blisters), and for drug formulations packaged in reservoirs or in multiple-dose assemblies of premetered dosage units that have a predetermined dose sequence, where these multiple-dose assemblies are labeled for use with a named inhalation device. The test for delivered dose uniformity over the entire contents also ensures that multidose products supply
the total number of discharges stated on the label. Unless otherwise directed in the individual monograph, the drug content of at least 9 of the 10 doses collected from one inhaler, in accordance with the procedure below, are between $75 \%$ and $125 \%$ of tabelaim
${ }^{\Delta}$ the target-delivered dose,, USP28
and none is outside the range of $65 \%$ to $135 \%$ of taim
$\Delta_{\text {the }}$ target-delivered dose. $\mathbf{\Delta U S P 2 8}$
If the contents of not more than three doses are outside the range of $75 \%$ to $125 \%$, but within the range of $65 \%$ to $135 \%$ of tabelelaim
© the target-delivered dose, $\mathbf{\Delta U S P 2 8}$
select two additional inhalers and follow the prescribed procedure for analyzing 10 doses from each. The requirements are met if not more than three results, out of the 30 values, lie outside the range of $75 \%$ to $125 \%$ of tabel claim
${ }^{\boldsymbol{\Delta}}$ the target-delivered dose,, USP28 and none is outside the range of $65 \%$ to $135 \%$ of tabelaim
©the target-delivered dose. $\triangle$ USP28

## METERED-DOSE INHALERS

Apparatus-Use Apparatus $A$ as directed in Sampling the Delivered Dose from Metered-Dose Inhalers under Delivered-Dose Uniformity at a flow rate of 28.3 liters of air per minute $( \pm 5 \%)$.

Procedure-A single dose is defined as the number of sprays specified in the product labeling as the minimum recommended dose. Select a single metered-dose inhaler, and follow the labeled instructions for priming, shaking, cleaning, and firing the inhaler throughout. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds, and fire one minimum recommended dose to waste. Wait for 5 seconds, and collect the next dose. Detach the inhaler from Apparatus $A$, and disconnect the vacuum. Assay the contents of the apparatus for drug after rinsing the filter and the interior of the apparatus with a suitable solvent. Collect two more doses, allowing at least 5 seconds between doses. Discharge the device to waste, waiting for not less than 5 seconds between actuations (unless otherwise specified in the individual monograph), until ( $n / 2$ ) +1 minimum recommended doses remain, in which $n$ is the number of minimum recommended doses on the label. Collect four more doses, allowing at least 5 seconds between doses, unless otherwise specified in the individual monograph. Discharge the device to waste, as before, until three doses remain. Collect the final three doses, allowing at least 5 seconds between doses. Note that the rate of discharges to waste should not be such to cause excessive canister cooling.

## DRY POWDER INHALERS

Apparatus-Use Apparatus $B$ as directed in Sampling the Delivered Dose from Dry Powder Inhalers under Delivered-Dose Uniformity at the appropriate airflow rate for testing.

Procedure-Proceed as directed for Procedure in Sampling the Delivered Dose from Dry Powder Inhalers under Delivered-Dose Uniformity. A single dose is defined as the number of actuations stated in the product labeling as the minimum recommended dose. Select a single inhaler and follow the labeled instructions for loading with powder, discharging and cleaning throughout. Collect a total of 10 doses-three doses at the beginning, four in the middle $[(n / 2)-1$ to $(n / 2)+2$, where $n$ is the number of minimum recommended doses on the label], and three at the end-of the labeled contents following the labeled instructions. Prior to collecting each of the doses to be analyzed, clean the inhaler as directed in the labeling.

## Particle Size

The particle or droplet size distribution in the spray discharged from metered-dose inhalers, and the particle size distribution in the cloud discharged from dry powder inhalers, are important characteristics used in judging inhaler performance. While particle size measurement by microscopy can be used to evaluate the number of large particles, agglomerates, and foreign particulates in the emissions of metered-dose inhalers (e.g., Epinephrine Bitartrate Inhalation Aerosol), whenever possible this test should be replaced with a method to determine the aerodynamic size distribution of the drug aerosol leaving the inhaler. The aerodynamic size distribution defines the manner in which an aerosol deposits during inhalation. When there is a log-normal distribution, the aerodynamic size distribution may be characterized by the mass median aerodynamic diameter (MMAD) and geometric standard deviation (GSD). The aerodynamic size distribution of the drug leaving me-tered-dose and dry powder inhalers is determined using Apparatus 1, 2, 3, өf 4

## $\Delta_{4}, 5$, or $6_{\mathbf{\Delta S P 2 8}}$

as specified in this chapter. A fine particle dose or fine particle fraction can also be determined as that portion of the inhaler output having an aerodynamic diameter less than the size defined in the individual monograph. This may be expected to correlate with the drug dose or that fraction of the drug dose that penetrates the lung during inhalation. Individual monographs may also define the emitted fractions of the delivered dose in more than one aerodynamic size range.

## AERODYNAMIC SIZE DISTRIBUTION

Cascade impaction devices classify aerosol particles and droplets on the basis of those particles' aerodynamic diameters. The principle of their operation, whereby they separate aerosol particles and droplets from a moving airstream on the basis of particle or droplet inertia, is shown in Figure 3. Because the dimensions of the induction port used to connect inhalers to the cascade impactors and impingers (shown in Appatatus 1, 2, 3, 4 and
(shown in Apparatus 1, 2, 3, 4, 5, and 6) $\boldsymbol{\Delta U S P 2 8}^{\text {, }}$
also define the mass of drug that enters the aerodynamic sizing device, these are carefully defined and, where possible, are held constant between each apparatus (see Figures 4, 6, 7, \&, and
© 8 , and 9). $\mathbf{\Delta U S P 2 8}$
Because the size distributions produced by different impactors are often a function of impactor design and the airflow rate through them, there is a need to standardize the instruments that are used to test inhalers (i.e., Apparatus 1 for metered dose inhalers)
$\Delta_{\text {(i.e., Apparatus }} 1$ or 6 for metered-dose inhalers $)_{\Delta U S P 28}$ or to provide guidelines on system suitability where different apparatuses may be used (i.e., Appratu-2, 3, or 4 for dry powder inhalers).
©(i.e., Apparatus 2, 3, 4, or 5 for dry powder inhalers). $\mathbf{\Delta U S P 2 8}$

Fig. 3. Schematic representation of the principle of operation of cascade impactors. (A single jet per impactor stage is shown. Impactors with multiple jets in each stage function in the same manner.)

Fig. 8. Apparatus 4: Schematic of multistage liquid impinger. (See Table 3- Table 4■1S (USP28) for component specifications.)

Because of the varied nature of the formulations and devices being tested, the cascade impaction system and technique selected for testing an inhaler should fulfill a number of criteria.

Stage Mensuration-Manufacturers of cascade impaction devices provide a definitive calibration for the separation characteristics of each impaction stage in terms of the relationship between the stage collection efficiency and the aerodynamic diameter of particles and droplets passing through it as an aerosol. Calibration is a property of the jet dimensions, the spatial arrangement of the jet and its collection surface, and the airflow rate passing through it. Because jets can corrode and wear over time, the critical dimensions of each stage, which define that impaction stage's calibration, must be measured on a regular basis. This process, known as stage mensuration, replaces the need for repetitive calibration (using standard aerosols) and ensures that only devices that conform to specifications are used for testing inhaler output. The process involves the measurement and adjustment of the critical dimensions of the instrument.

Inter-Stage Drug Loss (wall losses)—Where method variations are possible and there is no apparatus specified in the monograph, the selected technique should ensure that not more than $5 \%$ of the inhaler's total delivered drug mass (into the impactor) is subject to loss between the impaction device's sample collection surfaces. In the event that inter-stage drug losses are known to be greater than $5 \%$, either the procedure should be performed in such a way that wall losses are included along with the associated collection plate, or an alternative apparatus should be used. As an example, the following procedures described for Apparatus 1 and 3 have been written to include wall losses along with the associated collection plate.

Provided, however, that such losses are known to be less than or equal to $5 \%$ of the total delivered drug mass into the impactor and that there are no instructions to the contrary in an individual monograph, the technique may be simplified by only assaying drug on the collection plates.

Re-Entrainment-Where method variations are possible, the selected technique should seek to minimize particle re-entrainment (from an upper to a lower impaction stage) on stages that contribute to size fractions defined in the individual monograph, especially where this may affect the amounts of drug collected. Minimizing the number of sampled doses, the use of coated particle collection surfaces, and proving that multiple-dose techniques produce statistically similar results to those from smaller numbers of doses, are all methods that can be used for this purpose. In the event that reentrainment cannot be avoided, the number of doses collected, the time interval between doses, and the total duration of airflow through the cascade impaction device should be standardized. Under these circumstances, the presentation of impaction data should not presume the validity of the impactor's calibration (i.e., aerodynamic diameter ranges should not be assigned to drug masses collected on specific stages).

By using appropriate assay methods and a suitable mensurated impaction device, aerodynamic particle size distributions can be determined for drugs leaving the mouthpieces of metered-dose or dry powder inhalers. If temperature or humidity limits for use of the inhaler are stated on the label, it may be necessary to control the temperature and humidity of the air surrounding and passing
through the device to conform to those limits. Ambient conditions are presumed, unless otherwise specified in individual monographs.

Mass Balance-In addition to the size distribution, good analytical practice dictates that a mass-balance be performed in order to confirm that the amount of the drug discharged from the inhaler, which is captured and measured in the induction port-cascade impactor apparatus is within an acceptable range around the tabet elaim
© expected value. $\Delta U S P 28$
The total mass of drug collected in all of the components (material balance) divided by the total number of minimum recommended doses discharged is not less than $75 \%$ and not more than $125 \%$ of the average minimum recommended dose determined during testing for Delivered-Dose Uniformity. This is not a test of the inhaler but serves to ensure that the test results are valid.

Use one of the multistage impaction devices shown below, or an equivalent, to determine aerodynamic particle size distributions of drugs leaving the mouthpieces of metered-dose or dry powder inhalers. Appactus 1 (Figure - $)$ is
©Apparatus 1 and 6 [Figures 4 and 9 (without preseparator), respectively] $\operatorname{are}_{\Delta U S P 28}$
intended for use with metered-dose inhalers at a single airflow rate. Apparatus 2, 3, and 4 (Figures 6, 7, and \&, respectively)
${ }^{\wedge}$ Apparatus 2, 3, 4, and 5 (Figures 6, 7, 8, and 9, respectively) $\mathbf{\Delta U S P 2 8}$
are intended for use with dry powder inhalers at the appropriate airflow rate, Q-determined earlier, provided that the value $Q$
${ }^{\Delta} Q_{\text {out }}$, determined earlier, provided that the value of $Q_{\text {out }}$ USP28 falls in the range 30 to 100 L per minute.

NOTE-If Qis greater than 100 L per minute, testing should be performed at 100 L per minute; if $Q<30$ L per mintute, testing is performed at 30 L per minte.
$\mathbf{\Delta}_{\text {NOTE-If }} Q_{\text {out }}$ is greater than 100 L per minute, testing should be performed with $Q_{\text {out }}$ set at 100 L per minute; if $Q_{\text {out }}$ is less than 30 L per minute, testing is performed with $Q_{o u t}$ at

## 30 L per minute. $\Delta$ USP28

Apparatus 1 for Metered-Dose Inhalers-Use this apparatus, or an equivalent, at a flow rate of 28.3 L per minute $( \pm 5 \%)$, as specified by the manufacturer of the cascade impactor.

Design-The design and assembly of this apparatus and the induction port to connect the device to an inhaler are shown in Figs. 4, $4 a$, and $4 b .^{2}$

[^171]-Critical engineering dimensions applied by manufacturers to the stages of Apparatus 1 are provided in Table 2. During use, some occlusion and blockage of jet nozzles may occur and therefore, "in use" mensuration tolerances need to be justified.

Table 2. Critical Dimensions for the Jet Nozzles of Apparatus 1.

| Stage \# | Number of Jets | Nozzle Diameter <br> $(\mathrm{mm})$ |
| :---: | :---: | :---: |
| 0 | 96 | $2.55 \pm 0.025$ |
| 1 | 96 | $1.89 \pm 0.025$ |
| 2 | 400 | $0.914 \pm 0.0127$ |
| 3 | 400 | $0.711 \pm 0.0127$ |
| 4 | 400 | $0.533 \pm 0.0127$ |
| 5 | 400 | $0.343 \pm 0.0127$ |

| 7 | 201 | $0.254 \pm 0.0127$ |

-1S (USP28)
Procedure-Set up the multistage cascade impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device.
${ }^{\mathbf{\Delta}}$ To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent,
unless it has been demonstrated to be unnecessary. $\mathbf{\Delta S P 2 8}$ Attach the induction port and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port as shown in Fig. 4. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks. Turn on the vacuum pump to draw air through the cascade impactor, and calibrate the airflow through the system with an appropriate flowmeter attached to the open end of the induction port. Adjust the flow-control valve on the vacuum pump to achieve steady flow through the system at the required rate, and ensure that the airflow through the system is within $\pm 5 \%$ of the flow rate specified by the manufacturer. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds and discharge one delivery to waste. With the vacuum pump running, insert the mouthpiece into the mouthpiece adapter and immediately fire the minimum recommended dose into the cascade impactor. Keep the valve depressed for a duration sufficient to ensure that the dose has been completely discharged. If additional sprays are required for the sample, wait for 5 seconds before removing the inhaler from the mouthpiece adapter, shake the inhaler, reinsert it into the mouthpiece adapter, and immediately fire the next minimum recommended dose. Repeat until the required number of doses have been discharged. The number of
minimum recommended doses discharged must be sufficient to ensure an accurate and precise determination of Aerodynamic Size Distribution. [NOTE-The number of minimum recommended doses is typically not greater than 10.] After the last dose has been discharged, remove the inhaler from the mouthpiece adapter. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Disassemble the cascade impactor, place each stage and its associated collection plate or filter in a separate container, and rinse the drug from each of them. [NOTE-If it has been determined that wall losses in the impactor are less than or equal to $5 \%$, then the collection plates only may be used.]

Dilute each quantitatively to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the components. To analyze the data, proceed as directed under Data Analysis.

## Apparatus 2 for Dry Powder Inhalers-

Design-The design and assembly of Apparatus 2, and the induction port to connect the device to an inhaler, are shown in Fig. $6 .^{3}$ [NOTE-The induction port is shown in detail in Fig. 4a.] The impactor has five impaction stages and an after filter. At a volumetric airflow rate of 60 L per minute (the nominal flow rate, $Q_{n}$ ), the cutoff aerodynamic diameters $D_{50}, Q_{n}$ of Stages 1 to 5 are $10,5,2.5,1.25$, and $0.625 \mu \mathrm{~m}$, respectively. The after filter effectively retains aerosolized drug in the particle size range up to $0.625 \mu \mathrm{~m}$. Set up the multistage cascade impactor with the control system as specified in Fig. 5. If necessary, coat the particle collection surface of each of the stages tomsure that partieles that impact en a given stage are not re entrained in the flowing airstream. As semble the impactor as deseribed in the manufacturer's literature with an after filter below the final stage to eaptrre any fine particles that othervise would eseape from the deviee. Attach the induction pert and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiese and the induction port. Use a mouthpiece adapter that enstres that the tip of the inhaler mouthpiece is flush with the open end of the induction pert. Ensure that the various stage of the cascade impactor are connected with airtight seals to prevent leaks.
${ }^{\Delta}$ To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent,
unless it has been demonstrated to be unnecessary. $\mathbf{\Delta}$ USP28
Assemble the impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device. Attach the induction port and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks.

Turn on the vacuum pump, open the solenoid valve, and calibrate the airflow through the system as follows. Connect a flowmeter, calibrated for the volumetric flow rate leaving the meter, to the induetion pert.
$\Delta$ to the induction port. Use a flowmeter calibrated for the volumetric flow leaving the meter to directly determine $Q_{\text {ou }}$, or, if such a meter is unobtainable, calculate the volumetric

[^172]flow leaving the meter ( $Q_{\text {out }}$ ) using the ideal gas law. For example, for a meter calibrated for the entering volumetric flow ( $Q_{i n}$ ), use the formula:
$$
Q_{\text {out }}=Q_{\text {int }} P_{0} /\left(P_{0}-\Delta P\right),
$$
where $P_{0}$ is the atmospheric pressure and $\Delta P$ is the pressure drop over the meter. $A$ USP28
Adjust the flow-control valve to achieve a steady flow through the system at the required rate, $Q$
${ }^{\wedge} Q_{\text {ou }}$, so that $Q_{\text {ou }}$ USP28
is within $\pm 5 \%$ of the value determined during testing for Deliv-ered-Dose Uniformity. Ensure that critical flow occurs in the flow-control valve, at the oflue $Q$ to be used during testing,
$\Delta_{\text {airflow }}$ rate to be used during testing, by $\boldsymbol{A}_{\mathbf{U S P 2 8}}$
using the following procedure. With the inhaler in place, and the intended flow running, measure the absolute pressure on both sides of the flow-control valve (P2 and P3 in Fig. 5). A ratio of P3/P2 $\leq 0.5$ indicates critical flow. Switch to a more powerful pump and remeasure the test flow rate if $\mathrm{P} 3 / \mathrm{P} 2>0.5$. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens this valve for a duration of $T$ seconds
$\boldsymbol{\Delta}^{\boldsymbol{a s}}$ determined during testing for Delivered-Dose Uniformi-
ty. $\mathbf{\Delta U S P 2 8}$
Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by opening the two-way solenoid valve for a duration of $T$ seconds. After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.
Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Disassemble the cascade impactor, and place the after filter in a separate container. Rinse the drug from each of the stages and the filter, and dilute each quantitatively to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the components. Determine the cutoff diameters of each of the individual stages of the impactor, at the value of $\theta$
${ }^{\wedge} Q=Q_{\text {ou }} \backslash U S P 28$
employed in the test by the formula:
\[

$$
\begin{equation*}
D_{50, \underline{Q}}=D_{50, Q_{n}}\left(Q_{n} / Q\right)^{1 / 2}, \tag{Eq.1}
\end{equation*}
$$

\]

where $D_{50, Q}$ is the cutoff diameter at the flow rate, $Q$, employed in the test, and the subscript, $n$, refers to the nominal values determined when $Q_{n}$ equals 60 L per minute. Thus, when $Q$ equals 40

L per minute, the cutoff diameter of Stage 2 is given by the formula:

$$
D_{50,40 \mathrm{LPM}}=5 \mu \mathrm{~m} \times[60 / 40]^{1 / 2}=6.1 \mu \mathrm{~m} .
$$

General Procedure-Perform the test using Apparatus 2 at the airflow rate, $Q$,
${ }^{\boldsymbol{4}} \mathrm{Q}_{\text {out } \mathbf{\Delta U S P 2 8}}$
determined earlier, during testing for Delivered-Dose Uniformity, provided $Q$
${ }^{\Delta} \mathrm{Q}_{\text {out } \boldsymbol{\Delta} \text { USP28 }}$
is less than or equal to 100 L per minute. [NOTE-If $Q$
${ }^{\mathbf{\Delta}} Q_{\text {out } \mathbf{\Delta} \text { USP28 }}$
is greater than 100 L per minute, use an airflow rate of 100 L per minute.] Connect the apparatus to a flow control system that is based upon critical (sonic) flow as specified in Fig. 5 (see also For ble 2.)

[^175]Under steady flow conditions, at the appropriate volumetric airflow rate through the entire apparatus, ensure that critical (sonic) flow occurs in the flow control valve by determining the individual values for absolute pressure, P 2 and P 3 , so that their ratio $\mathrm{P} 3 / \mathrm{P} 2$ is less than or equal to 0.5 . If neessay,
${ }^{\wedge}$ UUSP28
Coat the particle collection surface of each of the stages of the cascade impactor to ensure that particles that have impacted on a given stage are not re-entrained in the flowing airstream This may be achieved by coating collection surfaces with silicene fluid, slyeerel, or other adhesive substanees.
${ }^{\Delta}$ unless this has been shown to be unnecessary. $\mathbf{\Delta U S P 2 8}$ Analyze the data as directed under Data Analysis.

## Apparatus 3 for Dry Powder Inhalers-

Design-Apparatus 3 is identical to Apparatus 1 (Fig. 4), except that the manufacturer's preseparator is added atop Stage 0 to collect large masses of noninhalable powder prior to their entry into the impactor, and the outlet nipple, used to connect to vacuum tubing B (Fig. 5), is replaced with one having an internal diameter $\geq 8$ mm . To connect the preseparator of the impactor to the induction port (Fig. 4a), a specially designed top for the preseparator must be used. This is shown in Fig. 7. ${ }^{4}$ The impactor, therefore, has eight stages, a preseparator (to collect large particulates), and an after filter. At a volumetric airflow rate of 28.3 L per minute (the nominal flow rate, $Q_{n}$ ), the cutoff aerodynamic diameters $D_{50}, Q_{n}$ of Stages 0 to 7 are $9.0,5.8,4.7,3.3,2.1,1.1,0.7$, and $0.4 \mu \mathrm{~m}$, respectively. The after filter effectively retains aerosolized drug in the particle size range up to $0.4 \mu \mathrm{~m}$. Connect the cascade impactor into the control system specified in Fig. 5. Omit Stage 6 and Stage 7 from the impactor if the test flow rate, $Q$,
${ }^{\Delta} Q_{\text {ou }}$
Qout, USP28
used during testing for Delivered-Dose Uniformity was greater than or equal to 60 L per minute. If neeessary, ceat the particlecel-lection-strface of each of the stages to ensure that particles that impact on a given stage are not re-entrained in the flowing air stream.
${ }^{\mathbf{\Delta}}$ To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary. AUSP28 Assemble the impactor as described in the manufacturer's literature with an after filter below the final stage to capture any fine particles that otherwise would escape from the device. Place an appropriate volume (up to 10 mL ) of an appropriate solvent into the preseparator, or coat the particle collection surfaces of the preseparator to prevent re-entrainment of impacted particles. [Caution-Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.] Attach a molded mouthpiece adapter to the end of the induction port to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the cascade impactor are connected with airtight seals to prevent leaks.
${ }^{4}$ The cascade impactor is available as the Andersen 1ACFM Non-Viable Cascade Impactor (Mark II) from Graseby Ine., 500 -Techmolegy Court, Smyma, GA, 30082 Thermo-Electron, 27 Forge Parkway, Franklin, MA 02038. 1 (USP28) The impactor is used with the preseparator.

Turn on the vacuum pump, open the two-way solenoid valve, and calibrate the airflow through the system as follows. Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Once the inhaler is positioned, discharge the powder into the apparatus by activating the timer and opening the two-way solenoid valve for the required duration, $T \pm 5 \%$
$\boldsymbol{\Delta}^{\boldsymbol{a s}}$ determined during testing for Delivered-Dose Uniformi-

## ty. $\mathbf{A S S P} 28$

After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, remove the inhaler from the mouthpiece adapter, and switch off the vacuum pump.

Carefully disassemble the apparatus. Using a suitable solvent, rinse the drug from the mouthpiece adapter, induction port, and preseparator, and dilute quantitatively to an appropriate volume. Rinse the drug from each stage, and the impaction plate immediately below, into appropriately sized flasks. Quantitatively dilute each flask to an appropriate volume. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the samples. The aerodynamic cutoff diameters of the individual stages of this device, in the airflow range between 30 and 100 L per minute, are currently
$\Delta_{\text {not well }}$ established. $\Delta$ USP28
Do not use the formula in Equation 1 to calculate cutoff diameters.
Procedure-Proceed as directed in the General Procedure under Apparatus 2, except to use Apparatus 3.

Apparatus 4 for Dry Powder Inhalers-
${ }^{\mathbf{4}}$ NOTE-Apparatus 4 , the multistage liquid impinger, has a small number of stages and is used extensively outside the
USA. It is provided here for the benefit of users in countries
other than the USA. $\Delta$ USP28
Design-The design and assembly of Apparatus 4 are shown in Figs. 8, 8a, and $8 b .^{5}$ The induction port, used to connect the device to an inhaler, is shown in Fig. 4a. The device is a multi-stage liquid impinger consisting of impaction Stages 1, 2, 3, and 4 and an integral after filter (Stage 5). The collection stages of the liquid impinger (see Fig. 8 and Table 3
-Table 4) 1 (USP28)
are kept moist, unlike those of traditional impactors, such as ant ratus 1, 2, and 3;
-Apparatus 1, 2, 3, 5, and 6; $\quad$ IS (USP28)
wetting may produce an effect similar to coating the stages of $4 p$ paratus 2 and 3
$\mathbf{- A p p a r a t u s ~ 2 , ~ 3 , ~}^{\text {3, }}$, and $6_{\text {(USP28) }}$
at certain flow rates, although this should be confirmed by demonstrating control over re-entrainment as described earlier. An impaction stage comprises an upper horizontal metal partition wall (B) through which a metal inlet jet tube (A) with its impaction plate

[^176](D) is protruding; a glass cylinder (E) with sampling port (F), forming the vertical wall of the stage; and a lower horizontal metal partition wall (G) through which a jet tube (H) connects to the lower stage. The tube into Stage 4 (U) ends in a multi-jet arrangement. The impaction plate (D) is secured in a metal frame (J), which is fastened by two wires (K) to a sleeve (L) secured on the jet tube (C). For more detail of the jet tube and impaction plate, see Fig. $8 a$. The horizontal plane of the collection plate is perpendicular to the axis of the jet tube and centrally aligned. The upper surface of the impaction plate is slightly raised above the edge of the metal frame. A recess around the perimeter of the horizontal partition wall guides the position of the glass cylinder. The glass cylinders are sealed against the horizontal partition walls with gaskets (M) and clamped together by six bolts ( N ). The sampling ports are sealed by stoppers. The bottom side of the lower partition wall of Stage 4 has a concentric protrusion fitted with a rubber O-ring ( P ) that seals against the edge of a filter placed in the filter holder. The filter holder (R) is a basin with a concentric recess in which a perforated filter support ( S ) is flush-fitted. The filter holder is designed for 76mm diameter filters. The whole impaction stage assembly is clamped onto the filter holder by two snap locks (T). The impinger is equipped with an induction port (Fig. 4a) that fits onto the Stage 1 inlet jet tube. A rubber O-ring on the jet tube provides an airtight connection to the induction port. An elastomeric mouthpiece adapter to fit the inhaler being tested provides an airtight seal between the inhaler and the induction port.

At a volumetric airflow rate of 60 L per minute (the nominal flow rate, $Q_{n}$ ), the cutoff aerodynamic diameters $D_{50, Q_{n}}$ of Stages 1 to 4 are $13.0,6.8,3.1$, and $1.7 \mu \mathrm{~m}$, respectively. The after filter effectively retains aerosolized drug in the particle size range up to $1.7 \mu \mathrm{~m}$. Ensure that Apparatus 4 is clean and free of drug solution from any previous tests. Place a $76-\mathrm{mm}$ diameter filter in the filter stage, and assemble the apparatus. Use a low pressure filter capable of quantitatively collecting the passing drug aerosol, which also allows a quantitative recovery of the collected drug. Set up Apparatus 4 using the control system as specified in Fig. 5. Attach the induction port (Fig. 4a) and mouthpiece adapter to produce an airtight seal between the inhaler mouthpiece and the induction port. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Ensure that the various stages of the apparatus are connected with airtight seals to prevent leaks. Turn on the vacuum pump, open the twoway solenoid valve, and calibrate the airflow through the system as follows. Connect a flowmeter, calibrated for the volumetric flow rate leaving the meter, to the induction port. Adjust the flow-control valve to achieve a steady flow through the system at the required rate, $Q$, se that $Q$
${ }^{\mathbf{\Delta}} Q_{\text {out }}$, so that $Q_{\text {out } \mathbf{\Delta S P 2 8}}$
is within $\pm 5 \%$ of the value determined during testing for Deliv-ered-Dose Uniformity. Ensure that critical flow occurs in the flow-control valve, at the value of $Q$
${ }^{\mathbf{\Delta}} Q_{\text {ou }} \mathbf{\Delta U S P 2 8}$
to be used during testing, using the following procedure. With the inhaler in place, and the intended flow running, measure the absolute pressure on both sides of the flow-control valve (P2 and P3 in Fig. 5). A ratio of $\mathrm{P} 3 / \mathrm{P} 2 \leq 0.5$ indicates critical flow. Switch to a more powerful pump and remeasure the test flow rate if P3/ $\mathrm{P} 2>0.5$. Adjust the timer controlling the operation of the twoway solenoid valve so that it opens that valve for the same duration, $T$, as used during testing for Delivered-Dose Uniformity. Dispense 20 mL of a solvent, capable of dissolving the drug, into each of the four upper stages of Apparatus 4, and replace the stoppers. [Caution-Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.] Tilt the apparatus to wet the stoppers, thereby neutralizing their electrostatic charge. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens the valve
for the same duration, $T$, as used during testing for Delivered-Dose Uniformity. Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by activating the timer and opening the two-way solenoid valve for the required duration, $T \pm 5 \%$. After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.

Dismantle the filter stage of Apparatus 4. Carefully remove the filter, and extract the drug with solvent. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume. Rinse the inside of the inlet jet tube to Stage 1 (Fig. 8), allowing the solvent to flow into the stage. Rinse the drug from the inner walls and the collection plate of each of the four upper stages of the apparatus, into the solution in the respective stage, by tilting and rotating the apparatus, while ensuring that no liquid transfer occurs between the stages. Using the method of analysis specified in the individual monograph, determine the mass of drug collected in each of the six volumes of solvent. Ensure that the method corrects for possible evaporation of the solvent during the test. This may involve the use of an internal standard (of known original concentration in the solvent and assayed at the same time as the drug) or the quantitative transfer of the liquid contents from each of the stages, followed by dilution to a known volume. Determine the cutoff diameters of each of the individual stages of the impactor, at the value of $Q$
${ }^{\Delta} Q=Q_{\text {out } \mathbf{\Lambda} U S P 28}$
employed in the test by the formula:

$$
D_{50, Q}=D_{50, Q_{n}}(Q n / Q)^{1 / 2}
$$

where $D_{50, Q}$ is the cutoff diameter at the flow rate, $Q$, employed in the test, and the subscript, ${ }_{n}$, refers to the nominal values determined when $Q_{n}$ equals 60 L of air per minute. Thus, when $Q$ equals 40 L of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$
D_{50,40 \mathrm{LPM}}=6.8 \mu \mathrm{~m} \times(60 / 40)^{1 / 2}=8.3 \mu \mathrm{~m}
$$

Procedure-Proceed as directed in the General Procedure under Apparatus 2, except to use Apparatus 4.

## ${ }^{\wedge}$ Apparatus 5 for Dry Powder Inhalers

Design—The design and assembly of Apparatus $5^{6}$ are shown in Figures 9, 9a, 9b, 9c, and 9d. The induction port, used to connect the device to an inhaler, is shown in Figure $4 a$. The device is a cascade impactor with seven stages and a micro-orifice collector (MOC). Over the design flow-rate range of 30 to 100 L per minute, the $50 \%$ efficiency cut-

[^177]off diameters of the stages ( $\mathrm{D}_{50}$ values) range between 0.24 $\mu \mathrm{m}$ to $11.7 \mu \mathrm{~m}$, evenly spaced on a logarithmic scale. In the design flow-rate range, there are always at least five stages with $\mathrm{D}_{50}$ values between $0.5 \mu \mathrm{~m}$ and $6.5 \mu \mathrm{~m}$. The collection efficiency curves for each stage are sharp and minimize overlap between stages. -Material may be aluminum, stainless steel, or other suitable material.■1S (USP28)

The impactor layout has removable impaction cups with all the cups in one plane (Figures 9-9c). There are three main sections to the impactor: the bottom frame that holds
the impaction cups, the seal body that holds the jets, and the lid that contains the interstage passageways (shown in Figures 9-9b). Multiple nozzles are used at all but the first stage (Figure 9c). The flow passes through the impactor in a sawtooth pattern.
Stage mensuration is performed periodically together with confirmation of other dimensions critical to the effective operation of the impactor. Critical dimensions are provided below in Fable 5- Table 6.■1S (USP28)

## Table 5. Gritieal-Dimensions-for the Next Generation-Phafmaceutieal Impaetor

| MOC Nozzle to seal body distance ${ }^{2}$ - dimension c | +4.470-14.530 |
|  | -14.429-14.571 $\mathbf{\\|}^{1 S}$ (USP28) |

[^178]In routine operation, the seal body and lid are held together as a single assembly. The impaction cups are accessible when this assembly is opened at the end of an inhaler test. The cups are held in a support tray, so that all cups can be removed from the impactor simultaneously by lifting out the tray. The impactor is ready for another test as as another tray of eups is inserted and the lid is elosed.
$A$ man $\mathrm{An}_{11 S}$ (USP28) induction port with internal dimensions identical to those defined in Figure $4 a$ is connected to the impactor inlet. When necessary, with dry powder inhalers, a preseparator can be added to avoid overloading the first stage. This preseparator connects between the induction port and the impactor. A suitable mouthpiece adapter is used to provide an airtight seal between the inhaler and the induction port.

At a volumetric airflow rate of 60 L per minute (the assigned reference flow rate for cutoff-diameter calculations, $Q_{n}$ ), the cutoff-aerodynamic diameters $\mathrm{D}_{50, \varrho_{n}}$ of Stages 1 to 7 are $8.06,4.46,2.82,1.66,0.94,0.55$ and $0.34 \mu \mathrm{~m}$, respectively. The apparatus contains a terminal micro-orifice collector (MOC) that for most formulations may eliminate the need for a final filter as determined by method validation. The MOC is an impactor nozzle plate and collection cup. The nozzle plate contains, nominally, 4032 jets, each a neminal approximately $_{\text {1S (USP28) }} 70 \mu \mathrm{~m}$ in diameter. Most particles not captured on Stage 7 of the impactor will be captured on the cup surface below the MOC. (For impactors operated at 60 L per minute, the MOC is capable of collecting $80 \%$ of $0.14-\mu \mathrm{m}$ particles). For formulations with a significant fraction of particles not captured by the MOC, there
is an optional filter holder that can replace the MOC or be placed downstream of the MOC containing a suitable afterfilter (glass fiber is often suitable).

Procedure-Assemble the apparatus with the preseparator (Figure 9d), unless experiments have shown that its omission does not result in increased interstage drug losses ( $>5 \%$ ) or particle re-entrainment, in which case the preseparator may be omitted.

Place fresh"1s (USP28) cups into the apertures in the cup tray. To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with the seal body attached, and operate the handle to lock the impactor together so that the system is airtight.

The preseparator may be assembled as follows: assemble the preseparator insert into the preseparator base; fit the preseparator base to the impactor inlet; add 15 mL of the solvent used for sample recovery to the central cup of the preseparator insert; place the preseparator body on top of this assembly; and close the two catches. [Caution-Some solvents form flammable vapor-air mixtures that may be ignited during passage through a vacuum pump. Take appropriate precautions (e.g., alternative solvents, use of vapor traps, minimal pump operating times, etc.) to ensure operator safety during testing.]

Connect dimensions as defined in Figure $4 a$ either to the impactor inlet or to the preseparator inlet atop the cascade impactor (Figure 9d). Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the inhaler, when inserted, lines up along the horizontal axis of the induction port. The front face of the inhaler mouth-
piece is flush with the front face of the induction port, - producing an airtight seal.■1S (USP28) When attached to the mouthpiece adapter, the inhaler should be positioned in the same orientation as intended for use. Connect the apparatus to a flow system according to the scheme specified in Figure 5.

Unless otherwise prescribed, conduct the test at the flow rate used in the test for Delivered-Dose Uniformity drawing 4 L of air from the mouthpiece of the inhaler and through the apparatus. Connect a flowmeter to the induction port. Use a flowmeter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter $\left(Q_{o u}\right)$ using the ideal gas law. For a meter calibrated for the entering volumetric flow ( $Q_{i n}$ ), use the formula:

$$
Q_{\text {out }}=Q_{\text {int }} P_{0} /\left(P_{0}-\Delta P\right),
$$

where $P_{0}$ is the atmospheric pressure and $\Delta P$ is the pressure drop over the meter. Adjust the flow control valve to achieve steady flow through the system at the required rate, $Q_{\text {out }}$ ( $\pm 5 \%$ ). Ensure that critical flow occurs in the flow-control valve by the procedure described for Apparatus 2. Adjust the timer controlling the operation of the two-way solenoid valve so that it opens the valve for the same duration, $T$, as used during testing for Delivered-Dose Uniformity.

Prime or load the dry powder inhaler with powder for inhalation according to the labeled instructions. With the vacuum pump running and the two-way solenoid valve closed, insert the inhaler mouthpiece, held horizontally, into the induction port mouthpiece adapter. Discharge the powder into the apparatus by activating the timer and opening the twoway solenoid valve for the required duration, $T+5 \%$. - $T( \pm 5 \%)$. ${ }^{1 \text { S }}$ (USP28) After the two-way solenoid valve has closed, remove the inhaler from the mouthpiece adapter. If additional doses are required for the sample, reload the inhaler according to the labeled instructions, reinsert the
mouthpiece into the mouthpiece adapter, and repeat the operation until the required number of doses have been discharged. After discharge of the last dose, switch off the vacuum pump.

Dismantle the apparatus, and recover drug for analysis as follows: remove the induction port and mouthpiece adapter from the preseparator and extract the drug into an aliquot of solvent; remove the preseparator from the impactor, without spilling the eup liquid into the impactor; seal the outlet of the preseparator with a suitable-stopper, add an aliquot of drug recovery solvent, if necessary; seal the preseparator in tet with another stitable stopper; and shake and rotate the preseparator gently and stowly, to extract the active ingredient from all inner surfaces. -if used, remove the preseparator from the impactor, without spilling the solvent into the impactor; and recover the active ingredient from all inner surfaces.11S (USP28)
Open the impactor by releasing the handle and lifting the lid. Remove the cup tray, with the collection cups, and recover the active ingredient from each cup into an aliquot of solvent. Using the method of analysis specified in the individual monograph, determine the mass of drug contained in each of the aliquots of solvent.

Determine the cutoff diameters of each of the individual stages of the impactor, at the value of $Q=Q_{\text {out }}$ employed in the test by the formula:

$$
D_{50, Q}=D_{50, Q_{n}}\left(Q_{\mathrm{n}} / Q\right)^{X}, \quad \text { (Eq. 2) }
$$

where $D_{50, Q}$ is the cutoff diameter at the flow rate, $Q$, employed in the test, and the subscript, $n$, refers to the nominal or reference value for $Q_{n}=60 \mathrm{~L}$ of air per minute (see Table母.-Table 7).■1S (USP28) The values for the exponent, $x$, are listed in Table 7 .als (USP28) Thus, when $Q=40 \mathrm{~L}$ of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$
D_{50,40 \mathrm{LPM}}=4.46 \mu \mathrm{~m} \times(60 / 40)^{0.52}=5.51 \mu \mathrm{~m} .
$$

Analyze the data as directed under Data Analysis.

## Table 6.

-Table 7.■1S (USP28) Cutoff Aerodynamic Diameter for Stages of Apparatus 5 and 6

Use Eq. 2 to calculate $D_{50, Q}$ for flow rates, $Q$, in the range 30 to 100 L per minute with $Q_{n}=60 \mathrm{~L}$ per minute.

| Stage | $D_{50, Q n}$ | $x$ |
| :---: | :---: | :---: |
| 1 | 8.06 | 0.54 |
| 2 | 4.46 | 0.52 |
| 3 | 2.82 | 0.50 |
| 4 | 1.66 | 0.47 |
| 5 | 0.94 | 0.53 |
| 6 | 0.55 | 0.60 |
| 7 | 0.34 | 0.67 |

## Apparatus 6 for Metered-Dose Inhalers

Design-Apparatus 6 is identical to Apparatus 5 (Figures 9-9d), except that the preseparator is not to be used. Use this apparatus at a flow rate of 30 L per minute ( $\pm 5 \%$ ), unless otherwise prescribed in the individual monograph.

Procedure-Assemble the apparatus without the preseparator. Place fresh! ${ }_{1 S}$ (USP28) cups into the apertures in the cup tray. To ensure efficient particle capture, coat the particle collection surface of each stage with glycerol, silicone oil, or other suitable liquid typically deposited from a volatile solvent, unless it has been demonstrated to be unnecessary. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with seal body attached,
and operate the handle to lock the impactor together so that the system is airtight. Connect $\mathbf{a n}_{1 S}$ (USP28) induction port with internal dimensions as defined in Figure $4 a$ to the impactor inlet. Use a mouthpiece adapter that ensures that the tip of the inhaler mouthpiece is flush with the open end of the induction port. Turn on the vacuum pump to draw air through the cascade impactor, and calibrate the airflow through the system with an appropriate flowmeter attached to the open end of the induction port. Adjust the flow-control valve on the vacuum pump to achieve steady flow through the system at the required rate, and ensure that the airflow through the system is within $\pm 5 \%$ of this flow rate. Unless otherwise prescribed in the patient instructions, shake the inhaler for 5 seconds, and discharge one delivery to waste. With the vacuum pump running, insert the mouth-
piece into the mouthpiece adapter, and immediately fire the minimum recommended dose into the cascade impactor. Keep the valve depressed for a duration sufficient to ensure that the dose has been completely discharged. If additional sprays are required for the sample, wait for 5 semefore removing the inhaler from the mouthpiece adapter, $\|_{\text {IS (USP28) }}$ shake the inhaler, reinsert it into the mouthpiece adapter, and immediately fire the next minimum recommended dose.

Repeat until the required number of doses have been discharged. The number of minimum recommended doses discharged must be sufficient to ensure an accurate and precise determination of Aerodynamic Size Distribution. [NOTEThe number of minimum recommended doses is typically not greater than 10.] After the last dose has been discharged, remove the inhaler from the mouthpiece adapter. Rinse the mouthpiece adapter and induction port with a suitable solvent, and dilute quantitatively to an appropriate volume.
Dismantle the apparatus, and recover the drug for analysis as follows: remove the induction port and mouthpiece adapter from the apparatus, and recover the deposited drug into an aliquot of solvent; open the impactor by releasing the handle and lifting the lid; remove the cup tray, with the collection cups; and extract the active ingredient in each cup
into an aliquot of solvent. Using the method of analysis specified in the individual monograph, determine the quantity of active ingredient contained in each of the aliquots of solvent.

Determine the cutoff diameters of each of the individual stages of the impactor, at the value of $Q$ employed in the test by using Eq. 2 with values obtained from Table 6-Table 7. 1 (USP28) Thus, when $Q=30 \mathrm{~L}$ of air per minute, the cutoff diameter of Stage 2 is given by the formula:

$$
D_{50,30 \mathrm{LPM}}=4.46 \mu \mathrm{~m} \times(60 / 30)^{0.52}=6.40 \mu \mathrm{~m} .
$$

To analyze the data, proceed as directed under Data Analysis. $\mathbf{U S S P 2 8}$

${ }^{\mathrm{a}}$ S Stages 6 and 7 are omitted from Apparatus 3 at airflow rates $>60 \mathrm{~L}$ per minute.
${ }^{\mathrm{b}}$ Stage 5 of Apparatus 4 is the filter stage (see Figure 8).
c $\Sigma \mathrm{A}$ is the total drug mass recovered from the apparatus; $\Sigma \mathrm{B}$ is the mass of drug recovered from the impactor (Apparatus 1,3 ,
5 and 6) or from the impactor stages beneath the uppermost stage (Apparatus 2, and 4).
${ }^{\text {d }}$ For Apparatus 5 and 6 , values for the drug masses AF and BF refer to collections from the MOC, and/or the after-filter if used.

## CALCULATIONS

Fine Particle Dose and Fine Particle Fraction-Calculate the total mass, $\Sigma \mathrm{A}$, of drug delivered from the mouthpiece of the inhaler into the apparatus. Then calculate the total mass, $R$, of drug found on the stages of the apparatus and the filter that captured the drug in the fine particle size range appropriate for the particular drug being tested. The Fine Particle Dose is calculated by the formula:

$$
R / n
$$

where $R$ is as stated above, and $n$ is the number of doses discharged during the test. The Fine Particle Fraction that would be delivered from the inhaler is then calculated by the formula:
$R / \Sigma \mathrm{A}$.

Cumulative Percentage (Cum\%) of Drug Mass Less Than Stated Aerodynamic Diameter-Construct Fable
${ }^{\Delta}$ Table-8 Table 911S (USP28) $\mathbf{\Delta U S P 2 8}$ by dividing the mass of drug on the filter stage by $\Sigma \mathrm{B}$ (see fable -5).

- (see Fable 7■ Table 8).■1S (USP28) $\mathbf{\Delta U S P 2 8}$

Multiply the quotient by 100 , and enter this number as a percentage opposite the effective cutoff diameter of the stage immediately above it in the impactor or impinger stack. For Apparatus 2 or 4, use Equation 1 to calculate the stage cutoff diameters, $D_{50, Q}$, at the airflow rate, $Q$, employed during the test.
${ }^{\Delta}$ For Apparatus 5 and 6, use Eq. 2 with Table 6 Table
7. 1 S (USP28) $\mathbf{\Delta S P} 28$

For Apparatus 1, use the cutoff diameters quoted by the manufacturer. For Apparatus 3, present the data as cumulative percentages of mass on and below the stated stage, and avoid assigning values to stage cutoff diameters. $\triangle$ USP28

Repeat the calculation for each of the stages in the impactor or impinger stack, in reverse numerical order (largest to smallest stage number). For each stage, calculate the cumulative percentage of mass less than the stated aerodynamic diameter by adding the percentage of the mass on that stage to the total percentage from the stages below and entering the value opposite the effective cutoff diameter of the stage above it in the stack. Thus, the percentage of drug on the filter can be seen to have aerodynamic diameters less than the cutoff diameter of the stage above the filter, and the percentage on the filter plus the percentage on the stage above have diameters less than the cutoff diameter of the stage above that, and so on. (erable -

#### Abstract

${ }^{\wedge}$ USP Reference Standards-USP Alcohol Determina- tion-Acetonitrile RS. USP Alcohol Determination-Alcohol RS.』USP28

Apparatus-Under typical conditions, use a gas chromatograph equipped with a flame-ionization detector and a $4-\mathrm{mm} \times$ $1.8-\mathrm{m}$ glass column packed with 100 - to 120 -mesh chromatographic column packing No. S3, using nitrogen or helium as the carrier gas. Prior to use, condition the column overnight at $235^{\circ}$ with a slow flow of carrier gas. The column is maintained at $120^{\circ}$, and the injection port and detector are maintained at $210^{\circ}$. Adjust the carrier flow and temperature so that acetonitrile, the internal standard, elutes in 5 to 10 minutes.

## Solutions-

Standed Solution Dilute- 5.0 mL of dehy drated aleehel with water to 250 mL .

Internal Standed Solution-Dilute 5.0 mL of ace nitrile with water to 250 mL .

4 $4 U S P 28$
Test Stock Preparation-Dilute the specimen under examination stepwise with water to obtain a solution containing approximately $2 \%(\mathrm{v} / \mathrm{v})$ of alcohol.

Test Preparation-Pipet 10 mL each of the Test the Internal Standetud Solution into a- 100 mb
${ }^{\Delta} 5 \mathrm{~mL}$ each of the Test Stock Preparation and the USP Alcohol Determination-Acetonitrile RS [NOTE-Alternatively, a $2 \%$ aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution.] into

```
a 50-mL_
volumetric flask, and dilute with water to volume.
    Standard Preparation - Pipet 10 mL each of the Statard Solu
tion and the Internal Standetd Solution inte a 100-mL
```

$\triangle 5 \mathrm{~mL}$ each of the USP Alcohol Determination-Alcohol RS and the USP Alcohol Determination-Acetonitrile RS [NOTE-Alternatively, a 2\% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution.] into a $50-\mathrm{mL}_{\mathbf{A} U S P 28}$ volumetric flask, dilute with water to volume, and mix.

Procedure—Inject about $5 \mu \mathrm{~L}$ each of Test Preparation and Standard Preparation, in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol $(\mathrm{v} / \mathrm{v})$ in the specimen under test according to the formula:

$$
2 R_{t} P / R_{s}
$$

$$
{ }^{\mathbf{\Delta}} C D\left(R_{U} / R_{S}\right), \mathbf{\Delta U S P 2 8}
$$

in which
${ }^{\Delta} C$ is the labeled concentration of USP Alcohol Determina-tion-Alcohol RS; ${ }_{\mathbf{\Delta S P 2 8}}$
$D$ is the dilution factor (the ratio of the volume of the Test Stock Preparation to the volume of the specimen taken); and $R_{U}$ and $R_{S}$ are the peak response ratios obtained for the Test Preparation and the Standard Preparation, respectively.

System Suitability Test-In a suitable chromatogram, the resolution factor, $R$, is not less than 2 ; the tailing factor of the alcohol peak is not greater than 4.5
-2.0; ${ }^{1 S}$ (USP28)
and six replicate injections of the Standard Preparation show a relative standard deviation of not more than $2.0 \%$ in the ratio of the peak of alcohol to the peak of the internal standard.

## Briefing

$\langle 645\rangle$ Water Conductivity, USP 27 page 2286 and page 233 of PF 30(1) [Jan.-Feb. 2004]. On the basis of comments received, it is proposed to include an accuracy requirement for the temperature measurement under Instrument Specifications and Operating Parameters.
(PW: F. Barletta) RTS-41218-1

## Change to read:

## INSTRUMENT SPECIFICATIONS AND OPERATING PARAMETERS

Water conductivity must be measured accurately using calibrated instrumentation. The conductivity cell constant, a factor used as a multiplier for the scale reading from the meter, must be known within $\pm 2 \%$. The cell constant can be verified directly by using a solution of known conductivity, or indirectly by comparing the instrument reading taken with the cell in question to readings from a cell of known or certified cell constant.

Meter calibration is accomplished by replacing the conductivity cell with NIST-traceable precision resistors (accurate to $\pm 0.1 \%$ of the stated value) or an equivalently accurate adjustable resistance device, such as a Wheatstone Bridge, to give a predicted instrument response. Each scale on the meter may require separate calibration prior to use. The frequency of recalibration is a function of instrument design, degree of use, etc. However, because some multiple scale instruments have a single calibration adjustment, recalibration may be required between each use of a different scale. The instrument must have a minimum resolution of $0.1 \mu \mathrm{~S} / \mathrm{cm}^{*}$ on the lowest range. Excluding the cell accuracy, the instrument accuracy must be $\pm 0.1 \mu \mathrm{~S} / \mathrm{cm}$.

Because temperature has a substantial impact on conductivity readings of specimens at high and low temperatures, many instruments automatically correct the actual reading to display the value that theoretically would be observed at the nominal temperature of $25^{\circ}$. This is done using a temperature sensor in the conductivity cell probe and an algorithm in the instrument's circuitry. This tem-

[^180]perature compensation algorithm may not be accurate. Conductivity values used in this method are nontemperature-compensated measurements.

- Accuracy of the temperature measurement must be $\pm 2^{\circ} \cdot \mathbf{1 S}$ (USP28)
The procedure described below is designed for measuring the conductivity of Purified Water and Water for Injection. Stage 1 of the procedure below may alternatively be performed (with the appropriate modifications to Step 1) using on-line instrumentation that has been appropriately calibrated, whose cell constants have been accurately determined, and whose temperature compensation function has been disabled. The suitability of such on-line instrumentation for quality control testing is also dependent on its location(s) in the water system. The selected instrument location(s) must reflect the quality of the water used.

## Change to read:

## PROCEDURE

## Stage 1

1. Determine the temperature of the water and the conductivity of the water using a nontemperature-compensated conductivity reading. The measurement may be performed in a suitable container or as an on-line measurement.
2. Using the Stage 1-Temperature and Conductivity Requirements table, find the temperature value that is not greater than the measured temperature,
${ }^{\Delta}$ i.e., the next lower temperature. $\quad$ USP28
The corresponding conductivity value is the limit at that tare.
${ }^{\Delta}$ on this table is the limit. [NOTE-Do not interpolate.] ${ }_{\boldsymbol{\Delta} U S P 28}$
3. If the measured conductivity is not greater than the table value, the water meets the requirements of the test for conductivity. If the conductivity is higher than the table value, proceed with Stage 2.

Stage 1-Temperature and Conductivity Requirements (for nontemperature-compensated conductivity measurements only) (Continued)

| Temperature | Conductivity Requirement $(\mu \mathrm{S} / \mathrm{cm})$ |
| :---: | :---: |
| 95 | 2.9 |
| 100 | 3.1 |

## Stage 2

4. Transfer a sufficient amount of water ( 100 mL or more) to a suitable container, and stir the test specimen. Adjust the temperature, if necessary, and, while maintaining it at $25 \pm 1^{\circ}$, begin vigorously agitating the test specimen while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than a net of $0.1 \mu \mathrm{~S} / \mathrm{cm}$ per 5 minutes, note the conductivity.
5. If the conductivity is not greater than $2.1 \mu \mathrm{~S} / \mathrm{cm}$, the water meets the requirements of the test for conductivity. If the conductivity is greater than $2.1 \mu \mathrm{~S} / \mathrm{cm}$, proceed with Stage 3.

## Stage 3

6. Perform this test within approximately 5 minutes of the conductivity determination in Step 5, while maintaining the sample temperature at $25 \pm 1^{\circ}$. Add a saturated potassium chloride solution to the same water sample $(0.3 \mathrm{~mL}$ per 100 mL of the test specimen), and determine the pH to the nearest 0.1 pH unit, as directed under $\mathrm{pH}\langle 791\rangle$.
7. Referring to the Stage 3-pH and Conductivity Requirements table, determine the conductivity limit at the measured pH value. If the measured conductivity in Step 4 is not greater than the conductivity requirements for the pH determined in Step 6, the water meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0 to 7.0 , the water does not meet the requirements of the test for conductivity.

Stage 3-pH and Conductivity Requirements
(for atmosphere and temperature equilibrated samples only)

|  | Conductivity Requirement $(\mu \mathrm{S} / \mathrm{cm})$ |
| :---: | :---: |
| 5.0 | 4.7 |
| 5.1 | 4.1 |
| 5.2 | 3.6 |
| 5.3 | 3.3 |
| 5.4 | 3.0 |

| 6.6 | 2.1 |
| 6.7 | 2.6 |
| 6.8 | 3.1 |
| 6.9 | 3.8 |
| 7.0 | 4.6 |

## GENERAL CHAPTERS

## General Information

## BRIEFING

$\langle\mathbf{1 2 2 5}\rangle$ Validation of Compendial Methods, USP 27 page 2622 and page 1634 of $P F 29(5)$ [Sept.-Oct. 2003]. On the basis of comments received, it is proposed to revise the Validation section to add the analytical characteristic "Robustness" to Table 1, to change the Definition under Robustness to indicate that this characteristic should be determined during the development of the analytical procedure, and to delete the previously proposed revision regarding dilution parallelism in the Determination under Specificity.
(PA4: H. Pappa) RTS-41073-1

## Change to read:

Test procedures for assessment of the quality levels of pharmaceutical products are subject to various requirements. According to Section 501 of the Federal Food, Drug, and Cosmetic Act, assays and specifications in monographs of the United States Pharmacopeia and the National Formulary constitute legal standards. The Current Good Manufacturing Practice regulations [21 CFR 211.194(a)] require that test methods, which are used for assessing compliance of pharmaceutical products with established specifications, must meet proper standards of accuracy and reliability. Also, according to these regulations [21 CFR 211.194(a)(2)], users of analytical methods described in the $U S P$ and the $N F$ are not required to validate accuracy and reliability of these methods, but merely verify their suitability under actual conditions of use. Recognizing the legal status of $U S P$ and $N F$ standards, it is essential, therefore, that proposals for adoption of new or revised compendial analytical methods
mpocedures $_{\mathbf{n}_{1 S} \text { (USP28) }}$
be supported by sufficient laboratory data to document their validity.

The text of this information chapter harmonizes, to the extent possible, with the Tripartite International Conference on Harmonization (ICH) documents Validation of Analytical Procedures and the Methodology extension text, which are concerned with analytical procedures included as part of registration applications submitted within the EC, Japan, and the USA. Some aspects (dissolution, drug release), which form part of this chapter, are only dealt with in passing in the ICH documents and are to be discussed in the future. Complete harmonization has not been possible, in part because of different uses of terminology. For example, the ICH use of "procedure" presents difficulty, as this term has a specific and different use throughout the $U S P-N F$.

## Change to read:

## SUBMISSIONS TO THE COMPENDIA

Submissions to the compendia for new or revised analytical methods

- procedures $_{\text {■1S (USP28) }}$
should contain sufficient information to enable members of the
USP Committe of Revision
-USP Council of Experts and its Expert Commit-

## tees $\quad 1 \mathrm{~S}$ (USP28)

to evaluate the relative merit of proposed procedures. In most cases, evaluations involve assessment of the clarity and completeness of the description of the analytical
$\square_{\text {procedures, }}^{\text {■ }}$ 1S (USP28)
determination of the need for the methods,

- procedures, ${ }^{1 S}$ (USP28)
and documentation that they have been appropriately validated. Information may vary depending upon the type of method involved. However, in most cases a submission will consist of the following sections.
Rationale-This section should identify the need for the methed

■ procedure $_{\text {n1S (USP28) }}$
and describe the capability of the specific
■ procedure $_{\text {(1S (USP28) }}$.
proposed and why it is preferred over other types of determinations. For revised procedures, a comparison should be provided of limitations of the current compendial
$\boldsymbol{m}_{\text {procedure }}{ }_{\text {1S (USP28) }}$
and advantages offered by the proposed methed.
$\square_{\text {procedure. }}$.1S (USP28)
Proposed Analytical Procedure-This section should contain a complete description of the analytical methed
$\square_{\text {procedure }}{ }_{\text {1S (USP28) }}$
sufficiently detailed to enable persons "skilled in the art" to replicate it. The write-up should include all important operational parameters and specific instructions such as preparation of reagents, performance of systems suitability tests, description of blanks used, precautions, and explicit formulas for calculation of test results.

Data Elements-This section should provide thorough and complete documentation of the validation of the analytical
■procedure.п1S (USP28)
It should include summaries of experimental data and calculations substantiating each of the applicable analytical performance characteristics. These characteristics are described in the following section.

## Change to read:

## VALIDATION

Validation of an analytical methed
$\square_{\text {procedure }} \mathbf{m}_{1 S}$ (USP28)
is the process by which it is established, by laboratory studies, that the performance characteristics of the

## $\square_{\text {procedure }}^{\mathbf{■}_{1 S}(\text { USP28) }}$

meet the requirements for the intended analytical applications. Typical analytical performance characteristics that should be considered in the validation of the types of methods
$\square_{\text {procedures }}{ }_{\text {■S (USP28) }}$
described in this document are listed in Table 1. Since opinions may differ with respect to terminology and use, each of the performance characteristics is defined in the next section of this chapter along with a delineation of a typical method or methods by which it may be measured.

Table 1. Typical Analytical Characteristics Used in Method Validation.
Accuracy
Precision
Specificity
Detection Limit
Quantitation Limit
Linearity
Range
■Robustness
Ruggedness $_{\text {■1S (USP28) }}$

In the case of compendial metheds,
$\square_{\text {procedures, }}$ ■1S (USP28)
revalidation may be necessary in the following cases: a submission to the USP of a revised analytical medt;

■procedure; ${ }^{1 \mathrm{IS} \text { (USP28) }}$
or the use of an established general
$\boldsymbol{m}_{\text {procedure }}{ }_{\text {■1S (USP28) }}$
with a new product or raw material (see below under Data Elements Required for Assay Validation).

The ICH documents give guidance on the necessity for revalidation in the following circumstances: changes in the synthesis of the drug substance; changes in the composition of the drug product; and changes in the analytical procedure.

## Analytical Performance Characteristics

## ACCURACY

Definition-The accuracy of an analytical
$\square_{\text {procedure }}{ }_{\text {■1S (USP28) }}$
is the closeness of test results obtained by that methed
■ procedure $_{\text {IS (USP28) }}$
to the true value. The accuracy of an analytical
$\square_{\text {procedure }}^{\mathbf{m}_{1 S} \text { (USP28) }}$
should be established across its range.
Determination-In the case of the assay of a drug substance, accuracy may be determined by application of the analytical methed
procedure $_{\text {■ } 1 \mathrm{~S}}$ (USP28)
to an analyte of known purity (e.g., a Reference Standard) or by comparison of the results of the methed
$\square_{\text {procedure }}^{1 S}{ }_{\text {IS }}{ }^{\text {(USP28) }}$
with those of a second, well-characterized
■ procedure, $\boldsymbol{m}_{1 S}$ (USP28)
the accuracy of which has been stated or defined.
In the case of the assay of a drug in a formulated product, accuracy may be determined by application of the analytical methed
$■_{\text {procedure }}^{\mathbf{n}_{1 S}(\text { USP28) }}$
to synthetic mixtures of the drug product components to which known amounts of analyte have been added within the range of the method.
$\square_{\text {procedure. }}$.1S (USP28)
If it is not possible to obtain samples of all drug product components, it may be acceptable either to add known quantities of the analyte to the drug product (i.e., "to spike") or to compare results with those of a second, well-characterized methe,

- procedure, $\boldsymbol{\square}$ 1S (USP28)
the accuracy of which has been stated or defined.
In the case of quantitative analysis of impurities, accuracy should be assessed on samples (of drug substance or drug product) spiked with known amounts of impurities. Where it is not possible to obtain samples of certain impurities or degradation products, results should be compared with those obtained by an independent methed.
${ }^{\square}$ procedure. $\quad 1 \mathrm{~S}$ (USP28)
In the absence of other information, it may be necessary to calculate the amount of an impurity based on comparison of its response to that of the drug substance; the ratio of the responses of equal amounts of the impurity and the drug substance (response factor) should be used if known.

Accuracy is calculated as the percentage of recovery by the assay of the known added amount of analyte in the sample, or as the difference between the mean and the accepted true value, together with confidence intervals.

The ICH documents recommend that accuracy should be assessed using a minimum of nine determinations over a minimum of three concentration levels, covering the specified range (i.e., three concentrations and three replicates of each concentration).

- Assessment of accuracy can be accomplished in a variety of ways, including evaluating the recovery of the analyte (percent recovery) across the range of the assay, or evaluating the linearity of the relationship between estimated and actual concentrations. The statistically preferred criterion is that the confidence interval for the slope be contained in an interval around 1.0 , or alternatively, that the slope be close to 1.0 . In either case, the interval or the definition of closeness should be specified in the validation protocol. The
acceptance criterion will depend on the assay and its variability and on the product. Setting an acceptance criterion based on the lack of statistical significance of the test of the null hypothesis that the slope is 1.0 is not an acceptable approach.■1S (USP28)

## PRECISION

Definition-The precision of an analytical med
mprocedure $_{\text {■1S (USP28) }}$
is the degree of agreement among individual test results when the method
$\square_{\text {procedure }}^{\mathbf{■}_{1 S}(\text { USP28) }}{ }^{\text {a }}$
is applied repeatedly to multiple samplings of a homogeneous sample. The precision of an analytical

■rocedure $_{\text {■1S (USP28) }}$
is usually expressed as the standard deviation or relative standard deviation (coefficient of variation) of a series of measurements. Precision may be a measure of either the degree of reproducibility or of repeatability of the analytical

- $_{\text {procedure }}^{\mathbf{■}_{1 S}(U S P 28)}$
under normal operating conditions. In this context, reproducibility refers to the use of the analytical procedure in different laboratories, as in a collaborative study. Intermediate precision expresses within-laboratory variation, as on different days, or with different analysts or equipment within the same laboratory. Repeatability refers to the use of the analytical procedure within a laboratory over a short period of time using the same analyst with the same equipment. For most purposes, repeatability is the criterion of concern in USP analytical procedures, although reproducibility between laboratories or intermediate precision may well be considered during the standardization of a procedure before it is submitted to the Pharmacopeia.

Determination-The precision of an analytical methed
$\square_{\text {procedure }}{ }_{\text {1S (USP28) }}$
is determined by assaying a sufficient number of aliquots of a homogeneous sample to be able to calculate statistically valid estimates of standard deviation or relative standard deviation (coefficient of variation). Assays in this context are independent analyses of samples that have been carried through the complete analytical procedure from sample preparation to final test result.

The ICH documents recommend that repeatability should be assessed using a minimum of nine determinations covering the specified range for the procedure (i.e., three concentrations and three replicates of each concentration or using a minimum of six determinations at $100 \%$ of the test concentration).

## SPECIFICITY

Definition-The ICH documents define specificity as the ability to assess unequivocally the analyte in the presence of components that may be expected to be present, such as impurities, degradation products, and matrix components. Lack of specificity of an individual analytical procedure may be compensated by other supporting analytical procedures. [NOTE-Other reputable international authorities (IUPAC, AOAC)

have preferred the term "selectivity," reserving "specificity" for those procedures that are completely selective.] For the or as say metheds
$\square_{\text {tests discussed }}^{\text {1S (USP28) }}$
below, the above definition has the following implications:
Identification Tests: ensure the identity of the analyte.
Purity Tests: ensure that all the analytical procedures performed allow an accurate statement of the content of impurities of an analyte (e.g., related substances test, heavy metals limit, organic volatile impurity limit).

## $\boldsymbol{■}_{\text {impurities). }}$.1S (USP28)

Assays: provide an exact result, which allows an accurate statement on the content or potency of the analyte in a sample.
Determination-In the case of qualitative analyses (identification tests), the ability to select between compounds of closely related structure that are likely to be present should be demonstrated. This should be confirmed by obtaining positive results (perhaps by comparison to a known reference material) from samples containing the analyte, coupled with negative results from samples that do not contain the analyte and by confirming that a positive response is not obtained from materials structurally similar to or closely related to the analyte.

In the case of analytical preedure
■procedures $_{\text {■1S (USP28) }}$
for impurities, specificity may be established by spiking the drug substance or product with appropriate levels of impurities and demonstrating that these impurities are determined with appropriate accuracy and precision.

In the case of the assay, demonstration of specificity requires that it can be shown that the procedure is unaffected by the presence of impurities or excipients. In practice, this can be done by spiking the drug substance or product with appropriate levels of impurities or excipients and demonstrating that the assay result is unaffected by the presence of these extraneous materials.

Fer assay or impurity procedures, this can be dene alter-
natively by demenstrating dilution parallelism between the standard and the sample-over the same range used for linearity. The respenses frem the standard and the analyte are plotted against the respective dilutions (or after appropriate mathematical transformation, if necessary) and the wo dilu tion curves are shown to be parallel within the limits of varration determined by the preset confidence interval for the

## procedure.

If impurity or degradation product standards are unavailable, specificity may be demonstrated by comparing the test results of samples containing impurities or degradation products to a second well-characterized procedure (e.g., a Pharmacopeial or other validated procedure). These comparisons should include samples stored under relevant stress conditions (e.g., light, heat, humidity, acid/base hydrolysis, oxidation). In the case of the assay, the results should be compared; in the case of chromatographic impurity tests, the impurity profiles should be compared.

The ICH documents state that when chromatographic procedures are used, representative chromatograms should be presented to demonstrate the degree of selectivity, and peaks should be appropriately labeled. Peak purity tests (e.g., using diode array or mass spectrometry) may be useful to show that the analyte chromatographic peak is not attributable to more than one component.

## DETECTION LIMIT

Definition-The detection limit is a characteristic of limit tests. It is the lowest amount of analyte in a sample that can be detected, but not necessarily quantitated, under the stated experimental conditions. Thus, limit tests merely substantiate that the amount of analyte is above or below a certain level. The detection limit is usually expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination-For noninstrumental methods,
$\square_{\text {procedures, }}^{\boldsymbol{m}}$ 1S (USP28)
the detection limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be reliably detected.

For instrumental procedures, the same method
■approach $_{\text {■1S (USP28) }}$
may be used as for noninstrumental
■procedures.■1S (USP28)
In the case of methods
■ procedures $_{\text {■ } 1 \text { (USP28) }}$
submitted for consideration as official compendial
${ }^{\square}$ procedures, $\quad$ 1S (USP28)
it is almost never necessary to determine the actual detection limit. Rather, the detection limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the required detection level. For example, if it is required to detect an impurity at the level of $0.1 \%$, it should be demonstrated that the procedure will reliably detect the impurity at that level.

In the case of instrumental analytical procedures that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be detected is established. Typically acceptable signal-to-noise ratios are $2: 1$ or $3: 1$. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever method is used, the detection limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the detection limit.

## QUANTITATION LIMIT

Definition-The quantitation limit is a characteristic of quantitative assays for low levels of compounds in sample matrices, such as impurities in bulk drug substances and degradation products in finished pharmaceuticals. It is the lowest amount of analyte in a sample that can be determined with acceptable precision and accuracy under the stated experimental conditions. The quantitation limit is expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination-For noninstrumental methods,
■procedures, ■1S (USP28)
the quantitation limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be determined with acceptable accuracy and precision.

For instrumental procedures, the same methe
$\boldsymbol{m}_{\text {approach }}{ }_{\text {■1S (USP28) }}$
may be used as for noninstrumental
${ }^{\text {■ procedures.■1S (USP28) }}$

In the case of methods
■procedures $_{\text {■ }}{ }_{\text {(USP28) }}$
submitted for consideration as official compendial metheds,
$\square_{\text {procedures, }}$ ■1S (USP28)
it is almost never necessary to determine the actual quantitation limit. Rather, the quantitation limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the quantitation level. For example, if it is required to assay an analyte at the level of 0.1 mg per tablet, it should be demonstrated that the methed
$\square_{\text {procedure }}^{\text {■1S (USP28) }}$
will reliably quantitate the analyte at that level.
In the case of instrumental analytical
$\square_{\text {procedures }}^{\text {■ }}$ (USP28)
that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be quantified is established. A typically acceptable sig-nal-to-noise ratio is $10: 1$. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever methed

■approach $_{\square 1 S}$ (USP28)
is used, the quantitation limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the quantitation limit.

## LINEARITY AND RANGE

Definition of Linearity-The linearity of an analytical method
$\square_{\text {procedure }}{ }_{\text {■1S (USP28) }}$
is its ability to elicit test results that are directly, or by a well-defined mathematical transformation, proportional to the concentration of analyte in samples within a given range.
$\square_{\text {Thus, }}$ in this section, linearity refers to the linearity of the relationship of concentration and assay measurement. In some cases, to attain linearity, the concentration and/or the measurement may be transformed. (Note that the weighting factors used in the regression analysis may change when a transformation is applied.) Possible transformations may include log, square root, or reciprocal, although other transformations are acceptable. If linearity is not attainable, a nonlinear model may be used. The goal is to have a model, whether linear or nonlinear, that describes closely the con-centration-response relationship.■1S (USP28)

Definition of Range-The range of an analytical

is the interval between the upper and lower levels of analyte (including these levels) that have been demonstrated to be determined with a suitable level of precision, accuracy, and linearity using the methed
$\square_{\text {procedure }}{ }_{\text {1S (USP28) }}$
as written. The range is normally expressed in the same units as test results (e.g., percent, parts per million) obtained by the analytical method.

■procedure.■1S (USP28)
Determination of Linearity and Range-Linearity should be established across the range of the analytical procedure. It should be established initially by visual examination of a plot of signals as a function of analyte concentration of content. If there appears to be a linear relationship, test results should be established by appropriate statistical methods (e.g., by calculation of a regression line by the method of least squares). In some tween the respense of an malyte and its concentration, the test data may have to be subjected to a mathematieal transformation.

■1S (USP28)
Data from the regression line itself may be helpful to provide mathematical estimates of the degree of linearity. The correlation coefficient, y-intercept, slope of the regression line, and residual sum of squares should be submitted.

The range of the

is validated by verifying that the analytical
$\square_{\text {procedure }}{ }_{\text {■1S (USP28) }}$
provides acceptable precision, accuracy, and linearity when applied to samples containing analyte at the extremes of the range as well as within the range.

ICH recommends that, for the establishment of linearity, a minimum of five concentrations normally be used. It is also recommended that the following minimum specified ranges should be considered:

Assay of a Drug Substance (or a finished product): from $80 \%$ to $120 \%$ of the test concentration.

Determination of an Impurity: from $50 \%$ to $120 \%$ of the sir fieation.
$\boldsymbol{\square}_{\text {acceptance criterion. }}$ 1S (USP28)
For Content Uniformity: a minimum of $70 \%$ to $130 \%$ of the test concentration, unless a wider or more appropriate range, based on the nature of the dosage form (e.g., metered-dose inhalers) is justified.

For Dissolution Testing: $\pm 20 \%$ over the specified range (e.g., if the speifieations
$\boldsymbol{m a c c e p t a n c e}$ criteria $_{1 \text { 1S (USP28) }}$
for a controlled-release product cover a region from $20 \%$, after 1 hour, and up to $90 \%$, after 24 hours, the validated range would be $0 \%$ to $110 \%$ of the label claim).

## RUGGEDNESS

Definition-The ruggedness of an analytical ise the gree of repreduribility of test results abtained by the analysis of the same samples under a varie of conditions, steh as different laboratories, different analysts, different instrments, different lots of reagents, different elapsed assay times, different assay temperafures, different days, ete. Ruggedness is normally expressed as the lack of influence on test results of operational and environmen tal variables of the analytieal method. Pugsedness is a measure of repredueibility of test results under the variation in conditions nor mally expected from laberatery to laboratory and frem analyst to analyst.

- procedure is the lack of influence on test results obtained by the analysis of the same samples under a variety of conditions, such as different analysts, different instruments, different lots of reagents, different elapsed assay times, different days, and other operational and environmental variables external to the analytical procedure documenta-
tion.■1S (USP28)
Determination-The ruggedness of an analytical
-procedure $_{\text {1S (USP28) }}$
is determined by analysis of aliquots from homogeneous lots in different laberateries,

■1S (USP28)
by different analysts, using operational and environmental conditions that may differ but are still within the specified parameters of the assay. The degree of reproducibility of test results is then determined as a function of the assay variables. This reproducibility may be compared to the precision of the assay under normal conditions to obtain a measure of the ruggedness of the analytical methed.

- procedure.■1S (USP28)

## ROBUSTNESS

Definition-The robustness of an analytical
$\square_{\text {procedure }}$ ■1S (USP28)
is a measure of its capacity to remain unaffected by small but deliberate variations in mether parameters and provides an indieation of its reliability
$\square_{\text {procedural parameters listed in the procedure documenta- }}$
tion and provides an indication of its suitability ${ }_{\square 1 S}$ (USP28) during normal usage.
■Robustness should be determined during development of the analytical procedure.■1S (USP28)

## SYSTEM SUITABILITY

If measurements are susceptible to variations in analytical conditions, these should be suitably controlled, or a precautionary statement should be included in the

■procedure.■1S (USP28)
One consequence of the evaluation of robustness and ruggedness should be that a series of system suitability parameters is established to ensure that the validity of the analytical methed
■ procedure $_{\text {1S (USP28) }}$
is maintained whenever used. Typical variations are the stability of analytical solutions, different equipment, and different analysts. In the case of liquid chromatography, typical variations are the pH of the mobile phase, the mobile phase composition, different lots or
suppliers of columns, the temperature, and the flow rate. In the case of gas chromatography, typical variations are different lots or suppliers of columns, the temperature, and the flow rate.

System suitability tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such. System suitability test parameters to be established for a particular methed

■ procedure $_{\mathbf{n}_{1 S}(\text { USP28) }}$
depend on the type of methed
$\square_{\text {procedure }}{ }_{\text {■1S (USP28) }}$
being evaluated. They are especially important in the case of chromatographic methods, and submissions
$\square_{\text {procedures. Submissions }}^{\mathbf{m}_{1 S} \text { (USP28) }}$
to the USP should make note of the requirements under the System Suitability section in the general test chapter Chromatography $\langle 621\rangle$.

## Data Elements Required for Assay

## ■1S(USP28) Validation <br> Compendial assay procedtres

$\boldsymbol{m}_{\text {test }}$ requirements ${ }_{\text {■ }}^{1 S}$ (USP28)
vary from highly exacting analytical determinations to subjective evaluation of attributes. Considering this of assays,
-broad variety, ${ }^{\text {■1S (USP28) }}$
it is only logical that different test methods
$\boldsymbol{\square}_{\text {procedures }} \boldsymbol{■ 1 S}$ (USP28)
require different validation schemes. This chapter covers only the most common categories of assays

■ tests $_{\text {■1S (USP28) }}$
for which validation data should be required. These categories are as follows:

Category I-Analytical
$\square_{\text {procedures }}{ }^{1 \mathrm{~S}}$ (USP28)
for quantitation of major components of bulk drug substances or active ingredients (including preservatives) in finished pharmaceutical products.

Category II-Analytical metheds
■ procedures $_{\text {■1S }_{\text {(USP28) }}}$
for determination of impurities in bulk drug substances or degradation compounds in finished pharmaceutical products. These metheds
$\square_{\text {procedures }}^{\boldsymbol{\square 1 S} \text { (USP28) }}$
include quantitative assays and limit tests.
Category III-Analytical
■procedures $_{\text {п1S (USP28) }}$
for determination of performance characteristics (e.g., dissolution, drug release).
Category IV-Identification tests.
For each assay
$\square_{\text {■1S (USP28) }}$
category, different analytical information is needed. Listed in Table 2 are data elements that are normally required for each of theat egories of assays.
$\square_{\text {these categories.■1S (USP28) }}$

Table 2. Data Elements Required for Assay

| Analytical | Assy | Assay |  | Assy | Assy |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Characteristics | $\square_{\text {1S (USP28) }}$ <br> Category I | als (USP28) <br> Category II |  | $\square_{\text {■1S (USP28) }}$ <br> Category III | ■!1S (USP28) <br> Category IV |

* May be required, depending on the nature of the specific test.

Already established general assays and tests (e.g., titrimetric method of water determination, bacterial endotoxims test)
$\square_{\text {procedures (e.g., titrimetric determination of water, bacte- }}$
rial endotoxins) $\quad$ 1S (USP28)
should be revalidated to verify their accuracy (and absence of possible interference) when used for a new product or raw material. The validity of an analytical
$\boldsymbol{m}_{\text {procedure }}{ }_{\text {■ } 1 \text { (USP28) }}$
can be verified only by laboratory studies. Therefore, documentation of the successful completion of such studies is a basic requirement for determining whether a methed
$\square_{\text {procedure }}^{\mathbf{■ 1 S}_{\text {(USP28) }}}$
is suitable for its intended application(s). Appropriate documentation should accompany any proposal for new or revised compendial analytical procedures.

## BRIEFING

$\langle\mathbf{1 2 3 0}\rangle$ Water for Health Applications, page 3146 of the First Supplement. On the basis of comments received, the Pharmaceutical Waters Expert Committee is proposing revisions to this general information chapter primarily in the Microbial Considerations section.

## WATER FOR HEMODIALYSIS

Chemical and microbial components that can be found in drinking water meeting U.S. Environmental Protection Agency National Primary Drinking Water Regulations (or equivalent)

## $\square_{\text {may }}^{1 S}$ (USP28)

have the potential to produce significant negative effects in patients undergoing hemodialysis. It is, therefore, necessary to subject the water to further treatment to reduce these components to acceptable levels. The Water for Hemodialysis monograph provides bacterial and chemical tests that are required to ensure patient safety. Additional testing is recommended as follows:
(1) Excess levels of aluminum, fluorides, and chlorides may be found seasonally in drinking water as a result of chemicals used in water treatment. These components should be monitored in Water for Hemodialysis being produced in accordance with established standard operating procedures. The maximum acceptable levels of these elements and compounds are listed in Table 1.
(2) A comprehensive validation testing of the system producing Water for Hemodialysis should be performed, at least annually, to ensure that the water treatment equipment is functioning properly. The maximum acceptable levels of elements and compounds are listed in Table 1. Routine testing is performed in accordance with the monograph.

Table 1. Maximum Allowable Chemical Levels in Water for Hemodialysis (water used to prepare dialysate and concentrates from powder at a dialysis facility and to reprocess dialyzers for multiple use)*

* Reprinted with permission from ANSI/AAMI RD62: 2001, Water treatment equipment for hemodialysis applications, copyright Association for the Advancement of Medical Instrumentation, Arlington, VA.

The chemical limits included in Table 1 have been recognized by federal government agencies as standards for Water for Hemodialysis. Written standard operating procedures for water testing should be established by the physician in charge or the designated facility manager. The test frequency decision should be based upon historical data analysis, the quality of the source water as reported by the municipal water treatment facility or public health agency in the area, etc. Records should be maintained to document levels and any necessary action taken.

Chemical analysis of water components listed should be performed using methods referenced in the American Public Health Association's Standard Methods for the Examination of Water and Wastewater, $19^{\text {th }}$ Edition, ${ }^{1}$ those referenced in the U.S. Environmental Protection Agency's Methods for the Determination of Metals in Environmental Samples, ${ }^{2}$ or equivalent methods as described in ANSI/AAMI RD 62:2001.

## Change to read:

## MICROBIAL CONSIDERATIONS

The Water for Hemodialysis monograph includes microbial limits of 100 cfu per mL and endotoxin limits of 2 USP Endotoxin Units per mL . Culture media should be tryptic soy agar or equivalent, and colonies should be counted after incubation at a temperature range between $30^{\circ}$ and $35^{\circ}$, for no less than 48 hours. Sampling the water should be done at the end of the water purification cascade at the point where the water enters the equipment.

[^181]- dialysis equipment. Samples should be assayed within 30 minutes of collection or immediately refrigerated and then assayed within 24 hours of collection. $\quad$ IS (USP28)
Quantification of bacterial endotoxins is performed using the Limulus Amebocyte Lysate (LAL) clotting method
$\square_{\text {or any other LAL test }}{ }_{1 S}{ }_{\text {(USP28) }}$
found in the USP general test chapter Bacterial Endotoxins Test $\langle 85\rangle$.

Because of the incubation time required to obtain definitive microbiological results, water systems should be microbiologically monitored to confirm that they continue to produce water of acceptable quality. "Alert" and "Action Levels" are therefore necessary for the monitoring and control of the system. An Alert Level constitutes a warning and does not require a corrective action. An Action Level indicates a drift from normal operating conditions and requires that corrective action be taken
-to bring the process back into the normal operating range.
Exceeding an Alert or Action Level does not imply that water quality has been compromised. 1 . (USP28)
The recommended Action Level for a total viable microbial count in the product water is 50 cfu per mL , and the recommended Alert Level for bacterial endotoxins is 0.5 USP Endotoxin Unit per mL (also see Microbial Considerations under Water for Pharmaceutical Purposes $\langle 1231\rangle$ ).

## REAGENTS, INDICATORS, AND SOLUTIONS Reagent Specifications

## Test Solutions

## BRIEFING

Test Solutions (TS), USP 27 page 2725, page 3162 of the First Supplement, and page 316 of PF 30(1) [Jan.-Feb. 2004]. For Iodine and Potassium Iodide TS, it is proposed to change the name to Iodine and Potassium Iodide TS 1, to differentiate from the new test solution, Iodine and Potassium Iodide TS 2. This new TS is used as a reagent in Identification test $C$ in the monographs for Corn Starch, Potato Starch, Tapioca Starch, and Wheat Starch, which appear elsewhere in this issue of $P F$. Other proposals include a correction in the preparation of Ammonia TS and a modification in the Potassium Pyroantimonate TS to exclude the use of sodium hydroxide because the test solution is used in the general chapter Sodium $\langle 191\rangle$.
(HDQ: M. Marques) RTS-41144-5; 41173-3; 41301-1; 41334-3

## Change to read:

Perchloric Acid, Tenth-Normal (0.1 N) (in Glacial Acetic Acid)

$$
\mathrm{HClO}_{4}, \mathbf{1 0 0 . 4 6}
$$

$$
10.05 \mathrm{~g} \text { in } 1000 \mathrm{~mL}
$$

Note-Where called for in the tests and assays, this volumetric solution is specified as " 0.1 N perchloric acid." Thus, where 0.1 N or other strength of this volumetric solution is specified, the solu-
tion in glacial acetic acid is to be used, unless the words "in dioxane" are stated. [See also Perchloric Acid, Tenth-Normal ( 0.1 N ) in Dioxane.]
Mix 8.5 mL of perchloric acid with 500 mL of glacial acetic acid and 21 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL . Alternatively, the solution may be prepared as follows. Mix 11 mL of 60 percent perchloric acid with 500 mL of glacial acetic acid and 30 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL .
Allow the prepared solution to stand for 1 day for the excess acetic anhydride to be combined, and determine the water content by Method I (see Water Determination $\langle 921\rangle$ ), except to use a test specimen of about 5 g of the 0.1 N perchloric acid that is expected to contain approximately 1 mg of water and the Reagent (see Reagent under Method Ia in Water Determination $\langle 921\rangle$ ) diluted such that 1 mL is equivalent to about 1 to 2 mg of water. If the water content exceeds $0.5 \%$, add more acetic anhydride. If the solution contains no titratable water, add sufficient water to obtain a content of between $0.02 \%$ and $0.5 \%$ of water. Allow the solution to stand for 1 day, and again titrate the water content. The solution so obtained contains between $0.02 \%$ and $0.5 \%$ of water, indicating freedom from acetic anhydride.

Standardize the solution as follows.
Weigh accurately about 700 mg of potassium biphthalate, previously crushed lightly and dried at $120^{\circ}$ for 2 hours, and dissolve it in 50 mL of glacial acetic acid in a $250-\mathrm{mL}$ flask. Add 2 drops of crystal violet TS, and titrate with the perchloric acid solution until the violet color changes to blue-green. Deduct the volume of the perchloric acid consumed by 50 mL of the glacial acetic acid. and ealeulate the normality.

■■1S (USP28)
Each 20.42 mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

Sulfuric Acid, Half-Normal ( 0.5 N ) in Alcohol<br>$\mathrm{H}_{2} \mathrm{SO}_{4}, 98.08$<br>24.52 g in 1000 mL

Add slowly, with stirring, 13.9 mL of sulfuric acid to a sufficient quantity of dehydrated alcohol to make 1000 mL . Cool, and standardize against tromethamine as described under Hydrochloric Acid, Half-Normal ( 0.5 N ) in Methanol.

## Change to read:

Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)
$\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{NOH}, 259.47$
25.95 g in 1000 mL

Dissolve 40 g of tetra- $n$-butylammonium iodide in 90 mL of anhydrous methanol in a glass-stoppered flask. Place in an ice bath, add 20 g of powdered silver oxide, insert the stopper in the flask, and agitate vigorously for 60 minutes. Centrifuge a few mL, and test the supernatant liquid for iodide (see Iodide $\langle 191\rangle$ ). If the test is positive, add an additional 2 g of silver oxide, and continue to allow to stand for 30 minutes with intermittent agitation. When all of the iodide has reacted, filter through a fine-porosity, sintered-glass funnel. Rinse the flask and the funnel with three $50-\mathrm{mL}$ portions of anhydrous toluene, adding the rinsings to the filtrate. Dilute with a mixture of three volumes of anhydrous toluene and 1 volume of anhydrous methanol to 1000 mL , and flush the solution for $10 \mathrm{~min}-$ utes with dry, carbon dioxide-free nitrogen. [NOTE-If necessary to obtain a clear solution, further small quantities of anhydrous methanol may be added.] Store in a reservoir protected from carbon dioxide and moisture, and discard after 60 days. Alternatively, the solution may be prepared by diluting a suitable volume of commercially available tetrabutylammonium hydroxide solution in methanol with a mixture of 4 volumes of anhydrous toluene and 1 volume of anhydrous methanol. [NOTE-If necessary to obtain a clear solution, further small quantities of methanol may be added.]

Standardize the solution on the day of use as follows. Dissolve about 400 mg of primary standard benzoic acid, accurately weighed, in 80 mL of dimethylformamide, add 3 drops of a 1 in

100 solution of thymol blue in dimethylformamide, and titrate to a blue endpoint with the tetrabutylammonium hydroxide solution, delivering the titrant from a buret equipped with a carbon dioxide absorption trap. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 12.21 mg of benzoic acid.

$$
\mathrm{m}_{\mathrm{N}}=\frac{\text { mg benzoic acid }}{122.1 \times \mathrm{mL}\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{NOH}} \quad \text { 1S (USP28) } \mathbf{\Delta U S P 2 7}
$$

## Change to read:

## ${ }^{\text {A }}$ Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N

Prepare as described for Tetrabutylammonium Hydroxide, Tenth-Normal ( 0.1 N ) using isopropyl alcohol instead of toluene, and standardize as described. Alternatively, the solution may be prepared by diluting a suitable volume of commercially available tetrabutylammonium hydroxide solution in methanol with 4 volumes of anhydrous isopropyl alcohol.

$$
\mathbf{m}^{\mathbf{N}}=\frac{\mathrm{mg} \text { benzoic acid }}{122.1 \times \mathrm{mL}\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{NOH}} \quad \begin{aligned}
& \mathrm{S}(\text { USP28) } \mathbf{\Delta U S P 2 7}

$$

## Change to read:

Tetramethylammonium Bromide, Tenth-Molar (0.1 M)

$$
\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NBr}, \mathbf{1 5 4 . 0 5}
$$

15.41 g in 1000 mL

Dissolve 15.41 g of tetramethylammonium bromide in water to make 1000 mL , and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a beaker, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS, and mix. Add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Caleulate the molarity.

$$
\mathrm{M}=\frac{\mathrm{mL} \mathrm{AgNO}_{3} \times \mathrm{N} \mathrm{AgNO}_{3}}{\mathrm{~mL}\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NBr}} \quad \square 1 \mathrm{~S}(U S P 28)

## Change to read:

Tetramethylammonium Chloride, Tenth-Molar (0.1 M)

$$
\begin{array}{r}
\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NCl}, \mathbf{1 0 9 . 6 0} \\
10.96 \mathrm{~g} \text { in } 1000 \mathrm{~mL}
\end{array}
$$

Dissolve 10.96 g of tetramethylammonium chloride in water to make 1000 mL , and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a flask, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS, and mix. Add 5 mL of nitrobenzene and 2 mL of ferric ammonium sulfate TS, shake, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Galeulate the melarity.

$$
\mathbf{M}=\frac{\mathrm{mL} \mathrm{AgNO}_{3} \times \mathrm{N} \mathrm{AgNO}_{3}}{\mathrm{~mL}\left(\mathrm{CH}_{3}\right)_{4} \mathrm{NCl}} \square_{1 \mathrm{~S}(\text { USP28) }}
$$

## Change to read:

## Titanium Trichloride, Tenth-Normal (0.1 N) <br> $\mathrm{TiCl}_{3}, \mathbf{1 5 4 . 2 3}$ <br> 15.42 g in 1000 mL

Add 75 mL of titanium trichloride solution (1 in 5) to 75 mL of hydrochloric acid, dilute to 1000 mL , and mix. Standardize the solution as follows, using the special titration apparatus described.

Apparatus-Store the titanium trichloride solution in the reservoir of a closed-system titration apparatus in an atmosphere of hydrogen.

Use a wide-mouth, $500-\mathrm{mL}$ conical flask as the titration vessel, and connect it by means of a tight-fitting rubber stopper to the titration buret, an inlet tube for carbon dioxide, and an exit tube. Arrange for mechanical stirring. All joints must be air-tight. Arrange to have both the hydrogen and the carbon dioxide pass through wash bottles containing titanium trichloride solution (approximately 1 in 50) to remove any oxygen.

If the solution to be titrated is to be heated before or during titration, connect the titration flask with an upright reflux condenser through the rubber stopper.

Standardization-Place an accurately measured volume of about 40 mL of 0.1 N ferric ammonium sulfate VS in the titration flask, and pass in a rapid stream of carbon dioxide until all the air has been removed. Add the titanium trichloride solution from the buret until near the calculated endpoint (about 35 mL ), then add through the outlet tube 5 mL of ammonium thiocyanate TS, and continue the titration until the solution is colorless. Galeulate the farmality.

$$
\mathrm{N}=\frac{\mathrm{mL} \mathrm{FeNH}_{4}\left(\mathrm{SO}_{4}\right)_{2} \times \mathrm{NFeNH}_{4}\left(\mathrm{SO}_{4}\right)_{2}}{\mathrm{~mL} \mathrm{TiCl}}{ }_{3} \quad \llbracket 1 \mathrm{~S}(\mathrm{USP28)}
$$

## Change to read:

> Zinc Sulfate, Twentieth-Molar $(\mathbf{0 . 0 5} \mathbf{~ M})$ $\mathrm{ZnSO}_{4} \cdot 7 \mathrm{H}_{2} \mathrm{O}, \mathbf{2 8 7 . 5 6}$ 14.4 g in 1000 mL

Dissolve 14.4 g of zinc sulfate in water to make 1 liter. Standardize the solution as follows:

Measure accurately about 10 mL of 0.05 M edetate disodium VS into a $125-\mathrm{mL}$ conical flask, and add, in the order given, 10 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 2 mL of dithizone TS. Titrate with the zinc sulfate solution to a clear, rose-pink color. Galeulate the molarity.

NOTE FOr many of the reagents mentioned in the foregoing section, the correspending standards of the 6th edition (1980)-of Reagent Chemicats, published by the Ameriean Chemieal Society, should be consulted. For a limited number of other reagents, the standards are adapted frem these appearimg in Reagent Chemicats and Standatds, 5th edition, by Joseph Resin and copyrighted by the publisher, $D$. Van Nestrand Co., Ine.

## REFERENCE TABLES

## BRIEFING

Container Specifications for Capsules and Tablets, USP 27 page 2741, page 3166 of the First Supplement, and page 1048 of PF 30(3) [May-June 2004].
(HDQ) RTS—38696-1; 40239-1; 40962-1; 41219-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the Packaging and storage requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

## Change to read:

Ammonio Methacrylate Copolymer: Colorless, clear to white-opaque granules or a white powder, both with a faint amine-like odor. Soluble to freely soluble in methanol, in alcohol, and in isopropyl alcohol, each of which contains small amounts of
water; soluble to freely soluble in acetone, in ethyl acetate, and in methylene chloride. The solutions are clear to slightly cloudy. Insoluble in petroleum ether and in water. NF category: Coating agent;
$\square_{\text {tablet binder; polymer membrane. } \text { ■ }_{1 S} \text { (USP28) }}$

## Add the following:

-Fenbendazole: White to off-white powder. Practically insoluble in water; very slightly soluble in methanol; sparingly soluble in dimethylformamide.■1S (USP28)

## Add the following:

-Fluticasone Propionate (micronized): Fine, white powder.■1S (USP28)

## Add the following:

-Fluvastatin Sodium: White to pale yellow, brownish pale yellow, or reddish pale yellow hygroscopic powder. Soluble in alcohol, in methanol, and in water. $\quad 1$ (USP28)

## Add the following:

-Fluvoxamine Maleate: White to off-white crystalline powder. Freely soluble in alcohol and in chloroform; sparingly soluble in water; and practically insoluble in diethyl ether.■1S (USP28)

## Add the following:

-Gonadorelin Acetate: White to slightly yellowish powder. Soluble in water; sparingly soluble in methanol.■1S (USP28)

## Add the following:

-Mefloquine Hydrochloride: White or slightly yellow, crystalline powder. It exhibits polymorphism. Freely soluble in methanol; soluble in alcohol; very slightly soluble in water. ${ }^{1 S}$ (USP28)

## Change to read:

Methacrylic Acid Copolymer: White powder having a faint, characteristic odor. The polymer is insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5 ; soluble in diluted alkali, in simulated intestinal fluid TS,
and in buffer solutions of pH 7 and above. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. The polymer is soluble to freely soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than $3 \%$ of water.
${ }^{\text {■ }}$ NF category: Coating agent. $\quad 1 \mathrm{IS}$ (USP28)

## Add the following:

-Polydecene: Clear, colorless, odorless, and tasteless liquid. Very slightly soluble in water. NF category: Emollient; ointment base; solvent; vehicle (oleaginous).■1S (USP28)

## Delete the following:

MTitanium-Dioxide: White, oderless, tasteless pewder. Its 4 in 10 suspension in wher is neutral to litmens. Inseluble in water, in hydrochloric acid, in nitrie acid, and in 2 N sulfaric acid. Dissolves in hydrofluoric acid and in hot sulfaric acid. Is rendered soluble by fusion with petassium bisulfate or with alkali-carbenates or hy drox ides. NF category: Ceating agent.■1S (USP28)

## Add the following:

-Titanium Dioxide [Nomenclature title to come]: White to slightly colored powder. Its 1 in 10 suspension in water is neutral to litmus. Insoluble in water, in hydrochloric acid, in nitric acid, and in 2 N sulfuric acid. Dissolves in hydrofluoric acid and in hot sulfuric acid. Is rendered soluble by fusion with potassium bisulfate or with alkali carbonates or hydroxides.■1S (USP28)

## Add the following:

-Titanium Dioxide: White to slightly colored powder. Its 1 in 10 suspension in water is neutral to litmus. Insoluble in water, in hydrochloric acid, in nitric acid, in 2 N sulfuric acid, in dehydrated alcohol, and in ether. Dissolves in hydrofluoric acid and in hot sulfuric acid. Is rendered soluble by fusion with potassium bisulfate or with alkali carbonates or hydroxides. NF category: Coating agent.■IS (USP28)

## Add the following:

-Topiramate: White to off-white powder. Freely soluble in dichloromethane. 1 (USP28)

Thiabendazole Chewable Tablets-See PF Vol. 29 No. 6, page 1991.

Thiacetarsamide-See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection-See PF Vol. 29 No. 1, page 127.

Thiamine Hydrochloride Tablets-See PF Vol. 30 No. 1, page 190.
Thiopental Sodium-See PF Vol. 29 No. 5, page 1586.
Thioridazine Oral Suspension-See PF Vol. 29 No. 6, page 1992.
Thiothixene Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Thiothixene Hydrochloride Oral Solution-See PF Vol. 29 No. 6, page 1993.
Tiagabine Hydrochloride-See PF Vol. 29 No. 5, page 1587.
Tiamulin Fumarate-See PF Vol. 30 No. 3, page 938.
Timolol Maleate Tablets-See PF Vol. 30 No. 1, page 191.
Tobramycin Inhalation Solution-See PF Vol. 29 No. 2, page 438.
Tolazoline Hydrochloride-See PF Vol. 29 No. 5, page 1588.
Tolbutamide-See PF Vol. 29 No. 5, page 1588.
Tolcapone-See PF Vol. 30 No. 3, page 939.
Tolcapone Tablets-See PF Vol. 30 No. 3, page 943.
Triamcinolone Acetonide-See PF Vol. 30 No. 3, page 945.
Triamcinolone Acetonide Lotion-See PF Vol. 30 No. 2, page 538.
Triamcinolone Acetonide Topical Emulsion-See PF Vol. 30 No. 2, page 538.
Trichlorfon-See PF Vol. 26 No. 6, page 1576.
Trifluoperazine Hydrochloride-See PF Vol. 29 No. 6, page 1993. Triflupromazine Hydrochloride-See PF Vol. 29 No. 6, page 1994.

Triflupromazine Oral Suspension-See PF Vol. 29 No. 6, page 1994.

Trimethobenzamide Hydrochloride-See PF Vol. 29 No. 5, page 1589.

Trimethoprim-See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate-See PF Vol. 29 No. 6, page 1995.
Triprolidine and Pseudoephedrine Hydrochlorides Tablets-See PF Vol. 30 No. 1, page 192.
Trisulfapyrimidines Oral Suspension-See PF Vol. 29 No. 6, page 1996.

Tubocurarine Chloride-See PF Vol. 29 No. 6, page 1996.
Urea-See PF Vol. 29 No. 5, page 1589.
Urea C for Oral Solution-See PF Vol. 29 No. 2, page 441.
Urofollitropin-See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection-See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate-See PF Vol. 24 No. 3, page 6180.
Ursodiol-See PF Vol. 29 No. 1, page 128.
Ursodiol Capsules-See PF Vol. 29 No. 5, page 1589.
Valproic Acid Injection-See PF Vol. 26 No. 4, page 939.
Valrubicin-See PF Vol. 30 No. 3, page 946.
Valsartan-See PF Vol. 29 No. 6, page 1996.
Valsartan Capsules-See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 6, page 2000.
Vancomycin Hydrochloride for Oral Solution-See PF Vol. 30 No. 1, page 193.
Vasopressin-See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide-See PF Vol. 30 No. 1, page 193.
Vecuronium Bromide for Injection-See PF Vol. 25 No. 4, page 8449.

Verapamil Hydrochloride-See PF Vol. 29 No. 5, page 1598.
Verteporfin-See PF Vol. 30 No. 3, page 947.
Vitamin E-See PF Vol. 27 No. 5, page 3159
Sterile Purified Water-See PF Vol. 30 No. 3, page 947.
White Lotion-See PF Vol. 30 No. 2, page 538.
Small Intestinal Submucosa Wound Matrix-See PF Vol. 30 No. 2, page 538.
Xylazine-See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Zidovudine-See PF Vol. 29 No. 6, page 2006.
Zidovudine Oral Solution-See PF Vol. 29 No. 6, page 2006.
Zileuton-See PF Vol. 30 No. 3, page 948.
Zinc Gluconate-See PF Vol. 29 No. 3, page 683.
Zinc Sulfide Topical Suspension-See PF Vol. 30 No. 2, page 546.

## DIETARY SUPPLEMENTS

## MONOGRAPHS

Chaste Tree-See PF Vol. 30 No. 2, page 546.
Powdered Chaste Tree Extract-See PF Vol. 29 No. 4, page 1269.
Horse Chestnut-See PF Vol. 30 No. 2, page 550.
Powdered Horse Chestnut Extract-See PF Vol. 30 No. 2, page 550.

Choline Bitartrate-See PF Vol. 30 No. 3, page 950.
Choline Chloride-See PF Vol. 30 No. 3, page 951.
Chondroitin Sulfate Sodium-See PF Vol. 30 No. 1, page 197.
Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 200.

Red Clover-See PF Vol. 30 No. 2, page 550
Powdered Red Clover Extract-See PF Vol. 30 No. 2, page 552.
Black Cohosh-See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh-See PF Vol. 28 No. 5, page 1460.
Powdered Black Cohosh Extract-See PF Vol. 28 No. 5, page 1461.

Black Cohosh Tablets-See PF Vol. 28 No. 5, page 1462.
Cranberry Liquid Preparation-See PF Vol. 30 No. 3, page 951.
Docosahexaenoic Acid-See PF Vol. 26 No. 6, page 1648.
Docosahexaenoic Acid Capsules-See PF Vol. 26 No. 6, page 1651.

Docosahexaenoic Acid Oil—See PF Vol． 26 No．6，page 1652.
Echinacea angustifolia－See PF Vol． 30 No．2，page 552.
Powdered Echinacea angustifolia Extract－See PF Vol． 30 No．2， page 554.
Echinacea pallida－See PF Vol． 30 No．2，page 555.
Powdered Echinacea pallida Extract－See PF Vol． 30 No．2，page 556.

Echinacea purpurea Aerial Parts－See PF Vol． 30 No．2，page 557.
Echinacea purpurea Root－See PF Vol． 30 No．2，page 561.
Powdered Echinacea purpurea Extract－See PF Vol． 30 No．2， page 561.
Eleuthero－See PF Vol． 26 No．6，page 1596.
Fish Oil Rich in Omega－3 Acids－See PF Vol． 29 No．4，page 1272.

Fish Oil Rich in Omega－3 Acids Capsules－See PF Vol． 29 No．4， page 1278.
Ginger Capsules－See PF Vol． 28 No．3，page 814.
Powdered Ginkgo Extract－See PF Vol． 27 No．2，page 2233.
Ginkgo Capsules－See PF Vol． 27 No．2，page 2238.
Ginkgo Tablets－See PF Vol． 27 No．2，page 2240.
American Ginseng－See PF Vol． 30 No．2，page 563.
American Ginseng Capsules－See PF Vol． 30 No．2，page 565.
American Ginseng Tablets－See PF Vol． 30 No．2，page 567.
Powdered American Ginseng－See PF Vol． 30 No．2，page 564.
Powdered American Ginseng Extract－See PF Vol． 30 No．2，page 564.

Asian Ginseng－See PF Vol． 30 No．2，page 569.
Asian Ginseng Capsules－See PF Vol． 30 No．2，page 571.
Asian Ginseng Tablets－See PF Vol． 30 No．2，page 573.
Powdered Asian Ginseng－See PF Vol． 30 No．2，page 570.
Powdered Asian Ginseng Extract－See PF Vol． 30 No．2，page 570.

Glucosamine and Chondroitin Sulfate Sodium Tablets－See PF Vol． 30 No．1，page 201.
Goldenseal－See PF Vol． 30 No．3，page 952.
Powdered Goldenseal－See PF Vol． 30 No．3，page 953.
Powdered Goldenseal Extract－See PF Vol． 30 No．3，page 954.
Licorice－See PF Vol． 26 No．5，page 1363.
Powdered Licorice Extract－See PF Vol． 30 No．2，page 574.
Lutein－See PF Vol． 29 No．2，page 470.
Lutein Preparation－See PF Vol． 29 No．2，page 472.
Lycopene－See PF Vol． 30 No．2，page 574.
Lycopene Preparation－See PF Vol． 30 No．2，page 576.
Lycopene Tomato Extract－See PF Vol． 30 No．2，page 578.
Milk Thistle Capsules－See PF Vol． 29 No．2，page 479.
Minerals Capsules－See PF Vol． 28 No．5，page 1543.
Minerals Tablets－See PF Vol． 28 No．5，page 1543.
Pygeum－See PF Vol． 30 No．3，page 954.
Pygeum Capsules－See PF Vol． 30 No．3，page 959.
Pygeum Extract－See PF Vol． 30 No．3，page 956.
Pyridoxine Hydrochloride Injection－See PF Vol． 30 No．2，page 583.

Powdered St．John＇s Wort Extract—See PF Vol． 30 No．2，page 584.

Ubidecarenone Capsules－See PF Vol． 30 No．1，page 202.
Valerian Capsules－See PF Vol． 27 No．1，page 1825.
Oil－and Water－Soluble Vitamins Tablets－See PF Vol． 30 No．2， page 585.
Oil－and Water－Soluble Vitamins with Minerals Capsules－See PF Vol． 28 No．5，page 1544.
Oil－and Water－Soluble Vitamins with Minerals Oral Solution－ See PF Vol． 30 No．2，page 585.
Oil－and Water－Soluble Vitamins with Minerals Tablets－See PF Vol． 30 No．2，page 585.
Oil－Soluble Vitamins Tablets－See PF Vol． 28 No．5，page 1547.
Water－Soluble Vitamins Tablets－See PF Vol． 30 No．2，page 587.
Water－Soluble Vitamins with Minerals Capsules－See PF Vol． 28 No．5，page 1547.
Water－Soluble Vitamins with Minerals Tablets－See PF Vol． 30 No．2，page 587.

## GENERAL CHAPTERS

## General Tests and Assays

## General Requirements for Tests and Assays

〈1〉 Injections－See PF Vol． 29 No．3，page 707.
〈11〉 USP Reference Standards－See PF Vol． 23 No．6，page 5180； PF Vol． 24 No．5，page 6925；PF Vol． 25 No．5，page 8893；PF Vol． 26 No．1，page 218；PF Vol． 26 No．3，page 793；PF Vol． 26 No．4，page 1101；PF Vol． 26 No．5，page 1369；PF Vol． 27 No．1，page 1832；PF Vol． 27 No．2，page 2268；PF Vol． 27 No．4，page 2806；PF Vol． 27 No．6，page 3348；PF Vol． 28 No．2，page 433；PF Vol． 28 No．3，page 839；PF Vol． 28 No． 4，page 1224；PF Vol． 28 No．5，page 1468；PF Vol． 28 No．6， page 1913；PF Vol． 29 No．1，page 163；PF Vol． 29 No．2， page 483；PF Vol． 29 No．3，page 710；PF Vol． 29 No．4，page 1137；PF Vol． 29 No．5，page 1601；PF Vol． 29 No．6，page 2022；PF Vol． 30 No．1，page 211；PF Vol． 30 No．2，page 613； PF Vol 30 No．3，page 998.

Apparatus for Tests and Assays
＜41〉Weights and Balances－See PF Vol． 30 No．3，page 999.

## Microbiological Tests

$\langle 55\rangle$ Biological Indicators－Resistance Performance Tests—See PF Vol． 30 No．1，page 212.

## Biological Tests and Assays

＜81 $\rangle$ Antibiotics－Microbial Assays－See PF Vol． 30 No．3，page 1002.

## Chemical Tests and Assays

## LIMIT TESTS

〈231〉 Heavy Metals－See PF Vol． 30 No．3，page 1004.
$\langle 267\rangle$ Porosimetry by Mercury Intrusion－See PF Vol． 29 No．3， page 712.

## OTHER TESTS AND ASSAYS

〈301〉 Acid－Neutralizing Capacity—See PF Vol． 30 No．3，page 1006.

〈381〉 Elastomeric Closures for Injections－See PF Vol． 30 No．1， page 220 ．
〈386〉 Environmentally Sensitive Preparations－See PF Vol． 29 No．4，page 1143.
＜467〉 Organic Volatile Impurities－See PF Vol． 29 No．4，page 1153.

〈518〉 Solution Calorimetry—See PF Vol． 28 No．4，page 1299.

## Physical Tests and Determinations

＜601〉 Aerosols，Metered－Dose Inhalers，and Dry Powder Inhal－ ers－See PF Vol． 29 No．4，page 1176.
〈611）Alcohol Determination－See PF Vol． 30 No．2，page 617.
＜621 Chromatography－See PF Vol． 30 No．3，page 1007.
$\langle 625\rangle$ Clarity and Degree of Opalescence of Liquids－See PF Vol． 26 No．6，page 1616.
$\langle 627\rangle$ Degree of Color of Liquids－See PF Vol． 26 No．6，page 1617.

〈643〉 Total Organic Carbon－See PF Vol． 29 No．6，page 2026.
645 Water Conductivity－See PF Vol． 30 No．1，page 233.
661）Containers－See PF Vol． 29 No．2，page 490.
＜696 Crystallinity Determination by Solution Calorimetry－See PF Vol． 29 No．1，page 175.
〈698〉 Deliverable Volume－See PF Vol． 29 No．6，page 2029.
699 Density of Solids－See PF Vol． 28 No．2，page 603.
＜711 Dissolution－See PF Vol． 30 No．1，page 234.
$\langle 730\rangle$ Inductively Coupled Plasma（ICP）—See PF Vol． 30 No．3， page 1022 ．
〈785〉 Osmolarity－See PF Vol． 29 No．6，page 2033.
〈791 pH—See PF Vol． 29 No．6，page 2037.
495）Pharmaceutical Compounding－Nonsterile Preparations－ See PF Vol． 29 No．1，page 179.
（811）Powder Fineness－See PF Vol． 28 No．2，page 611.
823）Radiopharmaceuticals for Positron Emission Tomography－ Compounding－See PF Vol． 29 No．2，page 494.
＜846 Specific Surface Area－See PF Vol． 28 No．2，page 612.
＜921）Water Determination－See PF Vol． 29 No．5，page 1610.

## General Information

Introduction－See PF Vol． 29 No．6，page 2039.
$\langle 1010\rangle$ Analytical Data－Interpretation and Treatment－See PF Vol． 30 No．1，page 236.
＜1043〉 Ancillary Materials for Cell，Gene，and Tissue－Engineered Products－See PF Vol． 30 No．2，page 629.
$\langle 1051\rangle$ Cleaning Glass Apparatus－See PF Vol． 30 No．1，page 264.

〈1072〉 Disinfectants and Antiseptics—See PF Vol． 29 No．3，page 726.

〈1075〉 Good Compounding Practices－See PF Vol． 29 No．2，page 497.
＜1078〉 Good Manufacturing Practices for Bulk Pharmaceutical Excipients－See PF Vol． 28 No．5，page 1504.
$\langle 1079\rangle$ Good Storage and Shipping Practices－See PF Vol． 29 No． 5，page 1612.
$\langle 1080\rangle$ Bulk Pharmaceutical Excipients－Certificate of Analy－ sis－See PF Vol． 28 No．5，page 1650.
〈1082 $\rangle$ Genotoxicity Testing－See PF Vol． 30 No．1，page 264.
＜1086 Impurities in Official Articles－See PF Vol． 29 No．4，page 1214.
＜1089〉 In Vitro，Absorption－Indicating Cell Culture System－See PF Vol． 25 No．5，page 8733.
〈1111〉 Microbiological Attributes of Nonsterile Pharmaceutical Products－See PF Vol． 25 No．2，page 7785.
〈1116〉 Microbiological Evaluation of Clean Rooms and Other Controlled Environments－See PF Vol． 25 No．3，page 8264.

## REAGENTS，INDICATORS，AND SOLUTIONS

## Reagent Specifications

Acetal－See PF Vol． 30 No．2，page 644.
2－Acetamidophenol－See PF Vol． 25 No．6，page 9107.
Agarose－See PF Vol． 27 No．6，page 3363.
Air－Nitrous Oxide Certified Standard－See PF Vol． 28 No．4，page 1234.

Ammonium Pyrrolidinedithiocarbamate－See PF Vol． 30 No．3， page 1043.
Anion－exchange Resin，Styrene－Divinylbenzene－See PF Vol． 30 No．3，page 1043.
Anti－A Blood Grouping Reagent，Anti－B Blood Grouping Re－ agent，and Anti－A，B Blood Grouping Reagent－See PF Vol． 29 No．2，page 505.
Anti－D（Rh $h_{o}$ ）Reagent－See PF Vol． 29 No．2，page 505.
Anti－D Reagent－See PF Vol． 29 No．2，page 506.
Antihuman Globulin Reagent－See PF Vol． 29 No．2，page 506.
Antithrombin III for Amidolytic Test－See PF Vol． 29 No．1，page 264.

Bacterial Alkaline Protease Preparation－See PF Vol． 30 No．2， page 644.
Barbituric Acid－See PF Vol． 29 No．1，page 265.
Benzamidine Hydrochloride Hydrate－See PF Vol． 30 No．2，page 644.

Benzil－See PF Vol． 28 No．4，page 1305.
Blood Group $\mathrm{A}_{1}$ and Blood Group B Red Blood Cells－See PF Vol． 29 No．2，page 506.
Bovine Collagen－See PF Vol． 30 No．2，page 644.
Rat Tail Collagen－See PF Vol． 30 No．2，page 644.
Branched Polymeric Sucrose－See PF Vol． 27 No．6，page 3363.
Bromelain－See PF Vol． 28 No．2，page 552.
1，4－Butanediol－See PF Vol 25 No．5，page 8747.
Butyrolactone－See PF Vol． 22 No．6，page 3248.
dl－Camphene－See PF Vol． 28 No．6，page 1951.
Capric Acid－See PF Vol 25 No．5，page 8749.
Cation－exchange Resin，Styrene－Divinylbenzene－See PF Vol． 30 No．3，page 1043.
p－Chlorophenol－See PF Vol． 30 No．3，page 1044.
4－Chlorophenol－See PF Vol． 30 No．3，page 1045.
Citric Acid－See PF Vol． 30 No．3，page 1044.
Citric Acid，Anhydrous－See PF Vol． 30 No．3，page 1044.
Cyclohexylmethanol－See PF Vol． 30 No．2，page 644.
DEAE－Agarose－See PF Vol． 29 No．1，page 265.
Deoxyadenosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxycytidine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyguanosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyribonucleic Acid Polymerase－See PF Vol． 27 No．6，page 3365.

Deoxythymidine Triphosphate－See PF Vol． 27 No．6，page 3365.
Deuterated Methanol－See PF Vol． 29 No．6，page 2054.
Dicyclohexyl－See PF Vol． 30 No．2，page 645.
Dicyclohexyl Phthalate－See PF Vol． 26 No．2，page 504.
Diethylpyrocarbonate－See PF Vol． 27 No．6，page 3365.
Diisobutylene－See PF Vol． 28 No．4，page 1305.
1，5－Dimethyl－1，5－diazundecamethylene Polymethobromide－See PF Vol． 30 No．1，page 315.
$N, N$－Dimethylformamide Diethyl Acetal－See PF Vol． 29 No．5， page 1681.
$N, N$-Dimethyldodecylamine- $N$-oxide-See PF Vol. 27 No. 4, page 2837.

1,9-Dimethyl-Methylene Blue-See PF Vol. 30 No. 2, page 645.
Dimethyl Sulfoxide-See PF Vol. 30 No. 3, page 1045.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bro-mide-See PF Vol. 27 No. 6, page 3365.
Dioleoylglycerol-See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol-See PF Vol. 28 No. 3, page 849.

Disodium Arsenate-See PF Vol. 28 No. 4, page 1305.
3-(Dodecyldimethylammonio)propanesulfonate-See PF Vol. 30 No. 2, page 645.
Drabkin's Reagent-See PF Vol. 29 No. 2, page 507.
Escin-See PF Vol. 27 No. 4, page 2837.
Ethidium Bromide-See PF Vol. 27 No. 6, page 3366.
Ethylbenzene-See PF Vol. 30 No. 2, page 645.
Fibroblast Growth Factor-2-See PF Vol. 30 No. 2, page 645.
9-Fluorenylmethyl Chloroformate-See PF Vol. 25 No. 5, page 8916.

Formamide, Anhydrous-See PF Vol. 27 No. 5, page 3115.
Glucose-See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid-See PF Vol. 27 No. 6, page 3366.
L-Glutamine-See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate-See PF Vol. 27 No. 6, page 3366.
Hexadecane-See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide-See PF Vol. 29 No. 1, page 265.
Hexane, Solvent-See PF Vol. 30 No. 3, page 1045.
Hexane, Solvent, Chromatographic-See PF Vol. 30 No. 3, page 1046.

Hexanes-See PF Vol. 30 No. 3, page 1046.
L-Histidine Hydrochloride Monohydrate-See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide-See PF Vol. 28 No. 4, page 1305.
Hydrocodone Diol-See PF Vol. 28 No. 4, page 1306.
IgG-Coated Red Cells-See PF Vol. 29 No. 2, page 507.
Iodoethane-See PF Vol. 24 No. 6, page 7327.
Isoferulic Acid-See PF Vol. 27 No. 4, page 2837.
Isovaleric Acid-See PF Vol. 30 No. 3, page 1046.
Lanthanum Chloride-See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide-See PF Vol. 28 No. 3, page 851.
Lauryl Dimethyl Amine Oxide-See PF Vol. 30 No. 2, page 645.
Lead Acetate Paper-See PF Vol. 29 No. 1, page 265.
Linoleic Acid-See PF Vol. 27 No. 6, page 3367.
$\alpha$-Lipoic Acid-See PF Vol. 27 No. 6, page 3367.
Melamine-See PF Vol. 29 No. 6, page 2055.
Methanol, Aldehyde-Free-See PF Vol. 30 No. 2, page 646.
Methoxyphenylacetic Acid-See PF Vol. 30 No. 3, page 1046.
Methylbenzothiazolone Hydrazone Hydrochloride-See PF Vol. 30 No. 2, page 646.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride-See PF Vol. 25 No. 3, page 8280.
Methyl Iodide-See PF Vol. 30 No. 3, page 1046.
2-Methyl-5-nitroimidazole-See PF Vol. 25 No. 2, page 7804.
4-Methylpentan-2-ol-See PF Vol. 30 No. 2, page 646.
Methyl Sulfoxide-See PF Vol. 30 No. 3, page 1047.
Methyl Yellow-See PF Vol. 29 No. 5, page 1682.
Monooleoylglycerol-See PF Vol. 26 No. 6, page 1622.
Nonionic Wetting Agent-See PF Vol. 30 No. 3, page 1047.
Nonylphenol Polyoxyethylene Ether-See PF Vol. 27 No. 6, page 3368.

Oligo-deoxythymidine-See PF Vol. 27 No. 6, page 3368.
Oxygen-Helium Certified Standard-See PF Vol. 30 No. 2, page 646.

Pentadecanoic Acid Methyl Ester—See PF Vol. 26 No. 6, page 1622.

Phenol Red, Sodium-See PF Vol. 27 No. 6, page 3368.
Phenylmethylsulfonyl Fluoride-See PF Vol. 30 No. 2, page 647.
Polyoxyethylene (23) Lauryl Ether-See PF Vol. 29 No. 2, page 507.

Polyoxyethylene (20) Sorbitan Monolaurate-See PF Vol. 27 No. 6, page 3368 .

Propionaldehyde-See PF Vol. 30 No. 2, page 647.
Putrescine Dihydrochloride-See PF Vol. 27 No. 6, page 3369.
Pyridoxal 5-phosphate-See PF Vol. 29 No. 6, page 2055.
Red-Cell Lysing Agent-See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase-See PF Vol. 27 No. 6, page 3369.
Ribonuclease Inhibitor-See PF Vol. 27 No. 6, page 3369.
Sodium Arsenite, Twentieth-Molar ( 0.05 M )-See PF Vol. 29 No. 4, page 1250 .
Sodium 1-Heptanesulfonate-See PF Vol. 30 No. 3, page 1047.
Sodium 1-Heptanesulfonate Monohydrate-See PF Vol. 30 No. 2, page 647.
Sodium 1-Hexanesulfonate-See PF Vol. 30 No. 3, page 1048.
Sodium Hydrogen Sulfate-See PF Vol. 29 No. 5, page 1682.
Sodium Iodate-See PF Vol. 27 No. 6, page 3369.
Tetrahydro-2-furancarboxylic Acid-See PF Vol. 25 No. 5, page 8748.

N -(2-Tetrahydrofuroyl)piperazine-See PF Vol. 25 No. 5, page 8748.

1,1,4,4-Tetraphenyl-1,3-butadiene-See PF Vol. 26 No. 6, page 1623.

Thrombin Human-See PF Vol. 29 No. 6, page 2055.
Thymidine-See PF Vol. 27 No. 6, page 3369.
Thyroglobulin-See PF Vol. 30 No. 1, page 316.
Trioleoylglycerol-See PF Vol. 26 No. 6, page 1623.
Tritirachium Album Proteinase K-See PF Vol. 30 No. 2, page 647.

Tropic Acid—See PF Vol. 30 No. 3, page 1048.
Tropine-See PF Vol. 30 No. 2, page 647.
L-Tyrosine Disodium-See PF Vol. 27 No. 6, page 3370.
Tuberculin, Purified Protein Derivative (Tuberculin PPD)-See PF Vol. 29 No. 5, page 1682.
Vinyl Acetate-See PF Vol. 21 No. 2, page 466.
2-Vinylpyridine-See PF Vol. 26 No. 2, page 504.
1-Vinyl-2-pyrrolidone-See PF Vol. 22 No. 6, page 3249.
Wright's Stain-See PF Vol. 30 No. 1, page 316.
$m$-Xylene-See PF Vol. 28 No. 6, page 1952.
Zinc Sulfate Heptahydrate-See PF Vol. 26 No. 2, page 504.

## Indicator Test Papers

Methyl Green-See PF Vol. 28 No. 4, page 1306.
Methyl Green-Iodomercurate Paper-See PF Vol. 28 No. 4, page 1306.

Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.
Ninhydrin TS-See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS-See PF Vol. 27 No. 1, page 1905.

## Test Solutions

Folin-Ciocalteu Phenol TS-See PF Vol. 30 No. 1, page 316.
Hydroxylamine Hydrochloride TS—See PF Vol. 30 No. 1, page 317.

Methyl Yellow TS—See PF Vol. 30 No. 1, page 317.

## Volumetric Solutions

Hydrochloric Acid, Alcoholic, Tenth-Molar (0.1 M)—See PF Vol. 28 No. 4, page 1235.
Lead Perchlorate, Tenth-Molar ( 0.1 M )—See PF Vol. 30 No. 3, page 1048.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 28 No. 4, page 1235.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N—See PF Vol. 29 No. 2, page 508.

## Reagent Footnotes

Reagent Footnotes-See PF Vol. 30 No. 2, pages 647-648.
Footnote 112-See PF Vol. 30 No. 1, page 317.
Footnote 113-See PF Vol. 30 No. 2, page 648.
Footnote 114 -See PF Vol. 30 No. 2, page 648.
Footnote 115-See PF Vol. 30 No. 2, page 648.
Footnote 116-See PF Vol. 30 No. 2, page 648.

## HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps (Stages).

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In $P F$, this stage appears as OFFICIAL INQUIRY STAGE 4 in the Harmonization section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

## Stage 5: Consensus

## A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

## B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

## MONOGRAPHS (USP)

BriEfing

Saccharin Calcium, USP 27 page 1665 and page 1705 of $P F$ 29(5) [Sept.-Oct. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Saccharin Calcium monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | - | + |
| Identification B | + | - | + |
| Identification C | - | - | + |
| Water | + | - | + |
| Readily carbonizable <br> substances | + | - | + |
| Limit of benzoate <br> and salicylate | - | - | + |
| Assay | + | - | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Heavy metals, Labeling, Clarity of solution, Color of solution, Limit of toluenesulfonamides, Identification (IR), Packaging and storage.

Specific local attributes: USP: Organic volatile impurities.
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the ADOPTION STAGE 6 document and the current $N F$ monograph include the following:
(1) In the opening paragraph (the Definition)-The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) Packaging and storage-No change.
(3) USP Reference standards-A reference for Saccharin Calcium is added for use in Identification test $A$.
(4) Clarity of solution-This test is added to comply with EP standards.
(5) Color of solution-This test is added to comply with EP standards.
(6) Identification-Identification tests $A, B$, and $D$ are replaced with a more definitive IR absorption test. Identification test $C$ is retained, but separated into two tests ( $B$ and $C$ ).
(7) Water-No change.
(8) Readily carbonizable substances-No change.
(9) Selenium-This test is deleted because it is unnecessary for this compound.
(10) Limit of toluenesulfonamides-The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method.
(11) Heavy metals-No change.
(12) Limit of benzoate and salicylate-No change.
(13) Organic volatile impurities-No change.
(14) Assay-No change.
(EMC: J. Lane) RTS-41235-5

## Change to read:

## Saceharin-Caleitm

$$
\begin{aligned}
& \mathrm{E}_{14} \mathrm{H}_{8} \mathrm{CaN}_{2} \Theta_{6} \mathrm{~S}_{2}-31 / 2 \mathrm{H}_{2} \Theta \quad 467.49 \\
& \text { 1,2 Benzisethiazol } 3(2 H) \text { one, } 1,1 \text { dioxide, ealeium salt, hydrate } \\
& \text { (2:7). } \\
& \text { 1,2 Benzisethiazolin-3-one-1,1 dioxide-ealeium salt hydrate } \\
& \text { (2:7) [6381-915]. } \\
& \text { Anhydreas } 404.44 \text { [6485-343]. }
\end{aligned}
$$

H-Saceharin Caleium contains not less than-98.0 pereent and net more than 101.0 pereent of $\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{Ca}$ $\mathrm{N}_{2} \mathrm{O}_{4} \mathrm{~S}_{2}$, caleulated on the anhydrous basis.
Packaging and-storage-Preserve in well closed containers.
Labeling Where the quantity of saceharin caleitm is indieated in the - abeling of any preparation containing Saceharin-Caleium, this shall be expressed in terms of saceharin $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}\right)$.
USP Referenee standards $\langle H\rangle$ - USP o Toluenesulfonamide RS. USP $P_{P}$-Toltenesulfontle RS.

## Identifieation-

A: Dissolve about 100 mg in 5 mL of sodimm hydroxide solut tion (1 in 20), evaporate to drymess, and gently fuse the residue over a small flame until it no longer evolves ammenia. Allow the residue to cool, dissolve in 20 mL of water, neutralize with 3 N hydrechloric acid, and filter: the addition of a drep of ferrie ehloride TS to the filtrate produces a violet color.

B: Mix 20 mg with 40 mg of resoreinel, add 10 drops of sut furie acid, and heat the mixture in a suitable liguid bath at $200^{\circ}$ for 3 mintutes. Allow it to cool, and add 10 mL of water and an eveess of 1 N sodium hydroxide: a fluoreseent green liquid results.

C: A solution ( 1 in 10 ) meets the requirements of the tests for Calcium- 191 ):

D: $\quad$ To 10 mL of a solution ( $1 \mathrm{in}-10$ ) add 1 mL of hydrechlorie acid: a crystalline precipitate of saceharin is formed. Wash the preeipitate with cold water, and dry at $105^{\circ}$ for 2 heurs: it melts between $226^{\circ}$ and $230^{\circ}$, the procedure for Class $I$ being used (see Melting Range or Temperatur $\langle 744$ ) •.
Water, Methed $I\langle 924\rangle$ : not more than $15.0 \%$.

Readily carbonizable substances- $\langle 271\rangle$-Dissolve 200 mg in 5 mL of sulfuric acid $T S$, and maintain at a temperature of $48^{\circ}$ to $50^{\circ}$ for 10 minutes: the selution has no more coler than Matehing Flutid 4.
Selenium- $\langle 294\rangle:-0.093 \%$.
Toltenesulfonamides-
Internal standerd solution, Standard stock solution, and Stan dard preparations. Prepare as direeted for Internal standedrd solthtion, Standard stock solution, and Standard preparations in the test for Toluene ulfonamides under Saccharin (see NF monograph).

Test preparation Prepare as directed under Column Partition Chromagraply (see Chromatograpy (624)), employing a chromatographie tube fitted with a perous glass disk in its base, a plastie stopeock on the delivery tube, and a reservir on the top. Adda mixture consisting of 10 g of Solid Support and a solution of 2.0 है, aceuraty weighed, of Saceharin Caleitm in 8.0 mL of sodium earbonate solution ( 1 in 20), and proceed as directed for Test preparation in the test for Toluenesulfonamides under Sachatrin (see NF monegraph), beginning with "Pack the contents."

Chromatographic system and Proedtre Proeeed as direeted for Chrematographic systen and Proeedure in the test for Tolue nesulfonider under Stecharin (see NF menegraph).
Heary metals, Method $I\langle z 34\rangle$ - Dissolve- 4 g in 46 mL of wher, add -4 mL of dilute hydrochloric acid ( 1 in 12 ), mix, and rub the inner wall of the vessel with a glass rod untilerystallization begins. Allow the solution to stand for 1 hour, then pass through a dry fit ter, disearding the frrst 10 mL of the filtrate, and use 25 mL of the subsequen filtrate for the Test Preparation: the limit is $0.001 \%$.
Limit of benzate and salieylate-To 10 mL of a solution (1 in 20), previously acidiffed with 5 drops of 6 N aretic acid, add-3 drops of ferric chloride TS: no precipitate or violet coler appears. Organie volatile impurities, Meth $H\langle 467\rangle$ : meets the requirements.
Assay Aceurately weigh about 500 me of Saceharin Caleinm, and transfer completely to a separator with the aid of 10 mL of water. Add 2 mL of 3 N hydrochloric acid, and extract the precipi ated saceharin frost with 30 mL , then with five 20 mL pertions, of a mixture of chloreform and aleohol ( $9: 1)$. Evaperate the eem bined extracts on a steam bath to dryness, with the aid of acurrent ef air, then dissolve the residte in 40 mL of aleohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination on a mixture of 40 mL of alcohol and 40 mL of water, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent 1020.22 mg of $\mathrm{C}_{4} \mathrm{H}_{3} \mathrm{EaN}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}-$

## Saccharin Calcium

$\mathrm{C}_{14} \mathrm{H}_{8} \mathrm{CaN}_{2} \mathrm{O}_{6} \mathrm{~S}_{2} \cdot 31 / 2 \mathrm{H}_{2} \mathrm{O} \quad 467.49$

1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide, calcium salt, hydrate $(2: 7)$.

1,2-Benzisothiazolin-3-one 1,1-dioxide calcium salt hydrate (2:7) [6381-91-5].

Anhydrous 404.44 [6485-34-3].
» Saccharin Calcium contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{14} \mathrm{H}_{8} \mathrm{CaN}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in well-closed containers. Store at reom temperature.

Labeling-Where the quantity of saccharin calcium is indicated in the labeling of any preparation containing Saccharin Calcium, this shall be expressed in terms of saccharin $\left(\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}\right)$.

USP Reference standards $\langle 11\rangle$ —USP Saccharin Calcium
RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.

Clarity of solution-[NOTE-The Test solution is to be compared to the Reference suspension $A$ and to water in diffused daylight 5 minutes after preparation of Reference suspension A.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.
Primary opalescent suspension-[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE-This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension B.

Test solution-Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with the same solution to 25 mL , and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension $A$, Reference suspension $B$, water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the Test solution, Reference suspension A, Reference suspension B, water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). [NOTEThe diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] The Test solution shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced than that of Reference suspension $A$.

## Color of solution-

Standard stock solution-Combine 3.0 mL of ferric chloride $\mathrm{CS}, 3.0 \mathrm{~mL}$ of cobaltous chloride $\mathrm{CS}, 2.4 \mathrm{~mL}$ of cupric sulfate CS , and 1.6 mL of dilute hydrochloric acid ( 10 g per L).

Standard solution-[NOTE—Prepare the Standard solution immediately before use.] Transfer 1.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix.

Test solution-Use the Test solution from Clarity of solution.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution, a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the Test solution, the Standard solution, a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the Standard solution.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ - Dry the specimen at $105^{\circ}$ for 2 hours before use.
B: To a solution ( 1 in 10 ) add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid, dropwise, until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. This precipitate is insoluble in 6 N acetic acid but dissolves in hydrochloric acid.
C: Calcium salts moistened with hydrochloric acid impart a transient yellowish red color to a nonluminous flame.

Water, Method I $\langle 921\rangle$ : not more than $15.0 \%$.
Readily carbonizable substances $\langle 271\rangle$ —Dissolve 200 mg in 5 mL of sulfuric acid (between $94.5 \%$ and $95.5 \%$ [w/w] of $\mathrm{H}_{2} \mathrm{SO}_{4}$ ), and keep at a temperature of $48^{\circ}$ to $50^{\circ}$ for 10 minutes: the solution has no more color than Matching Fluid $A$, when viewed against a white background.

Heavy metals, Method I $\langle 231\rangle$ —Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid ( 1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the Test Preparation: the limit is $0.001 \%$.

## Limit of toluenesulfonamides-

Internal standard solution-Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL .
Reference solution-Dissolve 20.0 mg of USP $o$-Toluenesulfonamide RS and 20.0 mg of USP $p$-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL . Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL . Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the Internal standard solution.

Test solution-Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 10 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to pH 7 to 8 , and dilute with water to 50 mL . Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Using a small quantity
of methylene chloride, quantitatively transfer the residue into a suitable $10-\mathrm{mL}$ tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the Internal standard solution.

Blank solution-Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The instrument is equipped with a flame-ionization detector and contains a $0.53-\mathrm{mm} \times 10-\mathrm{m}$ fused silica column, coated with G3 phase (film thickness $2 \mu \mathrm{~m}$ ). The injector port, column, and detector temperatures are maintained at about $250^{\circ}, 180^{\circ}$, and $250^{\circ}$, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of $1: 2$.

Procedure-Inject about $1 \mu \mathrm{~L}$ of the Reference solution. Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than $50 \%$ of the full scale of the recorder. The substances are eluted in the following order: $o$-toluenesulfonamide, $p$-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to $o$-toluenesulfonamide and $p$-toluenesulfonamide is at least 1.5. Inject about $1 \mu \mathrm{~L}$ of the Blank solution. In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, $o$-toluenesulfonamide and $p$-toluenesulfonamide. Inject about $1 \mu \mathrm{~L}$ of the Test solution and $1 \mu \mathrm{~L}$ of the Reference solution. If any peaks due to $o$-toluenesulfonamide and $p$ toluenesulfonamide appear in the chromatogram obtained with the Test solution, the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the Reference solution ( 10 ppm of $o$-toluenesulfonamide and 10 ppm of $p$-toluenesulfonamide).

Limit of benzoate and salicylate-To 10 mL of a solution ( 1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, Method $I\langle 467\rangle$ : meets the requirements.

Assay-Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Calcium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.22 mg of $\mathrm{C}_{14} \mathrm{H}_{8} \mathrm{CaN}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$. 1 IS (USP28)

Saccharin Sodium, USP 27 page 1665 and page 1708 of $P F$ 29(5) [Sept.-Oct. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Saccharin Sodium monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Eabeling. Where the quantity of saceharin sodimm is indiented in the labeling of any preparation containing Saceharin-Sodium, this shall be expressed in terms of saceharin $\left(\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}\right)$.
USP Reference standards- $\langle 4\rangle$-USP ${ }_{0}$ Toluenesulfonamide RS. USP p Tolturnesulfonamide RS.

## Identifiention-

A: The residue obtained by igniting it respends to the tests for Soditum $\langle 194$ ):

B: To 10 mL of a solution ( 1 in 10 ) add 1 mL of hydrochlorie reid: a crystalline precipitate of saceharim is formed. Wash the preeipitate with cold water until the last washing is free from chloride, and dry at $105^{\circ}$ for 2 hours: it melts between $226^{\circ}$ and $230^{\circ}$, the procedure for Class I being used (see Melting Range ar Tempera ture (744) خ.
Alkalinity A solution (1-in-10) is neutral or alkaline to litmers, but no red color is produeed with phenolphthalein TS.
Toltenesulfonamides-
Internal standard solution, Standard stock solution, and Stantad preparations- Prepare as directed for Internal standed solt tion, Standad stock solution, and Standerd prepatrations in the test for Toltenesulfonamides under Sachatu (see NF monograph).

Test preparation Prepare as directed under Column Partition Chromatography (see Chromatography (624)), employing a chromatographic tube fitted with a perous glass disk in its base, a plastie stoperck on the delivery tube, and a reservir on the top. Adda mixture ensisting of 10 g of Solid Support and a solution of 2.0 है, aceurately weighed, of Saecharin Soditm in 8.0 mL of sodium ear benate solution ( 1 in 20), and preceed as directed under Test preparation in the test for Tolurnesulfonamides under Sacharin (see NF menegraph), beginning with "Pack the contents."

Chrematographic system and Procedure Preceed as directed for Chromatggraphic syistem and Procedure in the test for Tolue nesulfonde under Sachath (see NF menograph).
Heavy metals, Meth $I\langle 234\rangle$ - Dissolve 4 s in 46 mL of water, add 4 mL of $1 N$ hydrochleric acid, mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, and then flter through a dry fllter, dis earding the first 10 mL of the filtrate: the limit, determined on 25 mL of the subsequent filtrate, is $0.001 \%$.
Organie volatile imptrities, Meth $H$ ( $H 67\rangle$ : meets the requirements.
Other requirements It respends to Identifieation $A$ and $B$, and meets the requirements of the tests-for Water, Benzate and salicylate, Selenium, and Readily earbanizable substanees under Sachatrin Caleinm.
Assay Proceed with Saceharin Sodium as directed in the Assay under Sacchatin Calcium. Each mL of 0.1 N sodium hydroxide is equivalent to $20.52 \mathrm{mg}_{\mathrm{g}}$ of $\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{NNa}_{3} \mathrm{~S}$.

## ■accharin Sodium

$\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{NNaO}_{3} \mathrm{~S} \cdot 2 \mathrm{H}_{2} \mathrm{O} \quad 241.20$
1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide, sodium salt, dihydrate.

1,2-Benzisothiazolin-3-one 1,1-dioxide sodium salt dihydrate [6155-57-3].
Anhydrous 205.17 [128-44-9].
» Saccharin Sodium contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{NNaO}_{3} \mathrm{~S} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in well-closed containers. Store at reom temperature.

Labeling-Where the quantity of saccharin sodium is indicated in the labeling of any preparation containing Saccharin Sodium, this shall be expressed in terms of saccharin $\left(\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}\right)$.

USP Reference standards $\langle 11\rangle — U S P$ Saccharin Sodium RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide $R S$.

Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension $A$ and to water in diffused daylight 5 minutes after preparation of Reference suspension $A$.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE-This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE-This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension B.

Test solution-Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with * the same solution to 25 mL , and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension $A$, Reference suspension B, water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the Test solution, Reference suspension $A$, Reference suspension B, water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically
against a black background (see Visual Comparison under Spectrophotometry and Light-Scattering 〈851〉). [NOTEThe diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] The Test solution shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced that that of Reference suspension A.

## Color of solution-

Standard stock solution-Combine 3.0 mL of ferric chloride $\mathrm{CS}, 3.0 \mathrm{~mL}$ of cobaltous chloride $\mathrm{CS}, 2.4 \mathrm{~mL}$ of cupric sulfate CS , and 1.6 mL of dilute hydrochloric acid ( 10 g per L).

Standard solution-[NOTE-Prepare the Standard solution immediately before use.] Transfer 1.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix.
Test solution-Use the Test solution from Clarity of solution.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution, a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the Test solution, the Standard solution, a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the Standard solution.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ - Dry the specimen at $105^{\circ}$ for 2 hours before use.

B: $\quad$ To a solution ( 1 in 10 ) add 2 mL of $15 \%$ potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of potassium pyroantimonate TS , and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

C: Sodium salts impart an intense yellow color to a nonluminous flame.

Acidity or alkalinity-To a solution of 1.0 g in 10 mL of carbon dioxide-free water add 1 drop of phenolphthalein TS: no pink color is produced. Then add 1 drop of 0.1 N sodium hydroxide: a pink color is produced.

Water, Method I $\langle 921\rangle$ : not more than $15.0 \%$.
Readily carbonizable substances $\langle 271\rangle$ —Dissolve 200 mg in 5 mL of sulfuric acid (between $94.5 \%$ and $95.5 \%$ [w/w] of $\mathrm{H}_{2} \mathrm{SO}_{4}$ ), and keep at a temperature of $48^{\circ}$ to $50^{\circ}$ for 10 minutes: the solution has no more color than Matching Fluid $A$, when viewed against a white background.

Heavy metals, Method $I\langle 231\rangle$ —Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the Test Preparation: the limit is $0.001 \%$.

## Limit of toluenesulfonamides-

Internal standard solution-Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL .

Reference solution-Dissolve 20.0 mg of USP $o$-Toluenesulfonamide RS and 20.0 mg of USP $p$-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL . Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL . Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the Internal standard solution.

Test solution-Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 410 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8 , and dilute with water to 50 mL . Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable $10-\mathrm{mL}$ tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the Internal standard solution.

Blank solution-Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The instrument is equipped with a flame-ionization detector and contains a $0.53-\mathrm{mm} \times 10-\mathrm{m}$ fused silica column, coated with G3 phase (film thickness $2 \mu \mathrm{~m}$ ). The injector port, column, and detector temperatures are maintained at about $250^{\circ}, 180^{\circ}$, and $250^{\circ}$, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of $1: 2$.

Procedure-Inject about $1 \mu \mathrm{~L}$ of the Reference solution. Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than $50 \%$ of the full scale of the recorder. The substances are eluted in the following order: $o$-toluenesulfonamide, $p$-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to $o$-toluenesulfonamide and $p$-toluenesulfonamide is at least 1.5. Inject about $1 \mu \mathrm{~L}$ of the Blank solution. In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, $o$-toluenesulfonamide, and $p$-toluenesulfonamide. Inject about $1 \mu \mathrm{~L}$ of the Test solution and $1 \mu \mathrm{~L}$ of the Reference solution. If any peaks due to $o$-toluenesulfonamide and $p$ toluenesulfonamide appear in the chromatogram obtained with the Test solution, the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the Reference solution ( 10 ppm of $o$-toluenesulfonamide and 10 ppm of $p$-toluenesulfonamide).

Limit of benzoate and salicylate-To 10 mL of a solution ( 1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, Method $I\langle 467\rangle$ : meets the requirements.

Assay-Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Sodium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.52 mg of $\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{NNaO}_{3} \mathrm{~S}$.■1S (USP28)

## MONOGRAPHS (NF)

BRIEFING

Butylparaben, NF 22 page 2833 and page 1967 of $P F$ 28(6) [Nov.-Dec. 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this monograph. The presented text represents the ADOPTION STAGE 6 draft in the harmonization process.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Identification A | + | + | + |
| Appearance of <br> solution | + | + | + |
| Acidity | + | + | + |
| Related substances |  |  |  |
| Sulphated ash | + | + | + |
| Assay | + | + | + |

* JP will not include the system suitability requirement and consequently will not include reference solution (b).

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Identification by infrared spectrophotometry, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Local requirements: JP: Heavy metals (20 ppm); USP: Organic volatile impurities.

Differences between the ADOPTION STAGE 6 document and the current $N F$ monograph include the following:
(1) In the opening paragraph (the Definition)-Calculations using the dried substance are deleted, as the Loss on drying test is deleted. The acceptance range has been widened.
(2) Packaging and storage-No change.
(3) USP Reference standards-The reference standard for Propylparaben has been added for the Related substances test.
(4) Identification-The test for Melting range has been moved under Identification.
(5) Color of solution-This test is added to comply with EP standards.
(6) Melting range-Moved under Identification.
(7) Acidity-The EP test method has replaced the current USP method.
(8) Loss on drying-Deleted.
(9) Residue on ignition-The limits are increased to not more than $0.1 \%$ to comply with EP standards.
(10) Organic volatile impurities-No change.
(11) Related substances-This test is added to comply with EP standards.
(12) Assay-The sample amount and the amount of 1 N sodium hydroxide has changed, and the heating process has changed to a specific temperature and does not include refluxing.
(EMC: J. Lane) RTS-41235-3

## Change to read:

## Butylparaben

$\mathrm{G}_{4} \mathrm{H}_{4} \mathrm{O}_{3} \quad 194.23$
Benzoic acid, 4 hydroxy, butylester:
Butyl p hydroxybenzoate [94-26-8].

HButylparaben contains not less than 99.0 pereent and not more than 100.5 pereent of $\mathrm{C}_{44} \mathrm{H}_{44} \mathrm{O}_{3}$, calculated on the dried basis.

Packaging and storage- Preserve in well closed containers. USP Referenee standards- $\langle 4\rangle$-USP Bullaben RS.
Identifiention, Infrated Abserption $\langle 197 \mathrm{M}\rangle$ ):
Melting range $\langle 744\rangle$ : ben $68^{\circ}$ and $72^{\circ}$.
Aeidity Heat 0.75 g in 15 mL of water at $80^{\circ}$ for 1 minnte, cool, and filter: the filtrate is neutral or acid to litmus. To 10 mb of the filtrate add 0.20 mL of 0.10 N sodium hydroxide and 2 drops of methyl red TS: the solution is yellow.
Loss-on-drying $\langle 734\rangle$-Dry it over silien gel for 5 hours: it leses not more than $0.5 \%$ of its weight.
Residur-0n ignition- $\langle\mathbf{Z 8 4}$ ): net mere than $0.05 \%$.
Organic volatile impurities, Meth $I V\langle 467\rangle$ : meets the requirements.
Assay Transfer about 2 g of Butylparaben, neeurately weighed, to a flack fitted with a ground glass stopper and equipped for refluxing under a water cooled condenser. Add 40.0 mL of 1 N so dium hydroxide VS, and reflux for 1 hour. Cool to room temperattre, and rimse the eondenser with water. Titrate the exeess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the end point potentiometically (see Titrimetry $\langle 544$ )). Perform a blank determination (see Residual Titrations under Titrimetry (544)). Each mL of 1 N sodimm hydroxide is equivalent to 194.2 mg of $\mathrm{E}_{4} H_{44} \Theta_{3}=$

## Butylparaben

$\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3} \quad 194.23$

Benzoic acid, 4-hydroxy-, butyl ester.
Butyl $p$-hydroxybenzoate [94-26-8].
» Butylparaben contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3}$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Butylparaben RS. USP Propylparaben RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Melting range $\langle 741\rangle$ : between $68^{\circ}$ and $71^{\circ}$.
Color of solution-Dissolve 1 g in alcohol, dilute with alcohol to 10 mL , and mix (Butylparaben solution). This solution is clear and not more intensely colored than alcohol or a solution prepared immediately before use by mixing 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL , and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL . Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

Acidity-To 2 mL of Butylparaben solution prepared in the Color of solution test add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS, and titrate with 0.10 N sodium hydroxide: not more than 0.1 mL is required to produce a blue color.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

## Related substances-

Test solution-Prepare a solution of Butylparaben in acetone containing 10 mg per mL .

Standard solutions-Transfer 0.5 mL of the Test solution to a $100-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix (Standard solution A). Dissolve 10 mg , accurately weighed, of USP Butylparaben RS in 1 mL of the Test solution, and dilute with acetone to 10 mL (Standard solution $B)$.

Procedure-Separately apply $2 \mu \mathrm{~L}$ of the Test solution and $2 \mu \mathrm{~L}$ of each Standard solution to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ), coated with a $0.25-\mathrm{mm}$ layer of chromatographic octadecylsilanized silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid ( $70: 30: 1$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution with that of the principal spot in the chromatogram of Standard solution $A$ : the intensity of any individual secondary spot in the chromatogram of the Test solution is not greater than that of the principal spot obtained in the chromatogram of Standard solution $A(0.5 \%)$. The test is not valid unless the chromatogram obtained with Standard solution $B$ shows two clearly separated principal spots.

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.

Assay-To about 1.000 g of Butylparaben, accurately weighed, add 20.0 mL of 1 N sodium hydroxide VS, and heat at about $70^{\circ}$ for 1 hour. Cool rapidly in an ice bath. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS,
continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$. Each mL of 1 N sodium hydroxide is equivalent to 194.2 mg of $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3 \cdot \text { - }}$ IS (NF23)

## BRIEFING

Microcrystalline Cellulose, NF 22 page 2845 and page 1305 of PF 29(4) [July-Aug. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Microcrystalline Cellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on corresponding monograph for Microcrystalline Cellulose that was prepared by the U.S. Pharmacopeia. This draft was based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5A and 5B drafts.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Labeling | - | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| Conductivity | + | + | + |
| pH | + | + | + |
| Loss on drying $^{1}$ | + | + | + |
| Residue on ignition | + | + | + |
| Bulk density ${ }^{2}$ | + | + | + |
| Water-soluble <br> substances | + | + |  |
| Ether-soluble <br> substances | + | + |  |

${ }^{1}$ USP will retain, as a specific local attribute, that the value can be within a percentage range, as specified within the labeling.
${ }^{2}$ USP will retain, as a specific local attribute, that the bulk density value is wthin the labeled specification.

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Heavy metals, Microbial limits, Labeling, Packaging and storage.

Specific local attributes: JP: Identification C——Dispersion test; USP: Organic volatile impurities, Particle size distribution estimation by analytical sieving.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the Adoption Stage 6 document and the current $N F$ monograph include the following:
(1) Definition-No change.
(2) Packaging and storage-No change.
(3) Labeling-Additional information is presented to clarify particle size testing.
(4) Identification test $B$-The requirements to be within the labeled specification are deleted.
(5) Microbial limits-No change.
(6) Conductivity-No change.
(7) pH -The upper limit is increased to 7.5 from 7.0 to conform to EP and JP standards and to be consistent with the monograph for Powdered Cellulose.
(8) Loss on drying - No change.
(9) Residue on ignition-The standard for this test was increased to not more than $0.1 \%$, which conforms to EP standards.
(10) Bulk density-No change.
(11) Water-soluble substances-The standard for this test was changed from $0.24 \%$ to $0.25 \%$.
(12) Ether-soluble substances-No change.
(13) Heavy metals-No change.
(14) Organic volatile impurities-No change.
(15) Particle size distribution estimation by analytical sieving-To further strengthen the monograph, a test for the determination of particle size distribution is added. Because the determination of particle size distribution is not a compendial requirement for this article, the test does not contain limit values. The test provides a means for ensuring that suppliers and users of Microcrystalline Cellulose who have an interest in this property may obtain this value by the same method. Users who do not require any definite particle size range material obviously would have no concern about this material property or monograph test.
(EMC: J. Lane) RTS-41235-8

## Change to read:

## Mierocrystalline Cellulose

## Gellulese.

Gellulese [900434-9].
\# Mierocrystalline Cellulose is purified, partially depolymerized cellulose prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

## Packaging and-storage Preserve in tight containers.

Eabeling The labeling indieates the nominallossondrying, bulk density, and degree of polymerization values. Degree of polymer ization compliance is determined using Identificution test $B$. Where the partiele-size distribution-is stated in the labeling, the labeling indientes the $d_{10}, d_{50}$, and $d_{90}$ values and the range for each.

## Identifieation-

A: Prepare iodinated zine chloride solution by dissolving 20 g of zine chlloride and 6.5 g of potassimm iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 minntes. Place about 10 mg
of Mierecrystalline Cellulose on a watch glass, and disperse in 2 mL of iodinated zine chloride solution: the substance takes on a violet blue color.

B: Transfer 1.3 g of Miereerystalline-Cellulese, aceurately weighed to 0.1 mg, to a 125 mL conieal flack. Add 25.0 mL of water and 25.0 mL of 1.0 M empriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanieat shaker until completely dissolved. Transfer 7.0 mL of the solution a calibrated number 150 Cannen. Fenske or equivalent ${ }^{+}$- viseosimeter. Allow the solution toquilibrate at $25 \pm 0.1^{\circ}$ for not less than 5 minutes. Time the flow between the 2 marks on the viseo simeter, and record the flow time, $t_{4}$, in seonds. Caleulate the ki nematic viseosity, $(K H)_{4}$, of the Mieroerystalline Cellulose taken by the formma:-

$$
t_{+}\left(\xi_{+}\right),
$$

in which $k_{4}$ is the viscosimeter constant (see-Viseosity $\langle 914$ ) $)$. Ob ain the flow time, $t_{3}$, for a 0.5 M eupriethylenediamine hydroxide solution using a number 100 Cannon Fenske or equivalent ${ }^{+}$-viseosimeter. Caleulate the kinematic viseosity, $(K I)_{3}$, of the solvent by the formmat:-

$$
t_{2}\left(f_{z}\right),
$$

in which $k_{2}$ is the viseosimeter eonstant. Determine the relative viseosity, $\eta_{m,}$, of the Mierocrystalline Cellulose specimen taken by the fermala:-

$$
(K I)_{+}+(K I)_{2}=
$$

Determine the intrinsic viseosity, $[\eta] e$, by interpolation, using the Intrinsic Iiseosity Table in the Reference Tables section. Caleulate the degree of pelymerization, $P$, by the formala:-

$$
\left((95)[n]+\left(4 Y_{s}[(100 \quad 0)\right.\right.
$$

in whieh $W_{s}$-is the weight, in $g$, of the Mierecrystalline Cellulese taken, and $\% L O D$ is the value obtained from the test for Less on drying. The degree of pelymerization is not greater than 350 , and is within the labeled specifieation.
Mierobiallimits $\langle 64\rangle$-The total qerebic mierebial cetnt dees net exeeed 1000 efu per f, the total combined molds and yeasts count dees not exeeed 100 efu per g, and it meets the requirements of the tests for absence-of Staphylococeus attrens and Preudementis aerugingsa and for absence of Escherichia coli and Salmenellat species.
Conductivity Shake about 5_ with 40 mL of water for 20-min utes, andeentrifuge. Retain the-supernatant liquidfor use in the pH test. Using an appropriate enduetivity meter that has been standar dized with a petassitum chloride conductivity ealibration-standard ${ }^{2}$ having a conductivity of 100 uS per cm , measure the conductivity of the-supernatant solution after a-stablereading is obtained, and measure the conductivity of the water used to prepare the test specimen. The conductivity of the supernatant solution does not exceed the conductivity of the water by more than 75 uS per em. $\mathbf{p H}\langle 794\rangle$ : between 5.0 and 7.0 in the-supernatant solution obtained in the Conductivity lest.
Goss-0ndrying $\langle 734\rangle$ - Dry it at $105^{\circ}$ for 3 heurs. it loses net mere than $7.0 \%$ of its weight, or some other lower pereentage, or is within a pereentage range, as specified in the labeling.
Residue-on ignition $\langle\mathbf{Z} 84\rangle$ : net mere than $0.05 \%$

[^184]Bulk density Use a volume meter ${ }^{2}$ that has been fitted with a 10 mesh sereen. The volume meter is freestanding of the brass-or stainless steel cup, which is calibrated to a capacity of $25.0 \pm 0.05 \mathrm{~mL}$ and has an inside diameter of $30.0 \pm 2.0 \mathrm{~mm}$. Weigh the emply eup, pesition it under the chate, and slowly pour the powder from a height of 5.1 cm ( 2 inehes) above the fumet through the volume meter, at a rate suitable to prevent clogeging, until the eup overflows. [NOTE-If exeessive clogging of the sereen oceurs, remove the screen.] Level the excess powder, and weigh the filled eup. Caleulate the bulk density by dividing the weight ef the powder in the eup by the volume of the eup: the bulk density is within the labeled specifiention.
Water-soluble substanees-Shake 5.0 g with about $80-\mathrm{mL}$ of water for 10 minutes, filter with the aid of waymm through filter paper (Whatman No. 42 or equivalent) int a wacemm flack. Trans fer the filtrate to a tared beaker, evaporate to dryness without char ring, dry at $105^{\circ}$ for 1 hour, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight ob tained from a blank determination does not exeed 12.0 mm ( $0.24 \%$ ).
Ether-soluble substanees Place 10.0 gin achrematography eot umn having an internal diameter of about 20 mm , and pass 50 mL ef peroxide free ther through the columm. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue $105^{\circ}$ for 30 minutes, cool in a desicentor, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not eweed 5.0 mg ( $0.05 \%$ )
Heary metals, Method $I\langle\langle 234\rangle:-0.001 \%$.
Organie volatile impurities, Methad $I V\langle 467)$ : meets the requirements.

## ■Microcrystalline Cellulose

Cellulose.

Cellulose [9004-34-6].
» Microcrystalline Cellulose is purified, partially depolymerized cellulose prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

Packaging and storage-Preserve in tight containers.
Labeling-The labeling indicates the nominal loss on drying, bulk density, and degree of polymerization values. Degree of polymerization compliance is determined using

[^185]Identification test $B$. Where the particle size distribution is stated in the labeling, proceed as directed under Particle Size Distribution Estimation by Analytical Sieving $\langle 786\rangle$; the labeling indicates the $\mathrm{d}_{10}, \mathrm{~d}_{50}$, and $\mathrm{d}_{90}$ values (see Powder Fineness $\langle 811\rangle$ ) and the range for each.

## Identification-

A: Prepare iodinated zinc chloride solution by dissolving 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for $15 \mathrm{~min}-$ utes. Place about 10 mg of Microcrystalline Cellulose on a watch glass, and disperse in 2 mL of iodinated zinc chloride solution: the substance takes on a violet-blue color.

B: Transfer 1.3 g of Microcrystalline Cellulose, accurately weighed to 0.1 mg , to a $125-\mathrm{mL}$ conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanical shaker until completely dissolved. Transfer 7.0 mL of the solution to a calibrated number 150 Cannon-Fenske, or equivalent, viscosimeter. Allow the solution to equilibrate at $25 \pm 0.1^{\circ}$ for not less than 5 minutes. Time the flow between the two marks on the viscosimeter, and record the flow time, $t_{1}$, in seconds. Calculate the kinematic viscosity, $(K V)_{1}$, of the Microcrystalline Cellulose taken by the formula:

$$
t_{1}\left(k_{1}\right)
$$

in which $k_{1}$ is the viscosimeter constant (see Viscosity $\langle 911\rangle$ ). Obtain the flow time, $t_{2}$, for a 0.5 M cupriethylenediamine hydroxide solution using a number 100 CannonFenske, or equivalent, viscosimeter. Calculate the kinematic viscosity, $(K V)_{2}$, of the solvent by the formula:

$$
t_{2}\left(k_{2}\right)
$$

in which $k_{2}$ is the viscosimeter constant. Determine the relative viscosity, $\eta_{r e l}$, of the Microcrystalline Cellulose specimen taken by the formula:

$$
(K V)_{1} /(K V)_{2}
$$

Determine the intrinsic viscosity, $[\eta] c$, by interpolation, using the Intrinsic Viscosity Table in the Reference Tables section. Calculate the degree of polymerization, $P$, by the formula:

$$
(95)[\eta] c / W_{s}[(100-\% L O D) / 100]
$$

in which $W_{S}$ is the weight, in g , of the Microcrystalline Cellulose taken; and $\% L O D$ is the value obtained from the test for Loss on drying. The degree of polymerization is not greater than 350 .

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , the total combined molds and yeasts count does not exceed 100 cfu per $g$, and it meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa and for absence of Escherichia coli and Salmonella species.

Conductivity-Shake about 5 g with 40 mL of water for 20 minutes, and centrifuge. Retain the supernatant for use in the $p H$ test. Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard having a conductivity of $100 \mu \mathrm{~S}$ per cm , measure the conductivity of the supernatant after a stable reading is obtained, and measure the conductivity of the water used to prepare the test specimen. The conductivity of the supernatant does not exceed the conductivity of the water by more than $75 \mu \mathrm{~S}$ per cm .
$\mathbf{p H}\langle 791\rangle$ : between 5.0 and 7.5 in the supernatant obtained in the Conductivity test.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $7.0 \%$ of its weight, or some other lower percentage, or is within a percentage range, as specified in the labeling.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Bulk density-Use a volumeter that has been fitted with a $10-$ mesh screen. The volumeter is freestanding of the brass or stainless steel cup, which is calibrated to a capacity of $25.0 \pm 0.05 \mathrm{~mL}$ and has an inside diameter of $30.0 \pm 2.0$ mm . Weigh the empty cup, position it under the chute, and slowly pour the powder from a height of $5.1 \mathrm{~cm}(2$ inches) above the funnel through the volumeter, at a rate suitable to prevent clogging, until the cup overflows. [NOTE-If excessive clogging of the screen occurs, remove the screen.] Level the excess powder, and weigh the filled cup. Calculate the bulk density by dividing the weight of the powder in the cup by the volume of the cup: the bulk density is within the labeled specification.

## Particle size distribution estimation by analytical sieving

 $\langle 786\rangle$ - [NOTE-In cases where there are no functionality-related concerns regarding the particle size distribution of the article, this test may be omitted.] Where the labeling states the particle size distribution, determine the particle size distribution as directed in the chapter.Water-soluble substances-Shake 5.0 g with about 80 mL of water for 10 minutes, filter with the aid of vacuum through filter paper (Whatman No. 42 or equivalent) into a vacuum flask. Transfer the filtrate to a tared beaker, evaporate to dryness without charring, dry at $105^{\circ}$ for 1 hour, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed $12.5 \mathrm{mg}(0.25 \%)$.

Ether-soluble substances-Place 10.0 g in a chromatographic column having an internal diameter of about 20 mm , and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at $105^{\circ}$ for 30 minutes, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 5.0 mg ( $0.05 \%$ ).

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.
Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.■1S (NF23)

## BRIEFING

Powdered Cellulose, NF 22 page 2847 and page 1307 of $P F$ 29(4) [July-Aug. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Powdered Cellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Powdered Cellulose that was prepared by the U.S. Pharmacopoeia. This draft was based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5A and 5B drafts.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Labeling | - | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| pH | + | + | + |
| Loss on drying | + | + | + |
| Residue on ignition | + | + | + |
| Water-soluble <br> substances | + | + | + |
| Ether-soluble <br> substances | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Identification C-Dispersion test (JP); Characters, Heavy metals, Microbial limits, Packaging and storage.

Specific local attributes: USP: Organic volatile impurities.
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the ADOPTION STAGE 6 document and the current $N F$ monograph include the following:
(1) Definition-No change.
(2) Packaging and storage-No change.
(3) Labeling-No change.
(4) Identification test $B$-This test is deleted. The former test $C$ is now labeled as test $B$. The deleted test is considered a func-tionality-related test, which is not appropriate for Harmonization.
(5) Identification test $C$-Now labeled as Identification test $B$. The lower limit for the degree of polymerization is deleted, as are requirements to be within the labeled specification.
(6) Microbial limits-No change.
(7) pH -No change.
(8) Loss on drying - The limit is increased to $6.5 \%$ from $6.0 \%$ to conform to EP and JP standards. The drying time is increased from 2 hours to 3 hours.
(9) Residue on ignition-The addition of sulfuric acid is allowed. The limit has not changed.
(10) Water-soluble substances-No change.
(11) Ether-soluble substances-No change.
(12) Heavy metals-No change.
(13) Organic volatile impurities-No change.
(EMC: J. Lane) RTS-41235-10

## Powdered Cellulose

\#-Powdered Cellulose is purified, mechanieally disintegrated cellulose prepared by processing alpha celltt lose obtained as a pulp from fibrous plant materials.

Packaging and storage Preserve in tight containers.
Labeling. The labeling indieate the neminal-degree of pelymer ization value. Degree of polymerization compliance is determined using Identification test $C$.

## Identification-

A: Prepare indinated zine chloride solution by dissolving 20 g of zine chloride and 6.5 g of petassimm iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Powdered Cellulese on wateh glass, and disperse in 2 mL of iodinated zine chloride solution: the substance takes on a violet bletecolor.

B: Mix 30 g with 270 mL of water in a single-speed, hight speed (equal to or greater than $18,000-\mathrm{rpm})$ power blender that has a clover shape jar design for 5 minutes. The jar and blades meet the following speciffentions: the jar has an inside diameter of 7.0 em at the bettom and 9.2 cm at the top, and an overall height of 21.9 cm ; and the 4 blades are arranged so that 2 of the blades are peinted up and 2 are peinted down. Transfer 100 mL of the disper
sion to a 100 mL graduated cylinder, and allow to stand for 1 hour: the Powdered Cellulose settles in the cylinder, and a supernatant liquid appears above the layer of the cellulose.
C: Transfer 0.25 of Powdered-Cellulose, aceurately weighed to 0.1 mg , to a 125 mL conienl flask. Proceed as direeted for Identification test $B$ under Mieroerystalline Cellullose, begin ning with " Add 25.0 mL of water." The degree of polymerization is be ween 440 and 2250 and is within the labeled speciffention.
Mierobial limits $\langle 64$-The tatallabic mierobial count not exceed 1000 efu per g, the total combined molds and yeasts count does not exceed 100 efuper g, and it meets the requirement of the tests for absenee of Staphytococus atreus and Psedemand teruginesa and for absence of Eseherichiceoli and Salmenellat species.
$\mathbf{p H}\langle 797\rangle$-Mix 10 g with 90 mL of water, and allow to stand with oceasional-stirring for 1 hour: the pH -f the supernatant liquid is between 5.0 and 7.5.
Less ondrying $\left\langle 731\right.$ ) - Dry it at $105^{\circ}$ for 2 hours: it loses not more than $6.0 \%$ of its weight.
Residue-on-ignition- $\langle 284$ ): not more than 0.3\%, caleulated on the dried basis, the addition of sulfuric acid being omitted frem the procedure.
Water-soluble-substanees Mix 6.0 g with $90-\mathrm{mL}$ of recently beiled and cooled water, and allow to stand with oceasional stirring for 10 minttes. Filter, with the aid of vaettm, diseard the frist 10 mL of the filtrate, and pass the filtrate through the same filter a second time, if necessary, to obtain a clear filtrate. Evaporate a 15.0 mL portion of the filtrate in a tared evaporating dish to dryness without chatring, dry at $105^{\circ}$ for 1 hour, cool in a desiecator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination doe not eweed 15.0 mg ( $1.5 \%$ )

Ether-soluble substanees Place 10.0 gin achrematography col umm having an internal diameter of about 20 mm , and pass 50 mL of peroxide free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has ewaperated, dry the residue at $105^{\circ}$ for 30 minntes, cool in a desiecater, and weigh: the difference be ween the weight of the residue and the weight obtained from a blank determination does not exeeed 15.0 mg ( $0.15 \%$ )
Heary metals, Meth $I\langle\langle 234\rangle:-0.001 \%$.
Organic volatile impurities, Method $W\langle\langle 467\rangle$ : meets the requirements.

Labeling-The labeling indicates the nominal degree of polymerization value. Degree of polymerization compliance is determined using Identification test $B$.

## Identification-

A: Prepare iodinated zinc chloride solution by dissolving 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for $15 \mathrm{~min}-$ utes. Place about 10 mg of Powdered Cellulose on a watch glass, and disperse in 2 mL of iodinated zinc chloride solution: the substance takes on a violet-blue color.
B: Transfer 0.25 g of Powdered Cellulose, accurately weighed to 0.1 mg , to a $125-\mathrm{mL}$ conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanical shaker until completely dissolved. Transfer 7.0 mL of the solution to a calibrated number 150 Cannon-Fenske, or equivalent, viscosimeter. Allow the solution to equilibrate at $25 \pm 0.1^{\circ}$ for not less than 5 minutes. Time the flow between the two marks on the viscosimeter, and record the flow time, $t_{1}$, in seconds. Calculate the kinematic viscosity, $(K V)_{1}$, of the Powdered Cellulose taken by the formula:

$$
t_{1}\left(k_{1}\right)
$$

in which $k_{1}$ is the viscosimeter constant (see Viscosity $\langle 911\rangle$ ). Obtain the flow time, $t_{2}$, for a 0.5 M cupriethylenediamine hydroxide solution using a number 100 CannonFenske, or equivalent, viscosimeter. Calculate the kinematic viscosity, $(K V)_{2}$, of the solvent by the formula:

$$
t_{2}\left(k_{2}\right)
$$

## ■ Powdered Cellulose

» Powdered Cellulose is purified, mechanically disintegrated cellulose prepared by processing alpha cellulose obtained as a pulp from fibrous plant materials.

Packaging and storage-Preserve in tight containers.
in which $k_{2}$ is the viscosimeter constant. Determine the relative viscosity, $\eta_{\text {rel }}$, of the Powdered Cellulose specimen taken by the formula:

$$
(K V)_{1} /(K V)_{2} .
$$

Determine the intrinsic viscosity, $[\eta]$ c, by interpolation, using the Intrinsic Viscosity Table in the Reference Tables section. Calculate the degree of polymerization, $P$, by the formula:

$$
(95)[\eta] c / W_{s}[(100-\% L O D) / 100],
$$

in which $W_{s}$ is the weight, in g , of the Powdered Cellulose taken; and $\% L O D$ is the value obtained from the test for Loss on drying. The degree of polymerization is greater than 440.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , the total combined molds and yeasts count does not exceed 100 cfu per g , and it meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa and for absence of Escherichia coli and Salmonella species.
$\mathbf{p H}\langle 791\rangle$-Mix 10 g with 90 mL of water, and allow to stand with occasional stirring for 1 hour: the pH of the supernatant is between 5.0 and 7.5 .

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $6.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.3 \%$, calculated on the dried basis.

Water-soluble substances-Mix 6.0 g with 90 mL of recently boiled and cooled water, and allow to stand with occasional stirring for 10 minutes. Filter, with the aid of vacuum, discard the first 10 mL of the filtrate, and pass the filtrate through the same filter a second time, if necessary, to obtain a clear filtrate. Evaporate a $15.0-\mathrm{mL}$ portion
of the filtrate in a tared evaporating dish to dryness without charring, dry at $105^{\circ}$ for 1 hour, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed 15.0 mg (1.5\%).

Ether-soluble substances-Place 10.0 g in a chromatography column having an internal diameter of about 20 mm , and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at $105^{\circ}$ for 30 minutes, cool in a desiccator, and weigh: the difference between the weight of the residue and the weight obtained from a blank determination does not exceed $15.0 \mathrm{mg}(0.15 \%)$.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.■1S (NF23)

## Briefing

Croscarmellose Sodium, NF 22 page 2856 and page 702 of $P F$ 30(2) [Mar.-Apr. 2004]. A modification is made in the test for Degree of substitution to correct the endpoint color to agree with the harmonization text.
(EMC: J. Lane) RTS-41224-1

## Change to read:

## Crosearmellose Sodium

H-Crosearmellose Sodium is a cross linked polymer of earboxymethyleellulose sodium.

Packaging and-storage Preserve in tight containers.

## Identification-

A: Mix $1 \frac{\mathrm{~g}}{\mathrm{~g}}$ of it with 100 mL of methylene blue solution ( 1 im 250,000 ), stir the mixture, and allow it to settle: the Cresearmellese Sodium absorbs the methylene blue and settles as a blue, fibrous mass.

B: Mix 1 g of it with 50 mL of water. Transfer 1 mL of the mixture to a small test tube, and add 1 mL of water and 5 drops of 1 naphthel TS. Ineline the test ube, andearefully add 2 mL of sut furic acid dow the side so that it forms a lower layer: a red purple color develops at the interface.

6: A pertion of the mixture of it with water, prepared as directed in Identifion test $B$, respends to the tests for Sodium〈194〉:
$\mathbf{p H}(794\rangle$ - Mix 1 g of it with-99-mL of water for 1 hour: the pH of the dispersion is between 5.0 and 7.0 .
Loss-0n-drying $\left\langle 734\right.$ ) Dry it at $105^{\circ}$ to constant weight: it loses net more than $10.0 \%$ of its weight.
Sodium-chloride and-sodium-glyeolate-
SODH: CHLORIDE. Weigh aceurately about 5 of it into - 250 mL beaker, add 50 mL of water and 5 mL of $30 \%$ hydrogen per exide, and heat on a steam bath for 20 minutes, stirring oecasion ally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitrie acid, and titrate with 0.05 N silver nitrate VS , determining the endpoint potentiometrieally, using a silver based indientor elee trode and a double jumetion reference electrode containing $10 \%$ potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly (see Ti trimetry (544) ). Caleulate the percentage of sodium chloride in the specimen taken by the formmata:

$$
584.4 V N H[(100-b) 47
$$

in which $V$ and $N$ represent the volume, in mL , and the nommality, respectively, of the-silver nitrate, $b$ is the pereentage of Less on drying, determined separately, $W$ is the weight, in of, of the-speei men, and 584.4 is an equivalenee factor for sodium-chloride.

SODUM-GLYCOLATE Transfer about 500 mg of it, aceurately weighed, inte a 100 mL beaker, meisten thereughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass red to ensure proper hydration (usually abeut 15 minutes). Slowly add 50 mL of acetone, with stirring, then add 1 g of sodium ehloride, and stir for several minutes to ensure eomplete precipita tion of the earbexymethyleellulese. Filter threugh aseft, open tex fared paper, previensly wetted with a small amennt of acetene, and evllect the flltrate in a 100 mL volumetric flask. Use an additionat 30 mL of acetone to facilitate the transfer of the selids and to wash the filter cake, then dilute with acetone to volume, and mix.

Prepare a-series of standard solutions as follows. Transfer 100 mg of glyeolic acid, previously dried in a desiceator at roem tem perature overnight and aceurately weighed, to a 100 mL volut metric flask, dissolve-in water, dilute with water to volume, and mix. Use this selution within 30-days. Transfer 1.0, 2.0, 3.0, and 4.0 mL pertions of the selation, respectively, to separate 100 mL volumetric flacks, add water to each flask to make 5 mL , then ade 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Transfer 2.0 mL of the test solution and 2.0 mL of each standard selution teseparate 25 mL velumetric flacks, and prepare a blank flask eontaining 2.0 mb of a selution containing $5 \%$ each of glaciat acetic aeid and water in acetene. Place the uncovered flasks in a beiling water bath for 20 minutes, aceurately timed, to remove the acetone, remove from the bath, and cool. Add to each flask 5.0 mL of 2,7 dihydroxynaphthatene TS , mix, add an additionat 15 mL , and again mix. Gover the mouth of each flack with a-small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 minutes, then remove from the bath, cool, dilute-with sulfuric acid to volume, and mix.

Determine the abserbance of each selution at 540 nm, with a suitable-spectrephotemeter, against the blank, and prepare-a-standardeurve using the absorbanees-obtained from the-standard soltr
tions. From the standard curve and the absorbance of the test specimen, determine the weight (w), in mg, of glycolic acid in the specimen, and calculate the percentage of sodium glycolate in the specimen taken by the formmat:

$$
12.9 w /[(100-b) H]
$$

in which 12.9 is a factor eonverting sfyeolic acid to sodium glyeetate, $b$ is the pereentage of Lass an drying, determined separately, and $W$ is the weight, in s, of the specimen. The sum of the pereentages of sodium chloride and sodium glycolate is not more than $0.5 \%$.
Heary metats, Method $I T\langle Z 31\rangle:-0.001 \%$.
Degree of substitution Transfer about 1 g of it, aceurately weighed, to a glass stoppered, 500 mL conieal flask, add 300 mL of sodium chloride solution ( 1 in 10 ), then add $25.0-\mathrm{mL}$ of 0.1 N sodium hydroxide VS. Insert the stopper, and allow to stand for 5 minates with intermittent shaking. Add 5 drops of m- eresel purple TS, and from abure add about 15 mL of 0.1 N hydrochlorie acidVS. Insert the stopper in the flask, and shake. If the solution is purple, add 0.1 N hydrochloric acid VS in 1 mL portions until the solution beemes yellow, shaking after each addition. Titrate with $\theta .1 \mathrm{~N}$ sodimm hydroxide VS to a priple endpoint. Caleulate the net number of milliequivalents, $M$, of base required for the neutralization of 1 g of Croseamellose Sodium, on the dried basis. Deter mine the pereentage of residue on ignition, $C$, of the Groseamellose Sodium on the dried basis as directed under Resi the on Ignition $\langle 281\rangle$, using sufficient culfaric acid to meisten the entire residue after the initial-charring step, and additional sulfurie acid if an exeessive amount of carbonaceous material remains after the initial complete volatilization of white fumes.
Galeulate the degree of acid earboxymethyl substitution, A, taken by the formma:-

$$
1150 \mathrm{M} /(7102 \quad-412 \mathrm{M} \quad 80 \mathrm{C})
$$

Galculate the degree of sodium carboxymethyl substitution, $S$, ta ken by the formula:

$$
(162+584) C 1(7102 \quad 806)
$$

The degree of substitution is the sum of $A+S$. It is been 0.60 and 0.85 , caleulate on the dried basis.
Content of water-soluble material-Disperse about 10 g, ac eurately weighed, in 800 mL of water, aceurately measured, and stir for 1 minute every 10 minutes during the first 30 minutes. At tou to stand for an additional heur, or centrifuge, if neeessary. De ean about 200 mL of the queous slumy onto a rapid flltering fller paper in a vacuum filtration funnel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared 250 mL beaker, weigh aceurately, and calculate the weight, in g, of the fil trate, $\mathrm{H}_{3}$, by difference. Coneentrate on a hot plate a amall vol ume, but not to dryness, dry at $105^{\circ}$ for 4 houtrs, again weigh, and ealeulate the weight, in g , of residue- $H_{+}$, by difference. Caleulate the pereentage of water soluble material in the-specimen, on the dried basis, taken by the formula:-

$$
100 H_{+}\left(800+H_{2}\right)\left[H_{2} H_{2}(1-0.01 b)\right],
$$

in which $H_{2}$ is the weight, in $\frac{5}{5}$, of the specimen taken, and $b$ is the pereentage Less on drying of the specimen taken. It is between $4.0 \%$ and $10.0 \%$.
Settling volume $\mathrm{Te}-75 \mathrm{~mL}$ of water in a 100 mL graduated cy linder add 1.5 g of it in 0.5 g pertions, shaking vigoreusly after each addition. Add water to make 100 mL , shake again until all of the powder is homegeneously distributed, and allow to stand for 4 hours. Note the volume of the settled mass. It is between 10.0 and 30.0 mL .

Organie volatile imptrities, Metha $I V\langle 467)$ : meets the requirements.

## ${ }^{\Delta}$ Croscarmellose Sodium

» Croscarmellose Sodium is the sodium salt of a cross-linked, partly $O$-(carboxymethylated) cellulose.

## Change to read:

Packaging and storage-Preserve in well-closed containers. ${ }^{\text {D }}$ No storage requirements specified. ${ }^{1 S}$ (NF23)

## Identification-

A: Mix 1 g of it with 100 mL of methylene blue solution (1 in 250,000 ), stir the mixture, and allow it to settle: the Croscarmellose Sodium absorbs the methylene blue and settles as a blue, fibrous mass.

B: Mix 1 g of it with 50 mL of water. Transfer 1 mL of the mixture to a small test tube, and add 1 mL of water and 5 drops of 1-naphthol TS. Incline the test tube, and carefully add 2 mL of sulfuric acid down the side so that it forms a lower layer: a reddish-violet color develops at the interface.

C: A portion of the mixture of it with water, prepared as directed in Identification test $B$, responds to the flame test for Sodium $\langle 191\rangle$.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , the total combined molds and yeasts count does not exceed 100 cfu per g , and it meets the requirements of the tests for absence of Escherichia coli. $\mathbf{p H}\langle 791\rangle$-Mix 1 g of it with 100 mL of water for 5 min utes: the pH of the dispersion is between 5.0 and 7.0.
Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 6 hours: it loses not more than $10.0 \%$ of its weight.

## Sodium chloride and sodium glycolate-

SODIUM CHLORIDE-Weigh accurately about 5 g of it into a $250-\mathrm{mL}$ beaker, add 50 mL of water and 5 mL of 30 percent hydrogen peroxide, and heat on a steam bath for 20
minutes, stirring occasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitric acid, and titrate with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-based indicator electrode and a double-junction reference electrode containing $10 \%$ potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly (see Titrimetry $\langle 541\rangle$ ). Calculate the percentage of sodium chloride in the specimen taken by the formula:

$$
584.4 V N /[(100-b) W]
$$

in which 584.4 is the equivalence factor for sodium chloride; $V$ and $N$ represent the volume, in mL , and the normality, respectively, of the silver nitrate; $b$ is the percentage of Loss on drying, determined separately; and $W$ is the weight, in g , of the specimen.

## SODIUM GLYCOLATE-

Test solution-Transfer about 500 mg of Croscarmellose Sodium, accurately weighed, into a $100-\mathrm{mL}$ beaker, moisten thoroughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 minutes). Slowly add 50 mL of acetone, with stirring, then add 1 g of sodium chloride, and stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a soft, opentextured paper, previously wetted with a small amount of acetone, and collect the filtrate in a $100-\mathrm{mL}$ volumetric flask. Use an additional 30 mL of acetone to facilitate the transfer of the solids and to wash the filter cake, then dilute with acetone to volume, and mix.

Standard solutions - Transfer 100 mg of glycolic acid, previously dried in a desiccator at room temperature overnight and accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 30 days.] Transfer 1.0-
$\mathrm{mL}, 2.0-\mathrm{mL}, 3.0-\mathrm{mL}$, and $4.0-\mathrm{mL}$ portions of the solution, respectively, to separate $100-\mathrm{mL}$ volumetric flasks, add water to each flask to make 5 mL , then add 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Procedure-Transfer 2.0 mL of the Test solution and 2.0 mL of each of the Standard solutions to separate $25-\mathrm{mL}$ volumetric flasks, and prepare a blank flask containing 2.0 mL of a solution containing $5 \%$ each of glacial acetic acid and water in acetone. Place the uncovered flasks in a boiling water bath for 20 minutes, accurately timed, to remove the acetone, remove from the bath, and cool. Add to each flask 5.0 mL of 2,7-dihydroxynaphthalene TS, mix, add an additional 15 mL , and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 minutes, then remove from the bath, cool, dilute with sulfuric acid to volume, and mix.

Determine the absorbance of each solution at 540 nm , with a suitable spectrophotometer, against the blank, and prepare a standard curve using the absorbances obtained from the Standard solutions. From the standard curve and the absorbance of the Test solution, determine the weight (w), in mg, of glycolic acid in the Test solution, and calculate the percentage of sodium glycolate in the portion of Croscarmellose Sodium taken by the formula:

$$
12.9 w /[(100-b) W],
$$

in which 12.9 is a factor converting glycolic acid to sodium glycolate; $b$ is the percentage of Loss on drying, determined separately; and $W$ is the weight, in g , of Croscarmellose Sodium taken to prepare the Test solution. The sum of the percentages of sodium chloride and sodium glycolate is not more than $0.5 \%$.

## Change to read:

Residue on ignition $\langle 281\rangle$ : between $14.0 \%$ and $28.0 \%$, calculated on the dried basis, about 1.0 g being used for the test, using sufficient sulfuric acid to moisten the entire residue after the initial charring step, and additional sulfuric acid if an excessive amount of carbonaceous material remains after the initial complete volatilization of white fumes. Ignition merature $60 \pm 50^{\circ}-\square_{1 S}$ (NF23)

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.

## Change to read:

Degree of substitution-Transfer about 1 g of it, accurately weighed, to a glass-stoppered, $500-\mathrm{mL}$ conical flask, add 300 mL of sodium chloride solution ( 1 in 10), then add 25.0 mL of 0.1 N sodium hydroxide VS. Insert the stopper, and allow to stand for 5 minutes with intermittent shaking. Add 5 drops of $m$-cresol purple TS, and from a buret add about 15 mL of 0.1 N hydrochloric acid VS. Insert the stopper in the flask, and shake. If the solution is ${ }^{\text {vio- }}$ let, $1 \mathrm{SS}\left({ }_{\text {NF23 }}\right)$ add 0.1 N hydrochloric acid VS in $1-\mathrm{mL}$ portions until the solution becomes yellow, shaking after each addition. Titrate with 0.1 N sodium hydroxide VS to a purple ${ }^{\text {violet }}{ }_{1 S}{ }_{\text {(NF23) }}$ endpoint. Calculate the net number of milliequivalents, $M$, of base required for the neutralization of 1 g of Croscarmellose Sodium, on the dried basis.

Calculate the degree of acid carboxymethyl substitution, $A$, by the formula:

$$
1150 M /(7102-412 M-80 C)
$$

in which $C$ is the percentage of residue on ignition of the Croscarmellose Sodium as determined in the test for Residue on Ignition $\langle 281\rangle$.

Calculate the degree of sodium carboxymethyl substitution, $S$, by the formula:

$$
(162+58 A) C /(7102-80 C)
$$

The degree of substitution is the sum of $A+S$. It is between 0.60 and 0.85 , calculated on the dried basis.

Content of water-soluble material-Disperse about 10 g , accurately weighed, in 800 mL of water, accurately measured, and stir for 1 minute every 10 minutes during the first 30 minutes. Allow to stand for an additional hour, or centrifuge, if necessary. Decant about 200 mL of the aqueous slurry onto a rapid-filtering filter paper in a vacuum filtration funnel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared $250-\mathrm{mL}$ beaker, weigh accurately, and calculate the weight, in g , of the filtrate, $W_{3}$, by difference. Concentrate on a hot plate to a small volume, but not to dryness, dry at $105^{\circ}$ for 4 hours, again weigh, and calculate the weight, in g , of residue $W_{1}$, by difference. Calculate the percentage of water-soluble material in the specimen, on the dried basis, taken by the formula:

$$
100 W_{1}\left(800+W_{2}\right) /\left[W_{2} W_{3}(1-0.01 b)\right]
$$

in which $W_{2}$ is the weight, in g , of the specimen taken; and $b$ is the percentage Loss on drying of the specimen taken: not more than $10.0 \%$ is found.

Settling volume-To 75 mL of water in a $100-\mathrm{mL}$ graduated cylinder add 1.5 g of it in $0.5-\mathrm{g}$ portions, shaking vigorously after each addition. Add water to make 100 mL , shake again until all of the powder is homogeneously distributed, and allow to stand for 4 hours. Note the volume of the settled mass. It is between 10.0 and 30.0 mL .

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements. $\mathbf{\Delta F F 2 3}$

BRIEFING

Ethylparaben, NF 22 page 2866 and page 1968 of PF 28(6) [Nov.-Dec. 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this monograph. The presented text represents the ADOPTION STAGE 6 draft in the harmonization process.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |

| Definition | + | + | + |
| Identification A | + | + | + |
| Appearance of <br> solution | + | + | + |
| Acidity | + | + | + |
| Related substances ${ }^{*}$ | + | + | + |
| Sulphated ash | + | + | + |
| Assay | + | + | + |

* JP will not include the system suitability requirement and consequently will not include reference solution (b).

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Identification by infrared spectrophotometry, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Local requirements: JP: Heavy metals ( 20 ppm ); USP: Organic volatile impurities.

Differences between the ADOPTION STAGE 6 document and the current $N F$ monograph include the following:
(1) In the opening paragraph (the Definition)-Calculations using the dried substance are deleted, as the Loss on drying test is deleted. The acceptance range has been widened.
(2) Packaging and storage - No change.
(3) USP Reference standards-The reference standard for Methylparaben has been added for the Related substances test.
(4) Identification-The test for Melting range has been moved under Identification.
(5) Color of solution - This test is added to comply with EP standards.
(6) Melting range-Moved under Identification.
(7) Acidity-The EP test method has replaced the current USP method.
(8) Loss on drying-Deleted.
(9) Residue on ignition-The limits are increased to not more than $0.1 \%$ to comply with EP standards.
(10) Organic volatile impurities-No change.
(11) Related substances-This test is added to comply with EP standards.
(12) Assay-The sample amount and the amount of 1 N sodium hydroxide has changed and the heating process has changed to a specific temperature and does not include refluxing.
(EMC: J. Lane) RTS-41235-9

## Ethylparaben

## $\epsilon_{2} H_{42} \theta_{2} \quad 166.17$

Benzoic acid, 4 hydroxy, ethyl ester.
Ethylp hydroxybenzonte $\quad[120-478]$.
\#Ethylparaben contains not less than-99.0 percent and net more than 100.5 percent of $\mathrm{C}_{9} \mathrm{H}_{49} \Theta_{3}$, caleulated on the dried basis.

Packaging and-storage- Preserve in well closed containers.
USP Reference-standards- $\langle 4\rangle$-USP Ethylparaben RS.
Identification, Infrated Absorption- 197 M ) :
Melting range $\langle 744\rangle$ :- between $115^{\circ}$ and $118^{\circ}$.
Organic volatile impurities, Methed $W$ (467): meets therequirements.
Other requirements It meets the requirements for Acidity, Less en drying, and Residue on ignition under Bullparaben.
Assay Proceed with Ethylparaben as directed in the Assay under Buthiparaben. Each mL of 1 N soditm hydroxide is equivalent to $166.2 \mathrm{mg}_{\mathrm{of}} \mathrm{C}_{9} \mathrm{H}_{40} \mathrm{O}_{2}=$

## Ethylparaben

$\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3} \quad 166.17$

Benzoic acid, 4-hydroxy-, ethyl ester.

Ethyl p-hydroxybenzoate [120-47-8].
» Ethylparaben contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3}$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Ethylparaben RS. USP Methylparaben RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Melting range $\langle 741\rangle$ : between $96^{\circ}$ and $99^{\circ}$.
Color of solution-Dissolve 1 g in alcohol, dilute with alcohol to 10 mL , and mix (Ethylparaben solution). This solution is clear and not more intensely colored than alcohol or a solution prepared immediately before use by mixing 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL , and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL . Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

Acidity-To 2 mL of Ethylparaben solution prepared in the Color of solution test add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS, and titrate with 0.10 N sodium hydroxide: not more than 0.1 mL is required to produce a blue color.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

## Related substances-

Test solution-Prepare a solution of Ethylparaben in acetone containing 10 mg per mL .
Standard solutions-Transfer 0.5 mL of the Test solution to a $100-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix (Standard solution A). Dissolve 10 mg , accurately weighed, of USP Methylparaben RS in 1 mL of the Test solution, and dilute with acetone to 10 mL (Standard solution $B$ ).

Procedure-Separately apply $2 \mu \mathrm{~L}$ of the Test solution and $2 \mu \mathrm{~L}$ of each Standard solution to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ), coated with a $0.25-\mathrm{mm}$ layer of chromatographic octadecylsilanized silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid ( $70: 30: 1$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution with that of the principal spot in the chromatogram of Standard solution $A$ : the intensity of any individual secondary spot in the chromatogram of the Test solution is not greater than that of the principal spot obtained in the chromatogram of Standard solution $A(0.5 \%)$. The test is not valid unless the chromatogram obtained with Standard solution $B$ shows two clearly separated principal spots.

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.

Assay-Transfer about 1.000 g of Ethylparaben, accurately weighed, to a flask fitted with a ground-glass stopper. Add 20.0 mL of 1 N sodium hydroxide VS, and heat at about $70^{\circ}$ for 1 hour. Cool rapidly in an ice bath. Carry out the titration of the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ). Each mL of 1 N sodium hydroxide is equivalent to 166.2 mg of $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{3 \cdot \text {-1 }}$ (NF23)

## Methylparaben

## $\mathrm{E}_{8} \mathrm{H}_{8} \mathrm{O}_{3} \quad 152.15$

Benzoic acid, 4 hydroxy, methyl ester.
Methyl $p$ hydroxybenzonte $[99-76-3]$.

H-Methylparaben contains not less than-99.0 percent and not more than 100.5 percent of $\mathrm{C}_{8} \mathrm{H}_{8} \Theta_{3}$.

Packaging and storage- Preserve in well closed containers.
USP Referenee-standards- $\langle H\rangle$-USP Methylparaben RS. USP Ethylpaben RS.

## Identifiention-

A: Infrated Absorption- 197 M$\rangle$ =
B: The principal spet obtained in the chrematogram- of Test solution B prepared as directed in the test for Chromatographic purity correspends in size and $R_{+}$value to that of the principal sper ebtrined from Standed solution- $B$.

C: Transfer about 10 mg to a tube, add 1 mL of sodium earbonate TS, mix, beil for 30 seconds, and cool (Test solution - 4). Transfer about 10 mg to seend test tube, add 1 mL of sodimm earbenate TS, and mix (Test solution B). [NOTE-The Methylparaben partly dissolves in Test solution B.]-Prepare a solution of 4 aminountipyrine in pH 9.0 alkaline berate buffer containing 4 mes per mL . Simultaneously add 5 mL of the- 4 amineantipyrine solution and 0.5 mL of potassium ferricyanide TS to Test solution $A$ and Test solution $B$, and mix: Test solution $B$ beemer yellow to erange brown and Test solution $A$ beeomes orange to red, with the coler of Test solution $A$ being clearly more intense than any similar color that may be obtained with Test solution $B$.
Color of solution Dissolve 1 g in alcohol, dilute with aleohol to 10 mL , and mix (Methylparaben solution). This solution is clear and not more intensely colored than a solution prepared immediately before use by mixing 2.4 mL of ferric chloride $\mathrm{CS}, 1.0 \mathrm{~mL}$ of eobaltous chloride $C S$, and 0.4 mL of eupric sulfate $C S$ with -0.3 N hydrechloric acid to make 10 mL , and diluting 5 mL of this solttion with 0.3 N hydrechlorie acid to make 100 mL . Make the eom parisen by viewing the solutions downward in matehed color emparisen tubes ggainst a white surface (see Color and Achromieif $\langle 634$ ) ).
Aeidity To 2 mL of Methylparable prepared in the Cot Or of solution test add 3 mL of aleohel, 5 mL of earben dioxidefree water, and 0.1 mL of bromoresol green TS, and titratewith 0.10 N sodium hydroxide: not more than 0.1 mL is required to produee ablue coler.
Residmeon-ignition- $\langle z 81\rangle$ : not mere than $0.1 \%$.

## Ghromatographie ptrity -

Fest solutions. Prepare a solution of Methylparaben in acetone eontaining 10 mg per mL (Test solution A). Transfer 1.0 mL of this solution to a 10 mL velumetric flack, dilute with acetone to vol the, and mix (Test soltion B).

Standard solutions. Transfer 0.5 mL of Test solution A to a 100 mL volumetric flask, dilute with acetone to volume, and mix (Stan dard solion 4). Dissolve an aceurately weighed quantity of USP Methylparaben PS in aeetone, and mix tobtain a solution having a known concentration of about 1 mg per mb (Standard solution B). Transfer about 10 mg of USP Ethylparaben-RS, aeeurately weighed, to a 10 mL volumetric flack, dissolve in- 1 mL of Test solution A, dilute with neetone to velume, and mix (Standeted solution $C$ ).
Preedure Separately apply $2 \mu \mathrm{~L}$ of each Test solution and 2 $\mu$ L of each Standard solution to a hin layer ehrematographic plate (seeChromtograpy $\langle 624$ ) ) matographic octadecylsilanized siliea gel mixtare. Pevelop the ehromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid ( $70: 30: 1$ ) until the sol vent front has moved about three fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short wavelength UV light, and eompare the intensities of any seeondary spots observed in the chrematogram of Test solution $A$ with that of the prineipal spet in the chromatogram of Stand solution A: the intensity of any individual secondary spot in the chromatogram-of Test solution $A$ is not greater than that of the prineipal spot obtained in the chromatogram of Standed solution $4(0.5 \%)$. The test is not valid unless the ehromatogram obtained with Standerd solution $-G$ shows two clearly separated principal-spets.
Melting range $\langle 744\rangle$ : be $125^{\circ}$ and $128^{\circ}$.
Organie volatile impurities, Methed $I V\langle 467\rangle$ : meets the requirements.
Assay Transfer about 2 gof Methylparaben, aceuraty weighed, to a flack fitted with a ground glass stopper and equipped for refluxing under a water cooled condenser. Add -40.0 mL of $1 \mathrm{~N}-\mathrm{se}$ dium hydroxide VS, and reflux for 1 hour. Cool to reom temperature, and rinse the condenser with water. Titrate the exeess sodium hydroxide with-1N sulfuric acid VS, continuing the titration until the second point of inflection and determining the end peint petentiometrieally (see Titrimetry $\langle 544$ ) ). Perform a blank determination (see Residual Titrations under Titrimetry (544)). Each mL of 1 N soditm hydroxide is equivalent to 152.2 mg of $\mathrm{G}_{8} \mathrm{H}_{8} \mathrm{O}_{3}=$

## Methylparaben

$\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{3} \quad 152.15$

Benzoic acid, 4-hydroxy-, methyl ester.

Methyl p-hydroxybenzoate [99-76-3].

## » Methylparaben contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{3}$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Ethylparaben RS. USP Methylparaben RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Melting range $\langle 741\rangle$ : between $125^{\circ}$ and $128^{\circ}$.
Color of solution-Dissolve 1 g in alcohol, dilute with alcohol to 10 mL , and mix (Methylparaben solution). This solution is clear and not more intensely colored than alcohol or a solution prepared immediately before use by mixing 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL , and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL . Make the comparison by viewing the solutions downward in matched colorcomparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

Acidity-To 2 mL of Methylparaben solution prepared in the Color of solution test add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS, and titrate with 0.10 N sodium hydroxide: not more than 0.1 mL is required to produce a blue color.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

## Related substances-

Test solution-Prepare a solution of Methylparaben in acetone containing 10 mg per mL .

Standard solutions-Transfer 0.5 mL of the Test solution to a $100-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix (Standard solution A). Dissolve 10 mg , accurately weighed, of USP Ethylparaben RS in 1 mL of the Test solution, and dilute with acetone to 10 mL (Standard solution $B)$.

Procedure-Separately apply $2 \mu \mathrm{~L}$ of the Test solution and $2 \mu \mathrm{~L}$ of each Standard solution to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ), coated with a $0.25-\mathrm{mm}$ layer of chromatographic octadecylsilanized silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid ( $70: 30: 1$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution with that of the principal spot in the chromatogram of Standard solution $A$ : the intensity of any individual secondary spot in the chromatogram of the Test solution is not greater than that of the principal spot obtained in the chromatogram of Standard solution $A(0.5 \%)$. The test is not valid unless the chromatogram obtained with Standard solution $B$ shows two clearly separated principal spots.

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.

Assay-To about 1.000 g of Methylparaben, accurately weighed, add 20.0 mL of 1 N sodium hydroxide VS, and heat at about $70^{\circ}$ for 1 hour. Cool rapidly in an ice bath. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$. Each mL of 1 N sodium hydroxide is equivalent to 152.1 mg of $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{3 \cdot \boldsymbol{\square}}$ 1S (NF23)

## BRIEFING

Propylparaben, NF 22 page 2924 and page 1970 of $P F$ 28(6) [Nov.-Dec. 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this monograph. The presented text represents the ADOPTION STAGE 6 draft in the harmonization process.

* JP will not include the system suitability requirement and consequently will not include reference solution (b).

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Identification by infrared spectrophotometry, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Local requirements: JP: Heavy metals (20 ppm); USP: Organic volatile impurities.

Differences between the ADOPTION STAGE 6 document and the current $N F$ monograph include the following:
(1) In the opening paragraph (the Definition)-Calculations using the dried substance are deleted because the Loss on drying test is deleted. The acceptance range has been widened.
(2) Packaging and storage-No change.
(3) USP Reference standards-The reference standard for Ethylparaben has been added for the Related substances test.
(4) Identification-The test for Melting range has been moved under Identification.
(5) Color of solution-This test is added to comply with EP standards.
(6) Melting range-Moved under Identification.
(7) Acidity-The EP test method has replaced the current USP method.
(8) Loss on drying-Deleted.
(9) Residue on ignition-The limits are increased to not more than $0.1 \%$ to comply with EP standards.
(10) Organic volatile impurities-No change.
(11) Related substances-This test is added to comply with EP standards.
(12) Assay-The sample amount and the amount of 1 N sodium hydroxide has changed and the heating process has changed to a specific temperature and does not include refluxing.
(EMC: J. Lane) RTS-41235-2

## Change to read:

## Propylparaben

$\mathrm{E}_{10} \mathrm{H}_{42} \mathrm{O}_{2} \quad 180.20$
Benzoic acid, 4 hydroxy, propyl ester.
Propylp hydroxybenzoate [94-13-3].
H-Propylparaben contains not less than 99.0 percent and not more than 100.5 percent of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{3}$, calet tated on the dried basis.
Paeknging and-storage-Preserve in well closed containers.
USP Referenee standards $\langle H\rangle$-USP Propylpat RS.
Identifiention, Infrated Absorption- $\langle 197 \mathrm{M}\rangle$ )=
Melting range $\langle 744\rangle$ :- berween $95^{\circ}$ and $98^{\circ}$.
Organie volatile impurities, Methed $\mathrm{H}\langle 467\rangle$ : meets the requirements.
Other requirements It meets the requirements of the tests for Aeidity, Loss on drying, and Residue on ignition under Butl paraben.
Assay Proceed with Propylparaben as directed in the Assay under Buthlparaben. Each mL of 1 N sodium hydroxide is equivalent $180.2 \mathrm{mg}_{5}$ of $\mathrm{G}_{40} \mathrm{H}_{42} \mathrm{O}_{3}=$

## Propylparaben

$\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{3} \quad 180.20$
Benzoic acid, 4-hydroxy-, propyl ester.
Propyl $p$-hydroxybenzoate [94-13-3].
» Propylparaben contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{3}$.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Ethylparaben RS. USP Propylparaben RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Melting range $\langle 741\rangle$ : between $96^{\circ}$ and $99^{\circ}$.
Color of solution-Dissolve 1 g in alcohol, dilute with alcohol to 10 mL , and mix (Propylparaben solution). This solution is clear and not more intensely colored than alcohol or a solution prepared immediately before use by mixing 2.4 mL of ferric chloride $\mathrm{CS}, 1.0 \mathrm{~mL}$ of cobaltous chloride CS , and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL , and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL . Make the comparison by viewing the solutions downward in matched col-or-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).
Acidity-To 2 mL of Propylparaben solution prepared in the Color of solution test add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS, and titrate with 0.10 N sodium hydroxide: not more than 0.1 mL is required to produce a blue color.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

## Related substances-

Test solution-Prepare a solution of Propylparaben in acetone containing 10 mg per mL .

Standard solutions-Transfer 0.5 mL of the Test solution to a $100-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix (Standard solution A). Dissolve 10 mg , accurately weighed, of USP Ethylparaben RS in 1 mL of the Test solution, and dilute with acetone to 10 mL (Standard solution B).

Procedure-Separately apply $2 \mu \mathrm{~L}$ of the Test solution and $2 \mu \mathrm{~L}$ of each Standard solution to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of chromatographic octadecylsilanized silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid $(70: 30: 1)$ until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under shortwavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the Test solution with that of the principal spot in the chromatogram of Standard solution $A$ : the intensity of any individual secondary spot in the chromatogram of the Test solution is not greater than that of the principal spot obtained in the chromatogram of Standard solution $A(0.5 \%)$. The test is not valid unless the chromatogram obtained with Standard solution $B$ shows two clearly separated principal spots.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Assay-Transfer about 1.000 g of Propylparaben, accurately weighed, to a flask fitted with a ground-glass stopper. Add 20.0 mL of 1 N sodium hydroxide VS, and heat at about $70^{\circ}$ for 1 hour. Cool rapidly in an ice bath. Carry out the titration of the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ). Each mL of 1 N sodium hydroxide is equivalent to 180.2 mg of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{3}$. 1 IS (NF23)

## Briefing

Saccharin, $N F 22$ page 2825 and page 1711 of $P F 29(5)$ [Sept.Oct. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Saccharin monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

## Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Loss on drying | + | + | + |
| Readily carbonizable <br> substances | + | + | + |
| Residue on ignition | + | + | + |
| Limit of benzoate <br> and salicylate | - | + | + |
| Assay | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Heavy metals, Melting range, Clarity of solution, Limit of toluenesulfonamides, Identification (IR), Packaging and storage.

Specific local attributes: USP: Organic volatile impurities; JP: Description.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the ADOPTION STAGE 6 document and
the current $N F$ monograph include the following:
(1) In the opening paragraph (the Definition)-The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) Packaging and storage-No change.
(3) USP Reference standards-A reference for Saccharin is added for use in the Identification test.
(4) Clarity of solution-This test is added to comply with EP standards.
(5) Color of solution-This test is added to comply with EP standards.
(6) Identification-Identification tests $A$ and $B$ are replaced with a more definitive IR absorption test.
(7) Melting range-No change.
(8) Loss on drying-No change.
(9) Readily carbonizable substances-No change.
(10) Residue on ignition-No change.
(11) Limit of toluenesulfonamides-The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method.
(12) Selenium-This test is deleted because it is unnecessary for this compound.
(13) Heavy metals-No change.
(14) Limit of benzoate and salicylate-No change.
(15) Organic volatile impurities-No change.
(16) Assay-No change.

## Change to read:

## Saceharin

$\mathrm{E}_{2} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S} \quad 183.19$
1,2 Benzisethiazol-3(2H) one, 1,1 dioxide.
1,2 Benzisothiazolin 3-one-1,1 dioxide [81-07-2].
HSaceharin contains net less than 98.0 percent and net more than 101.0 pereent of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}$, ealeulated on the dried basis.

Packaging and-storage- Preserve in well closed containers.
USP Reference standards- $\langle 4\rangle$-USP - Toltenesulfonnide RS. USP $P_{p}$ Tolterndfande RS.

## Identifieation-

A: Dissolveabent 100 mg in 5 mL of sodium hydroxide solution ( 1 in 20), evaporate the solution to drymess, and gently fuse the residue over a small flame until it no lenger evolves ammenia. A1 tow the residue to eol, dissolve it in 20 mL of water, neutralize the solution with 3 N hydrechloric acid, and filter: the addition of a drop of ferric chloride TS to the filtrate produces a violet coler.

B: Mix 20 mg with 40 mg of resoreinel, add 10 dreps of sul furie acid, and heat the mixture in a suitable liquid bath at $200^{\circ}$ for 3 minttes. Allow it to cool, and add 10 mL of water and an exeess of 1 N sodium hydroxide: a flureseent green liquid results.
Melting range $\langle 744\rangle$ :- be $226^{\circ}$ and $230^{\circ}$.
Lossondrying $\left\langle 734\right.$ ) - Dry it at $105^{\circ}$ for 2 hems: it loses not mere than $1.0 \%$ of its weight.
Readily earbonizable substanees- $\langle 274\rangle$ - Dissolve 200 mg in 5 mL of sulftrie acid TS, and keep at a temperature of $48^{\circ}$ to $50^{\circ}$ for 10 minutes: the solution has no more color than Matehing Flaid A.

Residue-0n ignition- $\langle 284\rangle$ : net mere than $0.2 \%$.
Toluenesulfonamides-
mernal stand solution Place 10 mg of n-tricosane in a 10 mL volumetric flask, dissolve in $n$ heptane, dilute with $n$ heptane to valume, and mix.

Standard stock solution Transfer 20 me weighed, of USP o Toluenesulfonamide RS and of USP $p$ - Toluenesulfenamide RS to a 10 mL volumetric flask, dissolve in methylene chloride, dilute with methylene chloride to volume, and mix.

Stan Transfer 100, 150, 200, and $250 \mu \mathrm{~L}$, re spectively, of Standard stoek solution to each of four 10 mL velt metric flasks. Add $250 \mu \mathrm{~L}$, aceurately measured, of Internat standerd solution to each flask, dilute each with methylene-chle-
ride to volume, and mix. These preparations contain, in each mL , $25 \mu \mathrm{~g}$ of $n$-trieosane and, respectively, $20,30,40$, and 50 - g of each toluenesulfonamide isomer.

Test preparation- Prepare as direeted under Column Partition Chromatography (see Chrematography ( 624 ) , employing a chromatographie tube fitted with a porous glass disk in its base, a plas tie stopeock on the delivery tube, and a reservir at the top. Add a mixture consisting of 12 g of Solid Support and a solution of 2.0 ह\%, aceurately weighed, of Saceharin with 12 mL of filtered soditm biearbenate solution ( 1 in 11). Add about 200 mg of sodium biear benate to effect complete solution of the saceharin. Pack the com tents of the tube by tapping the column on a padeled surface, and then by tamping firmly from the top. Place 100 mL of methylene ehloride in the reserveir, and adjust the stopeock so that 50 mL of eluate is collected in 20 to 30 minter. To the eluate add $25 \mu \mathrm{\mu}$ of Internal standard solution, mix, and concentrate the solution, by suitable means, to a volume of 1.0 mL .

Chromagre syist (see-Chromegraphy $\langle 624$ )) Under ypieal conditions, the instrument is equipped with a flame-ionization detector, and contains a $1.8 \mathrm{~m} \times 3.2 \mathrm{~mm}$ glass columm packed with $10 \%$ liquid phase 63 on 100 to 120 mesh suppert S1AB, utilizing a glass lined sample introduction system or on cellumn injection. The injector pert, column, and detector block are maintained at temperatures of about $225^{\circ}, 210^{\circ}$, and $250^{\circ}$, re spectively, and diry helium is used as the earrier ges at a flow rate of about 30 mL per minute.

Procedure Inject pertions (about $2.5 \mu \mathrm{~L}$ ) of the Stated pre parations, suceessively, into a gas chrematograph, and recordeach ehromatogram so as to obtain at least $50 \%$ of maximum recerder respense. Measure the areas under the first ( 8 toltenesulfenamide), second ( $p$-toluenesulfonamide), and third ( $n$ trieosane) peaks, and fer each chromatogram record the values as $A_{o}, A_{t}$, and $A_{A}$, respec tively. Caleulate the ratios $R_{0}$, and $R_{p}$ taken by the equations:

$$
R_{\theta}=A_{\theta}+A_{\#} \text { and } R_{F}=A_{p}+A_{\#} ;
$$

and prepare standard curves by plotting the concentrations, in $\mu \mathrm{g}$ per mL, of USP $\&$ Toluenesulfonamide RS and of USP $p$-Toluenesulfonamide $R S$ in the Stethedrd preparations versus $R_{s}$ and $R_{p}$, re spectively. [NOTE-Relative retention times are, approximately, $\theta .39$ for $\theta$ tolthenesulfonamide, 0.46 for $p$ toltenesulfonamide, and 1.0 for $n$ trieosane.] Similarly inject a pertion (about $2.5 \mu \mathrm{~L}$ ) ef the Test preparation, and record the chromatogram. Measure the areas under the first (o-toluenesulfonamide), second ( $p$-tolthenesut fonamide), and third (n tricosane) peaks, and record the values as $t_{s}, t_{p}$, and $t_{A}$, respectively. Caleulate the ratios - , and + , taken by the equations:-

$$
f_{0}=A_{0}+A_{t}-\text { and } r_{p}=a_{p}+A_{A_{*}} ;
$$

and, from the standard-urve, determine the concentration, in $\mu \mathrm{g}$ per mL , of each toluenesulfonamide isomer in the Test prepara tion: the total amount of toluenesulfonamides in the specimen taken is not more than $0.0025 \%$.
Selenium- $\langle 294\rangle: \quad 0.003 \%$, a 100 mg specimen, mixed with 100 mg of magnesitm oxide, being used.
Heary metals, Method $H\langle Z 34\rangle: \quad 0.001 \%$.
Benzoie and salieylic aeids To 10 mL of a hot, satrated solth tion of it add ferric chloride TS, dropwise: no precipitate or violet color appears in the liquid.
Organic volatile impurities, Method $V\langle 467\rangle$ : meets the requirements.

Solvent Use dimethyl sulfoxide.
Assay Aceurately weigh about 500 mg of Saceharin, dissolve in 40 mL of aleohel, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any nee ssary correction. Each mL of 0.1 N sodium hydroxide is equivalent to $18.32 \mathrm{mg}_{5}$ of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}$.

## ■Saccharin

$\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S} \quad 183.19$
1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide.
1,2-Benzisothiazolin-3-one 1,1-dioxide [81-07-2].
» Saccharin contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}$, calculated on the dried basis.

Packaging and storage-Preserve in well-closed containers. Store at room temperature.

USP Reference standards $\langle 11\rangle —$ USP Saccharin RS. USP $o$-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.

Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension $A$ and to water in diffused daylight 5 minutes after preparation of Reference suspension A.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE-This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before
use.] Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension B.

Test solution-Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with the same solution to 25 mL , and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension $A$, Reference suspension $B$, water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the Test solution, Reference suspension $A$, Reference suspension $B$, water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and Light-Scattering 〈851〉). [NOTEThe diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] The Test solution shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced than that of Reference suspension $A$.

## Color of solution-

Standard stock solution-Combine 3.0 mL of ferric chloride $\mathrm{CS}, 3.0 \mathrm{~mL}$ of cobaltous chloride $\mathrm{CS}, 2.4 \mathrm{~mL}$ of cupric sulfate CS , and 1.6 mL of dilute hydrochloric acid ( 10 g per L).

Standard solution-[NOTE—Prepare the Standard solution immediately before use.] Transfer 1.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix.
Test solution-Use the Test solution from Clarity of solution.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of the Standard solution, a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the Test solution, the Standard solution, a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the Standard solution.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Melting range $\langle 741\rangle$ : between $226^{\circ}$ and $230^{\circ}$.
Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 2 hours: it loses not more than $1.0 \%$ of its weight.

Readily carbonizable substances $\langle 271\rangle$-Dissolve 200 mg in 5 mL of sulfuric acid (between $94.5 \%$ and $95.5 \%$ [w/w] of $\mathrm{H}_{2} \mathrm{SO}_{4}$ ), and keep at a temperature of $48^{\circ}$ to $50^{\circ}$ for 10 minutes: the solution has no more color than Match$\operatorname{ing}$ Fluid $A$, when viewed against a white background.

Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$. Ignition temperature: $600 \pm 50^{\circ}$.

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.

## Limit of toluenesulfonamides-

Internal standard solution-Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL .

Reference solution-Dissolve 20.0 mg of USP $o$-Toluenesulfonamide RS and 20.0 mg of USP $p$-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL . Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL . Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the Internal standard solution.

Test solution-Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 10 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8 , and dilute with water to 50 mL . Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10 mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the Internal standard solution.

Blank solution-Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding $40^{\circ}$. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The instrument is equipped with a flame-ionization detector and contains a $0.53-\mathrm{mm} \times 10-\mathrm{m}$ fused silica column, coated with G3 phase (film thickness $2 \mu \mathrm{~m}$ ). The injector port, column, and detector temperatures are maintained at
about $250^{\circ}, 180^{\circ}$, and $250^{\circ}$, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of $1: 2$.

Procedure-Inject about $1 \mu \mathrm{~L}$ of the Reference solution. Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than $50 \%$ of the full scale of the recorder. The substances are eluted in the following order: $o$-toluenesulfonamide, $p$-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to $o$-toluenesulfonamide and $p$-toluenesulfonamide is at least 1.5 . Inject about $1 \mu \mathrm{~L}$ of the Blank solution. In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, $o$-toluenesulfonamide, and $p$-toluenesulfonamide. Inject about $1 \mu \mathrm{~L}$ of the Test solution and $1 \mu \mathrm{~L}$ of the Reference solution. If any peaks due to $o$-toluenesulfonamide, and $p$ toluenesulfonamide appear in the chromatogram obtained with the Test solution, the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the Reference solution ( 10 ppm of $o$-toluenesulfonamide and 10 ppm of $p$-toluenesulfonamide).

Limit of benzoate and salicylate-To 10 mL of a hot, saturated solution of it add ferric chloride TS, dropwise: no precipitate or violet color appears in the liquid.

Organic volatile impurities, Method $V\langle 467\rangle$ : meets the requirements.

Solvent-Use dimethyl sulfoxide.
Assay-Accurately weigh about 500 mg of Saccharin, dissolve in 40 mL of alcohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N sodium hydroxide is equivalent to 18.32 mg of $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}$.■1S (NF23)

## Briefing

Sodium Starch Glycolate, $N F 22$ page 2933 and page 3202 of PF 22(6) [Nov.-Dec. 1996]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Sodium Starch Glycolate monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Sodium Starch Glycolate that was prepared by the U.S. Pharmacopeia. This draft was based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5 A and 5 B drafts.

## Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| pH | + | + | + |
| Loss on drying | + | + | + |
| Limit of iron | + | + | + |
| Limit of sodium <br> chloride | + | + | + |
| Limit of sodium <br> glycolate | + | + | + |
| Assay | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Packaging and storage, Labeling, Microbial limits, Heavy metals, Identification by IR absorption.

Specific local attributes: Appearance of solution (EP).
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the Adoption Stage 6 document and the current $N F$ monograph include the following:

1. Definition-Modified to be more specific in terms of Type A and Type B.
2. Packaging and storage-No change.
3. Labeling-Requirements to label indicating Type A or Type $B$, the botanical source of the starch from which it was derived, and the cross-linking agent are added.
4. USP Reference standards-Reference standards for sodium starch glycolate Type A and Type B are added for use with Identification test $A$.
5. Identification - An IR absorption test and a test for sodium are added.
6. Microbial limits-No change.
7. $p H$-Clarification of the requirements for Type A and Type B is added.
8. Loss on drying-No change.
9. Limit of iron-The test from the EP is adopted.
10. Heavy metals-No change.
11. Limit of sodium chloride-A simpler procedure using a silver nitrate titration is adopted.
12. Limit of sodium glycolate-This test is added to comply with EP standards.
13. Assay-No change.
(EMC: J. Lane) RTS-41235-1

## Change to read:

## Soditm-Starch-Glycolate

## Stareh earboxymethyl ether, soditm salt.

\#Sodium Stareh Glyeolate is the sodium salt of a carbexymethyl ether of stareh. It contains not less than 2.8 pereent and not more than 4.2 percent of sodium. (Na) on the dried, aleohol-washed basis. It may contain not more than 7.0 percent of Sodium Chloride.

Packaging and-storage-Preserve-in well-clesed containers, preferably protected from wide-variations in temperature and hamidity, whieh may catse caking.
Eabeling The labeling indieates the pHrange.
Itentifieation A slightly acidified-solution of it is colored blue by iodine and petassiam iodide-TS.
Mierobial limits- $\langle 64$ - It meets the requirements of the tests for absenee of Salmenella species and Escherichia ooli.
$\mathrm{pH}\langle 794\rangle$-Disperse 1 gin 30 mL of water: the pH of the resulting suspension is either between 3.0 and 5.0 or between 5.5 and 7.5 .
Loss ondrying $\left\langle 734\right.$ ) - Dry it at $130^{\circ}$ for 90 mintutes: it loses net more than $10.0 \%$ of its weight.
Iron $\langle 244\rangle \div \quad 0.002 \%$, the Test preparation being prepared as directed for Test preparation under Heaw metals, Method IIT 〈z34); a- $0.5-5$ test specimen being used and the final solution being dilated with water to -47 mL .

Heary metals, Meth $\Psi\langle 234\rangle$ : $0.002 \%$.
Sodium ehboride- Weigh aceurately about 1 g, transfer to acenieal flask, add 20 mL of $80 \%$ aleohol, 0.1 mL of phenolphthalein TS, and 1 N soditm hydroxide solution until the-suspension beeomes faintly pink, stir for 10 mintutes, and filter. Repeat the extraction until chloride has been completely extracted, as shown by a test with silver nitrate TS. Dry the insoluble pertion at $105^{\circ}$ to cen stant weight ( 4 mg ), and reserve it for the 4 ssay. Evaporate the eombined filtrates, and dry the residue at $105^{\circ}$ to constant weight. The weight of the dried residue is not greater than $15 \%$ of the weight of Sodium Stareh Glye ${ }^{\text {ant ataken. If the weight of the dried }}$ residue is not more than $7.0 \%$ of the weight of Sodimm Stareh Gly colate taken, the requirement is met. If the weight is greater than $7.0 \%$ of the weight of Sodium Starch Glycolate taken, transfer it with the aid of water to a 200 mL volumetric flask, add 5 mL of nitric acid and 40.0 mL of 0.1 N silver nitrate $V \mathrm{~S}$, mix, and dilute with water to volume. Allow it to stand in the dark for 30 mintutes, and filter. To 100.0 mL of the filtrate add 5 mL of ferric ammenitum
sulfate TS , and titrate with 0.1 N ammenium thiocyanate VS (see Residual Titrations under Titnimetry (544) ). Caleulate the percentage of sodium chloride by the formma:-

$$
5.844\left(40 N_{4}-2 H N_{z}\right) / W
$$

in which $N_{+}$and $N_{2}$ are the normalities of the silver nitrate VS and the ammenium thio yanate VS, respectively, $V$ is the volume, in mL, of ammenium thierymate VS used in the titration, and $W$ - is the weight, in of, of Sodium Stareh Glyeolate taken.
Assay Transfer an aceurately weighed pertion, $B$, (about 700 mg) of the dried $80 \%$ aleohel insoluble pertion obtained in the test for Soditn chloride, to a suitable flask, add 80 mL of glacial acetic acid, heat the mixture under reflux, on a beiling water bath, for 2 hours, cool to room temperature, and titrate with 0.1 N perehloric acid VS, determinimg the endpoint potentiometrically. Cateulate the percentage of sodium combined in the form of sodium stareh glyeolate by the formula:
$100(22.99) H_{3} \mathrm{Al}_{3}+B$,
in which $V_{2}$ is the volume, in mL , of the perchloric acid $\mathrm{VS}, \mathrm{N}_{3}$ is the normality of the perchloric acid VS, and $B$ is the weight, in mo, of the dried aleohol insoluble residue taken for the Assety.

## ■Sodium Starch Glycolate

Starch carboxymethyl ether, sodium salt.
» Sodium Starch Glycolate is the sodium salt of a carboxymethyl ether of starch or of a cross-linked carboxymethyl ether of starch. It may contain not more than 7.0 percent of Sodium Chloride. The pH and assay requirements for Type A and Type $B$ are set forth in the accompanying table.

|  |  |  | \% Sodium, com- <br> bined as sodium <br> starch glycolate |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | pH |  | Max. |
| Type | Min. | Min. | Max. |  |
| A | 5.5 | 7.5 | 2.8 | 4.2 |
| B | 3.0 | 5.0 | 2.0 | 3.4 |

Packaging and storage-Preserve in well-closed containers, preferably protected from wide variations in temperature and humidity, which may cause caking.

Labeling-Label it to indicate the botanical source of the starch from which it was derived, the cross-linking agent (if used), the pH range, and whether it is Type A or Type B.

USP Reference standards $\langle 11\rangle$ —USP Sodium Starch Glycolate Type A RS. USP Sodium Starch Glycolate Type B RS

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: A slightly acidified solution of it is colored blue to violet by the addition of iodine and potassium iodide TS 1 .

C: A 2-mL portion of the solution prepared for the test for Limit of iron meets the requirements of the potassium carbonate-potassium pyroantimonate test for Sodium $\langle 191\rangle$.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.
$\mathbf{p H}\langle 791\rangle$-Disperse 1 g in 30 mL of water: the pH of the resulting suspension is either between 5.5 and 7.5 for Type A or between 3.0 and 5.0 for Type B.

Loss on drying $\langle 731\rangle$ —Dry it at $130^{\circ}$ for 90 minutes: it loses not more than $10.0 \%$ of its weight.

Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.

## Limit of iron-

Standard solution-Dissolve 863.4 mg of ferric ammonium sulfate $\left[\mathrm{FeNH}_{4}\left(\mathrm{SO}_{4}\right)_{2} \cdot 12 \mathrm{H}_{2} \mathrm{O}\right]$ in water, add 25 mL of 2 N sulfuric acid, dilute with water to 500.0 mL , and mix. Pipet 10 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of $1.0 \mu \mathrm{~g}$ of iron per mL .

Test solution-[NOTE-Save a portion of this solution for Identification test $C$.] Place 2.5 g in a silica or platinum crucible, and add 2 mL of 10 N sulfuric acid. Heat on a water bath, then cautiously raise the temperature progressively over an open flame. Ignite, preferably in a muffle furnace, at $600 \pm 25^{\circ}$. Continue heating until all black particles have disappeared. Cool, add a few drops of 2 N sulfuric acid, and heat and ignite as above. Add a few drops of 2 M ammonium carbonate, evaporate to dryness, and ignite as above. Cool, dissolve the residue in 50 mL of water, and mix.

Procedure-Treat the Test solution and the Standard solution as follows. Transfer 10 mL of the solution to a suitable beaker, add 2 mL of citric acid solution ( 1 in 5 ) and 0.1 mL of thioglycolic acid, and mix. Render the solution alkaline, using litmus paper as an external indicator, by the addition of ammonium hydroxide, dilute with water to 20 mL , and mix. Allow the solutions to stand for 5 minutes: the color of the solution from the Test solution is a shade of pink no deeper than that of the solution from the Standard solution ( $0.002 \%$ ).

Limit of sodium chloride-Transfer to a beaker about 500 mg of Sodium Starch Glycolate, accurately weighed, and suspend in 100 mL of water. Add 1 mL of nitric acid. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a suitable silver-based indicator electrode and a double-junction reference electrode containing a $10 \%$ potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

Limit of sodium glycolate-[NOTE-Conduct this test without exposure to daylight. Use low-actinic glassware.]

Standard solution-Transfer 310 mg of glycolic acid, previously dried over phosphorus pentoxide in a desiccator at room temperature overnight, to a $500-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume. Transfer 5.0 mL of this solution to a $100-\mathrm{mL}$ beaker, add 4 mL of 6 N acetic acid, and allow to stand for about 30 minutes. Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a $100-\mathrm{mL}$ volumetric flask. Rinse the beaker and filter paper with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 hours without shaking. Use the clear supernatant as the Standard solution.

Test solution-Transfer 200 mg , accurately weighed, to a $100-\mathrm{mL}$ beaker. Add 4 mL of 6 N acetic acid and 5 mL of water. Stir until dissolution is complete (about 10 minutes). Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a $100-\mathrm{mL}$ volumetric flask. Rinse the beaker, and filter with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 hours without shaking. Use the clear supernatant as the Test solution.

Procedure-Treat the Test solution and the Standard solution as follows. Heat 2.0 mL of the solution on a water bath for 20 minutes to remove acetone. Cool to room temperature. Prepare a 2,7 -dihydroxynaphthalene solution as follows. Dissolve 10 mg of 2,7-dihydroxynaphthalene in 100 mL of sulfuric acid, allow to stand until decolorized, and use within 2 days. Add 20.0 mL of this 2,7-dihydroxynaphthalene solution to the solution under test, mix, and heat on a water bath for 20 minutes. Cool under running water, and transfer quantitatively to a $25-\mathrm{mL}$ volumetric flask. Maintain the flask under running water, and dilute with sulfuric acid to volume. Within 10 minutes determine the absorbance of the solution at 540 nm with a suitable spectropho-
tometer, using water as the blank: the absorbance of the solution from the Test solution is not more than that of the solution from the Standard solution (2.0\%).

Assay-Weigh about 1 g , transfer to a conical flask, add 20 mL of $80 \%$ alcohol, stir for 10 minutes, and filter. Repeat the extraction until the chloride has been completely extracted, as shown by a test with silver nitrate. Dry the insoluble portion at $105^{\circ}$ to constant weight, and transfer an accurately weighed portion (about 700 mg ) of the dried $80 \%$ alco-hol-insoluble portion to a suitable flask, add 80 mL of glacial acetic acid, heat the mixture under reflux on a boiling water bath for 2 hours, cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Calculate the percentage of sodium combined in the form of sodium starch glycolate by the formula:

$$
100(22.99) V N / W,
$$

in which $V$ is the volume, in mL , of the perchloric acid consumed; $N$ is the normality of the perchloric acid; and $W$ is the weight, in mg , of the dried alcohol-insoluble residue taken for the Assay.■1S (NF23)

## BRIEFING

Corn Starch, page 715 of PF 30(2) [Mar.-Apr. 2004]; Potato Starch, page 718 of PF 30(2) [Mar.-Apr. 2004]; Wheat Starch, page 723 of $P F 30(2)$ [Mar.-Apr. 2004]. It is proposed to revise Identification test $C$ to reflect the use of a new test solution, Iodine and potassium iodide TS 2, which appears in the section Reagents, Indicators, and Solutions in this issue of $P F$.
(EMC: J. Lane) RTS-41144-2

## Add the following:

## ${ }^{\Delta}$ Corn Starch

» Corn Starch consists of the starch granules separated from the mature grain of corn [Zea mays Linné (Fam. Gramineae)].

Packaging and-storage-Preserve in well-closed containers.

Labeling-Where Corn Starch is intended for use in preparing Absorbable Dusting Powder, it is so labeled and the label states that it must be subjected to further processing during the preparation of Absorbable Dusting Powder.

## Change to read:

## Identification-

A: Under a microscope, using not less than $20 \times$ magnification and using a mixture of glycerin and water $(1: 1)$ as a mounting agent, it appears as either angular polyhedral granules of irregular sizes with diameters ranging from about $2 \mu \mathrm{~m}$ to about $23 \mu \mathrm{~m}$ or as rounded or spheroidal granules of irregular sizes with diameters ranging from about $25 \mu \mathrm{~m}$ to about $35 \mu \mathrm{~m}$. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between crossed nicol prisms, the starch granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: To 10 mL of the meteilage obtained in Identification
test $B$, add 0.04 mL of iodine and potassitm iodide TS: an erange red to dark blue color is produced, which disappears en heating.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of $\mathbf{m i n d i n e}^{\text {iodine }}$ and potassium iodide TS 2:1S (NF23) an orange-red to dark blue color is produced, which disappears on heating.

## Iodinesolution Dissolve 12.7gofiodine and 20gofpe-

 fassiumiodide-in water, and dilute with water to 1000.0 mL. Fe 10.0 mL of this seltion, ade 0.6 of petassium iodide, and dilute with water to 100.0 mL . Prepare immediately be fore use: ■is (NF23)Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , the total combined molds and yeasts count does not exceed 100 cfu per g , and it meets the requirements of the test for the absence of Escherichia coli. Where it is intended for use in preparing Absorbable Dusting Powder, it also meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Corn Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 4.0 and 7.0.

Loss on drying $\langle 731\rangle$ —Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $15.0 \%$ of its weight.

## Change to read:

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature

Limit of iron-Shake 1.5 g of Corn Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured volume of this solution with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide—Not more than $50 \mu \mathrm{~g}$ per g . REAGENTS-

Carbon dioxide-Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.

Hydrogen peroxide solution-Dilute 30\% hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

APPARATUS-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom, boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

PROCEDURE-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow
of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparatus in a water bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) V N / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL , of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organic volatile impurities, Methol $H\langle\langle 467\rangle$ : meets the requirements.:ANF23

» Potato Starch is obtained from the tuber of Solanum tuberosum $L$.

Packaging and-storage-Preserve in well-closed containers.

## Change to read:

## Identification-

A: Under a microscope, using a mixture of glycerin and water $(1: 1)$ as a mounting agent, it presents granules, either irregularly shaped, ovoid, or pear-shaped, usually $30 \mu \mathrm{~m}$ to $100 \mu \mathrm{~m}$ in size, but occasionally exceeding $100 \mu \mathrm{~m}$, or rounded, $10 \mu \mathrm{~m}$ to $35 \mu \mathrm{~m}$ in size. There are occasional compound granules having two or four components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of iodine and potassium iodide TS
 duced, which disappears on heating.

Microbial limits $\langle 61\rangle$ —The total aerobic microbial count does not exceed 1000 cfu per $g$, the total combined molds and yeasts count does not exceed 100 cfu per g , and it meets the requirements of the test for the absence of Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Potato Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 5.0 and 8.0.
Loss on drying $\langle 731\rangle$-Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $20.0 \%$ of its weight.

## Change to read:

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature $600 \pm 50^{\circ} \cdot$ ■. $_{\text {1S (NF23) }}$

Limit of iron-Shake 1.5 g of Potato Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured vol-
ume of this solution with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide: not more than $50 \mu \mathrm{~g}$ per g . REAGENTS-

Carbon dioxide-Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.

Hydrogen peroxide solution-Dilute $30 \%$ hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

APPARATUS-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints, except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

PROCEDURE-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid
solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparatus in a water bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) \mathrm{VN} / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL, of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organie volatile imptrities, Method $W\langle\langle 467\rangle$ : meets the requirements._NF23

## Identification-

A: Under a microscope, using a mixture of glycerin and water ( $1: 1$ ) as a mounting agent, it presents large and small granules, and very rarely, intermediate sizes. The large granules, usually $10 \mu \mathrm{~m}$ to $60 \mu \mathrm{~m}$ in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are $2 \mu \mathrm{~m}$ to $10 \mu \mathrm{~m}$ in diameter. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.
B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

6: To 1 mL of the mutilage obtained in Itentification
test $B$, add 0.05 mL of iodine and potassium iodide TS: a

## dark blue color is produced, which disappears on heating.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of foline $\mathbf{m}_{\text {iodine }}$ and potassium iodide TS 2:-1S (NF23) an orange-red to dark blue color is produced, which disappears on heating.

## Iodine solution Dissolve 12.7 g of iodine and 20 g of pe-

tassitm iodide in water, and dilute with water to 1000.0 mL .
Fe 10.0 mL of this solution, add 0.6 g of petassitum iodide,
and dilute with water to 100.0 mL . Prepare-immediately be
fore use:-1.1S(NF23)
Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 cfu per g , the total combined molds and yeasts count does not exceed 100 cfu per g , and it meets the requirements of the test for the absence of Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Wheat Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 4.5 and 7.0.

Loss on drying $\langle 731\rangle$-Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $15.0 \%$ of its weight.

## Change to read:

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature $600 \pm 50^{\circ} \square 1 \mathrm{C}($ NF23 $)$

Total protein: not more than $0.3 \%$ of total protein (corresponding to $0.048 \% \mathrm{~N}_{2}$, conversion factor: 6.25).

Procedure-Accurately weigh 6.0 g of test substance containing about 2 mg of nitrogen, transfer to a combustion flask, and add 4 g of a powdered mixture of 100 g of potassium sulfate, 5 g of cupric sulfate, and 2.5 g of selenium, and three glass beads. Wash any adhering particles from the
neck into the flask with 5 mL of sulfuric acid, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely (e.g., by means of a glass bulb with a short stem) to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulfuric acid in the neck of the flask. [Note-Precautions should be taken to prevent the upper part of the flask from becoming overheated.] Continue the heating for 30 minutes, unless otherwise directed. Cool, dissolve the solid material by cautiously adding to the mixture 25 mL of water, cool again, and place in a steam distillation apparatus. Add 30 mL of sodium hydroxide solution (42 in 100), and distill immediately by passing steam through the mixture. Collect about 40 mL of distillate in 20.0 mL of 0.01 N hydrochloric acid and enough water to cover the tip of the condenser. Towards the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. [NOTE-Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver.] Titrate the distillate with 0.01 N sodium hydroxide, using methyl purple TS as indicator ( $n_{1} \mathrm{~mL}$ of 0.01 N sodium hydroxide).
Repeat the test using about 50 mg of glucose in place of the substance to be examined ( $n_{2} \mathrm{~mL}$ of 0.01 N sodium hydroxide).

$$
\text { Content of nitrogen }=\left(0.01401\left(n_{2}-n_{1}\right)\right) / m,
$$

where $m$ is the amount of test substance weighed, in g .
Limit of iron-Shake 1.5 g of Wheat Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10),
0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured volume of this solution with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide: not more than $50 \mu \mathrm{~g}$ per g . REAGENTS-

Carbon dioxide-Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.

Hydrogen peroxide solution-Dilute 30\% hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

APPARATUS-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom, boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints, except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.
PROCEDURE-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow.

Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparratus in a water bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) \mathrm{VN} / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL , of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organie volatile impurities, Method $I V\langle 467$ ): meets the requirements._ANF23

## GENERAL CHAPTERS

General Tests and Assays

## General Requirements for Tests and Assays

## Briefing

$\langle 846\rangle$ Specific Surface Area, USP 27 page 2385. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the Specific Surface Area General Chapter, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following text represents the ADOPTION STAGE 6 document. The EP draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the EP.

There are very few differences between the international harmonization ADOPTION STAGE 6 document for Specific Surface Area and the current USP General Chapter, $\langle 846\rangle$ Specific Surface Area. The fundamental principles have not changed.

## Change to read:

## <846>-SPECIFIC SURFACE AREA

Introduetion The specifie surface are of a powder is deter mined by physieal adsorption of a gas on the suface of the selid and by measuring the amount of adsorbate gas corresponding to a single layer (menolayer) on the surface. Physieal adserption results from relatively weak forees (van der Wanls forees) between the ad sorbategas molecules and the adsorbent surface of the test powder. The ameunt of gas adsorbed can be measured by a gravimetric, volumetric, or continturus flow procedure. Since the amount of gas adsorbed under a given pressure tends to increase on decreas ing the temperature, adsorption measurements are ustally made at
a low temperature. Measurement is performed at 77 K , the beiling point of liquid nitrogen. The data are treated according to the Bru nater, Emmett, and Teller (BET) adsorption isotherm equation:-

Where $P$, in mm of mereury, is the partial vapor pressure of adsor bate gas in equilibrium with the surface at $77 \mathrm{~K}, P_{s}$, in mmof mer emy, is the satwated pressure of the adserbate gas, $K_{s}$, in mL, is the volume of gas adsorbed at standard temperature and pressure(STP, 273.15 K and 760 mm of mereury), $Y_{m}$, in mL , is the volume of gas adsorbed at STP to produce an apparent monolayer on the sample surface, and $C$ is a dimensionless constant that is related to the en thalpy of adserption of the adsorbate gas on the pewder sample. $A$ value of $Y_{\text {s }}$ is measured a a Then the BET value-

is pletted against $P / P$, necording to equation (1). This plet should yield a straight line. The data are considered aceeptable if the cor relation coefficient, $r$, of the linear regression is not less than 0.9975; that is, $r^{2}$ is not less than 0.995 . From the resulting linear plot, the slope, which is equal to $(C, 1) / Y_{.} C$, and the intereept, which is equal to $1 H Y_{m} \in$, are evaluated by linear regression analy sis. Frem these values, $V_{\text {m }}$-is caleulated as $1 /($ slope + intereept $)$, while- $C$ is ealeulated as (slopelintereept) +1 . From the value of
 tated by the equation:
in which $N$ is the Avogadre constant $\left(6.023 \times 10^{23}\right.$ mole $\left.{ }^{-4}\right), a$ is the effective cross sectional area of one adsorbate molecule ( 0.162 $* 10^{-18} \mathrm{~m}^{2}$ for nitregen or $0.195 \times 10^{-18} \mathrm{~m}^{2}$ for krypten), m is the mass, in f , of test pewder, and 22400 is the volume, in mb, veet pied by 1 mole of the adsorbate gas at STP, allowing for miner departares from-ideality.

Some caleulations and procedures, deseribed below, require the absolute value of $P_{a}$, defined above, and of the baremetric pressure, $B$, in mmof mercury. For liquid nitrogen open to the atmosphere in a Dewar vessel, $P$, and $B$ are taken to be equal to the measured atmospheric pressure (i.e., baremetric pressure) plus 10 mam of mereury. Seme instruments automatically perform the above mea strements and comptatations. The upward correction of $P_{2}$ and $B$ allows for the elevation of the beiling peint of nitrogen eatnsed by impurities, such as oxygen, dissolvedin the liquid nitrogen-in the-open Dewar vessel. This chapter deseribes the dynamic flow gas adsorption teehnique (Methed I) and the volumetric gas ad serption technique (Method II).

## $\theta$ thgassing

Before the specifie surface area the sample can be determined, it is necessary to remove gases and vapers that may have beeme physically adserbe ont the surface after manufacture and during treatment, handling, and storage. If outgassing is not achieved, the specific surface area may be reduced or may be variable beeatese an intermediate area of the strface is covered with molecules of the previously adsorbed gases-or vapors.

Conditions The outgassing conditions must be demenstrated to yield reprodurible BET plots, as diseussed under Introduction, a eonstant weight of test powder, and no-detectable physical or ehemieal changes in the test powder. The outgassing conditions are-critical for obtaining the required precision and aceuracy of specific surface area measurements on phamacentienls beeause of the sensitivity of the surface of the materials. The outgassing eonditions define by the temperature, pressure, and time should be so chosen that the original surface of the solid is reproduced as closely as possible. Outgassing of many substances is often achieved by applying a vacumm or by purging the sample in a flow ing stream of a nemreactive gas. In either ease, elevated temperatures are-sometimes applied to increase the rate at whieh the contaminants leave the surface. Outgassing by heating the test powder may change the nature-of the-surface and should be avoided unless specifieally indieated in the individual monograph. The outgassing conditions stated in the menograph for each material have been derived where possible from studies of several mat terials from various manufacturers. If henting is employed, the ree emmended temperature and time of outgossing are as low as pes sible so as to achieve reproduribly high measures of specific sur face are within an acceptable time span. For outgassing sensitive specimens the deserption adsorption cyeling method may be employed.

Procedure-To outgas the test specimen by the desorption ad sorption cyeling method, proceed as follows. Allow the test pow der to equilibrate with the adsorbate gas, nitrogen at $P / P_{\theta}=0.30$-r krypen at $P / P=1.038 \times 10^{-3}$, for at least one minte. Raise the Dewar vessel containing liquid nitrogen at 77 K up-to a defined point on the sample cell. This level should be high enough above the level of the sample to enstre that the temperature drops to 77 K yet below any connections, such as 0 rings in the cell holder, which could leak if cooled. At least one minute after vigorous boil ing of liquid nitrogen has subsided, recordor zero the gas detector integrator signal according to Method I, or record the pressure sig anl aceording to Meth $\Psi$ (adsorption-signal). Lower the Dewar vessel from the sample cell, and surround the sample cell with a beaker of water at room temperature. Record the gas detector integrator signal according to Method I, or record the pressure signat according to the Method $I$ (deserption signal) when the signal has become constant. Repent the cooling heating eycle until three suc eessive desorption signals differ by not more than $3 \%$. If possible, reweigh the sealed sample cell containing the test powder and subtract the mass of the empty sample eell to obtain the actual mass, m, of the test powder. The sealed sample cell containing the test pow der may be weighed after the meastrement of the specific surface area, if neessayy.

## Standard Materials

The method employed for the determination of the specific sur face are of the samples should be tested using reference-standards ef known surface area, such as alpha alumina, purchased together with a certificate of analysis from a seientifieally aceredited source.*The chosen reference standard should have a specific sur face area as simitar as possible to that of the porder sample and should be treated with the utmost care. If the measured specific sur face area of the reference material does not fall within the range specified on the eertifient of analysis from an aceredited seuree, the same adsorbate gas being used, the elements of the methed and the gas adsorption apparatus should be carefully examined to iden tify the ense of the diserepaney, whieh should then be eliminated.

[^186]
## МЕТНӨФ Т ТНЕ ФУNAMHC FLOW MЕТНӨР

Prineiples of the Method- In the dynamic flow method, the recommended adsorbate gas, is nitrogen or krypton, while helitm is mployed as a diluent gas, which is not adsorbed under the ree emmended conditions. For powder samples of surface area less than about $0.3 \mathrm{~m}^{3}$ (or of specific surface area less than about 0.5 $\mathrm{m}^{2}-\frac{8}{5}$ 1) krypton is the preferred adsorbate gas, while for samples of greater surface area, nitrogen is preferred. $\Lambda$ minimmen of three mixtures of the appropriate adsorbate gas with helium are required within the $P / P$, range 0.05 to 0.30 , such as $0.100,0.200$, and 0.300 mole fraction of nitrogen or $3.46 \times 10^{-4}, 6.92 \times 10^{-4}$, and $1.038 \times 10^{-3}$ mole fraction of krypten, where $P / P$ is the relative pressure of the adsorbate gas, $P$ being the partial vaper pressure and $P_{\text {a }}$-being the suturated vapor pressure of the adsorbate gas. These mixtures should be certified to within $1 \%$ (absolute) or may be obtained by using a suitable apparatus to mix the appropriate adsorbate gas with helimm in propertions aceurate to $1 \%$. Nitro gen or krypton, at least 99.9 mole pereent, is also required for ealibrating the gas detector integrator employed for measuring the velume or mass of the gas adsorbed, or desorbed, by the test powder. The gas detector integrator should provide a signal that is approximately proportional to the volume of the gas passing through it under defined conditions of temperature and pressure. For this purpese, a thermal conductivity detector with an electromic integrator is one ameng various suitable types. A minimmmof three data peints within the recommended range of 0.05 to 0.30 for $P / P_{\text {o }}$ should be determined.

Procedure Aceurately weigh a quantity of the test powder, such that the 1 surface area is at least $1 \mathrm{~m}^{2}$, if pessible, in a tared gas adsorption flow eell. [NOTE-Transfer the test powder earefully int the flow eell so that aclear path is provided for the flow of the gas. An approximate value of the mass, $m$, of the test powder to be taken may be caleulated from the mean particle diameter, $d$, and the tre or crystal density, $\rho$, assuming spherieal partieles by the equa-tion:-

$$
m=A d \rho / 6
$$

in which $A$ is the sufface are desired. Because of the assumptions en which it is based, this equation must not be mployed to caleu tate the actual surface area.] Outgas the powder sample.

Pass the gas mixture eontaining the largest mole fraction of the adsorbate gas, nitrogen or krypton, within the recommended range over the test powder for at least 30 seconds. Raise the Dewar vessel eontaining liquid nitrogen at 77 K up to a defmed point on the flow eell. As mentioned above, this level should be high enough above the level of the sample to ensure that the temperature dreps to 77 K ye below any connections, such as 0 rings in the cell holder, which could leak if cooled. Record or zero the gas detector integrator signal (adserption signal) at least one minute after vigorous beiling of liquid nitrogen has subsided. Lower the Dewar vessel from the flow cell, and surround the flow cell with a beaker of water at room temperature. Pecord the gas detector integrater sif fal (desorption signal) when the signal becomes constant. Repeat the cooling heating eycle until three suecessive desorption sighals differ by not mere than $3 \%$. The data for the first peint may be derived from the desorption adsorption cyeling method, provided that this method is employed for outgossing the powder sample.

Record the last thre desorption values at the largest mole frac tion of the adsorbate gas, and caleulate the arithmetic mean. Calibrate the gas detector integrator by injecting, from a gas tight syringe, a known volume of adsorbate gas, measured to $\pm 2 \%$,
so as to give a signal within $15 \%$ of the last three desorption sig nals. Caleulate the correspending volume of adsorbate gas, $K_{\text {t }}$ (im mm-of mereury), at standard temperature and pressure (STP, 273.15 K and 760 mm of mereury), frem the alibrater integrator signal by the equation:-

in which $Y_{\text {e }}$ is the volume, in mL, of gas injected for calibration, $A_{4}$ is the detector integrator respense for the gas desorbed from the test powder, $A_{\text {e }}$ is the detector integrator signal respense for the ealibration volume, $B$ is the measured barometric pressure, in mm-of mereury without the eorrection (deseribed above under In moturn), and $T$, in $K$, is the temperattre of volume meastrement (room temperatre). If possible, weigh the sealed flow celleontain ing the test powder, and subtract the mass of the empty flow cell from this mass to obtain the aetual mass, m, of the powder taken.

Prepare at least two other mixtures of the appropriate adsorbate gas with helium, as described above. For each of these gas mix tares, repeat the above cooling heating cycle, beginning with "Pass the gas mixture." Repeat the measurements for each of the gas mixtures until three sureessive desorption signals differ by not more than $3 \%$. Immediately after recording each gas mix tere signal, calibrate the gas detector integrator, and caleulate $-{ }_{\text {a }}^{\text {a }}$ as directed in the previeus paragraph.

If the BET plot is not linear, when using nitrogen as the adsor bate gas, or if the measured amounts of nitrogen adsorbed are not repeatable to within $\pm 30$, lack of striet propertionality between the meastred values and the actual amounts of nitrogen adsorbed may be suspeeted, perhaps becatse of the thermat diffusion effect of nitrogen. The magnitude of this effeet inereases, and the aecu ray and precision of the measurements decrease, with decreasing specific surface area the pewder specimen. Under these cireumt stanees, and especially if the surface area of the powder sample is tess than $0.3 \mathrm{~m}^{2}$ or if the specifie surface area of the powder sample is less than $0.5 \mathrm{~m}^{2} \mathrm{~m}^{+}$, as mentioned above, the thermal diffusion effect may be considerably redueed or eliminated by using an ad serbate gas that has a lower vaper pressure, such as krypten, in stead of nitrogen. Since-for krypton the saturated vapor pressure at 77 K is only 2.63 mm of mereury, the required mole fractions of kryptan in the three mixtures of krypten with helimm are less than those of nitrogen in its mixtures with helimm by a factor of 2.63/760-0.00346. Sinee the eross sectional are of the kypton moleeule is not well defined, it is reemmended that the standard value, $a=0.195 \mathrm{~mm}^{2}$, be used in equation (2) when caleulating the specific surface area, and that the name of the adsorbate gas em ployed be stated, if it is not nitregen, when reporting the value of the specific surface area.

## МЕТНӨФ- THE VOLUMETRIC METHOР

Prineiples of the Method-In the volumetric method, the ree emmended adsorbate gas is nitrogen which is admitted into the evacuated space above the previously outgassed powder sample to give a deffned equilibritm pressure, $P$, of the gas. The use of a diluent gas, sueh as helium, is therefore unnecessary, although helium may be employed for other purposes, such as to measure the void volume. Sinee only pure adsorbate gas, instead of a gas mixture, is employed, interfering effeets of thermal diffusion are avoided in this method. Consequently, the use of an adsorbate
gas possessing a low vaper pressure at 77 K , such as krypton, is unnecessary. Some instruments employ a balance tube to offse the effects of free space, thermal gradients, and non ideal gas behavior. Other instruments claim other advantages. The use of equipment from any partieular manufacturer is not specifieally endorsed.

The volume of nittrogen admitted into the sample tube of give the equilibrium pressure, $P$, is equal to the sum of the volume of gas aetually adsorbed, $I$, plus the volume of gas in the free space around and above the sample, $V_{f}$, which must be either corrected for by suitable adjustment of the instrument or balaneed out. $Y$ is then converte by the following equation to the volume, $Y_{\text {a }}$, -recu pied by the same amount of ges at standard temperature and pressure (STP, 273.15 K and 760 mm of mereury):

$$
\begin{aligned}
& \left.\hline V_{\alpha}=[V \times B \times(2) \quad \mathrm{mmHg})\right] . \quad \text { (5) }
\end{aligned}
$$

Several instruments attomatieally perform the above measurements and computations. The instrument mantal should always beconsulted for guridanee and for a complete description of the proeedures for data aequisition and computation. $A$ value of $K_{4}$-is meastred at each of not less than three values of $P / P$, and the data are plotted so as to provide a value of the specific surface area as deseribed above under Introduction.

Procedure Aceurately weigh a quantity of the test powder, such that the total surface area is at least $1 \mathrm{~m}^{2}$, if possible, in a tared gas adsorption tube. [To caleulate an approximate value of the mass of the test powder to be taken, use equation (3).] Admit a small amount of dry nitregen into the sample tube to provent con amination of the clean surface, remove the sample tube, insert the stopper, and weigh it. Caleulate the weight of the sample. Attach the sample tube to the dynamic volumetric apparatus. Cautiously evactate the sample down to a presstre of 0.02 mm of meretry or tess.

If the prineiple of operation of the instrument requires the deter mination of the void volume in the sample tabe, for example, by the admission of a nonadsorbed gas, such as helium, this procedure is carried out at this point, followed by evacuation of the sample down to 0.02 mm of mereury or less. The adsorption of nitrogen gas is then meastred as described below.

Raise a Dewar vessel containing liquid nitrogen at 77 K up to a defined peint on the sample cell as directed under Meth $I$. Admit a sufficient valume of nitrogen gen to give relative pressure, $P / P_{s}$; equal to $0.10 \pm 0.02$. Measure the volume adsorbed, $Y_{4}$. Repent the measurement of $K_{\text {H }}$ at $P / P_{\text {e }}$ values of $0.20 \pm 0.02$ and $0.30 \pm 0.02$. A minimum of three points is required. Additional meacure ments may be carried out, especially on these rare oecasions when nemlinearity is obtained at a $P / P$, value close to 0.3 . Since nenlinearity is often obtained at $P / P$, at or below 0.05 , values in this res ion are not recommended. The test for linearity, the treatment of the data, and the calleulation of the specific surface area of the sample are described above under Introduction.

## Single-Point Measurement

Normally, at least three measurements of $Y_{\text {a }}$, each at a different value of $P / P$, are required for the determination of specific surface area by Meth I Or Meth IH. However, under certain cireumstances it may be aceeptable to determine the specific surface area ef a powder from a single value of $F_{\text {s }}$ meastred at a single value of
$P / P_{s}$, such as 0.300 (correspending to 0.300 mole of nitrogen or 0.001038 mole fraction of krypton), using the following equation for calculating $Y_{m}$ :-

The specific-surface area is caleulated from the value-of $H_{. . .}$by eqution (2) stated above.

The single peint methed may be employed directly for a series of powder samples of a given material for which the material con stant, $C$, is much greater than unity. This cireumstance may be veriffed by comparing value of speciffe surface area determined by the single point method with that detemined by the multiple point method for the series of powder samples. Close similarity between the single point values and multiple point values suggests that $1 / \mathrm{C}$ approaches zero:

The single peint method may be employed indirectly for a series of very similar powder samples of a given material for which the material constant, $C$, is not infinite but may be assumed to be in variant. Under this cireumstanee, the error associated with the sin gle point method can be redured of eliminated by using the multiple peint method to evaluate $C$ for one of the samples of the series from the BET plet, from which $C$ is caleulated as $(1+$ stope intereept). Then $Y_{\text {w }}$ is caleulated from the single value of $F_{*}$ measured at a single value of $P / P$, by the equation::

The specific suffee area is calculated from- $Y_{\text {m }}$ by equation (2) stat ed above.

## - $<846\rangle$ SPECIFIC SURFACE AREA

## INTRODUCTION

The specific surface area of a powder is determined by physical adsorption of a gas on the surface of the solid and by calculating the amount of adsorbate gas corresponding to a monomolecular layer on the surface. Physical adsorption results from relatively weak forces (van der Waals forces) between the adsorbate gas molecules and the adsorbent surface of the test powder. The determination is usually carried out at the temperature of liquid nitrogen.

The amount of gas adsorbed can be measured by a volumetric or continuous flow procedure.

## BRUNAUER, EMMETT AND TELLER (BET)

THEORY AND SPECIFIC SURFACE AREA DETERMINATION

## Multipoint Measurement

The data are treated according to the Brunauer, Emmett and Teller (BET) adsorption isotherm equation:

$$
\begin{equation*}
\frac{1}{\left[V_{a}\left(\frac{P_{o}}{P}-1\right)\right]}=\frac{C-1}{V_{m} C} \times \frac{P}{P_{o}}+\frac{1}{V_{m} C} \tag{1}
\end{equation*}
$$

$P=$ partial vapor pressure of adsorbate gas in equilibrium with the surface at 77.4 K (b.p. of liquid nitrogen), in Pa ,
$P_{o}=$ saturated pressure of adsorbate gas, in Pa ,
$V_{a}=$ volume of gas adsorbed at standard temperature and pressure (STP) [273.15 K and atmospheric pressure $\left.\left(1.013 \times 10^{5} \mathrm{~Pa}\right)\right]$, in mL ,
$V_{m}=$ volume of gas adsorbed at STP to produce an apparent monolayer on the sample surface, in mL ,
$C=$ dimensionless constant that is related to the enthalpy of adsorption of the adsorbate gas on the powder sample.
A value of $V_{a}$ is measured at each of not less than three values of $P / P_{o}$.

Then the BET value

$$
\frac{1}{\left[V_{a}\left(\frac{P_{o}}{P}-1\right)\right]}
$$

is plotted against $P / P_{o}$, according to equation (1). This plot should yield a straight line usually in the approximate relative pressure range 0.05 to 0.3 . The data are considered acceptable if the correlation coefficient, $r$, of the linear regression is not less than 0.9975 ; that is, $r^{2}$ is not less than 0.995 . From the resulting linear plot, the slope, which is equal to $(C-1) / V_{m} C$, and the intercept, which is equal to $1 / V_{m} C$, are evaluated by linear regression analysis. From these values, $V_{m}$ is calculated as $1 /($ slope + intercept ), while $C$ is calculated as (slope/intercept) +1 . From the value of $V_{m}$ so determined, the specific surface area, $S$, in $\mathrm{m}^{2} \cdot \mathrm{~g}^{-1}$, is calculated by the equation:

$$
\begin{equation*}
S=\frac{V_{m} N a}{m \times 22400} \tag{2}
\end{equation*}
$$

$N=$ Avogadro constant $\left(6.023 \times 10^{23} \mathrm{~mol}^{-1}\right)$,
$a=$ effective cross-sectional area of one adsorbate molecule, in square meters ( $0.162 \mathrm{~nm}^{2}$ for nitrogen and $0.195 \mathrm{~nm}^{2}$ for krypton),
$m=$ mass of test powder, in g ,
$22400=$ volume, in mL, occupied by one mole of the adsorbate gas at STP allowing for minor departures from the ideal.

A minimum of three data points is required. Additional measurements may be carried out especially when nonlinearity is obtained at a $P / P_{o}$ value close to 0.3 . Because nonlinearity is often obtained at a $P / P_{o}$ value below 0.05 , values in this region are not recommended. The test for linearity, the treatment of the data, and the calculation of the specific surface area of the sample are described above.

## Single-Point Measurement

Normally, at least three measurements of $V_{a}$, each at different values of $P / P_{o}$, are required for the determination of specific surface area by the dynamic flow gas adsorption technique (Method I) or by volumetric gas adsorption (Method II). However, under certain circumstances described below, it may be acceptable to determine the specific surface area of a powder from a single value of $V_{a}$ measured at a single value of $P / P_{o}$ such as 0.300 (corresponding to 0.300 mole of nitrogen or 0.001038 mole fraction of krypton), using the following equation for calculating $V_{m}$ :

$$
\begin{equation*}
V_{m}=V_{a}\left(1-\frac{P}{P_{o}}\right) \tag{3}
\end{equation*}
$$

The specific surface area is then calculated from the value of $V_{m}$ by equation (2) given above.

The single-point method may be employed directly for a series of powder samples of a given material for which the material constant $C$ is much greater than unity. These circumstances may be verified by comparing values of specific surface area determined by the single-point method with that determined by the multipoint method for the series of powder samples. Close similarity between the single-point values and multipoint values suggests that $1 / C$ approaches zero.

The single-point method may be employed indirectly for a series of very similar powder samples of a given material for which the material constant $C$ is not infinite but may be assumed to be invariant. Under these circumstances, the error associated with the single-point method can be reduced or eliminated by using the multipoint method to evaluate $C$ for one of the samples of the series from the BET plot, from
which $C$ is calculated as $(1+$ slope/intercept $)$. Then $V_{m}$ is calculated from the single value of $V_{a}$ measured at a single value of $P / P_{o}$, by the equation:

$$
\begin{equation*}
V_{m}=V_{a}\left(\frac{P_{o}}{P}-1\right)\left[\frac{1}{C}+\frac{C-1}{C} \times\left(\frac{P}{P_{o}}\right)\right] \tag{4}
\end{equation*}
$$

The specific surface area is calculated from $V_{m}$ by equation (2) given above.

## EXPERIMENTAL TECHNIQUES

This section describes the methods to be used for the sample preparation, the dynamic flow gas adsorption technique (Method I) and the volumetric gas adsorption technique (Method II).

## Sample Preparation

## OUTGASSING

Before the specific surface area of the sample can be determined, it is necessary to remove gases and vapors that may have become physically adsorbed onto the surface after manufacture and during treatment, handling, and storage. If outgassing is not achieved, the specific surface area may be reduced or may be variable because an intermediate area of the surface is covered with molecules of the previously adsorbed gases or vapors. The outgassing conditions are critical for obtaining the required precision and accuracy of specific surface area measurements on pharmaceuticals because of the sensitivity of the surface of the materials.

The outgassing conditions must be demonstrated to yield reproducible BET plots, a constant weight of test powder, and no detectable physical or chemical changes in the test powder.

The outgassing conditions defined by the temperature, pressure, and time are chosen so that the original surface of the solid is reproduced as closely as possible. Outgassing of many substances is often achieved by applying a vacuum by purging the sample in a flowing stream of a nonreactive, dry gas or by applying a desorption-adsorption cycling method. In either case, elevated temperatures are sometimes applied to increase the rate at which the contaminants leave the surface. Caution should be exercised when outgassing powder samples using elevated temperatures to avoid affecting the nature of the surface and the integrity of the sample.

If heating is employed, the recommended temperature and time of outgassing are as low as possible to achieve reproducible measurement of specific surface area in an acceptable time. For outgassing sensitive samples, other outgassing methods such as the desorption-adsorption cycling method may be employed.

## ADSORBATE

The standard technique is the adsorption of nitrogen of analytical quality at liquid nitrogen temperature.

For powders of low specific surface area ( $<0.2 \mathrm{~m}^{2} \mathrm{~g}^{-1}$ ) the proportion adsorbed is low. In such cases, the use of krypton at the liquid nitrogen temperature is preferred because the low vapor pressure exerted by this gas greatly reduces error. The use of larger sample quantities, where feasible (equivalent to $1 \mathrm{~m}^{2}$ or greater total surface area using nitrogen), may compensate for the errors in determining low surface areas.

All gases used must be free from moisture.

## QUANTITY OF SAMPLE

A quantity of the test powder is accurately weighed such that the total surface of the sample is at least $1 \mathrm{~m}^{2}$ when the adsorbate is nitrogen and $0.5 \mathrm{~m}^{2}$ when the adsorbate is krypton.

Lower quantities of sample may be used after appropriate validation.

## Measurements

Because the amount of gas adsorbed under a given pressure tends to increase when the temperature is decreased, adsorption measurements are usually made at a low temperature. Measurement is performed at 77.4 K , the boiling point of liquid nitrogen.

## Method I: The Dynamic Flow Method

## PRINCIPLE

In the dynamic flow method (see Figure 1), the recommended adsorbate gas is dry nitrogen or krypton, while helium is employed as a diluent gas, which is not adsorbed under the recommended conditions.

A minimum of three mixtures of the appropriate adsorbate gas with helium are required within the $P / P_{o}$ range 0.05 to 0.30 .

The gas detector-integrator should provide a signal that is approximately proportional to the volume of the gas passing through it under defined conditions of temperature and pressure. For this purpose, a thermal conductivity detector with an electronic integrator is one among various suitable types. A minimum of three data points within the recommended range of 0.05 to 0.30 for $P / P_{o}$ is determined.

Fig. 1. Schematic diagram of the dynamic flow method apparatus.

## PROCEDURE

A known mixture of the gases, usually nitrogen and helium, is passed through a thermal conductivity cell, through the sample again, through the thermal conductivity cell, and then to a recording potentiometer.

The sample cell is immersed in liquid nitrogen, and the sample adsorbs nitrogen from the mobile phase. This unbalances the thermal conductivity cell, and a pulse is generated on a recorder chart.

The sample is removed from the coolant; this gives a desorption peak equal in area and in the opposite direction to the adsorption peak. Because this is better defined than the adsorption peak, it is the one used for the determination.

To effect the calibration, a known quantity of adsorbate, sufficient to give a peak of similar magnitude to the desorption peak, is injected into the system, and the proportion of gas volume per unit peak area is obtained.

A mixture of nitrogen and helium is used for a singlepoint determination; and several such mixtures or premixing two streams of gas are used for a multipoint determination.

The calculation is the same as the volumetric method.

## Method II: The Volumetric Method

PRINCIPLE

In the volumetric method (see Figure 2), the recommended adsorbate gas is nitrogen, which is admitted into the evacuated space above the previously outgassed powder sample to give a defined equilibrium pressure, $P$, of the gas. The use of a diluent gas, such as helium, is therefore unnecessary, although helium may be employed for other purposes, such as to measure the dead volume.

Because only pure adsorbate gas, instead of a gas mixture, is employed, interfering effects of thermal diffusion are avoided in this method.

Fig. 2. Schematic diagram of the volumetric method apparatus.

## PROCEDURE

A small amount of dry nitrogen is admitted into the sample tube to prevent contamination of the clean surface, the sample tube is removed, a stopper is inserted, the tube is weighed, and the weight of the sample is calculated. Then the sample tube is attached to the volumetric apparatus. The sample is cautiously evacuated down to the specified pressure (e.g., between 2 Pa and 10 Pa ). Alternately, some instruments are operated by evacuating to a defined rate of pressure change (e.g., less than $13 \mathrm{~Pa} / 30 \mathrm{~s}$ ) and by holding for a defined period of time before commencing the next step.

If the principle of operation of the instrument requires the determination of the dead volume in the sample tube, for example, by the admission of a nonadsorbed gas, such as helium, this procedure is carried out at this point, followed by evacuation of the sample. The determination of dead vol-
ume may be avoided using difference measurements: that is, by means of reference and sample tubes connected by a differential transducer. The adsorption of nitrogen gas is then measured as described below.

Raise a Dewar vessel containing liquid nitrogen at 77.4 K up to a defined point on the sample cell. Admit a sufficient volume of adsorbate gas to give the lowest desired relative pressure. Measure the volume adsorbed, $V_{a}$. For multipoint measurements, repeat the measurement of $V_{a}$ at successively higher $P / P_{o}$ values. When nitrogen is used as the adsorbate gas, $P / P_{o}$ values of $0.10,0.20$, and 0.30 are often suitable.

## Reference Materials

Periodically verify the functioning of the apparatus using appropriate reference materials of known surface area that has a specific surface area similar to that of the sample to be examined.■1S (USP28)

## Briefing

＜905〉 Uniformity of Dosage Units，USP 27 page 2396 and page 1587 of $P F$ 28（5）［Sept．－Oct．2002］．The United States Phar－ macopeia is the coordinating pharmacopeia in the efforts toward international harmonization of the specifications provided in this general test chapter．The Stage 5B text for this chapter has been signed－off by the Pharmacopeial Discussion Group members． The text presented herein represents a merger of the Stage 5B text and the national $U S P$ text．This combined text，which is being pub－ lished in this issue of $P F$ for information only，not for public com－ ment，is scheduled for publication in USP 28－NF 23，with a scheduled implementation date of 1 April 2006．Earlier implemen－ tation by individual companies may be done at their discretion．

Major differences between this current text and that of the
STAGE 4 ＂merged＂draft that was published on pages 1595－ 1599 of PF 28（5）［Sept．－Oct．2002］are listed below．
（1）The text discussing harmonization in the first paragraph of the STAGE 4 draft has been deleted in this current draft because the revised chapter will not officially be harmonized until the EP adopts the global text in the European Pharmacopoeia， Supplement 5．2，official December 2004 and the JP adopts the global text in the $J P X V$ ，official April 2006．At that time USP will republish this text with the addition of symbols for the national text throughout and with the explanatory intro－ ductory text，＂Portions of this general chapter have been har－ monized with the corresponding texts of the European Pharmacopoeia or the Japanese Pharmacopoeia．Those por－ tions that are not harmonized are marked with symbols（＊）to specify this fact．＂
（2）The term＂active ingredient＂in the STAGE 4 draft has been replaced globally by the preferred term＂drug substance＂．
（3）In the current listing of dosage forms that require testing by Content Uniformity（see item C3 in the text），suspensions or emulsions or gels in unit－dose containers or in soft capsules that are intended for systemic administration only are distin－ guished from those that are intended for external，cutaneous administration．
（4）A new Table 1 ，linking the various dosage forms to the appro－ priate Uniformity of Dosage Units test procedure，has been added to the current text．
（5）The text listing those dosage forms for which Weight Varia－ tion is applicable has been revised for clarity．
（6）The definition for the reference value $M$ in Table 2 has been revised to indicate coverage of cases where the target test sample amount（amount of drug substance）at time of manu－ facture，$T$ ，is either（a）less than or equal to $101.5 \%$ ，or（b） greater than 101．5\％．
（7）The variable $U$ ，an overage factor that was indicated for use in cases where the drug product was formulated with an overage of drug substance to compensate for stability losses during product shelf life，has been deleted from the current text． The addition of such overages is no longer considered to be acceptable．
（8）The text regarding the term Acceptance Value，$A V$ ，has been expanded for clarity．
（9）The text relating to the variables $L 1$ and $L 2$ in Table 2 has been expanded，and the values＂ 0.75 M ＂and＂ 1.25 M ＂have been replaced by formulas that clarify how the computations are made．
（10）The first paragraph in the Weight Variation section of the cur－ rent text contains new text for clarity．This text indicates that the assay results，designated as $A$ ，are to be expressed as＂$\%$ of label claim＂．
（11）Revised text stating that the drug substance concentration is assumed to be uniform（throughout the batch）has been added to the first paragraph under Weight Variation．For the purpose
of this chapter，tablet concentration，unlike tablet content，is assumed to be independent of individual dosage unit weight when Weight Variation is applicable．．

## Change to read：

## 〈905〉UNIFORMITY OF DOSAGE UNITS

NOTE－In this chapter，unit and dosage mit are－synomymous． The uniformity of destige units can be demenstrated by either of we methods，weight variation or centent unifermity．The require－ ments of this chapter apply beth to dosage units containing a single active ingredient and to dosage units containing fwor mere active ingredients；unless otherwise－specifled in the individual mene－ graph，they apply individually to each active ingredient in the product．

Content Unifermity requirements may be applied in all eases． The test for Content Uniformity is required for：－
（1）coated ablets，other than film coated tablets containing 50 mg or more of an active－ingredient that comprises $50 \%$ or more（by weight）of one tablet；
（2）transdermal systems；
（3）suspensions in single unit containers－or in soft capsules；
（4）inhalations（other than solutions for inhalation packaged inglass or plastic ampuls，intended for use in nebulizers） packaged in premetered dosage units（For inhalers and premetered desage units labeled for use with a mamed in halation deviee，alse see Aerosols，Metered Dese Inhat ers，and Dry Powder Intaters $\langle 6 \theta 1\rangle$ ；；
（5）solids（including sterile solids）that are packaged in unit dose containers and that contain active or inactive added substances，except that the test for Weight Variation may be－applied in the－special－situations－stated below；and
（6）suppesitories．
When the test for Content Uniformity is not required，the test for Weight Variation may be applied in any of the following sitations：
（1）products containing 50 mg or mereof an active ingredient eomprising $50 \%$ or more，by weight，of the dosage unit $\theta$ ，in the ease of hard capsules，the capsule contents，ex eept that uniformity of other aetive ingredients present in lesser propertions is demenstrated by meeting Centent Uniformity requirements；
（2）liqutid filled soft eapsules other than soft eapsules con－ faining suspensions；
（3）solids（including sterile－selids）that are packaged in sin gle unit containers and contain no added substances， whether active－or inactive；
（4）solids（ineluding sterile－solids）that are－packaged in sin gle unit containers，with or without added substances， whether active or inactive，that have been prepared frem true－solutions and freeze－dried in the fanaleontainers and are－labeled to indieate this methed of preparation；and
（5）solations for inhalation packaged in glass or plastic am puls，intended for use in nebulizers，oral solutions，and syrups when these artieles are packaged in single unit eontainers．

## WEHGHT VARझATHON

For the determination of dosage unit uniformity by weight var iation, select not fewer than 30 units, and proced as follows for the dosage form designated. [NOTE-Specimens other than these test units may be drawn frem the same bateh for Assay determinations.]

Uneanted and Film-Conted Tablets-Weigh aceurately 10 tab lets individually. From the result of the Assay, obtained as directed in the individual menograph, calculate the content of active ingre dient in each of the 10 tablets, assuming homegeneous distribution of the active ingredient.

Hard-Capsules Weigh aecurately 10 eapsules individually, taking are to preserve the identity of each capsule. Remove the eontents of each eapsule by a suitable means. Weigh aceuraty the emptied shells individually, and caleulate for each eapsule the net weight of its contents by subtrating the weight of the shell from the respective gross weight. From the results of the Assay, ebtained as direeted in the individual menegraph, caleulate the entent of active ingredient in each of the eapsules, assuming homogeneous distribution of the active ingredient.

Soft-Capstules Determine the net weight of the content of in dividual capsules as follows. Weigh aceurately the 10 intact eap sules individually to obtain their gross weights, taking care to preserve the identity of each capsule. Then cut open the capsules by means of a suitable clean, dry cutting instrument such as seis sers or a sharp open blade, and remove the contents by washing with a suitable solvent. Allow the oceluded solvent to evaporate from the shells at room temperature over a period of about 30 min utes, taking precautions to avoid uptake or less of meisture. Weigh the individual shells, and caleulate the net contents. From the results of the Assety, obtained as directed in the individual menegraph, caleulate the content of active ingredient in each of the eqpoules, assuming hemegeneous distribution of the active ingredient.

Solids (Ineluding Sterile-Solids) in-Single-Unit ContainersProeed as direeted for Hard Capsules, treating each unit as deseribed therein.

Solutions for Inhalation-Packnged in-Glass-or Plastic Ampuls, Intended for Use in Nebulizers Proeed as directed for Hard Capsules, treating each unit as described therein.

Oral Solutions and Syrups Packaged in-Single-Unit Containers Weigh accurately the amount of liquid that drains in not more than 5 seeonds from each of 10 -individual containers. If nee ssary, compute the equivalent volume after determining the apparent density. Frem the result of the Assay, obtained as direeted in the individual monograph, caleulate the content of active ingredient in the liquid drained from ach of the 10 units.

## CONTENT UNHFORMHTY

For the determination of dosage unit uniformity by assay of in dividual units, select not fewer than 30 units, and proced as fot tows for the dosage form designated.

UNCOATED AND COATED TABLETS, HARD AND SOFT CAPSULES, SUP POSITORLES, TRANSPERMAL SYSTEMS, ORAL SOLUTЮNS IN SINGLE UNHT CONTAINERS, SUSPENSIONS IN SINGLE UNHT CONTAINERS, SYR UPS IN SINGLE UNHT CONTAINERS, INHALATMNS PACKAGED IN PREME TERED-DOSAGE UNHTS, AND SOLIDS (INCLUDING STERHE SOLISS) IN SINGLE UNHT CONTAINERS, Assay 10 maits individually as direeted in the Assay in the individual menegraph, unless otherwise specifred in the Procedure for content uniformity. For oral solutions, suspensions, and syrups in single unit containers, eonduct the Assay en the ameant of well mixed material that drains frem an individ walcentainer in not mere than 5 seeonds, andexpress the results as delivered dese. Where the amount of active-ingredient in a single desage unit differs from that required in the Assty, adjust the de gree of dilution of the selutions and/or the volume-of aliquets-se that the concentration of the active ingredients in the final solution
is of the same order as that obtained in the Assay procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see Titrinetry $(544$ )); see alse Preedures under Tests and Assays in the General Notices and Requirements. If any such modifiea tions are made in the Assay procedure set forth in the individunt monegraph, make the appropriate corresponding changes in the ealeulation formula and titration factor:

Where a special Procedure for content uniformity is specified in the test for Uniformity of dosege units in the individual meno graph, make any necessary correction of the results obtained as fol tows.
(1) Prepare - composite-specimen of a sufficient number of dosage units to provide the amoun of specimencalled for in the Assay in the individual monograph plus the amount required for the special Proe dure for eontent uniformity in the monograph by finely powdering tablets or mixing the contents of eapsules or oral solutions, syrups, suspen sions, or solids in single unit enntainers to obtain a hemegeneous mixture. If a hemogeneous mixture cannet be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the at tive ingredient, and use appropriate aliquet pertions of this solution for the specified procedures.
(2) Assay separate, aecurately measured portions of the eom pesite-specimen of eapsules or tablets or suspensions-or inhalations or solids in single mit containers, both (a) as direeted in the Assety, and (b) using the special Proedure for content uniformity in the menegraph.
(3) Caleulate the weight of active ingredient equivalent to-1 average dosage unit, by (a) using the results obtained by the Assay procedure, and by (b) using the results obtained by the special procedure.
(4) Caleulate the correction factor, $F$, by the formula:-

$$
F=A / P
$$

in which $A$ is the weight of active ingredient equivalent to 1 over age dosage unit obtained by the Assety procedure; and $P$ is the weight of active ingredient equivalent to 1 average dosage mit obtained by the special procedure. If

is greater than 10 , the use of a correction factor is net valid.
(5) A valideorrection may be appliedonly if $F$ is not less than 1.030 nor greater than 1.100 , or, not less than 0.900 nor greater than 0.970 , and if $F$ is between 0.970 and 1.030 no correction is required.
(6) If $F$ lies between 1.030 and 1.100 , or between 0.900 and 0.970 , caleulate the weight of active ingredient in each dosage unit by multiplying each of the weights found using the special procedure by $F$.

## Galeulation of the Relative Standard Periation

The use of preprogrammed ealeulators or computers is aeeepta ble. A manual mathematical method is as follows:
s-smple-standard deviation:
$R S D$ - relative standard deviation (the sample standard devia tion expressed as a percentage of the mean).
$\bar{X}$ - mean of the values obtained from the units tested, ex pressed as a pereentage of the label claim.
$\#-$ number of units tested.
$x_{4}, x_{2}, x_{2} \ldots x_{4}=$ individual values $\left(x_{i}\right)$ of the units tested, ex pressed as a percentage of the label claim.

## Griteria

Apply the following criteria, unless othervise specified in the individual menegraph.
(4) If the Average of the Limits Specified in the Potency Defini tion in the Individual Monograph is 100.0 Pereent or Less-

GOMPRESSED TABLETS (COATED OR UNCOATED), SUPPOSITORIES, ORAL SOLUTONS IN SINGLE UNT CONTAINERS, SYRUPS IN SINGLE UNIT CONTANERS, SUSPENSONS IN SNNGLE UNT CONTAINERS, SOLIDS (HNCLUDNG STERHE SOLIDS) IN SNNGLE UNIT CONTANHERS, ANDSTER HESOLIDS FOR PARENTERAL USE-Unless therwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the active ingredient in each of the 10 dosage units as determined from the Weight Variation or the Content Uni fomity method lies within the range of $85.0 \%$ to $115.0 \%$ of the tabelclaim and the Relative standed devion is less than-or equal - $6.0 \%$.

If 1 unit is outside the range of $85.0 \%$ to $115.0 \%$ of label claim and no mit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim, or if the Relative standard deviation is greater than $6.0 \%$, or if both enditions prevail, test 20 -additional units. The requirements are met if not more than 1 unit of the 30 is outside the range of $85.0 \%$ to $115.0 \%$ of label claim and no unit is outside the range of $75.0 \%$ 125.0\% of labelelaim and the Relative stateder tion of the 30 dosage units does not $7.8 \%$

GAPSULES, TRANSDERMAL SYSTEMS, INHALATYNS PACKAGED-IN PREMETERED DOSAGE UNITS, AND MOLDED TABLETS-Unless other wise specified in the individual monegraph, the requirements for dosage uniformity are met if the amount of the active ingredient in not less than 9 of the 10 dosage units as determined from the Height Variation or the Content Uniformity method lies within the range of $85.0 \%$ to $115.0 \%$ of label clam and no unit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim and the Relative stan dad devion the 10 dosage uits is less than or equal to $6.0^{\circ} \%$.

If 2 or 3 dosage units are outside the range of $85.0 \%$ to $115.0 \%$ of label claim, but not outside the range of $75.0 \%$ to $125.0 \%$ of tabel claim, or if the Relative standed devian is greater than $6.0 \%$ or if beth conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30 are outside the range of $85.0 \%$ to $115.0 \%$ of label claim and no wit is outside the range of $75.0 \%$ to $125.0 \%$ flabelelaim, and the Relative standed devien of the 30 desage units does not exeed $7.8 \%$
(B) If the Average of the Limits Specified in the Poteney Defini tion in the Individual Monograph is Greater than 100.0 Percent-
(1) If the average value of the dosage units tested is 100.0 pereent or less, the requirements are as in (A).
(2) If the average value of the dosage units tested is greater than or equal to the average of the limits speciffed in the potency definition in the individual monograph, the requirements are as in ( 4 ), exeept that the words "label elaim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency def inition in the menegraph divided by 100 ".
(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as in ( 4 ), exeept that the-words "label elaim" are replace by the werds "labelclaim multiplied by the average value of the dosage units tested (expressed as a pereent of label claim) divided by 100 ".

## ^ $\langle 905\rangle$ UNIFORMITY OF DOSAGE UNITS

[NOTE-In this chapter, unit and dosage unit are synonymous.]

To ensure the consistency of dosage units, each unit in a batch should have a drug substance content within a narrow range around the label claim. Dosage units are defined as dosage forms containing a single dose or a part of a dose of drug substance in each unit.

The term "uniformity of dosage unit" is defined as the degree of uniformity in the amount of the drug substance among dosage units. Therefore, the requirements of this chapter apply to each drug substance being comprised in dosage units containing one or more drug substances, unless otherwise specified in the individual monograph.

The uniformity of dosage units can be demonstrated by either of two methods, Content Uniformity or Weight Variation (see Table 1). The test for Content Uniformity is based on the assay of the individual content of drug substance(s) in a number of individual dosage units to determine whether the individual content is within the limits set. The Content Uniformity method may be applied in all cases. The test for Content Uniformity is required for those dosage forms described in (C1)-(C6) below:
(C1) coated tablets, other than film-coated tablets
containing 25 mg or more of a drug substance that comprises $25 \%$ or more (by weight) of one tablet;
(C2) transdermal systems;
(C3) suspensions or emulsions or gels in unit-dose containers or in soft capsules that are intended for systemic administration only (not for those drug products that are intended for external, cutaneous administration);
(C4) inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units. For inhalers and premetered dosage units labeled for use with a named inhalation device, also see Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers $\langle 601\rangle$;
(C5) solids (including sterile solids) that are packaged in single-unit containers and that contain active or inactive added substances, except that the test for Weight Variation may be applied in the special situations stated in (W2) and (W3) below; and
(C6) suppositories.

The test for Weight Variation is applicable for the following dosage forms:
(W1) solutions for inhalation that are packaged in glass or plastic ampuls and intended for use in nebulizers, and oral solutions packaged in unit-dose containers and into soft capsules; solids (including sterile solids) that are packaged in single-unit containers and contain no added substances, whether active or inactive; hard capsules, uncoated tablets, or filmcoated tablets, containing 25 mg or more of a drug substance comprising $25 \%$ or more, by weight, of the dosage unit or, in the case of hard capsules, the capsule contents, except that uniformity of other drug substances present in lesser proportions is demonstrated by meeting Content Uniformity requirements.

The test for Content Uniformity is required for all dosage forms not meeting the above conditions for the Weight Variation test. Alternatively, products listed in item (W4) above that do not meet the $25 \mathrm{mg} / 25 \%$ threshold limit may be tested for uniformity of dosage units by Weight Variation instead of the Content Uniformity test if the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than $2 \%$, based on process validation data and development data. The concentration RSD is the RSD of the concentration per dosage unit ( $\mathrm{w} / \mathrm{w}$ or $\mathrm{w} / \mathrm{v}$ ), where concentration per dosage unit equals the assay result per dosage unit divided by the individual dosage unit weight. See the RSD formula in Table 2.

Table 1. Application of Content Uniformity (CU) and Weight Variation (WV) Tests for Dosage Forms

| Dosage Form | Type | Subtype | Dose \& Ratio of Drug Substance |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\begin{aligned} & \geq 25 \mathrm{mg} \& \\ & \quad \geq 25 \% \end{aligned}$ | $\begin{gathered} <25 \mathrm{mg} \& \\ <25 \% \end{gathered}$ |
| Tablets | Uncoated |  | WV | CU |
|  | Coated | Film | WV | CU |
| Capsules |  | Others | CU | CU |
|  | Hard |  | WV | CU |
|  | Soft | Suspension, emulsion, or gel | CU | CU |

## CONTENT UNIFORMITY

Select not less than 30 units, and proceed as follows for the dosage form designated. Where the amount of drug substance in a single dosage unit differs from that required in the Assay, adjust the degree of dilution of the solutions and/or the volume of aliquots so that the concentration of the drug substances in the final solution is of the same order as that obtained in the Assay procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see Titrimetry $\langle 541\rangle$ ); see also Procedures under Tests and Assays in the General Notices and Requirements. If any such modifications are made in the Assay procedure set forth in the individual monograph, make the appropriate corresponding changes in the calculation formula and titration factor.

Where a special Procedure for content uniformity is specified in the test for Uniformity of dosage units in the individual monograph, make any necessary correction of the results obtained as follows.
(1) Prepare a composite specimen of a sufficient number of dosage units to provide the amount of specimen called for in the Assay in the individual monograph plus the amount required for the special Procedure for content
uniformity in the monograph by finely powdering tablets or mixing the contents of capsules or oral solutions, suspensions, emulsions, gels, or solids in single-unit containers to obtain a homogeneous mixture. If a homogeneous mixture cannot be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the drug substance, and use appropriate aliquot portions of this solution for the specified procedures.
(2) Assay separate, accurately measured portions of the composite specimen of capsules or tablets or suspensions or inhalations or solids in single-unit containers, both (a) as directed in the Assay, and (b) using the special Procedure for content uniformity in the monograph.
(3) Calculate the weight of drug substance equivalent to 1 average dosage unit, by (a) using the results obtained by the Assay procedure, and by (b) using the results obtained by the special procedure.
(4) Calculate the correction factor, $F$, by the formula:

$$
F=W / P,
$$

in which $W$ is the weight of drug substance equivalent to 1 average dosage unit obtained by the Assay procedure, and $P$ is the weight of drug substance equivalent to 1 average dosage unit obtained by the special procedure. If

$$
\frac{100|W-P|}{W}
$$

is greater than 10 , the use of a correction factor is not valid.
(5) The correction factor is to be applied only if $F$ is not less than 1.030 nor greater than 1.100 , or not less than 0.900 nor greater than 0.970 . If $F$ is between 0.970 and 1.030 , no correction is required.
(6) If $F$ lies between 1.030 and 1.100 , or between 0.900 and 0.970 , calculate the weight of drug substance in each dosage unit by multiplying each of the weights found using the special procedure by $F$.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers, and Solids (including Sterile Solids) in SingleUnit Containers-Assay 10 units individually as directed in the Assay in the individual monograph, unless otherwise specified in the Procedure for content uniformity in the individual monograph. Calculate the acceptance value as directed below.

For oral solutions, oral suspensions, oral emulsions, or oral gels in single-unit containers, conduct the Assay on the amount of well-mixed material that drains from an individual container in not more than 5 seconds, or for highly viscous products, conduct the Assay on the amount of well-mixed material that is obtained by quantitatively removing the contents from an individual container, and express the results as the delivered dose.

Calculation of Acceptance Value-Calculate the acceptance value by the formula:

$$
|M-\bar{X}|+k s,
$$

in which the terms are as defined in Table 2.

Table 2

| Variable | Definition | Conditions | Value |
| :--- | :--- | :--- | :--- |
| $\bar{X}$ | Mean of individual contents $\left(\chi_{1}\right.$, <br> $\left.\chi_{2}, \ldots, \chi_{n}\right)$, expressed as a per- <br> centage of the label claim |  |  |
| $\chi_{1}, \chi_{2}, \ldots, \chi_{n}$ | Individual contents of the units <br> tested, expressed as a percentage <br> of the label claim |  |  |

Table 2 (Continued)

| Variable | Definition | Conditions | Value |
| :---: | :---: | :---: | :---: |
| $n$ | Sample size (number of units in a sample) |  |  |
| $k$ | Acceptability constant | If $n=10$, then $k=$ | 2.4 |
|  |  | If $n=30$, then $k=$ | 2.0 |
| $s$ | Sample standard deviation |  | $\left[\frac{\sum_{i=1}^{n}\left(\chi_{i}-\bar{X}\right)^{2}}{n-1}\right]^{\frac{1}{2}}$ |
| RSD | Relative standard deviation (the sample standard deviation expressed as a percentage of the mean) |  | $\frac{100 s}{\bar{X}}$ |
| $M$ (case 1) to be applied when $T \leq 101.5$ | Reference value | $\begin{aligned} & \text { If } 98.5 \% \leq \bar{X} \\ & \leq 101.5 \% \text {, then } \end{aligned}$ | $\begin{gathered} M=\bar{X} \\ (A V=k s) \end{gathered}$ |
|  |  | If $\bar{X}<98.5 \%$, then | $\begin{gathered} M=98.5 \% \\ (A V=98.5-\bar{X}+k s) \end{gathered}$ |
|  |  | If $\bar{X}>101.5 \%$, then | $\begin{gathered} M=101.5 \% \\ (A V=\bar{X}-101.5+k s) \end{gathered}$ |
| $M$ (case 2) to be applied when $T>101.5$ | Reference value | If $98.5 \leq \bar{X} \leq T$, then | $\begin{gathered} M=\bar{X} \\ (A V=k s) \end{gathered}$ |
|  |  | If $\bar{X}<98.5 \%$, then | $\begin{gathered} M=98.5 \% \\ (A V=98.5-\bar{X}+k s) \end{gathered}$ |
|  |  | If $\bar{X}>\mathrm{T}$, then | $\begin{gathered} M=T \% \\ (A V=\bar{X}-T+k s) \end{gathered}$ |

Table 2 (Continued)

| Variable | Definition | Conditions | Value |
| :---: | :---: | :---: | :---: |
| Acceptance value ( $A V$ ) |  |  | general formula: $\|M-\bar{X}\|+k s$ <br> (Calculations are specified above for the different cases.) |
| L1 | Maximum allowed acceptance value |  | $L 1=15.0$ unless otherwise specified in the individual monograph |
| L2 | Maximum allowed range for deviation of each dosage unit tested from the calculated value of $M$ | On the low side, no dosage unit result can be less than (1$L 2 * 0.01) M$, while on the high side no dosage unit result can be greater than (1 + $L 2 * 0.01$ ) $M$. (This is based on an $L 2$ value of 25.0 .) | $L 2=25.0$ unless otherwise specified in the individual monograph |
| $T$ | Target test sample amount at time of manufacture. For purposes of this Pharmacopeia, unless otherwise specified in the individual monograph, $T$ is $100.0 \%$, and for manufacturing purposes, $T$ is the manufacturer's approved target test amount value at the time of manufacture. |  |  |

Suppositories, Transdermal Systems, and Inhalations Packaged in Premetered Dosage Units-[NOTE-Acceptance value calculations are not required for these dosage forms.] Assay 10 units individually as directed in the Assay in the individual monograph, unless otherwise specified in the Procedure for content uniformity.

## WEIGHT VARIATION

Select not less than 30 dosage units, and proceed as follows for the dosage form designated. The result of the $A s$ say, obtained as directed in the individual monograph, is designated as result $A$, expressed as \% of label claim (see Calculation of the Acceptance Value). Assume that the concentration (weight of drug substance per weight of dosage unit) is uniform. [NOTE-Specimens other than these test units may be drawn from the same batch for assay determinations.]

Uncoated or Film-Coated Tablets-Accurately weigh 10 tablets individually. Calculate the drug substance content, expressed as $\%$ of label claim, of each tablet from the weight of the individual tablet and the result of the $A s$ say. Calculate the acceptance value.

Hard Capsules-Accurately weigh 10 capsules individually, taking care to preserve the identity of each capsule. Remove the contents of each capsule by a suitable means. Accurately weigh the emptied shells individually, and calculate for each capsule the net weight of its contents by subtracting the weight of the shell from the respective gross weight. Calculate the drug substance content, expressed as $\%$ of label claim, of each capsule from the net weight of the individual capsule content and the result of the Assay. Calculate the acceptance value.

Soft Capsules-Accurately weigh 10 intact capsules individually to obtain their gross weights, taking care to preserve the identity of each capsule. Then cut open the capsules by means of a suitable clean, dry cutting instrument such as scissors or a sharp open blade, and remove the contents by washing with a suitable solvent. Allow the occluded solvent to evaporate from the shells at room temperature over a period of about 30 minutes, taking precautions to avoid uptake or loss of moisture. Weigh the individual shells, and calculate the net contents. Calculate the drug substance content, expressed as $\%$ of label claim, in each capsule from the net weight of product removed from the individual capsules and the result of the Assay. Calculate the acceptance value.

Solids (Including Sterile Solids) in Single-Unit Con-tainers-Proceed as directed for Hard Capsules, treating each unit as described therein. Calculate the acceptance value.

Oral Solutions Packaged in Single-Unit ContainersAccurately weigh the amount of liquid that drains in not more than 5 seconds from each of 10 individual containers. If necessary, compute the equivalent volume after determining the density. Calculate the drug substance content, expressed as \% of label claim, in the liquid drained from each unit from the net weight of the individual container content and the result of the Assay. Calculate the acceptance value.

Calculation of Acceptance Value-Calculate the acceptance value as shown in Content Uniformity, except that the individual contents of the units are replaced with the individual estimated contents defined below.

$$
\begin{aligned}
\chi_{1}, \chi_{2}, \ldots, \chi_{n}= & \text { the individual estimated contents } \\
& \text { of the units tested, where } \\
& =w_{i} \times A / \bar{W}
\end{aligned}
$$

$$
\begin{array}{ll}
w_{1}, w_{2}, \ldots, w_{n}= & \begin{array}{r}
\text { individual weights of the units } \\
\\
\\
\text { tested, }
\end{array} \\
A & \quad \text { content of drug substance }(\% \text { of } \\
\text { label claim) determined as } \\
& \\
& \\
& \text { described in the Assay, and } \\
\bar{W} & \text { mean of individual weights } \\
& \left(w_{1}, w_{2}, \ldots, w_{n}\right) .
\end{array}
$$

Solutions for Inhalation Packaged in Glass or Plastic Ampuls and Intended for Use in Nebulizers-[NOTEAcceptance value calculations are not required for these dosage forms.] Accurately weigh 10 containers individually, taking care to preserve the identity of each container. Remove the contents of each container by a suitable means. Accurately weigh the emptied containers individually, and calculate for each container the net weight of its contents by subtracting the weight of the container from the respective gross weight. From the results of the Assay, obtained as directed in the individual monograph, calculate the drug substance content, expressed as \% of label claim, in each of the containers.

## CRITERIA

Apply the following criteria, unless otherwise specified in the individual monograph.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers, and Solids (Including Sterile Solids) in SingleUnit Containers-The requirements for dosage uniformity are met if the acceptance value of the first 10 dosage units is less than or equal to $L 1 \%$. If the acceptance value is greater than $L 1 \%$, test the next 20 units and calculate the acceptance value. The requirements are met if the final acceptance value of the 30 dosage units is less than or equal to $L 1 \%$, and no individual content of any dosage unit is less than (1-
$L 2 * 0.01) M$ nor more than $(1+L 2 * 0.01) M$ as specified in the Calculation of Acceptance Value under Content Uniformity or under Weight Variation. Unless otherwise specified in the individual monograph, $L 1$ is 15.0 and $L 2$ is 25.0.

## Suppositories-

Limit $A$ (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)-Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in each of the 10 dosage units as determined from the Content Uniformity method lies within the range of $85.0 \%$ to $115.0 \%$ of the label claim, and the RSD is less than or equal to $6.0 \%$.
If 1 unit is outside the range of $85.0 \%$ to $115.0 \%$ of label claim, and no unit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim, or if the RSD is greater than $6.0 \%$, or if both conditions prevail, test 20 additional units. The requirements are met if not more than 1 unit of the 30 is outside the range of $85.0 \%$ to $115.0 \%$ of label claim, and no unit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim and the RSD of the 30 dosage units does not exceed $7.8 \%$.

Limit $B$ (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)-
(1) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under Limit $A$, except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100 ".
(2) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual
monograph, the requirements are as specified under Limit A, except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100 ".

Transdermal Systems and Inhalations Packaged in

## Premetered Dosage Units-

Limit $A$ (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)-Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in not less than 9 of the 10 dosage units as determined from the Content Uniformity method (or, in the case of solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers, from either the Content Uniformity or the Weight Variation method) lies within the range of $85.0 \%$ to $115.0 \%$ of label claim, and no unit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim, and the RSD of the 10 dosage units is less than or equal to $6.0 \%$.

If 2 or 3 dosage units are outside the range of $85.0 \%$ to $115.0 \%$ of label claim, but not outside the range of $75.0 \%$ to $125.0 \%$ of label claim, or if the RSD is greater than $6.0 \%$ or if both conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30
are outside the range of $85.0 \%$ to $115.0 \%$ of label claim and no unit is outside the range of $75.0 \%$ to $125.0 \%$ of label claim, and the RSD of the 30 dosage units does not exceed 7.8\%.

Limit $B$ (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)-
(1) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under Limit $A$, except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100 ".
(2) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under Limit $A$, except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by $100 "$. $\triangle$ USP28

## PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the Staff Directory to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

## Briefing

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How To Use $P F$ ), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.
PHARMACOPEIAL PREVIEWS ..... 1487
GENERAL INFORMATION CHAPTERS ..... 1489
〈1073〉 Effusivity ..... 1489

# GENERAL CHAPTERS <br> General Information 

## BRIEFING

$\langle\mathbf{1 0 7 3}\rangle$ Effusivity. A new general chapter for effusivity, designated Efflusivity $\langle 1073\rangle$, is being previewed. Effusivity is a heat transfer property present in all materials in all formats-solids, liquids, pastes, powders, and gases. As such, this property has many potential uses in the production of pharmaceuticals for controlling product consistency, homogeneity, and final product quality. This chapter provides general information on this technique, which may have application in certain cases as a manufacturing real-time control technique.
(PDF: G. Ritchie; PDF: W. Paul) RTS-41237-1

## Add the following:

## 〈1073〉 EFFUSIVITY

## INTRODUCTION

Effusivity (thermal effusivity) is a thermal property present in materials of all formats-solid, liquid, paste, powder, and gas. Effusivity measures the rate at which a material can absorb heat and is defined as the square root of the product of the thermal conductivity, density, and specific heat capacity. Specifically, effusivity is the thermal property that dictates the interfacial temperature when two semi-infinite bodies meet (see Sample Thickness). [NOTE-See the final section of this chapter, Definition of Terms and Symbols, for the terms and symbols referred to in this chapter and commonly employed in effusivity technology.]

Every material has a specific thermal effusivity value. Effusivity is sensitive to composition because materials differ in effusivity value $\left(W_{s}^{1 / 2} / m^{2} \cdot K\right)$ from 5 for air to 1600 for water to several thousand for advanced composites. As a result, effusivity can differentiate between materials in solid, liquid, and powder formats. In the application of blend evaluation, the blending endpoint can then be identified when the effusivities of samples at different positions in the blender give minimum variation (see Definition of Terms and Symbols). The effusivity of a powder sample is driven by the properties of the particles and the interparticle material (typically air). Because effusivities of pharmaceutical solid materials (typically 150 to $800 \mathrm{Ws}^{1 / 2} / \mathrm{m}^{2} \cdot K$ ) are much higher than that of air, effusivity technology can also identify particle size distribution and density of powders. Because the effusivity of liquids (i.e., water is $1600 \mathrm{Ws}^{1 / 2} / \mathrm{m}^{2} \cdot K$ ) is so much greater than powder, effusivity technology can be used to monitor wet granulation and drying.

A big advantage of effusivity technology is that accurate measurements can be made rapidly and nondestructively. Furthermore, effusivity sensors only require brief contact with any materials investigated. As a result, effusivity technology allows in situ measurements and on-line monitoring of processes in challenging environments. If the material is in motion during the measurement but makes periodic contact with the sensor (as in blending), the measurement is taken only during the periods of contact.

## MODIFIED HOT WIRE (MHW) INTERFACIAL HEAT REFLECTANCE

A fast, nondestructive and accurate effusivity measurement can be performed using a transient heat interfacial reflectance MHW technique (see Definition of Terms and Symbols).

The sample is tested by placing the heating elements of the sensor of the apparatus against the surface of the sample (see Definition of Terms and Symbols). A known quantity of electrical current is passed through the heating elements of the sensor for a known time, which results in a temperature rise (less than 5 K ) at the sensor/sample interface. The size of the temperature increase is measured, and because the temperature rise of the element is inversely proportional to the ability of the sample to transfer heat, a relationship between the change in temperature and material characteristics can be developed. This relationship is created through the use of a calibration equation using well-characterized samples (see Definition of Terms and Symbols). The value of effusivity can then be measured by inputting the appropriate sample test data into the calibration equation.

During the transient measurement, the heat flows into the sample. The longer the test duration, the further the heat wave penetrates into the sample based on the Einstein equation:

$$
d=(4 \alpha t)^{1 / 2}
$$

where:

$$
\begin{aligned}
& d=\text { distance traveled by } 1 \% \text { of the heat wave (m) } \\
& \alpha=\text { the thermal diffusivity of the material }\left(\mathrm{m}^{2} / \mathrm{s}\right)
\end{aligned}
$$

$$
t=\text { the time }(\mathrm{s})
$$

Tests with a longer duration cause heat to travel further into the sample, and, therefore, the resulting effusivity measurement represents a larger volume of material, or a larger scale
of scrutiny. It is important to balance the scale of scrutiny appropriately with the expectations of homogeneity and consistency in the material evaluated.

For powder samples, the effusivity varies with packing conditions because air has an effusivity of $5 \mathrm{Ws}^{1 / 2} / \mathrm{m}^{2} \cdot \mathrm{~K}$. As the material is compressed, air is removed and the effusivity value increases. After a user-defined nominal pressure of 15 Pa is applied for most materials, the effusivity measurement reaches a plateau when it is plotted against applied pressure. This is referred to as the threshold pressure and should be independently determined for materials that are tested offline. Alternately, if a sensor used for effusivity measurements weighs at least 500 g and has a surface area equal to or less than a $6.4-\mathrm{cm}(2.5-\mathrm{inch})$ diameter, adequate pressure is supplied. During on-line testing, the column of powder above a sensor face provides adequate pressure if the sensor is at least 20 cm below the powder surface.
Although the scale of scrutiny is only 200 to 500 mg , in off-line blend evaluation, each sample should be 25 g or more to establish reproducible compression and consistency in sample treatment. It is recommended that samples be placed in a container whose inner diameter is in close proximity to the outer diameter of the sensor. This prevents additional movement and spreading of the sample and results in improved reproducibility. In the case of a $6.4-\mathrm{cm}$ diameter sensor, a $250-\mathrm{mL}$ beaker makes an excellent single, sample holder. On the other hand, the threshold pressure will not affect evaluation results in on-line blend evaluation as long as the sensors are placed at a level well below the fill line in order for the downward pressure of the powder above the sensor to generate the equivalent pressure (see Definition of Terms and Symbols).

## Other Factors Affecting Effusivity Quantification

Moisture-Effusivity values are sensitive to the amount of moisture contained in a sample. It is, therefore, important to maintain consistent sample moisture during calibrations and sample testing, unless it is the moisture variations that are the desired measurement. Because water has an effusivity of $1600 \mathrm{Ws}^{1 / 2} / \mathrm{m}^{2} \cdot K$, the content of $1 \%$ water increases the effusivity of a typical powder by $3 \%$.

Environmental Temperature-The variation of environmental temperature may jeopardize the target precision and accuracy (see Definition of Terms and Symbols). It is recommended that the variation of the environmental temperature should be less than $\pm 1 \mathrm{~K}$ to achieve absolute effusivity measurements with accuracies of $1 \%$ to $2 \%$. If the environmental temperature cannot be controlled, then it should be measured and recorded. The temperature data then provide a basis upon which a suitable correction for temperature effects can be formulated. Because the major application of effusivity is the relative effusivity or determination of effusivity plateaus rather than absolute effusivity (e.g., blend evaluation and drying), and each set of measurements is taken at the same environmental temperature, this factor typically has little or no affect on the final results.

Sample Thickness-Because heat is applied and detected on the same side of the material, if the sample is completely penetrated during a test, the material on the other side of the sample will be factored into the test results, producing a false representation of the effusivity value of the sample. Therefore, any off-line sample that is tested should be thicker than the depth of heat penetration during the test. In blend evaluation, a typical 2 -second test penetrates into the powders approximately 0.5 mm , which is why a $25-\mathrm{g}$ sample placed in a container with sides matching the sensor dimensions is recommended. In an on-line measurement, the thickness of sample has no significance, because the
sample is semi-infinite and the heat never reaches the far side of the sample. The worst-case scenario for minimum sample thickness would be to use the longest test time of 10 seconds and a high effusivity material (crystalline material with high moisture). In this scenario, a minimum sample thickness of 5 mm would be required.

Sensor/Sample Interface Temperature-The differences in test results caused by variability in the starting temperature are not negligible. It is, therefore, critical to monitor the sensor/sample interface temperature and ensure that the temperature is the same at the start of each test. To achieve this, a cooling time may be used between two successive experiments (see Definition of Terms and Symbols). Otherwise, the temperature of the sensor/sample interface should be measured and recorded. The temperature data then provide a basis upon which a suitable correction for the effects of starting sensor/sample interface temperature can be formulated.
(In)homogeneity-Effusivity at the surface of a sample may or may not represent the effusivity of the bulk of the sample. The extent of regional differences in effusivity will depend on the homogeneity or inhomogeneity of the sample. As a result, differences in homogeneity or inhomogeneity can be detected by regional differences in effusivity values. In pharmaceutical analysis, this characteristic enables effusivity technology to be an efficient, effective tool for blend evaluation. The limiting factor is the range of effusivities of the components in the mixture. If all the materials had effusivities with a span of $10 \mathrm{Ws}^{1 / 2} / \mathrm{m}^{2} \cdot K$, the technique would not be able to differentiate between blended and unblended material because the relative standard deviation (RSD) between sensors at different locations in the powder bed would start at a maximum of $1.25 \%$.

Power Supply-Accuracy and precision of the test results depend directly on the accuracy and precision of the power supply for heating elements. Therefore, it is desirable to use a high-precision, constant current and voltage power supply in the constant current and voltage configuration, respectively. Also, the power supply should be capable of delivering sufficient current to the heating elements such that the sensor generates a statistically significant temperature rise at the sensor/sample interface. The ideal temperature rise at the sensor/sample interface ranges from statistically significant to less than 5 K .

## APPARATUS

The sensor of the apparatus is based on the modified transient hot wire technique, which means that the heating elements are supported on a backing that provides mechanical support and electrical and thermal insulation (see Definition of Terms and Symbols). Such a modification eliminates the intrusive nature of hot wire technique, thereby allowing solids to be tested without melting, or otherwise modifying the sample to conform to the geometry of the test cell.

The sensor of this apparatus consists of three parallel wires mounted on a piece of thermally and electrically insulating backing. The parallel wires function as heating and guarding elements to generate a measurable rectangular one-dimensional heat flow. The constant current or voltage electrical source supplies power to the heating elements. The two outer wires are guard heaters, preventing the undesired lateral spread of heat from the heating elements and generating rectangular one-dimensional heat flow. The sensor of this apparatus functions by measuring the temperature rise at the sensor/sample interface. The temperature rise at the sensor/sample interface is measured as the voltage rises over time in a constant current configuration, or as the current rises over time in a constant voltage configuration. An

ADC (analog/digital converter) with suitable input range and resolution should be connected to the sensor. The temperature rise is recorded using an appropriate data acquisition rate.

In on-line blend evaluation, the effusivity sensors can be retrofitted onto a blender. It is recommended to retrofit the sensors onto the covers of the blender for reasons of flatness and economics as well as for constant applied load of the material on top of the sensors. The measurement is taken while the blender is inverted. The number of sensors placed depends on the system and the size of the blenders, but typically it is four to eight sensors. For bin blenders with flat surfaces, the volume limitation on the lower end is related to the surface area of the bin so that no fewer than two sensor ferrules can be retrofitted on each side of the blender.

## FACTORY/VENDOR CALIBRATION

MHW technique is a comparative (secondary) method of measurement and the sensor must be calibrated with standards, which have known effusivity values. This calibration is conducted at the factory. The MHW instruments are factory calibrated with four calibration standards in triplicate. [NOTE-Calibration standards should be selected from or traceable to a recognized source of national standards.] During calibration, the test time and cooling time are established.

The highest/lowest effusivity of the sample must be less/ greater than the highest/lowest effusivity of the calibration standard. The heating elements of the sensor must be completely covered by the standard. Handling the standard should be minimized. Avoid touching the sample/standard with bare hands or fingers because such touching can lead to significant disruption of thermal equilibrium.

Relatively stable thermal equilibrium must exist between the sensor and the sample in order for accurate and precise measurements to be made. Thermal equilibrium is disrupted during each test because the temperature of the sensor/sample interface increases during a test. As a result, it is desirable to employ a cooling time between two successive experiments to allow the system to (1) re-establish thermal equilibrium between the sensor and the sample and (2) ensure that the temperature of the sensor/sample interface is the same at the start of the each test. Depending on thermal diffusivity of the sample and sensor power, the cooling time needed may vary from a few seconds to several minutes or more. An acceptable cooling time should make temperature or voltage differences from the beginning to end of a test sequence less than 0.5 K or 0.9 mV . In blend evaluation, the typical cooling time is 1 to 3 minute(s). This is a factor that is set during factory calibration and is directly proportional to the test time. If the tests are conducted without cooling, the temperature of the sensor/sample interface should be recorded. The apparatus should be corrected for the difference in the initial sensor/sample interface temperature.

Test time may vary from less than 1 second to a few minutes, depending on the sample's thermal diffusivity (see Definition of Terms and Symbols). The lower the sample's thermal diffusivity, the shorter the test time, and vice versa. In blend evaluation, the typical test time is 1 to 10 seconds.

Data collection rates should be fast enough to provide statistical confidence in the test results. Shorter test times will require faster data collection rates. The data collection rate is determined such that at least 100 data points can be collected at each test. In blend evaluation, the typical data collection rate is 100 to 400 Hz .

The factory calibration is acceptable when the squared correlation coefficient resulting from the least-square correlation between raw instrument response and known thermal effusivities of the standards is greater than or equal to 0.990 ( $R^{2} \geq 0.990$ ). Other correlation techniques should result in equivalent precision and bias in the tests after an acceptable calibration (see Definition of Terms and Symbols). Upon an acceptable calibration, both precision and bias estimates are less than $\pm 3 \%$ RSD between sensors and less than $\pm 1 \%$ RSD within a single sensor. Appropriateness and accuracy of the calibration are proven when a reference standard is tested and the effusivity value is within $\pm 5 \%$.

An effusivity reference material should be checked daily to ensure that the calibration has not drifted. The absolute effusivity value should be maintained within acceptance criteria at all times. Aside from that, the calibration should be carried out when the testing environment changes or when a need arises to change operating parameters such as test time and sampling frequency.

## DEFINITION OF TERMS AND SYMBOLS

ABSOLUTE EFFUSIVITY is the numerical value of effusivity. ACCURACY is the closeness of test results obtained to the true value.

BACKING is a piece of thermally and electrically insulating material to provide mechanical support for heating elements, to help generate one-dimensional heat flow, and to avoid a short circuit.

BIAS, also referred to as systematic error, is a fixed deviation that is inherent in every measurement.

BLEND ENDING POINT is a blend status when the blend uniformity is reached.

CALIBRATION is the process by which standard materials are used to determine the settings of instruments that correspond to particular values of voltage, current, frequency, or other output.

CALIBRATION EQUATION is an equation used to convert raw instrument response to effusivity values.

CALIBRATION STANDARD is a sample having known thermal effusivity value and selected from or traceable to a recognized library of national standards.

COOLING TIME is the time interval between two successive experiments, in seconds (s).

DATA ANALYSIS WINDOW is a calculation method to select part of data instead of whole data collected to determine the effusivity of samples tested.

DENSITY is the mass per unit volume of the material, in kg / $\mathrm{m}^{3}$ 。

ENDING TIME is the time point counted as the last valid data for the calculation of effusivity. It defines the ending point of the data analysis window.

HEATING ELEMENT is a thin material with high electrical resistance to generate a measurable temperature increase at the sensor/sample interface.

INTERFACIAL HEAT REFLECTANCE is a reflectance measurement technique where the sensors supply the heat source to samples and detect the heat flow reflected from the samples. PRECISION is the degree of agreement among individual test results when the method is applied repeatedly to multiple samplings of a homogeneous sample. It is important to distinguish between within sensor and between sensor precisions in all reports.

RELATIVE EFFUSIVITY is the effusivity value of a specific sample relative to the mean effusivity of a group of such samples.

SAMPLING FREQUENCY is the frequency of testing during each set of test.

SPECIFIC HEAT CAPACITY is the quantity of heat required to raise the temperature of a unit of mass of a substance by a unit change in temperature, in $J /(\mathrm{kg} \cdot \mathrm{K})$.

START TIME is the elapsed time from the beginning of the test to the time point counted as the first valid data for the calculation of effusivity. It defines the start point of the data analysis window, in s .

TEST TIME is the elapsed time from start to finish of passing current through the heating elements to perform a single test, in s .

THERMAL CONDUCTIVITY is the time rate of steady state heat flow through a unit area of a homogeneous material induced by a unit temperature gradient in a direction perpendicular to that unit area, in $W / m \cdot K$.

THERMAL DIFFUSIVITY is the ratio of thermal conductivity of a substance to the product of its density and specific heat, in $m^{2} / s$.

THERMAL EFFUSIVITY, $e$, also referred to as effusivity or thermal inertia, is the square root of the product of the thermal conductivity, density, and specific heat capacity, in $W s^{1 / 2} / m^{2} \cdot K$. In the MHW technique, $e$, is calculated using the following formula:

$$
1 / e \infty(d \Delta T / d t)
$$

in which, $\Delta T$ is the temperature rise at the sensor/sample interface, and $d t$ is the time period corresponding to this temperature rise.

## STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the In-Process Revision and Pharmacopeial Previews sections. Readers interested in submitting comments should see Instructions to Authors.

## Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to $U S P-N F$ revision will be considered for publication in the Pharmacopeial Forum under the section Stimuli to the Revision Process. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract-Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.
References-Consult a current copy of the Pharmacopeial Forum and the ACS Style Guide for assistance with reference style.

Copyright - Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.
Contact Person-When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions-Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft ${ }^{\circledR}$ Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be cameraready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

# Determination of the Hydroxypropoxy Content in Hydroxypropyl Cellulose by ${ }^{1} \mathrm{H}$ NMR 

T. Andersson ${ }^{1}$, S. Richardson ${ }^{1}$, and M. Erickson ${ }^{1,2}$

#### Abstract

The authors describe the use of ${ }^{1} \mathrm{H}$ NMR for determination of molar substitution and hydroxypropoxy content in hydroxypropyl cellulose. The method is developed as a possible alternative to the present pharmacopeial methods (GC and titration). The method is shown to be robust and gives a good correlation to the titration procedure described in the USP monograph, Hydroxypropyl Cellulose.

## INTRODUCTION

The hydroxypropoxy (HP) content of high-substituted hydroxypropyl cellulose (HPC) is determined by different methods in the United States Pharmacopeia (USP) (1) and the Japanese Pharmacopeia (JP) (2). USP uses chromic acid oxidation followed by titration, whereas $J P$ utilizes a treatment with hydroiodic acid followed by a gas chromatographic method (Zeissel-GC) for the HP content analysis. The USP assay has been reported to be more accurate than the $J P$ method. The $J P$ method is, however, more reproducible but gives consistently lower results compared to the USP method (3). A proposal for a harmonized monograph for HPC using chromic acid oxidation as the assay was published in Pharmeuropa 14.2 (4). However, chromic acid is considered a hazardous material by $J P$.

This report describes an alternative method for determination of the HP content in HPC by ${ }^{1} \mathrm{H}$ NMR based on the paper of Tezuka et al. (5). In this method HPC is acetylated (see Figure 1), which allows direct determination of the molar substitution of the polymer.

Fig. 1. The structure of acetylated HPC.
The areas from the ${ }^{1} \mathrm{H}$ NMR signals from the methyl group in the introduced acetyl group (signal a) and from the methyl group in the HP group (signal b) are used to determine the molar substitution (MS) (see Figure 2).

Fig. 2. The ${ }^{1} \mathrm{H}$ NMR spectrum of acetylated HPC.

The weight percentage of HP groups accordingly is calculated by the following formula:

$$
\mathrm{HP}(\mathrm{w} / \mathrm{w} \%)=75 \times \mathrm{MS} \times 100 /(58 \times \mathrm{MS}+162)
$$

$$
\mathrm{MS}=3 \mathrm{~b} / \mathrm{a}
$$

It also has been reported by Ho et al. (6) that ${ }^{1} \mathrm{H}$ NMR was used to determine HP content in HPC without derivatization. This method (i.e., by dissolving the HPC directly in $\mathrm{CDCl}_{3}$ ) was also evaluated. However, this method gave integrals with low reproducibility and was therefore abandoned.

[^187]
## EXPERIMENTAL

Two HPC samples from different manufacturers were investigated, HPC L from Nippon Soda Company (Tokyo, Japan) and HPC LF (Klucel) from Hercules (Wilmington, DE, USA). The HPC samples were acetylated according to the method of Tezuka et al. (5) in order to acetylate all hydroxyl groups in the polymer, which also makes it soluble in common NMR solvents. Acetylation was carried out by dissolving 150 mg of HPC in acetic anhydride ( 2.25 mL ) and pyridine $(0.75 \mathrm{~mL})$. The mixture was then allowed to reflux for 3 h .

The acetylated products were dialyzed against water in Spectra/Por dialysis membranes (Spectrum Laboratories, Rancho Dominguez, CA, USA) with a molecular weight cutoff of 10 kDa for 24 h and finally freeze-dried overnight. Typically, $8-12 \mathrm{mg}$ of this material was transferred to a $5-$ mm NMR tube. DMSO- $d_{6}(0.7 \mathrm{~mL})$ was added to the tube, which dissolved the acetylated HPC after heating.

The ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian 500 Inova spectrometer operating at a magnetic field of 11.7 T , equipped with a $5-\mathrm{mm}{ }^{1} \mathrm{H}\{\mathrm{X}\}$ inverse detection gradient probe. The probe had a maximum working temperature of $80^{\circ} \mathrm{C}$.

The FID was recorded with at least 16 scans, and the spectral window was at least between -2 and 10 ppm referring to the solvent signal of DMSO ( 2.49 ppm ). A $45^{\circ}$ pulse was used with an acquisition time of 5 seconds and a delay time of 5 seconds between each pulse. The total time for obtaining one FID using these parameters is less than 5 minutes. The acquisition data were zero filled at least twofold, and the transformation was made using a line-broadening factor of 0.3 . The spectra were phased correctly prior to the integration. The signal area of a was integrated between 2.20 ppm and 1.60 ppm , and $\mathbf{b}$ was integrated between 1.50 ppm and 0.70 ppm . Usually the ${ }^{1} \mathrm{H}$ NMR spectra were recorded both at $25^{\circ} \mathrm{C}$ and at $78{ }^{\circ} \mathrm{C}$.

## RESULTS AND DISCUSSION

Three different acetylations were made on two different samples using the reported acetylation time, 3 h (5). To check if the acetylation had been driven to completeness, acetylation for 1 h and 6 h was also carried out. For results, see Table 1. The ${ }^{1} \mathrm{H}$ NMR data were compared with the results obtained by a determination of the HP content according to the $U S P$ method.

Table 1. Assay of HP groups, HP (w/w\%)

| Sample | $\begin{gathered} \text { HP, w/w\% } \\ \left(\begin{array}{c} \text { (H NMR, } \\ \left.\mathbf{3} \mathbf{h}^{\mathrm{a}}\right) \end{array}\right. \\ \hline \end{gathered}$ | $\begin{gathered} \text { HP, w/w\% } \\ \left({ }^{\mathbf{1}} \mathrm{H} \text { NMR },\right. \\ \left.1 \mathrm{~h}^{\mathrm{a}}\right) \end{gathered}$ | $\begin{gathered} \text { HP, w/w\% } \\ \left({ }^{( }{ }^{\prime} \mathrm{H} N \mathrm{NR},\right. \\ \left.6 \mathrm{~h}^{2}\right) \end{gathered}$ | HP, w/w\% (USP) |
| :---: | :---: | :---: | :---: | :---: |
| HPC L | 73.7 | 74.4 | 73.8 | 74.5 |
|  | 73.8 | 74.7 |  |  |
|  | 73.8 |  |  |  |
| HPC LF | 77.4 | 77.6 | 77.4 | 73.6 |
|  | 76.8 | 77.7 |  |  |
|  | 76.5 |  |  |  |

${ }^{\text {a }}$ Acetylation time

The results were in reasonably good agreement with the USP method. The ${ }^{1} \mathrm{H}$ NMR method seems to be reproducible and robust with respect to acetylation time. Other magnetic field strengths ( 300 and 600 MHz ) and higher temperatures $\left(78{ }^{\circ} \mathrm{C}\right)$ have been used for the NMR determinations with no significant changes in the results.

In order to verify that the method also works for HPC of different molecular weights, a series of determinations were made on samples from Klucel that were kindly supplied by

Hercules. The average molecular weights of these samples cover the range from 80 kDa to $>1000 \mathrm{kDa}$ (7). In Table 2 the results of these NMR determinations are shown together with data provided by Hercules on the HP content obtained by $U S P$ and $J P$ methodology.

Table 2. Determination of the HP content in HPC with different viscosity grades (Klucel) by ${ }^{1}$ H NMR spectroscopy.

|  | HP content (w/w\%) |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Sample | $1 \mathrm{H}^{\prime} \mathrm{H} \mathrm{NMR}$ <br> $\left(25{ }^{\circ} \mathrm{C}\right)$ | 1 <br> ${ }^{1} \mathrm{H} \mathrm{NMR}$ <br> $\left(78{ }^{\circ} \mathrm{C}\right)$ | $\boldsymbol{J P}$ | $\boldsymbol{U S P}$ |
| EF 7926 | 75.9 | 75.6 | 59.3 | 72.5 |
| LF 8056 | 76.1 | 75.9 | 59.7 | 74.2 |
| JF 8865 | 76.1 | 75.5 | 60.2 | 74.3 |
| GF 8271 | 77.2 | 76.2 | 60.3 | 76.6 |
| MF 8810 | $78.0^{*}$ | 78.1 | 60.6 | 75.7 |
| HF 8679 | $79.2^{*}$ | 78.9 | 61.0 | 76.1 |

* The ${ }^{1} \mathrm{H}$ NMR spectra were poorly resolved.

For the highest molecular weight samples (MF and HF sample designations) viscous solutions containing small gel particles were obtained upon dissolution of the acetylated samples in DMSO- $d_{6}$ at room temperature. In order to increase solubility, the samples were also run at $78{ }^{\circ} \mathrm{C}$. In Table 2, data from both $25^{\circ} \mathrm{C}$ and $78^{\circ} \mathrm{C}$ are reported. In general, the spectra obtained at $78^{\circ} \mathrm{C}$ showed a higher resolution (sharper NMR signals) compared with $25^{\circ} \mathrm{C}$, in particular for the MF and HF samples. No significant difference was, however, observed in the determination of the molar substitution of any of the samples.

It can thus be concluded that the NMR determination also works for high-substituted HPC of different molecular weights that are available on the market.

For low-substituted HPC ( $14.7 \mathrm{w} / \mathrm{w} \%$ HP by the $J P$ method) the acetylation did not yield a soluble material that was useful for NMR determination.

## CONCLUSION

NMR is a versatile method for determining the molar substitution of HPC and thus for calculating the HP content. It is applicable to high-substituted HPC of different molecular weights. No hazardous material is used in the method. The determination, when made on an acetylated sample, is not dependent on the use of any external (or internal) standard
and seems quite insensitive (robust) to experimental conditions, in contrast to the currently used pharmacopeial methods. An appropriately executed NMR determination can be expected to give the true value for the molar substitution of the polymer, and the determination is not dependent on exact experimental conditions.

The NMR method is proposed as an alternative to, or a replacement for, the present pharmacopeial methods in a harmonized monograph for hydroxypropyl cellulose. It may, alternatively, be used as a reference method.

# Improving Sensitivity and Robustness of Chromatographic Assays for Netilmicin 

Yaqi Cai, Jun Cheng, Shifen Mou, and Petr Jandik*

#### Abstract

This article discusses the optimization of a chromatographic method for the determination of netilmicin sulfate. The performance of a polymeric column is compared with that of a silica-based column. The total run time with the silicabased column was only 15 minutes vs. 45 minutes that were required with the polymeric column. The signal-to-noise ratio was also improved with the silica-based column. Also described is the optimization of the integrated amperometric detection. A quadruple potential waveform originally introduced for the detection of carbohydrates was optimized for netilmicin and its accompanying impurities. The authors explain the importance of completely reporting all parameters influencing the performance of electrochemical detection.

## INTRODUCTION

Two recent publications $(1,2)$ describe a technique for chromatographic assays of netilmicin and impurities frequently accompanying netilmicin in pharmaceutical formulations. The technique is based on a separation in conjunction with integrated amperometric detection.

The first of the two reports offers a thorough description of an optimization of mobile phase composition. The influence of pH on retention time and peak symmetry was evaluated between pH 2 and 7. Acetonitrile, 2-methyl-2propanol, dimethyl sulfoxide, acetone, and tetrahydrofuran were evaluated as organic modifiers. A 4-factorial design process was utilized to determine the optimum concentrations of tetrahydrofuran, sodium sulfate, and sodium octanesulfonate in conjunction with optimizing the column temperature.

According to both reports, the ion-pair separation worked best if carried out on a polymeric stationary phase (styrenedivinylbenzene). However, no comparison or references to comparisons by other authors are provided to support the claim. Although the studies mention the exact flow rate and concentration of sodium hydroxide added post-column to enable the electrode reaction of the aminoglycosides on a gold electrode, neither of the two reports provides any information about the size of the detection electrode or the geometry of the gasket inside the detection cell. The gasket geometry determines the size of the fluid channel inside the cell and is thus, together with the size of the working electrode, one of the essential parameters required for successful reproduction of the reported method. Similar problems exist in the description of the amperometric waveform. Only one of the reports (1) provides both the electrode potentials and time intervals. The second report gives only the poten-

[^188]tial values without specifying any time intervals. Because the first report is not referenced in the second publication, interested readers will not be able to reproduce the method without their own optimization or access to the first of the two reports. In this article, we compare separation results obtained for netilmicin and accompanying impurities with the polymeric and silica-based columns. We also discuss the influence of essential electrode cell parameters on the detection results. A new waveform for the detection of aminoglycosides is presented and compared with the previously recommended waveform.

## EXPERIMENTAL

## Separation of Netilmicin and of Related Impurities

In addition to the polymeric reversed-phase column described in the previous two reports $(1,2)(8 \mu \mathrm{~m}$ particle size, 100 nm pore size, styrene-divinylbenzene, column diameter 4.6 mm , column length 250 mm ), we used a silica-based re-versed-phase column incorporating a polar group near the surface of the silica particle for improved hydrolytic stability. This phase consists of a C16 functional group bonded to the surface of silica using a sulfonamide group coupled to an ether linkage. The particle size was $5 \mu \mathrm{~m}$ and pore size 12 nm . The column diameter and length were 4.6 and 150 mm , respectively.

For the separations with the silica-based reversed-phase column, the mobile phase composition was as described previously (1, 2): $35 \mathrm{~g} / \mathrm{L}$ anhydrous sodium sulfate, $0.5 \mathrm{~g} /$ L sodium octane sulfonate, $10 \mathrm{~mL} / \mathrm{L}$ tetrahydrofuran, and $50 \mathrm{~mL} / \mathrm{L}$ of 0.2 M potassium dihydrogenphosphate previously adjusted to pH 3.0 with a dilute solution of phosphoric acid. In order to reproduce the separation of reference 1 with the polymeric column, we had to modify the reported eluent composition to the following: $38 \mathrm{~g} / \mathrm{L}$ anhydrous so-
dium sulfate, $0.4 \mathrm{~g} / \mathrm{L}$ sodium octane sulfonate, $13 \mathrm{~mL} / \mathrm{L}$ tetrahydrofuran, and $50 \mathrm{~mL} / \mathrm{L}$ of 0.2 M potassium dihydrogenphosphate previously adjusted to pH 3.0 .

All chemicals used for the preparation of this mobile phase were of reagent-grade purity or better.

## Apparatus

A typical system for reversed-phase separations and integrated amperometric detection of aminoglycosides such as netilmicin and its accompanying impurities includes an autosampler, dual-piston pump with a built-in eluent degasser, a column thermostat (column temperature of $40^{\circ} \mathrm{C}$ was used in all experiments discussed here), a pressurized vessel for post-column addition of 0.5 M sodium hydroxide (a dual-piston pump can also be utilized; see Experimental Considerations below), and an electrochemical detector. The eluent and post-column addition flow rates were 1.0 and $0.3 \mathrm{~mL} / \mathrm{min}$, respectively, in all our experiments. A suitable electrochemical detector must be able to produce amperometric waveforms presented in Tables $1 a$ and $1 b$. Additionally, it must include a three-electrode amperometric cell containing a gasket defining the flow path, a gold working electrode, a suitable counter electrode, and a silver-silver chloride reference electrode. The cell gaskets in our system had the following dimensions (thickness $\times$ fluid channel width $\times$ fluid channel length) gasket A: $0.140 \times$ $3.5 \times 14 \mathrm{~mm}$; gasket B: $0.050 \times 1.8 \times 14 \mathrm{~mm}$. Gasket A was used with a gold electrode having a diameter of 3 mm and gasket B with a gold electrode having a diameter of 1.4 mm .

## Preparation of Standards and Test Solutions

We prepared the following final dilutions of standards in the chromatographic mobile phase according to the protocol from Reference 2 :
$1 \mu \mathrm{~g} / \mathrm{mL}$ netilmicin sulfate
$10 \mu \mathrm{~g} / \mathrm{mL}$ each netilmicin sulfate, sisomicin sulfate, and $1-\mathrm{N}$ ethylgaramine sulfate
$0.97 \mathrm{mg} / \mathrm{mL}$ of "the substance to be examined."
The "substance to be examined (STBE)" was a netilmicin formulation obtained from a pharmaceutical manufacturing facility in China (No. 2 Drug Manufacturer of Wuxi City).
Injection volume for all standard and STBE chromatograms was $25 \mu \mathrm{~L}$.

# OPTIMIZATION OF CHROMATOGRAPHIC METHOD 

## General Comments

On the one hand, Reference 1 describes a well-designed and complete optimization of the chromatographic mobile phase. On the other hand, some additional improvements are possible by evaluating different types of reversed-phase columns (polymer-based vs. silica-based) and by an optimization of detection parameters for integration amperometry (electrode size, gasket geometry, waveform, etc.).

## Column Evaluation

We compared the analytical performance of two types of reversed-phase columns. The first of the two columns was a polymeric reversed-phase type specified in References 1 and 2 (see Experimental for additional details). The second of the two columns was a new type containing silica-based reversed-phase spherical particles made more hydrolytically stable by inclusion of a polar group in the otherwise hydrophobic alkyl chain. The new type of reversed-phase tolerates long-term rinsing with pure water better than do reversed-phase packings without any polar groups and exhibits improved long-term stability over the pH range of 2.0 to 8.0 (see additional description in Experimental). When
comparing the two different columns we used the optimized detection conditions discussed in the following section of our report.

Injecting the standard solution containing $10 \mu \mathrm{~g} / \mathrm{mL}$ of netilmicin sulfate, sisomicin sulfate, and 1-N-ethylgaramine sulfate onto both types of columns, using identical flow rates for the eluent and post-column 0.5 M hydroxide ( 1.0 and $0.3 \mathrm{~mL} / \mathrm{min}$ respectively), we obtained the chromatograms of Figure 1. The corresponding peak resolution data are presented in Table 2. Our resolution results with the polymeric reversed-phase column exceed those reported in Reference 1 and are also better than the values required by Reference 2. This validates the results of our column evaluation. The peak resolution of $R>2$ observed with the silicabased column is generally considered as sufficient (3) for two peaks exhibiting extreme peak height ratios (e.g., peak height ratios $>100$ ) as in the case of chromatographic assays of netilmicin formulations. Resolution achieved on the sili-ca-based column can thus be considered adequate for netilmicin assays.

In the next experiment, we compared the signal-to-noise ratio for the same amount of netilmicin ( 25 picograms) using the same mobile phase and identical optimized detection conditions.
The signal (peak height in nC ) to noise (peak-to-peak noise in nC ) ratios were 12.86 and 31.75 for the polymeric and silica-based columns, respectively. The observed sig-nal-to-noise value with the polymeric column is thus better than that specified in Reference 2. On the other hand, the signal-to-noise ratio of the silica-based column is improved by a factor of two in comparison with the polymeric column.
