${ }^{\mathbf{4}} \mathbf{D}$ : Prepare a gas chromatograph as directed in the $A s$ say, and inject USP Nitrous Oxide RS and a sample of Ni trous Oxide into the gas chromatograph. The retention time of the major peak in the chromatogram of the Nitrous Oxide sample corresponds to that of the chromatogram of the USP

Nitrous Oxide RS. _USP28 $^{\text {U }}$

## Change to read:

Assay-Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for Nitrogen dioxide, into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than $70 \%$ of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of $\mathrm{N}_{2}$ and $\mathrm{O}_{2}$ from $\mathrm{N}_{2} \mathrm{O}$, although the $\mathrm{N}_{2}$ and $\mathrm{O}_{2}$ may not be separated from each other. Use industrial grade helium ( $99.99 \%$ ) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by annir helimmeer tified standard (see under Reagents in the section Reagents, Indieators, and Solutions),
${ }^{\Delta}$ USP Air-Helium RS, ${ }_{\text {aUSP28 }}$
and is equivalent to not more than $1.0 \%$ of air when compared to the peak response of the air helium certified standard,
${ }^{\boldsymbol{\Delta}}$ USP Air-Helium RS, ${ }_{\mathbf{A}}^{\boldsymbol{A} U S P 28}$
indicating not less than $99.0 \%$, by volume, of $\mathrm{N}_{2} \mathrm{O}$.

Briefing
Nystatin Lotion, USP 27 page 1350. It is proposed to change the title of this monograph to Nystatin Topical Emulsion. See briefing under Amphotericin B Lotion.

BRIEFING

Nystatin Topical Emulsion-See briefing under Amphotericin $B$ Lotion.
(NL: C. Barnstein) RTS-40803-1

## Add the following:

## ©Nystatin Topical Emulsion

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Nystatin Lotion)
» Nystatin Topical Emulsion contains not less than 90.0 percent and not more than 140.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage-Preserve in tight containers, at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Nystatin $R S$.
$\mathbf{p H}\langle 791\rangle$ : between 5.5 and 7.5.
Assay-Proceed with Topical Emulsion as directed in the Assay under Nystatin Cream. $\mathbf{\Delta U S P 2 8}$
(Official July 1, 2007)

## Briefing

Omeprazole, USP 27 page 1358. Based on the comments received, it is proposed to clarify that the pH of the Phosphate buffer under Assay should be adjusted, if necessary, to 7.6.
(PA4: E. Gonikberg) RTS-40863-1

## Change to read:

## Assay-

Phosphate buffer-Dissolve 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, dilute with water to 1000 mL , and mix. Dilute 250 mL of this solution with water to 1000 mL .
${ }^{4}$ If necessary, adjust the pH with phosphoric acid to

### 7.6. USP28

Mobile phase-Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (3:1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of 0.01 M sodium borate and acetonitrile ( $3: 1$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Omeprazole RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.2 mg per mL .

Assay preparation-Transfer about 100 mg of Omeprazole, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

System suitability solution-Dilute a volume of Standard preparation with Diluent to obtain a solution containing about 0.1 mg of USP Omeprazole RS per mL.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 0.8 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 6.0; the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure—Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}$ in the portion of Omeprazole taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Omeprazole RS in theStandard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparationand the Standard preparation, respectively.

## BRIEFING

Orphenadrine Citrate, USP 27 page 1362 and page 1944 of PF 29(6) [Nov.-Dec. 2003]. The proposed change is made to identify the compounds described by relative retention time in the test for Related compounds.

## Briefing

Oxybutynin Chloride Extended-Release Tablets. Because there is no existing USP monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for Related compounds and in the Assay is based on analyses performed with the Inertsil Phenyl brand of L11 column. The typical retention time for the oxybutynin peak is about 5 minutes.
(PA4: E. Gonikberg) RTS-40034-1

## Add the following:

## ©Oxybutynin Chloride ExtendedRelease Tablets

» Oxybutynin Chloride Extended-Release Tablets contain not less than 90 percent and not more than 110 percent of the labeled amount of $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}$.

Packaging and Storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Oxybutynin Chloride RS. USP Oxybutynin Related Compound A RS.

## Identification-

A: Infrared Absorption $\langle 197\rangle$ -
Test specimen-Add a quantity of finely powdered Tablets, equivalent to about 15 mg of oxybutynin chloride, to 5 mL of water per tablet. Mix for one minute. Adjust with 0.1 N sodium hydroxide to a pH between 7 and 8 . Extract the solution twice with 10 mL of ether. Combine and evaporate the ether extract, and dry under vacuum over silica gel for at least 30 minutes. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.
Standard specimen-Dissolve 15 mg of USP Oxybutynin chloride RS in 5 mL of water. Proceed as directed for the Test specimen, beginning with "Adjust with".

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay.

Uniformity of dosage units $\langle 905\rangle$-meet the requirements.

## Related compounds-

Mobile phase, Diluent, Preparation medium, Impurity stock solution and System suitability solution-Proceed as directed in the Assay.
Impurity standard solution-Dilute the Impurity stock solution with Diluent to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ of phenylcyclohexylglycolic acid (Oxybutynin related compound A) per mL.

Test solution- Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the Impurity standard solution, and record the peak responses as directed for Procedure: the tailing factor is greater than 0.75 and not more than 2.5 for the phenylcyclohexylglycolic acid peak. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, $R$, between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5 ; and the relative standard deviation of peak area responses for six replicate injections of System suitability solution is not more than $3 \%$ for each compound.
Procedure-Separately injects equal volumes (about 50 $\mu \mathrm{L}$ ) of the Impurity standard solution and the Test solution into the chromatograph, record the chromatograms and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$
C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of phenylcyclohexylglycolic acid in the Impurity standard solution, and $r_{U}$ and $r_{S}$ are the peak responses for each impurity obtained from the Test solution and the Impurity standard solution, respectively. Disregard any peak less than $0.1 \%$ : not more than $1 \%$ of phenylcyclohexylglycolic acid is found, and not more than $2 \%$ of total impurities is found.

## Assay-

Mobile phase-Prepare a mixture of water, acetonitrile, and triethylamine (65:35:0.15). Adjust with phosphoric acid to a pH of 3.9 , degas, and filter.
Diluent-Use water adjusted with phosphoric acid to a pH of 3.5 .

Preparation medium-Prepare a solution of methanol and acetonitrile (1:1).

Impurity stock solution-Dissolve an accurately weighed quantity of USP Oxybutynin Related compound $A R S$ in acetonitrile, to obtain a solution having a known concentration of about 0.11 mg of phenylcyclohexylglycolic acid per mL . [NOTE-Oxybutynin related compound A is phenylcyclohexylglycolic acid.]
System suitability solution-Transfer 10 mL of the Standard stock solution and 1 mL of the Impurity stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.
Standard stock preparation-Dissolve an accurately weighed quantity of USP Oxybutynin Chloride $R S$ in acetonitrile, to obtain a solution having a known concentration of about 0.37 mg per mL .
Standard preparation-Dilute the Standard stock preparation with Diluent to obtain a solution having a known concentration of about 0.1 mg per mL .

FOR TABLETS THAT CONTAIN 5 MG OF OXYBUTYNIN CHLO-RIDE-Place 10 tablets in a $500-\mathrm{mL}$ volumetric flask, add 150 mL of Preparation medium, and stir overnight or until dissolved. Dilute with Diluent to volume. Mix thoroughly, centrifuge, and use the clear supernatant.

FOR TABLETS THAT CONTAIN 10 MG OF OXYBUTYNIN CHLORIDE OR MORE-Place 10 tablets in a $1000-\mathrm{mL}$ volumetric flask, add 300 mL of Preparation medium, and stir overnight or until dissolved. Dilute with Diluent to volume. If necessary, make a further dilution with Diluent to obtain a solution with a final concentration equivalent to 0.1 mg per mL of oxybutynin chloride. Mix thoroughly, centrifuge, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor is greater than 0.75 and not more than 2.5. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, $R$, between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5 ; and the relative standard deviation of peak area responses for six replicate injections of System suitability solution is not more than $3 \%$ for each compound.
Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard Preparation and Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of oxybutynin chloride $\left(\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}\right)$ in the portion of Tablets taken by the formula

$$
C \times V \times D\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of oxybutynin chloride in the Standard preparation; $V$ is the volume, in mL , of the Assay preparation; $D$ is the dilution factor; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Briefing

Padimate O Lotion, USP 27 page 1397. It is proposed to change the title of this monograph to Padimate O Topical Emulsion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40804-1

## Padimate $\mathbf{O}$ Lotion

(Current title—not to change until July 1, 2007) Monograph title change—to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Padimate O Topical Emulsion

BRIEFING
Padimate O Topical Emulsion-See briefing under Amphotericin $B$ Lotion.
(NL: C. Barnstein) RTS-40804-1

## Add the following:

## - Padimate O Topical Emulsion

(Monograph under this new title—to become official July 1, 2007)
(Current monograph title is Padimate $O$ Lotion)
» Padimate O Topical Emulsion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NO}_{2}$.

Packaging and storage-Preserve in tight, light-resistant containers.

USP Reference standards $\langle 11\rangle —$ USP Padimate $O R S$.
Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Assay-

Mobile phase-Prepare a suitable filtered and degassed solution containing methanol, water, and glacial acetic acid (85:15:0.5).

Standard preparation-Dissolve an accurately weighed quantity of USP Padimate O RS in isopropyl alcohol, and dilute quantitatively, and stepwise if necessary, with isopropyl alcohol to obtain a solution having a known concentration of about $100 \mu \mathrm{~g}$ per mL .

Assay preparation-Transfer an accurately weighed quantity of Topical Emulsion, equivalent to about 100 mg of padimate O , to a $100-\mathrm{mL}$ volumetric flask, and add about 75 mL of isopropyl alcohol. Heat gently with swirling until the specimen is dispersed. Cool to room temperature, dilute with isopropyl alcohol to volume, and mix. Pipet 10.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with isopropyl alcohol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $308-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ basedeactivated packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and re-
cord the peak responses as directed for Procedure: the tailing factor is not more than 2.5 , and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NO}_{2}$ in the portion of Topical Emulsion taken by the formula:

$$
C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Padimate O RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for padimate O obtained from the Assay preparation and the Standard preparation, respectively. $\triangle$ USP28
(Official July 1, 2007)

Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension, USP 27 page 1427. An editorial revision is indicated to conform with the title change proposed for Hydrocortisone Acetate Lotion. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40805-1

## Change to read:

Assay for hydrocortisone acetate-Using an accurately measured volume of Topical Suspension, proceed as directed in the $A s$ say under Hydrocortisone Acetate Lotion
(Hydrocortisone Acetate Topical Emulsion, Official July 1, 2007). $\triangle U S P 28$

## Briefing

Phenytoin Oral Suspension, USP 27 page 1479 and page 1965 of PF 29(6) [Nov.-Dec. 2003]. In the test for Dissolution it is proposed to add instructions for the introduction of the sample into the dissolution vessel because the procedure used to introduce the sample has a great impact on the dissolution results.
(BPC: M. Marques) RTS-40811-1

## Change to read:

Dissolution $\langle 711\rangle$ -
0.05 M Tris buffer-Dissolve 36.3 g of tris(hydroxymethyl)aminomethane and 60 g of sodium lauryl sulfate in 6 L of water, adjust with hydrochloric acid to a pH of $7.5 \pm 0.05$, and degas.

Medium: 0.05 M Tris buffer; 900 mL .
Apparatus 2: 35 rpm .
Time: 60 minutes.
${ }^{\triangle}$ Dissolution procedure-Shake the sample suspension well, about 100 shakes. Using a $5-\mathrm{mL}$ syringe, collect approximately 5 mL of suspension, and record the weight. With the paddles lowered, gently empty the contents of each syringe into the bottom of each vessel containing the Dissolution Medium. Start rotating the paddles. Reweigh each syringe, and determine the amount of suspension delivered into each vessel. At the end of 60 minutes, remove 4 mL from each vessel, and pass through a $0.45-\mu \mathrm{m}$ nylon filter presaturated with Dissolution Medium. $\mathbf{A}$ USP28
Determine the amount of $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{2}$ dissolved by employing the following method.
0.02 M Sodium phosphate buffer-Dissolve 2.76 g of monobasic sodium phosphate in 1 L of water.
Mobile phase-Prepare a filtered and degassed mixture of 0.02 M Sodium phosphate buffer, methanol, and acetonitrile (50:27:23), and mix. Adjust with phosphoric acid to a pH of 3.0 . Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Standard solution-Transfer about 70 mg of USP Phenytoin RS, accurately weighed, to a $500-\mathrm{mL}$ volumetric flask. Dissolve in 15 mL of methanol, dilute with Dissolution Medium to volume, and mix.

Fest pension, aeeurately weighed, into each dissolution vessel. Withdraw the sample after 60 minutes, and filter.
${ }^{\Delta}$ USP28
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $240-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the responses as directed for Procedure: the column efficiency is not less than 5400 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Fest solution
$\Delta_{\text {solution under test }}^{\mathbf{A}_{\text {USP28 }}}{ }^{\text {S }}$
into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{2}$ dissolved. [NOTE-The density of Oral Suspension must be determined and used in calculating the quantity, in mg , of phenytoin dissolved.]

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{2}$ is dissolved in 60 minutes.

## Add the following:

about 10 mg each of USP Propoxyphene Related Compound A RS and USP a d 2 acetoxy - 4 dimethylamine 1,2 diphenyl 3 -methyl butane RS
${ }^{\mathbf{\Delta}}$ USP Propoxyphene Related Compound B RS $\mathbf{A U S P 2 8}$
in 20 mL of methanol in
$\Delta_{\text {into }}$ USP28
a $50-\mathrm{mL}$ volumetric flask,
${ }^{\boldsymbol{\Delta}}$ dissolve using 2 mL of methanol,,$_{\mathbf{\Delta S P 2 8}}$
dilute with Mobile phase to volume, and mix.
${ }^{\wedge}$ Standard solution-Transfer 5.0 mL of the Standard stock solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mo-
bile phase to volume, and mix. $\triangle$ USP28
Test solution-Use the Assay preparation.
System suitability solution Combine 1.0 mL of the Related compounds. Standend stock solution containing about 0.2 mg per mL of each related compernd with 10.0 mL of the Standerd Test solution, and mix.
${ }^{\mathbf{\Delta}}$ Transfer 1.0 mL of the Standard stock solution to a 10.0 mL volumetric flask, dilute with Mobile phase to volume, and mix. $\Delta$ USP28

Chromatographic system (see Chromatography $\langle 621\rangle$ )-Proceed as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.63 for propoxyphene related compound A, 0.78 for $x-d 2$ aeetoxy 4 -dimethylamine-1,2 diphe-nyl-3 methylbutane,
${ }^{\Delta}$ propoxyphene related compound $\mathrm{B},{ }_{\mathbf{\Delta S P} 28}$
and 1.0 for propoxyphene hydrochloride; the resolution, $R$, between $\alpha$ d 2 acetoxy 4 -dimethylamino-1,2 diphenyl-3 methylbut路,
${ }^{\text {4 }}$ propoxyphene related compound $\mathrm{B}, \mathbf{\Delta U S P 2 8}$ and propoxyphene
$\boldsymbol{\Delta}_{\text {related compound }} \mathrm{A}_{\mathbf{\Delta} U S P 28}$
is not less than 1.4 ;
${ }^{\Delta} 2.0 ;_{\mathbf{\Delta S P 2 8}}$
and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-
${ }^{\Delta}$ Separately ${ }_{\mathbf{A S P} \text { U }}$
inject a
${ }^{4}$ equal ${ }_{\text {aUSP28 }}$
volumes (about $50 \mu \mathrm{~L}$ ) of the Test solution
$\boldsymbol{\Delta}_{\text {and }}$ the Standard solution ${ }_{\mathbf{A S P 2 8}}$
into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the perenge
${ }^{4}$ quantity, in $\mathrm{mg},{ }_{\text {USP2 }}$
of propoxyphene related compound A in the portion of Propoxyphene Hydrochloride taken by the formula:

$$
\begin{aligned}
& 100\left(r_{i}+\Psi_{4}\right) \text {, } \\
& { }^{\Delta} 50 C\left(r_{U} / r_{S}\right)_{, \mathbf{\Delta S P 2 8}}
\end{aligned}
$$

in which $F_{i}$ is the individual peak respense of propexyphene related eompound $A$ in the Test solution; and ${ }_{s}$ is the sum of the respenses for all of the peaks:
${ }^{\Delta} C$ is the concentration, in mg per mL , of USP Propoxyphene Related Compound A RS in the Standard solution; and $r_{U}$ and $r_{S}$ are the propoxyphene related compound A peak responses obtained from the Test solution and Stan-
dard solution, respectively. $\Delta$ USP28
Not more than $0.5 \%$ of propoxyphene related compound $A$ as the hydrochloride
A UUSP28
is found. Calculate the percenge
${ }^{\Delta}$ quantity, in mg , $\triangle U S P 28$
of $\alpha d-2$ aeetoxy 4 dimethylamine-1,2 diphenyl 3-methylbutane,
${ }^{\Delta}$ propoxyphene related compound B as the ${ }_{\Delta U S P 28}$
hydrochloride in the portion of Propoxyphene Hydrochloride taken by the formula:

$$
\begin{gathered}
100(1.112)\left(r_{t} \not+r_{t}\right), \\
\triangle 50 C(361.93 / 325.45)\left(r_{U} / r_{S}\right),_{\Delta U S P 28}
\end{gathered}
$$

in which 1.112 is the ratio of the molecular weight of $\alpha d 2$ ace exy 4 dimethylamine 1,2 diphenyl 3 methylbutane hydrechleride to that of $\alpha d 2$ acetoxy - 4 dimethylamine 1,2 diphenyl 3 methyl butane free base; $;$ is the individual penk respense of $\alpha-d / 2$ acet oxy 4 dimethylamine-1,2 diphenyl-3 methylbutane in the Test solution; and $T_{s}$, is the sum of the respenses for all of the peaks:
${ }^{\Delta} C$ is the concentration, in mg per mL , of USP $\alpha-d-$ Acet exy 4-dimethylamine-1,2 diphenyl 3-methylbutane RS USP Propoxyphene Related Compound B RS in the Standard solution; 361.93 and 325.45 are the molecular weights of $\alpha-d$-2 acetoxy-4-dimethylamine-1,2-diphenyl-3-methyl butane, propoxyphene related compound $B$ as the hydrochloride and $\alpha$ 2 2 eny-4 dimethylamino-1,2 diphenyl-3-methylbutane, propoxyphene related compound B , respectively; and $r_{U}$ and $r_{S}$ are the $\alpha-2$-acetoxy-4-di methylamine 1,2 diphenyl 3 methylbutane, propoxyphene related compound B peak responses obtained from the Test
solution and the Standard solution, respectively. $\triangle$ USP28.
Not more than $0.6 \%$ of $* d-2$ acetoxy - 4 dimethylamine-1,2 diphenyl 3 methylbutane,
${ }^{4}$ propoxyphene related compound B as the ${ }_{\Delta U S P 28}$ hydrochloride is found.

## Assay-

${ }^{\mathbf{4}} 0.1 M_{\mathbf{4} U S P 28}$
Monobasic ammonium phosphate buffer, pH 6.3-Dissolve 11.5 g of monobasic ammonium phosphate and 1.0 mL of triethylamine in 1000 mL of water, adjust with $10 \%$ sodium hydroxide to a pH of $6.3 \pm 0.05$, and mix.

Mobile phase-Prepare a filtered and degassed mixture of methanol and 6.01-M
$\Delta_{0.1} M_{\Delta U S P 28}$
Monobasic ammonium phosphate buffer, pH 6.3 (67:33). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard preparation-Dissolve an accurately weighed quantity of USP Propoxyphene Hydrochloride RS in Mobile phase to obtain a solution having a known concentration of about 5.0 mg per mL .
Assay preparation-Transfer about 250 mg of Propoxyphene Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the retention time of propoxyphene hydrochloride is about 9 minutes; the resolution, $R$, between $\alpha-d 2$ acetoxy 4 dimethylamine 1,2 diphenyl 3 methylbutane and propoxyphene is not less than 1.4;
$\Delta_{\text {the tailing factor for the propoxyphene hydrochloride peak }}$ is not more than $3.5 ;_{\mathbf{\Delta S P}}$ IS
and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ in the portion of Propoxyphene Hydrochloride taken by the formula:

$$
100 \mathrm{C}\left(+_{t}+\Psi_{s}\right)
$$

$$
{ }^{\mathbf{\Delta}} 50 C\left(r_{U} / r_{S}\right)_{, \mathbf{\Delta U S P 2 8}}
$$

in which $C$ is the concentration, in mg per mL , of USP Propoxyphene Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Quazepam Tablets, USP 27 page 1614. It is proposed to revise the test for Related compounds to correct the composition of Standard solution C. The reference to USP Quazepam Related Compound A RS was inadvertently replaced with USP Quazepam RS.

[^58]
## Change to read:

Related compounds-
Test solution-Grind 10 Tablets to a fine powder. Dissolve an accurately weighed portion of the powder in methylene chloride to obtain a solution having a concentration of 10 mg of quazepam per mL . Mix for 30 minutes, and centrifuge.

Standard solution $A$-Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 10 mg per mL .

Standard solution B-Dissolve an accurately weighed quantity of USP Quazepam RS in methylene chloride to obtain a solution having a known concentration of about 0.04 mg per $\mathrm{mL}(0.2 \%)$.

Standard solution C-Dissolve an accurately weighed quantity of USP Quazepam RS
${ }^{\Delta}$ USP Quazepam Related Compound A RS ${ }_{\Delta U S P 28}$
in methylene chloride to obtain a solution having a known concentration of about 0.3 mg per $\mathrm{mL}(1.5 \%)$.

Procedure-Separately apply $10 \mu \mathrm{~L}$ each of the Test Solution and Standard solution $A$ and $5 \mu \mathrm{~L}$ each of Standard solutions $B$ and $C$ to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of cyclohexane, ethyl acetate, and ether (170:40:25) in a paper-lined tank until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under short-wavelength UV light. Compare the intensity of the secondary spot in the chromatogram
of the Test solution having the same $R_{F}$ value as the principal spot in the chromatogram of Standard solution $C$. The spot is not larger or more intense than the principal spot obtained from Standard solution C. Compare the intensities of any additional secondary spots observed in the chromatogram of the Test solution with that of the principal spot in the chromatogram of Standard solution B: no additional secondary spot from the chromatogram of the Test solution is larger or more intense than the principal spot obtained from Standard solution B, and the sum of the intensities of the additional secondary spots obtained from the Test solution is not more than $0.6 \%$.

## BRIEFING

Resorcinol and Sulfur Lotion, USP 27 page 1643. It is proposed to change the title of this monograph to Resorcinol and Sulfur Topical Suspension. See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40806-1

## Resorcinol and Sulfur Lotion

(Current title-not to change until July 1, 2007)
Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Resorcinol and Sulfur Topical Suspension

BRIEFING
Resorcinol and Sulfur Topical Suspension-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40806-1

## Add the following:

## $\triangle$ Resorcinol and Sulfur Topical Suspension

(Monograph under this new title-to become official July 1, 2007)
(Current monograph title is Resorcinol and Sulfur Lotion)
» Resorcinol and Sulfur Topical Suspension is Resorcinol and Sulfur in a suitable hydroalcoholic vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of resorcinol $\left(\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{2}\right)$ and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of sulfur (S).

Packaging and storage-Preserve in tight containers.
USP Reference standards $\langle 11\rangle-U S P$ Resorcinol $R S$.

## Identification-

A: Transfer a quantity of Topical Suspension, equivalent to about 20 mg of resorcinol, to a $15-\mathrm{mL}$ centrifuge tube, add 5 mL of 5 N sodium hydroxide, mix, and centrifuge the mixture for 5 minutes. Decant the supernatant into a test tube, and retain the residue for Identification test $B$. Add 0.5 mL of chloroform, mix, and heat on a steam bath: an intense crimson color is produced. Add a slight excess of hydrochloric acid: the color changes to pale yellow (presence of resorcinol).

B: Place a small portion of the residue from the centrifuge tube in Identification test $A$ on the tip of a spatula, and burn it: sulfur dioxide, which turns moistened starch-iodate paper blue, is formed (presence of sulfur).

Alcohol content $\langle 611\rangle$-Determine by the gas-liquid chromatographic method, acetone being used as the internal standard: it contains between $90.0 \%$ and $110.0 \%$ of the labeled amount of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

## Assay for resorcinol-

Mobile phase-Prepare a suitable degassed solution of water, acetonitrile, and methanol (about 55:7:6) such that the retention times of resorcinol and caffeine are about 3 minutes and 4 minutes, respectively.

Internal standard solution-Dissolve about 140 mg of caffeine in 2 mL of chloroform, add methanol to make 100 mL , and mix.

Standard preparation-Transfer 50 mg of USP Resorcinol RS, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution and 5.0 mL of Internal standard solution to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Assay preparation-Transfer an accurately weighed portion of Topical Suspension, equivalent to about 20 mg of resorcinol, to a $150-\mathrm{mL}$ beaker. Add 40 mL of methanol and 5.0 mL of Internal standard solution, and heat on a steam bath for 5 minutes. Cool the mixture to room temperature, and decant the liquid into a $100-\mathrm{mL}$ volumetric flask. Wash the residue in the beaker by adding 20 mL of methanol to the beaker. Heat on a steam bath for 5 minutes, cool the mixture to room temperature, and decant the liquid into the volumetric flask. Repeat the washing, heating, cooling, and decanting. Dilute the contents of the volumetric flask with methanol to volume, and mix.

Procedure-Introduce equal volumes (about $10 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into a high-pressure liquid chromatograph (see Chromatography $\langle 621\rangle$ ), operated at room temperature, by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained from the Standard preparation is about 0.6 full scale. Typically, the apparatus is fitted with a $4-\mathrm{mm}$ $\times 30-\mathrm{cm}$ column containing packing L1 and is equipped with an UV detector capable of monitoring absorption at 280 nm , and a suitable recorder. In a suitable chromatogram the coefficient of variation for five replicate injections of the Standard preparation is not more than $3.0 \%$. Measure the peak responses at equivalent retention times, obtained from
the Assay preparation and the Standard preparation, and calculate the quantity, in mg , of $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{2}$ in the portion of Topical Suspension taken by the formula:

$$
(100 C)\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Resorcinol RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the ratios of the responses of the resorcinol and caffeine peaks obtained from the Assay preparation and the Standard preparation, respectively.

Assay for sulfur-Transfer an accurately weighed portion of Topical Suspension, equivalent to about 85 mg of sulfur, to a suitable flask, add 40 mL of sodium sulfite solution ( 1 in 20), a few drops of antifoam, and a few boiling chips, and boil under a reflux condenser for 1 hour. Cool to room temperature, add 10 mL of formaldehyde solution and 6 mL of 6 N acetic acid, and dilute with water to 150 mL . Add 3 mL of starch TS, and titrate with 0.1 N iodine VS until a permanent blue color is produced. Each mL of 0.1 N iodine is equivalent to 3.206 mg of $\mathrm{S}_{.}$USSP28
(Official July 1, 2007)

## BRIEFING

Rifampin and Isoniazid Capsules, USP 27 page 1651 and page 1862 of $P F$ 28(6) [Nov.-Dec. 2002]; Rifampin, Isoniazid, and Pyrazinamide Tablets, USP 27 page 1653 and page 1865 of $P F$ (28(6) [Nov.-Dec. 2002]; Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets, USP 27 page 1654. It is proposed to revise the Standard preparation in the Assay for rifampin and isoniazid under Rifampin and Isoniazid Capsules and in the Assay for rifampin, isoniazid, and pyrazinamide in the other two monographs. Because it has been observed that the rifampin component of the Standard preparation degrades rapidly with time, it is proposed to add a note to the Standard preparation stating that it is to be used within 10 minutes.
(PA7a: W. Wright) RTS-40695-1

Dissolution $\langle 711\rangle$ -
Medium: 0.1 N hydrechloric acid;
$\Delta 10 \mathrm{mM} \mathrm{pH} 6.8$ sodium phosphate buffer, prepared by dissolving 7 g of anhydrous dibasic sodium phosphate in 5 L of water, and adjusting with phosphoric acid to a pH of
6.8 ; $_{\text {USP2 }}$

900 mL .
Apparatus 1: 100 rpm .
Time: 45 minutes.
Determine the amount of rifampin $\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}\right)$ diselv by employing the following method.
© and isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$ dissolved using filtered portions of the solution under test and by employing the procedure set forth in the Assay for rifampin and isoniazid. $\Delta U S P 28$

Phosphate buffer solution Dissolve 15.3- g of dibasic potas simm phesphate and 80.0 s of menobasie petassium phesphate inte a 1 liter volumetric flask, mix, dilute with water to volume, and mix.
 USP Iseniazid PS into a 100 mL volumetric flask. Pissolve in and dilute with 0.1 N hydrochloric acid to volume, and mix.

Stadad strek solution- Aceurately weigh about 66 mg of USP Rifampin PS inte 200 mL volumetric flack, dissolve in 10 mL of 0.1 N hydrochloric acid, and mix. Add 50.0 mL of Isonid stan dacd solution, dilute with 0.1 N hydrochlorie acid to volume, and mix. [Nөте- Prepare this solution immediately before the test is performed, and place in the dissolution bath at the start of the test.].

Stadedred solution At the end of the test rm, transfer a 5.0 mb aliquet of the Stand stock solution and 10.0 mL of Phosphate buffer solution to a 50 mL volumetric flack. Dilute with water to volume, and mix. [NOTE-Analyze the solution immediately, if possible, and if not, within 3 hours after final dilution.]

Fest solution At the end of the test rum, withdraw a 25 mL aliquet, and filter, disearding the first 10 mL of the filtrate. Allow to eool for abeut 10 minutes, and transfer 5.0 mL of the filtrate and 10.0 mL of the Phosphate buffer solution to a 50 mL volumetric flack. Dilute with water to volume, and mix. [NOTE-Analyze the solution immediately, if pessible, and if not, within 3 hours after final dilution.?
Betermine the ameunt of rifampin $\left(\mathrm{C}_{42} \mathrm{H}_{58} \mathrm{~N}_{4} \Theta_{42}\right)$ dissolved from absorbanees at the wavelength of maximum absorbance at about 475 nm of the Standard solution and the Test solution.
Petermine the mount of isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$ dissolved by em ploying the following method.

Mobile phase Prepare a filtered and degassed mixare of water, Phosphate buffer solution, and methanol (850:100:50). Make ad justments if neeessay (see System Suitubility under Chromatog raphy-(624)).

Ehromatographie syistem (see-Chromatography $\langle 624$ ) (The tiquid chromategraph is equipped with a 254 nm detector and a $4.0 \mathrm{~mm} \times 30 \mathrm{~cm}$ column that contains $10-\mathrm{mm}$ packing L1. The flow rate is about 1.5 mL per minute.

Procedure Separately inject equal volumes (about $50-\mu \mathrm{L}$ ) of the Standed solution and the Test solution int the chremategraph, record the chromatograms, and meastre the respenses for the iso niazid peaks.
© $\Delta$ USP28
USP28 ${ }_{\text {Tolerances-N }}$ Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}$ and not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}$ are dissolved in 45 minutes.

## Change to read:

Assay for rifampin and isoniazid-
Buffer solution-Dissolve 1.4 g of dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8 .

Solution A-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (96:4).

Solution B-Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (55:45).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve accurately weighed quantities of USP Rifampin RS and USP Isoniazid RS in a mixture of Buffer solution and methanol (96:4) to obtain a solution having known concentrations of about 0.16 mg per mL and 0.08 mg per mL , respectively.
${ }^{\boldsymbol{\Delta}}$ [NOTE-Use this solution within 10 minutes. $]_{\Delta U S P 28}$
Assay preparation-Weigh the contents of not fewer than 10 Capsules, mix, and transfer an accurately weighed portion of the powder, equivalent to about 8 mg of isoniazid, to a $100-\mathrm{mL}$ volumetric flask, and add about 90 mL of Buffer solution. Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with Buffer solution to volume, and mix. [NOTE-Use this solution within 2 hours.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $238-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ base-deactivated packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-5$ | 100 | 0 | isocratic |
| $5-6$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $6-15$ | 0 | 100 | isocratic |

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 2.6 and 1.0 for rifampin and isoniazid, respectively; the column efficiency is not less than 50,000 and not less than 6,000 theoretical plates for rifampin and isoniazid, respectively; the tailing factors are not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg , of rifampin $\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}\right)$ and isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$ in the portion of Capsules taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Rifampin RS, calculated on the dried basis, or of USP Isoniazid RS, as appropriate, in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the corresponding analytes obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Rifampin, Isoniazid, and Pyrazinamide Tablets, $U S P 27$ page 1653 and page 1865 of $P F$ 28(6) [Nov.-Dec. 2002]-See briefing under Rifampin and Isoniazid Capsules.

## Dissolution $\langle 711\rangle$ -

Medium: simmated gastric fluid TS, witheut pepsin;
${ }^{\boldsymbol{\Delta}} 10 \mathrm{mM} \mathrm{pH} 6.8$ sodium phosphate buffer, prepared by dissolving 7 g of anhydrous dibasic sodium phosphate in 5 L of water, and adjusting with phosphoric acid to a pH of
6.8; UUSP28

900 mL .
Apparatus 1: 100 rpm .
Time: 30 minutes.
Standard stok solution Prepare a-solution in Dissolution Me dium having known concentrations of about 0.22 mg of USP Iso fiazid PS and 1.3 mg of USP Pyrazinamide RS per mL. Use this selution on the day prepared.

Imtermediate standtad solution-Transfer about 27 mg of USP Rifampin PS, aceurately weighed, to a 200 mL volumetric flask, add 50.0 mL of the Standed stock solution, and swinl to dissolve. Bilute with Dissolution Medium to volume, and mix. Place this flask into the dissolution bath immediately prier to stating the tabtet dissolution. Withdraw the flask from the dissolution bath at the same time that the solutions under test are withdrawn.

- $\Delta$ USP28

Determine the amount of $\mathrm{G}_{42} \mathrm{H}_{58} \mathrm{~N}_{4} \Theta_{42}$ dissolved by employing the following method.
$\Delta_{\text {rifampin }}\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}\right)$, isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$, and pyrazinamide $\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}\right)$ dissolved using filtered portions of the solution under test and by employing the procedure set forth in the Assay for rifampin, isoniazid, and pyrazina-

Standard solution Transfer 10.0 mL of the Internediate stan Ated sum to -50 mL volumetrie flask, dilute with Dissolution Mediun to volume, and mix.
Preedure Transfer 10.0 mL of the filtered solution under test to a separate 50 mL volumetrie flask, dilute with Dissolution Me diun to volume, and mix. Coneomitantly determine the UV absor bances at 475 nm , of the solution obtained and the Standard solution, using Dissolution Medium as the blank. Calculate the quantity, in mg, of rifampin $\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \Theta_{42}\right)$ dissolved by the for meta:-

$$
45006\left(A_{\downarrow}+A_{s}\right)
$$

in which- $C$ is the concentration, in ms per mL, of USP Rifampin RS- in the Standard solution; and $A_{b}$-and $A_{s}$ are the absorbances of the solution under test and the Standard solution, respectively.

Foteranes Not less than $80 \%$ ( $Q$ ) of the labeled amount of ir fampin $\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{42}\right)$ is dissolved in 30 minutes. Petermine the amount of $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}$ and $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}$-dissolved by employing the following method.

Mobile phase. Prepare a filtered and degassed mixture of water, 4-M monobasic petassium phosphate, and acetonitrile ( $860: 100: 40$ ). Make adjustments if necessayy (see System Suitabil ity under Chromatography ( 621 )).
fystem suitability solution Prepare a solution of isonicotinie acid in Dissoluth Medium contrining about 0.125 me per mL. Transfer 10 mL of this solution and 4 mL of the Stated stock solution to a 100 mL velumetric flack containing 15 mL of 1 M dibasic potassium phosphate and 30 mL of Mobile phase. Dilute with Mobile phase to velume, and mix.

Standard solution- Transfer 15.0 mL of the Intermediate stan thed soltion to 100 mL volumetric flask eontaining 15 mL of 4 M dibasie petassimm phesphate and 30 mL of Mobile phase. Dilute with Mobile phase to volume, and mix. This solution may be used for 20 heurs.

Fest solution Withdraw 60 mL of the solution under test, and filter, disearding the first 20 mL of the filtrate. Centrifuge the fil trate for 5 minutes. Transfer 15.0 mL of this solution to a 100 mL velumetric flask entaining 15 mL of 1 M dibasic potassimm phosphate and 30 mL of Mobile phase. Dilute with Mobile phase to volume, and mix. This solution may be used for 20 hours.

Chromatographic system (see Chromatography (624)) The liquid chromatograph is equipped with a 254 mm detector and a $4.6 \mathrm{~mm} \times 30 \mathrm{~cm}$ column that contains packing L44. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedtre: the relative retention times are about 0.7 for isonicotinic acid, 1.0 for pyrazinamide, and 1.8 for isoniazid; and the resolution, $R$, be tween isonicotinie acid and pyrazinamide is not less than 2.5 and beween pyrazinamide and isoniazid not less than- 4.0 . Chromatograph the Standard solution, and record the peak respenses as directed for Procedure: the relative standard deviations determined from the pyrazinamide and isoniazid respenses for repliente injec tiens are net mere than $1.5 \%$.

Preedure- Separately inject equal volumes (about $50-\mu \mathrm{L}$ ) of the Standurd solution and the Test solution into the ehromatograph, record the chromatograms, and measure the areas-for the major peaks. Caleulate the quantity, in me, of isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$ dis solved by the formula:

$$
6000 C\left(r_{t}+r_{5}\right)
$$

in which- $C$ is the eoneentration, in mes per mL, of USP Iseniazid PS in the Stamdtard solution; and + tand ra are the isoniazid peak areas obtained from the Test solution and the Standard solution, respectively. Caleulate the quantity, in me, of pyrazinamide $\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}\right)$ dissolved by the-same formala, exeept to read "USP Pyrazinamide-RS" where "USP Isoniazid PS" is speeiffed, and "pyrazinamide" where "isoniazid"" is speeified.
$\triangle$
AUSP28
Tolerances-Not less than $80 \%(Q)$ of the labeled ameant
$\Delta_{\text {amounts of rifampin }}\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}\right)$ and ${ }_{\mathbf{A} \text { USP28 }}$
of isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$ and not less than $75 \%$ of the labeled amount of pyrazinamide $\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}\right)$ are dissolved in 30 minutes.

## Change to read:

Assay for rifampin, isoniazid, and pyrazinamide-
Buffer solution-Dissolve 1.4 g of dibasic sodium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 6.8 .

Solution A-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (96:4).

Solution B-Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (55:45).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve accurately weighed quantities of USP Rifampin RS, USP Isoniazid RS, and USP Pyrazinamide RS in a mixture of Buffer solution and methanol (96:4) to obtain a solution having known concentrations of about 0.16 mg per mL , 0.08 mg per mL , and 0.43 mg per mL , respectively.
$\Delta^{\text {[NOTE——Use this solution within } 10 \text { minutes.] }}{ }_{\text {AUSP28 }}$
Assay preparation - Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 8 mg of isoniazid, to a $100-\mathrm{mL}$ volumetric flask, and add about 90 mL of Buffer solution. Sonicate for about 10 minutes, allow to equilibrate to room temperature, dilute with Buffer solution to volume, and mix. [NOTE-Use this solution within 2 hours.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $238-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ base-deactivated packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-5$ | 100 | 0 | isocratic |
| $5-6$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $6-15$ | 0 | 100 | isocratic |

Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about $1.8,0.7$, and 1.0 for rifampin, isoniazid, and pyrazinamide, respectively; the resolution, $R$, between isoniazid and pyrazinamide is not less than 4 ; the column efficiency is not less than 50,000 , not less than 6,000 , and not less than 10,000 theoretical plates for rifampin, isoniazid, and pyrazinamide, respectively; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantities, in mg , of rifampin $\left(\mathrm{C}_{43} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{12}\right)$, isoniazid $\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}\right)$, and pyrazinamide $\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}\right)$ in the portion of Tablets taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Rifampin RS, calculated on the dried basis, or of USP Isoniazid RS or of USP Pyrazinamide RS, as appropriate, in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the corresponding analytes obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets, USP 27 page 1654 -See briefing under Rifampin and Isoniazid Capsules.

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of the appropriate USP Reference Standard in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses of the corresponding analyte obtained from the Standard preparation and the Assay preparation, respectively.

## Briefing

Saccharin Sodium Tablets, USP 27 page 1666. It is proposed to remove the cross-reference to the Identification tests $A$ and $B$ under Saccharin Calcium by adding the text to the monograph. See the briefing for Identification test in the harmonization draft proposal for Saccharin Calcium on page 1705 of PF 29(5) [Sept.-Oct. 2003].
(EMC: C. Sheehan) RTS-40757-1

## Change to read:

Identification-
${ }^{\Delta} \mathbf{A}_{\mathbf{\Delta U S P 2 8}}$
Dissolve a quantity of Tablets, equivalent to about 1 g of saccharin, in 10 mL of water, filter if necessary, and to the solution add 5 mL of 3 N hydrochloric acid: a white precipitate of saccharin is formed. Collect the precipitate on a filter, wash with small portions of cold water until the last washing is practically free from chloride, and dry it at $105^{\circ}$ for 2 hours: the saccharin so obtained melts between $226^{\circ}$ and $230^{\circ}$, the procedure for Class I being used (see Melting Range or Temperature $\langle 741\rangle$ )., and responds to Identifican $A$ and $B$ under Saccharin Caleitm.
${ }^{\Delta}$ [Note-Use also in Identification tests $B$ and $C$.]
B: Dissolve about 100 mg in 5 mL of sodium hydroxide solution (1 in 20), evaporate to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve in 20 mL of water, neutralize with 3 N hydrochloric acid, and filter: the addition of a drop of ferric chloride TS to the filtrate produces a violet color.

C: Mix 20 mg with 40 mg of resorcinol, add 10 drops of sulfuric acid, and heat the mixture in a suitable liquid bath of $200^{\circ}$ for 3 minutes. Allow it to cool, and add 10 mL of water and an excess of 1 N sodium hydroxide: a fluorescent green liquid results. USSP28 $^{\text {. }}$

## BRIEFING

Selenium Sulfide Lotion, USP 27 page 1685. It is proposed to change the title of this monograph to Selenium Sulfide Topical Suspension. See briefing under Amphotericin B Lotion.

```
(NL: C. Barnstein) RTS-40807-1
```

## Selenium Sulfide Lotion

(Current title-not to change until July 1, 2007) Monograph title change-to become official July 1, 2007 (see Official Title Changes on the first page of InProcess Revision):
See Selenium Sulfide Topical Suspension

## BRIEFING

Selenium Sulfide Topical Suspension-See briefing under $A m$ photericin B Lotion.
(NL: C. Barnstein) RTS-40807-1

## Add the following:

## ©Selenium Sulfide Topical Suspension

(Monograph under this new title-to become official July 1, 2007)
('Current monograph title is Selenium Sulfide Lotion)
» Selenium Sulfide Topical Suspension is an aqueous, stabilized suspension of Selenium Sulfide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $\mathrm{SeS}_{2}$. It contains suitable buffering and dispersing agents.
note-Where labeled for use as a shampoo, it contains a detergent. Where labeled for other uses, it may contain a detergent.

Packaging and storage-Preserve in tight containers.
Identification-Digest about 2 g with 5 mL of nitric acid over gentle heat for 1 hour, dilute with water to about 50 mL , and filter: the solution responds to Identification test $A$ under Selenium Sulfide, when tested as directed, beginning with "to 10 mL of the filtrate add 5 mL of water."
$\mathbf{p H}\langle 791\rangle$ : between 2.0 and 6.0.

Assay-Place a portion of well-mixed Topical Suspension, equivalent to about 100 mg of selenium sulfide and accurately weighed, in a suitable flask. Cautiously digest with 25 mL of fuming nitric acid over gentle heat for 2 hours, and proceed as directed in the Assay under Selenium Sulfide, beginning with "Cool, transfer the solution to a $250-\mathrm{mL}$ volumetric flask." Each mL of 0.05 N sodium thiosulfate is equivalent to 1.789 mg of $\mathrm{SeS}_{2}$. Where the Topical Suspension is labeled in terms of percentage ( $\mathrm{w} / \mathrm{v}$ ) or of the amount of $\mathrm{SeS}_{2}$ in a given volume of Topical Suspension, determine the density of the Topical Suspension as follows: Using a tared, $100-\mathrm{mL}$ volumetric flask, weigh 100 mL of Topical Suspension that previously has been shaken to ensure homogeneity, allowed to stand until the entrapped air rises, and finally inverted carefully just prior to transfer to the volumetric flask. From the observed weight of 100 mL of the Topical Suspension, calculate the quantity of $\mathrm{SeS}_{2}$ in each 100 mL . |  |

## Add the following:

## ${ }^{\Delta}$ Small Intestinal Submucosa Wound Matrix

» Small Intestinal Submucosa Wound Matrix is a biologically derived, collagen-based wound care product, translucent and off-white in color. It is obtained from the small intestinal submucosa layer of the domestic pig (Sus scrofa L.). This layer has been mechanically separated from the adjoining layers of the intestine to remove the serosal, mucosal, and muscular elements. The isolated submucosa is chemically cleaned, decellularized, freeze-dried, and terminally sterilized. Small Intestinal Submucosa Wound Matrix also undergoes a viral inactivation; the inactivation method is validated using parvovirus, reovirus, pseudorabies virus, and leukemia retrovirus as the test viruses. By dried weight, Small Intestinal Submucosa Wound Matrix consists of about 70 percent protein, about 20 percent carbohydrate, and about 7 percent lipid. The protein component is primarily collagen type I (approximately 90 percent), with minor amounts of elastin and collagen type III, collagen type IV, and collagen type VI. In addition to these compo-
nents, additional extracellular matrix components, such as glycosaminoglycans and basic fibroblast growth factor, are also retained.

Packaging and storage-Package in single-use, peel-open pouches that are gas permeable for sterilization purposes. Store under clean, dry conditions at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-The package is labeled to indicate the dimensions of the enclosed Small Intestinal Submucosa Wound Matrix, the expiry date, required storage conditions, and the lot number. The label indicates that the Wound Matrix is sterile if the package is intact, and that the Wound Matrix is designed for single patient, one-time use.

USP Reference standards-USP Endotoxin RS.
USP Authentic Visual References-USP Cultured Rat Pheochromocytoma Reference Photomicrographs. These photomicrographs represent examples of normal and differentiated rat pheochromocytoma cells and are used to assist in ascertaining bioactivity.

Bacterial endotoxins $\langle 85\rangle$-Immerse $70 \mathrm{~cm}^{2}$ of Small Intestinal Submucosa Wound Matrix in 40 mL of LAL Reagent Water. Extract for 60 minutes at $37^{\circ}$ with shaking. Remove a $100-\mu \mathrm{L}$ aliquot to measure the amount of bacterial endotoxins. It contains not more than 20.0 USP Endotoxin Units per $70 \mathrm{~cm}^{2}$.

Sterility $\langle 71\rangle$ : meets the requirements.
Fibroblast growth factor-2 content-
8 M Urea-Dissolve 480.4 g of urea in about 700 mL of water. Dilute with water to 1 L . [Caution-Urea is highly toxic. Avoid skin contact.]

Extraction buffer-Mix 250 mL of 8 M Urea and 750 mL of water. To this solution add 6.0 g of tromethamine and 2.5 g of heparin, and mix to dissolve.
$N$-Ethylmaleimide solution-Dissolve 25 g of N -ethylmaleimide in 90 mL of alcohol. Dilute with alcohol to 100 mL .

Phenylmethylsulfonyl fluoride solution-Dissolve 3.5 g of phenylmethylsulfonyl fluoride in 100 mL of alcohol with gentle heating. [Caution-Phenylmethylsulfonyl fluoride is highly toxic. Avoid skin contact and inhaling dust and vapors.]

Benzamidine hydrochloride solution-Dissolve 15.7 g of benzamidine hydrochloride hydrate in 90 mL of water. Dilute with water to 100 mL .

IgG: agarose suspension—Prepare a suspension containing 5 to 10 mg of human immunoglobulin G : agarose in 0.5 M sodium chloride with $0.01 \%$ thimerisal. ${ }^{1}$

Calibrator diluent-Prepare an aqueous buffered protein solution, with preservative, suitable for the performance of ELISA (see Biotechnology Derived Products $\langle 1045\rangle$ ). ${ }^{2}$
$I g G$ : agarose-diluent-Remove an aliquot of the $I g G: a$ garose suspension, allow the agarose beads to settle, and discard the supernatant. Measure the volume of the remaining agarose gel, add an equal volume of Calibrator diluent, and mix the slurry for 1 hour at $4^{\circ}$. Prepare immediately before use.

Test solution-Pulverize the Small Intestinal Submucosa Wound Matrix in liquid nitrogen using a mortar and pestle that has been prechilled to $-80^{\circ}$. Transfer 10 g of powdered tissue to 100 mL of Extraction buffer. Mix 0.5 mL each of $N$-Ethylmaleimide solution, Phenylmethylsulfonyl fluoride solution, and Benzamidine hydrochloride solution, and adjust to a pH of 7.4 using sterile solutions of either 0.5 M sodium hydroxide or 0.5 M hydrochloric acid. Extract the powdered Small Intestinal Submucosa Wound Matrix with

[^59]constant stirring at $4^{\circ}$ for 24 hours. Centrifuge the extract at $12,000 \times g$ for 30 minutes at $4^{\circ}$. Place the supernatant into dialysis tubing with a molecular weight cut-off of 3500 daltons; dialyze at $4^{\circ}$ with stirring against about 20 L of water. Change the dialysis water 3 times a day for 2 days. Collect the solution from the dialysis tubing, and centrifuge at $12,000 \times g$ for 30 minutes at $4^{\circ}$. Lyophilize the supernatant and reconstitute the lyophilisate in water, with vortexing, to a concentration of 10 mg per mL . Centrifuge at $5000 \times g$ for 3 minutes, and discard the pellet. Add $50 \mu \mathrm{~L}$ of $\operatorname{IgG}$ : $a$ -garose-diluent to the lyophilisate solution, and mix for 1 hour at $4^{\circ}$. Centrifuge at $12,000 \times g$ for 5 minutes at $4^{\circ}$, recover the supernatant, and store at $4^{\circ}$. Use within 24 hours of preparation.
Procedure-Examine duplicate aliquots of the Test solution by a suitably sensitive ELISA method: ${ }^{3}$ the analysis is considered valid if the ELISA kit generates a linear standard curve with the square of the correlation coefficient $\left(r^{2}\right)$ not less than 0.95 , and if the duplicate aliquots of the Test solution yield results that are within $20 \%$ of each other. The average content of fibroblast growth factor-2 is not less than $10,000 \mathrm{pg}$ per g of Small Intestinal Submucosa Wound Matrix.

## Glycosaminoglycan content-

1,9-Dimethylmethylene blue solution-Mix 95 mL of 0.1 M hydrochloric acid in 500 mL of water. Add 16 mg of 1,9dimethylmethylene blue, 3.04 g of aminoacetic acid, and 2.37 g of sodium chloride. Dilute with water to 1 L and adjust to a pH of 3.0 using sterile solutions of either 1.0 M sodium hydroxide or 1.0 M hydrochloric acid. Store in low-actinic glassware.

[^60]Sterile PBS solution-Prepare a sterile solution that contains 8065.0 mg and 200.0 mg of sodium chloride and potassium chloride, respectively, per L of 0.01 M sodium phosphate buffer, pH 7.4 .

Proteinase K solution-Prepare a solution of Tritirachium album proteinase K in water having an activity of 600 units per mL.

Stock heparin standard solution-Prepare a solution containing 1 mg of heparin per mL of water.

Heparin standard curve solutions-Using the Stock heparin standard solution, prepare three solutions containing $20 \mu \mathrm{~g}$ per $\mathrm{mL}, 50 \mu \mathrm{~g}$ per mL , and $100 \mu \mathrm{~g}$ per mL of heparin, respectively.

## Blank solution-Use water.

Test solution-Prepare test samples in duplicate. Accurately weigh about 25 mg of Small Intestinal Submucosa Wound Matrix and cut into small pieces (roughly $2 \mathrm{~mm} \times 2$ mm ). Transfer to a $1.5-\mathrm{mL}$ microcentrifuge tube, and add $180 \mu \mathrm{~L}$ of Sterile PBS solution and $20 \mu \mathrm{~L}$ of Proteinase $K$ solution. Mix, and incubate the sample at $56^{\circ}$ for 15 minutes; during the incubation mix intermittently on a vortex mixer. Cool the sample to room temperature. Dilute with water to obtain a concentration of 12.5 mg of digested Small Intestinal Submucosa Wound Matrix per mL.

Collagen control solution-Accurately weigh about 25 mg of a bovine collagen, type I , that contains less than 1 $\mu \mathrm{g}$ of glycosaminoglycan per mg . Transfer to a $1.5-\mathrm{mL}$ microcentrifuge tube, and add $180 \mu \mathrm{~L}$ of Sterile PBS solution and $20 \mu \mathrm{~L}$ of Proteinase $K$ solution. Mix, and incubate the sample at $56^{\circ}$ for 15 minutes; during the incubation mix intermittently on a vortex mixer. Cool the sample to room temperature. Dilute with water to obtain a concentration of 12.5 mg of digested bovine collagen per mL .

Procedure (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ )-To triplicate $100-\mu \mathrm{L}$ aliquots each of Heparin standard curve solutions, Blank solution, Test solution, and Col-
lagen control solution, add 2.5 mL of 1,9-Dimethylmethylene blue solution. Mix on a vortex mixer for 1 second and immediately read the absorbance at 525 nm . Generate a standard curve of absorbance versus concentration using the averages of each Heparin standard curve solution, correcting for the blank, and calculate the regression line and regression coefficient. The concentration of glycosaminoglycan in the Test solution and Collagen control solution is determined directly from the regression line. If the absorbance of the Test solution is greater than the highest Heparin standard curve solution, then dilute the Test solution appropriately, and repeat the Procedure beginning with "To triplicate $100-\mu \mathrm{L}$ aliquots." The test is considered valid if the regression curve has a square of the correlation coefficient ( $r^{2}$ ) not less than 0.95 ; the triplicate aliquots of the Test solution and Collagen control solution yield results that are within $20 \%$ of each other, respectively; and the average glycosaminoglycan content of the Test solution is statistically greater than the Collagen control solution using one-tailed, unequal variances, $t$-test at $\alpha=0.05$. The average glycosaminoglycan content of the Test solution is not less than $2 \mu \mathrm{~g}$ per mg.

## Metabolic activity assessment-

Dulbecco's modified Eagle's tissue culture medium-Prepare a solution that contains the components included in the following table:

|  | Content <br> (mg per L) |
| :--- | :---: |
| Calcium nitrate, tetrahydrate | 100.0 |
| Ferric nitrate, nonahydrate | 0.10 |
| Potassium chloride | 400.0 |

| Cyanocobalamine | 0.0050 |

MTT reagent-Use a suitable solution of 3-(4,5-di-methylthiazol-2yl)-2,5-diphenyl tetrazolium bromide. ${ }^{4}$

Detergent reagent-Use a suitable sodium dodecyl sulfate detergent solution. ${ }^{5}$

Procedure-Remove three $12-\mathrm{mm}$ diameter circular sections of Small Intestinal Submucosa Wound Matrix, using the appropriate size biopsy punch. Immerse each section into individual wells of a 12 -well cell culture plate (dimension of each well is about 22 to 23 mm in diameter and about 17 to 18 mm in depth), each containing 1 mL of Dulbecco 's modified Eagle's tissue culture medium. Prepare a positive control by harvesting a full-thickness section of porcine jejunum immediately following slaughter. Rinse the section of jejunum in $37^{\circ}$ isotonic sodium chloride solution for 5 minutes to remove intestinal debris. Using scissors, split open the section of jejunum to form a sheet. Remove three 12mm diameter circular sections of jejunum, using the appropriate size biopsy punch. Immerse each section into individual wells of a 12 -well cell culture plate, each well containing 1 mL of Dulbecco's modified Eagle's tissue culture medium. Treat these positive control wells in the same manner as the test wells. Prepare a blank solution using 1 mL of Dulbecco's modified Eagle's tissue culture medium. Allow sections to hydrate for 5 minutes, add $50 \mu \mathrm{~L}$ of $M T T$ reagent to each of the sections and the blank, and

[^61]mix. Incubate for 3 hours at $37^{\circ}$ in an atmosphere containing $5 \%$ carbon dioxide. Add $100 \mu \mathrm{~L}$ of Detergent reagent to each well, and mix. Leave the samples at ambient temperature in the dark for 2 hours. Measure the absorbance of the resulting solution at 570 nm , adjusting for the blank. For the test to be valid, the average absorbance in the positive control wells is greater than 0.100 . The average absorbance reading for the Small Intestinal Submucosa Wound Matrix wells is less than 0.100 .

## Bioactivity-

NOTE-Aseptic cell culture techniques should be employed throughout the performance of this test.
Modified RPMI-1640 culture medium-Prepare a sterile solution that contains the components included in the following table:

| Component | Content <br> $(\mathrm{mg} \mathrm{per} \mathrm{L)}$ |
| :--- | :---: |
| Calcium chloride | 264.9 |
| Ferric nitrate, nonahydrate | 0.10 |
| Potassium chloride | 400.0 |
| Magnesium sulfate, heptahydrate | 200.0 |
| Sodium chloride | $6,400.0$ |
| Sodium bicarbonate | $3,700.0$ |
| Sodium phosphate, monobasic, | 125.0 |
| $\quad$ monohydrate | $4,500.0$ |
| Glucose | 15.0 |
| Phenol red | 110.0 |
| Sodium pyruvate | 84.0 |
| L-Arginine hydrochloride | 48.0 |
| L-Cystine | 30.0 |
| Aminoacetic acid | 42.0 |
| L-Histidine hydrochloride, monohy- |  |
| drate | 104.8 |
| L-Isoleucine | 104.8 |
| L-Leucine |  |

|  | Content <br> (mg per L) |
| :--- | :---: |
| L-Lysine hydrochloride | 146.2 |
| L-Methionine | 30.0 |
| L-Phenylalanine | 66.0 |
| L-Serine | 42.0 |
| L-Threonine | 95.2 |
| L-Tryptophan | 16.0 |
| L-Tyrosine | 72.0 |
| L-Valine | 93.6 |
| L-Calcium pantothenate | 4.0 |
| Choline chloride | 4.0 |
| Folic acid | 4.0 |
| Inositol | 7.0 |
| Nicotinamide | 4.0 |
| Pyridoxine hydrochloride | 4.0 |
| Riboflavin | 0.40 |
| Thiamine hydrochloride | 4.0 |
| Sodium 1-heptanesulfonic acid | 2383.0 |

Penicillin-streptomycin solution-Prepare a suitable buffered solution containing 10,000 USP Penicillin Units of penicillin per mL and 10 mg of streptomycin per $\mathrm{mL} .{ }^{6}$
PC12 cell line culture medium-Mix 420 mL of Modified RPMI-1640 culture medium, 50 mL of horse serum, ${ }^{7} 25 \mathrm{~mL}$ of fetal bovine serum, ${ }^{8}$ and 5 mL of Penicillin-streptomycin solution. Sterilize by passing through a $0.22-\mu \mathrm{m}$ filter.

[^62]Sterile PBS solution-Prepare as described under Glycosaminoglycan content.
Rat tail collagen solution-Prepare a suspension containing 0.2 mg of rat tail collagen, type I , in sterile water.

Cell culture apparatus-Prepare by adding a sufficient volume of Rat tail collagen solution to completely cover the bottom of each well of a 12 -well cell culture plate (dimension of each well is about 22 to 23 mm in diameter and about 17 to 18 mm in depth). Incubate under sterile conditions for 2 hours at $37^{\circ}$ or overnight at room temperature. Remove the Rat tail collagen solution by aspiration. Rinse with sterile PBS solution that has been preheated to $37^{\circ}$.

PC12 cells-Use cultured rat pheochromocytoma cells (ATCC CRL-1721).

Cultivation of PC12 cells-Starting from a frozen culture, prewarm PC12 cell line culture medium to $37^{\circ}$. Add 15 mL of prewarmed PC12 cell line culture medium to a T-75 culture flask. Place a single vial containing the frozen PC12 cells in a $37^{\circ}$ water bath with gentle agitation until they start to thaw (about 1 minute). Complete the thawing procedure by slowly rotating the vial between the hands. Rinse the outside of the vial with $70 \%$ ethanol. Transfer the contents of the vial to the T-75 flask, and mix. Incubate the cells overnight at $37^{\circ}$ in a $5 \%$ carbon dioxide atmosphere. Transfer the contents of the T-75 culture flask to a sterile centrifuge tube, centrifuge at $200 \times g$ for 5 minutes at $37^{\circ}$, and discard the supernatant. Resuspend the cells in 15 mL of PC12 cell line culture medium, and transfer the contents back into the T-75 culture flask. Incubate the cells at $37^{\circ}$ in a $5 \%$ carbon dioxide atmosphere for 3 days.

Cell feeding-At the end of 3 days, the cells will need to be fed for optimal growth. To feed the cells, remove a flask of cells from the incubator, tightening the cap in the process. Examine the T-75 flask under the microscope and check for microbial contamination and confluency. If there is microbi-
al contamination, then discard the flask. If the cells appear confluent, follow the instructions below for perpetuating the PC12 cell line (see Culture perpetuation). Otherwise, harvest the cells from the flask by pipeting the contents of the flask across the bottom of the flask several times. Transfer the cell suspension to a sterile $50-\mathrm{mL}$ centrifuge tube. Centrifuge the cells at $200 \times g$ for 5 minutes at $37^{\circ}$, and discard the supernatant. Resuspend the cells in 13 mL of PC12 cell line culture medium, prewarmed to $37^{\circ}$. Transfer the cell suspension back to the T-75 flask, and mix. Loosen the cap of the flask, and return to the incubator; incubate the cells at $37^{\circ}$ in a $5 \%$ carbon dioxide atmosphere for another 3 to 7 days.

Culture perpetuation-To perpetuate a line of PC12 cells for culture, examine under the microscope a T-75 flask containing cells and check for microbial contamination and confluency. If there is microbial contamination, discard the flask and use another. If the cells do not appear confluent, then follow the instructions above for feeding the PC12 cell line (see Cell feeding), beginning with "Otherwise, harvest the cells from the flask by pipeting the contents of the flask across the bottom of the flask several times." If the cells are confluent and there is no contamination, harvest the cells from the flask by pipeting the contents of the flask across the bottom of the flask several times to loosen up the cells from their attachment to the bottom of the flask and to break up cell clusters. Check under the microscope prior to proceeding to insure that most of the cells have detached from the plastic. Transfer the cell suspension to a sterile $50-\mathrm{mL}$ centrifuge tube, and centrifuge the cells at $200 \times$ $g$ for 5 minutes at $37^{\circ}$. Discard the supernatant and resuspend the cells with 10 mL of PC12 cell line culture medium, prewarmed to $37^{\circ}$. Dispense an equal amount of the cell suspension into each of 3 to 5 T-75 flasks, each flask containing 10 mL of PC12 cell line culture medium, prewarmed to $37^{\circ}$,
and mix. Return the passed cells to the incubator, being sure to loosen the cap of the flasks. Incubate the cells at $37^{\circ}$ in a $5 \%$ carbon dioxide atmosphere. Feed the cells after three days as directed above, beginning with "To feed the cells, remove a flask of cells from the incubator, tightening the cap in the process." [NOTE-To perform the test for Bioactivity, cells that have undergone more than 15 passages after obtaining them from ATCC should not be used.]

Positive control solution-Prepare a solution containing about 10 ng of fibroblast growth factor-2 per mL of PC12 cell line culture medium.

Negative control solution-Use PC12 cell line culture medium.

Test solution-Immerse $70 \mathrm{~cm}^{2}$ of Small Intestinal Submucosa Wound Matrix in sterile water for 5 minutes. Remove the Small Intestinal Submucosa Wound Matrix, and blot excess water using sterile gauze. Weigh the rehydrated Small Intestinal Submucosa Wound Matrix to the nearest 0.1 g and add Modified RPMI-1640 culture medium at a ratio of 7.5 mL of Modified RPMI-1640 culture medium for each 1.0 g of Small Intestinal Submucosa Wound Matrix. Incubate for 24 hours at $37^{\circ}$ with constant shaking. Remove the Small Intestinal Submucosa Wound Matrix, and pass the solution through a $0.22-\mu \mathrm{m}$ filter. Add sufficient quantities of sterile horse serum and sterile fetal bovine serum to concentrations of $10 \%$ and $5 \%$, respectively, and add a sufficient quantity of Penicillin-streptomycin solution such that there are 100 USP Penicillin Units and 0.1 mg of streptomycin per mL. Adjust the pH of the Test Solution to 7.4, using a sterile solution of either 1.0 M sodium hydroxide or 1.0 M hydrochloric acid.

Procedure-Harvest a flask of confluent PC12 cells by centrifuging at $200 \times g$ for 5 minutes. Remove the supernatant by aspiration, and resuspend the pellet to obtain a concentration of about $1 \times 10^{6}$ cells per mL of PC12 cell
line culture medium. Add to each of three wells of the Cell culture apparatus 1.0 mL of Negative control solution. To a second set of three wells add to each 1.0 mL of Positive control solution, and to a third set of three wells add to each 1.0 mL of Test solution. Add to each well about 20,000 cells, mix by gentle rocking, and incubate for 48 hours at $37^{\circ}$. For each well, count 3 random microscopic fields of cells using a microscope with a $10 \times$ ocular lens and a $20 \times$ objective lens. Each field should have at least 20 cells; avoid large clumps of cells where individual cell bodies cannot be ascertained. Determine the total number of cells in the field and, using USP Cultured Rat Pheochromocytoma Reference Photomicrographs of normal and differentiated rat pheochromocytoma cells for comparison, determine the total number of cells that have formed at least one neurite-like extension at least twice the diameter of a normal, undifferentiated cell body. For each experimental group, record the total number of cells counted and the total number of cells differentiated across all three wells, and calculate the total percentage of cells that have differentiated. For a test to be valid, the following criteria must be met: (1) none of the wells are microbially contaminated; (2) the weighted percentage of differentiated cells across the Negative control solution wells is less than $5 \%$; (3) the weighted percentage of differentiated cells across the Positive control solution wells is greater than $6 \%$; and (4) the weighted percentage of differentiated cells across the Negative control solution wells is statistically less than the weighted percentage of differentiated cells across the Positive control solution wells, using a one-sided, two-sample test for proportions at $\alpha=0.05$. The weighted percentage of differentiated cells incubated in the Test solution wells is statistically greater than those incubated in the Negative control solution wells, using a one-sided, two-sample test for proportions at $\alpha=0.05 \cdot \mathbf{\Delta U S P 2 8}$

Zinc Sulfide Topical Suspension-See briefing under Amphotericin B Lotion.
(NL: C. Barnstein) RTS-40809-1

## Add the following:

## ©Zinc Sulfide Topical Suspension <br> (Monograph under this new title-to become official July 1, 2007) <br> (Current monograph title is White Lotion)

» Prepare Zinc Sulfide Topical Suspension as follows:

$$
\begin{array}{ll}
\text { Zinc Sulfate. . . . . . . . . . . . . . . . . . . . . . . . } & 40 \mathrm{~g} \\
\text { Sulfurated Potash. . . . . . . . } \\
\hline 0 \mathrm{~g}
\end{array}
$$

Purified Water, a sufficient quantity, to make

1000 mL

Dissolve the Zinc Sulfate and the Sulfurated Potash separately, each in 450 mL of Purified Water, and filter each solution. Add the sulfurated potash solution slowly to the zinc sulfate solution with constant stirring. Then add the required amount of Purified Water, and mix.

NOTE-Prepare the Topical Suspension fresh, and shake it thoroughly before dispensing.

Packaging and storage-Dispense in tight containers. $\triangle$ USP28
(Official July 1, 2007) MONOGRAPHS

#### Abstract

BRIEFING Chaste Tree, page 1264 of $P F$ 29(4) [July-Aug. 2003]. On the basis of comments received, it is proposed to revise the previously proposed thin-layer chromatographic procedure in the test for Identification. It is also proposed to revise the test for Loss on drying to include drying conditions omitted in the original monograph. (DSB: G. Giancaspro) RTS-40335-1

## Add the following:

© Chaste Tree
» Chaste Tree consists of the dried ripe fruits of Vitex agnus-castus L. (Fam. Verbenaceae). It contains not less than 0.05 percent of agnuside and not less than 0.08 percent of casticin, calculated on the dried basis.

Packaging and storage-Store Preserve in a well-closed light resistant container, protectere frem meisture and store at controlled room temperature.

Labeling-The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

USP Reference standards $\langle 11\rangle —$ USP Agnuside RS. USP Casticin RS. USP Powdered Chaste Tree Extract RS.

## Botanic characteristics-

Macroscopic-Mature chaste tree fruits are spherical to ovoid, 2 to 4 mm in diameter, very hard, usually with a short pedicil. The fruit is reddish brown to black, slightly rough,
and covered with glandular hairs. There are four grooves perpendicular to one another, and a slight depression on the apex, more evident on large fruits. The internal appearance of the fruit is yellowish. The internal structure of the fruit includes four compartments, each containing an oblong seed with a high fat content. A group of up to six spongy, light tan, immature fruits also accompanies mature fruits. The fruit is often covered by a tubular, greenish gray, fine tomentous calyx, which is persistent and has five teeth.

Microscopic-The exocarp is brown and narrow, consisting of parenchymatous cells with thin walls and partially lignified cells with many pitted thickenings on the inside. In surface view, the exocarp shows an epidermis of polygonal cells with irregular thickenings and glandular hairs, each with a short single-celled stalk and a four-celled head containing essential oil. The outer mesocarp consists of several layers of brown, isodiametric parenchyma cells. The inner mesocarp consists of finely pitted sclerenchymatous cells, some with moderately thickened walls, others consisting of isodiametric stone cells with small lumen. The endocarp consists of a layer of small brown sclereid cells. The seeds are small, having large cotyledons surrounded by thinwalled large parenchymatous cells that have ribbed thickenings. The nutritive tissue and the cells of the germ contain aleuron grains and oil globules. Starch is absent. The outer epidermis of calyx is composed of polygonal cells, covered by abundant unicellular or multicellular curved trichomes. The inner epidermis of calyx is glabrous and composed of rectangular, elongated cells with slightly wavy walls.

## Identification-

${ }^{\boldsymbol{4}}$ A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Test solution-Transfer about 1 g of the powdered plant material to a screw-capped centrifuge tube. Add 10 mL of methanol, and heat in a water bath at $60^{\circ}$ for 10 to 15 minutes, cool, and filter. Apply $60 \mu \mathrm{~L}$ to the plate in bands that are 2 cm in length.

Standard solution-Transfer about 100 mg of USP Powdered Chaste Tree Extract RS to a screw-capped centrifuge tube. Add 1 mL of methanol, and heat in a water bath at $60^{\circ}$ for 10 minutes. Centrifuge, and use the clear supernatant. Apply 20 to -30 $90 \mu \mathrm{~L}$ to the plate.

Developing solvent system-Use the upper phase of a mixture of ethyl acetate, methanol, and water (77:15:8).

Spray reagent-Prepare a solution of $p$-dimethylaminobenzaldehyde in 1 N hydrochloric acid containing 10 mg per mL.
Procedure-Develop the chromatogram to a length of not less than 1812 cm , and dry the plate in a current of air. Spray the plate with Spray reagent, and heat for 10 minutes at $120^{\circ}$. The chromatogram obtained from the Test solution shows the following: a blue zone (at an $R_{F}$ value of about 0.21 ) thans pink in due to the presence of aucubin and that corresponds in color and $R_{F}$ value to a similar zone in the chromatogram of the Standard solution; a blue zone (at an $R_{F}$ value of about 0.44 ) turns pink in time as a result of the presence of agnuside and that corresponds in color and $R_{F}$ value to a similar zone in the chromatogram of the Standard solution; ene yellow zone at an $R_{F}$ value that is between that of agnuside and auteubin and correspends in eolor and $R_{\text {I }}$ value to a similar zone in the chromatogram of the Stactar solution; and one yellowish-green zone (above ablue zone) that is near the broad zone, violet in the middle,
that is near to the solvent front and that corresponds in color and $R_{F}$ value to a similar zone in the chromatogram of the Standard solution. Other colored zones of varying intensities may be observed in the chromatogram of the Test solution.

B: ${ }_{\Delta U S P 28}$ The chromatogram of the Test solution in the test for Content of casticin shows a peak at the retention time corresponding to the casticin peak in the chromatogram of the Standard solution.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed $10^{6}$ per g , the total combined molds and yeast count does not exceed $10^{4}$ per $g$, and the enterobacterial count does not exceed $10^{3}$.

## Change to read:

Loss on drying $\langle 731\rangle-{ }^{\Delta}$ Dry 1 g at $105^{\circ}$ for 2 hours. It $\operatorname{loses}_{\mathbf{\Delta U S P 2 8}}$ not more than $10.0 \%$.

Foreign organic matter $\langle 561\rangle$ : not more than $3.0 \%$.
Total ash $\langle 561\rangle$ : not more than $8.0 \%$.
Acid-insoluble ash $\langle 561\rangle$ : not more than $2.0 \%$.
Pesticide residues $\langle 561\rangle$ : meets the requirements.
Heavy metals, Method III $\langle 231\rangle$ : not more than $20 \mu \mathrm{~g}$ per g.

## Content of casticin-

Solution $A$-Use filtered and degassed methanol.
Solution B—Use a filtered and degassed solution of 5.88 g of phosphoric acid in 1000 mL of water.

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Casticin RS in methanol, with sonication. Dilute quantitatively, and stepwise if necessary, with metha-
nol to obtain a solution having a known concentration of about 0.05 mg per mL . Filter through a cellulose membrane having a $0.45-\mu \mathrm{m}$ or finer porosity.

Test solution-Accurately weigh approximately 1000 mg of ground plant material, and place in a suitable container with stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at $19,000 \mathrm{rpm}$ for 2 minutes. Filter each supernatant, and transfer to a $250-\mathrm{mL}$ round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness. Dissolve the residue in methanol, quantitatively transfer to a $20-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. Filter through a cellulose membrane having a $0.45-\mu \mathrm{m}$ or finer porosity.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $348-\mathrm{nm}$ detector and a $3.1-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $25^{\circ}$. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 50 | 50 | equilibration |
| $0-13$ | $50 \rightarrow 65$ | $50 \rightarrow 35$ | linear gradient |
| $13-18$ | $65 \rightarrow 100$ | $35 \rightarrow 0$ | linear gradient |
| $18-23$ | $100 \rightarrow 50$ | $0 \rightarrow 50$ | linear gradient |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor for casticin is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention time of the peak corresponding to casticin in the Test solution by com-
parison with the chromatogram of the Standard solution. Calculate the percentage of casticin in the portion of Chaste Tree taken by the formula:

$$
2000(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Casticin RS in the Standard solution; $W$ is the weight, in mg, of the Chaste Tree taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses of casticin obtained from the Test solution and the Standard solution, respectively.

## Content of agnuside-

Solvent: a mixture of water and methanol (95:5).
Solution $A$-Use filtered and degassed acetonitrile.
Solution B-Use a filtered and degassed solution of 5.88 g of phosphoric acid in 1000 mL of water.
Standard solution-Dissolve an accurately weighed quantity of USP Agnuside RS in Solvent, with sonication. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg per mL . Filter through a cellulose membrane having a $0.45-\mu \mathrm{m}$ or finer porosity.

Test solution-Accurately weigh approximately 1000 mg of ground plant material, and place in a suitable container with a stopper. Extract twice with 40 mL of methanol, using a hand homogenizer at $19,000 \mathrm{rpm}$ for 2 minutes. Centrifuge, and transfer each supernatant to a $250-\mathrm{mL}$ round-bottom flask. Rinse the residue with methanol, and filter the resulting solution into the flask. Evaporate the combined extract to dryness, and dissolve the residue in 2 mL of Solvent. Quantitatively transfer the solution to a solid-phase extraction cartridge packed with neutral aluminum oxide previously conditioned with 5 mL of Solvent. Connect the cartridge to a vacuum pressure not exceeding 300 mbar , and collect the eluate. Rinse the round-bottom flask with 2 mL of Solvent, and pass this solution through the cartridge, apply the vacuum, and collect the eluate. Rinse the cartridge
with 4 mL of Solvent, and collect the eluate. Combine the eluates from the cartridge, transfer to a $10-\mathrm{mL}$ volumetric flask, and dilute with Solvent to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $258-\mathrm{nm}$ detector and a $3.1-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $25^{\circ}$. The flow rate is about 1.3 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A <br> (minutes) | Solution B <br> $(\%)$ |  |
| :---: | :---: | :---: | :--- |
| 0 | 7 | 93 | Elution |
| $0-0.6$ | $7 \rightarrow 10$ | $93 \rightarrow 90$ | equilibration |
| $0.6-5$ | 10 | 90 | linear gradient |
| $5-7$ | $10 \rightarrow 14$ | $90 \rightarrow 86$ | linear gradient |
| $7-13$ | $14 \rightarrow 15$ | $86 \rightarrow 85$ | linear gradient |
| $13-13.1$ | $15 \rightarrow 100$ | $85 \rightarrow 0$ | linear gradient |
| $13.1-18$ | 100 | 0 | isocratic |
| $18-18.1$ | $100 \rightarrow 7$ | $0 \rightarrow 93$ | linear gradient |
| $18.1-23$ | 7 | 93 | re-equilibration |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the tailing factor for agnuside is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention time of the peak corresponding to agnuside in the the Test solution by comparison with the chromatogram obtained from the Standard solution. Calculate the percentage of agnuside in the portion of Chaste Tree taken by the formula:

$$
1000(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Agnuside RS in the Standard solution; $W$ is the weight, in mg , of the Chaste Tree taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses of agnuside obtained from the Test solution and the Standard solution, respectively..1S (USP27)

## Identification-

A: Thin-layer chromatographic identification test $\langle 201\rangle$ -
Test solution-Transfer about 1 g of the powdered plant material to a screw-capped centrifuge tube. Add 10 mL of a mixture of methanol and water ( $6: 4$ ), heat in a steam bath for 10 to 15 minutes, cool, and filter. Apply 20 to $30 \mu \mathrm{~L}$ to the plate in bands that are 2 cm in length.

Standard solution-Transfer about 100 mg of USP Powdered Red Clover Extract RS to a screw-capped centrifuge tube. Add 1 mL of a mixture of alcohol and water (7:3), and heat in a steam bath for 10 minutes. Centrifuge, and use the clear supernatant. Apply 20 to $30 \mu \mathrm{~L}$ to the plate.

Developing solvent system-Use the toper phase of

- $\Delta U S P 28$
a mixture of ethyl acetate, water, formic acid, and glacial acetic acid (100:27:11:11).

Spray reagent A-Prepare a solution of 2-aminoethyl diphenylborinate in methanol containing 10 mg per mL .

Spray reagent $B$-Prepare a solution of polyethylene glycol 4000 in alcohol containing 50 mg per mL .

Procedure-Develop the chromatogram to a length of not less than 18 cm , and dry the plate in a current of air. Spray the plate with Spray reagent $A$ followed by Spray reagent B, and examine the plate under UV light at 365 nm : the chromatogram obtained from the Test solution shows a blue zone at an $R_{F}$ value of about 0.7 that corresponds in color and $R_{F}$ value to that in the chromatogram obtained from the Standard solution; one yellowish green zone at an $R_{F}$ value of about 0.55 corresponding in color and $R_{F}$ value to that in the chromatogram obtained from the Standard solution; and one yellowish orange zone at an $R_{F}$ value of about 0.50 corresponding in color and $R_{F}$ value to that in the chromatogram of the Standard solution. Other colored zones of varying intensities may be observed in the chromatogram obtained from the Test solution.

B: The chromatogram of the Test solution exhibits peaks for daidzein, genistein, formononetin, and biochanin A at retention times that correspond to those in the chromatogram of the Standard solution, as obtained in the test for Content of isoflavones. Calculate the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones by the formula:

$$
(B+G) /(D+F),
$$

in which $B, G, D$, and $F$ are the percentages of biochanin A, genistein, daidzein, and formononetin, respectively, as obtained in the test for Content of isoflavones: the ratio is between 0.1 and 10 .

## Content of isoflavones-

Solvent: a mixture of alcohol and water (1:1).
Solution A-Prepare a filtered and degassed mixture of water and acetonitrile ( $75: 25$ ) containing $0.05 \%$ trifluoroacetic acid.

Solution B-Use filtered and degassed acetonitrile containing $0.05 \%$ trifluoroacetic acid.

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution 1 - Pissolve an aceurately weighed quantity of USP Powdered Red Clover Extract PS in 2 N hydrechloric acid ( 0.5 mL per each mg of Extract) with shaking for 1 minute and heating in a water bath for 30 minutes. Dilute with Solvent to ob tain a solution having a known concentration of about 0.5 mg per mL . Filter through a membrane having a $0.45 \mu \mathrm{~m}$ or finer porosity.
${ }^{\Delta}$ Transfer an accurately weighed quantity of USP Powdered
Red Clover Extract RS, equivalent to about 30 mg of the labeled content of isoflavones, to a $250-\mathrm{mL}$ volumetric flask. Add 15 mL of dehydrated alcohol, sonicate until dissolved, dilute with Solvent to volume, and mix. Transfer 50.0 mL of this solution to a round-bottom flask, and evaporate to dryness under vacuum. Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 minutes. Quantitatively transfer the resulting solution with the aid of about 15 mL of alcohol, to a $50-\mathrm{mL}$ volumetric flask, and dilute with Solvent to volume. Centrifuge, or filter through a membrane having a $0.45-\mu \mathrm{m}$ or finer porosi-

## ty. $\mathbf{\text { Standa }}$

Standard solution 2-Dissolve an accurately weighed quantity of USP Formononetin RS in a mixture of $n$-propanol and water (1:1) with sonication. Dilute quantitatively, and stepwise if necessary, with the mixture of $n$-propanol and water (1:1) to obtain a solution having a known concentration of about 0.1 mg per mL . Filter through a membrane having a $0.45-\mu \mathrm{m}$ or finer porosity.

Test solution-Accurately weigh approximately 2500 mg of ground plant material, and place in a $120-\mathrm{mL}$ flask with a stopper. Add exactly 100 mL of Solvent, close the flask, and shake on an orbital or wrist-action shaker for not less than 12 hours. Transfer 50.0 mL of this solution to a round-bottom flask, and evaporate to dryness under vacuum
© at about $40^{\circ} \cdot \mathbf{\Delta U S P 2 8}$
Add 15 mL of 2 N hydrochloric acid, and heat in a water bath for 30 minutes. Quantitatively transfer this solution with the aid of about 15 mL of alcohol, to a $50-\mathrm{mL}$ volumetric flask, and dilute with Solvent to volume. Filter through a membrane having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first 4 mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains end-packed $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $45^{\circ}$. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-2$ | 100 | 0 | isocratic |
| $2-2.5$ | $100 \rightarrow 87$ | $0 \rightarrow 13$ | linear gradient |
| $2.5-7.5$ | $87 \rightarrow 80$ | $13 \rightarrow 20$ | linear gradient |
| $7.5-7.8$ | $80 \rightarrow 73$ | $20 \rightarrow 27$ | linear gradient |
| $7.8-8.0$ | $73 \rightarrow 55$ | $27 \rightarrow 45$ | linear gradient |

## BRIEFING

Echinacea angustifolia, USP 27 page 1987 and page 1578 of $P F$ 26(6) [Nov.-Dec. 2000]. Changes in the Definiton are proposed according to data received indicating that the appropriate level of markers are reached after 1 year of growth. Since there is some confusion in the literature about the correct isomer of cynarin known to be present in E. angustifolia roots, it is proposed to change the name cynarin(e) to dicaffeoylquinic acids in order to describe more accurately the markers intended to be used as positive identifiers of E. angustifolia. The peak of one of the isomers of dicaffeoylquinic acids known as cynarin(e) elutes just before the retention time corresponding to echinacoside. Yet, another regioisomer might be found in E. angustifolia having a similar retention time to chicoric acid in the Chromatographic system used in the test for Content of total phenols. It is proposed to modify the visualization of the spots in the TLC identification test for alkamides according to comments received. Drying conditions previously omitted are now added. A typographical error in the requirement for $k^{\prime}$ is corrected in the test for Content of total phenols.

Calculate the percentage of total phenols in the portion of Echinacea angustifolia taken by adding the individual percentages calculated.

## BRIEFING

Powdered Echinacea angustifolia Extract, USP 27 page 1989. On the basis of comments received, it is proposed to modify the visualization of the spots in the TLC identification test for alkamides. Drying conditions previously omitted are now added. In the test for Content of total phenols it is proposed to reflux the Test preparation in order to improve the recovery. It is also proposed to reduce the minimum requirement in the test for Content of dodecatetraenoic acid isobutylamides. The Labeling section is revised to add a warning statement to be applied to the label and to allow specific claims for extracts standardized to higher contents of alkamides. See also the briefing under Echinacea angustifolia.

Content of dodecatetraenoic acid isobutylamides-
Mobile phase and Standard solution 2-Proceed as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia.

Standard solution 1-Dissolve an accurately weighed quantity of USP Powdered Echinacea angustifolia Extract RS in methanol, shaking for 1 minute, and dilute with methanol to volume to obtain a solution having a known concentration of about 1 mg per mL . Pass through a membrane filter having a $0.45-\mu \mathrm{m}$ or finer porosity.

Test solution-Transfer about 500 mg of Powdered Extract, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Add 80 mL of methanol, and sonicate for 30 minutes. Dilute with methanol to volume, and pass through a membrane filter having a $0.45-\mu \mathrm{m}$ or finer porosity.

Chromatographic system-Prepare as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia. Chromatograph Standard solution 1, and record the peak responses as directed for Procedure: the chromatogram obtained is similar to the Reference Chromatogram for alkamides provided with the USP Powdered Echinacea angustifolia Extract RS,
$\triangle$ and the resolution, $R$, between the two isomers of dodeca-
tetraenoic acid isobutylamides is not less than $1.0 \boldsymbol{\wedge}_{\mathbf{\Delta S P}}$ _
Chromatograph Standard solution 2, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 3.5 ; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.5 \%$.

Procedure-Proceed as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia. Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of Powdered Extract taken by the formula:

$$
10,000(1.353)(C / W)\left(r_{i} / r_{S}\right)
$$

in which 1.353 is the response factor for $2 E, 4 E$-hexadienoic acid isobutylamide; $C$ is the concentration, in mg per mL , of USP $2 E, 4 E$-Hexadienoic Acid Isobutylamide RS in Standard solution 2; $W$ is the weight, in mg , of the portion of Powdered Extract taken; $r_{i}$ is the sum of the peak responses of the relevant analytes obtained from the Test solution; and $r_{S}$ is the peak response obtained from Standard solution 2.

BRIEFING
Echinacea pallida, USP 27 page 1989. It is proposed to revise the Latin binomial in the Definition according to the nomenclature in Herbs of Commerce, $2^{\text {nd }}$ Edition. See also the briefing under Echinacea angustifolia for other changes.
(DSB: G. Giancaspro) RTS-40483-5

## Change to read:

» Echinacea pallida consists of the dried rhizome and roots of Echinacea pallida Nuttall
${ }^{\wedge}$ (Nutt.) Nutt. ${ }^{U S P 28}$
(Fam. Asteraceae). It is harvested in the fall after 3 or more years of growth. It contains not less than 0.5 percent of total phenols, calculated on the dried basis as the sum of caftaric acid $\left(\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{9}\right)$, chicoric acid $\left(\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{12}\right)$, chlorogenic $\operatorname{acid}\left(\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{O}_{9}\right)$, and echinacoside $\left(\mathrm{C}_{35} \mathrm{H}_{46} \mathrm{O}_{20}\right)$.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -
PRESENCE OF ECHINACOSIDE AND ABSENCE OF GYNARINE
${ }^{\triangle}$ DICAFFEOYLQUINIC ACIDS (CYNARIN(E)- $\Delta$ USP28
Test solution-Proceed as directed for Identification test $A$ under Echinacea angustifolia, except to use Echinacea pallida instead of Echinacea angustifolia.

Standard solution 1-Dissolve an accurately weighed quantity of USP Powdered Echinacea pallida Extract RS in methanol to obtain a solution having a known concentration of about 10 mg per mL.

Standard solution 2, Developing solvent system, Spray reagent 1, and Spray reagent 2-Proceed as directed for Identification test $A$ under Echinacea angustifolia.

Procedure-Proceed as directed in the chapter. Develop the chromatograms in Developing solvent system until the solvent front has moved not less than 48
${ }^{\Delta} 12$ _USP28
cm , and dry the plate in a current of air. Spray the plate with Spray reagent 1 followed by Spray reagent 2 , and examine the plate under UV light at 365 nm : the chromatogram obtained from the Test solution shows a yellowish zone at an $R_{F}$ value of 0.14 , characteristic of echinacoside (absent or traces in Echinacea purpurea), corresponding in color and $R_{F}$ value to that in the chromatogram of Standard solution 1, and does not show a zone characteristic of eynarine
$\Delta_{1,3-d i c a f f e o y l q u i n i c ~ a c i d ~}^{\Delta U S P 28}$
(present in Echinacea angustifolia) corresponding in color and $R_{F}$ value to that in the chromatogram of Standard solution 2. Other colored zones of varying intensities may be observed in the chromatogram of the Test solution.

B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle-$ PRESENCE OF KETOALKENYNES-
Test solution-Evaporate to dryness the chloroform extract retained from preparation of the Test solution in Identification test $A$ at $40^{\circ}$ in vacuum. To the residue add 1 mL of alcohol, and pass through a nylon membrane filter having a porosity of $0.45 \mu \mathrm{~m}$.

Standard solution 1-Transfer an accurately weighed quantity of USP Powdered Echinacea pallida Extract RS to a centrifuge tube, and add chloroform to obtain a solution having a concentration of about 10 mg per mL . Shake for 1 minute, and centrifuge. Use the supernatant.

Standard solution 2-Dissolve an accurately weighed quantity of $\beta$-sitosterol in methanol to obtain a solution having a concentration of about 1 mg per mL .

Developing solvent system-Prepare a mixture of toluene and ethyl acetate $(7: 3)$.

Spray reagent 1-Prepare a $1 \%$ solution of vanillin in alcohol.
Spray reagent 2-Prepare a $10 \%$ solution of sulfuric acid in alcohol.

Procedure-Proceed as directed for Identification test A. Spray the plate with Spray reagent 1 followed by Spray reagent 2, and heat the plate at $120^{\circ}$ for 3 minutes. The chromatogram obtained from the Test solution shows green, brown, and violet zones above the spot for $\beta$-sitosterol ( $R_{F}$ range 0.6 to 0.8 ). These zones (unlike those in Echinacea angustifolia and Echinacea purpurea) are characteristic of ketoalkenynes, and correspond in $R_{F}$ value to the zones in the chromatogram obtained from Standard solution 1.

C: The retention time of the major peak in the chromatogram of the Test solution corresponds to that of the echinacoside peak in the chromatogram of Standard solution 1, as obtained in the test for Content of total phenols.
${ }^{\boldsymbol{\Delta}}$ The peak area of any peak detected at the locus of 1,3-di-
caffeoylquinic acid is not more than $1 \%$ of the peak area for
echinacoside peak. $\mathbf{\Delta}$ USP28

## Change to read:

Content of total phenols-
Solvent, Solution A, Solution B, Mobile phase, and Standard solution 2-Prepare as directed for Content of total phenols under Echinacea angustifolia.

Standard solution 1-Proceed as directed for Content of total phenols under Echinacea angustifolia, except to use USP Powdered Echinacea pallida Extract RS instead of USP Powdered Echinacea angustifolia Extract RS.

Test solution-Proceed as directed for Content of total phenols under Echinacea angustifolia, except to use finely powdered Echinacea pallida instead of Echinacea angustifolia.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—Prepare as directed for Content of total phenols under Echinacea angustifolia. Chromatograph Standard solution 1, and record the peak responses as directed for Procedure: the chromatogram obtained is similar to the Reference Chromatogram for total phenols provided with USP Powdered Echinacea pallida Extract RS. Chromatograph Standard solution 2, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 3.5 $\Delta_{3.0} ;_{\mathbf{U S P} 28}$
the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.5 \%$.

Procedure-Proceed as directed for Content of total phenols under Echinacea angustifolia. Separately calculate the percentages of caftaric acid $\left(\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{9}\right)$, chicoric acid $\left(\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{12}\right)$, chlorogenic acid $\left(\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{O}_{9}\right)$, and echinacoside $\left(\mathrm{C}_{35} \mathrm{H}_{46} \mathrm{O}_{20}\right)$ in the portion of Echinacea pallida taken by the formula:

$$
2500 F(C / W)\left(r_{i} / r_{S}\right)
$$

in which $F$ is the response factor and is equal to 0.695 for chicoric acid, 0.881 for caftaric acid, 1.000 for chlorogenic acid, and 2.220 for echinacoside; $C$ is the concentration, in mg per mL , of USP Chlorogenic Acid RS in Standard solution 2; $W$ is the weight, in mg , of Echinacea pallida taken; and $r_{i}$ and $r_{S}$ are the peak responses for the relevant analyte obtained from the Test solution
and Standard solution 2, respectively. Calculate the percentage of total phenols in the portion of Echinacea pallida taken by adding the individual percentages calculated.

## BRIEFING

Powdered Echinacea pallida Extract, USP 27 page 1991. It is proposed to delete the reference to dicaffeoylquinic acids from the Definition since they should be absent in E. pallida. It is also proposed to revise the Labeling section to include a warning statement to be applied to the label. See also the briefings under Echinacea angustifolia and Echinacea pallida for other changes.
(DSB: G. Giancaspro; DSI: J. Salguero) RTS—40483-6; 40889-2

## Change to read:

» Powdered Echinacea pallida Extract is prepared from Echinacea pallida roots by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of the starting crude plant material to Powdered Extract is between $2: 1$ and $8: 1$. It contains not less than 4.0 percent and not more than 5.0 percent of total phenols, calculated on the dried basis as the sum of caftaric acid $\left(\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{9}\right)$, chicoric acid $\left(\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{12}\right)$, chlorogenic acid $\left(\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{O}_{9}\right)$, lieaffeylquinic acids $\left(\mathrm{G}_{25} \mathrm{H}_{24} \Theta_{12}\right.$;

Solvent, Solution A, Solution B, Mobile phase, and Standard solution 2-Proceed as directed for Content of total phenols under Echinacea angustifolia.

Standard solution 1-Proceed as directed for Content of total phenols under Echinacea angustifolia, except to use USP Powdered Echinacea pallida Extract RS instead of USP Powdered Echinacea angustifolia Extract RS.

Test solution-Transfer about 60 mg of Powdered Extract, accurately weighed, to a 50 mL eentrifuge tube
$\Delta_{\text {an }}$ appropriate round bottom flask equipped with a conden-
Ser. $\begin{aligned} & \text { USP28 } \\ & \text { Add } \\ & 25.0 \mathrm{~mL}\end{aligned}$ of Solvent, shake
$\Delta^{\text {and }}$ heat under reflux while shaking ${ }_{\Delta U S P 28}$
by mechanical means for 15 minutes. Centrifuge, or pass through a membrane filter having a $0.45-\mu \mathrm{m}$ or finer porosity.

Chromatographic system-Prepare as directed for Content of total phenols under Echinacea angustifolia. Chromatograph Standard solution 1, and record the peak responses as directed for Procedure: the chromatogram obtained is similar to the Reference Chromatogram for total phenols provided with USP Powdered Echinacea pallida Extract RS. Chromatograph Standard solution 2, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 3.5
-3.0; ${ }_{\text {USP28 }}$
the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.5 \%$.

Procedure-Proceed as directed for Content of total phenols under Echinacea angustifolia. Separately calculate the percentage of each relevant component of total phenols in the portion of Powdered Extract taken by the formula:

$$
2500 F(C / W)\left(r_{i} / r_{S}\right)
$$

in which $F$ is the response factor and is equal to 0.695 for chicoric acid, 0.881 for caftaric acid, 1.000 for chlorogenic acid, and 2.220 for echinacoside; $C$ is the concentration, in mg per mL , of USP Chlorogenic Acid RS in Standard solution 2; $W$ is the weight, in mg , of the portion of Powdered Extract taken; and $r_{i}$ and $r_{S}$ are the peak responses for the relevant analyte obtained from the Test solution and Standard solution 2, respectively. Calculate the percentage of total phenols in the portion of Powdered Extract taken by adding the individual percentages calculated.

Briefing
Echinacea purpurea Aerial Parts. Because there is no existing USP monograph for this article, a new monograph is being proposed.
(DSB: G. Giancaspro) RTS-40334-1

## Add the following:

## ©Echinacea purpurea Aerial Parts

## » Echinacea purpurea Aerial Parts consists of the

 aerial parts of Echinacea purpurea (L.) Moench (Fam. Asteraceae). It is harvested during the flowering stage. It contains not less than 1.0 percent of chicoric acid, and not less than 0.01 percent of dodecatetraenoic acid isobutylamides $\left(\mathrm{C}_{16} \mathrm{H}_{25} \mathrm{NO}\right)$ on the dried basis.Packaging and storage-Store in tight, light-resistant containers at controlled room temperature.

Labeling-The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards $\langle 11\rangle$ —USP Chlorogenic Acid RS. USP Powdered Echinacea purpurea Extract RS. USP
2E,4E-Hexadienoic Acid Isobutylamide RS.

## Botanical characteristics-

MACROSCOPIC-The herb is an erect, coarse, rough-hairy perennial, usually up to 90 cm tall, rarely up to 180 cm . The leaves are alternate and simple; the lowermost leaves are slender, long, and petioled, ovate to broadly lanceolate, mostly penta-nerved, acute or acuminated at the apex, abruptly narrowed or rarely cordate at the base, usually sharply dentate, and 7 to 20 cm long and 2.5 to 7.5 cm wide; the
petioles are mostly winged at the summit. The upper leaves are narrower, often almost entirely sessile, lanceolate or ovate lanceolate, and usually with 3 veins.

The flower heads are radiate, to 15 cm across, solitary or few, and long-peduncled, with 12 to 20 rays, purple, crimson, or rarely pale; the bristle disks are often orange, 3.5 to 7.5 cm long; the involucre is depressed-hemispheric; the bracts are lanceolate, spreading or appressed, imbricated in 2 to 4 series, and hairy on the outer surface with ciliate margins; the receptacle is conical, the scales of the receptacle stiff, spinescent, and conspicuously longer than the disc flowers; the chaff is carinate and cuspidate; the achenes are 3 to 4 mm in length, tetrasided, obypyramidal, and thick; the pappus has a short, dentate crown.

## MICROSCOPIC-

Leaf-The leaf has a thickness of 200 to $350 \mu \mathrm{~m}$, with an epidermis 9 to $13 \mu \mathrm{~m}$ thick, largely without chloroplasts; the stomata are 28 to $35 \mu \mathrm{~m}$, abundant on the dorsal surface and fewer on the ventral surface; the mesophyll is clearly divided into palisade parenchyma and sponge parenchyma. The palisade parenchyma is one layer thick, with elongated cells 50 to $65 \mu \mathrm{~m}$ in length, oriented at right angles to the leaf surface, containing numerous chloroplasts. The sponge parenchyma is 150 to $250 \mu \mathrm{~m}$ thick, with cells of irregular shape, and has multiple cell layers, few chloroplasts, and large intercellular spaces. The phloem bundles of the lateral veins within the sponge parenchyma are bound by a onelayer sheath of small parenchymous cells, with vascular elements of the midrib surrounded by large-celled parenchyma. The uniseriate trichomes are few in the ventral surface, numerous on the dorsal surface, typically tricelled, occasionally tetra- or pentacelled, 250 to $500 \mu \mathrm{~m}$ in length, each arising from an epidermal cell; the epidermal cell walls appear with moderate thickening; the vessels are various, scalariform, with variable reticulated width.

Petiole-The parenchyma appear without chloroplasts, in several layers adjacent to a layer of collenchyma; 5 to 7 phloem bundles of small- to medium-sized vessels are weakly lignified and embedded in the parenchyma in the form of an arc; the wing ribs of the upper surface of the slightly hollowed petiole are marginal.

Inflorescence-The epidermal cells of the ray florets are square, $50 \mu \mathrm{~m}$, with a transparent, beaded cell wall; various elements of the asteraceous exhibit inflorescence; numerous multicellular jointed trichomes of the involucral bracts are 500 to $800 \mu \mathrm{~m}$ in length; tangential sections of the paleae with numerous fiber bundles are 10 to $15 \mu \mathrm{~m}$ in diameter and 100 to $150 \mu \mathrm{~m}$ in length; cell walls are thin. The epidermis of ray florets is reddish to violet; the epidermal cells from the end of the corolla form rounded papillae; a stigma of papillary cells is present; asteraceous pollen grains are 20 to $30 \mu \mathrm{~m}$ and spherical with a warty exine.
Calcium oxalate is negative; crystals of inulin and starch granules are rare.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ —

PRESENCE OF CHICORIC ACID AND ABSENCE OF ECHINACO-SIDE-

Test solution—Add 5 mL of diluted alcohol (7:3) to 0.5 g of the powdered plant material, and shake for 1 minute. Centrifuge, and use the supernatant solution.
Standard solution-Dissolve an accurately weighed quantity of USP Powdered Echinacea purpurea Extract RS in methanol to obtain a solution having a concentration of about 10 mg per mL .

Developing solvent system, Spray reagent 1, and Spray reagent 2-Prepare as directed for Identification test $A$ under Echinacea angustifolia.

Procedure-Proceed as directed in the chapter. Develop the chromatograms in Developing solvent system until the solvent front has moved not less than 18 cm , and dry the plate in a stream of air. Spray the plate with Spray reagent 1 followed by Spray reagent 2, and examine the plate under UV light at 365 nm : the chromatogram obtained from the Test solution shows a yellowish-green zone at an $R_{F}$ value of 0.75 due to chicoric acid and another yellowish-green zone at an $R_{F}$ value of 0.45 due to caftaric acid, both zones corresponding in color and $R_{F}$ value to zones in the chromatogram obtained from the Standard solution. The chromatogram obtained from the Test solution does not show or shows only traces of a zone at an $R_{F}$ value of 0.1 due to echinacoside (present in Echinacea angustifolia and in Echinacea pallida). Other colored zones of varying intensities may be observed in the chromatogram obtained from the Test solution.

B: The retention times for the relevant peaks in the chromatogram of the Test solution, mainly due to caftaric acid and chicoric acid, correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of chicoric acid and caftaric acid. A peak for echinacoside is not detected or is very weak.

C: The retention times for the relevant peaks in the chromatogram of the Test solution, mainly due to dodecatetraenoic isobutyl amides, correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of dodecatetraenoic isobutylamides.

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed $10^{5}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count does not exceed $10^{3}$.

Loss on drying $\langle 731\rangle$ —Dry 1 g of the powdered plant material: it loses not more than $12 \%$ of its weight.

Foreign organic matter $\langle 561\rangle$ : not more than $3.0 \%$.
Total ash $\langle 561\rangle$ : not more than $10.0 \%$, determined on 3 g .
Acid-insoluble ash $\langle 561\rangle$ : not more than $2.5 \%$.
Pesticides residues $\langle 561\rangle$ : meet the requirements.
Heavy metals, Method III $\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per g.

## Content of chicoric acid and caftaric acid-

Solvent, Solution A, Solution B, Mobile phase, and Standard solution 2-Proceed as directed in the test for Content of total phenols under Echinacea angustifolia.

Standard solution 1-Dissolve an accurately weighed quantity of USP Powdered Echinacea purpurea Extract RS in Solvent, shaking for 1 minute, and dilute with Solvent to obtain a solution having a known concentration of about 5 mg per mL . Pass through a membrane filter having a $0.45-$ $\mu \mathrm{m}$ or finer porosity.

Test solution-Proceed as directed for Content of phenols under Echinacea angustifolia, except to use finely powdered Echinacea purpurea Aerial Parts instead of Echinacea angustifolia.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $330-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained at $35^{\circ}$. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-13$ | $90 \rightarrow 78$ | $10 \rightarrow 22$ | linear gradient |
| $13-14$ | $78 \rightarrow 60$ | $22 \rightarrow 40$ | linear gradient |
| $14-17.5$ | 60 | 40 | isocratic |
| $17.5-18$ | $60 \rightarrow 90$ | $40 \rightarrow 10$ | linear gradient |
| $18-30$ | 90 | 10 | equilibration |

Chromatograph Standard solution 1, and record the peak responses as directed for Procedure: the chromatogram obtained is similar to the Reference Chromatogram for total phenols provided with USP Powdered Echinacea purpurea Extract RS. Chromatograph Standard solution 2, and record the responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2 \%$.

Procedure-Proceed as directed in the test for Content of total phenols under Echinacea angustifolia. Separately calculate the percentages of caftaric acid $\left(\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{9}\right)$ and chicoric acid $\left(\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{12}\right)$ in the portion of Echinacea purpurea Aerial Parts taken by the formula:

$$
2500 F(C / W)\left(r_{U} / r_{S}\right)
$$

in which $F$ is the response factor and is equal to 0.695 for chicoric acid, 0.881 for caftaric acid, and 1.000 for chlorogenic acid; $C$ is the concentration, in mg per mL , of USP Chlorogenic Acid RS in Standard solution 2; $W$ is the weight, in mg, of Echinacea purpurea Aerial Parts taken; and $r_{U}$ and $r_{S}$ are the peak responses for the relevant analyte obtained from the Test solution and Standard solution 2, respectively. Calculate the percentage of total phenols in the portion of Echinacea purpurea Aerial Parts taken by adding the individual percentages calculated.

## Content of dodecatetraenoic acid isobutylamides-

Mobile phase and Standard solution 2-Proceed as directed in the test for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia.

Standard solution 1-Proceed as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia, except to use USP Powdered Echinacea purpurea Extract RS instead of USP Powdered Echinacea angustifolia Extract RS.

Test solution-Proceed as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia, except to use Echinacea purpurea Aerial Parts instead of Echinacea angustifolia.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia, except to use the Reference Chromatogram for alkamides provided with USP Powdered Echinacea purpurea Extract RS instead of the Reference Chromatogram provided with USP Powdered Echinacea angustifolia Extract RS.
Procedure-Proceed as directed in the test for Content of dodecatetraenoic acid isobutylamides under Echinacea angustifolia. Identify the peaks of the two isomers of dodecatetraenoic acid isobutylamides in the chromatogram obtained from the Test solution by comparison with the chromatogram obtained from Standard solution 1. Calculate the percentage of dodecatetraenoic acid isobutylamides in the portion of Echinacea purpurea Aerial Parts taken by the formula:

$$
10(1.353)(C / W)\left(r_{U} / r_{S}\right),
$$

in which 1.353 is the response factor for $2 E, 4 E$-hexadienoic acid isobutylamide; $C$ is the concentration, in mg per mL , of USP $2 E, 4 E$-Hexadienoic Acid Isobutylamide RS in Standard solution 2; $W$ is the weight, in g , of Echinacea purpurea Aerial Parts taken; $r_{U}$ is the sum of the peak responses of the relevant analytes obtained from the Test solution; and $r_{S}$ is the peak response obtained from Standard solution 2. $\triangle$ USP28

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ PRESENCE OF CHICORIC ACID AND ABSENCE OF ECHINACOSIDE-
Test solution-Prepare as directed for Identification test $A$ under Echinacea angustifolia, except to use Echinacea purpurea Root instead of Echinacea angustifolia.

Standard solution 1-Proceed as directed for Identification test A under Echinacea angustifolia, except to use USP Powdered Echinacea purpurea Extract RS instead of USP Powdered Echinacea angustifolia Extract RS.

Standard solution 2, Developing solvent system, Spray reagent 1, and Spray reagent 2-Prepare as directed for Identification test $A$ under Echinacea angustifolia.

Procedure-Proceed as directed in the chapter. Develop the chromatograms in Developing solvent system until the solvent front has moved not less than 18 cm , and dry the plate in a current of air. Spray the plate with Spray reagent 1 followed by Spray reagent 2, and examine the plate under UV light at 365 nm : the chromatogram obtained from the Test solution shows a yellowish-green zone at an $R_{F}$ value of 0.75 due to chicoric acid and another yellow-ish-green zone at an $R_{F}$ value of 0.45 due to caftaric acid, both zones corresponding in color and $R_{F}$ value to zones in the chromatogram obtained from Standard solution 1. The chromatogram obtained from the Test solution does not show or shows only traces of a zone at an $R_{F}$ value of 0.1 due to echinacoside (present in Echinacea angustifolia and in Echinacea pallida) that corresponds to a yellowish spot in the chromatogram obtained from Standard solution 1, and does not show a zone that corresponds in color and $R_{F}$ value to the spot for eynarine
${ }^{\boldsymbol{\Delta}}$ 1,3-dicaffeoylquinic acid (cynarin) $\boldsymbol{\Delta U S P 2 8}$
(present in Echinacea angustifolia) in the chromatogram obtained from Standard solution 2. Other colored zones of varying intensities may be observed in the chromatogram obtained from the Test solution.

B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ PRESENCE OF ISOBUTYLALKENYLAMIDES-
Test solution-Proceed as directed for Identification test $B$ under Echinacea angustifolia, except to use the chloroform extract retained from Identification test $A$ under Echinacea purpurea Root instead of the chloroform extract retained from Identification test A under Echinacea angustifolia.

Standard solution 1-Dissolve an accurately weighed quantity of USP Echinacea purpurea Extract RS in methanol to obtain a solution having a known concentration of about 10
$\wedge_{100}{ }_{\text {ASP2 }}$
mg per mL.
Standard solution 2, Developing solvent system, and Spray re-agent-Proceed as directed for Identification test $B$ under Echinacea angustifolia.

Procedure-Proceed as directed in the chapter. Develop the chromatograms in Developing solvent system until the solvent front has moved not less than 18

[^63]cm , and dry the plate in a current of air. Examine the plate under UV light at 254 nm : the chromatogram obtained from the Test solution shows ene zone corresponding in $R_{t}$ value to the zone due to $\beta$ sitesterol in the chromatogram of Standet solution 2, and

- $\Delta U S P 28$
one main zone corresponding in $R_{F}$ value to the zone due to dode-ca- $2 E, 4 E, 8 Z, 10 E$-tetraenoic acid isobutylamide and dodeca$2 E, 4 E, 8 Z, 10 Z$-tetraenoic acid isobutylamide in the chromatogram of Standard solution 1
- and below this zone there are several other zones due to
$\alpha, \beta, \gamma, \delta$-unsaturated isobutylamides. ${ }_{\text {UUSP2s }}$
Spray the plate with Spray reagent, and then heat the plate at $100^{\circ}$ for 5 minutes. Examine the plate under long-wavelength UV light: the zone due to dodeca- $2 E, 4 E, 8 Z, 10 E$-tetraenoic acid isobutylamide and dodeca- $2 E, 4 E, 8 Z, 10 Z$-tetraenoic acid isobutylamide turns blue-black, and below this zone there are several other zones due to $\alpha, \beta, \gamma, \delta$-unsaturated isobutylamides (not detectable in Echinacea pallida) that turn violet (unlike the corresponding zones in the chromatogram of Echinacea angustifolia that are mostly yellowish due to $\alpha, \beta$-unsaturated isobutylamides).
${ }^{\Delta}$ A zone due to $\beta$-sitosterol that corresponds in $R_{F}$ value to the principal spot in the chromatogram of Standard solution

2 is also observed. $\triangle U S P 28$
$\mathbf{C}$ : The retention times for the relevant peaks in the chromatogram of the Test solution, mainly due to caftaric acid and chicoric acid, correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of total phenols. An echinacoside peak is not detectable or is very weak.

## Briefing

Powdered Echinacea purpurea Extract, USP 27 page 1993. It is proposed to revise the Definition to allow the preparation of extracts both from the aerial parts and from the roots, in accordance with the proposed new monograph for Echinacea purpurea Aerial Parts, appearing elsewhere in this issue of $P F$. It is also proposed to revise the Labeling section to add a warning statement to be applied to the label and a requirement indicating the proportion of starting roots/aerial parts if the article were prepared from a mixture of them. Since the Content of dodecatetraenoic isobutylamides is lower in the leaves and stems, extracts prepared from variable proportions of aerial parts may contain variable content of these compounds. Therefore, it is proposed to label the standardized target Content of dodecatetraenoic isobutylamides in the article. See also the briefing under Echinacea angustifolia for other changes.
(DSB: G. Giancaspro; DSI: J. Salguero) RTS—40843-4; 40889-3

Briefing

> American Ginseng Capsules. Because there is no existing $U S P$ monograph for this article, the following new monograph is proposed.
(DSB: G. Giancaspro) RTS-40775-1

## Add the following:

## AAmerican Ginseng Capsules

» American Ginseng Capsules contain Powdered American Ginseng Extract. Capsules contain not less than 90.0 percent and not more than 110.0 percent of Extract, calculated as the sum of ginsenosides $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd .

Packaging and storage-Preserve in tight containers, protected from light. Store at controlled room temperature.
Labeling-The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the amount of Extract, in mg per Capsule. Label the Capsules to indicate the percentage of ginsenosides in the Extract contained in the Capsules. For soft-gelatin Capsules, state the method for Content of ginsenosides with which the product complies only if Method 1 is not used.

USP Reference standards—USP Powdered American Ginseng Extract RS.

## Identification-

A: Proceed as directed for Identification $A$ under American Ginseng using the following Test solutions.

Test solution for soft-shell gelatin capsules-Transfer a portion of the content of the Capsules, equivalent to about 100 mg of Extract, to a separatory funnel containing 30 mL of a solution consisting of a mixture of hexanes, methanol,
and water (20:15:10), dissolve in this mixture, and collect the lower layer. Wash the upper layer with three $15-\mathrm{mL}$ portions of a mixture of methanol and water (15:10), and combine the washings with the lower layer. Evaporate to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Dissolve the residue in 5 mL of methanol.

Test solution for hard-shell gelatin capsules-Transfer a portion of the content of the Capsules, equivalent to about 100 mg of Extract, to a conical flask. Extract at $55^{\circ}$ with three $20-\mathrm{mL}$ portions of a mixture of water and methanol (8:2). Evaporate the combined extracts to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Dissolve the residue in 5 mL of methanol.
B: The retention times of the peaks for ginsenosides $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rb}_{2}, \mathrm{Rc}_{2}$, and Rd in the chromatogram of the Test solution correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of ginsenosides under American Ginseng. The ratio of the peak response for $\mathrm{Rb}_{2}$ to the peak response for $\mathrm{Rb}_{1}$ is less than 0.4 ; and the ratio of the peak response for $\mathrm{Rg}_{1}$ to the peak response for $\mathrm{Rb}_{1}$ is less than 0.3 . The chromatogram shows no significant peak at the retention time corresponding to that of the $R_{F}$ for ginsenoside in the chromatogram of Standard solution 2, as obtained in the test for Content of ginsenosides under American Ginseng.

Microbial limits $\langle 2021\rangle$ —The total aerobic microbial count does not exceed $10^{4}$ per g . The total combined molds and yeasts count does not exceed $10^{3}$ per g . It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.

Dissolution $\langle 2040\rangle$ : [To come.]
Disintegration $\langle 2040\rangle$ : meet the requirements.
Weight variation $\langle 2091\rangle$ : meet the requirements.

## Content of ginsenosides-

METHOD 1-
Mobile phase and Chromatographic system-Proceed as directed in the test for Content of ginsenosides under American Ginseng.

Standard solution-Transfer an accurately weighed quantity of USP Powdered American Ginseng Extract RS, and dilute quantitatively, and stepwise if necessary, with a mixture of water and alcohol (6:4) to obtain a solution having a known concentration of about 0.2 mg per mL of ginsenoside $\mathrm{Rb}_{1}$.

Test solution (for soft-gelatin capsules)-Using a suitable cutting instrument, open not fewer than 20 Capsules, and transfer the contents to a suitable container. Mix to homogenize, and transfer an accurately weighed portion, expected to contain an amount of Extract equivalent to 12 mg of ginsenosides, to a suitable flask with a stopper. Add 5.0 mL of tetrahydrofuran, and sonicate for 5 minutes. Add 25.0 mL of a mixture of methanol and water (40:60), and shake for 50 minutes in an automatic shaker. Transfer about 15.0 mL of the obtained emulsion to a centrifuge tube with a stopper, add about 800 mg of sodium chloride, shake for 30 seconds, and centrifuge to obtain a clear upper phase. Dilute 1.0 mL of the upper phase with 4 mL of water in a suitable tube, and transfer the solution to a column containing 360 mg of packing L2 that has been previously treated with 3.0 mL of methanol followed by 8.0 mL of water. [NOTE-Elute slowly, not faster than 1 drop per second, in all elution steps. Do not use vacuum.] Rinse the tube with 5 mL of water, transfer to the column taking the precaution of slow elution, and discard the eluate. Repeat the elution with 5 mL of a mixture of methanol and water (40:60), and discard the eluate. Elute the ginsenosides with 5.0 mL of methanol. Eva-
porate the solution under a stream of nitrogen at $40^{\circ}$ (about 50 minutes), and dissolve the residue with 1.0 mL of a solution of acetonitrile and water (2:8).

Procedure-Proceed as directed for Procedure in the test for Content of ginsenosides under American Ginseng. Separately calculate the quantity, in mg , of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ) in the portion of American Ginseng Capsules taken to prepare the Test solution by the formula:

$$
0.3 P C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered American Ginseng Extract RS in the Standard solution; $P$ is the labeled percentage of the corresponding ginsenoside in the USP Powdered American Ginseng Extract RS; $r_{U}$ is the peak response for each relevant ginsenoside in the chromatogram of the Test solution; and $r_{S}$ is the peak response of the corresponding ginsenoside in the chromatogram of the Standard solution. Calculate the content of ginsenosides, in mg , as the sum of the individual quantities of each relevant ginsenoside $\left(\operatorname{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb} b_{2}\right.$, and Rd ).

METHOD 2-
Mobile phase and Chromatographic system-Proceed as directed in the test for Content of ginsenosides under American Ginseng.
Solvent $A$ : upper phase of a mixture consisting of hexane, methanol, and water (4:3:2).

Solvent B: lower phase consisting of a mixture of hexane, methanol, and water (4:3:2).
Standard solution-Prepare a solution of USP Powdered American Ginseng Extract RS in a mixture of water and alcohol (6:4) having a known concentration of about 1 mg of $\mathrm{Rb}_{1}$ per mL .

Test solution 1 (for soft-gelatin capsules)-Using a suitable cutting instrument, open not fewer than 20 Capsules, and transfer the contents to a suitable container. Mix to homogenize, and transfer an accurately weighed portion, expected to contain an amount of Extract equivalent to 15 mg of total ginsenosides, to a $50-\mathrm{mL}$ flask. Add 10.0 mL of Solvent $A$, and sonicate for 3 to 5 minutes at $25^{\circ}$ to $30^{\circ}$. Transfer the solution to a $125-\mathrm{mL}$ separator funnel. To the residue, add 10 mL of Solvent B, and sonicate for 3 to 5 minutes at $25^{\circ}$ to $30^{\circ}$. Transfer the solution to the same separator funnel. Repeat the above procedure twice (the total volume will be about 60 mL ). Shake, and then allow the phases to separate. Collect the combined lower phase in a round-bottom flask, and wash the combined upper phase twice with 10 mL of Solvent B. Evaporate the combined lower phase to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Quantitatively transfer the residue to a $10.0-\mathrm{mL}$ volumetric flask using small volumes of methanol, and dilute with methanol to volume.

Test solution 2 (for hard-gelatin capsules)-Accurately weigh the contents of not fewer than 20 Capsules, and composite the contents. Transfer an accurately weighed portion of the composite, expected to contain an amount of Extract equivalent to approximately 15 mg of total ginsenosides, to a conical flask. Add 15 mL of methanol, and shake to mix. Sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes. Cool, pass through filter paper, and return the residue to the conical flask. Add another 15 mL of methanol, sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes, and filter. Wash the residue with three $15-\mathrm{mL}$ portions of methanol. Evaporate the combined extracts and washing to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Quantitatively transfer the residue to a $10.0-\mathrm{mL}$ volumetric flask using small volumes of methanol, and dilute with methanol to volume.

Procedure-Proceed as directed for Procedure in the test for Content of ginsenosides under American Ginseng. Separately calculate the quantity, in mg , of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ) in the portion of Capsules taken to prepare the Test solution 1 or Test solution 2 by the formula:

$$
0.1 P C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered American Ginseng Extract RS in the Standard solution; and the other terms are as defined for Method 1. Calculate the content of ginsenosides, in mg , as the sum of the individual quantities of each relevant ginsenoside $\left(\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2} \text {, and } \mathrm{Rd}\right)_{\cdot \mathbf{\Delta U S P 2 8}}$

## Briefing

American Ginseng Tablets. Because there is no existing USP monograph for this article, the following monograph is proposed. (DSB: G. Giancaspro) RTS-40775-2

## Add the following:

## ©American Ginseng Tablets

» American Ginseng Tablets contain Powdered American Ginseng Extract. Tablets contain not less than 90.0 percent and not more than 110.0 percent of Extract, calculated as the sum of ginsenosides $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd .

Packaging and storage-Preserve in tight containers, protected from light. Store at controlled room temperature.

Labeling-The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the amount of Extract, in mg per Tablet. Label the Tablets to indicate the percentage of total ginsenosides in the Extract contained in the Tablets.

USP Reference standards—USP Powdered American Ginseng Extract RS.

## Identification-

A: Proceed as directed for Identification $A$ under American Ginseng using the following Test solution.

Test solution-Reduce the Tablets to a very fine powder. Transfer a quantity of the powder, equivalent to about 100 mg of Extract, to a conical flask. Extract at $55^{\circ}$ with three $20-\mathrm{mL}$ portions of a mixture of water and methanol (8:2). Evaporate the combined extracts to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Dissolve the residue in 5 mL of methanol.

B: The retention times of the peaks for ginsenosides $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rb}_{2}, \mathrm{Rc}_{2}$, and Rd in the chromatogram of the Test solution correspond to those in the chromatogram of Standard solution 1, as obtained in the test for Content of ginsenosides under American Ginseng. The ratio of the peak reaponse for $R b_{2}$ to the peak response for $R b_{1}$ is less than 0.4 ; and the ratio of the peak response for $\mathrm{Rg}_{1}$ to the peak response for $R b_{1}$ is less than 0.3 . The chromatogram shows no significant peak at the retention time corresponding to that of the $R_{F}$ for ginsenoside in the chromatogram of Standard solution 2, as obtained in the test for Content of ginsenosides under American Ginseng.
Microbial limits $\langle 2021\rangle$-The total aerobic microbial count does not exceed $10^{4}$ per g . The total combined molds and yeasts count does not exceed $10^{3}$ per g . It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.

Dissolution $\langle 2040\rangle$ - [To come.]
Disintegration $\langle 2040\rangle$ : meet the requirements.

Weight variation $\langle 2091\rangle$ : meet the requirements.

## Content of ginsenosides-

Mobile phase and Chromatographic system-Proceed as directed for the Content of ginsenosides under American Ginseng.

Standard solution-Prepare a solution of USP Powdered American Ginseng Extract RS in a mixture of water and alcohol (6:4) having a known concentration of about 1 mg of $\mathrm{Rb}_{1}$ per mL .
Test solution-Accurately weigh not fewer than 20 Tablets, and reduce to a very fine powder. To a conical flask, transfer an accurately weighed portion of the powder expected to contain an amount of Extract equivalent to about 15 mg of total ginsenosides. Add 15 mL of methanol, and shake to mix. Sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes. Cool, pass through filter paper, and return the residue to the conical flask. Add another 15 mL of methanol, sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes, and filter. Wash the residue with three $15-\mathrm{mL}$ portions of methanol. Evaporate the combined extracts and washings to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Quantitatively transfer the residue to a $10.0-\mathrm{mL}$ volumetric flask using small volumes of methanol, and dilute with methanol to volume.

Procedure-Proceed as directed for Procedure in the test for Content of ginsenosides under American Ginseng. Separately calculate the quantity, in mg , of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ) in the portion of Tablets taken to prepare the Test solution by the formula:

$$
0.1 P C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered American Ginseng Extract RS in the Standard solution; $P$ is the labeled content of the corresponding ginsenoside in the USP Powdered American Ginseng Extract RS; and $r_{U}$ and $r_{S}$ are the peak responses of the relevant ginsenosides obtained from the Test solution and the Stan-
dard solution, respectively. Calculate the content of ginsenosides as the sum of the individual quantities of $\mathrm{Rg}_{1}, \mathrm{Re}$, $\mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and $\mathrm{Rd}_{\mathbf{\Delta U S P 2 8}}$
$\boldsymbol{\Delta}$ and dissolve in 10.0 mL of a mixture of water and alcohol
$(6: 4)_{\Delta U S P 28}$
[NOTE-The concentrations of ginsenoside $\mathrm{Rg}_{1}$ and ginsenoside $R b_{1}$ in this solution are not expected to be equal, and are determined on the basis of the labeled quantities present in USP Powdered Asian Ginseng Extract RS.]Transfer the mixture-to a ehromatographic tube fllled with diatomaceous earth eapable of holding an aqueuts layer of 20 mL . Wait for 15 minutes, elute 75 mL of butyl aleohel saturated with water, collect the eluate, and evaporate the eluate in a rotary evaperater in vacumen at $55^{\circ}$ to $60^{\circ}$ to dryness. Dissolve the residue in 10.0 mL of methanel.
$\Delta$
${ }^{\wedge} \mathrm{U}$ USP28
Test solution-Reduce about 100 g of Asian Ginseng to a powder, and transfer about 1.0 g of the powder, accurately weighed, to a $100-\mathrm{mL}$ round-bottom flask fitted with a reflux condenser. Add 50 mL of a mixture of water and alcohol (6:4) and a few grains of pumice, and boil on a water bath under reflux for 1 hour. Cool, and filter. Wash the flask and the residue with 20 mL of a mixture of water and alcohol (6:4), and pass through the same filter. Combine the filtrates, and evaporate in a rotary evaporator at $50^{\circ}$ to dryness. To the residue so obtained add 20 mL of water, mix, and proeed as directed for Standerd solution, beginning with "Transfer the mix tare to a chrematographic tube".

Chromatographic system (see-Chromatography $\langle 624\rangle$ ). The liquid chromatograph is equipped with a 203 nm detector and a $3.9 \mathrm{~mm} \times 30 \mathrm{~cm}$ columm that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Fime(minutes) | $\begin{gathered} \text { Solution } A \\ (\%) \end{gathered}$ | $\begin{gathered} \text { Solution } B \\ (\%) \end{gathered}$ | Elution |
| :---: | :---: | :---: | :---: |
| $\theta$ | 82 | 18 | equilibration |
| -0-10 | 82 | 18 | isocratic |
| 10-50 | $82 \rightarrow 60$ | $18 \rightarrow 40$ | linear gradient |
| 50-80 | 60 | 40 | isocratic |

 Re, $R b_{2}$, and Rd .] Chromatograph about $10-\mu \mathrm{of}$ the standerd solution, and record the peak responses as directed for Procture: the chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used; the relative retention times for ginsenoside $\mathrm{R}_{\mathrm{g}_{+}}$and ginseneside Re are 1.0 and 1.03 , respectively; the resolution, $R$, between ginsenoside $\mathrm{Reg}_{+}$and ginseneside Re is not less than 0 .9; the resolution, $R$, between ginsenoside $R b_{+}$and a neighboring minor peak, at relative retention times of 1.86 and 1.89 , respectively, is not less than 1.0 ; the column efficieney determined from the gin senoside $\mathrm{Rg}_{4}$ and ginsenoside Rb peaks is not less than 17,000 and 41,000 theoretieal plates, respectively; the tailing factors for ginse neside $\mathrm{Rg}_{4}$ - and ginseneside $\mathrm{Rb}_{4}$ are not mere than 1.0 and 1.2 , re spectively; and the relative standard deviation for replicate injections is not more than $4.0 \%$ for ginseneside P है + and gimsene side $\mathrm{Pb}_{4}$ :
${ }^{\boldsymbol{\Delta}}$ Dissolve the residue in 10.0 mL of a mixture of water and alcohol (6:4). $\mathbf{A} U S P 28$
Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentages of ginsenosides $\mathrm{Rb}_{1}$ and $\mathrm{Rg}_{1}$ in the portion of Asian Ginseng taken by the formula:

$$
1000(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of ginsenoside $\mathrm{Rg}_{1}$ or ginsenoside $\mathrm{Rb}_{1}$ in the Standard solution; $W$ is the weight, in mg , of Asian Ginseng taken to prepare the Test solution; and $r_{U}$
and $r_{S}$ are the peak responses of ginsenoside $\mathrm{Rg}_{1}$ or ginsenoside $\mathrm{Rb}_{1}$ obtained from the Test solution and the Standard solution, respectively.

## Briefing

Powdered Asian Ginseng, USP 27 page 2008. It is proposed to add the content of marker compounds in the Definition for consistency with other USP botanicals monographs.
(DSB: G. Giancaspro) RTS-40775-5

## Change to read:

» Powdered Asian Ginseng is Asian Ginseng reduced to a fine or very fine powder.
${ }^{\Delta}$ It contains not less than 0.2 percent of ginsenoside $\mathrm{Rg}_{1}$ and not less than 0.1 percent of ginsenoside $\mathrm{Rb}_{1}$, both calculated on the dried basis. ${ }_{\triangle U S P 28}$

Briefing

Powdered Asian Ginseng Extract, USP 27 page 2008. On the basis of comments received, it is proposed to modify the temperature and the gradient in the chromatographic procedure for Content
of ginsenosides. It is reported that performing the chromatographic run at $25^{\circ}$ improves the resolution, and a washing step added after the elution of analytes avoids carry over of late eluting peaks in subsequent chromatograms.
(DSB: G. Giancaspro) RTS-40775-6

## Change to read:

Content of ginsenosides-
Diluent-Prepare a mixture of water and alcohol (6:4).
Solution A-Use filtered and degassed water.
Solution B-Prepare a filtered and degassed mixture of acetonitrile and water (8:2).

Mobile phase-Use variable mixtures of Solution A and Solution $B$ as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solution-Transfer an accurately weighed amount of USP Powdered Asian Ginseng Extract RS to a suitable volumetric flask, fill the flask with Diluent to about $60 \%$ of its nominal volume, dissolve by sonicating for 10 minutes, dilute with Diluent to volume to obtain a solution having a known concentration of about 24 mg per mL , mix, and filter.
Test solution- Proceed as directed for Standard solution, except to use Powdered Extract.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $203-\mathrm{nm}$ detector, a 4.6$\mathrm{mm} \times 2.0-\mathrm{cm}$ guard column that contains packing L1, and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ analytical column that contains
${ }^{\mathbf{\Delta}} 3-\mathrm{\mu m}_{\mathbf{\Delta} U S P 28}$
packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$
$\triangle 25^{\circ}$
$25^{\circ} \cdot \mathbf{\Delta U S P 2 8}$
The chromatograph is programmed as follows. Chromatograph the Standard solution, and record the peak areas as directed for Procedure: the chromatogram is similar to the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used; and the relative standard deviation, determined for the sum of the peak areas for the six major ginsenosides, for replicate injections is not more than $2.0 \%$.

| $\begin{gathered} \text { Time } \\ \text { (minutes) } \end{gathered}$ | Solution A (\%) | Solution B (\%) | Elution |

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, identify the peaks for the ginsenosides by comparison with the Reference Chromatogram provided with the lot of USP Powdered Asian Ginseng Extract RS being used, and measure the peak areas for the six major ginsenosides. Calculate the percentage of each relevant ginsenoside $\left(\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}\right.$, $R b_{2}$, and $R d$ ) in the portion of Powdered Extract taken by the formula:

$$
\left(W_{S} / W_{T}\right)\left(r_{U} / r_{S}\right) P
$$

in which $W_{S}$ is the weight, in mg, of USP Powdered Asian Ginseng Extract RS taken to prepare the Standard solution; $W_{T}$ is the weight, in mg, of Powdered Extract taken to prepare the Test solution; $r_{U}$ and $r_{S}$ are the peak areas for each relevant ginsenoside obtained from the Test solution and the Standard solution, respectively; and $P$ is the labeled amount, in percentage, of each relevant ginsenoside in USP Powdered Asian Ginseng Extract RS. Calculate the Content of ginsenosides, in percentage, by adding the percentages of each relevant ginsenoside.

## Briefing

Asian Ginseng Capsules-This proposed new monograph was previously published in Pharmacopeial Previews (see page 775 of PF 26(3) [May-June 2000]), but was later canceled because of concerns that the monograph had two different tests for Content of ginsenoside. The Expert Committee has since decided to accept the use of multiple procedures within the same monograph; therefore, the current version is being forwarded to In-Process Revision.
(DSB: G. Giancaspro) RTS-40774-1

## Add the following:

## ©Asian Ginseng Capsules

## » Asian Ginseng Capsules contain Powdered

 Asian Ginseng Extract. Capsules contain not less than 90.0 percent and not more than 110.0 percent of Extract calculated as the sum of ginsenosides $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd .Packaging and storage-Preserve in tight containers, protected from light. Store at controlled room temperature.

Labeling-The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the amount of Extract, in mg per Capsule. Label the Capsules to indicate the content of ginsenosides as a percentage of the Extract contained in the Capsules. State the method for Content of ginsenosides with which the product complies only if Method 1 is not used.

USP Reference standards $\langle 11\rangle$ —USP Powdered Asian Ginseng Extract RS.

## Identification-

A: For soft-shell gelatin capsules-Transfer a portion of the contents of the Capsules, equivalent to about 100 mg of Extract to a separatory funnel containing 30 mL of a mixture of hexanes, methanol, and water (20:15:10), dissolve, and collect the lower layer. Wash the upper layer with three portions of 15 mL each of a mixture of methanol and water (15:10), and combine the washings with the lower layer. Evaporate to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Dissolve the residue in 10 mL of a mixture of methanol and water ( $15: 10$ ), and proceed as directed for Identification under Asian Ginseng, beginning with "Apply separately in bands."

For hard-shell gelatin capsules-Transfer a portion of the contents of the Capsules equivalent to about 100 mg of Extract to a conical flask. Extract at $55^{\circ}$ with three portions of 20 mL each of a mixture of water and methanol (8:2). Evaporate the combined extracts to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Dissolve the residue in 10 mL of a mixture of methanol and water (15:10), and proceed as directed for Identification under Asian Ginseng, beginning with "Apply separately in bands."

B: The retention times of the relevant analytes obtained in the chromatogram of the Test solution in the Procedure under Content of ginsenosides correspond to those obtained
in the chromatogram of the Standard solution. The chromatogram of the Test solution shows a peak at the retention time corresponding to that of the $R_{F}$ for ginsenoside in the chromatogram of the Standard solution.

Microbial Limits $\langle 2021\rangle$ - The total aerobic microbial count does not exceed $10^{4}$ per g . The total combined molds and yeasts count does not exceed $10^{3}$ per g. It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.

Disintegration $\langle 2040\rangle$ : meet the requirements.
Dissolution $\langle 711\rangle$ : [To come.]
Weight variation $\langle 2091\rangle$ : meet the requirements.

## Content of ginsenosides-

METHOD 1-
Mobile phase and Chromatographic system-Proceed as directed for Content of ginsenosides under Powdered Asian Ginseng Extract.

Standard solution-Transfer an accurately weighed amount of USP Powdered Asian Ginseng Extract RS to a suitable container, and dilute quantitatively and stepwise, if necessary, with a mixture of water and alcohol (6:4) to obtain a solution having a known concentration of about 0.1 mg per mL of ginsenoside $\mathrm{Rb}_{1}$.

Test solution (for soft-gelatin capsules)-Using a suitable cutting instrument open not fewer than 20 capsules, and transfer the contents to a suitable container. Mix to homogenize, and transfer an accurately weighed portion expected to contain an amount of Extract equivalent to 12 mg of ginsenosides to a suitable flask with a stopper. Add 5.0 mL of tetrahydrofuran, and sonicate for 5 minutes. Add 25.0 mL of a mixture of methanol and water ( $40: 60$ ), and shake for 50 minutes in an automatic shaker. Transfer about 15.0 mL of the obtained emulsion to a centrifuge tube with a stopper, add about 800 mg of sodium chloride, shake for 30 seconds, and centrifuge to obtain a clear upper phase. Dilute 1.0 mL
of the upper phase with 4 mL of water in a suitable tube, and transfer the solution to a column containing 360 mg of packing L2 that has been previously treated with 3.0 mL of methanol followed by 8.0 mL of water. [NOTE-Elute slowly, not faster than 1 drop per second in all elution steps. Do not use vacuum.] Rinse the tube with 5 mL of water, transfer to the column taking the precaution of slow elution, and discard the eluate. Repeat the elution with 5 mL of a mixture of methanol and water (40:60), and discard the eluate. Elute the ginsenosides with 5.0 mL of methanol. Evaporate the solution under a stream of nitrogen at $40^{\circ}$ (about 50 minutes), and dissolve the residue with 1.0 mL of a solution of acetonitrile and water (2:8).

Procedure-Proceed as directed for Procedure in Content of ginsenosides under Powdered Asian Ginseng Extract. Separately calculate the quantity, in mg, of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ) in the portion of Asian Ginseng Capsules taken to prepare the Test solution by the formula:

$$
0.3 P C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered Asian Ginseng Extract RS in the Standard solution; $P$ is the labeled percentage of the corresponding ginsenoside in the USP Powdered Asian Ginseng Extract RS; $r_{U}$ is the peak response for each relevant ginsenoside in the chromatogram of the Test solution; and $r_{S}$ is the peak response of the corresponding ginsenoside in the Standard solution. Calculate the content of ginsenosides, in mg , as the sum of the individual quantities of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ).

METHOD 2-
Solvent $A$ : upper 2 phase of a mixture of hexane-metha-nol-water (4:3:2)

Solvent B: lower phase of a mixture of hexane methanol water (4:3:2)

Mobile phase and Chromatographic system—Proceed as directed for Content of ginsenosidesunder Powdered Asian Ginseng Extract.

Standard solution - Prepare a solution of USP Asian Ginseng Extract RS in a mixture of water and alcohol (6:4) having a known concentration of about 0.5 mg of $\mathrm{Rb}_{1}$ per mL .
Test solution I (for soft-gelatin capsules)-Using a suitable cutting instrument open not fewer than 20 capsules, and transfer the contents to a suitable container. Mix to homogenize, and transfer an accurately weighed portion expected to contain an amount of Extract equivalent to 15 mg of total ginsenosides to a 50 mL flask. Add 10.0 mL of Solvent $A$ and sonicate for $3-5$ minutes at $25-30^{\circ} \mathrm{C}$.

Transfer the solution to a 125 mL separator funnel. To the residue, add 10 mL of Solvent $B$ and sonicate for 3-5 minutes at $25-30^{\circ} \mathrm{C}$. Transfer the solution to the same separator funnel. Repeat the above procedure twice (Total volume about 60 mL ). Shake and then allow the phases to separate. Collect the lower phase in a round bottom flask and wash the upper phase twice with 10 mL of Solvent B. Evaporate the combined lower phases to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Quantitatively transfer the residue to a $10.0-\mathrm{mL}$ volumetric flask using small volumes of methanol, and complete with methanol to volume.

Test solution II (for hard-gelatin capsules)—Accurately weight the contents of not fewer than 20 Capsules, and composite the contents. Transfer an accurately weighed portion of the composite expected to contain an amount of Extract equivalent to approximately 15 mg of total ginsenosides to a conical flask. Add 15 mL of methanol, and shake to mix. Sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes. Cool, pass through filter paper, and return the residue to the conical flask. Add another 15 mL of methanol, sonicate the mixture at $25^{\circ}$ to $30^{\circ}$ for 30 minutes, and filter. Wash the residue with three portions of 15 mL of methanol each. Evaporate
the combined extracts and washing to dryness under vacuum at $45^{\circ}$ to $50^{\circ}$. Quantitatively transfer the residue to a $10.0-\mathrm{mL}$ volumetric flask using small volumes of methanol, and complete with methanol to volume.

Procedure-Proceed as directed for Procedure in Content of ginsenosides under Powdered Asian Ginseng Extract. Separately calculate the quantity, in mg, of each relevant ginsenoside ( $\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ) in the portion of Asian Ginseng Capsules taken to prepare Test solution I or Test solution II by the formula:

$$
0.1 P C\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered Asian Ginseng Extract RS in the Standard solution; and the other terms are as defined under Method 1. Calculate the content of ginsenosides, in mg , as the sum of the individual quantities of each relevant ginsenoside $\left(\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}\right.$, $\mathrm{Rc}, \mathrm{Rb}_{2}$, and Rd ). $\mathbf{\Delta U S P 2 8}$

BRIEFING

## Content of ginsenosides-

Solution A, Solution B, Mobile phase, and Chromatographic system-Proceed as directed for Content of ginsenosides under Powdered Asian Ginseng Extract.

Standard solution-Transfer about 200 mg of USP Powdered Asian Ginseng Extract RS, accurately weighed, to a suitable container, dissolve in 5 mL of water, and transfer quantitatively, with the rid of an additional 5 mL of water, to a chromagraphic tube filled with diatomaceeus eath capableof holding a 20 mL aqueeus tayer. Wait for 15 minates, and elate the coltma with 75 mL of $n-$ bulylaleohol saturated with water. Evaporate to dryness in waemm between $55^{\circ}$ and $60^{\circ}$, and dissolve the residue in 5.0 mL of metha noly
${ }^{\Delta} 5.0 \mathrm{~mL}$ of a mixture of water and alcohol (6:4), and filter. $\mathbf{A S P P 2 8}$

Test solution-Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed amount of the powder, equivalent to about 200 mg of Powdered Extract, to a conical flask, and extract three times, each with a $20-\mathrm{mL}$ portion of a mixture of methanol and water (8:2), in a $55^{\circ}$ bath for 30 minutes, stirring with a magnetic stirrer. Evaporate the combined extracts to dryness in vacuum between $45^{\circ}$ and $50^{\circ}$. Dissolve the residue in 5 mL of water, and trancfer quantitatively, with the rid of an additional 5 mL of water, to chremagraphic fube filled with diatemaerus eath eapable of holding 20 mL aquern layer. Wait for 15 minutes, and elute the column with 75 mL of $n$ butyl aleohal saturated with water. Evaperate to drymess in vacumm between $55^{\circ}$ and $60^{\circ}$, and dissolve the residue in 5.0 mL of methanel
© 5.0 mL of a mixture of water and alcohol (6:4), and filter. ${ }^{\text {USP2 }} 8$
$\stackrel{\text { Procedure-Proceed as directed for Content of ginsenosides un- }}{ }$ der Powdered Asian Ginseng Extract, except to calculate the quantity, in mg , of each relevant ginsenoside $\left(\mathrm{Rg}_{1}, \mathrm{Re}, \mathrm{Rb}_{1}, \mathrm{Rc}, \mathrm{Rb}_{2}\right.$, and Rd ) in the portion of Tablets taken by the formula:

$$
0.05 P C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Powdered Asian Ginseng Extract RS in the Standard solution; and the other terms are as defined therein. Calculate the quantity, in mg , of ginsenosides by adding the individual amounts calculated as above.

## Briefing

Powdered Licorice Extract, USP 27 page 2019 and page 1365 of $P F 26(5)$ [Sept.-Oct. 2000]. It is proposed to revise the Labeling section to add a warning statement to be applied to the label.
(DSI: J. Salguero) RTS-40887-1

## Change to read:

Labeling-The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. The label also indicates the content of glycyrrhizic acid, the extracting solvent or solvent mixture used for preparation, and the ratio of the starting material to final product.
${ }^{\Delta}$ The label bears a statement indicating that "Excessive amounts or long-term use of Licorice may cause high blood pressure or low potassium, which have been associated with irregular heartbeat and/or muscle weakness. Licorice may worsen the effects of congestive heart failure, cirrhosis, or
kidney failure. Diuretic use may increase the risk. If you are pregnant or nursing a baby, seek the advice of a health professional before using this product." ${ }_{\triangle U S P 28}$
It meets the requirements for Labeling under Botanical Extracts $\langle 565\rangle$.

## Add the following:

-Microbial limits $\langle 2021\rangle$-The total bacterial count does not exceed $10^{4}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and the enterobacterial count does not exceed $10^{3}$ per g. It meets the requirements of the tests for absence of Salmonella species, Escherichia coli, and Staphylococcus aureus.■2S (USP27)

## BRIEFING

Lycopene, page 851 of $P F$ 29(3) [May-June 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded to In-Process Revision with modifications based on comments received. The existence of lycopene from different sources in the market created confusion among the consumers and manufacturers of dietary supplements. To clarify the situation, the USP Expert Committee on Nomenclature and Labeling proposes the addition of a Labeling section requiring the indication of whether the article is obtained from natural sources or prepared synthetically.
(NL: W. Paul; DSB: G. Giancaspro) RTS—40413-1; 40331-1

## Add the following:

## ©Lycopene

$\mathrm{C}_{40} \mathrm{H}_{56} \quad 536.88 \quad[502-65-8]$.

## » Lycopene is a mixture of geometrical isomers of

 lycopene. It contains not less than 96.0 percent and not more than 101.0 percent of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, calculated on the dried basis.Packaging and storage-Preserve in tight, light-resistant containers, under inert gas, and store in a cool place.

USP Reference standards $\langle 11\rangle$-USP Lycopene RS.
Labeling-Label it to indicate whether the article is obtained from natural sources or is prepared synthetically. If obtained from natural sources, label it to indicate the natural source including its Latin binomial.

## Identification-

A: Ultraviolet-Visible Absorption $\langle 197 \mathrm{U}\rangle-$ Spectral range: 300 to 700 nm .

Solution: Prepare as directed below for the Test solution in the test for Content of lycopene.

Ratio: $A_{476} / A_{508}$, between 1.10 and 1.14.
B: The retention time of the major peak in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution, as obtained in the test for Content of all-E-lycopene, 5Z-lycopene, and related compounds.

Loss on drying $\langle 731\rangle$ —Dry it in vacuum over phosphorous pentoxide at $40^{\circ}$ for 4 hours: it loses not more than $0.2 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$.
Heavy metals, Method II $\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per g. Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## Content of all-E-lycopene, 5Z-lycopene, and related

 compounds-Mobile phase-Prepare a filtered and degassed mixture of tert-butyl methyl ether, methanol, and tetrahydrofuran (784:665:74, w:w:w). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve a suitable quantity of USP Lycopene RS in Mobile phase to obtain a solution containing about 2 mg per 100 mL .

Test solution-Transfer about 15 mg of Lycopene to a 25mL volumetric flask, and dissolve in tetrahydrofuran containing 50 mg of butylated hydroxytoluene per L. Dilute with the same solvent to volume. Pipet 2 mL into a $50-$ mL volumetric flask, and add 8 mL tetrahydrofuran. Dilute with tert-butyl methyl ether to volume. Use this solution for injection.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $472-\mathrm{nm}$ detector, one $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ L61 packing; and a second column connected in series containing $3-\mu \mathrm{m}$ packing L61. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.07 for $5 Z-$ lycopene, and 1.0 for all- $E$-lycopene; the resolution, $R$, between all- $E$-lycopene and 5Z-lycopene is not less than 1.0; the tailing factor is not less than 0.8 and not more than 2.0 ; and the relative standard deviation for replicate injections for the all- $E$-lycopene is not more than $2.0 \%$. [NOTE-New columns may require up to 30 injections before the system suitability requirements are met.]

Procedure—Inject about $10 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of related compounds in the portion of Lycopene taken by the formula:

$$
T\left(r_{s} / r_{T}\right)
$$

in which $T$ is the percentage of total lycopene isomers obtained in the test for Content of lycopene; $r_{s}$ is the sum of the responses of all peaks excluding the peak for all- $E$-lycopene and the peak for $5 Z$-lycopene; and $r_{T}$ is the total detected area. Not more than $7.0 \%$ of other related compounds cal-
culated as lycopene are found. Calculate the percentage of the $5 Z$-lycopene isomer in the portion of Lycopene taken by the formula:

$$
T\left(r_{5 Z} / r_{T}\right),
$$

in which $r_{5 Z}$ is the peak response for the 5Z-lycopene isomer, and the other terms are as described above. Not more than $23.0 \%$ of the $5 Z$-lycopene isomer is found. Calculate the percentage of all-E-lycopene taken by the formula:

$$
T\left(r_{E} / r_{T}\right)
$$

in which $r_{E}$ is the peak response of the all- $E$-lycopene isomer, and the other terms are as described above. Not less than $70.0 \%$ of all- $E$-lycopene is found.

## Content of lycopene-

Test stock solution-Transfer about 25 mg of Lycopene to a $100-\mathrm{mL}$ volumetric flask, add about 25 mg of butylated hydroxytoluene and about 60 mL of methylene chloride, and sonicate to dissolve. Dilute with methylene chloride to volume.

Test solution-Transfer 2.0 mL of the Test stock solution to a $200-\mathrm{mL}$ volumetric flask, and dilute with cyclohexane to volume.

Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 476 nm , using cyclohexane as the blank. Calculate the percentage of $\mathrm{C}_{40} \mathrm{H}_{56}$ in the portion of Lycopene taken by the formula:

$$
1000 \mathrm{~A} / 331 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of Lycopene taken to prepare the Test stock solution; and 331 is the absorptivity of the pure lycopene in cyclohexane. $\mathbf{\Delta}$ USP28

## Briefing

Lycopene Preparation, page 852 of $P F$ 29(3) [May-June 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded to In-Process Revision with modifications on the basis of comments received. It is proposed to revise the limits for all- $E$ - and $5 Z$-isomers. See also the briefing under Lycopene for proposed changes in Labeling requirements.
(NL: W. Paul; DSB: G. Giancaspro) RTS-40413-2

## Add the following:

## ©Lycopene Preparation

» Lycopene Preparation is a combination of Lycopene with one or more inert substances and suitable antioxidants. It may be in a solid or oily liquid form. It contains not less than 95.0 percent and not more than 120 percent of the labeled amount of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight, light-resistant containers, under inert gas. Store the oil preparations in a cool place and the solid preparations at controlled room temperature.

Labeling-Label it to state the name and content of added antioxidants and inert substances. Label it to indicate whether the article is prepared with Lycopene from natural sources or from synthetic Lycopene. If prepared with Lycopene from natural sources, label it to indicate the natural source including its Latin binomial.

USP Reference standards-USP Lycopene RS.

Identification, Ultraviolet-Visible Absorption $\langle 197 \mathrm{U}\rangle$ FOR OILY PREPARATIONS-

Spectral range: 300 to 700 nm .
Solution: Prepare as directed below for the Test solution in the test for Content of lycopene (for oily preparations).

Ratio: $A_{476} / A_{508}$ between 1.10 and 1.14 in cyclohexane. FOR SOLID PREPARATIONS-

Spectral range: 300 to 700 nm .
Solution: Prepare as directed below for the Test solution in the test for Content of lycopene (for solid preparations).

Ratio: $A_{472} / A_{504}$ between 1.09 and 1.13 in isopropyl alcohol.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $1.0 \%$.
Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Solvent: dimethylformamide.
Content of all-E-lycopene, 5Z-lycopene, and related compounds-
Mobile phase, Standard solution, and Chromatographic system-Proceed as directed for Content of all-E-lycopene, 5Z-lycopene and related compounds under Lycopene.

Test solution for oil preparations-Transfer a quantity of oil preparation, equivalent to about 15 mg of lycopene, to a $25-\mathrm{mL}$ volumetric flask, and dissolve in tetrahydrofuran containing 50 mg of butylated hydroxytoluene per L. Dilute with the same solvent to volume. Pipet 2 mL into a $50-\mathrm{mL}$ volumetric flask, and add 8 mL of tetrahydrofuran. Dilute with tert-butyl methyl ether to volume. Use this solution for injection.
Test solution for solid preparations-Transfer a quantity of solid preparation, equivalent to 5 mg of lycopene, into a $250-\mathrm{mL}$ volumetric flask, and add about 60 units of bacterial alkaline protease preparation or another suitable enzyme and about 25 mg of butylated hydroxytoluene. Add 2.5
mL of water, place in an ultrasonic bath at $50^{\circ}$ for 10 min utes, and shake occasionally until the material is finely divided with no lumps. Add 5 mL of tetrahydrofuran, 40 mL of dehydrated alcohol, and place again for about 1 minute in the ultrasonic bath. Cool to room temperature, and dilute with tert-butyl methyl ether to volume. Shake vigorously. Allow the precipitate to settle, and filter the supernantant.

Procedure-Proceed as directed for Content of all-E-lycopene, 5Z-lycopene, and related compounds under Lycopene. Calculate the percentage of related compounds in the portion of Lycopene Preparation taken by the formula:

$$
r_{s} / r_{T}
$$

in which $r_{s}$ is the sum of the responses of all peaks excluding the peak for all- $E$-lycopene and the peak for 5Z-lycopene; and $r_{T}$ is the total detected area in the chromatogram: not more than $7.0 \%$ of other related compounds, calculated as lycopene, are found. Calculate the percentage of 5Z-lycopene isomer in the portion of Lycopene Preparation taken by the formula:

$$
r_{5 Z} / r_{T}
$$

in which $r_{s Z}$ is the peak response for the 5Z-lycopene isomer, and the other terms are as described above: not more than $23.0 \% 30.0 \%$ of the $5 Z$-lycopene isomer is found. Calculate the percentage of all- $E$-lycopene in the portion of Lycopene Preparation taken by the formula:

$$
r_{E} / r_{T}
$$

in which $r_{E}$ is the peak response of the all- $E$-lycopene isomer, and the other terms are as described above: not less than $70.0 \% 65.0 \%$ of all- $E$-lycopene is found.

## Content of lycopene

## TEST FOR OILY PREPARATIONS-

Test stock solution-Transfer an accurately weighed quantity of Lycopene Preparation containing about 25 mg of lycopene to a $100-\mathrm{mL}$ volumetric flask, and add about 25 mg of butylated hydroxytoluene and about 60 mL of methylene chloride. Sonicate to dissolve, and dilute with methylene chloride to volume.
Test solution-Transfer 2.0 mL of the Test stock solution to a $200-\mathrm{mL}$ volumetric flask, and dilute with cyclohexane to volume.

Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 476 nm , using cyclohexane as the blank. Calculate the percentage of lycopene in the portion of Lycopene Preparation taken by the formula:

$$
1000 \mathrm{~A} / 331 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of the portion of Lycopene Preparation taken to prepare the Test stock solution; and 331 is the absorptivity of the pure lycopene in cyclohexane.

## TEST FOR SOLID PREPARATIONS-

Test stock solution-Transfer an accurately weighed quantity of Lycopene Preparation containing about 5 mg of lycopene into a $200-\mathrm{mL}$ volumetric flask. Add about 60 units of bacterial alkaline protease preparation or another suitable enzyme and about 25 mg of butylated hydroxytoluene. Add 2.5 mL of diluted ammonium hydroxide (2 in 100). Incubate in a water bath (about $40^{\circ}$ ) until the matrix has dissolved (about 1 to 2 minutes), while rotating the flask to avoid having material stick to the glass surface. Add 5 mL of tetrahydrofuran, and shake until no colored precipitate remains. Add another portion of 2 mL of tetrahydrofuran. Add 40 mL of dehydrated alcohol, and shake until the mixture is
homogeneous. Add 100 mL of diethyl ether, and shake vigorously. Dilute with diethyl ether to volume, shake vigorously, and allow to stand until the solid has settled.

Test solution-Transfer 2.0 mL of the supernatant from the Test stock solution to a $25-\mathrm{mL}$ volumetric flask, and dilute with isopropyl alcohol to volume.

Procedure-Determine the absorbance of the Test solution at the wavelength of maximum absorbance at about 472 nm , using isopropyl alcohol as the blank. Calculate the percentage of lycopene in the portion of Lycopene Preparation taken by the formula:

$$
250 \mathrm{~A} / 320 \mathrm{~W},
$$

in which $A$ is the absorbance of the Test solution; $W$ is the weight, in g , of the portion of Lycopene Preparation taken to prepare the Test stock solution; and 320 is the absorptivity of the pure lycopene in isopropyl alcohol. $\Delta$ USP28

## BRIEFING

Lycopene Tomato Extract, page 855 of $P F 29$ (3) [May-June 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded to In-Process Revision with modifications on the basis of comments received. It is proposed to revise the Definition to allow the addition of tocopherols as antioxidants, to correct the Latin binomial, and to better reflect the products available in the international market. Since this article is prepared by extraction from ethyl acetate, a limit for this solvent is proposed. A test for Limit of aflatoxins is also included. It is also proposed to revise the limit for Water content and to revise the Labeling section for consistency with other USP monographs for articles of botanical origin.
(DSB: G. Giancaspro) RTS-40208-1

## Add the following:

## ©Lycopene Tomato Extract Containing Lycopene

## » Eyeopene Tomato Extract Containing Lycopene

 is an ethyl acetate extract of the natural tomato lipids., witheut any addition of ether ingredients It is produced from the pulp of ripe fruits of Lyeopersicullum L. Lycopersicon esculentum Mill. (Fam. Solanaceae), after removing the tomato serum. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$. It contains not less than 5.7 4.7 percent and not more than 12 percent of lycopene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, not less than 0.8 percent of the combined amount of phytofluene $\left(\mathrm{C}_{40} \mathrm{H}_{68}\right)$ and phytoene $\left(\mathrm{C}_{40} \mathrm{H}_{64}\right)$, not less than 0.2 percent of beta carotene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, and not less than 1.0 percent of tocopherols $\left(\mathrm{C}_{28} \mathrm{H}_{48} \mathrm{O}_{2}\right)$ on the anhydrous basis. Tocopherols may be added as antioxidants.Packaging and storage-Preserve in tight, light-resistant containers, and store in a cool place.

Labeling-Label it to state the content of lycopene in percentage and that the material should be heated to $50^{\circ}$ and mixed before use. Label it to indicate the Latin binomial and the part of the plant from which the article is derived.

USP Reference standards $\langle 11\rangle$ —USP Lycopene RS. USP Eyeopent Tomato Extract Containing Lycopene RS.

Clarity of solution-Warm the sample to $50^{\circ}$ in a water bath. Mix well with a glass rod or a spatula. Accurately weigh about 1 g of the Extract directly into a $100-\mathrm{mL}$ volumetric flask. Add 50 mL of methylene chloride, and sonicate
the solution for 1 minute to completely dissolve the sample. Bring to room temperature, dilute with methylene chloride to volume, and mix well. The solution is clear: no deposit or turbidity is formed.

## Identification-

A: Presence of lycopene, phytofluene, and phytoeneButylated hydroxytoluene stock solution, Diluting solution, Standard solution A, Standard solution B, and Test solution-Proceed as directed in the test for Content of lycopene.

Chromatographic system-Proceed as directed in the test for Content of other carotenoids and tocopherols. The chromatogram of the Test solution exhibits peaks at the retention times for lycopene, phytofluene, and phytoene corresponding to those obtained in the chromatogram of the System suitability solution, as directed in the test for Content of other carotenoids and tocopherols.

B: Ratio of all-E-lycopene and 5Z-lycopene-
Butylated hydroxytoluene stock solution-Proceed as directed in the test for Content of lycopene.

Mobile phase-Prepare a filtered and degassed solution of $0.05 \%$ diisopropylethylamine in $n$-hexane. Mix well, and sonicate for 3 to 4 minutes.

Test solution-Proceed as directed in the test for Content of lycopene, except to make the final dilution by transferring 5 mL to a $100-\mathrm{mL}$ volumetric flask and diluting with $n$-hexane to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with two $4.0-\mathrm{mm} \times$ $25-\mathrm{cm}$ columns that contain $5-\mu \mathrm{m}$ packing L3 (300 $\AA$ pore size), connected in a series and kept at $22^{\circ}$, and a $472-\mathrm{nm}$ detector. The flow rate is 0.5 mL per minute. The peak for all- $E$-lycopene elutes between 30 to 45 minutes; the relative retention time for all- $E$-lycopene is 1.00 ; and the relative re-
tention time for 5Z-lycopene is in the range from 1.04 to 1.10. Both peaks have a maximum absorbance at about 472 nm .

Procedure-Inject about $10 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, measure the peak responses of the two major peaks, and calculate their area ratio by the formula:

$$
r_{U 1} / r_{U 2}
$$

in which $r_{U 2}$ is the peak response of all- $E$-lycopene; and $r_{U 1}$ is the peak response of $5 Z$-lycopene. The area ratio is not more than 0.10 .

Viscosity $\langle 911\rangle$ : Equilibrate the Extract at $37^{\circ}$ in a $30-\mathrm{mL}$ glass vial. Determine the viscosity using a rotational viscosimeter equipped with a spindle (No. 6 spindle) having a cylinder 1.47 cm in diameter and 0.16 cm high attached to a shaft 0.32 cm in diameter, with a distance of 3.02 cm from the top of the cylinder to the lower tip of the shaft. The spindle is rotating at the appropriate speed and immersion depth to obtain a scale reading between $10 \%$ and $90 \%$ of full scale. Calculate the viscosity, in centipoises, by multiplying the scale reading by the constant for the spindle and speed used: the viscosity is not more than 5000 centipoises.

Microbial limits $\langle 2021\rangle$ : It meets the requirements of the tests for absence of Salmonella species, Escherichia coli, and Pseudomonas aeruginosa. The total aerobic microbial count does not exceed 1000 per g, and the total combined molds and yeasts count does not exceed 200 per g.

Limit of aflatoxins $\langle 561\rangle$ : not more than $4 \mu \mathrm{~g}$ per kg of total aflatoxins B1, B2, G1, and G2; not more than $2 \mu \mathrm{~g}$ per kg of aflatoxin B1.

Water, Method Ia $\langle 921\rangle$ : not more than $0.5 \% 0.8 \%$.
Particle size distribution-Transfer 1 drop to a microscope slide, and spread evenly. Isopropanol may be used as a diluent, if necessary. Examine the slide under a microscope
equipped with a calibrated ocular micrometer, using about $450 \times$ magnification (see Optical Microscopy $\langle 776\rangle$ ). Scan the slide, and note the size of the individual particles: not fewer than $98 \%$ of the particles are less than $20 \mu \mathrm{~m}$ in length when measured along the longest axis, not fewer than $60 \%$ of the particles are less than $5 \mu \mathrm{~m}$, and not fewer than $40 \%$ of the particles are less than $2 \mu \mathrm{~m}$.

Pesticide residues $\langle 561\rangle$ : meets the requirements.
Heavy metals, Method II $\langle 231\rangle: 10 \mu \mathrm{~g}$ per g.
Organic volatile impurities, Method IV $\langle 467\rangle$ —Use diethyl phthalate as the solvent in preparation of the Standard Solution and the Test Solution. Heat the sealed vial at $70^{\circ}$ for 120 minutes: meets the requirements. The limit for ethyl acetate is 50 ppm .

## Content of lycopene-

Butylated hydroxytoluene stock solution-Dissolve 2.5 g of butylated hydroxytoluene in methylene chloride to make 500 mL . [NOTE-This solution can be stored protected from light for up to 3 months.]

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, methanol, methylene chloride, and $n$-hexane (850:100:25:25). Add $0.05 \%$ of diisopropylethylamine, mix well, and sonicate for 3 to 4 minutes.

Diluting solution—Prepare a mixture of acetonitrile, methylene chloride, methanol, $n$-hexane, and butylated hydroxytoluene (600:150:150:100:0.5). Add $0.05 \%$ of diisopropylethylamine, mix well, and sonicate for 3 to 4 minutes.

Standard solution A-Transfer an accurately weighed quantity of USP Lycopene RS, equivalent to 6 to 8 mg of lycopene, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in 10 mL of methylene chloride, using a sonicator. Dilute with Diluting solution to volume to obtain a solution having a known concentration of about 0.07 mg of lycopene per mL .

Determine the exact concentration of Standard solution $A$ by employing the following method.

Standard solution B-Transfer 2.0 mL of Standard solution $A$ to a $100-\mathrm{mL}$ volumetric flask, add 10 mL of alcohol and 10 mL of Butylated hydroxytoluene stock solution, dilute with $n$-hexane to volume, and mix.

Procedure-Determine the absorbance of this solution at the maximum absorbance at about 472 nm . Calculate the concentration of Standard solution $A$, in ppm of lycopene, by the formula:

$$
50,000 A_{x} / 345,
$$

in which $A_{x}$ is the absorbance of Standard solution B, and 345 is the absorptivity for pure lycopene in $n$-hexane at 472 nm .

Standard solution C-Transfer an accurately weighed quantity of USP Tomato Extract Containing Lycopene RS, equivalent to 6 to 8 mg of lycopene, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in 10 mL of methylene chloride, using a sonicator. Dilute with Diluting solution to volume to obtain a solution having a known concentration of about 0.07 mg of lycopene per mL .

Test solution-Warm the sample of the Extract to $50^{\circ}$ in a water bath. Mix well with a glass rod or a spatula. Accurately weigh a quantity of 1 to 1.2 g of the sample into a $100-\mathrm{mL}$ volumetric flask. Add 10 mL of Butylated hydroxytoluene stock solution and 30 mL of methylene chloride, and sonicate the solution for 1 minute in order to dissolve the sample completely. Cool to room temperature, dilute with methylene chloride to volume, and mix well. Transfer 5.0 mL to a $50-\mathrm{mL}$ volumetric flask, and dilute with Diluting solution to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a 472 -nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7 maintained at a temperature of $39 \pm 1^{\circ}$. The
flow rate is about 0.7 mL per minute. Chromatograph Standard solution $A$, record the chromatograms, and measure the peak responses as directed for Procedure: the retention time for lycopene is about 6 minutes; and the relative standard deviation of the lycopene peak area for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes ( $10 \mu \mathrm{~L}$ ) of Standard solution A or Standard solution C, and the Test solution into the chromatograph, record the chromatograms, and measure the responses of the major lycopene peaks. Calculate the percentage of lycopene in the portion of Extract taken by the formula:

$$
100(C / W)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A$ or Standard solution $C$; $W$ is the weight, in mg , of Extract taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the areas of the lycopene peak responses obtained from the Test solution and Standard solution A or Standard solution $C$, respectively.

## Content of other carotenoids and tocopherols (phyto-

 fluene, phytoene, beta carotene, and tocopherols)-Butylated hydroxytoluene stock solution, Diluting solution, Standard solution A, Standard solution B, Standard solution C, and Test solution-Proceed as directed in the test for Content of lycopene.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile, methanol, methylene chloride, and $n$-hexane (475:475:25:25). Add $0.05 \%$ of diisopropylethylamine, mix well, and sonicate for 3 to 4 minutes.
System suitability solution-Prepare a solution of USP Lyeopene Tomat Extract RS- in Diluting solution, having a-encentration of about 1 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $4.6-\mathrm{mm} \times 25-$ cm column that contains $5-\mu \mathrm{m}$ packing L1 maintained at a
temperature of $39 \pm 1^{\circ}$ and a detector set at 472 nm for lycopene, at 450 nm for beta carotene, at 350 nm for phytofluene, and at 288 nm for phytoene and tocopherol. The flow rate is about 0.6 mL per minute.

Chromatograph fysurn Standard solution $C$, record the chromatograms, and measure the peak responses and the peak retention times as directed for Procedure: the chromatogram of fyst solut Standard solution $C$ is similar to the Reference Chromatogram provided with the USP Lyemato Extract Containing Lycopene RS; the relative retention times in the chromatogram of Sysem sutability solandard solution $C$ are about 0.6 for the peaks of the tocopherol isomers, 1.0 for the peaks of the lycopene isomers, 1.5 to 1.7 for the peaks of the beta carotene isomers, 1.6 to 1.8 for the peaks of the phytofluene isomers, and 1.8 to 2.2 for the phytoene peak; and the relative standard deviation for replicate injections for the peak of the lycopene isomers is not more than $2 \%$.

Procedure-Separately inject equal volumes ( $10 \mu \mathrm{~L}$ ) of Standard solution $A$ and the Test solution into the chromatograph, and record the chromatograms. Identify the locus of the peaks for the lycopene isomers, beta carotene isomers, phytofluene isomers, and phytoene by comparison with the Reference Chromatogram provided with the corresponding lot of USP Lyene Tomato Extract Containing Lycopene RS. Measure the sum of the peak responses of the lycopene isomers at 472 nm in the Standard solution A. In the Test solution, measure the sum of the peak responses of the beta carotene isomers at 450 nm , the sum of the peak responses of the phytofluene isomers at 350 nm , the response of the phytoene at 288 nm , and the sum of the peak responses of all tocopherols at 288 nm .

Determine the concentration of Standard solution $A$ as directed in the test for Content of lycopene.

Calculate the percentage of beta carotene in the portion of Extract taken by the formula:

$$
100(C / W)\left(r_{U 1} / r_{S}\right)(345 / 259.2)
$$

in which $C$ is the concentration, in ppm, of Standard solution Aor Standard solution $C$; $W$ is the weight, in mg, of Extract taken to prepare the Test solution; $r_{U I}$ is the sum of the peak responses for the beta carotene isomers at 450 nm obtained from the Test solution; $r_{S}$ is the sum of the peak responses for the lycopene isomers at 472 nm obtained from Standard solution A; and 345 and 259.2 are the absorptivities for pure lycopene and for pure beta carotene, respectively.

Calculate the percentage of phytofluene in the portion of Extract taken by the formula:

$$
100(C / W)\left(r_{U 2} / r_{S}\right)(345 / 135)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A$ or Standard solution $C$; $W$ is the weight, in mg , of Extract taken to prepare the Test solution; $r_{U 2}$ is the sum of the peak responses for phytofluene isomers at 350 nm obtained from the Test solution; $r_{S}$ is the sum of the peak responses for the lycopene isomers at 472 nm obtained from the Standard solution A or Standard solution C; and 345 and 135 are the absorptivities for pure lycopene and for pure phytofluene, respectively.
Calculate the percentage of phytoene in the portion of Extract taken by the formula:

$$
100(C / W)\left(r_{U 3} / r_{S}\right)(345 / 125)
$$

in which $C$ is the concentration, in ppm, of Standard solution A or Standard solution C; $W$ is the weight, in mg , of Extract taken to prepare the Test solution; $r_{U 3}$ is the area of the phytoene peak response at 288 nm obtained from the Test solution; $r_{S}$ is the sum of the peak responses for
the lycopene isomers at 472 nm obtained from Standard solution $A$; and 345 and 125 are the absorptivities for pure lycopene and for pure phytoene, respectively.

Calculate the percentage of tocopherols in the portion of
Extract taken to prepare the Test solution by the formula:

$$
100(C / W)\left(r_{U 4} / r_{S}\right)(345 / 8.5)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A$ or Standard solution $C$; $W$ is the weight, in mg , of Extract taken to prepare the Test solution; $r_{U 4}$ is the sum of the peak responses for all the tocopherol peaks at 288 nm obtained from the Test solution; $r_{S}$ is sum of the peak responses for the lycopene isomers at 472 nm obtained from the Standard solution A; 345 is the absorptivity for pure lycopene; and 8.5 is the average absorptivity for toco-

## Briefing

Pyridoxine Hydrochloride Injection, USP 27 page 1609. It is proposed to correct the formula in the Procedure in the Assay.
(DSN: L. Evans) RTS-40728-1

## Change to read:

Assay-
Ammonium chloride-ammonium hydroxide buffer-Dissolve 16 g of ammonium chloride in 70 mL of water, add 16 mL of ammonium hydroxide, dilute with water to 100 mL , mix, and filter.

Chlorimide solution-Dissolve 40 mg of 2,6-dichloroquinonechlorimide in 100 mL of isopropyl alcohol. Store the solution in a refrigerator, and use within one month. Do not use the solution if it has become pink.

Standard stock solution-Dissolve a suitable quantity of USP Pyridoxine Hydrochloride RS, accurately weighed, in 0.1 N hydrochloric acid, quantitatively dilute with the same solvent to obtain a solution having a known concentration of about 0.1 mg per mL , and mix. Keep the solution in an amber bottle, in a cool place.
Standard preparation-In a $100-\mathrm{mL}$ volumetric flask dilute 10.0 mL of Standard stock solution with water to volume, and mix. Prepare this solution daily as needed.

Assay preparation-Dilute an accurately measured volume of Injection, equivalent to about 100 mg of pyridoxine hydrochloride, quantitatively and stepwise with water to a concentration of about $10 \mu \mathrm{~g}$ of pyridoxine hydrochloride per mL .
Procedure-
(a) Pipet 5 mL of the clear Assay preparation into a flask, add 25.0 mL of isopropyl alcohol, and mix. Pipet 5 mL of the isopropyl alcohol dilution into a glass-stoppered, $25-\mathrm{mL}$ graduated cylinder or test tube, and add in succession, mixing after each addition, 1.0 mL of Ammonium chloride-ammonium hydroxide buffer, 1.0 mL of sodium acetate solution ( 1 in 5 ), and 1.0 mL of water. Cool to about $25^{\circ}$, then add 1.0 mL of Chlorimide solution, shake vigorously for 10 seconds, accurately timed. Sixty seconds, accurately timed, after the addition of the Chlorimide solution, determine the absorbance at the wavelength of maximum absorbance at about 650 nm , with a suitable spectrophotometer, using water as the blank. [NOTE-Make the reading promptly to avoid errors due to fading of the color.] Designate the absorbance as $A_{U}$.
(b) Repeat procedure (a), but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as $A_{U}{ }^{\prime}$.
(c) Repeat procedure (a), but substitute 5.0 mL of the Standard preparation for the 5.0 mL of the Assay preparation. Designate the absorbance as $A_{S}$.
(d) Repeat procedure (c), but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as $A_{S}{ }^{\prime}$.

Calculate the quantity, in mg, of Pyridoxine Hydrochloride $\left(\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{NO}_{3} . \mathrm{HCl}\right)$ in each mL of the Injection taken by the formula:

$$
10(C H)\left(A_{t}-A_{t}{ }^{\prime}\right)\left(A_{s}-A_{s}^{\prime}\right)
$$

$$
\mathbf{\Delta}_{10}(C / V)\left(A_{U}-A_{U}^{\prime}\right) /\left(A_{S}-A_{S}^{\prime}\right),_{\mathbf{\Delta U S P 2 8}}
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Pyridoxine Hydrochloride RS in the Standard preparation; $V$ is the volume, in mL , of Injection taken; and $A_{b}$ and $A_{s}$ are as defined therein.
$\boldsymbol{\Delta}_{\text {the }}$ other terms are as defined above. $\quad$ USP28

## Briefing

Powdered St. John's Wort Extract, USP 27 page 2033 and page 702 of $P F$ 29(3) [May-June 2003]. It is proposed to revise the Labeling section to include a warning statement to be applied to the label.
(DSI: J. Salguero) RTS-40894-1

## Change to read:

» Powdered St. John's Wort Extract is prepared from comminuted St. John's Wort extracted with 80 percent methanol or other suitable solvents. The ratio of the starting crude plant material to Powdered Extract is between $3: 1$ and $7: 1$.
$\square_{1 S}$ (USP27)
It contains not less than $\theta .2$
-90.0.1 $\mathbf{n i s}_{\text {(USP27) }}$
percent
-and not more than 110.0 percent $_{1 \text { IS }_{(U S P 27)}}$ of the

- labeled ${ }_{\text {1S (USP27) }}$
combined total of hypericin $\left(\mathrm{C}_{30} \mathrm{H}_{16} \mathrm{O}_{8}\right)$ and pseudohypericin $\left(\mathrm{C}_{30} \mathrm{H}_{16} \mathrm{O}_{9}\right)$ and not less than 3.0
-90.0 $\mathbf{n I S ~}_{\text {(USP27) }}$
percent
-and not more than 110.0 percent $_{1 \text { IS (USP }^{27)}}$ of hyperforin $\left(\mathrm{C}_{35} \mathrm{H}_{52} \mathrm{O}_{4}\right)$.

## Change to read:

Labeling-The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of hypericin, pseudohypericin, and hyperforin; the extracting solvent or solvent mixture used for preparation; and the ratio of the starting crude plant material to Powdered Extract.
${ }^{\Delta}$ The label bears a statement indicating that "Rare cases of allergic reactions and photosensitivity have been reported with the use of St. John's Wort. St. John's Wort interacts with numerous medications. Check with your health care provider before using." $\Delta U S P 28$

## Change to read:

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ (presence of hypericin, pseudohypericin, hyperoside, and rutin)-

Test solution-Transfer about 1 g of Powdered Extract, accurately weighed, to a $50-\mathrm{mL}$ flask, add 20.0 mL of methanol, shake well, and use the clear supernatant.

Standard solution-Transfer about 0.25 g of USP Powdered St. John's Wort Extract RS, accurately weighed, to a $25-\mathrm{mL}$ flask, add 5.0 mL of methanol, shake well, and use the clear supernatant.

Developing solvent system-Prepare a mixture of ethyl acetate, water,

- glacial acetic acid, $\mathbf{m}_{1 S}$ (USP27) and formic acid $(50: 40: 10)$
-(10:2.6:1.1:1.1), $\boldsymbol{m}_{1 S}$ (USP27)
and use the upper phase of the mixture. [NOTE-Saturate the chromatographic chamber with the Developing solvent system vapors prior to the development of the chromatogram.]

Spray reagent $A$-Prepare a solution of diphenylborinic acid, ethanolamine ester in methanol containing 10 mg per mL .

Spray reagent B-Prepare a solution of polyethylene glycol 400 in alcohol containing 50 mg per mL .

Procedure-Develop the chromatogram until the solvent front has moved not less than 18 cm , and dry the plate with the aid of a current of air. Spray the plate with Spray reagent $A$, then with Spray reagent B, and examine the plate under UV light at 365 nm : the two red zones due to hypericin and pseudohypericin at $R_{F}$ values of about $\theta .89$
${ }^{-0.85}{ }_{\text {日 } 1 \mathrm{SS}}$ (USP27) and 0.88
-0.80, $\mathbf{1 S}_{1 S}$ (USP27)
respectively, in the chromatogram of the Test solution, correspond in color and $R_{F}$ value to those in the chromatogram of the Standard solution; the two yellow zones due to hyperoside and rutin at $R_{F}$ values of about 0.20

```
\(\square_{0.50} \operatorname{mS}_{1 S}\) (USP27)
and 0.52
```

-0.35, $\quad$ 1S (USP27)
respectively, in the chromatogram of the Test solution, correspond in color and $R_{F}$ value to those in the chromatogram of the Standard solution. Other colored zones of varying intensities may be observed in the chromatogram of the Test solution.

B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ (presence of hyperforin)-

Test solution and Standard solution-Proceed as directed for Identification test $A$.

Developing solvent system-Prepare a mixture of solvent hexane and ethyl acetate (8:2). [NOTE-Saturate the chromatographic chamber with the Developing solvent system vapors prior to the development of the chromatogram.]

Spray reagent Transfer
-Prepare a solution containing $_{\mathbf{m}_{1 S}(\text { USP27) }}$
0.38 g of ceric ammonium sulfate and 3.8 g of ammonium molybdate tor
$\boldsymbol{- i n}_{\mathbf{n}_{1 S}}$ (USP27)
$100-\mathrm{mL}$ tolumetrie flack, add 2.4 mL
${ }^{-1}{ }^{1 S}$ (USP27)
of
$\mathrm{m}_{\mathrm{n} 1 \mathrm{~S}}$ (USP27)
sulfuric acid. dilute carefully with water to volume, and mix.
$\boldsymbol{m}_{\text {■ }}$ (USP27)

Procedure-Develop the chromatogram until the solvent front has moved not less than 18 cm , and dry the plate with the aid of a current of air. Spray the plate with Spray reagent, heat the plate at $140^{\circ}$ for 15 minutes, and examine under UV light: the blue zone due to hyperforin at an $R_{F}$ value of about 0.54 in the chromatogram of the Test solution corresponds in color and $R_{F}$ value to that in the chromatogram of the Standard solution.

## Add the following:

-Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total bacterial count does not exceed $10^{4}$ per g, and the total combined molds and yeasts does not exceed
$10^{3}$ per g.mis (USP27)

## Change to read:

Assay for biotin,
$\Delta_{\text {Method }} 1_{\Delta U S P 28}$
-Proceed as directed in the Assay for biotin, Method 2 under Oiland Water-Soluble Vitamins with Minerals Tablets, except to read Oral Solution in place of Tablets and to use the following Assay preparation.

Assay preparation-Transfer an accurately measured volume of Oral Solution to a volumetric flask, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a concentration of 0.1 ng of biotin per mL .

## Add the following:

4Assay for biotin, Method 2-Proceed as directed in the Assay for biotin, Method 3 under Oil- and Water-Soluble Vitamins with Minerals Tablets, except to read Oral Solution in place of Tablets and to use the following Assay preparation.

Assay preparation-Transfer an accurately measured volume of Oral Solution to a volumetric flask, and dilute quantitatively, and stepwise if necessary with water, to obtain a solution having a concentration of $0.6 \mu \mathrm{~g}$ of biotin per mL . Adjust the solution with either dilute acetic acid or 0.1 N sodium hydroxide to a pH of between 6.0 and 7.0. $\mathbf{\text { USP28 }}$

## Briefing

Oil- and Water-Soluble Vitamins with Minerals Tablets, USP 27 page 2063; Oil- and Water-Soluble Vitamins Tablets, USP 27 page 2051; Oil- and Water-Soluble Vitamins with Minerals Oral Solution, USP 27 page 2057; Water-Soluble Vitamins Tablets, USP 27 page 2084; Water-Soluble Vitamins with Minerals Tablets, USP 27 page 2089. It is proposed to add a third alternative Assay for biotin to the Oil- and Water-Soluble Vitamins with Minerals Tablets monograph, which also affects the monographs listed above. It has been reported that the current two methods are inadequate for the analysis of some marketed products. The proposed method incorporates the use of solid-phase extraction
into the sample preparation. Analyses are performed with a Waters Oasis MAX Vac RC cartridge to prepare the sample preparation and a Phenomenex Luna brand of L1 column for the liquid chromatographic procedure. The typical retention time for the biotin peak is 22 minutes.
(DSN: L. Evans) RTS-40079-1; 40079-2; 40079-3; 400794; 40079-5

## Add the following:

^Assay for biotin, Method 3-[NOTE-Use low-actinic glassware throughout this procedure.]

Buffer-Transfer 800 mL of water and 100 mL of triethylamine to a $1000-\mathrm{mL}$ volumetric flask. Add 80 mL of $85 \%$ phosphoric acid, dilute with water to volume, and mix.

Mobile phase-Transfer 80 mL of acetonitrile and 10 mL of Buffer to a $1000-\mathrm{mL}$ volumetric flask. Dilute with water to volume, mix, filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography〈621〉).
Standard preparation-Transfer about 25 mg of USP Biotin RS, accurately weighed, to a $250-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 1.5 mL of this solution to a $250-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about $0.6 \mu \mathrm{~g}$ per mL of USP Biotin RS. [NOTE-A portion of the Standard preparation will be used to determine the percent recovery of biotin from the Solid-phase extraction procedure.]

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about $60 \mu \mathrm{~g}$ of biotin, to a $100-\mathrm{mL}$ volumetric flask. Add about 80 mL of water, and sonicate for 30 to 40 minutes with occasional mixing. Cool to room temperature, dilute with water to volume, mix, and filter. Adjust the pH of the solution with either dilute acetic acid or 0.1 N sodium hydroxide to between 6.0 and 7.0.

Solid-phase extraction-[NOTE-Condition the extraction column specified in this procedure in the following manner. Wash the column with a $2-\mathrm{mL}$ portion of methanol. Equilibrate with a $2-\mathrm{mL}$ portion of water.] Separately pipet 5.0 mL of the Assay preparation and Standard preparation into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing with a sorbent-mass of 60 mg . [NOTE-The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a polymer of copolymer $N$-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkyamino group. * ] Wash the column with 10 mL of $30 \%(\mathrm{v} / \mathrm{v})$ methanol in water. Apply an appropriate volume (about 4.9 $\mathrm{mL})$ of $30 \%(\mathrm{v} / \mathrm{v})$ methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a $5-\mathrm{mL}$ volumetric flask, containing $100 \mu \mathrm{~L}$ of $40 \%(\mathrm{w} / \mathrm{v})$ sodium acetate in water, and dilute with $30 \%(\mathrm{v} / \mathrm{v})$ methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $200-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column containing packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than $2 \%$. Chromatograph the portion of Standard preparation that has undergone solid-phase extraction, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2 \%$; and the recovery is between $95 \%$ and $100 \%$.

Procedure-Separately inject equal volumes (about 100 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation that have undergone solid-phase extraction, into the chro-

[^64]matograph, record the chromatograms, and measure the responses for the biotin peak. Calculate the quantity, in $\mu \mathrm{g}$, of biotin $\left(\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}\right)$ in the portion of Tablets taken by the formula:
$$
100 C\left(r_{U} / r_{S}\right),
$$
in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Biotin RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the biotin peak responses obtained from the Assay preparation and the Standard preparation, respectively._USSP28

## MONOGRAPHS (NF)

## Briefing

Acesulfame Potassium. Because there is no existing NF monograph for this excipient, a new monograph is being proposed. This new monograph is based on the Acesulfame Potassium monographs derived from the $46^{\text {th }}$ Session of the Joint FAO/WHO Expert Committee on Food Additives. Responses to manufacturer comments have also been incorporated.
(EMC: K. Russo) RTS-40209-5

## Add the following:

## ©Acesulfame Potassium

## $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{NO}_{4} \mathrm{SK} \quad 201.24$

6-Methyl-1,2,3-oxathiazine-4(3H)-one-2,2-dioxide potassium salt.

3,4-dihydro-6-methyl-1,2,3-oxathiazine-4-one-2,2-dioxide potassium salt [55589-62-3].
»Acesulfame Potassium contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{NO}_{4} \mathrm{SK}$, calculated on the dried basis.

Packaging and storage-Preserve in well-closed containers.

USP Reference standards $\langle 11\rangle$ —USP Acesulfame Potassium RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: A solution (1 in 10 ) responds to the tests for Potassium $\langle 191\rangle$.

Acidity or alkalinity—Dissolve 4.0 g in 20 mL of carbon dioxide-free water, add 0.1 mL of bromothymol blue TS. If the solution is yellow, not more than 0.2 mL of 0.01 N sodium hydroxide is required to produce a blue color. If the solution is blue, not more than 0.2 mL of 0.01 N hydrochloric acid is required to produce a yellow color.

Loss on drying $\langle 731\rangle$ —Dry at $105^{\circ}$ for 3 hours: it loses not more than $1.0 \%$ of its weight.

Limit of fluoride- [NOTE-Use plasticware throughout this test.]

Buffer solution-Dissolve 210 g of citric acid monohydrate in 400 mL of water. Adjust with concentrated ammonia to a pH of 7.0 , dilute with water to 1000 mL , and mix (Solution A). Dissolve 132 g of monobasic ammonium phosphate in water, dilute with water to 1000 mL , and mix (Solution B). To a suspension of 292 g of edetate disodium in about 500 mL of water, add about 200 mL of ammonium hydroxide, and mix to dissolve (Solution C). Adjust with ammonium hydroxide to a pH between 6 and

7, dilute with water to make 1000 mL , and mix. Mix equal volumes of Solution A, Solution B, and Solution C, and adjust with ammonium hydroxide to a pH of 7.5 .
Standard stock solution-Weigh accurately 0.442 g of sodium fluoride, previously dried at $300^{\circ}$ for 12 hours, into a 1-L volumetric flask, dilute with water to volume, and mix. Store the solution in a closed plastic container. Immediately before use, pipet 5 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains $10 \mu \mathrm{~g}$ of fluoride ion.

Standard solutions-To separate $50-\mathrm{mL}$ volumetric flasks pipet $0.5,1.5,5$, and 15 mL of the Standard stock solution, add to each volumetric flask 15.0 mL of Buffer solution, dilute with water to volume, and mix.
Test solution-Place 1 g of Acesulfame Potassium, accurately weighed, in a $50-\mathrm{mL}$ volumetric flask, dissolve in water, add 15.0 mL of Buffer solution, dilute with water to volume, and mix.

Procedure-Concomitantly measure the potential (see Titrimetry $\langle 541\rangle$ ), in mV , of the Standard solutions and the Test solution, with a suitable pH meter equipped with a flu-oride-specific ion electrode and a silver-silver chloride reference electrode. When taking the measurements, transfer the solution to a $25-\mathrm{mL}$ beaker, and immerse the electrodes. Insert a polytef-coated stirring bar into the beaker, place the beaker on a magnetic stirrer having an insulated top, and allow to stir until equilibrium is attained (about 1 to 2 minutes). Rinse, and dry the electrodes between measurements, taking care not to scratch the crystal in the flouride-specific ion electrode. Measure the potential of each Standard solution, and plot the fluoride concentration, in $\mu \mathrm{g}$ per mL , versus the potential, in mV , on semilogarithmic paper. Measure the potential of the Test solution, and
determine from the standard curve the fluoride concentration, in $\mu \mathrm{g}$ per mL . Calculate the percentage of fluoride in the portion of Acesulfame Potassium taken by the formula:

$$
5(C / W)
$$

in which $C$ is the fluoride concentration, in $\mu \mathrm{g}$ per mL , from the standard curve; and $W$ is the weight, in mg, of Acesulfame Potassium taken to prepare the Test solution: not more than $0.0003 \%$ of fluoride is found.

Heavy metals, Method $I\langle 231\rangle: 10 \mu \mathrm{~g}$ per g.

## Chromatographic purity-

Tetrabutylammonium hydrogen sulfate solution-Dissolve 3.3 g of tetrabutylammonium hydrogen sulfate in 1 L of water, and mix.

Mobile phase-Prepare a mixture of Tetrabutylammonium hydrogen sulfate solution and acetonitrile (3:2), filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve suitable quantities of USP Acesulfame Potassium RS and ethyparaben in water to obtain a solution containing about $2 \mu \mathrm{~g}$ per mL of each.

Standard solution-Dissolve an accurately weighed quantity of USP Acesulfame Potassium RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.2 $\mu \mathrm{g}$ per mL .

Test solution-Transfer about 100 mg of Acesulfame Potassium, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in water, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $227-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. Chro-
matograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between acesulfame potassium and ethyparaben peaks is not less than 2 .

Procedure-[NOTE-Use peak areas where peak responses are indicated.] Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for a run time not less than 3 times the retention time of the acesulfame potassium peak, and measure the responses of the peaks: the response of any peak at a retention time other than that of acesulfame potassium in the chromatogram obtained from the Test solution does not exceed the response of the acesulfame potassium peak in the chromatogram obtained from the Standard solution ( $0.002 \%$ ).

Assay-Dissolve about 150 mg of Acesulfame Potassium, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.12 mg of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{NO}_{4} \mathrm{SK} \cdot{ }_{\Delta N F 23}$

## Briefing

[^65]
## Add the following:

## ©Adipic Acid

$\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4} \quad 146.1$
Hexanedioic acid.
1,4-Butanedicarboxylic acid [124-04-9].
» Adipic Acid contains not less than 99.0 percent and not more than 101.0 percent of $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4}$, calculated on the dried basis.

Packaging and storage-Store in tight containers.
Identification-Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Melting range $\langle 741\rangle$ : between $151^{\circ}$ and $154^{\circ}$.
Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ to constant weight: it loses not more than $0.2 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Limit of nitrates-

Standard stock solution-Dissolve about 815 mg of potassium nitrate in 500 mL of water, and mix.

Standard solution-Dilute 1 mL of the Standard stock solution with water to 10 mL , and mix. Dilute 1 mL of this solution with water to 50 mL to obtain a solution containing 2 ppm of nitrate. Use 1.5 mL of this solution, and proceed as directed under Procedure, beginning with "add 2 mL of concentrated ammonia".

Test solution-Transfer 5 g of Adipic Acid to a $50-\mathrm{mL}$ volumetric flask. Dissolve in water, with heating, and dilute with water to volume. Allow to cool and crystallize, then pass through a sintered-glass filter. Wash the filter with
water, and collect the filtrate and washings until a volume of 50 mL is obtained. [NOTE-This solution is to be used in the tests for Chloride, Sulfate, Iron, and Heavy metals.]

Procedure-To 1.0 mL of the Test solution add 2 mL of concentrated ammonia, 0.5 mL of manganese sulfate solution (1 in 100), 1 mL of sulfanilamide solution (1 in 100), and dilute with water to 20 mL . Add 100 mg of zinc powder, and cool in an ice bath for 30 minutes, shaking periodically. Filter 10 mL of the solution, and cool in an ice bath, then add 2.5 mL of hydrochloric acid and 1 mL of a naphthylethylenediamine dihydrochloride solution (1 in 100). Allow to stand at room temperature for 15 minutes: the color of the Test solution is not darker than a concomitantly prepared Standard solution; the limit is $0.003 \%$. The test is invalid if a concomitantly prepared blank solution (prepared using 1 mL of water instead of 1 mL of the Test solution) is darker than a solution containing 2 mg of potassium permanganate per L .

Chloride $\langle 221\rangle$-A 5-mL portion of the Test solution from the Limit of nitrates test shows no more chloride than a corresponding $0.14-\mathrm{mL}$ portion of 0.020 N hydrochloric acid: the limit is $0.02 \%$.

Sulfate $\langle 221\rangle$ —A $5-\mathrm{mL}$ portion of the Test solution from the Limit of nitrates test shows no more sulfate than a corresponding $0.26-\mathrm{mL}$ portion of 0.020 N sulfuric acid: the limit is $0.05 \%$.

Iron $\langle 241\rangle$-Use a $10-\mathrm{mL}$ portion of the Test solution from the Limit of nitrates test: the limit is $0.001 \%$.

Heavy metals, Method $I\langle 231\rangle$ : 0.001\%.
Assay-Dissolve 60 mg of Adipic Acid in 50 mL of water. Add 0.2 mL of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a permanent pale pink endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 7.31 mg of $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{4 \cdot \Delta N F 23}$

## Briefing

Betadex, NF 22 page 2831 and page 206 of $P F 30(1)$ [Jan.-Feb. 2004]. It is proposed to revise the upper limit of the acceptance criteria from 101.0 percent to 102.0 percent in response to comments received that the precision of the Assay does not support the current specification.
(EMC: D. Bempong) RTS-40181-1

## Change to read:

» Betadex is a nonreducing cyclic compound composed of seven alpha-(1-4) linked D-glucopyranosyl units. It contains not less than 98.0 percent and not more than 101.0
$\boldsymbol{\Delta r}^{102.0} \mathbf{\Delta}^{\text {NF23 }}$
percent of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{7}$, calculated on the anhydrous basis.

## Change to read:

## Assay-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and water (65:35). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard solution-Dissolve 2.0 g of glycerol in water contained in a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Pass through a $0.45-\mu \mathrm{m}$ membrane filter. Use fresh, or store in a freezer, thaw in hot water, and mix.

Standard preparation-Dissolve an accurately weighed quantity of USP Beta Cyclodextrin RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 10 mg per mL . Use fresh, or store in a freezer, thaw in hot water, and mix. Mix 1.0 mL of this solution with 1.0 mL of Internal standard solution.

System suitability preparation-Prepare a solution in water containing about 5 mg per mL each of USP Alpha Cyclodextrin RS and USP Beta Cyclodextrin RS. Pass through a $0.45-\mu \mathrm{m}$ membrane filter.

Assay preparation-Transfer about 1 g of Betadex, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Pass this solution through a $0.45-\mu \mathrm{m}$ membrane filter. Mix 1.0 mL with 1.0 mL of Internal standard solution.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The tiquid ehrematograph is equipped with a refractive inder detector that is maintained at a constant temperature of $25^{\circ}$, a $4.6 \mathrm{~mm} *$ 25 cm colum that contains 10 um packing L 8 , and a guard col umm that contains packing $L 8$. The columms are maintained at a eonstant temperature of $25 \pm 2^{\circ}$, and the flow rate is about 2.0 mL per minute.
${ }^{\Delta}$ The chromatograph is equipped with a refractive index detector, a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L8, and a guard column that contains packing L8. The columns and, if necessary, the detector are maintained at a constant temperature of about $25 \pm 2^{\circ}$, and the flow rate is about 2.0 mL per minute. If the detector or the columns
are operated at a temperature other than $25 \pm 2^{\circ}$, the system also must be shown to meet all system suitability require-
ments. ANF23 $^{\text {N }}$
Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the alpha cyclodextrin and beta cyclodextrin peaks exhibit baseline separation, the relative retention times being about 0.8 and 1.0 , respectively; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right)_{7}$ in the portion of Betadex taken by the formula:

$$
100 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of anhydrous beta cyclodextrin in the Standard preparation, as determined from the concentration of USP Beta Cyclodextrin RS, corrected for moisture content by a titrimetric water determination; and $R_{U}$ and $R_{S}$ are the peak response ratios of the beta cyclodextrin peak to the internal standard peak obtained from the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Calcium Silicate, NF 22 page 2834. On the basis of comments received, it is proposed to revise the Definition to include crystalline or amorphous Calcium Silicate. It is proposed to revise the limits in the tests for pH and Ratio of silicon dioxide to calcium oxide and to replace the test for Limit of fluoride with a revised version. Revisions are also proposed in the Assay for silicon dioxide and in the Assay for calcium oxide.
(EMC: D. Bempong) RTS-39546-1

## Change to read:

» Calcium Silicate,

is a compound of calcium oxide and silicon dioxide. It contains not less than 4.0 percent of calcium oxide and not less than 45.0
${ }^{4} 35.0_{\Delta N F 23}$
percent of silicon dioxide.

## Change to read:

$\mathbf{p H}\langle 791\rangle$ : between 8.4 and 10.2,
$\Delta_{11.2}$, NF 23.
determined in a well-mixed aqueous suspension (1 in 20).

## Change to read:

## Limit of fluoride-

NOTE Stere all selutions in plastic centainers.
Buffer seldtion Adt 800 mL of het water to 74.4 g of edetate disodium and 24.2 g of tris(hydroxymethyl)aminemethane, and stir until dissolved. Adjust with 5 N sodium hydroxide to a pH of 7.5-7.7. Allow the-selation to eoel, and adjust with 5 N ditum hydroxide to a pHof 8.0 . Dilute with water to 1000 mL , and mix.

Electrode syistem Use a fluride specific, ion-indicating elec trode and a calomelreference-electrodeconnected to a pH meter eapable of measuring petentials with a reproducibility of $\pm 0.2$ $\mathrm{mV}($ seep $H\langle 794\rangle$ ).

Standard steck solution- Dissolve an aceurately weighed quan tity of USP Sodium Plurride RS quantitatively in water to obtain a solution containing $221 \mu \mathrm{~g}$ per mL . Each mL of this stock solution entains 100 per of fluride ion.

Standard selutions [NOTE Prepare on the day of use.] Transfer 10.0 mL of Standturd stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. This solution eontains 10 his of fluorideion per mL (Standard solution A). Transfer 1.0 mL of Standard stock solution to a secend 100 mL voltmetrie flask, dilute with water to volume, and mix. This selution contains $1.0 \mu \mathrm{~g}$ of fluoride ion per mL (Standard solution $B$ ).

Fest solution Transfer 5.0 o of of Calcium Silicate to a 150 mL pelytefbeaker. Add 40 mL of water and 20 mL of 1 N hydrechlorie acid. Heat to near beiling for 1 minnte, stirring continuously. Coet in an iee bath, transfer the suspension to a 100 mL volumetrie flack, dilute with water to volume, and mix.

Proecdure Tramsfer 20.0 mL Of Standard solution A, Standard solution $B$, and the Test solution to separate polytef beakers, add 10.0 mL of Buffer solution to each beaker, and stir with a plastic coated stirring bar. Concomitantly measure the petentials, in mV, of the-selations. [NOTE When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibritm is attained (1 to 2 minutes), and re eerd the petential. Rimse and dry the electrodes between measurements, taking eare to avoid damaging the erystal of the ion speeifie electrode.] Plet the logarithms of the fleorideion concentrations, in Hg per mL , of the Standard solutions versus petential, in mV. Frem the measured potential of the Test solution and the standard respense line, determine the eoneentration, $C$, in he per $m b$, of fltt oride-ion in the Test solution. Caleulate the quantity, in ug of fleride perg of Caleitm Silieate by multiplying $C$ by 20 . The limit is 10 सf per है
${ }^{\mathbf{4}}$ [NOTE-Store all solutions in plastic containers.]
Buffer solution-Transfer 147 g of sodium citrate to a

Standard stock solution-Dissolve an accurately weighed quantity of USP Sodium Fluoride RS in water to obtain a solution containing $221 \mu \mathrm{~g}$ per mL . Each mL of this stock solution contains $100 \mu \mathrm{~g}$ of fluoride ion.

Test solution-Transfer about 2.0 g of Calcium Silicate, accurately weighed, to a $100-\mathrm{mL}$ plastic beaker containing a magnetic stir bar. Add 20 mL of water and 2.0 mL of hydrochloric acid. Cover with a watch glass, and heat with stirring to a vigorous boil. Remove from heat, and cool. Transfer the cooled suspension to a $100-\mathrm{mL}$ plastic beaker. Add 25 mL of Buffer solution, and adjust with ammonium hydroxide or hydrochloric acid to a pH between 5 and 6 . Add 50 mL of Ionic strength adjustment buffer and water to make 100 mL of solution.

Standard response line-Obtain a standard response line with four standard solutions containing $0,0.10,0.20$, and $0.40 \mu \mathrm{~g}$ per mL of fluoride as follows. Add 23 mL of water, 2 mL of hydrochloric acid, and 25 mL of Buffer solution to a $100-\mathrm{mL}$ plastic beaker. Adjust with ammonium hydroxide to a pH between 5 and 6, and add Ionic strength adjustment buffer to obtain 100 mL of solution. Insert the electrode into the solution, stir for at least 15 minutes, and record the potential for the standard solution containing $0 \mu \mathrm{~g}$ of fluoride per mL . When the electrode has stabilized, add $100 \mu \mathrm{~L}$ of the Standard stock solution to the beaker, and stir. Allow the electrode to stabilize for 5 minutes, and measure the potential for the standard solution containing $0.10 \mu \mathrm{~g}$ of fluoride per mL . Similarly add another $100 \mu \mathrm{~L}$ and $200 \mu \mathrm{~L}$ of the Standard stock solution and record the potential for the standard solutions, containing $0.20 \mu \mathrm{~g}$ per mL of fluoride and $0.40 \mu \mathrm{~g}$ per mL of fluoride, respectively. After each addition, continue to stir for 5 minutes before recording the reading.
electrode and a calomel reference electrode connected to a pH meter capable of measuring potentials with a reproduci-
bility of $\pm 0.2 \mathrm{mV}$ (see $p H\langle 791\rangle$ ).

Procedure-Insert the calibrated electrode into the Test solution, stir for 5 minutes, and record the measurement. From the measured potential of the Test solution and the standard response line, determine the concentration, $C$, in $\mu \mathrm{g}$ per mL , of fluoride ion in the Test solution. Calculate the quantity, in $\mu \mathrm{g}$ per g of fluoride in Calcium Silicate by the formula:

$$
100 C / W
$$

in which $W$ is the weight, in g , of Calcium Silicate taken. The limit is $10 \mu \mathrm{~g}$ per $\mathrm{g}_{\boldsymbol{\Delta}}{ }^{\mathrm{N} F 23}$

Change to read:
Assay for silicon dioxide-Transfer about 400 mg of Caleimmsi tieate,
$\Delta_{\text {the }}$ appropriate amount of Calcium Silicate (see Table 1.) $\mathbf{\Delta N F 2 3}$
accurately weighed, to a beaker, add 5 mL of water and 10 mL of perchloric acid, and heat until dense white fumes of perchloric acid are evolved. Cover the beaker with a watch glass, and continue to heat for 15 minntes lenger.
$\Delta_{2}$ hours. $_{\mathbf{A N F}^{N F}{ }^{23}}$
Allow to cool, add 30 mL of water, filter, and wash the precipitate with 200 mL of hot water. [NOTE-Retain the combined filtrate and washings for use in the Assay for calcium oxide.] Transfer the filter paper and its contents to a platinum crucible, heat slowly to dryness, then heat sufficiently to char the filter paper.After and ander at about $1300^{\circ}$
${ }^{\Delta} 900^{\circ}$ to $1000^{\circ}{ }_{\Delta N F 23}$
to constant weight. Moisten the residue with 5 drops of sulfurie
$\Delta$ perchloric
acid, add 15 mL of hydrofluoric acid, heat cautiously on a hot plate until all of the acid is driven off, and ignite at a temperature not lower than $1000^{\circ}$ to constant weight. Cool in a desiccator, and weigh: the loss in weight represents the weight of $\mathrm{SiO}_{2}$. The percentage of silicon dioxide in the Calcium Silicate is between $90.0 \%$ and $110.0 \%$ of the content stated in the labeling, or within the range of percentages stated in the labeling.
${ }^{\wedge}$ Table 1.

| Sample weight | Calcium oxide content |
| :--- | :---: |
| about 400 mg | greater than $25 \%$ |
| about 600 mg | $11-25 \%$ |
| about 1000 mg | $4-10 \%$ |

## Change to read:

Assay for calcium oxide-Neutralize the combined filtrate and washings retained from the Assay for silicon dioxide to litmus with 1 N sodium hydroxide. Add, while stirring, about 30 mL
$\triangle 10 \mathrm{~mL}$
of 0.05 M edetate disodium VS from a $50-\mathrm{mL}$ buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.804 mg of CaO . The percentage of CaO in the Calcium Silicate is between $90.0 \%$ and $110.0 \%$ of the content stated in the labeling, or within the range of percentages stated in the labeling.

## Change to read:

Ratio of silicon dioxide to calcium oxide-Divide the percentage of silicon dioxide obtained in the Assay for silicon dioxide by the percentage of calcium oxide obtained in the Assay for calcium oxide: the quotient obtained is between 4.3
${ }^{\Delta} 0.5{ }_{\text {A }}{ }^{2}$ F23
and 20 .

## BRIEFING

Cellulose Acetate Butyrate, page 7861 of $P F 25(2)$ [Mar.-Apr. 1999]. It is proposed to change the title to Cellaburate. It is also proposed to revise the Definition to specify that the acetyl and butyryl limits are calculated on the previously dried basis to be consistent with the determination of the limits in the test for Acetyl and butyryl content.
(EMC: D. Bempong) RTS-40864-1

## Add the following:

## $\Delta$ Cellulose Acetate Butyrate

## Cellaburate

(Graphic formula to come)

Cellulose, acetate butanoate.
Cellulose, acetate butyrate.
Acetylbutyrylcellulose.
Cellulose butyrate acetate.
Cellulose acetate butyrate [9004-36-8].
» Cellulese Acetate Butyrate Cellaburate is a reaction product of cellulose, acetic anhydride or acetic acid, and butyric acid or butyric anhydride. It contains not less than 1.0 percent and not more than 41.0 percent acetyl $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}\right)$ groups, by weight, and not less than 5.0 percent and not more than 57.356 .0 percent butyryl $\left(\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{O}\right)$ groups, by weight, calculated on the anhydrous, previously dried, acid-free basis.

Packaging and-storage-Preserve in tight containers.
Labeling-The labeling indicates the nominal percentage ranges of acetyl and butyryl groups.

USP Reference standards $\langle 11\rangle$ USP Cellulose Acetate Bumate RS. USP Cellaburate RS.

Identification, Infrared Absorption $\langle 197 \mathrm{~F}\rangle$-Dissolve 150 mg in 1 mL of acetone. Evenly cast 1 drop of the solution on a sodium chloride plate. Heat the plate at $105^{\circ}$ for 10 minutes.

Water, Method $I\langle 921\rangle$ : not more than $5.0 \%$, a mixture of methylene chloride and methanol (2:1) being used in place of the methanol solvent.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : 0.002\%.

## Limit of free acid-

Indicator solution-Transfer about 0.5400 .675 g of bromocresol purple, accurately weighed, to a 1-L volumetric flask. Dissolve in 20025 mL of 0.0100 .10 N sodium hydroxide, dilute with water to volume, and mix.

Calibration solutions-Pipet 1, 2, 3, and 4 mL of 0.001 N acetic acid VS into four $100-\mathrm{mL}$ volumetric flasks, respectively. Pipet 4 mL of the Indicator solution into each flask
and into an empty $100-\mathrm{mL}$ volumetric flask, and dilute each flask with water to volume to obtain solutions containing $0.0,0.60,1.20,1.80$, and $2.40 \mu \mathrm{~g}$ of acetic acid per mL.

Control solution-Place 96 mL of water in a suitable bottle, add a stirring bar, cap the bottle, and stir for 75 minutes at room temperature. Pipet 4 mL of Indicator solution into the bottle, and mix.

Test solution-Transfer about 1 to 2 g of Cellulose Ace Bute, Cellaburate, accurately weighed, to a bottle, and add 96 mL of water. Add a stirring bar, cap the bottle, and stir for 75 minutes at room temperature. Pipet 4 mL of Indicator solution into the bottle, stir to mix, and allow the solid to settle for 2 minutes.

Calibration-Determine the absorbances of the Calibration solutions in a $1-\mathrm{cm}$ cell at the wavelength of maximum absorption of the basic form of bromocresol purple at about 589 nm , with a suitable spectrophotometer, using water as the blank. The absorbance difference, $A_{S}$, between the 0.0 $\mu \mathrm{g}$ per mL solution and the other solutions is expressed by the formula:

$$
a \epsilon_{s}+\left(60 \times 10^{6}\right)
$$

in which a is the absorptivity of the basic form of bromocresol purple, in mL per em mole; $b$ is the cell path length, in $\mathrm{em} ; \mathrm{G}_{\mathrm{s}}$ is the concentration of the acetic acid, in $\mu \mathrm{g}$ per mL ; and $60 \times 10^{6}$ is the molecular weight of acetic acid in $\mu \mathrm{g}$ per mole. Plot $A_{\varsigma}$ Grgus $G_{\varsigma}$ adheres to Beer's law over the range stated under Calibration solutions. Plot $A_{S}$ versus $C_{S}$ (the concentration of the acetic acid in $\mu \mathrm{g}$ per mL ) on linear graph paper, and draw the straight line best fitting the points including the origin.

Procedure-Pass 10 mL of the Test solution through a polytef syringe filter that has been presoaked in isopropyl alcohol. Determine the absorbance of the filtered Test solution in a $1-\mathrm{cm}$ cell at about 589 nm on the same spectrophotometer, using water as the blank. In the same manner,
determine the absorbance of the Control solution. Calculate the percentage of free acid, as acetic acid, in the portion of Gellule Aee Butyrate Cellaburate taken by the formula:

$$
\left(100 C_{U} / W_{U}\right) / 10,000
$$

in which 100 is the total volume, in mL, of the Test solution; $C_{U}$ is the concentration of free acid, calculated as acetic acid, in $\mu \mathrm{g}$ per mL , based on the absorbance difference between the Control solution and the Test solution read directly from the calibration plot; and $W_{U}$ is the weight, in g , of Cellulose Ace Cellaburate taken to prepare the Test solution. [NOTE-If the $C_{U}$ value is greater than $2.42 .8 \mu \mathrm{~g}$ per mL , reduce the test sample size by half in the Test solution, and repeat the determination.] Not more than $0.1 \%$ is found.

## Acetyl and butyryl content-

Internal standard solution-Prepare a solution of isovaleric acid in pyridine containing about 4.6 mg per mL , and store it in a tightly closed container.

Saponification solution-Place 250 mL of $n$-propyl alcohol in a $500-\mathrm{mL}$ volumetric flask, add 65.5 g of potassium hydroxide, and mix to dissolve. Dilute with $n$-propyl alcohol to volume, and mix.

Acid solution-Place 250 mL of $n$-propyl alcohol in a $500-\mathrm{mL}$ volumetric flask, add 166 mL of hydrochloric acid, and mix. Dilute with $n$-propyl alcohol to volume, and mix.

Standard preparation-Transfer about 0.20 g of glacial acetic acid and 0.31 g of butyric acid, each accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dilute with Internal standard solution to volume, and mix.
Test preparation-Transfer about 0.15 g of Cellulese Ace, Cellaburate, previously dried at $105^{\circ}$ for 1 hour and accurately weighed, into a $25-\mathrm{mm} \times 160-$ mm test tube. Pipet 10 mL of Internal standard solution into the test tube, and dissolve by stirring and heating at $110^{\circ}$ for 30 minutes. While stirring, add 5 mL of Saponification solu-
tion slowly into the tube. Heat at $110^{\circ}$ for 10 minutes. Cool, and add 5 mL of the Acid solution. Mix on a vortex mixer, and allow the precipitate to settle.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused silica column bonded with a $1-\mu \mathrm{m}$ layer of phase G35, and a split injection system with a split ratio of about $35: 1$. Helium is used as the carrier gas flowing at a rate of about 8 mL per minute. The injection port, column, and detector block temperatures are maintained at $250^{\circ}, 125^{\circ}$, and $250^{\circ}$, respectively. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.45 for acetic acid, 0.85 for butyric acid, and 1.00 for isovaleric acid; the tailing factor for the butyric acid peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than $3.0 \%$.
Calibration-Inject about $1 \mu \mathrm{~L}$ of the Standard preparation into the chromatograph, and record the chromatogram as directed for Procedure. Repeat two more times. Calculate the average unit weight response, $F_{S A}$, of acetic acid per 10 mL of the Internal standard solution by the formula:

$$
(10 / 50) q_{R A} / R_{S A},
$$

in which 10/50 is the volume ratio of the Internal standard solution in the Test preparation and in the Standard preparation; $q_{R A}$ is the weight, in g , of acetic acid in the Standard preparation; and $R_{S A}$ is the average peak response ratio of acetic acid and isovaleric acid. Similarly, calculate the average unit weight response, $F_{S B}$, of butyric acid per 10 mL of the Internal standard solution by the formula:

$$
(10 / 50) q_{R B} / R_{S B},
$$

in which $10 / 50$ is the volume ratio of the Internal standard solution in the Test preparation and in the Standard preparation; $q_{R B}$ is the weight, in g , of butyric acid in the Standard preparation; and $R_{S B}$ is the average peak response ratio of butyric acid and isovaleric acid.

Procedure-Inject about $1 \mu \mathrm{~L}$ of the upper clear solution from the Test preparation into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of acetyl in the portion of Cellulose Ace Cellaburate taken by the formula:

$$
(43 / 60)(100) R_{U A} F_{S A} / W_{U}
$$

in which $43 / 60$ is the ratio of the formula weights of acetyl and acetic acid; $R_{U A}$ is the peak area response ratio of acetic acid and isovaleric acid in the Test preparation; $F_{S A}$ is as defined under Calibration; and $W_{U}$ is the weight, in g , of Cet Ale Aellaburate taken to prepare the Test preparation. Similarly, calculate the percentage of butyryl in the portion of Cellule Cellaburate taken by the formula:

$$
(71 / 88)(100) R_{U B} F_{S B} / W_{U},
$$

in which $71 / 88$ is the ratio of the formula weights of butyryl and butyric acid; $R_{U B}$ is the peak area response ratio of butyric acid and isovaleric acid in the Test preparation; $F_{S B}$ is as defined under Calibration; and $W_{U}$ is the weight, in g , of Gellulose Ace Butyrate Cellaburate taken to prepare the Test preparation. $\mathbf{\Lambda N F 2 3 ~}^{\text {N }}$

## Briefing

Galactose. Because there is no existing $N F$ monograph for this excipient, a new monograph is proposed based on the Galactose monograph in the European Pharmacopeia Fourth Edition and manufacturer comments.
(EMC: K. Russo) RTS-40209-2

## Add the following:

©Galactose

$\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \quad 180.16$
$\alpha$-D-Galactopyranose. [3646-73-9].
» Galactose is one of the products of the metabolism of lactose, a naturally occuring sugar in dairy products, by the digestive enzyme lactase.

Packaging and storage-Store in tight containers.
USP Reference standards $\langle 11\rangle$ —USP Dextrose RS. USP
Galactose RS. USP Lactose Monohydrate RS.
Appearance of solution-Dissolve, with heating at $50^{\circ}$, 10.0 g of galactose in 50 mL of carbon dioxide-free water. The solution is not more intensely colored than a solution prepared immediately before use by mixing 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, and 2.4 mL of cupric sulfate CS with dilute hydrochloric acid ( 10 g per L ) to make 10 mL , and diluting 1.5 mL of this solution with the dilute hydrochloric acid to 100 mL . Make the comparison by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Test solution-Dissolve 10 mg in 20 mL of a mixture of methanol and water (3:2).

Standard solution 1: $500 \mu \mathrm{~g}$ per mL in a mixture of methanol and water (3:2).
Standard solution 2-Prepare a solution using USP Galactose RS, USP Dextrose RS and USP Lactose Monohydrate RS each at a concentration of $500 \mu \mathrm{~g}$ per mL in a mixture of methanol and water (3:2).

Application volume: $2 \mu \mathrm{~L}$.
Developing solvent system: propanol and water (85:15).
Procedure-Develop the plate in an unsaturated tank.
After the solvent front has developed over 15 cm , remove the plate from the tank. Dry the plate with warm air, then spray the plate with a thymol solution [ 0.5 g in a mixture of alcohol and sulfuric acid (95:5)]. Heat for 10 minutes in an oven at $130^{\circ}$. The $R_{F}$ of the principal spot obtained from the Test solution corresponds to that obtained from the Standard solution. [NOTE-There must be three clearly resolved spots in the chromatogram for Standard solution 2 in order for the results to be valid.]

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+78.0^{\circ}$ and $+81.5^{\circ}$ at $20^{\circ}$.

Test solution: Transfer 10.0 g to a $100-\mathrm{mL}$ volumetric flask, and dissolve in 80 mL of water. Add 0.2 mL of ammonia TS, allow to stand for 30 minutes, then dilute with water to volume.

Microbial limits $\langle 61\rangle$ : It meets the requirements of the test for absence of Salmonella species, Escherichia coli, Staphylcoccus aureus, and Pseudomonas auruginosa. The total
aerobic microbial count does not exceed $10^{3}$ cfu per g , and the total combined molds and yeasts count does not exceed $10^{2}$ cfu per g .

Acidity-Dissolve 10.0 g , with heating at $50^{\circ}$, in 40 mL of carbon dioxide-free water. Dilute with carbon dioxide-free water to 50 mL [NOTE-Use this solution for the Barium test.] To 30 mL of this solution, add 0.3 mL of phenolphthalein TS, and titrate with 0.01 N sodium hydroxide to a pink color: not more than 1.5 mL of 0.01 N sodium hydroxide is required to produce a pink color.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Barium-

Standard solution-To 5 mL of the solution prepared for the Acidity test, add 6 mL of water.
Test solution-To 5 mL of the solution prepared for the Acidity test, add 5 mL of water and 1 mL of dilute sulfuric acid. Allow to stand for 1 hour: any opalescence in the Test solution is not more intense than that of the Standard solution.

## Limit of lead-

Diluent-Dilute 12 mL of acetic acid with water to 100 mL . Mix equal parts of this solution and water to prepare the Diluent.
Lead standard stock solution-Transfer an accurately weighed amount of lead nitrate, about 400 mg , to a $250-$ mL volumetric flask. Dilute with water, to volume and mix.
Lead standard solution-Dilute 1.0 mL of Lead standard stock solution with water to 10 mL . Dilute 1.0 mL of this solution with water to 10 mL .
Standard solutions-Into three identical flasks, add 0.5 $\mathrm{mL}, 1.0 \mathrm{~mL}$, and 1.5 mL of Lead standard solution, respectively, and then add to each flask a $20.0-\mathrm{g}$ amount of galactose. Dilute with Diluent to 100 mL . To each flask add 2.0 mL of ammonium pyrrolidinedithiocarbamate solution (10
g per L ) and 10.0 mL of methyl isobutyl ketone, then shake for 30 seconds. [NOTE-Protect from light.] Allow the layers to separate, and use the methyl isobutyl ketone (upper) layer for analysis.

Test solution-Dissolve 20.0 g of Galactose in Diluent, and dilute with Diluent to 100 mL . Add 2.0 mL of ammonium pyrrolidinedithiocarbamate solution ( 10 g per L ) and 10.0 mL of methyl isobutyl ketone, then shake for 30 seconds. [NOTE-Protect from light.] Allow the layers to separate, and use the methyl isobutyl ketone (upper) layer for analysis.

Procedure-Concomitantly determine, at least in triplicate, the absorbances of the Standard solutions and the Test solution at 283.3 nm , with a suitable atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ), equipped with a lead hollow-cathode lamp as the radiation source and an air-acetylene flame. Record the average steady readings for each of the Standard solutions and the Test solution. Plot the absorbances of the Standard solutions and the Test solution versus the amount of lead added. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of lead in the Test solution: not more than $0.5 \mu \mathrm{~g}$ per $g$ is found. $\boldsymbol{\Delta}^{\text {NF23 }}$

## Briefing

Maleic Acid, page 2005 of PF 28(6) [Nov.-Dec. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision.
(EMC: E. Gonikberg) RTS-40862-1

## Add the following:

## ©Maleic Acid

$\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$
116.07
(Z)-Butenedioic acid
Cis-Butenedioic acid $\quad[110-16-7]$.
» Maleic Acid contains not less than 99.0 percent and not more that 101.0 percent of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$, calculated on the anhydrous basis.

## Packaging and storage-Preserve in glasserner

 tight glass containers, protected from light. Store at room temperature.USP Reference standards $\langle 11\rangle —$ USP Fumaric Acid RS. USP Maleic Acid RS.

## Identification-

A: Dissolve about 500 mg of Maleic Acid in 10 mL of water: the pH of the solution is not less than 2 .

B: The principal spot in the chromatogram obtained from Test solution 2 corresponds in color, size, and $R_{F}$ value to that in the chromatogram obtained from the Maleic acid standard solution, as obtained in the test for Limit of fumaric acid.

C: Dissolve about 35 mg of resorcinol in 10 mL of sulfuric acid (Resorcinol solution). Dissolve about 100 mg of Maleic Acid in 10 mL of water (Test solution). To 0.3 mL of the Test solution add 3 mL of the Resorcinol solution, and heat in a water bath for 15 minutes: no color develops. To 3 mL of the Test solution add 1 mL of bromine TS, heat in a water bath for 15 minutes to remove the bromine, then heat
to boiling, and cool. To 0.2 mL of this solution, add 3 mL of the Resorcinol solution, and heat in a water bath for 15 minutes: a violet-pink color develops.

## Color and clarity of solution-

Dilute hydrochloric acid solution-Mix 27.5 mL of hydrochloric acid with sufficient water to make 1000 mL .

Reference solution-Mix 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with Dilute hydrochloric acid solution to make 10 mL . Dilute 5 mL of this solution with Dilute hydrochloric acid solution to make 100 mL .

Test solution-Dissolve about 5 g of Maleic Acid in 50 mL of water.

Procedure-Place the Reference solution and the Test solution in matched color-comparison tubes, and compare the solutions by viewing them downward against a white surface (see Color and Achromicity $\langle 631\rangle$ ): the Test solution is clear and not more intensely colored than the Reference solution.

Water, Method $I\langle 921\rangle$ : not more than $2.0 \%$ is found.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on a $1.0-\mathrm{g}$ portion.

Heavy metals, Method II $\langle 231\rangle$ -
Test solution-Transfer 1.0 g of Maleic Acid to a quartz crucible, add 0.5 g of magnesium oxide, and mix. Ignite the crucible to dull redness until a homogeneous white or gray-ish-white mass is obtained. Ignite at $800^{\circ}$ for 1 hour, cool, and dissolve the residue by adding two $5-\mathrm{mL}$ portions of diluted hydrochloric acid. Add 0.1 mL of phenolphthalein TS, and then add ammonium hydroxide until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, then add 0.5 mL of glacial acetic acid in excess, and dilute with water to 20.0 mL .

Standard solution-To 0.5 g of magnesium oxide, add 1.0 mL of Standard Lead Solution, and evaporate to dryness at $105^{\circ}$ for 1 hour. Following the procedure described above
for preparation of the Test solution, ignite, dissolve in diluted hydrochloric acid, add ammonia and then acetic acid, and dilute with water to 20.0 mL .

Procedure-To 12 mL of the Test solution, add 2.0 mL of pH 3.5 Acetate Buffer, mix, add to 1.2 mL of thioacetamideglycerin base TS, and mix immediately. To 10 mL of the Standard solution, add 2.0 mL of the Test solution and 2.0 mL of pH 3.5 Acetate Buffer, mix, add 1.2 mL of thioaceta-mide-glycerin base TS, and mix immediately. Prepare a blank, using a mixture of 10 mL of water and 2.0 mL of the Test solution. Compared to the blank, the solution obtained from the Standard solution shows a light brown color. Dilute each of the solutions obtained from the Test solution and the Standard solution with water to 50 mL , allow to stand for 2 minutes, and view downward over a white surface. The color of the solution obtained from the Test solution is not darker than that of the solution obtained from the Standard solution: not more than $10 \mu \mathrm{~g}$ per g .

## Limit of fumaric acid-

Adsorbent: $0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution 1-Dissolve an accurately weighed quantity of Maleic Acid in acetone to obtain a solution having a concentration of about 100 mg per mL .
Test solution 2-Transfer about 1.0 mL of Test solution 1 to a $50-\mathrm{mL}$ volumetric flask, dilute with acetone to volume, and mix.

Maleic acid standard solution-Dissolve an accurately weighed quantity of USP Maleic Acid RS in acetone to obtain a solution having a known concentration of about 2 mg per mL.

Fumaric acid standard solution-Dissolve an accurately weighed quantity of USP Fumaric Acid RS in acetone to obtain a solution having a known concentration of about 1.5 mg per mL .

Resolution solution-Prepare a mixture of Maleic acid standard solution and the Fumaric acid standard solution (1:1).

Developing solvent system-Prepare a mixture of heptane, butanol, chloroform, and anhydrous formic acid (44:36:16:16).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$, using an unsaturated chamber. Separately apply $10 \mu \mathrm{~L}$ of the Resolution solution and $5 \mu \mathrm{~L}$ each of Test solution 1, Test solution 2, the Maleic acid standard solution, and the Fumaric acid standard solution. Dry the plate at $100^{\circ}$ for 15 minutes, and examine the plate under short-wavelength UV light at 254 nm . The chromatogram obtained from the Resolution solution exhibits two clearly separated spots, and any spot corresponding to fumaric acid in the chromatogram of Test solution 1 does not exceed, in size or intensity, the principal spot obtained in the chromatogram of the Fumaric acid standard solution: not more than $1.5 \%$ of fumaric acid is found.

## Limit of iron -

Diluted standard iron solution-Immediately before use, dilute 1 volume of the Standard Iron Solution, prepared as directed under Iron $\langle 241\rangle$, with 9 volumes of water. [NOTE-This solution contains the equivalent of $1 \mu \mathrm{~g}$ of iron per mL.]

Potassium thiocyanate solution-Dissolve 9.7 g of potassium thiocyanate in 100 mL of water.

Test solution-Dissolve about 1 g of Maleic Acid, accurately weighed, in 10 mL of water. Add 2 mL of diluted hydrochloric acid and 0.05 mL of bromine TS. After 5 min utes, remove the excess of bromine with the aid of a current of air, add 3 mL of Potassium thiocyanate solution, and shake well.

Standard solution-To 5 mL of Diluted standard iron solution add 6 mL of water. Add 1 mL of diluted hydrochloric acid and 0.05 mL of bromine TS. After 5 minutes, remove the excess of bromine with the aid of a current of air, add 3 mL of Potassium thiocyanate solution, and shake well.

Procedure-Allow the Standard solution and the Test solution to stand for 5 minutes. Any red color in the Test solution is not more intense than that in the Standard solution: not more than $5 \mu \mathrm{~g}$ per g.

Assay—Dissolve about 500 mg of Maleic Acid, accurately weighed, in 50 mL of water, and titrate with 1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Each mL of 1 N sodium hydroxide is equivalent to 58.04 mg of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4 \cdot \boldsymbol{\Delta} \times 23}$

## BRIEFING

Nitrogen, NF 22 page 2899; Nitrogen 97 Percent, NF 22 page 2899. These monographs are being revised to add new USP Reference Standards.
(AER: K. Zaidi) RTS-40629-1

## Add the following:

${ }^{4}$ USP Reference standards $\langle 11\rangle — U S P$ Nitrogen RS. USP Oxygen-Helium RS. anF23

## Change to read:

Identification -The flame-of a burning woed splinter is extinguished when inserted inte a test tube-fllled with Nitrogen. [NOTE-Exercise caution.]
${ }^{4}$ Prepare a gas chromatograph as directed in the Assay, and inject USP Nitrogen RS and the nitrogen sample into a gas chromatrograph. The retention time of the major peak in the chromatogram of the nitrogen sample corresponds to that in the chromatogram of the USP Nitrogen RS. $\mathbf{\Delta N F 2 3}^{N}$

## Change to read:

Assay-Introduce a specimen of Nitrogen into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than $70 \%$ of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 3 m in length and 4 mm in inside diameter and is packed with a molecular sieve prepared from a synthetic alkali-metal aluminosilicate capable of absorbing molecules having diameters of up to 0.5 nm , which permit complete separation of oxygen from nitrogen. Use industrial grade helium $(99.99 \%)$ as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by aoxygen helium certified stan dard (see under Reagents in the seetion Reagents, Indicators, and Solutions),
${ }^{\text {the }}$ the USP Oxygen-Helium RS, , $_{\text {NF23 }}$
and is equivalent to not more than $1.0 \%$ of oxygen when compared to the peak response of the
${ }^{\boldsymbol{\Delta}}$ USP Oxygen-Helium RS, ${ }_{\mathbf{\Delta N F 2 3}}$
indicating not less than $99.0 \%$, by volume, of $\mathrm{N}_{2}$.

## BRIEFING

Nitrogen 97 Percent, NF 22 page 2899-See briefing under Ni trogen. In addition, minor editorial style changes have been made.
(AER: K. Zaidi) RTS-40629-2

## Add the following:

${ }^{\Delta}$ USP Reference standards $\langle 11\rangle$ —USP Nitrogen 97 Per-

## Change to read:

Identification-The flame of a burning splinter is extinguished when inserted into a test fllled with Nitrogen 97 Per eent. [NOTE-Exereise eatution.]
${ }^{\Delta}$ Prepare a gas chromatograph as directed in the Assay, and inject USP Nitrogen 97 Percent RS and a sample of Nitrogen 97 Percent into the gas chromatograph. The retention time of the major peak in the chromatogram of the test sample corresponds to that in the chromatogram of the USP Nitrogen 97 Percent RS. $\mathbf{\Delta N F 2 3 ~}$

## Change to read:

Assay-Proceed as directed in the Assay under Nitrogen. The peak response produced by the assay specimen exhibits a retention time corresponding to that produced by moxysen heliumeertified stan dard (see mader Reagents in the section Reagents, Indientors, and solutions)
$\Delta_{\text {the USP Oxygen-Helium }} \mathrm{RS}_{\mathbf{A}^{N F 23}}$
and is equivalent to not more than $3.0 \%$ of oxygen when compared to the peak response of the-oxysen helimm certified standard,
${ }^{\boldsymbol{\Delta}}$ USP Oxygen-Helium RS, ${ }_{\mathbf{\Delta}}$ NF23
indicating not less than $97.0 \%$, by volume, of $\mathrm{N}_{2}$.

## Briefing

Polyoxyl Stearyl Ether, page 1118 of PF 29(4) [July-Aug 2003]. It is proposed to revise the name of the USP Reference Standard to reflect the chemical composition of the material.
(EMC: E. Gonikberg) RTS-40862-3

## Add the following:

## ■Polyoxyl Stearyl Ether

Polyethylene glycol monostearyl ether [9005-00-9].

## » Polyoxyl Stearyl Ether is a mixture of the mono-

 stearyl ethers of mixed polyethylene glycols, the average polymer length being equivalent to not less than 2 and not more than 20 oxyethylene units (nominal value). It may contain various amounts of free stearyl alcohol and some free polyethylene glycol.Packaging and storage-Preserve in tight containers, and store in a cool, dry place.

Labeling-Label it to indicate the average nominal number of oxyethylene units.

## Change to read:

USP Reference standards $\langle 11\rangle$ USP Polyoxyl Steatyl Ether RS. ${ }^{\text {A }}$ USP Polyoxyl 10 Stearyl Ether RS._nF23

Appearance of solution-Dissolve 5.0 g of Polyoxyl Stearyl Ether in 50.0 mL of alcohol. The solution is not more intensely colored than a solution prepared immediately before use by mixing 12.0 mL of ferric chloride CS, 5.0 mL of cobaltous chloride CS , and 2.0 mL of cupric sulfate CS with dilute hydrochloric acid ( 10 g per L ) to make 50.0 mL , and diluting 12.5 mL of this solution with dilute hydrochloric acid ( 10 g per L ) to make 100.0 mL . Make the comparison by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~F}\rangle$-Use a thin film of melted test specimen.

B: Dissolve or disperse 0.1 g in alcohol, add 10 mL of diluted hydrochloric acid, 5 mL of barium chloride TS, and 10 mL of phosphomolybdic acid solution (1 in 10): a precipitate is formed.

Acid value $\langle 401\rangle$ : not more than 1.0, determined on 5.0 g . Hydroxyl value $\langle 401\rangle$ : within the ranges specified in the table below.

Alkalinity—Dissolve 2.0 g of Polyoxyl Stearyl Ether in a hot mixture of 10 mL of alcohol and 10 mL of water. Add 0.05 mL of bromothymol blue TS, and titrate with 0.1 N hydrochloric acid to a yellow endpoint: not more than 0.5 mL of 0.1 N hydrochloric acid is required.

Water, Method $I\langle 921\rangle$ : not more than $3.0 \%$.
Limit of free ethylene oxide and dioxane-[CautionEthylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between $4^{\circ}$ and $8^{\circ}$.] [NOTE-Before using the Polyethylene Glycol 200 in this test, remove any volatile components from it by placing 500 mL of Polyethylene Glycol 200 in a $1000-\mathrm{mL}$ round-bottom flask, attaching the flask to a rotary evaporator, and evaporating at a temperature of $60^{\circ}$ and under a vacuum of 10 to 20 mm Hg for 6 hours.]
Acetaldehyde solution-Prepare a solution of acetaldehyde in water, containing a known concentration of about $10 \mu \mathrm{~g}$ per mL . [NOTE-Prepare the Acetaldehyde solution fresh just prior to use.]
Ethylene oxide stock solution-Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glassstoppered conical flask, add about 50 mL of Polyethylene Glycol 200, and reweigh the flask. Transfer about 5 mL of the liquid ethylene oxide to a $100-\mathrm{mL}$ beaker chilled in a mixture of sodium chloride and wet ice (1:3). Using a gas-tight syringe that has been previously cooled to $-10^{\circ}$, transfer about $300 \mu \mathrm{~L}$ (corresponding to about 250 mg ) of liquid ethylene oxide to the Polyethylene Glycol 200, and swirl gently to mix. Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by
weight difference. Adjust the weight of the mixture with Polyethylene Glycol 200 to 100.0 g , replace the stopper, and swirl gently to mix. This stock solution contains about 2.5 mg of ethylene oxide per g. [NOTE-Prepare this stock solution fresh just prior to use, and store in a refrigerator.]

Ethylene oxide solution-Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add about 35 mL of Polyethylene Glycol 200, and reweigh the flask. Using a gastight gas chromatographic syringe that has been chilled in a refrigerator, transfer about 1 g of the chilled Ethylene oxide stock solution, accurately weighed, to the tared, conical flask. Adjust the weight of the solution with Polyethylene Glycol 200 to 50.0 g , replace the stopper, and swirl gently to mix. Transfer about 10 g of this solution, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing about $10 \mu \mathrm{~g}$ of ethylene oxide per mL . [NOTE-Prepare this solution fresh just prior to use, and store in a refrigerator.]

Dioxane solution-Dissolve about 1.0 g of dioxane, accurately weighed, in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg of dioxane per mL .

Standard solution A-Transfer 0.1 mL of Ethylene oxide solution to a $10-\mathrm{mL}$ pressure headspace vial, add 0.1 mL of Acetaldehyde solution and 0.1 mL of Dioxane solution, seal the vial, and mix.

Standard solution B-Transfer about 1.0 g of the substance under test, accurately weighed, to another $10-\mathrm{mL}$ pressure headspace vial, add 0.1 mL of Ethylene oxide solution, 0.1 mL of Dioxane solution, and 1.0 mL of $N, N$-dimethylacetamide. Seal the vial, and mix.

Test solution-Transfer about 1.0 g of the substance under test, accurately weighed, to a $10-\mathrm{mL}$ pressure headspace vial, add 1.0 mL of $N, N$-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— [NOTE--The use of a headspace apparatus that automatically transfers a measured amount of headspace is allowed.] The gas chromatograph is equipped with a flame-ionization detector, maintained at about $250^{\circ}$, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ glass or quartz capillary column bonded with a $1.0-\mu$ m layer of phase G1. The injection port is equipped with a split injection port with a split ratio of 20:1 and is maintained at about $150^{\circ}$. The column temperature is maintained at $50^{\circ}$ for 5 minutes after injection, then programmed to increase at the rate of $5^{\circ}$ per minute to $180^{\circ}$, then at the rate of $30^{\circ}$ per minute to $230^{\circ}$ and then maintained at $230^{\circ}$ for 5 minutes. Each vial is heated at a temperature of $90^{\circ}$ for 45 minutes before a suitable portion of its headspace is injected. The carrier gas is helium flowing with a linear velocity of about 20 cm per second. [NOTE-If the headspace apparatus is used, then an injection time of 12 seconds and a transfer line temperature of $150^{\circ}$ are recommended.] Chromatograph the gaseous phase of Standard solution $A$, and record the peak responses as directed for Procedure: the relative retention times are about 0.94 for acetaldehyde and 1.0 for ethylene oxide; the resolution, $R$, between acetaldehyde and ethylene oxide is not less than 2.0 ; the dioxane peak is detected with a signal-to-noise ratio of not less than 5 ; and the relative standard deviation for replicate injections is not more than $15 \%$.

Procedure-Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes (about 1 mL ) of the gaseous headspace of Standard solution $B$ and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the mean areas of the ethylene oxide and dioxane peaks in the
chromatogram obtained from the Test solution are not greater than half the mean areas of the corresponding peaks in the chromatogram obtained from Standard solution B. Calculate the concentration of ethylene oxide, in $\mu \mathrm{g}$ per g , in the portion of the substance under test taken by the formula:

$$
A r_{U} /\left[\left(r_{S} W_{U}\right)-\left(r_{U} W_{S}\right)\right]
$$

in which $A$ is the quantity, in $\mu \mathrm{g}$, of ethylene oxide added to Standard solution B; $r_{U}$ and $r_{S}$ are the ethylene oxide peak responses obtained from the Test solution and Standard solution $B$, respectively; and $W_{U}$ and $W_{S}$ are the weights, in g , of the substance under test taken to prepare the Test solution and Standard solution B, respectively: not more than $1 \mu \mathrm{~g}$ per g is found.

Calculate the concentration of dioxane, in $\mu \mathrm{g}$ per g , in the portion of the substance under test taken by the formula:

$$
A_{D} r_{U} / 5\left[\left(r_{S} W_{U}\right)-\left(r_{U} W_{S}\right)\right]
$$

in which $A_{D}$ is the amount, in $\mu \mathrm{g}$, of dioxane added to Standard solution $B ; r_{U}$ and $r_{S}$ are the dioxane peak responses obtained from the Test solution and Standard solution B, respectively; and $W_{U}$ and $W_{S}$ are as defined above: not more than $10 \mu \mathrm{~g}$ per g is found. $\mathrm{IS}_{\text {(NF22) }}$

## Briefing

Sesame Oil, NF 22 page 2926. Due to difficulties experienced in procuring the System suitability solution reagents, 1,2-dilinoleoyl-3-oleoyl- rac-glycerol (OLL) and 1,2-dilinoleoyl-3-palmitoyl-racglycerol (PLL), for the test for Triglyceride composition, it is proposed to make these materials available as new Reference Stan-
dards. USP Sesame Oil Related Compound A RS and USP Sesame Oil Related Compound B RS will now replace the current reagents OLL and PLL, respectively.
(EMC: C. Sheehan) RTS-40837-1

## Add the following:

${ }^{4}$ USP Reference standards $\langle 11\rangle —$ USP Sesame Oil Related Compound A RS. USP Sesame Oil Related Compound B RS. ^ $^{N F 23}$

## Change to read:

## Triglyceride composition-

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and methylene chloride ( $60: 40$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

NOTE-The fatty acid radicals are designated as linoleic (L), oleic $(\mathrm{O})$, palmitic $(\mathrm{P})$, and stearic ( S ), and the common abbreviations for triglycerides used are as follows: trilinolein (LLL), 1,2-dilino-leoyl-3-oleoyl-rac-glycerol (OLL), 1,2-dilinoleoyl-3-palmitoyl-rac-glycerol (PLL), 1,2-dioleoyl-3-linoleoyl-rac-glycerol (OOL), 1-palmitoyl-2-oleoyl-3-linoleoyl-rac-glycerol (POL), triolein (OOO), 1-linoleoyl-2-oleoyl-3-stearoyl-rac-glycerol (SOL), and 1,2-dioleoyl-3-palmitoyl-rac-glycerol (POO).

System suitability solution-Transfer 30 mgen of OLL and PLL, aceurately weighed, to a 10 mL volumetric flask, dis solve in and dilute with Mobile phase to volume, and mix.
${ }^{\Delta}$ Dissolve an accurately weighed quantity of USP Sesame Oil Related Compound A RS and USP Sesame Oil Related Compound B RS in Mobile phase to obtain a solution having a known concentration of about 3 mg of each per mL . [NOTE-USP Sesame Oil Related Compound A RS is OLL and USP Sesame Oil Related Compound B RS is PLL]. aFF23

Test solution-Transfer about 200 mg of Oil, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The chromatograph is equipped with a refractive index detector and two $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ columns in series that contain packings L 1 and are maintained at a constant temperature about $30^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.93 for OLL and 1.0 for PLL; the resolution, $R$, between OLL and PLL is not less than 1.8 ; the relative standard deviation for replicate injections, determined from peak areas, is not more than $1.5 \%$; and the relative standard deviation for replicate injections, determined from peak area ratios of OOL to POL, is not more than $2.2 \%$.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the areas for the eight major triglyceride peaks, eluting from 0 to about 40 min utes, with relative retention times stated in the table below and in the order specified. Calculate the percentage of each of these triglycerides in the portion of Oil taken by the formula:

$$
100(A / B)
$$

in which $A$ is the peak area for each individual triglyceride; and $B$ is the sum of the areas of all the peaks, excluding the solvent peak.

| Triglyceride | Relative Retention Time | Composition (\%) |
| :---: | :---: | :---: |
| LLL | 0.55 | 7.0 to 19.0 |
| OLL | 0.65 | 13.0 to 30.0 |
| PLL | 0.69 | 5.0 to 9.0 |
| OOL | 0.77 | 14.0 to 25.0 |
| POL | 0.82 | 8.0 to 16.0 |
| OOO | 0.93 | 5.0 to 14.0 |
| SOL | 0.97 | 2.0 to 8.0 |
| POO | 1.0 | 2.0 to 8.0 |

## BRIEFING

Sodium Stearyl Fumarate, $N F 22$ page 2934. It is proposed to increase the volume of chloroform added in the Assay from 1 mL to 10 mL . This is due to reports received that the sodium stearyl sulfate sample did not dissolve completely in 1 mL of chloroform and 20 mL of glacial acetic acid as specified in the monograph.
(EMC: D. Bempong) RTS-40750-1

## Change to read:

Assay-Transfer about 250 mg of Sodium Stearyl Fumarate, accurately weighed, to a $50-\mathrm{mL}$ conical flask, mix with $1-\mathrm{mt}$

## © $10 \mathrm{~mL}^{\text {NF23 }}$

of chloroform, and add 20 mL of glacial acetic acid to dissolve. Add quinaldine red TS, and titrate with 0.1 N perchloric acid VS. Each mL of 0.1 N perchloric acid is equivalent to 39.05 mg of $\mathrm{C}_{22} \mathrm{H}_{39} \mathrm{NaO}_{4}$.

Briefing
Sodium Sulfite, page 2007 of $P F 28(6)$ [Nov.-Dec. 2002]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision.
(EMC: E. Gonikberg) RTS-40862-2

## Add the following:

©Sodium Sulfite
$\mathrm{Na}_{2} \mathrm{SO}_{3} \quad 126.0 \quad[7757-83-7]$.
" Sodium Sulfite contains not less than 95.0 percent and not more than 100.5 percent of $\mathrm{Na}_{2} \mathrm{SO}_{3}$.

Packaging and storage-Preserve in tight containers. Store at room temperature.

## Identification-

A: Dissolve 5 g of Sodium Sulfite in 100 mL of water: the pH of the solution is between 8.0 and 10.0. [NOTE-Reserve portions of the solution so obtained for use in Identification test $B$ and in the test for Color and clarity of solution.]

B: To 5 mL of the solution from Identification test $A$, add 0.5 mL of iodine TS: the solution is colorless and it meets the requirements of the barium chloride test for Sulfate $\langle 191\rangle$.
$\mathbf{C}$ : It meets the requirements of the pyroantimonate precipitate test for Sodium $\langle 191\rangle$.

Color and clarity of solution-Examine the solution prepared for Identification test $A$ : the solution is clear and colorless.

Heavy metals, Method $I\langle 231\rangle$ : $10 \mu \mathrm{~g}$ per g , the Test Preparation being prepared as follows. To 8.0 g of Sodium Sulfite add 25 mL of water. Shake until mostly dissolved, and
slowly and carefully add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL . Use a $25-\mathrm{mL}$ portion.

## Limit of iron-

Standard solution-Immediately before use, dilute 1 volume of Standard Iron Solution, prepared as directed under Iron $\langle 241\rangle$, to 10 mL with water. [NOTE-This solution contains the equivalent of $1 \mu \mathrm{~g}$ of iron per mL .]

Test solution-To 10.0 g of Sodium Sulfite add 25 mL of water. Shake until mostly dissolved, and carefully and slowly add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL . Use a $10-\mathrm{mL}$ portion.

Procedure-To the Standard solution and the Test solution separately add 2 mL of a citric acid solution having a concentration of 200 g per liter, and then add 0.1 mL of thioglycolic acid. Mix, make alkaline with stronger ammonia water, and dilute with water to 20 mL . Allow to stand for 5 minutes. Any pink color in the Test solution is not more intense than that in the Standard solution: not more than 10 $\mu \mathrm{g}$ per g is found.

## Limit of selenium-

Selenium standard solution-[Caution-Selenium is toxic; handle it with care.] Dissolve about 0.1 g of metallic selenium, accurately weighed, in 2 mL of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three more times. Dissolve the residue so obtained in 50 mL of diluted hydrochloric acid, transfer to a $1000-\mathrm{mL}$
volumetric flask, dilute with diluted hydrochloric acid to volume, and mix to obtain a solution having a known concentration of about $100 \mu \mathrm{~g}$ of selenium per mL .
Procedure-Prepare a test solution as follows. To 3.0 g of Sodium Sulfite add 10 mL of formaldehyde TS, and slowly and carefully add 2 mL of hydrochloric acid. Heat in a water bath for 20 minutes. In parallel prepare a Standard solution as follows. To 1.0 g of Sodium Sulfite add 0.2 mL of Selenium standard solution and 10 mL of formaldehyde TS, and slowly and carefully add 2 mL of hydrochloric acid. Heat in a water bath for 20 minutes. Any pink color in the test solution is not more intense than that in the Standard solution: not more than $10 \mu \mathrm{~g}$ per g is found.

Limit of thiosulfates-To 2.0 g of Sodium Sulfite add 100 mL of water. Shake to dissolve, and add 10 mL of formaldehyde TS and 10 mL of acetic acid. Allow to stand for 5 minutes. Add 0.5 mL of starch TS and titrate with 0.1 N iodine VS. Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ), and note the difference in volumes required: the difference is not more than 0.15 mL (0.1\%).

## Limit of zinc-

Zinc standard stock solution-Prepare a solution containing 1 mL of acetic acid and the amount of zinc sulfate equivalent of 0.440 g of $\mathrm{ZnSO}_{4} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ in 100.0 mL of water. [NOTE-This solution contains the equivalent of $1000 \mu \mathrm{~g}$ of Zn per mL .]

Zinc standard solutions-Dilute a volume of the Zinc standard stock solution quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $25 \mu \mathrm{~g}$ of zinc per mL . Transfer 1.0$\mathrm{mL}, 2.0-\mathrm{mL}$, and $4.0-\mathrm{mL}$ portions of this solution to separate $100-\mathrm{mL}$ volumetric flasks. Dilute the contents of each flask with water to volume, and mix to obtain solutions having known concentrations of about $0.25 \mu \mathrm{~g}$ of zinc per mL , $0.5 \mu \mathrm{~g}$ of zinc per mL , and $1.0 \mu \mathrm{~g}$ of zinc per mL , respectively.

Test solution-To 10.0 g of Sodium Sulfite add 25 mL of water. Shake until mostly dissolved, and carefully and slowly add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL . Transfer 2.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Procedure-Concomitantly determine the absorbances of the Zinc standard solutions and the Test solution at the zinc emission line at 213.9 nm with an atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ), equipped with a zinc hollow-cathode lamp and an air-acetylene flame. Plot the absorbances of the Zinc standard solutions versus concentration of zinc, in $\mu \mathrm{g}$ per mL , and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration of zinc, in $\mu \mathrm{g}$ per mL , in the Test solution: not more than $25 \mu \mathrm{~g}$ per g is found.

Assay-Transfer about 250 mg of Sodium Sulfite, accurately weighed, to a $500-\mathrm{mL}$ beaker, add 50.0 mL of 0.1 N iodine VS, and shake to dissolve. Add 1 mL of starch TS, and titrate with 0.1 N sodium thiosulfate VS to a clear endpoint. Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ), and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 6.30 mg of $\mathrm{Na}_{2} \mathrm{SO}_{3 \cdot \mathbf{\Delta N F 2 3}}$

## Briefing

Sodium Tartrate. Because there is no existing $N F$ monograph for this excipient, a new monograph is being proposed. This new monograph is based on the Sodium Tartrate monograph in the Food Chemicals Codex V and related monographs from the $7^{\text {th }}$ Session of the Joint FAO/WHO Expert Committee on Food Additives.
(EMC: K. Russo) RTS-40209-4

## Add the following:

## ${ }^{\Delta}$ Sodium Tartrate

$\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{Na}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O} \quad 230.08$
Disodium L-tartrate.
Disodium (+)-2,3-dihydroxybutanedioic acid [868-188].
» Sodium Tartrate contains not less than 99.0 percent and not more than 100.5 percent of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{Na}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, calculated on the dried basis.

## Packaging and storage-Store in a tight container.

## Identification-

A: Responds to the tests for Sodium $\langle 191\rangle$.
B: Responds to the tests for Tartrate $\langle 191\rangle$.
$\mathbf{p H}\langle 791\rangle$ : between 7 and 9 ( 1 in 10 solution).
Loss on drying $\langle 731\rangle$-Dry it at $150^{\circ}$ for 3 hours: it loses between $14.0 \%$ and $17.0 \%$ of its weight.

Heavy metals, Method $I\langle 231\rangle: 0.002 \%$.
Limit of oxalate-Dissolve 1.0 g of Sodium Tartrate in 10 mL of water, then add 5 drops of diluted acetic acid and 2 mL of calcium chloride TS: no turbidity develops within 1 hour. Not more than $0.1 \%$ is found.

Assay-Transfer about 250 mg of Sodium Tartrate, accurately weighed and previously dried at $150^{\circ}$ for 3 hours, to a $250-\mathrm{mL}$ beaker, and dissolve by stirring and heating to near the boiling point in 150 mL of acetic acid. Cool the solution to room temperature. Titrate with 0.1 N perchloric acid VS (in glacial acetic acid), determining the endpoint potentiometrically. Perform a blank determination, and make any necessary adjustments (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N perchloric acid is equivalent to 9.703 mg of $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{Na}_{2} \mathrm{O}_{6 \cdot \boldsymbol{\wedge} F 23}$

## Briefing

Succinic Acid. Because there is no existing $N F$ monograph for this excipient, a new monograph is being proposed. This new monograph is based on the Succinic Acid monograph in the Food Chemicals Codex V.
(EMC: K. Russo) RTS-40209-3

## Add the following:

## $\triangle$ Succinic Acid

$\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{4} \quad 118.09$
Butanedioic acid [110-15-6].
» Succinic Acid contains not less than 99.0 percent and not more then 100.5 percent of $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{4}$.

Packaging and storage-Store in a well-closed container. Identification-Place a drop of a saturated solution of the sample in a micro test tube, and add a drop of ammonium chloride solution ( 0.5 in 100) and several mg of zinc powder. Cover the mouth of the tube with a disk of filter paper moistened with a solution in hexane containing $p$-dimethylaminobenzaldehyde (5 in 100) and trichloroacetic acid (20 in 100). Heat with a small flame for about 1 minute: a pink to red-violet stain appears on the paper.

Melting range $\langle 741\rangle$ : between 185.0 and 190.0.
Residue on ignition $\langle 281\rangle$ : not more than $0.025 \%$.
Heavy metals, Method $I\langle 231\rangle: 0.002 \%$.
Assay-Dissolve about 250 mg , accurately weighed, in 25 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS and titrate with 0.1 N sodium hydroxide VS to the production of a permanent pink color. Each mL of 0.1 N sodium hydroxide is equivalent to 5.905 mg of $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{4 \cdot \boldsymbol{\Delta} \text { NF23 }}$

## Method III

pH 3.5 Acetate Buffer-Prepare as directed under Method I.
Standard Preparation-Transfer a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask, and add a further volume of nitric acid equal to the incremental volume of nitric acid added to the Test Preparation. Heat the solution to the production of dense, white fumes, cool, cautiously add 10 mL of water and, if hydrogen peroxide was used in treating the Test Preparation, add a volume of 30 percent hydrogen peroxide equal to that used for the substance being tested, and boil gently to the production of dense, white fumes. Again cool, cautiously add 5 mL of water, mix, and boil gently to the production of dense, white fumes and to a volume of 2 to 3 mL . Cool, dilute cautiously with a few mL of water, add 2.0 mL of Standard Lead Solution (20 $\mu \mathrm{g}$ of Pb ), and mix. Transfer to a $50-\mathrm{mL}$ color-comparison tube, rinse the flask with water, adding the rinsing to the tube until the volume is 25 mL , and mix.

Test Preparation-
${ }^{\Delta}$ Unless otherwise indicated in the individual monograph, use a quantity, in g , of the substance to be tested as calculated by the formula:
in which $L$ is the Heavy metals limit, as a percentage. $\triangle$ USP28 If the substance is a solid-Transfer the
$\Delta_{\text {weighed }}^{\text {USP28 }}$
quantity of the test substance sper in swh
$\Delta_{\triangle U S P 28}$
to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask. [NOTE-A $300-\mathrm{mL}$ flask may be used if the reaction foams excessively.] Clamp the flask at an angle of $45^{\circ}$, and add a sufficient quantity of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to moisten the substance thoroughly. Warm gently until the reaction commences, allow the reaction to subside, and add additional portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat, and boil gently until the solution darkens. Cool, add 2 mL of nitric acid, and heat again until the solution darkens. Continue the heating, followed by addition of nitric acid until no further darkening occurs, then heat strongly to the production of dense, white fumes. Cool, cautiously add 5 mL of water, boil gently to the production of dense, white fumes, and continue heating until the volume is reduced to a few mL . Cool, cautiously add 5 mL of water, and examine the color of the solution. If the color is yellow, cautiously add 1 mL of 30 percent hydrogen peroxide, and again evaporate to the production of dense, white fumes and a volume of 2 to 3 mL . If the solution is still yellow in color, repeat the addition of 5 mL of water and the peroxide treatment. Cool, dilute cautiously with a few mL of water, and rinse into a $50-\mathrm{mL}$ color-comparison tube, taking care that the combined volume does not exceed 25 mL .
If the substance is a liquid-Transfer the
$\Delta_{\text {weighed }}{ }_{\text {USP28 }}$
quantity of the test substance specified in the individual menograh

to a clean, dry, $100-\mathrm{mL}$ Kjeldahl flask. [NOTE-A $300-\mathrm{mL}$ flask may be used if the reaction foams excessively.] Clamp the flask at an angle of $45^{\circ}$, and cautiously add a few mL of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid. Warm gently until the reaction commences, allow the reaction to subside, and proceed as directed for If the substance is a solid, beginning with "add additional portions of the same acid mixture."
${ }^{\Delta}$ Monitor Preparation-Proceed with the digestion using the same amount of sample and the same procedure as directed in the Test Preparation until the step "Cool, dilute cautiously with a few mL of water." Add 2.0 mL of Lead Standard Solution ( $20 \mu \mathrm{~g}$ of lead), and mix. Transfer to a $50-\mathrm{mL}$ color comparison tube, rinse the flask with water, adding the rinsing to the tube until the volume is

25 mL , and mix. $\triangle$ USP28
Procedure-Treat the Test Preparation, the Standard Preparation
$\boldsymbol{a n d}_{\text {and }}$ the Monitor Preparation $\mathbf{\Delta U S P 2 8}$ as follows: Adjust

tion-Acetonitrile RS. USP Alcohol Determination-Alco-

## hol $R S_{.}$_USP28

Apparatus-Under typical conditions, use a gas chromatograph equipped with a flame-ionization detector and a $1.8-\mathrm{m} \times$ 4-mm (ID) glass column packed with 100- to 120-mesh chromatographic column packing No. S3, using nitrogen or helium as the carrier. Prior to use, condition the column overnight at $235^{\circ}$ with a slow flow of carrier gas. The column is maintained at $120^{\circ}$, and
the injection port and detector are maintained at $210^{\circ}$. Adjust the carrier flow and temperature so that acetonitrile, the internal standard, elutes in 5 to 10 minutes.
Solutions-
Standard Solution- Dilute 5.0 mL of dehy drated aleohol with water to 250 mL .
Internal Standtud Solution- Dilute 5.0 mL of acetonitrile with water to 250 mL .

- $\triangle$ USP28

Test Stock Preparation-Dilute the specimen under examination stepwise with water to obtain a solution containing approximately $2 \%(\mathrm{v} / \mathrm{v})$ of alcohol.

Test Preparation-Pipet 10 mL each of the Test Solland the Internal Standed Solution into a 100 mL
$\Delta 5 \mathrm{~mL}$ each of the Test Stock Preparation and the USP Alcohol Determination-Acetonitrile RS [NOTE-Alternatively, a $2 \%$ aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution.] into
a $50-\mathrm{mL}$
volumetric flask, and dilute with water to volume.
Standard Preparation-Pipet 10 mL - of the Star tion and the Internal Standerd Solution into a 100 -mb
$\triangle 5 \mathrm{~mL}$ each of the USP Alcohol Determination-Alcohol RS and the USP Alcohol Determination-Acetonitrile RS
[NOTE-Alternatively, a $2 \%$ aqueous solution of acetonitrile of suitable quality may be used as the internal standard solu-
tion.] into a $50-\mathrm{mL}_{\mathbf{\Delta U P} 28}$
volumetric flask, dilute with water to volume, and mix.
Procedure-Inject about $5 \mu \mathrm{~L}$ each of Test Preparation and Standard Preparation, in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol ( $\mathrm{v} / \mathrm{v}$ ) in the specimen under test according to the formula:

$$
2 R_{6} P / R_{8}
$$

$$
{ }^{\mathbf{\Delta}} C D\left(R_{U} / R_{S}\right), \mathbf{\Delta U S P 2 8}
$$

in which
${ }^{\Delta} C$ is the labeled concentration of USP Alcohol Determina-
tion-Alcohol RS; ${ }_{\mathbf{\Delta S S P 2 8}}$
$D$ is the dilution factor (the ratio of the volume of the Test Stock Preparation to the volume of the specimen taken); and $R_{U}$ and $R_{S}$ are the peak response ratios obtained for the Test Preparation and the Standard Preparation, respectively.

System Suitability Test-In a suitable chromatogram, the resolution factor, $R$, is not less than 2 ; the tailing factor of the alcohol peak is not greater than 1.5; and six replicate injections of the Standard Preparation show a relative standard deviation of not more than $2.0 \%$ in the ratio of the peak of alcohol to the peak of the internal standard.

Briefing
<621 Chromatography, USP 27 page 2272 and page 228 of PF 30(1) [Jan.-Feb. 2004]. On the basis of comments received, it is proposed to revise the section on Thin-Layer Chromatography in order to update the text in accordance with current technology.

## INTRODUCTION

This chapter defines the terms and procedures used in chromatography and provides general information. Specific requirements for chromatographic
${ }^{\boldsymbol{4}}$ procedures for ${ }_{\Delta U S P 28}$
drug substances and dosage forms, including adsorbent and developing solvents, are given in the individual monographs.

Chromatography is defined as a procedure by which solutes are separated by a dynamic differential migration process in a system consisting of two or more phases, one of which moves continuously in a given direction and in which the individual substances exhibit different mobilities by reason of differences in adsorption, partition, solubility, vapor pressure, molecular size, or ionic charge density. The individual substances thus
$\Delta_{\text {separated }}{ }_{\text {4SSP28 }}$
can be identified or determined by analytical methods.
© procedures. $\Delta$ USP28
The general chromatographic technique requires that a solute undergo distribution between two phases, one of them fixed (stationary phase), the other moving (mobile phase). It is the mobile phase that transfers the solute through the medium until it eventually emerges separated from other solutes that are eluted earlier or later. Generally, the solute is transported through the separation medium by means of a flowing stream of a liquid or a gaseous solvent known as the "eluant." The stationary phase may act through adsorption, as in the case of adsorbents such as activated alumina ; siliea gel, and ion exchange resins,
$\Delta_{\text {and silica gel, }}^{\mathbf{\Delta U S P 2 8}}$
or it may act by dissolving the solute, thus partitioning the latter between the stationary and mobile phases. In the latter proeess, a tiquid conting held on an inert support serves as the stationary phase.
${ }^{\boldsymbol{\Delta}}$ In the latter process, a liquid coated onto an inert support, or chemically bonded onto silica gel, or directly onto the wall of a fused silica capillary, serves as the stationary phase. $\triangle U S P 28$
Partitioning is the predominant mechanism of separation in gas-liquid chromatography, paper chromatography, and forms of column chromatography
$\boldsymbol{\Delta}_{\text {and thin-layer chromatography }}^{\mathbf{A S S P 2 8}}{ }$
designated as liquid-liquid ehromatography.
${ }^{\Delta}$ separation. $\triangle U S P 28$
In practice, separations frequently result from a combination of adsorption and partitioning effects.
${ }^{\Delta}$ Other separation principles include ion exchange, ion pair formation, size exclusion, hydrophobic interaction, and chiral recognition. $\triangle$ USP28
The types of chromatography useful in qualitative and quantitative analysis that are employed in the $U S P$
${ }^{\Delta}$ procedures ${ }_{\triangle U S P 28}$
are column, gas, paper, thin-layer,
© (including high-performance thin-layer chromatogra-
phy), ${ }_{\text {, USP28 }}$
and pressurized liquid chromatography (commonly called highpressure or high-performance liquid chromatography). Paper and thin-layer chromatography are ordinarily more useful for purposes of identification, because of their convenience and simplicity. Column chromatography offers a wider choice of stationary phases and is useful for the separation of individual compounds, in quantity, from mixtures. Both ehromatography and pressurized liv wid chromatography require more elaberate apparatus and usually provide high resolution metheds that will identify and quatitate very small amounts of material.
${ }^{\star}$ Modern high-performance thin-layer chromatography, gas chromatography, and pressurized liquid chromatography require more elaborate apparatus but usually provide high resolution and identify and quantitate very small amounts of material. $\triangle$ USP28

## Change to read:

Use of Reference Substances in Identity Tests-In paper and thin-layer chromatography, the ratio of the distance (this distance being measured to the point of maximum intensity of the spot
$\left.\Delta^{\text {or zone }}\right)_{\Delta U S P 28}$
traveled on the medium by a given compound to the distance traveled by the front of the mobile phase, from the point of application of the test substance, is designated as the $R_{F}$ value of the compound. The ratio between the distances traveled by a given compound and a reference substance is the $R_{R}$ value. $R_{F}$ values vary with the experimental conditions, and thus identification is best accomplished where an authentic specimen of the compound in question is used as a reference substance on the same chromatogram.

For this purpose, chromatograms are prepared by applying on the thin-layer adsorbent or on the paper in a straight line, parallel to the edge of the chromatographic plate or paper, solutions of the substance to be identified, the authentic specimen, and a mixture of nearly equal amounts of the substance to be identified and the authentic specimen. Each sample application contains approximately the same quantity by weight of material to be chromatographed. If the substance to be identified and the authentic specimen are identical, all chromatograms agree in color and $R_{F}$ value and the mixed chromatogram yields a single spot; i.e., $R_{R}$ is 1.0 .

## Change to read:

Location of Components-The spots
$\Delta^{\text {or zones }}{ }_{\Delta U S P 28}$
produced by paper or thin-layer chromatography may be located by the following: ( 1 ) direet inspection if the eompounds are visible tuder white or either short wavelength ( 254 nm ) or long wave-
length ( 360 nm ) UV light, (2) inspection in white or UV light after treatment with reagents that will make the spots visible (reagents are most conveniently applied with an atomizer), (3) use of a Gei ger Müller counter or auteradiographic techniques in the ease of the presence of radionctive-substanees, or (4) evidenee resulting from stimulation or inhibition of bacterial growth by the placing ef removed pertions of the adserbent and substance on inoeulated mediat.
© (1) direct inspection if the compounds are visible under white or either short-wavelength ( 254 nm , quenching of fluorescence of indicator) or long-wavelength ( 365 nm , self-fluorescence) UV light, (2) inspection in white or UV light after treatment (derivatization) with reagents that will make the substance visible (reagents are most conveniently applied by dipping the plate into the reagent solution or spraying such solution onto the plate with an atomizer), (3) scanning the plate prior to or after derivatization at any desired wavelength (in absorption or fluorescence mode) using a scanning densitometer, (4) use of a GeigerMüller counter or autoradiographic techniques in the case of the presence of radioactive substances, or (5) evidence resulting from biological activity (such as stimulation or inhibition of growth of microorganisms, bioluminescence, or biochemical reactions) by the placing of removed portions of the adsorbent and substance on inoculated media, or performing biochemical tests directly on the plate by covering the plate with, or dipping it into, a suspension of the biological test system. $\triangle$ USP28
In open-column chromatography, in pressurized liquid chromatography performed under conditions of constant flow rate, and in gas chromatography, the retention time, $t$, defined as the time elapsed between sample injection and appearance of the peak concentration of the eluted sample zone, may be used as a parameter of identification. Solutions of the substance to be identified or derivatives thereof, of the reference compound, and of a mixture of equal amounts of these two are chromatographed successively on the same column under the same chromatographic conditions. Only one peak should be observed for the mixture. The ratio of the retention times of the test substance, the reference compound, and a mixture of these, to the retention time of an internal standard is called the relative retention time $R_{R}$ and is also used frequently as a parameter of identification.

The deviations of $R_{R}, R_{F}$, or $t$ values measured for the test substance from the values obtained for the reference compound and mixture should not exceed the reliability estimates determined statistically from replicate assays of the reference compound.

Chromatographic identification by these methods under given conditions strongly indicates identity but does not constitute definitive identification. Coincidence of identity parameters under 3 to 6 different sets of chromatographic conditions (temperatures, column packings, adsorbents, eluants, developing solvents, various
chemical derivatives, etc.) increases the probability that the test and reference substances are identical. However, many isomeric compounds cannot be separated. Specific and pertinent chemical, spectroscopic, or physicochemical identification of the eluted component combined with chromatographic identity is the most valid criterion of identification. For this purpose, the individual components separated by chromatography may be collected for further identification
© or chromatographic separation may be combined with other analytical techniques. Some of those investigations (such as UV, IR, RAMAN, and MS) can also be made directly on the thin-layer chromatography plate. $\mathbf{\perp}$ USP28

## Change to read:

## THIN-LAYER CHROMATOGRAPHY

In thin-layer chromatography, the adsorbent is a relatively thin, uniform layer of dry, finely powdered material applied to a glass, plastic, or metal sheet or plate, glass plates being most commonly employed. The coated plate can be considered an "open chromatographic column" and the separations achieved may be based upon adsorption, partition, or a combination of both effects, depending on the particular type of suppert,
${ }^{\Delta}$ stationary phase, ${ }_{\mathbf{A}}$ USP28
its preparation, and its use with different solvents. Thin-layer chromatography on ion-exchange flms
$\Delta^{\text {layers }}{ }_{\Delta U S P 28}$
can be used for the fractionation of polar compounds. Presumptive identification can be effected by observation of spots
$\Delta_{\text {or zones }}{ }_{\text {USPP28 }^{28}}$
of identical ${ }_{R}{ }_{F}$ value and about equal magnitude obtained, respectively, with an unknown and a reference sample chromatographed on the same plate. A visual comparison of the size of the spots
${ }^{4}$ or intensity of the spots or zones ${ }_{\triangle U S P 28}$
may serve for semiquantitative estimation. Quantitative measurements are possible by means of densitometry, flteresenee, and fluorescence quenching;
(absorbance or fluorescence measurements), $\boldsymbol{\Delta U S P 2 8}$ or the spots may be carefully removed from the plate, followed by elution with a suitable solvent and spectrophotometric measurement. For two-dimensional thin-layer chromatography, the chromatographed plate is turned at a right angle and again chromatographed, usually in another chamber equilibrated with a different solvent system.

Apparatus-Acceptable apparatus and materials for thin-layer chromatography consist of the following.

Flat glass plates of convenient size, typieally $20 \mathrm{~cm} \times 20 \mathrm{~cm} .^{+}$
An aligning tray a flat surface upen which to align and rest the plates during the applieation of the adsorbent.

A storage rack to hold the prepared plates during drying and tramsportation. The rack holding the plates should be kept in a desiccater or be capable of being sealed in order to protect the plates from the enviremment after removal from the drying oven.
The adsorbent consists of finely divided adsorbent materials, normally 5 to -40 um in diameter, suitable for chromatography. It ean be applied directly to the glass plate or can be bended to the

[^67]plate by means of plaster of paris (hydrated calcium sulfate) [at a ratio of $5 \%$ to $15 \%]$ or with starch paste or other binders. The for mer will not yield as hard a surface as will the stareh, but it is not affected by strengly oxidizing spray reagents. The adsorbent may eontain fluorescing material to aid in the visualization of spots that absorb ultraviolet light.

A spreater, which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire strface of the plate.

Adeveloping ehamber that ean aceommodateoneor more plates and can be properly elosed and sealed as deseribed under Aseent ing Chromatogetyly. The chamber is fitted with a plate suppurt wack that supports the plates, back to back, with the lidof the chamber in place.

A template (generally made of plastic) to aid in placing the test spots at definite intervals, to mark distanees as needed, and to aid in tabeling the plates.

A graduat mieropipe capable of delivering $10 \mu \mathrm{~L}$ velumes. Fotal volumes of test and standard solutions are specified in the individual menegraph.
A reagent spratyer that will-emit a fine-spray and will not itself be attacked by the reagent.

An ultraviolet light source suitable for observations with short $(254 \mathrm{~nm})$ and long ( 360 nm ) UV wavelengths.
${ }^{\triangle} \mathrm{A}$ TLC or HPTLC plate. The chromatography is generally carried out using precoated plates or sheets (on glass, aluminum, or polyester support) of suitable size. It may be necessary to clean the plates prior to separation. This can be done by migration of, or immersion in, an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion, or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at $120^{\circ}$ for 20 minutes. The stationary phase of TLC plates has an average particle size of $10-15 \mu \mathrm{~m}$, and that of HPTLC plates an average particle size of $5 \mu \mathrm{~m}$. Alternatively flat glass plates of convenient size, typically 20 $\mathrm{cm} \times 20 \mathrm{~cm}$ can be coated as described under Preparation of Chromatographic Plates.

A suitable manual, semiautomatic, or automatic application device can be used to ensure proper positioning of the plate and proper transfer of the sample, with respect to volume and position, onto the plate. Alternatively, a template can be used to guide in manually placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates. For the proper application of the solutions, micropipets, microsyringes, or calibrated disposable capillaries are recommended.

For ascending development, a chromatographic chamber made of inert, transparent material and having the following specifications is used: a flat bottom or twin trough, a tightly fitted lid, and a size suitable for the plates. For horizontal development, the chamber is provided with a reservoir for the mobile phase, and it also contains a device for directing the mobile phase to the stationary phase.
Devices for transfer of reagents onto the plate by spraying, immersion, or exposure to vapor and devices to facilitate any necessary heating for visualization of the separated spots or zones.

A UV light source suitable for observations under short ( 254 nm ) and long ( 365 nm ) wavelength UV light.
A suitable device for documentation of the visualized chromatographic result.

Procedure-Apply the prescribed volume of the test solution and the standard solution in sufficiently small portions to obtain circular spots of 2 to 5 mm in diameter ( 1 to 2 mm on HPTLC plates) or bands of 10 to 20 mm by 1 to 2 mm ( 5 to 10 mm by 0.5 to 1 mm on HPTLC plates) at an appropriate distance from the lower edge-during chromatography the application position must be 3 mm (HPTLC) to 5 mm (TLC) above the level of the developing solvent-and from the sides of the plate. Apply the solutions on a line parallel to the lower edge of the plate with an interval of at least 10 mm ( 5 mm on HPTLC plates) between the centers of spots or 4 mm ( 2 mm on HPTLC plates) between the edges of bands, and allow to dry.
Ascending Development-Line at least one wall of the chromatographic chamber with filter paper. Pour into the chromatographic chamber a quantity of the mobile phase sufficient for the size of the chamber to give, after impregnation of the filter paper, a level of depth appropriate to the dimension of the plate used. For saturation of the chromato-
graphic chamber, close the lid, and allow the system to equilibrate. Unless otherwise indicated, the chromatographic separation is performed in a saturated chamber.

Place the plate in the chamber, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase, and close the chamber. The stationary phase faces the inside of the chamber. Remove the plate when the mobile phase has moved over the prescribed distance. Dry the plate, and visualize the chromatograms as prescribed. For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Horizontal Development-Introduce a sufficient quantity of the developing solvent into the reservoir of the chamber using a syringe or pipet. Place the plate horizontally in the chamber, connect the mobile phase direction device according to the manufacturer's instructions, and close the chamber. If prescribed, develop the plate starting simultaneously at both ends. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate, and visualize the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Detection-Observe the dry plate first under short-wavelength UV light ( 254 nm ) and then under long-wavelength UV light ( 365 nm ) or as stated in the monograph. If further directed, spray, immerse, or expose the plate to vapors of the specified reagent, heat the plate when required, observe, and compare the test chromatogram with the standard chromatogram. Document the plate after each observation. Measure and record the distance of each spot or zone from the point
of origin, and indicate for each spot or zone the wavelength under which it was observed. Determine the $R_{F}$ values for the principal spots or zones (see Glossary of Symbols).

Quantitative Measurement-Using appropriate instrumentation, substances separated by TLC and responding to ultraviolet-visible (UV-Vis) irradiation prior to or after derivatization can be determined directly on the plate. While moving the plate or the measuring device, the plate is examined by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate optical system. Substances containing radionuclides can be quantified in three ways: (1) directly by moving the plate alongside a suitable counter or vice versa; (2) by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter; or (3) by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail, and measuring the radioactivity using a liquid scintillation counter (see Radioactivity $\langle 821\rangle$ ).

The apparatus for direct quantitative measurement on the plate is a densitometer that is composed of a mechanical device to move the plate or the measuring device along the x axis and the $y$-axis, a recorder, a suitable integrator or a computer; and, for substances responding to UV-Vis irradiation, a photometer with a source of light, an optical device capable of generating monochromatic light, and a photo cell of adequate sensitivity, all of which are used for the measurement of reflectance. In the case where fluorescence is measured, a suitable filter is also required to prevent the light used for excitation from reaching the photo cell while permitting the emitted light or specific portions thereof to pass. The linearity range of the counting device must be verified.

For quantitative tests, it is necessary to apply to the plate not less than three standard solutions of the substance to be examined, the concentrations of which span the expected
value in the test solution (e.g., $80 \%, 100 \%$, and $120 \%$ ). Derivatize with the prescribed reagent, if necessary, and record the reflectance or fluorescence in the chromatograms obtained. Use the measured results for the calculation of the amount of substance in the test solution.

## Preparation of Chromatographic Plates-

## Apparatus-

Flat glass plates of convenient size, typically $20 \mathrm{~cm} \times 20$
cm .
An aligning tray or a flat surface upon which to align and rest the plates during the application of the adsorbent.
A storage rack to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The adsorbent consists of finely divided adsorbent materials, normally 5 to $40 \mu \mathrm{~m}$ in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of Paris (calcium sulfate hemihydrate [at a ratio of $5 \%$ to $15 \%$ ]) or with starch paste or other binders. The plaster of Paris will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb UV light.
A spreader, which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over
the entire surface of the plate. USP28
Procedure- [NOTE-In this procedure, use purified water that is obtained by distillation.] Clean the
-glass $_{\triangle U S P 28}$
plates scrupulously, as by immersion in chremic acidecernsing mixtere,
${ }^{\Delta}$ using an appropriate cleaning solution (see Cleaning Glass
Apparatus $\langle 1051\rangle$ ),
rinsing them with copious quantities of water until the water runs off the plates without leaving any visible water or oily spots, then dry. It is important that the plates be completely free from lint and dust when the adsorbent is applied.

Arrange the plate or plates on the aligning tray, place a 5- $\times 20-$ cm plate adjacent to the front edge of the first square plate and another $5-\times 20-\mathrm{cm}$ plate adjacent to the rear edge of the last square, and secure all of the plates so that they will not slip during the application of the adsorbent. Position the spreader on the end plate opposite the raised end of the aligning tray. Mix 1 part of adsorbent with 2 parts of water (or in the ratio suggested by the supplier) by shaking vigorously for 30 seconds in a glass-stoppered conical flask, and transfer the slurry to the spreader. Usually 30 g of adsorbent and 60 mL of water are sufficient for five $20-\times 20-\mathrm{cm}$ plates. Complete the application of adsorbents using plaster of Paris binder within 2 minutes of the addition of the water, because thereafter the mixture begins to harden. Draw the spreader smoothly over the plates toward the raised end of the aligning tray, and remove the spreader when it is on the end plate next to the raised end of the aligning tray. (Wash away all traces of adsorbent from the spreader immediately after use.) Allow the plates to remain undisturbed for 5 minutes, then transfer the square plates, layer side up, to the storage rack, and dry at $105^{\circ}$ for 30 minutes. Preferably place the rack at an angle in the drying oven to prevent the condensation of moisture on the back sides of plates in the rack. When the plates are dry, allow them to cool to room temperature, and inspect the uniformity of the distribution and the texture of the adsorbent layer; transmitted light will show uniformity of distribution, and reflected light will show uniformity of texture. Store the satisfactory plates over silica gel in a suitable chamber.
Place two flter paper wieks, 18 cm in height and as wide as the length of the developing chamber, into the chamber, add about 100 mL of the solvent (sufficient to have a depth of 5 to 10 mm at the bottom of the chamber), seal the cover to the top of the chamber, and allow the system to equilibrate; it is essential that the wieks become completely wet. Alternatively, the chamber may be completely lined with filter paper. In either ease, assure that the fllter paper dips int the solvent at the bettem of the chamber. Where rapor saturation of the chamber by these methods is undesirable, it is so indiented in the individual menograph.

Apply the test solution and the standard solution, as direeted in the individual menegraph, at peints abeut 1.5 em apart and about 2 em from the lower edge of the plate (the lower edge is the first part over which the spreader moved in the application of the adsorbent fayer), and allow to dry. Aveid physieal disturbance of the adsor bent during the spetting procedure (by the pipet or other applicator) or when handling the plates. The template will aid in determining the spet peints and the 10 to 15 em distance through whieh the solvent fromt should pass.

Place a mark 10 to 15 em abeve the spet peint. Arrange the plate en the supperting rack (test spets toward the bottom), and introduce the rack into the developing chamber. Allow the solvent in the chamber to reach the lower edge of the adsorbent, but do not allow the spet peints to be immersed. Put the cover in place, and maintain the system matil the solvent aseends to a point 10 to 15 cm above the initial spets, this usually requires about 15 minutes to 1 hour. Remove the plate from the developing chamber, mark the solvent front, air dry the plates, and observe first under short wavelength UV light ( 254 mm ) and then under long wavelength UV light $(360 \mathrm{~nm})$. Measure and record the distance of each spot from the peint of origin, and indiente for each spe the wavelength under which it was observed. Determine the $R_{F}$ values for the principat spets (see Glossaty of Symbels). If futher directed, spray the spets with the reagent specified, observe, and compare the test chromatogram with the standard chromatogram.

## Contintous-Development Thin-Layer Chromatography

In contrast to conventional thin layer chromatography, which is earried out in a closed tank, the eontintrous development or continyous flow technique allows the upper end of the plate to project
through a slot in the cover of the developing chamber. When the developing solvent reaches the slot, continuous evaporation-0ceurs, producing a steady flow of solvent over the plate. In conventional thin layer chromatography, spet migration ceases when the solvent reaches the top of the plate, after which the spots simply enlarge by diffusion. In the continteus flow process, spet migration contintes as long as the plate remains in the tank and the develeping solvent is net exhatusted.

Development may be continted for several hours after the solvent reaches the top of the plate, to provide adequate migration of the spots. Ustally spots of a standardsolution, a test solution, and a mixture of equal amounts of test and standard solutions, are initially applied at a standard distance from the base of the plate. Iden tity of the standard and test substanees is conflirmed by their migrating equal distances from the origin and by the observation that the two substances applied as a mixture show no tendeney to separate.

A major advantage of contintrous development thin layer ehromatography stems from the greater solvent selectivity for sol vents of low solvent strength. Solvent strength refers to the propery of a developing solvent that causes solutes to migrate, and it is strongly influeneed by the polarity of the solvent. Inereasing the solvent strength by adding a more polar solvent eauses the $R_{t}$ walue to increase. Solvent selectivity refers to the ability of a solvent system to produre differen $R_{\text {F }}$ values for closely related substances. In eonventional thin layer chromatography, a solvent system giving an $R_{F}$ value in the range of 0.3 to 0.7 , but with adequate selectivity to permit separation of the substanees being examined is usually selected. It is math easier to find solvent systems produring adequate migration than to find those affording adequate selectivity.

Solvent systems of lower strength generally exhibit higher selec tivity, but are diffieult to employ in conventional thin layer ehrematography beeatse they result in very little migration before the solvent reaches the top of the plate. Migration may be in ereased, however, by repeated drying and redevelopment of the plate or, more conveniently, by providing means for ovaperation of solvent at the top of the plate, whieh results in continurus devel epment. Two techniques are used: contintuous development and short bed continuous development thin layer chrematography.

An $R_{\text {F }}$ value cannot be measured in continuous development thin layer ehrematography. Substances may be compared either by their migration distance over a fixed period of time or by comparisen with the migration of a standard substance applied to the plate.

## GONTINUOUS DEVELOPMENT

Apparatus. Aeceptable apparatus and materials for contintuens development thin layer chromatography are the same as those deseribed under conventional Thin Layer Chromagraphy, exeeptas follows.

Adeveloping ehamber is use that eonsists of a reetangular tank, approximately $23 \mathrm{~cm} \times 23 \mathrm{~cm} \times 9 \mathrm{~cm}$, equipped with a glass solvent trough and a platform about 3.75 em high to elevate the solvent trough above the base of the tank. The chamber is fitted with a cover having a $21 \times 6 \mathrm{~cm}$ slot in the front edge.

Proeedure- Apply the standard solution, the test solution, and a mixture of equal amounts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the ele ated empty solvent treugh with the adsorbent en the underside of the leaning plate. The adsorbent rests against a piece of heary (about 1 mm thick) ${ }^{2}$ flter paper measuring $20 \mathrm{~cm}-$ 3 cm , folded lengthwise and placed over the front edge of the tank. Place the developing solvent in the trough; set the cover in place, and seal all openings exeept where the adsorbent contacts the paper wiek. The plate extends about $1-\mathrm{em}$ beyond the top of the tank.

[^68]After the solvent reaches the top of the plate, allow development to eontinue for an appropriate time. Then remove and dry the plate, and detect the spots by suitable means.

## SHORT BED-CONTINUOUS DEVELOPMENT

A major advantage of the short bed technique derives frem the faet that solvent velocity is inversely related to bed length. Since spot migration depends upon the otal amount of solvent passing over the plate, the short bed permits useful migration to be ob tained in a reasonable time with solvent having very low solvent strength. Lower diffusion in solvents of low solvent strength produres smaller and mere dense spets, which enhanees beth detect ability and diseermment of small differenees in migration distanee.
Apparatus Aceeptable apparatus and materials for short bed eontintrus development thin layer chromatography are the same as these described under conventional Thin Latyer Chrematog raphy, except as follows.

A shallow developing chamber ${ }^{3}$ approximately $22 \mathrm{~cm}-9 \mathrm{~cm}$ $* 3 \mathrm{~cm}$, equipped with a cover plate and tight fitting polytef wings that enable the chamber to be sealed against the plate, is used. The inside bettom of the chamber contains ridges that suppert the plate and allow it to be inserted at different angles, thereby warying the length of the plate contained within the tank.

Procedure Apply the standard solution, the test solution, and a mixture of equal parts of the standard solution and the test solut tion to a line about 2 cm from the base of the plate. Place the plate in the developing chamber (adsorbent side up), and add the devel eping solvent to the chamber. No paper wiek is employed. After the solvent reaches the top of the plate, allow development to cont tince for an appropriate time. Then remove and dry the plate, and detect the spets by suritable means.

## SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the resolution and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

The resolution, $R$, [NOTE-All terms and symbols are defined in the Glossary of Symbols] is a function of column efficiency, $N$, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation,

[^69]$S_{R}$, if the requirement is $2.0 \%$ or less; data from six replicate injections are used if the relative standard deviation requirement is more than $2.0 \%$.
The tailing factor, $T$, a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see Fig. 2). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

Fig. 2. Asymmetrical chromatographic peak.
These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see Procedures under Tests and Assays in the General Notices). Adjustments of operating eonditions to meet system suit ability requirements may be neeessary.
${ }^{\Delta}$ If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum specification that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when Referene Standards suitable standards (including Reference Standards) are available for all lytes compounds used in the suitability test and are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.
pH of Mobile Phase (HPLC)-The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within $\pm 0.2 \pm 0.5$ units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within $\pm 10 \%$, provided the permitted pH variation (see above) is met.

## Ratio of Components in Mobile Phase (HPLC) The

ameunt of the miner The following adjustment limits apply to minor components of the mobile phase (specified at $50 \%$ or less). The amount(s) of these component(s) can be adjusted by $\pm 30 \%$ relative or $\pm 2 \%$ absolute (i.e., in relation to the total mobile phase), whichever is larger. However, the change in any component cannot exceed $\pm 10 \%$ absolute, nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

## Binary Mixtures-

SPECIFIED RATIO OF 50:50-Thirty percent of 50 is $15 \%$ absolute, but this exceeds the maximum permitted change of $\pm 10 \%$ absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40:60 to $60: 40$.

SPECIFIED RATIO OF 95:5-Thirty percent of 5 is $1.5 \%$ absolute. However, because adjustments up to $\pm 2 \%$ absolute are allowed, the ratio may be adjusted within the range of 93:7 to 97:3.

SPECIFIED RATIO OF 2:98-Thirty percent of 2 is $0.6 \%$ absolute. In this case an absolute adjustment of $\pm 2 \%$ is not allowed because it would reduce the amount of the first component to zero. Therefore the maximum allowed adjustment is within the range of 1.4:98.6 to 2.6:97.4.

## Ternary Mixtures-

SPECIFIED RATIO OF 60:35:5-For the second component, $30 \%$ of 35 is $10.5 \%$ absolute, which exceeds the maximum permitted change of $\pm 10 \%$ absolute in any component.

Therefore the second component may be adjusted only within the range of $25 \%$ to $45 \%$ absolute. For the third component, $30 \%$ of 5 is $1.5 \%$ absolute. Since $\pm 2 \%$ absolute is permitted and provides more flexibility, the third component may be adjusted within the range of $3 \%$ to $7 \%$ absolute. In all cases, a sufficient quantity of the first component is used to give a total of $100 \%$. Therefore, mixture ranges of 50:45:5 to 70:25:5 or 58:35:7 to 62:35:3 would meet the requirement.

## Detar Wavelength of UV-Visible Detector

(HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, $\pm 3 \mathrm{~nm}$.

Column Length (GC, HPLC): can be adjusted by as much as $\pm 70 \%$. $-50 \%$ to $+100 \%$.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as $\pm 25 \% 50 \% . \pm 25 \%$ for HPLC and $\pm 50 \%$ for GC.

Film Thickness (Capillary GC): can be adjusted by as much as $-50 \%$ to $+100 \%$.

Particle Size (HPLC): can be reduced by as much as 50\%.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as $\pm 50 \%$.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. It
provided there-are no adverse-effects-on facters such as baseline, peak shapes, resolution, linearity, and retention times.

Column Temperature (HPLC): can be adjusted by as much as $\pm 20^{\circ} . \pm 10^{\circ}$. Column thermostating is recommended to improve control and reproducibility of retention time.

Column Temperature (GC): can be adjusted by as much as $\pm 2 \%$ in terms of abselute temperature. $\pm 10 \%$.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to $\pm 20 \%$ is permitted.

Gradient Elution (HPLC)—The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column. USPP28 $^{\text {Und }}$
Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.
To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.
The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails
$\Delta_{\text {System suitability }}^{\text {AUSP28 }^{\text {U }}}$
requirements are unacceptable.

## CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE-Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category
of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

## Packings

L1-Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L2-Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L3-Porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L4-Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L5-Alumina of controlled surface porosity bonded to a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L6-Strong cation-exchange packing-sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter. L7-Octylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L8-An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, $10 \mu \mathrm{~m}$ in diameter.

L9- $10-\mu \mathrm{m}$ irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating.

L10-Nitrile groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L11-Phenyl groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L12-A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to $50 \mu \mathrm{~m}$ in diameter.

L13-Trimethylsilane chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L14-Silica gel $10 \mu \mathrm{~m}$ in diameter having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating.
L15-Hexylsilane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L16-Dimethylsilane chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L17-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to $11 \mu \mathrm{~m}$ in diameter.

L18-Amino and cyano groups chemically bonded to porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L19-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about $9 \mu \mathrm{~m}$ in diameter.

L20-Dihydroxypropane groups chemically bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.
L21-A rigid, spherical styrene-divinylbenzene copolymer, 5 to $10 \mu \mathrm{~m}$ in diameter.

L22-A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about $10 \mu \mathrm{~m}$ in size.

L23-An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about $10 \mu \mathrm{~m}$ in size.

L24-A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to $63 \mu \mathrm{~m}$ in diameter. ${ }^{5}$

L25-Packing having the capacity to separate compounds with a molecular weight range from 100-5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-so-

[^70]luble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.
L26-Butyl silane chemically bonded to totally porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L27-Porous silica particles, 30 to $50 \mu \mathrm{~m}$ in diameter.
L28-A multifunctional support, which consists of a high purity, $100 \AA$, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29-Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 $\mu \mathrm{m}$ in diameter with a pore volume of $80 \AA$.

L30-Ethyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter.

L31-A strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of $8.5-\mu \mathrm{m}$ macroporous particles having a pore size of $2000 \AA$ and consisting of ethylvinylbenzene cross-linked with $55 \%$ divinylbenzene.

L32-A chiral ligand-exchange packing-L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L33-Packing having the capacity to separate dextrans by molecular size over a range of 4000 to $500,000 \mathrm{Da}$. It is spherical, silica-based, and processed to provide pH stability. ${ }^{6}$

L34-Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about $9 \mu \mathrm{~m}$ in diameter.

L35-A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of $150 \AA$.

L36-A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to $5-\mu \mathrm{m}$ aminopropyl silica.

L37-Packing having the capacity to separate proteins by molecular size over a range of 2,000 to $40,000 \mathrm{Da}$. It is a polymethacrylate gel.
L38-A methacrylate-based size-exclusion packing for watersoluble samples.

L39-A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40-Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to $20 \mu \mathrm{~m}$ in diameter.

L41-Immobilized $\alpha_{1}$-acid glycoprotein on spherical silica particles, $5 \mu \mathrm{~m}$ in diameter.

L42-Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, $5 \mu \mathrm{~m}$ in diameter.

L43-Pentafluorophenyl groups chemically bonded to silica particles
$\square$ by a propyl spacer, $\quad$ 1S (USP27)
5 to $10 \mu \mathrm{~m}$ in diameter.
L44-A multifunctional support, which consists of a high purity, $60 \AA$, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45-Beta cyclodextrin bonded to porous silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter.

L46-Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, $10 \mu \mathrm{~m}$ in diameter.

L47-High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, $8 \mu \mathrm{~m}$ in diameter. ${ }^{\text {? }}$

L48-Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, $15 \mu \mathrm{~m}$ in diameter.

[^71]L49-A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{8}$
L50-Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to $15 \mu \mathrm{~m}$ in diameter, and a surface area not less than $350 \mathrm{~m}^{2}$ per g . Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene. ${ }^{9}$
L51-Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{10}$
L52-A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{11}$
L53-Weak cation-exchange resin consisting of ethylvinylbenzene, $55 \%$ cross-linked with divinylbenzene copolymer, 3 to 15 $\mu \mathrm{m}$ diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than $500 \mu \mathrm{Eq} /$ column.

L54-A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 $\mu \mathrm{m}$ in diameter.
${ }^{\boldsymbol{\Delta}}$ L55-A strong cation-exchange resin made of porous silica coated with polybutadiene-maleic acid copolymer, about $5 \mu \mathrm{~m}$ in diameter. ${ }^{14} \Delta U S P 27$
${ }^{4}$ L56-Propyl silane chemically bonded to totally porous silica particles, 3 to $10 \mu \mathrm{~m}$ in diameter. ${ }^{15}{ }_{\Delta U S P 27}$
-L53 \#\# (Alendronic Acid Tablets, PRP-X100)—An an-ion-exchange resin consisting of a rigid, spherical styrenedivinylbenzene copolymer with trimethylammonium groups at a loading of about 2 mEq per $\mathrm{g}, 3$ to $20 \mu \mathrm{~m}$ in diameter. ${ }^{\mathrm{a}}{ }^{2 S}$ (USPP7)

[^72]-L54 \#\# (Maltose, Aminex HPX-87N)—Strong cationexchange resin consisting of sulfonated cross-linked styr-ene-divinylbenzene copolymer in the sodium form, about
7 to $11 \mu \mathrm{~m}$ in diameter. ${ }^{\mathrm{b}}{ }^{2 S}$ (USP27)
-L57 \#\# (Nevirapine, Supelcosil ABZ)—Spherical, porous silica gel, 3 or $5 \mu \mathrm{~m}$ in diameter, the surface of which has been covalently modified with palmitamidopropyl groups and endcapped with acetamidopropyl groups to a ligand density of about $6 \mu$ moles per $\mathrm{m}^{2}$. ${ }^{\mathrm{c}}$. ${ }^{2 S}$ (USP27)
-L58 \#\# (Albumin Human, Antithrombin III Human, TSKgel G3000 SW) -Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa . It is spherical ( $10 \mu \mathrm{~m}$ ), silica-based, and processed to provide hydrophilic characteristics and pH stability. ${ }^{\text {d }}$ 2S (USP27)
-L64 \#\# (Lycopene, Lycopene Preparation, YMC 30)C30 silane bonded phase on a fully porous spherical silica, 3 to $15 \mu \mathrm{~m}$ in diameter. $\boldsymbol{m}_{2 S}$ (USP27)
-L\#\# (Clopidogrel Bisulfate, Ultron ES-OVM)—A chir-al-recognition protein, ovomucoid, chemically bonded to silica particles, about $5 \mu \mathrm{~m}$ in diameter, with a pore size of $120 \AA$. $\mathbf{L S S}_{\text {(USP27) }}$
-L\#\# (Enoxaparin Sodium Injection, IonPac AG11)-[To come.] $]_{\text {2S (USP27) }}$
-L\#\# (Enoxaparin Sodium Injection, IonPac AS11)-[To come.] $]_{\text {2S (USP27) }}$
-L\#\# (Enoxaparin Sodium, Dowex 1X8)—[To come.] ${ }^{2 S}$ (USP27)
-L\#\# (Enoxaparin Sodium, Dowex 50WX2)—[To
come.] ${ }_{\text {WS }}$ (USP27)

## Phases

G1-Dimethylpolysiloxane oil.
G2-Dimethylpolysiloxane gum.
G3-50\% Phenyl-50\% methylpolysiloxane.
G4-Diethylene glycol succinate polyester.
G5-3-Cyanopropylpolysiloxane.
G6-Trifluoropropylmethylpolysiloxane.
G7-50\% 3-Cyanopropyl-50\% phenylmethylsilicone.
G8-80\% Bis(3-cyanopropyl)-20\% 3-cyanopropylphenylpoly-
siloxane (percentages refer to molar substitution).
G9-Methylvinylpolysiloxane.
G10-Polyamide formed by reacting a $\mathrm{C}_{36}$ dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00:0.90:0.20.

G11—Bis(2-ethylhexyl) sebacate polyester.
G12-Phenyldiethanolamine succinate polyester.
G13-Sorbitol.
G14-Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15-Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16-Polyethylene glycol compound (av. mol. wt. about 15,000 ). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.

G17-75\% Phenyl-25\% methylpolysiloxane.
G18-Polyalkylene glycol.
G19-25\% Phenyl-25\% cyanopropyl-50\% methylsilicone.
G20-Polyethylene glycol (av. mol. wt. of 380 to 420).
G21-Neopentyl glycol succinate.
G22-Bis(2-ethylhexyl) phthalate.
G23-Polyethylene glycol adipate.
G24-Diisodecyl phthalate.
G25-Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.

G26-25\% 2-Cyanoethyl-75\% methylpolysiloxane.
G27-5\% Phenyl-95\% methylpolysiloxane.
G28-25\% Phenyl-75\% methylpolysiloxane.
G29-3,3'-Thiodipropionitrile.
G30-Tetraethylene glycol dimethyl ether.
G31-Nonylphenoxypoly(ethyleneoxy) ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30 .

G32-20\% Phenylmethyl-80\% dimethylpolysiloxane.
G33-20\% Carborane-80\% methylsilicone.
G34-Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35-A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.

G36-1\% Vinyl-5\% phenylmethylpolysiloxane.
G37-Polyimide.
G38-Phase G1 containing a small percentage of a tailing inhibitor. ${ }^{16}$

G39—Polyethylene glycol (av. mol. wt. about 1500).
G40-Ethylene glycol adipate.
G41-Phenylmethyldimethylsilicone ( $10 \%$ phenyl-substituted).
G42-35\% phenyl-65\% dimethylpolysiloxane (percentages re-
fer to molar substitution).
G43-6\% cyanopropylphenyl-94\% dimethylpolysiloxane (percentages refer to molar substitution).

G44-2\% low molecular weight petrolatum hydrocarbon grease and $1 \%$ solution of potassium hydroxide.

G45-Divinylbenzene-ethylene glycol-dimethylacrylate.
G46-14\% Cyanopropylphenyl-86\% methylpolysiloxane.
G47-Polyethylene glycol (av. mol. wt. of about 8000).
G48-Highly polar, partially cross-linked cyanopolysiloxane.

[^73]■G49 Proprietary derivatized phenyl greups on a pelysilexane
backbene- ${ }^{\text {T }}$ 2S (USP27)
-G50 \#\# (Docosahexaenoic Acid)—Polyethylene glycol, cross-linked (av. mol. wt. of more than 20,000)..$^{\mathrm{e}} \mathbf{L S S}_{\text {(USP27) }}$

## Supports

NOTE--Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A-Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with $\mathrm{Na}_{2} \mathrm{CO}_{3}$ flux and calcining above $900^{\circ}$. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ${ }^{18}$ to mask surface silanol groups.
S1AB-The siliceous earth as described above is both acid- and base-washed. ${ }^{18}$

S1C-A support prepared from crushed firebrick and calcined or burned with a clay binder above $900^{\circ}$ with subsequent acidwash. It may be silanized.

S1NS-The siliceous earth is untreated.
S2-Styrene-divinylbenzene copolymer having a nominal surface area of less than $50 \mathrm{~m}^{2}$ per g and an average pore diameter of 0.3 to $0.4 \mu \mathrm{~m}$.

S3-Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to $600 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0075 \mu \mathrm{~m}$.

S4-Styrene-divinylbenzene copolymer with aromatic -O and N groups, having a nominal surface area of 400 to $600 \mathrm{~m}^{2}$ per $g$ and an average pore diameter of $0.0076 \mu \mathrm{~m}$.

S5-40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6-Styrene-divinylbenzene copolymer having a nominal surface area of 250 to $350 \mathrm{~m}^{2}$ per g and an average pore diameter of $0.0091 \mu \mathrm{~m}$.

S7-Graphitized carbon having a nominal surface area of $12 \mathrm{~m}^{2}$ per g.

S8-Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9-A porous polymer based on 2,6-diphenyl-p-phenylene oxide.

S10-A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g modified with $\mathrm{small}^{19}$ amounts of petrolatum and polyethylene glycol compound. ${ }^{19}$

S12-Graphitized carbon having a nominal surface area of 100 $\mathrm{m}^{2}$ per g .

## GENERAL CHAPTERS

## General Information

## BRIEFING

#### Abstract

$\langle 1043\rangle$ Ancillary Materials for Cell, Gene, and Tissue-Engineered Products. This new general information chapter is being proposed by the USP Expert Committee on Gene Therapy, Cell Therapy, and Tissue Engineering (GCT). Interested parties are encouraged to send in comments to USP headquarters by June 30, 2004 for consideration.

(GCT: I. DeVeau) RTS-40763-1

## Add the following:

- $\langle 1043\rangle$ ANCILLARY MATERIALS FOR CELL, GENE, AND TISSUE-ENGINEERED PRODUCTS

## INTRODUCTION

A wide variety of reagents and materials, many of which are unique or complex, are required for the manufacture of cell, gene, and tissue-engineered products. These materials include plasma- or serum-derived products, biological extracts, antibiotics, cytokines, culture media, antibodies, polymeric matrices, separation devices, density gradient media, toxins, conditioned media supplied by "feeder cell layers", fine chemicals, enzymes, and processing buffers. Many of these items are used to ensure the survival and promote the growth of certain cell populations, although their mechanism of action may not be entirely understood. Examples include fetal bovine serum (FBS) and various media supplements. Other items, such as highly purified cholera toxin, are introduced into the processing stream during man-
ufacturing to exert a specific biochemical effect and are immediately washed out in subsequent processing steps to avoid unwanted toxicity at a later point. The finished biological products produced in such processes are often complex mixtures that, in some cases, cannot be completely characterized. Careful scrutiny of the materials used in manufacturing is necessary to prevent the introduction of adventitious agents or toxic impurities, as well as to ensure the ultimate safety, effectiveness, and consistency of the final product.

In cell, gene, and tissue-engineered product manufacturing, these reagents and materials are collectively called ancillary materials (AMs). AMs have also been referred to as ancillary products, ancillary reagents, processing aids, and process reagents. AMs were first discussed under the synonym ancillary products in the U.S. Food and Drug Administration Notice, "Application of Current Statutory Authorities to Human Somatic Cell Therapy Products and Gene Therapy Products" (Federal Register 58(197), October 14, 1993, pp. 53248-53251). This document established the FDA's authority to regulate human somatic cell therapy products and gene therapy products. AMs are also synonymous with "processing materials" that were defined in 21 CFR Part 1271, "Current Good Tissue Practice for Manufacturers of Human Cellular and Tissue-Based Products; Inspection and Enforcement; Proposed Rule" (Federal Register 66(5), January 8, 2001, pp. 1508-1559). AMs can be analogous to "components", and in some cases, "containers" as described in the current good manufacturing practice (cGMP) regulations for finished pharmaceuticals as outlined in 21 CFR 211.80 through 211.94 and 211.101(b) and (c).

The defining property of AMs is that they are not intended to be present in the final product. They are materials used as processing and purification aids or agents that exert their ef-
fect on the therapeutic substance. Materials or components that are intended to be in the final product dosage form (e.g., genetic materials, biopolymeric supports, physiological buffers) are not AMs. Cell banks and virus banks are also not considered AMs; there are a number of guidances that describe requirements for their certification. However "helper" viruses and "helper" plasmids may be considered AMs when they are not intended to be part of the final product.

The quality of an AM can affect the stability, safety, potency, and purity of a cell, gene, or tissue-engineered product. For example, the mechanism by which an AM exerts its effect may not be known, and the impact of normal variation of the AM on the quality and safety of the therapeutic product may not be understood. Alternatively, AMs of human or animal origin may present an infectious disease transmission risk. Other AMs, if administered to humans, may cause an immune reaction. Finally, an AM with toxic properties that is introduced into a manufacturing process and is not adequately removed in subsequent processing steps will expose the patient to a toxic substance and may impair the effectiveness of the therapeutic entity. These risks to the quality and safety of the therapeutic product are often heightened with cell, gene, and tissue-engineered products, due to the limited ability to conduct extensive in-process and release tests. For example, lack of in-process holding steps or limited shelf life may create the need to administer the cell, gene, or tissue-engineered products before in-process or final-release testing results are available. In other cases, the scarcity of suitable donor tissue or the complex logistics in the transport of biological materials may limit the amount of material available for testing. To minimize these risks, whenever possible, it is necessary to implement rigorous material qualification and prudent application of manufacturing process controls.

Frequently, these novel therapeutic products are created using complicated biological processes. The AMs employed in these procedures may be selected primarily for their unique functional contributions or biological effects. Whenever possible, it is preferable to source AMs that are approved or licensed therapeutic products because they are well characterized, have an established toxicological profile, and are manufactured according to controlled and documented procedures. Conversely, the AM may be intended "for research use" and may, therefore, lack the level of qualification necessary for use in the production of a therapeutic product. In either case, the manufacturer of the cell, gene, or tissue-engineered product should develop comprehensive and scientifically sound qualification plans to ensure the traceability, consistency, suitability, purity, and safety of the AM. In cases where AMs are products approved for use for therapeutic purposes, the level of qualification will probably be less extensive than that for a material intended for research purposes. However, their suitability in the manufacturing process will still need to be established when the AM is being used beyond the scope of its intended use or labeling. The purpose of this chapter is to provide guidance in developing appropriate qualification programs for AMs employed in cell, gene, and tissue-engineered product manufacturing.

## QUALIFICATION OF ANCILLARY MATERIALS

Qualification is the process of acquiring and evaluating data to establish the source, identity, purity, biological safety, and overall suitability of a specific AM. The responsibility for AM qualification resides with the developer or manufacturer of the cell, gene, or tissue-engineered product. This section outlines the basis by which a manufacturer can establish rational and scientifically sound programs for qualifying AMs, although the broad nature of the cell, gene, and
tissue-engineered products and of the AM used to produce these products make it difficult to recommend specific tests or protocols for a qualification program. Thorough documentation is the cornerstone of any qualification program.

A well-designed qualification program becomes more comprehensive as product development progresses. In the early stages of product development, safety is the primary focus. In the later stages, AM production and qualification activities should be comprehensively developed to support eventual licensure of the cell, gene, and tissue-engineered product. On some occasions, complex or unique substances that have been shown to be essential for process control or production may not be available from suppliers that produce them in compliance with cGMP. In these situations, the manufacturer will have to develop a scientifically sound strategy for qualification. A qualification program for AMs used in cell, gene, and tissue-engineered product manufacturing should address each of the following areas: (1) identification, (2) selection and suitability for use in manufacturing, (3) characterization, (4) vendor qualification, and (5) quality assurance and control.

## Identification

The first step in any qualification program is the listing of all of the AMs used in a given product manufacturing and where in the manufacturing process they are to be employed. The source and intended use for each material should be established, and the necessary quantity or concentration of each material should be determined. Also, alternate sources for each material should be identified.

## Selection and Suitability for Use

Developers of cell, gene, and tissue-engineered products should establish and document selection criteria for AMs and qualification criteria for each vendor early in the design phase of product development. Selection criteria should include assessments of microbiological and chemical purity, identity, and biological activity pertinent to the specific manufacturing process. It is important to address these issues early in product development because certain AMs that are initially considered necessary may be impossible or prohibitively expensive to qualify, thereby justifying the investigation of alternatives or replacements. Examples include some animal- or human-derived materials that in some cases have alternate (i.e., plant or chemically synthesized) sources.

AMs of animal or human origin should be selected cautiously due to the potential infectious or zoonotic disease risks associated with these materials. Vendors should be selected that can supply documentation regarding the country of origin for animal-derived AMs to address concerns regarding transmissible spongiform encephalopathies and other diseases of agricultural concern, like tuberculosis and brucellosis. In many cases, the chain of custody for an-imal-derived AMs (i.e., abattoir $\rightarrow$ intermediate processing center $\rightarrow$ final processing center) will need to be documented. Vendors of human-derived AMs should be able to supply documentation regarding material traceability. For instance, human plasma-derived AMs should be sourced from licensed facilities that control the donor pool and appropriately screen the individual donors for relevant human infectious diseases. In some cases, vendors of animal- and human-derived AMs supply different grades of materials, some of which will be more suitable for use in cell, gene, and tissue-engineered product manufacturing than other grades. For example, FBS can be obtained that has been pro-
cessed to reduce the risk of bovine viral contamination by subjecting it to validated irradiation and nanofiltration processes. Also, many animal and human plasma-derived components are subjected to chemical (detergent or solvent treatment) or physical (heat exposure for extended periods of time) treatments that have been shown through validation studies to significantly reduce the risk of adventitious microbial or viral contamination associated with starting AMs. Such AMs are preferred for use in cell, gene, and tissue-engineered product manufacturing processes because they significantly reduce the risks associated with the original material.

The complexity of risk assessment can be reduced by employing one of a number of quantitative or semiquantitative approaches, such as failure mode effects analysis (FMEA), quality function deployment (QFD), or hazard analysis and critical control point (HACCP). These programs typically assign a point value to each risk parameter for an AM that results in cumulative scores that make it easier to prioritize effort and resources for decreasing the risks associated with AMs. For example, an AM that has a strong safety profile and is used in minimal amounts in upstream steps of the manufacturing process and is thoroughly washed from the system would accumulate a low point score. Conversely, an AM that is known to be toxic and is employed in downstream processing would, therefore, possess a higher potential for appearing as a residual in the final product and would be assigned a higher point value. One can also assign points based on the risk classification (see Risk Classification).

## Characterization

Specific quality control characterization tests need to be developed or adopted and implemented for each AM. The set of tests for each AM should assess a variety of quality attributes, including identity, purity, functionality, and freedom from microbial or viral contamination. The appropriate level of testing for each AM is derived from its risk assessment profile and the knowledge gained during development. Test specifications should be developed for each AM to ensure consistency and performance of the manufacturing process. Acceptance criteria should be established and justified on the basis of the data obtained from lots used in preclinical and early clinical studies, lots used for demonstration of manufacturing consistency, and relevant development data, such as those arising from analytical procedure development and stability studies.

Some AMs that are biological in nature may be difficult to fully characterize. Because these materials exert their effects through complex biological activities, and biochemical testing may not be predictive of the AM's process performance, functional or performance testing may be needed. Performance variability of such materials may have a detrimental impact on the potency and consistency of the final therapeutic product. Examples of complex functionality testing for AMs include growth promotion testing of individual lots of FBS on the cell line used in manufacturing, performance testing of digestive enzyme preparations, and in vitro tissue culture cytotoxicity assays. (see aspects of Performance Testing).

## Vendor Qualification

Vendors supplying AMs should be qualified at the earliest opportunity. An early audit of the vendor's manufacturing facility, including their GMP and AM testing program, are basic elements of a vendor qualification program. A review of the vendor's processing procedures and documentation program is essential in establishing confidence in the vendor as a reliable supplier. Additionally, vendors that have been certified through an ISO inspection program or audited by other governmental agencies tend to have robust quality systems in place. Reports of past audits of U.S. suppliers obtained through the Freedom of Information (FOI) Act may augment the qualification process.

It is important to develop a good working relationship with a vendor. In some cases, the vendor may provide higher manufacturing standards, custom formulation services, or replacement of substandard components upon request, with or without additional costs. A good rapport is essential if further investigation into AM suppliers is warranted. It is also critical to ensure that the vendor takes appropriate steps to prevent cross contamination between its products during manufacture. Vendors should be familiar with the principles of validation, especially cleaning validation, as well as viral inactivation and sterilization validation. Finally, systems should be established where vendors supply written certification of processing or sourcing changes to customers, well in advance of the implementation of the changes so that customers can evaluate the potential impact of such changes.

## Quality Control and Quality Assurance

Because the components of the qualification program are multifaceted and need to be in compliance with cGMP, they should be monitored by a quality assurance/quality control unit (QAU). Typical QAU activities include the following systems or programs: (1) incoming receipt, segregation, inspection, and release of materials prior to use in manufacturing, (2) vendor auditing and certification, (3) certificate of analysis verification testing, (4) formal procedures and policies for out-of-specification materials, (5) stability testing, and (6) archival sample storage.

## RISK CLASSIFICATION

A scientifically sound and rational qualification program should be designed for each AM and should take into account the source and processes employed in its manufacture. Whenever available, AMs that are approved or licensed therapeutic products are preferable because they are wellcharacterized with an established toxicological profile and are manufactured according to controlled and documented procedures. Licensed biologics, approved drugs, and approved or cleared medical devices or implantable materials that have been incorporated into cell, gene, or tissue-engineered product manufacturing processes present a known or more favorable safety profile for the patient than nonapproved or nonlicensed versions. Qualification programs for these AMs should reflect the extensive scrutiny that these items were subjected to in their development and manufacture. Consequently, greater emphasis should be placed on the investigation of the impact of inherent variability of these AMs on final product function. For instance, a manufacturer may utilize human serum albumin, intended for human administration, as a supplement to a cell cultivation medium for a cell-based product. Because the cell-based product is marketed as a licensed biological, one need not
repeat all the testing already performed by the supplier as part of material qualification. In contrast, the impact of lot-to-lot variability on cell growth rate or maintenance of an important differentiated cellular property may be a prudent area of investigation. Alternatively, the stability of this material at the concentration employed in processing or its potential for interaction with other processing components may also be areas worthy of investigation. Such approaches to AM qualification therefore focus on the AM as a potential source of variability that may influence final product potency and safety. Qualification programs for these AMs should be comprehensive to minimize consumer risk and ensure that unacceptable lots or adulteration will be detected.

The qualification program must also take into account the quantity of the AM employed in manufacturing as well as its point of introduction in the manufacturing process. A relevant example is the use of FBS as a supplement to a tissue culture medium used to expand a stem cell population from a specific tissue for eventual administration to a patient (see Manufacturing Overview under Cell and Gene Therapy Products $\langle 1046\rangle$ ). A qualification program for such an AM would include (a) assurance that the serum was sourced from a country or region known to be free of bovine spongiform encephalopathy (BSE); (b) assurance that the source herds are monitored and test negative for specific diseases relevant in agricultural settings (e.g., tuberculosis, brucello-
sis, foot and mouth disease); (c) testing of the serum for sterility, mycoplasma, endotoxin content, and adventitious bovine viruses known to be associated with the material; ${ }^{1}$ (d) the review and archiving of the supplier's certificate of analysis; (e) lot-to-lot assessment of the ability of the serum to consistently expand a representative cell population using a standardized cell culture quality control assay; and (f) onsite audit of the supplier to ensure that the material is sourced and processed in a manner deemed acceptable by a responsible QA unit.

To aid manufacturers and developers in the design of their qualification programs for a variety of AMs, tiers of sample risk categories are presented in Tables 1-4 and are provided as a guide. Risk is also dependent on the amount and the stage at which the AM is used in the manufacturing process. Tables 1-4 do not address the impact of quantity or stage of use.
Tier 1-These AMs are low-risk, highly qualified materials that are well-suited for use in manufacturing. The AM is either a licensed biologic, an approved drug, an approved or cleared medical device, or it is intended for use as an implantable biomaterial. Generally these components or materials are obtained as a sterile packaging system or dosage form intended for their label use, but are instead utilized "off label" in the manufacturing process for the cell, gene, or tissue-engineered product.

[^75]Tier 2-These AMs are low-risk, well-characterized material that are well-suited for use in manufacturing. Their intended use is for drug, biologic, or medical device manufacture, including cell, gene, and tissue-engineered products as AMs, and they are produced under relevant cGMPs. Most animal-derived materials are excluded from this category.

Tier 3-These AMs are a moderate risk material that will require a higher level of qualification than previous tier materials. Frequently, these materials are produced for in vitro diagnostic use and are not intended for use in the production of cell, gene, or tissue-engineered products. In some cases, upgrade of AM manufacturing processes may be necessary in order to employ the AM in manufacturing of these products (e.g., modification of the production process for a diagnostic grade monoclonal antibody to include robust viral removal steps in purification).

Tier 4-This is the highest risk level for AMs. Extensive qualification is necessary prior to use in manufacturing. The material is not produced in compliance with cGMPs. AMs are not intended for use in the production of cell, gene, or tissue-engineered products. This risk level includes highly
toxic substances with known biological mechanisms of action, and also includes most complex, animal-derived fluid materials not subjected to adventitious viral removal or inactivation procedures. These materials may require (a) an upgrade of AM manufacturing processes; (b) treatment of AMs to inactivate or remove adventitious agents, diseasecausing substances, or specific contaminants (e.g., animal viruses, prions); (c) testing of each lot of material to ensure that it is free of adventitious agents, disease-causing substances, or specific contaminants; (d) validation of the manufacturing process of the cell, gene, or tissue-engineered product to assess consistency of removal of a known toxic substance or lot-release testing to demonstrate reduction levels considered to be safe; or (e) validation of the manufacturing process of the cell, gene, or tissue-engineered product to assess consistency of removal or inactivation of adventitious agents, disease-causing substances, or specific contaminants associated with the material. Developers in the early stages of development should evaluate the necessity of these materials and explore alternative substances or sources.

Table 1. AM Risk Tier 1
Low-Risk, Highly Qualified Materials with Intended Use as Therapeutic Drug or Biologic, Medical Device, or Implantable Material

| Example | Typical Use in Cell, Gene, or Tissue-Engineered Product Manufacturing | Qualification or Risk Reduction Activities |
| :---: | :---: | :---: |
| Recombinant insulin for injection | Cell culture medium additive | DMF cross reference (when possible or practical) <br> Certificate of analysis |
| Organ preservation fluid | Process biological fluid employed in tissue transport or processing |  |
| Human serum albumin for injection | Cell culture medium |  |
| Sterile fluids for injection | Process biological fluid employed in tissue transport, cell processing, purification | Assess lot-to-lot effect on process performance ${ }^{2}$ <br> Assess removal from final pro- |
| Implantable biomaterials (formed collagen, silicone, polyurethane constructs intended for surgical implantation) | Scaffolds, matrices for immobilized cellular cultivation | Stability assessment on AM as stored for use in manufacturing ${ }^{3}$ |
| Recombinant deoxyribonuclease for inhalation or injection | Process enzyme employed in viral vector manufacturing, stem cell processing |  |
| Antibiotics for injection ${ }^{4}$ | Cell culture medium and biopsy transport fluid additive to reduce risk of bacterial contamination |  |
| Injectable monoclonal antibodies | Immunologically targeting specific cell populations for selection or removal |  |
| Injectable cytokines | Cell culture medium |  |
| Vitamins for injection; defined nutrients, chemicals, or excipients intended for injection | Cell culture medium additive employed in cell expansion, controlled cellular differentiation/ activation step, or manufacture of a viral vector |  |
| IV bags, transfer sets and tubing, cryopreservation bags, syringes, needles | Storage vessels or container closure systems, closed aseptic transfer systems |  |

## PERFORMANCE TESTING

In cases where AMs are chosen for their ability to provide a particular biological function in producing the therapeutic product, performance testing becomes an essential component of their overall qualification. This is especially true when the AM plays a critical role in modulating a complex biochemical effect and has a large impact on product manufacturing yield, purity, or final product potency. These AMs tend to be complex substances or mixtures, are frequently biologically sourced, and can exhibit significant lot-to-lot variability. As a result, these AMs usually have no simple identity test, nor can they be easily characterized by physical or chemical tests. The development of well-defined performance assays for complex AMs will not only ensure process reproducibility and final product quality, but in many cases will satisfy the identity testing criteria in accordance with 21 CFR 211.84(d).

In some cases, the initial qualification of an AM for use in manufacturing should be the investigation of the effect of the amount of the AM on the desired response (increased yield, purity, or potency of the therapeutic product). The amount of the AM used in manufacturing should be chosen to consistently yield the desired effect while minimizing issues by removing the AM in subsequent processing steps. Such testing frequently assesses the important functional attribute expected of the AM in a scaled-down or simulated manufacturing process. Some examples follow:

- If an AM is added to the culture media because it promotes cellular proliferation or the secretion of a critical therapeutic agent, the assay could demonstrate that each lot of AMs produces the expected rate and amount of cellular proliferation or the expected level of secreted therapeutic agent.
- If a monoclonal antibody is used to purify a particular cell type, the new lot of monoclonal antibody could be shown to purify the cell population with the expected recovery and purity for the desired cell type.
- If a deoxyribonuclease is used to degrade cellular DNA, new lots could be tested for the ability of the deoxyribonuclease to degrade DNA.
- If a particular type of density gradient material is used to purify a vector or cell, new lots of the material used to make the gradient could be shown to purify the vector or cell to an acceptable level.
- If a plasmid or viral vector is used in the production of a gene therapy vector (e.g., helper function), new lots of the helper vector could be shown to produce the expected amounts of the gene therapy vector.
- If a cell therapy is produced in a hollow-fiber bioreactor, new lots of the bioreactor could be shown to produce the anticipated amount of cell product.

The actual assay used may well evolve as the manufacturing process is developed further and the critical relationships of the AM and the final product are better understood.

Because most performance testing yields relative results, it is often helpful to assay a new lot of AMs side by side with an approved lot of AMs or an official reference standard, if available. This simultaneous comparison helps to reduce the variability due to different lots of cells or vectors and will help discern variability associated with the different lots of AMs. If performance testing involves assays to demonstrate that the new lot of AMs does not affect the impurity profile of the final therapeutic product, either by generating new impurities or by increasing the level of existing impurities, it is helpful to assay both for the total level of impurities, as well as look for the presence of new impurities. An immunologically-based binding assay can typically assess only the total level of impurities. For example, a Western blot of the gene therapy product that is probed both with an-
tibodies to the product and antibodies to host cell proteins is useful for detecting new protein species and significant increases in the levels of host cell impurities. This initial qualification is enhanced by a performance assay that has a quantitative readout with a clear change in the signal when a significant change in the amount of AMs is introduced into the assay (e.g., dose response). A threshold-type response (i.e., there are two levels of response to the AM and neither large changes in an AM below a certain dose nor above a certain dose change the response) can make it more difficult to select a concentration of AM that consistently results in the desired effect and minimizes the residual levels of the AM in the final therapeutic product.

## ANCILLARY MATERIALS RESIDUAL LEVEL

## ASSESSMENT AND REMOVAL

AMs are not intended to be present in the final dosage form in cell, gene, and tissue-engineered products. Their presence in the final product could lead to undesired effects in the recipient or have a detrimental effect on product potency. Undesired effects in humans include direct toxicity of the AM or an unwanted immunogenic response. Some examples include the following:

- In the generation of a tumor vaccine using a patient's tumor biopsy as the starting material, a chemical entity is introduced to denature the cell surface proteins and tumor antigens to enhance their antigenicity. The chemical entity is known to be highly toxic.
- Antibiotics may be added to a transport solution for human cells to address microbial contamination issues associated with the procurement procedure. Residual levels of the antibiotic may affect the proliferative capacity of the final engineered cellular product. Residual antibiotics could also cause an anaphylactic response in some individuals.
- FBS, employed in the cultivation of an engineered human skin graft, may cause the development of a humoral antibody response directed against bovine proteins.
- Aggregated mouse immunoglobulin, a trace impurity in a purified preparation of mouse monoclonal antibody used to target a cell population for immunoselection, may be immunogenic.
- A cytokine, employed as an immunomodulator in the generation of a gene-modified autologous tumor vaccine product, may elicit a severe reaction in the recipient.
- Cholera toxin, employed as part of a cell culture medium for a cell therapy product intended for intravenous administration, will be highly toxic to the recipient if it is not removed during processing.

These risks can be mitigated through the design of processes to include steps to adequately remove the AM through dilution, separation, or inactivation, as well as the development of analytical detection assays to assess the AM levels during processing and in the final therapeutic product. Assessment and removal strategies for residual AMs should be considered in the early phases of process development. There are two different approaches for assessing residual AM levels in the final therapeutic product: (1) Validation studies can demonstrate that the process is capable of removing more of the AM than would be present in a worst-case scenario. (2) The residual levels of an AM can be measured for each lot at an appropriate step in the manufacturing process.
Validation of an AM removal is often best performed by spiking the impure product with "worst case" or higher levels of the AM and showing the purification process is capable of removing the AM to "undetectable levels". Clearance factors can then be generated for each purification step in a manner analogous to that done in viral clearance
studies. When designing the validation studies, the following three considerations should be included: (1) The assay should be able to accurately quantitate the AM in each sample matrix. (2) If the validation is conducted at a scale smaller than that used for routine lot production, the comparability of this smaller scale process to the full scale process needs to be demonstrated. This usually means that the smaller scale process is operated using the same critical parameters as the full scale process with the product generated at each step having a similar purity and yield. (3) As with any spiking study, one has to demonstrate that the additional, higher level of AM has not affected the purification process. If the second approach of measuring residual levels of the AM in each lot is used, the specification for the maximum amount of AM in the final therapeutic product is based on the amount of the AM in the lots used in toxicological or clinical studies or known toxicological data.

The development of sensitive and reproducible analytical assays for AMs is another important component of a risk reduction approach. Two types of assays are useful in assessing the levels of residual AM impurity: a limit test and a quantitative test. Either test should be accurate, precise, robust, and have a low limit of detection. Assays for residual AMs may be performed on the product before it is formulated (e.g., on the drug substance) to avoid any interference of the components used in the formulation with the assay for residual AMs or in the final drug product. Spike-recovery controls are often included in such assays to demonstrate that the sample matrix does not inhibit the detection of the AM. Preferably, assays should be designed to detect all forms of AMs including aggregates, fragments, or conjugates. Aggregated protein has been shown to be particularly immunogenic.

Immunoassays such as ELISA are most commonly used to assess residual levels of AMs. An ELISA for bovine serum albumin (BSA) has been used to assess residual levels of FBS. Polymerase chain reaction (PCR) technology has been employed to assess residual levels of host cell DNA. Labeling cells with ${ }^{3} \mathrm{H}$ thymidine or performing PCR for a feeder cell-specific gene sequence are two ways to assess for residual levels of feeder cells. If "wash out" of the AM is achieved by exhaustive dilution associated with further processing activities, it may be useful to calculate the dilution factor for the AM during this processing. In some cases, this is sufficient to ensure that the AM has been reduced to safe levels for early clinical development. Data should be obtained later in clinical development to confirm the wash out of the AM at the expected step(s). This approach is particularly useful when there is pre-existing knowledge of the therapeutic levels and toxicity of the AM. In other cases, information regarding the safety and tolerability of the AM should be collected (in preclinical toxicology studies or later with human clinical studies) in order to determine the safe or nontoxic levels that must be achieved. These data may be needed even for an AM that is approved for use for therapeutic purposes if it is being used in a manner inconsistent with its intended use or labeling or if the route of administration or dosage level of the AM may present risks not previously encountered or considered.

## CONCLUSION

While many types of AMs are used during the manufacture of cell, gene, and tissue-engineered products, they have received less emphasis than the final products. However, the importance of AM quality to the quality of the final product cannot be overstated. Good quality AMs should perform as intended in a consistent manner, batch-to-batch, if they are carefully selected and appropriately used. AMs of
insufficient quality will affect the quality and the effectiveness of the final product and endanger the health of patients. Thus, implementing an AM qualification program that addresses the risks associated with the AM, the stage of manufacture at which it is used, and the amount of the AM used during manufacture will ensure the safety and effectiveness of the final product.

## APPENDIX

AMs used in cell, gene, and tissue-engineered products will be regulated in the context of the manufacturing process of the cell, gene, and tissue-engineered products. Certain AMs may already be approved for uses other than for cell, gene, and tissue-engineered product manufacture. It is preferable to source AMs that are approved therapeutic products when they are available because they are wellcharacterized with an established toxicological profile and are manufactured according to controlled and documented procedures. The following list of documents should provide relevant regulatory guidance and a description of best practices in product and process development, manufacturing, quality control, and quality assurance:

## REAGENTS, INDICATORS, AND SOLUTIONS

## Reagent Specifications

## Briefing

Acetal. This new reagent is used as a component of Standard solution $C$ in the test for Volatile impurities under the harmonized monograph for Alcohol, which appears in the Harmonization section of this PF.
(HDQ: M. Marques) RTS-40773-1

## Add the following:

${ }^{\boldsymbol{4}}$ Acetal, $\mathrm{C}_{6} \mathrm{H}_{14} \mathrm{O}_{2}$ - 118.2-Use a suitable grade. $\Delta$ USP28

## BriEfing

Bacterial Alkaline Protease Preparation. This new reagent is specified in the test for Content of all-E-lycopene, 5Z-lycopene, and related compounds, and the test for Content of lycopene under Lycopene Preparation, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40413-2

## Add the following:

${ }^{\text {4 }}$ Bacterial Alkaline Protease Preparation-Use a suitable grade. ${ }^{116}{ }_{\Delta U S P 28}$

## Briefing

Benzamidine Hydrochloride Hydrate. This new reagent is used in the test for Fibroblast growth factor-2 content in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) $\quad$ RTS-40758-2

## Add the following:

${ }^{\text {© }}$ Benzamidine Hydrochloride Hydrate, $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{~N}_{2}$. $\mathrm{HCl}-156.6$ [1670-14-0]—White to off-white powder. Use a suitable grade. ${ }^{10}{ }_{\Delta U S P 28}$

## BRIEFING

Bovine Collagen. This new reagent is used in the test for Glycosaminoglycan content in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40758-4

## Add the following:

${ }^{\Delta}$ Bovine Collagen-Use a suitable grade that contains less than $1 \mu \mathrm{~g}$ glycosaminoglycan per $\mathrm{mg} .{ }^{10}{ }_{\Delta}{ }^{\text {USP28 }}$

## BRIEFING

Rat Tail Collagen. This new reagent is used in the Bioactivity test in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40758-12

## Add the following:

${ }^{\boldsymbol{\Delta}}$ Rat Tail Collagen-Use a suitable grade. ${ }^{102} \mathbf{\Delta U S P 2 8}^{\text {— }}$

## BRIEFING

Cyclohexylmethanol. This new reagent is used in the preparation of the Standard solutions in the test for Related compounds in the draft monograph for Benzyl Alcohol, which appears in the Harmonization section of this $P F$.
(HDQ: M. Marques) RTS-40773-8

## Add the following:

${ }^{\Delta}$ Cyclohexylmethanol, $\mathrm{C}_{7} \mathrm{H}_{14} \mathrm{O}-\mathbf{1 1 4 . 1 9}$ —Use a suitable grade. $\triangle U S P 28$

## Briefing

Dicyclohexyl. This new reagent is used in the preparation of the Dicyclohexyl solution in the test for Related compounds in the draft monograph for Benzyl Alcohol, which appears in the Harmonization section of this PF.

$$
\text { (HDQ: M. Marques) } \quad \text { RTS }-40773-8
$$

## Add the following:

$$
\begin{aligned}
& \mathbf{\Delta} \text { Dicyclohexyl, } \mathrm{C}_{12} \mathrm{H}_{22}-\mathbf{1 6 6 . 3 1} \text { —Use a suitable } \\
& \text { grade. } \Delta U S P 28
\end{aligned}
$$

## BRIEFING

1,9-Dimethyl-Methylene Blue. This new reagent is used in the test for Glycosaminoglycan content in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40758-6

## Add the following:

© $\mathbf{1}$,9-Dimethyl-Methylene Blue, $\mathrm{C}_{36} \mathrm{H}_{46} \mathrm{Cl}_{4} \mathrm{~N}_{6} \mathrm{OS}_{2} \mathrm{Zn}$ -
850.1 [23481-50-7]—Dark green powder. Use a suitable grade. ${ }^{10}{ }_{\Delta U S P 28}$

## BRIEFING

3-(Dodecyldimethylammonio)propanesulfonate. This new reagent is used to prepare the Medium in the Dissolution test under Mephobarbital Tablets, appearing elsewhere in this number of $P F$.

## Add the following:

> s3-(Dodecyldimethylammonio)propanesulfonate (Lauryl sulfobetaine, $N, N$-dimethyl- $N$-dodecyl-N-(3-sulfopropyl) ammonium betaine), $\mathrm{C}_{17} \mathrm{H}_{37} \mathrm{NO}_{3} \mathrm{~S}-\mathbf{3 3 5 . 5 4}$
> [14933-08-5]-Use a suitable grade. $\mathbf{\Delta U S P 2 8}$

## BRIEFING

Ethylbenzene. This new reagent is used in the preparation of the Ethylbenzene solution in the test for Related compounds in the draft monograph for Benzyl Alcohol, which appears in the Harmonization section of this $P F$.
(HDQ: M. Marques) RTS-40773-8

## Add the following:

©thylbenzene, $\mathrm{C}_{8} \mathrm{H}_{10}-\mathbf{1 0 6 . 1 7}-$ Not less than $99.5 \%$. $\mathbf{\Delta S P 2 8}$

## Briefing

Fibroblast Growth Factor-2. This new reagent is used in the Bioactivity test in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) $\quad$ RTS-40758-8

## Add the following:

©Fibroblast Growth Factor-2—Use a suitable grade. ${ }^{114}{ }_{\Delta U S P 28}$

## Briefing

Lauryl Dimethyl Amine Oxide. This new reagent is specified in the Dissolution Medium in the monograph for Isradipine Capsules, which appears elsewhere in this number of $P F$.

$$
\text { (HDQ: M. Marques) } \quad \text { RTS-40548-11 }
$$

## Add the following:

${ }^{4}$ Lauryl Dimethyl Amine Oxide (N,N-Dimethyldodecy-lamine-N-oxide), $\mathrm{C}_{14} \mathrm{H}_{31} \mathrm{NO}$, [1643-20-5]-229.41—Use a suitable grade. ${ }^{115}{ }_{\Delta U S P 28}$

## Briefing

Methanol, Aldehyde-Free. This new reagent is used in the section Suitability for determination of aldehydes under the reagent methylbenzothiazolone hydrazone hydrochloride that is specified in the test for Aldehyde in the draft monograph for Ethylcellulose, which appears in the Harmonization section of this $P F$.
(HDQ: M. Marques) RTS-40768-1

## Add the following:

${ }^{\Delta}$ Methanol, Aldehyde-Free, $\mathrm{CH}_{3} \mathrm{OH}$ - 32.04-Dissolve 25 g of iodine in 1 L of methanol and pour the solution, with constant stirring, into 400 mL of 1 N sodium hydroxide. Add 150 mL of water, and allow to stand for 16 hours. Filter, and boil under a reflux condenser until the odor of iodoform disappears. Distill the solution by fractional distillation. It contains not more than $0.001 \%$ of aldehydes and ketones. $\Delta$ USP28

## BRIEFING

Methylbenzothiazolone Hydrazone Hydrochloride, page 1599 of PF 28(5) [Sept.-Oct. 2002]. This new reagent is used as a specified component of the Acetaldehyde test in the draft monograph for Ethylcellulose, which appears in the Harmonization section of this $P F$.
(HDQ: M. Marques) RTS-40768-1

## Add the following:

${ }^{4}$ Methylbenzothiazolone Hydrazone Hydrochloride, $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{CIN}_{3} \mathrm{~S} \cdot \mathrm{H}_{2} \mathrm{O}-\mathbf{2 3 3} .7$ [38894-11-0] Use a stitable grade. An almost white or yellowish, crystalline powder.

Melting point $\langle 741\rangle$ : about $270^{\circ}$.

Suitability for determination of adehydes-To 2 mL of aldehyde-free methanol add $60 \mu \mathrm{~L}$ of a 1 g per L solution of propionaldehyde in aldehyde-free methanol and 5 mL of a 4 g per L solution of methylbenzothiazolone hydrazone hydrochloride. Mix, and allow to stand for 30 minutes. Prepare a blank omitting the propionaldehyde solution. Add 25.0 mL of a 2 g per L solution of ferric chloride to the test solution and to the blank, dilute with acetone to 100.0 mL , and mix. The absorbance of the test solution, measured at 660 nm using the blank as compensation liquid, is not less than 0.62. UUSP28 $^{\text {. }}$

## BRIEFING

4-Methylpentan-2-ol. This new reagent is used as a component of Test solution B in the test for Volatile impurities under the harmonized monograph for Alcohol, which appears in the Harmonization section of this PF.
(HDQ: M. Marques) RTS-40773-1

## Add the following:

44-Methylpentan-2-ol, $\mathrm{C}_{6} \mathrm{H}_{14} \mathrm{O}-\mathbf{1 0 2} .2$ - Use a suitable grade. $\triangle U S P 28$

## BRIEFING

Oxygen-Helium Certified Standard, USP 27 page 2699. The reagent Oxygen-Helium Certified Standard is being proposed for deletion. It is being replaced by the new USP Oxygen-Helium RS, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40629-10

## Delete the following:

${ }^{4}$ Oxygen-Helium-Certified Standard- A mixture of 1.0\% exygen in industrial grade helium. It is available from mest suppliers of specialty fostes. $\mathbf{A U S P 2 8}$

## BRIEFING

Phenylmethylsulfonyl Fluoride. This new reagent is used in the test for Fibroblast growth factor- 2 content in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40758-10

## Add the following:

${ }^{\text {© }}$ Phenylmethylsulfonyl Fluoride, $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{FO}_{2} \mathrm{~S}-\mathbf{1 7 4 . 2}$ [329-98-6]-White to faint yellow powder. Use a suitable grade. ${ }^{10}{ }_{\Delta U S P 28}$

## BRIEFING

Propionaldehyde. This new reagent is used to prepare the reagent, methylbenzotiazolone hydrazone hydrochloride, specified in the test for Aldehyde in the Ethylcellulose monograph, which appears in the Harmonization section of this PF.
(HDQ: M. Marques) RTS-40768-1

## Add the following:

${ }^{\wedge}$ Propionaldehyde, $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}-\mathbf{5 8 . 0 8}$-Use a suitable grade. $\triangle$ USP28

## BRIEFING

Sodium 1-Heptanesulfonate, Monohydrate. This new reagent is used in the test for Chromatographic purity and in the Assay under Homatropine Hydrobromide, which appears elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS—37240-2

## Add the following:

${ }^{\text {4 }}$ Sodium 1-Heptanesulfonate Monohydrate, $\mathrm{C}_{7} \mathrm{H}_{15}$ $\mathrm{NaO}_{3} \mathrm{~S} \cdot \mathrm{H}_{2} \mathrm{O}-\mathbf{2 2 0 . 2 6}$ [22767-50-6]—Use a suitable grade. $\Delta$ USP28

## Briefing

Tritirachium Album Proteinase K. This new reagent is used in the test for Glycosaminoglycan content in the proposed new monograph for Small Intestinal Submucosa Wound Matrix, appearing elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS-40758-14

## Add the following:

${ }^{\Delta}$ Tritirachium Album Proteinase K—Use a suitable grade. ${ }^{113} \mathbf{\Delta U S P 2 8}^{\text {U }}$

## Briefing

Tropine. This new reagent is used in the test for Limit of tropine under Homatropine Hydrobromide, which appears elsewhere in this number of $P F$.
(HDQ: M. Marques) RTS—37240-3

## Add the following:

${ }^{\Delta}$ Tropine, $\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{NO}-\mathbf{1 4 1 . 2}$ [120-29-6]-Use a suitable grade. $\mathbf{\Delta S P 2 8}$

## Briefing

Reagent Footnotes, USP 27 page 2738, page 1133 of $P F$ 26(4) [July-Aug. 2000], page 3373 of $P F 27(6)$ [Nov.-Dec. 2001], page 266 of $P F$ 29(1) [Jan.-Feb. 2003], page 508 of $P F$ 29(2) [Mar.-Apr. 2003], page 1257 of PF 29(4) [July-Aug. 2003], and page 317 of PF 30(1) [Jan.-Feb. 2004]. The following new reagents reference Footnote 10 : Bovine collagen; Benzamidine hydrochloride hydrate; 1,9-Dimethyl-methylene blue; and Phenylmethylsulfonyl fluoride. The new reagent Rat tail collagen references Footnote 102 . Footnotes $113,114,115$, and 116 are added to provide information regarding the commercial availabil-
ity of Tritirachium album proteinase K, Fibroblast growth factor-2, Lauryl dimethyl amine oxide, and Bacterial alkaline protease preparation, respectively.

## REFERENCE TABLES

## BRIEFING

Container Specifications for Capsules and Tablets, USP 27 page 2741, and page 2055 of $P F$ 29(6) [Nov.-Dec. 2003].
(HDQ) RTS-40598-1; 40774-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the Packaging and storage requirements set forth in the individual monographs. It lists the capsules and tablets that are, or will be, official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

## BRIEFING

Description and Relative Solubility of USP and NF Articles, USP 27 page 2747, page 5310 of $P F 23(6)$ [Nov.-Dec. 1997], page 7017 of $P F 24(5)$ [Sept.-Oct. 1998], page 8282 of $P F 25(3)$ [MayJune 1999], page 8589 of $P F$ 25(4) [July-Aug. 1999], page 8917 of PF 25(5) [Sept.-Oct. 1999], page 9254 of PF 25(6) [Nov.-Dec. 1999], page 837 of $P F$ 26(3) [May-June 2000], page 1135 of $P F$ 26(4) [July-Aug. 2000], page 1385 of $P F$ 26(5) [Sept.-Oct. 2000], page 1907 of PF 27(1) [Jan.-Feb. 2001], page 2281 of $P F$ 27(2) [Mar.-Apr. 2001], page 2839 of $P F$ 27(4) [July-Aug. 2001], page 3374 of PF 27(6) [Nov.-Dec. 2001], page 554 of $P F$ 28(2) [Mar.Apr. 2002], page 1236 of $P F$ 28(4) [July-Aug. 2002], page 1542 of $P F$ 28(5) [Sept.-Oct. 2002], page 1953 of $P F$ 28(6) [Nov.-Dec. 2002], page 266 of $P F$ 29(1) [Jan.-Feb. 2003], page 509 of $P F$ 29(2) [Mar.-Apr. 2003], page 812 of $P F$ 29(3) [May-June 2003], page 1262 of $P F$ 29(4) [July-Aug. 2003], page 1684 of PF 29(5) [Sept.-Oct. 2003], page 2057 of PF 29(6) [Nov.-Dec. 2003], and page 317 of $P F 30$ (1) [Jan.-Feb. 2004].
(HDQ) RTS—37240-1; 40209-1; 40209-2; 40209-3; 402094; 40209-5; 40773-2; 40773-4; 40773-6; 40814-1; 40814-2; 40862-1; 40862-2; 40864-1

## Add the following:

${ }^{\Delta}$ Acesulfame Potassium: A white, crystalline powder or colorless crystals. Soluble in water; very slightly soluble in acetone and in alcohol. NF category: Sweetening agent. $\Delta$ USP28

## Add the following:

${ }^{4}$ Adipic Acid: A white, crystalline powder. Freely soluble in alcohol and in methanol; soluble in boiling water and in acetone; slightly soluble in water. NF category: Buffering agent. $\Delta U S P 28$

## Add the following:

${ }^{\Delta}$ Cellulose Acetate Butyrate:- Cellaburate: Fine white or almost white powder or granules. Available in a range of viscosities, acetyl and butyl contents. Slightly hygroscopic; soluble in acetone, in methylene chloride, in pyridine, and in dimethyl sulfoxide; practically insoluble in water and in alcohol. NF category: Coating agent; polymer membranes. $\triangle$ USP28

## Delete the following:

Citric Acid: Colerless, translueent erystals, or white, granular to fine, erystalline pewder. The hydreus formisefflorescent in dry air. The anhydreus form melts at abeut $153^{\circ}$, with decempesition. Very soluble in water; freely soluble in aleehel; very slightly selut ble in ether. NF eategory: Acidifying agent; buffering agent._USP28

## Add the following:

${ }^{\wedge}$ Anhydrous Citric Acid: Colorless, translucent crystals, or white, granular to fine, crystalline powder. in dry air. Melts at about $153^{\circ}$, with decomposition. Very soluble in water; freely soluble in alcohol; very slightly soluble in ether. NF category: Acidifying agent; buffering agent. $\Delta$ USP28

## Add the following:

${ }^{\Delta}$ Citric Acid Monohydrate: Colorless, translucent crystals, or white, granular to fine, crystalline powder. Efflorescent in dry air. Very soluble in water; freely soluble in alcohol; very slightly soluble in ether. NF category: Acidifying agent; buffering agent. $\triangle$ USP28

## Add the following:

${ }^{\boldsymbol{4}}$ Galactose: A white, crystalline or finely granulated powder. Soluble in water; very slightly soluble in alcohol.
NF category: Sweetening agent._USP28

## Change to read:

Homatropine Hydrobromide: White crystals, or white, crystalline powder. Is affected by light.
${ }^{4}$ Slowly darkens on exposure to light. $\triangle$ USP28
Freely soluble in water; sparingly soluble in alcohol; slightly soluble in chloroform; insoluble in ether.
${ }^{\mathbf{4}}$ Melts between $214^{\circ}$ and $217^{\circ}$, with slight decomposition. $\mathbf{\Delta}$ USP28

## Add the following:

${ }^{\Delta}$ Maleic Acid: White, crystalline powder. Freely soluble in water and in alcohol; sparingly soluble in ether. _USP28 $^{\text {U }}$

## Add the following:

${ }^{4}$ Sodium Sulfite: Colorless crystals. Freely soluble in water, very slightly soluble in alcohol. NF category: Antioxidant. $\triangle$ USP28

## Add the following:

${ }^{4}$ Sodium Tartrate: Transparent, colorless, odorless crystals. Freely soluble in water; insoluble in alcohol. NF category: Sequestering agent. $\triangle$ USP28

## Add the following:

${ }^{\Delta}$ Corn Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. NF category: Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent. $\Delta$ USP28

## Add the following:

${ }^{\Delta}$ Potato Starch: Irregular, angular, white masses or fine powder. Is odorless, and has a slight, characteristic taste. Insoluble in cold water and in alcohol. NF category: Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent._ USSP28 $^{\text {. }}$

## Add the following:

${ }^{4}$ Wheat Starch: Irregular, angular, white masses or fine powder. Is odorless and has a slight, characteristic taste. Insoluble in cold water and in alcohol. NF category: Tablet and/or capsule diluent; tablet disintegrant; tablet binder; suspending and/or viscosity-increasing agent. $\triangle$ USP28

## Add the following:

${ }^{4}$ Succinic Acid: White, odorless crystals. Soluble in water, in alcohol, and in glycerin; freely soluble in boiling water. NF category: Neutralizing agent. $\triangle U S P 28$

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

## GENERAL NOTICES AND REQUIREMENTS

"Official" and "Official Articles"-See PF Vol. 29 No. 6, page 1823.

Significant Figures and Tolerances-See PF Vol. 29 No. 6, page 1824.

Terbutaline Sulfate-See PF Vol. 29 No. 5, page 1585.
Terbutaline Sulfate Inhalation Aerosol-See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection-See PF Vol. 26 No. 3, page 756.
Terbutaline Sulfate Tablets-See PF Vol. 30 No. 1, page 188.
Testosterone-See PF Vol. 29 No. 5, page 1585.
Tetracaine Hydrochloride-See PF Vol. 29 No. 5, page 1586.
Theophylline-See PF Vol. 29 No. 5, page 1586.
Theophylline Syrup-See PF Vol. 27 No. 1, page 1819.
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tab-lets-See PF Vol. 30 No. 1, page 189.
Thiabendazole Oral Suspension-See PF Vol. 29 No. 6, page 1990.

Thiabendazole Tablets-See PF Vol. 29 No. 6, page 1991.
Thiabendazole Chewable Tablets-See PF Vol. 29 No. 6, page 1991.

Thiacetarsamide-See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection-See PF Vol. 29 No. 1, page 127.

Thiamine Hydrochloride Tablets-See PF Vol. 30 No. 1, page 190.
Thiopental Sodium-See PF Vol. 29 No. 5, page 1586.
Thioridazine Oral Suspension-See PF Vol. 29 No. 6, page 1992.
Thiothixene Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Thiothixene Hydrochloride Oral Solution-See PF Vol. 29 No. 6, page 1993.
Tiagabine Hydrochloride-See PF Vol. 29 No. 5, page 1587.
Tiamulin Fumarate-See PF Vol. 30 No. 1, page 190.
Timolol Maleate Tablets-See PF Vol. 30 No. 1, page 191.
Tobramycin Inhalation Solution-See PF Vol. 29 No. 2, page 438. Tolazoline Hydrochloride-See PF Vol. 29 No. 5, page 1588.
Tolbutamide-See PF Vol. 29 No. 5, page 1588.
Triamcinolone Acetonide-See PF Vol. 29 No. 5, page 1588.
Triamterene Capsules-See PF Vol. 29 No. 3, page 671.
Triamterene and Hydrochlorothiazide Capsules-See PF Vol. 29 No. 3, page 672.
Triamterene and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 3 , page 672 .
Trichlorfon-See PF Vol. 26 No. 6, page 1576.
Trifluoperazine Hydrochloride-See PF Vol. 29 No. 6, page 1993.
Triflupromazine Hydrochloride-See PF Vol. 29 No. 6, page 1994.
Triflupromazine Oral Suspension-See PF Vol. 29 No. 6, page 1994.

Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 5, page 1589.

Trimethoprim-See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate-See PF Vol. 29 No. 6, page 1995.
Triprolidine and Pseudoephedrine Hydrochlorides Tablets-See PF Vol. 30 No. 1, page 192.
Trisulfapyrimidines Oral Suspension—See PF Vol. 29 No. 6, page 1996.

Tubocurarine Chloride-See PF Vol. 29 No. 6, page 1996.
Urea-See PF Vol. 29 No. 5, page 1589.
Urea C for Oral Solution-See PF Vol. 29 No. 2, page 441.
Urofollitropin-See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection-See PF Vol. 28 No. 6, page 1881.
Urokinase Concentrate-See PF Vol. 24 No. 3, page 6180.
Ursodiol-See PF Vol. 29 No. 1, page 128.
Ursodiol Capsules-See PF Vol. 29 No. 5, page 1589.
Valproic Acid-See PF Vol. 29 No. 3, page 673.
Valproic Acid Injection-See PF Vol. 26 No. 4, page 939.
Valsartan—See PF Vol. 29 No. 6, page 1996.

Valsartan Capsules-See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets-See PF Vol. 29 No. 6, page 2000.
Vancomycin Hydrochloride for Oral Solution-See PF Vol. 30 No. 1, page 193.
Vasopressin-See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide-See PF Vol. 30 No. 1, page 193.
Vecuronium Bromide for Injection-See PF Vol. 25 No. 4, page 8449.

Verapamil Hydrochloride-See PF Vol. 29 No. 5, page 1598.
Verteporfin for Injection-See PF Vol. 29 No. 3, page 677.
Vitamin A—See PF Vol. 29 No. 6, page 2004.
Vitamin E-See PF Vol. 27 No. 5, page 3159.
Water for Hemodialysis-See PF Vol. 29 No. 3, page 680.
Water for Injection-See PF Vol. 29 No. 3, page 679.
Bacteriostatic Water for Injection-See PF Vol. 29 No. 4, page 1084.

Sterile Water for Inhalation-See PF Vol. 29 No. 4, page 1085.
Sterile Water for Injection-See PF Vol. 29 No. 4, page 1086.
Sterile Water for Irrigation-See PF Vol. 29 No. 4, page 1087.
Purified Water-See PF Vol. 29 No. 3, page 680.
Sterile Purified Water-See PF Vol. 29 No. 4, page 1088.
Xylazine-See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride-See PF Vol. 29 No. 6, page 2005.
Yttrium 90 Ibritumomab Tiuxetan Injection-See PF Vol. 29 No. 3 , page 681 .
Zidovudine-See PF Vol. 29 No. 6, page 2006.
Zidovudine Oral Solution-See PF Vol. 29 No. 6, page 2006.
Zileuton-See PF Vol. 29 No. 6, page 2006.
Zinc Gluconate-See PF Vol. 29 No. 3, page 683.

## DIETARY SUPPLEMENTS

## MONOGRAPHS

Chaste Tree-See PF Vol. 29 No. 4, page 1264.
Powdered Chaste Tree-See PF Vol. 29 No. 4, page 1268.
Powdered Chaste Tree Extract-See PF Vol. 29 No. 4, page 1269.
Chondroitin Sulfate Sodium-See PF Vol. 30 No. 1, page 197.
Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 200.
Cod Liver Oil-See PF Vol. 29 No. 4, page 1019.
Cod Liver Oil Capsules-See PF Vol. 29 No. 3, page 623.
Black Cohosh-See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh-See PF Vol. 28 No. 5, page 1460.
Powdered Black Cohosh Extract-See PF Vol. 28 No. 5, page 1461.
Black Cohosh Tablets-See PF Vol. 28 No. 5, page 1462.
Docosahexaenoic Acid-See PF Vol. 26 No. 6, page 1648.
Docosahexaenoic Acid Capsules-See PF Vol. 26 No. 6, page 1651.
Docosahexaenoic Acid Oil—See PF Vol. 26 No. 6, page 1652.
Eleuthero-See PF Vol. 26 No. 6, page 1596.
Fish Oil Rich in Omega-3 Acids-See PF Vol. 29 No. 4, page 1272.
Fish Oil Rich in Omega-3 Acids Capsules-See PF Vol. 29 No. 4, page 1278.
Ginger Capsules-See PF Vol. 28 No. 3, page 814.
Powdered Ginkgo Extract-See PF Vol. 27 No. 2, page 2233.
Ginkgo Capsules-See PF Vol. 27 No. 2, page 2238.
Ginkgo Tablets-See PF Vol. 27 No. 2, page 2240.
American Ginseng-See PF Vol. 27 No. 2, page 2243.
Powdered American Ginseng-See PF Vol. 27 No. 2, page 2247.
Glucosamine and Chondroitin Sulfate Sodium Tablets-See PF Vol. 30 No. 1, page 201.
Goldenseal-See PF Vol. 27 No. 2, page 2255.
Licorice-See PF Vol. 26 No. 5, page 1363.
Powdered Licorice Extract-See PF Vol. 26 No. 5, page 1365.
Lutein-See PF Vol. 29 No. 2, page 470.
Lutein Preparation-See PF Vol. 29 No. 2, page 472.

Maritime Pine－See PF Vol． 29 No．4，page 1279.
Maritime Pine Extract－See PF Vol． 29 No．4，page 1282.
Milk Thistle Capsules－See PF Vol． 29 No．2，page 479.
Minerals Capsules－See PF Vol． 28 No．5，page 1543.
Minerals Tablets－See PF Vol． 28 No．5，page 1543.
Nettle－See PF Vol． 29 No．4，page 1285.
Powdered Nettle－See PF Vol． 29 No．4，page 1289.
Powdered Nettle Extract－See PF Vol． 29 No．4，page 1289
Oil－and Water－Soluble Vitamins Tablets－See PF Vol． 28 No．5， page 1544.
Oil－and Water－Soluble Vitamins with Minerals Capsules－See PF Vol． 28 No．5，page 1544.
Oil－and Water－Soluble Vitamins with Minerals Tablets－See PF Vol． 29 No．2，page 510.
Oil－Soluble Vitamins Tablets－See PF Vol． 28 No．5，page 1547.
Saw Palmetto Capsules－See PF Vol． 29 No．4，page 1291.
Saw Palmetto Extract－See PF Vol． 26 No．6，page 1567.
Powdered St．John＇s Wort Extract—See PF Vol． 29 No．3， page 702.
Ubidecarenone Capsules－See PF Vol． 30 No．1，page 202.
Valerian Capsules－See PF Vol． 27 No．1，page 1825.
Water－Soluble Vitamins with Minerals Capsules－See PF Vol． 28 No．5，page 1547.
Water－Soluble Vitamins with Minerals Tablets－See PF Vol． 28 No．5，page 1548.

## GENERAL CHAPTERS

## General Tests and Assays

## General Requirements for Tests and Assays

〈1〉 Injections－See PF Vol． 29 No．3，page 707.
〈11〉 USP Reference Standards－See PF Vol． 23 No．6，page 5180； PF Vol． 24 No．5，page 6925；PF Vol． 25 No．5，page 8893；PF Vol． 26 No．1，page 218；PF Vol． 26 No．3，page 793；PF Vol． 26 No．4，page 1101 ；PF Vol． 26 No．5，page 1369；PF Vol． 27 No．1，page 1832；PF Vol． 27 No．2，page 2268；PF Vol． 27 No．4，page 2806；PF Vol． 27 No．6，page 3348；PF Vol． 28 No．2，page 433；PF Vol． 28 No．3，page 839；PF Vol． 28 No． 4，page 1224；PF Vol． 28 No．5，page 1468；PF Vol． 28 No．6， page 1913；PF Vol． 29 No．1，page 163；PF Vol． 29 No．2， page 483；PF Vol． 29 No．3，page 710；PF Vol． 29 No．4，page 1137；PF Vol． 29 No．5，page 1601；PF Vol． 29 No．6，page 2022；PF Vol． 30 No．1，page 211.

## Microbiological Tests

$\langle 55\rangle$ Biological Indicators－Resistance Performance Tests－See PF Vol． 30 No．1，page 212.

## Chemical Tests and Assays

## IDENTIFICATION TESTS

$\langle 197\rangle$ Spectrophotometric Identification Test－See PF Vol． 29 No． 3 ，page 711 ．

## LIMIT TESTS

＜231 Heavy Metals－See PF Vol． 30 No．1，page 217.
＜267 Porosimetry by Mercury Intrusion－See PF Vol． 29 No．3， page 712 ．

## OTHER TESTS AND ASSAYS

〈311〉 Alginates Assay－See PF Vol． 29 No．4，page 1138.
〈341）Antimicrobial Agents－Content－See PF Vol． 29 No．4， page 1141.
〈381〉 Elastomeric Closures for Injections－See PF Vol． 30 No．1， page 220 ．
＜386〉 Environmentally Sensitive Preparations－See PF Vol． 29 No．4，page 1143 ．
〈401〉 Fats and Fixed Oils－See PF Vol． 29 No．4，page 1145.
＜429〉 Light Diffraction Measurement of Particle Size－See PF Vol． 29 No．4，page 1146.
＜467〉 Organic Volatile Impurities－See PF Vol． 29 No．4，page 1153.

〈518〉 Solution Calorimetry—See PF Vol． 28 No．4，page 1299.

## Physical Tests and Determinations

$\langle 601\rangle$ Aerosols，Metered－Dose Inhalers，and Dry Powder Inha－ lers－See PF Vol． 29 No．4，page 1176.
〈611）Alcohol Determination－See PF Vol． 29 No．5，page 1606.
621 Chromatography－See PF Vol． 30 No．1，page 228.
＜625 $\rangle$ Clarity and Degree of Opalescence of Liquids－See PF Vol． 26 No．6，page 1616.
$\langle 627\rangle$ Degree of Color of Liquids－See PF Vol． 26 No．6，page 1617.

〈643〉 Total Organic Carbon－See PF Vol． 29 No．6，page 2026.
＜645 Water Conductivity－See PF Vol． 30 No．1，page 233.
661 Containers－See PF Vol． 29 No．2，page 490.
＜696 Crystallinity Determination by Solution Calorimetry－See PF Vol． 29 No．1，page 175.
〈698〉 Deliverable Volume－See PF Vol． 29 No．6，page 2029.
699）Density of Solids－See PF Vol． 28 No．2，page 603.
711）Dissolution－See PF Vol． 30 No．1，page 234.
＜724）Drug Release－See PF Vol． 29 No．3，page 715.
＜730〉 Inductively Coupled Plasma（ICP）—See PF Vol． 28 No．6， page 1922.
〈785〉 Osmolarity＿See PF Vol． 29 No．6，page 2033.
＜789 Particulate Matter in Ophthalmic Solutions－See PF Vol． 28 No．5，page 1496.
〈791〉 pH—See PF Vol． 29 No．6，page 2037.
＜795〉 Pharmaceutical Compounding－Nonsterile Preparations－ See PF Vol． 29 No．1，page 179.
＜811 Powder Fineness－See PF Vol． 28 No．2，page 611.
＜823 Radiopharmaceuticals for Positron Emission Tomography－ Compounding－See PF Vol． 29 No．2，page 494.
＜846 Specific Surface Area－See PF Vol． 28 No．2，page 612.
9921）Water Determination－See PF Vol． 29 No．5，page 1610.

## General Information

Introduction－See PF Vol． 29 No．6，page 2039.
$\langle 1010\rangle$ Analytical Data－Interpretation and Treatment－See PF Vol． 30 No．1，page 236.
＜1051〉 Cleaning Glass Apparatus－See PF Vol． 30 No．1，page 264.

〈1072〉 Disinfectants and Antiseptics—See PF Vol． 29 No．3，page 726.

〈1075〉 Good Compounding Practices－See PF Vol． 29 No．2，page 497.
＜1078 Good Manufacturing Practices for Bulk Pharmaceutical Excipients－See PF Vol． 28 No．5，page 1504.
$\langle 1079\rangle$ Good Storage and Shipping Practices－See PF Vol． 29 No． 5，page 1612.
$\langle 1080\rangle$ Bulk Pharmaceutical Excipients－Certificate of Analy－ sis－See PF Vol． 28 No．5，page 1650.
〈1082 $\rangle$ Genotoxicity Testing－See PF Vol． 30 No．1，page 264.
〈1086 Impurities in Official Articles－See PF Vol． 29 No．4，page 1214.
＜1089 $\rangle$ In Vitro，Absorption－Indicating Cell Culture System－See PF Vol． 25 No．5，page 8733.
＜1111〉Microbiological Attributes of Nonsterile Pharmaceutical Products－See PF Vol． 25 No．2，page 7785.
＜1116〉 Microbiological Evaluation of Clean Rooms and Other Controlled Environments－See PF Vol． 25 No．3，page 8264.
〈1118〉 Monitoring Devices－Time，Temperature，and Humidity－ See PF Vol． 29 No．1，page 206.

＜1265〉 Written Prescription Drug Information－See PF Vol． 29 No．4，page 1224.

## Dietary Supplements

〈2021＞Microbial Limit Tests－Nutritional Supplements－See PF Vol． 29 No．1，page 268.
＜2022〉 Microbiological Procedures for Absence of Objectionable Microorganisms in Nutritional and Dietary Articles－See PF Vol． 29 No．1，page 287.
＜2023〉Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements－See PF Vol． 29 No．1，page 296.
$\langle 2040\rangle$ Disintegration and Dissolution of Nutritional Supple－ ments－See PF Vol． 29 No．2，page 513.
＜2091〉 Uniformity of Dietary Supplement Intake Units－See PF Vol． 28 No．5，page 1549.

## REAGENTS，INDICATORS，AND SOLUTIONS

## Reagent Specifications

Acetaldehyde－See PF Vol． 29 No．4，page 1227.
2－Acetamidophenol－See PF Vol． 25 No．6，page 9107.
Acetyl Chloride－See PF Vol． 29 No．4，page 1228.
Agarose－See PF Vol． 27 No．6，page 3363.
Air－Nitrous Oxide Certified Standard－See PF Vol． 28 No．4，page 1234.

Albumin Bovine Serum－See PF Vol． 29 No．4，page 1228.
Alum－See PF Vol． 29 No．4，page 1228.
Alumina，Activated－See PF Vol． 29 No．4，page 1229.
4－Amino－3－hydroxy－1－naphthalenesulfonic Acid－See PF Vol． 29 No．4，page 1229.
Ammonia Detector Tube－See PF Vol． 29 No．4，page 1229.
Ammonia Water，Stronger－See PF Vol． 29 No．4，page 1229.
Ammonium Hydroxide－See PF Vol． 29 No．4，page 1229.
Ammonium Pyrrolidinedithiocarbamate－See PF Vol． 27 No．5， page 3115.

Anti－A Blood Grouping Reagent，Anti－B Blood Grouping Re－ agent，and Anti－A，B Blood Grouping Reagent－See PF Vol． 29 No．2，page 505.
Anti－D $\left(\mathrm{Rh}_{\mathrm{o}}\right)$ Reagent－See PF Vol． 29 No．2，page 505.
Anti－D Reagent－See PF Vol． 29 No．2，page 506.
Antihuman Globulin Reagent－See PF Vol． 29 No．2，page 506.
Antithrombin III for Amidolytic Test－See PF Vol． 29 No．1，page 264.

Arsenic Trioxide－See PF Vol． 29 No．4，page 1230.
Bacterial Alkaline Protease Preparation－See PF Vol． 28 No．2， page 552.
Barbituric Acid－See PF Vol． 29 No．1，page 265.
Benzil－See PF Vol． 28 No．4，page 1305.
Benzoic Acid－See PF Vol． 29 No．4，page 1230.
Blood Group $\mathrm{A}_{1}$ and Blood Group B Red Blood Cells－See PF Vol． 29 No．2，page 506.
7 Percent Bovine Serum Albumin Certified Standard－See PF Vol． 29 No．4，page 1230.
Branched Polymeric Sucrose－See PF Vol． 27 No．6，page 3363.
Bromelain－See PF Vol． 28 No．2，page 552.
1，4－Butanediol－See PF Vol 25 No．5，page 8747.
Butyl Acetate，Normal－See PF Vol． 29 No．4，page 1230.
Butyl Alcohol－See PF Vol． 29 No．4，page 1230.
Butyl Alcohol，Tertiary－See PF Vol． 29 No．4，page 1230.
n－Butylboronic Acid－See PF Vol． 29 No．4，page 1231.
Butyrolactone－See PF Vol． 22 No．6，page 3248.
Calcium Acetate－See PF Vol． 29 No．4，page 1231.
Calcium Carbonate－See PF Vol． 29 No．4，page 1231.
Calcium Chloride，Anhydrous－See PF Vol． 29 No．4，page 1231.
dl－Camphene－See PF Vol． 28 No．6，page 1951.
Capric Acid－See PF Vol 25 No．5，page 8749.
Carbon Dioxide Detector Tube－See PF Vol． 29 No．4，page 1232.
Carbon Monoxide Detector Tube－See PF Vol． 29 No．4，page 1232.

Casein－See PF Vol． 29 No．4，page 1232.
Cation－Exchange Resin，Styrene－Divinylbenzene，Strongly Acidic－See PF Vol． 29 No．4，page 1232.
Ceric Ammonium Sulfate－See PF Vol． 29 No．4，page 1233.
Cesium Chloride－See PF Vol． 29 No．6，page 2054.
Chloramine T－See PF Vol． 29 No．4，page 1233.
Chlorine Detector Tube－See PF Vol． 29 No．4，page 1233.
p－Chloroaniline－See PF Vol． 29 No．4，page 1234.
Chlorobenzene－See PF Vol． 29 No．4，page 1234.
Chloroform，Alcohol－free－See PF Vol． 29 No．4，page 1234.
4－Chloro－1－naphthol－See PF Vol． 29 No．4，page 1234.
Chromatograhic Reagents－See PF Vol． 29 No．4，page 1234.
Chromotropic Acid－See PF Vol． 29 No．4，page 1235.
Cobaltous Acetate－See PF Vol． 29 No．4，page 1235.
Compactin－See PF Vol． 29 No．4，page 1235.
Coomassie Blue G－250 C－See PF Vol． 29 No．4，page 1235.
Cupric Chloride－See PF Vol． 29 No．4，page 1236.
Cyclohexylmethanol－See PF Vol． 28 No．3，page 849.
DEAE－Agarose－See PF Vol． 29 No．1，page 265.
Deoxyadenosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxycytidine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyguanosine Triphosphate－See PF Vol． 27 No．6，page 3364.
Deoxyribonucleic Acid Polymerase－See PF Vol． 27 No．6，page 3365.

Deoxythymidine Triphosphate－See PF Vol． 27 No．6，page 3365. Deuterated Methanol－See PF Vol． 29 No．6，page 2054.
Dextran，High Molecular Weight－See PF Vol． 29 No．4，page 1236.

Dibutylammonium Phosphate－See PF Vol． 26 No．4，page 1132.
Dichloroacetic Acid－See PF Vol． 29 No．4，page 1236.
Dicyclohexyl－See PF Vol． 28 No．3，page 849.
Dicyclohexyl Phthalate－See PF Vol． 26 No．2，page 504.
Diethylamine－See PF Vol． 29 No．4，page 1236.
Diethylpyrocarbonate－See PF Vol． 27 No．6，page 3365.
Diisobutylene－See PF Vol． 28 No．4，page 1305.
1，5－Dimethyl－1，5－diazundecamethylene Polymethobromide－See PF Vol． 30 No．1，page 315.
$\mathrm{N}, \mathrm{N}$-Dimethylformamide Diethyl Acetal—See PF Vol. 29 No. 5, page 1681.
$N, N$-Dimethyldodecylamine- $N$-oxide-See PF Vol. 27 No. 4, page 2837.

1,3-Dimethyl-2-imidazolidinone-See PF Vol. 29 No. 4, page 1237.

Dimethyl Sulfoxide, Spectrophotometric Grade-See PF Vol. 29 No. 4, page 1237.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bro-mide-See PF Vol. 27 No. 6, page 3365.
2,4-Dinitrofluorobenzene-See PF Vol. 29 No. 4, page 1237.
Dioleoylglycerol-See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol-See PF Vol. 28 No. 3, page 849.

Disodium Arsenate-See PF Vol. 28 No. 4, page 1305.
Disodium Chromotropate-See PF Vol. 29 No. 4, page 1237.
1-Dodecanol-See PF Vol. 29 No. 4, page 1238.
Dodecyl Lithium Sulfate-See PF Vol. 29 No. 4, page 1238.
Drabkin's Reagent-See PF Vol. 29 No. 2, page 507.
Eosin Y (Eosin Yellowish Y) -See PF Vol. 29 No. 4, page 1238.
Escin-See PF Vol. 27 No. 4, page 2837.
Ethidium Bromide-See PF Vol. 27 No. 6, page 3366.
Ethylbenzene-See PF Vol. 28 No. 3, page 850.
9-Fluorenylmethyl Chloroformate-See PF Vol. 25 No. 5, page 8916.

Formamide, Anhydrous-See PF Vol. 27 No. 5, page 3115.
$\beta$-Galactosidase Suspension-See PF Vol. 29 No. 4, page 1238.
Glucose-See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid-See PF Vol. 27 No. 6, page 3366.
L-Glutamine-See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate-See PF Vol. 27 No. 6, page 3366.
1-Heptadecanol-See PF Vol. 29 No. 4, page 1238.
Hexadecane-See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide-See PF Vol. 29 No. 1, page 265.
Hexokinase and Glucose-6-phosphate Dehydrogenase Suspen-sion-See PF Vol. 29 No. 4, page 1239.
L-Histidine Hydrochloride Monohydrate-See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide-See PF Vol. 28 No. 4, page 1305.
Horseradish Peroxidase Conjugated to Goat Anti-Mouse IgGSee PF Vol. 29 No. 4, page 1239.
Hydriotic Acid-See PF Vol. 29 No. 4, page 1239.
Hydrocodone Diol-See PF Vol. 28 No. 4, page 1306.
Hydrogen Sulfide Detector Tube-See PF Vol. 29 No. 4, page 1239.

4-Hydroxybenzoic Acid Isopropyl Ester-See PF Vol. 29 No. 4, page 1239.
IgG-Coated Red Cells-See PF Vol. 29 No. 2, page 507.

## HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps (Stages).

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In $P F$, this stage appears as OFFICIAL INQUIRY STAGE 4 in the Harmonization section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

## Stage 5: Consensus

## A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

## B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

# MONOGRAPHS (USP) 

## BRIEFING

Alcohol, USP 27 page 59 and page 1699 of PF 29(5) [Sept.Oct. 2003]. The European Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of compendial standards for the Alcohol monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Identification A | + | + | + |
| Identification B | + | + | + |
| Appearance | + | + | + |
| Acidity or alkalinity | + | + | + |
| Relative density | + | + | + |
| Absorbance | + | + | + |
| Volatile impurities | + | + | + |
| Residue on evapo- <br> ration | + | + | + |
| Storage | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters.
Definition and Relative density: Each pharmacopeia specifies a different range for the content; the values for relative density vary accordingly and, in addition, are expressed at different temperatures.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the ADOPTION STAGE 6 document and the current USP monograph include the following:
(1) Definition-No change.
(2) Packaging and storage-Storage conditions to protect from light are added.
(3) USP Reference standards-A reference standard for Alcohol is added for use in the Identification test.
(4) Identification-Tests $A$ and $B$ are replaced with a more definitive IR absorption test, and the test for specific gravity is moved under Identification.
(5) Clarity of solution-This test is added to comply with EP standards.
(6) Color of solution-This test is added to comply with EP standards.
(7) Specific gravity-No change.
(8) Acidity-This test is replaced by a test for Acidity or alkalinity to comply with EP standards.
(9) Limit of nonvolatile residue-The sample size is increased from 40 to 100 mL .
(10) Water-insoluble substances-This test is deleted. Because the monograph contains tests for Nonvolatile residue and Volatile impurities, this test is no longer needed.
(11) Aldehydes and other foreign organic substances-This test is replaced with a Volatile impurities test.
(12) Amyl alcohol and nonvolatile, carbonizable substancesThis test is replaced with a Volatile impurities test.
(13) Ultraviolet absorbance-This test is added to comply with EP standards.
(14) Limit of acetone and isopropyl alcohol-This test is replaced with a Volatile impurities test.
(15) Methanol-This test is replaced with a Volatile impurities test.
(16) Volatile impurities-This chromatographic test is added to limit a wide array of volatile impurities within a single test method.
(EMC: J. Lane) RTS-40773-1

## Change to read:

## Aleohel

$\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}$
Ethenel.
Ethyl aleohel_ $\quad[64-17.5]$.
\#- Alcohol contains not less than 92.3 percent and not more than 93.8 percent, by weight, corresponding to not less than 94.9 pereent and not more than 96.0 pereent, by volume, at $15.56^{\circ}$, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Packaging and-storage- Preserve-in tight containers, remete frem flire.

## Identifieation-

A: Mix 5 drops in a small beaker with 1 mL of potassimm per manginate solution ( 1 in 100 ) and 5 -drops of 2 N sulfuric acid, and eover the beaker immediately with a filter paper meistened with - a selution recently prepared by dissolving 0.1 g of sodium nitrofer rieyanide and 0.25 g of piperazine in 5 mL of water: an intense blue eoler is produced on the filter paper, the coler becoming paler after $a$ few minuter.
B: To 5 mL of a solution ( 1 in 10 ) add 1 mL of 1.0 N soditm hydroxide, then slowly (over a period of 3 minutes) add 2 mL of 0.1 N iodine: the odor of iodoform develops, and a yellow preeipitate is formed within 30 mintutes.
Speeific gravity $\langle 844\rangle$ - between 0.812 and 0.816 at $15.56^{\circ}$, indieating between $92.3 \%$ and $93.8 \%$, by weight, or between $94.9 \%$ and $96.0 \%$, by velume, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.
Acidity Tb 50 mL , in a glass stoppered flask, add 50 mL of re eently beiled water. Add phenelphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink color that persists for 30 seconds: not more than 0.90 mL of 0.020 N sodium hydroxide is required for neutralization.
Limit of nonvolatile residue-Evaporate 40 mL in a tared dish on a water bath, and dry at $105^{\circ}$ for 1 hour: the weight of the residue does not exeed 1 mg.
Water insoluble substanees- Dilute it with an equal volume of water: the mixture is clear and remains clear for 30 minutes after eooling to $10^{\circ}$.
Aldehydes and other foreign organie substanees-Place 20 mL in a glass-stoppered cylinder that has been thoroughly cleaned with hydrochloric acid, then rinsed with water and finally with the At
eohol to be tested. Cool the contents to approximately $15^{\circ}$, and add, by means of a carefully cleaned pipet, 0.10 mL of 0.10 N pe tassium permanganate, noting aceurately the time of addition. Mix at one by inveriting the stoppered eylinder, and allow it to stand at $15^{\circ}$ for 5 minutes: the pink color dees not entirely disappear.
Amylaleoholand nonvolatile, carbonizable substanees Allow 25 mL to vaperate spentaneously from a pereelain dish, carefully protect from dust, until the suface of the dish is barely meist: ne redor brown color is produced immediately upon the addition of a few dreps of sulfuric acid.
Limit of acetone and isopropylaleohol To 1.0 mL add 1.0 mL of water, 1.0 mL of a saturated solution of dibasic sodium pherphate, and 3.0 mL of a satrated solution of potassium permangafate. Warm the mixture to $45^{\circ}$ to $50^{\circ}$, and allow to stand until the permanganate color is discharged. Add 3.0 mL of 2.5 N sodium hydroxide, and filter, without washing, through a sintered glass fil ter. Prepare a control by mixing 1.0 mL of the saturated solution of dibasic sodium phesphate, 3.0 mL of 2.5 N sodium hydroxide, 80 He of acetone, and 5.0 mL of water. To ach solution add 1 mL of furfural solution ( 1 in 100 ), allow to stand for 10 minutes, then to 1.0 mL of each solution add 3 mL of hydrechloric acid: any pink evler produced in the test solution is net more intense than that in the control.
Methanol To 1 drep add 1 drep of water, 1 drep of dilute phos phoric acid ( 1 in 20), and 1 drep of potassium permangenate-solur tion ( 1 in 20). Mix, allow to stand for 1 minute, and add sodium metabisulfte solution ( 1 in 20), drepwise, until the permanganate evlor is discharged. If a brewn color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat on a water bath at $60^{\circ}$ for 10 minutes: any violet coler should not exeed that produred by 0.04 mg of methanel in 1 mL of water, treated in the same way as the sample.

AAlcohol
$\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O} \quad 46.07$
Ethanol.
Ethyl alcohol [64-17-5].
» Alcohol contains not less than 92.3 percent and not more than 93.8 percent, by weight, corresponding to not less than 94.9 percent and not more than 96.0 percent, by volume, at $15.56^{\circ}$, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Packaging and storage-Preserve in tight containers, protected from light. ind remole from heat, sparks, or open flames.

USP Reference standards $\langle 11\rangle$ —USP Alcohol RS.
Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension $A$ and to water in diffused daylight 5 minutes after preparation of Reference suspension A.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE-This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE-This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension $B$.

Test solution $A$-The substance to be examined.
Test solution B-Dilute 1.0 mL of Test Solution $A$ to 20 mL with water, and allow to stand for 5 minutes before testing.

Procedure-Transfer a sufficient portion of Test solution $A$ and Test solution $B$ to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension A, Reference suspension $B$, and water to separate matching test tubes. Compare Test solution A, Test solution B, Reference suspension $A$, Reference suspension $B$, and water in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). [NOTE-The diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] Test solution $A$ and Test solution $B$ show the same clarity as that of water or their opalescence is not more pronounced than that of

## Reference suspension $A$.

## Color of solution-

Standard stock solution-Combine 3.0 mL of ferric chloride $\mathrm{CS}, 3.0 \mathrm{~mL}$ of cobaltous chloride $\mathrm{CS}, 2.4 \mathrm{~mL}$ of cupric sulfate CS , and 1.6 mL of dilute hydrochloric acid ( 10 g per L).

Standard solution-[NOTE—Prepare the Standard solution immediately before use.] Transfer 1.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix.

Test solution-The substance to be examined.
Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution and water to separate, matching test tubes. Compare the Test solution, Standard solution, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophoto-
metry and Light-Scattering $\langle 851\rangle$ ). The Test solution has the appearance of water or is not more intensely colored than the Standard solution.

## Identification-

A: It complies with the test for Specific gravity.
B: Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ or $\langle 197 \mathrm{~S}\rangle$ neat.
Specific gravity $\langle 841\rangle$ : between 0.812 and 0.816 at $15.56^{\circ}$, indicating between $92.3 \%$ and $93.8 \%$, by weight, or between $94.9 \%$ and $96.0 \%$, by volume, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

## Acidity or alkalinity-

Phenolphthalein solution-Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL .

Procedure-To 20 mL of alcohol, add 20 mL of freshly boiled and cooled water and 0.1 mL of Phenolphthalein solution. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide. The solution is pink ( 30 ppm , expressed as acetic acid).

Ultraviolet absorption—Record the UV absorption spectrum of the test material from 200 to 400 nm in a $1-\mathrm{cm}$ cell: maximum absorbance 0.40 at $240 \mathrm{~nm}, 0.30$ between 250 and 260 nm , and 0.10 between 270 and 340 nm . Examine between 235 and 340 nm , in a $5-\mathrm{cm}$ cell, using water as the compensation liquid. The absorption curve is smooth.

## Volatile impurities-

Test solution $A$-The substance to be examined.
Test solution B—Add $150 \mu \mathrm{~L}$ of 4-methylpentan-2-o1 to 500.0 mL of the substance to be examined.

Standard solution A-Dilute $100 \mu \mathrm{~L}$ of methanol to 50.0 mL with the substance to be examined. Dilute 5.0 mL of the solution to 50.0 mL with the substance to be examined.

Standard solution B-Dilute $50 \mu \mathrm{~L}$ of methanol and 50 $\mu \mathrm{L}$ of acetaldehyde to 50.0 mL with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 10.0 mL with the substance to be examined.

Standard solution C-Dilute $150 \mu \mathrm{~L}$ of acetal to 50.0 mL with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 10.0 mL with the substance to be examined.

Standard solution D-Dilute $100 \mu \mathrm{~L}$ of benzene to 100.0 mL with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 50.0 mL with the substance to be examined.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, maintained at about $280^{\circ}$, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused silica capillary column bonded with a $1.8-\mu \mathrm{m}$ layer of phase G43. The carrier gas is helium with a linear velocity of about 35 cm per second and a split ratio of 1:20. The column is maintained at $40^{\circ}$ for the first 12 minutes after an injection is made and is increased from $40^{\circ}$ to $240^{\circ}$ from 12 to 32 minutes after injection. During the period of 32 to 42 minutes after an injection is made the column is maintained at $240^{\circ}$. The injector port is maintained at $200^{\circ}$.

Procedure-Inject about $1.0 \mu \mathrm{~L}$ of Standard solution B into a suitable gas chromatograph, and record the chromatogram. The resolution, $R$, between the first major peak (acetaldehyde) and the second major peak (methanol) is not less than 1.5. Separately inject equal volumes $(1.0 \mu \mathrm{~L})$ of Test solution $A$ and Test solution $B$ into the chromatograph, record the chromatograms, and measure the major peaks. Calculate the concentration of methanol in Test solution A: not more than half the area of the corresponding peak in the chromatogram obtained with Standard solution A (200 $\mathrm{ppm})$.

Calculate the sum of the contents of acetaldehyde and acetal, expressed as acetaldehyde, using the following expression:

$$
\left[\left(10 \times A_{E}\right) /\left(A_{T}-A_{E}\right)\right]+\left[\left(30 \times C_{E}\right) /\left(C_{T}-C_{E}\right)\right]
$$

where $A_{E}$ is the area of the acetaldehyde peak in the chromatogram obtained with the Test solution $A ; A_{T}$ is the area of the acetaldehyde peak in the chromatogram obtained with Standard solution B; $C_{E}$ is the area of the acetal peak in the chromatogram obtained with Test solution $A$; and $C_{T}$ is the area of the acetal peak in the chromatogram obtained with Standard solution $C$ : not more than 10 ppm , expressed as acetaldehyde.

Calculate the content of benzene using the following expression:

$$
\left(2 B_{E}\right) /\left(B_{T}-B_{E}\right),
$$

where $B_{E}$ is the area of the benzene peak in the chromatogram obtained with Test solution $A$; and $B_{T}$ is the area of the benzene peak in the chromatogram obtained with Standard solution $D$ : not more than 2 ppm . If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

The total of all other impurities in the chromatogram obtained with Test solution B: not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with Test solution B (300 ppm).
Disregard any peaks that are 0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with Test solution $B(9 \mathrm{ppm})$.

Limit of nonvolatile residue-Evaporate 100 mL in a tared dish on a water bath, and dry at $100^{\circ}$ to $105^{\circ}$ for 1 hour: the weight of the residue does not exceed 2.5 mg . $\Delta U S P 28$

## BRIEFING

Dehydrated Alcohol, USP 27 page 60 and page 1702 of $P F$ $29(5)$ [Sept.-Oct. 2003]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of compendial standards for the Dehydrated Alcohol monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| Appearance | + | + | + |
| Acidity or alkalinity | + | + | + |
| Relative density | + | + | + |
| Absorbance | + | + | + |

| Residue on evapo- <br> ration | + | + | + |
| Storage | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters.
Relative density: The values for relative density are expressed at different temperatures in the three pharmacopeias.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications

Differences between the ADOPTION STAGE 6 document and the current $U S P$ monograph include the following:
(1) Definition-No change.
(2) Packaging and storage-Storage conditions to protect from light are added.
(3) USP Reference standards-A reference standard for alcohol is added for the Identification test.
(4) Identification-Tests $A$ and $B$ are replaced with a more definitive Infrared absorption test, and the test for Specific gravity is moved under Identification.
(5) Clarity of solution-This test is added to comply with EP standards.
(6) Color of solution-This test is added to comply with EP standards.
(7) Specific gravity-No change.
(8) Acidity-This test is replaced by a test for Acidity or alkalinity to comply with EP standards.
(9) Limit of nonvolatile residue-The sample size is increased from 40 to 100 mL .
(10) Water-insoluble substances-This test is deleted. Because the monograph contains tests for Nonvolatile residue and Volatile impurities, this test is no longer needed.
(11) Aldehydes and other foreign organic substances-This test is replaced with a Volatile impurities test.
(12) Amyl alcohol and nonvolatile, carbonizable substancesThis test is replaced with a Volatile impurities test.
(13) Ultraviolet absorbance-The standards have been modified to comply with EP standards.
(14) Limit of acetone and isopropyl alcohol-This test is replaced with a Volatile impurities test.
(15) Methanol-This test is replaced with a Volatile impurities test.
(16) Volatile impurities-This chromatographic test is added to limit a wide array of volatile impurities within a single test method.
(EMC: J. Lane)
RTS-40773-7

## Change to read:

## Dehydrated Aleohol

\# Dehydrated Aleohol contains not less than 99.2 pereent, by weight, corresponding to not less than 99.5 pereent, by voltame, at $15.56^{\circ}$, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Packaging and-storage Preserve in tight containers, remote frem fire.

## Identifiention-

A: Mix 5 dreps in a small beaker with 1 mL of petassium per manganate solution ( 1 in 100) and 5 drops of 2 N sulfuric acid, and eover the beaker immediately with a filter paper moistened with a solution recently prepared by dissolving 0.1 gof sodium nitrofer ricyanide and 0.25 gof piperazine in 5 mL of water: an intense blue evlor is produced on the flter paper, the color beeoming pater after a few mintutes.

B: To 5 mL of a solution ( 1 in 10) add 1 mL of 1.0 N sodium hydroxide, then slowly (over a period of 3 mintes) add 2 mL of $\theta .1 \mathrm{~N}$ iodine: the odor of iodeform develops, and a yellow preei pitate is formed within 30 minutes.
Speeifie gravity $\langle 844\rangle:$ not more than 0.7962 at $15.56^{\circ}$, indieating not less than $99.2 \%$ of $_{2} \mathrm{H}_{5} \mathrm{OH}$ by weight.
Acidity $\mathrm{To}-50 \mathrm{~mL}$, in a glass stoppered flask, add 50 mL of re eently boiled water. Add phenolphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink coler that persists for 30 seconds: not mere than 0.90 mL of 0.020 N sodium hydroxide is required for neutralization.
Limit of nonvolatile residue-Evaporate 40 mL in a tared dishon a water bath, and dry at $105^{\circ}$ for 1 hour: the weight of the residue does not exceed 1 ms.
-Water-insoluble substances-Dilute it with an equal volume of water: the mixture is clear and remains clear for 30 minutes after eoveling to $10^{\circ}$.
Aldehydes and other foreign organie substanees-Place 20 mL in a glass-stoppered eylinder that has been thoroughly cleaned with hydrechlorie acid, then rinsed with water and finally with the Dehydrated Aleohel to be tested. Cool the contents to approximately $15^{\circ}$, and add, by means of a carefally cleaned pipet, 0.10 mL of 0.10 N petassitum permanganate, noting aecurately the timeof ad dition. Mix at once by inverting the stoppered cylinder, and allow it to stand $15^{\circ}$ for 5 minntes: the pink color does not entirely disарреат.

Amylalcohol and nonvolatile, carbonizable substances Allow 25 mL to evaporate spontaneously from a poreelain dish, carefully protected from dust, until the surface of the dish is barely moist: $\mathrm{n} \theta$ red or brewn color is produced immediately upen the addition of a few drops of sulfuric acid.
Utraviolet absorbanee Record the UVabsorption spectrmbe tween 340 nm and 235 nm in a $1-\mathrm{cm}$ cell, with water in a matehed eell in the reference beam: the absorbance is not more than 0.08 at 240 nm , and 0.02 between 270 nm and 340 nm , and the eurve drawn threugh these peints is smooth.
Limil of acetone and isopropylaleohol.To 1.0 mL add 1 mL of water, 1 mL of a saturated solution of dibasic sodium phosphate, and 3 - mL of a saturated solution of potassitm permancanate. Warm the mixture to $45^{\circ}$ to $50^{\circ}$, and allow to stand until the per mangenate color is diseharged. Add 3 mL of 2.5 N sodimm hydrox ide, and filter, without washing, through a sintered glass filter. Prepare a control containing 1 mL of the saturated solution of di basic sodium phosphate, 3 mL of 2.5 N sodium hydroxide, and 80 He of acetone in 9 mL . To each solution add 1 mL of furfural solut tion ( 1 in 100), and allow to stand for 10 minutes, then to 1.0 mL of each solution add 3 mL of hydrochloric acid: any pink color produred in the test solution is not more intense than that in the control.
Methanol- To 1 drep add 1-drop of water, 1 drop of dilute phos phoric acid ( 1 in 20), and 1 drop of potassium permanganate solut tion ( 1 in 20). Mix, allow to stand for 1 minute, and add sodium metabisulfte solution ( 1 in 20), drepwise, until the permanganate coler is diseharged. If a brewn color remains, add 1 drep of the dilute phosphoric acid. To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat on a water bath at $60^{\circ}$ for 10 minttes: no violet color appears.

## ©Dehydrated Alcohol

$\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O} \quad 46.07$
Ethanol.
Ethyl alcohol [64-17-5].
» Dehydrated Alcohol contains not less than 99.2 percent, by weight, corresponding to not less than 99.5 percent, by volume, at $15.56^{\circ}$, of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Packaging and storage-Preserve in tight containers, protected from light. from fire.

USP Reference standards $\langle 11\rangle$ —USP Dehydrated Alcohol $R S$.

Clarity of solution-[NOTE-Test solution is to be compared to Reference suspension $A$ and to water in diffused daylight 5 minutes after preparation of Reference suspension $A$.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in water, dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE-This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE-This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension B.

Test solution $A$-The substance to be examined.
Test solution B-Dilute 1.0 mL of Test solution $A$ to 20 mL with water and allow to stand for 5 minutes before testing.

Procedure-Transfer a sufficient portion of Test solution $A$ and Test solution $B$ to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Simi-
larly transfer portions of Reference suspension A, Reference suspension $B$, and water to separate, matching test tubes. Compare Test solution $A$, Test solution B, Reference suspension $A$, Reference suspension $B$, and water in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and LightScattering $\langle 851\rangle$ ). [NOTE-The diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and Reference suspension $B$ can readily be distinguished from Reference suspension A.] Test solution $A$ and Test solution $B$ show the same clarity as that of water, or their opalescence is not more pronounced than that of Reference suspension A.

## Color of solution-

Standard stock solution-Combine 3.0 mL ferric chloride CS, 3.0 mL cobaltous chloride CS, 2.4 mL cupric sulfate CS , and 1.6 mL dilute hydrochloric acid ( 10 g per L ).

Standard solution-[NOTE-Prepare the Standard solution immediately before use.] Transfer 1.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix.

Test solution-The substance to be examined.
Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution and water to separate matching test tubes. Compare the Test solution, Standard solution, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution has the appearance of water or is not more intensely colored than the Standard solution.

## Identification-

A: It complies with the test for Specific gravity.
B: Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ or $\langle 197 \mathrm{~S}\rangle$ neat.
Specific gravity $\langle 841\rangle$ : not more than 0.7962 at $15.56^{\circ}$, indicating not less than $99.2 \%$ of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$, by weight.

Acidity or alkalinity-To 20 mL of alcohol, add 20 mL of freshly boiled and cooled water and 0.1 mL of Phenolphthalein solution. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide. The solution is pink ( 30 ppm , expressed as acetic acid).
Phenolphthalein solution-Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol and dilute to 100 mL with water.

Ultraviolet absorption-Record the UV absorption spectrum of the test material from 200 to 400 nm in a $1-\mathrm{cm}$ cell: maximum absorbance 0.40 at $240 \mathrm{~nm}, 0.30$ between 250 and 260 nm , and 0.10 between 270 and 340 nm . Examine between 235 and 340 nm , in a $5-\mathrm{cm}$ cell, using water as the compensation liquid. The absorption curve is smooth.

## Volatile impurities-

Test solution $A$-The substance to be examined.
Test solution B-Add $150 \mu \mathrm{~L}$ of 4-methylpentan-2-ol to 500.0 mL of the substance to be examined.

Standard solution A-Dilute $100 \mu \mathrm{~L}$ of methanol to 50.0 mL with the substance to be examined. Dilute 5.0 mL of the solution to 50.0 mL with the substance to be examined.

Standard solution B-Dilute $50 \mu \mathrm{~L}$ of methanol and 50 $\mu \mathrm{L}$ of acetaldehyde to 50.0 ml with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 10.0 mL with the substance to be examined.

Standard solution C-Dilute $150 \mu \mathrm{~L}$ of acetal to 50.0 mL with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 10.0 mL with the substance to be examined.

Standard solution D—Dilute $100 \mu \mathrm{~L}$ of benzene to 100.0 mL with the substance to be examined. Dilute $100 \mu \mathrm{~L}$ of the solution to 50.0 mL with the substance to be examined.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame ionization detector, maintained at about $280^{\circ}$, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused silica capillary column bonded with a $1.8 \mu \mathrm{~m}$ layer of phase G43. The carrier gas is helium with a linear velocity of about 35 cm per second and a split ratio of 1:20. The column is maintained at $40^{\circ}$ for the first 12 minutes after an injection is made and is increased from $40^{\circ}$ to $240^{\circ}$ from 12 to 32 minutes after injection. During the period of 32 to 42 minutes after an injection is made the column is maintained at $240^{\circ}$. The injector port is maintained at $200^{\circ}$.
Procedure-Inject about $1.0 \mu \mathrm{~L}$ of Standard solution B into a suitable gas chromatograph, and record the chromatogram. The resolution, $R$, between the first major peak (acetaldehyde) and the second major peak (methanol) is not less than 1.5. Separately inject equal volumes ( $1.0 \mu \mathrm{~L}$ ) of Test solution $A$ and Test solution $B$ into the chromatograph, record the chromatograms, and measure the major peaks. Calculate the concentration of methanol in Test solution A: not more than half the area of the corresponding peak in the chromatogram obtained with Standard solution A (200 ppm).

Calculate the sum of the contents of acetaldehyde and acetal, expressed as acetaldehyde, using the following expression:

$$
\left[\left(10 \times A_{E}\right) /\left(A_{T}-A_{E}\right)\right]+\left[\left(30 \times C_{E}\right) /\left(C_{T}-C_{E}\right)\right],
$$

where $A_{E}$ is the area of the acetaldehyde peak in the chromatogram obtained with the Test solution; $A_{T}$ is the area of
the acetaldehyde peak in the chromatogram obtained with Standard solution B; $C_{E}$ is the area of the acetal peak in the chromatogram obtained with Test solution $A$; and $C_{T}$ is the area of the acetal peak in the chromatogram obtained with Standard solution $C$ : not more than 10 ppm , expressed as acetaldehyde.
Calculate the content of benzene using the following expression:

$$
\left(2 B_{E}\right) /\left(B_{T}-B_{E}\right),
$$

where $B_{E}$ is the area of the benzene peak in the chromatogram obtained with Test solution $A$, and $B_{T}$ is the area of the benzene peak in the chromatogram obtained with Standard solution $D$ : not more than 2 ppm . If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

The total of all other impurities in the chromatogram obtained with Test solution $B$ is not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with Test solution $B$ ( 300 ppm ). Disregard any peaks that are 0.03 times the area of the peak corresponding to 4 -methylpentan-2-ol in the chromatogram obtained with Test solution B (9 ppm).

Limit of nonvolatile residue-Evaporate 100 mL in a tared dish on a water bath, and dry at $100^{\circ}$ to $105^{\circ}$ for 1 hour: the weight of the residue does not exceed 2.5 mg . $\mathbf{U} U S P 28$

## BRIEFING

Citric Acid, USP 27 page 461 and page 872 of PF 28(3) [MayJune 2002]. It is proposed to delete the monograph. See briefings under Citric Acid, Anhydrous and Citric Acid, Monohydrate.
(EMC: J. Lane) RTS-40769-4

## Delete the following:

## © Citric Acid

$\mathrm{G}_{6} \mathrm{H}_{8} \Theta_{7} \quad 192.12$
$1,2,3$ Prepanetriearbexylic acid, 2 hydroxy -
Gitric acid [77-92 9$]$.
Menohydrate 210.14 [5949-29-1].
\#Citric Acid is anhy drous or contains one molecule of water of hydration. It contains not less than 99.5 per cent and not more than 100.5 percent of $\mathrm{G}_{6} \mathrm{H}_{8} \mathrm{O}_{7}$, cal eulated on the anhydrous basis.

Paekaging and-storage-Preserve in tight containers.
Labeling Label it to indiente whether it is anhydreus or hydrous. Identifiention A solution respends to the tests for Citrate $\langle 194$ ) : Water, Method $I\langle 924\rangle \div$ not more than $0.5 \%$ (anhydrous form) and net more than $8.8 \%$ (hydrous form).
Readily carbonizable substances Transfer 1.0-g, powdered for the test, to a $22 \times 175 \mathrm{~mm}$ test ube previeusly rimsed with 10 mL of sulfuric acid TS and allowed to drain for 10 minutes. Add 10 mL of sulfuric acid TS, agitate until- solution is complete, and immerse in a water bath at $90 \pm 1^{\circ}$ for $60 \pm 0.5$ minutes, keeping the level of the acid below the level of the water during the entire period. Gool the tube in rumning water, and tramsfer the acid to a color eomparison tube: the color of the acid is not darker than that of a similar volume of Matching Fluid K (see Color and Achromicim $\langle 634\rangle$ ) in a matehing tube, the tubes being observed vertically against a white background.
Residtue on-ignition- $\langle 284\rangle$ : not more than- $0.05 \%$.
Sulfate-To 10 mL of a solution ( 1 in 100) add 1 mL of barium ehloride TS to which has been added 1 drep of hydrechlorie acid: ne turbidity is produeed.
Arsenic, Meth $I\langle z 14\rangle \div 3$ Ppm.
Heary metals- $\langle 234\rangle \div 0.001 \%$.
Limit of oxalate-Neutralize 10 mL of a solution ( 1 in 10) with 6 N ammenium hydroxide, add 5-drops of 3 N hydrochloric acid, eool, and add 2 mL of ealeimm chloride TS: no tarbidity is produeed.
Organie volatile imptrities, Methat $I V\langle 467\rangle$ : meets the requirements.
Assay Place about 3 g of Citric Acid in a tared flask, and weigh aceurately. Dissolve in 40 mL of water, add phenolphthatein TS, and titrate with 1 N sodimm hydroxide VS . Each mL of 1 N sodimm hydroxide is equivalent to 64.04 mg of $\mathrm{C}_{6} \mathrm{H}_{8} \Theta_{7^{-}} \mathbf{\Delta}$ USP28

## BRIEFING

Citric Acid, Anhydrous, page 872 of $P F$ 28(3) [May-June 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Citric Acid, Anhydrous monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Citric Acid, Anhydrous that was prepared by the European Pharmacopoeia. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia. The current USP monograph for Citric Acid will be replaced with two separate monographs for Anhydrous Citric Acid and Citric Acid Monohydrate.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Appearance of solu- <br> tion | + | + | + |
| Readily carbonizable <br> substances | + | + | + |
| Oxalic acid | + | + | + |
| Sulfates | + | + | + |
| Aluminium | + | - | + |
| Water | + | + | + |
| Sulphated ash | + | + | + |
| Assay | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Identification, Heavy metals, Characters, Labeling, Bacterial endotoxins, Sterility, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the European Pharmacopoeia Adoption Stage 6 document and the current USP monograph include the following:
(1) Definition-Changed to include only Anhydrous Citric Acid in order to conform to the individual monograph for Anhydrous Citric Acid.
(2) Packaging-No change.
(3) Labeling-The indication of anhydrous or hydrous is deleted in order to conform to the individual monograph for Anhydrous Citric Acid. A requirement that the label indicates where it is intended for use in dialysis solutions is added. Considerations for bacterial endotoxins and sterility are added.
(4) USP Reference standards-A USP Citric Acid Reference Standard that is used in the Identification test is added.
(5) Clarity of solution-This test is added in order to conform with EP standards.
(6) Color of solution-This test is added in order to conform with EP standards.
(7) Identification-The test for citrate is deleted, and a more definitive infrared absorption test is added.
(8) Bacterial endotoxins-Statements are added that refer to the limits under the appropriate dosage form monograph. Specific requirements have been omitted.
(9) Sterility-Statements are added that refer to the limits under the appropriate dosage form monograph.
(10) Water-The standard for this test is increased from $0.5 \%$ to $1.0 \%$ in order to conform with EP standards.
(11) Residue on ignition-The standard for this test is increased from $0.05 \%$ to $0.1 \%$ in order to conform with JP standards.
(12) Readily carbonizable substances-No change.
(13) Sulfate-The test procedure is changed to a quantitative test in order to conform to EP standards.
(14) Arsenic-This test is deleted because the Heavy metals test sufficiently accounts for arsenic.
(15) Heavy metals-No change.
(16) Limit of oxalic acid-The test procedure is changed to a quantitative test in order to conform to EP standards.
(17) Limit of aluminum-This test is added in order to conform with EP standards concerning usage in dialysis. This requirement is similar to the Limit of aluminum in the USP Calcium Acetate monograph.
(18) Organic volatile impurities-No change.
(19) Assay-The sample size is decreased from 3 g in 40 mL of water to 0.55 g in 50 mL of water. The amount of Anhydrous Citric Acid that is equivalent to 1 mL of 1 N sodium hydroxide is changed to specify a more accurate quantity (i.e., from 64.04 mg to 64.03 mg ).
(EMC: J. Lane) RTS-40769-2

## Add the following:

## ©Citric Acid, Anhydrous Anhydrous Citric Acid

$\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} \quad 192.13$
1,2,3-Propanetricarboxylic acid, 2-hydroxy-.
Citric acid [77-92-9].
» Anhydrous Citric Acid contains not less than 99.5 percent and not more than 100.5 percent of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7}$, calculated on the anhydrous basis.

Packaging and-storage-Preserve in tight containers.
Labeling-Where it is intended for use in dialysis solutions, it is so labeled. Where Anhydrous Citric Acid must be subjected to further processing during the preparation
 be subjected to further processing during the preparation
of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Anhydrous Citric Acid is sterile, it is so labeled.

USP Reference standards $\langle 11\rangle — U S P$ Citric Acid RS.
Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension $A$ in diffused daylight 5 minutes after preparation of Reference suspension A.]
Hydrazine sulfate solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours before use.

## Hexmethyle solution Methenamine solu-

 tion-Transfer 2.5 g of Hewnethye Methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.Primary opalescent suspension-[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine sulfate solution to the Hexmen Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.
Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension B.
Test solution-Dissolve 2.0 g of Anhydrous Citric Acid in about 5 mL of water, dilute with water to 10 mL , and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension $A$, Reference suspension $B$, and water to separate matching test tubes. Compare the Test solution, Reference suspension $A$, Reference suspension $B$, and water in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and LightScattering $\langle 851\rangle$ ). [NOTE-The diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] The Test solution shows the same clarity as that of water.

## Color of solution-

Standard stock solutions-Prepare three solutions, $A, B$, and $C$, containing, respectively, the following parts of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid ( 10 g per L ):
$A-2.4: 0.6: 0: 7.0$.
$B-2.4: 1.0: 0.4: 6.2$.
C-9.6:0.2:0.2:0.
Standard solutions-[NOTE—Prepare the Standard solutions immediately before use.] Transfer 2.5 mL of Standard stock solution $A$ to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix to obtain Standard solution A. Transfer 2.5 mL of Standard stock solution $B$ to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix to obtain Standard solution B. Transfer 0.75 mL of Standard stock solution $C$ to a $100-\mathrm{mL}$ volumetric flask, dilute with dilute hydrochloric acid ( 10 g per L ) to volume, and mix to obtain Standard solution C.

Test solution-Use the Test solution prepared as directed in the test for Clarity of solution.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution A, Standard solution B, Standard solution C, and water to separate matching test tubes. Compare the Test solution, Standard solution A, Standard solution B, Standard solution $C$, and water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution is not more intensely colored than Standard solutions $A, B$, or water.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$-Dry the substance to be examined at $105^{\circ}$ for 2 hours.

Bacterial endotoxins $\langle 85\rangle$-If inted for use in the manufacturing of parenteral dosage forms, without a futher appropriate procedure for the removal-of bacterial endotoxins, not more that 0.5 I . U. of en milligram. The level of bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Anhydrous Citric Acid is used can be met. Where the label states that Anhydrous Citric Acid must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Anhydrous Citric Acid is used can be met.

Sterility $\langle 71\rangle$ - Where the label states that Anhydrous Citric Acid is sterile, it meets the requirements for Sterility $\langle 71\rangle$ under the relevant dosage form monograph(s) in which Anhydrous Citric Acid is used.

Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

Readily carbonizable substances-Transfer 1.0 g of powdered Anhydrous Citric Acid to a $22-\times 175-\mathrm{mm}$ test tube previously rinsed with 10 mL of sulfuric acid TS and allowed to drain for 10 minutes. Add 10 mL of sulfuric acid TS, agitate until solution is complete, and immerse in a water bath at $90 \pm 1^{\circ}$ for $60 \pm 0.5$ minutes, keeping the level of the acid below the level of the water during the entire period. Cool the tube in running water, and transfer the acid to a color-comparison tube: the color of the acid is not darker than that of a similar volume of Matching Fluid K (see Color and Achromicity $\langle 631\rangle$ ) in a matching tube, the tubes being observed vertically against a white background.

## Sulfate-

Standard sulfate solution A-To 181 mg of dibasic potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of 30 percent alcohol, swirl to dissolve, dilute with 30 percent alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with 30 percent alcohol to volume, and mix. This solution contains $10 \mu \mathrm{~g}$ of sulfate per mL .

Standard sulfate solution B-To 181 mg of dibasic potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, dilute with water to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. This solution contains $10 \mu \mathrm{~g}$ of sulfate per mL .

Citric acid solution-Dissolve 2.0 g of Anhydrous Citric Acid in about 10 mL of water, dilute with water to 30 mL , and mix.

Procedure-To 4.5 mL of Standard sulfate solution $A$ add 3 mL of a barium chloride solution (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of the resulting suspension, add 15 mL of the Citric acid solution and 0.5 mL of 5 N acetic acid, and mix (test solution). Prepare the Standard
solution in the same manner, except use 15 mL of Standard sulfate solution B instead of the Citric acid solution: any turbidity produced in the test solution after 5 minutes standing is not greater than that produced in the Standard solution (0.015\%).

Heavy metals $\langle 231\rangle: 0.001 \%$.
Limit of oxalic acid-Prepare a citric acid solution by dissolving 800 mg of Anhydrous Citric Acid in 4 mL of water. Add 3 mL of hydrochloric acid and 1 g of granular zinc, boil for 1 minute, and allow to stand for 2 minutes. Transfer the supernatant to a test tube containing 0.25 mL of a phenylhydrazine hydrochloride solution (1 in 100), and heat to boiling. Cool rapidly, transfer to a graduated cylinder, and add an equal volume of hydrochloric acid and 0.25 mL of a potassium ferricyanide solution (1 in 20). Shake, and allow to stand for 30 minutes (test solution). Concomitantly prepare a control solution in the same manner, except use 4 mL of an oxalic acid solution containing 0.10 mg per mL , equivalent to 0.0714 mg of anhydrous oxalic acid per mL , instead of the citric acid solution: any pink color produced in the test solution is not more intense than that produced in the control solution ( $0.036 \%$ ).

Limit of aluminum (where it is labeled as intended for use in dialysis)-

Standard aluminum solution-To 352 mg of aluminum potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, add 10 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, transfer 1.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
pH 6.0 Acetate buffer-Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0 , dilute with water to 250 mL , and mix.

Test solution-Dissolve 20.0 g of Anhydrous Citric Acid in 100 mL of water, and add 10 mL of pH 6.0 Acetate buffer. Extract this solution with successive portions of 20, 20, and 10 mL of a $0.5 \%$ solution of 8-hydroxyquinoline in chloroform, combining the chloroform extracts in a $50-\mathrm{mL}$ volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.
Standard solution-Prepare a mixture of 2.0 mL of Standard aluminum solution, 10 mL of pH 6.0 Acetate buffer, and 98 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.
Blank solution-Prepare a mixture of 10 mL of pH 6.0 Acetate buffer and 100 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.
Procedure-Determine the fluorescence intensities of the Test solution and the Standard solution in a fluorometer set at an excitation wavelength of 392 nm and an emission wavelength of 518 nm , using the Blank solution to set the instrument to zero. The fluorescence of the Test solution does not exceed that of the Standard solution ( $0.2 \mu \mathrm{~g} \mathrm{per} \mathrm{g}$ ).
Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Assay—Place about 0.550 g of Anhydrous Citric Acid in a tared flask, and weigh accurately. Dissolve in 50 mL of water, add 0.5 mL of phenolphthalein TS, and titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 64.03 mg of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7 \cdot \mathbf{\Delta} U S P 28}$

## Briefing

Citric Acid Monohydrate, page 876 in PF 28(3) [May-June 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Citric Acid, Monohydrate monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Citric Acid, Monohydrate that was prepared by the European Pharmacopoeia. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia. The current USP monograph for Citric Acid will be replaced with two separate monographs for Anhydrous Citric Acid and Citric Acid Monohydrate.

| Assay |  |  | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Identification, Heavy metals, Characters, Labeling, Bacterial endotoxins, Sterility, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the European Pharmacopoeia Adoption Stage 6 document and the current $U S P$ monograph for Citric Acid include the following:
(1) Definition-Changed to include only Citric Acid Monohydrate in order to conform to the individual monograph for Citric Acid Monohydrate.
(2) Labeling-The indication of anhydrous or hydrous is deleted in order to conform to the individual monograph for Citric Acid Monohydrate. A requirement that the label indicate where it is intended for use in dialysis solutions is added. Considerations for bacterial endotoxins and sterility are added.
(3) USP Reference standards-A USP Citric Acid Reference Standard that is used in the Identification test is added.
(4) Clarity of solution-This test is added in order to conform with EP standards.
(5) Color of solution - This test is added in order to conform with EP standards.
(6) Identification-The test for Citrate is deleted and a more definitive infrared absorption test is added.
(7) Packaging-No change.
(8) Bacterial endotoxins-Statements are added that refer to the limits under the appropriate dosage form monograph. Specific requirements have been omitted.
(9) Sterility-Statements are added that refer to the limits under the appropriate dosage form monograph.
(10) Water-The standard for this test is changed from not more than $8.8 \%$ to a range of $7.5 \%$ to $9.0 \%$ in order to conform with EP standards.
(11) Residue on ignition-The standard for this test is increased from $0.05 \%$ to $0.1 \%$ in order to conform with JP standards.
(12) Readily carbonizable substances-No change.
(13) Sulfate-The test procedure is changed to a quantitative test in order to conform to EP standards.
(14) Arsenic-This test is deleted because the Heavy metals test sufficiently accounts for arsenic.
(15) Heavy metals-No change.
(16) Limit of oxalic acid-The test procedure is changed to a quantitative test in order to conform to EP standards.
(17) Limit of aluminum - This test is added in order to conform with EP standards concerning usage in dialysis. This requirement is similar to the Limit of aluminum in the USP Calcium Acetate monograph.
(18) Organic volatile impurities-This test is deleted because it is not necessary.
(19) Assay-The sample size is decreased from 3 g in 40 mL of water to 0.55 g in 50 mL of water. The amount of Citric Acid Monohydrate that is equivalent to 1 mL of 1 N sodium hydroxide is changed to specify a more accurate quantity (i.e., from 64.04 mg to 64.03 mg ).
(EMC: J. Lane) RTS-40769-3

## Add the following:

## ${ }^{\Delta}$ Citric Acid Monohydrate

$\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} \cdot \mathrm{H}_{2} \mathrm{O} \quad 210.14$
1,2,3-Propanetricarboxylic acid, 2-hydroxy-, monohy-
drate $\quad[5949-29-1]$. drate [5949-29-1].
» Citric Acid Monohydrate contains one molecule of water of hydration. It contains not less than 99.5 percent and not more than 100.5 percent of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7}$, calculated on the anhydrous basis.

Packaging and-storage-Preserve in tight containers.
Labeling-Where it is intended for use in dialysis solutions, it is so labeled. Where Citric Acid Monohydrate must be subjected to further processing during the preparation of
injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Citric Acid Monohydrate is sterile, it is so labeled.

USP Reference standards $\langle 11\rangle$ —USP Citric Acid RS
Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension $A$ in diffused daylight 5 minutes after preparation of Reference suspension A.]
Hydrazine sulfate solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours before use.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE-This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine sulfate solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension A. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension $B$.

Test solution-Dissolve 2.0 g of Citric Acid Monohydrate in about 5 mL of water, dilute with water to 10 mL , and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension $A$, Reference suspension $B$, and water to separate matching test tubes. Compare the Test solution, Reference suspension $A$, Reference suspension $B$, and water in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and LightScattering $\langle 851\rangle$ ). [NOTE-The diffusion of light must be such that Reference suspension $A$ can readily be distinguished from water, and that Reference suspension $B$ can readily be distinguished from Reference suspension A.] The Test solution shows the same clarity as that of water.

## Color of solution-

Standard stock solutions-Prepare three solutions, $A, B$, and $C$, containing, respectively, the following parts of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid ( 10 g per L ):
$A-2.4: 0.6: 0: 7.0$
$B-2.4: 1.0: 0.4: 6.2$
C-9.6:0.2:0.2:0
Test solution-Use the Test solution prepared in the Clarity of solution test.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm . Similarly transfer portions of Standard solution A, Standard solution B, Standard solution C, and water to separate matching test tubes. Compare the Test solution, Standard solution A, Standard solution B, and Standard solution C, and water in diffused daylight, viewing vertically against a white background (see Visual Com-
parison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The Test solution is not more intensely colored than Standard solutions $A, B$, and $C$ or water.

Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ — Dry the substance to be examined at $105^{\circ}$ for 2 hours.

Bacterial endotoxins $\langle 85\rangle$ - If intended for use in the man ufacturing of parenteral dosage forms, withent a futher ap propriate procedure for the removal of bacterial endotoxins, not mere that $0.5 \mathrm{I} . \mathrm{U}$. of entoxin per milligram. The level of bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used can be met. Where the label states that Citric Acid Monohydrate must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used can be met.

Sterility $\langle 71\rangle$-Where the label states that Citric Acid Monohydrate is sterile, it meets the requirements for Sterility $\langle 71\rangle$, under the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used.

Water, Method $I\langle 921\rangle$ : between $7.5 \%$ and $9.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$, determined on 1.0 g .

Readily carbonizable substances-Transfer 1.0 g of powdered Citric Acid Monohydrate, to a $22-\times 175-\mathrm{mm}$ test tube previously rinsed with 10 mL of sulfuric acid TS, and allow to drain for 10 minutes. Add 10 mL of sulfuric acid TS, agitate until solution is complete, and immerse in a water bath at $90 \pm 1^{\circ}$ for $60 \pm 0.5$ minutes, keeping the level of the acid below the level of the water during the entire period. Cool the tube in running water, and transfer the acid to a color-comparison tube: the color of the acid is not
darker than that of a similar volume of Matching Fluid $K$ (see Color and Achromicity $\langle 631\rangle$ ) in a matching tube, the tubes being observed vertically against a white background.

## Sulfate-

Standard sulfate solution A-To 181 mg of dibasic potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of 30 percent alcohol, swirl to dissolve, dilute with 30 percent alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with 30 percent alcohol to volume, and mix. This solution contains $10 \mu \mathrm{~g}$ of sulfate per mL .

Standard sulfate solution B-To 181 mg of dibasic potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, dilute with water to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. This solution contains $10 \mu \mathrm{~g}$ of sulfate per mL .
Citric acid solution-Dissolve 2.0 g of Citric Acid Monohydrate in about 10 mL of water, dilute with water to 30 mL , and mix.

Procedure-To 4.5 mL of Standard sulfate solution $A$ add 3 mL of a barium chloride solution (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of the resulting suspension, add 15 mL of the Citric acid solution and 0.5 mL of 5 N acetic acid, and mix (test solution). Prepare the Standard solution in the same manner, except use 15 mL of Standard sulfate solution B instead of the Citric acid solution: any turbidity produced in the test solution after 5 minutes standing is not greater than that produced in the Standard solution (0.015\%).

Heavy metals $\langle 231\rangle$ : $0.001 \%$.
Limit of oxalic acid—Prepare a citric acid solution by dissolving 800 mg of Citric Acid Monohydrate in 4 mL of water. Add 3 mL of hydrochloric acid and 1 g of granular
zinc, boil for 1 minute, and allow to stand for 2 minutes. Transfer the supernatant to a test tube containing 0.25 mL of a phenylhydrazine hydrochloride solution (1 in 100), and heat to boiling. Cool rapidly, transfer to a graduated cylinder, and add an equal volume of hydrochloric acid and 0.25 mL of a potassium ferricyanide solution (1 in 20). Shake, and allow to stand for 30 minutes (test solution). Concomitantly prepare a control solution in the same manner, except use 4 mL of an oxalic acid solution containing 0.10 mg per mL , equivalent to 0.0714 mg of anhydrous oxalic acid per mL, instead of the citric acid solution: any pink color produced in the test solution is not more intense than that produced in the control solution ( $0.036 \%$ ).

Limit of aluminum (where it is labeled as intended for use in dialysis)-
Standard aluminum solution-To 352 mg of aluminum potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, add 10 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, transfer 1.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
pH 6.0 Acetate buffer-Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0 , dilute with water to 250 mL , and mix.
Test solution-Dissolve 20.0 g of Citric Acid Monohydrate in 100 mL of water, and add 10 mL of pH 6.0 Acetate buffer. Extract this solution with successive portions of 20, 20 , and 10 mL of a $0.5 \%$ solution of 8 -hydroxyquinoline in chloroform, combining the chloroform extracts in a $50-\mathrm{mL}$ volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.

Standard solution-Prepare a mixture of 2.0 mL of Standard aluminum solution, 10 mL of pH 6.0 Acetate buffer, and 98 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.
Blank solution-Prepare a mixture of 10 mL of pH 6.0 Acetate buffer and 100 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.

Procedure-Determine the fluorescence intensities of the Test solution and the Standard solution in a fluorometer set at an excitation wavelength of 392 nm and an emission wavelength of 518 nm , using the Blank solution to set the instrument to zero. The fluorescence of the Test solution does not exceed that of the Standard solution ( $0.2 \mu \mathrm{~g}$ per g ).

Assay—Place about 0.550 g of Citric Acid Monohydrate in a tared flask, and weigh accurately. Dissolve in 50 mL of water, add 0.5 mL of phenolphthalein TS, and titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 64.03 mg of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7 \cdot \mathbf{\Delta}}$ USP28

Sodium Chloride, USP 27 page 1699 and page 1249 of $P F$ 28(4) [July-Aug. 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Sodium Chloride monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Sodium Chloride that was prepared by the European Pharmacopoeia. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia.

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Appearance of solution, Arsenic, Bacterial endotoxins, Heavy metals, Characters, Labeling, Sterility, Storage.
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the European Pharmacopoeia Adoption Stage 6 document and the current USP monograph include the following:

1. Definition-No change.
2. Labeling-Considerations have been made for Bacterial endotoxins and Sterility.
3. Appearance of solution-No change.
4. Packaging-No change.
5. Identification-The test for Chloride is modified to comply with EP standards.
6. Bacterial endotoxins-This test is added to comply with parenteral dosage use.
7. Sterility-This test is added to comply with parenteral dosage use.
8. Acidity or alkalinity-No change.
9. Loss on drying-A sample weight of 1.000 g is added.
10. Limit of bromides-No change.
11. Limit of phosphates-No change.
12. Limit of potassium - The test is changed to a method of direct calibration to comply with EP standards.
13. Iodides-No change.
14. Aluminum-This test is added to conform to EP standards concerning usage in dialysis. This requirement is similar to the Limit of aluminum test in the USP Calcium Acetate monograph.
15. Magnesium and alkaline-earth metals-No change.
16. Arsenic-No change.
17. Iron-The limit prescribed by the USP is retained. The general method is modified to create better conditions of evaluation.
18. Barium-Solution concentrations are altered.
19. Ferrocyanides-No change.
20. Sulfate-The test is modified to comply with EP standards.
21. Nitrites-No change.
22. Assay-This test is modified to comply with EP standards.
(EMC: J. Lane) RTS-40769-7

## Change to read:

## Sodium Chloride

$\mathrm{NaCl}-58.44$
Sodium chleride-
Sodium chleride [7647 14-5].
\#-Sodium Chloride contains not less than-99.0 percent and not more than 100.5 percent of NaCl , caleulateden the dried basis. It contains no added substance.

Packaging and storage- Preserve in well closed containers.
Labeling Where Sodium-Chloride is intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solu tions, hemodialysis solutions, or hemefiltration solutions, it is so tabeled.
Appearance of solution- Dissolve 20.0 g of it in carben dioxidefree water, and dilute with the same solvent 100.0 mL . This solutien is clear and colerless.
Identifiention A solution (1 in 20) respends to the tests for SO ditur $\langle 194\rangle$-and for Chloride $\langle 191\rangle$ :
Acidity or alkalinity To 20 mL of the solution prepared for the test for Appearance of solution, add 0.1 mL of bremothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N soditm hydroxide is required to change the color of this solution. Loss ondrying (734) - Dry itat $105^{\circ}$ for 2 heurs: it loses not more than $0.5 \%$ of its weight.
Iodides Meisten 5- of it by the drepwise addition of a freshly prepared mixture of 0.15 mL of sodimm nitrite solution ( 1 in 10 ), 2 mL of 1 N sulfurie acid, 25 mL of iodide freestareh TS, and 25 mL of water. After 5 minutes, examine the substance in naturat light. No blue coler is observed.
Aluminum- $\langle\mathbf{2 0 6}\rangle$ (where it is labeled as intended for use in the manufacture of peritoneal dialysis solutions, hemodialysis solutions, or hempfiltration solutions). Proceed as directed using 10.0 g of Sodime Chloride to prepare the Test Preparation: the limit is 0.2 Hy pers.
Magnesitm andalkaline-earth metals To 200 mL of water add 0.1 s of hydroxylamine hydrochloride, 10 mL of pH 10.0 amme nia ammonium chloride buffer (prepared by dissolving 5.4 g of ammenium chloride in 20 mL of water, adding 20 mL of ammo nium hydroxide and diluting to 100 mL ), 1 mL of 0.1 M zine sul fate, and about 0.2 g of eriochrome black $T$ trituration. Heat to about $40^{\circ}$. Titrate this solution with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Chloride dissolved in 100 mL of water. If the eoler changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 2.5 mb ( $0.01 \%$, ealeulated as Ca ).
Arsenie, Method $I\langle z 14\rangle \div 1 \mu \mathrm{sper}$ ह.

Barium Dissolve 4.0 g in 20 mL of water, filter if necessary, and divide the solution into portions. To one pertion add 2 mL of 2 N sulfuric acid, and to the other add 2 mL of water: the solutions are equally clear after standing for 2 hours.
Ferrocyanides Dissolve 2.0 g in 6 mL of water. Add 0.5 mL of a mixture of 5 mL of ferric ammenimm-sulfate solution ( 1 g g in 100 mL of 0.1 N sulfuric acid) and 95 mL of ferrous sulfate solution ( 1 in 100): No blue coler develops in 10 mintes.
Sulfate- $\langle z 21\rangle$ - 1.0 g pertion shows no more sulfate than correspends to 0.20 mL of 0.020 N sulfuric acid ( $0.020 \%$ ).
Iron $\langle 244\rangle$-Dissolve 5.0 g in 45 mL of water and 2 mL of hydroehloric acid: the limit is $2 \mu \mathrm{~g}$ per of.
Nitrites To 10 mL of the solution prepared in the test for Appeat ane of solution, add 10 mL of water, and measure the absorbance of the solution in a 1 em cell at 354 mm . The absorbanee is not greater than 0.01 .
Heary metats, Meth $I\langle 234\rangle: 5 \mathrm{ppm}$.
Limit of bromides To 0.5 mL of the solution prepared for the test for Appearane of shltion, add 4.0 mL of water, 2.0 mL of pH-4.7 phenel red TS, and 1.0 mL of chloramine $T$ solution ( 0.1 mos per mL), and mix immediately. After 2 minutes, add 0.15 mL of 0.1 N sodium thiosulfate, mix, dilute with water to 10.0 mL , and mix. The absorbance of this solution mearured at 590 nm, using water as the comparisen liguid, is not greater than that of a Stan dard solution, conemitantly prepared, using 5.0 mL of a solution eontaining 3.0 mg of petassitm bromide per liter and preee ding as above, starting with the addition of 2.0 mL of pH 4.7 phenol red TS ( $0.010 \%$ ).
Limil of phosphates-Dilute 2 mL of the solution prepared in the test for Appear of solution to 100 mL with water. Add 4 mL of sulfomolybdic acid TS, and add 0.1 mL of a mixtme of 1 mL of strenger acid stannous chloride TS and 10 mL of 2 N hydrechlorie acid. Concemitantly prepare a Standard solution using a mixture of $Z \mathrm{~mL}$ of a freshly prepared 1 to 100 dilution of a stock solution eontaining 0.716 mg of monobasic potassium phosphate per mL and 98 mL of water. After 10 minutes compare the colors of 20 mL of each solution. Any color in the test solution is not more in tense than that in the Standard solution ( $0.0025 \%$ ).
Limil of potassium. (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)

Stock test solution Transfer 10.0 ह of Sodimm-Chloride to a 100 mL volumetric flask, add water and swinl to dissolve, dilute with water to volume, and mix.

Standerd solution [NOTE-The Standerd solution-and Test si hutions may be modified, if necessary, to obtain solutions of suit able coneentrations adaptable to the linear or working range of the instrument.] Dissolve 1.144 . 5 of potassium chloride, previously dried at $105^{\circ}$ for 3 heurs, in water, dilute with water to 1000 mL , and mix. This solution contains the equivalent of $600 \mathrm{\mu} \mathrm{~g}$ of petassium per mL. Dilute quantitatively with water to obtain a solution containing the equivalent of 50 - 5 g of potascium per mL .

Test solutions. To three 25 mL volumetric flacks add 10.0 mL ef Stock est solutivn. To two of the flasks add 5.0 mL and 10.0 mL of Standed solution, respectively. Dilute all three flasks with water to volume, and mix.

Proedure Using atomic abserption-spectrophotometry (see Spectrophometyy and Light Seattering $(851\rangle$ ), analyze the Test solutions by the method of standard addition analysis using an air acetylene flame and a wavelength of 766.5 nm . The limit is $0.05 \%$.
Assay Dissolve about 200 mg of Sodium Chloride, aceurately weighed, in 10 mL of water, and add 10 mL of glacial acetic acid, 75 mL of methamel, and 3-dreps of eosin Y TS. Titrate, with shak ing, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 $N$ silver nitrate is equivalent to 5.844 mg of NaCl .

## ©Sodium Chloride

NaCl
58.44

Sodium Chloride
Sodium Chloride [7647-14-5].
» Sodium Chloride contains not less than 99.0 percent and not more than 100.5 percent of NaCl , calculated on the dried basis.

Packaging and-storage-Preserve in well-closed containers.

Labeling-Where Sodium Chloride is intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions, it is so labeled. Where Sodium Chloride must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of Bacterial endotoxins, it is so labeled. Where Sodium Chloride is sterile, it is so labeled.

Appearance of solution-Dissolve 20.0 g of Sodium Chloride in carbon dioxide-free water, and dilute with the same solvent to 100.0 mL . This solution is clear and colorless.

Identification-It responds to the tests for Sodium $\langle 191\rangle$ and for Chloride.

Chloride—Dissolve about 3 mg of Sodium Chloride in 2 mL of water. Acidify with diluted nitric acid and add 0.4 mL of silver nitrate TS. Shake and allow to stand. A curdled, white precipitate is formed. Centrifuge and wash the precipitate with three 1-mL portions of water, and discard the washings. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant may not become perfectly clear. Suspend the precipitate in 2 mL of water
and add 1.5 mL of 10 N ammonium hydroxide. The precipitate dissolves easily with the possible exception of a few large particles, which dissolve more slowly.

## Bacterial endotoxins $\langle 85\rangle$-If intended for use in the

 manufacture of parenteral dosage forms, it contains net more than 5 I.U. of ere gram. The level of Bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Sodium Chloride is used can be met. Where the label states that Sodium Chloride must be subjected to further processing during the preparation of injectable dosage forms, the level of Bacterial endotoxins are such that the requirement under the relevant dosage form monograph(s) in which Sodium Chloride is used can be met.Sterility $\langle 71\rangle$ —Where the label states that Sodium Chloride is sterile, it meets the requirements for Sterility, under the relevant dosage form monograph(s) in which Sodium Chloride is used.

Acidity or alkalinity-To 20 mL of the solution prepared for the test for Appearance of solution, add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

Loss on drying $\langle 731\rangle$-Dry the test material at $105^{\circ}$ for 2 hours: it loses not more than $0.5 \%$ of its weight, determined on a 1.000 g sample.

Limit of bromides-To 0.5 mL of the solution prepared for the test for Appearance of solution, add 4.0 mL of water, 2.0 mL of pH 4.7 phenol red TS , and 1.0 mL of chloramine T solution ( 0.1 mg per mL ), and mix immediately. After 2 minutes, add 0.15 mL of 0.1 N sodium thiosulfate, mix, dilute with water to 10.0 mL , and mix. The absorbance of this solution measured at 590 nm , using water as the comparison liquid, is not greater than that of a Standard solution, concomitantly prepared, using 5.0 mL of a solution containing
3.0 mg of potassium bromide per L and proceeding as above, starting with the addition of 2.0 mL of pH 4.7 phenol red TS ( $0.010 \%$ ).

Limit of phosphates-Dilute 2 mL of the solution prepared in the test for Appearatre of solution to 100 mL with water. Add 4 mL of sulfomolybdic acid TS, and add 0.1 mL of a mixture of 1 mL of stronger acid stannous chloride TS and 10 mL of 2 N hydrochloric acid. Coneomitantly prepare a Standed solution in the same manner, using a mixture of $Z \mathrm{~mL}$ of a freshly prepared 1 to 100 dilution of a stock solution containing 0.716 mg of menobasic potassitm phesphate per mL and 98 mL of water. After 10 minutes empare the colers of 20 mL of each solution. Any color in the test solution is not more intense than that in the Stanlad solum (0.0025\%, or 25 ppm$)$.

Phosphate stock standard solution-Dissolve an accurately weighed quantity of monobasic potassium phosphate in water to obtain a solution with a concentration of about 0.716 mg per mL .

Phosphate standard solution-Dilute 1 mL of the Stock standard solution with water to 100 mL . Prepare this solution fresh.

Standard solution-Dilute 2 mL of the Phosphate standard solution with water to 100 mL .

Test solution-Dilute 2 mL of the solution prepared in the test for Appearance of solution with water to 100 mL .

Procedure-To the Standard solution and the Test solution, add 4 mL of sulfomolybdic acid TS, and add 0.1 mL of a mixture of 1 mL of stronger acid stannous chloride TS and 10 mL of 2 N hydrochloric acid. After 10 minutes, compare the colors of 20 mL of each solution: any color in the Test solution is not more intense than that in the Standard solution ( $0.0025 \%$ ).

Limit of potassium (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)-

Test solution-Transfer 1.00 g of Sodium Chloride to a $100-\mathrm{mL}$ volumetric flask, add water and swirl to dissolve, dilute with water to volume, and mix.

Standard solution-[NOTE-The Standard solution and the Test solution may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.] Dissolve 1.144 g of potassium chloride, previously dried at $105^{\circ}$ for 3 hours, in water, dilute with water to 1000 mL , and mix. This solution contains the equivalent of $600 \mu \mathrm{~g}$ of potassium per mL . Dilute as required to obtain not fewer than three solutions at concentrations that span the expected value in the Test solution.

Procedure-Using atomic absorption spectrophotometry (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ), measure, at least three times, the emission intensity of the Test solution and the Standard solution using an air-acetylene flame and a wavelength of 766.5 nm . Prepare a calibration curve from the mean of the readings obtained with the Standard solution, and determine the concentration of potassium in the Test solution. The limit is $0.05 \%$.

Iodides-Moisten 5 g of Sodium Chloride by the dropwise addition of a freshly prepared mixture of 0.15 mL of sodium nitrite solution ( 1 in 10), 2 mL of 1 N sulfuric acid, 25 mL of iodide-free starch TS, and 25 mL of water. After 5 minutes, examine the substance in natural light. No blue color is observed.

Aluminum (where it is labeled as intended for use in the manufacture of peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)-

Standard aluminum solution-To 352 mg of aluminum potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, add 20 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, transfer 1.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.
pH 6.0 Acetate buffer-Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0 , dilute with water to 250 mL , and mix.

Test solution-Dissolve 20.0 g of Sodium Chloride in 100 mL of water, and add 10 mL of pH 6.0 Acetate buffer. Extract this solution with successive portions of 20,20 , and 10 mL of a $0.5 \%$ solution of 8 -hydroxyquinoline in chloroform, combining the chloroform extracts in a $50-\mathrm{mL}$ volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.

Standard solution-Prepare a mixture of 2.0 mL of Standard aluminum solution, 10 mL of pH 6.0 Acetate buffer, and 98 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.

Blank solution-Prepare a mixture of 10 mL of pH 6.0 Acetate buffer and 100 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.

Procedure-Determine the fluorescence intensities of the Test solution and the Standard solution in a fluorometer set at an excitation wavelength of 392 nm and an emission wavelength of 518 nm , using the Blank solution to set the instrument to zero. The fluorescence of the Test solution does not exceed that of the Standard solution $(0.2 \mu \mathrm{~g}$ per g$)$.

Magnesium and alkaline-earth metals-To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of pH 10.0 ammonia-ammonium chloride buffer (prepared by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide and diluting to 100 mL ), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T trituration. Heat to about $40^{\circ}$. Titrate this solution with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Chloride dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 $M$ edetate disodium consumed in the second titration does not exceed $2.5 \mathrm{~mL}(0.01 \%$, calculated as Ca$)$.

Arsenic, Method $I\langle 211\rangle: 1 \mu \mathrm{~g}$ per g.

## Iron-

Test solution-Use a $10-\mathrm{mL}$ portion of the solution prepared for the test for Appearance of solution.

Standard solution-Immediately before use, dilute Standard iron solution (see Iron $\langle 241\rangle$ ) 1 to 10 with water. This solution contains the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Combine 4 mL of this solution and 6 mL of water.

Procedure-To each of the solutions, add 2 mL of a 200 g per L solution of citric acid and 0.1 mL of thioglycolic acid. Mix, make alkaline with stronger ammonia water, and dilute with water to 20 mL . After 5 minutes, any pink color in the Test solution is not more intense than that from the Standard solution. The limit is $2 \mu \mathrm{~g}$ per g .

Barium-To 5 mL of the solution prepared for the test for Appearance of solution, add 2 mL of 2 N sulfuric acid and 5 mL of water. To another 5 mL of the solution prepared for the test for Appearance of solution, add 7 mL of water. The solutions are equally clear after standing for 2 hours.

Ferrocyanides-Dissolve 2.0 g in 6 mL of water. Add 0.5 mL of a mixture of 5 mL of ferric ammonium sulfate solution ( 1 g in 100 mL of 0.1 N sulfuric acid) and 95 mL of ferrous sulfate solution (1 in 100): no blue color develops in 10 minutes.

## Sulfate-

Standard sulfate solution A-To 181 mg of potassium sul-
fate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of $30 \%$ alcohol, swirl to dissolve, dilute with $30 \%$ alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with $30 \%$ alcohol to volume, and mix. This solution contains 10 $\mu \mathrm{g}$ of sulfate per mL .

Standard sulfate solution B-To 181 mg of potassium sulfate in a $100-\mathrm{mL}$ volumetric flask, add a few mL of water, swirl to dissolve, dilute with water to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a $1000-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. This solution contains $10 \mu \mathrm{~g}$ of sulfate per mL .

Sodium chloride solution-Dissolve 2.5 g of Sodium Chloride in 50 mL of water.
Procedure-To 1.5 mL of Standard sulfate solution $A$ add 1 mL of a barium chloride solution ( 1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of the resulting suspension, add 15 mL of the Sodium Chloride solution and 0.5 mL of 5 N acetic acid, and mix (Test solution). Prepare the Standard solution in the same manner, except use 15 mL of Standard sulfate solution B instead of the Sodium Chloride solution: any turbidity produced in the Test solution after 5 minutes standing is not greater than that produced in the Standard solution ( $0.020 \%$ ).

Nitrites-To 10 mL of the solution prepared in the test for Appearance of solution, add 10 mL of water, and measure the absorbance of the solution in a $1-\mathrm{cm}$ cell at 354 nm . The absorbance is not greater than 0.01 .

Heavy metals, Method I $\langle 231\rangle$ : 5 ppm .
Assay—Dissolve 50 mg of Sodium Chloride, accurately weighed, in water and make 50 mL . Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of $\mathrm{NaCl}_{\mathbf{\perp}}$ USP28 $^{\text {U }}$

## MONOGRAPHS (NF)

## BRIEFING

Benzyl Alcohol, NF 22 page 2830 and page 879 of $P F$ 28(3) [May-July 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for Benzyl Alcohol, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following draft monograph represents the ADOPTION STAGE 6 draft, which has been accepted by the members of the Pharmacopeial Discussion Group.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Identification | + | + | + |
| Appearance of solu- <br> tion | + | + | + |
| Refractive index | + | + | + |
| Acidity | + | + | + |
| Benzaldehyde and <br> other related sub- <br> stances | + | + | + |
| Peroxide value | + | + | + |
| Residue on evapo- <br> ration | + | + | + |
| Assay | + | + |  |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Labeling, Storage.
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Proposed changes to the current $N F$ monograph include the following:
(1) Definition-The lower limit is changed from 97.0 percent to 98.0 percent based on the argument that this quality is easily obtainable and that the tight limits of the Related compounds test justify a tighter limit for the Assay.
(2) Packaging-No change.
(3) Labeling-Requirements for injectable dosage forms are added.
(4) USP Reference standards-A new reference standard for benzyl alcohol is added to comply with the proposed IR test.
(5) Clarity of solution - This test is added because of the possible use of benzyl alcohol in parenteral dosage forms.
(6) Color of solution-This test is added because of the possible use of benzyl alcohol in parenteral dosage forms.
(7) Identification-In light of comments received, the use of infrared absorption spectrophotometry is adopted for this test.
(8) Specific gravity-This test has been deleted from the monograph and added to the Benzyl Alcohol entry under Description and Solubility.
(9) Peroxide value-This test is added to conform to EP standards.
(10) Refractive index - The lower limit is changed to reflect EP standards.
(11) Acidity-Minor editorial changes are made.
(12) Residue on ignition-This test is deleted. Inorganic compounds are not likely to be present because distillation procedures are used during the production of this substance.
(13) Limit of nonvolatile residue-The sample weight is increased from 2 g to 10 g to ensure greater accuracy.
(14) Halogenated compounds and halides-This test is deleted. The GC method adequately controls benzyl chloride, and inorganic halogenated compounds are not likely to be present because distillation procedures are used during the production of this substance.
(15) Related compounds-The Benzaldehyde test is renamed as a Related compounds test. The test is revised to specify a G16 column based on analyses performed with a DB-Wax column, to reduce solution volumes and to widen the limits for the impurities under test.
(16) Organic volatile impurities-This test is deleted, as it is not necessary.
(17) Assay-The phenolphthalein solution preparation is changed to conform to EP methods.
(EMC: J. Lane) RTS-40773-8

## Change to read:

## Benzyl Aleohol

$\mathrm{E}_{7} \mathrm{H}_{8} \mathrm{O}-108.14$
Benzenemethanel.
Benzyl aleehel [100-51-6].
\#Benzyl Aleohol contains not less than-97.0 pereent and not more than 100.5 pereent of $\mathrm{C}_{7} \mathrm{H}_{8} \Theta$.
Packaging and storage-Preserve in tight containers, and prevent expestre to light.

Identification Add 2 or 3 drops of it to 5 mL of potassimm per manganate solution ( 1 in 20), and acidify with 2 N sulfuric acid: the odor of benzaldehyde is perceptible.
Specifie gravity $\langle 844\rangle$ : between 1.042 and 1.047.
Refractive index- $\langle 834\rangle$ :- 1.539 and 1.541 at $20^{\circ}$.
Aeidity Neutralize 50 mL of aleohol containing 1 mL of phenolphthatein TS with 0.10 N sodium hydroxide. Dissolve 10 mt of Benzyl Aleohel in 10 mL of the neutralized aleohel, and titrate with 0.10 N sodium hydroxide: not more than 1.0 mL is consumed.
Residtreon-ignition- $\langle z 81\rangle$ - Evaporate 25 mL in a suitablecrut eible, and ignite constant weight: not more than $0.005 \%$ is found.
Nonvolatile residte- Evaporate 2.0 of of it to dryness on a water bath, and dry the residue at $105^{\circ}$ for one hour. Cool in a desiecator, and weigh: not more than $1-\mathrm{mg}$ is found.
Halogenated compounds and-halides [NOTE-All glassuare used for this proeedure must be chloride free and may be prepared by soaking overnight in a mixture consisting of water and nitric acid ( $1: 1$ ), rinsing with water, and storing full of water.]

Standard preparation Dissolve an aceurately weighedquantity of sodium chleride in water, and dilute quantitatively, and stepwise if neeessary, with water to obtain a solution having a known eon eentration of 0.0132 mg of NaCl per mL .

Fest preparation Dissolve 6.7 g in 50 mL of aleohel, dilute with water to 100.0 mL , and mix. To 10.0 mL of this solution add 7.5 mL of 2 N sodium hydroxide and 0.125 g of niekel alumifum catalyst, and heat this mixttre in a conieal flask on a water bath for 10 minutes. Allow to eool to room temperature and filter, eellecting the filtrate in a 25 mL volumetrie flack. Wash with three $z \mathrm{~mL}$ pertions of aleohol, dilute the combined filtrate and washings with water to volume, and mix.

Blank preparation Prepare as directed for Test preparation, emitting the Benzyl Aleohel.

Ferric anmanimenlfate solution Shake 30.0. g of ferrie ammonium sulfate with 40 mL of nitric acid, dilute with water to 100 mL , and mix. Centrifuge or filter, if necessary, to obtain a-clear solution.

Proedure-To four 25 mL velumetric flacks separately transfer 10.0 mL of the Test preparation, 10.0 mL of the Statert prept Fation, 10.0 mL of the Blank preparation, and 10.0 mL of water. To each flask add 5.0 mL of Ferric ammenneme solution, mix, and add dropwise and with swirling 2 mL of nitric acideand 5.0 mL of a solution of mereuric thiocyanate in anhydrous alcohol ( 0.3 in 100). Shake, dilute the eonents of each flack with water to volume, and let the solutions stand in a water bath at $20^{\circ}$ for 15 mimutes. Measure the absorbanee at 460 nm of the solution made from the Fest preparation against the solution from the Blank preparation, and measure the absorbance at 460 nm of the solution from the Standard preparation against the solution from water. The former is not greater than the latter $(0.03 \%$ as Cl $)$.

## Benzaldehyde-

Internal standard solution-Prepare a solution-in acetonitrile eontainimg about 0.2 mg of methylparaben per mL.
Mobile phase-Prepare a suitable degassed and filtered mixture of water and acenitrile ( $62: 38$ ). Make adjustments if necessary (see-Chrematograyly $\langle 624$ ).

Stada solution Prepare a solution in ace anitrile eontaining 0.200 mg of benzaldehyde per mL.

Standtard preparation Transfer 5.0 mL of Standerd solution and 5.0 mL of Intern standed solution to a 50 mL volumetric flask, add ace mitrile to volume, and mix.

Fest preparation Pipet 2 mL of Benzyl Aleohel and 10 mL of
 with acenitrile volume, and mix.

Chromatographie syistem (see-Chromatography $\langle 624$ ) The tiquid chromatograph is equipped with - 282 nm detector and a $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ column that contains packing L 7 . The flow rate is about 1.0 mL per minute. Chromatograph the Test preparation, and record the peak respenses as directed under Precedtre: the
resolution, $R$, between the benzyl alcehol and methylparaben peaks is not less than 2.0. Chromatograph the Standard preparation, and record the peak respenses as directed mider Procedure: the relative standard deviation of the ratio of the peak respenses for replieate injections is not more than $2.0 \%$.

Proedtre- Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Stand preparation and the Test preparation inte the chromatograph, record the chrematograms, and measure the respenses for the major peaks. The relative retention times are about 0.6 for benzyl aleohol, 0.7 for methylparaben, and 1.0 for benzaldehydeGaleulate the percentage of benzaldehyde taken by the formula:

$$
0.1\left(R_{t}+R_{s}\right)
$$

in which $R_{\downarrow}$ and $R_{f}$ are the response ratios of benzaldehyde to methylparaben obtained for the Test preparation and the-Standard preparition, respectively: net mere than- $0.20 \%$ is fount.
Organie volatile impurities, Method $V\langle 467\rangle \div$ meets the requirements.
Assay Te about 900 mg of Benzyl Aleehel, aeeurately weighed, add 15.0 mL of a mixture of pyridine and acetic anhydride (7:1), and heat on a water bath under reflux for 30 minutes. Coel, add 25 mL of water, add 5 dreps of a 1 in 100 solation of phenelphthalein in pyridine, and titrate with 1 N soditum hydroxide VS. Perform a blank determination. Caleulate the pereentage-of $\mathrm{C}_{7} \mathrm{H}_{8} \Theta$ taken by the fermata:-

$$
10.81 N\left(Y_{p}-Y_{t}\right) / H,
$$

in which $Y_{L}$ and $Y_{B}$ are the number of mL of 1 N sodium hydroxide tosed for the Benzyl Aleohel and the blank, respectively; and $W$ is the weight, in of, of Benzyl Aleohel taken.

## ©Benzyl Alcohol

20024-26
$\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{O} \quad 108.14$
Benzenemethanol.
Benzyl alcohol [100-51-6].
» Benzyl Alcohol contains not less than 98.0 percent and not more than 100.5 percent of $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{O}$.

Packaging and-storage - Preserve in tight containers, and prevent exposure to light.

Labeling-Where Benzyl Alcohol is intended for use in the manufacture of injectable dosage forms, it is so labeled.

USP Reference standards $\langle 11\rangle$ —USP Benzyl Alcohol RS. Clarity of solution-[NOTE-The Test solution is to be compared to Reference suspension 1 in diffused daylight 5 minutes after preparation of Reference suspension 1.]

Hydrazine solution-Transfer 1.0 g of hydrazine sulfate to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand 4 to 6 hours before use.

Methenamine solution-Transfer 2.5 g of methenamine to a $100-\mathrm{mL}$ glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension-[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of Hydrazine solution to the Methenamine solution in the $100-\mathrm{mL}$ glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard-[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the Primary opalescent suspension to a 1000mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions-Transfer 5.0 mL of the Opalescence standard to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension 1. Transfer 10.0 mL of the Opalescence standard to a second $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain Reference suspension 2.

Test solution-Dissolve 2.0 g of Benzyl Alcohol in 60 mL of water, and mix.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm , to obtain a depth of 40 mm . Similarly transfer portions of Reference suspension 1, Reference suspension 2, and water to separate matching test tubes. Compare the Test solution, Reference suspension 1, Reference suspension 2, and water in diffused daylight, viewing vertically against a black background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). [NOTE-The diffusion of light
must be such that Reference suspension 1 can readily be distinguished from water, and that Reference suspension 2 can readily be distinguished from Reference suspension 1.] The Test solution shows the same clarity as that of water, or its opalescence is not more pronounced than that of Reference suspension 1.

## Color of solution-

Test solution-Use the Test solution prepared in the test for Clarity of solution.

Procedure-Transfer a sufficient portion of the Test solution to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm , to obtain a depth of 40 mm . Similarly transfer a portion of water to a separate matching test tube. Compare the color of the Test solution with that of water in diffused daylight, viewing vertically against a white background (see Visual Comparison under Spectrophotometry and Light-Scattering $\langle 851\rangle)$. The Test solution has the color of water.

Identification-Infrared Absorption $\langle 197 \mathrm{~F}\rangle$, on undried specimen.

Peroxide value $\langle 401\rangle$ : not more than 5 .
Refractive index $\langle 831\rangle$ : between 1.538 and 1.541 at $20^{\circ}$.
Acidity-Neutralize 50 mL of alcohol containing 1 mL of phenolphthalein TS with 0.10 N sodium hydroxide. Dissolve 10 mL of Benzyl Alcohol in 10 mL of the neutralized alcohol, and titrate with 0.10 N sodium hydroxide to the first appearance of a pink color that persists for not less than 30 seconds: not more than 1.0 mL is consumed.

Limit of nonvolatile residue-[NOTE-Ensure that the Benzyl Alcohol to be examined complies with the test for Peroxide value $\langle 401\rangle$ before performing this test.] Evaporate 10.0 g of Benzyl Alcohol on a water bath to dryness, and dry the residue at $105^{\circ}$ for 1 hour. Cool in a desiccator, and weigh. The residue weighs not more than 5 mg : not more than $0.05 \%$ of nonvolatile residue is found.

## Related compounds-

Test solution-Use the Benzyl Alcohol specimen under examination.

Ethylbenzene solution-Transfer 100 mg of ethylbenzene, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Test solution to volume, and mix. Transfer 1.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, dilute with Test solution to volume, and mix.

Dicyclohexyl solution-Transfer 2.0 g of dicyclohexyl to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Test solution to volume, and mix. Transfer 1.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, dilute with Test solution to volume, and mix.

Standard solution 1-Transfer 750 mg of benzaldehyde, accurately weighed, and 500 mg of cyclohexylmethanol, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Test solution to volume, and mix. Transfer 0.5 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, add 1.0 mL of Ethylbenzene solution and 1.5 mL of Dicyclohexyl solution, dilute with Test solution to volume, and mix.
Standard solution 2 (where the Benzyl Alcohol under test is intended for use in the manufacture of injectable dosage forms)—Transfer about 250 mg of benzaldehyde, accurately weighed, and about 500 mg of cyclohexylmethanol, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Test solution to volume, and mix. Transfer 0.5 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, add 1.0 mL of Ethylbenzene solution and 1.0 mL of Dicyclohexyl solution, dilute with Test solution to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ column coated with a $0.5-$ $\mu \mathrm{m}$ film of G16. Helium is used as the carrier gas flowing at a rate of 1.2 mL per minute at $50^{\circ}$. The injection port and
detector temperatures are maintained at about $200^{\circ}$ and $310^{\circ}$, respectively. The column temperature is programmed to increase linearly from $50^{\circ}$ to $220^{\circ}$ at a rate of $5^{\circ}$ per minute, and is maintained at $220^{\circ}$ for 35 minutes. Chromatograph the appropriate Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.28 for ethylbenzene, 0.59 for dicyclohexyl, 0.68 for benzaldehyde, 0.71 for cyclohexylmethanol, and 1.0 for benzyl alcohol; and the resolution, $R$, between benzaldehyde and cyclohexylmethanol is not less than 3.0.

Procedure-Separately inject equal volumes (about 0.1 $\mu \mathrm{L}$ ) of the appropriate Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. [NOTE-Disregard any peak having an area less than 0.01 times the area of the ethylbenzene peak in the chromatogram of the appropriate Standard solution. In the chromatogram of the Test solution, verify that there are no peaks with the same retention times as those of ethylbenzene or dicyclohexyl.]

In the chromatogram of the Test solution, the area of any peak corresponding to benzaldehyde is not greater than the difference between the area of the peak due to benzaldehyde in the chromatogram of Standard solution $1(0.15 \%)$ or in the chromatogram of Standard solution $2(0.05 \%)$ and the area of the peak due to benzaldehyde in the chromatogram of the Test solution.

In the chromatogram of the Test solution, the area of any peak corresponding to cyclohexylmethanol is not greater than the difference between the area of the peak due to cyclohexylmethanol in the chromatogram of Standard solution $1(0.10 \%)$ or in the chromatogram of Standard solution $2(0.10 \%)$ and the area of the peak due to cyclohexylmethanol in the chromatogram of the Test solution.

In the chromatogram of the Test solution, the sum of the areas of any peaks with retention times less than that of benzyl alcohol, excluding the peaks due to benzaldehyde and cyclohexylmethanol, is not greater than four times the area of the ethylbenzene peak in the chromatogram of Standard solution $1(0.04 \%)$ or is not greater than two times the area of the ethylbenzene peak in the chromatogram of Standard solution 2 ( $0.02 \%$ ).
In the chromatogram of the Test solution, the sum of the areas of any peaks with retention times greater than that of benzyl alcohol is not greater than the area of the dicyclohexyl peak in the chromatogram of Standard solution 1 ( $0.3 \%$ ) or in the chromatogram of Standard solution 2 ( $0.2 \%$ ).

Organie volatile impurities, Method $V\langle 467\rangle$ :-meets the requirements.

Assay-To about 900 mg of Benzyl Alcohol, accurately weighed, add 15.0 mL of a freshly prepared mixture of pyridine and acetic anhydride (7:1), and boil under reflux for 30 minutes. Cool, add 25 mL of water, add 0.25 mL of a phenolphthalein solution prepared by dissolving 100 mg of phenolphthalein in 80 mL of alcohol and diluting with water to 100 mL , and titrate with 1 N sodium hydroxide VS. Perform a blank determination (see Titrimetry $\langle 541\rangle$ ). Calculate the percentage of $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{O}$ taken by the formula:

$$
10.81 N\left(V_{B}-V_{U}\right) / W,
$$

in which $V_{U}$ and $V_{B}$ are the number of mL of 1 N sodium hydroxide used for the Benzyl Alcohol and the blank, respectively; and $W$ is the weight, in g, of Benzyl Alcohol taken. ${ }^{N F 23}$

## BRIEFING

Carboxymethylcellulose Calcium, $N F 22$ page 2841 and page 1252 of PF 28(4) [July-Aug. 2002]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this article. The revisions presented in this proposal, which represents the ADOPTION STAGE 6 draft, reflect the Committee of Revision's results in this harmonization effort and have been accepted by the members of the Pharmacopeial Discussion Group.

## Carboxymethyleellulose Caleium

Gellulese, earboxymethylether, caleium salt.
Cellulese carboxymethyl ether calcium salt. [9050-04-8].
\#Carboxymethyleellulose Caleitm is the caleium salt of a polyeaboxymethyl ether of cellulose.

Packaging and-storage- Preserve in tight containers.
Identifiention-
A: Shake theroughly 0.1 g with 10 mL of water, followed by $z$ mL of 1 N soditm hydroxide, allow to stand for 10 mintutes, and use 1 mL of this solution as the test solution, retaining the remain der of it for Identification tests $B$ and $C$. To 1 mL of the test solution add water to make 5 mL , then to 1 drop of the resulting solution add 0.5 mL of chromotropic acid TS, and heat in a wath bath for 10 minutes: a red purple coler develops.
B: Shake 5 mL of the test solution obtained in Identifieation test $A$ with $10-\mathrm{mL}$ of acetone: a white, floeculent precipita is formed.

C: Shake 5 mL of the test solution obtained in Identifieation test A with 1 mL of ferric chloride TS: a brown, floceulent precipi tate is formed.

Đ: Ignite 1 g to ash, dissolve the residue in 10 mL of water and 5 mL of 6 N aeetic acid, and filter, if neeessary. Boil the filtrate, eool, and neutralize with 6 N ammenium hydroxide: the solution respends to the tests for Calcium- $\langle 19\rangle\rangle$ :
Atkalinity Shak thereughly 1.0 g with 50 mL of freshly beiled and cooled water, and add 2 drops of phenolphthatein TS: no red color develops.
Less on drying $\left\langle 734\right.$ - Dry it at $105^{\circ}$ for 4 heurs: it loses not more than $10.0 \%$ of its weight.
Residue on ignition- $\left\langle\frac{284\rangle}{}\right.$ : between 10.0\% and 20.0\%, about 0.5 g, previously dried, being used for the test, and an ignition tem perature of $450^{\circ}$ to $550^{\circ}$ being used.
Chloride-$\langle z 24\rangle$ Shake heroughly 0.80 g with 50 mb of water, dissolve in 10 mL of 1 N sodium hydroxide, add water to make 100 mL , and use 20 mL of this solution as the test solution, retainime the remainder of it for the test for sulfate. Heat 20 mL of the test solution with 10 mL of 2 N nitric acid in a water bath until a floc eulent precipitate is formed, cool, centrifuge, and remove the supernatant liquid. Wash the precipitate with three $10-\mathrm{mL}$ pertions of water by centrifuging each time, combine the supernatant liquid and the washings, add water to make 100 mL , and mix: a 25 mL pertion of this solution shous ne more chloride than is contained in 0.20 mL of 0.020 N hydrechleric acid ( $0.36 \%$ ).

Silieate- Weigh aceurately about $1-\frac{g}{5}$, ignite in a platinmm dish, add 20 mL of 3 N hydrochloric acid, cover with a wateh glass, and boil gently for 30 minutes. Remove the wateh glass, andera perate in a water bath, with the aid of a current of air, to dryness. Continte heating for 1 hour, add 10 mL of hot water, stir well, and filter through quantitative filter paper. Wash the residue with her water, dry it together with the filter paper after no turbidity is pro dured on the addition of silver nitrate TS to the last washing, then ignite to constant weight: not more than $1.5 \%$ of residue is ob tained.
Sulfate $\langle 224\rangle$-Heat 10 mL of the test solution obtained in the test for Chterite with 1 mL of hydrochloric acid in a water bath untila floculent preeipitate is formed, cool, centrifuge, and remove the supernatant liquid. Wash the precipitate with three 10 mL pertions of water by centriftging each time, combine the supernatant liguid and the washings, add wate to make 100 mL , and mix: a 25 mL pertion of this solution shows ne meresulfate than is contained in 0.20 mL of 0.020 N sulfuric acid ( $0.96 \%$ ).

Heary metats- $\langle$ z31 $\rangle$ - Determine as directed in the test for Heawy metals under Methyleellullose, except to use only 1 gof Carboxy methylcellulose Caleium. The limit is $0.002 \%$.
Stareh Heat 0.10 with 10 mL of water, cool, and add 2 dreps of iodine TS: no blue color develops.
Organie volatile impurities, Methad $I K\langle 467\rangle \div$ meets the requirements.

## ©Carboxymethylcellulose Calcium

Cellulose, carboxymethyl ether, calcium salt.
Cellulose carboxymethyl ether calcium salt
[9050-04-8].
» Carboxymethylcellulose Calcium is the calcium salt of a polycarboxymethyl ether of cellulose.

Packaging and-storage-Preserve in tight containers.

## Identification-

A: Shake thoroughly 0.1 g with 10 mL of water, followed by 2 mL of 1 N sodium hydroxide, allow to stand for 10 minutes, and use 1 mL of this solution as the test solution, retaining the remainder of it for Identification tests $B$ and $C$. To 1 mL of the test solution add water to make 5 mL , then to 1 drop of the resulting solution add 0.5 mL of chromotropic acid TS, and heat in a water bath for 10 minutes: a red-purple color develops.

B: Shake 5 mL of the test solution obtained in Identification test $A$ with 10 mL of acetone: a white flocculent precipitate is formed.

C: Shake 5 mL of the test solution obtained in Identification test $A$ with 1 mL of ferric chloride TS: a brown, flocculent precipitate is formed.

D: Ignite 1 g to ash, dissolve the residue in 10 mL of water and 5 mL of 6 N acetic acid, and filter, if necessary. Boil the filtrate, cool, and neutralize with 6 N ammonium hydroxide: the solution responds to the tests for Calcium $\langle 191\rangle$.

Alkalinity—Shake thoroughly 1.0 g with 50 mL of freshly boiled and cooled water, and add 2 drops of phenolphthalein TS: no red color develops.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 4 hours: it loses not more than $10.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : between $10.0 \%$ and $20.0 \%$, about 1.0 g , previously dried, being used for the test. an-ignition temperature of $450^{\circ}$ to $550^{\circ}$ being used.

Heavy metals $\langle 231\rangle$-Determine as directed in the test for Heavy metals under Methylcellulose, except to use only 1 g of Carboxymethylcellulose Calcium. The limit is $0.002 \%$.

Limit of chloride $\langle 221\rangle$ - Shake thoroughly 0.80 g with 50 mL of water, dissolve in 10 mL of 1 N sodium hydroxide, add water to make 100 mL , and use 20 mL of this solution as the test solution, retaining the remainder of it for the test for Limit of sulfate. Heat 20 mL of the test solution with 10 mL of 2 N nitric acid in a water bath until a flocculent precipitate is formed, cool, centrifuge, and remove the supernatant. Wash the precipitate with three $10-\mathrm{mL}$ portions of water by centrifuging each time, combine the supernatant and the washings, add water to make 100 mL , and mix: a $25-\mathrm{mL}$ portion of this solution shows no more chloride than is contained in 0.20 mL of 0.020 N hydrochloric acid (0.36\%).

Limit of sulfate $\langle 221\rangle$ —Heat 10 mL of the test solution obtained in test for Limit of chloride with 1 mL of hydrochloric acid in a water bath until a flocculent precipitate is formed, cool, centrifuge, and remove the supernatant. Wash the precipitate with three $10-\mathrm{mL}$ portions of water by centrifuging each time, combine the supernatant and the washings, add water to make 100 mL , and mix: a $25-\mathrm{mL}$ portion of this solution shows no more sulfate than is contained in 0.21 mL of 0.020 N sulfuric acid $(1.0 \%) \cdot \mathbf{\Delta N F 2 3}^{\text {N }}$

## Cellacefate

Gellulese, acetate, 1,2 benzenediearbexylate.
Cellulese [9004-38 0].
\# Cellacefate is a reaction product of phthalic anhydride and a partial acetate ester of cellulose. It contains not less than 21.5 percent and not more than 26.0 per eent of acetyl $\left(\mathrm{C}_{2} \mathrm{H}_{3} \theta\right)$ groups and not less than 30.0 percent and not more than 36.0 percent of phthalyl(oearboxy benzoyl, $\mathrm{G}_{8} \mathrm{H}_{5} \mathrm{O}_{3}$ ) groups, caleulated on the anhydrous, acid free basis.

Paekaging and-storage- Preserve in tight containers.
USP Referenee standards- $\langle H\rangle$ USP Cellutese Aeetate Phthat ters

## Ifentifieation-

A: Infrat Abserption $\langle 197 \mathrm{~K}\rangle$-Do not dry specimens.
B: Dissolve abert 150 mg in 1 mL of acene, and perriontoa elear slass plate in an area good difflow: a glossy, clear film is depesited as the acene evaporates.
Viseosity $\langle 914\rangle$ - Dissolve 15 -g, caleulated on the anhydrous ba sis, in 85 g of a mixture of 249 parts of anhydreus acetone and 4 part of water, by weight: the apparent viseosity (see Procedure for Methyleellules wher IViscosity $\langle 914\rangle$ ) is between- 45 and 90 cen tipeises, determined at $25 \pm 0.2^{\circ}$.
Water, Methad $I\langle 924\rangle$ : net mere than $5.0 \%$, a mixture of dehy drated aleohol and methylene-chloride (3:2) being used instead of methand as the solvent.
Residue-on ignition- $\langle 284\rangle \div$ net mere than $0.1 \%$.
Heary metals, Method $I\langle z 31\rangle \div 0.001 \%$.
Himit of free acid. Transfer 3.0 g , aceurately weighed, to glass stoppered flask, add 100 mL of dilute methanel (1 in 2), insert the stopper in the flask, and shake for 2 hours. Filter, and wash the flask and the filter with 10 mL pertions of the methanol solution, adding the washings to the filtrate. Titrate the combined filtrate and washings with 0.1 N sodium hydroxide VS to a phenolphtha tein endpeint. Perform a blank determination on 120 mL of the dilute methanol ( 1 in 2). Caleulate the pereentage of free acid, $B$, by the formula:-

$$
0.83064 / H
$$

in which $A$ is the velume, in mL, of 0.1 N sodium hydroxideconstmed, corrected for the blank, and $W$ is the weight, in go, of the Gellacefate, caleulated on the anhydrous basis. Not more that $3.0 \%$, caleulated as phthalic acid, is found.
Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.
Phthalyl content Transfer about 1-8, aceurately weighed, to a eonical flask, dissolve in 50 mL of a mixture of aleohol and ace one (3:2), add phenolphthalein TS, and titrate with 0.1 N sodium hy droxide VS. Perform a blank determination, and make any neeessary correction. Caleulate the pereentage of phthalyl, on the acid free basis, by the formula:

$$
100[(1.4914 / \text { H) } \quad 1.795 B] /(100-B)
$$

in which 4 is the volume, in mL, of 0.1 N sodimm hydroxide consumed after correction for the blank, $W$ is the weight, in $g$, of Cet tacefate taken, calculated on the anhydrous basis, and $B$ is the pereentage of acid found in the test for Limit of free acid.

Content of acetyl Transfer about 500 mg , aceurately weighed, to a glass stoppered flask, and add 50 mL of water and 50.0 mL of 0.5 N soditm hydroxide VS. Connect the flask to a reflux condenser, and reflux for 60 minutes. Cool, add 5 drops of phenelphthalein TS, and titrate with 0.5 N hydrechloric acid VS. Perform a blank determination. Caleulate the free and combined acids, as acetyl, taken by the formmat:-

$$
2.152(A / H)
$$

in which 4 is the volume, in mL , of 0.5 N soditm hydroxide con sumed after correction for the blank, and $W$ is the weight, ing, of Gellacefate aken, on the anhydrous basis. Caleulate the pereentage of acetyl, on the acid free basis, taken by the formula:
$[100(P-0.5182 B) /(100-B)]-0.5772 C$,
in whieh $P$ is the free and combined acids, as aeetyl, $B$ is the per eentage of acid found in the test for Free aeid, and $C$ is the pereen tage of phthalyl found in the test for Phthaly/ content.

## ${ }^{\Delta}$ Cellacefate

Cellulose, acetate, 1,2-benzenedicarboxylate.
Cellulose acetate phthalate [9004-38-0].
» Cellacefate is a reaction product of phthalic anhydride and a partial acetate ester of cellulose. It contains not less than 21.5 percent and not more than 26.0 percent of acetyl $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}\right)$ groups and not less than 30.0 percent and not more than 36.0 percent of phthalyl(o-carboxybenzoyl) $\left(\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{O}_{3}\right)$ groups, calculated on the anhydrous, acid-free basis.

Packaging-and-storage - Preserve in tight containers.
USP Reference standards $\langle 11\rangle —$ USP Cellulose Acetate Phthalate RS.

Identification, Infrared absorption $\langle 197 \mathrm{~K}\rangle$ —Do not dry specimens.

Viscosity $\langle 911\rangle$-Dissolve 15 g , calculated on the anhydrous basis, in 85 g of a mixture of 249 parts of anhydrous acetone and 1 part of water, by weight: the apparent viscosity (see Procedure for Methylcellulose under Viscosity $\langle 911\rangle$ ) is between 45 and 90 centipoises, determined at 25 $\pm 0.2^{\circ}$.

Water, Method I $\langle 921\rangle$ : not more than $5.0 \%$, a mixture of dehydrated alcohol and methylene chloride (3:2) being used instead of methanol as the solvent.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$. Ignition temperature $600 \pm 50^{\circ}$.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Limit of free acid—Transfer 3.0 g , accurately weighed, to a glass-stoppered flask, add 100 mL of dilute methanol ( 1 in 2), insert the stopper in the flask, and shake for 2 hours. Filter, and wash the flask and the filter with two $10-\mathrm{mL}$ portions of the methanol solution, adding the washings to the filtrate. Titrate the combined filtrate and washings with 0.1 N sodium hydroxide VS to a phenolphthalein endpoint. Perform a blank determination on 120 mL of the dilute methanol (1 in 2). Calculate the percentage of free acid, $B$, by the formula:

$$
0.8306 A / W,
$$

in which $A$ is the volume, in mL , of 0.1 N sodium hydroxide consumed, corrected for the blank; and $W$ is the weight, in g , of the Cellacefate, calculated on the anhydrous basis. Not more than $3.0 \%$, calculated as phthalic acid, is found.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

Phthalyl content-Transfer about 1 g , accurately weighed, to a conical flask, dissolve in 50 mL of a mixture of alcohol and acetone (3:2), add phenolphthalein TS, and titrate with
0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Calculate the percentage of phthalyl, on the acid-free basis, by the formula:

$$
100[(1.491 A / W)-1.795 B] /(100-B),
$$

in which $A$ is the volume, in mL , of 0.1 N sodium hydroxide consumed after correction for the blank; $W$ is the weight, in g , of Cellacefate taken, calculated on the anhydrous basis; and $B$ is the percentage of acid found in the test for Limit of free acid.

Content of acetyl-Transfer about 100 mg , accurately weighed, to a glass-stoppered flask, and add 25.0 mL of 0.1 N sodium hydroxide VS. Connect the flask to a reflux condenser, and reflux for 30 minutes. Cool, add 5 drops of phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS. Perform a blank determination. Calculate the free and combined acids, as acetyl, taken by the formula:

$$
0.4305(A / W)
$$

in which $A$ is the volume, in mL , of 0.1 N sodium hydroxide consumed after correction for the blank; and $W$ is the weight, in g , of Cellacefate taken, on the anhydrous basis. Calculate the percentage of acetyl, on the acid-free basis, taken by the formula:

$$
[100(P-0.5182 B) /(100-B)]-0.5772 C,
$$

in which $P$ is the free and combined acids, as acetyl; $B$ is the percentage of acid found in the test for Limit of free acid; and $C$ is the percentage of phthalyl found in the test for Phthalyl content. $\mathbf{A N F 2 3}^{\text {N }}$

## Briefing

Cellulose Acetate, NF 22 page 2847 and page 1255 of $P F 28$ (4) [July-Aug. 2002]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this article. The revisions presented in this proposal, which represents the ADOPTION STAGE 6 draft, reflect the Committee of Revision's results in this harmonization effort and have been accepted by the members of the Pharmacopeial Discussion Group.

## Cellulose Acetate

| Gellulese aceate. |  |
| :---: | :---: |
| Gellulose, acetate | [9004-35 |
| Gellulose, diaceta | [9035-69-2]. |
| Gellulose, triacet | [9012 09 |

\#Cellulose Acetate is partially or completely acety tated cellulose. It contains not less than 29.0 pereent and not more than 44.8 percent, by weight, of acety $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}\right)$ groups. Its acetyl content is not less than 90.0 pereent and not more than 110.0 percent of that indicated on the label.

Paekaging and-storage - Preserve in tight containers.
Labeling The label stater the neminal pereentage entent of aceyly
USP Referenee standards- $\langle H\rangle$-USP Cellutose Aeetate RS.
Identifieation- Prepare a - 1 in 10 solution of Cellulose Acetate, previously dried, in dioxane. Spread 1 drep of the solution on a sodium chloride plate, place a second sodium chloride plate over it, and spread the specimen between the plates. Separate the plates, heat them both at $105^{\circ}$ for 1 hemr, and reassemble the dried plates: the IR absorption speetrum exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cellulase Acetate RS, treate in the same manner.
Less endrying $\left\langle 734\right.$ ) - Dry it at $105^{\circ}$ for 3 heurs: it loses net mere than $5.0 \%$ of its weight.
Residue on ignition- $\langle z 81\rangle \div$ not more than $0.1 \%$.
Heary metals, Method $I T\langle 231\rangle \div 0.001 \%$.
Free acid- Transfer about 5-o, previously dried and aceurately weighed, to 250 mL flask. Add 150 mL of freshly beiled, cooled water, insert the stopper in the flack, swirl the suspension gently, and allow it to stand for 3 hours. Filter through paper, and wash the flask and the filter with water, adding these washings to the filtrateAdd phenelphthalein-TS, and titrate the combined filtrate and washings with 0.01 N soditm hydroxide VS. Each mL of 0.04 N sodium hydroxide is equivalent to 0.6005 mg of acetic acid: not mere than $0.1 \%$ is found, on the dried basis.
Organic volatile impurities, Method $I K\langle 467\rangle$ :meets the require ments.

## Content of neetyl-

FOR CELLLLOSE ACETATE LABELED TOCONTAIN NOT MORE THAN 42.0\%OF ACETYL GROUPS- Transfer about 2 of, previously dried and aceurately weighed, to 500 mL flack. Add 100 mL of acetene and 5 mL to 10 mL of water to the flask, imsert the stopper in the flask, and stir with a magnetic stimrer until solution is complete. Add 30 mL , aceurately measured, of 1.0 N sodimm hydroxide VS to the solution, with constant stirring. $\Lambda$ finely divided precipitate of regenerated cellulese, free frem lumps, is obtained. Insert the stopper in the flack, and stir with a magnetic stirrer for 30 minutes. Add 100 mL of hot water, washing down the sides of the flask, and stir for 4 to 2 minutes. Titrate the exeess sodium hydrexide solution with 1.0 A sulfuric acid VS to a phenelphthatein endpeint. Treat a blank in the same manner. Caleulate the percentage of acetyl taken by the formmat:-

$$
4.305(B-A) / W
$$

in which $B$ and $A$ are the volumes, in mL , of 1.0 N sulfuric acid consumed by the blank and the Cellulese Acetate, respectively, and Whis the weight, in of, of Cellulose-Acetate taken.

FOR-GELLULOSE ACETATE LABELED-TOCONTAIN MORETHAN-42.0\% OF ACETYL GROUPS - Transfer about 2 g, previeusly dried and ac eurately weighed, to a 500 mL conieal flask. Add 30.0 mL of dimethylsulfoxide and 100 mL of aeetene, and stir for 16 hours with the aid of a magnetic stirrer. Pipet 30 mL of 1 N sodium hydroxide VS slewly inte the flask, with censtant stiming. Insert the stepper in the flask, and stir for 6 minutes. Allow to stand without stirrimg for 60 minates. Restmestiming, and add $100-\mathrm{mL}$ of water that has been preheated to $80^{\circ}$, washing down the sides of the flask. Stir for 2 minutes, and coel toreom temperature. Add-4 to 5-drops of phenelphthalein TS, and titrate the exeess soditm hydroxide with 0.5 N hydrechlerie acid VS. Ade an aceurately meastred ex eess of about 0.5 mL of 0.5 N hydrechloric acid VS. Stir for 5 min utes. Allow to stand for 30 minutes. Titrate with 0.5 N sedium hydrexide $V S$ to a persistent pink endpeint, using a magnetic stir fer for agitation. Caleulate the net number of milliequivalents of sodium hydroxide consumed, and correet this value by use of the average of two blank determinations run concomitantly through the entire procedure. Caleulate the pereentage of acetyl taken by the fermula:

$$
4.305 n+H 2
$$

in which $n$ is the corrected value of the net number of milliequiven lents of sedium hydrexide consumed, and $M$ is the weight, in gi, of Cellulese-Acetate taken.

## ©Cellulose Acetate

Cellulose acetate.
$\begin{array}{ll}\text { Cellulose, diacetate } & {[9035-69-2] .} \\ \text { Cellulose, triacetate } & {[9012-09-3] .}\end{array}$
» Cellulose Acetate is partially or completely acetylated cellulose. It contains not less than 29.0 percent and not more than 44.8 percent, by weight, of acetyl $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}\right)$ groups, calculated on the dried basis. Its acetyl content is not less than 90.0 percent and not more than 110.0 percent of that indicated on the label.

Packaging storage-Preserve in tight containers.
Labeling-The tabeling states the nominal percentage content of acetyl.

USP Reference standards $\langle 11\rangle$ —USP Cellulose Acetate $R S$.

Identification-Prepare a solution of Cellulose Acetate (1 in 10), previously dried, in dioxane. Spread 1 drop of the solution on a sodium chloride plate, place a second sodium chloride plate over it, and spread the specimen between the plates. Separate the plates, heat them both at $105^{\circ}$ for 1 hour, and reassemble the dried plates: the IR absorption spectrum exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cellulose Acetate RS, treated in the same manner.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.
Free acid-Transfer about 5 g , accurately weighed, to a $250-\mathrm{mL}$ flask. Add 150 mL of freshly boiled, cooled water, insert the stopper into the flask, swirl the suspension gently, and allow it to stand for 3 hours. Filter through paper, and wash the flask and the filter with water, adding these washings to the filtrate. Add phenolphthalein TS, and titrate the combined filtrate and washings with 0.01 N sodium hydroxide VS. Calculate the percentage of free acid in the portion of Cellulose Acetate taken by the formula:

$$
0.06005 A / W,
$$

in which $A$ is the volume, in mL , of 0.01 N sodium hydroxide consumed; and $W$ is the weight, in g , of the Cellulose Acetate taken, calculated on the dried basis. Not more than $0.1 \%$, calculated as acetic acid, is found.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## Content of acetyl-

FOR CELLULOSE ACETATE LABELED TO CONTAIN NOT MORE THAN $42.0 \%$ OF ACETYL GROUPS-Transfer about 2 g , accurately weighed, to a $500-\mathrm{mL}$ flask. Add 100 mL of acetone and 5 mL to 10 mL of water to the flask, insert the
stopper into the flask, and stir with a magnetic stirrer until solution is complete. Add 30 mL , accurately measured, of 1.0 N sodium hydroxide VS to the solution, with constant stirring. A finely divided precipitate of regenerated cellulose, free from lumps, is obtained. Insert the stopper into the flask, and stir with a magnetic stirrer for 30 minutes. Add 100 mL of water that has been preheated to $80^{\circ}$, washing down the sides of the flask, stir for 2 minutes, and cool to room temperature. Titrate the excess sodium hydroxide solution with 1.0 N sulfuric acid VS to a phenolphthalein endpoint. Treat a blank in the same manner. Calculate the percentage of acetyl in the portion of Cellulose Acetate taken by the formula:

$$
4.305(B-A) / W,
$$

in which $B$ and $A$ are the volumes, in mL , of 1.0 N sulfuric acid consumed by the blank and the Cellulose Acetate, respectively; and $W$ is the weight, in g , of Cellulose Acetate taken, calculated on the dried basis.

## FOR CELLULOSE ACETATE LABELED TO CONTAIN MORE

THAN $42.0 \%$ OF ACETYL GROUPS-Transfer about 2 g , accurately weighed, to a $500-\mathrm{mL}$ conical flask. Add 30.0 mL of dimethylsulfoxide and 100 mL of acetone, and stir for 16 hours with the aid of a magnetic stirrer. Pipet 30 mL of 1 N sodium hydroxide VS slowly into the flask, with constant stirring. Insert the stopper into the flask, and stir for 6 minutes. Allow to stand without stirring for 60 minutes. Resume stirring, and add 100 mL of water that has been preheated to $80^{\circ}$, washing down the sides of the flask. Stir for 2 minutes, and cool to room temperature. Add 4 to 5 drops of phenolphthalein TS, and titrate the excess sodium hydroxide solution with 0.5 N hydrochloric acid VS. Add an accurately measured excess of about 0.5 mL of 0.5 N hydrochloric acid VS. Stir for 5 minutes. Allow to stand for 30 minutes. Titrate with 0.5 N sodium hydroxide VS to a persistent pink endpoint, using a magnetic stirrer for
agitation. Calculate the net number of milliequivalents of sodium hydroxide consumed, and correct this value by use of the average of two blank determinations run concomitantly through the entire procedure. Calculate the percentage of acetyl in the portion of Cellulose Acetate taken by the formula:

$$
4.305 n / W,
$$

in which $n$ is the corrected value of the net number of milliequivalents of sodium hydroxide consumed; and $W$ is the weight, in g , of Cellulose Acetate taken, calculated on the dried basis. ^NF $^{\text {F2 }}$

## Briefing

Croscarmellose Sodium, NF 22 page 2856 and page 1567 of PF 28(5) [Sept.-Oct. 2002]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for the Croscarmellose Sodium monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The revisions presented in this proposal, which represents the ADOPTION STAGE 6 draft , are based on comments received in response to the Official Inquiry Stage 4 draft, which appeared in Pharmacopeial Previews on page 4007 of PF 23(3) [May-June 1997].

The following Harmonization Stage 6 draft is present for regional implementation. The table below illustrates which attributes of the draft are agreed upon by EP, JP, and USP, and which attributes are not.
Pharmacopeial Discussion Group Sign-Off
Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Packaging and stor- <br> age | + | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| Identification C | - | + | + |
| pH | + | + | + |
| Loss on drying | + | + | + |
| Residue on ignition | + | + | + |
| Degree of substitu- <br> tion | + | + | + |
| Settling volume | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Identification of sodium, Microbial limits, Heavy metals, Sodium chloride and sodium blycolate, Water-soluble substances, Organic volatile impurities.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between this Adoption Stage 6 document and the current $N F$ monograph include the following:
(1) Definition-Revisions are made to make the definition more specific.
(2) Packaging-The container type is changed from tight to wellclosed.
(3) Identification-No change.
(4) Microbial limits-This section is added to strengthen the monograph. The proposed limits are consistent with those proposed for oral solids.
(5) pH -The volume of water used is changed to 100 mL , and the mixing time is changed from 1 hour to 5 minutes, based on comments received.
(6) Loss on drying - The drying time is changed to 6 hours, based on data indicating that an equilibrium loss on drying value is obtained after 6 hours.
(7) Sodium chloride and sodium glycolate-No change.
(8) Residue on ignition-This section is added as a test separate from Degree of substitution.
(9) Heavy metals-No change.
(10) Degree of substitution-The Residue on ignition test is deleted, having become a separate test.
(11) Content of water-soluble material-No change.
(12) Settling volume-No change.
(13) Organic volatile impurities-No change.
(EMC: J. Lane) RTS-40875-1

## Change to read:

## Crosearmellose Sodium

## \#-Crosearmellose Sodimm is across-linked polymer of

 earboxymethyleellulese sodium.
## Paekaging and-storage-Preserve in tight containers.

## Identifieation-

A: Mix 1 g of it with 100 mL of methylene blue solution ( 1 im 250,000 ), stir the mixture, and allow it to settle: the Croscarmellose Sodium absorbs the methylene blue and settles as a blue, fibrous mass.
B: Mix 1 g of it with 50 mL of water. Transfer 1 mL of the mix ture to small test tube, and add 1 mL of water and 5 drops of 1 naphthel TS. Ineline the test tube, and carefully add 2 mL of sulfuric acid down the side-so that it forms a lower layer: a red purple coler develops at the interface.

C: A portion of the mixture of it with water, prepared as direc ted in Identification test $B$, respends to the tests for Sodium-〈194): $\mathbf{p H}\langle 794\rangle$ - Mix 1 g of it with 99 mL of water for 1 hourr: the pH of the dispersion is between 5.0 and 7.0 .
Loss-0n-drying $\left\langle 734\right.$ ) Dry it at $105^{\circ}$ to constant weight: it leses tot mere than $10.0 \%$ of its weight.

## Sodium-chloride and-sodium-glyeolate-

SODHM CHLORIDE-Weigh aceurately about 5 g of it into 250 mL beaker, add 50 mL of water and 5 mL of $30 \%$ hydrogen per oxide, and heat on a steam bath for 20 minutes, stirring oceasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of
nitric acid, and titrate with 0.05 N silver nitrate VS , determining the endpoint potentiometrieally, using a silver based indientor elecrode and a double junction reference electrode containing $10 \%$ petassium nittate filling solution in the outer jacket and a standard filling solution in the inner jacket, and stiming constantly (see Titrimetry (544) ). Caleulate the pereentage of sodium chloride in the specimen taken by the formula:

$$
584.4 \mathrm{VNH}(100-b) H 4,
$$

in which $V$ and $N$ represent the volume, in mL , and the nommality, respectively, of the-silver nitrate, $b$ is the pereentage of Loss ont drying, determine separately, Wis the weight, in of, of the speci men, and 584.4 is an equivalence factor for sodium chloride.
sodum glycolate Transfer about 500 mg of it, aceurately weighed, into a 100 mL beaker, meisten thoreughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 minutes). Slowly add 50 mL of acetone, with stirring, then add 1 gof sodium ehleride, and stir for several minthes to ensure complete precipita tion of the earboxymethyleellulose. Filter through a soft, open tex tured paper, previously wetted with a small amount facetone, and eellect the filtrate in a 100 mL volumetric flask. Use an additional 30 mL of ace 0 ne facilitate the transfer of the solids and to wash the filter cake, then dilute with acetene to volume, and mix.

Prepare a series of standard solutions as follows. Transfer 100 mg of ghyeolic acid, previously dried in a desiecator at room tem-perature-overnight and aceurately weighed, to a 100 mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Use this solution within 30 days. Transfer $1.0,2.0,3.0$, and 4.0 mL pertions of the solution, respectively, to separate 100 mL velumetric flasks, add water to each flask to make 5 mL , then add 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Fransfer 2.0 mL of the test solution and 2.0 mL of each standard selution to separate 25 mL volumetric flacks, and prepare a blank flask eontaining 2.0 mL of a solution eontaining 5\% ach of glacial acetic acid and water in acetone. Place the uncovered flasks in a boiling water bath for 20 -minutes, aceurately timed, to remove the acetone, remove from the bath, and cool. Add to each flack 5.0 mL of 2,7 dihydroxynaphthatene TS, mix, add an additionat 15 mL , and again mix. Cover the mouth of each flack with a small piece of alumintm foil. Place the flasks upright in a beiling water bath for 20 minutes, then remove from the bath, cool, dilute with sulftric acid to volume, and mix.

Determine the absorbance of each solution at 540 nm, with a suitable spectrophotemeter, against the blank, and prepare a standard eurve using the abserbance obtained from the standard solur tions. From the standard eurve and the absorbance of the test specimen, determine the weight (w), in me, of glyeolic acid in the-sperimen, and caleulate the pereentage of soditm glyeolate in the specimen taken by the formetla:

$$
12.9 w /(100-b) H 4,
$$

in which 12.9 is a fator converting glyeolic acid to sodimm glyeo tate, $b$ is the pereentage of Less on drying, determined separately, and $W$ is the weight, in g, of the specimen. The sum of the pereen tages of sodium chloride and sodium slycolate is not more than $0.5 \%$.
Heary metats, Methed $I\langle\langle z 3\rangle) \div 0.001 \%$.
Degree of substitution- Transfer about 1-of it, aceurately weighed, to a glass stoppered, 500 mL conieal flask, add- 300 mL of sodium chloride solution ( 1 in 10 ), then add 25.0 mL of 0.1 N soditm hydroxide VS. Insert the stopper, and allow to stand for 5 minates with intermittent shaking. Add 5 -drops of m-eresel purple TS, and from a buret add about 15 mL of 0.1 N hydrochloric acid VS. Insert the stopper in the flask, and shake. If the solution is purple, add 0.1 N hydrochloric acid VS in 1 mL peritions until the
solution becomes yellow, shaking after each addition. Titrate with 0.1 N sodium hy droxide VS to a purple endpoint. Caleulate the net number of milliequivalents, $M$, of base required for the neutraliza tion of 1 g of Creseamellose Sodium, on the dried basis. Deter mine the percentage of residue on ignition, $C$, of the Gresearmellose Soditm on the dried basis as directed under Resi due on Ignition $\langle 284\rangle$, using sufficient sulfuric acid to meisten the entire residue after the initial charring step, and additional sulfurie acid if an excessive amount of carbonaceous material remains after the initial complete volatilization of white fumes.

Galeulate the degree of acid earboxymethyl substitution, $A$, at ken by the formula:

$$
1150 M H(7102-412 M-80 C)
$$

Galeulate the degree of sodium earboxymethyl substitution, $S$, ta ken by the formula:

$$
(162+584) C /(7102 \quad 80 C)
$$

The degree of substitution is the sum- of $A+S$. It is between 0.60 and 0.85 , caleulated on the dried basis.
Content of water soluble material Disperse about 10- s, at eurately weighed, in 800 mL of water, cucurately meacured, and stir for 1 minate every 10 minutes durimg the farst 30 minutes. A1 low tostand for an additional hour, or centrifuge, if neeessary. Deeant about 200 mL of the aqueous-slumy onto a rapid filtering fllter paper in a vacuum filtration fanmel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared 250 mL beaker, weigh aceurately, and caleulate the weight, in of, of the fit trate, $\mathrm{H}_{3}$, by difference. Coneentrate on a hot plate to a small wot tume, but not to dryness, dry at $105^{\circ}$ for 4 hours, again weigh, and ealeulate the weight, in g, of residue $H_{4}$, by difference. Caleulate the pereentage of water soluble material in the specimen, on the Aried basis, taken by the formula:

$$
100 H_{4}\left(800+W_{2}\right) /\left[H_{2} H_{3}(1-0.01 b)\right]
$$

in whieh $\mathrm{H}_{2}$ is the weight, in g, of the specimen taken, and $b$ is the pereentage Loss on drying of the-specimen taken. It is between $1.0 \%$ and $10.0 \%$

Settling voltme To 75 mL of water in a 100 mL graduated ey tinder add $1.5-\frac{g}{}$ of it in -0.5 - 5 pertions, shaking vigoreusly after each addition. Add water to make 100 mL , shake again until all of the pewder is hemegeneeusly distributed, and allow to stane for 4 heurs. Note the volume of the settled mass. It is between 10.0 and 30.0 mL .

Organie volatile imptrities, Method $H\langle\langle 467\rangle \div$ meets the requirements.

## ${ }^{\Delta}$ Croscarmellose Sodium

## » Croscarmellose Sodium is the sodium salt of a

 cross-linked, partly $O$-(carboxymethylated) cellulose.Packaging and-storage-Preserve in well-closed containers.

## Identification-

A: Mix 1 g of it with 100 mL of methylene blue solution ( 1 in 250,000 ), stir the mixture, and allow it to settle: the Croscarmellose Sodium absorbs the methylene blue and settles as a blue, fibrous mass.

B: Mix 1 g of it with 50 mL of water. Transfer 1 mL of the mixture to a small test tube, and add 1 mL of water and 5 drops of 1-naphthol TS. Incline the test tube, and carefully add 2 mL of sulfuric acid down the side so that it forms a lower layer: a reddish-violet color develops at the interface.

C: A portion of the mixture of it with water, prepared as directed in Identification test $B$, responds to the flame test for Sodium $\langle 191\rangle$.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed 1000 per g , the total combined molds and yeasts count does not exceed 100 per g , and it meets the requirements of the tests for absence of Escherichia coli. $\mathbf{p H}\langle 791\rangle$-Mix 1 g of it with 100 mL of water for 5 min utes: the pH of the dispersion is between 5.0 and 7.0.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 6 hours: it loses not more than $10.0 \%$ of its weight.

## Sodium chloride and sodium glycolate-

SODIUM CHLORIDE-Weigh accurately about 5 g of it into a $250-\mathrm{mL}$ beaker, add 50 mL of water and 5 mL of $30 \%$ hydrogen peroxide, and heat on a steam bath for 20 minutes, stirring occasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitric acid, and titrate with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-based indicator electrode and a dou-ble-junction reference electrode containing $10 \%$ potassium
nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly (see Titrimetry $\langle 541\rangle$ ). Calculate the percentage of sodium chloride in the specimen taken by the formula:

$$
584.4 V N /[(100-b) W]
$$

in which $V$ and $N$ represent the volume, in mL , and the normality, respectively, of the silver nitrate; $b$ is the percentage of Loss on drying, determined separately; $W$ is the weight, in g , of the specimen; and 584.4 is the equivalence factor for sodium chloride.

SODIUM GLYCOLATE-Transfer about 500 mg of it, accurately weighed, into a $100-\mathrm{mL}$ beaker, moisten thoroughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 minutes). Slowly add 50 mL of acetone, with stirring, then add 1 g of sodium chloride, and stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a soft, opentextured paper, previously wetted with a small amount of acetone, and collect the filtrate in a $100-\mathrm{mL}$ volumetric flask. Use an additional 30 mL of acetone to facilitate the transfer of the solids and to wash the filter cake, then dilute with acetone to volume, and mix.

Prepare a series of standard solutions as follows. Transfer 100 mg of glycolic acid, previously dried in a desiccator at room temperature overnight and accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in water, dilute with water to volume, and mix. Use this solution within 30 days. Transfer $1.0-\mathrm{mL}, 2.0-\mathrm{mL}, 3.0-\mathrm{mL}$, and $4.0-\mathrm{mL}$ portions of the solution, respectively, to separate $100-\mathrm{mL}$ volumetric flasks, add water to each flask to make 5 mL , then add 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Transfer 2.0 mL of the test solution and 2.0 mL of each standard solution to separate $25-\mathrm{mL}$ volumetric flasks, and prepare a blank flask containing 2.0 mL of a solution containing $5 \%$ each of glacial acetic acid and water in acetone. Place the uncovered flasks in a boiling water bath for 20 minutes, accurately timed, to remove the acetone, remove from the bath, and cool. Add to each flask 5.0 mL of $2,7-$ dihydroxynaphthalene TS, mix, add an additional 15 mL , and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 minutes, then remove from the bath, cool, dilute with sulfuric acid to volume, and mix.

Determine the absorbance of each solution at 540 nm , with a suitable spectrophotometer, against the blank, and prepare a standard curve using the absorbances obtained from the standard solutions. From the standard curve and the absorbance of the test specimen, determine the weight (w), in mg, of glycolic acid in the specimen, and calculate the percentage of sodium glycolate in the specimen taken by the formula:

$$
12.9 w /[(100-b) W]
$$

in which 12.9 is a factor converting glycolic acid to sodium glycolate; $b$ is the percentage of Loss on drying, determined separately; and $W$ is the weight, in g , of the specimen. The sum of the percentages of sodium chloride and sodium glycolate is not more than $0.5 \%$.

Residue on ignition $\langle 281\rangle$ : between $14.0 \%$ and $28.0 \%$, calculated on the dried basis, about 1.0 g being used for the test, using sufficient sulfuric acid to moisten the entire residue after the initial charring step, and additional sulfuric acid if an excessive amount of carbonaceous material remains after the initial complete volatilization of white fumes. Ignition temperature $600 \pm 50^{\circ}$.

Heavy metals, Method II $\langle 231\rangle$ : $0.001 \%$.

Degree of substitution-Transfer about 1 g of it, accurately weighed, to a glass-stoppered, $500-\mathrm{mL}$ conical flask, add 300 mL of sodium chloride solution (1 in 10), then add 25.0 mL of 0.1 N sodium hydroxide VS. Insert the stopper, and allow to stand for 5 minutes with intermittent shaking. Add 5 drops of $m$-cresol purple TS, and from a buret add about 15 mL of 0.1 N hydrochloric acid VS. Insert the stopper in the flask, and shake. If the solution is purple, add 0.1 N hydrochloric acid VS in 1-mL portions until the solution becomes yellow, shaking after each addition. Titrate with 0.1 N sodium hydroxide VS to a purple endpoint. Calculate the net number of milliequivalents, $M$, of base required for the neutralization of 1 g of Croscarmellose Sodium, on the dried basis.

Calculate the degree of acid carboxymethyl substitution, $A$, by the formula:

$$
1150 M /(7102-412 M-80 C)
$$

where $C$ is the percentage of residue on ignition of the Croscarmellose Sodium as determined in the test for Residue on ignition $\langle 281\rangle$.

Calculate the degree of sodium carboxymethyl substitution, $S$, by the formula:

$$
(162+58 A) C /(7102-80 C)
$$

The degree of substitution is the sum of $A+S$. It is between 0.60 and 0.85 , calculated on the dried basis.

Content of water-soluble material-Disperse about 10 g , accurately weighed, in 800 mL of water, accurately measured, and stir for 1 minute every 10 minutes during the first 30 minutes. Allow to stand for an additional hour, or centrifuge, if necessary. Decant about 200 mL of the aqueous slurry onto a rapid-filtering filter paper in a vacuum filtration funnel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared $250-\mathrm{mL}$ beaker, weigh accurately, and calculate the weight, in g , of the filtrate, $W_{3}$, by
difference. Concentrate on a hot plate to a small volume, but not to dryness, dry at $105^{\circ}$ for 4 hours, again weigh, and calculate the weight, in g , of residue $W_{l}$, by difference. Calculate the percentage of water-soluble material in the specimen, on the dried basis, taken by the formula:

$$
100 W_{1}\left(800+W_{2}\right) /\left[W_{2} W_{3}(1-0.01 b)\right],
$$

in which $W_{2}$ is the weight, in g , of the specimen taken; and $b$ is the percentage Loss on drying of the specimen taken: not more than $10.0 \%$ is found.

Settling volume-To 75 mL of water in a $100-\mathrm{mL}$ graduated cylinder add 1.5 g of it in $0.5-\mathrm{g}$ portions, shaking vigorously after each addition. Add water to make 100 mL , shake again until all of the powder is homogeneously distributed, and allow to stand for 4 hours. Note the volume of the settled mass. It is between 10.0 and 30.0 mL .

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements. $\boldsymbol{\Delta N F 2 3}^{\text {N }}$

## Briefing

Ethylcellulose, NF 21 page 2865 and page 1568 of $P F$ 28(5) [Sept.-Oct. 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Ethylcellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Ethylcellulose prepared by the European Pharmacopoeia. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia.

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Heavy metals, Loss on drying.
Specific local attributes: Identification B (EP) i.e. "it complies with the limits of assay."

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the Adoption Stage 6 document and the current $N F$ monograph include the following:
(1) Definition-Revisions are made to make the definition more specific.
(2) Packaging-No change.
(3) Labeling-The requirement that ethoxy content be stated on the label is deleted.
(4) USP Reference standards-No change.
(5) Identification-The identification test is replaced with a more definitive IR absorption test.
(6) Viscosity-This test is modified to comply with EP and JP standards.
(7) Acidity or alkalinity-This test is added to comply with EP standards.
(8) Loss on drying-No change.
(9) Residue on ignition-The standards for this test are modified to comply with those of EP.
(10) Lead-This test is deleted, based on comments received that the test is not needed.
(11) Heavy metals-No change.
(12) Organic volatile impurities-This test is deleted, based on comments received that the test is not needed.
(13) Acetaldehyde-This test is added to comply with EP standards.
(14) Chlorides-This test is added to comply with EP standards.
(15) Assay-The current NF test is replaced with a more specific chromatographic procedure, in part to comply with EP standards.

## Change to read:

## Ethyleellulose

Gellulese, ethyl ether.
Gellulese ethyl ether. [9004-573].
\# Ethyleellulese is an ethyl ether of cellulese. When dried at $105^{\circ}$ for 2 hours, it contains not less that 44.0 percent and not more than 51.0 percent of ethoxy $\left(-\mathrm{OC}_{2} \mathrm{H}_{5}\right)$ sromps.

Packaging and storage-Preserve in well closed containers.
Labeling Label it to indieate its viseosity (under the conditions specified herein) and its ethoxy content.
USP Referenee-standards- $\langle H\rangle$ USP Ethyteellutose RS.
Identifieation Dissolve 5 - 5 in 95 g of a mixtrre of 80 parts of toluene and 20 parts of alcohol, by weight: a clear, stable, slightly yellow solution recults. Pour a few mL of this solution onto a sodium chloride plate, and allow the solvent to evaporate: a thin, fough, contintreus, clear film remains. The IR absorption spectrum of the film so obtained exhibits maxima only at the-same wavelengths as that of a similar preparation of USP Ethyleellulose RS. The film, prepared from the test specimen and removed from the plate, is flammable-
Viseosity
Solvent syistems For Ethyleellulese containing less than 46.5 pereent of ethoxy groups, prepare a-solvent system consisting of 69 pats of toluene and 40 parts of aleohel, by weight. Otherwise, prepare a solvent system consisting of 80 parts of toltene and 20 parts of aleohol, by weight.

Proedure Place a quatity of undried Ethyleellulose, ac eurately weighed and equivalent to 5.0 g of solids on the dried ba sis, in a bottle containing $95 \pm 0.05$ go of the appropriate solvent system. Shake or tumble the bottle until the sample is completely dissolved. Adjust the temperature of the solution to $25 \pm 0.1^{\circ}$, and determine the viseosity as deseribed in the section Procedure for Gellulose Derivatives under Iiseosity $\langle 914$, but make all determi fations at $25^{\circ} / 25^{\circ}$ insted of $20^{\circ} / 20^{\circ}$ as directed therein. The vis eosity is net less than $90.0 \%$ and net mere than $110.0 \%$ of that stated on the label for a labeled viscosity of 10 centipoises or more; not less than $80.0 \%$ and not more than $120.0 \%$ of that stated on the tabel for a labeled viseosity of less than 10 centipeises but more than 6 eentipeises; and not less than $75.0 \%$ and not more than $140.0 \%$ of that stated on the label for a labeled viseosity of 6 een tiperises or less.
Less ondrying $\left\langle 734\right.$ ) - Dry it at $105^{\circ}$ for 2 hemrs: it leses net mere than 3.0\% of its weight.
Residue on ignition $\langle z 84\rangle \div$ net mere than $0.4 \%$.
Head- $\langle 254\rangle \div 10 \mathrm{ppm}$.
Heary metals, Method $I\left\langle\langle 234\rangle: 20\right.$ per per $\frac{1}{8}$.
Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the require ments.
Assay Proeed as directed under Methoxy Determination- $\langle 431$ ); using about 50 mg of Ethyleellulese, previously dried and aceurately weighed. Each mL of 0.1 N seditm thiesulfate-is equiver lent to 0.7510 mg of $\left(\mathrm{OC}_{2} \mathrm{H}_{5}\right)$.

## © Ethylcellulose

Cellulose, ethyl ether.
Cellulose ethyl ether [9004-57-3].
» Ethylcellulose is a partly $O$-ethylated cellulose. It contains not less than 44.0 percent and not more than 51.0 percent of ethoxy $\left(-\mathrm{OC}_{2} \mathrm{H}_{5}\right)$ groups, calculated with reference to the dried substance.

Packaging and-storage-Preserve in well-closed containers.

Labeling-Label it to indicate its nominal viscosity in millipascal seconds for a 5 percent $\mathrm{m} / \mathrm{m}$ solution.

USP Reference standards $\langle 11\rangle$ —USP Ethylcellulose RS.
Identification, Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Viscosity $\langle 911\rangle$-Shake a quantity of ethylcellulose equivalent to 5.00 g of the dried substance with 95 g of a mixture of 20 g of alcohol and 80 g of toluene until the substance is dissolved. Determine the viscosity using a capillary viscometer. The viscosity, determined at $25^{\circ}$ and expressed in $\mathrm{mPa} \cdot \mathrm{s}$, is not less than $80.0 \%$ and not more than $120.0 \%$ of that stated on the label for a nominal viscosity greater than $6 \mathrm{mPa} \cdot \mathrm{s}$; and not less than $75.0 \%$ and not more than $140.0 \%$ of that stated on the label for a nominal viscosity not greater than $6 \mathrm{mPa} \cdot \mathrm{s}$.

Acidity or alkalinity-To 0.5 g of ethylcellulose, accurately weighed, add 25 mL of carbon dioxide-free water and shake for 15 minutes. Pass through a sintered-glass filter (40) with a maximum diameter of pores between $16 \mu \mathrm{~m}$ and $40 \mu \mathrm{~m}$. To 10 mL of this solution, add 0.1 mL of Phenolphthalein solution and 0.5 mL of 0.01 N sodium hydroxide. The solution is pink. To 10 mL of this solution, add 0.1 mL of Methyl red solution and 0.5 mL of 0.01 N hydrochloric acid. The solution is red.

Phenolphthalein solution-Dissolve 100 mg of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL .

Methyl red solution-Dissolve 50 mg of methyl red in a mixture of 1.86 mL of 0.1 N sodium hydroxide and 50 mL of alcohol, and dilute with water to 100 mL .

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 2 hours: it loses not more than $3.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.5 \%$, determined on 1.0 g .

Heavy metals, Method II $\langle 231\rangle: 20 \mu \mathrm{~g}$ per g.
Acetaldehyde-Introduce 3.0 g into a $250-\mathrm{mL}$ conical flask with a ground-glass stopper, add 10 mL of water, and stir by mechanical means for 1 hour. Allow to stand for 24 hours, filter, and dilute the filtrate with water to 100.0 mL . Transfer 5.0 mL to a 25 mL volumetric flask, add 5 mL of a 0.5 g per L solution of methylbenzothiazolone hydrazone hydrochloride, and heat in a water bath at $60^{\circ}$ for 5 minutes. Add 2 mL of Ferric chloride-sulfamic acid reagent, and heat again at $60^{\circ}$ for 5 minutes. Cool, and dilute with water to 25.0 mL . The solution is not more intensely colored than a standard prepared at the same time and in the same manner using, instead of the 5.0 mL of the filtrate, 5.0 mL of a reference solution prepared by diluting 3.0 mL of Acetaldehyde standard solution with water ( 100 ppm ) to 100.0 mL .

Ferric chloride-sulfamic acid reagent-Prepare a solution containing 10 g per L of ferric chloride and 10 g per L of sulfamic acid.

Acetaldehyde standard solution-Dissolve 1.0 g of acetaldehyde in 2-propanol, and dilute with the same solvent to 100.0 mL . Dilute 5.0 mL of the solution with water to 500.0 mL . Prepare immediately before use.

Chlorides-Disperse 250 mg in 50 mL of water, heat to boiling, and allow to cool, shaking occasionally. Filter, and discard the first 10 mL of the filtrate. Dilute 10 mL of
the filtrate with water to 15 mL . Add 1 mL of Dilute nitric acid, and pour the mixture as a single addition into a test tube containing 1 mL of 0.1 N silver nitrate VS. Prepare a standard in the same manner using 10 mL of Chloride standard solution and 5 mL of water. Examine the tubes laterally against a black background. After standing for 5 minutes protected from light, any opalescence in the test solution is not more intense than that in the standard ( $0.1 \%$ ).
Dilute nitric acid-Dilute 20 mL of nitric acid with water to 100 mL .

Chloride standard solution-Immediately before use, dilute with water to 100 times its volume a solution containing sodium chloride equivalent to 0.824 g per L of sodium chloride.

## Assay-

NOTE-Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps of the Test solution preparation and the Reference solution preparation in a properly functioning hood.

Internal standard solution-Dilute $120 \mu \mathrm{~L}$ of toluene with $o$-xylene to 10 mL .
Test solution-Transfer 50.0 mg of ethylcellulose, 50 mg of adipic acid, and 2.0 mL of the Internal standard solution into a suitable 5 mL thick-walled reaction vial, with a pres-sure-tight septum closure. Cautiously add 2.0 mL of hydriodic acid, immediately close the vial tightly, and weigh the contents and the vial accurately. Shake the vial for 30 seconds, heat to $125^{\circ}$ for 10 minutes, allow to cool for 2 minutes, shake again for 30 seconds, and heat to $125^{\circ}$ for 10 minutes. Afterwards allow to cool for 2 minutes, and repeat shaking and heating for a third time. Allow the vial to cool for 45 minutes, and reweigh. If the loss is greater than 10 mg , discard the mixture and prepare another. Use the upper layer for analysis.

Reference solution-Transfer 100.0 mg of adipic acid, 4.0 mL of the Internal standard solution and 4.0 mL of hydriodic acid into a suitable 10 mL thick-walled reaction vial with a pressure-tight septum closure. Close the vial tightly, and weigh the vial and contents accurately. Afterwards inject $50 \mu \mathrm{~L}$ of the iodoethane through the septum with a syringe, weight the vial again, and calculate the mass of iodoethane added, by difference. Shake well, and allow the layers to separate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $2-\mathrm{mm} \times 5.0-\mathrm{m}$ stainless steel column packed with $3 \% \mathrm{G} 2$ on $150-\mu \mathrm{m}$ to $180-\mu \mathrm{m}$ mesh support S1A. The carrier gas is nitrogen, flowing at a rate of about 15 mL per minute. The injection port and detector temperatures are both maintained at $200^{\circ}$. The column temperature is maintained at $80^{\circ}$.
Procedure-Inject $1 \mu \mathrm{~L}$ of the upper layer of the Reference solution into the chromatograph, record the chromatogram, and record the areas of the peaks. The relative retention times are as follows: iodoethane 0.6 , toluene 1.0 , and $o$-xylene 2.3. Adjust the sensitivity of the system so that the heights of the two principal peaks are at least $50 \%$ of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to iodoethane and toluene is at least 2.0. Inject $1 \mu \mathrm{~L}$ of the Test solution into the chromatograph, and record the chromatogram as directed for Reference solution. Use the retention
times observed in the chromatogram of the Reference solution to identify the peaks in the chromatogram of the Test solution. Calculate the percentage of ethoxy groups by the formula:

$$
[451000 / 312]\left[Q_{1} m_{2}\right] /\left[Q_{2} m_{1}(100-d)\right],
$$

where $Q_{1}$ is the ratio of the iodoethane peak area to the toluene peak area in the chromatogram obtained with the Test solution; $Q_{2}$ is the ratio of the iodoethane peak area to the toluene peak area in the chromatogram obtained with the Reference solution; $m_{1}$ is the mass of ethylcellulose used in the Test solution in mg ; $m_{2}$ is the mass of iodoethane used in the Reference solution in mg ; and $d$ is the loss on drying as a percentage. $\mathbf{\Delta N F 2 3}^{\text {N }}$

## Briefing

Hydroxyethyl Cellulose, NF 22 page 2877. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Hydroxyethyl Cellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the Revised OFFICIAL INQUIRY STAGE 4 document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia. The harmonization draft sections proposed for the $N F$ monograph have been editorially styled. Readers are urged to review these In-Process Revision proposals carefully and to respond to USP no later than May 1, 2004.

Major changes proposed include:
(1) In the opening paragraph (the Definition)-A more simple definition is used.
(2) Packaging-No change.
(3) Labeling-A style change is added to specify apparent viscosity.
(4) Identification-Tests $B$ and $C$ are replaced by three different tests to comply with EP and JP standards.
(5) Viscosity-The EP method for Apparent viscosity has been adopted.
(6) pH -The lower limit is expanded from 6.0 to 5.5 .
(7) Loss on drying-No change.
(8) Residue on ignition-The EP standard of not more than 4.0\% has been adopted.
(9) Chlorides-This test is added to comply with EP standards.
(10) Nitrates-This test is added to comply with EP standards.
(11) Limit of glyoxal-This test is added to comply with EP standards. Technical grades of hydroxyethyl cellulose are frequently treated with glyoxal to improve their processing properties. Carry over to pharmaceutical grade materials cannot be excluded. Glyoxal is a highly reactive impurity that warrants limiting.
(12) Limit of ethylene oxide-This test is added to comply with EP standards. Ethylene oxide can be a starting material in the manufacture of hydroxyethyl cellulose and is a highly toxic substance.
(13) Limit of 2-chloroethanol-This test is added to comply with EP standards.
(14) Organic volatile impurities-No change.
(15) Heavy metals-No change.
(EMC: J. Lane) RTS-40798-1

## Add the following:

## Hydroxyethyl Cellulose

Cellulose, 2-hydroxyethyl ether [9004-62-0].
» Hydroxyethyl Cellulose is a partially $O$-(2-hydroxyethylated) cellulose.

Packaging-Preserve in well-closed containers.
Labeling-The labeling indicates the apparent viscosity, in millipascal seconds for a $2 \%$ solution.

## Identification-

A: Stir about 1 g into 100 mL of water: After about 10 minutes, dilute with water to 100 mL , and stir to dissolve.

B: To 10 mL of the solution obtained from Identification test $A$, add 0.3 mL of dilute acetic acid (contains not less than 115 g per L and not more than 125 g per L of $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}$ ) and 2.5 mL of a 100 g per L solution of tannic acid. A yel-lowish-white, flocculent precipitate is formed which dissolves in ammonia TS.

C: In a test tube about 160 mm in length, thoroughly mix 1 g of it with 2 g of finely powdered manganese sulfate. Introduce to a depth of 2 cm into the upper part of the tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 200 g per L solution of diethanolamine and 11 volumes of a 50 g per L solution of sodium nitroprusside, adjust with 1 N hydrochloric acid to a pH of about 9.8. Insert the tube 8 cm into a silicone oil bath, and heat at $190^{\circ}$ to $200^{\circ}$. The filter paper becomes blue within 10 minutes. Carry out a blank test.

D: Dissolve 0.2 g of it completely, without heating, in 15 mL of a 700 g per L solution of sulfuric acid. Pour the solution with stirring into 100 mL of iced water, and dilute with iced water to 250 mL . In a test tube, mix thoroughly while cooling in iced water 1 mL of the solution with 8 mL of sulfuric acid, added dropwise. Heat on a water bath for exactly 3 minutes, and immediately cool in iced water. While the mixture is cold, carefully add 0.6 mL of Ninhydrin solution, and mix well. Allow to stand at $25^{\circ}$. A pink color is produced immediately and does not become violet within 100 minutes.

Ninhydrin solution-Dissolve 3 g of ninhydrin in 100 mL of a 45.5 g per L solution of sodium bisulfite.

Apparent viscosity $\langle 911\rangle: 75 \%$ to $140 \%$ of the value is stated on the label. While stirring, introduce a quantity of the substance to be examined equivalent to 2.00 g of the dried substance into 50 g of water. Dilute with water to 100.0 g , and stir to dissolve. Determine the viscosity using a rotating viscometer at $25^{\circ}$ and at a shear rate of $100 \mathrm{~s}^{-1}$ for substances with an expected viscosity up to $100 \mathrm{mPa} \cdot \mathrm{s}$, at a shear rate of $10 \mathrm{~s}^{-1}$ for substances with an expected viscosity between $100 \mathrm{mPa} \cdot \mathrm{s}$ an $20,000 \mathrm{mPa} \cdot \mathrm{s}$ and at a shear rate of $1 \mathrm{~s}^{-1}$ for substances with an expected viscosity above $20,000 \mathrm{mPa} \cdot \mathrm{s}$.

If it is impossible to obtain a shear rate of exactly $1 \mathrm{~s}^{-1}, 10$ $\mathrm{s}^{-1}$, or $100 \mathrm{~s}^{-1}$ respectively, use a rate slightly higher and a rate slightly lower, and interpolate.
$\mathbf{p H}\langle 791\rangle$ : between 5.5 and 8.5. Use the solution obtained from Identification test $A$.

Loss on drying $\langle 731\rangle$ —Dry a 1.000 g sample at $100^{\circ}$ to $105^{\circ}$ for 3 hours: it loses not more than $10.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $4.0 \%$, determined on a 1.0 g sample.

## Chlorides-

Test solution-Disperse a quantity of the substance to be examined equivalent to 1.0 g of the dried substance in 50 mL of water that has been previously boiled and cooled. After 10 minutes, dilute with water to 100 mL that has been previously boiled and cooled, and stir to dissolve. Dilute 1 mL of this solution with water to 30 mL .

Chloride standard solution ( 5 ppm Cl )—Immediately before use, dilute with water to 100 times its volume a solution containing sodium chloride equivalent to 0.824 g in 1000.0 mL .

Standard solution-Mix 10 mL of Chloride standard solution ( 5 ppm Cl ) and 5 mL of water.

Procedure-Add 1 mL of a dilute nitric acid solution (125 g per L ) to the Test solution, and pour the mixture as a single addition into a test tube, containing 1 mL of silver nitrate solution ( 17 g per L). Prepare a standard in the same manner, using the Standard solution in place of the Test solution. Examine the tubes laterally against a black background. After standing for 5 minutes protected from light, any opalescence in the Test solution is not more intense than that in the Standard solution.

Nitrates-[NOTE-Prepare all solutions immediately before use.]

Buffer solution-To a mixture of 50 mL of 2 N sulfuric acid and 800 mL of water, add 135 g of potassium phosphate, monobasic, and dilute with water to 1000 mL .

Buffered water-Dilute 80 mL of Buffer solution with water to 2000 mL .

Nitrate standard solution (500 ppm NO 3 )—Dissolve 0.8154 g of potassium nitrate in 500 mL of Buffered water, and dilute with the same solvent to 1000.0 mL .

Test solution-Dissolve 0.50 g of the substance to be examined in Buffered water, and dilute with the same solvent to 100.0 mL .

Reference solutions-If hydroxyethyl cellulose has an apparent viscosity of $1000 \mathrm{mPa} \cdot \mathrm{s}$ or less, dilute $10.0 \mathrm{~mL}, 20.0$ mL , and 40.0 mL of Nitrate standard solution (500 ppm $\mathrm{NO}_{3}$ ) to 100.0 mL with Buffered water, and mix. If hydroxyethyl cellulose has an apparent viscosity of more than $1000 \mathrm{mPa} \cdot \mathrm{s}$, dilute $1.0 \mathrm{~mL}, 2.0 \mathrm{~mL}$, and 4.0 mL of Nitrate standard solution ( $500 \mathrm{ppm} \mathrm{NO} \mathrm{N}_{3}$ ) with Buffered water, to 100.0 mL , and mix.

Procedure-Carry out the measurements for each solution, potentiometrically (see Titrimetry $\langle 541\rangle$ ), using as an indicator, a nitrate selective electrode and a silver-silver chloride electrode with a 0.1 M ammonium sulfate as a reference electrode. Calculate the concentration of nitrates using a calibration curve: maximum of $3.0 \%$ (dried substance), if hydroxyethyl cellulose has an apparent viscosity of $1000 \mathrm{mPa} \cdot \mathrm{s}$ or less and a maximum of $0.2 \%$ (dried substance), if hydroxyethyl cellulose has an apparent viscosity of more than $1000 \mathrm{mPa} \cdot \mathrm{s}$.

## Limit of glyoxal-

Standard solution-In a 100 mL graduated flask, weigh a quantity of glyoxal solution ( $40 \%(\mathrm{w} / \mathrm{w})$ ) corresponding to 0.200 g of $\mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}_{2}$, and make up with alcohol to volume.

Immediately before use dilute the solution with the same solvent to 100 times its volume. Immediately before use, dilute the solution above with alcohol to 10 times its volume.

Test solution-Introduce 1.0 g of it into a test tube with a ground glass stopper, and add 10.0 mL of alcohol. Stopper the tube, and stir by mechanical means for 30 minutes. Centrifuge, and retain the supernatant.

Procedure-To 2 mL of the Test solution, add 5.0 mL of a 4 g per L solution of methylbenzothiazolone hydrazone hydrochloride in an $80 \%(\mathrm{v} / \mathrm{v})$ solution of glacial acetic acid in water. Shake to homogenize. After 2 hours, the solution is not more intensely colored than a standard prepared at the same time and in the same manner using 2.0 mL of the Standard solution instead of the 2.0 mL of the Test solution: not more than 20 ppm .

Limit of ethylene oxide-[NOTE-All vials must be closed immediately with a butyl rubber membrane stopper, coated with aluminum or polytetrafluoroethylene and secured with an aluminum crimped cap.]

Polyethylene glycol 200 preparation-Introduce 500 mL of polyethylene glycol 200 into a 1000 mL round-bottom flask. Using a rotation evaporator remove any volatile components applying for 6 hours at a temperature of $60^{\circ}$ and in a vacuum with a pressure of 1.5 kPa to 2.5 kPa .
Ethylene oxide stock solution-[NOTE-All operations carried out in the preparation of these solutions must be conducted in a fume-hood. The operator must protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in an airtight container in a refrigerator at $4^{\circ}$ to $8^{\circ}$. Carry out all determinations three times.]

Ethylene oxide solution-Weigh 1.00 g of cold Ethylene oxide stock solution (equivalent to 2.5 mg of ethylene oxide) into a cold flask containing 40.0 g of cold Polyethylene glycol 200 preparation. Mix and determine the exact mass, and
dilute to a calculated mass to obtain a solution containing 50 $\mu \mathrm{g}$ of ethylene oxide per g of solution. Weigh 10.00 g into a flask containing about 30 mL of water, mix, and dilute with water ( $10 \mu \mathrm{~g}$ per mL of ethylene oxide) to 50.0 mL . Prepare immediately before use.

Standard preparation A-Accurately weigh, and transfer 1.00 g of the substance to be examined into an identical 5 mL vial. Add 0.2 mL of cooled Ethylene oxide solution and 0.8 mL of water. It swells in water but does not dissolve.

Standard preparation B-To 0.1 mL of Ethylene oxide solution in a 5 mL vial add 0.1 mL of a freshly prepared 10 mg per L solution of acetaldehyde.
Test preparation-Accurately weigh and transfer 1.00 g of the substance to be examined to a 5 mL vial (other sizes may be used depending on the operating conditions), and add 1 mL of water. It swells in water but does not dissolve.

Into a dry, clean test tube, cooled in a mixture of 1 part of sodium chloride and 3 parts of crushed ice, introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to $-10^{\circ}$, inject about $300 \mu \mathrm{~L}$ (corresponding to about 0.25 g ) of liquid ethylene oxide into 50 mL of Polyethylene glycol 200 preparation. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption ( $M_{e o}$ ). Dilute with Polyethylene glycol 200 preparation to 100.0 mL . Mix well before use. To 10 mL of a 500 g per L suspension of magnesium chloride in ethanol, add 20.0 mL of 0.1 N alcoholic hydrochloric acid VS (dilute 5.0 mL of 1 N hydrochloric acid VS with alcohol to 500.0 mL ) in a flask. Stopper, shake to obtain a saturated solution, and allow to stand overnight to equilibrate. Weigh 5.00 g of Ethylene oxide stock solution into the flask, and allow to stand for 30 minutes. Titrate with 0.1 N alcoholic potassium hydroxide VS determining the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$ ). Carry out a blank titration, replacing
the substance to be examined with the same quantity of Polyethylene glycol 200 preparation. Calculate the content of ethylene oxide in mg per g by the formula:

$$
\left(\left(V_{0}-V_{1}\right) \times f \times 4.404\right) / m
$$

where $V_{0}$ and $V_{1}$ are the volumes of alcoholic potassium hydroxide used respectively for the blank titration and the assay; $f$ is the factor of the alcoholic potassium hydroxide solution; and $m$ is the mass of the sample taken (g).

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The gas chromatograph is equipped with a flame-ionization detector, maintained at about $250^{\circ}$, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused silica capillary column bonded with a $1.0-\mu \mathrm{m}$ layer of phase G2. The carrier gas is helium with a linear velocity of about $20 \mathrm{~cm} / \mathrm{s}$ and a split ratio of 1:20. The column temperature is maintained at $50^{\circ}$ for the first 5 minutes after an injection is made, than the temperature is increased at a rate of $30^{\circ}$ to $230^{\circ}$, and maintained at $230^{\circ}$ for 5 minutes. The injection port temperature is maintained at $150^{\circ}$. Static head space conditions are used that include an equilibration temperature of $70^{\circ}$, an equilibration time of 45 minutes, and use a pressurization time of 30 seconds. Maintain the transfer line temperature at $75^{\circ}$. Inject about 1.0 mL of the gaseous phase of Standard preparation B into a suitable gas chromatograph, and record the chromatogram. Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are not less than $15 \%$ of the full scale of the recorder. The resolution, $R$, between the peaks corresponding to acetaldehyde and ethylene oxide is at least 2.0.

Procedure-Separately inject equal volumes ( 1.0 mL ) of the gaseous phase of the Test preparation and Standard preparation $A$ into the chromatograph, record the chromatograms, and measure the major peaks. In the chromatogram obtained with the Test preparation, the area of any peak cor-
responding to ethylene oxide is not greater than half the area of the peak due to ethylene oxide in the chromatogram obtained with Standard preparation $A$ : not more than 1 ppm .

The content of ethylene oxide in ppm can be calculated by the formula:

$$
\left(A_{T} \times M_{E O} \times C\right) /\left(0.25\left(A_{R} \times M_{T}-A_{T} \times M_{\mathrm{R}}\right)\right),
$$

where $C=C_{E O} /\left(M_{E O} \times 10\right)$, and where $A_{T}$ is the area of the peak corresponding to ethylene oxide in the chromatrogram obtained with the Test preparation; $A_{R}$ is the area of the peak corresponding to ethylene oxide in the chromatogram obtained with Standard preparation $A ; M_{E O}$ is the mass of absorbed ethylene oxide (used for preparing the Ethylene oxide solution) in $\mathrm{g} ; M_{T}$ is the mass of the substance to be examined in g in the Test preparation; $M_{R}$ is the mass of the substance to be examined in g in the Standard preparation $A ; C$ is the correction factor to be determined from the formula; $C_{E O}$ is the ethylene oxide content in mg per mL , determined by titration.

Limit of 2-chloroethanol- [NOTE-All vials must be closed immediately with a butyl rubber membrane stopper, coated with aluminum or polytetrafluoroethylene, and secured with an aluminum crimped cap.]

Test preparation-Transfer 50 mg of the substance to be examined to a 10 mL vial (other sizes maybe used depending on the operating conditions), add $2 \mu \mathrm{~L}$ of isopropyl alcohol. Seal the vial, and mix.

Standard preparation A-Accurately weigh and dissolve 0.125 g of 2-chloroethanol, and dilute with isopropyl alcohol to 50.0 mL . Dilute 1.0 mL of the solution with 2-propanol to 10.0 mL .

Standard preparation B-Transfer 50 mg of it to an identical 10 mL vial, add $2 \mu \mathrm{~L}$ of Standard preparation A, seal the flask, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, maintained at about $250^{\circ}$, and a $0.32-\mathrm{mm} \times 50-\mathrm{m}$ fused silica capillary column bonded with a $1.2-\mu \mathrm{m}$ layer of phase G2. The carrier gas is helium with a linear velocity of about 25 to $35 \mathrm{~cm} / \mathrm{s}$ and a split ratio of 1:10. The column temperature is maintained at $60^{\circ}$ for the first 6 minutes after an injection is made, increased from $60^{\circ}$ to $110^{\circ}$ from 6 minutes to 16 minutes after injection, and increased from $110^{\circ}$ to $230^{\circ}$ from 16 minutes to 31 minutes after injection. The temperature is then maintained at $230^{\circ}$ for 5 minutes. The injection port temperature is maintained at $150^{\circ}$. Static head space conditions are used that include an equilibration temperature of $110^{\circ}$, an equilibration time of 20 minutes. Maintain the transfer line temperature at $115^{\circ}$.

Procedure-Separately inject about 2.0 mL of the gaseous phase of Standard preparation B, and the Test preparation into a suitable gas chromatograph, and record the chromatogram. The retention time of 2-chloroethanol is about 7.8 minutes. In the chromatogram obtained with the Test preparation, the area of any peak corresponding to 2chloroethanol is not greater than 0.5 times the area of the peak due to 2-chloroethanol in the chromatogram obtained with Standard preparation B: not more than 10 ppm .

Heavy metals, Method II $\langle 231\rangle: 20 \mu \mathrm{~g}$ per g.
Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## BRIEFING

Starch, NF 22 page 2939. Because monographs for Corn Starch, Potato Starch, and Wheat Starch are being addressed for Harmonization ADOPTION STAGE 6, the Starch monograph is proposed for deletion, as it is no longer needed.
(EMC: J. Lane) RTS-40769-1

## Delete the following:

## $\Delta$ Stareh

## Stareh. <br> Stareh [ 0095 25-8].

\#-Stareh consists of the gramules separated from the mature grain of corn [Zea mays Linné (Fum. Grami neae)] or of wheat [Triticum aestivum Linné (Fam. Gramineae)], or from tubers of the potato [Solammetuberosum Linmé (Fam. Solanaceae)].
NOTE-Starches obtained from-different botanieal sources may not have identical properties with respect to their use for specific pharmaceutical purposes, e.g., as a tablet-disintegrating agent. Therefore, types of stareh should not be interehanged unless performance equivalency has been aseentained.

Packaging and-storage Preserve in well clesed containers. Labeling Label it to indieate the botanieal source from which it was derived.
Botanie-characteristies-
Corn-starch Pelygonat, reunded or sphereidal grantles up-te about $35 \mathrm{\mu m}$ in diameter and usually having a cireular or sev eral rayed central cleft.

Wheat stareh Two distinet ypesef granales aresimple lentieut tar large granules 20 to 25 - mm or up to 50 - mm in diameter, and small spherieal gramules 5 to 10 km in diameter. Striations are faintly marked and coneentric.

Potatostarch Simple-granules, irregularly oveid or spherical, 30 to $100 \mathrm{\mu m}$ in diameter, and subspherieal gramules 10 to $35 \mathrm{\mu m}$ in diameter. Striations are well marked and concentric.

## Identifieation-

A: Prepare a smooth mixture of 1 g of it with 2 mL of cold water, stir it into 15 mL of boiling water, boil gently for 2 minutes, and cool: the product is a translucent, whitish jelly.

B: A water slumy of it is colered reddish violet to deep blue by dine TS.
Mierobial limits $\langle 64\rangle$-It meets the requirements of the tests for absenee of Salmenella species and Escherichia ooli.
 Stareh, transferring to a suitable nommetallic container, and adding 100 mL of water. Agitate continuously at a moderate rate for 5 min utes, then stop agitation, and immediately determine the pH to the fearest 0.1 unit: the pH , determined potentiometrieally, is between 4.5 and 7.0 for Corn starch and Wheat starch, and is between 5.0 and 8.0 for $P$ otato starel.
Lessondrying $\left\langle 734\right.$ ) - Dry itat $120^{\circ}$ for 4 heurs: it leses net mere than $14.0 \%$ of its weight.
Residue-on-ignition- $\langle z 81\rangle \div$ not more than $0.5 \%$, determined on a 2.0 gest specimen.

Iren- $\langle z 44\rangle$ - Dissolve the residtue obtained in the test for Residtue en ignition in 8 mL of hydrochloric acid with the aid of gentle heat ing, dilute with water to 100 mL , and mix. Dilute 25 mL of this solution with water to -47 mL : the limit is $0.002 \%$.
Oxidizing substances Transfer 4.0-5 to a glass-stoppered, 125 mL conieal flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 mintues. Deeant into a glass stoppered, 50 mL centri fuge tube, andeentifuge toclarify. Transfer 30.0 mL of clear super matant liguid to a glass stoppered, 125 mL conical flack. Add 1 mL ef ghacial acetic acid and 0.5 g to 1.0 of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minntes in the dark. Add 4 mL of stareh TS, and titrate with 0.002 N sodirm thiosulfate VS to the disappearance of the stareh iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 Hg of oxidant, ealeulated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $0.002 \%$ ).
Sulfur dioxide Mix 20 g with 200 mL of water until a smoeth suspension is obtained, and filter. To 100 mL of the clear filtrate add 3 mL of stareh TS, and titrate with 0.010 N iodine

to the first permanent blue color: not more than 2.7 mL is con stmed (0.008\%).
Organic volatile impurities, Method $I K\langle 467\rangle$ :- meets the requir ements..nN23

## BRIEFING

Corn Starch, page 882 of PF 28(3) [May-June 2002]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Corn Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the corresponding monograph for Starch that was prepared by the United States Pharmacopeia. The USP draft was based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by USP. The current $N F$ monograph for Starch will be proposed for deletion, to be replaced by new monographs for Corn Starch, Potato Starch, and Wheat Starch.

Pharmacopeial Discussion Group Sign-Off Document

| Limit of iron | + | + | + |
| Limit of oxidizing <br> substances | + | + | + |
| Sulfur dioxide <br> determination | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Microbial contamination, Storage, Labeling.
Specific local attributes: Foreign matter (EP).
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.
Differences between the International Harmonization Adoption Stage 6 document for Corn Starch and the current NF Starch monograph include the following:
(1) Definition-Changed to include only Corn Starch, as to conform to the individual monograph for Corn Starch.
(2) Identification test $C$-The test is modified to use 1 mL of mucilage, instead of 10 mL , and a new, less concentrated test solution is added.
(3) Packaging-No change.
(4) Labeling-A requirement that the label indicate where it is intended for use in preparing Absorbable Dusting Powder is added to ensure that microbial limits are met.
(5) Botanical characteristics-This test has been modified and moved to the Identification section.
(6) Identification-A microscopic test is added that is similar to the Botanical characteristics section. The other two tests are modified slightly for clarification.
(7) Microbial limits-The revised limit for the total combined molds and yeasts count in the test is based on comments received. The addition of the requirements for Absorbable Dusting Powder are based on specific microbial requirements for Absorbable Dusting Powder.
(8) pH -The lower limit is expanded in order to conform with EP standards.
(9) Loss on drying-The revised test conditions reportedly correspond to ISO 1666 and are preferred by users of starches because of reduced testing time.
(10) Residue on ignition-The standard for this test is increased from $0.5 \%$ to $0.6 \%$ in order to conform with EP standards.
(11) Limit of iron-The test procedure is changed in order to conform to EP standards.
(12) Limit of oxidizing substances-No change.
(13) Limit of sulfur dioxide-The change in the standard reflects the corresponding limits proposed by the EC food laws.
(14) Organic volatile impurities-This test is deleted, as it is not necessary.
(EMC: J. Lane) RTS-40773-4

## Add the following:

## ©Corn Starch

» Corn Starch consists of the starch granules separated from the mature grain of corn [Zea mays Linné (Fam. Gramineae)].

Packaging and-storage-Preserve in well-closed containers.

Labeling-Where Corn Starch is intended for use in preparing Absorbable Dusting Powder, it is so labeled and the label states that it must be subjected to further processing during the preparation of Absorbable Dusting Powder.

## Identification-

A: Under a microscope, using not less than $20 \times$ magnification and using a mixture of glycerin and water (1:1) as a mounting agent, it appears as either angular polyhedral granules of irregular sizes with diameters ranging from about $2 \mu \mathrm{~m}$ to about $23 \mu \mathrm{~m}$ or as rounded or spheroidal granules of irregular sizes with diameters ranging from about $25 \mu \mathrm{~m}$ to about $35 \mu \mathrm{~m}$. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between crossed nicol prisms, the starch granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: Te 10 mL of the mucilage obtained in Identification test $B$, add 0.04 mL of iodine and potassium iodide TS: an erange red to dark blue color is produced, which disappears

## en heating.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of Iodine solution: an orange-red to dark blue color is produced, which disappears on heating.

Iodine solution-Dissolve 12.7 g of iodine and 20 g of potassium iodide in water, and dilute with water to 1000.0 mL . To 10.0 mL of this solution, add 0.6 g of potassium iodide, and dilute with water to 100.0 mL . Prepare immediately before use.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $100010^{3}$ per g , the total combined molds and yeasts count does not exceed $10010^{2}$ per g , and it meets the requirements of the test for the absence of Escherichia coli. Where it is intended for use in preparing Absorbable Dusting Powder, it also meets the requirements of the tests for absence of Staphylococcus aureus and Pseudomonas aeruginosa.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Corn Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 4.0 and 7.0.

Loss on drying $\langle 731\rangle$ - Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $15.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature $600 \pm 50^{\circ}$.

Limit of iron-Shake 1.5 g of Corn Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured volume of this solution with water to obtain a Diluted

Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL. Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per $g$.

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide-Not more than $50 \mu \mathrm{~g}$ per g .

## Reagents-

Carbon dioxide-Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.

Hydrogen peroxide solution-Dilute $30 \%$ hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.
Apparatus-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom, boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Procedure-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid
solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparatus in a water bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) \mathrm{VN} / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL , of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organic volatile imptrities, Meth $H\langle\langle 467\rangle$ :-meets the requirements. $\mathbf{A N F}^{\text {NF }}$

BRIEFING

Potato Starch, page 885 of $P F 28(3)$ [May-June 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Potato Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph represents the ADOPTION STAGE 6 document. The EP draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by EP. The current NF monograph for Starch will be proposed for deletion, to be replaced by Corn Starch, Potato Starch, and Wheat Starch.

## Add the following:

## $\Delta$ Potato Starch

## » Potato Starch is obtained from the tuber of Solanum tuberosum $L$.

Packaging and-storage-Preserve in well-closed containers.

## Identification-

A: Under a microscope, using a mixture of glycerin and water (1:1) as a mounting agent, it presents granules, either irregularly shaped, ovoid, or pear-shaped, usually $30 \mu \mathrm{~m}$ to $100 \mu \mathrm{~m}$ in size, but occasionally exceeding $100 \mu \mathrm{~m}$, or rounded, $10 \mu \mathrm{~m}$ to $35 \mu \mathrm{~m}$ in size. There are occasional compound granules having two or four components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of iodine and potassium iodide TS: a dark blue color is produced, which disappears on heating.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $100010^{3}$ per g , the total combined molds and yeasts count does not exceed $10010^{2}$ per g , and it meets the requirements of the test for the absence of Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Potato Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 5.0 and 8.0.

Loss on drying $\langle 731\rangle$-Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $20.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature $600 \pm 50^{\circ}$.

Limit of iron-Shake 1.5 g of Potato Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured volume of this solution with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid
solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide: not more than $50 \mu \mathrm{~g}$ per g .

## Reagents-

Carbon dioxide-Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.
Hydrogen peroxide solution-Dilute 30\% hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with
standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Procedure-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparatus in a bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the
contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) \mathrm{VN} / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL , of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organic volatile impurities, Methed $I H(467)$ : meets the requirements._NF23

## Briefing

Rice Starch. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Rice Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised OFFICIAL INQUIRY STAGE 4 document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts. The text presented is similar to the harmonization drafts for Corn, Wheat, and Potato Starch that appear in this issue of Pharmacopeial Forum.
(EMC: J. Lane) RTS-40773-3

## Add the following:

## Rice Starch

» Rice Starch is obtained from the caryopsis of Oryza sativa $L$.

Packaging-Preserve in well-closed containers.

## Identification-

A: Examined under a microscope using a mixture of equal volumes of glycerin and water, it presents polyhedral, simple grains $1 \mu \mathrm{~m}$ to $10 \mu \mathrm{~m}$, mostly $4 \mu \mathrm{~m}$ to $6 \mu \mathrm{~m}$, in size. These simple grains often gather in ellipsoidal, compound grains $50 \mu \mathrm{~m}$ to $100 \mu \mathrm{~m}$ in diameter. The granules have a poorly visible central hilum and there are no concentric striations. Between crossed nicol prisms, the starch granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of Iodine and potassium iodide solution: an orange-red to dark blue color is produced, which disappears on heating.

Iodine and potassium iodide solution-To 10.0 mL of 0.05 M iodine, add 0.6 g of potassium iodide and dilute to 100.0 mL with water. Prepare immediately before use.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $10^{3}$ cfu per g , the total combined molds and yeasts count does not exceed $10^{2}$ cfu per g , and it meets the requirements of the test for the absence of Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Rice Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 5.0 and 8.0.

Loss on drying $\langle 731\rangle$-Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $15.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen.

Foreign matter-Examine under a microscope using a mixture of equal volumes of glycerin and water: not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Limit of iron-Shake 1.5 g of Rice Starch with 15 mL of 2 $N$ hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, dilute an accurately measured volume of this solution quantitatively with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and proceeding in the same manner as directed for the preparation of the Test solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant liquid to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of $0.002 N$ sodium thiosul-
fate VS is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate VS is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide-Not more than $50 \mu \mathrm{~g}$ per g .
Reagents-
Carbon dioxide - Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5), and filter if necessary.

Hydrogen peroxide solution-Dilute $30 \%$ hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.
Apparatus-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. A suitable apparatus for sulfur dioxide determination is shown in the accompanying diagram (Figure $1)$. The apparatus consists essentially of a $500-\mathrm{mL}$ threeneck, round-bottom, boiling flask, $A$, a separatory funnel, $B$, having a capacity of 100 mL or greater, a gas inlet tube, of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser, $C$, having a jacket length of 200 mm , and a delivery tube, $E$, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, $D$. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Fig. 1.

Procedure—Add 150 mL of water to the boiling flask $(A)$. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. To 10 mL of Hydrogen peroxide solution, add 0.15 mL of Bromophenol blue indicator solution. Add 0.1 N sodium hydroxide until a violet-blue color is obtained, without exceeding the end-point. Place the solution in the test tube $(D)$. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel $(B)$ from the boiling flask and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask. Boil the mixture for 1 hour. Open the stopcock of the funnel and stop the flow of carbon diox-
ide and also the heating and the cooling water. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200mL conical flask, and mix. Heat on a water bath for 15 minutes and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination and make any necessary correction (see Titrimetry $\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) V N / W
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide, $V$ is the volume, in mL , of titrant consumed, $N$ is the normality of the titrant, and $W$ is the weight, in g , of test specimen taken.

Organic volatile impurities, Method IV $\langle 467\rangle$ : meets the requirements.

## BRIEFING

Wheat Starch, page 888 of $P F$ 28(3) [May-June 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Wheat Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph represents the ADOPTION STAGE 6 document. The EP draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by EP. The current $N F$ monograph for Starch will be proposed for deletion, to be replaced by Corn Starch, Potato Starch, and Wheat Starch.

Pharmacopeial Discussion Group Sign-Off Document

| Attributes | EP | JP | USP |
| :--- | :---: | :---: | :---: |
| Definition | + | + | + |
| Identification A | + | + | + |
| Identification B | + | + | + |
| Identification C | + | + | + |
| pH | + | + | + |
| Iron | + | + | + |
| Total protein | + | - | + |
| Oxidizing substances | + | + | + |
| Sulfur dioxide | + | + | + |
| Loss on drying | + | + | + |
| Sulphated ash | + | + | + |

Legend: + will adopt and implement; - will not stipulate.
Nonharmonized attributes: Characters, Microbial contamination, Storage.

Specific local attributes: Foreign matter (EP).
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the International Harmonization Adoption Stage 6 document for Wheat Starch and the current NF Starch monograph include the following:
(1) Definition-Changed to include only Wheat Starch, as to conform to the individual monograph for Wheat Starch.
(2) Packaging-No change.
(3) Labeling-Deleted.
(4) Identification test $C$-The iodine test solution preparation is added.
(5) Botanical characteristics-This test has been modified and moved to the Identification section.
(6) Identification-A microscopic test is added that is similar to the Botanical characteristics section. The other two tests are modified slightly for clarification.
(7) Microbial limits-The revised limit for the total combined molds and yeasts count in the test is based on comments received.
(8) pH -No change.
(9) Loss on drying-The revised test conditions reportedly correspond to ISO 1666 and are preferred by users of starches because of reduced testing time.
(10) Residue on ignition-The standard for this test is increased from $0.5 \%$ to $0.6 \%$ in order to conform with EP standards.
(11) Total Protein-This test is added to conform with EP.
(12) Limit of iron-The test procedure is changed in order to conform to EP standards.
(13) Limit of oxidizing substances-No change.
(14) Limit of sulfur dioxide-The change in the standard reflects the corresponding limits proposed by the EC food laws.
(15) Organic volatile impurities-This test is deleted, as it is not necessary.
(EMC: J. Lane) RTS-40773-2

## Add the following:

## © Wheat Starch

» Wheat Starch is obtained from the caryopsis of Triticum aestivum L. (T. vulgare Vill.).

Packaging and-storage-Preserve in well-closed containers.

## Identification-

A: Under a microscope, using a mixture of glycerin and water (1:1) as a mounting agent, it presents large and small granules, and very rarely, intermediate sizes. The large granules, usually $10 \mu \mathrm{~m}$ to $60 \mu \mathrm{~m}$ in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are $2 \mu \mathrm{~m}$ to $10 \mu \mathrm{~m}$ in diameter. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.

B: Suspend 1 g of it in 50 mL of water, boil for $1 \mathrm{~min}-$ ute, and cool: a thin, cloudy mucilage is formed.

C: Te 1 mL of the mucilage obtained in Identificution

## test $B$, add 0.05 mL of iodine and petassium iodide $\mathrm{TS}:$ a

## dark blue color is produced, which disappears on heating.

C: To 1 mL of the mucilage obtained in Identification test $B$, add 0.05 mL of Iodine solution: an orange-red to dark blue color is produced, which disappears on heating.

Iodine solution-Dissolve 12.7 g of iodine and 20 g of potassium iodide in water, and dilute with water to 1000.0 mL . To 10.0 mL of this solution, add 0.6 g of potassium iodide, and dilute with water to 100.0 mL . Prepare immediately before use.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count does not exceed $100010^{3}$ per g , the total combined molds and yeasts count does not exceed $10010^{2}$ per g , and it meets the requirements of the test for the absence of Escherichia coli.
$\mathbf{p H}\langle 791\rangle$ —Prepare a slurry by weighing 5.0 g of Wheat Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, and allow to stand for 15 minutes. Determine the pH to the nearest 0.1 unit: the pH , determined potentiometrically, is between 4.5 and 7.0.

Loss on drying $\langle 731\rangle$ —Dry about 1 g , accurately weighed, at $130^{\circ}$ for 90 minutes: it loses not more than $15.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.6 \%$, determined on a $1.0-\mathrm{g}$ test specimen. Ignition temperature $600 \pm 50^{\circ}$.

Total protein: not more than $0.3 \%$ of total protein (corresponding to $0.048 \% \mathrm{~N}_{2}$, conversion factor: 6.25).
Procedure-Accurately weigh 6.0 g of test substance containing about 2 mg of nitrogen, transfer to a combustion flask, and add 4 g of a powdered mixture of 100 g of potassium sulfate, 5 g of cupric sulfate, and 2.5 g of selenium, and three glass beads. Wash any adhering particles from the neck into the flask with 5 mL of sulfuric acid, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with
condensation of sulfuric acid in the neck of the flask; precautions should be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 minutes, unless otherwise prescribed. Cool, dissolve the solid material by cautiously adding to the mixture 25 mL of water, cool again, and place in a steam distillation apparatus. Add 30 mL of sodium hydroxide solution (42 in 100), and distil immediately by passing steam through the mixture. Collect about 40 mL of distillate in 20.0 mL of 0.01 N hydrochloric acid and enough water to cover the tip of the condenser. Towards the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with 0.01 N sodium hydroxide, using methyl purple TS as indicator ( $\mathrm{n}_{1} \mathrm{~mL}$ of 0.01 N sodium hydroxide).
Repeat the test using about 50 mg of glucose in place of the substance to be examined ( $\mathrm{n}_{2} \mathrm{~mL}$ of 0.01 N sodium hydroxide).

$$
\text { Content of nitrogen }=\left(0.01401\left(\mathrm{n}_{2}-\mathrm{n}_{1}\right)\right) / \mathrm{m}
$$

where $m$ is the amount of test substance weighed, in $g$.
Limit of iron-Shake 1.5 g of Wheat Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL , and mix (Test Solution). Prepare a Standard Iron Solution containing the equivalent of $10 \mu \mathrm{~g}$ of iron per mL as directed under Iron $\langle 241\rangle$. Immediately before use, quantitatively dilute an accurately measured volume of this solution with water to obtain a Diluted Standard Iron Solution containing the equivalent of $1 \mu \mathrm{~g}$ of iron per mL . Prepare the Standard Solution by transferring 10 mL of the Diluted Standard Iron Solution to a test tube and pro-
ceeding in the same manner as directed for the preparation of the Test Solution, beginning with "add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the Test Solution is not more intense than that in the Standard Solution, corresponding to a limit of $10 \mu \mathrm{~g}$ of iron per g .

Limit of oxidizing substances-Transfer 4.0 g to a glassstoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS , and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate is required ( $20 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ).

Limit of sulfur dioxide: not more than $50 \mu \mathrm{~g}$ per g .

## Reagents-

Carbon dioxide—Use carbon dioxide, with a flow regulator that will maintain a flow of $100 \pm 10 \mathrm{~mL}$ per minute.

Bromophenol blue indicator solution-Dissolve 100 mg of bromophenol blue in 100 mL of dilute alcohol (1 in 5 ), and filter if necessary.

Hydrogen peroxide solution-Dilute $30 \%$ hydrogen peroxide with water to obtain a $3 \%$ solution. Just before use, add 3 drops of Bromophenol blue indicator solution, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus-In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is
collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500mL three-neck, round-bottom, boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm , and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Procedure-Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of $100 \pm 5 \mathrm{~mL}$ per minute through the Apparatus. Start the condenser coolant flow. Add 10 mL of Hydrogen peroxide solution to a receiving test tube. After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of test specimen into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Position the Apparatus in a water bath, and Boil the mixture for 1 hour. Remove the receiving test tube, and transfer its contents to a $200-\mathrm{mL}$ wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the $200-\mathrm{mL}$ conical flask, and mix. Heat
on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of Bromophenol blue indicator solution, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination, and make any necessary correction (see Titrimetry
$\langle 541\rangle$ ). Calculate the content, in $\mu \mathrm{g}$ per g , of sulfur dioxide in the test specimen taken by the formula:

$$
1000(32.03) V N / W,
$$

in which 32.03 is the milliequivalent weight of sulfur dioxide; $V$ is the volume, in mL , of titrant consumed; $N$ is the normality of the titrant; and $W$ is the weight, in g , of test specimen taken.

Organic volatile imptrities, Method $H(467)$ : meets the requirements. $\mathbf{\Delta N F}^{\mathrm{NF} 23}$

## PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the Staff Directory to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

## Briefing

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How To Use PF), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1

## BriEfing

Methylphenidate Hydrochloride, USP 27 page 1217 and page 1932 of PF 29(6) [Nov.-Dec.2003]. It is proposed to replace the tests for Limit of erythro $\left[\left(R^{*}, S^{*}\right)\right]$ isomer and Limit of $\alpha$-phenyl-2-piperidineacetic acid hydrochloride and the existing Assay with a new test for Related compounds and a new Assay. The liquid chromatographic procedures are performed with a Zorbax Eclipse-XDB C18 brand of L1 column. The retention time of methylphenidate is about 29 minutes. The limits for impurities are also being revised. It is also proposed to add new USP Reference Standards and to add storage conditions to the Packaging and storage section.
(PA3: S. Salado) RTS-38283-1

Limil of erythro $\left[\left(R^{*} *, S *\right)\right]$ isomer-
Mobile solvent Prepare a solution consisting of a mixture of ehloroform, methanol, and ammenium hydroxide (190:10:1).

Petecting reagent Dissolve 0.7 g of bismuth subnitrate in 40 mL of a mixture of water and glacial acetic acid ( $4: 1$ ). Add- 40 mL of potassium iodide solution (2 in 5), then add 120 mL of gla eial ucetic acid and 250 mL of water.

Test solution Prepare a solution in methanol containing 50 mg of Methylphenidate Hydrochloride per mL.

Proedure Prepare methanel solutions of Methylphenidate Hydrechloride and of USP Methylphenidate Hydrochloride Ery thro Isomer RS containing 50 mg per mb and 0.5 mg per mb , respectively. Apply $20 \mu \mathrm{~L}$ pertions of each-solutionApply $20 \mu \mathrm{H}$ pertions of the Test solution and USP Methylphenidate Hydroehloride Erythro-Isomer Solution RSto a suitable thin layer chromatographie plate (seeChromatography $\langle 624$ ) ) eont withan 0.25
mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram, using the Mobile solvent, in a suitable ehamber, lined with absorbent paper and previously equilibrated with the Mobile solvent, until the solvent frent has moved about three fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to eraporate. Loeate the spots on the plate by spraying first with the Deteeting reagent and then with 1 N sulfuric acid. Any spot in the lane from the methylphenidate hydrochloride at the same $R_{F}$ as the erythro iso mer is not larger or more intense than that produced by USP Methylphenidate Hydrechloride Erythre-Isemer RS,USP Methyl phenidate-Hydrochloride Erythro Isomer Solution RS, when viewed under ordinaty lighting (1\%).

## Delete the following:

Limit of $\alpha$-phenyl-2-piperidineacetic acid hydrochloride -
Agbile solvent Mix 65 volumes of chloroform with 25 vol umes of methanel and 5 volumes of acetic acid.
Sodium hydroxide methand- Prepare a 1 in 2500 -solution-of sodium hydroxide in methanol.
Spray reagent $I . \mathrm{Mix} 850 \mathrm{mg}$ of bismuth subnitrate with 40 mL of water and 10 mL of glacial acetic acid (Solution A). Dissolve 8 s ef potassitm iodide in 20 mL of water (Selution B). Mix Selations $A$ and $B$ together to obtain the Stock solution. [NOTE-This Stock solution may be stored for several menths in a dark bottle.] Mix 10 mL of the Stock solution with 20 mL of glacial acetic acid, and dilute with water to make 100 mL to bbtain the Spray reagent.
fpray reagent II Use hydrogen peroxide solution.
Standard preparation- Dissolve a suitable quantity of USP $\alpha$ Phenyl 2 piperidineacetic Acid Hydrochloride RS in Sodium hy droxide methathol to obtain a solution having a known coneentra fion of about 240 - 4 g per mL
Test preparation Dissolve 400 mg of Methylphenidate Hydroehloride, aceurately weighed, in Sodium hydroxide methatal to make 10.0 mL . Use immediately after preparation.
Proedure Apply $10 \mu \mathrm{~L}$ pertions of the Test preparation and the Standard preparation to a suitable thin layer chromatographie plate (see-Chromatograply ( 624 )) eonted with a- 0.25 mm layer of ehrematographic siliea gel. Allow the spets to dry, and develop the ehromatogram, using the Mobile solvent, in a suitable chamber, lined with absorbent paper and previously equilibrated with Mobile solvent, until the solvent frent has moved about three fouthis of the length of the plate. Remeve the plate frem the developing ehamber, and allow the plate to dry for 30 minutes. Spray the plate with Spray reagent I followe by Spray reagent II.-NOTE-After spray ing with the Spray reagents, cover the plate with a second plate to prevent fading of the spots.] Examine the plate: any spot in the lane from the Test preparation having the same $R_{2}$ value as the prineipat spot from the Stand preparation is not larger or more intense than that produre by the Standard preparation (0.6\%).

## Add the following:

## Related compounds-

Buffer solution and Mobile phase-Prepare as directed in the Assay.

Standard solution-Dissolve accurately weighed quantities of USP Methylphenidate Hydrochloride RS, USP Methylphenidate Related Compound C RS, USP Methylphenidate Related Compound D RS, USP Methylphenidate Related Compound B RS, USP Methylphenidate Related Compound E RS, USP Methylphenidate Related Com-
pound F RS, USP Methylphenidate Related Compound H RS, and USP Methylphenidate Related Compound G RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing about $0.4 \mu \mathrm{~g}$ per mL of USP Methylphenidate Related Compound C RS, USP Methylphenidate Related Compound E RS, and USP Methylphenidate Related Compound H RS; about $0.8 \mu \mathrm{~g}$ per mL of USP Methylphenidate Hydrochloride RS, USP Methylphenidate Related Compound D RS, USP Methylphenidate Related Compound B RS, and USP Methylphenidate Related Compound F RS; and about $1.2 \mu \mathrm{~g}$ per mL of USP Methylphenidate Related Compound G RS.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are de-
scribed in Table 1; the resolution, $R$, between adjacent peaks is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $5.0 \%$ for each peak.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure all of the peak area responses. Calculate the percentage of each impurity in the portion of Methylphenidate Hydrochloride taken by the formula:

$$
5(C / W)\left(r_{i} / r_{S}\right),
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of each impurity in the Standard solution; $W$ is the weight, in mg, of the sample taken; $r_{i}$ is the peak area for each impurity; and $r_{S}$ is the peak area of the respective substance in the Standard solution: the impurities meet the requirements provided in Table 1. [NOTE-Compare the $\alpha$-phenyl-2-pyridylacetonitrile peak and all of the unknown peaks with the methylphenidate hydrochloride peak.]

Table 1

|  | Relative |  |
| :--- | :---: | :---: |
| Compound name | Retention | Limit |
| Methylphenidate related compound E | Time | $(\%)$ |
| Methylphenidate related compound C | about 0.18 | 0.1 |
| Methylphenidate related compound H | about 0.22 | 0.1 |
| Methylphenidate related compound F | about 0.24 | 0.1 |
| Methylphenidate related compound D | about 0.40 | 0.1 |
| Methylphenidate related compound B | about 0.45 | 0.4 |
| Methylphenidate hydrochloride | about 0.59 | 0.1 |
| Methylphenidate related compound G | 1.0 | - |
| $\alpha$-Phenyl-2-pyridylacetonitrile | about 2.0 | 0.15 |
| Unknown | about 2.4 | 0.1 |
| Total | - | 0.1 |

## Change to read:

Assay-Dissolve about 225 mg of Methylphenidate Hydroehloride, ceeurately weighed, in 50 mL of glacial acetic acid in a 125 mL conieal flask. Add 15 mL of mereuric acetate TS and 5 drops of $p$ naphtholbenzein TS, and titrate with 0.1 N perchlorie acid VS to a green endpeint. Perform a blank determination, and make any necessary eorrection. Each mLof 0.1 N perehloric acid is equivalent 26.98 mg of $\mathrm{C}_{44} \mathrm{H}_{4_{9}} \mathrm{NO}_{2} \cdots \mathrm{HCl}$.

Buffer solution-Transfer about 3.4 g of monobasic potassium phosphate and 2.0 g of sodium 1-heptanesulfonate to a 1-L volumetric flask. Dissolve in and dilute with water to volume, and mix. Add 1 mL of triethylamine, and adjust with phosphoric acid to a pH of $2.42 \pm 0.02$.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (78:22). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard preparation-Dissolve an accurately weighed quantity of USP Methylphenidate Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.4 mg per mL .

Assay preparation-Transfer about 20 mg of Methylphenidate Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask containing about 40 mL of Mobile phase. Sonicate for 10 minutes to dissolve, and cool to room temperature. Dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Assay preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak areas for the methylphenidate hydro-
chloride peaks. Calculate the quantity, in mg , of $\mathrm{C}_{14} \mathrm{H}_{19} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ in the portion of Methylphenidate Hydrochloride taken by the formula:

$$
50 C\left(r_{U} / r_{S}\right)
$$

in which C is the concentration, in mg per mL , of USP Methylphenidate Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## DIETARY SUPPLEMENTS MONOGRAPHS

## BRIEFING

Tomato Extract Containing Lycopene Capsules. Because there is no existing USP monograph for this article, the following new monograph is being previewed.
(DSB: G. Giancaspro) RTS—36476-1

## Add the following:

## Tomato Extract Containing Lycopene Capsules

## » Tomato Extract Containing Lycopene Capsules

 contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Extract calculated by its content of lycopene$\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$. They contain phytofluene, phytoene, beta carotene, and tocopherols in the following ratios with respect to lycopene: not less than 0.11 for the combined amount of phytofluene $\left(\mathrm{C}_{40} \mathrm{H}_{68}\right)$ and phytoene $\left(\mathrm{C}_{40} \mathrm{H}_{64}\right)$, not less than 0.03 for beta carotene $\left(\mathrm{C}_{40} \mathrm{H}_{56}\right)$, and not less than 0.14 for tocopherols $\left(\mathrm{C}_{28} \mathrm{H}_{48} \mathrm{O}_{2}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers. Store at $22^{\circ}$, with excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-The label states the official name and the Latin binomial of the species from which the Extract contained in the Capsules was derived. Label them to state the content of Extract per Capsule, and the content of lycopene in percentage of the Extract contained in each Capsule.

USP Reference standards $\langle 11\rangle$ —USP Lycopene RS. USP
Tomato Extract Containing Lycopene RS.

## Identification-

A: Determine the content of the Capsules as directed for Identification test $A$ under Tomato Extract Containing Lycopene.
B: Determine the content of the Capsules as directed for Identification test $B$ under Tomato Extract Containing Lycopene. The area ratio is not more than 0.10 .

Microbial limits $\langle 2021\rangle$-It meets the requirements of the tests for absence of Salmonella species, Escherichia coli, and Pseudomonas aeruginosa. The total aerobic bacterial count does not exceed 1000 per g , and the total combined molds and yeasts count does not exceed 200 per g.

Dissolution $\langle 711\rangle$ - [To come.]
Weight variation $\langle 2091\rangle$ : meet the requirements.

## Content of lycopene-

Butylated hydroxytoluene stock solution, Diluting solution, Standard solution A, Standard solution B, and Chromatographic system-Proceed as directed in the test for Content of lycopene under Tomato Extract Containing Lycopene.

Test solution-Quantitatively transfer the weighed contents of not fewer than 8 Capsules to a $100-\mathrm{mL}$ volumetric flask using 30 to 50 mL of methylene chloride as solvent. Add 10 mL of Butylated hydroxytoluene stock solution. Sonicate the solution for 1 minute to completely dissolve the sample. Cool to room temperature, dilute with methylene chloride to volume, and mix well. Dilute with Diluting solution to obtain a solution having an expected concentration of about 0.07 mg of lycopene per mL .

Procedure-Separately inject equal volumes ( $10 \mu \mathrm{~L}$ ) of Standard solution A and the Test solution into the chromatograph, record the chromatograms, and measure the responses of the major lycopene peaks. Calculate the concentration of lycopene in Standard solution A, in ppm, by the formula:

$$
50,000 A_{X} / 345
$$

in which $A_{X}$ is the absorbance of Standard solution B, and 345 is the absorptivity of pure lycopene. Calculate the quantity, in mg, of lycopene per Capsule by the formula:

$$
0.1(C / N)\left(r_{U} / r_{S}\right)(D)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A ; N$ is the number of Capsules taken to prepare the Test solution; $D$ is the dilution factor for the preparation of the Test solution using Diluting solution; and $r_{U}$ and $r_{S}$ are the areas of the lycopene peak responses obtained from the Test solution and Standard solution A, respectively.

Content of other carotenoids and tocopherols (phytofluene, phytoene, beta carotene, and tocopherols)-

Butylated hydroxytoluene stock solution, Diluting solution, Standard solution A, Standard solution B, and Test solution-Proceed as directed in the test for Content of lycopene.
Mobile phase, System suitability solution, and Chromatographic system-Proceed as directed in the test for Content of other carotenoids and tocopherols (phytofluene, phytoene, beta carotene, and tocopherols) under Tomato Extract Containing Lycopene.

Procedure-Separately inject equal volumes ( $10 \mu \mathrm{~L}$ ) of Standard solution $A$ and the Test solution into the chromatograph, and record the chromatograms. Identify the locus of the peaks for lycopene isomers, beta carotene isomers, phytofluene isomers, and phytoene by comparison with the Reference Chromatogram provided with the corresponding lot of USP Tomato Extract Containing Lycopene RS. Measure the sum of the peak responses of the lycopene isomers at 472 nm in Standard solution $A$, the sum of the peak responses of the beta carotene isomers at 450 nm , the phytofluene isomers at 350 nm , the response of the phytoene isomers at 288 nm , and the sum of the peak responses of all tocopherols at 288 nm in the Test solution.

Determine the concentration of Standard solution $A$ as directed for Procedure under Content of lycopene.

Calculate the quantity, in mg, of beta carotene per Capsule by the formula:

$$
0.1(C / N)\left(r_{U 1} / r_{S}\right)(D)(345 / 259.2)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A ; N$ is the number of Capsules taken to prepare the Test solution; $D$ is the dilution factor for the preparation of the Test solution using Diluting solution; $r_{U 1}$ is the sum of the peak responses for beta carotene isomers at 450 nm obtained from the Test solution; $r_{S}$ is sum of the peak responses for
the lycopene isomers at 472 nm obtained from Standard solution A; 345 is the absorptivity of pure lycopene; and 259.2 is the absorptivity of pure beta carotene.

Calculate the quantity, in mg, of phytofluene per Capsule by the formula:

$$
0.1(C / N)\left(r_{U 2} / r_{S}\right)(D)(345 / 135)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A ; N$ is the number of Capsules taken to prepare the Test solution; $D$ is the dilution factor for the preparation of the Test solution using Diluting solution; $r_{U 2}$ is the sum of the peak responses for phytofluene isomers at 350 nm obtained from the Test solution; $r_{S}$ is sum of the peak responses for the lycopene isomers at 472 nm obtained from Standard solution $A ; 345$ is the absorptivity of pure lycopene; and 135 is the absorptivity of pure phytofluene.
Calculate the quantity, in mg, of phytoene per Capsule by the formula:

$$
0.1(C / N)\left(r_{U 3} / r_{S}\right)(D)(345 / 125)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A ; N$ is the number of Capsules taken to prepare the Test solution; $D$ is the dilution factor for the preparation of the

Test solution using Diluting solution; $r_{U 3}$ is the area of the phytoene peak response at 288 nm obtained from the Test solution; $r_{S}$ is the sum of the peak responses for the lycopene isomers at 472 nm obtained from Standard solution A; 345 is the absorptivity for pure lycopene; and 125 is the absorptivity for pure phytoene.
Calculate the quantity, in mg, of tocopherols per Capsule by the formula:

$$
0.1(C / N)\left(r_{U 4} / r_{S}\right)(D)(345 / 8.5)
$$

in which $C$ is the concentration, in ppm, of Standard solution $A ; N$ is the number of Capsules taken to prepare the Test solution; $D$ is the dilution factor for the preparation of the Test solution using Diluting solution; $r_{U 4}$ is the sum of the peak responses for all of the tocopherol peaks at 288 nm obtained from the Test solution; $r_{S}$ is sum of the peak responses for the lycopene isomers at 472 nm obtained from Standard solution A; 345 is the absorptivity of pure lycopene; and 8.5 is the average absorptivity of tocopherols.

## STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the In-Process Revision and Pharmacopeial Previews sections. Readers interested in submitting comments should see Instructions to Authors.
STIMULI TO THE REVISION PROCESS ..... 737
Instructions to Authors ..... 739

## Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to $U S P-N F$ revision will be considered for publication in the Pharmacopeial Forum under the section Stimuli to the Revision Process. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract-Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.
References-Consult a current copy of the Pharmacopeial Forum and the ACS Style Guide for assistance with reference style.

Copyright - Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.
Contact Person-When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions-Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft ${ }^{\circledR}$ Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be cameraready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Pharmacopeial Forum
Executive Secretariat, USP
12601 Twinbrook Pkwy.
Rockville, MD 20852

## NOMENCLATURE

This section includes supplements to the latest edition of the USP Dictionary of USAN and International Drug Names that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

## USP Dictionary of USAN and International Drug Names 2003 USP DICTIONARY SUPPLEMENT 6

IMPORTANT-Save this Supplement. This and all supplements appearing in $P F$ are needed to keep the 2003 edition of the USP Dictionary (USPD) up to date. The cumulative contents of the supplements to the current (2003) edition will be included in the next complete edition of the Dictionary.

## New United States Adopted Names (USAN)

No newly established United States Adopted Names (USAN) are available for publication at this time. See preceding and succeeding numbers of $P F$ for other new USAN to supplement the Dictionary main volume.

## Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

## Dextiopronin

Add the following chemical structure:

## Maridomycin

Change the chemical structure to read:

## Mazaticol

Change the chemical structure to read:

## Pemetrexed Disodium

Add the following to be the first chemical name:
L-Glutamic acid, $N$-[4-[2-(2-amino-4,7-dihydro-4-oxo-1 $H$-pyrro-lo[2,3-d] pyrimidin-5-yl)ethyl]benzoyl]-, disodium salt (9CI)

## Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested par-
ties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names'"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

## Recommended International Nonproprietary Names

The following 43 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or
descriptions and the molecular formulae, appears in WHO Drug Information, Vol 17, No. 4, 2003.

| Recommended INN | Recommended INN | Recommended INN | Recommended INN |
| :--- | :--- | :--- | :--- |
| Alvocidib | Bertilimumab | Fipamezole | Oxeglitazar |
| Anatibant | Bortexomib | Gemcabene | Posizolid |
| Ardenermin | Cinacalcet | Ibrolipim | Rafabegron |
| Arimoclomol | Darunavir | Iclaprim | Rupintrivir |
| Arundic Acid | Dexmethylphenidate | Iosimenol | Salcaprozic Acid |
| Aselizumab | Disufenton Sodium | Latidectin | Sorafenib |
| Asoprisnil Ecamate | Dofequidar | Lurasidone | Squalamine |
| Ataciguat | Doramapimod | Mantabegron | Tacedinaline |
| Atazanavir | Etiprednol Dicloacetate | Matuzumab | Telbivudine |
| Barixibat | Etravirine | Meclinertant | Tolevamer |
| Barusiban | Etriciguat | Mitratapide |  |

## Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official United States Pharmacopeia or National Formulary. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the Federal Register of February 1988.

All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.
A formal procedure ${ }^{1}$ is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all

| Prosulgrel Hydrochloride |  |

[^79]USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.
A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.
Submissions to the USAN Council are expected to conform to the established Guiding Principles ${ }^{2}$ and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.
Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

## Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to recommend specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as proposals ("Proposed International Nonproprietary Names"). A period of four months from the date of publication in WHO Drug Information is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event
that no objection is received, the WHO proceeds with listing and publishing the names so devised as recommendations ("Recommended International Nonproprietary Names"), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable category, are separated by double spacing from the name(s) and category for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

| Suggested INN | Category |
| :---: | :---: |
| Ceftobasidril Daloxate Ceftobasitol Daloxate Ceftrobipirol Daloxate Ceftrotapirol Daloxate | Broad spectrum cephalosporin antibiotic |
| Cenalidomide Lenalidomide | Treatment of multiple myeloma, myelodysplastic syndromes, solid tumors including glioma and metastatic melanoma, Crohn's disease, and congestive heart failure |
| Combotide Endotide Tetratide | Anticancer |
| Dasantafil | Treatment of erectile dysfunction |
| Denufosol | Treatment of rhinitis, URI and lung disease, including Cystic Fibrosis. Also, retinal detachment and edema |
| Depelestat Epelestat | Treatment of bronchopulmonary inflammatory damage, specifically Cystic Fibrosis |
| Dirlotapide | Treatment of obesity in companion animals (dogs) |
| Emglumegad Eglumetad | Antianxiety; smoking cessation |
| Emporide Meporide Oriporide | Treatment of ischemic heart disease and chronic heart failure |
| Eslansoprazole Levoprazole Solansoprazole | Treatment of reflux esophagitis, GERD, duodenal ulcer and gastric ulcer (proton pump inhibitor) |
| Fidexaban | Anticoagulant |

| Suggested INN | Category |
| :---: | :---: |
| Flumethrin | Ectoparasiticide for topical use on dogs, cattle, sheep, goats, horses, and honey bees |
| Gadobrinic Acid Gadophenoxetic Acid Gadorinic Acid Gadotrexic Acid Gadoxetic Acid | Diagnostic aid |
| Gantacurium Chloride | Induce muscle paralysis as surgical adjunct; neuromuscular blocker |
| Golimumab Rolimumab | Treatment of rheumatoid arthritis, uvetis, asthma, and Crohn's disease |
| Idroequol Idronoxil | Antineoplastic |
| Ilapezil <br> Ladopezil <br> Ladostigil <br> Lavopezil <br> Lavostigmine | Treatment of Alzheimer's disease |
| Lanimostim | Antineoplastic; anti-infective growth factor that acts on both progenitor and mature cells of the macrophage line |
| Latistaurib <br> Lestaurtinib <br> Litratinib | Treatment of tumors such as prostate and pancreatic carcinomas (selective inhibitor of tyrosine kinase) |
| Lemuteporfin Lemuxaporfin | Photosensitivity agent with applications of photodynamic therapy |
| Lumiliximab | Treatment of allergic asthma, allergic rhinitis, and chronic lymphocytic leukemia |
| Mecasermin Obasermin | Antidiabetic |
| Metasentan Renasentan Renosentan | Treatment of cardiovascular diseases (endothelin receptor antagonist) |
| Milataxel | Antineoplastic |
| Papifutespen | Treatment of diseases caused by human papilloma virus |
| Paritumumab | Antineoplastic; treatment of EGF expressing tumors |
| Pegcamotecan | Treatment of small cell lung cancer, and gastric adenocarcinoта |
| Pelitinib Pelritinib | Antineoplastic |

| Suggested INN | Category |
| :---: | :---: |
| Perzinfotel | Treatment of neuropathic pain |
| Prasugrel | Inhibition of platelet aggregation; platelet ADPP 2 Y12 antagonist |
| Procarogammadex Pronagammadex Sunagammadex | A cyclodextrin determined for the termination of steroid muscle relaxants (such as rocuronium and vecuronium) |
| Radafaxine | Anti-depressant; treatment of anxiety disorders |
| Regadenoson | Adenosine $A_{2 A}$ agonist; use as an adjunctive pharmacologic agent in cardiac perfusion imaging studies |
| Retapamulin Retazamulin | Topical antibiotic for secondarily infected traumatic lesions (SITL) and secondarily infected dermatoses (SID) or impetigo |
| Selodenoson | Management of atrial fibrillation and atrial flutter |
| Stefbaczumab Tefibazumab | Treatment of Staphylococcus aureus infections |
| Stenavancin Telavancin | Antibacterial agent active against gram-positive pathogens |
| Taltobulin | Treatment of solid tumors |
| Tandutinib | Treatment of acute myelogenous leukemia |
| Tiplactinin Tiplastinin Tiplaxtinin | Treatment of fibrinolytic impairment diseases |
| Torapsel | Treatment of acute myocardial infarction ( $P$-Selectin antagonist) |
| Tredulamine Trodulamine Trodusqualine Trodusquemine | Appetite suppression |
| Valamycin Valimycin Valomycin | Antibiotic for use in the treatment of bacterial infections in animals |
| Vatalanib | Antineoplastic |
| Vestipitant | Anti-depressant; anti-anxiety; prevention of nausea and vomiting; used in the treatment of functional dyspepsia, irritable bowel syndrome, and GERD |
| Yttrium Y 90 Tacatuzumab | Tumor eradication |

## INDEX

This is a cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).

## [Note-This index covers Vol. 30 No. 1, pp. 1-381, Vol. 30, No. 2

 pp. 383-755]

## New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1002505 | Acesulfame Potassium (200 mg) | F0C136 | \$260 |
| 1012939 | Allantoin (200 mg) | F0C169 | \$156 |
| 1019417 | Amifostine Disulfide (25 mg) | F0C152 | \$487 |
| 1029953 | Ammonium Chloride (200 mg) | F0C134 | \$156 |
| 1043750 | Aspartame Acesulfame (200 mg) | F0C137 | \$156 |
| 1048619 | Benazepril Hydrochloride (125 mg) | F0C250 | \$156 |
| 1048620 | Benazepril Related Compound A ( 15 mg ) | F0C252 | \$487 |
| 1048630 | Benazepril Related Compound B ( 15 mg ) | F0C256 | \$487 |
| 1065618 | Betahistine Hydrochloride (200 mg) | F0C105 | \$156 |
| 1078733 | Bupropion Hydrochloride (200 mg) | F0C123 | \$208 |
| 1097636 | Cefepime Hydrochloride (500 mg) | F0C063 | \$156 |
| 1097647 | Cefepime Hydrochloride System Suitability ( 25 mg ) | F0C095 | \$156 |
| *1098118 | Cefpiramide ( 300 mg ) | F0C203 | \$156 |
| 1111001 | Chlorhexidine (200 mg) | F0C306 | \$156 |
| 1111103 | Chlorhexidine Acetate ( 500 mg ) | F0C281 | \$156 |
| 1133536 | Choline Bitartrate (200 mg) | F0C057 | \$156 |
| 1133547 | Choline Chloride (200 mg) | F0C058 | \$156 |
| 1140247 | Clomipramine Hydrochloride ( 200 mg ) | F0C075 | \$156 |
| 1140349 | Clonazepam Related Compound C ( 25 mg ) | F0C340 | \$487 |
| *1140393 | Clonidine (200 mg) | F0C401 | \$156 |
| 1140418 | Clonidine Related Compound A ( 25 mg ) | F0C373 | \$487 |
| 1148500 | Copovidone (100 mg) | F0C194 | \$156 |
| *1152701 | Cyclandelate ( 200 mg ) | F0C384 | \$156 |
| 1171900 | Desflurane ( 0.5 mL ) | F0C187 | \$156 |
| 1171910 | Desflurane Related Compound A ( 0.1 mL ) | F0C031 | \$487 |
| 1179708 | Dextran 40 (50 mg) | F0C247 | \$156 |
| 1179741 | Dextran 70 (50 mg) | F0C260 | \$156 |
| 1224959 | Dolasetron Mesylate (200 mg) | F0C319 | \$156 |
| 1224960 | Dolasetron Mesylate Related Compound A ( 25 mg ) | F0C321 | \$487 |
| 1225292 | Dorzolamide Hydrochloride Related Compound A (20 mg) | F0C068 | \$487 |
| 1225419 | Doxazosin Mesylate (200 mg) | F0C079 | \$156 |
| 1234704 | Powdered Eleuthero Extract (1.5 g) | F0C291 | \$520 |
| 1234806 | Emedastine Difumarate (100 mg) | F0C059 | \$156 |
| 1269458 | Fenoldopam Mesylate (200 mg) | F0C125 | \$156 |
| 1269469 | Fenoldopam Related Compound A ( 20 mg ) | F0C124 | \$487 |
| 1269470 | Fenoldopam Related Compound B ( 20 mg ) | F0C126 | \$487 |
| *1272204 | Fludarabine Phosphate ( 300 mg ) | F0C374 | \$156 |
| 1273808 | Flumazenil (200 mg) | F0C305 | \$780 |
| 1279837 | Fluoxetine Related Compound C ( 15 mg ) | F0C352 | \$487 |
| 1286060 | Formononetin ( 50 mg ) | F0C196 | \$520 |
| 1286366 | Fosphenytoin Sodium (250 mg) | F0C156 | \$156 |

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1287675 | Gadoversetamide (200 mg) | F0C172 | \$156 |
| 1287686 | Gadoversetamide Related Compound A ( 200 mg ) | F0C173 | \$487 |
| 1288306 | Ganciclovir (200 mg) | F0C287 | \$364 |
| 1288317 | Ganciclovir Related Compound A ( 15 mg ) | F0C288 | \$624 |
| 1288510 | Gemfibrozil Related Compound A ( 20 mg ) | F0C101 | \$487 |
| 1294207 | Glucosamine Hydrochloride ( 200 mg ) | F0C363 | \$156 |
| 1315012 | Hydrocodone Bitartrate Related Compound A CII (70 mg) | F0C214 | \$513 |
| 1348907 | Isoflupredone Acetate (200 mg) | F0C109 | \$156 |
| 1349014 | Isoflurane Related Compound A ( 0.1 mL ) | F0C232 | \$487 |
| *1349025 | Isoflurane Related Compound B ( 0.1 mL ) | F0C233 | \$487 |
| 1355709 | Powdered Kava Extract (1 g) | F0C161 | \$260 |
| 1355753 | Kawain (200 mg) | F0C160 | \$208 |
| 1356020 | Ketamine Related Compound A ( 50 mg ) | F0C118 | \$487 |
| 1356836 | Lamivudine (200 mg) | F0C361 | \$156 |
| *1370270 | Loratadine ( 200 mg ) | F0C414 | \$260 |
| 1392454 | Meropenem ( 300 mg ) | F0C201 | \$182 |
| 1396309 | Metformin Hydrochloride (200 mg) | F0C209 | \$182 |
| 1396310 | Metformin Related Compound A ( 50 mg ) | F0C210 | \$487 |
| 1441232 | Metoprolol Related Compound A ( 20 mg ) | F0C343 | \$520 |
| *1441243 | Metoprolol Related Compound B ( 50 mg ) | F0C377 | \$520 |
| 1441254 | Metoprolol Related Compound C ( 20 mg ) | F0C344 | \$520 |
| *1441265 | Metoprolol Related Compound D ( 50 mg ) | F0C378 | \$520 |
| 1449518 | Nabumetone (200 mg) | F0C072 | \$156 |
| 1471914 | Norgestimate ( 200 mg ) | F0C086 | \$156 |
| 1478582 | Ondansetron Hydrochloride ( 300 mg ) | F0C222 | \$208 |
| 1478593 | Ondansetron Related Compound A ( 50 mg ) | F0C191 | \$487 |
| 1478618 | Ondansetron Related Compound C ( 50 mg ) | F0C251 | \$487 |
| 1478629 | Ondansetron Related Compound D ( 50 mg ) | F0C226 | \$487 |
| 1482207 | Oxaprozin (200 mg) | F0C115 | \$156 |
| 1483301 | Oxfendazole (200 mg) | F0C128 | \$156 |
| 1491332 | Paclitaxel (200 mg) | F0C180 | \$1,508 |
| 1491343 | Paclitaxel Related Compound A ( 20 mg ) | F0C179 | \$754 |
| 1491354 | Paclitaxel Related Compound B ( 20 mg ) | F0C181 | \$754 |
| 1500251 | Paroxetine Related Compound D ( 15 mg ) | F0C228 | \$487 |
| 1535019 | Phenytoin Related Compound A ( 50 mg ) | F0C155 | \$487 |
| 1535020 | Phenytoin Related Compound B ( 50 mg ) | F0C157 | \$487 |
| 1593412 | Quinapril Related Compound A ( 50 mg ) | F0C114 | \$487 |
| 1593423 | Quinapril Related Compound B ( 50 mg ) | F0C116 | \$487 |

## New Items at a Glance (Continued)

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1596807 | Quinine Hydrochloride Dihydrate ( 1 g ) | F0C108 | \$156 |
| 1598303 | Ramipril ( 200 mg ) | F0C099 | \$156 |
| 1598314 | Ramipril Related Compound A (20 mg) | FOC100 | \$487 |
| 1599500 | Powdered Red Clover Extract ( 500 mg ) | F0C188 | \$260 |
| 1604508 | Rimantadine Hydrochloride ( 300 mg ) | F0C266 | \$156 |
| 1610090 | Scopoletin (20 mg) | F0C329 | \$156 |

## USP CATALOG

## USING AND ORDERING USP REFERENCE STANDARDS

## Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the United States Pharmacopeia-National Formulary (USP-NF). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the $U S P-N F$. The Reference Standards also lend themselves to many other applications, including measurements required to attain accurate and reproducible results in modern chromatographic and spectrophotometric methods.

## Rigorous Testing and Quality Control

USP Reference Standards are selected for their high purity, critical characteristics, and suitability for the intended purpose. Unless a USP Reference Standard label states a specific potency or content, the USP Reference Standard is taken as being $100 \%$ pure for the USP purposes for which it is provided.

Heterogeneous substances, of natural origin, are also designated "Reference Standards" where needed. Usually these are the counterparts of international standards.

USP Reference Standards are established through a process of rigorous testing, evaluation, and quality control (See page 6 for a process overview). They are independently tested in three or more laboratories-USP, FDA, and academic and industrial laboratories throughout the United States. The Reference Standards are released under the authority of USP's Board of Trustees, on the recommendation of the USP Reference Standards Expert Committee, which approves selection and suitability of each lot.

## Reference Standards Categories

USP offers more than 1,519 Reference Standards for pharmaceuticals, excipients, and dietary supplements. On pages 12-50 of this catalog, you'll find a full list of available USP and NF Reference Standards, with information updated through Dec. 2003. The list includes:

- Reference Standards required by the current official edition of $U S P-N F$.
- Reference Standards not required in the current $U S P-N F$, but for which sufficient demand remains.
- Reference Standards specified in the current edition of the Food Chemicals Codex (FCC).
- Authentic Substances (AS)—highly purified samples of chemicals, including substances of abuse, required by analytical, clinical, pharmaceutical, and research laboratories.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration (DEA) of the U.S. Department of Justice.

USP also collaborates with the World Health Organization in its program to provide international biological standards and chemical reference materials for antibiotics, biologicals, and chemotherapeutic agents. Some USP Reference Standards are standardized in terms of the corresponding international standards.

## Proper Use of USP Reference Standards

USP Reference Standards are provided primarily for quality control use in conducting the pharmacopeial assays and tests described in the $U S P-N F$. Neither Reference Standards nor Authentic Substances are intended for use as drugs, dietary supplements, or medical devices.

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Users of USP Reference Standards should refer to General Chapter $\langle 11\rangle$ in the $U S P-N F$ :

## Listing and directions in USP-NF

- Refer to the list of revisions, additions, and deletions of individual USP Reference Standards in USP 27-NF 22. Individual $U S P$ or $N F$ monographs specify the USP Reference Standard(s) required for assay and test procedures. The USP 27-NF 22 General Test Chapter $\langle 11\rangle$ USP Reference Standards provides additional information and instructions for proper use and storage. Note that if specific instructions for use appearing on the label of a USP Reference Standard differ from the instructions in Chapter $\langle 11\rangle$, the instructions on the label take precedence.
- Consult the cumulative updates to Reference Standards information provided in USP-NF Supplements and also in $U S P-N F$ Interim Revision Announcements, which are published in USP's bimonthly journal, Pharmacopeial Forum.

## Suitability for use

- The user must ascertain that the Reference Standards they are using are an official lot.
- The user must determine the suitability of Reference Standards for applications and uses not in the $U S P-N F$.

## USING AND ORDERING USP REFERENCE STANDARDS

## Storing

- Ensure that the USP Reference Standards are stored in their original stoppered containers, according to any special label directions, away from heat and humidity, and protected from light.

## Weighing

- Ensure that Reference Standard substances are accurately weighed-taking due account of relatively large errors potentially associated with weighing small masses-where it is directed that a standard solution or a standard preparation be prepared for a quantitative determination. See USP 27-NF 22 General Chapters $\langle 41\rangle$ Weights and Balances and $\langle 31\rangle$ Volumetric Apparatus, and USP-NF General Notices, for information regarding appropriate use of USP Reference Standards.

## Drying

- Use a clean and dry vessel, and not the original container, as the drying vessel where a USP Reference Standard is required to be dried before use.
- Make sure not to dry a specimen repeatedly at temperatures above 25 degrees.
- Follow any special drying requirements specified on the Reference Standards label or in specific sections of USP or NF monographs (note that any specific instructions on the label or in the monograph supersede the usual instructions in Procedures under Tests and Assays in USP-NF General Notices).
- Follow Method I under $U S P-N F$ General Chapter $\langle 921\rangle$ Water Determination where the titrimetric determination of water is required at the time a Reference Standard is to be used.
Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, users must titrate about 50 mg of the Reference Standard with a fourfold dilution of the reagent.

## ORDERING USP REFERENCE STANDARDS

## Four convenient ways to order

1. Phone: Call USP with your requirements: (800) 227-8772 from the U.S. or Canada and (301) 881-0666 from other countries. Please note that DEA controlled substances cannot be placed over the phone.

Hours of operation:
Monday-Friday
8:30AM-5:00PM

Fax: Fax your orders to (301) 816-8148.
Online: Order through the World Wide Web at
http://www.usp.org/products. Please note that DEA controlled substances cannot be ordered online.
Mail: Send all mail orders to:
U.S. Pharmacopeia

Customer Service Department
12601 Twinbrook Parkway
Rockville, MD 20852, USA

## Important Order/Policy Information

For fax and mail orders, please use the order form at the back of this catalog. Official purchase orders on company letterhead may also be used to order USP Reference Standards. The purchase orders must have billing and shipping addresses and should include the catalog number, the name of the official Reference Standard, and the number of units ordered. Lot numbers need not be specified on written purchase orders as USP only ships current official lots. Confirmation orders may be sent and must clearly be designated as such. The USP does not assume responsibility for duplication of orders not clearly marked as confirmation orders.

## Pricing

USP Reference Standards must be ordered in whole units. Please note that one unit may include several individual containers.

Reference Standards unit prices included in the product listings from pages $12-50$ of this catalog are effective until December 31, 2004. Please note that prices and package sizes are subject to change without notice.

## No Returns or Exchanges

USP Reference Standards may not be returned or exchanged for refund.

## Quantity Discounts

A 5\% discount is allowed for 5-24 units of any one Reference Standard in a single order, and a $10 \%$ discount for 25 or more units of any one Reference Standard in a single order. These discounts are subject to change without notice.

## Shipping

- Reference Standards orders can only be shipped to a street address and not to P.O. boxes.

## USING AND ORDERING USP REFERENCE STANDARDS

- Orders to the U.S. and Ontario, Canada are shipped via air courier of USP's choice at a charge of $\$ 11$ or via air courier of the customer's choice at an additional $\$ 25$ charge.
- Non-controlled substance orders to Canadian provinces other than Ontario are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Non-controlled substance orders to be shipped outside the U.S. and Canada are accepted directly by USP only when customs forms related to export are not required. They are shipped via air courier of USP's choice at a charge of U.S. $\$ 70$. Carriers of the customer's choice incur an additional $\$ 25$ charge.
- Shipping in cold pack can be done at customer request for an extra charge of $\$ 25$.
- Controlled substance orders to anywhere outside the U.S. are shipped via air courier of USP's choice with a charge of U.S. $\$ 220$.
- An additional shipping charge may be assessed for dangerous goods shipments.
- An additional shipping charge of $\$ 75$ will be assessed for rush/ same-day shipments.
- Customers may provide their shipping account numbers to have shipping charged directly.

## Payment

- Full payment in advance, in U.S. dollars, is required for all U.S. orders unless open account status has been granted by USP's Finance Department. To apply for open account status, an application can be requested by calling (301) 816-8177.
- Full payment in advance, in U.S. dollars, is required for all non-U.S. orders.
- Payment may be made by check, money orders, credit cards (VISA, MasterCard, American Express), and electronic wire transfer (please call (301) 816-8177 to get bank information for wire transfers). The customer is responsible for any bank fees and must include it in the payment. The customer is also responsible for any other fees such as customs duties, taxes, or tariffs.

## List Chemicals

The following Reference Standards are "List Chemicals":
Dihydroergotamine Mesylate
*Ephedrine Sulfate
Ergonovine Maleate

[^82]Ergotamine Tartrate<br>Methylergonovine Maleate<br>Phenylpropanolamine Bitartrate<br>Phenylpropanolamine HCl<br>Pseudoephedrine HCl<br>Pseudoephedrine Sulfate

An organization in the United States seeking to purchase a List Chemical Reference Standard for resale to another customer must have a DEA registration (either a controlled substance or List Chemical registration). If an organization in the United States is purchasing the List Chemical Reference Standard for its own analytical use, it must provide USP with a letter on company letterhead describing the reason for the purchase.

## CONTROLLED DRUG SUBSTANCE ORDER

## DEA Requirements (U.S. Orders)

For all orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)- to be shipped within the U.S., a copy of the customer's current DEA Registration Certificate must be on file with USP. To order Schedule I and II standards, customers must submit, with their order forms or purchase orders, a DEA Form 222-C, properly completed. In addition, customers ordering DEA Schedules III and IV must provide appropriate DEA registration numbers for those schedules on their order forms or purchase orders.

## DEA Requirements (International Orders)

For all international controlled drug substance orders, please contact Julie Smith at (301) 816-8164 or foreigncontrols@ usp.org.

All orders for controlled drug substances-regulated by the U.S. Drug Enforcement Administration (DEA)-to be shipped outside the U.S. must be accompanied by:

1. Full payment.
2. An import permit (in English or with an English translation attached) valid at least 6 months from the date of its receipt by USP Customer Service.
3. A statement of non-reexport and use for medical or scientific purposes (in English or with an English translation attached).
4. Purchase Order or Price Quote given by USP.

## USING AND ORDERING USP REFERENCE STANDARDS

On receiving the order, USP takes 2-3 business days to:

- Review all documents to make sure they are adequate and appropriate.
- Complete and legally approve the required DEA forms.
- Forward the forms to the DEA office to obtain the necessary Export Permits.

USP cannot ship items without an Export Permit. While it typically takes 6-10 weeks to get the permit from the DEA, USP has no control over the time in which permits are issued. On receiving the Export Permit, USP completes processing of the order in 1-3 days and ships out the materials through its freight forwarder.

Controlled substances (CI, CII, CIII, CIV, CV) and List Chemicals shipped to an international address, including Canada, add $\$ 25$ per unit.

For controlled substance orders to be shipped to Mexico, in addition to the DEA processing period, an additional week is required to obtain a certificate from the Mexican Embassy, authorizing the shipment to enter the country. Customers will pay an additional $\$ 114$ to cover the fee charged by the Mexican Embassy per import permit.

## Back Orders

USP will ship a back-ordered item if that item becomes available within 30 days of the date the order is placed if there is a valid open P.O. or payment for the item. If the order is more than 30 days old when the item becomes available, the customer will receive a Notice of Availability (NOA), indicating that the item is available. Such items will be shipped only after USP receives written authorization by the customer. The order will be canceled if the Reference Standard does not become available within six months of the original order. NOAs not replied to within 45 days of generation will be cancelled, and the customer account will be credited appropriately.

Customers may send confirmation orders for back-ordered Reference Standards that subsequently become available. They must clearly designate the confirmation orders as such-USP is not responsible for duplication of orders not clearly designated.

## HOW TO READ PRODUCT LISTINGS

Column 1 (Catalog Number): Catalog number currently assigned to each Reference Standard and Authentic Substance. Please include this number in your orders.

Column 2 (Former Catalog Number): Catalog numbers assigned prior to July 2002. These numbers are provided for your convenience so you can easily cross-reference current numbers against your earlier orders.

Column 3 (Description): Product description as designated in $U S P-N F$, the product label, and / or the Drug Enforcement Administration Control Schedule, as applicable. The quantity of material per container follows the name in parentheses (all materials are in single containers unless otherwise specified).

Column 4 (Current Lot): Current lot designation of each official item being distributed as of the date of this catalog. If the current lot is blank, the item is not in distribution.

Column 5 (Change Code): Codes that identify any change in USP Reference Standards status or information since the Nov./Dec. 2003, official Catalog. Code interpretations are as follows:

| Change <br> Code | Interpretation |
| :---: | :--- |
| 1 | New Reference Standard |
| 2 | New lot |
| 3 | Change in package size or description |
| 4 | Correction of typographical error |
| 5 | New catalog number-use for all orders |
| 6 | Previous lot no longer official; only |
| 7 | current lot to be used |
| 7 | Valid use date of previous lot extended |
| 8 | Change in catalog number and /or name, <br>  <br> 9 |
| see cross-reference section <br> Discontinued |  |

Column 6 (Previous Lot/Valid Use Date): Identifies lots no longer being distributed. The indicated month and in parenthesis indicates the date (last day of the month) through which that lot was valid as an official USP Reference Standard. (e.g. "F-1 (06/ 00 )" means lot F-1 is no longer being distributed, but was considered official through June 30, 2000.)

Column 7 (CAS Number)*: Chemical Abstracts Service number, when available, for USP Reference Standards and Authentic Substances. In case of mixtures, typically, the CAS number of the analyte of interest is listed.

Column 8 (Price) lists the price of the reference standard.

[^83]
## New Lots in Distribution

| Cat. <br> No. | Description | Curr. <br> Lot. | Change Code* | Previous Lot/Valid Use Date | $\begin{array}{\|l} \hline \text { CAS } \\ \text { No. } \\ \hline \end{array}$ | Price |

## Dietary Supplement Reference Standards Available from USP

| Cat. <br> No. | Description | Curr. <br> Lot | Price |
| :---: | :---: | :---: | :---: |
| MISCELLANEOUS DIETARY SUPPLEMENTS |  |  |  |
| 1133570 | Chondroitin Sulfate Sodium ( 300 mg ) | FOB256 | \$156 |
| 1133638 | Chromium Picolinate ( 100 mg ) | F | \$156 |
| 1150353 | Creatinine ( 100 mg ) | F | \$156 |
| 1294207 | Glucosamine Hydrochloride ( 200 mg ) | F0C363 | \$156 |
| 1611955 | Selenomethionine ( 100 mg ) | F0B006 | \$156 |
| VITAMINS-MINERALS |  |  |  |
| 1043003 | Ascorbic Acid (1 g) (Vitamin C) | Q0B012 | \$156 |
| 1071508 | Biotin ( 200 mg ) | H1B019 | \$156 |
| 1086356 | Calcium Ascorbate (200 mg) | F-1 | \$156 |
| 1087009 | Calcium Pantothenate (200 mg) (Vitamin B5) | N-1 | \$156 |
| 1131009 | Cholecalciferol ( $30 \mathrm{mg} / \mathrm{ampule}$; 5 ampules) (Vitamin D3) | M0B157 | \$159 |
| 1131803 | Delta-4,6-cholestadienol ( 30 mg ) | F | \$156 |
| 1152009 | Cyanocobalamin (1.5 g of mixture with mannitol; $10.7 \mathrm{mcg} / \mathrm{mg}$ of mixture) (Vitamin B12) | N | \$156 |
| 1179504 | Dexpanthenol ( 500 mg ) | J0C293 | \$160 |
| 1239005 | Ergocalciferol ( $30 \mathrm{mg} / \mathrm{ampule;} 5$ ampules) (Vitamin D2) | P0B275 | \$168 |
| 1241007 | Ergosterol ( 50 mg ) | H | \$156 |
| 1286005 | Folic Acid ( 500 mg ) (Vitamin M or Vitamin Bc) | P | \$156 |
| 1286027 | Folic Acid Related Compound A (50 mg) (Calcium Formyltetrahydrofolate) | IOB176 | \$156 |
| 1381006 | Menadione (200 mg) (Vitamin K3) | H-3 | \$156 |
| 1461003 | Niacin (200 mg) | H-1 | \$156 |
| 1462006 | Niacinamide ( 500 mg ) (Vitamin B3) | M-1 | \$156 |
| 1494501 | Panthenol, Racemic ( $200 \mathrm{mg} \mathrm{)}$ | G | \$156 |
| 1494807 | Pantolactone ( 500 mg ) | F | \$487 |
| 1538006 | Phytonadione ( 500 mg ) (Vitamin K1) | N0B303 | \$156 |
| 1550001 | Potassium Gluconate ( $200 \mathrm{mg} \mathrm{)}$ | H0C064 | \$156 |
| 1587001 | Pyridoxine Hydrochloride (200 mg) (Vitamin B6) | P | \$156 |
| 1603006 | Riboflavin ( 500 mg ) (Vitamin B2) | NOC021 | \$156 |
| 1613509 | Sodium Ascorbate (200 mg) | G-1 | \$156 |
| 1614002 | Sodium Fluoride (1 g) | H-1 | \$156 |
| 1656002 | Thiamine Hydrochloride ( 500 mg ) (Vitamin B1 Hydrochloride) | 0 | \$156 |
| 1667600 | Alpha Tocopherol ( 250 mg ) (Vitamin E Alcohol) | M | \$156 |
| 1667701 | Alpha Tocopheryl Acetate ( 250 mg ) (Vitamin E Acetate) | K | \$156 |
| 1667803 | Alpha Tocopheryl Acid Succinate (250 mg) (Vitamin E Succinate) | F-5 | \$156 |
| 1716002 | Vitamin A (10 ampules containing vitamin A acetate in cottonseed/peanut oil) | V0C258 | \$156 |
| 1717504 | Vitamin D Assay System Suitability (1.5 g) | F | \$156 |

## Controlled Substances Reference Standards Available from USP

| Cat. No. | Description | Curr. Lot | Price |
| :---: | :---: | :---: | :---: |
| 1012906 | Alfentanil Hydrochloride CII (500 mg) | F0B016 | \$207 |

〈11〉 USP Reference Standards ..... 785
ERRATA LIST FOR USP 27-NF 22 ..... 787
IN-PROCESS REVISION ..... 789
GENERAL NOTICES AND REQUIREMENTS ..... 794
Preservation, Packaging, Storage, and Labeling ( $1^{\text {st }}$ Supp to USP 28) ..... 798
Tests and Assays (1st Supp to USP 28) ..... 795
MONOGRAPHS (USP) ..... 802
Acyclovir ( $1^{\text {st }}$ Supp to USP 28) ..... 802
Alendronic Acid Tablets [new] (Proposal for $4^{\text {th }}$ IRA) ..... 804
Amphetamine Sulfate ( $1^{\text {st }}$ Supp to USP 28) ..... 807
Atracurium Besylate Injection (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 808
Benzocaine ( $1^{\text {st }}$ Supp to USP 28) ..... 809
Bupropion Hydrochloride Extended-Release Tablets (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 810
Carbidopa (1 $1^{\text {st }}$ Supp to USP 28) ..... 811
Methionine C 11 Injection (Proposal for $4^{\text {th }}$ IRA) ..... 811
Carboxymethylcellulose Sodium Suspension [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 812
Ciclopirox Olamine ( $1^{\text {st }}$ Supp to USP 28) ..... 813
Ciprofloxacin Injection ( $1^{\text {st }}$ Supp to USP 28) ..... 813
Clonidine Transdermal System [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 814
Clopidogrel Tablets [new] (1 ${ }^{\text {st }}$ Supp to USP28) ..... 820
Desogestrel and Ethinyl Estradiol Tablets [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 823
Dextroamphetamine Sulfate ( $1^{\text {st }}$ Supp to USP 28) ..... 831
Diatrizoate Meglumine ( $1^{\text {st }}$ Supp to USP 28) ..... 832
Dicyclomine Hydrochloride Capsules ( $1^{\text {st }}$ Supp to USP 28) ..... 832
Dicyclomine Hydrochloride Tablets (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 834
Divalproex Sodium Delayed-Release Tablets ( $1^{\text {st }}$ Supp to USP 28) ..... 835

[^89] targeted is shown in parentheses next to each proposed item.
Doxycycline Hyclate ( $1^{\text {st }}$ Supp to USP 28) ..... 836
Multiple Electrolytes Injection Type 1 ( $1^{\text {st }}$ Supp to USP 28) ..... 836
Multiple Electrolytes Injection Type 2 ( $1^{\text {st }}$ Supp to USP 28) ..... 838
Multiple Electrolytes and Dextrose Injection Type 1 ( $1^{\text {st }}$ Supp to USP 28) ..... 838
Multiple Electrolytes and Dextrose Injection Type 2 ( $1^{\text {st }}$ Supp to USP 28) ..... 838
Multiple Electrolytes and Dextrose Injection Type 3 (1 $1^{\text {st }}$ Supp to USP 28) ..... 839
Ephedrine (Proposal for $5^{\text {th }}$ IRA) ..... 839
Ephedrine Hydrochloride (Proposal for $5^{\text {th }}$ IRA) ..... 839
Ephedrine Sulfate (Proposal for $5^{\text {th }}$ IRA) ..... 840
Conjugated Estrogens ( $1^{\text {st }}$ Supp to USP 28) ..... 840
Fexofenadine Hydrochloride [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 841
Fexofenadine Hydrochloride Capsules [new] (1st Supp to USP 28) ..... 845
Fluoxetine Hydrochloride ( $1^{\text {st }}$ Supp to USP 28) ..... 848
Fluoxetine Capsules ( $1^{\text {st }}$ Supp to USP 28) ..... 849
Fluoxetine Delayed-Release Capsules [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 849
Fluoxetine Tablets ( $1^{\text {st }}$ Supp to USP 28) ..... 852
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets [new] (1st Supp to USP 28) ..... 853
Hyoscyamine Sulfate Elixir (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 857
Hyoscyamine Sulfate Injection (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 858
Hyoscyamine Sulfate Oral Solution (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 860
Hyoscyamine Sulfate Tablets ( $1^{\text {st }}$ Supp to USP 28) ..... 861
Hypromellose Ophthalmic Solution ( $1^{\text {st }}$ Supp to USP 28) ..... 862
Indinavir Sulfate [new] (1st Supp to USP 28) ..... 862
Indomethacin Topical Gel [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 866
Ipecac ( $1^{\text {st }}$ Supp to USP 28) ..... 866
Powdered Ipecac (1st Supp to USP 28) ..... 867
Diluted Isosorbide Mononitrate [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 868
Isosorbide Mononitrate Extended-Release Tablets [new] (1st Supp to USP 28) ..... 871
Ivermectin ( $1^{\text {st }}$ Supp to USP 28) ..... 875
Lamivudine ( $1^{\text {st }}$ Supp to USP 28) ..... 881
Leuprolide Acetate [new] (1st Supp to USP 28) ..... 882
Levodopa ( $1^{\text {st }}$ Supp to USP 28) ..... 888
Levodopa Tablets ( $1^{\text {st }}$ Supp to USP 28) ..... 890
Loratadine (1 $1^{\text {st }}$ Supp to USP 28) ..... 891
Lypressin Nasal Solution (1 $1^{\text {st }}$ Supp to USP 28) ..... 893
Magnesium Chloride ( $1^{\text {st }}$ Supp to USP 28) ..... 893
Melengestrol Acetate [new] (1 $1^{\text {st }}$ Supp to USP 28) ..... 893
Mesalamine Extended-Release Capsules (1 $1^{\text {st }}$ Supp to USP 28) ..... 896
Metformin Hydrochloride Tablets [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 897
Methscopolamine Bromide [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 899
Mirtazapine [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 900
Mirtazapine Tablets [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 902
Naproxen ( $1^{\text {st }}$ Supp to USP 28) ..... 904
Octisalate ( $1^{\text {st }}$ Supp to USP 28) ..... 904
Octocrylene (1st Supp to USP 28) ..... 905
Ondansetron Oral Solution [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 905
Opium ( $1^{\text {st }}$ Supp to USP 28) ..... 907
Oxybutynin Chloride (1 $1^{\text {st }}$ Supp to USP 28) ..... 908
Paroxetine Hydrochloride ( $1^{\text {st }}$ Supp to USP 28) ..... 911
Paroxetine Tablets (Proposal for $4^{\text {th }}$ IRA) ..... 919
Camphorated Phenol Topical Solution [new] (1st Supp to USP 28) ..... 922
Phenylephrine Bitartrate [new] (1st Supp to USP 28) ..... 923
Propoxyphene Hydrochloride (1 $1^{\text {st }}$ Supp to USP 28) ..... 925
Propoxyphene Napsylate ( $1^{\text {st }}$ Supp to USP 28) ..... 927
Pyrimethamine Tablets (1st Supp to USP 28) ..... 929
Riboflavin ( $1^{\text {st }}$ Supp to USP 28) ..... 929
Sorbitol Solution (Proposal for $5^{\text {th }}$ IRA) ..... 929
Spironolactone Oral Suspension [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 929
Spironolactone and Hydrochlorothiazide Oral Suspension [new] (1st ${ }^{\text {st }}$ Supp to USP 28) ..... 930
Stavudine [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 932
Stavudine Capsules [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 934
Stavudine for Oral Solution [new] ( $1^{\text {st }}$ Supp to USP 28) ..... 937
Tiamulin Fumarate ( $1^{\text {st }}$ Supp to USP 28) ..... 938
Tolcapone [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 939
Tolcapone Tablets [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 943
Triamcinolone Acetonide (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 945
Valrubicin ( $1^{\text {st }}$ Supp to USP 28) ..... 946
Verteporfin (1 $1^{\text {st }}$ Supp to USP 28) ..... 947
Sterile Purified Water (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 947
Zileuton (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 948
DIETARY SUPPLEMENTS-MONOGRAPHS ..... 950
Choline Bitartrate ( $1^{\text {st }}$ Supp to USP 28) ..... 950
Choline Chloride (1st Supp to USP 28) ..... 951
Cranberry Liquid Preparation ( $1^{\text {st }}$ Supp to USP 28) ..... 951
Goldenseal (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 952
Powdered Goldenseal (1 $1^{\text {st }}$ Supp to USP 28) ..... 953
Powdered Goldenseal Extract ( $1^{\text {st }}$ Supp to USP 28) ..... 954
Pygeum [new] (1 ${ }^{\text {st }}$ Supp to USP 28) ..... 954
Pygeum Extract [new] (1 $1^{\text {st }}$ Supp to USP 28) ..... 956
Pygeum Capsules [new] (1 $1^{\text {st }}$ Supp to USP 28) ..... 959
EXCIPIENTS
Excipients, USP and NF Excipients, Listed by Category (NF 23) ..... 961
MONOGRAPHS (NF) ..... 966
Ammonium Sulfate (Proposal for $5^{\text {th }}$ IRA) ..... 966
Candelilla Wax (Proposal for $5^{\text {th }}$ IRA) ..... 966
Low-Substituted Carboxymethylcellulose Sodium (Proposal for $5^{\text {th }}$ IRA) ..... 966
Cellaburate [new] (Proposal for $5^{\text {th }}$ IRA) ..... 967
Cetrimonium Bromide (Proposal for $5^{\text {th }}$ IRA) ..... 970
Cetyl Alcohol (1st Supp to NF 23) ..... 970
Copovidone [new] (1 $1^{\text {st }}$ Supp to NF 23) ..... 970
Hydrogenated Cottonseed Oil (Proposal for $5^{\text {th }}$ IRA) ..... 974
Dibutyl Phthalate (Proposal for $5^{\text {th }}$ IRA) ..... 974
Diethylene Glycol Stearates (Proposal for $5^{\text {th }}$ IRA) ..... 974
Ethylene Glycol Stearates (Proposal for $5^{\text {th }}$ IRA) ..... 974
Glyceryl Distearate (Proposal for $5^{\text {th }}$ IRA) ..... 975
Glyceryl Monolinoleate (Proposal for $5^{\text {th }}$ IRA) ..... 975
Glyceryl Monooleate (Proposal for $5^{\text {th }}$ IRA) ..... 975
Glyceryl Monostearate (1 ${ }^{\text {st }}$ Supp to NF 23) ..... 975
Hymetellose (Proposal for $5^{\text {th }}$ IRA) ..... 975
Hypromellose Acetate Succinate [new] ( $1^{\text {st }}$ Supp to NF 23) ..... 976
Hypromellose Phthalate ( $1^{\text {st }}$ Supp to NF 23) ..... 984
Maltitol Solution (Proposal for $5^{\text {th }}$ IRA) ..... 984
Maltol [new] (1st Supp to NF 23) ..... 984
Maltose [new] ( $1^{\text {st }}$ Supp to NF 23) ..... 985
Palmitic Acid [new] ( $1^{\text {st }}$ Supp to NF 23) ..... 987
Phenolsulfonphthalein [new] (1 ${ }^{\text {st }}$ Supp to NF 23) ..... 988
Polyisobutylene (Proposal for $5^{\text {th }}$ IRA) ..... 990
Sodium Caprylate [new] (1st Supp to NF 23) ..... 990

Senior Editorial Assistants
Olivia Hebron; Micheline Tranquille
Editorial Assistant
Milagro M. Welter

Please address comments on $P F$
content to Executive Secretariat $U S P-N F, 12601$ Twinbrook Pkwy.
Rockville, MD 20852
Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org
Pharmacopeial Forum is covered in Current Contents/Life Sciences and in the Science Citation Index (SCI), in International Pharmaceutical Abstracts, and in Current Awareness in Biological Sciences.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-455

## Moving?

Our subscribers' records and publication labels are computergenerated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, PF Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852. Fax: (301) 816-8148.

## STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through Pharmacopeial Forum $(P F)$, for the development of official pharmaceutical standards.

USP publishes Pharmacopeial Forum ( $P F$ ) bimonthly as the working vehicle of the USP Council of Experts. PF provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the United States Pharmacopeia and the National Formulary (USP-NF).
$P F$ includes the following:

1. Potential revisions-entirely new standards, revision ideas, and drafts not yet targeted for official adoption (Pharmacopeial Previews)
2. Proposed revisions-new or revised standards targeted for official adoption (In-Process Revision)
3. Adopted revisions-new or revised standards that become official and binding before the publication of the next $U S P-$ NF or Supplement (Interim Revision Announcement)

USP welcomes comments and data on potential, proposed, or official standards. ${ }^{*}$ Comments, along with USP's responses, will be published either in PF Briefings, the Commentary section of $P F$, the Commentary section of Supplements to USP-NF, or the Commentary section of $U S P-N F$.

[^90]The chart below shows the public review and comment process and its relationship to standards development.

# Public Review and Comment Process for Standards Development 

Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

## HOW TO USE PF

This section provides descriptions of the various parts of $P F$. It also includes Committee Designations and the Staff Directory.

The contents of the different sections of $P F$ are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the Staff Directory) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

# Proposed and Adopted Revisions 

| Section | Content | How Readers Can Respond |
| :---: | :---: | :---: |
| Pharmacopeial <br> Previews <br> Early ideas for revisions | -Briefing: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: <br> - the controversial nature of an item; <br> - the application of new technologies that require further study; and <br> - articles produced by multiple sources. | Review drafts and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview. |
| In-Process Revision Revisions targeted for adoption | -Briefing: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. <br> -New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see Standards Development). New or revised text is marked with symbols ( ${ }^{\square}$ or ) to specify the tentative earliest date on which the revision would be officially adopted. | Review material and send comments promptly to USP staff liaison (see the Staff Directory). Guidelines on how to comment are found at the end of the Policies and Announcements section. |
| Harmonization <br> Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally | - Briefing: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under Pharmacopeial Previews or under In-Process Revision, both separate sections of Harmonization. <br> -For In-Process Revision, new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted. | Review material and provide comments to the appropriate staff liaison cited in the Briefing preceding each Preview or In-Process Revision. |
| Interim Revision <br> Announcement <br> Adopted standards | Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ${ }^{\circ}$. | Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance. |

## Other Sections

## Committee Designations

Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

## Staff Directory

Names of all USP scientific staff liaisons with contact information.

## Policies and Announcements

- General scientific and policy issues affecting $U S P-N F$ standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

## Stimuli to the Revision Process

- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

## Nomenclature

- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the USP Dictionary of USAN and International Drug Names
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

## Index

Cumulative directory for the content of all issues of $P F$ beginning with $P F$ 30(1).

## Reference Standards Catalog

List of official USP Reference Standards specified in $U S P-N F$, along with availability and ordering information.

## Chromatographic Reagents Used in USP-NF and Pharmacopeial Forum

Update of chromatographic reagents based on the proposals published in this issue of $P F$.

## EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

| AER | Aerosols |
| :---: | :---: |
| AMB | Analytical Microbiology |
| BBP | Blood and Blood Products |
| BNA | Bioavailability and Nutrient Absorption |
| BNT | Biotechnology and Natural Therapeutics and Diagnostics |
| BPC | Biopharmaceutics |
| BST | Biostatistics |
| CRX | Compounding Pharmacy |
| DSB | Dietary Supplements-Botanicals |
| DSI | Dietary Supplements-Information |
| DSN | Dietary Supplements-Non-Botanicals |
| EMC | Excipient Monograph Content ${ }^{\dagger}$ |
| ESC | Excipients-Substances and Characterization ${ }^{\dagger}$ |
| ETM | Excipients-Test Methods |
| GCT | Gene Therapy, Cell Therapy, and Tissue Engineering |
| GTB | General Toxicity and Biocompatibility |
| NL | Nomenclature and Labeling |
| PA1 | Pharmaceutical Analysis 1 |
| PA2 | Pharmaceutical Analysis 2 |
| PA3 | Pharmaceutical Analysis 3 |
| PA4 | Pharmaceutical Analysis 4 |
| PA5 | Pharmaceutical Analysis 5 |
| PA6 | Pharmaceutical Analysis 6 |
| PA7 | Pharmaceutical Analysis 7-Antibiotics |
| PDF | Pharmaceutical Dosage Forms |
| PPC | Parenteral Products-Compounding and Preparation |
| PPI | Parenteral Products-Industrial |
| PSD | Packaging, Storage, and Distribution |
| PW | Pharmaceutical Waters |
| RMI | Radiopharmaceuticals and Medical Imaging |
| SMU | Safe Medication Use |
| VET | Veterinary Drugs |
| VVI | Vaccines, Virology, and Immunology |

[^91]
## STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

| STAFF | E-MAIL | PHONE | ASSIGNMENT |
| :--- | :--- | :--- | :--- |
| Clydewyn M. Anthony, <br> Senior Scientific Associate | cma@usp.org | $(301) 816-8139$ | Pharmaceutical Analysis 1 <br> (PA1) |
| Frank P. Barletta, Consultant <br> Charles H. Barnstein, Consultant | fpb@usp.org <br> ehbarnstein@ <br> email.msn.com | $(301) 816-8328$ | Pharmaceutical Waters (PW) |

## POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on $U S P-N F$ standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

USP TO HOLD FIRST ANNUAL SCIENTIFIC MEETING. MEETING FOCUSES ON PRODUCT AND PROCESS STANDARDS. The United States Pharmacopeia (USP) is pleased to announce that it will hold its first USP Annual Scientific Meeting at the Sheraton Woodbridge Place in Iselin, N.J. from Sept. 27 to 29, 2004. The new USP Annual Scientific Meeting, which replaces the organization's open conference format, will allow stakeholders the opportunity to learn about and discuss science topics that are the foundation of USP's standardssetting activities.
"We are creating one annual meeting to allow USP to address multiple topics and to allow more people to participate in USP's standards-setting activities," said Roger L. Williams, M.D., USP executive vice president and chief executive officer. "This one-stop approach allows stakeholders the opportunity to meet with USP at one time and in one convenient location."

Preliminary USP Annual Scientific Meeting topics to be presented are the following:

- Biologics and Biotechnology Products
- Chromatography
- Dissolution
- Excipients and Pharmaceutical Waters
- Making the $U S P-N F$ Work for You
- Microbiology
- Process Analytical Technology
- Specifications

In addition, USP will offer its Pharmacopeial Education courses on Analytical Method Validation, Basic Statistics and their Practical Applications to USP, Dissolution, Microbiology, and USP 100 and 101. These courses and the USP Annual Scientific Meeting session tracks will be approved for continuing pharmaceutical education units (CEUs). Attendees of the USP Annual Scientific Meeting also can learn about other USP initiatives and how to become involved in USP's processes through the various USP volunteer bodies.

The USP Annual Scientific Meeting is designed for $U S P-$ $N F$ and USP Reference Standards customers and other USP stakeholders including pharmaceutical scientists focusing on chemistry, microbiology, biologics and biotechnology, Process Analytical Technology, excipients, dissolution, and chromatography.

For further information about the USP Annual Scientific Meeting, please visit www.usp.org/conferences, or call 301-816-8226.

USAN COUNCIL SECRETARIAT REVISES USAN FEE-FOR-SERVICE CHARGES. A revised schedule of fee-for-service charges has been placed in effect as of January 1, 2004. The increased fees appear on the USAN submission forms that are provided under Appendix XI of the 2004 edition of the USP Dictionary of USAN and International Drug Names. This announcement will be important to inform users of the USP Dictionary who are not yet using the revised 2004 edition of the changes.

For further information please contact:

United States Adopted Names (USAN) Program<br>American Medical Association<br>515 North State Street<br>Chicago, IL 60610<br>Phone: 312-464-4046<br>Fax: 312-464-4028<br>Web site: http://www.ama-assn.org/go/usan

PLASMA SPECTROCHEMISTRY. There are currently no monographs in the $U S P-N F$ that use inductively-coupled plasma as an analytical technique. Considering that use of this technique could have a great impact on the future of pharmaceutical testing for inorganic elements, in Pharmacopeial Forum 28(6) [Nov.-Dec. 2002], USP published a proposed new general chapter Inductively Coupled Plasma $\langle 730\rangle$, for public review and comment. Several comments were received, which led to the formation of a working group that was charged with identifying issues and redrafting the chapter. USP's working group on Plasma Spectrochemistry then organized a Roundtable Discussion session at the 2004 Winter Conference on Plasma Spectrochemistry (Jan. 210,2004, Ft. Lauderdale, Florida) in order to get additional public input before publishing a revised proposal. Titled $\langle 730\rangle$ Plasma Spectrochemistry, this proposed new general chapter is presented in this issue of Pharmacopeial Forum for public review and comment. For further information contact Kahkashan Zaidi, Ph.D. at 301-816-8269 or via email at kxz@usp.org.

NOTICE OF REVISION PERTAINING TO THE PACKAGING AND STORAGE STATEMENTS FOR EXCIPIENT ARTICLES. Changes in the Packaging and storage sections of the following excipient monographs will appear in this Pharmacopeial Forum, 30(3) [MayJune 2004].

This will apply to the following new excipient monographs, which became official in USP27-NF22: Ammonium Sulfate, Candelilla Wax, Cetrimonium Bromide, Hydrogenated Cottonseed Oil, Tribasic Sodium Phosphate, Glyceryl Distearate, Glyceryl Monolinoleate, and Glyceryl Monooleate.

It will also apply to the following new and revised excipient monographs, which became official in the First Supplement to USP27-NF22: Dibutyl Phthalate, Diethylene Glycol Stearates, Ethylene Glycol Stearates, Hydrogenated Soybean Oil, Hymetellose, Low-Substituted Carboxymethylcellulose Sodium, Medium-Chain Triglycerides, Polyisobutylene, Sodium Cetostearyl Sulfate, Sorbitol, Sorbitol Solution, Maltitol Solution, and Noncrystallizing Sorbitol Solution.

As well, it will apply to the following official excipient monographs for which revision proposals are currently presented in Pharmacopeial Forum: Pregelatinized Starch and Tapioca Starch.

Lastly, the Committee wishes to apply this principle to proposed new excipient monographs for which revision proposals are currently presented in Pharmacopeial Forum: Copovidone, Modified Starch, Pregelatinized Modified Starch, Maltose, Anhydrized Liquid Sorbitol, Phenolsulfonphthalein, and Hypromellose Acetate Succinate.

For more information, please contact Catherine Sheehan at 301-816-8262 or cxs@usp.org.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE USP-NF. We are pleased to announce the availability of the USP Guideline for Submitting Requests for Revision to the USP-NF. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP Staff, and the Drug Substance, Complex Actives, and Excipients

Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Laura A. McCurry, Manager, Pharmacopeial Education, lam@usp.org, 301-816-8285; Diana Lenahan, Program Associate, dpl@usp.org, 301-816-8530; or visit the website at www.usp.org/ education to register. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2004

| Date | Name of course | Location |
| :--- | :--- | :--- |
| May 19 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| May 20 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| June 10 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| July 19 and 20 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| August 10 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| August 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| August 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| October 14 | Fundamentals of Microbiological Testing | USP Headquarters, Rockville, MD |
| October 18 and 19 | Fundamentals of Dissolution | USP Headquarters, Rockville, MD |
| November 11 | Analytical Method Validation | USP Headquarters, Rockville, MD |

Calendar of Pharmacopeial Education Courses, 2004 (continued)

| Date | Name of course | Location |
| :--- | :--- | :--- |
| November 11 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| November 12 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |
| November 12 | Fundamentals of Dissolution (Lecture) | USP Headquarters, Rockville, MD |
| December 2 | Analytical Method Validation | USP Headquarters, Rockville, MD |
| December 8 | Standards 100: Fundamentals of the Use of $U S P-$ <br> $N F$ and the Standards Development Process | USP Headquarters, Rockville, MD |
| December 9 | Standards 101: Advanced Use of $U S P-N F$, General <br> Notices, and Monograph Chapters | USP Headquarters, Rockville, MD |

VISIT THE USP WEB SITE AT 〈http://www.usp.org . Various resources related to Pharmacopeial standards are presented, including highlights from $P F$.

## USP-NF AVAILABLE IN THREE ELECTRONIC

FORMATS. The trusted reference for official pharmaceutical standards is available in three convenient electronic formats-CD, intranet, and online. The CD is ideal for single users who prefer to have $U S P-N F$ on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official $U S P-N F$ content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

## CHROMATOGRAPHIC REAGENTS NOW AVAILABLE.

 Chromatographic Reagents lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in Pharmacopeial Forum (PF) since 1980. Chromatographic Reagents also helps to track which column reagents were used to validate methods that have become official and are included in $U S P-N F$. The branded column reagents list is updated bimonthly through Pharmacopeial Forum. Chromatographic Reagents can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international
harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907

F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a $P F$ should be submitted to the appropriate USP scientific staff liaison identified at the end of the Briefing accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the Staff Directory included in every $P F$.

Please note that $U S P-N F$ is being published in an annual edition with one main book and two Supplements a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

The publication and comment schedule for USP 27-NF 22 is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2003 | November 2003 | January 2004 |
| Supplement One | October 15, 2003 | February 2004 | April 2004 |
| Supplement Two | February 17, 2004 | June 2004 | August 2004 |

The publication and comment schedule for USP $28-N F 23$ is as follows:

|  | Comment Deadline | Publication Date | Official Date |
| :--- | :--- | :--- | :--- |
| Main Book | May 15, 2004 | November 2004 | January 2005 |
| Supplement One | October 15, 2004 | February 2005 | April 2005 |
| Supplement Two | February 17, 2005 | June 2005 | August 2005 |

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in Supplements to $U S P-N F$ (twice yearly). Between Supplements, official revisions are published in $P F$ in the Interim Revision Announcement; these revisions are also incorporated in the upcoming Supplement. The electronic version of $U S P-N F$ is updated as each Supplement becomes available and, therefore, contains all official text up to and including the contents of the latest Supplement.

## Publication Schedules

| Publication | Publication Date | Official Date |
| :---: | :---: | :---: |
| $1{ }^{\text {st }}$ Supplement | Feb. 2004 | Apr. 1, 2004 |
| PF 30(2) [Mar.-Apr. 2004] | Mar. 2004 | Not Applicable |
| $2^{\text {nd }} I R A$ [published in $P F 30(2)$ ] | Mar. 2004 | Apr. 1, 2004 |
| PF 30(3) [May-June 2004] | May 2004 | Not Applicable |
| $3{ }^{\text {rd }}$ IRA [published in PF 30(3)] | May 2004 | June 1, 2004 |

* Tentative

## INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the $U S P-N F$ that become effective before the effective date of the next Supplement or that were not ready for adoption by the closing date for the upcoming Supplement. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.
Symbols-Interim revisions are shown with new text (if any) enclosed in circles, ${ }^{\bullet}$ new text $\mathbf{D}_{\mathbf{0}}$. Text enclosed in squares, ${ }^{\bullet}$ new text $_{\square}$, has already been adopted in a Supplement. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$ • or ${ }^{\bullet}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the $I R A$ or Supplement in which the revision first appeared. For example, $\bullet_{2}$ indicates that the revision was officially adopted in the Second Interim Revision Announcement, and $\quad \mathbf{m S O}_{2 S}$ (USP27) indicates that the revision was officially adopted in the Second Supplement to USP 27.

Errata-At the end of the Interim Revision Announcement section is a list of errata and corrections to USP 27-NF 22. The page number indicates where the item is found in $U S P-N F$. If necessary, this list will be updated with every issue of $P F$. This information will also be cumulative in the next available Supplement, and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

# THIRD INTERIM REVISION ANNOUNCEMENT 

By authority of the United States Pharmacopeial Convention, Inc.<br>Prepared by the Council of Experts and published by the Board of Trustees<br>Larry L. Braden, Chair<br>USP Board of Trustees<br>Roger L. Williams, Executive Vice President and Chairman, USP Council of Experts

John W. Gasper, Director, Executive Secretariat

Official June 1, 2004.
Released May 1, 2004.

[^92]
## New USP Reference Standards

The following USP Reference Standards, which were indicated in past Supplements to USP-NF as being not yet available, have since become available. Thus, the official date of each USP 27 or NF 22 standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list.

USP Benazepril Hydrochloride RS (July 1, 2004)
USP Benazepril Related Compound A RS (May 1, 2004)
USP Benazepril Related Compound B RS (May 1, 2004)
USP Positive Bioreaction RS (November 1, 2004)
USP Cefpiramide RS (September 1, 2004)
USP Powdered Chaste Tree Extract RS (November 1, 2004)
USP Chlorhexidine RS (July 1, 2004)
USP Chlorhexidine Acetate RS (July 1, 2004)
USP Chlorhexidine Related Compounds RS (November 1, 2004)
USP Chlorogenic Acid RS (November 1, 2004)
USP Clonazepam Related Compound C RS (July 1, 2004)
USP Clonidine RS (September 1, 2004)
USP Clonidine Related Compound A RS (September 1, 2004)
USP Clonidine Related Compound B RS (November 1, 2004)
USP Cyclandelate RS (September 1, 2004)
USP Desflurane RS (May 1, 2004)
USP Dextran 40 RS (May 1, 2004)
USP Dextran 70 RS (May 1, 2004)
USP Dolasetron Mesylate RS (July 1, 2004)
USP Dolasetron Mesylate Related Compound A RS (July 1, 2004)
USP Powdered Echinacea purpurea Extract RS (November 1, 2004)

USP Powdered Eleuthero Extract RS (July 1, 2004)
USP Fludarabine RS (September 1, 2004)
USP Flumazenil RS (May 1, 2004)
USP Fluoxetine Related Compound C RS (July 1, 2004)
USP Ganciclovir RS (May 1, 2004)
USP Ganciclovir Related Compound A RS (July 1, 2004)
USP Glucosamine Hydrochloride RS (July 1, 2004)
USP $2 E, 4 E$-Hexadienoic Acid Isobutlamide RS (November 1, 2004)

USP Isoflurane Related Compound A RS (September 1, 2004)
USP Isoflurane Related Compound B RS (September 1, 2004)
USP Lamivudine RS (July 1, 2004)
USP Lamivudine Resolution Mixture A RS (November 1, 2004)
USP Loratadine RS (September 1, 2004)
USP Medroxyprogesterone Acetate Related Compound A RS (November 1, 2004)
USP Methylphenidate Hydrochloride Erythro Isomer Solution CII RS (November 1, 2004)
USP Metoprolol Related Compound A RS (July 1, 2004)
USP Metoprolol Related Compound B RS (September 1, 2004)
USP Metoprolol Related Compound C RS (September 1, 2004)
USP Metoprolol Related Compound D RS (September 1, 2004)
USP Metoprolol Succinate RS (November 1, 2004)
USP Mitoxantrone System Suitability Mixture RS (November 1, 2004)

USP Naratriptan Hydrochloride RS (November 1, 2004)
USP Paroxetine Related Compound D RS (May 1, 2004)
USP Phenytoin Related Compound B RS (July 1, 2004)
USP Powdered Red Clover Extract RS (May 1, 2004)
USP Residual Solvent Class 1—Benzene RS (November 1, 2004)

USP Residual Solvent Class 1-1,2 Dichloroethane RS (November 1, 2004)
USP Residual Solvent Class 1-1,2 Dichloroethene RS (November 1, 2004)
USP Residual Solvent Class 1-Carbon Tetrachloride RS (November 1, 2004)
USP Residual Solvent Class 1-1,1,1-Trichloroethane RS (November 1, 2004)
USP Residual Solvent Mixture-Class 1 RS (November 1, 2004)
USP Rimantidine Hydrochloride RS (July 1, 2004)
USP Scopoletin RS (July 1, 2004)
USP Sevoflurane RS (May 1, 2004)
USP Sevoflurane Related Compound A RS (May 1, 2004)
USP Sotalol Hydrochloride RS (July 1, 2004)
USP Sotalol Related Compound A RS (May 1, 2004)
USP Sotalol Related Compound B RS (May 1, 2004)
USP Sotalol Related Compound C RS (May 1, 2004)
USP Stearoyl Polyoxylglycerides RS (May 1, 2004)
USP Tiamulin Fumarate RS (July 1, 2004)
USP Tiamulin Related Compound A RS (July 1, 2004)
USP Valsartan RS (November 1, 2004)
USP Vecuronium Bromide RS (September 1, 2004)
USP Vinorelbine Tartrate RS (May 1, 2004)

The official dates of any USP 27 or NF 22 standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

## USP Alteplase RS

USP Amiloxate RS
USP Cinoxate RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Enalapril Related Compound B RS
USP Enzacamene RS
USP Fludeoxyglucose RS
USP Ginseng Extract RS
USP Gonadorelin Hydrochloride RS
USP Hypericin RS
USP Lactase RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Ondansetron Related Compound B RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Sargramostim RS
USP Sulisobenzone RS
USP $\Delta^{8}$-tetrahydrocannabinol RS
USP $\Delta^{9}$-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS
USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

## MONOGRAPHS (USP)

## Mitoxantrone Hydrochloride

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Mitoxantrone Hydrochloride RS. ${ }^{\bullet}$ USP Mitoxantrone System Suitability Mixture $R S$. ${ }^{\circ}$

## Change to read:

Assay-
Sodium 1-heptanesulfonate solution-Dissolve 22.0 g of sodium 1-heptanesulfonate in about 150 mL of water, pass through a suitable filter having a $0.5-\mu \mathrm{m}$ or finer porosity, and transfer the filtrate to a $250-\mathrm{mL}$ volumetric flask. Wash the filter with about 50 mL of water, adding the filtrate to the $250-\mathrm{mL}$ volumetric flask. Add 32.0 mL of glacial acetic acid to the volumetric flask, dilute with water to volume, and mix.

Mobile phase-Prepare a suitable degassed mixture of water, acetonitrile, and Sodium 1-heptanesulfonate solution (750:250:25). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution- Prepare a solution of USP Mitoxantrone System Suitability Mixture RS in a suitable volume of Mo bile phase to obtain a solution containing about 0.2 mg of 8 -amino-1,4-dihydroxy-5[[2-[(2-hydroxyethyl)amino]ethyl]amino]-9,10anthracenedione hydrochloride (mitoxantrone related compound A) and 0.1 mg of mitoxantrone hydrochloride per $\mathrm{mL} . \bullet 3$

Standard preparation-Transfer about 20 mg of USP Mitoxantrone Hydrochloride RS, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, add 40 mL of Mobile phase, and dissolve by sonicating for about 5 minutes. Cool to room temperature, dilute with Mobile phase to volume, and mix.

Assay preparation-Transfer about 20 mg of Mitoxantrone Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, add 40 mL of Mobile phase, and dissolve by sonicating for about 5 minutes. Cool to room temperature, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a 254 -nm detector and a 3.9$\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L11. The flow rate is about 3 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for mitoxantrone and 1.0 for mitoxantrone related compound A ; the resolution, $R$, between mitoxantrone and mitoxantrone related compound A is not less than 3.0 ; and the tailing factor for the mitoxantrone peak is not more than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, for mitoxantrone is not less than 3.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. NOTE-After use, wash the column with a mixture of acetonitrile and water (50:50), and store in this mixture. Calculate the quantity, in mg , of $\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{~N}_{4} \mathrm{O}_{6} \cdot 2 \mathrm{HCl}$ in the portion of Mitoxantrone Hydrochloride taken by the formula:

$$
50 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of anhydrous mitoxantrone hydrochloride in the Standard preparation, as determined from the content of USP Mitoxantrone Hydrochloride RS corrected for the water content determined by a titrimetric water determination; and $r_{U}$ and $r_{S}$ are the mitoxantrone peak areas ob-
tained from the Assay preparation and the Standard preparation, respectively.

Following is a list of errata and corrections to $U S P 27-N F 22$. The page number indicates where the item is found in USP 27-NF 22. If necessary, this list will be updated with every issue of $P F$. This information will also be available as a cumulative table in the next available Supplement and will appear in its corrected form in the next annual edition of $U S P-N F$. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

## IN-PROCESS REVISION

This section contains proposals for adoption as official USP or $N F$ standards (either proposed new standards or proposed revisions of current $U S P$ or $N F$ standards). These may be any of the following: (1) items that previously appeared under Pharmacopeial Previews and are now formally proposed as revisions; (2) proposed revisions placed directly under In-Process Revision; or (3) modifications of revisions previously proposed under In-Process Revision. Readers should review material in this section and provide comments to the staff liaison (use the Staff Directory to find the contact information). Information on how to comment is found in the Policies and Announcements section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

## BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see How to Use $P F$ ), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
(PA5: K. Russo) RTS-55678-1
Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

- new text.
if slated for an Interim Revision Announcement to USP 27-NF 22 (IRA);
$\Delta_{\text {new text }}{ }_{\mathbf{U S P 2 8}}$
if slated for USP 28-NF 23; and
- $_{\text {new text }}$
if slated for a Supplement to $U S P-N F$. The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ${ }^{\bullet}$. or ${ }^{\bullet}$ or ${ }_{\Delta}$, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular IRA or Supplement or indicates the USP or NF as the publication where the revision will appear if approved. For example, $\bullet_{2}$ indicates that the revision is proposed for the Second Interim Revision Announcement, and $\mathbf{N 2 S}_{\text {(USP 27) }}$ indicates that the proposed revision is slated for the Second Supplement to USP 27, and $\Delta_{\Delta S P 28}$ and $\Delta_{\Delta F 23}$ indicate that the revisions are proposed for USP 28 and NF 23, respectively.

Official Title Changes Where the specification "Monograph title change" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.
IN-PROCESS REVISION ..... 789

## Briefing

General Notices and Requirements, $U S P 27$ page 1, page 3034 of the First Supplement, and page 424 of PF 30(2) [Mar.Apr. 2004]. It is proposed to revise the section, Tests and Assays, to clarify the default conditions for reporting assay and other test results. It is also proposed to insert a statement in the section for Preservation, Packaging, Storage, and Labeling on the basis of discussions at a recent Open Conference on Packaging, Storage, and Distribution that was held October 12-15, 2003. Of particular interest to the participants were those monographs relating to excipients and active pharmaceutical ingredients (APIs). It was noted that most excipients are temperature stable, and, therefore, do not need storage restrictions, especially during shipping and distribution. This statement is intended to provide guidance to those preparing monographs for submission to USP so that there is consistency in the methods used when formulating the packaging and storage standards.
(PA6: K. Zaidi; PSD: C. Okeke) RTS-40982-1; 41095-1

## SIGNIFICANT FIGURES AND TOLERANCES

Where limits are expressed numerically herein, the upper and lower limits of a range include the two values themselves and all intermediate values, but no values outside the limits. The limits expressed in monograph definitions and tests, regardless of whether the values are expressed as percentages or as absolute numbers, are considered significant to the last digit shown.

Equivalence Statements in Titrimetric Procedures-The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, it is to be understood that the number of significant figures in the concentration of the titrant corresponds to the number of significant figures in the weight of the analyte. Blank corrections are to be made for all titrimetric assays where appropriate (see Titrimetry $\langle 541\rangle$ ).

Tolerances-The limits specified in the monographs for Pharmacopeial articles are established with a view to the use of these articles as drugs, nutritional or dietary supplements, or devices, except where it is indicated otherwise. The use of the molecular formula for the active ingredient(s) named in defining the required strength of a Pharmacopeial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute ( 100 percent) purity.

A dosage form shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. The tolerances and limits stated in the definitions in the monographs for Pharmacopeial articles allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions.

Where the minimum amount of a substance present in a nutritional or dietary supplement is required to be higher than the lower tolerance limit allowed for in the monograph because of applicable legal requirements, then the upper tolerance limit contained in the monograph shall be increased by a corresponding amount.

The specified tolerances are based upon such attributes of quality as might be expected to characterize an article produced from suitable raw materials under recognized principles of good manufacturing practice.

The existence of compendial limits or tolerances does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" the Pharmacopeial quality. Similarly, the fact that an article has been prepared to closer tolerances than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the Pharmacopeial requirements.
Interpretation of Requirements-Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated limits to determine whether there is conformance with compendial assay or test requirements. The observed or calculated values usually will contain more significant figures than there are in the stated limit, and absereater tated
$\square_{\text {a reportable }}^{\mathbf{m}_{2 S}}{ }_{(U S P 27)}$
result is to be rounded off to the number of places that is in agreement with the limit expression by the following procedure. ENOTE-Limits, which are fixed numbers, are not rounded off.]
-Intermediate calculations (e.g., slope for linearity in Validation of Compendial Methods $\langle 1225\rangle$ ) may be rounded for reporting purposes, but the original value (not rounded) should be used for any additional required calculations. Rounding off should not be done until the final calculations for the reportable value have been completed. [NOTE-Limits, which are fixed numbers, are not rounded off.]

A reportable value is often a summary value for several individual determinations. It is the end result of a completed measurement method, as documented. It is the value compared with the acceptance criterion. In most cases, the reportable value is used as documentation for internal or external
users.■2S (USP27)
When rounding off is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5 , it is eliminated and the preceding digit is unchanged. If this digit is greater than 5 , it is eliminated and the preceding digit is increased by one. If this digit equals 5 , the 5 is eliminated and the preceding digit is increased by one.

## GENERAL CHAPTERS

Each general chapter is assigned a number that appears in brack－ ets adjacent to the chapter name（e．g．，$\langle 621\rangle$ Chromatography）． General chapters that include general requirements for tests and as－ says are numbered from $\langle\lambda\rangle$ to－$\langle\boldsymbol{\theta} 99\rangle$ ，chapters that are informat tonal are numbered from－$\langle 1000$ ）to $\langle 1999$ ，and chapters pertaining to nutrition supplements are numbered above $\langle 2000$ ）：
－Articles recognized in this compendia must comply with the official standards and tests and assays in the General No－ tices，relevant monographs，and General Chapters numbered below 1000．General Chapters numbered above 1000 are considered to be interpretive and are intended to provide in－ formation on，give definition to，or describe a particular sub－ ject．They contain no official standards，tests，assays，or other mandatory requirements applicable to any pharmaco－ peial article unless specifically referenced in a monograph or elsewhere in the Pharmacopeia．${ }^{\text {2S }}$（USP27）

The use of the general chapter numbers is encouraged for the identification and rapid access to general tests and information．It is especially helpful where monograph section headings and chap－ ter names are not the same（e．g．，Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ in a monograph refers to method $\langle 197 \mathrm{U}\rangle$ under general tests chapter〈197〉 Spectrophotometric Identification Tests；Specific rotation $\langle 781 \mathrm{~S}\rangle$ in a monograph refers to method $\langle 781 \mathrm{~S}\rangle$ under general tests chapter $\langle 781\rangle$ Optical Rotation；and Calcium $\langle 191\rangle$ in a mono－ graph refers to the tests for Calcium under general tests chapter〈191〉 Identification Tests－General）．

## Change to read：

## TESTS AND ASSAYS

Apparatus－A specification for a definite size or type of con－ tainer or apparatus in a test or assay is given solely as a recommen－ dation．Where volumetric flasks or other exact measuring， weighing，or sorting devices are specified，this or other equipment of at least equivalent accuracy shall be employed．（See also Ther－
mometers $\langle 21\rangle$ ，Volumetric Apparatus $\langle 31\rangle$ ，and Weights and Bal－ ances $\langle 41\rangle$ ．）Where low－actinic or light－resistant containers are specified，clear containers that have been rendered opaque by ap－ plication of a suitable coating or wrapping may be used．

Where an instrument for physical measurement，such as a spec－ trophotometer，is specified in a test or assay by its distinctive name， another instrument of equivalent or greater sensitivity and accuracy may be used．In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used，solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure．

Where a particular brand or source of a material，instrument，or piece of equipment，or the name and address of a manufacturer or distributor，is mentioned（ordinarily in a footnote），this identifica－ tion is furnished solely for informational purposes as a matter of convenience，without implication of approval，endorsement，or cer－ tification．Items capable of equal or better performance may be used if these characteristics have been validated．

Where the use of a centrifuge is indicated，unless otherwise spe－ cified，the directions are predicated upon the use of apparatus hav－ ing an effective radius of about 20 cm （ 8 inches）and driven at a speed sufficient to clarify the supernatant layer within 15 minutes．

Unless otherwise specified，for chromatographic tubes and col－ umns the diameter specified refers to internal diameter（ID）；for other types of tubes and tubing the diameter specified refers to out－ side diameter（OD）．

Steam Bath－Where the use of a steam bath is directed，exposure to actively flowing steam or to another form of regulated heat，cor－ responding in temperature to that of flowing steam，may be used．

Water Bath－Where the use of a water bath is directed without qualification with respect to temperature，a bath of vigorously boil－ ing water is intended．

Foreign Substances and Impurities－Tests for the presence of foreign substances and impurities are provided to limit such sub－ stances to amounts that are unobjectionable under conditions in which the article is customarily employed（see also Impurities in Official Articles $\langle 1086\rangle$ ）．

While one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity，strength，quality， and purity，it is manifestly impossible to include in each mono－ graph a test for every impurity，contaminant，or adulterant that might be present，including microbial contamination．These may arise from a change in the source of material or from a change in the processing，or may be introduced from extraneous sources． Tests suitable for detecting such occurrences，the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice，should be employed in addition to the tests provided in the individual monograph．

Other Impurities－Official substances may be obtained from more than one process，and thus may contain impurities not con－ sidered during preparation of monograph assays or tests．Wherever a monograph includes a chromatographic assay or purity test based on chromatography，other than a test for erganic velatile impuri ties，
$\square_{\text {residual solvents }}{ }_{\text {n2S }}$（USP27）
and that monograph does not detect such an impurity，solvents ex－ cepted，the impurity shall have its amount and identity，where both are known，stated under the heading Other Impurity（ies）by the la－ beling（certificate of analysis）of the official substance．

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is $0.1 \%$ or greater． Tests suitable for detection and quantitating unlabeled impurities， when present as the result of process change or other identifiable， consistent occurrence，shall be submitted to the USP for inclusion in the individual monograph．Otherwise，the impurity shall be identified，preferably by name，and the amount listed under the heading Other Impurity（ies）in the labeling（certificate of analysis） of the official substance．The sum of all Other Impurities combined
with the monograph-detected impurities does not exceed $2.0 \%$ (see Ordinary Impurities $\langle 466\rangle$ ), unless otherwise stated in the monograph.

Categories of drug substances excluded from Other Impurities requirements are fermentation products and semi-synthetics derived therefrom, radiopharmaceuticals, biologics, biotechnologyderived products, peptides, herbals, and crude products of animal or plant origin. Any substance known to be toxic must not be listed under Other Impurities.

■Residual Solvents-The requirements are stated in Or ganic Volatile Impurities $\langle 467\rangle$ together with information in Impurities in Official Articles $\langle 1086\rangle$. Thus all drug substances, excipients, and products are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. The requirements have been aligned with the ICH guideline on this topic. If solvents are used during production, they are of suitable quality. In addition, the toxicity and residual level of each solvent are taken into consideration, and the solvents are limited according to the principles defined and the requirements specified in Organic Volatile Impurities $\langle 467\rangle$, using the general methods presented therein or other suitable methods. $\quad$ 2S (USP27)

Procedures-Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the utilization of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures utilized. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all of the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for assuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing process validation studies and from in-process controls may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or com-
puterized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not fewer than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.

Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not fewer than a given number, usually 20, of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the Assay procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for Loss on drying, or Water, or Loss on ignition, respectively, is given in the monograph.
-Results are calculated on an "as-is" basis unless otherwise

## specified in the monograph. 1S (USP28) $_{1 S}$

Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for Loss on drying or Water, the expression "previously dried" without qualification signifies that the substance is to be dried as directed under Loss on drying or Water (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter USP Reference Standards $\langle 11\rangle$, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within $10 \%$ of the specified weight or volume. However, the weight or volume taken is accurately determined and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under Volumetric Apparatus $\langle 31\rangle$, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under Volumetric Apparatus $\langle 31\rangle$, may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as " 25.0 mL " and " 25.0 mg ," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under Volumetric Apparatus $\langle 31\rangle$ or under Weights and Balances $\langle 41\rangle$.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession. See also Use of Reference Standards under Spectrophotometry and Light-Scattering $\langle 851\rangle$.

Blank Determination-Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator-The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution-Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see Volumetric Apparatus $\langle 31\rangle$ ).

Drying to Constant Weight-The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration-Where it is directed to "filter," without further qualification, the intent is that the liquid be filtered through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests-The Pharmacopeial tests headed Identification are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight-The specification "ignite to constant weight" means that the ignition shall be continued, at $800 \pm 25^{\circ}$ unless otherwise indicated, until two consecutive
weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators-Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL , or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms-Logarithms used in the assays are to the base 10.
Microbial Strains-Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible-This term indicates a quantity not exceeding 0.50 mg .

Odor-Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, of either a freshly opened package of the article (for packages containing not more than 25 g ) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about $100-\mathrm{mL}$ capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements-The term " mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions-Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with Purified Water.

An expression such as "( 1 in 10 )" means that 1 part by volume of a liquid is to be diluted with, or 1 part by weight of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts by volume.

An expression such as " $20: 5: 2$ )" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under Volumetric Solutions in the section Reagents, Indicators, and Solutions, and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity-Unless otherwise stated, the specific gravity basis is $25^{\circ} / 25^{\circ}$, i.e., the ratio of the weight of a substance in air at $25^{\circ}$ to the weight of an equal volume of water at the same temperature.

Temperatures-Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at $25^{\circ}$. Where moderate heat is specified, any temperature not higher than $45^{\circ}\left(113^{\circ} \mathrm{F}\right)$ is indicated. See Storage Temperature under Preservation, Packaging, Storage, and Labeling for other definitions.

Time Limit-In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum-The term "in vacuum", denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water-Where water is called for in tests and assays, Purified Water is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide-free water," see the introduction to the section Reagents, Indicators, and Solutions. For High-purity Water see Containers $\langle 661\rangle$.

Water and Loss on Drying - Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading Water. Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading Loss on drying. However, Loss on drying is most often given as the heading where the loss in weight is known to represent residual volatile constituents including organic solvents as well as water.

Test Results, Statistics, and Standards-Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compliance with good manufacturing practices generally, are developed and followed to assure that the article will indeed comply with compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for Dissolution and Uniformity of dosage units, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.
-Where the Content Uniformity determinations have been made using the same procedure specified in the Assay, the average of all of the individual Content Uniformity determinations may be used as the Assay value. 1 1s (USP27)

Description-Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table Description and Relative Solubility of USP and NF Articles in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility-The statements concerning solubilities given in the reference table Description and Relative Solubility of USP and NF Articles for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table. Soluble Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

|  | Parts of Solvent <br> Required for <br> 1 Part of Solute |
| :--- | :--- |
| Descriptive <br> Term | Less than 1 <br> Very soluble |
| Freely soluble 1 to 10 |  |
| Soluble | From 10 to 30 |
| Sparingly soluble | From 30 to 100 |
| Slightly soluble <br> Very slightly soluble <br> Practically insoluble, <br> or Insoluble | From 100 to 1000 |

Interchangeable Methods-Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the European Pharmacopoeia and/or the Japanese Pharmacopoeia and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method from one of these pharmacopeias, it should comply with the requirements of the United States Pharmacopeia. However, where a difference appears, or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

## Change to read:

## PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers-The container is that which holds the article and is or may be in direct contact with the article. The immediate contain$e r$ is that which is in direct contact with the article at all times. The closure is a part of the container.

Prior to its being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The Pharmacopeial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

Tamper-Evident Packaging - The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the tamper-evident packaging and labeling requirements of the FDA where applicable.
Preferably, the immediate container and/or the outer container or protective packaging utilized by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

Light-Resistant Container (see Light Transmission under Containers $\langle 661\rangle$ )-A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container
may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to "protect from light" in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering prior to dispensing.

Well-Closed Container-A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container-A tight container protects the contents from contamination by extraneous liquids, solids, or vapors, from loss of the article, and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution, and is capable of tight re-closure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

NOTE-Where packaging and storage in a tight container or a well-closed container is specified in the individual monograph, the container utilized for an article when dispensed on prescription meets the requirements under Containers-Permeation $\langle 671\rangle$.

Hermetic Container-A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Unit Container-A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

Single-Dose Container (see also Containers for Injections under Injections $\langle 1\rangle$ )-A single-dose container is a single-unit container for articles intended for parenteral administration only. A singledose container is labeled as such. Examples of single-dose containers include pre-filled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Unit-Dose Container-A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

Unit-of-Use Container-A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

Multiple-Unit Container-A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Multiple-Dose Container (see also Containers for Injections under Injections $\langle 1\rangle$ )-A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

Storage Temperature and Humidity-Specific directions are stated in some monographs with respect to the temperatures and humidity at which Pharmacopeial articles shall be stored and distributed (including the shipment of articles to the consumer) when
stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply (see also Stability under Pharmaceutical Dosage Forms $\langle 1151\rangle$ ). The conditions are defined by the following terms.

Freezer-A place in which the temperature is maintained thermostatically between $-25^{\circ}$ and $-10^{\circ}\left(-13^{\circ}\right.$ and $\left.14^{\circ} \mathrm{F}\right)$.

Cold-Any temperature not exceeding $8^{\circ}\left(46^{\circ} \mathrm{F}\right)$. A refrigerator is a cold place in which the temperature is maintained thermostatically between $2^{\circ}$ and $8^{\circ}\left(36^{\circ}\right.$ and $\left.46^{\circ} \mathrm{F}\right)$.

Cool-Any temperature between $8^{\circ}$ and $15^{\circ}\left(46^{\circ}\right.$ and $\left.59^{\circ} \mathrm{F}\right)$. An article for which storage in a cool place is directed may, alternatively, be stored and distributed in a refrigerator, unless otherwise specified by the individual monograph.

Room Temperature-The temperature prevailing in a working area.

Controlled Room Temperature-A temperature maintained thermostatically that encompasses the usual and customary working environment of $20^{\circ}$ to $25^{\circ}\left(68^{\circ}\right.$ to $77^{\circ} \mathrm{F}$ ); that results in a mean kinetic temperature calculated to be not more than $25^{\circ}$; and that allows for excursions between $15^{\circ}$ and $30^{\circ}\left(59^{\circ}\right.$ and $86^{\circ} \mathrm{F}$ ) that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to $40^{\circ}$ are permitted as long as they do not exceed 24 hours. Spikes above $40^{\circ}$ may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to $25^{\circ}$ ", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variations. (See also Stability under Pharmaceutical Dosage Forms $\langle 1151\rangle$.)

An article for which storage at Controlled room temperature is directed may, alternatively, be stored and distributed in a cool place, unless otherwise specified in the individual monograph or on the label.

Warm-Any temperature between $30^{\circ}$ and $40^{\circ}\left(86^{\circ}\right.$ and $\left.104^{\circ} \mathrm{F}\right)$. Excessive Heat-Any temperature above $40^{\circ}\left(104{ }^{\circ} \mathrm{F}\right)$.
Protection from Freezing-Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Dry Place-The term "dry place" denotes a place that does not exceed $40 \%$ average relative humidity at Controlled Room Temperature or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to $45 \%$ relative humidity provided that the average value is $40 \%$ relative humidity.

Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.
${ }^{\boldsymbol{4}}$ Storage under Nonspecific Conditions-Where no specific directions or limitations are provided in the packaging and storage section of individual monographs or in the article's labeling, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Articles shall be protected from moisture, freezing,
and excessive heat, and, where necessary, from light during shipping and distribution. Active pharmaceutical ingredients are exempt from this requirement. $\triangle U S P P^{27}$

■Repackaging Instructions-Except where a drug product is packaged in a container intended to be dispensed directly to the patient, such as a unit-of-use or unit-dose container, the labeling shall contain directions specifying the types of containers suitable for repackaging the drug product so as to maintain its identity, strength, quality, and purity. Such directions shall be sufficient to allow a repackager or dispenser to select an adequate container and shall include a description of the composition of the container(s), e.g., glass, polyethylene, polyvinyl chloride, and any moisture vapor transmission rate characteristics required. The labeling shall also indicate whether or not the container is to afford light protection, and shall include any storage or shipping temperature restrictions to which the drug as repackaged shall be limited (see 21 CFR 201.100).n.ms (USP27)

Labeling-The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in this Pharmacopeia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the Pharmacopeial requirements set forth for the articles.

Amount of Ingredient per Dosage Unit-The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Pharmacopeial articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in Deliverable Volume $\langle 698\rangle$. Pharmacopeial drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see Percentage Measurements), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each $5-\mathrm{mL}$ portion of the liquid or resulting liquid. Unless
otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units (see also Units of Potency in these General Notices).

Use of Leading and Terminal Zeros-In order to help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg$]$ ). The quantity of active ingredient when expressed as a decimal number smaller than one shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg ]).

Labeling of Salts of Drugs-It is an established principle that Pharmacopeial articles shall have only one official name. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids; but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

Labeling Vitamin-Containing Products-The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.
${ }^{\boldsymbol{\Delta}}$ Labeling Botanical-Containing Products-The label of
an herb or other botanical intended for use as a dietary sup-

plement bears the statement, "If you are pregnant or nursing a baby, seek the advice of a health professional before using this product." |  |
| :--- |
| USP28 |

Labeling Parenteral and Topical Preparations-The label of a preparation intended for parenteral or topical use states the names of all added substances (see Added Substances in these General Notices and Requirements, and see Labeling under Injections $\langle 1\rangle)$, and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

Labeling Electrolytes-The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

Labeling Alcohol-The content of alcohol in a liquid preparation shall be stated on the label as a percentage ( $\mathrm{v} / \mathrm{v}$ ) of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$.

Special Capsules and Tablets-The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used.
Expiration Date and Beyond-Use Date-The label of an official drug product, nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/89," "Exp. June 89," or "Expires 6/89"). [NOTE-For additional information and
guidance, refer to the Nonprescription Drug Manufacturers Association's Voluntary Codes and Guidelines of the OTC Medicines Industry.]

The monographs for some preparations state how the expiration date that shall appear on the label is to be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the Pharmacopeial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article must not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the General Notices and Requirements of this Pharmacopeia. The be-yond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution prior to use, a suitable be-yond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multi-ple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) one year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be one year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturer's container, whichever is earlier, unless stability data or the manufacturer's labeling indicates otherwise.

The dispenser must maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than $25^{\circ}$. The plastic material used in packaging the dosage forms must afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records must be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

Pharmaceutical Compounding-The label on the container or package of an official compounded preparation shall bear a be-yond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded
preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, is to be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see Stability Criteria and Beyond-Use Dating under Stability of Compounded Preparations in the general tests chapter ${ }^{\boldsymbol{\Delta}}$ Pharmaceutical Compounding-Nonsterile Preparations $\begin{array}{l}\text { USPP27 }\end{array}$ (795 $\rangle$ ).
-Guidelines for Packaging and Storage Statements in

## USP-NF Monographs

In order to provide users of the $U S P-N F$ with proper guidance on how to package and store compendial articles, every monograph in the $U S P-N F$ is required to have a packaging and storage specification.

For those instances where, for some reason, storage information is not yet found in the Packaging and storage specification of a monograph, the section Storage Under NonSpecific Conditions is included in the General Notices as interim guidance. The Storage Under Nonspecific Conditions statement is not meant to substitute for the inclusion of proper, specific storage information in the Packaging and storage statement of any monograph.

For the packaging portion of the statement, the choice of containers is given in the General Notices and includes Light-Resistant Container, Well-Closed Container, Tight Container, Hermetic Container, Single-Unit Container, Sin-gle-Dose Container, Unit-Dose Container, and Unit-of-Use Container. For most preparations, the choice is determined by the container in which it is to be dispensed (e.g., tight, well-closed, hermetic, unit-of-use, etc). For active pharmaceutical ingredients (APIs), the choice would appear to be tight, well-closed, or, where needed, a light-resistant container. For excipients, given their typical nature as large-volume commodity items, with containers ranging from drums to tank cars, a well-closed container is an appropriate de-
fault. Therefore, in the absence of data indicating a need for a more protective class of container, the phrase "Preserve in well-closed containers" should be used as a default for excipients.

For the storage portion of the statement, the choice of storage temperatures presented in the General Notices includes Freezer, Cold, Cool, Room Temperature, Controlled Room Temperature, Warm, Excessive Heat, and Protection from Freezing. The definition of a dry place is provided if protection from humidity is important.

For most preparations, the choice is determined by the experimentally determined stability of the preparation and may include any of the previously stated storage conditions as determined by the manufacturer. For APIs that are expected to be retested before incorporation into a preparation, a more general and nonrestrictive condition may be desired. In this case, the specification "room temperature" (the temperature prevailing in a working area) should suffice. The use of the permissive room temperature condition reflects the stability of an article over a wide temperature range. For excipients, the phrase "No storage requirements specified" in the Packaging and storage statement of the monograph would be appropriate.

Because most APIs in the $U S P-N F$ have associated Reference Standards, special efforts should be considered to ensure that the Reference Standards' storage conditions correspond to the conditions indicated in the $U S P-N F$ monographs.

The Packaging, Storage, and Distribution Expert Committee may review questionable Packaging and storage statements on a case-by-case basis. In cases where the Packaging and storage statements are incomplete, the monographs would move forward to publication while the Packaging and storage statements are temporarily deferred. 1 (USP28)

## Briefing

Acyclovir, USP 27 page 890, page 3039 of the First Supplement, and page 431 of $P F 30$ (2) [Mar.-Apr. 2004]. Based on available stability data and information, it is proposed to revise the Packaging and storage section; and the revision previously proposed in PF 30(2) is hereby cancelled. Minor editorial changes are also made to clarify the text.

## Assay and limit for guanine-

Mobile phase-Prepare a filtered and degassed solution of glacial acetic acid in water (1 in 1000). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

- System suitability preparation 1—Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 mg of each per mL .

System suitability preparation 2-Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per $\mathrm{mL} . \bullet 4$

Guanine standard preparation-Transfer about 8.75 mg of guanine, accurately weighed, to a $500-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix.
${ }^{\bullet}$ Transfer 2.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a known concentration of about $0.7 \mu \mathrm{~g}$ per $\mathrm{mL} . \bullet 4$

Standard preparation-Dissolve about 25 mg of USP Acyclovir RS, accurately weighed, in 5 mL of 0.1 N sodium hydroxide in a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution and 2.0 mL of the Guanine stant and preparation
$\bullet$
to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having knownemeentrations of about 0.1 mg of USP Acyelovir PS per mL and $0.7 \mu \mathrm{~g}$ of granine per mL .
-a known concentration of about 0.1 mg of USP Acyclovir

## RS per mL. $\bullet 4$

Assay preparation-Dissolve about 100 mg of Acyclovir, accurately weighed, in 20 mL of 0.1 N sodium hydroxide in a $200-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a 4.2$\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph Stand preparation,
-System suitability preparation 1,@4
and record the peak responses as directed for Procedure: the resolution, $R$, between acyclovir and guanine is not less than 2.0; the tailing factor for the analyte peak is not more than 2 ; and the relative standard deviation for replicate injections
${ }^{\bullet}$ for the acyclovir peak ${ }_{\bullet 4}$
is not more than $2.0 \%$.
${ }^{\bullet}$ Chromatograph System suitability preparation 2, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$. $\bullet$

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation,

- Guanine standard preparation, $\bullet 4$
and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in $\mu \mathrm{g}$, of guanine in the portion of Acyclovir taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of guanine in the Stand preparation
${ }^{\bullet}$ Guanine standard preparation; $\bullet 4$
and $r_{U}$ and $r_{S}$ are the peak responses due to guanine in the Assay preparation and the stan,
${ }^{\bullet}$ Guanine standard preparation, $\bullet_{4}$
respectively: not more than $0.7 \%$ of guanine is found. Calculate the quantity, in mg , of $\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{3}$ in the portion of Acyclovir taken by the formula:

$$
1000 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Acyclovir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses due to acyclovir in the Assay preparation and the Standard preparation, respectively.

## BRIEFING

Alendronic Acid Tablets, page 440 of $P F 30(2)$ [Mar.-Apr. 2004]. Consistent with established policy of using the same terminology in the monograph title as appears in the strength expression for a dosage form, Alendronic Acid Tablets has been proposed to be the title for this new monograph.

A monograph on this proposed new $U S P$ dosage form first appeared in a Pharmacopeial Preview in PF 24(1) [Jan.-Feb. 1998] and, subsequently, under In-Process Revision in PF 25(5)[Sept.Oct. 1999], PF 26(2) [Mar.-Apr. 2000], and PF 28(1) [Jan.-Feb. 2002] under the name Alendronate Sodium Tablets. Revisions proposed by the Expert Committee on Nomenclature and Labeling in PF 28(3)[May-June 2002] included changing the title of this new monograph to Alendronic Acid Tablets. The briefing to that revision proposal stated "A previous USP Nomenclature Committee adopted a policy to name the active moiety in the title if the strength is expressed in terms of the active moiety, and name the derivative in the title if the strength is expressed in terms of the derivative. The nomenclature thus proposed for this monograph is changed from naming the drug ingredient as the salt to naming the active moiety to be consistent with policy."

USP received an objection to the "active moiety" terminology used in the briefing, the correspondent indicating that "the free acid is not the active moiety of this drug," and "evidence established that alendronic acid is never present at the site of action." Further to this, the correspondent added that "The ultimate site of action is in the bone and specifically in the osteoclast cell. When alendronate sodium is administered to a patient, it will be present in the osteoclast as alendronate and not alendronic acid because the intracellular pH is 7.0 approximately. The intracellular pH is well above the pKa of Alendronic acid." Removal of the term "active moiety" from the briefing section of the In-Process Revision monograph therefore was requested.

Concerning the proposal to change the title, the correspondent further stated "It is, however, our understanding that the USP policy on nomenclature is to utilize the name of the molecule on which dosing is based, according to the FDA approved labeling, in the title of the monograph. In this case, the labeling refers to 5,10 , 35,40 , and 70 mg doses based on the free acid form of Alendronate (i.e., Alendronic acid). Therefore, to be consistent with policy, Alendronic acid should be used in the title of the monograph. This policy is not intended to establish or define the pharmacologically active substance (i.e., active moiety)."

The Expert Committee on Nomenclature and Labeling found the correspondent's comments persuasive and determined that, although "active moiety" terminology appearing in the informational briefing statements was inappropriate and, inasmuch as there was no objection to the proposed title change, Alendronic Acid Tablets was approved as the title for the proposed new monograph. However, in subsequent actions taken by the Expert Committee on Nomenclature and Labeling, the title of the existing 15-year-old policy was changed from "Active Moiety Policy" to "Salt Nomenclature Policy." The policy, without substantive change other than its title, is stated as the following:

Salt Nomenclature Policy. The term used in the title of the monograph on a dosage form formulated with a salt of an acid or base shall be the same as that used in expressing the strength of the article. Where the strength is expressed in terms of the salt, the same salt name is used in the monograph title. Where the strength is expressed in terms of the free acid or base, the same acid or base name is used in the monograph title.

Alendronic Acid Tablets is proposed to be the title of the monograph on this dosage form, which is proposed to be included in USP 28-NF 23, but with an official date of July 1, 2006, which is 18 months later than the official date of USP $28-N F 23$. Use of the revised name would be permitted as of January 1, 2005,
the official date of USP 28-NF 23, but use of the name Alendronic Acid Tablets would not become mandatory until July 1, 2006. The 18-month extension is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the terminology.
(NL: C. Barnstein) RTS-41136-1

## Add the following:

## AAlendronate Sodium- Tablets Alendronic Acid Tablets

-(Title for this new monograph—to become official July 1, 2006)

## » Alendronate Sodium Tablets entain Alendronic <br> Acid Tablets contain an amount of Alendronate Sodium, equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled <br> amount of alendronatesodium $\left(\mathrm{C}_{4} \mathrm{H}_{4_{2}} \mathrm{NNa}_{7} \mathrm{P}_{2} \cdots 3 \mathrm{H}_{2} \mathrm{O}\right)$. alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$.

Packaging and storage-Preserve in tight containers.
Store at between $15^{\circ}$ and $30^{\circ}$.
Labeling-The labeling indicates weekly dosing where appropriate.

USP Reference standards $\langle 11\rangle$ —USP Alendronate Sodium RS.

Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: water; 900 mL .
Apparatus 2: 50 rpm .

## Time: 15 minutes.

Determine the amount of $\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}$ dissolved by employing the following method.

Buffer solution and Mobile phase-Prepare as directed in the Assay.
0.05\% 9-Fluorenylmethyl chloroformate solutionTransfer 100 mg of 9-fluorenylmethyl chloroformate to a $200-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix. This solution must be freshly prepared.

Borate buffer-Dissolve 6.2 g of boric acid in approximately 950 mL of water, adjust with 1 N sodium hydroxide to a pH of 9.0 , and dilute with water to 1 L .

Diluent-Transfer 176.4 g of sodium citrate dihydrate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Dissolution Medium to volume, and mix.

Standard stock solution-Dissolve an accurately weighed quantity of USP Alendronate Sodium RS in Dissolution Medium, and dilute quantitatively and stepwise, with the same solvent to obtain a solution having a known concentration corresponding to the concentration that would be obtained by dissolving 1 Tablet in 900 mL of the same Medium. Calculate the concentration, $C$, in mg per mL , of anhydrous alendronate sodium in this solution.
Standard solution-Transfer 5.0 mL of the Standard stock solution to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing 1.0 mL of Diluent and 5.0 mL of Borate buffer, and mix for about 3 minutes. Add 4.0 mL of $0.05 \%$ 9-Fluorenylmethyl chloroformate solution, and agitate for about 30 seconds. Allow the solution to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 5 minutes. Use a portion of the clear upper aqueous layer.

Reagent blank-Using 5 mL of water, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Test solution-After 15 minutes, withdraw a portion of the solution under test, and centrifuge immediately. Using 5.0 mL of the clear supernatant, proceed as directed for Standard solution, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution, the Test solution, and the Reagent blank into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ dissolved by the formula:

$$
827.1 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is defined under the Standard stock solution; and $r_{U}$ and $r_{s}$ are the peak areas obtained from the Test solution and the Standard solution, respectively. [NOTE-827.1 is the molecular weight conversion factor $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right.$ ) $\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2}$ ) multiplied by the volume of the Medium ( 900 mL ).]

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ is dissolved in 15 minutes. Tablets labeled for weekly dosing: not less than $75 \%(Q)$ of the labeled amount of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ is dissolved in 15 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Assay- <br> Mobile phase Prepare a 7.2 mM solution of nitric acid im <br> HPLC grade water.

System suitability solution-Prepare a solution of USP
Alendrenate Sodium RS and sodium biphesphate in HPLC grade water containing 0.2 mg per mL and 0.1 mg per mL , respectively.

Standerd preparation-Prepare a solution-of USP Alen dronate Sodium-RS in HPLC grade water having a known eoneentration of about 0.52 mg of alendronate sodium trihy drate per mL.

Assay preparation Weigh and finely powder not fewer
than 20-Tablets. Transfer an aceurately weighed pertion of the powder, equivalent to about 100 mg of alemerenic acid, to a $250-\mathrm{mL}$ volumetric flack, discolve in HPLC grade water, senieate for 30 mintutes, and shake for 10 mintutes. Bilute with HPLC grade water to velume, and mix. Pass a pertion of this selution through a filter having a 0.45 mm-ar finer porosity, and use the flltrate.

Chromatographic system (see Chromatography $\langle 624\rangle$ )
The liquid chromatograph is equipped with a 240 -nm detecfor and a $4.1 \mathrm{~mm} \times 25 \mathrm{em}$ columm that contains packing L53. L\#\# (see-Chromatography $\langle 624\rangle$ ). The flow rate-is about 1.6 mL per minute. Chrematograph the-System sutability solution, and record the peak responses as-directed for Procedure: the resolution, $R$, between alendronate and phesphate is not less than 2.0; the tailing factor is net mere than 1.5 ; and the relative standard deviation for replieate in jections is net mere than $2.0 \%$.

Procedure Separately inject equal-volumes (about 100 HL) of the Standard preparation and the Assay preparation into the ehrematograph, record the chrematograms, and measure the respenses for the major peaks. Caleulate the
quantity, in mg, of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{43} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ in the por tion of Tablets taken by the formula:

$$
250(249.10 / 325.12) C\left(r_{4}+r_{5}\right)
$$

in which 249.10 and 325.12 are the melecular weights of alendronic acid and alendronate sodium tribydrate, respeetively; $C$ is the eencentration, in mg per $m \mathrm{~mL}$, of alendrenate sodium tribydrate-in the Standard preparation; andrırandrs are the peak respenses obtained from the Assay preparation and the Standard preparation, respectively.

Diluent-Transfer 29.4 g of sodium citrate dihydrate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.
Buffer solution-Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0 , dilute with water to volume, and mix.
$0.1 \%$ 9-Fluorenylmethyl chloroformate solution-Transfer 250 mg of 9 -fluorenylmethyl chloroformate to a 250 mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare this solution fresh just prior to use.
Borate solution-Transfer 38.1 g of sodium borate to a $1000-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (75:20:5). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock preparation-Prepare a solution of USP Alendronate Sodium RS in diluent containing 0.03 mg of anhydrous alendronate sodium per mL .

Standard preparation-Transfer 5.0 mL of the Standard stock preparation to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube containing 5 mL of Borate solution, and mix for
about 3 minutes. Add 4 mL of $0.1 \%$ 9-Fluorenylmethyl chloroformate solution, and agitate for about 30 seconds. Allow the solution to stand at room temperature for $25 \mathrm{~min}-$ utes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 10 minutes. Use the clear upper aqueous layer.

Assay stock preparation-Transfer not fewer than 10 Tablets to a $1000-\mathrm{mL}$ volumetric flask. Add 500 mL of Diluent, shake by mechanical means for 30 minutes, and sonicate for 5 minutes. Dilute with Diluent to volume, mix, and centrifuge a portion of this solution. Quantitatively dilute a portion of the clear supernatant to a concentration in a range of 0.02 to 0.03 mg per mL .

Assay preparation-Using 5.0 mL of the Assay stock preparation, proceed as directed for Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Reagent blank-Using 5 mL of Diluent, proceed as directed for Standard preparation, beginning with "to a $50-\mathrm{mL}$ polypropylene screw-cap centrifuge tube."

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $266-\mathrm{nm}$ detector and a $4.1-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L21. The column is maintained at a constant temperature of about $35^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation, Assay preparation, and the Reagent blank into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Calculate the quantity, in mg , of alendronic acid $\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2}\right)$ in the portion of Tablets taken by the formula:

$$
0.919 D C\left(r_{U} / r_{s}\right),
$$

in which $D$ is the dilution factor for the Assay stock preparation; $C$ is the concentration, in mg per mL , of anhydrous USP Alendronate Sodium RS in the Standard stock preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively. [NOTE-0.919 is the molecular weight conversion factor $\left.\left(\mathrm{C}_{4} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{P}_{2} / \mathrm{C}_{4} \mathrm{H}_{12} \mathrm{NNaO}_{7} \mathrm{P}_{2}\right).\right]_{\mathbf{\Delta} U S P 28}$

## Briefing

Amphetamine Sulfate, USP 27 page 143 and page 443 of $P F$ 30(2) [Mar.-Apr. 2004]; Dextroamphetamine Sulfate, USP 27 page 576 and page 476 of PF 30(2) [Mar.-Apr. 2004]. A revision is proposed to increase the drying time of the benzoyl derivative formed in Identification test $A$, to assure that the sample is dry, and the melting range obtained is accurate.
(PA3: S. Salado) RTS-39348-2

## Change to read:

## Identification-

A: Dissolve about 100 mg in 5 mL of water, add 5 mL of 1 N sodium hydroxide, cool to about $10^{\circ}$, add 1 mL of a mixture of 1 volume of benzoyl chloride and 2 volumes of absolute ether, insert the stopper, and shake for 3 minutes. Filter the precipitate, wash with about 10 mL of cold water, and recrystallize from diluted alcohol: the crystals of the benzoyl derivative of amphetamine so obtained, after drying at $80^{\circ}$ for 2 homs,
-3 hours, 1 1S (USP28)
melt between $131^{\circ}$ and $135^{\circ}$, the procedure for Class $I$ being used (see Melting Range or Temperature $\langle 741\rangle$ ).
B: A solution (1 in 10) responds to the tests for Sulfate $\langle 191\rangle$.

## Change to read:

Chromatographic purity-
Diluent-Dilute 3.12 mL of phosphoric acid with water to 1000 mL .

Buffer solution-Dissolve 2.16 g of sodium 1-octanesulfonate in 1000 mL of water, and add 1.0 mL of $0.1 \%$ triethylamine solution (N).
triethylamine. $\triangle$ USP28
Mix, and adjust with phosphoric acid to a pH of 2.5 .
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (144:37:19). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard stock solution-Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in Diluent to obtain a solution having a known concentration of about 0.3 mg per mL .

Standard solution-Dilute an accurately measured volume of Standard stock solution in Diluent to obtain a solution having a known concentration of about 0.003 mg per mL .

Test solution-Transfer about 30 mg of Amphetamine Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of Diluent, sonicate for 5 minutes, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a 4.6$\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard stock solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the amphetamine peak and any adjacent peak, if any, is not less than 1.5.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Amphetamine Sulfate taken by the formula:

$$
10,000(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Dextroamphetamine Sulfate RS in the Standard solution; $W$ is the weight, in mg , of Amphetamine Sulfate taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for amphetamine obtained from the Standard solution: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

## Related compounds-

Buffer solution, Solution A, Solution B, Mobile phase, and Standard preparation-Proceed as directed in the Assay under Atracurium Besylate.

System suitability solution-Heat a portion of the Standard preparation at $90^{\circ}$ for 30 minutes, and chill immediately to about $5^{\circ}$.

Diluted standard preparation-Dilute a portion of the Standard preparation quantitatively, and stepwise if necessary, with Solution $A$ to obtain a solution having a known concentration of about 0.02 mg per mL .

Test preparation-Use the Assay preparation.
Chromatographic system-Prepare as directed for Chromatographic system in the Assay. Chromatograph the System suitability solution and the Diluted standard preparation, record the chromatograms, and measure the responses for the degradation products by comparing the peak responses of the System suitability solution to those of the Diluted standard preparation as directed for Procedure: the retention times relative to the atracurium besylate cis-cisisomer are about 0.22 for the acidic compound, 0.29 for laudanosine, 0.44 and 0.50 for the trans- and cis-isomers, respectively, of the hydroxy compound, and about 1.28 and 1.33 for the trans- and cis-isomers, respectively, of the monoacrylate.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Diluted standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the peak responses, except the peak due to benzenesulfonic acid occurring at a retention time of about 0.08 relative to the atracurium besylate cis-cis-isomer. Calculate the percentage of each impurity in the portion of Test preparation taken by the formula:

$$
100(C / \mathrm{M})\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Atracurium Besylate RS in the Diluted standard preparation; $M$ is the concentration of atracurium besylate, in mg per mL , in the Test preparation; $r_{i}$ is the peak response for each impurity obtained from the Test preparation; and $r_{s}$ is the sum of the responses of all the peaks obtained from the Diluted standard preparation: not more than $6.0 \%$ of the acidic compound, not more than $6.0 \%$ of the combined cis- and trans-isomers of the hydroxy compound, not more than $3.0 \%$ of laudanosine, and not more than $3.0 \%$ of the combined cis- and trans-isomers of the monoacrylate, them $0.5 \%$ of other known impurities
-and not more than $2.0 \%$ of other known synthetic impur-
ities ${ }_{\text {1S (USP28) }}$
is found; not more than $0.1 \%$ of any other impurity is found; and not more than $15.0 \%$ of total impurities is found.

## Assay-

Buffer solution, Solution A, Solution B, Mobile phase, and Standard preparation - Proceed as directed in the Assay under Atracurium Besylate.

Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 50 mg of atracurium besylate, to a $50-\mathrm{mL}$ volumetric flask, dilute with Solution $A$ to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a 4.6$\mathrm{mm} \times 25-\mathrm{cm}$ column that contains base-deactivated packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution $A$ <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 80 | 20 | equilibration |
| $0-5$ | 80 | 20 | isocratic |
| $5-15$ | $80 \rightarrow 40$ | $20 \rightarrow 60$ | linear gradient |
| $15-25$ | 40 | 60 | isocratic |
| $25-30$ | $40 \rightarrow 0$ | $60 \rightarrow 100$ | linear gradient |

Chromatograph replicate injections of the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for the atracurium besylate trans-trans-isomer, 0.9 for the cis-trans-isomer, and 1.0 for the cis-cisisomer; the resolution, $R$, between the atracurium besylate trans-trans-isomer and the cis-trans-isomer and between the atracurium besylate cis-trans-isomer and the cis-cis-isomer is not less than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the three atracurium besylate isomer peaks. Calculate the quantity, in mg, of atracurium besylate $\left(\mathrm{C}_{65} \mathrm{H}_{82} \mathrm{~N}_{2} \mathrm{O}_{18} \mathrm{~S}_{2}\right)$ in each mL of the Injection taken by the formula:

$$
50(C N) 10 C\left(r_{\llcorner }+r_{n}\right)
$$

$$
{ }^{\mathbf{\Delta}} 50(C / V)\left(r_{U} / r_{S}\right), \mathbf{\Delta U S P 2 8}
$$

in which $C$ is the concentration, in mg per mL , of USP Atracurium Besylate RS in the Standard preparation; $V$ is the volume, in mL , of Injection taken for the Assay preparation; and $r_{U}$ and $r_{S}$ are the sums of the peak responses of the atracurium besylate trans-trans, trans-cis, and cis-cis-isomers obtained from the Assay preparation and the Standard preparation, respectively.

## Briefing

Benzocaine, USP 27 page 217. It is proposed to revise the Assay with a newer method by replacing the current titration with a reverse phase HPLC procedure. It is proposed to change the upper assay limits in the Definition from 101.0 percent to 102.0 percent, based on the precision requirement of the proposed HPLC Assay procedure. The HPLC method was validated using a YMC phenyl brand of L11 column; benzocaine elutes at approximately 9 minutes.
(PA1: KAR) RTS-40722-1

## Change to read:

» Benzocaine, dried over phosphorus pentoxide for 3 hours, contains not less than 98.0 percent and not more than 101.0

- 102.0 $\mathbf{n}_{1 S}$ (USP28) percent of $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{2}$.

## Change to read:

Assay- Pissolve about 300 mg of Benzoeaine, previously dried and aceurately weighed, in a mixture of 100 mL of water and 15 mL of hydrechloric acid. Cool the solution in an ice bath to about $10^{\circ}$, and titrate with 0.1 M sodium nitrite VS until a blue color is produced immediately when the titrated solution-is applied on stareh iodide paper. When the titration is complete, the endpeint is reproducible after the mixture has been allowed to stand for 5 mintutes. Perform a blank determination, and make any necessary eorrection. Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of $\mathrm{C}_{9} \mathrm{H}_{4} \mathrm{NO}_{2}$.
-Aqueous solution-To 980 mL of water, add 20 mL of acetic acid and 1 mL of triethylamine, and mix well. The pH should be between 2.95 and 3.0 , adjust as needed.
Mobile phase-Prepare a filtered and degassed mixture of Aqueous solution and methanol ( $60: 40$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Benzocaine RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.024 mg per mL .

Assay preparation-Transfer about 24 mg of Benzocaine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Dilute 10 mL of this solution with Mobile phase to 100 mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $285-\mathrm{nm}$ detector and a $2.0-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L11. The flow rate is about 0.2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor of the benzocaine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the benzocaine peaks. Calculate the quantity, in mg, of $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{2}$ in the portion of Benzocaine taken by the formula:

$$
1000 C\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentrations, in mg per mL, of USP Benzocaine RS in the Standard preparation; $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and Standard preparation, respectively; and the factor of 1000 is for the dilution factor for the Assay preparation. $\quad$ 1S (USP28)

## Briefing

Bupropion Hydrochloride Extended-Release Tablets, USP 27 page 280 and page 3047 of the First Supplement. It is proposed to add two Drug release tests to this monograph because the FDA recently approved two generic versions of this product. In the absence of any adverse comment, it is proposed to implement this revision via the Fifth Interim Revision Announcement pertaining to $U S P$ 27-NF 22, with an official date of October 1, 2004.
(BPC: M. Marques) RTS—39935-1; 40495-3

## Add the following:

${ }^{\bullet}$ Labeling-When more than one Drug release test is given, the labeling states the Drug release test used only if Test 1 is not used.es

## Change to read:

Drug release $\langle 724\rangle$ -
${ }^{\bullet}$ TEST $1-\bullet 5$
Medium: ${ }^{\bullet}$ water; 900 mL .

Apparatus 2: 50 rpm .
Times: 1, 4, and 8 hours.
Procedure- Determine the amount of $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{ClNO} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm , using a $1.0-\mathrm{cm}$ cell, on filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same Medium.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{ClNO} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Ac ceptance Table $1\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $25 \%$ and $45 \%$ |
| 4 | between $60 \%$ and $85 \%$ |
| 8 | not less than $80 \%$ |

- TEST 2-If the product complies with this test, the labeling indicates that it meets USP Drug release Test 2.
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid, $\mathrm{pH} 1.5 ; 900 \mathrm{~mL}$.
Apparatus 1: 50 rpm .
Times: $1,2,4$, and 6 hours.
Determine the percentages of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{ClNO} \cdot \mathrm{HCl}$ dissolved by employing the following method.

Buffer solution-Dissolve 3.45 g of sodium phosphate monobasic monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of $2.80 \pm 0.05$.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and methanol ( $65: 35$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard solution-Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in Medium, and dilute quantitatively, and stepwise if necessary, with Medium to obtain a solution having a known concentration similar to the one expected in the Test solution.
Test solution-Use portions of the solution under test, and pass through a $0.45-\mu \mathrm{m}$ nylon filter.
Chromatographic system (see Chromatography $\langle 621\rangle$ — The liquid chromatograph is equipped with a 298 -nm detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromato-
graph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.

Tolerances-The percentages of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{ClNO} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table $1\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $25 \%$ and $50 \%$ |
| 2 | between $40 \%$ and $65 \%$ |
| 4 | between $65 \%$ and $90 \%$ |
| 6 | not less than $80 \%$ |

TEST 3-If the product complies with this test, the labeling indicates that it meets USP Drug release Test 3.

Medium, Apparatus, and Procedure-Proceed as directed for Test 1 , except using the wavelength of about 250 nm .

$$
\text { Times: } 1,2,4 \text {, and } 6 \text { hours. }
$$

Tolerances: The percentages of the labeled amount of $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{ClNO} \cdot \mathrm{HCl}$ dissolved at the times specified conform to Acceptance Table $1\langle 724\rangle$.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $30 \%$ and $55 \%$ |
| 2 | between $50 \%$ and $75 \%$ |
| 4 | between $70 \%$ and $90 \%$ |
| 6 | not less than $80 \%$ |

## Briefing

Carbidopa, USP 27 page 327. To improve laboratory efficiency, it is proposed to revise Identification test $B$ by replacing the existing UV absorption test with an HPLC test, which uses data obtained in the Assay.
(PA3: S. Salado) RTS-40892-1

## Change to read:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$.
B: Ultaviolet Abserption $\langle 197 \mathrm{U}\rangle$ -
Solution: -40 ne per mL.
Hedinm: hydrechloric acid in methand ( 4 in 100). Absorptiv ities at 282 nm , caleulated on the dried basis, do net differ by more than $3.0 \%$.
-B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay. ${ }^{15}$ (USP28)

## Briefing

Methionine C 11 Injection, USP 27 page 332 and page 468 of PF 30(2) [Mar.-Apr. 2004]. The proposal to revise the Definition to allow alternative labeling chemistry is now republished as a proposal to implement the revision via the Fourth Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of August 4, 2004.
(RMI: A. Wilk) RTS-40885-1

## Delete the following:

## Change to read:

» Methionine C 11 Injection is a sterile isotonic solution, suitable for intravenous administration of $\pm[1-$ ${ }^{4}$ C] methionine,
${ }^{\bullet} \mathrm{L}\left[{ }^{11} \mathrm{C}\right]$ methionine, ${ }^{\circ}$
in which a portion of the molecules are labeled with radioactive ${ }^{11} \mathrm{C}$. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ${ }^{11} \mathrm{C}$ expressed in MBq (or in mCi ) at the time indicated in the labeling. It may contain preservatives and stabilizers.

## Briefing

Carboxymethylcellulose Sodium Suspension, page 8088 of PF 25(3) [May-June 1999]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with modifications to In-Process Revision.
(CRX: C. Okeke) RTS-41007-1

## Add the following:

## ■Carboxymethylcellulose Sodium Suspension

» Carboxymethylcellulose Sodium Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled content of Carboxymethylcellulose Sodium in 100 mL of Sus-
pension. Prepare Carboxymethylcellulose Sodium Suspension of the designated percentage strength as follows (see Phatmacy Compothding Pr- (H64〉 Pharmaceutical Compounding—Nonsterile Preparations $\langle 795\rangle$ ):

Carboxymethylcellulose Sodium
(medium viscosity, between 400
and 1500 cps )
for $0.25 \%$ Suspension . . . . . . . 250 mg
for $0.5 \%$ Suspension . . . . . . . . $\quad 500 \mathrm{mg}$
for $1.0 \%$ Suspension . . . . . . . . $\quad 1.0 \mathrm{~g}$
Methylparaben. . . . . . . . . . . . . . . 120 mg
Purified Water, a sufficient quantity
to make. . . . . . . . . . . . . . . . . . $\quad 100 \mathrm{~mL}$
Dissolve the Methylparaben in 50 mL of Purified Water maintained at a temperature of $70^{\circ}$ to $80^{\circ}$. Slowly add the Carboxymethylcellulose Sodium to the hot solution while continuously stirring. Add sufficient refrigerated Purified Water (temperature $15^{\circ}$ or lower) to obtain 100 mL of suspension, and mix to produce the Suspension.

Packaging and storage-Preserve in tight, light-resistant containers. Store at room temperature or in a refrigerator.

Labeling-Label it to state, as part of the official title, the content of Carboxymethylcellulose Sodium expressed as a percentage. Label it also to indicate the viscosity, in centipoises, of the Carboxymethylcellulose Sodium taken for the Suspension. The label states that Carboxymethylcellulose Sodium Suspension is to be well shaken.

Beyond-use date-Fourteen days after the day on which it was compounded.

## Compliance assay-[To come.] $]_{\text {1S (USP28) }}$

## Briefing

Ciclopirox Olamine, USP 27 page 448 and page 3049 of the First Supplement. It is proposed to make a minor editorial revision to clarify the Procedure in the test for Related compounds.
(PA7b: B. Davani) RTS-40899-1

## Change to read:

${ }^{4}$ Related compounds-[NOTE-Carry out the operations avoiding exposure to actinic light. All materials that are in direct contact with Ciclopirox Olamine (i.e, column materials, reagents, solvents, etc.) should contain only very low amounts of extractable metal cations.]

Mobile phase-Prepare a filtered and degassed mixture of an edetate disodium solution ( 0.96 in 1000), acetonitrile, and glacial acetic acid (770:230:0.1). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Rinsing solution-Prepare a mixture of water, acetonitrile, glacial acetic acid, and acetylacetone (500:500:1:1).

Standard stock solution-Dissolve 15 mg of USP Ciclopirox Related Compound A RS and 15 mg of USP Ciclopirox Related Compound B RS, accurately weighed, in 1 mL of acetonitrile and 7 mL of Mobile phase. Dilute the solution thus obtained to 10.0 mL with Mobile phase to obtain a solution having a known concentration of 1.5 mg of each USP Reference Standard per mL.

Standard solution A-Dilute 1.0 mL of Standard stock solution to 200.0 mL with a mixture of Mobile phase and acetonitrile $(9: 1)$. Standard solution B-Dilute 2.0 mL of Standard solution A to 10.0 mL with a mixture of Mobile phase and acetonitrile $(9: 1)$.

Test solution-Dissolve 40 mg of Ciclopirox Olamine, accurately weighed, in a mixture of 2 mL of acetonitrile, $20 \mu \mathrm{~L}$ of glacial acetic acid, and 15 mL of Mobile phase. If necessary, use an ultrasonic bath to dissolve. Dilute with Mobile phase to 20.0 mL , and mix.

Resolution solution-Mix 5 mL of Standard stock solution with 5 mL of the Test solution.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 298 nm and a $4.0-\mathrm{mm} \times 8-\mathrm{cm}$ column that contains packing L10. [NOTE-Ciclopirox related compound A has an intense absorbance at 220 nm and 6-cyclohexyl-4-methyl$2(1 H)$-pyridone, ciclopirox related compound B , and ciclopirox have intense absorbances at 298 nm .] The flow rate is about 0.7 mL per minute. Chromatograph the Resolution solution at 298 nm , and record the peak responses as directed for Procedure: the resolution between the ciclopirox related compound B peak and
ciclopirox peak is not less than 2.0. Chromatograph the Standard solution $B$ at 298 nm , and record the peak responses as directed for Procedure: the chromatogram obtained shows at 298 nm a peak corresponding to ciclopirox related compound B with a signal-to-noise ratio of not less than 3. Chromatograph the Test solution at 298 nm , and record the peak responses as directed for Procedure: the tailing factor for the ciclopirox peak is less than 2.0 .

Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of Standard solution A, Standard solution B, and the Test solution into the chromatograph, and record the chromatograms. [NOTE-In order to ensure desorption of disruptive metal ions, every new column must be rinsed with the Rinsing solution over a period of not less than 15 hours and then with the Mobile phase for not less than 5 hours with a flow rate of 0.2 mL per minute. The chromatographic run time is not less than 2.5 times the retention time of the ciclopirox peak.] The relative retention times are about 0.5 for ciclopirox related compound A, 0.9 for 6-cyclohexyl-4-methyl-2 $(1 H)$-pyridone, 1.0 for ciclopirox, and 1.3 for ciclopirox related compound B. The peak response at 220 nm of the ciclopirox related compound A peak in the chromatogram obtained from the Test solution is not more than the peak response at 220 nm of the corresponding peak in the chromatogram obtained from Standard solution $A$ ( $0.5 \%$ with reference to ciclopirox). The sum of responses at 298 nm of the
$\boldsymbol{m i m p u r i t y}_{\mathbf{m}_{1 S}}{ }_{\text {(USP28) }}$
peaks in the chromatogram obtained from the Test solution is not more than the peak response at 298 nm of the ciclopirox related compound B peak in the chromatogram obtained from Standard solution $A(0.5 \%$ with reference to ciclopirox). At 298 nm disregard any peak due to the solvent and any peak with a response less than the response of the ciclopirox related compound B peak in the chromatogram obtained from Standard solution B at $298 \mathrm{~nm}(0.1 \%$ with reference to ciclopirox). $\mathbf{\Delta U S P 2 7}$

## Briefing

Ciprofloxacin Injection, USP 27 page 456 and page 473 of $P F$ 30(2) [Mar.-Apr. 2004]. It is proposed to make a minor editorial revision to clarify the Procedure in the test for Limit of ciprofloxacin ethylenediamine analog.
(PA7b: B. Davani) RTS-40898-1

## Change to read:

» Ciprofloxacin Injection is a sterile solution of Ciprofloxacin
$\Delta^{\text {or Ciprofloxacin Hydrochloride }}{ }_{\Delta U S P 28}$
in Sterile Water for Injection, in 5 percent Dextrose Injection, or in 0.9 percent Sodium Chloride Injection prepared with the aid of Lactic Acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ciprofloxacin $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{FN}_{3} \mathrm{O}_{3}\right)$.

## Change to read:

Limit of ciprofloxacin ethylenediamine analog-
Mobile phase and Chromatographic system-Proceed as directed in the Assay under Ciprofloxacin.

Standard preparation, Resolution solution, and Assay prepara-tion-Proceed as directed in the Assay for ciprofloxacin.

Procedure-Proceed as directed for Procedure in the Assay for ciprofloxacin. Calculate the percentage of ciprofloxacin ethylenediamine analog from the chromatogram obtained from the Assay preparation in the Assay for ciprofloxacin by the formula:

$$
100\left[0.7 r_{A} /\left(0.7 r_{A}+r_{C}\right)\right]
$$

in which 0.7 is the respense
$\mathbf{■}_{\text {correction }}^{1 \mathrm{IS} \text { (USP28) }}$
factor for ciprofloxacin ethylenediamine analog; relative to that of eiprofloxacin

## -1S (USP28)

and $r_{A}$ and $r_{C}$ are the responses of the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak, respectively. It contains not more than $0.5 \%$ of ciprofloxacin ethylenediamine analog.

## Briefing

Clonidine Transdermal System, page 84 of $P F 30(1)$ [Jan.Feb. 2004]. The USP Clonidine RS is corrected. Editorial style changes have also been made.
(PA5: A. Wilk) RTS-40494-1

## Add the following:

## Clonidine Transdermal System

» Clonidine Transdermal System contains not less than 80.0 percent and not more than 120.0 percent

Of the labeled amount of clonidine $\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}\right) .2 .0 \mathrm{mg}$ and not more than 3.0 mg of elonidine, if labeled to deliver 0.1 mg of clonidine per day for one week; not less than 4.0 mg and not more than 6.0 mg of clonidine, if labeled to-deliver 0.2 mg of clonidine per day for one week; and not less than 6.0 mg and not more than 9.0 mg of clenidine, if labeled to deliver 0.3 mg - $f$ elonidine per day for one week. 80.0 percent and not more than 120.0 percent of the labeled amount of clonidine $\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}\right)$.

Packaging and storage-Preserve in sealed, single-dose containers at a temperature not exceeding $30^{\circ}$.

Labeling-The label states the total amount of clonidine in the Transdermal System and the release rate, in mg per day, for the duration of the application of one system.

USP Reference standards $\langle 11\rangle$ —USP Clonidine Hydroehloride RS. USP Clonidine Related Compound B RS.

NOTE-Throughout the following procedures, avoid the use of tetrahydrofuran stabilized with butylated hydroxytoluene (BHT). In the presence of peroxides, BHT may react with clonidine, producing impurity peaks.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
pH 9.2, 2 M Tris buffer—Dissolve 121.14 g of tris-(hydroxymethyl)aminomethane in 500 mL of water. Adjust with dilute hydrochloric acid to a pH of 9.2.

Test specimen-Carefully peel the release liner from each Transdermal System, and place a number of Transdermal Systems, equivalent to about 25 mg of clonidine, into a $50-\mathrm{mL}$ screw-capped centrifuge tube. Add 5 mL of chloroform, and using a vortex mixer, mix for 5 minutes. Let stand for 30 minutes, and mix intermittently using a vortex mixer.

Transfer the chloroform solution to another $50-\mathrm{mL}$ centrifuge tube, and wash the residue with an additional 3 mL of chloroform, combining the extracts. Add 2 mL of 0.5 N hydrochloric acid to the extract, mix on a vortex mixer for 1 minute, and centrifuge at about 1000 rpm for 4 minutes. Remove and discard the bottom chloroform layer. Extract the aqueous layer with 4 mL of chloroform. Centrifuge at about 1000 rpm for an additional 5 minutes and again discard the bottom chloroform layer. Add 5 mL of $\mathrm{pH} 9.2,2$ M Tris buffer and 3 mL of methylene chloride. Mix on a vortex mixer for 1 minute. Centrifuge at about 1000 rpm for 4 minutes. Transfer the bottom methylene chloride layer into a $100-\mathrm{mL}$ beaker, and dry the methylene chloride with anhydrous sodium sulfate (about $1 / 4$ liquid height). Decant, and evaporate to dryness with a stream of nitrogen. Dry at $105^{\circ}$ for 30 min utes, and allow to cool in a desiccator.

## Spectal range: 3500 to $3600 \mathrm{~cm}^{-1}$.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Uniformity of dosage units $\langle 905\rangle$ : meets the requirements.

## Drug release $\langle 724\rangle$ -

Medium: $\quad 0.001 \mathrm{M}$ phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; 160 mL 200 mL for systems containing more than 5 mg of clonidine.

Times: $8,24,96$, and 168 hours.
Apparatus 7-Proceed as directed in the chapter, [Sizef sample holder using the transdermal system holder-angled disk (see Figure 7a). To prevent overhang, choose the appropriate size of the holder, 1.42 or 1.98 inches, based on the size of the system. Use $100-\mathrm{mL}$ beakers for Medium volumes of $80-\mathrm{mL}$ and $300-\mathrm{mL}$ beakers for Medium volumes of 200 mL . Gently press the Transdermal

System to a dry, smooth, square piece of cellulose membrane ${ }^{*}$, or equivalent, with the adhesive side against the membrane. Attach the membrane system to a suitable inert sample holder with a Viton O-ring, or equivalent, such that the backing of the system is adjacent to, and centered on, the bottom of the sample holder. Trim the excess of cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker such that each system is continuously immersed in a beaker containing the specified volume of Medium. The filled beakers are weighed and preequilibrated to $32.0 \pm 0.3^{\circ}$ prior to immersing the test sample. Agitate the sample in an up-down motion at a frequency of 30 cycles per minute with an amplitude of $2.0 \pm 0.1 \mathrm{~cm}$. The Medium must be added daily to the beakers during each interval to maintain sample immersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of Medium, weighed and pre-equilibrated to $32.0 \pm 0.3^{\circ}$.

Determine the amount of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released by employing the following method.
Solvent Dissolve 2.04 g of menebasic petassitum phesphate and 2.88 g of 1 pentanesulfonic acid sodium 1 penta fesulfonate in 300 mL of water. Adjust with phospherie

```
acid to a pH of 3.5.
```

Mobile phase -Prepare a filtered and degassed mixture of Solvent and methanol(26:14). Make adjustments if neeessary (see System Suitability under Chromatography $\langle 621\rangle$ ). Use a filtered and degassed $0.1 \%$ solution of triethylamine in a mixture of water and methanol ( $70: 30$ ), and adjust with phosphoric acid to a pH of $6.0 \pm 0.2$. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

[^93]Fest solution At each of the test times, withdraw a 10 mL aliquet of the solution from each container.

Standetrd solution Prepare a solution of USP Clonidine
Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of clonidine similar to that of the Test

## soltition.

System suitability solution-Prepare a solution of USP Clonidine Hydrochloride RS in 0.001 M phosphoric acid having a known concentration of about $10 \mu \mathrm{~g}$ per mL .

Standard solutions-Prepare a minimum of four standard solutions of USP Clonidine Hydrechloride RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the Test solutions.

Test solutions-At the end of each release interval, allow the beakers to cool to room temperature, and make up for evaporative Medium losses by adding Medium to obtain the original weight. Mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210 \mathrm{~nm} 220-$ nm detector and a $4.0 \mathrm{~mm} \times 30 \mathrm{~cm} 4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the tailing factor is not more than $\geq 2.0$; the capacity factor is not less than 0.5 ; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \pm 25 \mu \mathrm{~L}$ ) of filtered portions of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Construct a standard curve of concentration ( $\mu \mathrm{g}$ per mL ) of clonidine in the Standard solutions versus peak area
by linear regression analysis. The correlation coefficient is not less than 0.995 . Calculate the release rate of clonidine by the formula:

## CV/TA,

in which $C$ is the concentration, $\mu \mathrm{g}$ per mL , of clonidine in the sample obtained from the standard curve; $V$ is the volume, in mL , of the Medium; $T$ is the time, in hours; and $A$ is the area, in $\mathrm{cm}^{2}$, of the transdermal system.

## Tolerances - The amme of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released,as a per-

 eentage of the labeled amemn of the dose absorbed in vive, as us per hour per $\mathrm{cm}^{2}$, at the time specified eonforms to Aceeplate Table 4.| Time (heurts) | Ameunt dissolved |
| :---: | :---: |
| 8 | between 28\% and 68\% |
| 96 | between 116\% and 288\% |
| 168 | been 170\% and 357\% |
| Time (hours) | Amount dissolved ( $\mathrm{\mu g} / \mathrm{h}-$ $\mathrm{em}^{2}+$ |
| 8 | between 7.5 and 16.0 |
| 24 | between 1.5 and 6.0 |
| 96 | between 1.5 and 4.6 |
| 168 | been 1.5 and 3.3 |

The ameunt of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ released, as a percentage of the tabeled amount of the dose absorbed in vive, as $\mu \mathrm{g}$ per hour per $\mathrm{cm}^{2}$, at the times specified conforms to Acceptance Table 4. The release rate of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ from the Transdermal System, expressed as $\mu \mathrm{g}$ per hour per $\mathrm{cm}^{2}$ at the times specified, conforms to Acceptance Table 4.

| Time <br> (hours) | Time for sampling <br> (hours) | Ameme dissolved Re- <br> lease rate $\left(\mu \mathrm{g} / \mathrm{h} / \mathrm{cm}^{2}\right)$ |
| :---: | :---: | :---: |
| $0-8$ | 8 | between 7.5 and 16.0 |
| $8-24$ | 24 | between 1.5 and 4.6 |
| $24-96$ | 96 | between 1.5 and 4.6 |
| $96-168$ | 168 | between 1.5 and 3.3 |

## Chromatographie purity -Related compounds-

Buffer solution Dissolve 2.0 of sodilum 1 pentanesut fenate, 13.61 g of menebasic petassitm phesphate, and 2 mL of triethylamine in about 1000 mL of water in a 2 liter velumetric flask, adjust with phespheric acid to a pH of $4.0 \pm 0.1$, dilute with water to volume, and mix.

Mebile phase Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $1: 1$ ), and, if necessaty, at just with phespheric acid to apHef $4.5 \pm 0.1$. Make adjust ments if necessary (see System Suitability under Chromatograplyy $\langle 624\rangle$ ).

Piltent 1. Dissolve 1 mL of triethylamine in about 800 mL of water in a 1 - liter volumetric flask, adjust with phesphoric acid to a pH of $10.0 \pm 0.1$, dilute with water to ve fame, and mix. Transfer this solution to a 2 - liter volumetrie flask, dilute with acetonitrile to volume, and mix.

Bithent 2 Dissolve 1 mL of triethylamine and 4.36 g of dibasic petassium phesphate in about 800 mL of water in a Hiter volumetrie flask, adjust with phesphorie acid to a pH of $10.0 \pm 0.1$, dillute with water to veltame, and mix. Transfer this selution to a 2 liter volumetric flask, dilute with acet enitrile to volume, and mix.

Standard solation Dissolve an aceurately weighed quantity of USP Clonidine Hydrechloride RS in Diltent 1 to obtain a solution having a known concentration of about $\theta .1 \mathrm{mg}$ per ml . Dilute an aceurately measured volume of this solution quantitatively with Diltuent 2 to obtain a solth
tion having a known concentration of about $16.2 \mu \mathrm{~g}$ of USP Clenidine-Hydrechloride-RS per mL (equivalent to about 14.0 ng of clenidine per mL ).

Fest solution-Carefully peel the release liner from each Transdermal System, and place a number of Transdermat Systems, equivalent to about 15 mg of clenidine, into a 150 mL polytef lined serew cap tabe. Add 30 mL of $n$ heptane, cap, and mix on a vortex mixer for 2 minutes. Allow to stand for about 3 hours, but every 30 mintutes during this period mix on a vortex mixer until the Transdermal Systems are delaminated. Add 0.3 mL of methanol and 45 mL of 0.01 N sulfuric acid, shake for at least 2 minutes, and centriftge. Retain the $n$ heptane layer, and transfer the aqueens stipernatant layer to a second $150-\mathrm{mL}$ polytef lined serew eap tube. Add 9 mL of ammonitum hydroxide to the aqueous stpernatant layer, and mix. Extract the $n$-heptane layer with an additional 45 mL of 0.01 N sulftric acid for at least 2 minutes, and combine this aqueous supernatant layer with the first aqueous layer in the $150-\mathrm{mL}$ polytef lined serew eap tube. [NOTE The total length of time of extraction with $\theta .01 \mathrm{~N}$ sulfuric acid-should not exceed 1 heur to avoid degradation of any related impurity that may be present.] Ex tract the aquerus layer by shaking vigerously for 2 mintutes with each of $30-\mathrm{mL}$ pertions of chloreform, collecting thechloreform extracts in a 150 -mL pelytef lined serew eap tube. Evaperate the chloreform extracts under nitrogen to dryness, and dissolve the residtue in 15.0 mL of Diltuent 2. Chromatographic system (see Chromatography $\langle 624\rangle$ ) The liquid chrematograph is equipped with a 210 - nm detec for and a $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ coltum that contains packing L10. The flow rate is about 1 mL per minte. Chromatograph the Statatad solttion, and record the peak responses as directed for Proedtre: the coltuma efficiency is not less
than- 4000 theoretieal plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate in jections is net mere than $2.0 \%$.

Procedure Separately inject equal volumes (about 20 HE) of the Statedted soltion and the Test solution into the ehromatograph, record the chromatograms, and meastre the peak responses. Calculate the pereentage of each impurity in the Transdermal Systems taken by the formula:-

$$
(230.10 / 266.56)(1.5 \mathrm{C} / \mathrm{NL})\left(+_{4}++_{s}\right),
$$

in whieh 230.10 and 266.56 are the molecular weights of elonidine and clonidine hydrechloride, respectively, $C$ is the concentration, in ehloride RS in the Standard solution; $N$ is the number of Transtermal Systems taken to prepare the Test solution; I is the labeled amount, in mg, of clonidine in each Transdermal System taken; $r_{t}$-is the peak respense for each impurity ebtained from the Test solution; and $x_{s}$ is the clonidine peak respense obtained frem the Standard solution: not more than $1.4 \%$ of total impurities is found. not mere that $1.4 \%$ of any impurity is feund, and not more than $2.4 \%$ of total impurities is found.

Mobile phase, Diluent, System suitability solution, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Clonidine Related Compound B RS in tetrahydrofuran, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1 mg per mL . Prepare a minimum of four Standard solutions in Diluent that bracket the expected clonidine related compound B concentration in the sample. The standard concentrations should be within the range of 0.2 to $10.0 \mu \mathrm{~g}$ per mL . [NOTE-Standard solutions are stable for up to 2 days if stored at $4^{\circ}$.]

Test solution-Use the Assay preparation, prepared as directed in the Assay.
Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of at least three Standard solutions that will bracket the expected sample concentration range and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the clonidine related compound B. Calculate the peak response ratios of the analyte, and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient; it should be not less than 0.995 . Determine the concentration of the clonidine related compound B. Calculate the amount, in $\mu \mathrm{g}$ per $\mathrm{cm}^{2}$, of the clonidine related compound B in the portion of the Transdermal System taken by the formula:

## CV/A,

in which $C$ is the concentration of clonidine related compound B , in $\mu \mathrm{g}$ per mL , obtained from the linear regression analysis; $V$ is the volume of the Test solution in mL ; and $A$ is the area of the sample system in $\mathrm{cm}^{2}$. Not more than $10.0 \mu \mathrm{~g}$ per $\mathrm{cm}^{2}$ of clonidine related compound $B$ is found.

## Assay-

Mobile phase Prepare a filtered and degassed mixtare of sodium 1-pentanesulfonate and methanol $(63: 36)$. Make adjustments if necessary (see System-Suitability under Chromatography $\langle 621$ ) .

Standard prepatation- Dissolve an aceurately weighed quantity of USP Clonidine Hydrochloride RS in 0.01N sut furic acid, and dilute quantitatively, and stepwise if necessary, with 0.01 N sulfuric acid to obtain a solution having a known concentration of about $46 \mu$ p per mL. 0.046 T per mL (equivalent to about $0.040 T$ of clonidine per mL ), $T$ being the total amount, in mg, of clonidine in each Transder-mal-System.

Assay preparation Carefully peel the release liner frem 1 Transdermal System, and cut the Transdermal System inte segments. Quantitatively transfer the-segments into an appropriate polytef lined serew cap centrifuge tube, add 10 mL of 0.01 N sulfuric acid sattrated with $n$ heptane, acet rately measured, cap, and heat to $60^{\circ}$ for 3 hours. Add 10 mL of $n$-heptane, cap, shake vigoreusly for 1 mintute, and heat to $60^{\circ}$ for about 16 hours. Allow the solution to-coel 6-roem temperature, add 15 mL of 0.01 N sulfuric acid sa ferated with $n$-heptane, cap, and mix in a vertex mixer for about 2 mintites. Allow to separate, and filter the aqueous layer. [NOTE If backing membrane has not delaminated, repeat with a new Transtermal System.] Use the aqueens layer as the Assay preparation.

Chromatographic system(see-Chrematography- $\langle 621\rangle$ )The liquid chromatograph is equipped with a 210 nm-detec tor, a $3.9-\mathrm{mm} \times 2 \mathrm{~cm}$ guard coltmm that contains packing L 2 , and a $3.9 \mathrm{~mm} \times 30 \mathrm{em}$ coltumm that contains packing E1. The flow rate is about 1.5 mL per minute. Chremate graph the Standard preparation, and record the peak respenses as directed forProcedtre: the tailing factor is net mere than 2.0 ; and the relative standard deviation for replieate injections is not more than $2.0 \%$.

Procedure Separately inject equal volumes (about 50 HL) of the Standtrd preparation and the Assay prepatation inte the-chremategraph, record the-chremategrams, and measure the respenses for the major peaks. Caleulate the quantity, in $\mu$ g, of clenidine $\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}\right)$ in the Transtermat System taken by the formula:-

$$
21.58 C\left(r_{\llcorner }+r_{s}\right)
$$

$(230.10 / 266.56)(25 C)\left(r_{4}++_{s}\right)$,
in which 230.10 and 266.56 are the molecular weights of elonidine and clonidine hydrochloride, respectively; $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Clonidine Hydreehboride RS in the Standard preparation; and $t_{t}$ and $\Psi_{s}$ are the peak respenses-obtained from theAssay preparation and the Standard preparation,respectively.
Mobile phase-Dissolve 4 mL of triethylamine in 1.6 L of water, and adjust with phosphoric acid to a pH of 3.0. Add 2.4 L of acetonitrile, stir the solution for 30 minutes, filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluent-Prepare a mixture of tetrahydrofuran and methanol (1:1).

System suitability solution-Dissolve an accurately weighed quantity of USP Clonidine RS and USP Clonidine Related Compound B RS in Diluent to obtain a solution having known concentrations of about $250 \mu \mathrm{~g}$ per mL and $10 \mu \mathrm{~g}$ per mL , respectively.

Standard preparation-Dissolve a suitable amount, accurately weighed, of USP Clonidine Hydrehtride RS in tetrahydrofuran to obtain a solution having a known concentration of about 1 mg per mL . Prepare a minimum of four Standard preparations in Diluent that bracket the expected clonidine concentration in the sample. The standard concentrations should be within the range of 50 to $300 \mu \mathrm{~g}$ per mL. [NOTE-Standard preparations are stable for up to 2 days if stored at $4^{\circ}$.]

Assay preparation-Remove each Transdermal System from its package, discard the release liner from each system, and transfer into a $50-\mathrm{mL}$ centrifuge tube with a Teflon-lined screw cap. Add the appropriate volume of tetrahydrofuran indicated below. Vigorously mix on a vortex mixer until the systems are washed down and fully submerged in the tetrahydrofuran. Let the systems soak in tetrahydrofuran for about 5 minutes, and mix on a vortex mixer until the sys-
tems are completely delaminated. Allow the systems to remain submerged for an additional 60 minutes, and mix using a vortex mixer every 30 minutes. Add methanol in a volume equal to the volume of tetrahydrofuran, and mix vigorously on a vortex mixer. The solution turns milky. Centrifuge for ten minutes at 2000 rpm . Use the supernatant as the Assay preparation.

| For systems containing about 2.5 mg <br> of clonidine | 7.0 mL |
| :--- | :--- |
| For systems containing about 5.0 mg |  |
| of clonidine |  |$\quad 14.0 \mathrm{~mL}$

For systems containing about 7.5 mg
21.0 mL
of clonidine

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a detector capable of measuring at 210 nm and 242 nm , and a $4.6-\mathrm{mm} \times$ $15-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1 mL per minute. The detector is programmed initially to 242 nm and 210 nm after the elution of the clonidine peak but prior to the elution of the clonidine related compound B. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention time is 1.0 for clonidine and 1.5 for clonidine related compound B ; the resolution, $R$, between clonidine and clonidine related compound $B$ is not less than 2.0 ; the capacity factor, $k^{\prime}$, is not less than 0.6 for clonidine; the tailing factor for both clonidine and clonidine related compound B is not more than 3.0 ; and the relative standard deviation of the clonidine peak area for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of at least three Standard preparations that will bracket the expected sample concentration range and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the clonidine. Calculate the peak response ratios of the analyte and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient; it should be not less than 0.995 . Calculate the amount, in mg , of $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{~N}_{3}$ in the Transdermal System taken by the formula:

$$
C V / 1000
$$

in which $C$ is the concentration of clonidine, in $\mu \mathrm{g}$ per mL , obtained from the linear regression analysis; and $V$ is the volume of the Assay preparation in mL per sample system.■1S (USP28)

## Briefing

Clopidogrel Tablets. Because there is no existing USP monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the test for Related compounds and in the Assay are based on analyses performed with a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ Ultron ES-OVM column that contains $5-\mu \mathrm{m}$ packing L\#\# (see Chromatography $\langle 621\rangle$ ). The typical retention time for clopidogrel is about 4.6 minutes.
(PA5: A. Wilk; BPC: M. Marques) RTS—36201-3; 40048-2

## Add the following:

## ■Clopidogrel Tablets

» Clopidogrel Tablets contain Clopidogrel Bisulfate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clopidogrel $\left(\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{ClNO}_{2} \mathrm{~S}\right)$.

Packaging and storage-Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Clopidogrel Bisulfate RS. USP Clopidogrel Related Compound A RS. USP Clopidogrel Related Compound B RS. USP Clopidogrel Related Compound C RS.

## Identification-

A: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ -
Spectral range: 250 to 300 nm .
Solution: Use the test solution prepared as directed in the test for Uniformity of dosage units.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: $\quad \mathrm{pH} 2.0$ hydrochloric acid buffer (see Buffer solutions under Reagents, Indicators, and Solutions); 1000 mL .

Apparatus 2: 50 rpm .
Time: 30 minutes.
Standard solution-Dissolve an accurately weighed quantity of USP Clopidogrel RS in 20.0 mL of methanol, and dilute quantitatively, and stepwise if necessary, with Medium to obtain a solution having a known concentration corresponding to that of the solution under test.

Procedure-Determine the amount of $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{ClNO}_{2} \mathrm{~S}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 240 nm on filtered portions of the solution under test in comparison with the Standard solution.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{ClNO}_{2} \mathrm{~S}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Procedure for content uniformity-Using a suitable volumetric flask, place 1 Tablet in 50.0 mL of 0.1 N hydrochloric acid. Sonicate for 5 minutes, and cool. Quantitatively transfer 5.0 mL of this solution to the flask, and dilute with 0.1 N hydrochloric acid to 50.0 mL . Pass a portion of the solution through a suitable filter having a $0.45-\mu \mathrm{m}$ or finer porosity, discarding the first 5 mL . Determine the amount of clopidogrel by employing UV absorption at the wavelength of maximum absorbance at about 270 nm , in comparison with a Standard solution having a known concentration of USP Clopidogrel Bisulfate RS in 0.1 N hydrochloric acid.

## Related compounds-

Phosphate buffer and Mobile phase-Prepare as directed in the Assay under Clopidogrel Bisulfate.
System suitability solution-Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS, USP Clopidogrel Related Compound A RS, USP Clopidogrel Related Compound B RS, and USP Clopidogrel Related Compound C RS in methanol. Dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having concentrations of about $1 \mu \mathrm{~g}$ per $\mathrm{mL}, 1 \mu \mathrm{~g}$ per $\mathrm{mL}, 2 \mu \mathrm{~g}$ per mL and $3 \mu \mathrm{~g}$ per mL , respectively.

Standard solution-Dissolve accurately weighed quantities of USP Clopidogrel Related Compound A RS and USP Clopidogrel Related Compound C RS in methanol. Di-
lute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having known concentrations of about $1 \mu \mathrm{~g}$ per mL and $5 \mu \mathrm{~g}$ per mL , respectively.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of clopidogrel, to a $200-\mathrm{mL}$ volumetric flask, add 5 mL of methanol, dilute with Mobile phase to volume, and mix. Let it stand for 10 minutes, and mix. Pass a portion of this solution through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity, and use the filtrate after discarding the first 5 mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L\#\#. The flow rate is about 1.0 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between clopidogrel and each of the two enantiomers of clopidogrel related compound $B$ is not less than 2.5. [NOTEThe relative retention times are about 0.5 for clopidogrel related compound A, 0.8 and 1.2 for the two enantiomers of clopidogrel related compound $\mathrm{B}, 1.0$ for clopidogrel, and 2.0 for clopidogrel related compound C]. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $15 \%$.

Procedure-Inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of related compounds in the portion of Tablets taken by the formula:

$$
20(C / W)\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the appropriate USP Reference Standard in the Standard solution; $W$ is the weight, in mg , of clopidogrel in the portion of Tablets used to prepare the Test solution based on the labeled quantity of clopidogrel per Tablet, Tablet weight, and the weight of the portion of Tablets used; and $r_{U}$ and $r_{S}$ are the peak responses of the corresponding related compounds obtained from the Test solution and the Standard solution, respectively: not more than $0.2 \%$ of clopidogrel related compound A is found, not more than $1.0 \%$ of clopidogrel related compound C is found, not more than $0.2 \%$ of any other single impurity (excluding clopidogrel related compound B) is found, and not more than $1.2 \%$ of total impurities (excluding clopidogrel related compound $B$ ) is found.

## Assay-

Phosphate buffer, Mobile phase, System suitability solution, Standard stock solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Clopidogrel Bisulfate.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of clopidogrel bisulfate, to a $100-\mathrm{mL}$ volumetric flask, and add 50 mL of methanol. Sonicate for 5 minutes, and stir with a magnetic stirrer for 30 minutes. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to the flask, dilute with methanol to 50.0 mL , and mix. Pass a portion of this solution through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity, and use the filtrate after discarding the first 5 mL .

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the analyte peaks. Calculate the
quantity, in mg, of clopidogrel $\left(\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{ClNO}_{2} \mathrm{~S}\right)$ in the portion of Tablets taken by the formula:

$$
1000(321.82 / 419.90) C\left(r_{U} / r_{s}\right)
$$

in which 321.82 is the molecular weight of clopidogrel; 419.90 is the molecular weight of clopidogrel bisulfate; $C$ is the concentration, in mg per mL , of USP Clopidogrel $\mathrm{Bi}-$ sulfate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BriEfing

Desogestrel and Ethinyl Estradiol Tablets, page 1448 of PF 29(5) [Sept.-Oct. 2003]. It is proposed to add a second test to the Dissolution test because FDA has approved a new generic product that is bioequivalent to the Reference Listed Drug but, due to differences in the formulation, requires a new dissolution test.
(BPC: M. Marques) RTS-40002-3

## Add the following:

## ■Desogestrel and Ethinyl Estradiol Tablets

» Desogestrel and Ethinyl Estradiol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and ethinyl estradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}\right)$.

Packaging and storage-Preserve in well-closed containers.

Labeling-When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.

USP Reference standards $\langle 11\rangle-U S P$ Desogestrel $R S$. USP Desogestrel Related Competad B RS. USP Deseges trel Related Compend C RS. USP Ethinyl Estradiol RS. USP Ethinyl Estradiol Related Compennd A RS.

Thin-layer chromatographic identification test $\langle 201\rangle$ -
Adsorbent: oetadeeylsilanized ehromatographie siliea gel mixtare.

Test solution Transfer a quantity of finely ground Ta blets, equivalent to about 2.4 mg of desogestrel, to a stoppered $10-\mathrm{mL}$ centriftuge tube, add 4.8 mL of acetone, and shake vigereusly for 1 minute. Centrifuge for 5 minutes, and transfer 2.7 mL of the clear supernatant into a suitable eentainer, pretected frem light. Evaporate to dryness in a hood using nitrogen at room temperature, and dissolve the residue so obtained in 0.45 mL of methylene chloride. 0.25 mL of a mixture of hexanes, methanol, and isopropyl aleehol(90:15:5).

Standed solutions. Prepare-separate-selutions in methy lene chloride, a mixture of hexanes, methanol, and isopropyl alcohel (90: 15:5) to contain about 23 mg of USP Desegestrel RS per mL and $0.5-0.6 \mathrm{mg}$ of USP Ethinyl Estradiol RS per mL.

Application valume: $110 \mu \mathrm{~L}$.
Developing solvent system: a mixtare-of toltene-and ethyl acetate (80: 20).

Procedtre Proeed as directed in the chapter. Spray the plate with a solution of sulfuric acid in aleohel ( 1 in 50), and dry at $110^{\circ}$ for 5 to 10 mintutes. Visualize the spets under long wavelength UV light: ethinylestradiol and desogestrel exhibit $R_{x}$ values of about 0.30 and 0.58 , respectively.

Test solution-Transfer 25 Tablets to a suitable container, add 50 mL of water, and sonicate until the Tablets disintegrate (if necessary, remove any coating with water before sonication). Place the sample in a separatory funnel, add 25 mL of ether, and shake well to extract the actives. Using a glass pipet, transfer the ether layer to a clean beaker, and evaporate to about 10 mL .

Standard solution-Dissolve a quantity of USP Desogestrel RS and USP Ethinyl Estradiol RS in methanol to obtain a solution containing about 0.15 mg per mL and 0.03 mg per mL , respectively.
Application volume: $\quad 30 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform and alcohol ( $96: 4$ ).
Procedure-Proceed as directed in the chapter, and then air-dry. Spray the plate with a mixture of methanol and sulfuric acid (50:50), place in an oven at $105^{\circ}$ for about five minutes, and examine the plate: meets the requirements.

Dissolution $\langle 711\rangle$ -
TEST 1-
Medium: $\quad 0.05 \%$ soditm latryl sulfate dodecy soditm
sulfate sodium lauryl sulfate with an assay content of not less than $95 \%$; 500 mL .

Apparatus 2: 50 rpm .
Time: 30 minutes.
Determine the amounts of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and ethinyl estradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ dissolved by employing the following method.

Piltent, Soltion A, Soltion B, and Mobile phase Pro-
eeed as directed in the Assaty.
Standard solution Dissolve accurately weighed quantities of USP Desogestrel RS and USP Ethinyl Estradiol RS, and dilute quantitatively, and stepwise if necessary, with Pissolution Meditm to obtain a solution having knowneeneentrations equivalent to the expected concentrations of the
selution under test. [NOTE-A volume of acetonitrile Diltent net exceeding 6\% of the final total volume of the Standard solution may be used todissolveUSP Desogestrel RS, and a volume of a mixture of methanol and water $(90: 10)$ Diltent net exceeding $4 \%$ of the final total volume of the Standard seltition may be used to dissolveUSP Ethinyl EstradiolPS.]

Chromatographic system- Proceed as directed in the $A s$ say. Te-valuate the system-suitability requirements, use the

## Standard preparation prepared as direeted in the Assay.

Proedtre Separately inject equal volumes (about 200 HL) of the Standard solution and a filtered centrifuged por tion of the solution under test into the chromatograph, reeord the chromatograms, and measture the responses for the major peaks. Caleulate the quantities of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and ethinyl estradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{z}\right)$ dissolved by eomparison with the correspending peak respenses obtained frem the Standard solation and the solution under test.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Desogestrel standard stock solution-Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.25 mg per mL .
Ethinyl estradiol standard stock solution-Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.25 mg per mL .

Desogestrel diluted standard solution-Transfer 1.0 mL of Desogestrel standard stock solution to a $50-\mathrm{mL}$ volumetric flask. Dilute with Dissolution Medium to volume, and mix. This solution contains about 0.005 mg per mL of USP Desogestrel RS.
Ethinyl estradiol diluted standard solution-Transfer 1.0 mL of Ethinyl estradiol standard stock solution to a $50-\mathrm{mL}$ volumetric flask. Dilute with Dissolution Medium to volume, and mix. This solution contains about 0.005 mg per mL of USP Ethinyl Estradiol RS.

Standard solution-Dilute quantitative portions of Desogestrel diluted standard solution and Ethinyl estradiol diluted standard solution with Dissolution Medium to obtain a solution containing about $0.3 \mu \mathrm{~g}$ per mL and $0.06 \mu \mathrm{~g}$ per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Test solution-Centrifuge a portion of the dissolution sample, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector (for desogestrel analysis), a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of 285 nm and an emission wavelength of 310 nm ; a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11; and a $4.6-\mathrm{mm} \times 12.5-\mathrm{mm}$ guard column that also contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.2 for ethinyl estradiol and 1.0 for desogestrel, and the relative standard deviation is not more than $3.0 \%$.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}$ and $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}$ dissolved by the formula:

$$
(0.05 C)(100 / K)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Desogestrel RS or USP Ethinyl Estradiol RS in the Standard solution; $K$ is the labeled amount, in mg per Tablet, of $\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}$ or $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}$; and $r_{U}$ and $r_{S}$ are the peak responses for desogestrel or ethinyl estradiol obtained from the Test solution and the Standard solution, respectively.
Tolerances-Not less than $80 \%(Q)$ of each of the labeled amounts of $\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}$ and $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}$ is dissolved in 30 minutes.

TEST 2-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: $\quad 0.3 \%$ sodium lauryl sulfate; 500 mL .
Apparatus 2: 100 rpm.
Time: 30 minutes.
Determine the amounts of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and ethinyl estradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ dissolved by the chromatographic method used in Test 1.

Tolerances-Not less than $80 \%(Q)$ of each of the labeled amounts of $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements for Content Uniformity with respect to desogestrel and to ethinyl estradiol.

Loss on drying $\langle 731\rangle$ —Powder zo-40 40 Tablets, and dry the portion at $105^{\circ}$ for 3 hours: it loses not more than $4.0 \%$ of its weight.

Water, Method Ic $\langle 921\rangle$ : net mere than 5.4\%, using 35 mg of ground Tablets heated at $170^{\circ}$. not more than $5.4 \%$ using a portion of the Tablet containing about 35 mg and a suitable evaporation technique that releases the water by heating the specimen in a stream of dry inert gas, this gas then being passed into the cell.

## Related compounds-

Piluent, Solution A, Solution B, Mobile phase, Desoges trel standard stock solution, and Ethinyl estradiol standard stock solution Prepare as directed in the Assay:

Related compounds standard stock solution-Separately dissolve aceurately weighed quantities of USP Ethinyl Es madiol Related Compound A RS, USP Desogestrel Related Compound B RS, and USP Desogestrel Related Compound GRS in Diluent, and dilute quantitatively, and stepwise if neeessary, with Diltent to obtain a solution having a known eoncentrations of about 0.006 mg per $\mathrm{mL}, 0.00375 \mathrm{mg}$ per mL , and 0.00375 mg per mL , respectively. concentration- $f$ about $50 \%$ relative to the expected concentration of ethinyl estradiol and desogestrel in the Test solution.

Standard solution Transfer 5.0 mL of Ethinyl estradiol standard stock solution and 2.0 mL of Related compeunds standed stock solution to a 100 mL volumetric flask, add an aceurately measured volume-of Desogestrel standard stock solution to obtain a final solution having a concentration, in mg per mt, correspending to the expected concentration of desogestrel in the Test solution. Dilute with Biltent to volume, and mix. Transfer 2.0 mL of Related ermpeunds standard stock solution and an aceurately mensured volume each of Ethinyl estradiol standard stock solu tion and Desogestrel standard stock solution to a $100-\mathrm{mb}$ volumetric flack to obtain a final solution having an acet rately known concentration in mg per mL , correspending
approximately to the expected concentration of desogestrel andethinyl estradiol in the Test solution. Dilute with Diltent to volume, and mix.

Fest solution Use the Assay preparation.
Chromatographic systen- Prepare as directed in the -As say. [NOTE-The related compernds $A$ and C Ethinyl estradiol related compound $A$ and desogestrel related compound $G$ are menitored using a wavelength of $230-250$ nm, and all ether compeunds are menitored at 210205 nm .] Chrematograph the Statedted solttion, and record the peak responses as-directed for Procedure: the column efficiency determined from the ethinyl estradiol peak is not less than 2500 theore tieal plates; the tailing factor for the ethinylestradiol peak is between 0.9 and 1.5; and the relative standard deviation for replicate injections determined from the desegestrel and ethimy estradiol peaks is net more than $2.0 \%$, and net more than $5.0 \%$ determine from the peaks for each related compound.

Procedure Separately inject equal volumes (about 25 $200 \mu \mathrm{H})$ of the Standard solution and the Test solution inte the ehrematograph, record the chromatograms, and measure the peak heights areas respenses for ethinyl estradiol related eompound $A$, desogestrel related compound $B$, and desogestrel related compeund C. disregarding the peak, if any, with a retention time of about 12 minutes. Calculate the pereentage of ethinyl estradiol related compound $A$ in the per tion of Tablets taken by the formula:
4166.6C( $\left.+r_{i}++_{s}\right)$,
$200(C L L)\left(r_{i}++_{s}\right)$,
in which $C$ is the concentration, in mg per mL, of USP Ethinyl Estradiol Related Compound A RS in the Standard so tution; $L$ is the labeled amount, in mg, of ethinyl estradiolin each Tablet; and $r$; and $r_{s}$-are the peak heights areas respenses for ethinyl estradiol related compound $A$ obtained from the Test solution and the Standard solution, respec tively: not more than $0.5 \% 2.0 \%$ of ethinyl estradiol related eompound $A$ is found. Calculate the pereentages of desogestrel related compound B and desogestrel related compound G in the pertion of Tablets taken by the formula:

```
666.6C(+5++s),
```

## $200(C / L)\left(+r_{i}+\underset{s}{ }\right)$

in which $C$ is the concentration, in mg per mL , of USP Des egestrel Related Compound B RS or USP Desogestrel Re-tated-Compomal C RS in the Standard solution; $L$ is the tabeled amount, in mg, of desegestrel in each Tablet; and frand $f_{\text {s }}$ are the peak heights areas respenses for desegestrel related compernd $B$ or desogestrel rełated compernd $C$, as appropriate, obtained from the Test solution and the Standard solution, respectively: not more than $0.5 \%$ each 2.0\% of desegestrel related compernd $B$ is fetnd; net mere than 3.0\% of desogestrel related compound C is found; and not more than $2.0 \%-5.0 \%$ of total related compounds is found.

Solution A-Prepare a mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50).

Solution B-Prepare a mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 ( $80: 20$ ).

Mobile phase-Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of acetonitrile and water (50:50).

Desogestrel standard stock solution-Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL .

Ethinyl estradiol standard stock solution-Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL .

Standard solution-Dilute quantitative portions of Desogestrel standard stock solution and Ethinyl estradiol standard stock solution with Diluent to obtain a solution containing about $0.6 \mu \mathrm{~g}$ per mL and $0.12 \mu \mathrm{~g}$ per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Test solution 1-Transfer 20 Tablets to a $200-\mathrm{mL}$ volumetric flask. Add about 120 mL of Diluent, and shake for about 30 minutes. Dilute with Diluent to volume, and mix. Centrifuge a portion of the dissolution sample, and use the clear supernatant

Test solution 2-Dilute a portion of Test solution 1 with Diluent to obtain a solution containing about $0.6 \mu \mathrm{~g}$ per mL of ethinyl estradiol.
Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a programmable variable wavelength UV detector and a spectrofluorometric detector with an excitation wavelength of 285 nm and an emission wavelength of 310 nm ; a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11; and a $4.6-\mathrm{mm} \times 12.5-$ mm guard column that also contains packing L11. The chromatograph is programmed as follows.

| Time (minutes) | Solution A (\%) | Solution B <br> (\%) | Elution | UV Detector (nm) | Flow Rate ( $\mathrm{mL} / \mathrm{min}$.) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 100 | 0 | equilibration | 210 | 2 |
| 0-4 | 100 | 0 | isocratic | 210 | 2 |
| 4-10 | 100 | 0 | isocratic | 244 | 2 |
| 10-20 | 100 | 0 | isocratic | 210 | 2 |
| 20-25 | 0 | 100 | linear gradient | 210 | 2.5 |
| 25-30 | 0 | 100 | isocratic | 210 | 3 |
| 30-32 | 100 | 0 | linear gradient | 210 | 2 |
| 32-35 | 100 | 0 | re-equilibration | 210 | 2 |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are 0.18 for ethinyl estradiol and 1.0 for desogestrel; the resolution, $R$, between ethinyl estradiol and desogestrel is not less than 2.0; the tailing factor is not more than 2.0 for ethinyl estradiol and desogestrel; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Inject a volume (about $200 \mu \mathrm{~L}$ ) of Test solution 2 into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of $17 \beta$-ethinyl estradiol in the portion of Tablets taken by the formula:

$$
100\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the height of any peak at a relative retention time of 0.20 ; and $r_{s}$ is the peak height of ethinyl estradiol obtained with the spectrofluorometric detector. Inject a volume (about $200 \mu \mathrm{~L}$ ) of Test solution 1 into the chromatograph, record the chromatograms, and measure the peak
heights for the major peaks obtained within 20 minutes. Calculate the percentage of estrone in the portion of Tablets taken by the formula:

$$
100\left(r_{U} / r_{s}\right)-E
$$

in which $r_{U}$ is the height of any peak at a relative retention time of $0.20 ; r_{s}$ is the peak height of ethinyl estradiol obtained with the UV detector at 210 nm ; and $E$ is the percentage of $17 \beta$-ethinyl estradiol obtained in the Tablets. Calculate the percentage of 3-ketodesogestrel in the portion of Tablets taken by the formula:

$$
100(1 / F)\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the height of any peak at a relative retention time of 0.32 obtained with the UV detector at $244 \mathrm{~nm} ; r_{s}$ is the peak height of desogestrel obtained with the UV detector at 210 nm ; and $F$ is the relative response factor, equal to 4.1. Calculate the percentage of any other impurity taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the height of any peak other than those mentioned above; and $r_{s}$ is the peak height of ethinyl estradiol obtained with the UV detector. Any peak below $0.1 \%$ is not considered. Not more than $0.5 \%$ of ethinyl estradiol impurities is found; not more than $0.5 \%$ of desogestrel impurities is found; and not more than $2.0 \%$ of total impurities is found.

Assay-
Biltent Prepare a mixture of acetonitrile methanel and water (4:1). (60:40).

Solution A Use acetonitrile.
Solution-B. Prepare a filtered and degassed mixture of acetonitrile and water $(1: 1)$.

Mebile phase Use variable mixtures of Soltution $A$ and Solution B as directed for Chromatographic system. Make adjustments if neeessary (see System Suitability under Chrematography (624) .

Pesogestrel standard stock solution- Dissolve an aeet rately weighed quantity of USP Desogestrel RS in Diluent methanol to obtain a solution having a known concentration of about $0.25-0.35 \mathrm{mg}$ per mL.

Ethinyl estradiel standard stock solution- Dissolve an aecurately weighed quantity of USP Ethinyl Estradiol RS in Diluent methanel to obtain a selution having a known eencentration of about $0.25-0.21$ mg per mL .

Standard preparation-Transfer 5.0 mL of Ethinyl estrat diol standard stack solution to a 100 mL volumetric flask, and add an aceurately measured volume of Desogestrel standard stock selution to obtain a solution having a known eencentration, im mo per mL , correspending to the expected eoncentration of desogestrel in the Assay preparation. Dilete with Diluent to voltme, and mix. Transfer an aceurately measured voltme each of Ethinyl estratiol standtard stock solution and Desogestrel standard stock solution to a-100 mL voltmetrie flask to obtain a final solution having an ac-
eurately known concentration in mg per mL, correspending approximately to the expected concentration of desogestrel and ethinyl estradiol in the Assay preparation. Dilute with Biltent to volume, and mix.

Assay preparation Transfer 101410 Tablets to $30-\mathrm{mE}$ 50 mL stoppered centriftuge tube, add $20.0-30 \mathrm{~mL}$ of Dilt ent, and sonicate for 25 minutes with intermittent mixing on a vortex mixer, until all Tablets have broken apart. Extract for 30 mintutes on a benehtop shaker. Centrifuge, anduse the elear supernatant. [NOTE-Retain apertion of this solutionto use as the Test solution in the test for Related compeunds.]

Chromatographic system (see Chromatography- $\langle 621\rangle$ The liquid chromatograph is equipped with either a pregrammable variable wavelength detector or two separate detectors capable of menitoring at $210-205$ nm and at $230-250$ 230 nm and $-4.6 \mathrm{~mm} \times 15 \mathrm{em} 25$-mmedtmm that contains stable-bended $5 \mathrm{\mu m}$ packing 41 . The flow rate is about 21.5 mL per mintte, and the column temperature is maintained at $40^{\circ}$. The chromatograph is programmed as follows. Chrematograph the Standard preparation, and record the peak respenses as directed for Preedure: the coltmmneffieieney determined from the ethinyl estradiol peak is not less than 2500 theoretical plates; the tailing factor for the ethinyles tradiol peak is between 0.9 and 1.5 ; and the relative standard deviation for replieate injections is not more than $2.0 \%$ $1.5 \%$, determined frem the desogestrel and ethinyl estradiol peaks.

| Time (minutes) | Solution 4 (\%) | Solution B (\%) | Elution |
| :---: | :---: | :---: | :---: |

Proecture Separately inject equal volumes (about 25 HL) of the Standard preparation and the Assay preparation into the chromatograph, record the chrematograms, and measure the peak areas at $210-205 \mathrm{~nm}$. Separately calculate the ameunts, in $\mu \mathrm{g}$, of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \Theta\right)$ andethinyles tradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \Theta_{2}\right)$ in the pertion of Tablets taken by the for mula:-

$$
\left(L G_{s}+G_{t}\right)\left(F_{t}++_{s}\right),
$$

in which $L$ is the labeled quantity, in $\mu \mathrm{g}$, of the relewant and Hyte in each Tablet; $G_{s}$ is the concentration, in $\mu$ g per mL, of the appropriate USP Reference-Standard in the Statatard preparation; $G_{t}$ is the concentration, in $\mu$ gs per mL , of the eorrespending analyte in the Assay preparation, based on the labeled quantity per Tablet and the extent of dilution; and $r_{4}$ and $r_{s}$ are the peak respenses areas obtained from the Assay preparation and the Standard preparation, re-
spectively.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50:50). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of acetonitrile and water (50:50).

Desogestrel standard stock solution-Dissolve an accurately weighed quantity of USP Desogestrel RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL .

Ethinyl estradiol standard stock solution-Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL .

Standard preparation-Dilute appropriate aliquots of Desogestrel standard stock solution and Ethinyl estradiol standard stock solution with Diluent to obtain a solution having a known concentration of about $0.6 \mu \mathrm{~g}$ per mL and $0.12 \mu \mathrm{~g}$ per mL of USP Desogestrel RS and USP Ethinyl Estradiol RS, respectively.

Assay preparation-Transfer 20 Tablets into a $200-\mathrm{mL}$ volumetric flask. Add about 120 mL of Diluent, and shake for about 30 minutes. Dilute with Diluent to volume, and mix. Centrifuge a portion of the sample, and transfer an accurately measured volume to a $50-\mathrm{mL}$ volumetric flask to obtain a final concentration of about $0.6 \mu \mathrm{~g}$ per mL of desogestrel. Dilute with Diluent to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector (for desogestrel analysis), a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of 285 nm and an emission wavelength of 310 nm ; a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L11; and a $4.6-\mathrm{mm} \times 12.5-\mathrm{mm}$ guard column that also contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention
times are about 0.2 for ethinyl estradiol and 1.0 for desogestrel; the tailing factor for both analytes is not more than 2.0; and the relative standard deviation is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of desogestrel $\left(\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}\right)$ and ethinyl estradiol $\left(\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{2}\right)$ in the portion of Tablets taken by the formula:

$$
(500 C / V)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Desogestrel RS or USP Ethinyl Estradiol RS in the Standard preparation; $V$ is the volume of the aliquot of solution taken for the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses for desogestrel or ethinyl estradiol obtained from the Assay preparation and the Standard preparation, respectively.■IS (USP28)

## Briefing

Dextroamphetamine Sulfate, $U S P 27$ page 576 and page 476 of PF 30(2) [Mar.-Apr. 2004]-See briefing under Amphetamine Sulfate.
(PA3: S. Salado) RTS-39348-1
pitate, wash it with about 10 mL of cold water, and recrystallize it from diluted alcohol: the crystals of the benzoyl derivative of dextroamphetamine so obtained, after being dried at $105^{\circ}$ for 4 homr,

## Chromatographic purity-

Diluent-Dilute 3.12 mL of phosphoric acid with water to 1000 mL .

Buffer solution-Dissolve 2.16 g of sodium 1-octanesulfonate in 1000 mL of water, and add 1.0 mL of $0.1 \%$ triethylamine solution ( $\mathrm{N} / \mathrm{V}$ ).
triethylamine. $\Delta$ USP28
Mix, and adjust with phosphoric acid to a pH of 2.5 .
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, and methanol (144:37:19). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock solution-Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in Diluent to obtain a solution having a known concentration of about 0.3 mg per mL .

Standard solution-Dilute an accurately measured volume of Standard stock solution in Diluent to obtain a solution having a known concentration of about 0.003 mg per mL .

Test solution-Transfer about 30 mg of Dextroamphetamine Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask. Dissolve in 50 mL of Diluent, sonicate for 5 minutes, dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-$ $\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard stock solution, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the dextroamphetamine peak and any adjacent peak is not less than 1.5.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dextroamphetamine Sulfate taken by the formula:

$$
10,000(C / W)\left(r_{i} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Dextroamphetamine Sulfate RS in the Standard solution; $W$ is the weight, in mg , of Dextroamphetamine Sulfate taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for amphetamine obtained from the Standard solution: not more than $0.1 \%$ of any individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

-Labeling-Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of in-
jectable dosage forms. $\quad$ 2S (USP27)

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Diatrizoic Acid RS. USP Diatrizoic Acid Related Compound A RS.

## Change to read:

Free aromatic amine-Transfer 1.0 g to a $50-\mathrm{mL}$ volumetric flask, and add 5 mL of water and 10 mL of 0.1 N sodium hydroxide. To a second $50-\mathrm{mL}$ volumetric flask transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a Standard solution prepared by dissolving a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain a known concentration of 500 $\mu \mathrm{g}$ per mL . To a third $50-\mathrm{mL}$ volumetric flask add 5 mL of water and 10 mL of 0.1 N sodium hydroxide to provide a blank.

Treat each flask as follows. Add 25 mL of methyl sulfoxide,

- dimethyl sulfoxide, ${ }^{\text {n }}$ 1S (USP28)
insert the stopper, and mix by swirling gently. Chill in an ice bath in the dark for 5 minutes. [NOTE-In conducting the following steps, keep the flasks in the ice bath and in the dark as much as possible until all of the reagents have been added.] Add slowly 2 mL of hydrochloric acid, mix, and allow to stand for 5 minutes. Add 2 mL of sodium nitrite solution (1 in 50 ), mix, and allow to stand for 5 minutes. Add 1 mL of sulfamic acid solution (2 in 25), shake, and allow to stand for 5 minutes. [Caution-Considerable pressure is produced.] Add 2 mL of a 1 in 1000 solution of $N$-(1-naphthy1)ethylenediamine dihydrochloride in dilute propylene glycol ( 7 in 10), and mix.

Remove the flasks from the ice bath and from storage in the dark, and allow to stand in a water bath at $22^{\circ}$ to $25^{\circ}$ for 10 min utes. Shake gently and occasionally during this period, releasing the pressure by loosening the stopper. Dilute with water to volume, and mix.

Within 5 minutes from the time of diluting the solutions in all three flasks to 50 mL , concomitantly determine the absorbances of the solution from the substance under test and the Standard solution in $1-\mathrm{cm}$ cells at the wavelength of maximum absorbance at about 465 nm , with a suitable spectrophotometer, versus the prepared blank. The absorbance of the solution from the Diatrizoate Meglumine is not greater than that of the Standard solution (0.05\%).

## Add the following:

-Other requirements-Where the label states that Diatrizoate Meglumine is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Diatrizoate Meglumine Injection. Where the label states that Diatrizoate Meglumine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Diatrizoate Meglumine Injection.■2S (USP27)

## Briefing

Dicyclomine Hydrochloride Capsules, USP 27 page 598 and page 1459 of $P F 29(5)$ [Sept.-Oct 2003]; Dicyclomine Hydrochloride Tablets, USP 27 page 600 and page 1462 of $P F$ 29(5) [Sept.-Oct. 2003]. It is proposed to replace the UV absorbance method in the test for Dissolution with a liquid chromatographic procedure similar to that previously proposed for the Assay. The liquid chromatographic procedure in the test for Dissolution is based on the analyses performed with the $3.5-\mu \mathrm{m}$ XTerra RP-8 brand of L7 column. The typical retention time observed for the dicyclomine peak is about 4 to 7 minutes.

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.01 \mathrm{~N}$ hydrochloric acid; 500 mL .
Apparatus 2: 50 rpm .
Time: 45 minutes.

Picric acid solution Transfer about 100 mg of pieric acid and 14.5 g of anhydrous sodium acetate to a 500 mL volumetric flask and dissolve in 400 mL of water. Add 20.0 mL of glacial acetic aeid, dilute with water volume, and mix.
-Determine the amount of $\mathrm{C}_{19} \mathrm{H}_{35} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ dissolved by employing the following method.

Mobile phase-Prepare as directed in the Assay.
0.04 M Phosphate buffer, pH 7.5—Dissolve 2.72 g of monobasic potassium phosphate in 450 mL of water, adjust with $10 \%$ sodium hydroxide to a pH of $7.5 \pm 0.1$, dilute with water to 500 mL , and mix.
Buffer-acetonitrile mixture—Prepare a mixture of 0.04 M
Phosphate buffer, pH 7.5 and acetonitrile ( $1: 1$ ).1s (USP28)
Standard solution-Prepare a solution in 0.01 N hydrechlorie acid

- Medium ${ }_{\text {1S }}$ (USP28)
having a known concentration of about $18 \mu$

per mL of USP Dicyclomine Hydrochloride RS.
-Transfer 25.0 mL of this solution to a suitable flask, add 25.0 mL of the Buffer-acetonitrile mixture, and mix.

Test solution-Filter a portion of the solution under test through a $0.7-\mu \mathrm{m}$ glass microfiber filter. Transfer 5.0 mL of the filtrate to a suitable flask, add 5.0 mL of the Buf-fer-acetonitrile mixture, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column containing $3.5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the responses as directed for Procedure: the tailing factor for the analyte peak is not more than 2.0 , and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Determine the amount of $\mathrm{C}_{10} \mathrm{H}_{25} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ dis solved using the following procedure. Pipet 20 mL each of the se lution under test, the Standard solution, and 0.01 N hydrechloric acid to provide a blank, inte-separate suitable separaters. Add 5.0 mL of Pieric acid soldtion and 25.0 mL of chloroform to each separator, and shake for one-minute. Collect the-chloroform layer in a suitable vessel containing 2.0 g of anhydreus sodium- sulfate, shake and allow the-solutions to stand for ten minutes. Coneomiantly determine the absorbanees of the solutions at the wavelength of maximum abserbance at about 405 nm , using the blank to set the spectrophotemeter.
-Separately inject equal volumes (about $250 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in mg, of $\mathrm{C}_{19} \mathrm{H}_{35} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ dissolved. 1 IS (USP28)
Tolerances-Not less than $75 \%$ (Q) of the labeled amount of $\mathrm{C}_{19} \mathrm{H}_{35} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ is dissolved in 45 minutes.

## Change to read:

## Assay-

Internalstandardsolution Dissolveaquantity of phenacetin in methanel to obtain a selution having a concentration of about 2.5 mg per mL.

Standard preparation Dissolvenan aceurately weighed quantity of USP Dieyclomine Hydrochleride RS in methanol to obtain a solution having a known concentration of about 1 mg per mL . Transfer 2.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, add 2.0 mL of Internal standard soldtion, dilate with methanel tovelume, and mix.

Assay preparation Remeve, as completely as pessible, the eentents of not fewer than 20-Capsules, and mix the eentents. Tramsfer an aceurately weighed pertion of the pewder, equivalent to about 10 mg of dieyclomine hydrochloride, to a 25 mL volu metric flask, add 10.0 mL of Internal standard solution, dilute with methanel to velume, and mix. Filter 15 mL of this solution, dis earding the first 5 mL , and transfer 5.0 mL to a 10 mL volametrie flask. Dilute with methanel to volume, and mix.

Chramatographic system (see-Chrematography $\langle 624\rangle$ ) The gas chromatograph is equipped with a flame ionization detector and a $15 \mathrm{~m} \times 0.5 \mathrm{~mm}$ fused silica columm coated with a 1 Hm phase G3. The column is maintained at $160^{\circ}$ for 2 minutes, then programmed at $20^{\circ}$ per minute for 4 minutes, and held at a finat temperature of $240^{\circ}$ for 5 minutes. The-injection pert and detector temperatures are maintained at $250^{\circ}$. Nitregen is used as the earrier gas at a flow rate of 2 mL per minute. Chrematograph the Standard preparation, and record the peak respenses as directed for Preee dure: the resolution, $R$, between phenacetin and dieyelemine-is net less than 2; the tailing factor for dieyelemine-is not more than 2.0; and the relativestandard deviation for replieate injections is net mere than $2.0 \%$

Proecture Separately inject equalvolumes (about $2 \mu \mathrm{H}$ ) of the Standard preparation and the Assay preparation inte the chromat tograph, record the chromatograms, and measure the respenses for the majer peaks. Caleulate the quantity, in me, of dieyclomine hy drechloride $\left(\mathrm{C}_{40} \mathrm{H}_{35} \mathrm{~N} \mathrm{NO}_{2} \cdot \mathrm{HCl}\right)$ in the pertion of Capsules taken by the formula:

$$
50 C\left(R_{t}+R_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Dieyclemine Hydrechloride RS in the Standard preparation; and $R_{5}$-and $R_{s}$ are the peak respense raties of dicyclomine to phenacetin obtained from the Asisty preparation and the Standard prepariation, respectively.

- 0.02 M Phosphate buffer, pH 7.5—Dissolve 2.72 g of monobasic potassium phosphate in 900 mL of water, adjust with $10 \%$ sodium hydroxide to a pH of $7.5 \pm 0.1$, dilute with water to 1000 mL , and mix.

Mobile phase—Prepare a mixture of acetonitrile and 0.02 M Phosphate buffer, pH 7.5 (70:30), filter, and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent-Prepare a mixture of acetonitrile and water (70:30).
Standard preparation-Dissolve an accurately weighed quantity of USP Dicyclomine Hydrochloride RS in Diluent to obtain a solution having a known concentration of about 0.4 mg per mL . [NOTE-This solution is stable for 2 days].

Assay preparation-Remove, as completely as possible, the contents of not less than 20 Capsules, and mix the contents. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of dicyclomine hydrochloride, to a $50-\mathrm{mL}$ volumetric flask. Add 2.0 mL of water, and sonicate for at least 2 minutes to disperse the sample. Add 35 mL of acetonitrile, sonicate for at least 5 minutes, and shake on a mechanical shaker for at least 30 minutes. Add 10 mL of water, allow the preparation to equilibrate to room temperature, then dilute with water to volume, and mix. Centrifuge, for at least 5 minutes, a portion of this solution in a $15-\mathrm{mL}$ glass centrifuge tube. Use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column containing $3-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the Standard preparation, and record the responses as directed for Procedure: the tailing factor for the analyte peak is not more than 1.5 , and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{19} \mathrm{H}_{35} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ in the portion of Capsules taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Dicyclomine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the areas of the dicyclomine peak obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{D S S}^{2 S}$ (USP27)

Tablet to a dissolution vessel containing the Medium of the Buffer stage. [NOTE-Do not perform an analysis of the Medium in the Acid stage.]

BUFFER STAGE-
Medium: $\quad \mathrm{pH} 7.5$ phosphate buffer (prepared by dissol-
ving 40.83 g of monobasic potassium phosphate and 9.84 g of sodium hydroxide in 5000 mL of water, adjusting with 0.08 N hydrochloric acid to a pH of 7.5 , and diluting with water to 6000 mL ); 900 mL .

Apparatus 2: 50 rpm .
Time: 1 hour. ${ }^{1 S}$ (USP28)
Determine the amount of $\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{O}_{2}$ dissolved

- in the Buffer stage ${ }_{\text {1S }}$ (USP28)
by employing the following method.
Citrate buffer-Dissolve 0.5 g of citric acid monohydrate and $0.4 \mathrm{~g}_{\text {IS (USP27) }}$ of dibasic sodium phosphate in 1.0 liter of water. Potassium phosphate buffer-Dissolve 6.8 g of monobasic potassium phosphate and 1.7 g of sodium hydroxide in 1.0 liter of water. Adjust with phosphoric acid to a pH of $7.4 \pm 0.1$.
Mobile phase-Prepare a mixture of Citrate buffer, Potassium phosphate buffer, and acetonitrile ( $35: 35: 30$ ). Adjust with phosphoric acid to a pH of $3.0 \pm 0.1$, and mix. Filter and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Prepare a solution of USP Valproic Acid RS in the pH 7.5 Phosphate buffer

- Medium ${ }_{\text {1S (USP28) }}$
used in the Buffer stage, having a known concentration of about 0.12 mg per mL . [NOTE-A volume of acetonitrile not exceeding the $10.0 \%$ of the total volume may be used to dissolve the USP Valproic Acid RS.]
Test solution-If necessary, dilute a portion of each filtered solution under test with the pH 7.5 Phesphete buffer
- Medium ${ }_{\text {IS }}$ (USP28)
used in the Buffer stage to obtain a solution having a concentration of about 0.12 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a 210 -nm detector and a 3.9$\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L11. The flow rate is about 1.2 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more that 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valproic acid $\left(\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{O}_{2}\right)$ dissolved by the formula:

$$
900 C D\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Valproic Acid RS in the Standard solution; $D$ is the dilution factor used to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas of val-
proic acid obtained from the Test solution and the Standard solution, respectively.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{O}_{2}$ is dissolved in 2 heurs.
-1 hour in the Buffer stage.■1S (USP28)

## BRIEFING

Doxycycline Hyclate, USP 27 page 669. Doxycycline Hyclate is doxyclycline hydrochloride hemihydrate hemiethanolate. This monograph currently provides a test for Water with limits of between $1.4 \%$ and $2.8 \%$ (theory for the hemihydrate $=1.76 \%$ ). To further characterize the compound as the hemiethanolate, it is proposed to revise this monograph by adding a test and limit for Content of ethanol. It is proposed to specify that the test for Content of ethanol is to be performed using the gas chromatographic method included in the general chapter Organic Volatile Impurities $\langle 467\rangle$, using the version proposed on page 1153 of $P F 29(4)$ [July-Aug. 2003], which is targeted for publication in the Second Supplement to USP 27-NF 22. The proposed limits for Content of ethanol are between $4.3 \%$ and $6.0 \%$ (theory for the hemiethanolate $=4.49 \%$ ).
(PA7a: W. Wright) RTS-41049-1

## Add the following:

-Content of ethanol: between $4.3 \%$ and $6.0 \%$, when tested as directed in the general chapter Organic Volatile Impurities $\langle 467\rangle$, using Procedure $A$ under Water-Soluble Articles in the section Identification, Control, and Quantification of Residual Solvents.■1S (USP28)

## Briefing

Multiple Electrolytes Injection Type 1, USP 27 page 687; Multiple Electrolytes Injection Type 2, USP 27 page 688; Multiple Electrolytes and Dextrose Injection Type 1, USP 27 page 690; Multiple Electrolytes and Dextrose Injection Type 2, USP 27 page 691; Multiple Electrolytes and Dextrose Injection

Type 3, USP 27 page 693. It is proposed to revise the Definition to remove ambiguity about the possible combinations of electrolytes. In the Multiple Electrolytes Injection Type 1 monograph, it is proposed to delete the $60^{\circ}$ temperature condition to eliminate peak tailing in the Assay for gluconate and to correct the dimensions of the guard column used in the Assay for gluconate and in the Assay for acetate.

» Multiple Electrolytes and Dextrose Injection Type 3 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, and chloride ions. In addition, the salts may

■ $\quad$ 1S (USP28)
provide ions of ammonium, or acetate and phosphate, or phosphate and lactate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium $(\mathrm{Na})$, potassium ( K ), ammonium $\left(\mathrm{NH}_{4}\right)$, acetate $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)$, phosphate $\left(\mathrm{PO}_{4}\right)$, and lactate $\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{3}\right)$, not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride $(\mathrm{Cl})$, and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \cdot \mathrm{H}_{2} \mathrm{O}\right)$. It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH . It contains no antimicrobial agents.

## Briefing

Ephedrine, USP 27 page 707; Ephedrine Hydrochloride, USP 27 page 707; Ephedrine Sulfate, USP 27 page 708 and page 1476 of PF 29(5) [Sept.-Oct. 2003]. It is proposed to correct the concentration of ammonium hydroxide used in the procedure in the test for Ordinary impurities. Deletion of the 3.6 M designation redefines the reagent as ammonium hydroxide, which is concentrated (undiluted) ammonium hydroxide, according to the definition in the Reagents section of the $U S P$. In the absence of any adverse
comments, it is proposed to implement this revision via the Fifth Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of October 1, 2004.

## Briefing

Fexofenadine Hydrochloride, page 1790 of PF 28(6) [Nov.Dec. 2002]. Based on comments received, revisions are proposed based on FDA approved tests and acceptance criteria: the qualitative Identification test $B$ is replaced by a requirement for retention time agreement between the Assay preparation and Standard preparation; a quantitative test for Content of chloride is added; in Identification test $C$ a range is specified between $193^{\circ}$ and $199^{\circ}$; a test for Specific surface area is also proposed; and in the test for Related compounds, the acceptance criterion for any other unknown impurity is restated as less than $0.1 \%$. Other editorial changes have been made.
(PA1: K. Russo) RTS-39653-1; 40193-1; 40512-1

## Add the following:

## ■Fexofenadine Hydrochloride

$\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl} \quad 538.13538 .12$
Benzeneacetic acid, 4-[1-hydroxy-4-[4-(hydroxydiphenyl-methyl)-1-piperidinyl]butyl]- $\alpha, \alpha$-dimethyl-, hydrochloride, $( \pm)$ -
( $\pm$ )-p-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)piperidi-no]butyl]- $\alpha$-methylhydratropic acid, hydrochloride [138452-21-8].
» Fexofenadine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in well closed, light re sistaners. Preserve in tight, light-resistant containers and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound $A$ RS. USP Fexofenadine Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Dissolve 30 mg f Fevenadine Hydrochloride in 2
mL of methanel, add 30 mL of water, and acidify with nittic
acid: meets the requirements of the test for Chloride $\langle 194\rangle$ :
The retention time of the fexofenadine peak in the chroma-
togram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

C: Differential Scanning Calorimetry $\langle 891\rangle$ —Accurately weigh 2 to 6 mg of Fexofenadine Hydrochloride into an aluminum pan, and crimp the pan using a suitable sample press. Analyze the sample from $25^{\circ}$ to $225^{\circ}$ at $10^{\circ}$ per minute. The sample exhibits a single endotherm $190^{\circ}$ between $193^{\circ}$ and $199^{\circ}$. [NOTE-The pan can be sealed hermetically provided a pin hole is punched into the lid so that the sample can degas during heating.]

Water, Method Ic $\langle 921\rangle$ : not more than $0.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.
Specific surface area, Method II $\langle 846\rangle$-Outgas a portion of Fexofenadine Hydrochloride (about 0.2 to 0.5 g ), using helium flow for 1 hour at $100^{\circ}$ or vacuum for 1 hour at $100^{\circ}$. Test the sample using gas sorption: between 2.5 and $5.0 \mathrm{~m}^{2}$ per g .

## Limit of fexofenadine related compound B-

Ammonium acetate buffer solution-Add 2.3 mL of glacial acetic acid to 2000 mL of water. Adjust with 6 N ammonium hydroxide to a pH of $4.0 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of Ammonium acetate buffer solution and acetonitrile (80:20).

Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Add about 1.2 mg of USP Fexofenadine Related Compound B RS, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix. Transfer 2.0 mL of the solution so obtained into a $100-\mathrm{mL}$ volumetric flask, add about 25 mg of USP Fexofenadine Hydrochloride RS, accurately weighed, dilute with Mobile phase to volume, and mix.

Standard solution-Dilute the System suitability solution quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $2.5 \mu \mathrm{~g}$ of USP Fexofenadine Hydrochloride RS per mL.

Test solution-Dissolve an accurately weighed quantity of Fexofenadine Hydrochloride in Mobile phase to obtain a solution having a concentration of about 0.25 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{m} 25-\mathrm{cm}$ column that contains packing L45. The column is maintained at room temperature. The flow rate is about 0.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the retention time for fexofenadine is between 15 and 23 minutes; the relative retention times are about 0.7 for fexofenadine related compound B and 1.0 for fexofenadine; and the resolution, $R$, between fexofenadine and fexofenadine related compound $B$ is not less than 1.5 3.0.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of fexofenadine related compound B in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
1.25\left(r_{I} / r_{s}\right),
$$

in which 1.25 is the response factor for fexofenadine related compound B relative to fexofenadine; $r_{I}$ is the peak response for fexofenadine related compound B obtained from the Test solution; and $r_{s}$ is the peak response for fexofenadine obtained from the Standard solution: not more than $0.1 \%$ is found.

## Related compounds-

Phosphate-perchlorate buffer, Diluting solution, Mobile phase, Sys and Chromatographic system-Prepare as directed in the Assay.

Standard solution Dissolve an aceurately weighed quantity of USP Fexofenadine-Related Compound A RS
in Diluting solution to obtain a solution having a known eoncentration of about 0.5 mg per mL. Dilute with Mobite phase quantitatively, and stepwise if neeessary, to-ebtain a selution having a known concentrat ion of about 0.005 mg permE.

Reference solution-Use the Assay preparation, prepared as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay stock preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution, the Standard solution, the Reference solution, and the Mobile phase (used as the blank) into the chromatograph, record the chromatograms, and measure the peak areas, excluding the peaks corresponding to those obtained from the Mobile phase. Calculate the quat in mg, percentage of fexofenadine related compound A in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
50 C\left(+\quad+r_{s}\right)
$$

$$
100\left(C_{S} / C_{T}\right)\left(r_{I} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL, of USP Fexofenadine Related Compound A RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of
fexofenadine in the Test solution; and $r_{I}$ and $r_{s}$ are the peak responses for fexofenadine related compound A obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of decarboxylated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperi-dinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Fexofenadine Hydrochloride taken by the formula

$$
(100 / 1.1)\left(C_{S} / C_{T}\right)\left(r_{U} / r_{S}\right)
$$

in which 1.1 is the response factor for the decarboxylated degradant relative to fexofenadine; $C_{s}$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard solution; $C_{T}$ is the concentration, in mg per mL , of fexofenadine in the Test solution; $r_{U}$ is the peak response of the decarboxylated degradant obtained from the Test solution; and $r_{s}$ is the peak response of fexofenadine obtained from the Standard solution. Galeulate the pereen age of other impurities in the portion of Ferofenadine Hy drochloride taken by the formula:-

$$
100 \pi+\left(16.67 r_{s}\right)
$$

in which $r$;is the peak respense for each impurity obtained from the Test solution; andrs is the peak respense for fen efenadine obtained from the Test olution: Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
100\left(C_{S} / C_{T}\right)\left(r_{U} / r_{\mathrm{S}}\right)
$$

in which $C_{s}$ is the concentration, in mg per mL , of fexofenadine in the Reference solution; $C_{T}$ is the concentration, in mg per mL , of fexofenadine in the Test solution; $r_{U}$ is the peak response for any other impurity obtained from the Test
solution; and $r_{s}$ is the peak response of fexofenadine obtained from the Reference solution. more than $0.2 \%$ of ferofenadine related compound A is found; and not more than 0.45\% of impurities is found. Not more than $0.18 \%$ of fexofenadine related compound A is found; not more than $0.15 \%$ of decarboxylated degradant is found; not more than $0.1 \%$ of any other unknown impurity is found; and not more than $0.3 \% 0.30 \%$ of total impurities is found.

Content of chloride—Dissolve about 300 mg of Fexofenadine Hydrochloride, accurately weighed, in 50 mL of methanol. Titrate with 0.1 N silver nitrate VS, and determine the endpoint potentiometrically (see Titrimetry $\langle 541\rangle$. Each mL of 0.1 N silver nitrate VS is equivalent to 3.545 mg of chloride: not less than $6.45 \%$ and not more than $6.75 \%$ of chloride is found, calculated on the anhydrous basis.

Assay-
Phosphate-perchlorate buffer-Dissolve 6.64 g of monobasic sodium phosphate and 0.84 g of sodium perchlorate in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Diluting solution-Prepare a mixture of acetonitrile and Phosphate-perchlorate buffer (50:50).

Mobile phase-Prepare a filtered and degassed mixture of Phosphate-perchlorate buffer and acetonitrile ( $65: 35$ ). Add 3 mL of triethylamine per L, and mix. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System sutability preatan- Standard preparationPrepare a solution of USP Fexofenadine Hydrochloride RS and USP Fexofenadine Related Compound A RS in Mobile phase having known concentrations of about 0.06 mg per mL and 0.005 mg per mL , respectively.

Standard preparation Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in Dilut ing solution to obtain a solution having a known concentration of about 0.5 mg per mL . Dilute quantitatively, and stepwise if necessary, with Mebile phase to obtain acencen tration of 0.06 mg of USP Fexofenadine Hydrechloride RS per mL.

Assay stock preparation-Transfer about 50 mg of Fexofenadine Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with Diluting solution to volume to obtain a solution having a concentration of about 1.0 mg of fexofenadine hydrochloride per mL .

Assay preparation-Transfer 3.0 mL of Assay stock preparation to a $50-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume to obtain a solution having a concentration of about 0.06 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L11. The column is maintained at room temperature. The flow rate is about 1.5 mL per minute. Chromatograph the fystem suitability pration, Standard preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between fexofenadine and fexofenadine related compound A is not less than 10 ; the tailing factor is not more than 2.0 ; and the relative standard deviations for replicate injections determined from fexofenadine and fexofenadine related compound A are not more than $2.0 \%$ and $3.0 \%$, respectively.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the areas for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
833.3 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses for fexofenadine obtained from the Assay preparation and the Standard preparation, respectively.■IS (USP28)

## Briefing

Fexofenadine Hydrochloride Capsules, page 1027 of $P F$ 29(4) [July-Aug. 2003]. Based on comments received, revisions are proposed to the monograph based on FDA approved acceptance criteria. It is proposed to change the upper assay limit presented in the Definition from 107.0 percent to 105.0 percent. A limit for total other unknown impurities is proposed to be added to the Related compounds procedure. Minor editorial changes have also been made.
(PA1: K. Russo) RTS—39653-2; 40193-2; 40512-2

## Add the following:

## ■Fexofenadine Hydrochloride Capsules

» Fexofenadine Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0105 .0 percent of the labeled amount of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound $A$
RS. USP Fex fenaline Related Compound B-RS.

## Identification-

A: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.
B: Infrared Absorption $\langle 197 \mathrm{~K}\rangle-$
Test specimen-Empty the contents of several Capsules, equivalent to about 60 mg of fexofenadine hydrochloride, into a suitable capped tube. Add 10 mL of a mixture of acetonitrile and methanol ( $10: 1$ ), and shake until the sample is dispersed. Allow to settle. Decant, filter, and collect the supernatant in a suitable beaker. Evaporate the solvent to near dryness by using a stream of nitrogen and with gentle heating from an appropriate source (steam, low-temperature hot plate). While still warm, add 5 mL of water and 5 drops of diluted hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for about 30 minutes. Pass through a 10to $15-\mu \mathrm{m}$ filtering crucible with fritted disk. Dry the precipitate in an air oven for 1 hour at $105^{\circ}$.
Dissolution $\langle 711\rangle$ —
Medium: water; 900 mL .
Apparatus 2: 50 rpm.
Times: 15 and 45 minutes.
Determine the amount of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ dissolved by employing the following method.

Buffer solution-Dissolve 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and 0.5 mL 0.3 mL of phosphoric acid in 300 mL of water, and mix.

Mobile phase-Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (700:300), and mix. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability stock solution-[NOTE—A small amount of glacial acetic acid, not to exceed $5 \%$ of the total volume, is used, if necessary, to dissolve USP Fexofenadine Related Compound A RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Related Compound A RS in water to obtain a solution having a known concentration of 0.44 mg per mL .

System suitability solution-Prepare a solution of USP Fexofenadine Hydrochloride RS in System suitability stock solution containing about 0.01 mg of USP Fexofenadine Related Compound A RS and 0.06 mg of USP Fexofenadine Hydrochloride RS per mL.

Standard solution-[NOTE-A small amount of methanol, not to exceed $0.5 \%$ of the total volume, is used, if necessary, to dissolve USP Fexofenadine Hydrochloride RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in water to obtain a solution having a known concentration of 0.07 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between fexofenadine and fexofenadine related compound A is not less than 2.0. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and filtered portions of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine peaks. Calculate the quantity of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ dissolved.
Tolerances-Not less than $50 \%(Q)$ of the labeled amount of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ is dissolved in 15 minutes. Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}$ is dissolved in 45 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Water, Method $I\langle 921\rangle$ : between $3.5 \%$ and $8.0 \%$, the titration being performed at $50^{\circ}$ and the titration vessel being kept in a heated water jacket.

## Related compounds-

Pherphate perehlorate buffer- Prepare as direeted in the Assem.

Phosphate-perchlorate buffer, Diluting solution, Mobile phase, Sysm, and Chromatographic system—Proceed as directed in the Assay under Fexofenadine Hydrochloride.

Standard solution-Use the Standard preparation, prepared as directed in the Assay under Fexofenadine Hydrochloride.

Reference solution-Use the Assay preparation, prepared as directed in the Assay.

Test solution-Use the Assay stock preparation, prepared as directed in the Assay.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
responses for the major peaks. Calculate the percentage of fexofenadine related compound A in the portion of Capsules taken by the formula:

$$
100\left(C_{S} / C_{T}\right)\left(r_{U} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL, of USP Fexofenadine Related Compound A RS in the Standard solution; $C_{T}$ is the concentration of fexofenadine in the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses of fexofenadine related compound A obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of decarboxylated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2 , in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
(100 / 1.1)\left(C_{S} / \mathrm{C}_{T}\right)\left(r_{U} / r_{S}\right),
$$

in which 1.1 is the response factor for the decarboxylated degradant relative to fexofenadine; $C_{S}$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard solution; $C_{T}$ is the concentration of fexofenadine in the Test solution; $r_{U}$ is the peak response of the decarboxylated degradant obtained from the Test solution; and $r_{s}$ is the peak response of fexofenadine obtained from the Standard solution. Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken by the formula:

$$
100\left(C_{R} / C_{T}\right)\left(r_{U} / r_{R}\right)
$$

in which $C_{R}$ is the concentration, in mg per mL , of fexofenadine in the Reference solution; $C_{T}$ is the concentration of fexofenadine in the Test solution; $r_{U}$ is the peak response for any other impurity obtained from the Test solution; and $r_{R}$ is
the peak response of fexofenadine obtained from the Reference solution. mere than $0.3 \%$ ferofene hydro ehloride related compound $\Lambda$ is found. Not more than $0.3 \%$ of fexofenadine related compound A , not more than $0.2 \%$ of decarboxylated degradant, and less than $0.1 \%$ of any other unknown impurity is found; not more than $0.2 \%$ total other unknown impurities, and not more than $0.5 \%$ of total impurities is found.

## Assay-

Phosphate perehlorate buffer Dissolve 6.64g of menebasie sodium phesphate and 0.84 g of sodium perchlerate in 1000 mL of water. Adjust with phospheric acid to a pH- p . 4.02.0.

Phosphate-perchlorate buffer, Diluting solution, Mobile phase, fystan, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Fexofenadine Hydrochloride.

Assay stock preparation - Remove, as completely as possible, the contents of not fewer than 20 Capsules, mix the combined contents, and finely powder by using a mortar and pestle. Transfer a portion of the powder, equivalent to about 50 mg of fexofenadine hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Add 40 mL of Diluting solution, and shake by mechanical means for 60 minutes. Sonicate for about 2 minutes. Allow to cool to room temperature, dilute with Diluting solution to volume, and mix.

Assay preparation-Transfer 3.0 mL of the Assay stock preparation to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the
quantity, in mg , of fexofenadine hydrochloride $\left(\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{NO}_{4} \cdot \mathrm{HCl}\right)$ in the portion of Capsules taken by the formula:

$$
833.3 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Fluoxetine Hydrochloride, USP 27 page 822; Fluoxetine Tablets, USP 27 page 824. It is proposed to revise the USP Reference standards section to change the name of USP Fluoxetine Related Compound B RS to USP Fluoxetine Related Compound B Solution RS. Other sections affected by the change are revised accordingly.
(PA3: S. Salado) RTS-40938-1

## Related compounds-

Mobile phase-Proceed as directed in the Assay.
Test solution 1 -Transfer about 56 mg of Fluoxetine Hydrochloride, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Test solution 2-Transfer 2 mL of Test solution 1, accurately measured, to a $10-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

System suitability solution-Dissolve about 22 mg of USP Fluoxetine Hydrochloride RS in 10 mL of 1 N sulfuric acid, and heat to $85^{\circ}$ for 3 hours. Cool, transfer 0.4 mL of this solution to a $25-\mathrm{mL}$ volumetric flask, and add about 28 mg of USP Fluoxetine Hydrochloride RS, 1 mg of USP Fluoxetine Related Compound A RS, and 4 mg of USP Fluoxetine Related Compound B RS.
-0.5 mL of USP Fluoxetine Related Compound B Solution

## RS. 1 IS (USP28)

Dilute with Mobile phase to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ base-deactivated packing L7. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.24 for $\alpha$ -[2-(methylamino)ethyl]benzenemethanol (if present), 0.27 for fluoxetine related compound B (if present), 0.94 for fluoxetine related compound A, 1.0 for fluoxetine, and 2.17 for 4 -trifluoromethylphenol; and the ratio of the height of the fluoxetine related compound A peak to the depth of the valley between the fluoxetine and fluoxetine related compound A peaks (measured from the fluoxetine related compound A peak height) is not more than 1.1.
Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of Test solution 1 and Test solution 2 into the chromatograph, record the chromatograms for not less than twice the elution time for fluoxetine, and measure the peak responses. Calculate the percentage of fluoxetine related compound A in the portion of Fluoxetine Hydrochloride taken by the formula:

$$
100 r_{A} /\left(r_{A}+r_{U}\right)
$$

in which $r_{A}$ is the peak response of fluoxetine related compound A obtained from Test solution 2; and $r_{U}$ is the peak response of fluoxetine obtained from Test solution 2.

Calculate the percentage of each of the other impurities in the portion of Fluoxetine Hydrochloride taken by the formula:

$$
100 r_{i} /\left(r_{s}+5 r_{U}\right)
$$

in which $r_{i}$ is the peak response for each impurity obtained from Test solution 1; $r_{s}$ is the sum of the responses of all the peaks, excluding fluoxetine, obtained from Test solution 1; and $r_{U}$ is as defined above: not more than $0.15 \%$ of fluoxetine related compound A is found; not more than $0.25 \%$ of $\alpha$-[2-(methylamino)ethyl]benzenemethanol is found; not more than $0.25 \%$ of fluoxetine related compound B is found; not more than $0.1 \%$ of any other individual impurity is found; and not more than $0.5 \%$ of total impurities is found.

## BRIEFING

Fluoxetine Capsules, USP 27 page 822; Fluoxetine Tablets, USP 27 page 824 . It is proposed to revise the limits in the test for Chromatographic purity so that both dosage forms reflect the typical values found in stability studies for approved products.
(PA3: S. Salado) RTS-40907-1

## Change to read:

## Chromatographic purity-

Triethylamine buffer-Proceed as directed in the Assay under Fluoxetine Hydrochloride.

Mobile phase-Prepare a filtered and degassed mixture of Triethylamine buffer and acetonitrile ( $65: 35$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.01 mg per mL .

Test solution-Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the combined contents, equivalent to about 20 mg of fluoxetine, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L10. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution for at least 22 minutes, and record the peak responses as directed for Procedure: the column efficiency is not less than 1100 theoretical plates; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses of all of the peaks: not more than $0.25 \%$ of any individual impurity is found, and not more than $0.40 \%$

- $0.80 \%_{\text {■ }}^{1 S}$ (USP28)
of total impurities is found.

BRIEFING

Fluoxetine Delayed-Release Capsules, page 1486 of $P F$ 29(5) [Sept.-Oct. 2003]. It is proposed to add a Drug release test to this new monograph.
(BPC: M. Marques) RTS—35912-1

## Add the following:

## ■Fluoxetine Delayed-Release Capsules

## » Fluoxetine Delayed-Release Capsules contain

 an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}\right)$.Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Fluoxetine Hydrochloride RS. USP Fluoxetine Related Compound C RS.

Identification, Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ -
Test specimen-Transfer the contents of 3 Capsules to a suitable container, and grind to a fine powder. Transfer an a portion of the powder, equivalent to about 40 mg of fluoxetine, to a suitable container, and dissolve in 25 mL of 0.1 N hydrochloric acid. Filter, and transfer 10 mL of the solution so obtained to a separatory funnel, add 20 mL of methylene chloride, and mix. Allow the phases to separate, and transfer the organic layer to a small glass container. Evaporate to dryness with the aid of a current of air and mild heat. Redissolve the residue with a few
drops of methylene chloride, and transfer to a potassium bromide plate. Dry or evaporate to a thin film with the aid of a stream of nitrogen.

Drug release $\langle 724\rangle$ [Tocome.]
Apparatus 3: 12 dips per minute (dpm), using a polypropylene 40 -mesh screen on the top and bottom of the reciprocating cylinder.

## ACID STAGE-

Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 250 mL , deaerated. Operate the apparatus for 2 hours at 12 dpm , withdraw an aliquot of the Medium, and allow the apparatus to proceed to the Buffer stage.

Standard solution-Prepare a solution of USP Fluoxetine Hydrochloride RS in Acid stage Medium having a known concentration of about 0.036 mg per mL .

Test solution-Use portions of the solution under test passed through a filter having a $0.45-\mu \mathrm{m}$ porosity.

Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}$ dissolved from the minimum (most negative) of the first derivative of UV absorbances at about 278 nm in comparison with the Standard solution.

Tolerances-Not more than $10 \%$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}$ is dissolved in 2 hours. BUFFER STAGE-

Medium: $\quad \mathrm{pH} 6.8$ phosphate buffer (Prepared by mixing 3 L of 0.1 N hydrochloric acid and 1 L of 0.2 M tribasic sodium phosphate, and adjusting, if necessary, with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of $6.8 \pm 0.05$ ); 250 mL , deaerated. Operate the apparatus for 45 minutes at 12 dpm , and withdraw an aliquot of the Medium.

Standard solution-Prepare a solution of USP Fluoxetine Hydrochloride RS in Buffer stage Medium, having a known concentration of about 0.36 mg per mL .

Test solution-Use portions of the solution under test passed through a filter having a $0.45-\mu \mathrm{m}$ porosity.
Procedure-Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}$ dissolved from the difference between the maximum UV absorbance at about 264 nm and the absorbance at 290 nm in comparison with the Standard solution.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}$ is dissolved in 45 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Chromatographic purity-

Ion-pair solution-Dissolve about 6.5 g of sodium 1-octanesulfonate and 2.9 g of anhydrous sodium acetate in 1 li ter of water, and adjust with glacial acetic acid to a pH of 5.0.

Mobile phase-Prepare a filtered and degassed mixture of Ion-pair solution and acetonitrile ( $58: 42$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Degraded fluoxetine solution-Dissolve a quantity of USP Fluoxetine Hydrochloride RS in 0.1 N hydrochlorid 1.0 N sulfuric acid to obtain a solution containing about 2.2 mg per mL . Heat to $85^{\circ}$ for 3 hours, and cool to room temperature.

Fluoxetine related compound solution-Dissolve anacewrely a quantity of USP Fluoxetine Related Compound C RS in Mobile phase to obtain a solution containing about 0.5 mg per mL .

System suitability solution-Transfer oigher about 13.5 mg of USP Fluoxetine Hydrochloride RS to a $100-\mathrm{mL}$ volumetric flask, add 2 mL of Degraded fluoxetine solution and 2 mL of Fluoxetine related compound solution, and dissolve in and dilute with

Mobile phase to volume. Transfer 10.0 mL of this solution to a $250-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Detector sensitivity solution-Transfer 1 mL of the System suitability solution to a $100-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume.

Test solution-Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a $250-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Filter before injection.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L7. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1 mL per minute. Inject the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.49 for $\alpha, \alpha, \alpha$-trifluoro- $p$-cresol, 0.70 for fluoxetine related compound C , and 1.0 for fluoxetine; the resolution, $R$, between $\alpha, \alpha, \alpha$-trifluoro- $p$-cresol and fluoxetine related compound C is not less than 2.0; and the resolution, $R$, between fluoxetine related compound C and fluoxetine is not less than 6.0. Chromatograph the Detector sensitivity solution, and record the peak responses as directed for Procedure: the signal-tonoise ratio for the fluoxetine peak is not less than 10 .

Procedure-Inject a volume (about $50 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram for at least three times the retention time of the fluoxetine peak, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:
in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.2 \%$ of any individual impurity is found, and not more than $0.7 \%$ of total impurities is found.

## Assay-

Ion-pair solution-Dissolve about 2.9 mL of glacial acetic acid and about 7.1 g of sodium 1-pentanesulfonate in 1 liter of water. Adjust with 5 N sodium hydroxide to a pH of 5.0.
Mobile phase-Prepare a filtered and degassed mixture of methanol and Ion-pair solution ( $67: 33$ ). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

System suitability solution-Dissolve suitable quantities of USP Fluoxetine Hydrochloride RS and $\alpha, \alpha, \alpha$-trifluoro- $p$-cresol in Mobile phase to obtain a solution containing about $110 \mu \mathrm{~g}$ per mL and $20 \mu \mathrm{~g}$ per mL , respectively.
Standard preparation-Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.11 mg per mL .

Assay preparation-Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a $500-\mathrm{mL}$ volumetric flask, shake by mechanical means for about 10 minutes, and then sonicate for about 5 minutes. Cool the solution to room temperature, dilute with Mobile phase to volume, and mix. Transfer 5.0 mL of this solution to a $10.0-\mathrm{mL}$ volumetric flask. Dilute with Mobile phase to volume, and mix. Filter the solution before injection.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The liquid chromatograph is equipped with a $227-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 7.5-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at $38^{\circ}$. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.7 for $\alpha, \alpha, \alpha$-trifluoro- $p$-cresol and 1.0 for fluoxetine; the resolution, $R$, between $\alpha, \alpha, \alpha$-trifluoro- $p$-cresol and fluoxetine is not less than 4.0; the tailing factor for the fluoxetine peak is not more than 1.7 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of fluoxetine $\left(\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~F}_{3} \mathrm{NO}\right)$ in the portion of Capsules taken by the formula:

$$
1000(309.33 / 345.79) C\left(r_{U} / r_{S}\right)
$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; $C$ is the concentration, in mg per mL , of USP Fluoxetine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Fluoxetine Tablets, USP 27 page 824—See briefing under Fluoxetine Hydrochloride and Fluoxetine Capsules.

## Change to read:

## Chromatographic purity-

Ion-pair solution-Dissolve 6.5 g of sodium 1-octanesulfonate in 1000 mL of water, add 2.9 mL of phosphoric acid, and adjust with a sodium hydroxide solution ( 1 in 5) to a pH of 3.0 .

Mobile phase-Prepare a filtered and degassed mixture of Ionpair solution and acetonitrile ( $57: 43$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Resolution solution-Transfer 1 mL of USP Fltoxetine Related Gempound B-RS
-USP Fluoxetine Related Compound B Solution
$\mathrm{RS}_{\mathbf{m}_{1 S} \text { (USP28) }}$
and about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100mL volumetric flask. Add 2 mL of a solution prepared by dissolving about 22 mg of USP Fluoxetine Hydrochloride RS in 10 mL of 1 N sulfuric acid, heating at about $85^{\circ}$ for 3 hours, and cooling to room temperature. Dilute with Mobile phase to volume, and mix. Pipet 10.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Detector sensitivity solution-Prepare a solution of Resolution solution in Mobile phase (1 in 100).

Standard solution-Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.0135 mg per mL .

Test solution-Place 10 Tablets in a volumetric flask of suitable size. Dissolve in and dilute with Mobile phase to volume to obtain a solution having a concentration of about 2 mg of fluoxetine per mL . Pass a portion of the solution through a suitable filter, and use the filtrate.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a 4.6$\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $3.5-\mu \mathrm{m}$ packing L7. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph in the following order the Mobile phase, the Detector sensitivity solution, and the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.19 for $\alpha$-[2-(methylamino) ethyl]benzenemethanol, 0.26 for fluoxetine related compound B , and 1.0 for fluoxetine; the resolution, $R$, between $\alpha-[2-$ (methyl-amino)ethyl]benzenemethanol and fluoxetine related compound B is not less than 4.5 ; and the signal-to-noise ratio for the Detector sensitivity solution is not less than 10 .

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for a period of time equal to three times the retention time of the main peak, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$
100(309.33 / 345.79)\left(C_{S} / C_{U}\right)\left(r_{i} / r_{S}\right)
$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; $C_{S}$ is the concentration, in mg per mL , of USP Fluoxetine Hydrochloride RS in the Standard solution; $C_{U}$ is the concentration, in mg per mL , of fluoxetine in the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; and $r_{S}$ is the peak response for fluoxetine obtained from the Standard solution: not more than $0.2 \%$

- $0.25 \%$ (USP28).
of any individual impurity is found; and not more than $0.8 \%$
- $0.80 \%$ (USP28)
of total impurities is found.

## Briefing

Hydrocodone Bitartrate and Homotropine Methylbromide Tablets, page 1267 of PF 28(4) [July-Aug. 2002]. This proposed new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded to In-Process Revision. Editorial style changes have been made.
(PA2: C. Anthony) RTS-40986-1

## Add the following:

## ■Hydrocodone Bitartrate and Homatropine Methylbromide Tablets

## » Hydrocodone Bitartrate and Homatropine

 Methylbromide Tablets contain not less than 90.0 percent and not more than 110.0 percent ofthe labeled amounts of hydrocodone bitartrate disesquihydrate $\left(\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{NO}_{3} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \cdot 2^{1 / 2} \mathrm{H}_{2} \mathrm{O}\right)$ and homatropine methylbromide $\left(\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{BrNO}_{3}\right)$.

NOTE-Use of silanized autosampler vials such as dimethyldichlorosilane vials* is required for the Dissolution test, the Limit tests, and the Assay to prevent drug degradation.

Packaging and storage-Preserve in tight, light-resistant containers.

USP Reference standards $\langle 11\rangle$ —USP Dihydrocodeine Bitartrate RS. USP Homatropine Methylbromide RS. USP Hydrocodone Bitartrate RS.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Solution A-Dissolve 850 mg of bismuth subnitrate in a mixture of 10 mL of glacial acetic acid and 40 mL of water.
Solution $B$-Dissolve 8 g of potassium iodide in 20 mL of water.

Stock solution: a mixture of Solution $A$ and Solution B (1:1).

Solvent: a mixture of methanol and water ( $9: 1$ ).
Spray reagent 1 - [NOTE—Prepare immediately before use.] Prepare a mixture of water, glacial acetic acid, and Stock solution (50:10:5).

Spray reagent 2: hydrogen peroxide TS.
Standard solution 1-Transfer an accurately weighed quantity of about 30 mg of USP Homatropine Methylbromide RS to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solvent to volume, and mix.

[^94]Standard solution 2-Transfer an accurately weighed quantity of about 25 mg of USP Hydrocodone Bitartrate RS to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Solvent to volume, and mix.

Test solution-Transfer a portion of 20 finely powdered Tablets, equivalent to the average Tablet weight, to a centrifuge tube, add 5.0 mL of Solvent, centrifuge, and use the supernatant.
Developing solvent system: a mixture of ethyl acetate, water, and formic acid (134:33:33).

Procedure-Apply $50 \mu$ L of Standard solution 1, Standard solution 2, and the Test solution, and proceed as directed in the chapter. Remove the plate, and dry at $105^{\circ}$. Spray the plate with Spray reagent 1 and then with Spray reagent 2. The $R_{F}$ values for the principal spots in the chromatogram of the Test solution correspond to those of the Standard solutions.

B: The retention times of the major peaks in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ - [To come].
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Limit of dihydrocodeine bitartrate, hydrocodone diol, and related substances-

Ion-pair solution-Prepare 0.005 M sodium 1-octanesulfonate, and adjust with glacial acetic acid to a pH of $2.5 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of Ion-pair solution and methanol (6:4). Add 0.5 mL of triethylamine per liter. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve about 2 mg each of hydrocodone diol and USP Dihydrocodeine Bitartrate RS in 35 mL of Mobile phase in a $100-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume. Dilute this solution quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of each of about $0.1 \mu \mathrm{~g}$ per mL .

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $280-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.67 for hydrocodone diol, 0.75 for dihydrocodeine bitartrate, and 1.0 for hydrocodone bitartrate; the resolution, $R$, between hydrocodone diol and dihydrocodeine bitartrate is not less than 2.0 ; and the relative standard deviation for replicate injections of each of these compounds is not more than $5.0 \%$.

Procedure-Separately inject equal volumes (about 200 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentages of hydrocodone diol and dihydrocodeine bitartrate in the portion of Tablets taken by the formula:

$$
100\left(r_{D} / r_{S}\right)
$$

in which $r_{D}$ is the individual peak response of either hydrocodone diol or dihydrocodeine in the chromatogram obtained from the Test solution; and $r_{s}$ is the peak response of hydrocodone bitartrate in the chromatogram obtained from the Standard solution: not more than $0.5 \%$ of hydro-
codone diol is found, and not more than $1.0 \%$ of dihydrocodeine bitartrate is found. Calculate the percentage of each other related substance in the portion of Tablets taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for any individual related substance with a retention time greater than 5 minutes; and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.5 \%$ of any individual related substance is found. The sum of all impurities is not more than $1.5 \%$.

Limit of homatropine hydrobromide and related sub-stances-

Buffer solution-Prepare a solution of 0.005 M dibasic potassium phosphate, and adjust with phosphoric acid to a pH of $6.4 \pm 0.1$.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (17:3). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard solution-Dissolve an accurately weighed quantity of homatropine hydrobromide in Mobile phase, and dilute quantitatively with Mobile phase to obtain a solution having a known concentration of about $0.6 \mu \mathrm{~g}$ per mL .

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $5.0 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
peak responses. Calculate the percentage of homatropine hydrobromide in the portion of Tablets taken by the formula:

$$
100\left(r_{H} / r_{S}\right)
$$

in which $r_{H}$ is the individual peak response of homatropine hydrobromide in the chromatogram obtained from the Test solution; and $r_{s}$ is the peak response for homatropine methylbromide in the chromatogram obtained from the Standard solution: not more than $0.5 \%$ of homatropine hydrobromide is found. Calculate the percentage of each other related substance in the portion of Tablets taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for any individual related substance with a relative retention time less than 0.44 in relation to the retention time of hydrocodone bitartrate; and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.5 \%$ of any individual related substance is found. The sum of all impurities is not more than $1.5 \%$.

## Limit of tropine-

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel.

Diluent: diethyl ether.
Test solution: Finely powder 25 Tablets, and add to a centrifuge tube. Pipet 5.0 mL of diethyl ether into the centrifuge tube, mix on a vortex mixer for 5 minutes, centrifuge, and use the supernatant.

Standard stock solution-Dissolve an accurately weighed quantity of tropine in Diluent, and dilute quantitatively with Diluent to obtain a solution having a known concentration of about $150 \mu \mathrm{~g}$ per mL .

Stock solutions-Transfer 5.0 mL of the Standard stock solution to a $10-\mathrm{mL}$ volumetric flask, and dilute with Diluent to volume quantitatively, and stepwise if necessary, to obtain Standard solutions $A, B, C$, and $D$ having known concentrations of about $75 \mu \mathrm{~g}$ per $\mathrm{mL}, 37.5 \mu \mathrm{~g}$ per $\mathrm{mL}, 18.75$ $\mu \mathrm{g}$ per mL , and $9.38 \mu \mathrm{~g}$ per mL , respectively.

Spray reagent-Dissolve 300 mg of platinic acid in 3 mL of diluted hydrochloric acid, add 97 mL of water and 100 mL of $6 \%$ potassium iodide in water, and mix.

Developing solvent system: a mixture of alcohol and ammonium hydroxide (400:100).

Procedure-Apply equal volumes (about $500 \mu \mathrm{~L}$ ) of the Standard stock solution, Standard solutions A, B, C, and D, and the Test solution to a thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ), and proceed as directed in the chapter. After the plate has dried, position it in a chamber saturated with iodine vapor for about 30 minutes, then place it in a hood to allow the iodine to sublime from the plate, and spray the plate with Spray reagent until spots appear. Any spot from the Test solution occurring at an $R_{F}$ value corresponding to tropine is not greater in size or intensity than the corresponding spot obtained from Standard solution B $(0.5 \%)$ : not more than $0.5 \%$ of tropine is found.

Assay-
Buffer solution-Prepare a solution of 0.005 M dibasic potassium phosphate, and adjust with phosphoric acid to a pH of $6.4 \pm 0.01$.
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (17:3).

Standard preparation-Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS and USP Homatropine Methylbromide RS in Mobile phase, and dilute quantitatively with Mobile phase to obtain a solution having known concentrations of about 0.2 mg per mL and 0.06 mg per mL , respectively.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of hydrocodone bitartrate and about 1.5 mg of homatropine methylbromide, to a $25-\mathrm{mL}$ volumetric flask. Pipet 15 mL of the Mobile phase into the volumetric flask, sonicate for 15 minutes, and then shake with a wrist-action shaker for 15 additional minutes. Pipet an additional 10 mL of Mobile phase into the volumetric flask, and mix well. Pass the solution through a filter having a $0.45-\mu \mathrm{m}$ porosity prior to injection into the chromatograph.
Chromatographic system-The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.44 for homatropine methylbromide and 1.0 for hydrocodone bitatrate; the resolution, $R$, between hydrocodone bitartrate and homatropine methylbromide is not less than 2.5 ; and the relative standard deviation for replicate injections is not more than 3.0\% for each analyte.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount, in mg , of homatropine methylbromide $\left(\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{BrNO}_{3}\right)$ in the portion of Tablets taken by the formula:

$$
\left(L C_{S} / C_{U}\right)\left(r_{U} / r_{s}\right)
$$

in which $L$ is the labeled quantity, in mg , of homatropine methylbromide in each Tablet; $C_{s}$ is the concentration, in mg per mL , of USP Homatropine Methylbromide RS in the Standard preparation; $C_{U}$ is the concentration, in mg per mL , of homatropine methylbromide in the Assay pre-
paration, based on the labeled amount per Tablet and the extent of dilution; and $r_{U}$ and $r_{S}$ are the homatropine methylbromide peak responses obtained from the Assay preparation and the Standard preparation, respectively. Calculate the amount, in mg, of hydrocodone bitartrate disesquihydrate $\left(\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{NO}_{3} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \cdot 2^{1 / 2} \mathrm{H}_{2} \mathrm{O}\right)$ in the portion of Tablets taken by the formula:

$$
(494.50 / 449.46)\left(L C_{S} / C_{U}\right)\left(r_{U} / r_{S}\right)
$$

in which 494.50 and 449.46 are the molecular weights of hydrocodone bitartrate disesquihydrate and anhydrous hydrocodone bitartrate, respectively; $L$ is the labeled amount, in mg , of hydrocodone bitartrate disesquihydrate in each Tablet; $C_{S}$ is the concentration, in mg per mL, of USP Hydrocodone Bitartrate RS in the Standard preparation; $C_{U}$ is the concentration, in mg per mL , of hydrocodone bitartrate disesquihydrate in the Assay preparation, based on the labeled amount per Tablet and the extent of dilution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Hyoscyamine Sulfate Elixir, USP 27 page 949. It is proposed to replace the current gas chromatographic procedure in the Assay with a stability-indicating liquid chromatographic procedure. The liquid chromatographic procedure is based on analyses performed with the Phenomenex Synergi Polar RP brand of L11. The typical retention time for hyoscyamine is about 12 minutes.
(PA4: E. Gonikberg) RTS-40539-1

## Change to read:

Assay-
Internal stadtard solution Dissolve about 25 mg of hematropine hydrobromide in water containe in a 50 mL volumetrie flask, add water to volume, and mix. Prepare fresh daily.

Standard preparation- Dissolve about 10 mg of USP Hyoseynmine Sulfate $R S$, necurately weighed, in water contrined in a 100 mL volumetric flask, add water to volume, and mix. Prepare fresh daily. Pipet 5 mL of this solution into a separator, add 2.0 mL of Internal staderd soltion, and adjust with 6 N mmmonium hydre*ide to a pH of 9 . Extract with three 10 mL pertions of methylene ehloride, filter the methylene chloride extracts through 1 g of anhy drous sodium sulfate supperted by a small cotton plug in a funmel into a suitable container, anderaporate on a steam bath with the aid ef acurrent of air to dryness. Do not heat past drymess. Dissolve the residue in 2.0 mL of methylene chloride.
Assay preparation-Transfer an aceurately measured volume of Elixir, equivalent to about 0.5 mg of hyoseyamine sulfate, to a-se parator containing 5 mL of water, add 5 mL of 1 N sulfuric acid, and extract with a 25 mL pertion of methylene chloride, disearding the extract. Add 2.0 mL of Internal standard solution. Proceed as directed under Stan preparation, beginning with " adjust with 6 N ammenitm hydroxide to a pH of 9 ."

Chromatographic system Under typical conditions, the gas ehromatograph contains a $1.8 \mathrm{~m} \times 2 \mathrm{~mm}$ glass colmmm packed with $3 \%$ liquid phase $G 3$ on- suppert S1AB, conditioned as directed (see-Chromagraphy (624)). Maintain the colmman at $225^{\circ}$, and use nitrogen as the earrier gac.

Syistem suitability Chremategraph a sufficient number of injec tions of the Standard preparation, and record peak areas as directed under Predure. The analytienl-system is suitable for eenducting this assay if the relative standard deviation for the ratio of the peak areas not $2.0 \%$, the resolution factor is not less than 4.0 , and the tailing factor does not exeed 2.0 .

Proedtre Inject appropriate pertions of the Assaly preparation and the Standad preparation suceessively into the gas chromatograph. Measure the areas under the peaks for hyoseyamine and homatropine in each chromatogram. Caleulate the ratio, $R_{t}$, of the area of the hyoseymmine peak to the area of the internal standard peak in the chromatogram from the Assay, and similarly caleulate the ratio $R_{s}$, in the ehromatogram from the Standard preparation. Ealeulate the quantity, in me, of $\left(\mathrm{C}_{42} \mathrm{H}_{23} \mathrm{NO}_{2}\right)_{2}-\mathrm{H}_{2} \mathrm{SO}_{4} \cdot \mathrm{IH}_{2} \mathrm{O}$ in each mL of the Elixir taken by the formula:

$$
0.05(1.053)(H / H)\left(R_{+}+R_{s}\right),
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoseyamine-sulfate to that of anhydrous hyoseyamine-sulfate, H- is the weight, in mg, of USP Hyoseyamine-Sulfate-RS taken for the Staded prepariation, and Vis the volume, in mb, of Elixir taken.

- Diluent-Use 0.01 N hydrochloric acid.

Buffer solution-Transfer 13.6 g of monobasic potassium phosphate to a $2000-\mathrm{mL}$ volumetric flask, dissolve in about 1800 mL of water, adjust with phosphoric acid to a pH of $3.0 \pm 0.1$, dilute with water to volume, mix, and filter.

Mobile phase-Prepare a degassed mixture containing
Buffer solution and methanol (75:25).

Standard stock preparation-Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in Diluent to obtain a solution having a concentration of about 0.16 mg of anhydrous hyoscyamine sulfate per mL. [NOTE-This solution may be stored in a refrigerator for 30 days.]

Standard preparation-Transfer 3.0 mL of the Standard stock preparation into a $100-\mathrm{mL}$ volumetric flask, dilute to volume with Diluent, and mix. Calculate the concentration, $C$, in mg per mL , of anhydrous hyoscyamine sulfate in this solution.

Tropic acid solution-Dissolve an accurately weighed quantity of tropic acid in Diluent to obtain a solution having a concentration of about $4 \mu \mathrm{~g}$ of tropic acid per mL .

System suitability preparation-Transfer 3.0 mL of the Standard stock preparation into a $100-\mathrm{mL}$ volumetric flask, add 4.0 mL of the Tropic acid solution, dilute to volume with Diluent, and mix.

Assay preparation-Transfer an accurately measured volume of Elixir, equivalent to about 0.25 mg of hyoscyamine sulfate, to a $50-\mathrm{mL}$ volumetric flask; dilute with Diluent to volume; and mix. Pass an aliquot through a $0.45-\mu \mathrm{m}$ filter, discarding the first 5 mL of filtrate.

Chromatographic system-The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L11 and a $3-\mathrm{mm} \times$ 4-mm guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $30^{\circ}$. Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the elution order is tropic acid peak, followed by hyoscyamine peak; the resolution, $R$, between the tropic acid and hyoscyamine peaks is not less than 1.5 ; the tailing factor for the hyoscyamine peak is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in each mL of the Elixir taken by the formula:

$$
50 \times 1.053 \times(C / V)\left(r_{U} / r_{S}\right)
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; $C$ is as defined under Standard preparation; $V$ is the volume, in mL , of the Elixir taken; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Hyoscyamine Sulfate Injection, USP 27 page 950; Hyoscyamine Sulfate Oral Solution, USP 27 page 950 and page 1904 of PF 29(6) [Nov.-Dec 2003]; Hyoscyamine Sulfate Tablets, USP 27 page 951 . It is proposed to replace the current gas chromatographic procedure in the Assay with a stability-indicating liquid chromatographic procedure. The liquid chromatographic procedure is based on analyses performed with the Phenomenex Synergi Polar RP brand of L11. The typical retention time for hyoscyamine is about 15 minutes.

## Change to read:

Assay-
Internal standerd solution Dissolve about 25 mg of hematropine hydrebremide in water eontained in a 50 mL volumetrie flask, add water to volume, and mix. Prepare fresh daily.
Standard prepparation-Dissolve about 10 mg of USP Hyoseya mine-Sulfate PS, aceurately weighed, in water contained in a 100 mL volumetric flask, add water to volume, and mix. Prepare fresh daily. Pipet 10 mL of this solution into a separator, add 2.0 mL of Imternal standard solution, and adjust with 6 N ammonium hydrovide to a pH -f 9 . Extract with three 10 mL portions of methylene
ehloride, filter the methylene chloride extracts through $1 . g$ of anhy drous soditm sulfate supported by a small cotton plug in a funnel into curitable container, and everorate on a steam bath with the aid ef aceurrent of air to dryness. Do not heat past drymess. Dissolve the residue in 2.0 mL of methylene chloride.

Assay preparation- Transfer an aceurately measured volume of Injection, equivalent to about 1.0 mg of hyoseyamine sulfate, to a separator containing 5 mL of water, and add 2.0 mL of Internat standard solution. Proceed as directed under Standard preparation, beginning with "adjust with 6 N ammenium hydrexide to a pHof 9 ."

Chromatographic syistem-Under typieal conditions, the gas ehromatograph contains a $1.8 \mathrm{~m} \rightarrow 2 \mathrm{~mm}$ glass columm packed with $3 \%$ liquid phase G 3 on suppert S1AB, cenditioned directed (see-Chremagraphy (624)). Maintain the collumn at $225^{\circ}$, and use nitrogen as the carrier ges.

Syistem suitability Chromatograph a sufficient number of injec tions of the Standard preparation, and record peak areas as diree ted under Produre. The analytieal-system is suitable-for eonducting this assay if the relative standard deviation for the ratio of the peak areas does not $2.0 \%$, the resolution factor is not tess than 4.0 , and the tailing factor does not exeeed 2.0 .

Procedure Inject appropriate pertions of the Assaly preparation and the Standed preparation successively into the gas chromatograph. Mearure the areas under the peaks for hyoseyamine and homatropine in each chromatogram. Caleulate the ratio, $R_{t}$, of the are of the hyoseymmine peak to the area of the intemal- standard peak in the chromatogram from the Assay preparation, and simi tarly ealeulate the ratio $R_{s}$, in the ehromatogram from the Standed preparation. Caleulate the quantity, in me, of $\left(\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{NO}_{2}\right)_{2} \cdots \mathrm{H}_{2}$ $\mathrm{SO}_{4}-2 \mathrm{H}_{3} \mathrm{O}$ in each mL of the Injection taken by the formula:-

$$
\theta .1(1.053)(H / H)\left(R_{4}+R_{s}\right)
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoseyamine-sulfate to that of anhydreus hyoseyamine sulfate, $W$ is the weight, in mg, of USP Hyoseyamine Sulfate RS taken for the Standerd preparation, and $V$ is the volume, in mL , of Injec tion taken.

## - Diluent-Use 0.01 N hydrochloric acid.

Buffer solution-Transfer 13.6 g of monobasic potassium phosphate to a $2000-\mathrm{mL}$ volumetric flask, dissolve in about 1800 mL of water, adjust with phosphoric acid to a pH of $3.0 \pm 0.1$, dilute with water to volume, mix, and filter.

Mobile phase-With continuous stirring, add 0.3 mL of triethylamine to 1800 mL of the Buffer solution. Add 200 mL of acetonitrile, mix well, and degas.

Standard stock preparation-Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in Diluent to obtain a solution having a concentration of about 0.16 mg of anhydrous hyoscyamine sulfate per mL . [NOTE-This solution may be stored in a refrigerator for 30 days.]

Standard preparation-Transfer 3.0 mL of the Standard stock preparation into a $100-\mathrm{mL}$ volumetric flask, dilute to volume with Diluent, and mix. Calculate the concentration, $C$, in mg per mL , of anhydrous hyoscyamine sulfate in this solution.
Assay preparation-Transfer an accurately measured volume of Injection, equivalent to about 1.0 mg of hyoscyamine sulfate, to a $200-\mathrm{mL}$ volumetric flask; dilute with Diluent to volume; and mix. Pass an aliquot through a $0.45-\mu \mathrm{m}$ filter, discarding the first 5 mL of filtrate.
Chromatographic system-The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L11 and a $3-\mathrm{mm} \times$ $4-\mathrm{mm}$ guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $30^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.8 , and the relative standard deviation for six replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in each mL of Injection taken by the formula:

$$
100 \times 1.053 \times(C / V)\left(r_{U} / r_{S}\right)
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; $C$ is as defined under Standard preparation; $V$ is the volume, in mL , of Injection taken; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Hyoscyamine Sulfate Oral Solution, USP 27 page 950 and page 1904 of $P F$ 29(6) [Nov.-Dec. 2003]-See briefing under Hyoscyamine Sulfate Injection.

## Assay-

Internal stander solution Dissolve about 25 mg of hematropine hydrobromide in water contained in a 50 mL volumetrie flask, add water to volume, and mix. Prepare fresh daily.

Standard preparation Dissolve about 10 mg of USP Hyoseya mine Sulfate PS , aceurately weighed, in water contained in a 100 mL volumetric flask, add water to volume, and mix. Prepare fresh daily. Pipet 10 mL of this solution into a separater, add 2.0 mL of finternal standard solution, and adjust with 6 N ammonimm hydrovide to a pH of 9 . Extract with three 15 mL pertions of methylene ehloride, filter the methylene ehleride extracts through 1 g of anhy drous sodium sulfate supported by a small cotton plug in a fanmel into a suitable container, and evaporate on steam bath with the aid of acurrent of air to dryness. Do not heat past drymess. Dissolve the residue in 2.0 mL of methylene chloride.

Assefy preparation. Transfer an aceurately measured volume of Oral-Solution, equivalent to about 1.0 mg of hyoseyamine-sulfate, to a separator containimg 5 mL of water, add 5 mL of 1 N sulftrie acid, and extract with a 25 mL pertion of methylene chloride, dis earding the extract. Add 2.0 mL of Internal standard solution. Proeeed as directed under Standerd preparation, beginning with "adjust with 6 N ammonimm hydroxide to a pH of 9 ."

Chromatographie syistem-Under ypieal cenditions, the gas ehromagraph contains a $1.8 \mathrm{~mm} \times 2 \mathrm{~mm}$ glass columm packed with 3\% liquid phase 63 on support S1AB, conditioned as directed (see-Chremagraph (624)). Maintain the collumn at $225^{\circ}$, and tuse nitrogen as the carrier gas.

System suitability Chromatograph a sufficient number of injec tioms of the Standurd preparation, and record peak areas as direc ted under Procdure. The analytieal system is suitable-for eondueting this assay if the relative standard deviation for the ratio of the peak areas does not $2.0 \%$, the reselution factor is not less than 4.0 , and the tailing factor does not exeed 2.0 .

Procedure Inject appropriate pertions of the Assay preparation and the Standard preparationsuccessively into the gas chromatograph. Measure the areas under the peaks for hyoscyamine and homatropine in each chromatogram. Caleulate the ratio, $R_{t}$, of the are of the hyoseymmine peak to the are of the internal- standard peak in the chromatogram from the Assay preparation, and simitarly ealeulate the ratio, $R_{s}$, in the ehromategram from the Staded preparation. Caleulate the quantity, in me, of $\left(\mathrm{C}_{12} \mathrm{H}_{23} \mathrm{NO}_{2}\right)_{2}-\mathrm{H}_{2}$ $\mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in each mL of the Oral Solution taken by the formmla:

$$
0.1(1.053)(H /)\left(R_{L}+R_{s}\right),
$$

in which 1.053 is the ratio of the molecular weight of hy drated hyoscyamine sulfate to that of anhydrous hyoseyamine sulfate, $W$ is the weight, in mg, of USP Hyoscyamine Sulfate RS taken for the Standard prepatration, and $V$ is the volume, in mb , of $\Theta \mathrm{rat}$ Solution taken.
-Diluent, Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Hyoscyamine Sulfate Injection.

Assay preparation-Transfer an accurately measured volume of Oral Solution, equivalent to about 0.5 mg of hyoscyamine sulfate, to a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Pass an aliquot through a 0.45$\mu \mathrm{m}$ filter, discarding the first 5 mL of filtrate.

Procedure-Separately inject equal volumes (about 50
$\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in each mL of Oral Solution taken by the formula:

$$
100 \times 1.053 \times(C / V)\left(r_{U} / r_{S}\right)
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; $C$ is defined under Standard preparation; $V$ is the volume, in mL , of Oral Solution taken; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

Briefing

Hyoscyamine Sulfate Tablets, USP 27 page 951—See briefing under Hyoscyamine Sulfate Injection.

## Change to read:

## Assay-

pH 9.0 buffer Dissolve 34.8 g of dibasic petassium phesphate in 900 mL of water, and adjust to a pH Of 9.0 , determined electrometrieally, by the addition of 3 N hydrochlerie acid or 1 N sodimm hydroxide, as neeessary, with mixing.

Imternal standard solution- Dissolve about 25 mg of homatropine hydrobremide, aceurately weighed, in water contained in a 50 mL volumetrie flack, add water to volume, and mix. Prepare fresh daily.

Standard preparation- Dissolve about 10 mg of USP Hyoseya mine Sulfate RS, cuecurately weighed, in water contained in a 100 ml volumetrie flack, add water to volume, and mix. Prepare fresh daily. Pipet 10.0 mL of this solution inte a separator, add 2.0 mL of Internal steded soltion 5.0 mL of $p H 9.0-\mathrm{buffer}$, and adjust with 1 N sodium hydroxide to a pH 0 f 9.0 . Extract with 10 mL pertions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium-sulfate-supported by a small cetten plus in a fumnel into a 50 mL beaker, and evaperate under nitrogen to dryness. Dissolve the residue in 2.0 mL of methylene chloride.

Assay preparation Weigh and finely powder not less than-20 Fablets. Transfer an aceurately weighed portion of the powder, equivalent to about 1.0 mg of hyoseyamine sulfate, to a-separator eontaining 5 mL of $p H-9.0$ buffer, and add, by pipet, 2.0 mL of faternal standard solution. Proceed as directed under Standard preparation, beginning with "'adjust with-1 N sodium hydroxide - pH of 9.0.י

Chrematographie rystem- Under ypieal conditions, the instrut ment contains a $1.8 \mathrm{~mm} \times 2 \mathrm{~mm}$ glass columm packed with $3 \% \mathrm{G} 3$ on S1AB, conditioned as direeted (see-Chromatography $\langle 624$ ). Maintain the column at $225^{\circ}$, and use nitrogen as the carrier gas at a flow rate of 25 mL per minute.

System sutitability Chromatograph six to ten injections of the Stand preparation, and reeord penk areas as directed mader Proedure. The analytienl system is suitable for conducting this assay if the relative standard deviation for the ratio of the peak areas does not exeed $2.0 \%$, the resolution factor is not less than 4.0 , and the tailing factor does not exceed 2.0 .

Precedure Inject $1 \mu \mathrm{~L}$ pertions of the Assay preparation and the Standard preparation successively int the gas chromatograph. Measure the areas under the peaks for hyoseyamine sulfate and he matropine hydrobremide in each ehrematogram. Caleulate the ratio, $A_{t}$, of the are of the hyoseyamine-sulfate peak to the area of the internal standard peak in the chromatogram frem the Assay pre paration, and similarly caleulate the ratio, $A_{s}$, in the chromatogram from the Standard preparation. Caleulate the quantity, in mg, of $\left(\mathrm{C}_{4} \mathrm{H}_{22} \mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in the pertion of Tablets taken by the formma:-

$$
1.053(W / 10)\left(A_{t}+A_{s}\right),
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoseyamine sulfate that of anhydreus hyoseyamine-sulfate, and Wis the weight, in me, of USP Hyoseyamine Sulfate RS taken for the Standed preparation.
-Diluent, Buffer solution, Mobile phase, Standard stock preparation, and Standard preparation-Proceed as directed in the Assay under Hyoscyamine Sulfate Injection.

Tropic acid solution-Dissolve an accurately weighed quantity of tropic acid in Diluent to obtain a solution having a concentration of about $3 \mu \mathrm{~g}$ of tropic acid per mL.
System suitability preparation-Transfer 3.0 mL of the Standard stock preparation into a $100-\mathrm{mL}$ volumetric flask, add 4.0 mL of the Tropic acid solution, dilute to volume with Diluent, and mix.

Assay preparation-Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 0.125 mg of hyoscyamine sulfate, to a $25-\mathrm{mL}$ volumetric flask. Add about 20 mL of the Diluent, and sonicate for 15 minutes with occasional swirling. Allow to cool to room temperature, dilute with Diluent to volume, and mix. Pass an aliquot through a $0.45-\mu \mathrm{m}$ filter, discarding the first 5 mL of filtrate.
Chromatographic system—The liquid chromatograph is equipped with a $205-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $4-\mu \mathrm{m}$ packing L11 and a $3-\mathrm{mm} \times$ $4-\mathrm{mm}$ guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $30^{\circ}$. Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the elution order is tropic acid peak, followed by hyoscyamine peak; the resolution, $R$, between the tropic acid and hyoscyamine peaks is not less than 1.5 ; the tailing factor for the hyoscyamine peak is not more than 1.8 ; and the relative standard deviation for six replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the area responses for the major peaks. Calculate the quantity, in mg, of $\left(\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ in the portion of Tablets taken by the formula:

$$
25 \times 1.053 \times C\left(r_{U} / r_{s}\right)
$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; $C$ is as defined under Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

Assay preparation-Dilute an accurately measured volume of Ophthalmic Solution quantitatively with water to obtain a solution having an equivalent concentration of about $100 \mu \mathrm{~g}$ of hypromellose per mL .

Procedure-Pipet 2 mL each of the Standard preparation, the Assay preparation, and water to provide a blank, into separate, glass-stoppered test tubes. To each tube add 5.0 mL of diphenylamine solution (prepared by dissolving 3.75 g of colorless diphenylamine crystals in 150 mL of glacial acetic acid and diluting the solution with 90 mL of hydrochloric acid), mix, and immediately insert the tubes into an oil bath at $105^{\circ}$ to $110^{\circ}$ for 30 minutes, the temperature being kept uniform within $0.1^{\circ}$ during heating. Remove the tubes, and place them in an ice-water bath for 10 minutes or until thoroughly cool. At room temperature and using a suitable spectrophotometer, concomitantly determine the absorbances of the solutions from the Standard preparation and the Assay preparation at 635 nm , using the water solution as the blank. Calculate the quantity, in mg, of hypromellose in each mL of the Ophthalmic Solution taken by the formula:

$$
0.001 C(d / V)\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Hydroxy propyl Methyleellulose RS
-USP Hypromellose $\mathrm{RS}_{\text {■1S (USP28) }}$
in the Standard preparation;' $V$ is the volume, in mL , of Ophthalmic Solution taken; $d$ is the dilution factor of $V$ used to obtain the Assay preparation; and $A_{U}$ and $A_{S}$ are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

## Briefing

Hypromellose Ophthalmic Solution, USP 27 page 952. In accordance with the implemented name change of the Reference Standard, from USP Hydroxypropyl Methylcellulose RS to USP Hypromellose RS, it is proposed to make the corresponding change in the USP Reference standard $\langle 11\rangle$ section and in the Assay. This is consistent with the change to the compendial name, Hypromellose, official on September 1, 2002.

accurately weighed, in water, and dilute quantitatively with water to obtain a solution having a known concentration of about $100 \mu \mathrm{~g}$ per mL .

## Briefing

Indinavir Sulfate. This new monograph replaces the monograph that was published on page 2165 of $P F 27(2)$ [Mar.-Apr. 2001] and subsequently canceled. On the basis of information received from the sponsor, the specifications were further clarified to be consistent with the validation method.
(PA7b: B. Davani) RTS-41029-1

## Add the following:

## ■Indinavir Sulfate

$\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4} \cdot \mathrm{H}_{2} \mathrm{SO}_{4} \quad 711.87$
D-erythro-Pentonamide, 2,3,5-trideoxy- N -(2,3-dihydro-2hydroxy -1 H-inden-1-yl) -5- [2- [[(1,1-dimethylethyl) amino]carbonyl]-4-(3-pyridinylmethyl)-1-piperazinyl]-2-(phenylmethyl)-, monohydrate, $[1(1 S, 2 R), 5(S)]$-, sulfate $(1: 1)$ (salt).
$(\alpha R, \gamma S, 2 S)$ - $\alpha$-Benzyl-2-(tert-butylcarbamoyl)- $\gamma$-hydroxy-$N$-[(1S,2R)-2-hydroxy-1-indanyl]-4-(3-pyridylmethyl)-1-piperazinevaleramide sulfate (1:1) (salt) [157810-81-6].
» Indinavir Sulfate contains not less than 98.5 percent and not more than 101.5 percent of $\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$, calculated on an anhydrous, solvent-free basis.

Packaging and storage-Preserve in tight containers, protected from moisture. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle — U S P$ Indinavir $R S$. USP Indinavir System Suitability RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$. The IR absorption spectrum exhibits maxima at about $3.0-3.1,5.9,6.2$, and $13.6 \mu \mathrm{~m}$.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+122^{\circ}$ and $+129^{\circ}$, at 365 nm , determined on the anhydrous, solvent-free basis.

Test solution: 10 mg per mL , in water.
Water, Method $I\langle 921\rangle$ : not more than $1.5 \%$, using 0.25 g .

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method $I\langle 231\rangle: \quad 0.001 \%$.

## Chromatographic purity-

Solution A-Dissolve 0.54 g of monobasic potassium phosphate and 2.79 g of dibasic potassium phosphate in 2 L of water.

Solution B-Use acetonitrile.
Diluent-Prepare a mixture of Solution $A$ and Solution B (1:1).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
System suitability solution-Transfer about 40 mg of USP Indinavir System Suitability RS to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Test solution-Transfer about 50 mg of Indinavir Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time $\quad$ Solution A Solution B

| (minutes) | $(\%)$ | $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| $0-40$ | $80 \rightarrow 30$ | $20 \rightarrow 70$ | linear gradient |
| $40-45$ | 30 | 70 | isocratic |
| $45-47$ | $30 \rightarrow 80$ | $70 \rightarrow 20$ | linear gradient |
| $47-52$ | 80 | 20 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times, based on the indinavir peak at about 21 to 26 minutes, are listed in Table 1; the resolution, $R$, between indinavir and related compound C is greater than 1.8; and the tailing factor, determined from the indinavir peak, is greater than 0.95 and less than 2.0 .

Table 1

| Table 1 |  |
| :---: | :---: |
| Indinavir Related | Approximate Relative |
| Compound | Retention Time |
| A | 0.18 |
| B | 0.80 |
| C | 0.98 |
| D | 1.14 |
| E | 1.30 |

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Indinavar Sulfate taken by the formula:
in which $r_{i}$ is the peak area response for each impurity; and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.1 \%$ of any individual impurity specified in Table 1 is found; and not more than $0.5 \%$ of total impurities is found.

## Content of alcohol-

Standard solution-Transfer 1.0 mL of dehydrated alcohol, at $20^{\circ}$, to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix. Dilute an accurately measured volume of the resulting solution quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.001 mL of alcohol per mL of solution.

Test solution-Transfer about 400 mg of Indinavir Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ capillary column coated with a $1.0-\mu \mathrm{m}$ film of phase G14. The carrier gas is helium, flowing at a rate of 10 mL per minute. The chromatograph is programmed as follows. The temperature of the column is maintained at $35^{\circ}$, the injection port temperature is maintained at $140^{\circ}$, and the detector temperature is maintained at $220^{\circ}$. At the end of each five-minute isothermal run, the oven temperature is increased to $200^{\circ}$ before adjusting the column temperature to $35^{\circ}$ for the next injection. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 0.1 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of

$$
100\left(r_{i} / r_{s}\right),
$$

alcohol, in mg, in the portion of Indinavir Sulfate taken by the formula:

$$
79,000\left(C_{S} / C_{U}\right)\left(r_{U} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mL per mL , of dehydrated alcohol in the Standard solution; $C_{U}$ is the concentration, in mg per mL, of Indinavir Sulfate in the Test solution; and $r_{U}$ and $r_{s}$ are the peak areas for alcohol obtained from the Test solution and the Standard solution, respectively: between $5.0 \%$ and $8.0 \%$ is found. [NOTE-The value 79,000 $=$ conversion to percent $(100 \%) \times$ density of ethanol at $20^{\circ}$ ( $790 \mathrm{mg} / \mathrm{mL}$ ).]

## Content of sulfate-

Methanolic formaldehyde solution-Transfer 1000 mL of methanol to a suitable container, add $300 \mu \mathrm{~L}$ of formaldehyde, and mix.

Diluent-Prepare a mixture of Methanolic formaldehyde solution and water (50:50).

Test solution-Dissolve about 500 mg of Indinavir Sulfate, accurately weighed, in about 80 mL of Diluent.

Procedure-Titrate with 0.1 M lead perchlorate VS, determining the endpoint potentiometrically, using a lead-specific electrode in conjunction with a suitable reference electrode. Each mL of 0.1 M lead perchlorate VS is equivalent to 9.604 mg of sulfate: between $13.2 \%$ and $14.4 \%$ is found, calculated on the anhydrous and solvent-free basis.

## Assay-

Dibutylammonium phosphate buffer-Transfer 20 mL of dibutyl ammonium phosphate to 1000 mL of water. While stirring, adjust with sodium hydroxide TS to a pH of $6.5 \pm 0.05$.

Mobile phase-Prepare a filtered and degassed mixture of Dibutylammonium phosphate buffer and acetonitrile (11:9). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve a suitable quantity of USP Indinavir RS, accurately weighed, in Mobile phase to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation-Transfer about 60 mg of Indinavir Sulfate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $260-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 4000 theoretical plates; the tailing factor is less than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{36} \mathrm{H}_{47} \mathrm{~N}_{5} \mathrm{O}_{4} \cdot \mathrm{H}_{2} \mathrm{SO}_{4}$ in the portion of Indinavir Sulfate taken by the formula:

$$
(1.1598) D C\left(r_{U} / r_{s}\right)
$$

in which $D$ is the dilution factor, in mL , for the Assay preparation; $C$ is the concentration, in mg per mL , of USP Indinavir RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. [NOTE-1.1598 = Indinavir Sulfate MW ( $711.87 \mathrm{~g} / \mathrm{mol}$ )/Indinavir MW $(613.80 \mathrm{~g} / \mathrm{mol})]_{\mathbf{n}}{ }^{1 S}($ USP28)

## Briefing

Indomethacin Topical Gel, page 5808 of PF 24(2) [Mar.-Apr. 1998]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with modifications to InProcess Revision.
(CRX: C. Okeke) RTS-41004-1

## Add the following:

## ■Indomethacin Topical Gel

» Indomethacin Topical Gel contains not less than 0.90 g and not more than 1.10 g of Indomethacin in 100 mL of gel. Prepare Indomethacin Topical Gel as follows:

Indomethacin. . . . . . . . . . . . . . . . $\quad 1.0 \mathrm{~g}$
Carbomer 941 . . . . . . . . . . . . . . . $\quad 2.0 \mathrm{~g}$
Purified Water . . . . . . . . . . . . . . . 10 mL
Alcohol (95\% ethyl alcohol) a
sufficient quantity, to make.... $\quad 100 \mathrm{~mL}$
Transfer the Indomethacin to a suitable beaker, and dissolve it in 55 mL of Alcohol. Transfer this solution to a glass mortar, and slowly add the Carbomer 941 so that it is thoroughly distributed. Press out any white lumps until a smooth gel is formed. Slowly add the Purified Water with mixing. Add a sufficient quantity of Alcohol to obtain a final volume of 100 mL , and mix. Transfer the Gel to a wide-mouth container or ointment jar.

Packaging and storage-Preserve in tight, light-resistant, wide-mouth containers or ointment jars. Store at controlled room temperature.

Labeling-Label it to state that it is for topical, external use only, that it should be used only as directed, and that the container should be kept tightly closed.

Beyond-use date-Thirty days after the day on which it was compounded.

Assay-[To come.] $]_{\text {1S (USP28) }}$

## BRIEFING

Ipecac, USP 27 page 1020. In the Assay for emetine and cephaeline, it is proposed to replace the name of the reagent methyl sulfoxide with its synonym dimethyl sulfoxide. The use of the name "dimethyl sulfoxide" is being standardized throughout the $U S P-N F$. In addition, minor editorial style changes have been made.
(BPC: M. Marques) RTS-41082-6

## Change to read:

## Assay for emetine and cephaeline-

Standard preparation-Weigh accurately a suitable quantity of USP Emetine Hydrochloride RS, and dissolve in 0.5 N sulfuric acid. Dilute quantitatively and stepwise with the same dilute sulfuric acid to obtain a solution having a known concentration equivalent to about $50 \mu \mathrm{~g}$ of emetine per mL .

Assay preparation-Prepare a Test Sample as directed in Methods of Analysis under Articles of Botanical Origin $\langle 561\rangle$. Transfer to a $150-\mathrm{mL}$ beaker about 200 mg , accurately weighed, of the fine powder. Add 2 mL of methyl sulfoxide,

- dimethyl sulfoxide, $\boldsymbol{m}_{1 S}$ (USP28)
mix with a flattened stirring rod to assure complete wetting of the powder, and allow to stand for about 30 minutes. Add 2 mL of water and about 1 g of sodium bicarbonate, and mix.

Phosphate buffer-Prepare approximately 0.5 M solutions of monobasic potassium phosphate (containing 5.1 g per 75 mL ) and dibasic potassium phosphate (containing 2.2 g per 25 mL ). Mix 3 volumes of 0.5 M monobasic potassium phosphate with 1 volume of 0.5 M dibasic potassium phosphate, and adjust by the addition of one or the other of the solutions to a pH of $6.0 \pm 0.05$. Dissolve 7.5 g of potassium chloride in 100 mL of the resulting solution.

Citric acid buffer-Prepare approximately 0.5 M solutions of sodium citrate (containing 6.5 g per 50 mL ) and citric acid (containing 4.8 g per 50 mL ). Mix equal volumes of these solutions, and adjust by addition of one or the other of the solutions to a pH of $4.0 \pm 0.05$.

Chromatographic columns-For each column, pack a pledget of fine glass wool in the base of a chromatographic tube (25-×200mm test tube to which is fused a $5-\mathrm{cm}$ length of $7-\mathrm{mm}$ tubing) with the aid of a tamping rod having a disk with a diameter about 1 mm less than that of the tube.

Prepare Column I as follows. To the Assay preparation add 6 g of purified siliceous earth, mix, transfer the mixture to the column, scrub the beaker with about 1 g of the purified siliceous earth, transfer this to the top of the column, and tamp. Prepare Column II using 3 g of the purified siliceous earth and 2 mL of Phosphate buffer; prepare Column III using 2 mL of Citric acid buffer and 3 g of the purified siliceous earth; and prepare Column IV using 2 mL of sodium hydroxide solution (1 in 50) and 3 g of the purified sili-ceous earth. Pack a pledget of glass wool on the top of each column.

Procedure-[NOTE-Use water-saturated solvents throughout this procedure. Rinse the tips of the chromatographic columns before discarding them.] Mount Columns I and II so that the effluent from Column I flows onto Column II. Pass three $50-\mathrm{mL}$ portions of ether through the columns, and discard Column $I$ and the eluate. Mount Column III below Column II and pass three $50-\mathrm{mL}$ portions of a mixture of 1 volume of ether and 3 volumes of chloroform through the columns. Discard Column II and the eluate. Wash Column III with 25 mL of the ether-chloroform mixture, followed by 25 mL of a mixture of equal volumes of ether and isooctane, and discard the washings. Wash Column $I V$ with 20 mL of a 1 in 50 solution of triethylamine in the ether-isooctane mixture, and discard the washing. Mount Column IV below Column III, and place as a receiver under Column IV a $125-\mathrm{mL}$ separator containing 15 mL of 4 N sulfuric acid. Pass through the columns 10 mL of a 1 in 5 solution of triethylamine in the ether-isooctane mixture, followed by three $10-\mathrm{mL}$ portions of a 1 in 50 solution of triethylamine in the ether-isooctane mixture. Discard Column III, and pass through Column IV 20 mL of the 1 in 50 solution of triethylamine in the ether-isooctane mixture. Shake the separator, allow the phases to separate, and transfer the aqueous extract to a $50-\mathrm{mL}$ volumetric flask. Extract with two additional $10-\mathrm{mL}$ portions of 0.5 N sulfuric acid, combining the extracts in the volumetric flask. Add 0.5 N sulfuric acid to volume, and mix (emetine solution).

Elute Column IV with 75 mL of chloroform, collecting the eluate in a $250-\mathrm{mL}$ separator containing 150 mL of ether. Discard Column IV. Extract with one $20-\mathrm{mL}$ and then with two $10-\mathrm{mL}$ portions of 0.5 N sulfuric acid, collecting the extracts in a $50-\mathrm{mL}$ volumetric flask. Rinse the stem of the separator, add the acid to volume, and mix (cephaeline solution).

Concomitantly determine the absorbances of the emetine solution, the cephaeline solution, and the Standard preparation in 1cm cells at the wavelength of maximum absorbance at about 283 nm and at 350 nm , with a suitable spectrophotometer, using 0.5 N sulfuric acid as the blank.

Calculate the quantity, in mg , of emetine in the portion of Ipecac taken by the formula:

$$
0.05 C\left(A_{283}-A_{350}\right)_{U} /\left(A_{283}-A_{350}\right)_{S}
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of emetine in the Standard preparation, and the parenthetic expressions are the differences in the absorbances of the solution of emetine from the $A s$ say preparation $(U)$ and the Standard preparation $(S)$, respectively, at the wavelengths indicated by the subscripts.

Calculate the quantity, in mg , of cephaeline in the portion of Ipecac taken by the formula:

$$
0.971(0.05 C)\left(A_{283}-A_{350}\right)_{U} /\left(A_{283}-A_{350}\right)_{S}
$$

in which 0.971 is the ratio of the molecular weight of cephaeline to that of emetine; $C$ is as defined above; and the parenthetic expres-
sions are the differences in the absorbances of the solution of cephaeline from the Assay preparation $(U)$ and the Standard preparation (S), respectively, at the wavelengths indicated by the subscripts.

## Briefing

Powdered Ipecac, USP 27 page 1021. In the Assay for emetine and cephaeline, it is proposed to replace the name of the reagent methyl sulfoxide with its synonym dimethyl sulfoxide. The use of the name "dimethyl sulfoxide" is being standardized throughout the $U S P-N F$. In addition, minor editorial style changes have been made.
(BPC: M. Marques) $\quad$ RTS-41082-5

## Change to read:

## Assay for emetine and cephaeline-

Standard preparation, Phosphate buffer, Citric acid buffer, and Chromatographic columns-Prepare as directed in the Assay for emetine and cephaeline under Ipecac.

Assay preparation-Transfer to a $150-\mathrm{mL}$ beaker about 200 mg , accurately weighed, of Powdered Ipecac. Add 2 mL of exide,

- dimethyl sulfoxide, ${ }^{1 / S}$ (USP28)
mix with a flattened stirring rod to ensure complete wetting of the powder, and allow to stand for about 30 minutes. Add 2 mL of water and about 1 g of sodium bicarbonate, and mix.

Procedure-Proceed as directed for Procedure in the Assay for emetine and cephaeline under Ipecac. Calculate the quantity, in mg , of emetine in the portion of Powdered Ipecac taken by the formula:

$$
0.05 C\left(A_{283}-A_{350}\right)_{U} /\left(A_{283}-A_{350}\right)_{S}
$$

in which the parenthetic expressions are the differences in the absorbances of the solution of emetine from the Assay preparation $(U)$ and the Standard preparation (S), respectively, at the wavelengths indicated by the subscripts; and $C$ is as defined for Procedure in the Assay for emetine and cephaeline under Ipecac. Calculate the quantity, in mg , of cephaeline in the portion of Powdered Ipecac taken by the formula:

$$
0.971(0.05 C)\left(A_{283}-A_{350}\right)_{U} /\left(A_{283}-A_{350}\right)_{S}
$$

in which 0.971 is the ratio of the molecular weight of cephaeline to that of emetine; the parenthetic expressions are the differences in the absorbances of the solution of cephaeline from the Assay preparation $(U)$ and the Standard preparation $(S)$, respectively, at the wavelengths indicated by the subscripts; and $C$ is as defined above.

## Briefing

Diluted Isosorbide Mononitrate, page 1509 of $P F$ 29(5) [Sept.-Oct. 2003]. It is proposed to revise the Definition to reflect its applicability to different formulations of the drug substance and to add a caution statement. Also, it is proposed to revise the test for Water to specify that Method Ic should be used.
(PA5: A. Wilk) RTS-40380-1; 40697-1

## Add the following:

## ■Diluted Isosorbide Mononitrate

$\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6} \quad 191.14$
d-Glucitol, 1,4:3,6-dianhydro-, 5-nitrate.

$$
\text { 1,4:3,6-Dianhydro-D-glucitol 5-nitrate } \quad[16051-77-7] .
$$

» Diluted Isosorbide Mononitrate is a dry mixture of isosorbide mononitrate $\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6}\right)$ with lactose or other suitable excipients to permit safe handling. It contains not less than 87.5 percent and not mere than- 92.5 pereent (w/w) 95.0 percent and not more than 105.0 percent of the labeled amount of isosorbide mononitrate $\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6}\right)$.

Caution-Exercise proper precautions in handling undiluted isosorbide mononitrate, which is a powerful explosive and can be exploded by percussion or excessive heat. Only exceedingly small amounts should be isolated.

Packaging and storage-Preserve in tight containers. Store at a temperature between $20^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Diluted Isosorbide Dinitrate RS. USP Isosorbide RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.
$\mathbf{p H}\langle 791\rangle$ : between 4.8 and 6.5. To prepare the test solution, dissolve 5.6 g of Diluted Isosorbide Mononitrate in 50 mL of boiling water, sonicate for 5 minutes, and allow to cool to room temperature.

Water, Method Ic $\langle 921\rangle$ : between $0.4 \%$ and $0.8 \%$. Proceed as directed for hygroscopic materials. To 1.0 g of sample, accurately weighed, add 5 mL of methanol, shake for 30 minutes, and centrifuge at about 2500 rpm for 5 minutes. Use 1.0 mL of the resulting supernatant.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Caution-Material is explosive upon heating; digest the sample thoroughly before ignition.

Heavy metals, Method $I\langle 231\rangle$ : not more than $10 \mu \mathrm{~g}$ per $g$.

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.

## Related compounds-

TEST 1-
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Standard solution 1-Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL .

Standard solution 2-Weigh accurately a quantity of USP Isosorbide RS , and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL .

Standard solution 3-Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL .

Test solution-Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: $20 \mu \mathrm{~L}$.
Developing solvent system: a mixture of absolute alcohol and toluene ( $8: 2$ ).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at $105^{\circ}$ for 5 minutes. Any spot in the chromatogram obtained from the Test solution and corresponding to the $R_{F}$ value of the spots obtained from the Standard solutions is not more intense than the spot in the chromatogram obtained from Standard solution 3: not more than $0.5 \%$ of any individual impurity is found. If the spot in the chromatogram obtained from the Test solution is nearly as intense as the
spot obtained from Standard solution 3, further dilute the Test solution ( $1: 1$ ) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted Test solution with the intensity of the spots obtained from the Standard solutions, correcting the percent level for the additional dilution of the Test solution.

TEST 2-
Mobile phase, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.

Isosorbide mononitrate related compound A standard so-lution-Prepare as directed for Isosorbide mononitrate related compound A standard preparation in the Assay.

Isosorbide dinitrate standard stock solution-Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL .

Standard solution-Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of Isosorbide mononitrate related compound A standard solution and a volume of Isosorbide dinitrate standard stock solution, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of USP Isosorbide Mononitrate RS per $\mathrm{mL}, 0.005 \mathrm{mg}$ of isosorbide mononitrate related compound A per mL , and 0.005 mg of isosorbide dinitrate per mL . Filter a portion of the solution, discarding the first few mL of the filtrate.
Test solution-Use the Assay preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of iso-
sorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$
5556(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the appropriate Reference Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the Standard solution; $W$ is the weight, in mg, of Diluted Isosorbide Mononitrate used to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas of the corresponding components obtained from the Test solution and the Standard solution, respectively: not more than $0.25 \%$ of isosorbide mononitrate related compound A is found; and not more than $0.25 \%$ of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$
100\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ is the peak area for each other impurity obtained from the Test solution; and $r_{s}$ is the sum of the areas of all the peaks: not more than $0.5 \%$ of total impurities is found including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than $0.5 \%$ of total impurities is found, the results for Test 1 and Test 2 being considered.

Assay-
Mobile phase-Prepare a filtered and degassed mixture of water and methanol ( $95: 5$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Transfer an accurately weighed quantity of USP Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to $4 \%$ of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg per mL .

Isosorbide mononitrate related compound A standard preparation-Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg per mL . Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL .
Resolution solution-Transfer 10.0 mL of Isosorbide mononitrate related compound A standard preparation, 1.0 mL of Standard preparation, and 4.0 mL of methanol to a $100-\mathrm{mL}$ volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation-Transfer about 110 mg of Diluted Isosorbide Mononitrate, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for isosorbide mononitrate related com-
pound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, $R$, between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg , of isosorbide mononitrate $\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6}\right)$ in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of isosorbide mononitrate in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak areas obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Isosorbide Mononitrate Extended-Release Tablets, page 1515 of $P F 29(5)$ [Sept.-Oct. 2003]. It is proposed to make further revisions in the test for Related compounds and in the Assay.
(PA5: A. Wilk) RTS-40697-3

## Add the following:

## ■Isosorbide Mononitrate ExtendedRelease Tablets

» Isosorbide Mononitrate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate $\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6}\right)$.

Packaging and storage-Preserve in tight containers. Store at a temperature between $20^{\circ}$ and $30^{\circ}$.

Labeling-[To come.]
USP Reference standards $\langle 11\rangle$ —USP Diluted Isosorbide Dinitrate RS. USP Isosorbide RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A $R S$.

Identification-
A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$-Proceed as directed for Identification test $A$ under Isosorbide Mononitrate Tablets.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Drug release $\langle 724\rangle$ — [To come.]
Uniformity of dosage units $\langle 905\rangle$ : meet the requirements for Content Uniformity. Proceed as directed in the Assay, except to use one Tablet in place of the portion of powdered Tablets used in the Assay preparation.
Water, Method $+\langle 924\rangle$ : net mere than $5.0 \%$.

Fest solution Weigh and finely powder 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to one-Tablet, aceurately weighed, to a suitable eontainer. Add 5.0 mL of methanol, shake for 45 minutes, and then centrifuge at about 4000 rpm for 10 minutes. Use 0.25 mL of the resulting supernatant, correcting for the

## blank.

## Related compounds-

TEST 1—
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Standard solution 1-Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2-Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL .

Standard solution 3-Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL .

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate to a suitable flask containing 20.0 mL of acetonitrile. Sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: $\quad 20 \mu \mathrm{~L}$.
Developing solvent system: a mixture of toluene, ethyl acetate, and isopropyl alcohol ( $53: 32: 15$ ).

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. After developing, dry the plate with warm air for about 10 minutes, dip the
plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at $105^{\circ}$ for 5 minutes. Any spot in the chromatogram obtained from the Test solution and corresponding to the $R_{F}$ value of the spots obtained from the Standard solutions is not more intense than the spot in the chromatogram obtained from Standard solution 3: not more than 1\% of any individual impurity is found. [NOTE-The $R_{F}$ values of isosorbide and isosorbide mononitrate are about 0.2 and 0.6 , respectively.] If the spot in the chromatogram obtained from the Test solution is nearly as intense as the spot obtained from Standard solution 3, further dilute the Test solution (1:1) with acetonitrile, repeat the test, and compare the intensity of the isosorbide spot in the diluted Test solution with the intensity of the spots obtained from the Standard solutions, correcting the percent level for the additional dilution of the Test solution.

TEST 2-
Mobile phase-Prepare a filtered and degassed mixture of water and methanol ( $75: 25$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Isosorbide mononitrate related compound A standard stock solution-Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.3 mg per mL .

Isosorbide dinitrate standard stock solution-Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.15 mg of isosorbide dinitrate per mL .

Standard stock solution-Transfer 2.0 mL of Isosorbide mononitrate related compound A standard stock solution and 4.0 mL of Isosorbide dinitrate standard stock solution to a $100-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Stat Resolution solution-Transfer about 24 mg of USP Isosorbide Mononitrate RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add 10.0 mL of Standard stock solution, add 20 mL of methanol, and dilute with water to volume.

Restand Standard solution-Transfer 10.0 mL of Standard stock solution and 20 mL of methanol to a $100-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a $50-\mathrm{mL}$ volumetric flask, add 40 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant ( 10 in 50 ) with water. Pass a portion of this solution through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity, and use the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the isosorbide mononitrate related compound A and the isosorbide mononitrate is not less than 1.0. [NOTE-The relative retention times are about 0.9 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 5.6 for isosorbide dinitrate.] Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the
relative standard deviation for replicate injections is not more than $10 \%$ for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

Procedure-Separately inject equal volumes (about 100 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate in the portion of Tablets taken by the formula:

$$
25(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the appropriate Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the Standard solution; $W$ is the weight, in mg , of isosorbide mononitrate in the sample used to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak areas of the corresponding component obtained from the Test solution and the Standard solution, respectively: not more than $0.25 \%$ of isosorbide mononitrate related compound A is found; and not more than $0.25 \%$ of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Tablets taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak area for each other impurity obtained from the Test solution; and $r_{s}$ is the sum of the areas of all the peaks: not more than $0.25 \%$ of total other impurities is found and not more than $0.5 \%$ of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate.

Assay-
Mobile phase-Prepare a filtered and degassed mixture of water and methanol ( $8: 2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Isosorbide mononitrate related compound A standard preparation-Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.15 mg per mL .

Resolution solution-Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, equivalent to about 30 mg of isosorbide mononitrate, to a $250-\mathrm{mL}$ volumetric flask. Dissolve in water, add 10.0 mL of Isosorbide mononitrate related compound A standard preparation, add 50 mL of methanol, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.12 mg of isosorbide mononitrate per mL and about 0.006 mg of isosorbide mononitrate related compound A per mL.

Standard preparation-Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, add a portion of methanol equivalent to about $20 \%$ of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a $100-\mathrm{mL}$ volumetric flask, add 50 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quanti-
tatively dilute the supernatant ( 10 in 50 ) with water. Pass a portion of this solution through a filter having a $0.45-\mu \mathrm{m}$ or finer porosity, and use the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—
The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 12.5-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 50 $\mu \mathrm{L} 20 \mu \mathrm{~L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of isosorbide mononitrate $\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{6}\right)$ in the portion of Tablets taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of isosorbide mononitrate in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.n1S (USP28)

## Briefing

Ivermectin, page 114 of $P F 30$ (1) [Jan.-Feb. 2004]. On the basis of comments received, the following changes are proposed for this new monograph: (1) the upper limit in the Definition is changed from 100.5 to 102.0 percent; (2) the Packaging and storage statement now includes a statement for drug substances that do not contain a suitable quantity of an antioxidant; (3) the tests for Clarity of solution and Color of solution are considered unnecessary; changes in the Chromatographic system are made in the limit test; changes in the Related compounds test are made to use the Standard preparation as directed in the Assay; (4) and changes to the Assay are made to improve the resolution between the peaks of interest and to simplify the equation of the two components, $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ and $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$. Interested parties are encouraged to submit comments to USP.
(VET: I. DeVeau) RTS-40838-1

## Add the following:

## ■Ivermectin

fvermectin [70288-86-7].
Component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ :

[70209-81-3].
\# Ivermectin is a mixture of $5-0$ demethyl 22,23dihydreavermectin $A_{1+}$ (compenent $B_{t_{n}}$ ) and 5-O demethyl 25 -de( 1 methylpropyl) 22,23 -dihydre-25-(1 methylethyl)avermectin $\Lambda_{\text {4b }}$ (compenent $\mathrm{B}_{\mathrm{tb}}$. It contains not less than 95.0 pereent of compenent $B_{16}$ plus compenent $B_{40}$, caleulated on the water, ethanel aleehel, and formamide free basis.
$»$ Ivermectin is a mixture of Avermectin $\mathrm{A}_{1 \mathrm{a}}, 5-O-$ demethyl-22,23-dihydro-(component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ) and Avermectin $\mathrm{A}_{1 \mathrm{a}}$, 5-O-demethyl-25-de(1- methyl-propyl)-22,23-dihydro-25-(1-methylethyl)-(component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ ). It contains not less than 90.0
percent of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$, and the sum of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ plus component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ is not less than 95.0 percent and not more than 100.5102 .0 percent, calculated on the anhydrous and alcoholand formamide-free basis. It may contain a small amounts of suitable antioxidant and chelating agents.

Packaging and storage-Preserve in tight containers. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$. Store between $2^{\circ}$ and $8^{\circ}$. Where the use of an antioxidant is allowed, store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

Labeling-If it is intended for veterinary use only, it is so labeled. Label it to state the name(s) and amount(s) of any added substance(s). Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards $\langle 11\rangle$ —USP Ivermectin $R S$.
Clarity of solution Transfer 1 g to a 50 mL volumetric flask, dissolve in and dilute with toluene to volume, and mix: the solution is clear.

Color of solution Pass a pertion of the solution prepared in the test for Clarity of solution through a fine peresity, sim tered glass filter. Determine the abserbance of the filtrate at 440 mm in a 1 em cell using toltene as the blank: the absorbance is not more than $0.024(1-0.01 V)$, in which $V$ is the stm of the percentages of water, aleohol, and formamide in the Ivermectin taken.

## Identification-

A: The-chrematogram of the Assay preparation, obtained as directed in the $A s s a y$, exhibits major peaks for eompenent $B_{+m}$ and compenent $B_{t b}$, the retention times of which correspend to these exhibited in the chrematogram
of the Standard preparation, obtained as directed in the -As say, and the ratio of compenent $B_{+4}$ tocempenent $B_{4-6}$ is net less than-9.0:1-9.0:1.0. Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.

B: Ultaviolet Abserption $\langle 197 \mathrm{U}\rangle$ -
Soltion: $20 \mu \mathrm{~g}$ per mL.
Meditm:- methanel. The spectrum exhibits maxima at about 238 nm and 245 nm and a shoulder at about 253 fm, and the absorptivity at the wavelength of maximmm abserption at about 245 nm is between 37.2 and 39.2 , caleu tated on the water, ethanel-aleohol, and formamide-free basis. The retention times of the component $\mathrm{H}_{2} \mathrm{~B}_{1 \text { a }}$ peak and the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ peak in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay. Clarity and color of solution Dissolve 1.0 g of it in to tarne to obtain 50 mL of solution: the solution is clear and its abserbance at 440 nm in a 1 -em cell is not more that 0.024 , toltene being used as the blank.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-17^{\circ}$ and $-20^{\circ}$, determined at $20^{\circ}$ and calculated on the water-, ethanel alcohol-, and formamide-free basis.

Test solution: $\quad 255 \mathrm{mg}$ per mL , in methanol.
Water, Method $I\langle 921\rangle$ : not more than $1.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method $I I\langle 231\rangle$ : $0.002 \%$.
Limit of alcohol and formamide-
Standetrd solutions- Transfer 3.0 mL of dehydrated aleehel to a 100 mL volumetric flask, dilute with water to vol ume, and mix (Solution 4). Transfer 1.0 mL of formamide to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix (Solution B). Transfer 3.0 mL of Solution $A$ and 3.0 mL of Solution $B$ to a 100 mL volumetric flack, dilute with water to volume, and mix to obtain a solution having coneentrations of ethanel aleohel and formamide of 0.0009 and 0.0003 mL per mL , respectively (Solutien C). Transfer 8.0
mL of Solution 4 and 8.0 mL of Solution $B$ to a $100-\mathrm{mL}$ velumetric flask, dilute with water to volume, and mix to ebtain a selution having cencentrations of ethanel aleohel and formamide of 0.0024 and 0.0008 mL per mL , respec tively (Solution D). Transfer 4.0 mL of Solution $C$ and 4.0 mL of Solution $D$ to separate $15-\mathrm{mL}$ centrifuge tubes, add 2.0 mL of $m$ xylene to each tube, stopper, mix, centrifuge, and discard the upper maylene layers. The retained lower fayers are Standerd solutions- $C$ and $D$.

Fest solution Transfer 120 mg of Ivermectin, aceurately weighed, to a 15 mL centrifuge tube, and dissolve in 2.0 mL of m xylene. Add 2.0 mL of water, mix, and centrifuge. Transfer the m- xylene-layer to a $15-\mathrm{mL}$ centrifuge tube, and extract again with 2.0 mL of water. Discard the $m-x y$ tene layer, and combine the twe aqueous layers to obtain the

## Fest solution.

Chromatographic syistem (see Chrematography $\langle 624\rangle$ ) The gas chromatograph is equipped with a flame ionization detector and contains a $1.8 \mathrm{~m} \times 3.2 \mathrm{~mm}$ columm packed with 80-10 - 100 mesh suppert S2. The injection pert is maint tained at abeut $190^{\circ}$, and the detector is maintained at abeut $250^{\circ}$. Helium is used as the carrier gas at a flow rate of about 40 mL per mintute. The columm is maintained at about $150^{\circ}$ for 12 minttes after injection, then raised at a rate of $20^{\circ}$ per mintete to $180^{\circ}$, and then held for 20 minters.

Procedure Separately inject equal volumes (about $2 \mu \mathrm{H}$ ) of Standard solutions $C$ and $D$ and the Test solution inte the ehromatograph, record the chromatograms, and measure the ethanel aleohel and formamide peak respenses. Plot the peak respenses for ethanel aleohol and formamide versus eoncentrations, in mL per mL, of ethanol aleohol and forma mide, respectively, obtained frem Standard solutions $C$ and P. From the graphs so obtained, determine the concentrations of ethanel aleohel and formamide in the Test solution. ENOTE-In the event that the peak respenses-of the Test solt
tion-are-signifieantly outside the ranges-of peak respenses ebtained with Standard solutions $C$ and $D$, prepare additional Standard solutions, and chromatograph them to obtain peak responses bracketing those obtained with the Fest solution.]-Caleulate the pereentages of ethanol aleohel and formamide in the pertion of Ivermectin taken by the for-mula:-

$$
400,000 \mathrm{Cd} / W,
$$

in which $C$ is the concentration of ethanol alcehol or formamide, in mL per mL, of the Test solution; $d$ is the density of ethanel aleohel ( 0.79 ) or formamide-(1.13); and $W$ is the weight, in mo, of Ivermectin taken: not more than $5.0 \%$ of ethanel aleohel $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$ and $3.0 \%$ of formamide are fount.

Internal standard solution-Dilute 0.5 mL of isopropyl alcohol with water to 100 mL , and mix.

Standard solution 1—Transfer 3.02 .0 mL of dehydrated alcohol to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution 2-Transfer 1.0 mL of formamide to a $100-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Standard solution 3-Transfer 5.0 mL of Standard solution 1 and 5.0 mL of Standard solution 2 to a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of formamide and alcohol of 0.001 and 0.00330 .002 mL per mL , respectively. Transfer 2.0 mL of this solution to a $15-\mathrm{mL}$ centrifuge tube, add 2.0 mL of $m$-xylene, insert the stopper, mix, and centrifuge. Remove the upper $m$-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix. Each mL of this solution contains about 0.00120 .0008 mL of alcohol and 0.0004 mL of formamide.

Standard solution 4-Transfer 10.0 mL of Standard solution 1 and 10.0 mL of Standard solution 2 to a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of alcohol and formamide of 0.0060 .004 and 0.002 mL per mL , respectively. Transfer 2.0 mL of this solution to a $15-\mathrm{mL}$ centrifuge tube, add 2.0 mL of $m$-xylene, insert the stopper, mix, and centrifuge. Remove the upper $m$-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix. Each mL of this solution contains about 0.00240 .0016 mL of alcohol and 0.0008 mL of formamide.

Test solution-Transfer 120 mg of Ivermectin, accurately weighed, to a $15-\mathrm{mL}$ centrifuge tube, and dissolve in 2.0 mL of $m$-xylene, heating in a water bath at $45 \pm 5^{\circ}$, if necessary. Add 2.0 mL of water, mix, and centrifuge. Transfer the $m-$ xylene layer to a $15-\mathrm{mL}$ centrifuge tube, and extract with 2.0 mL of water. Discard the upper $m$-xylene layer, combine the two retained lower aqueous layers, add 1.0 mL of Internal standard solution, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-
The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused-silica analytical column coated with a $3-\mu \mathrm{m}$ G43 stationary phase. The carrier gas is helium, with a $1: 510: 1$ split ratio and a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at about $40^{\circ}$ for 5 minutes after injection, and then increased at a rate of $20^{\circ}$ per minute to $180^{\circ}$, and maintained at $180^{\circ}$ for 2 minutes. The injection port temperature is maintained at about $440^{\circ}, 220^{\circ}$, and the detector temperature is maintained at about $250^{\circ} .280^{\circ}$.

Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of Standard solution 3, Standard solution 4, and the Test solution into the chromatograph, record the chromatograms,
and measure the peak responses for alcohol, formamide, and isopropyl alcohol. Plot the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol versus concentrations, in mL per mL , of alcohol and formamide, respectively, obtained from Standard solution 3 and Standard solution 4. From the graphs so obtained, and using the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol obtained from the chromatogram of the Test solution, determine the concentrations, $C$, of alcohol and formamide in the Test solution. [NOTE-In the event that the peak responses of the Test solution are significantly outside the ranges of peak responses obtained from Standard solution 3 and Standard solution 4, prepare additional Standard solutions, and chromatograph them to obtain peak responses bracketing those obtained with the Test solution.] Calculate the percentages of alcohol and formamide in the portion of Ivermectin taken by the formula:

$$
500,000 C D / W,
$$

in which $C$ is the concentration of alcohol or formamide, as appropriate, in mL per mL , in the Test solution; $D$ is the density of alcohol ( 0.79 ) or formamide (1.13); and $W$ is the weight, in mg, of Ivermectin taken: not more than $5.0 \%$ of alcohol and $3.0 \%$ of formamide is found.

Related substanees compounds-Using the chromato gram of the Assay preparation obtained as direeted in the Assaly, caleulate the percentage of each related substance compound in the Ivermectin taken by the formmat:-

$$
100
$$

[^95]Not more than 2\% of any individual related substance com pernd is found, and the-sum of all related substances is not mere than-4\%.

Mobile phase and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Proceed as directed for Standard preparation in the Assay.

Standard solution 1 Transfer $1.0-\mathrm{mL}$ of the Standard stock solution to a $100-\mathrm{mL}$ volumetric flack, dilute with methanel to veltume, and mix.

Standard solution 2 Transfer 5.0 mL of Standard solu fien 1 to a 100 mL volumetric flask, dilute with methanol to volume, and mix.

Test solution-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 20 HL) of Standard solution-1, Standard solution-2, (about $50 \mu \mathrm{~L})$ of the Standard solution and the Test solution into the chromatograph, record the chromatogram of the Test solution for a period of time equivalent to twice the retention time of the prineipat main peak in the chromatogram obtained from the Standard solution 1, Standard solution, and measure the respenses for the major peaks. In the chrematogram obtained from the Test soltuion, the area of any peak with a retention time of 1.3 to 1.5 abeut 1.2 to 1.4 , relative to the prineipal peak, is not greater than twiee 2.5 times the area of the principal peak in the chromatogram-ob fained frem Standard solution - 1 ( $2.0 \%$ 2.5\%); the area of any other peak, aside from the prineipal peaks, is not greater than the area of the principal peak in the chremategram obtained frem Standard solution 1 (1.0\%); and the sum of the areas of all the peaks, apart frem the proneipal peaks, is net greater than four times the area of the prin eipal peak in the ehromatogram obtained from Standard solution $1(4.0 \%)(4 \%)$. Disregard any peak with an area less
than that of the prineipal peak in the chrematogram of Standatd solution $2(0.05 \%)$. peak areas. Calculate the percentage of each impurity by the formula:

$$
100 r_{i} /\left(r_{s}-r_{b}\right)
$$

in which $r_{i}$ is the peak area for each individual impurity in the Test solution chromatogram; $r_{s}$ is the sum of all peaks in the Test solution chromatogram; and $r_{b}$ is the total area of all peaks in a blank chromatogram: not more than $2.5 \%$ is found for the sum of all peaks with a relative retention time of about 1.3 to 1.4 (corresponding to $\mathrm{H}_{4} \mathrm{~B}_{1 \mathrm{a}}$ isomers and $\Delta^{2,3}$ $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ); not more than $1 \%$ is found for the peak with a relative retention time of about 0.7 (corresponding to $8 \mathrm{a}-\mathrm{oxo}$ $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ ); not more than $0.7 \%$ is found for the peak with a relative retention time of about 0.5 (corresponding to Avermectin $\mathrm{B}_{1 \mathrm{a}}$ ); not more than $0.5 \%$ is found for any other individual impurity peak; not more than $1 \%$ is found for the sum of all ether individuat unidentified peaks; and not more than $4 \%$ is found for the sum of the areas of all the peaks, apart from the two main peaks $\left(\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}\right.$ and $\left.\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}\right)$. Disregard any peak with an area less than that of the two main peaks $\left(\mathrm{H}_{2} \mathrm{~B}_{4+\mathrm{an}}\right.$ and $\left.\mathrm{H}_{2} \mathrm{~B}_{4 \mathrm{~b}}\right)$ in the chromatogram- of Standated solution $2(0.05 \%)$ that is calculated to be less than $0.05 \%$.

Assay-
Mebile phase Prepare a mixture of acetenitrile, methanel, and water ( $530: 350: 120$ ), filter threugh a filter having a peresity of $1 \mu \mathrm{~m}$-r less, and degas. Make adjustments if necessary (see Systen Suitability under Chromatography $\langle 624\rangle$.

Standard preparation Dissolve an aceurately weighed quantity of USP Ivermectin RS quantitatively in Mobile phase to obtain a-solution having a knewn coneentration of about 0.5 mg per mL .

Assay preparation Transfer about 40 mg of Ivermectin, accurately weighed, to a 100 mL volumetric flask, dissolve in methanel, dilute with Mobile phase to volume, and mix. Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a 254 nm detec for and a $4.6 \mathrm{~mm} \times 25 \mathrm{~mm}$ celtumn that contains $5 \mathrm{\mu m}$ packing L1. The flow rate is about 1 mL per minute. Chrematograph the Standard preparation, and record the peak respenses as directed under Precedtre: compenent $\mathrm{B}_{4 \mathrm{~b}}$ is eluted at a retention time of about 14 minntes, followed by compenent $B_{1+}$ at a retention time of about 17 minntes. The reselution, $R$, between the peaks for component $B_{46}$ and eompenent $B_{\text {ten }}$ is not less than 3.0, the column efficiency determined from the compenent $B_{+\infty}$ peak is net less than 2000 theoretical plates, the tailing factor for the compenent $B_{\text {te }}$ peak is not more than 2.5, and the relative standard de viation of the peak respenses for compenent $B_{\text {te }}$ for replieate injections is not more than $1.0 \%$.

Proedure [NOTE-Use peak areas where peak respenses are indicated.] Separately inject equal volumes (about $50 \mathrm{\mu L}$ ) of the Standard prepatration and the Assay preparation into the-chromatograph, record the-chromategrams over a period of time that is twice the retention time of the peak for compenent $B_{t+4}$, and measure the peak respenses for compenent $B_{4 n}$ and compenent $B_{4}$. Caleulate the percentage of compenent $B_{+0}$ plus compenent $B_{4+}$ in the pertion of Ivermectin taken by the formula:-

$$
100(C P / H)\left(F_{t}+F_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Ivermectin RS in the Standerd preparation, $P$ is the designated percentage of the sum of compenent $B_{4+e}$ and compenent $B_{+6}$ in the USP Ivermectin RS, $W$ is the weight, in mg, of Iver mectin taken to prepare the $A$ ssay $p$ Peparation, and $f_{t}$ and $r_{s}$
are the sums of the peak respenses for compenent $B_{\text {ta }}$ and eompenent $B_{4}$-obtained from the Assay preparation and the Standard preparation, respectively.

Mobile phase_Prepare a mixture of acetonitrile, methanol, and water $(53: 35: 12)$, pass through a flter having a + - m or finer peresity, ( $53: 27.5: 19.5$ ), and degas. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ). Increasing the proportion of water increases the elution times and allows better separation of impurities.

Standard preparation-Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution having a known concentration of about 0.8 mg per mL .0 .4 mg per mL .

Assay preparation-Transfer about 80 mg 40 mg of Ivermectin, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with methanol to volume, and mix. Sonicate, if necessary.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1 mL 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.80 .75 for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ and 1.0 for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$; the resolution, $R$, between component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ and component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ is not less than 3.0 ; the column efficiency determined from the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak is not less than 2000 theoretical plates; the tailing factor for component $\mathrm{H}_{2} \mathrm{~B}_{1 \text { a }}$ peak is not more than 2.5 ; and the relative standard deviation for six replicate injections is not more than $1.0 \%$ determined from the component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ peak.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L})$ (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chroma-
tograms, and measure the peak areas for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ and component $\mathrm{H}_{2} \mathrm{~B}_{\mathrm{b} \text { b }}$. Calculate the quantity, in mg , of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}\left(\mathrm{C}_{48} \mathrm{H}_{74} \mathrm{O}_{14}\right)$ and component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ $\left(\mathrm{C}_{47} \mathrm{H}_{72} \mathrm{O}_{14}\right)$ in the portion of Ivermectin taken by the formula:

$$
100 \mathrm{C}\left(+_{\llcorner }+\Psi_{s}\right)
$$

$$
D C\left(r_{U} / r_{S}\right)
$$

in which $D$ is the dilution factor, in mL , used to prepare the Assay preparation; $C$ is the concentration, in mg per mL , of component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ or component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak for component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{a}}$ or component $\mathrm{H}_{2} \mathrm{~B}_{1 \mathrm{~b}}$ obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP27)

## Briefing

Lamivudine, USP 27 page 1064. It is proposed to revise the test for Limit of lamivudine enantiomer to specify the concentration of USP Lamivudine Resolution Mixture A RS used in the Resolution solution. It is also proposed in the test for Limit of residual solvents to replace the reagent methyl sulfoxide by its synonym dimethyl sulfoxide. The use of dimethyl sulfoxide will be standardized throughout $U S P-N F$.
(PA7b: B. Davani; BPC: M. Marques) RTS-40983-1; 41082-4

## Change to read:

Limit of lamivudine enantiomer-
0.1 M Ammonium acetate solution-Dissolve about 7.7 g of ammonium acetate in water, and dilute with water to 1000 mL .

Mobile phase-Prepare a suitable mixture of 0.1 M Ammonium acetate solution and methanol ( $95: 5$ ), mix, filter, and degas.
Resolution solution-Pissolve the eontents of 1 vial of USP Lamivudine Resolution Mixture $A$ RS in 5 mL of water, and quantiatavely transfer the solution to a 10 mL volumetric flask using successive 2 mL portions of water. Dilute with water to volume, and mix.
-Dissolve an accurately weighed quantity of USP Lamivudine Resolution Mixture A RS in water to obtain a solution having a known concentration of about 0.25 mg per mL . 1 (USP28)
Test solution-Transfer about 25 mg of Lamivudine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $270-\mathrm{nm}$ detector and a $4.6-$ $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L45. The column temperature is ${ }^{4}$ maintained at a constant temperature of between $15^{\circ}$ and $30^{\circ} \cdot \mathbf{\Delta S S P 2 7}$ The flow rate is about 1.0 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between lamivudine and lamivudine enantiomer is not less than 1.5 . [NOTE-The relative retention times are about 1.0 for lamivudine and about 1.2 for lamivudine enantiomer.]
Procedure-Inject a volume (about $10 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of lamivudine enantiomer in the portion of Lamivudine taken by the formula:

$$
100\left[r_{U} /\left(r_{U}+r_{S}\right)\right],
$$

in which $r_{U}$ and $r_{S}$ are the peak responses of lamivudine enantiomer and lamivudine, respectively: not more than $0.3 \%$ is found.

## Change to read:

Limit of residual solvents-
Internal standard solution-Transfer about ${ }^{\mathbf{\Delta}} 1 \mathrm{~mL}$ of 2-pentanone, accurately measured, ${ }_{\Delta U S P 27}$ to a $100-\mathrm{mL}$ volumetric flask, dilute with a mixture of methyls sulfoxide

- dimethyl sulfoxide $_{\text {IS (USP28) }}$
and water ( $1: 1$ ) to volume, and mix.
Standard solution- ${ }^{\mathbf{4}}$ Transfer 10 mL of Internal standard solution to a $100-\mathrm{mL}$ volumetric flask. To the same flask add an accurately measured quantity of about $100 \mu \mathrm{~L}$ of each of the following: dehydrated alcohol, isopropyl acetate, methanol, and triethylamine. Dilute with a mixture of methyl sulfoxide
- dimethyl sulfoxide $_{\boldsymbol{m}_{1 S} \text { (USP28) }}$
and water ( $1: 1$ ) to volume, and mix. $\Delta$ USP27
Test solution-Transfer about 5 g of Lamivudine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, add 10 mL of Internal standard solution, dilute with a mixture of methyl sulfoxide
- dimethyl sulfoxide $_{\mathbf{n}_{1 S}(\text { USP28) }}$
and water ( $1: 1$ ) to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )—The gas chromatograph is equipped with a split injection port, a flame-ionization detector, and a $0.53-\mathrm{mm} \times 50-\mathrm{m}$ column coated with a $5-\mu \mathrm{m}$ film of phase G1. The carrier gas is hydrogen at a pressure of 5 psig. The split flow rate is about 320 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at $70^{\circ}$ for 3 minutes, then increased at a rate of $30^{\circ}$ per minute to $200^{\circ}$, and maintained at that temperature for 6.5 minutes. The injection port temperature is maintained at $150^{\circ}$ and the detector temperature is maintained at $250^{\circ}$.

Procedure-Separately inject equal volumes (about $0.5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each residual solvent in the portion of Lamivudine taken by the formula:

$$
10(C / W)\left(R_{i} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of the respective analyte in the Standard solution; $W$ is the weight, in $g$, of Lamivudine taken; and $R_{i}$ and $R_{S}$ are the peak response ratios of the respective analyte to the internal standard obtained from the Test solution and the Standard solution, respectively: not more than $0.2 \%$ of alcohol is found; not more than $0.2 \%$ of isopropyl acetate is found; not more than $0.1 \%$ of methanol is found; not more than $0.1 \%$ of triethylamine is found; and not more than $0.3 \%$ of total residual solvents is found.

## BRIEFING

Leuprolide Acetate, page 1412 of PF 28(5) [Sept.-Oct. 2002]. On the basis of comments received, it is proposed to make the following revisions to this new monograph: in the test for Bacterial endotoxins, the instructions for performing the test are being deleted, allowing the analyst to use any method that meets the requirements specified in the general chapter Bacterial Endotoxins Test $\langle 85\rangle$; in the test for Water, the limit is being raised from "not more than $5.0 \%$ " to "not more than $8.0 \%$ "; and in the test for Amino acid content, much of the instruction for performing the test is being deleted and a citation to Amino Acid Analysis under the general chapter Biotechnology-Derived Articles-Tests $\langle 1047\rangle$ is added, thus allowing analysts to use any suitable, validated method for performing the amino acid analysis.
(BNT: I. DeVeau) RTS-40388-5

## Add the following:

## Leuprolide Acetate

$2 \quad 1269.481209 .41$ (as free base)
Luteinizing hormone-releasing factor (pig), 6-D-leucine-9-
( $N$-ethyl-L-prolinamide)-10-deglycinamide moneaeeacetate (salt).
5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tryosyl
tyrosyl-D-leucyl-L-leucyl-L-arginyl- $N$-ethyl-L-prolinamide meneetate acetate (salt) [74381-53-6].

## » Leuprolide Acetate is a synthetic nanopeptide nonapeptide agonist analog of luteinizing hor-mone-releasing factor. It contains not less than

 97.0 percent and not more than 103.0 percent of leuprolide ( $\mathrm{C}_{59} \mathrm{H}_{84} \mathrm{~N}_{16} \mathrm{O}_{12}$ ), calculated on the anhydrous, acetic acid-free basis.NOTE-Due to the hygroscopic nature of this material, analyses are performed immediately after opening the container in a glove box under dry nitrogen purge.
Caution-Leuprolide Acetate is a potent hormonal manipulator. Avoid skin contact and inhalation of dusts and mists.

Packaging and storage-Preserve in tight containers.
Store at a temperature not higher than $30^{\circ}$.
USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS. USP
Leuprolide Acetate RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Fest specimen Use the Assay prepation.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $38^{\circ}$ and- $12^{\circ}-38.0^{\circ}$ and $-42.0^{\circ}$ expressed on an anhydrous, acetic acid-free basis.

Test solution: $\quad 10.0 \mathrm{mg}$ per mL , in $4 \mathrm{~N} 1 \%$ acetic acid. Bacterial endotoxins $\langle 85\rangle$ -

NOTE-1 Prepare the solutions quickly, and use them im mediately. Where water is specified, use Sterile-Water for Irrigation.

NOTE 2-The pH of the mixtlre of the Test solutions and the LAL reagent should be between 6.0 and 8.0 .
Star stock solutions-Mix USP Endotoxin RS vigor eusly on a vortex mixer for not less than 1 minute, and dilute stitable quantities of USP Endotoxin RS with water to obtain solutions having known coneentrations of about 1.0 , $0.50,0.10,0.05$, and 0.005 USP Endorin Unit per mL.

Horking standerd solution Dilute 2.0 mL of the 1.0 USP
Endotoxin Unit per mL Stalldard stock solution with water m 10.0 mL , and mix.

Fest stoch Dissolve 20 - 40 mg of Let prolide Acetate, aceurately weighed, in a volume of 50 mM tris(hydroxymethyl)aminemethane buffer solution, and mix en a vortex mixer for abou 1 minte to obtain a solution having a coneentration of about 2.0 mg of leuprolide acetate per mL. Dilute with water, and mix on a vortex mixer to ob tain a solution having a concentration of about 1.0 mg of lemprolide acetate per mL.

Fest solution 1 Dilute 0.1 mL of the Test stock solution with 4.9 mL of 10 mM tris(hydroxymethyl)aminemethane buffer solution. (The finaldilution factor to be entered inte the system under Procedtre is 1 in 100.)

Fest solution 2 Dilute 0.1 mL of the Test stock solution with $9.9-\mathrm{mL}$ of 10 mM -tris(hydrexymethyl)aminemethane buffer solution. (The final dilution factor to be entered inte the system under Procedtre is 1 in 200 .)

Positive product control solutions Add 50 5 L of Werk ing standard solution to $50 \mu \mathrm{~L}$ of each Test solution already placed in the mierotiter wells.

System suitability The kinetic quantitative chromogenic system is equipped with a reader set at 405 nm , an appre-priate-incubation device, and a data manipulation deviee. Chrematograph the Standard stock solutions, record the peak respenses as directed for Procedure, and plat the loga rithms of reaction endpeint times versus the logarithms of the coneentrations of the Standtard stock solutions: the abse tute value-of the correlation coefficient for the-standard eurve is not less than 0.980 ; and the coefficient of variation fer replicate wells is net mere than 10\%. Preceed with the Positive product entrolsolutions as directed for Procedtre, and calculate the percentage of spike recovery by the formt ła:

## 100R/S,

in whieh $R$ is the amount, in USP Endotoxin Units per mL, of recovered spiked sample; and $S$ is 0.1 USP Endotoxim Unit per mL: $\pm 25 \%$ of the spike value is recovered. If this pereentage is feund to be maceeptable, proceed as directed for Procedure using Test solution 2 insteat of Test solution $+$

Procedure Enter concentrations of all solutions and finat dilution factors into the datastem. Use sendotoxin free mierotiter plates andendotoxin free polystyrene-ulture tabes.

Place each of the preparations in duplieate wells. Carefally dispense $100 \mu \mathrm{~L}$ of water endetoxin negative contrel and each of the-Standard stock solutions. Carefully dispense $50 \mu \mathrm{~L}$ of water and $50 \mu \mathrm{~L}$ of Test solution 1. Carefully dispense the Positive product control solution. Preineubate the plate for 10 mintutes at $37^{\circ}$. Near the end of the 10 mintte period, reconstitute each LAL reagent vial with 2.6 mL of water. Remove the mierotiter plate from the ineubation ehamber. Add $100-\mu \mathrm{L}$ of LAL reagent to each well of the mieretiter plate. Insert the mierotiter plate into the well reat er, and initiate the reading for each well. The system-soft Ware reports the endotoxin concentration in USP Endotoxin Units per mL. If caleulating manually, Use the standard curve to calculate the average endotoxin concentration, in USP Endotoxin Units per mL, in the pertion of Leu prolide Ace ate taken. Not It contains net more than 16.67 166.7 USP Endetoxin Units per mg of leuprolide acetate. A eemputerized system may be used to calculate the endotox inconcentration in USP Endotoxin Units per mes.It contains not more than 166.7 USP Endotoxin Units per mg of leuprolide acetate.

Water, Method Ic $\langle 921\rangle$ : not more than 5.0\%. $8.0 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.3 \%$.
Chromatographic purity-
Buffer solution, Organic modifier solution, Mobile phase, Standard stock preparation, and Degradation standard pre-paration-Prepare as directed in the Assay.

Standard solution-Transfer 1.0 mL of the Standard stock preparation to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Test solution-Transfer about 100 mg of Leuprolide Acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system-Proceed as directed in the Assay. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.80 for D-Ser-leuprolide, 0.90 for D-Hisleuprolide, 1.00 for leuprolide, 1.2 for L-Leu lemprolide, LLeu ${ }^{6}$-leuprolide, and 1.5 for acetyl-leuprolide.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for 90 minutes, and measure the peak responses. Calculate the percentage of each impurity in the portion of Leuprolide Acetate taken by the formula:

$$
0.01\left(W_{s} / W_{U}\right)\left(r_{i} / r_{s}\right) P
$$

in which $W_{s}$ is the weight of USP Leuprolide Acetate RS in the Standard stock preparation; $W_{U}$ is the weight, in mg , of Leuprolide Acetate in the Test solution; $r_{i}$ is the peak response for each impurity obtained from the Test solution; $r_{S}$ is the leuprolide peak response obtained from the Standard solution; and $P$ is the designated purity, in percentage, of USP Leuprolide Acetate RS: not more than $1.0 \%$ of acet-yl-leuprolide is found; not more than $0.5 \%$ each of D-Hisleuprolide, LLeu-leuprolide, $\mathrm{L}-\mathrm{Leu}^{6}$-leuprolide, and D-Ser-leuprolide is found; not more than $0.5 \%$ of any other individual impurity is found; and not more than $2.5 \%$ of total impurities is found.

## Content of acetic acid-

Diluent-Use methanol, and adjust with phosphoric acid to a pH of 2.5 .

Standard solution-Pipet 2.0 mL of glacial acetic acid into a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Transfer 4.0 mL of the solution so obtained to a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Transfer 10.0 mL of this solution to a $100-\mathrm{mL}$ vol-
umetric flask, dilute with Diluent to volume, and mix to obtain a solution having a known concentration of about 0.08 mg per mL .

Test solution-Transfer about 100 mg of Leuprolide Acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector and a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused-silica capillary column that contains a $1.2-\mu \mathrm{m}$ film of phase G35. The carrier gas is helium, flowing at a rate of about 10 mL per minute. The column temperature is maintained at about $100^{\circ}$, the injector port temperature is about $200^{\circ}$, and the detector port temperature is about $250^{\circ}$. Chromatograph the Standard solution, and record the peak respenses areas as directed for Procedure: the retention time of acetic acid is b.0 7.0 should be about 5 to 7 minutes; the column efficiency is not less than 15,000 theoretical plates; the tailing factor is not less than 0.8 and not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$. Chromatograph the Diluent, and record the peak areas as directed for Procedure: verify that there are no interfering peaks.

Procedure-Separately inject equal volumes (about 1.0 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph (splitless mode), record the chromatograms, and measure the responses for the acetic acid peaks. Calculate the percentage of acetic acid $\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}\right)$ in the portion of Leuprolide Acetate taken by the formula:

$$
\left(839.2 / W_{U}\right)\left(r_{U} / r_{s}\right),
$$

in which $W_{U}$ is the weight, in mg, of Leuprolide Acetate taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the acetic acid peak areas obtained from the Test solution and the Standard solution, respectively: not less than $4.87 \% 4.7 \%$ and not more than $9.0 \%$ is found.

Amino acid content-Use a suitable, validated procedure (see Amino Acid Analysis under Biotechnology-Derived Ar-ticles-Tests $\langle 1047\rangle$ ).

Buffer solution-Prepare a solution that is 0.15 N with respect to lithitm hydroxide and to cittic acid, and adjust with hydrechloric acid to pH of 2.20 .

Columan-regeneration buffer Prepare a- 0.3 N solution-of lithium hydroxide.

Ninhydrin reage Dilute 18 g of nimhydrin and 0.7 g of hydrindantin in 900 mL of dimethylsulfoxide. Sparge with nitrogen before-eapping, and mix on a-shaker for net less fhan 3 heurs.

Tryptoplat solution Prepare a fresh 5 $\times 10^{-5}$ M soltt fien of tryptophant

Mebite phase 1 Prepare asolution that is 0.2 N withre speet tolithium hydroxide and tocitric acid, and adjust with hydrechloric acid to apHof 2.83 .

Mobile phase 2 Prepare a solution that is 0.3 N with re speet to lithium hydrexide and tocitric acid, and adjust with hydrechloric acid to a pH of 3.33.

A@bite phase 3 Prepare a selution that is 0.6 N with respect tolithium hydroxide and to citric acid, and adjust with hydrochloric ceid to a pH of 3.57.

Mobite phase 4 Prepareasolution that is 0.95 N with respect tolithium hydroxide and tocitric acid, and adjust with hydrochloric acid a pH -f 3.98.

Stated solution solutions Prepare, in duplieate, a so lution having known coneentrations of about $5.0 \times 10^{-5} \mathrm{M}$ each of $L$-alanine, $L$ arginine, $L$ aspartic acid, $L$ glatamic acid, slycine, L -histidine, L -isoleurine, t leurine, L lysine,

E-methionine, E -phenylatanine, E -proline, t -serine, t -threefine, t tyrosine, and L valine and about $2.5 \times 10^{-5} \mathrm{M}$ of L eystine-

Fest solution Transfer about 64 mg of Lemprolide Acet ate, aceurately weighed, to a suitable vessel, and dissolve im 1.0 mL of water. Transfer 0.10 mL of this solution to a va entm hydrolysis tube, add 2.0 mL of 6 N hydrochloric acid, evacuate the tube, and heat for 16 hours at $120^{\circ}$. Transfer 0.10 mL of the hydrolysate so obtained to a suitable vessel, add 1 mL of water, and lyophilize. Dissolve in and dilute with Buffer solution to 10.0 mL .

Chromatographic system (see Chromatography $\langle 624\rangle$ ) The amine acid analyzer chromatograph is equipped with a $4-\mathrm{mm} \times 10$ em column that contains packing L34 and a detector set at $440 \mathrm{~nm}, 570 \mathrm{~nm}$, and 690 nm , where measurements at 690 nm are used for background corrections. The detector is placed after a pest coltumn reactor where the coltmmeffurnt and Ninhydrin reagent are heated to a temperature of about $135^{\circ}$. The flow rateof Ninhydrin re agent is about 10 mL per hour. The chrematograph-is pregrammed as follows. The flow rate is about 20 mL per hour. The coltumn temperature is programmed as follows.

| Time (minutes) | Solution |
| :---: | :---: |
| Q-30.5 | Mobile phase 1 |
| 30.5-68 | Mobile phase 2 |
| 68.78 | Mebile phase 3 |
| 78159 | Mobile phase 4 |
| 159-164 | Goluman regeneration buffer |
| 161.175 | Mobile phase 1 |

It is maintained at $34^{\circ}$ for 12 mintutes, then-inereased at a rate of $1.5^{\circ}$ per minute $6.63^{\circ}$, maintained at that temperature fer 74 mintutes, and finally inereased at a rate of $1.5^{\circ}$ per minute to $70^{\circ}$. [NOTE-During columan regeneration the cot tmm effluent is mixed with water, not with Ninhydrit re agent. After regeneration, the coltmm temperature is ehanged to $34^{\circ}$. After 5 minutes, the coltmm effluent is again mixed with Ninhydrin reagent.] Chromatograph the Standard solution solutions and the Tryptophan solution, and record the peak respenses areas as directed for Prece dure: the relative retention times are about 0.12 for serine, 0.15 for ghtatamic acid, 0.22 for proline, 0.37 for leurine, 0.40 for fyresine, 0.72 for tryptophan, 0.84 for histidine, and 1.00 for arginine; and the relative standard deviations determined from the arginine, aspartic acid, proline, and serine peaks for replieate injections are not more than- $4.0 \%$ each.

Procedure Inject equal volumes (about 50- $\mu \mathrm{L}$ ) of the Standard solution, the Tryptophan-selution, and the Test sothtion into the chrematograph, record the chromategrams, and measure the respenses areas for each amine acid peak. between 0.85 and 1.1 moles each of glatamic acid, proline, fyresine, histidine, and arginine permole of leuprolide acet ate is found; and serine and tryptophan are present. Caleut tate the average respense factor for each amine acid in the Standard solution taken by the formula:-

$$
0.5\left[\left(G_{\mathrm{st}} / R_{\mathrm{st}}\right)+\left(G_{\mathrm{sz}} / R_{\mathrm{sz}}\right)\right],
$$

in which- $G_{s+}$ and $\epsilon_{s \text { se }}$ are the concentrations-of the amine aeid, in moles per liter, in each of the duplieate-Standard
solutions, and $R_{s+}$ and $R_{s z}$ are peak area respenses areas of the amine acid in each of the duplicate Standard solutions. Caleulate the concentration of each amine acid in the Test solution, in moles per liter taken by the formala:-

$$
R_{t}\left(A_{R F s}\right),
$$

in whieh $R_{4}$ is the peak respense area of each amine acid in the Test solution; and $A_{\text {prs }}$ is the average response factor for the amine acid as caleulated above. Caleulate the relative molar ratio of each amine acid in Leuprolide Acetate taken by the formula:-

in whieh $\epsilon_{L}$ is the concentration of the amine acid in the Test solution and $G_{k}, G_{p}, G_{k}, G_{k}, G_{k}$, and $G_{k}$ are the concentra tions of glatamic acid, preline, leueine, fyrosine, histidine, and arginine, respectively, in the Test solution: between 0.85 and 1.1 moles each of glatamic acid, proline, leucine, fyrosine, histidine, and arginine per mole of Leuprolide Acetate is found; between 1.8 and 2.2 moles of leucine per mole of Leuprolide Acetate is found. Serine and tryptephan are also present.

Standard solutions-Prepare a solution having known equimolar amounts of L-alanine, L-arginine, L-aspartic acid, L-glutamic acid, glycine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, L-phenylalanine, L-proline, Lserine, L-threonine, L-tyrosine, and L-valine with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as norleucine, is used. Prepare a separate, equimolar solution of Ltryptophan.

Test solution-Transfer about 64 mg of Leuprolide Acetate, accurately weighed, to a suitable vessel, and dissolve in 1.0 mL of water. Transfer 0.10 mL of this solution to a va-
cuum hydrolysis tube, add 2.0 mL of 6 N hydrochloric acid, evacuate the tube, and heat for 16 hours at $120^{\circ}$. Transfer 0.10 mL of the hydrolysate so obtained to a suitable vessel, add 1 mL of water, and lyophilize. Dissolve in and dilute to a suitable volume in a buffer solution suitable for amino acid analysis.

Procedure-Inject equal volumes of the Standard solutions and the Test solution into the amino acid analyzer, and record and measure the responses for each amino acid peak. Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids in the Test solution, taking one-seventh of the sum of the number of moles of histidine, glutamic acid, leucine, proline, tyrosine, and arginine as equal to one: between 0.85 and 1.1 moles each of glutamic acid, proline, tyrosine, histidine, and arginine per mole of Leuprolide Acetate is found; between 1.8 and 2.2 moles of leucine per mole of Leuprolide Acetate is found. Serine and tryptophan are also present.

## Assay-

Buffer solution-Dissolve about 15.2 g of triethylamine in 800 mL of water, adjust with phosphoric acid to a pH of 3.0 , and dilute with water to 1000 mL .

Organic modifier solution-Prepare a mixture of acetonitrile and $n$-propyl alcohol ( $3: 2$ ).
Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and Organic modifier solution (85:15). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock preparation-Transfer about 100 mg of USP Leuprolide Acetate RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Standard preparation-Transfer 5.0 mL of Standard stock preparation into a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Degradation standard preparation-Transfer 5 mL of Standard stock preparation to a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume. Transfer 5 mL of the solution so obtained to a scintillation vial. Add $100 \mu \mathrm{~L}$ of 1 N sodium hydroxide solution, tightly cap, and shake vigorously. Place in an oven at a $100^{\circ}$ for 60 minutes, remove, allow to cool, add $50 \mu \mathrm{~L}$ of 1 M phosphoric acid, recap, and shake vigorously to mix.

Assay preparation-Transfer about 100 mg of Leuprolide Acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Transfer 5.0 mL of the solution so obtained to a 100 mL volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $220-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L1. The flow rate is between 1.0 and 1.5 mL per minute. Chromatograph the Degradation standard preparation, and record the peak responses as directed for Procedure: the retention time of leuprolide is between 41 and 49 minutes; the relative retention times are about 0.90 for the degradation product and 1.0 for leuprolide; and the resolution, $R$, between leuprolide and the degradation product is not less than 1.0. 1.5. Chromatograph the Mobile phase, and record the peak responses as directed for Procedure: verify that no extraneous peaks are present. Chromatograph the Standard preparation, and record the peak areas as directed for Procedure: the column efficieney is not less than 5500 theoretieal plates; the tailing factor is not less than 0.8 and not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms for 60 minutes, and measure the leuprolide peak respenses. areas. Calculate the percentage of leuprolide $\left(\mathrm{C}_{59} \mathrm{H}_{84} \mathrm{~N}_{16} \mathrm{O}_{12}\right)$ in the portion of Leuprolide Acetate taken by the formula:

$$
\left(H_{s} / H_{\downarrow}\right)\left(r_{\Delta} \downarrow \Psi_{s}\right) P,\left[\left(W_{S} / W_{U}\right)\left(r_{U} / r_{s}\right)(P)(0.9527)(100)\right] /(100-
$$

acetic acid content - water content),
in which $W_{S}$ is the weight, in mg, of USP Leuprolide Acetate RS in the Standard preparation; $W_{U}$ is the weight, in mg, of Leuprolide Acetate in the Assay preparation; $r_{U}$ and $r_{s}$ are the peak respenses areas obtained from the Assay preparation and the Standard preparation, respectively; and $P$ is the designated purity, in percentage, of USP Leuprolide Acetate RS.■1S (USP28)

## BRIEFING

Levodopa, USP 27 page 1079; Levodopa Tablets, USP 27 page 1081. A revision is proposed to modify the test for Related compounds to identify the impurities that could be present in this substance and to indicate the quantitation of these impurities using an external Standard.

## Briefing

Loratadine, page 3065 of the First Supplement. It is proposed to revise the Related compounds procedure to include an alternative procedure (Test 2) to accommodate a different synthesis route for the loratadine drug substance. The potential related compound 4,8-dichloro-6,11-dihydro-5 H -benzo[5,6]cyclohepta[1,2-b]pyri-din-11-one can be quantitated using the proposed Test 2 procedure. The reverse-phase HPLC gradient procedure was validated using a Hypersil BDS C18 column; loratadine elutes at approximately 21 minutes on this system. It is proposed to add two reference standards, USP Loratadine Related Compound A (desloratadine) and USP Loratadine Related Compound B (8-chloro-6,11-dihydro11 [N-methyl-4-piperidinylidene]-5H-benzo[5,6] cyclohepta[1,2$b]$ pyridine), to support the proposed Related compounds procedure; and to add a Labeling section to reflect the proposed Related compounds procedure revision.

## Related compounds-

$\square_{\text {NOTE-O }}$ On the basis of the synthetic route, perform either Test 1 or Test 2. Test 2 is recommended if 4,8-dichloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-one is a potential related compound.

TEST 1-1 1 S (USP28)
Mobile phase and Diluent-Prepare as directed in the Assay.
Standard stock solution - Prepare as directed for Standard preparation in the Assay.

Standard solution-Pipet 5.0 mL of Standard stock solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix. Dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $0.8 \mu \mathrm{~g}$ per mL .

Test solution-Use the Assay preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The column
temperature is maintained between $25^{\circ}$ and $35^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Test solution, and record the peak areas as directed for Procedure: the relative retention times are about 0.79 for 4-(8-chloro-11-fluoro-6,11-dihydro- 5 H -benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl and 1.0 for loratadine. Chromatograph the Standard solution, and record the peak area of the main peak as directed for Procedure: the relative standard deviation for replicate injections is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure all the peak areas in the Test solution and the area of the main peak in the Standard solution. Calculate the percentage of each impurity in the portion of Loratadine taken by the formula:

$$
10,000(C / F)\left(r_{i} / r_{s}\right) / W
$$

in which $C$ is the concentration, in mg per mL, of USP Loratadine RS in the Standard solution; $F$ is the relative response factor for each impurity, if known ( $F$ is 0.25 for 4-(8-chloro-11-fluoro-6,11-dihydro-5 H -benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl); $r_{i}$ is the peak area response for each impurity in the Test solution; $r_{S}$ is the peak area response of loratadine in the Standard solution; and $W$ is the quantity, in mg , of Loratadine taken to prepare the Test solution: not more than $0.2 \%$ of 4-(8-chloro-11-fluoro-6,11-dihydro-5 H -benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperidinecarboxylate ethyl is found; not more than $0.1 \%$ of any other individual impurity is found; and not more than $0.3 \%$ of total impurities is found.
${ }^{-}$TEST 2 -
Solution $A$ —Dissolve 0.96 g of 1-pentanesulfonic acid sodium salt in 900 mL of water. Adjust with phosphoric acid solution (1 in 10 ) to a pH of $3.00 \pm 0.05$, then dilute with water to 1 L . Filter and degas.

Solution B-Use acetonitrile.
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve accurately weighed quantities of USP Loratadine RS, USP Loratadine Related Compound A RS, and USP Loratadine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 0.1 mg per mL of each compound. Transfer 1.0 mL of this solution to a $10-\mathrm{mL}$ volumetric flask, add 2 mL of Solution $A$, then dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.01 mg per mL of loratadine.

Test solution-Transfer about 100 mg of Loratadine, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, and dissolve in 2 mL of methanol. Add 2 mL of Solution $A$, then dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column containing $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

| Time <br> $(\mathrm{min})$ | Solution A <br> $(\%)$ | Solution $B$ <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 75 | 25 | isocratic |
| $0-20$ | $75 \rightarrow 50$ | $25 \rightarrow 50$ | linear gradient |
| $20-30$ | $50 \rightarrow 40$ | $50 \rightarrow 60$ | linear gradient |
| $30-35$ | $40 \rightarrow 30$ | $60 \rightarrow 70$ | linear gradient |
| $35-45$ | 30 | 70 | isocratic |
| $45-50$ | $30 \rightarrow 75$ | $70 \rightarrow 25$ | step gradient |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times and response factors are as follows.

|  | Relative <br> Retention <br> Time with <br> Respect to <br> Loratadine | Relative <br> Response <br> Factor (F) <br> with Re- <br> spect to <br> Loratadine |
| :---: | :---: | :---: |
| Related Compound | 0.50 | 1.00 |
| Loratadine related <br> compound A <br> Loratadine related <br> compound B <br> 8-Chloro-6,11-dihydro-5H- <br> benzo[5,6]cyclohepta[1,2- <br> $b]$ pyridin-11-one | 0.53 | 0.89 |

of each impurity in the portion of Loratadine taken by the formula:
$(100 / F)\left(C_{S} / C_{T}\right)\left(r_{i} / r_{S}\right)$,
in which $C_{S}$ is the concentration, in mg per mL , of USP Loratadine RS in the Standard solution; $C_{T}$ is the concentration of the Test solution; $F$ is the relative response factor as indicated in the table ( $F=1.0$ for unknown impurities); $r_{i}$ is the peak area response for the individual impurity in the Test solution; and $r_{s}$ is the peak response for loratadine in the Standard solution: not more than $0.1 \%$ of loratadine related compound A is found; not more than $0.1 \%$ of loratadine related compound B is found; less than $0.1 \%$ for each individual unknown impurity is found; and not more than $0.3 \%$ total impurities is found.■1S (USP28)

## Briefing

Lypressin Nasal Solution, USP 27 page 1112. It is proposed to revise the USP Reference standards section to change the name of USP Posterior Pituitary RS to USP Vasopressin RS, as specified in the monograph for Vasopressin Injection.
(BNT: I. DeVeau) RTS-41030-1

## Change to read:

USP Reference standards $\langle 11\rangle$ USP Posterior Pituitary RS.

## Briefing

Magnesium Chloride, USP 27 page 1121. Comments were received that the formation of magnesium hydroxide precipitate may interfere with the Identification test for Chloride. It is proposed to add a Note that the sample solution should be acidified with dilute nitric acid prior to adding 6 N ammonium hydroxide.
(PA4: E. Gonikberg) RTS-41129-1

## Change to read:

Identification-A solution (1 in 20) responds to the tests for Magnesium $\langle 191\rangle$ and for Chloride $\langle 191\rangle$.

- [NOTE-When performing the test for Chloride, acidify the sample solution with dilute nitric acid prior to adding 6 N ammonium hydroxide.] ${ }_{\text {■S }}$ (USP28)

## Briefing

Melengestrol Acetate, page 1528 of PF 29(5) [Sept.-Oct. 2003]. On the basis of comments received, in the test for Limit of residual solvents, it is proposed to increase the acceptable standard deviation of the five replicate injections of the Standard solution from $5.0 \%$ to $10.0 \%$. Additional changes are being made in the test for Related compounds to avoid confusion between melengestrol acetate related compound A and melengestrol acetate related compound B. Minor editorial style changes have also been made.
(VET: I. DeVeau) RTS-41023-1

## Add the following:

## ■Melengestrol Acetate

$\mathrm{C}_{25} \mathrm{H}_{32} \mathrm{O}_{4} \quad 396.52$
Pregna-4,6-diene-3,20-dione, 17-(acetyloxy)-6-methyl-16-methylene-

17-Hydroxy-6-methyl-16-methylenepregna-4,6-diene-3,20-dione acetate [2919-66-6].
» Melengestrol Acetate contains not less than 97.0 percent and not more than 103.0 percent of $\mathrm{C}_{25} \mathrm{H}_{32} \mathrm{O}_{4}$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling-Label it to indicate that it is for veterinary use only.

USP Reference standards $\langle 11\rangle$ —USP Melengestrol Acetate RS. USP Melengestrol Acetate Related Compound A RS. USP Melengestrol Acetate Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle$ -
Solution: $\quad 10 \mu \mathrm{~g}$ per mL .
Medium: alcohol.
C: The retention time of the melengestrol acetate peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Melting temperature $\langle 741\rangle$ : between $219^{\circ}$ and $226^{\circ}$.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-132.0^{\circ}$ and $-122.0^{\circ}$, at $20^{\circ}$.
Test solution: $\quad 10.0 \mathrm{mg}$ per mL , in chloroform.
Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $0.5 \%$ of its weight.

Heavy metals, Method II $\langle 231\rangle$ : not more than $0.001 \%$.
Limit of residual solvents-
Standard solution-Separately and accurately transfer 2.5 mL of dehydrated alcohol, 5.5 mL of ethyl acetate, 0.5 mL of dichloromethane, and 0.4 mL of dioxane into a $100-\mathrm{mL}$ volumetric flask. Mix, and dilute with dimethylformamide to volume. Pipet 5 mL of this solution into another $50-\mathrm{mL}$ volumetric flask, mix well, and dilute with dimethylformamide to volume.

Test solution-Weigh accurately about 500 mg of Melengestrol Acetate, and transfer to a $5-\mathrm{mL}$ volumetric flask, add a suitable amount of dimethylformamide, and sonicate for 5 minutes until completely dissolved. Dilute with dimethylformamide to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The gas chromatograph is equipped with a flame-ionization detector and a $3-\mathrm{mm} \times 2-\mathrm{m}$ stainless steel column packed with S 3 porous polymeric beads, $60-80$ mesh size. The temperature of the injector port, column, and detector are maintained at $200^{\circ}, 155^{\circ}$, and $250^{\circ}$, respectively. The carrier gas is nitrogen, flowing at a rate of 60 mL per minute. Chromatograph the Standard solution, and record the peak areas as directed for Procedure: the elution order is alcohol, dichloromethane, ethyl acetate, dioxane, and dimethylformamide. The resolution, $R$, between each peak should be not less than 1.5 , and the relative standard deviation for five replicate injections is not more than $5.0 \%$. $10.0 \%$.
Procedure-Separately inject equal volumes (about 1.0 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the
peak areas for alcohol, dichloromethane, ethyl acetate, and dioxane. Calculate the concentration of the individual solvents, in ppm, in the portion of Melengestrol Acetate taken by the formula:

$$
C V\left(r_{U} / r_{s}\right) /(1000 W)
$$

in which $C$ is the concentration, in g per mL , of the relevant solvent in the Standard solution; $V$ is the sample volume in $\mathrm{mL} ; r_{U}$ and $r_{S}$ are the peak areas of the relevant solvent obtained from the Test solution and the Standard solution, respectively; and $W$ is the weight, in mg, of Melengestrol Acetate taken to prepare the Test solution: not more than 5000 ppm of alcohol, 5000 ppm of ethyl acetate, 600 ppm of dichloromethane, and 380 ppm of dioxane is found.

## Related compounds-

Mobile phase-Prepare a mixture of acetonitrile and water (50:50).

Standard solution-Dissolve an accurately weighed quantity of USP Melengestrol Acetate RS, USP Melengestrol Acetate Related Compound A RS, and USP Melengestrol Acetate Related Compound B RS in methanol to obtain a solution having known concentrations of about 0.005 mg of each per mL.

Test solution-Use the Assay preparation prepared as directed in the Assay.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a multiwavelength detector set at 240 and 262 nm and a $4.6-\mathrm{mm} \times$ $25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: [NOTE-Melengestrol acetate and melengestrol related compound A B will generate larger peak areas at 262 nm than at 240 nm ; melengestrol acetate related compound $B$ A will generate a larger peak area at 240 nm than at

262 nm ] the relative retention times are about $0.77,0.78$, 1.0 , and 1.05 for melengestrol acetate related compound A, melengestrol acetate, and melengestrol acetate related compound B , respectively; the resolution, $R$, between melengestrol acetate related compound A and melengestrol acetate related compound B is not less than 5.0 ; the column efficiency for the melengestrol acetate related compound A peak is greater than 1500 theoretical plates; the tailing factor is less than 2.0 ; and the relative standard deviation for replicate injections is not more than $5.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, identify the peaks, and determine which detector wavelength generates the larger peak area for each impurity. Using the larger peak area, calculate the percentage of each impurity in the portion of Melengestrol Acetate taken by the formula:

$$
100\left(C_{S} / C_{U}\right)\left(r_{i} / r_{S}\right)
$$

in which $C_{S}$ is the concentration, in mg per mL , of either melengestrol related compound A or melengestrol related compound B in the Standard solution [NOTE-If using the impurity peak area generated at $262 \mathrm{~nm}, 240 \mathrm{~nm}, C_{S}$ is the concentration of melengestrol related compound $A$; if using the impurity peak area generated at $240 \mathrm{~nm}, 262 \mathrm{~nm}, C_{S}$ is the concentration of melengestrol related compound B$] ; C_{U}$ is the concentration, in mg per mL , of melengestrol acetate in the Test solution; $r_{i}$ is the peak area of each impurity obtained from the Test solution; and $r_{s}$ is the peak area of either melengestrol related compound A or melengestrol related compound B obtained from the Standard solution [NOTEIf using the impurity peak area generated at $262 \mathrm{~nm}, 240$ $\mathrm{nm}, r_{s}$ is the peak area of melengestrol related compound A; if using the impurity peak area generated at 240 nm, $262 \mathrm{~nm}, C_{S}$ is the peak area of melengestrol related com-
pound B ]: not more than $0.5 \%$ of any identified impurity is found; not more than $0.2 \%$ of any unidentified impurity is found; and not more than $1.0 \%$ of total impurities is found.

Assay-
Mobile phase—Prepare a mixture of acetonitrile and water (50:50).

Standard preparation-Dissolve an accurately weighed quantity of USP Melengestrol Acetate RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation-Transfer about 50 mg of Melengestrol Acetate, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with methanol to volume.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $287-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the Standard preparation as directed for Procedure: the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2 ; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation in duplicate into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{25} \mathrm{H}_{32} \mathrm{O}_{4}$ in the portion of Melengestrol Acetate taken by the formula:

$$
2 C W\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the Standard preparation; $W$ is the weight, in mg , of Melengestrol Acetate used to prepare the Assay preparation; $r_{U}$ is the average peak area of the melengestrol acetate peak obtained from the Assay preparation; and $r_{s}$ is the average peak area of the melengestrol acetate peak obtained from the Standard preparation.■1S (USP28)

## Briefing

Mesalamine Extended-Release Capsules, USP 27 page 1173. It is proposed to specify the amount of Medium to be used in the Drug release test.
(BPC: M. Marques) RTS-40933-1

## Change to read:

Drug release $\langle 724\rangle$ -
Medium: $\quad 0.05 \mathrm{M} \mathrm{pH} 7.5$ phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate and 1 g of sodium hydroxide in water to make 1000 mL of solution, and adjusting with 10 N sodium hydroxide to a pH of $7.50 \pm 0.05$;
-900 mL .-1S (USP28) Apparatus 2: 100 rpm .
Times: $1,2,4$, and 8 hours.
Procedure-Determine the amount of $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{NO}_{3}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 330 nm of filtered portions of the solution under test suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS in the same Medium.
Tolerances-The percentages of the labeled amount of $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{NO}_{3}$ dissolved at the times specified conform to Acceptance Table 1.

| Time (hours) | Amount dissolved |
| :---: | :--- |
| 1 | between $5 \%$ and $25 \%$ |
| 2 | between $30 \%$ and $50 \%$ |
| 4 | between $60 \%$ and $90 \%$ |
| 8 | not less than $85 \%$ |

## Briefing

Metformin Hydrochloride Tablets, page 1927 of PF 29(6) [Nov.-Dec. 2003]. It is proposed to revise Dissolution Test 1 to change the apparatus used from Apparatus 2 to Apparatus 1. Based on the comments received, it is also proposed to change the limit of total impurities under Related compounds test to $0.6 \%$. This limit is representative of marketed products. Other changes are editorial.
(BPC: M. Marques; PA4: E. Gonikberg) RTS—40979-1; 41092-2

## Add the following:

## Metformin Hydrochloride Tablets

## »Metformin Hydrochloride Tablets contain not

 less than 95.0 percent and not more than 105.0 percent of metformin hydrochloride $\left(\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}\right)$.Packaging and storage-Preserve in tight containers. Store at controlled room temperature.

Labeling-When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.

USP Reference standards $\langle 11\rangle$ —USP Metformin Hydrochloride $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Test specimen-Transfer a quantity of powdered Tablets, equivalent to about 20 mg of metformin hydrochloride, to a suitable flask, add 20 mL of dehydrated alcohol, and shake. Filter, evaporate the filtrate on a water bath to dryness, and dry the residue at $105^{\circ}$ for 1 hour.

B: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. To 5 mL of the filtrate add 1.5 mL of 5 N sodium hydroxide solution and 1 mL of a 1-naphthol solution, prepared by dissolving 1 g of 1-naphthol in a solution containing 6 g of sodium hydroxide and 16 g of anhydrous sodium carbonate in 100 mL of water. Add 0.5 mL of sodium hypochlorite TS, dropwise, and with shaking: an or-ange-red color is produced that darkens on standing.

C: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. The filtrate meets the requirements of the tests for Chloride $\langle 191\rangle$.

Dissolution $\langle 711\rangle$ -
TEST 1—
Medium: $\quad$ pH 6.8 phosphate buffer; 1000 mL .
Apparatts 2: Apparatus 1: 100 rpm .
Time: 45 minutes.
Procedure—Determine the amount of $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 233 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same Medium.

Tolerances-Not less than 70\% (Q) of the labeled amount of $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}$ is dissolved in 45 minutes.

TEST 2-If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

FOR PRODUCTS LABELED TO CONTAIN 500 MG OF METFOR-MIN-

Medium: $\quad$ pH 6.8 phosphate buffer; 1000 mL .
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure-Proceed as directed for Test 1.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}$ is dissolved in 30 minutes.

FOR PRODUCTS LABELED TO CONTAIN 850 MG OR 1000 MG OF METFORMIN-

Medium: $\quad \mathrm{pH} 6.8$ phosphate buffer, 1000 mL .
Apparatus 2: 75 rpm .
Time: 30 minutes.
Procedure-Proceed as directed for Test 1.
Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Related compounds-

Mobile phase, Resolution solution, Biluted test solution, and Chromatographic system-Proceed as directed in the test for Related compounds under Metformin Hydrochloride.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 500 mg of metformin hydrochloride, to a $100-\mathrm{mL}$ volumetric flask, dissolve in Mobile phase, with shaking, dilute with Mobile phase to volume, and mix. Filter, and use the filtrate.

Diluted test solution-Proceed as directed for Metformin Hydrochloride, except to use the Test solution prepared as described herein.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Test solution and the Diluted test solution into the chromatograph, record the chromatograms for not less than twice the retention time of metformin, and measure the peak areas.

The area of any secondary peak in the chromatogram of the Test solution is not greater than the area of the major peak in the chromatogram of the Diluted test solution; and the sum of the areas of all secondary peaks in the chroma-
togram of the Test solution is not greater than five times the area of the major peak in the chromatogram of the Diluted test solution: not more than $0.1 \%$ of any impurity is found; and not more than $0.5 \% 0.6 \%$ of total impurities is found.

## Assay-

Standard preparation-Prepare a solution of USP Metformin Hydrochloride RS in water having a known concentration of about $10 \mu \mathrm{~g}$ per mL .

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of metformin hydrochloride, to a $100-\mathrm{mL}$ volumetric flask. Add 70 mL of water, shake by mechanical means for 15 minutes, dilute with water to volume, and filter, discarding the first 20 mL of the filtrate. Dilute 10.0 mL of the filtrate with water to 100.0 mL , and dilute 10.0 mL of the resulting solution with water to 100.0 mL .

Procedure-Concomitantly determine the absorbances of the Standard preparation and the Assay preparation, in 1cm cells, at the wavelength of maximum absorbance at about 232 nm , with a suitable spectrophotometer, using water as a blank. Calculate the quantity, in mg , of metformin hydrochloride $\left(\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N}_{5} \cdot \mathrm{HCl}\right)$ in the portion of Tablets taken by the formula:

$$
10 C\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Metformin Hydrochloride RS in the Standard preparation; and $A_{U}$ and $A_{S}$ are the absorbances obtained from the Standard preparation and the Assay preparation, respectively.■1S (USP28)

## BriEfing

Methscopolamine Bromide. On the basis of a recent request, it is proposed to reinstate this monograph, which was omitted from the $U S P$ in 1995.
(PA4: E. Gonikberg) RTS-40958-1

## Add the following:

## ■Methscopolamine Bromide

$\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{BrNO}_{4} \quad 398.30$

3-Oxa-9-azoniatricyclo[3.3.1.0 $0^{2,4}$ ]nonane, 7-(3-hydroxy-1-oxo-2-phenylpropoxy)-9,9-dimethyl-, bromide, [7(S)( $1 \alpha, 2 \beta, 4 \beta, 5 \alpha, 7 \beta]$-.
$6 \beta, 7 \beta$-Epoxy-3 $\alpha$-hydroxy-8-methyl-1 $\alpha H, 5 \alpha H$-tropanium bromide ( - )-tropate [155-41-9].
» Methscopolamine Bromide contains not less than 97.0 percent and not more than 103.0 percent of $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{BrNO}_{4}$, calculated on the dried basis.

Packaging and storage-Preserve in tight, light-resistant containers.

USP Reference standards $\langle 11\rangle$ —USP Methscopolamine Bromide RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: A solution (1 in 20) responds to the tests for Bromide $\langle 191\rangle$.

Specific rotation $\langle 781\rangle$ : between $-21^{\circ}$ and $-25^{\circ}$, calculated on the dried basis, determined in a solution containing 500 mg in each 10 mL .

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 2 hours: it loses not more than $2.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Assay-
Mobile phase-Prepare a solution containing 2.6 g of decyl sodium sulfate, in 450 mL of water. Add 550 mL of methanol, adjust with 1 N sulfuric acid to a pH of 3.5 , mix, filter, and degas.

Standard preparation-Transfer about 25 mg of USP Methscopolamine Bromide RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Assay preparation-Prepare as directed under the Standard preparation, using about 25 mg of Methscopolamine Bromide, accurately weighed.
Chromatographic system (see Chromatography $\langle 621\rangle$ The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for the peak responses is not greater than 2.0\%.

Procedure—Separately inject a volume (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into a chromatograph, record the chromatogram, and measure the peak responses. Calculate the quantity, in mg , of $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{BrNO}_{4}$ in the portion of Methscopolamine Bromide taken by the formula:

$$
100 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Methscopolamine Bromide RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses of the methscopolamine bromide obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Mirtazapine, page 529 of PF 29(2) [Mar.-Apr. 2003]; Mirtazapine Tablets, page 531 of $P F$ 29(2) [Mar.-Apr. 2003]. These new monographs, which previously appeared in Pharmacopeial Previews, are now forwarded with proposed changes to In-Process Revision. The chemical name and CAS number are corrected. Under Chromatographic purity, the Procedure indicates a run time for chromatograms, and the chemical name of the impurity specified by the relative retention time is provided. The Melting range section is deleted. The limit of water content is specified for the anhydrous and hemihydrate forms, and a Labeling section is added to reflect the anhydrous and hemihydrate forms.
(PA3: S. Salado) RTS-40470-1; 40474-1; 40157-1; 40509-1; 40540-1; 40900-1

## Add the following:

## ■Mirtazapine

$\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3} \quad 265.35$
Pyrazino[2, 1-a]pyrido[2,3-c][2]benzazepine,
1,2,3,4,10,14b-hexahydro-2-methyl-benzazepine.
1,2,3,4,10,14b-Hexahydro-2-methylpyrazino[2,1-a]pyri-do[2,3-c][2]-benzazepine
[61337-67-5 85650-52-8].
» Mirtazapine contains not less than 98.598 .0 percent and not more than 101.5102 .0 percent of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight containers, at temperature ber $15^{\circ}$ and store at controlled room temperature.

Labeling-Label it to indicate whether it is anhydrous or hemihydrate.

USP Reference standards $\langle 11\rangle$ —USP Mirtazapine $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Melting range $\langle 744\rangle$ : between $120^{\circ}$ and $124^{\circ}$.
Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+2^{\circ}$ and $-2^{\circ}$.
Test solution: 10 mg per mL , in denatured alcohol.
Water, Method I $\langle 921\rangle$ : not more than 3.0\%. $1.0 \%$ for the anhydrous form and between $1.0 \%$ and $3.5 \%$ for the hemihydrate form.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method $I\langle 231\rangle$ : $0.001 \%$.
Diluent: a mixture of methanol and water (85:15).
Test preparation-Dissolve 4.8 g of mirtazapine in 51 mL of methanol. Add 9 mL of water. Adjust 25 mL of this solution with 1 N acetic acid to a pH of between 3.0 and 4.0, using a short-range pH indicator paper as the internal indicator. Dilute with Diluent to 40 mL , and mix.

NOTE-Use Diluent instead of water to prepare the Standard preparation and Monitor preparation. Prepare a blank of Diluent, and use Diluent instead of water in the Procedure.

## Chromatographic purity-

Diluent, Buffer solution, and Mobile phase—Proceed as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Mirtazapine RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $0.1515 \mu \mathrm{~g}$ per mL .

Test solution-Transfer about 150 mg of Mirtazapine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $240-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard solution, and record the peak response as directed for

Procedure: the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $10.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L})$ of the Standard solution and the Test solution into the chromatograph, record the chromatograms, for about twice the retention time of Mirtazapine, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Mirtazapine taken by the formula:

$$
10,000 F(C / W)\left(r_{i} / r_{s}\right)
$$

in which $F$ is the relative response factor for the mirtazapine impurities and is equal to 0.24 for any impurity 4-methyl-1-(3-methyl-pyridin-2-yl)-2-phenyl-piperazine at a relative retention time of about 1.3 , and 1.0 for any other impurity; $C$ is the concentration, in mg per mL , of USP Mirtazapine RS in the Standard solution; $W$ is the weight, in mg , of Mirtazapine taken to prepare the Test solution; $r_{i}$ is the peak response of any impurity obtained from the Test solution; and $r_{S}$ is the mirtazapine peak response obtained from the Standard solution: not more than $0.1 \%$ of any individual impurity is found, and not more than $0.5 \%$ of total impurities is found. [NOTE-Disregard any peak representing less than $0.05 \%$ of the main peak and any peak that is due to the Di luent.]

Organic volatile impurities, Method $I V\langle 467\rangle$ : meets the requirements.

## Assay-

Diluent: a mixture of acetonitrile and water (50:50).
Buffer solution-Transfer about 36.0 g of tetramethylammonium hydroxide pentahydrate to a $2000-\mathrm{mL}$ volumetric flask, and dissolve in about 1950 mL of water. While stirring, adjust with phosphoric acid to a pH of 7.4 , dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution, acetonitrile, methanol, and tetrahydrofuran ( $65: 15: 12.5: 7.5$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Mirtazapine RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.3 mg per mL .
Assay preparation-Transfer about 30 mg of Mirtazapine, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $290-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak response as directed for Procedure: the column efficiency is not less than 7000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L})$ of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}$ in the portion of Mirtazapine taken by the formula:

$$
100 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Mirtazapine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.ns (USP28)

## Briefing

Mirtazapine Tablets, page 531 of PF 29(2) [Mar.-Apr. 2003]-See briefing under Mirtazapine. In the test for Chromatographic purity, it is proposed to revise the Procedure to indicate a run time for chromatograms and to provide the chemical name of the impurity specified by the relative retention time.
(PA3: S. Salado) RTS-40509-2

## Add the following:

## ■Mirtazapine Tablets

» Mirtazapine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mirtazapine $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}\right)$.

Packaging and storage-Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Mirtazapine $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
Extraction mixture: a mixture of water and $n$-hexane (1:1).

Test specimen-Transfer a quantity of finely powdered Tablets, equivalent to about 30 mg of mirtazapine, to a suitable centrifuge tube. Add Extraction mixture to obtain a solution of about 1 mg of mirtazapine per mL of $n$-hexane. Shake for 5 minutes, and centrifuge. Decant, and evaporate the supernatant.

Standard specimen-Dissolve an accurately weighed quantity of USP Mirtazapine RS in Extraction mixture to obtain a solution having a concentration of about 1 mg of mirtazapine per mL of $n$-hexane. Shake for 5 minutes, and centrifuge. Decant, and evaporate the supernatant.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid; 900 mL .
Apparatus 2: 50 rpm .
Time: 15 minutes.
Procedure: Determine the amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 315 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, in comparison with a Standard solution having a known concentration of USP Mirtazapine RS in the same Medium.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}$ is dissolved in 15 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements for Content Uniformity.

## Chromatographic purity-

Diluent, Buffer solution, and Mobile phase-Proceed as directed in the Assay under Mirtazapine.

Standard stock solution-Prepare as directed for Standard preparation in the Assay under Mirtazapine.

Standard solution-Transfer 5.0 mL of Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, dilute with Diluent to volume, and mix.

Test solution-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to the weight of 1 Tablet, to a suitable conical
flask. Add Diluent to obtain a solution having a concentration of about 1.5 mg of mirtazapine per mL of Diluent. Shake vigorously for 10 minutes, centrifuge an aliquot, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $240-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L 1 . The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard solution, and record the peak response as directed for Procedure: the column efficiency is not less than 7000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $10.0 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for about twice the retention time of mirtazapine, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Mirtazapine taken by the formula:

$$
5(F V)(C / W)\left(W_{20} / L\right)\left(r_{i} / r_{s}\right),
$$

in which $F$ is the relative response factor for the mirtazapine impurities and is equal to 0.24 for impurity 4-methyl-1-(3-methyl-pyridin-2-yl)-2-phenyl-piperazine at a relative retention time of about 1.3 , and 1.0 for any other impurity; $V$ is the total volume, in mL , of the Test solution; $C$ is the concentration, in mg per mL, of USP Mirtazapine RS in the Standard solution; $W$ is the weight, in mg , of the powdered Tablets taken to prepare the Test solution; $W_{20}$ is the weight of the 20 Tablets taken; $L$ is the labeled amount, in mg, of mirtazapine in each Tablet; $r_{i}$ is the peak response of any impurity obtained from the Test solution; and $r_{s}$ is the mirtazapine peak response obtained from the Standard solution: not more than $0.2 \%$ of any individual impurity is
found, and not more than $2.0 \%$ of total impurities is found. [NOTE-Disregard any peak representing less than $0.05 \%$ of the main peak and any peak that is due to the Diluent.]

## Assay-

Diluent, Buffer solution, Mobile phase, and Standard pre-paration-Prepare as directed in the Assay under Mirtazapine.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to the weight of 1 Tablet, to a suitable conical flask. Add Diluent to obtain a solution having a concentration of about 0.3 mg of mirtazapine per mL of Di luent. Shake vigorously for 10 minutes, centrifuge an aliquot, and use the clear supernatant.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a 290 -nm detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at $40^{\circ}$. Chromatograph the Standard preparation, and record the peak response as directed for Procedure: the column efficiency is not less than 7000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $1.5 \%$.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of mirtazapine $\left(\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{3}\right)$ in the portion of Tablets taken by the formula:
in which $V$ is the volume, in mL , of the Assay preparation; $C$ is the concentration, in mg per mL , of USP Mirtazapine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\mathbf{1 S}$ (USP28)

## Briefing

Naproxen, USP 27 page 1283. It is proposed to replace the solvent used in the Specific rotation test with one that has a lower potential for hazardous effects.
(PA1: C. Anthony) RTS-39540-1

## Change to read:

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $+63.0^{\circ}+68.5^{\circ}$.

## Briefing

Octocrylene, USP 27 page 1355. It is proposed to revise the test for Acidity to reflect data in the original submission.
(PA6: L. Evans) RTS-41111-1

## Change to read:

Acidity-Transfer 60 mL of alcohol to a suitable container, add 1 mL of phenolphthalein TS, and add sufficient 0.1 N sodium hydroxide to obtain a persistent pink color. Transfer 60 mL of this solution to a suitable container, add about 6 g of Octocrylene, accurately weighed, mix, and titrate with 0.1 N sodium hydroxide: not more than 0.18 mL of titrant per mg
$\mathbf{m}_{\mathrm{m}_{1 S}(U S P 28)}$
of Octocrylene is necessary to obtain a persistent pink endpoint.

## Briefing

Ondansetron Oral Solution, page 34 of $P F$ 26(1) [Jan.-Feb. 2000]. This new monograph, which previously appeared in Pharmacopeial Previews, is now being forwarded, with minor editorial revisions, to In-Process Revision.

$$
\text { (PA3: S. Salado) } \quad \text { RTS }-41103-1
$$

## Add the following:

## ■Ondansetron Oral Solution

» Ondansetron Oral Solution is a solution of Ondansetron Hydrochloride in a suitable vehicle. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of ondansetron $\left(\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}\right)$.

Packaging and storage-Preserve in well-closed, light-resistant containers.

USP Reference standards $\langle 11\rangle$ —USP Ondansetron Hydrochloride RS. USP Ondansetron Related Compound A RS. USP Ondansetron Related Compound C RS. USP Ondansetron Related Compound D RS.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -
Test solution-Dilute a portion of Oral Solution with a mixture of methanol and water ( $50: 50$ ) to obtain a solution containing about 0.2 mg of ondansetron per mL .
Standard solution: $\quad 0.25 \mathrm{mg}$ per mL in methanol.
Developing solvent system: chloroform, ethyl acetate, methanol, and ammonium hydroxide ( $90: 50: 40: 1$ ).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Escherichia coli. The total aerobic microbial count does not exceed 100 cfu per g, the Enterobac-
teriaceae count does not exceed 10 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

Deliverable volume $\langle 698\rangle$ : meets the requirements. $\mathbf{p H}\langle 791\rangle$ : between 3.3 and 4.0.

## Limit of ondansetron related compound D-

Mobile phase-Proceed as directed in the test for Limit of ondansetron related compound D under Ondansetron Hydrochloride.

System suitability solution-Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in Mobile phase; and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing about $0.5 \mu \mathrm{~g}$ per mL and $2 \mu \mathrm{~g}$ per mL , respectively.

Standard solution-Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in Mobile phase; and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about $0.5 \mu \mathrm{~g}$ per mL .
Test solution-Dilute, if necessary, an accurately measured volume of Oral Solution quantitatively with Mobile phase to obtain a solution containing about 0.8 mg of ondansetron per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $328-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between ondansetron related compound D and ondansetron related compound C is not less than 2.0; the tailing factor for ondansetron related compound D is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $4.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the volume of Oral Solution taken by the formula:

$$
100 D\left(C_{S} / C_{A}\right)\left(r_{U} / r_{s}\right)
$$

in which $D$ is the dilution factor for the Oral Solution in the Test solution; $C_{S}$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Ondansetron Related Compound D RS in the Standard solution; $C_{A}$ is the concentration, in $\mu \mathrm{g}$ per mL , of ondansetron in the Oral Solution, as determined in the Assay; and $r_{U}$ and $r_{s}$ are the peak responses of ondansetron related compound D obtained from the Test solution and the Standard solution, respectively: not more than $0.1 \%$ is found.

## Related compounds-

Mobile phase, System suitability solution, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Ondansetron Hydrochloride.

Test preparation-Use the Assay preparation.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound in the volume of Oral Solution taken by the formula:

$$
(293.36 / 329.82) 1000(F / V)\left(C_{S} / C_{A}\right)\left(r_{i} / r_{S}\right)
$$

in which 293.36 and 329.82 are the molecular weights of ondansetron and anhydrous ondansetron hydrochloride, respectively; $F$ is the relative response factor and is equal to 0.5 for ondansetron related compounds at relative retention times of about 0.45 and $0.58,0.75$ for ondansetron related
compounds at relative retention times of about $0.63,0.84$ and 1.1, and 1 for all other impurities; $V$ is the volume, in mL , of Oral Solution taken; $C_{S}$ is the concentration, in mg per mL , on the anhydrous basis, of USP Ondansetron Hydrochloride RS in the Standard preparation; $C_{A}$ is the concentration, in mg per mL , of ondansetron in the Oral Solution; $r_{i}$ is the peak response for any related compound obtained from the Test preparation; and $r_{s}$ is the peak response for ondansetron obtained from the Standard preparation: not more than $0.2 \%$ of any related compound is found, and the sum of all impurities is not more than $0.5 \%$.

## Assay-

Mobile phase, System suitability solution, Standard preparation, and Chromatographic system-Proceed as directed in the Assay under Ondansetron Hydrochloride.

Assay preparation-Transfer an accurately measured volume of Oral Solution, equivalent to about 9 mg of ondansetron, to a $100-\mathrm{mL}$ volumetric flask; dilute with Mobile phase to volume; and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $216-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.1 for ondansetron related compound A and 1.0 for ondansetron; and the resolution, $R$, between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 2.0 , and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and
measure the responses for the major peaks. Calculate the quantity, in mg , of ondansetron $\left(\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}\right)$ in each mL of Oral Solution taken by the formula:

$$
(293.36 / 329.82) 100(C / V)\left(r_{U} / r_{S}\right)
$$

in which 293.36 and 329.82 are the molecular weights of ondansetron and anhydrous ondansetron hydrochloride, respectively; $C$ is the concentration, in mg per mL , on the anhydrous basis, of USP Ondansetron Hydrochloride RS in the Standard preparation; $V$ is the volume, in mL , of Oral Solution taken; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BriEfing

Opium, USP 27 page 1361. In the Assay, it is proposed to replace the name of the reagent methyl sulfoxide with its synonym dimethyl sulfoxide. The use of the name "dimethyl sulfoxide" is being standardized throughout the $U S P-N F$. In addition, minor editorial style changes have been made.
(BPC: M. Marques) RTS-41082-3

## Change to read:

## Assay-

Chromatographic tubes, Citrate buffer, and Standard prepara-tion-Prepare as directed in the Assay under Paregoric.

Assay preparation-Transfer about 2 g of Opium, accurately weighed, to a $250-\mathrm{mL}$ beaker, add 20 mL of methyl-sulfoxide,
-dimethyl sulfoxide, ■ $^{1 S}$ (USP28)
and heat for 20 minutes on a steam bath, intermittently dispersing the substance with a flat-end stirring rod. Allow to stand for 15 minutes to permit undissolved material to settle, and carefully decant the supernatant into a $100-\mathrm{mL}$ volumetric flask. Add another 20 mL of methyl-sulfoxide

- dimethyl sulfoxide $_{\text {n } 1 \mathrm{~S} \text { (USP28) }}$
to the residue, rinsing the sides of the beaker with the methyl sulf exide.
- dimethyl sulfoxide. 1 IS (USP28)

Disperse and heat the substance as before, allow to settle, and decant into the volumetric flask. Repeat the dissolution one or two times, until the opium is dissolved (other than for small leaf fragments, sand-like particles, gelatinous materials, etc.). Rinse the beaker, and transfer the residue to the flask with the aid of water. Dilute with water to about 90 mL , and mix. If necessary, add 1 drop of alcohol to dispel any foam. Cool to room temperature, adjust with water to volume, and mix. Pass the resulting solution through a medium-porosity filter paper, discarding the first 20 mL of the filtrate.

Chromatographic columns-Pack a pledget of glass wool at the base of each of the three tubes, and fill with adsorbent using chromatographic siliceous earth as the base of the adsorbent, and tamping it firmly in place. Prepare the tubes as follows. Pack Column I in two layers, the lower layer consisting of 3 g of chromatographic siliceous earth mixed with 2 mL of Citrate buffer and the upper layer consisting of 3 g of chromatographic siliceous earth mixed with 2.0 mL of the Assay preparation and 0.5 mL of Citrate buffer. Dry-rinse the beaker in which the components of the two layers have been mixed with 1 g of chromatographic siliceous earth, and add it also to the top of Column I. Pack Column II with 3 g of chromatographic siliceous earth mixed with 2 mL of dibasic potassium phosphate solution ( 1 in 5.75). Pack Column III with 3 g of chromatographic siliceous earth mixed with 2 mL of sodium hydroxide solution (1 in 50). Place a small pad of glass wool above each column packing.

Procedure-Proceed as directed in the Assay under Paregoric. Calculate the percentage of anhydrous morphine in the Opium taken by the formula:

$$
0.25(C / W)\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of anhydrous morphine in the Standard preparation; $W$ is the weight, in g , of Opium taken; and $A_{U}$ and $A_{S}$ are the corrected absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

## Briefing

Oxybutynin Chloride, USP 27 page 1373 and page 642 of $P F$ 29(3) [May-June 2003]. On the basis of comments received, a revision is proposed in the test for Related compounds and in the Assay based on the updated liquid chromatographic procedure. The proposal for Related compounds previously published in PF 29(3) is being canceled and replaced with the updated method, and the proposal for the Assay is being published again with several changes. The procedure is based on analyses performed with the $3.5-\mu \mathrm{m}$ Zorbax C8 brand, or the $3-\mu \mathrm{m}$ Luna C8 brand of L7 col-
umn. The typical retention time for oxybutynin is about 14 minutes. The $P F 29(3)$ proposal for Packaging and storage is also being canceled.
(PA4: E. Gonikberg) RTS-41115-1

## Change to read:

Oxybutynin Related Compound B RS. USP Oxybutynin Re-
lated Compound C $R S_{\mathbf{■ 1 S}^{\text {(USP28) }}}$

## Delete the following:

## -Chromatographie purity-

Triethatane pherphatione 2 mL of trietha nolamine in about 900 mL of water in a 1000 mL volumetric flask, adjust with phosphoric acid to a pH of 3.5 , dilute with water to volume, and mix.

Mobile phase Prepare a degassed and filtered mixture of acet enitrile and Triethamolamine phosphate solution ( $65: 35$ ). Make adjustments if neeessary (see System Suitability under Chromato graphy (624) ).

Standard preparation- Prepare a solution containing 2.0 mg of USP Oxybuynin Chloride RS per mL and 10 Hy of USP Phenyl eyclohexylglyeolic Acid PS per mL in ace anitrile. Filter through a $0.45 \mathrm{\mu m}$ filter.

Test preparain. Transfer 200 mg of Oxybutyin Chloride, ac eurately weighed, to a 100 mL velumetric flask, dissolve in acet enitrile, dilute with acenitrile to volume, and mix.

Chromagraphic system (see-Chremography (624)) The 1iquid chromatograph is equipped with a 200 nm detector and -4.6 $\mathrm{mm} \times 25 \mathrm{~cm}$ coltumn that contains packing L7, and a shert preevlumm that contains packing 47 is used if neeessary. The columm is maintained at a temperature of $45^{\circ}$. The flow rate is about 3 mL per minute. Chromatograph a solution in acetonitrile containing 40 Hy permL each of USP OxybutyinChloride RS and USP Phenyl eycloherylglyeolic Acid $P S$, and record the peak responses as directed under Procedure: the relative-standard deviation of the respenses for replientinjections is not more than $3.0 \%$, and the resolution, $R$, of the main peaks is not less than 5.0 .

Procedure Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Test preparation into the chromatograph, and record the chromatograms. The relative retention times are about 0.2 for phenyleyelohexylglyeolic acid and 1.0 for oxybutynin. In the chromatogram of the-Test preparation, any peak correspending in retention time to phenyleyclohexylgly eolic acid has a respense not greater than that in the ehrematogram of the Standard preparation, and the sum of the respenses of all peaks, excluding the solvent front and oxybutynin, is not greater than wice that value-!1S (USP28)

## Add the following:

## -Related compounds-

Phosphate buffer and Mobile phase-Prepare as directed in the Assay.

System suitability stock solution-Dissolve accurately weighed quantities of USP Oxybutynin Related Compound B RS and USP Oxybutynin Related Compound C RS in Mobile phase to obtain a solution having known concentrations of about $100 \mu \mathrm{~g}$ of each USP Reference Standard per mL .

Standard stock solution-Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL .

System suitability solution-Transfer 10.0 mL of the System suitability stock solution to a $100-\mathrm{mL}$ volumetric flask, add 10.0 mL of the Standard stock solution, and dilute with Mobile phase to volume.

Standard solution-Transfer 15.0 mL of the Standard stock solution to a $100-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume. Transfer 5.0 mL of the solution obtained to a separate $100-\mathrm{mL}$ volumetric flask, and dilute with Mobile phase to volume. This solution contains about $7.5 \mu \mathrm{~g}$ of USP Oxybutynin Chloride RS per mL.

Test solution-Transfer about 50 mg of Oxybutynin Chloride, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system-Prepare as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between oxybutynin related compound B and oxybutynin related compound C peaks is not less than 1.1; and the relative standard deviation for replicate injections, determined from the oxybutynin peak, is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms for a total time of not less than twice the retention time of the oxybutynin peak, and measure all the peak responses (see Table 1 for known impurities). Calculate the percentage of each impurity in the portion of Oxybutynin Chloride taken by the formula:

$$
(C / W)(1 / F)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of USP Oxybutynin Chloride RS in the Standard solution; $W$ is the weight, in mg , of Oxybutynin Chloride taken to prepare the Test solution; $F$ is the relative response factor for each impurity (see Table 1 for the values); and $r_{U}$ and $r_{S}$ are the peak responses for each impurity obtained from the Test solution and for the oxybutynin peak in the Standard solution, respectively. [NOTE-For unknown impurities, use the relative response factor of the closest known impurity.]

Table 1

| Relative |  | Relative |  |

${ }^{6}$ 4-(ethylpropylamino)but-2-ynyl ( $\pm$ )-2-cyclohexyl-2-hy-droxy-2-phenylacetate
green endpoint. Perform a blank determination, and make any neeessary correction. Each mL of 0.1 Nperchloric acid is equivalent to 39.40 mg of $\mathrm{C}_{22} \mathrm{H}_{4+} \mathrm{NO}_{3} \cdot \mathrm{HCl}$.

- Phosphate buffer-Dissolve about 3.40 g 6.67 g of monobasic potassium phosphate and 4.35 g 8.55 g of dibasic potassium phosphate in 1 L of water, and mix.

Mobile phase-Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile ( $51: 49$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.5 mg 0.1 mg per mL .
Assay preparation-Transfer about 50 mg of Oxybutynin Chloride, accurately weighed, to a $100-\mathrm{mE} 10-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Transfer 2.0 mL of this solution to a separate $100-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $3-\mu \mathrm{m}$, or $3.5-\mu \mathrm{m}, 4.6-\mathrm{mm} \times 7.5-\mathrm{cm}$ column or $5-$ Imm $3.9 \mathrm{~mm} \times 15 \mathrm{em}$ column that contains packing L7. The column temperature is maintained at $45^{\circ}$. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the
quantity, in mg, of $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{NO}_{3} \cdot \mathrm{HCl}$ in the portion of Oxybutynin Chloride taken by the formula:

$$
100 \mathrm{C}\left(+_{5}++_{s}\right)
$$

$$
C D\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Oxybutynin Chloride RS in the Standard preparation; $D$ is the dilution factor for the Assay preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ IS (USP28)

## Add the following:

■ Paroxetine Hydrochloride

$\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl} \quad 365.83$
Piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)-, hydrochloride, (3S-trans)-.
(-)-(3S,4R)-4-(p-Fluorophenyl)-3-[(3,4-methylenedioxy)phenoxy]methyl]piperidine hydrochloride
[78246-49-8].
Hemihydrate 374.83 [GAS
» Paroxetine Hydrochloride is anhydrous or contains one-half molecule of water of hydration. It contains not less than 98.5 percent and not more than 102.0 percent of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$, calculated on the anhydrous and solvent-free basis.

## Change to read:

Packaging and storage-Preserve the anhydrous form in tight containers. Preserve the hemihydrate form in wellclosed containers. Store $15^{\circ}$ and $30^{\circ}-$ Store at controlled room temperature. ${ }^{1 S}$ (USP28)

Labeling-Label it to indicate whether it is the anhydrous or the hemihydrate form. Label it to indicate with which impurity tests the article complies.

USP Reference standards $\langle 11\rangle$ —USP Paroxetine Hydrochloride RS. USP Paroxetine Related Compound A RS. USP Paroxetine Related Compound B RS. USP Paroxetine Related Compound C RS. USP Pawetine Related Com D RS. USP Paroxetine Related Compound E RS. USP Paroxetine Related Compound F RS. USP Paroxetine Related Compound G RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{M}\rangle$ -
Test specimen-Dissolve a suitable portion of Paroxetine Hydrochloride in a solution of water in isopropyl alcohol (1 in 10), heat to $70^{\circ}$ to dissolve, recrystallize, and we the re sidte. and dry the residue under vacuum at $50^{\circ}$ for 3 hours.
Standard specimen: a similar preparation of USP Paroxetine Hydrochloride RS.

B: A solution (1 in 100) in a mixture of methanol and water $(1: 1)$ meets the requirements of the test for Chloride $\langle 191\rangle$.

Melting range, Class $I\langle 741\rangle$ : between $115^{\circ}$ and $126^{\circ}$ for the anhydrous form;[To come for the anhydrous form] be tween $141^{\circ}$ and $145^{\circ}$ for the hemihydrate form.

## Change to read:

Water, Method I $\langle 921\rangle$ : not more than $1.5 \%$ $1.0 \%{ }^{-1.5 \%}{ }_{1 S}$ (USP28) for the anhydrous form and between z.0\% $2.2 \%$ and $3.0 \% 2.8 \%$ for the hemihydrate form.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $0.002 \%$.
Limit of stereoisomers Limit of related compound C-
Mobile phase Prepare a filtered and degassed mixture of 0.5 M sodium chloride and methanol (4:1). Make adjust ments if necessary (see-System-Suitabilit) under Chromato (624) )
6.05 M Phesphate buffer solution Dissolve 8.7 g of di basic potassium phosphate in 1000 mL of water, and adjust with phespheric acid to a pH of 6.5 .

Mobile phase Prepare a filtered and degassed mixture of 0.05 M Phesphate buffer solution and acetonitrile (92:8). Make adjustments if neeessary (see-System Suitability under Chromatography $\langle 624$ ) .

Systen suitability solution Transfer about 5-mg of USP
Paroxetine Hydrechloride Related-Compound-C RS and about 5 mg of USP Paroxetine Hydrochloride- RS, aeeu rately weighed, to a $10-\mathrm{mL}$ volumetric flask. Dissolve in 4 mL of methanol, dilute with Mobile phase to volume, and mix.

Standard solution Dissolve-an aceurately weighed quantity of USP Parexetine-Related Compeund C RS and USP Paroxetine Hydrechloride RS in methanol, the volume of the solvent not exceeding 20\% of the final solution veftume, and dilute quantitatively with 0.5 M -soditum chloride to obtain a solution having a known concentration of about 0.01 mg of each USP Reference Standard per mL. If stepwise dilation is necessary, dilate with Mobite phatse instead.

Test solution Transfer about 100 mg of Parexetine Hy drochloride, aceurately weighed, to a 100 mL volumetric flask, dissolve in 20 mL of methanol, dilute with $0.5 \mathrm{M}-\mathrm{se}-$ ditim chloride volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chrematograph is equipped with a 295 nmedetec for and a- $4-\mathrm{mm} \times 10 \mathrm{~cm}$ coltmm that contains packing L41. The flot rate is about 0.5 mL per mintte. Chremategraph the Standard System suitability solution, and record the peak respenses as directed for Procedure: the relative retention times are about 0.56 for paroxetine-related compound $C$ and 1.0 for paroxetine; the resolution, $R$, between paroxetine related compound $C$ and paroxetine is not less than 1.8, the celtumn efficiency determined from the related compeund $G$
peak is not less than 230 theoretical plates; the tailing factor for the paroxetine related compernd $C$ peak is not more than 1.6; and the relative standard deviation for replieate injec tions is not more than $2.0 \%$.

Procedtre Separately inject equal volumes Inject avo lame (about $10 \mu \mathrm{~L}$ ) of the Standard solttion and the Test solution into the chromatograph, record the chromatogram, and measture all of the peak respenses. Caleutate the percenfage of paroxetine relatedeompernd $C$ in the pertion of Par oxetine Hydrochloride taken by the formmat:

$$
\begin{gathered}
10(C / H)\left(r_{4}+\Psi_{s}\right), \\
100\left(\not+r_{n}\right),
\end{gathered}
$$

in which $C$ is the concentration, in $\mu$ g per mL , of USP Par oxetine-Related Compound C RS in the Standerd solution; Wis the quantity, in mg, of Paroxetine Hydrechloride in the Test soluion; and $r_{4}$-and $r_{s}$ are the peak responses for par oxetine related compound-C obtained from the Test solution and the Standard solution, respectively. in which-ris the peak respense for paroxetine related compound $C$, andr. is the sum of the respenses of all of the peaks: not more than $0.1 \%$ is found.

## LIMIT OF RELATED-COMPOUND D-

Phesphate buffer. Prepare a 0.05 M menebasic soditm phosphate solution-in water, adjust with phesphoric acid to a pH of 3.0 , and mix.

Mobile phatse Prepare a filtered and degassed mixture of
Phosphate buffer and acetonitrile (3:2). Make adjustments if neeessary (see System Suitability under Chromatography $\langle 624\rangle$.

Standard solution Dissolve aceurately weighed quantities of USP Paroxetine-Related Compound D-RS and USP Paroxetine Hydrochloride RS in water, and dilute quantita
tively, and stepwise if necessaty, with water to obtain a-solation having known eoneentrations of about 0.1 and 1.0 mg per mL , respectively.

Fest solution Transfer about 100 mg of Paroxetine Hy drochloride, aceurately weighed, to a $50-\mathrm{mL}$ volumetrie flask, dissolve in and dilute with water to voltume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )_ The liquid chromatograph is equipped with a 295 nm detec tor and a $4.6 \mathrm{~mm} \times 25$-mm coltmm that contains packing E13. The flow rate is about 1 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention-times are about 1.2 for parexetine related compeund $D$ and 1.0 for paroxetine; the resolution, $R$, between paroxetine related eompound $D$ and parexetine is not less than 2.2; the columm efficiency determined from the paroxetine-related compound $D$ peak is not less than- 4000 theoretical plates; the failing factor for the related compound $D$ peak is not more than 1.8; and the relative standard deviation for replicate in jections is net mere than $2.5 \%$.

Procedtre Separately inject equal volumes (about 10 HL) of the Standard solution and the Test solution into the ehromagraph, record the chromatograms, and measure the respenses for the major peaks. Caleulate the pereentage of paroxetine related compound $D$ in the portion of Paroxetine Hydrochloride taken by the formula:-

$$
5(C / H)\left(r_{t}+r_{s}\right)
$$

in which $C$ is the concentration, in $\mu$ g per mL, of USP Parexetine Related Compernd D-RS in the Standard solution; Wis the quantity, in mg, of Paroxetine Hydrochloride in the Fest solution; and $r_{t}$-and $r_{s}$ are the peak respenses for par exetine related compound $D$ obtained from the Test solutiont
and the Standard solttion, respectively: the sum of the pereentages found in the Limit of related compernd $C$ and the Limit of related compernd $D$ tests is net mere than $0.1 \%$.

Mobile phase-Prepare a mixture of $n$-hexane, alcohol, water, and trifluoroacetic acid ( $900: 100: 2: 2$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Diluent: $\quad$ a mixture of alcohol and $n$-hexane ( $1: 1$ ).
Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Related Compound C RS, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 1 mg per mL .
Test solution-Transfer about 125 mg of Paroxetine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

System suitability solution-Dilute known volumes of the Test solution and the Standard solution with Diluent to obtain a solution having known concentrations of about 0.1 mg per mL of each of USP Paroxetine Hydrechloride RS Paroxetine Hydrochloride and of USP Paroxetine Related Compound C RS.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing E49. L51. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at $30^{\circ}$. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times for paroxetine and paroxetine related compound C are 1.0 and about 0.6 , respectively; the resolution, $R$, between paroxetine and paroxetine related compound C is not less than 2.0 ; and the tailing factor for paroxetine related compound C is not greater than 2.0. Chromatograph the

Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$ for the paroxetine related compound C .

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound C in the portion of Paroxetine Hydrochloride taken by the formula:

$$
10,000(C / H)\left(+++_{s}\right)
$$

$$
2500(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Related Compound C RS in the Standard solution; $W$ is the weight, in mg , of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; and $r_{i}$ and $r_{s}$ are the peak areas for paroxetine related compound C in the Test solution and the Standard solution, respectively: not more than of $0.1 \%$ of paroxetine related compound C is found.

## Change to read:

## Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydro-

 pyridine-Solution A-Prepare a filtered and degassed mixture of acetonitrile and trifluoroacetic acid (1000:1).

Solution B-Prepare a filtered and degassed mixture of water and trifluoroacetic acid (1000:1).
Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Related Compound E RS in a mixture of Solution $B$ and Solution $A(7: 3)$, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 1-methyl-4-( $p$-fluorophenyl)-$1,2,3,6$-tetrahydropyridine of about 0.2100 ng per mL. 20 ng per mL.■1S (USP28)

Test solution-Transfer about 20 mg of Paroxetine Hydrochloride, accurately weighed, to a suitable flask, add 1.0 mL of a mixture of Solution B and Solution $A(7: 3)$, and shake to dissolve.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a tandem mass spectrophotometric detector, monitoring the mass-to-charge ratio of 44 ã arising from the fragmentation of mass-tocharge ratio of 192 , and a $2.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains base-deactivated packing L1. The flow rate is about 0.15 mL per minute. The collision-induced disassociation sector is filled with sufficient argon gas to produce -20 eV collisions. Adjust the argon gas pressure as necessary. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 30 | 70 | equilibration |
| $0-10$ | 30 | 70 | isocratic |
| $10-10.5$ | $30 \rightarrow 90$ | $70 \rightarrow 10$ | linear gradient |
| $10.5-20$ | 90 | 10 | isocratic |
| $20-20.5$ | $90 \rightarrow 30$ | $10 \rightarrow 70$ | linear gradient |
| $20.5-30$ | 30 | 70 | isocratic |

Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the signal-to-noise ratio for the analyte response at a mass-to-charge ratio of 44 is not less than 5 ; and the relative standard deviation for replicate injections is not more than $5.0 \%$. [NOTE-A large peak
due to paroxetine is observed at about 10 minutes in this system. Divert the flow of eluate from the mass spectrometer at about 10 minutes after injection.]

Procedure-Separately inject equal volumes (about 100 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in pg ng, of 1-methyl-4-( $p$-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$
C I\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Related Compound E RS in the Standard solution; I is the amount, in ng, of 1-methyl-4-( $p$-fluorophenyl)-1,2,3,6-tetrahydropyridine in each mg of USP Paroxetine Related Compound E RS in the Standard solution; and $r_{U}$ and $r_{s}$ are the peak responses for 1-methyl-4-( $p$-fluorophe-nyl)-1,2,3,6-tetrahydropyridine obtained from the Test solution and the Standard solution, respectively: not more than 200 pg 100 ng 20 ng is found ( $0.0001 \%$ ).

Chromatographic purity-[NOTE-Perform all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to their material.]

TEST 1-
Solution A-Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180:20:1).

Solution B-Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180:20:1).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent: a mixture of water and tetrahydrofuran $(9: 1)$.
Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL .

System suitability solution-Dissolve, by sonication if necessary, suitable quantities of USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS in mixture of water and tetrahydroftran (9:1) Diluent to obtain a solution having known concentrations of about 0.01 mg of each USP Reference Standard per mL .

Test solution-Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a $25-\mathrm{mL}$ volumetric flask, dissolve in 20 mL of a mixture of water and tetrahydreftran $(9: 1)$, Diluent, sonicate, dilute with mixtme of water and etrahydreftran (9:1) Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $285-\mathrm{nm}$ detector eapable of menitoring at 263 and 295 nm and a $4.6-\mathrm{mm}$ $\times 25-\mathrm{cm}$ column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at $40^{\circ}$. The chromatograph is programmed as follows.

| Time (mintutes) | Solution - 4 <br> (\%) | Solution B $(\%)$ | Elution |
| :---: | :---: | :---: | :---: |
| $\theta$ | 80 | 20 | equilibration (for |
|  |  |  | 10-minutes) |
| $\theta-3 \theta$ | 88 | 20 | isperatie |
| 30-50 | $80 \rightarrow 20$ | 20, 80 | tinear gradient |
| 50-nd | 20 | 80 | isocratie |

Chromatograph the System suitability solution, and record the peak respenses as directed for Procedtre: the resolution,
$R$, between parexetine related compent $A$ and paroxetine related compeund $B$ is not less than 1.5; the coltumn eff
eieney determined from the paroxetine related compound A peak is not less than 10,000 theoretical plates; the tailing factor for the paroxetine related compound A peak is not more than 1.2; and the relative standard deviation for replieate injections is net mere than $1.0 \%$.

| Time | Solution A | Solution $B$ |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| 0 | 80 | 20 | equilibration |
| $0-30$ | 80 | 20 | isocratic |
| $30-50$ | $80 \rightarrow 20$ | $20 \rightarrow 80$ | linear gradient |
| $50-60$ | 20 | 80 | isocratic |
| $60-70$ | $20 \rightarrow 80$ | $80 \rightarrow 20$ | linear gradient |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.1 for paroxetine related compound B , and 1.0 for paroxetine related compound A ; the resolution, $R$, between paroxetine related compound A and paroxetine related compound B is not less than 2.0; and the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0 ; Chromater the Stard selution, and record the peak responses as directed for Proand the relative standard deviation for replicate injections is not more than $2.0 \%$ for paroxetine related compound A.

Procedure Inject a volume (about $20 \mu \mathrm{\mu}$ ) of the Test se thtion inte the chromatograph, record the chromatogram, and measure all of the peak respenses at both 263 and 295 nm . Calculate the percentage of each impurity in the pertion of Paroxetine Hydrochloride taken by the formula:$100(+\rightarrow+5)$,
in which $r_{i}$-is the peak response for each impurity; and $\boldsymbol{r}_{5}$ is the-sum of the respenses of all of the peaks: not more that $0.1 \%$ of any individual impurity is found, and not more than

## $0.5 \%$ of total impurities is found.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, Test solution, and Diluent into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$
2500(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Hydrochloride RS in the Standard solution; $W$ is the weight, in mg , of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; $r_{U}$ is the peak area of each impurity in the Test solution, excluding the peaks obtained in the chromatogram of the Diluent; and $r_{s}$ is the peak area of paroxetine obtained in the Standard solution: not more than of $0.5 \% 0.3 \%$ of any peak at a retention time of paroxetine related compound B is found; not more that $0.1 \%$ of any other individual impurity is found; and not more than $1.0 \%$ of total impurities is found.

TEST 2-
Phosphate buffer-Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A-Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (98:2).

Solution B—Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (6:4).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Diluent: a mixture of Phosphate buffer and acetonitrile (9:1).
Standard solution-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having known concentrations of about $4 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per mL , and $4 \mu \mathrm{~g}$ per mL , respectively.

Identification solution-Dissolve an accurately weighed quantity of Paroxetine Hydrochloride, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in Diluent to obtain a solution having known concentrations of about 2 mg per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per $\mathrm{mL}, 10 \mu \mathrm{~g}$ per mL , and 4 $\mu \mathrm{g}$ per mL , respectively.

Test solution-Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $210-\mathrm{nm}$ detector and a $3.9-\mathrm{mm} \times 15-\mathrm{cm}$ column that contains packing L 1 . The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-5$ | 100 | 0 | isocratic |
| $5-70$ | $100 \rightarrow 40$ | $0 \rightarrow 60$ | linear gradient |
| $70-90$ | $40 \rightarrow 0$ | $60 \rightarrow 100$ | linear gradient |
| $90-95$ | 0 | 100 | isocratic |
| $95-95.1$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $95.1-110$ | 100 | 0 | re-equilibration |

Chromatograph the Identification solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.91 for paroxetine related compound B, about 0.96 for paroxetine related compound $\mathrm{F}, 1.0$ for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $10.0 \%$ for the paroxetine related compound B, paroxetine related compound F , paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard solution and Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B , paroxetine related compound F , and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$
5000(C / W)\left(r_{i} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of the appropriate USP Reference Standard in the Standard solution; $W$ is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; and $r_{i}$ and $r_{s}$ are the peak areas for the corresponding impurity in the Test solution and the Standard solution, respectively: not more than of $0.5 \%$ of paroxetine related compound B is found; not more than $0.2 \%$ of paroxetine related compound F is found; and not more than $0.2 \%$ of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:
in which $C$ is the concentration, in mg per mL , of the USP Paroxetine Hydrochloride RS in the Standard solution; $W$ is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the Test solution; $r_{i}$ is the peak area for any unknown impurity in the Test solution; and $r_{s}$ is the peak area of paroxetine in the Standard solution: not more than of $0.1 \%$ of any single unknown impurity is found, and not more than $1.0 \%$ of total impurities is found.

Organic volatile impurities, Method $V\langle 467\rangle$ : meets the requirements.

## Assay-

Acetate buffer-Prepare a 0.05 M solution of ammonium acetate in water, adjust with glacial acetic acid to a pH of 4.5 , mix, and filter.

Mobile phase-Prepare a filtered and degassed mixture of Acetate buffer, acetonitrile, and triethylamine ( $60: 40: 1$ ). Adjust with glacial acetic acid to a pH of 5.5. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Dissolve suitable quantities of USP Paroxetine Related Compound B RS and USP Paroxetine Hydrochloride RS in water to obtain a solution having known concentrations of about 0.5 mg of each USP Reference Standard per mL.

Standard preparation-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg per mL .

Assay preparation-Transfer about 50 mg of Paroxetine Hydrochloride, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

$$
5000(C / W)\left(r_{i} / r_{s}\right)
$$

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L13. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for paroxetine related compound B and 1.0 for paroxetine; the resolution, $R$, between paroxetine related compound $B$ and paroxetine is not less than 2.0 ; the column efficiency determined from the paroxetine peak is not less than 3000 theoretical plates; the tailing factor for the paroxetine peak is not more than 1.6 ; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$ in the portion of Paroxetine Hydrochloride taken by the formula:

$$
100 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■2S (USP27)

## Briefing

Paroxetine Tablets, page 653 of $P F$ 29(3) [May-June 2003]. Consistent with established policy of using the same terminology in the monograph title as appears in the strength expression for a dosage form, Paroxetine Tablets has been proposed to be the title for this new monograph.

Paroxetine Tablets is proposed to be the title of this new monograph that will be included in the Second Supplement to USP 27$N F$ 22, but with an official date for the title to be February 1, 2006, which is 18 months later than the official date of the Second Supplement to USP 27-NF 22. Use of the revised name would be permitted as of August 1, 2004, the official date of the Second Supplement to USP 27-NF 22, but use of the name Paroxetine Tablets would not become mandatory until February 1, 2006. The 18month extension is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the terminology.
(NL: C. Barnstein) RTS-41137-1

## Add the following:

## ■Paroxetine Hydrochloride Tablets

-(The title for this monograph-to become official February 1, 2006)
» Paroxetine Hydrochloride Tablets contain an amount of Paroxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of paroxetine hydrochloride $\left(\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3}-\mathrm{HCl}\right)$.

Packaging and storage-Preserve in tight containers, and store at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Paroxetine Hydrochloride RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ -
Test specimen-Transfer an amount of finely powdered Tablets, equivalent to about 10090 mg of paroxetine hydroehloride, to a suitable flask, add 100 mL of 0.1 N hydrochloric acid, and stir for 1 hour. Transfer the mixture to a separatory funnel, and add ammonium hydroxide until the solution is alkaline to litmus paper. Add 100 mL of ethyl ether to the funnel, and shake for 2 minutes. Transfer the organic layer into the necessary number of centrifuge tubes, and centrifuge for 10 minutes. Recombine the clarified extracts, add 1 drop of water and 0.5 mL of 0.1 N hydrochloric acid, stir, and evaporate to dryness under a stream of nitrogen. Dry the residue in an oven at $90^{\circ}$ for 1 hour.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

C: Place a quantity of finely powdered Tablets, equivalent to about 500450 mg of paroxetine hydrochloride, into a stoppered flask. Add 100 mL of alcohol, and shake for 1 hour. Centrifuge about 20 mL of the mixture, and measure the angular rotation of the supernatant at $20^{\circ}$ (see Optical Rotation $\langle 781\rangle$ ): the angular rotation is between $-75^{\circ}$ and $-115^{\circ}$.

Dissolution $\langle 711\rangle$ -
Medium: simulated gastric fluid without enzyme; 900 mL .
Apparatus 2: 60 rpm .
Time: 60 minutes.
Determine the amount of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdots \mathrm{HC}$ dissolved by employing the following method.

Buffer solution and Mobile phase-Prepare as directed in the Assay.

Standard stock solution-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in an amount of methanol not exceeding $5 \%$ of the volume of the final solution, and dilute with Dissolution Medium to obtain a solution having a known concentration of about 0.63 mg per mL .

Standard solution-Quantitatively dilute the Standard stock solution with Dissolution Medium to obtain a solution having a concentration estimated to correspond to that of the filtered solution under test.

Chromatographic system-Proceed as directed in the Assay, except to prepare the Standard preparatien as directed mer Dissulth (714)= chromatograph the Standard solution.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of a portion of the solution under test, previously passed through a suitable $0.45-\mu \mathrm{m}$ membrane filter, and the Standard solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$ dissolved based on the peak responses obtained from the solution under test and the Standard solution.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \cdot \mathrm{HCl}$ is dissolved in 60 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## PROCEDURE FOR CONTENT UNIFORMITY-

Buffer solution, Mobile phase, and Chromatographic sys-tem-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Place 1 Tablet in a suitable volumetric flask, and add a volume of a hydrochloric acid solution (7 in 1000), equivalent to about $25 \%$ of the flask volume. Allow the Tablet to disintegrate, dilute with methanol to vo-
lume, and mix to obtain a solution containing about 0.1 mg of paroxetine hydrectride per mL . Centrifuge a portion of the solution.

Procedure-Proceed as directed in the Assay. Calculate the quantity, in mg , of $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3} \ldots \mathrm{HCl}$ in the Tablet taken by the formula:

```
#C(+54+s),
```

$$
V C(329.37 / 365.83)\left(r_{U} / r_{S}\right)
$$

in which $V$ is the volume of the flask used; $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test solution and the Standard solution, respectively; and the other terms are as defined therein.

## Assay-

Buffer solution-Prepare a mixture of water, phosphoric acid, and triethylamine ( $100: 0.6: 0.3$ ).

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (7:3). Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard preparation-Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL .

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of paroxetine hy drochloride, to a $200-\mathrm{mL}$ volumetric flask, dissolve in and
dilute with methanol to volume, and mix. Centrifuge a portion of this solution for 6 minutes. Transfer 20 mL of the supernatant to a $100-\mathrm{mL}$ volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ ) The liquid chromatograph is equipped with a $295-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 3.3-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L7. The flow rate is about 2.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 750 theoretical plates; the tailing factor is not more than 4 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $5 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of paroxetine hydrechloride $\left(\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{FNO}_{3}-\mathrm{HCl}\right)$ in the portion of Tablets taken by the formula:

$$
1000 C\left(+t_{t}++_{s}\right)
$$

$$
1000 C(329.37 / 365.83)\left(r_{U} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Paroxetine Hydrochloride RS in the Standard preparation; 329.37 and 365.83 are the molecular weights for paroxetine and paroxetine hydrochloride, respectively; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively. $\quad$ 2S (USP27)

## BRIEFING

Camphorated Phenol Topical Solution, page 1561 of $P F$ 29(5) [Sept.-Oct. 2003]. On the basis of new information received from the sponsor, it is proposed to slightly modify the acceptance criteria in the test for Specific gravity to be consistent with the product release specification. Editorial style changes have also been made.
(PA7b: B. Davani) RTS-41055-1

## Add the following:

## ■Camphorated Phenol Topical Solution

» Camphorated Phenol Topical Solution is a solution of camphor and phenol in Eucalyptus Oil and Light Mineral Oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of camphor $\left(\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{O}\right)$ and phenol $\left(\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}\right)$.

Packaging and storage-Preserve in tight containers. Store at room temperature, avoid excessive heat, and close cover after each use.

USP Reference standards $\langle 11\rangle —$ USP Camphor RS. USP Phenol RS.

Identification-The retention times of the camphor and phenol peaks in the chromatograms of the Assay preparation correspond to those of the Standard preparation, obtained as directed in the Assay.

Specific gravity $\langle 841\rangle$ : between 0.8640 .840 and 0.865 .

## Assay-

Internal standard solution-Transfer 250 mg , accurately weighed, of $n$-dodecane to a $25-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Standard preparation-Transfer about 96 mg of USP Phenol RS, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask. Add about 224 mg of USP Camphor RS, accurately weighed, to the flask. Dilute with chloroform to volume, and mix. Combine 5.0 mL of this solution with 5.0 mL of Internal standard solution in a $50-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Assay preparation-Transfer about 1 g of Topical Solution, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Add 5.0 mL of Internal standard solution, dilute with chloroform to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, maintained at a temperature of $200^{\circ}$, and a $2-\mathrm{mm}$ $\times 1.8$-m glass column packed with $100-$ to 120 -mesh S 1 A , coated with $15 \%$ G44. The carrier gas is helium. Adjust the column temperature to about $140^{\circ}$ so that the relative retention times are 0.3 for phenol, 0.8 for camphor, and 1.0 for the internal standard. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between the camphor peak and the internal standard peak is not less than 2.0, and between the phenol peak and the camphor peak not less than 5.0; and the relative standard deviation of the peak response ratio of the camphor peak and the phenol peak to the internal standard peak for five consecutive injections of the Standard preparation is not more than $2.0 \%$.

Procedure-Separately inject 1 to $2 \mu \mathrm{~L}$ of the Assay preparation and the Standard preparation into the gas chromatograph, record the chromatograms, and determine the peak
response ratios. Calculate the percentage of camphor (w/w) and the percentage of phenol ( $\mathrm{w} / \mathrm{w}$ ) in the portion of Topical Solution taken by the formula:

$$
\left(50 W_{R} / W\right)\left(R_{U} / R_{S}\right)
$$

in which $W_{R}$ is the weight, in mg , of the appropriate USP Reference Standard in the Standard preparation; $W$ is the weight of Topical Solution, in mg, taken to prepare the $A s$ say preparation; and $R_{U}$ and $R_{S}$ are the response ratios of the corresponding analyte peaks in the Assay preparation and the Standard preparation, respectively. $\quad$ IS (USP28)

## Briefing

Phenylephrine Bitartrate. Because there is no existing USP monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for Chromatographic purity are based on analyses performed with the Symmetry brand of L1 column. The typical retention times are about 2.0 for norphenylephrine, about 2.2 for (-)-phenylephrine, about 2.6 for phenylephrone, about 6.4 for 1-benzylphenylepherine, and about 6.9 for benzylphenylepherine HCl .
(PA1: C. Anthony) RTS—39860-1

## Add the following:

## ■Phenylephrine Bitartrate

## $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \quad 317.3$

R-2-(Methylamino)-1-(3-hydroxyphenyl)ethanol, hydrogentartrate.
(-)-1-(3-Hydroxyphenyl)-2-methylaminoethanol, hydrogentartrate.
(-)-3 Hydroxy- $\alpha$ [(methylamino) methyl] benzenemethanol, hydrogentartrate.
$1-m$-Hydroxy- $\alpha-[($ methylamino $)$ methyl $]$ benzylalcohol, hydrogentartrate [17162-39-0].
» Phenylephrine bitartrate contains not less than 99.0 percent and not more than 100.5 percent of $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6}$, calculated on the dried basis.

## Packaging and storage-Preserve in tight, light-resistant

 containers. Store at controlled room temperature.USP Reference standards $\langle 11\rangle$ —USP Phenylephrine Hydrochloride RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The alkaline of tartrate from the test for Specific rotation responds positively to the test for Tartrate $\langle 191\rangle$.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-53^{\circ}$ and $-57^{\circ}$ for the prepared sample.

Test solution-Prepare a sample solution of about 24 mg per mL in water. Make the solution slightly alkaline by adding concentrated ammonium hydroxide dropwise. Rub the wall of the vessel with a glass rod so that the base precipitates out. Filter the base under suction, wash with a little water and acetone, and dry at $105^{\circ}$ for 2 hours. Prepare and measure a 50 mg per mL solution of base precipitate in 1 M hydrochloric acid.
$\mathbf{p H}\langle 791\rangle$ : between 3.0 and 4.0 in $10 \% \mathrm{w} / \mathrm{v}$ aqueous solution.

Loss on drying $\langle 731\rangle$ —Dry at $105^{\circ}$ to a constant weight: it loses not more than $0.5 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Chromatographic purity-

Buffer solution-Dissolve 3.25 g of 1-octanesulfonic acid sodium salt monohydrate in 1 L of water. Adjust slowly with 3 M phosphoric acid to a pH of 2.8 .
Solution A-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile (9:1).
Solution B—Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (9:1).

Diluent-Prepare a mixture of Solution $A$ and Solution B (8:2).
System suitability solution-Dissolve accurately weighed quantities of USP Phenylephrine Hydrochloride RS, norphenylephrine hydrochloride, 1-benzylphenylepherine base, and benzylphenylepherine hydrochloride in Diluent, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.06 mg per $\mathrm{mL}, 0.09 \mathrm{mg}$ per $\mathrm{mL}, 0.07 \mathrm{mg}$ per mL , and 0.05 mg per mL , respectively.
Test solution-Transfer 78 mg of phenylephrine bitartrate, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dissolve in and dilute with Diluent to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $5.5-\mathrm{cm} \times 4-\mathrm{mm}$ column that contains packing L1. The column temperature and injector temperature are maintained at $45 \pm 2^{\circ}$. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

| Time | Solution $A$ | Solution B |  |
| :---: | :---: | :---: | :---: |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| 0 | 93 | 7 | equilibration |
| $0-10$ | $93 \rightarrow 30$ | $7 \rightarrow 70$ | linear gradient |
| $10-18$ | 30 | 70 | isocratic |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for norphenylephrine, about 1.0 for ( - -phenylephrine, about 1.2 for phenylephrone, about 2.9 for 1-benzylphenylepherine, and about 3.1 for benzylphenylepherine HCl .

The resolution, $R$, between norphenylephrine and $(-)$-phenylephrine is not less than 1.5 . The tailing factor of $(-)$-phenylephrine is less than 1.8 . The relative standard deviation for replicate injections is not more than $6 \%$.

Procedure-Inject about $10 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Phenylephrine Bitartrate taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity, and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.2 \%$ of any individual impurity is found, and not more than $0.5 \%$ of total impurities is found.

Assay-Transfer about 280 mg of Phenylephrine Bitartrate, accurately weighed, to a $100-\mathrm{ml}$ beaker, and dissolve by stirring in 60 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration and make the necessary correction (see Titrimetry $\langle 541\rangle$ ). Each mL of $0.1 \mathrm{~N} \mathrm{HClO}_{4}$ is equivalent to 31.73 mg of $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{6} \cdot \mathbf{1 S}$ (USP28)

## Briefing

Propoxyphene Hydrochloride, USP 27 page 1578 and page 529 of PF 30(2) [Mar.-Apr. 2004]; Propoxyphene Napsylate, USP 27 page 1582 and page 662 of PF 29(3) [May-June 2003]. On the basis of comments received, it is proposed to make further revisions to modify the System suitability solution in the test for Related compounds.
(PA2: C. Anthony) RTS-40678-1

Assay-
0.01 M
-0.1 $M_{\square 1 \mathrm{~S}}$ (USP28)
Monobasic ammonium phosphate buffer, pH 6.3-Dissolve 11.5 g of monobasic ammonium phosphate and 1.0 mL of triethylamine in 1000 mL of water, adjust with $10 \%$ sodium hydroxide to a pH of $6.3 \pm 0.05$, and mix.

Mobile phase-Prepare a filtered and degassed mixture of methanol and 0.01 M
-0.1 $M_{\text {■1S (USP28) }}$
Monobasic ammonium phosphate buffer, pH 6.3 (67:33). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
Standard preparation-Dissolve an accurately weighed quantity of USP Propoxyphene Hydrochloride RS in Mobile phase to obtain a solution having a known concentration of about 5.0 mg per mL .

Assay preparation-Transfer about 250 mg of Propoxyphene Hydrochloride, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a 3.9$\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the retention time of propoxyphene hydrochloride is about $9 \mathrm{~min}-$ utes; the resolution, $R$, between a d 2 aeetoxy 4 dimethylamine 1,2 diphenyl 3 methylbutane and propoxyphene is not less that +4;
-the tailing factor for the propoxyphene hydrochloride peak
is not more than 3.5 ; is (USP28)
and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $50 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg , of $\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{NO}_{2} \cdot \mathrm{HCl}$ in the portion of Propoxyphene Hydrochloride taken by the formula:

$$
100 C\left(x_{t}+r_{s}\right)
$$

$$
\text { ■ } 50 C\left(r_{U} / r_{S}\right), \llbracket 1 \mathrm{~S}(U S P 28)
$$

in which $C$ is the concentration, in mg per mL , of USP Propoxyphene Hydrochloride RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Change to read:

Dissolution $\langle 711\rangle$ -
Medium: $\quad 0.01 \mathrm{~N}$ hydrechleric acid;
$\square 0.1 \mathrm{~N}$ hydrochloric acid; ${ }^{1 \mathrm{~S}}$ (USP28)
900 mL .
Apparatus 2: 50 rpm .
Time: 45 minutes.
Procedure-Determine the amount of $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{ClN}_{4}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 273 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Pyrimethamine RS in the same Medium.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{ClN}_{4}$ is dissolved in 45 minutes.

## Briefing

Riboflavin, USP 27 page 1645. It is proposed to revise the test for Specific rotation by replacing the current procedure with the method given in the European Pharmacopoeia ( $E P$ ). In the current procedure the sample under test is dissolved in hydrochloric acid. However, it has been reported that along with handling difficulties associated with using concentrated hydrochloric acid, false readings were obtained due to interactions between the acid and the optical cell materials. It was found that these problems were not observed when 0.05 M sodium hydroxide is used as is described in the $E P$.
(DSN: L. Evans) RTS-40944-1

## Briefing

Spironolactone Oral Suspension, page 5813 of PF 24(2) [Mar.-Apr. 1998]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with modifications to In-Process Revision.
(CRX: C. Okeke) RTS-41005-1

## Add the following:

## ■Spironolactone Oral Suspension

## » Spironolactone Oral Suspension contains not

 less than 0.18 g and not more than 0.22 g of Spironolactone in 100 mL of Oral Suspension.Use Spironolactone, or the number of Spironolactone Tablets that contain the designated amount of Spironolactone, and prepare Spironolactone

Transfer the Spironolactone, or Spironolactone Tablets, to a glass mortar. [NOTE-If Tablets are used, finely powder the Tablets such that they pass through a 40- or 45 -mesh sieve, and place the sieved powder in a glass mortar. If the Tablets have a waxy coating that will not pass through a 40- or $45-\mathrm{mesh}$ sieve, transfer the unsieved portion to another glass mortar (holding the sieved portion to be added later), add 0.5 mL of alcohol ( $95 \%$ ethyl alcohol), and make a smooth paste; then transfer the sieved portion to the mortar containing the paste.] Dissolve the Cetylpyridinium Chloride in 10 mL of Purified Water, transfer this solution in divided portions to the mortar containing the spironolactone powder or paste, and mix to form a smooth paste. Place 20 mL of Purified Water in a beaker. Using moderate heat, stir to form a vortex, and slowly sprinkle the Xanthan Gum into the vortex to produce a uniform dispersion. Add the dispersion to the wetted powder paste, and mix until smooth. Add a sufficient
quantity of the Suspension Structured Vehicle (plain or sugar free) to obtain a final volume of 100 mL , and mix.

NOTE-Do not add flavors or colors to the formulation for oral syringe dosing of infants and younger children or for dosing by intubation. For older children, incorporate a suitable flavor and/or color just prior to bringing the product to final volume with the structured vehicle.

Packaging and storage-Preserve in tight, light-resistant containers. Store in a refrigerator, and avoid freezing.

Labeling-Label it to state that it should be stored in a refrigerator and should not be frozen; that it should be warmed to room temperature before filling oral syringes or dispensing; and that it is to be well shaken before using.

Beyond-use date-Fourteen days after the day on which it was compounded.

Assay-[To come.] $]^{1 S}$ (USP28)

## Briefing

Spironolactone and Hydrochlorothiazide Oral Suspension, page 5814 of PF 24(2) [Mar.-Apr. 1998]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded with modifications to In-Process Revision.
(CRX: C. Okeke) RTS-41006-1

## Add the following:

## ■Spironolactone and Hydrochlorothiazide Oral Suspension

» Spironolactone and Hydrochlorothiazide Oral Suspension contains not less than 0.18 g and not more than 0.22 g of Spironolactone and not less than 0.18 g and not more than 0.22 g of Hydrochlorothiazide in 100 mL of Oral Suspension.

Use Spironolactone and Hydrochlorothiazide, or the number of Spironolactone and Hydrochlorothiazide Tablets that contain the designated amounts of Spironolactone and Hydrochlorothiazide, and prepare Spironolactone and Hydrochlorothiazide Oral Suspension as follows (see Pharmaceutical Compounding-Nonsterile Preparations $\langle 795\rangle$ ):

## Briefing

Stavudine; Stavudine Capsules; Stavudine for Oral Solution. Because there are no existing USP monographs for this drug substance and dosage forms, new monographs based on submitted data are being proposed. The liquid chromatographic procedures in the Related compounds test and in the Assay are based on analyses performed with the Supelcosil LC-18-DB brand of L1 column.
(PA7b: B. Davani) RTS-40185-1

## Add the following:

## ©Stavudine

$\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4} \quad 224.21$
Thymidine, 2', 3'-didehydro-3'-deoxy-.
1-(2,3-Dideoxy- $\beta$-D-glycero-pent-2-enofuranosyl)thymine. [3056-17-5].
» Stavudine contains not less than 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$, calculated on an anhydrous and solvent-free basis.

Packaging and storage-Store protected from light and humidity. Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Stavudine RS. USP
Stavudine System Suitability Mixture RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781\rangle$ : between $-45^{\circ}$ and $-40^{\circ}$, calculated on the anhydrous basis, determined in a solution in water containing 10 mg per mL .

Water, Method $1\langle 921\rangle$ : not more than $0.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.3 \%$.
Heavy metals, Method $I\langle 231\rangle: \quad 0.002 \%$.
Related compounds-
NOTE—All testing solutions must be prepared immediately prior to use and remain refrigerated until use.
0.01 M Ammonium acetate-Prepare as directed in the Assay.
Solution A-Prepare a filtered and degassed mixture of 0.01 M Ammonium acetate and acetonitrile (96.5:3.5).

Solution B—Prepare a filtered and degassed mixture of 0.01 M Ammonium acetate and acetonitrile ( $75: 25$ ).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

System suitability solution-Prepare a 0.50 mg per mL solution of USP Stavudine System Suitability Mixture RS in water.

Test solution-Prepare a solution of Stavudine, accurately weighed, in water, and having a concentration of about 0.5 mg per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 2.1 mL per minute. The chromatograph is programmed as follows.

## Time $\quad$ Solution $A \quad$ Solution $B$

| (minutes) | $(\%)$ | $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-10$ | 100 | 0 | isocratic |
| $10-20$ | $100 \rightarrow 0$ | $0 \rightarrow 100$ | linear gradient |
| $20-30$ | 0 | 100 | isocratic |
| $30-35$ | $0 \rightarrow 100$ | $100 \rightarrow 0$ | linear gradient |
| $35-40$ | 100 | 0 | re-equilibration |

Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the retention time of the main stavudine peak is $10.5 \pm 2$ minutes; the relative retention times are about 1.0 for stavudine and 0.28 for thymine; the resolution, $R$, between thymidine epimer and thymidine is greater than or equal to 1.15 and between stavudine and $\alpha$-stavudine is greater than or equal to 1.0 ; the capacity factor, $k^{\prime}$, is greater than 4 ; and the column efficiency is greater than 9500 theoretical plates.

Procedure-Inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the System suitability solution and the Test solution into the chromatograph, record the chromatograms for twice the retention time of the major peak, or at least until the last impurity has eluted, and measure the area of the responses for
all the peaks. Determine the percentage of thymine in the portion of Stavudine taken by the formula:

$$
\left.(100)(F) r_{U} / r_{s}\right),
$$

in which $F$ is the relative response factor and is equal to 0.69; $r_{U}$ is the peak response of thymine obtained from the Test solution; and $r_{s}$ is the sum of the responses of all the related peaks in the chromatogram of the Test solution, including that of the main stavudine peak: not more than $0.5 \%$ of thymine is found. Calculate the percentage of all other impurities in the portion of Stavudine taken by the formula:

$$
100\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the peak area response of each impurity obtained from the Test solution; and $r_{s}$ is the sum of the area responses of all the related peaks in the chromatogram of the Test solution, including that of the main stavudine peak and disregarding any peak observed in the blank: not more than $0.1 \%$ of any impurity is found; and not more than $1.0 \%$ of total impurities is found, including thymine. The quantitation limit is $0.03 \%$ of the total sample related peak areas.

## Assay-

NOTE-All testing solutions must be prepared immediately prior to use and remain refrigerated until use.
0.01 M Ammonium acetate-Dissolve 0.77 g of ammonium acetate in about 900 mL of water in a $1000-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of 0.01 M Ammonium acetate and acetonitrile (95:5).

Standard preparation-Transfer about 10 mg of USP Stavudine RS, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, and dissolve in and dilute with water to volume. Pipet 10.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Assay preparation-Transfer about 10 mg of the Stavudine to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Pipet 10.0 mL of this solution into a $50-\mathrm{mL}$ volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 3.3-\mathrm{cm}$ column that contains $3-\mu \mathrm{m}$ packing L1. The flow rate is about 0.7 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the retention time of the stavudine peak is between 2.8 and 5.0 minutes; the column efficiency is not less than 800 theoretical plates; the tailing factor is less than or equal to 1.6 ; and the relative standard deviation for replicate injections is not more than 2.0\%.

Procedure-Separately inject equal volumes (about 25 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ in the portion of Stavudine taken by the formula:

$$
500 C\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Stavudine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Stavudine Capsules-See briefing under Stavudine.
(PA7b: B. Davani; BPC: M. Marques) RTS-40185-2

## Add the following:

## ■Stavudine Capsules

»Stavudine Capsules contain not less than 90.0 percent and not more than 105.0 percent of the labeled amount of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$.

Packaging and storage-Store in tightly closed containers at controlled room temperature.

USP Reference standards $\langle 11\rangle$ —USP Stavudine $R S$.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Test solution-Using sonication, dissolve a portion of Capsule contents in enough water to obtain a solution having a concentration of 0.2 mg of stavudine per mL , filter, and mix. Use the filtrate as the Test solution.

Application volume: $\quad 10 \mu \mathrm{~L}$, applied in two $5-\mu \mathrm{L}$ portions.

Developing solvent system: a mixture of chloroform, alcohol, and water (100:50:2).

Procedure-Proceed as directed in the chapter. Allow the spots to dry, and develop the chromatogram in the Developing solvent system until the solvent front has moved about

10 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air dry for 5 to 10 minutes.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Specific rotation $\langle 781 \mathrm{~S}\rangle$ : between $-40^{\circ}$ and $-45^{\circ}$, determined in a solution in water containing 10 mg of stavudine per mL . Disperse a sufficient quantity of Capsule content, equivalent to 200 mg of stavudine, in 50 mL of acetone. Bring to a boil, and pass through a fine-porosity filter. Precipitate the stavudine with 150 mL of heptane, filter the crystals, wash with heptane, and dry in air.

## Dissolution $\langle 711\rangle$ -

Medium: water; 900 mL .
Apparatus 2: 75 rpm .
Time: 30 minutes.
Determine the amount of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ dissolved by employing the following method.
0.01 M Ammonium acetate and Mobile phase-Prepare as directed in the Assay.

Standard solution-Dissolve an accurately weighed quantity of USP Stavudine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration corresponding to that of the solution under test.

Chromatographic system (see Chromatography $\langle 621\rangle$ )Proceed as directed in the Assay except that the liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency is not less than 800 theoretical plates; the tailing factor is not more than 2 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Determine the amount of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ dissolved, employing the procedure set forth in the Assay, making any necessary modifications. The injection volume is about $10 \mu \mathrm{~L}$.

Tolerances-Not less than $80 \%(Q)$ of the labeled amount of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

Water, Method $I\langle 921\rangle$ : not more than $3.5 \%$.

## Related compounds-

0.01 M Ammonium acetate and Mobile phase-Prepare as directed in the Assay.

Resolution solution-Proceed as directed in the Assay.
Standard solution-Using sonication, dissolve an accurately weighed quantity of thymine in water, and dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a known concentration of about $1 \mu \mathrm{~g}$ per mL.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Chromatographic system-Proceed as directed in the Assay. The relative standard deviation for replicate injections of the Standard solution is not more than $3.0 \%$.

Procedure-Proceed as directed in the Assay, recording the chromatograms for a period of time that is 2.5 times the retention time of stavudine, and measure the responses of all the peaks. Calculate the quantity of thymine in each Capsule taken by the formula:

$$
(C V D / N)\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of the Standard solution; $V$ is the volume, in mL , used to prepare the Test solution; $D$ is the dilution factor of the Test solution; $N$ is the number of Capsules taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Test
solution and the Standard solution, respectively. Not more than $1.0 \%$ of thymine is found. Calculate the percentage of unknown impurities, not including thymine, in the portion of Capsules taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity; and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.2 \%$ of any individual impurity is found; and not more than $2.0 \%$ of total impurities, including thymine, is found. The quantitation limit is $0.05 \%$ of the total sample related peak response.

## Assay-

NOTE-All solutions must be prepared immediately prior to use and remain refrigerated until use.
0.01 M Ammonium acetate-Dissolve 0.77 g of ammonium acetate in about 900 mL of water in a $1000-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of 0.01 M Ammonium acetate and acetonitrile (95:5).

Resolution solution-Dissolve accurately weighed quantities of thymine and thymidine in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of $0.1 \mu \mathrm{~g}$ per mL of each component.

Standard preparation-Transfer about 50 mg of USP Stavudine RS, accurately weighed, to a $500-\mathrm{mL}$ volumetric flask, and dissolve in about 200 mL of water, sonicate, dilute with water to volume, and mix.
Assay preparation-Open not fewer than 3 Capsules, and dissolve the contents quantitatively in water. Dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a concentration of about 0.1 mg of stavudine per mL.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a 268 -nm detector and a $4.6-\mathrm{mm} \times 3.3-\mathrm{cm}$ column that contains packing L1. The flow rate is about 0.7 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between thymine and thymidine is not less than 2.0 , and thymine is resolved from the void volume. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the retention time for the stavudine peak must be between 2.8 and 5.0 minutes; the column efficiency is not less than 800 theoretical plates; the tailing factor is not more than 1.8 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of stavudine $\left(\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}\right)$ in each Capsule taken by the formula:

$$
C(V / N)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Stavudine RS in the Standard preparation; $V$ is the volume, in mL , used to prepare the Assay preparation; $N$ is the number of Capsules taken to prepare the Assay preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■IS (USP28)

## Briefing

Stavudine for Oral Solution-See briefing under Stavudine. (PA7b: B. Davani) RTS-40187-1

## Add the following:

## Stavudine for Oral Solution

» Stavudine for Oral Solution, when reconstituted as directed in the labeling, yields a 1 mg per mL solution that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of stavudine $\left(\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}\right)$. It may contain suitable flavors, preservatives, sweeteners, and stabilizers.

Packaging and storage-Preserve in tightly closed containers, protected from excessive moisture. Store at controlled room temperature. After constitution, store the Oral Solution in tightly closed containers under refrigeration. Discard unused portion after 30 days.

Labeling-The label contains directions for constitution of the powder and states the equivalent amount of $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ in a given volume of the Oral Solution obtained after constitution.

USP Reference standards $\langle 11\rangle-U S P$ Stavudine RS.
Identification-The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Deliverable volume $\langle 698\rangle$ : meets the requirements.
$\mathbf{p H}\langle 791\rangle$ : between 5 and 7 when constituted as directed in the labeling.

Water, Method $I\langle 921\rangle$ : not more than $2.0 \%$

## Related compounds-

NOTE—All testing solutions must be prepared immediately prior to use and remain refrigerated until use.
Solution A, Solution B, Resolution solution, and Chromatographic system-Proceed as directed in the Assay.
Standard solution-Prepare as directed for Standard preparation in the Assay.

Test solution-Prepare as directed for Assay preparation in the Assay.

Procedure-Noting the retention times of the impurities relative to that of stavudine, calculate the percentage of all other impurities in the portion of Stavudine for Oral Solution taken by the formula:

$$
100\left(F r_{i} / r_{s}\right),
$$

in which $F$ is the relative response factor and is equal to 0.69 for thymine (relative retention time of about 0.24 ) and equal to 1.0 for all other peaks; $r_{i}$ is the peak area response of each impurity obtained from the Test solution; and $r_{s}$ is the sum of the area responses of all the sample-related peaks in the chromatogram including that of the main stavudine peak: not more than $1.0 \%$ of thymine is found, not more than $0.2 \%$ of any other individual impurity is found, and not more than $1.5 \%$ of total impurities is found.

Assay-
NOTE-All testing solutions must be prepared immediately prior to use and remain refrigerated until use.

25 mM Ammonium acetate—Dissolve 1.93 g of ammonium acetate in about 900 mL of water in a $1000-\mathrm{mL}$ volumetric flask. Dilute with water to volume, and mix.

Solution A-Prepare a filtered and degassed mixture of 25 mM Ammonium acetate and methanol (94: 6).

Solution B-Prepare a filtered and degassed mixture of 25 $m M$ Ammonium acetate and methanol (1:1).

Resolution solution-Prepare a solution in water of thymidine and thymine containing $2.5 \mu \mathrm{~g}$ of each per mL .

Standard preparation-Prepare a solution of USP Stavudine RS in water having a concentration of 0.1 mg per mL . Assay preparation-Transfer to a suitable volumetric flask an accurately measured volume of Oral Solution, constituted as directed in the labeling, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of 0.1 mg of stavudine per mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $268-\mathrm{nm}$ detector and a $4.6-\mathrm{mm} \times 3.3-\mathrm{cm}$ column that contains packing L1 and a $4-\mathrm{mm} \times 20-\mathrm{mm}$ guard column (L1). The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time <br> (minutes) | Solution A <br> $(\%)$ | Solution B <br> $(\%)$ | Elution |
| :---: | :---: | :---: | :--- |
| 0 | 100 | 0 | equilibration |
| $0-12$ | 100 | 0 | isocratic |
| 12.1 | $100 \rightarrow 0$ | $0 \rightarrow 100$ | step gradient |
| $12.1-17$ | 0 | 100 | isocratic |
| 17.1 | $0 \rightarrow 100$ | $100 \rightarrow 0$ | step gradient |
| $17.1-35$ | 100 | 0 | re-equilibration |

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between thymine and thymidine is not less than 8.4. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates; the tailing factor for the stavudine peak is not more than 2 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of stavudine $\left(\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}\right)$ in each mL of Oral Solution taken by the formula:

$$
(L / D)(C)\left(r_{U} / r_{s}\right)
$$

in which $L$ is the labeled quantity, in mg , of stavudine $\left(\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}\right)$ in each mL of the Oral Solution; $D$ is the concentration, in mg, of stavudine per mL of the Assay preparation, based on the labeled quantity of stavudine in the portion of Oral Solution taken; $C$ is the concentration, in mg per mL , of USP Stavudine RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak area responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Tiamulin Fumarate, USP 27 page 1842 and page 190 of $P F$ 30(1) [Jan.-Feb. 2004]. To improve reproducibility, it is proposed to revise Identification test $A$ to provide additional instructions for preparing the test material for analysis of the IR absorption spectrum.
(VET: I. DeVeau) RTS-41025-1

## Change to read:

USP Reference standards $\langle 11\rangle$ —USP Tiamulin Fumarate $R S$. USP Tosyl Pleurmutilin RS.

## Change to read:

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$ -

- [NOTE-Intimately mix Tiamulin Fumarate with potassium
bromide, but do not grind.] $]_{1 S}$ (USP28)
B: The retention time of the tiamulin fumarate peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Change to read:

## Chromatographic purity-

Dilute perchloric acid solution, Buffer solution, Mobile phase, System suitability solution, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation prepared as directed in the Assay.

Test solution-Use the Assay preparation prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, identify the tiamulin fumarate peak, and measure all of the peak responses. [NOTE-Possible tiamulin fumarate impurities include, but are not limited to, pleuromutilin, mutilin, 14-acetyl mutilin, 11-monoacetyl mutilin, plememe tilin,
©tiamulin related compound $\mathrm{A}, \mathbf{1}$ USP28
11,14-diacetyl mutilin, 8-dimethylderivative, bisdimethylderivative, and 11-ketoderivative, their retention times, relative to tiamulin fumarate, being about $0.25,0.3,0.5,0.6,0.8,1.1,1.3,1.4$, and 2.3 , respectively.] Calculate the area percentage of each impurity, relative to tiamulin fumarate, in the portion of Tiamulin Fumarate taken by the formula:

$$
100\left(r_{i} / r_{U}\right)
$$

in which $r_{i}$ and $r_{U}$ are the peak responses of each impurity and tiamulin fumarate, respectively: not more than $1.0 \%$ of any identified impurity is found; not more than $0.5 \%$ of any unidentified impurity is found; and not more than $2.0 \%$ of total impurities is found.

## Change to read:

Assay-
Dilute perchloric acid solution-Prepare a solution containing $6 \%$ of perchloric acid.

Buffer solution-Transfer 10 g of ammonium carbonate to a $1000-\mathrm{mL}$ volumetric flask, and dissolve in about 800 mL of water. Add 24 mL of Dilute perchloric acid solution, dilute with water to volume, mix, and filter.

Mobile phase-Prepare a mixture of methanol, Buffer solution, and acetonitrile ( $49: 28: 23$ ), filter, and degas.

System suitability solution-Dissolve accurately weighed quantities of USP Tiamulin Fumarate RS and USP Tesyl Pleuremutilin RS
${ }^{\boldsymbol{\Delta}}$ USP Tiamulin Related Compound A RS $\mathbf{\Delta U S P 2 8}$
in Mobile phase to obtain a solution having known concentrations of about 0.08 mg of each per mL .
Standard preparation-Dissolve an accurately weighed quantity of USP Tiamulin Fumarate RS in Mobile phase to obtain a solution having a known concentration of about 4 mg per mL .
Assay preparation-Transfer about 200 mg , accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $212-\mathrm{nm}$ detector and a 4.6 $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at $30 \pm 3^{\circ}$. Chromatograph the Standard preparation and the System suitability solution, and record the peak responses as directed for Procedure: plemmetilim
$\Delta_{\text {the tiamulin related compound }} \mathrm{A}_{\mathbf{\Delta U S P 2 8}}$ peak elutes prior to the tiamulin fumarate peak; the resolution, $R$, between plewremetilin
$\Delta_{\text {tiamulin related compound }} \mathrm{A}_{\mathbf{\Delta} U S P 28}$
and tiamulin fumarate is not less than 2.0; the capacity factor, $k^{\prime}$, determined from the tiamulin fumarate peak, is not less than 2.0 ; the column efficiency is not less than 14,000 ; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\mathrm{C}_{28} \mathrm{H}_{4} \mathrm{NO}_{4} \mathrm{~S} \cdot \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ in the portion of Tiamulin Fumarate taken by the formula:

$$
50 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Tiamulin Fumarate RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the tiamulin fumarate peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Briefing

Tolcapone, page 836 of PF 29(3) [May-June 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision with no changes.
(PA3: S. Salado) RTS-39849-1

## Add the following:

## ■Tolcapone

$\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5} \quad 273.24$
Methanone, (3,4-dihydroxy-5-nitrophenyl)(4-methyl-
phenyl).

3,4-Dihydroxy-4'-methyl-5-nitrobenzophenone
[134308-13-7].
» Tolcapone contains not less than 98.5 percent and not more than 101.5 percent of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$, calculated on dried and solvent-free basis.

Packaging and storage—Preserve in tight, light-resistant containers between $20^{\circ}$ and $25^{\circ}$.

USP Reference standards $\langle 11\rangle —$ USP Tolcapone RS. USP Tolcapone Related Compound A RS. USP Tolcapone Related Compound B RS.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Absorptivity-

Test Preparation-Prepare a solution of Tolcapone having a concentration of 0.01 mg per mL in 0.1 N alcoholic hydrochloric acid.

Procedure-Proceed as directed under Spectrophotometry and Light-Scattering $\langle 851\rangle$, and measure the absorbance: the maximum is between 265.2 and 269.3 , and the absorptivity is between 752.9 and 799.3.

Water, Method $I\langle 921\rangle$ : not more than $0.1 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.

## Limit of residual solvents-

Alcohol stock solution-Transfer $6.3 \mu \mathrm{~L}$ of absolute alcohol, using a microsyringe, to a $50-\mathrm{mL}$ volumetric flask containing dimethylformamide, and mix.

Methylene chloride stock solution-Transfer $3.8 \mu \mathrm{~L}$ of methylene chloride, using a microsyringe, to a $50-\mathrm{mL}$ volumetric flask containing dimethylformamide, and mix.
Standard solution-Transfer 10.0 mL of Alcohol stock solution and 1.0 mL of Methylene chloride stock solution to a $50-\mathrm{mL}$ volumetric flask. Dilute with dimethylformamide to volume, and mix.

Test solution-Transfer about 200 mg of Tolcapone, accurately weighed, to a $10-\mathrm{mL}$ volumetric flask, add 7 mL of dimethylformamide, and sonicate to dissolve. Dilute with dimethylformamide to volume, and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused silica column coated with $3.0-\mu \mathrm{m}$ G43 stationary phase, and a $0.53-\mathrm{mm} \times 5-\mathrm{m}$ fused silica column coated with $3.0-\mu \mathrm{m}$ G3 stationary phase. The carrier gas is helium, flowing at a rate of 5 mL per minute. The column is maintained at $35^{\circ}$. The temperatures of the injection port and the detector are maintained at $120^{\circ}$ and $260^{\circ}$, respectively. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention time is about 0.7 for alcohol and 1.0 for methylene chloride; and the relative standard deviation for replicate injections is not more than $10.0 \%$.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentages (w/w) of alcohol and methylene chloride in the portion of Tolcapone taken by the formula:

$$
(1000 D)(C / W)\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{L}$ per mL , of each solvent in the Standard solution; $D$ is the density, in mg per $\mu \mathrm{L}$, of each solvent at $20^{\circ} ; W$ is the weight, in mg , of Tolcapone taken to prepare the Test solution; and $r_{U}$ and $r_{s}$ are the peak areas of the appropriate analyte obtained from the Test solution and the Standard solution, respectively: not more than $0.25 \%$ of alcohol is found; and not more than $0.01 \%$ of methylene chloride is found. [NOTE-Condition the column at $220^{\circ}$ for 15 minutes after each injection.]

## Related compounds-

TEST 1-
Adsorbent- $0.25-\mathrm{mm}$ layer of chromatographic $5-\mu \mathrm{m}$ silica gel mixture with a suitable fluorescing substance (see Chromatography $\langle 621\rangle$ ).

Standard solution 1-Dissolve an accurately weighed portion of USP Tolcapone RS in chloroform, and dilute quantitatively, and stepwise if necessary, with chloroform to obtain a solution having a known concentration of 0.4 mg per mL .

Standard solution 2-Transfer 2.0 mL of Standard solution 1 to a $10-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Standard solution 3-Transfer 1.0 mL of Standard solution 1 to a $10-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Standard solution 4-Transfer 5.0 mL of Standard solution 3 to a $100-\mathrm{mL}$ volumetric flask, dilute with chloroform to volume, and mix.

Test solution-Transfer about 200 mg of Tolcapone, accurately weighed, to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with chloroform to volume, and mix. [NOTE-Prepare this solution last and chromatograph immediately.]

Application volume: $\quad 10 \mu \mathrm{~L}$.
Developing solvent system: a mixture of chloroform, formic acid, and ethyl acetate ( $83: 15: 2$ ).

Procedure-Apply the Test solution and each of the Standard solutions as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Dry the plate in a current of cold air, and view it under short wavelength UV. The $R_{F}$ values of analytes are as follows:

| Compound | $R_{F}$ |
| :--- | :---: |
| Tolcapone related compound A | about 0.2 |
| Tolcapone | about 0.5 |
| Tolcapone related compound B | about 0.7 |

Compare any spot at $R_{F}$ of 0.0 in the chromatogram obtained from the Test solution with the main spot of the Standard solution 2, Standard solution 3, and Standard solution 4, and obtain the approximate amount: not more than $0.1 \%$ of any impurity at $R_{F}$ of 0.0 is found. [NOTE-The $R_{F}$ of tolcapone related compound A and tolcapone related compound B are given just for reference. They are quantified in Test 2.]

TEST 2-
Diluent, System suitability solution, Mobile phase, and Chromatographic system-Proceed as directed in the Assay.
Standard solution-Use the Standard preparation, prepared as directed in the Assay.
Test solution-Use the Assay preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Tolcapone taken by the formula:

$$
(50,000 F)(C / W)\left(r_{i} / r_{s}\right),
$$

in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard solution; $F$ is the relative response factor of the impurity according to the table below; $W$ is the weight, in mg , of Tolcapone, calculated on the sol-vent- and water-free basis, used to prepare the Test solution; $r_{i}$ is the peak area for any impurity in the Test solution; and $r_{s}$ is the peak area for tolcapone in the Standard solution: the impurities meet the requirements given in the table below.

|  | Relative <br> Retention <br> Time | Relative <br> Response <br> Factor | Limit (\%) |
| :--- | :---: | :---: | :---: |
| Compound Name | about 0.6 | 1.14 | 0.1 |

| Tolcapone | 1.36 | 0.98 | 0.2 |
| Tolcapone related <br> compound B |  |  |  |
| Unknown impuri- <br> ties | - | 1.0 | 0.1 indivi- |
| dual, 0.2 |  |  |  |
| Total impurities | - | - | known <br> 0.5 |

## Assay-

Diluent-Prepare a mixture of methanol and acetonitrile (24:15).

System suitability solution-Dissolve an accurately weighed quantity of USP Tolcapone Related Compound A RS, USP Tolcapone RS, and USP Tolcapone Related Compound B RS in Diluent; and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about $5 \mu \mathrm{~g}$ per $\mathrm{mL}, 5 \mu \mathrm{~g}$ per mL , and $10 \mu \mathrm{~g}$ per mL , respectively. Transfer 2.0 mL of this solution to a $100-\mathrm{mL}$ volumetric flask, add about 63 mL of Diluent, dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of methanol, 0.05 M monobasic potassium phosphate having a pH of $2.0 \pm 0.1$, and acetonitrile ( $8: 7: 5$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Tolcapone RS in Diluent; and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 1.0 mg per mL . Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, add about 27.5 mL of Diluent, dilute with water to volume, and mix.

Assay preparation-Transfer about 50 mg of Tolcapone, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with Diluent to volume, and mix. Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, add about 27.5 mL of Diluent, dilute with water to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.6 for tolcapone related compound A, 1.0 for tolcapone, and about 1.4 for tolcapone related compound B ; and the resolution, $R$, between tolcapone related com-
pound $B$ and tolcapone is not less than 4.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $1.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major tolcapone peaks. Calculate the quantity, in mg, of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$ in the portion of Tolcapone taken by the formula:

$$
500 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## Briefing

Tolcapone Tablets, page 839 of PF 29(3) [May-June 2003]. This new monograph, which previously appeared in Pharmacopeial Previews, is now forwarded to In-Process Revision with no changes.
(PA3: S. Salado) RTS—39849-2

## Add the following:

## ■Tolcapone Tablets

» Tolcapone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tolcapone $\left(\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}\right)$.

Packaging and storage-Preserve in tight containers between $20^{\circ}$ and $25^{\circ}$.

USP Reference standards $\langle 11\rangle$ —USP Tolcapone RS. USP Tolcapone Related Compound A RS. USP Tolcapone Related Compound B RS.

## Identification-

A: Infrared Absorption-Grind 10 Tablets to a fine powder. Transfer an amount of powder, equivalent to 3 mg of tolcapone, into a polystyrene vial containing two mixing beads. Add 300 mg of infrared grade potassium bromide, and disperse the material in the matrix by agitating the capped vial in a grinding mill for 2 minutes. Transfer a portion of the sample to a sample cup. Record the diffuse reflectance IR spectrum between 2200 and $1090 \mathrm{~cm}^{-1}$ (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ). The spectrum thus obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Tolcapone RS, concomitantly measured.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

## Dissolution $\langle 711\rangle$ -

Medium: pH 6.8 phosphate buffer containing $1 \%$ of sodium lauryl sulfate; 900 mL .

Apparatus 2: 75 rpm .
Time: 30 minutes.
Procedure-Determine the amount of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 271 nm on filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Tolcapone RS in the same Medium. Calculate the amount of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$ dissolved in each Tablet.

Tolerances-Not less than $75 \%(Q)$ of the labeled amount of $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}$ is dissolved in 30 minutes.

Uniformity of dosage units $\langle 905\rangle$ : meet the requirements.

## Chromatographic purity-

Diluent 1, Diluent 2, System suitability solution, Mobile phase, and Chromatographic system-Proceed as directed in the Assay.

Standard solution-Use the Standard preparation, prepared as directed in the Assay.

Test solution-Use the Assay preparation, prepared as directed in the Assay.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major tolcapone peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:
in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard solution; $A$ is the average weight, in mg , of the Tablets; $W$ is the weight, in mg , of tablet powder taken to prepare the Test solution; $D$ is the labeled quantity, in mg , of tolcapone per Tablet; $r_{i}$ is the peak area for any impurity in the Test solution; and $r_{s}$ is the peak area for tolcapone in the Standard solution: not more than $0.1 \%$ of any individual impurity is found, and not more than $0.5 \%$ of total impurities is found.

## Assay-

Diluent 1-Prepare a mixture of methanol and acetonitrile (24:15).
Diluent 2-Prepare a mixture of methanol, water, and acetonitrile $(8: 7: 5)$.

System suitability solution-Dissolve an accurately weighed quantity of USP Tolcapone RS, USP Tolcapone Related Compound A RS, and USP Tolcapone Related Compound B RS in Diluent 2, and dilute quantitatively, and stepwise if necessary, with Diluent 2 to obtain a solution having a known concentration of about $104 \mu \mathrm{~g}$ per $\mathrm{mL}, 10.4$ $\mu \mathrm{g}$ per mL , and $10.4 \mu \mathrm{~g}$ per mL , respectively.

Mobile phase-Prepare a filtered and degassed mixture of methanol, 0.05 M monobasic potassium phosphate having a pH of $2.0 \pm 0.1$, and acetonitrile ( $8: 7: 5$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard preparation-Dissolve an accurately weighed quantity of USP Tolcapone RS in Diluent 1, and dilute quantitatively, and stepwise if necessary, with Diluent 1 to obtain a solution having a known concentration of about 1.0 mg per mL . Transfer 5.0 mL of this solution to a $50-\mathrm{mL}$ volumetric flask, add about 27.5 mL of Diluent 1, dilute with water to volume, and mix.

Assay preparation-Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of tolcapone, to a $100-\mathrm{mL}$ volumetric flask, add 10 mL of water, and sonicate for about 10 minutes. Add 65 mL of Diluent 1, and sonicate for about 15 minutes. Allow the sample to settle. If the material is still undispersed, sonicate for an additional 5 minutes. Dilute with water to volume, and mix. Centrifuge a portion of this solution, and transfer 5.0 mL of the supernatant to a $50-\mathrm{mL}$ volumetric flask. Dilute with Diluent 2 to volume, and mix. Pass a portion of this solution through a $0.45-\mu \mathrm{m}$ filter, and use the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $230-\mathrm{nm}$ detector and a $4.0-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.6 for tolcapone related compound A, 1.0 for tolcapone, and about 1.4 for tolcapone related compound B ; the resolution, $R$, between tolcapone related compound B and tolcapone is not less than 6.0; and the tailing factor is not more than 1.5 for the tolcapone peak. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of tolcapone $\left(\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{NO}_{5}\right)$ in the portion of Tablets taken by the formula:

$$
1000 C\left(r_{U} / r_{s}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Tolcapone RS in the Standard preparation; and $r_{U}$ and $r_{s}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.■1S (USP28)

## BRIEFING

Triamcinolone Acetonide, USP 27 page 1875 and page 1588 of PF 29(5) [Sept.-Oct. 2003]. In order to achieve better peak shape and resolution, it is proposed in the test for Chromatographic purity to change the solvent and specify the quantity and ratio used in the Test solution.
(PA1: C. Anthony) RTS-41027-1

## Change to read:

Packaging and storage-Preserve in well-closed containers.
-Store at $25^{\circ}$, excursions permitted between $15^{\circ}$ and $30^{\circ} \cdot{ }^{-2 S}$ (USP27)

## Add the following:

## Chromatographic purity-

Mobile phase-Prepare a filtered and degassed mixture of water and acetonitrile ( $17: 8$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Test solution-Transfer about 25 mg of Triamcinolone Acetonide, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask; dissolve in enitrile,

- 25 mL of methanol, ${ }_{1 S}$ (USP28)
shake vigorously to aid dissolution; dilute with
- Mobile phase ${ }_{\text {■1S (USP28) }}$
to volume; and mix.
Chromatographic system (see Chromatography $\langle 621\rangle$ )—The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a 3.9$\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Test solution, and record the peak responses as directed for Procedure: the resolution, $R$, between triamcinolone acetonide and any impurity peak is not less than 1.0.

Procedure-Inject about $20 \mu \mathrm{~L}$ of the Test solution into the chromatograph, record the chromatogram for not less than four times the retention time of triamcinolone acetonide, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Triamcinolone Acetonide taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the peak response for each impurity and $r_{S}$ is the sum of the responses of all peaks: not more than $0.3 \%$ of any individual impurity is found, and not more than $0.8 \%$ of total impurities is found.

## Add the following:

${ }^{\Delta}$ Other requirements-Where the label states that Triamcinolone Acetonide is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Triamcinolone Acetonide Injectable Suspension. Where the label states that Triamcinolone Acetonide must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under
Triamcinolone Acetonide Injectable Suspension. $\mathbf{4 S P 2 8}$
name "dimethyl sulfoxide" is being standardized throughout the $U S P-N F$. In addition, minor editorial style changes have been made.
(BPC: M. Marques) $\quad$ RTS-41082-2

## Change to read:

Limit of residual solvents-
Internal standard solution-Prepare a solution of $n$-propyl alcohol in methyl sulfoxide

- dimethyl sulfoxide $_{\mathbf{m}_{1 S} \text { (USP28) }}$
having a concentration of about $0.05 \mu \mathrm{~L}$ per mL .
Standard solution-Prepare a solution in Internal standard solution having a concentration of $2.5 \mu \mathrm{~g}$ of chloroform, $5.0 \mu \mathrm{~g}$ of dehydrated alcohol, $5.0 \mu \mathrm{~g}$ of acetone, $5.0 \mu \mathrm{~g}$ of butyl alcohol, $5.0 \mu \mathrm{~g}$ of dioxane, $10.0 \mu \mathrm{~g}$ of methylene chloride, $15.0 \mu \mathrm{~g}$ of diisopropyl ether, $20.5 \mu \mathrm{~g}$ of acetonitrile, $50 \mu \mathrm{~g}$ of pentane, and $100 \mu \mathrm{~g}$ of methanol in each mL, and sonicate.

Test solution-Dissolve about 200 mg of Valrubicin, accurately weighed, in 4.0 mL of Internal standard solution, and sonicate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The gas chromatograph is equipped with a flame-ionization detector and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$ fused-silica capillary column coated with a $5-\mu \mathrm{m}$ film of G2 stationary phase. The carrier gas is helium, flowing at a rate of 30 mL per minute. The column temperature is maintained at $220^{\circ}$. The injection port temperature and the detector block temperature are maintained at $250^{\circ}$. Chromatograph the Standard solution, and record the responses as directed for Procedure: the relative retention times are about 0.48 for methanol, 0.66 for dehydrated alcohol, 0.71 for acetonitrile, 0.76 for acetone, 0.86 for pentane, 0.92 for methylene chloride, 1.0 for $n$-propyl alcohol, 1.19 for diisopropyl ether, 1.22 for chloroform, 1.35 for butyl alcohol, and 1.52 for dioxane; the component solvent peaks are resolved; and the relative standard deviation of the ratios of the peak area of each solvent to the peak area of $n$-propyl alcohol is not more than $10 \%$.
Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the concentration, in $\mu \mathrm{g}$ per g , of each residual solvent in the portion of Valrubicin taken by the formula:

$$
4000(C / W)\left(R_{i} / R_{S}\right)
$$

in which $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of the respective individual solvent in the Standard solution; $W$ is the quantity, in mg , of Valrubicin taken to prepare the Test solution; and $R_{i}$ and $R_{S}$ are the peak area ratios of the respective individual solvent to $n$-propyl alcohol obtained from the Test solution and the Standard solution, respectively: not more than $50 \mu \mathrm{~g}$ per g of chloroform, $100 \mu \mathrm{~g}$ per g of dehydrated alcohol, $100 \mu \mathrm{~g}$ per g of acetone, $100 \mu \mathrm{~g}$ per g of butyl alcohol, $100 \mu \mathrm{~g}$ per g of dioxane, $300 \mu \mathrm{~g}$ per $g$ of methylene chloride, $410 \mu \mathrm{~g}$ per g of acetonitrile, $500 \mu \mathrm{~g}$ per $g$ of diisopropyl ether, $1000 \mu \mathrm{~g}$ per g of pentane, and $2000 \mu \mathrm{~g}$ per $g$ of methanol are found.

Valrubicin, USP 27 page 1928. In the test for Limit of residual solvents, it is proposed to replace the name of the reagent methyl sulfoxide with its synonym dimethyl sulfoxide. The use of the

## BRIEFING

Verteporfin, USP 27 page 1938. It is proposed to add a Sensitivity check solution in the Related compounds test to ensure detectability at the limit of quantitation. It is also proposed to replace the test for Limit of methylene chloride with a test for Organic volatile impurities to control additional solvents present in the approved drug product application.
(PA6: L. Evans) RTS-40002-2

## Change to read:

## Related compounds-

Solution A, Solution B, and Mobile phase—Proceed as directed in the Assay.
-Standard solution-Prepare as directed for the Standard preparation in the Assay.

Sensitivity check solution-Dilute the Standard solution with water to obtain a solution having a concentration of $0.25 \mu \mathrm{~g}$ per mL . 1 is (USP28)

Test solution-Prepare as directed for Assay preparation in the Assay.

Chromatographic system-
-Chromatograph the Sensitivity check solution at 410 nm , and record the peak heights: the ratio of the verteporfin peak height to the noise height is not less than 10 , the noise height
being determined by a suitable procedure. 1 (USP28)
Proceed as directed in the Assay. To evaluate the system suitability requirements, use the Standard preparation prepared as directed in the Assay.

Procedure—Inject a volume (about $20 \mu \mathrm{~L}$ ) of the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound in the portion of Verteporfin taken by the formula:

$$
100\left(r_{i} / r_{s}\right)
$$

in which $r_{i}$ is the individual peak response of each related compound; and $r_{s}$ is the sum of the responses of all the peaks. Not more than $0.6 \%$ of the peak having a retention time of about 0.56 relative to that of the first verteporfin isomer peak is found; not more than $0.8 \%$ of any other individual related compound is found; and the sum of all impurities is not more than $4.0 \%$.

Test solution: 10 mg of Verteporfin per mL in dimethylformamide.

Limit: not more than 5000 - s , per of of Verteporfin ( $0.5 \%$ )

## Add the following:

## BRIEFING

Sterile Purified Water, USP 27 page 1950 and page 3089 of the First Supplement. It it proposed to revise the test for Ammonia to make a correction in the calculation for the added ammonia. The calculation, which was previously added to make the procedure more definitive, lacks a dilution step that would bring the control to the $30 \mu \mathrm{~g}$ of added ammonia in 100 mL . This proposed revision would correct the oversight and make the procedure more practical for the user.
(PW: F. Barletta) RTS-41116-1

## Change to read:

Ammonia-For containers having a fill volume of less than 50 mL , dilute 50 mL of it with 50 mL of High-Purity Water (see Reagents under Containers $\langle 661\rangle$ ), and use this dilution as the test solution; where the fill volume is 50 mL or more, use 100 mL of it as the test solution. To 100 mL of the test solution add 2 mL of alkaline mercuric-potassium iodide TS: any yellow color produced immediately is not darker than that of a control containing $30 \mu \mathrm{~g}$ of added ammonia $\quad$ (fumished by adding 1.76 mL of 1.0 N amme

-(furnished by adding 1 mL of the final solution prepared by diluting 3.0 mL of ammonia TS with High-Purity Water to $100 \mathrm{~mL} ; 1.0 \mathrm{~mL}$ of this solution is further diluted to 100 $\mathrm{mL})_{1 \mathrm{IS}(U S P 28)}$
in 100 mL of High-Purity Water. This corresponds to a limit of 0.6 mg per L for containers having a fill volume of less than 50 mL and 0.3 mg per L where the fill volume is 50 mL or more.

## Delete the following:

ELimit of methylene chloride-Use the procedure for Method 1 under $O$ geanic Volatile Impurities $(467$ ), with the following exeeptions.

Standedrdsolution: $50 \mu \mathrm{~g}$ of methylene chloride per mL in dimethylformamide.

## BRIEFING

#### Abstract

Zileuton, USP 27 page 1965 and page 2006 of $P F 29(6)$ [Nov.Dec. 2003]. Based on comments received, the monograph is being revised. Procedures and acceptance criteria for Specific surface area, Arsenic, Limit of boron, Limit of Pyridine, and Organic volatile impurities are added, and the acceptance criteria in Test 1 in the test for Chromatographic purity are revised in compliance with FDA-approved submissions.

(PA1: K. Russo) RTS-40214-1; 40564-1

## Add the following:

■Specific surface area, Method $I\langle 846\rangle$ : Outgas a portion of the test sample, about 100 mg , at $90^{\circ}$ for 1 hour at ambient pressure using 0.001 mole fraction of krypton in helium as the adsorbate gas: between 0.9 and 3.1. $\mathrm{m}^{2}$ per g .■1S (USP28)

## Add the following:

■Arsenic, Method II $\langle 211\rangle$ : $\quad 2 \mu \mathrm{~g}$ per g.■1S (USP28)

## Add the following:

## -Limit of boron-

Sulfuric acid solution-Carefully add 50 mL of sulfuric acid to 450 mL of water, and mix.

Standard solution-Prepare a solution in Sulfuric acid solution having a concentration of about $2.0 \mu \mathrm{~g}$ of boron per mL . Use of a commercially prepared boron ICP standard solution is recommended.

Test solution-Accurately weigh approximately 1.0 g of Zileuton into a $125-\mathrm{mL}$ conical flask. Add 1 to 1.5 mL of sulfuric acid, and digest in a fume hood on a hot plate until charring begins. Add 2 mL of nitric acid to the cooled sample to aid digestion, and heat until brown fumes are not evolved. Cautiously add 30 percent hydrogen peroxide, dropwise, allowing the reaction to subside, and heating between drops. Add the first few drops very slowly with sufficient mixing in order to prevent a rapid reaction. Discontinue heating if foaming becomes excessive. When
the reaction has abated, heat cautiously, rotating the flask occasionally to prevent the sample from caking on glass exposed to the heating unit. Maintain oxidizing conditions at all times during the digestion by adding small quantities of the 30 percent hydrogen peroxide, whenever the mixture turns brown or darkens. Approximately 1 to 2 mL of nitric acid can be added, if necessary, which will create a refluxing effect to wash down any particles adhering to the neck of the flask. Continue the digestion until the organic matter is destroyed, gradually raising the temperature of the hot plate until fumes of sulfur trioxide are copiously evolved and the solution becomes colorless or retains only a light straw color. Transfer the solution to a $25-\mathrm{mL}$ volumetric flask using about 7 mL of water. Repeat the washing twice more, and combine the washings in the volumetric flask. Dilute with water to volume, and mix.

Procedure-The inductively coupled plasma-atomic emission spectrometer is set up with wavelength of 249.7 nm , RF power of 1.25 KW , argon torch flow of about 13 L per minute, argon nebulizer flow of about 1 L per minute, and argon auxillary flow of about 0.5 L per minute. Analyze the Standard solution and the Test solution, using Sulfuric acid solution as the blank. Calculate the quantity, in $\mu \mathrm{g}$ of boron per g , in the portion of Zileuton taken by the formula:

## $25 C / W$,

where $C$ is the concentration, in $\mu \mathrm{g}$ per mL , of boron in the Test solution determined from the instrument; and $W$ is the weight, in g , of the zileuton: not more than $10 \mu \mathrm{~g}$ per g is found.1S (USP28)

## Add the following:

## - Limit of pyridine-

Standard solution-Dissolve an accurately weighed quantity of pyridine, approximately 250 mg , in dimethyl sulfoxide, and dilute to 50 mL . Transfer $5 \mu \mathrm{~L}$ to a $100-$ mL sealed headspace vial.

Test Solution, Chromatography System, and ProcedureProceed as directed under Organic Volatile Impurities, Method IV, 〈467〉. Separately inject the Standard solution and the Test Solution into the gas chromatograph, and record the peak responses. Calculate the quantity, in ppm, of pyridine in the portion of Zileuton taken by the formula:

$$
100\left(r_{U} / r_{s}\right)\left(W_{S} / W_{U}\right)
$$

where $r_{U}$ and $r_{S}$ are the peak responses for pyridine in the Test solution and the Standard solution, respectively; $W_{S}$ is the weight, in mg, of pyridine used to prepare the Standard solution; and $W_{U}$ is the weights, in mg , of zileuton: not more than 100 ppm is found. ${ }^{1 S}$ (USP28)

## Change to read:

## Chromatographic purity-

## Assay

$\square_{\text {NOTE-The }}$ Standard preparation and the Assay preparation are to be refrigerated at or below $5^{\circ}$ immediately after preparation and during analysis using a refrigerated autosampler. The solutions are stable at or below $5^{\circ}$ for about 36 hours. $\quad$ 2S (USP 27

Buffer solution-Dissolve 7.7 g of ammonium acetate and 0.25 g of acetohydroxamic acid in about 900 mL of water in a $1000-\mathrm{mL}$ volumetric flask, adjust with perchloric acid to a pH of 2.0 , dilute with water to volume, and mix.

Mobile phase-Prepare a filtered and degassed mixture of Buffer solution and acetonitrile ( $72: 28$ ). Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Internal standard preparation-Transfer about 30 mg of methylparaben, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Standard stock preparation-Dissolve an accurately weighed quantity of USP Zileuton RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL .

Standard preparation-Transfer 5.0 mL of the Standard stock preparation and 4.0 mL of the Internal standard preparation to a $50-\mathrm{mL}$ volumetric flask, dilute with acetonitrile to volume, and mix.

Assay preparation-Transfer about 100 mg of Zileuton, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution and 4.0 mL of the Internal standard preparation to a $50-$ mL volumetric flask, dilute with acetonitrile to volume, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $260-\mathrm{nm}$ detector and a 4.6$\mathrm{mm} \times 30-\mathrm{cm}$ column that contains $10-\mu \mathrm{m}$ packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the resolution, $R$, between zileuton and methylparaben is not less than 5.0; the tailing factor is not more than 1.3 ; and the relative standard deviation for replicate injections is not more than $0.6 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the quantity, in mg, of $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ in the portion of Zi leuton taken by the formula:

$$
1000 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration, in mg per mL , of USP Zileuton RS in the Standard preparation; and $R_{U}$ and $R_{S}$ are the peak area ratios obtained from the Assay preparation and the Standard preparation, respectively.

## DIETARY SUPPLEMENTSMONOGRAPHS

## BRIEFING

Choline Bitartrate, USP 27 page 1979. On the basis of comments received, it is proposed to revise the Mobile phase and the derivatization procedure in the test for Chromatographic purity to improve separation.
(DSN: L. Evans) RTS-41054-1

## Change to read:

## Chromatographic purity-

Buffer solution, Mobile phase, Standard solution, and Chromatographic system-Proceed as directed for Chromatographic purity under Choline Chloride.

Test solution-Transfer about 500 mg of Choline Bitartrate, accurately weighed, to a centrifuge tube; add 2.0 mL of water; and swirl to dissolve. Add 0.5 mL of potassium chloride solution ( 7.5 in 25), centrifuge, and transfer 1.0 mL of the supernatant to a 24 mL screw-capped vial. Dry at $120^{\circ}$ for 2 hours. Add 400 mg of 3,5dinitrobenzoyl chloride and 10 mL of acetonitrile, and mix. Cap the vial, and heat at $55^{\circ}$ for + hemr.

- 2 hours.■1S (USP28)

Cool to room temperature, add 5 mL of water, and allow to stand for 2 minutes.

- 5 minutes. 1 (USP28)

Quantitatively transfer this solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

- Pipet 2.0 mL of the solution to a $25-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.■1S (USP28)

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Choline Bitartrate taken by the formula:

$$
(253.25 / 139.62) 5000(\mathrm{C} / \mathrm{H})\left(++_{5}+5\right)
$$

$$
\mathbf{\square}_{(253.25 / 139.62) 62,500(C / W)\left(r_{i} / r_{S}\right), ■ 1 \mathrm{SS}(U S P 28)}
$$

in which 253.25 and 139.62 are the molecular weights of choline bitartrate and choline chloride, respectively; $C$ is the concentration of USP Choline Chloride RS, in mg per mL, in the Standard solution; $W$ is the weight, in mg , of Choline Bitartrate taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity, other than that of the choline bitartrate derivative and 3,5-dinitrobenzoic acid; and $r_{s}$ is the peak response for the choline chloride derivative in the Standard solution: not more than $0.3 \%$ of any individual impurity is found; and not more than $2.0 \%$ of total impurities is found.

## Briefing

Choline Chloride, USP 27 page 1979. On the basis of comments received, it is proposed to revise the Mobile phase and the derivatization procedure in the test for Chromatographic purity to improve separation.

Quantitatively transfer the solution to a $50-\mathrm{mL}$ volumetric flask, dilute with Mobile phase to volume, and mix.

- Pipet 2.0 mL of the solution to a $25-\mathrm{mL}$ volumetric flask,
dilute with Mobile phase to volume, and mix.■1S (USP28)
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $208-\mathrm{nm}$ detector and a $4.6-$ $\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, is not less than 2 ; and the relative standard deviation determined from the choline chloride derivative peak is not more than $5 \%$.
Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Choline Chloride taken by the formula:

$$
5000(C H)\left(x_{i}+x_{s}\right)
$$

$$
\mathbf{■}^{62500(C / W)\left(r_{i} / r_{S}\right), \boldsymbol{■}_{1 \mathrm{~S}}(U S P 28)}
$$

in which $C$ is the concentration, in mg per mL , of USP Choline Chloride RS in the Standard solution; $W$ is the weight, in mg , of Choline Chloride taken to prepare the Test solution; $r_{i}$ is the peak response for each impurity, other than that for the choline chloride derivative and 3,5-dinitrobenzoic acid obtained from the Test solution; and $r_{s}$ is the peak response for the choline chloride derivative obtained from the Standard solution: not more than $0.3 \%$ of any individual impurity is found; and not more than $2.0 \%$ of total impurities is found.

## Briefing

Cranberry Liquid Preparation, USP 27 page 1986. In the test for Content of organic acids, it is proposed to revise the Chromatographic system and the system suitability requirements to more accurately represent the actual practices in some laboratories. The proposed changes are supported by data obtained with the YMC120A ODS-AQ brand of guard column and an L1 analytical col-
umn. Typical retention times for quinic, malic, citric, and fumaric acids are $4.8,5.8,10.8$, and 13.0 minutes, respectively. Editorial style changes have also been made.
(DSB: G. Giancaspro) RTS-30853-1

## Change to read:

Content of organic acids-
Mobile phase-Transfer about 27.2 g of monobasic potassium phosphate, accurately weighed, to a $1000-\mathrm{mL}$ volumetric flask, and dissolve in 950 mL of water. Adjust with phosphoric acid to a pH of 2.4 , dilute with water to volume, mix, and filter.

Standard preparation-Dissolve accurately weighed quantities of USP Citric Acid RS, USP Malic Acid RS, and USP Quinic Acid RS in water to obtain a solution having known concentrations of about 1.0 mg of each Reference Standard per mL .

Test preparation-Use the filtered Liquid Preparation.
Chromatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a $214-\mathrm{nm}$ detector, a 4.6 mm $\times 15 \mathrm{~mm}$,
-4.6-mm $\times 25-\mathrm{cm}_{\mathbf{1}_{1 S}}$ (USP28)
analytical column containing packing L1, and a guard column containing
$-5-\mu \mathrm{m}_{\text {■1S (USP28) }}$
packing L1. The flow rate is about 0.8 mE
$\mathbf{- n}_{0} .6 \mathrm{~mL}_{1 \mathrm{~S}}{ }_{\text {(USP28) }}$
per minute. Prior to use, condition the column with methanol, with water, and finally with Mobile phase. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.4 for quinic acid, 0.5 for malic acid, and 1.0 for citric acid; the resolution, $R$, between quinic acid and malic acid is not less than 7.0 ;
-2.5; 1 IS (USP28)
and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about $20 \mu \mathrm{~L}$ ) of the Standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentages of quinic acid, malic acid, and citric acid in the Liquid Preparation by the formula:
in which $C$ is the concentration, in mg per mL , of the appropriate Reference Standard in the Standard preparation; and $r_{U}$ and $r_{S}$ are the peak area responses of the appropriate analyte obtained from the Test preparation and the Standard preparation, respectively: not less than $0.9 \%$ each of quinic acid and citric acid is found; not less than $0.7 \%$ of malic acid is found; and the ratio of quinic acid to malic acid is not less than 1.0.

## Briefing

Goldenseal, USP 27 page 2013 and page 2255 of $P F$ 27(2) [Mar.-Apr. 2001]; Powdered Goldenseal, USP 27 page 2014; Powdered Goldenseal Extract, USP 27 page 2014. Adulteration of goldenseal with other plants has been detected. A common adulteration appears with Coptis sp., and it has been reported that an indicator of such adulteration is the presence of significant amounts of the alkaloid palmatine. Therefore, it is proposed to add a limit of palmatine in the USP monographs for Goldenseal. In addition, a simpler procedure for preparation of the Test solution, yielding results similar to those in the official procedure, is proposed in the test for Content of berberine and hydrastine and limit of palmatine.
(DSB: G. Giancaspro) RTS—32818-1; 34299-1

## Change to read:

## » Goldenseal consists of the dried roots and rhizomes

 of Hydrastis canadensis (Linné)-L.■1S (USP28)
(Fam. Ranunculaceae). It contains not less than 2.0 percent of hydrastine $\left(\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{NO}_{6}\right)$ and not less than 2.5 percent of berberine $\left(\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{NO}_{4}\right)$, calculated on the dried basis.

## Add the following:

-Microbial limits $\langle 2021\rangle$-The total aerobic microbial count does not exceed $1 \theta^{7} 10^{5}$ cfu per $g$, the total combined molds and yeasts count does not exceed $10^{5} 10^{4}$ cfu per $g$,
the coliform count does noteveed $10^{4}$ efu per $g$, and the enterobacterial count does not exceed $10^{4} 10^{3}$ cfu per g . It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. and Staphylococcus aut eHs.nis (USP28)

## Change to read:

## Content of berberine and hydrastine-

-Content of berberine and hydrastine and limit of pal-matine-■1S (USP28)

Mobile phase-Dissolve 9.93 g of monobasic potassium phosphate in 730 mL of distilled water. Add 270 mL of acetonitrile, mix, filter, and degas. Make other adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).
-System suitability solution-Prepare a solution of palmatine in a mixture of water and methanol ( $1: 1$ ) having a known concentration of about 0.05 mg per mL . Mix equal
volumes of this solution and the Standard solution.■1S (USP28), Standard solution-Dissolve accurately weighed quantities of USP Berberine Chloride RS and USP Hydrastine Hydrochloride RS in a mixture of water and methanol ( $1: 1$ ),
-and dilute quantitatively, and stepwise if neces-
sary, 1 1S (USP28)
to obtain a solution containing about 0.2 mg
$\square^{-} 0.05 \mathrm{mg}^{1 \mathrm{IS}}$ (USP28)
of each USP Reference Standard per mL. [note-Concentrations of berberine and hydrastine in this solution are calculated by multiplying the concentration of each of the USP Reference Standards by correction factors of 0.905 and 0.913 , respectively.]

Test solution-Finely powder a quantity of Goldenseal, and transfer 4.0 。
-0.12 g , ${ }^{1 S}$ (USP28)
accurately weighed, to a 500 mL round bettom flask.

- $50-\mathrm{ml}$ volumetric flask. Add 40 mL of a mixture of 0.1 M monobasic potassium phosphate and acetonitrile ( $60: 40$ ). Sonicate for 5 minutes, and shake for 10 minutes on a rotation shaker. Dilute with the mixture of 0.1 M monobasic potassium phosphate and acetonitrile ( $60: 40$ ), mix, and
filter. 1 IS (USP28)
Treat the Geldenseat with 150 mL of methanel, and extract for $\theta$ hours, or until the-solvent is clear. The-volume-of the thimble should be at least one half that of the-volume of methanel. Coet toroom temperature, and transfer the methanelextract to a-200mL volumetric flack. Rinse the extraction unit with methanel, quantitatively transfer the eontents the wolumetric flask, and ditute with methand to velume.

## -. ${ }^{1 S}$ (USP28)

- 1 SUROMatographic system (see Chromatography $\langle 621\rangle$ )-The liquid chromatograph is equipped with a 235 -nm detector and a 4.6 $\mathrm{mm} \times 150-\mathrm{mm}$ column that contains packing L 1 . The flow rate is about 1.8 mL per minute. Chromaghe the Stallitan,
-Inject the Standard solution into the chromatograph, ${ }_{\text {IS }}^{1 \text { S (USP28) }}$
and record the peak responses as directed for Procedure: the capacity factor, $k^{\prime}$, determined from the hydrastine and berberine peaks is not less than 3.0 ; the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0 ; and the relative standard deviation for replicate injections is not more than $2.5 \%$.
-Inject the System suitability solution into the chromatograph, and record the peak responses as directed for Procedure: identify the locus for palmatine, and calculate the resolution, $R$, with respect to hydrastine and berberine: the
resolution, $R$, between berberine and palmatine is not less than 1.5 , and the resolution, $R$, between hydrastine and palmatine is not less than 1.5 .nis (USP28)
[note- The ratal ime is 10 minules.]
-. 1 (USP28)
1 IS (USP28)
Procedure-Separately inject equal volumes (about $10 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentages of berberine and hydrastine in the portion of Goldenseal taken by the formula:

$$
100(C V / W)\left(r_{U} / r_{S}\right),
$$

in which $C$ is the concentration, in mg per mL , of berberine or hydrastine in the respective USP Reference Standard in the Standard solution, using the correction factors as noted above; $V$ is the final volume, in mL, of the Test solution; $W$ is the weight, in mg , of Goldenseal taken; and $r_{U}$ and $r_{S}$ are the peak areas for berberine and hydrastine obtained from the Test solution and the Standard solution, respectively: mess than $2.0 \%$ of hydrastine is found, and not less than $2.5 \%$ of berberine is found.
-Using the values obtained from the chromatogram of the Test solution, divide the peak area of berberine by the peak area of any peak at the locus for palmatine (if present): the ratio is more than $50: 1$. 1 (USP28)

## BRIEFING

Pygeum, page 1317 of $P F$ 29(4) [July-Aug. 2003]; Pygeum Extract, page 1318 of $P F 29$ (4) [July-Aug. 2003]; Pygeum Capsules, page 1322 of $P F$ 29(4) [July-Aug. 2003]. These new monographs, which previously appeared in Pharmacopeial Previews, are now forwarded to In-Process Revision, with changes to Pygeum Extract and Pygeum Capsules. The chromatographic procedure for the Content of sterols is based on determinations performed with a capillary column HP-5 brand of G27 silica bonded stationary phase. Typical retention times are 12.5 minutes
for $5 \alpha$-cholestanol, 17.8 minutes for campesterol, 18.7 minutes for stigmasterol, and 19.0 minutes for $\beta$-sitosterol. The chromatographic procedure for the Content of docosyl ferulate is based on determinations performed on a Supersphere 60, RP-8 brand column of packing L7. The typical retention time for docosyl ferulate is about 12.5 minutes.
(DSB: G. Giancaspro) RTS-37249-1

## Add the following:

## © Pygeum

» Pygeum consists of the bark of Prunus africana (Hook f.) Kalkman (Pygeum africanum Hook f.) Rosaceae. It contains not less than 9.0 percent of extractable matters.

Packaging and storage-Preserve in well-closed containers, and store at room temperature.

Labeling-The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards $\langle 11\rangle$ —USP Pygeum Extract $R S$. USP $\beta$-Sitosterol RS.

## Botanic characteristics-

Macroscopic-Bark pieces consist of long fragments of variable dimensions, from only a few cm to $1-\mathrm{m}$ long with a thickness varying from a few mm to $1-2 \mathrm{~cm}$. The color is brown, more or less dark on the external surface; light brown to red-brown on the internal surface. The external part of the bark presents a very dark and fissured rhytidome that in the samples of old trees is fragmented in more or less square plaques of about 1 to 5 cm . The thickness varies from 1 mm in young plants or branches to $5-8 \mathrm{~mm}$ in old plants. The outer surface may also be covered with whitish lichens
or thin filamentous moss. The internal bark, under the rhytidome, is clearer and has a more reddish coloration, with a long fibrous break, from reddish to light brown and dark brown in color, often presenting concentrical stratification cracks. The internal surface is more clear and presents small wrinkles.

Microscopic-The transverse section of the bark presents a suberized bed having a thickness depending on the age of the plant, consisting of multiple layers of small, square cells with the walls of moderate thickness. It presents a cortical parenchyma of more or less round cells, with a few apparent formations of very thin-walled selerites, sclereids, definitely sharp. Often, in the parenchyma, there are groups of cells containing oxalate druses; a few bigger cells with highly thickened walls can also be observed. It shows a liber with phloem zones and presenting medulary rays. The phloemical portions contain groups of fibrous cells with highly thickened walls as well as phloemical and parenchymal elements sometimes containing druses of oxalate. The medulary rays are of conical shape, larger on the external surface and thinner on the internal side; they can also contain druses of oxalate.

Thin-layer chromatographic identification test $\langle 201\rangle$ -
Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution-Transfer about 10 g of the powdered plant material to a soxhlet apparatus. Extract with 150 mL of methylene chloride for 4 hours. Evaporate the extract under vacuum to dryness. Dissolve the residue with 10 mL of methylene chloride. Apply $10 \mu \mathrm{~L}$ to the plate.
Standard solution 1-Prepare a solution of USP Pygeum Extract RS in chloroform having a concentration of about 10 mg per mL .

Standard solution 2-Prepare a solution of USP $\beta$-Sitosterol RS in chloroform having a concentration of about 1 mg per mL.

Developing solvent system: methylene chloride in a saturated chamber.

Spray reagent-Prepare a solution of sulfuric acid and water ( $1: 1$ ).

Procedure-Develop the chromatogram to a length of not less than 15 cm , and dry the plate in a current of air. Spray the plate with Spray reagent, and heat the plate at $100^{\circ}$ for 10 minutes. Examine the plate under white light: the chromatogram obtained with the Test solution shows one redviolet zone turning to grayish-brown near the origin that corresponds in color and $R_{F}$ value to that in the chromatogram of Standard solution 1; one red-violet zone turning to grayish brown at an $R_{F}$ about 0.08 , corresponding in color and $R_{F}$ value to that in the chromatogram of the Standard solution 2; above these spots a grayish-brown zone may be present, corresponding in color and $R_{F}$ value to that in the chromatogram of the Standard solution 1; and other colored zones of varying intensities may be observed in the chromatogram of the Test solution.

Total ash $\langle 561\rangle$ : not more than $10.0 \%$.
Loss on drying $\langle 731\rangle$ —Dry it at $60^{\circ}$ for 15 hours: it loses not more than $10.0 \%$ of its weight.

Foreign organic matter $\langle 561\rangle$ : not more than $5.0 \%$. Pesticide residues $\langle 561\rangle$ : meets the requirements.

Heavy metals $\langle 231\rangle$ : not more than $20 \mu \mathrm{~g}$ per g.
Extractable matter-Extract 2.00 g of the powdered material in a soxhlet apparatus with 150 mL of alcohol for 6 hours. Evaporate the solution to dryness under vacuum, and dry the residue at $105^{\circ}$ for 24 hours. ${ }^{1 S}$ (USP28)

## Briefing

Pygeum Extract, page 1318 of PF 29(4) [July-Aug. 2003]See briefing under Pygeum.

## Add the following:

## Pygeum Extract

» Pygeum Extract is prepared from the pulverized Pygeum using suitable solvents. It contains not less than 90 percent and not more than 110 percent of the labeled amount of docosyl ferulate and not less than 90 percent and not more than 110 percent of the labeled amount of total sterols as $\beta$-sitosterol, calculated on the dried basis.

Packaging and storage-Store in tight containers, protected from light.

Labeling-The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. Label the content in percentage of total sterols as $\beta$-sitosterol and the content in percentage of docosyl ferulate. It also meets the requirements for labeling in the chapter Extracts $\langle 565\rangle$.

USP Reference standards $\langle 11\rangle — U S P$ Docosyl Ferulate
RS. USP Pygeum Extract RS. USP $\beta$-Sitosterol RS.

## Identification-

A: Thin-Layer Chromatographic Identification Test $\langle 201\rangle$ -

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Test solution-Dissolve about 150 mg of Extract in 10 mL of chloroform. Apply $10 \mu \mathrm{~L}$ to the plate.

Standard solution 1-Prepare a solution of USP Pygeum Extract RS in chloroform having a concentration of about 15 mg per mL .

Standard solution 2-Prepare a solution of USP $\beta$-Sitosterol RS in chloroform having a concentration of about 2 mg per mL.

Developing solvent system: methylene chloride in a saturated chamber.

Spray reagent-Prepare a solution of sulfuric acid and water ( $1: 1$ ).

Procedure-Develop the chromatogram to a length of not less than 15 cm , and dry the plate in a current of air. Spray the plate with Spray reagent, and heat the plate at $100^{\circ}$ for 10 minutes. Examine the plate under white light: the chromatogram obtained with the Test solution shows one redviolet zone turning to grayish brown near the origin that corresponds in color and $R_{F}$ value to that in the chromatogram of Standard solution 1; one red-violet zone turning to grayish brown at an $R_{F}$ of about 0.08 corresponding in color and $R_{F}$ value to that in the chromatogram of Standard solution 2; above these spots a grayish-brown zone may be present, corresponding in color and $R_{F}$ value to that in the chromatogram of Standard solution 1; and other colored zones of varying intensities may be observed in the chromatogram of the Test solution.

B: The retention time of the peak for docosyl ferulate in the chromatogram of the Test solution, correspond to that in the chromatogram of the Standard solution as obtained in the Content of docosyl ferulate.

Loss on drying $\langle 731\rangle$-Dry about 1.0 g of Extract, accurately weighed, for 3 hours at $110^{\circ}$ : it loses not more than $10 \%$ of its weight.

Ash content $\langle 561\rangle$ : not more than $0.5 \%$.
Heavy metals $\langle 565\rangle$ : meets the requirement.
Residual solvents $\langle 565\rangle$ : meets the requirement.
Pesticide residue $\langle 561\rangle$ : meets the requirement.
Aflatoxins $\langle 561\rangle$ : not more than $4 \mu \mathrm{~g}$ per kg of total aflatoxins B1, B2, G1, and G2; not more than $2 \mu \mathrm{~g}$ per kg of aflatoxin B1.

Microbial limits $\langle 2021\rangle$ - The total aerobic microbial count does not exceed $10^{4}$ per g , the total combined molds and yeasts count does not exceed $10^{3}$ per g , and it meets the requirements of the tests for absence of Salmonella species, and Escherichia coli.

## Content of sterols-

Derivatizing solution: a mixture of bis(trimethylsilyl)acetamide and trimethylchlorosilane ( $9: 1$ ).

Internal standard solution-Prepare a solution containing 2 mg per mL of $5 \alpha$-cholestane in chloroform.

System suitability solution-Prepare a solution containing about 2 mg per mL each of campesterol, stigmasterol, and USP $\beta$-Sistosterol RS. Transfer 2.0 mL of this solution and 2.0 mL of Internal standard solution to a $10-\mathrm{mL}$ volumetric flask, and dilute with chloroform to volume. Evaporate about $500 \mu \mathrm{~L}$ of this solution to dryness using a stream of nitrogen. Dissolve the residue in $80 \mu \mathrm{~L}$ of Derivatizing solution and $20 \mu \mathrm{~L}$ of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Standard stock solution-Prepare a solution of USP $\beta$-Sitosterol RS in chloroform having a known concentration of about 2.0 mg per mL .

Standard solution-Transfer 2.0 mL of the Standard stock solution and 2.0 mL of the Internal standard solution to a $10-\mathrm{mL}$ volumetric flask, and dilute with chloroform to volume. Evaporate about $500 \mu \mathrm{~L}$ of this solution to dryness using a stream of nitrogen. Dissolve the residue in $80 \mu \mathrm{~L}$ of Derivatizing solution and $20 \mu \mathrm{~L}$ of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Test solution-Transfer an accurately weighed quantity of about 100 mg of Extract into a $100-\mathrm{mL}$, round-bottomed flask. Add 2.0 mL of Internal standard solution and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at $100^{\circ}$ for 30 minutes. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8 . Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8 that has been conditioned with a 2 column volume of $n$-hexane [NOTE-A suitable cartridge is Chromabond NH2, manufactured by Macheray Nagel, or equivalent.] Collect the eluate. Elute twice with a 1 -column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate about $500 \mu \mathrm{~L}$ of this solution to dryness under a stream of nitrogen. Dissolve the residue with $80 \mu \mathrm{~L}$ of Derivatizing solution and $20 \mu \mathrm{~L}$ of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a $0.32-\mathrm{mm} \times 30-\mathrm{m}$
capillary column coated with a G27 phase of $0.25-\mu \mathrm{m}$ thickness. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at $250^{\circ}$ for 5 minutes, then the temperature is increased at a rate of $5^{\circ}$ per minute to $320^{\circ}$. The injection port temperature and detector temperature are both maintained at $285^{\circ}$. The carrier gas is helium, with a flow rate adjusted to obtain a retention time of about 19 minutes for $\beta$-sitosterol, a split ratio of $1: 50$, and the make up is helium. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about $0.66,0.94,0.96$, and 1.00 for $5 \alpha$-cholestane, campesterol, stigmasterol, and $\beta$-sitosterol, respectively; the resolution, $R$, between campesterol and stigmasterol is not less than 2 ; the column efficiency is not less than 150,000 for the $5 \alpha$-cholestane peak; and the tailing factor for each relevant peak is not more than 2.0 .
Procedure-Separately inject equal volumes (about $2 \mu \mathrm{~L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Identify the signals corresponding to the relevant analytes by comparison with the chromatograms obtained with the System suitability solution.

Separately calculate the percentages of campesterol, stigmasterol, and $\beta$-sitosterol respectively in the portion of Extract taken by the formula:

$$
200 C / W\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration of $\beta$-sitosterol, in mg per mL , in the Standard solution; $W$ is the weight, in mg , of the Extract taken to prepare the Test solution; $R_{U}$ is the ratio of the appropriate sterol peak to the internal standard in the chromatogram of the Test solution; and $R_{S}$ is the ratio of the $\beta$-sitosterol peak to the $5 \alpha$-cholestane internal standard in
the chromatogram of the Standard solution. Calculate the total content of sterols in percentage by adding the individual percentages.

## Content of docosyl ferulate-

Solution $A$-Use mixture of methanol and water (95:5).
Solution B-Use a filtered and degassed mixture of Solution $A$ and acetonitrile.

Mobile phase-Use variable mixtures of Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography〈621〉).

Standard solution-Dissolve an accurately weighed quantity of USP Docosyl Ferulate RS with chloroform and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.02 mg per mL . Filter with a $0.45-\mu \mathrm{m}$ membrane or finer porosity.

Test solution-Weigh approximately 250 mg of Extract. Add 5 mL of chloroform, and quantitatively transfer to a $25-\mathrm{mL}$ volumetric flask. Dilute with acetonitrile to volume, and mix. Filter with a $0.45-\mu \mathrm{m}$ membrane or finer porosity discarding the first 4 mL of the filtrate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $323-\mathrm{nm}$ detector and a $4-\mathrm{mm} \times 25-\mathrm{cm}$ column that contains packing L7, and is maintained at a temperature of $25^{\circ}$. The flow rate is about 1.0 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency for the peak of docosyl ferulate is not less than 1700 theoretical plates; and the tailing factor for docosyl ferulate is not more than 2.0.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard solution, and the Test solution into the chromatograph, record the chromatograms, and measure
the areas of the analyte peaks. Calculate the percentage of docosyl ferulate in the portion of Extract taken by the formula:

$$
2500 C / W\left(r_{U} / r_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Docosyl Ferulate RS in the Standard solution; $W$ is the weight, in mg , of the portion of Extract taken to prepare the Test solution; and $r_{U}$ and $r_{S}$ are the peak responses for docosyl ferulate in the Test solution and the Standard solution, respectively. $\quad$ IS (USP28)

Briefing

Pygeum Capsules, page 1322 of PF 29(4) [July-Aug. 2003]See briefing under Pygeum.
(DSB. G. Giancaspro) RTS-37249-3

## Add the following:

## ■Pygeum Capsules

## » Pygeum Capsules contain Pygeum Extract.

 Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Extract, calculated as sterols and docosyl ferulate.Packaging and storage-Preserve in tight containers at controlled room temperature.

Labeling-The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. The label also indicates the amount of Extract, in mg per Capsule. Label the Capsules to indicate the amount of sterols and docosyl ferulate in percentage of the Extract contained in the Capsules.

USP Reference standards $\langle 11\rangle — U S P$ Docosyl Ferulate RS. USP Pygeum Extract RS. USP $\beta$-Sitosterol RS.

## Identification-

A: The retention times of the peaks for campesterol, stigmasterol and $\beta$-sitosterol, in the chromatogram of the Test solution, correspond to these in the chromatograms of the Standard solution, as obtained in the Content of sterols.

B: The retention time of the peak for docosyl ferulate in the chromatogram of the Test solution corresponds to that in the chromatogram of the Standard solution, as obtained in the Content of docosyl ferulate.

Disintegration $\langle 2040\rangle$ : meet the requirements for disintegration of botanical dosage forms.

RUPTURE TEST-[NOTE-See Dissolution $\langle 711\rangle$ for Apparatus.]

Medium: simulated gastric fluid TS; 500 mL .
Apparatus 2: 50 rpm.
Time: 15 minutes.
Procedure-Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

Tolerances-The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than

30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

Weight variation $\langle 2091\rangle$ : meet the requirements.
Microbial limits $\langle 2021\rangle$ —The total bacterial count does not exceed 1000 cfu per $g$. The total combined molds and yeasts count does not exceed 100 cfu per $g$. It meets the requirements of the tests for absence of Salmonella species and Escherichia coli.

## Content of sterols-

Derivatizing solution, Internal standard solution, System suitability solution, Standard stock solution, Standard solution, and Chromatographic system-Proceed as directed in Pygeum Extract.

Test solution-Transfer an accurately weighed quantity of Capsules, equivalent to about 100 mg of the labeled amount of Extract, into a $100-\mathrm{mL}$, round-bottomed flask. Add 2.0 mL of Internal standard solution and 20 mL of diluted hydrochloric acid. Attach a condenser, and reflux in a bath at $100^{\circ}$ for 30 minutes. Cool the solution to room temperature, and adjust by the addition of about 5 mL of 10 N sodium hydroxide to a pH of 8 . Extract twice using 50 mL of ether each time, wash the collected organic phases with 50 mL of water, and evaporate the organic phase to dryness under vacuum. Dissolve the residue with 4 mL of chloroform, and transfer to a cartridge containing 500 mg of packing L8 that has been conditioned with a 2 -column volume of $n$-hexane. [NOTE-A suitable cartridge is Chromabond NH2, manufactured by Macheray Nagel, or equivalent.] Collect the eluate. Elute twice with a 1 -column volume of a mixture of chloroform and isopropanol (2:1). Combine the eluates, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform. Evaporate about $500 \mu \mathrm{~L}$ of this solution to dry-
ness under a stream of nitrogen. Dissolve the residue with $80 \mu \mathrm{~L}$ of Derivatizing solution and $20 \mu \mathrm{~L}$ of pyridine. Allow to stand for not less than 10 minutes at room temperature.

Procedure-Proceed as directed in Pygeum Extract. Separately calculate the content, in mg, of campesterol, stigmasterol, and $\beta$-sitosterol, respectively in the portion of Capsules taken by the formula:

$$
2 C\left(R_{U} / R_{S}\right)
$$

in which $C$ is the concentration of $\beta$-sitosterol, in mg per mL , in the Standard solution; $W$ is the weight, in mg , of the Extract taken to prepare the Test solution; $R_{U}$ is the ratio of the appropriate sterol peak to the internal standard in the chromatogram of the Test solution; and $R_{S}$ is the ratio of the $\beta$-sitosterol peak to the $5 \alpha$-cholestane internal standard in the chromatogram of the Standard solution. Calculate the total content of sterols, in mg, by adding the individual contents.

## Content of docosyl ferulate-

Solution A, Solution B, Mobile phase, and Chromatographic system-Proceed as directed for the Content of docosyl ferulate in Pygeum Extract.

Standard solution-Dissolve an accurately weighed quantity of USP Docosyl Ferulate RS with chloroform, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.01 mg per mL . Filter with a $0.45-\mu \mathrm{m}$ membrane or finer porosity.

Test solution-Accurately weigh the contents of not fewer than 20 Capsules, and transfer an accurately weighed quantity of the material, equivalent to 0.2 mg of the labeled amount of docosyl ferulate, to a $50-\mathrm{mL}$ beaker. Add 5 mL of chloroform, and dissolve in an ultrasonic bath. Transfer to
a $20-\mathrm{mL}$ volumetric flask with the aid of not more than 2 mL of chloroform. Dilute with acetonitrile to volume, and mix. Filter through a $0.45-\mu \mathrm{m}$ membrane or finer porosity.

Procedure-Proceed as directed for the Procedure under Content of docosyl ferulate in Pygeum Extract, except to inject about $30 \mu \mathrm{~L}$ into the chromatograph. Calculate the content of docosyl ferulate, in mg , in the portion of Capsules taken by the formula:

$$
20 C\left(r_{U} / r_{S}\right)
$$

in which the terms are as defined therein. ${ }^{15}$ (USP28)

## Briefing

#### Abstract

Ammonium Sulfate, $N F 22$ page 2822; Candelilla Wax, $N F 22$ page 2836; Low-Substituted Carboxymethylcellulose Sodium, page 3169 of the First Supplement and page 1095 of PF 29(4) [July-Aug. 2003]; Cetrimonium Bromide, NF 22 page 2848; Hydrogenated Cottonseed Oil, NF 22 page 2854; Dibutyl Phthalate, page 3170 of the First Supplement; Diethylene Glycol Stearates, page 3171 of the First Supplement; Ethylene Glycol Stearates, page 3171 of the First Supplement; Glyceryl Distearate, $N F 22$ page 2872; Glyceryl Monolinoleate, $N F 22$ page 2873; Glyceryl Monoleate, $N F 22$ page 2874; Hymetellose, page 3172 of the First Supplement and page 1100 of PF 29(4) [JulyAug. 2003]; Maltitol Solution, NF 22 page 2891 and page 3173 of the First Supplement; Polyisobutylene, page 3175 of the First Supplement; Sodium Cetostearyl Sulfate, page 3177 of the First Supplement and page 1122 of PF 29(4) [July-Aug. 2003]; Tribasic Sodium Phosphate, NF 22 page 2932; Sorbitol, $N F 22$ page 2937 and page 3178 of the First Supplement; Sorbitol Solution, USP 27 page 1715, page of 3083 of the First Supplement, and page 1078 of PF 29(4) [July-Aug. 2003]; Noncrystallizing Sorbitol Solution, NF 22 page 2938 and page 3180 of the First Supplement; Hydrogenated Soybean Oil, page 3180 of the First Supplement; and Medium-Chain Triglycerides, page 3181 of the First Supplement.

It is proposed to revise the Packaging and storage requirements for the above $U S P-N F$ excipient monographs in accordance with the Packaging, Storage, and Distribution Expert Committee's decision to consider the storage conditions for excipients on a case-bycase basis, based on available scientific knowledge and stability

data. Excipients generally recognized as stable may not require any storage statement or may require a limited storage statement, as appropriate. In the absence of any significant adverse comment, it is proposed to implement these revisions via the Fifth Interim Revision Announcement pertaining to USP 27-NF 22, with an official date of October 1, 2004.

Store at up to $25^{\circ}$, exeursions permitted between $15^{\circ}$ and
$30^{\circ}$. Avoid exeessive heat and freezing. Protect from moist tre. No storage requirements specified.es

Cellulose, acetate butanoate.

Cellulose, acetate butyrate.

Acetylbutyrylcellulose.

Cellulose butyrate acetate.

Cellulose acetate butyrate [9004-36-8].
» Gellutese Acetate Butyrate Cellaburate is a reaction product of cellulose, acetic anhydride or acetic acid, and butyric acid or butyric anhydride.
It contains not less than 1.0 percent and not more than 41.0 percent acetyl $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}\right)$ groups, by weight, and not less than 5.0 percent and not more than 57.356 .0 percent butyryl $\left(\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{O}\right)$ groups, by weight, calculated on the mhydrous, previously dried, acid-free basis.

Packaging and-storage-Preserve in tight containers.
Labeling-The labeling indicates the nominal percentage ranges of acetyl and butyryl groups.

USP Reference standards $\langle 11\rangle$ USP Cellulose Acetate Bumate RS. USP Cellaburate RS.

Identification, Infrared Absorption $\langle 197 \mathrm{~F}\rangle$ —Dissolve 150 mg in 1 mL of acetone. Evenly cast 1 drop of the solution on a sodium chloride plate. Heat the plate at $105^{\circ}$ for 10 minutes.

Water, Method $I\langle 921\rangle$ : not more than $5.0 \%$, a mixture of methylene chloride and methanol (2:1) being used in place of the methanol solvent.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.

## $\triangle$ Cellulose Acetate Buthyrate Cellaburate

-(Title for this new monograph-to become official January 1, 2010) ${ }^{4}$

Cellaburate, page 597 of PF 30(2) [Mar.-Apr. 2004]. It is proposed to adopt Cellaburate as the title of this proposed new monograph. This nomenclature is desirable because it would result in harmonization with the terminology recommended by a World Health Organization (WHO) committee for use in pharmacopeias. There is no USAN at this time, but Cellaburate is an International Nonproprietary Name (INN) for this excipient.

A monograph on this proposed new $N F$ excipient first appeared in Pharmacopeial Previews in PF 23(4) [Jul.-Aug. 1997] and, subsequently, under In-Process Revision in PF 23(6) [Nov.-Dec. 1997], and PF 25(2) [Mar.-Apr. 1999] under the name Cellulose Acetate Butyrate.

Cellaburate is proposed by the Expert Committee on Nomenclature and Labeling to be the title of the monograph for this excipient monograph, which is proposed for inclusion in USP 28-NF 23, but with an official date of January 1, 2010, which is 60 months later than the January 1, 2005 official date of USP 28-NF 23. Use of the revised name would be permitted as of the January 1, 2005, the official date of $U S P$ 28-NF 23, but use of the name Cellaburate would not become mandatory until January 1, 2010. The 60 -month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, and for practitioners, consumers, and regulatory agencies to become familiar with the terminology.
(NL: C. Barnstein) RTS-41135-1

## Add the following:

## Limit of free acid-

Indicator solution-Transfer about $0.54 \theta 0.675 \mathrm{~g}$ of bromocresol purple, accurately weighed, to a 1-L volumetric flask. Dissolve in 20025 mL of 0.0100 .10 N sodium hydroxide, dilute with water to volume, and mix.

Calibration solutions-Pipet 1, 2, 3, and 4 mL of 0.001 N acetic acid VS into four $100-\mathrm{mL}$ volumetric flasks, respectively. Pipet 4 mL of the Indicator solution into each flask and into an empty $100-\mathrm{mL}$ volumetric flask, and dilute each flask with water to volume to obtain solutions containing $0.0,0.60,1.20,1.80$, and $2.40 \mu \mathrm{~g}$ of acetic acid per mL.

Control solution-Place 96 mL of water in a suitable bottle, add a stirring bar, cap the bottle, and stir for 75 minutes at room temperature. Pipet 4 mL of Indicator solution into the bottle, and mix.

Test solution-Transfer about 1 to 2 g of Gellulese Aeet Be, Cellaburate, accurately weighed, to a bottle, and add 96 mL of water. Add a stirring bar, cap the bottle, and stir for 75 minutes at room temperature. Pipet 4 mL of Indicator solution into the bottle, stir to mix, and allow the solid to settle for 2 minutes.

Calibration-Determine the absorbances of the Calibration solutions in a $1-\mathrm{cm}$ cell at the wavelength of maximum absorption of the basic form of bromocresol purple at about 589 nm , with a suitable spectrophotometer, using water as the blank. The absorbance difference, $A_{S}$, between the $0.0 \mu \mathrm{~g}$ per mL solution and the other solutions is byessed the formma:

$$
a b G_{s}+\left(60 \times 10^{6}\right)
$$

in which $a$ is the absorptivity of the basic form of bremeresel purple, in mL per em mole; $b$ is the cell path length, in $\mathrm{em} ; \mathrm{C}_{\mathrm{s}}$ is the concentration of the acetic acid, in $\mu \mathrm{g}$ per mL ; and $60 \times 10^{6}$ is the molecular weight of acetic acid in $\mu \mathrm{g}$ per mole. Plot $A_{s}$ ersus $G_{s}$ adheres to Beer's law over the range
stated under Calibration solutions. Plot $A_{S}$ versus $C_{S}$ (the concentration of the acetic acid in $\mu \mathrm{g}$ per mL ) on linear graph paper, and draw the straight line best fitting the points including the origin.

Procedure-Pass 10 mL of the Test solution through a polytef syringe filter that has been presoaked in isopropyl alcohol. Determine the absorbance of the filtered Test solution in a $1-\mathrm{cm}$ cell at about 589 nm on the same spectrophotometer, using water as the blank. In the same manner, determine the absorbance of the Control solution. Calculate the percentage of free acid, as acetic acid, in the portion of Gellulose Acetate Buyrate Cellaburate taken by the formula:

$$
\left(100 C_{U} / W_{U}\right) / 10,000,
$$

in which 100 is the total volume, in mL , of the Test solution; $C_{U}$ is the concentration of free acid, calculated as acetic acid, in $\mu \mathrm{g}$ per mL , based on the absorbance difference between the Control solution and the Test solution read directly from the calibration plot; and $W_{U}$ is the weight, in g , of Cellulose Ace Bellaburate taken to prepare the Test solution. [NOTE-If the $C_{U}$ value is greater than $2.42 .8 \mu \mathrm{~g}$ per mL , reduce the test sample size by half in the Test solution, and repeat the determination.] Not more than $0.1 \%$ is found.

## Acetyl and butyryl content-

Internal standard solution-Prepare a solution of isovaleric acid in pyridine containing about 4.6 mg per mL , and store it in a tightly closed container.

Saponification solution-Place 250 mL of $n$-propyl alcohol in a $500-\mathrm{mL}$ volumetric flask, add 65.5 g of potassium hydroxide, and mix to dissolve. Dilute with $n$-propyl alcohol to volume, and mix.

Acid solution-Place 250 mL of $n$-propyl alcohol in a $500-\mathrm{mL}$ volumetric flask, add 166 mL of hydrochloric acid, and mix. Dilute with $n$-propyl alcohol to volume, and mix.

Standard preparation-Transfer about 0.20 g of glacial acetic acid and 0.31 g of butyric acid, each accurately weighed, to a $50-\mathrm{mL}$ volumetric flask. Dilute with Internal standard solution to volume, and mix.

Test preparation-Transfer about 0.15 g of Cellulese Ace, Cellaburate, previously dried at $105^{\circ}$ for 1 hour and accurately weighed, into a $25-\mathrm{mm} \times 160-\mathrm{mm}$ test tube. Pipet 10 mL of Internal standard solution into the test tube, and dissolve by stirring and heating at $110^{\circ}$ for 30 minutes. While stirring, add 5 mL of Saponification solution slowly into the tube. Heat at $110^{\circ}$ for 10 minutes. Cool, and add 5 mL of the Acid solution. Mix on a vortex mixer, and allow the precipitate to settle.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The gas chromatograph is equipped with a flame-ionization detector, a $0.53-\mathrm{mm} \times 30-\mathrm{m}$ fused silica column bonded with a $1-\mu \mathrm{m}$ layer of phase G35, and a split injection system with a split ratio of about $35: 1$. Helium is used as the carrier gas flowing at a rate of about 8 mL per minute. The injection port, column, and detector block temperatures are maintained at $250^{\circ}, 125^{\circ}$, and $250^{\circ}$, respectively. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.45 for acetic acid, 0.85 for butyric acid, and 1.00 for isovaleric acid; the tailing factor for the butyric acid peak is not more than 1.5 ; and the relative standard deviation for replicate injections is not more than $3.0 \%$.

Calibration-Inject about $1 \mu \mathrm{~L}$ of the Standard preparation into the chromatograph, and record the chromatogram as directed for Procedure. Repeat two more times. Calculate the average unit weight response, $F_{S 4}$, of acetic acid per 10 mL of the Internal standard solution by the formula:
in which $10 / 50$ is the volume ratio of the Internal standard solution in the Test preparation and in the Standard preparation; $q_{R A}$ is the weight, in g , of acetic acid in the Standard preparation; and $R_{S A}$ is the average peak response ratio of acetic acid and isovaleric acid. Similarly, calculate the average unit weight response, $F_{S B}$, of butyric acid per 10 mL of the Internal standard solution by the formula:

$$
(10 / 50) q_{R B} / R_{S B}
$$

in which $10 / 50$ is the volume ratio of the Internal standard solution in the Test preparation and in the Standard preparation; $q_{R B}$ is the weight, in g , of butyric acid in the Standard preparation; and $R_{S B}$ is the average peak response ratio of butyric acid and isovaleric acid.
Procedure-Inject about $1 \mu \mathrm{~L}$ of the upper clear solution from the Test preparation into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of acetyl in the portion of Cellulese Ace Burate Cellaburate taken by the formula:

$$
(43 / 60)(100) R_{U A} F_{S A} / W_{U},
$$

in which $43 / 60$ is the ratio of the formula weights of acetyl and acetic acid; $R_{U A}$ is the peak area response ratio of acetic acid and isovaleric acid in the Test preparation; $F_{S A}$ is as defined under Calibration; and $W_{U}$ is the weight, in g, of Eet lulese Ace Burate Cellaburate taken to prepare the Test preparation. Similarly, calculate the percentage of butyryl in the portion of Cellule Ace Burate taken by the formula:

$$
(71 / 88)(100) R_{U B} F_{S B} / W_{U}
$$

$$
(10 / 50) q_{R A} / R_{S A},
$$

in which $71 / 88$ is the ratio of the formula weights of butyryl and butyric acid; $R_{U B}$ is the peak area response ratio of butyric acid and isovaleric acid in the Test preparation; $F_{S B}$ is as defined under Calibration; and $W_{U}$ is the weight, in g , of Gelluse Ae Butaburate taken to prepare the Test preparation. $\mathbf{\Delta N F 2 3}$

## BRIEFING

Cetrimonium Bromide, NF 22 page 2848—See briefing under Ammonium Sulfate.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40871-3

## Change to read:

Packaging and storage-Preserve in well-closed containers. Store at rom temperattre, and avoid eveessive heat and freezing. Protect from moisture.
${ }^{\bullet}$ No storage requirements specified.es

## Briefing

Cetyl Alcohol, NF 22 page 2849. On the basis of comments received, it is proposed to revise the System suitability solution in the Assay to use dehydrated alcohol instead of alcohol to be consistent with the use of dehydrated alcohol in the Assay preparation.
(EMC: C. Sheehan) RTS-41133-1

## Change to read:

## Assay-

System suitability solution-Dissolve accurately weighed quantities of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS in

- dehydrated ${ }_{\text {■S }}^{\text {(NF23) }}$
alcohol to obtain a solution having known concentrations of about 9 mg per mL and 1 mg per mL , respectively.

Assay preparation-Dissolve 100 mg of Cetyl Alcohol in 10.0 mL of dehydrated alcohol, and mix.

Chromatographic system (see Chromatography $\langle 621\rangle$ )-The gas chromatograph is equipped with a flame-ionization detector and a $3-\mathrm{mm} \times 2-\mathrm{m}$ column packed with $10 \%$ liquid phase G2 on support S1A. The carrier gas is helium. The column temperature is maintained at about $205^{\circ}$, the injection port at about $275^{\circ}$, and the detector at about $250^{\circ}$. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, $R$, between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than $1.5 \%$.

Procedure-Inject about $2 \mu \mathrm{~L}$ of the Assay preparation into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of $\mathrm{C}_{16} \mathrm{H}_{34} \mathrm{O}$ in the portion of Cetyl Alcohol taken by the formula:

$$
100\left(r_{U} / r_{s}\right)
$$

in which $r_{U}$ is the peak area for cetyl alcohol obtained from the Assay preparation; and $r_{s}$ is the sum of the areas of all the peaks except the solvent peak.

## BRIEFING

Copovidone, page 1097 of PF 29(4) [July-Aug. 2003]; Hypromellose Acetate Succinate, page 1102 of $P F$ 29(4) [July-Aug. 2003]; Maltose, page 1113 of $P F$ 29(4) [July-Aug. 2003]; Phenolsulfonphthalein, page 2018 of PF 29(6) [Nov.-Dec. 2003]; Anhydrized Liquid Sorbitol, page 1128 of $P F$ 29(4) [July-Aug. 2003]; Modified Starch, page 1132 of $P F$ 29(4) [July-Aug. 2003]; Pregelatinized Starch, NF 22 page 2939, page 3181 of the First Supplement, and page 1601 of $P F$ 29(5) [Sept.-Oct. 2003]; Pregelatinized Modified Starch, page 1133 of $P F$ 29(4) [JulyAug. 2003]; Tapioca Starch, $N F 22$ page 2940, page 3181 of the First Supplement, and page 1134 of PF 29(4) [July-Aug. 2003]. It is proposed to revise the Packaging and storage requirements for the above excipients in accordance with the Packaging, Storage, and Distribution Expert Committee's decision to consider the storage conditions for excipients on a case-by-case basis, based on available scientific knowledge and stability data. Excipients generally recognized as stable may not require a storage statement or may require a limited storage statement, as appropriate.

The revision of the Packaging and storage requirement for Pregelatinized Modified Starch is covered by a cross-reference to Modified Starch in the section Other requirements under Pregelatinized Modified Starch.

In addition, on the basis of comments received and for further clarification, it is proposed to revise the monograph for Copovidone to include a starch indicator solution in the test for Limit of monomers as a more accurate means of endpoint determination.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-1

## Add the following:

## Copovidone

$\left(\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}\right)_{n}+\left(\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{2}\right)_{m}$
Acetic acid ethenyl ester polymer with 1-ethenyl-2-pyrrolidone.

1-Vinyl-2-pyrrolidone polymer with vinyl acetate
[25086-89-9].
» Copovidone is a copolymer of 1-vinyl-2-pyrrolidone and vinyl acetate in the mass proportion of $3: 2$. The nominal K -value of Copovidone as stated in the labeling is not less than 90.0 percent and not more than 110.0 percent.

Packaging and storage-Preserve in tight containers. protected from moisture. Storeat $25^{\circ}$, exeursion permittedupto $40^{\circ}$. No storage requirements specified.

Labeling-Label it to indicate its nominal K-value.
USP Reference standards $\langle 11\rangle —$ USP Copovidone RS.
Clarity and color of solution-Dissolve 1.0 g in 10 mL of water: the solution is clear or slightly opalescent and colorless to pale yellow or pale red.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: $\quad$ To 5 mL of a solution $(1 \mathrm{in} 50)$ add a few drops of iodine TS: a deep red color is produced.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 3 hours: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.1 \%$.

## Limit of aldehydes-

Phosphate buffer-Transfer 8.7 g of monobasic potassium phosphate to a $500-\mathrm{mL}$ volumetric flask, and dissolve in 400 mL of water. Adjust, if necessary, with 1 N potassium hydroxide to a pH of 9.0 , dilute with water to volume, and mix.

Aldehyde dehydrogenase solution-Transfer a quantity of lyophilized aldehyde dehydrogenase equivalent to 70 units to a glass vial, dissolve in 10.0 mL of water, and mix. [NOTE-This solution is stable for 8 hours at $4^{\circ}$.]
NAD solution-Transfer 40 mg of nicotinamide adenine dinucleotide to a glass vial, dissolve in 10.0 mL of Phosphate buffer, and mix. [NOTE-This solution is stable for 4 weeks at $4^{\circ}$.]

Blank solution-Use water.
Standard solution-Transfer about 2 mL of water at $4^{\circ}$ to a glass weighing bottle, and weigh accurately. Add about 100 mg of freshly distilled acetaldehyde, and weigh accurately. Transfer this solution to a $100-\mathrm{mL}$ volumetric flask. Rinse the weighing bottle with several portions of water at $4^{\circ}$, and transfer each rinsing to the $100-\mathrm{mL}$ volumetric flask. Dilute the solution in the $100-\mathrm{mL}$ volumetric flask with water at $4^{\circ}$ to volume. Store at $4^{\circ}$ for about 20 hours. Pipet 1 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with Phosphate buffer to volume, and mix.

Test solution-Transfer about 1 g of Copovidone, accurately weighed, to a $100-\mathrm{mL}$ volumetric flask, dissolve in 50 mL of Phosphate buffer, dilute with Phosphate buffer to volume, and mix. Insert a stopper into the flask, heat at $60^{\circ}$ for 1 hour, and cool to room temperature.

Procedure-Pipet 0.5 mL each of the Standard solution, the Test solution, and the Blank solution into separate $1-\mathrm{cm}$ cells. Add 2.5 mL of Phosphate buffer and 0.2 mL of NAD solution to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 2 to 3 minutes at $22 \pm 2^{\circ}$. Determine the absorbances of the solutions at a wavelength of 340 nm . Add 0.05 mL of Aldehyde dehydrogenase solution to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 5 minutes at $22 \pm 2^{\circ}$. Determine the absorbances of the solutions at a wavelength of 340 nm . Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Copovidone taken by the formula:

$$
10(C / W)\left[\frac{\left(A_{U 2}-A_{U 1}\right)-\left(A_{B 2}-A_{B 1}\right)}{\left(A_{S 2}-A_{S 1}\right)-\left(A_{B 2}-A_{B 1}\right)}\right],
$$

in which $C$ is the concentration, in mg per mL , of acetaldehyde in the Standard solution; $W$ is the weight, in g, calculated on the dried basis, of Copovidone taken to prepare the Test solution; $A_{U 1}, A_{S 1}$, and $A_{B 1}$ are the absorbances of the solutions obtained from the Test solution, the Standard solution, and the Blank solution, respectively, before the addition of the Aldehyde dehydrogenase solution; and $A_{U 2}, A_{52}$, and $A_{B 2}$ are the absorbances of the solutions obtained from the Test solution, the Standard solution, and the Blank solution, respectively, after addition of the Aldehyde dehydrogenase solution: not more than $0.05 \%$ is found.

## Limit of hydrazine-

Standard solution-Dissolve an accurately weighed quantities of salicylaldazine and salicylaldehyde in toluene, and dilute quantitatively, and stepwise if necessary, with toluene to obtain a solution having a known concentrations of $9 \mu \mathrm{~g}$ per mL and 10 mg per mL , respectively.

Test solution-Transfer the equivalent of 2.5 g of dried Copovidone, accurately weighed, to a $50-\mathrm{mL}$ centrifuge tube, add 25 mL of water, and mix to dissolve. Add 500 $\mu \mathrm{L}$ of a 1 in 20 solution of salicylaldehyde in methanol, adjust the solution with 0.25 N sulfuric acid to a pH of about 2, swirl, and heat in a water bath at $60^{\circ}$ for 15 minutes. Allow to cool, add 2.0 mL of toluene, insert a stopper in the tube, shake vigorously for 2 minutes, and centrifuge. Use the clear upper toluene layer as the Test solution.

Procedure-Separately apply $10 \mu \mathrm{~L}$ of the Test solution and the Standard solution to a suitable thin-layer chromatographic plate (see Chromatography $\langle 621\rangle$ ) coated with a $0.25-\mathrm{mm}$ layer of dimethylsilanized chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methal and ( $2: 1$ ) acetonitrile and water ( $85: 15$ ) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under UV light at a wavelength of 365 nm : salicylaldazine appears as a fluorescent spot having an $R_{F}$ value of about 0.3 , 0.6 to 0.7 , and the fluorescence of any salicylaldazine spot from the Test solution is not more intense than that produced by the spot obtained from the Standard solution: not more than $1 \mu \mathrm{~g}$ per g is found.

## Limit of peroxides-

Copovidone solution-Transfer the equivalent of 2.0 g of dried Copovidone, accurately weighed, to a $50-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix.

Test solution-Transfer 25.0 mL of Copovidone solution to a $50-\mathrm{mL}$ beaker, add 2 mL of titanium trichloride-sulfuric acid TS, and mix. Allow to stand for 30 minutes at room temperature.

Blank solution-Transfer 25.0 mL of Copovidone solution to a $50-\mathrm{mL}$ beaker, add 2 mL of $13 \%$ sulfuric acid, and mix.

Procedure-Determine the absorbance of the Test solution in a $1-\mathrm{cm}$ cell at the wavelength of maximum absorbance at about 405 nm , with a suitable spectrophotometer, using the Blank solution as the blank: the absorbance is not more than 0.35 (corresponding to not more than $0.04 \%$, expressed as hydrogen peroxide).

Limit of monomers-Dissolve the equivalent of 5.0 g of dried Copovidone in 20 mL of methanol, and slowly add 20.0 mL of iodobromide TS. Allow to stand for 30 minutes, protected from light, with repeated shaking. Add 5 mL of potassium iodide solution (1 in 10), and titrate the liberated iodine with 0.1 N sodium thiosulfate VS until the solution is yellow. Continue the titration dropwise until the solution is colorless, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ): the difference between the volumes of 0.1 N sodium thiosulfate consumed in the blank and the specimen titrations is not more than 0.9 mL , corresponding to not more than $0.1 \%$ of monomers calculated as vinylpyrrolidone.

K-value-Transfer an accurately weighed quantity of undried Copovidone, equivalent to about 1.0 g on the dried basis, to a $100-\mathrm{mL}$ volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 1 hour. Determine the viscosity, using a capillary-tube viscosimeter (see Viscosity $\langle 911\rangle$ ), of this solution at $25 \pm 0.2^{\circ}$. Calculate the K -value of Copovidone by the formula:

$$
\frac{\sqrt{300 c \log z+(c+1.5 c \log z)^{2}}+1.5 c \log z-c}{0.15 c+0.003 c^{2}}
$$

in which $c$ is the weight, in g , on the dried basis, of the specimen tested in each 100.0 mL of solution, and $z$ is the viscosity of the test solution relative to that of water: the K-value is not less than $90.0 \%$ and not more than $110.0 \%$ of the Kvalue stated on the label.

Content of copolymerized vinyl acetate-Determine the saponification value as directed for Saponification Value under Fats and Fixed Oils $\langle 401\rangle$. Calculate the percentage of copolymerized vinyl acetate in the Copovidone taken by the formula:

$$
0.1(86.09 / 56.11)(S)
$$

in which 86.09 and 56.11 are the molecular weights of vinyl acetate and potassium hydroxide, respectively, and $S$ is the saponification value: not less than $35.3 \%$ and not more than $41.4 \%$ of the copolymerized vinyl acetate component, calculated on the dried basis, is found.

Nitrogen, Method II $\langle 461\rangle$-Proceed as directed using about 0.1 g of Copovidone, accurately weighed. In the procedure, use 5 g of a powdered mixture of potassium sulfate, cupric sulfate, and titanium dioxide ( $33: 1: 1$ ) instead of potassium sulfate and cupric sulfate ( $10: 1$ ), omit the use of hydrogen peroxide, and heat until the solution has a clear, yellow-green color and the sides of the flask are free from carbonaceous material. Then heat for a further 45 minutes, add 20 mL of water, instead of 70 mL , after the second heating, and use bromocresol green-methyl red TS instead of methyl red-methylene blue TS. Titrate the distillate with 0.05 N sulfuric acid VS until the color of the solution changes from green through pale grayish blue to pale grayish red-purple: the nitrogen content, on the dried basis, is not less than $7.0 \%$ and not more than $8.0 \%$.■ 1 S (NF23)

## Briefing

Hypromellose Acetate Succinate, page 1102 of $P F$ 29(4) [July-Aug. 2003]-See briefing under Copovidone.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-7

## Add the following:

## -Hypromellose Acetate Succinate

Hydroxypropyl methylcellulose acetate succinate.

Cellulose, 2-hydroxypropyl methyl ether, acetate hydrogen butanedioate.

Cellulose, 2-hydroxypropyl methyl ether, acetate succinate [71138-97-1].
» Hypromellose Acetate Succinate is a mixture of acetic acid and monosuccinic acid esters of hydroxypropyl methylcellulose. When dried at $105^{\circ}$ for 1 hour, it contains not less than 12.0 percent and not more than 28.0 percent of methoxy groups $\left(-\mathrm{OCH}_{3}\right)$, not less than 4.0 percent and not more than 23.0 percent of hydroxypropoxy
groups ( $-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}$ ), not less than 2.0 percent and not more than 16.0 percent of acetyl groups ( $-\mathrm{COCH}_{3}$ ), and not less than 4.0 percent and not more than 28.0 percent of succinoyl groups ( $-\mathrm{COC}_{2} \mathrm{H}_{4} \mathrm{COOH}$ ).

Packaging and storage-Preserve in tight containers. Store at room temperature. Avoid excessive heat and freez ing. Protect from meistere. No storage requirements specified.

Labeling-Label it to indicate its nominal viscosity type.
USP Reference standards $\langle 11\rangle$ —USP Hypromellose Acetate Succinate RS.

Identification, Infrared Abserption- $\langle 197 \mathrm{~K}\rangle$, on undried specimen. Infrared Absorption $\langle 197 \mathrm{~A}\rangle$ —Do not dry specimens. Use a Fourier transform infrared spectrometer fitted with a suitable accessory for single bounce attenuated total reflectance (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) with a diamond crystal. Acquire a background sin-gle-beam spectrum with a clean diamond crystal sampling plate in place. Place the sample on the diamond crystal sampling surface with a microspatula or equivalent. For best results, the sample should cover the crystal surface under the pressure point tip. Using the pressure device, apply pressure to the sample, making sure the sample remains centered under the pressure tip. Acquire a single-beam spectrum of the sample, and make the necessary corrections for the background. Release the pressure device, and clear it from the sample area. Wipe the sample off the crystal and pressure device tip, and rinse both with acetone. The IR spectrum so obtained exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Hypromellose Acetate Succinate RS.

Viscosity $\langle 911\rangle$ -
Sodium hydroxide solution-Immediately before use, dissolve 4.3 g of sodium hydroxide in carbon dioxide-free water to make 1000 mL .

Procedure-To 2.00 g of Hypromellose Acetate Succinate, previously dried, add Sodium hydroxide solution to make 100.0 g , insert a stopper into the vessel, and dissolve by constant shaking for 30 minutes. Adjust the temperature of the solution to $20 \pm 0.1^{\circ}$, and determine the viscosity in a suitable viscometer, as directed for Procedure for Cellulose Derivatives under Viscosity $\langle 911\rangle$. Its viscosity is not less than $80 \%$ and not more than $120 \%$ of that stated on the label.

Loss on drying $\langle 731\rangle$ —Dry it at $105^{\circ}$ for 1 hour: it loses not more than $5.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.20 \%$, determined at $600 \pm 50^{\circ}$.

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.
Limit of freestecinic acid-Transfer 1.5 g of Нургmellese Acetate Stecinate, previeusly dried at $105^{\circ}$ for 1 hour and aceurately weighed, to a separator, dissolve in 50 mL of a mixture of dehydrated aleohol and dichloremethane $(3: 2, \mathrm{v} / \mathrm{v})$, add 75 mL of water with shaking, and then add 50 mL of hexane and 1 gof sodium chloride. Shake-well, and separate the lower water layer. Extract the erganic layer with 50 mL of water, and combine the wash ing and the water layer. Ade 3 dreps of phenolphthatein TS, and titrate with 0.1 N soditm hydroxide VS. Perferm at blank determination, and make any necessary eorrection. Each mL of 0.1N sodium hydroxide is equivalent to 5.904 mg of $\mathrm{C}_{4} \mathrm{H}_{6} \Theta_{4} \div$ net mere than $1.0 \%$ is feunt.

## Limit of free acetic and succinic acids-

Phosphoric acid solution-Transfer 1.0 mL of 1.25 M phosphoric acid into a $50-\mathrm{mL}$ volumetric flask, and dilute with water to volume.
0.02 M Phosphate buffer—Dissolve 5.44 g of monobasic potassium phosphate in 2 L of water.

Diluent-Adjust 0.02 M Phosphate buffer with 1 N sodium hydroxide to a pH of 7.5 .

Acetic acid stock solution-Add approximately 20 mL of water to a stoppered, $100-\mathrm{mL}$ volumetric flask, place the flask on a balance, and tare. Transfer 2.0 mL of the glacial acetic acid to the flask, and record the weight of the acid added. Fill the flask with water to volume. Transfer 6.0 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, and dilute with water to volume.

Succinic acid stock solution-Accurately weigh about 130 mg of succinic acid into a $100-\mathrm{mL}$ volumetric flask. Add about 50 mL of water, and swirl the contents until the succinic acid is fully dissolved. Fill the flask with water to volume.

Mobile phase—Adjust the 0.02 M Phosphate buffer to a pH of 2.8 by dropwise addition of 6 M phosphoric acid. Filter through a $0.22-\mu \mathrm{m}$ nylon filter.

Standard solution-Transfer 4.0 mL of the Acetic acid stock solution into a $25-\mathrm{mL}$ volumetric flask. To the same flask, transfer 4.0 mL of the Succinic acid stock solution, dilute with Mobile phase to volume, and mix. Prepare this solution in duplicate.

Test solution-Accurately weigh about 102 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of Diluent to the vial, and stir the content for 2 hours. Then, transfer 4.0 mL of the Phosphoric acid solution to the same vial to bring the pH of the Test solution to 3 or less. Invert
the vial several times to ensure complete mixing, centrifuge, and use the clear supernatant as a Test solution. Prepare this solution in duplicate.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $215-\mathrm{nm}$ detector and a $4.6 \mathrm{~mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ packing L1. The column temperature is maintained between $20^{\circ}$ to $30^{\circ}$. The flow rate is about 1 mL per minute, and the run time is about 15 minutes. Chromatograph the first preparation of the Standard solution, and record the peak responses as directed for Procedure: the column efficiency, determined from the succinic acid peak, is not less than 8000 theoretical plates; the tailing of this peak is between 0.9 and 1.5 ; and the relative standard deviation for six replicate injections is not more than $2.0 \%$ for each peak. Chromatograph the second preparation of the Standard solution: the difference in peak areas between the two standard solutions for both acetic and succinic acid peaks does not exceed $2 \%$. [NOTE-After each run sequence, the column should be flushed first by $50 \%$ water and $50 \%$ acetonitrile for 60 minutes and then by $100 \%$ methanol for 60 minutes. The column should be stored in $100 \%$ methanol.]

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas corresponding to acetic and succinic acids. Calculate the percentage of free acetic acid, $A_{\text {free }}$, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
0.0768\left(W_{A} / W\right)\left(R_{U A} / R_{S A}\right)
$$

in which $W_{A}$ is the weight of glacial acetic acid, in mg, used to prepare the Acetic acid stock solution; $W$ is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the Test solution; and $R_{U A}$ and $R_{S A}$ are the peak responses for acetic acid obtained from the Test solution and the Standard
solution, respectively. Calculate the percentage of free succinic acid, $S_{\text {free }}$, in the Hypromellose Acetate Succinate taken by the formula:

$$
1.28\left(W_{S} / W\right)\left(R_{U S} / R_{S S}\right)
$$

in which $W_{S}$ is the weight of succinic acid, in mg , used to prepare the Succinic acid stock solution; $R_{U S}$ and $R_{S S}$ are the peak responses for succinic acid obtained from the Test solution and the Standard solution, respectively; and $W$ is as defined above: the sum of free acetic acid and free succinic acid found does not exceed $1.0 \%$.

## Content of acetyl and succinoyl groups-

Phosphoric acid solution, Acetic acid stock solution, Succinic acid stock solution, Mobile phase, Standard solution, and Chromatographic system-Proceed as directed in the test for Limit of free acetic and succinic acids.

Test solution-Accurately weigh about 12.4 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of 1.0 N sodium hydroxide to the vial, and stir the solution for 4 hours. Then, add 4.0 mL of 1.25 M phosphoric acid to the same vial to bring the pH of the solution to 3 or less. Invert the test sample solution vial several times to ensure complete mixing, and filter through a $0.22-\mu \mathrm{m}$ filter. Use the clear filtrate as the Test solution.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas corresponding to acetic and succinic acids. Calculate the percentage of acetic acid, $A$, in the portion of Hy promellose Acetate Succinate taken by the formula:

$$
0.0768\left(W_{A} / W_{U}\right)\left(R_{U A} / R_{S A}\right),
$$

in which $W_{A}$ is the weight of acetic acid, in mg , used to prepare the Acetic acid stock solution; $W_{U}$ is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the Test solution; and $R_{U A}$ and $R_{S A}$ are the peak responses for acetic acid obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of acetyl groups $\left(-\mathrm{COCH}_{3}\right)$ in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$
0.717\left(A-A_{\text {free }}\right)
$$

in which $A_{\text {free }}$ is the percentage of free acetic acid, as determined in the test for Limit of free acetic and succinic acid; and $A$ is as defined above. Calculate the percentage of succinic acid, $S$, in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
1.28\left(W_{S} / W_{U}\right)\left(R_{U S} / R_{S S}\right),
$$

in which $W_{S}$ is the weight of succinic acid, in mg, used to prepare the Succinic acid stock solution; $W_{U}$ is as defined above; and $R_{U S}$ and $R_{S S}$ are the peak responses for succinic acid obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of succinoyl groups $\left(-\mathrm{COC}_{2} \mathrm{H}_{4} \mathrm{COOH}\right)$ in the portion of Hydroxypropyl Methylcellulose Acetate Succinate taken by the formula:

$$
0.856\left(S-S_{\text {free }}\right)
$$

in which $S$ is as defined above; and $S_{\text {free }}$ is the percentage of free succinic acid, as determined in the test for Limit of free acetic and succinic acids.

## Content of methoxy and hydroxypropoxy groups-

fCamtion Hydriodic acid and its reaction byproducts are highly toxic. Perfom all steps in the preparation f the Test solution and the Standerd solution in aproperly functioning hood. Specific safety practices to be followed are be iden tifed the andys performing this test.?
Hydrid Use a reagent having a specific gravily of at least 1.69 , equivalent to $55 \% \mathrm{HH}$.

Internal standerd solution- Transfer about 2.5 g of to tuene, aceurately weighed, to a $100-\mathrm{mL}$ volumetric flask eontaining 10 mL of $\theta$ xylene, dilute with $\theta$ xylene to vo fume, and mix.

Stenderd solution Into suitable serum vial weigh about 135 mg of adipic acid and 4.0 mL of Hydriadic acd, pipet 4 mL of Interal stad solution int the vial, and close the vial seetrely with a stitable septum stopper. Weigh acet rately the vial and contents, add $30 \mu \mathrm{~L}$ - of isopropyl iodide through the septum with a syringe, weigh again, and calet tate the weight of isopropyl iodide added, by difference. Similarly, add $90-\mu \mathrm{L}$ of methyliodide weigh again, and ealeulate the weight of methyl iodide added, by difference. Shake, and allow the layers to separate.

Fest solution Transfer about 0.065 g of Hypromellose Acetate Suceinate, previously dried at $105^{\circ}$ for 1 hour and aceurately weighed, to a 5 mL thick walled reaction vial equippe with a pressure tight septum yype clostre, add an amount of adipic acid equal to the weight of the test spe eimen, and pipet 2 mL of Internal standard solution into the vial. Cautiously pipet 2 mL of Hydriodic aid into the mix ture, immediately eap the vial tightly, and weigh aceurately. Mix the contents of the vial continuously while heating at $150^{\circ}$ for 60 minttes. Allow the vial to cool for about 45 mintes, and weigh again. If the weight loss is greater than 10 -mg, discard the mixture, and prepare another Test preparation.

Chromatographic systen The gas chromatograph is equipped with a thermal conductivity detector and a-4 mm * 1.8 m glass coltum packed with 20\% liquid phase-G28 on 100 to 120 mesh support SIC that is not silanized. Hetimm is used as the carrier gas, and the temperature of the celtamm is maintained at $130^{\circ}$. Chrematograph the Standard solution, and record the peak respenses as directed for Proedure: the relative retention times of methyl iodide, isepropyliodide, toluene, ande-xylene are approximately 1.0,2.2, 3.6, and 8.0, respectively; and the resolution, $R$, between the tolnene and isopropyl iodide peaks is not less than 2.0 .

Galibration Inject about $2 \mu \mathrm{~L}$ of the upper layer of the Standerd solution inte the gas ehromatograph, and record the-chromatograms. Caleulate the relative respense factor, $F_{4}$, of equal weights of toluene and methyl iodide taken by the formula:-

$$
Q_{+4}+R_{\text {sert }}
$$

in which $Q_{4}$ is the quantity ratio of methyliodide to toltene in the Standard soltution, and $R_{\text {sur }}$-is the peak area ratio- of methyl iodide to toltuene obtained from the Stathdard soltttion. Similarly, calculate the relative respense factor, $F$, of equal weights of toluene and isopropyliodide taken by the formata:
$\qquad$

$$
Q_{0}+R_{s}
$$

in which $Q$.is the quantity ratio of isepropyl iodide to to thene in the Standard solution, and $R_{s i}$ is the peak area ratio of isopropyl iodide to toltene obtained from the Standard solution.

Procedure Inject about $2 \mu \mathrm{~K}$ of the upper layer of the Test solution inte the gas chromatograph, and record the ehrematograms. Caleulate the percentage of methoxy groups ( $\mathrm{OCH}_{3}$ ) in the portion of Hypromellose Acetate Succinate taken by the formula:-

$$
2(31 / 142) F_{\#} R_{14}\left(H_{7}+H_{t}\right),
$$

in which $31 / 142$ is the ratio of the formula weights of the methoxy group and methyl iodide; $F_{4}$-is defined under $C a-$ libration; $R_{\text {nu }}$ is the ratio of the area of the methyl iodide peak to that of the toluene peak obtained from the Test solt tion; $W_{7}$ is the weight, in f , of toluene used to prepare the Internal standard solution; and $\mathrm{H}_{+}$is the weight, in g, of Hypromellose Acetate Succinate taken to prepare the Test solution. Similarly, caleulate the pereentage of hydroxyprepexy groups ( $\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}$ ) in the pertion of Hypremellose Acetate Succinate taken by the formula:-

$$
z(75 / 170) F_{d} R_{u}\left(H_{\mp}+W_{\downarrow}\right)
$$

in which $75 / 170$ is the ratio of the formula weights of the hydroxypropoxy group and isopropyliodide; $F_{f}$ is defmed tader Catibration; $R_{\psi}$ is the ratio of the area of the isoprepyl iodide peak to that of the tolnene peak obtained from the Test solution; $W_{f}$ is the weight, in ge of toluene used to pre pare the Internat standetrd solution; and $H_{t}$ is the weight, in g, of Hypromellose Ace Sutecinate taken to prepare the Fest solution.

Gontent of streinoyl groups Transfer about 1 g of Hy promellose Aretate-Strecinate, previously dried at $105^{\circ}$ for Thour and acemately weighed, to aconical flask, dissolve in 50 mL of a mixture of aleohol, acetone, and water $(2: 2: 1$, WV), add 2 dreps of phenelphthalein TS, and titrate with
Q. 1 N soditm hydroxideVS. Perform a blank determination, and make any neeessary corrections. Caleulate the pereenage of suceinoyl groups by the formula:-
in whieh $V$ is the volume, in mL , of 0.1 N soditm hydroxide eensumed after correction for the blank; $W$ is the weight, in g, of Hypremellose Acetate Stuecinate taken; and $S$ is the percentage of free succinic acid found as directed in the test for Limit of free suceinic acid.

## Content of acetyl groups-

Apparatus Use the apparatus illustrated in Figutre 1.

Figure 1: Apparatus for Determination of Content of AcetylGroups

Internal standad solution-Transfer 1.0 mL of propionie acid into a 250 mL volumetrie flask, and dilute with Diluent volume-

Piltent Use dilute phespherie acid ( 1 in 5000 ).
Standard solution Transfer about 100 mg of glacial acetic acid, aceurately weighed, into a 100 mL velumetric flask, and dilute with Diluent to volume. Transfer 15 mL
of this selution to another $100-\mathrm{mL}$ volumetric flack, add 5.0 mL of the Internat standard solttion, and dilute with Dilt ent to volume.

Fest solution Transfer about 150 me of Hypromellose Acetate Suceinate, previously dried at $105^{\circ}$ for 1 hour and aceurately weighed, to decempesition flask D , add 5 mL of sodium hydroxide TS, dissolve by shaking, and decompose in a water bath at $60^{\circ}$ for 2 hours. After cooling, add 5 mL of diluted phosphoric acid ( 1 in 6 ), and immediately construct the apparatus as shown in Figute 1. Dip the decomposition flask and steam generator $B$ in the oil bath at $155^{\circ}$, while passing nitrogen from nitrogen induction tube H at a rate of 1 to 2 bubbles per second, continte the distillation at the same temperature, and collect the distillate in measuring eylinder $G$. Take 60 mL of the distillate, wash the inside of eendenser $F$ with 10 mL of water, combine the washing with the distillate in a $100-\mathrm{mL}$ volumetric flask, add 5.0 mL of the Internal standard solution, and dilute with water to ve tame.

Chromatographic system The gas chromatograph is equipped with a flame-ionization detector and a-3-mm $*$ Z m-glass columm packed with-60-10-80 mesh suppert S2. The carrier gas is helium, and the temperature of the coltamm is maintained at $180^{\circ}$. Adjust the flow rate so that the inter nal standard peak elutes in about 5 minutes. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the elution order is acetic acid, fot towed by the internal standard peak. The resolution, $R$, between these peaks is not less than 2.0; and the relative standard deviation for replicate injections is net mere than $2.0 \%$ for each of the peaks.

## Procedtre Separately inject equal volumes (about $2 \mu \mathrm{~L}$ )

of the Standerd solution and the Test solution inte the chromatograph, record the chromatograms, and measure the re spenses for the major peaks. Caleulate the ratio, $R_{t}$, of the
area of the acetic acid peak to the area of the internal-standard peak in the chromatogram obtained frem the Test solt tion, and similarly ealeulate the ratio, $R_{s}$, in the ehrematogram obtained from the Standard solution. Caleu tate the pereentage of acetylgroups ( $\mathrm{COCH}_{3}$ ) in the pertion of Нурromellose Acetate-Strecinate taken by the formata:-

$$
\left(R_{4}+R_{s}\right)\left(H H_{s}+H\right) \times 0.15 \times 71.68
$$

in whieh $W_{s}$ is the weight, in mg, of glacial acetic acid used to prepare the Standard solution; Wis the weight, in mg, of the pertion of Hypromellose Acetate Suecinate taken; and the other terms are as defined therein.

Content of methoxy and 2-hydroxypropoxy groups-[Caution-Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the Test solution and the Standard solution in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]

Hydriodic acid-Use a reagent having a specific gravity of at least 1.69 , equivalent to $55 \%$ hydrogen iodide.

Solution $A$-Prepare a mixture of water and methanol (90:10).

Solution B-Prepare a mixture of methanol and water (85: 15).

Mobile phase-Use variable mixtures of Solution $A$ and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography $\langle 621\rangle$ ).

Standard stock solution-Transfer 2 mL of $o$-xylene into a stoppered, $10-\mathrm{mL}$ volumetric flask, place the flask on a balance, and tare. Add about $200 \mu \mathrm{~L}$ of methyl iodide, insert the stopper into the flask, and accurately weigh: the weight of methyl iodide is about 350 mg . Tare the flask again, add
about $34 \mu \mathrm{~L}$ of isopropyl iodide, and accurately weigh the flask: the recorded weight of isopropyl iodide is about 50 mg . Dilute with $o$-xylene to volume, and mix.

Standard solution-Transfer about 85 mg of adipic acid into an $8-\mathrm{mL}$ vial (or other suitable container), add 2 mL of Hydriodic acid, and add 2.0 mL of the Standard stock solution. Shake and allow the phases to separate. Carefully transfer approximately 1.5 mL of the $o$-xylene (top) layer to a small vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of this solution into a $10-$ mL volumetric flask, and dilute with methanol to volume. [NOTE-This solution is stable for 8 hours at $5^{\circ}$.]

Test solution-Accurately weigh about 65 mg of Hypromellose Acetate Succinate into a $5-\mathrm{mL}$ reaction vial, add 2.0 mL of $o$-xylene and about 100 mg of adipic acid. Add 2.0 mL of Hydriodic acid, and close the vial tightly with a cap. [Caution-Use a cap that has a top safety relief valve, such as a Minniert valve, to prevent accidental explosion of the vial under high pressure when heated.] Weigh the vial before heating, and place the vial into a heating block at $150^{\circ}$. Shake the vial after 5 minutes and after 30 minutes of heating. Remove the vial from the heating block after 1 hour of heating, and cool. Weigh the vial. If the weight loss is greater than 10 mg , discard the mixture, and prepare another reaction solution. Carefully transfer approximately 1.5 mL of the top $o$-xylene layer into a small glass vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 ml of this solution into a $10-\mathrm{mL}$ volumetric flask, and dilute with methanol to volume. [NOTE-This solution is stable for 8 hours at $5^{\circ}$.]

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a $254-\mathrm{nm}$ detector and a $4.6 \mathrm{~mm} \times 15-\mathrm{cm}$ column that contains $5-\mu \mathrm{m}$ pack-
ing L1. The column temperature is maintained at $30^{\circ}$. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

| Time | Solution A | Solution B |  |
| :---: | :---: | :---: | :--- |
| (minutes) | $(\%)$ | $(\%)$ | Elution |
| 0 | 70 | 30 | equilibration |
| $0-8$ | $70 \rightarrow 40$ | $30 \rightarrow 60$ | linear gradient |
| $8-10$ | $40 \rightarrow 15$ | $60 \rightarrow 85$ | linear gradient |
| $10-17$ | 15 | 85 | isocratic |

[NOTE-These gradient elution times are established on an HPLC system with a dwell volume of approximately 2.0 mL . The injection time can be adjusted relative to the start of a run to accommodate the change in dwell volume from one HPLC system to another to achieve the separation described.] Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the column efficiency, determined from the methyl iodide peak, is not less than 10,000 theoretical plates; the tailing factor of this peak is between 0.9 and 1.5 ; and the relative standard deviation for replicate injections is not more than $2.0 \%$ for each peak.

Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak areas corresponding to methyl iodide and isopropyl iodide. Calculate the percentage of methoxy groups $\left(-\mathrm{OCH}_{3}\right)$ in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
4.38\left(W_{M} / W\right)\left(R_{U M} / R_{S M}\right),
$$

in which $W_{M}$ is the weight of methyl iodide, in mg, used to prepare the Standard stock solution; $W$ is the weight of Hypromellose Acetate Succinate, in mg, used to prepare the Test solution; and $R_{U M}$ and $R_{S M}$ are the peak responses for
methyl iodide obtained from the Test solution and the Standard solution, respectively. Calculate the percentage of 2hydroxypropoxy groups $\left(-\mathrm{OCH}_{2} \mathrm{CHOHCH}_{3}\right)$ in the portion of Hypromellose Acetate Succinate taken by the formula:

$$
8.84\left(W_{I} / W\right)\left(R_{U I} / R_{S I}\right)
$$

in which $W_{I}$ is the weight of isopropyl iodide, in mg, used to prepare the Standard stock solution; $R_{U I}$ and $R_{S I}$ are the peak responses for methyl iodide obtained from the Test solution and the Standard solution, respectively; and $W$ is as defined above. 1 S (NF23)

## Briefing

Hypromellose Phthalate, NF 22 page 2879. In accordance with the implemented name change of the Reference Standard, from USP Hydroxypropyl Methylcellulose Phthalate RS to USP Hypromellose Phthalate RS, it is proposed to make the corresponding change in the USP Reference standards $\langle 11\rangle$ section of the monograph.
(EMC: C. Sheehan) RTS-40945-1

## BRIEFING

Maltitol Solution, NF 22 page 2891 and page 3173 of the First Supplement-See briefing under Ammonium Sulfate.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40871-20

## Change to read:

Packaging and storage--Preserve in well-closed containers. Đe not store below $20^{\circ}$. 1 S (NF22)
${ }^{\bullet}$ No storage requirements specified.es

## Briefing

Maltol. Because there is no existing $N F$ monograph for this product, a new monograph, based on the Maltol monograph on page 273 of the Food Chemicals Codex, Fifth Edition, is being proposed.
(EMC: D. Bempong) RTS-40947-1

## Add the following:

## ■ Maltol

» Maltol contains not less than 99.0 percent of $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{3}$, calculated on the anhydrous basis.

Packaging and storage-Preserve in tight containers, protected from light.

USP Reference standards $\langle 11\rangle —$ USP Maltol $R S$.

## Identification-

A: Infrared Absorption $\langle 197 \mathrm{~K}\rangle$.
B: Ultraviolet Absorption $\langle 197 \mathrm{U}\rangle-$
Solution: 0.01 mg per mL.
Medium: $\quad 0.1 \mathrm{~N}$ hydrochloric acid.
Melting range, Class $1 a\langle 741\rangle$ : between $160^{\circ}$ and $164^{\circ}$.
Water, Method $I\langle 921\rangle$ : not more than $0.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$, determined on 1.0 g .

Lead $\langle 251\rangle$ : $\quad 10 \mu \mathrm{~g}$ per g.
Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.002 \%$.
Assay-
Standard preparation-Dissolve an accurately weighed quantity of USP Maltol RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.01 mg per mL .
Assay preparation-Transfer about 50 mg of Maltol, accurately weighed, to a $250-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.1 N hydrochloric acid to volume, and mix. Pipet 5 mL of this solution into a $100-\mathrm{mL}$ volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.
Procedure-With a suitable spectrophotometer, using 0.1 N hydrochloric acid as a blank, concomitantly determine the absorbances of the Standard preparation and the Assay preparation at the wavelength of maximum absorbance at
about 274 nm . Calculate the quantity, in mg , of $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{3}$ in the portion of Maltol taken by the formula:

$$
5000 C\left(A_{U} / A_{S}\right)
$$

in which $C$ is the concentration, in mg per mL, of USP Maltol RS in the Standard preparation; and $A_{U}$ and $A_{S}$ are the absorbances obtained from the Assay preparation and the Standard preparation, respectively.■1S (NF23)

## Briefing

Maltose, page 1113 of PF 29(4) [July-Aug. 2003]—See briefing under Copovidone.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-4

## Add the following:

## -Maltose

$\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11} \cdot \mathrm{H}_{2} \mathrm{O} \quad 360.31$
$\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11} \quad 342.30$
4-O- $\alpha$-D-Glucopyranosyl- $\beta$-D-glucopyranose.
» Maltose is a sugar. It contains one molecule of water of hydration or is anhydrous. It contains not less than 92.0 percent of maltose, calculated on the anhydrous basis. The amounts of other sugars, if detected, are not included in the requirements or the calculated amount under Other Impurities.

## Change to read:

Packaging and storage-Preserve in tightentainers. Preserve in well-closed containers. Store at room tempera-(tre-No storage requirements specified. ${ }^{1 S}$ (NF23)

USP Reference standards $\langle 11\rangle$ —USP Maltose Monohydrate $R S$.

## Identification-

A: Add 2 to 3 drops of a solution of Maltose $(1$ in 20$)$ to 5 mL of hot alkaline cupric tartrate TS. A red precipitate is formed.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the chromatogram of the Standard preparation, as obtained in the Assay.
$\mathbf{p H}\langle 791\rangle$ —Prepare a 1 in 10 solution in carbon dioxide-free water. For the anhydrous form, it is between 3.7 and 4.7 and for the monohydrate form, it is between 4.0 and 5.5.

Water, Method I $\langle 921\rangle$ —The anhydrous form contains not more than $1.5 \%$. The monohydrate form contains not less than $5.0 \%$ and not more than $6.5 \%$.

Residue on ignition $\langle 281\rangle$ : not more than $0.05 \%$, determined on a $2-\mathrm{g}$ portion, accurately weighed.

Heavy metals, Method I 231$\rangle$ : not more than $5 \mu \mathrm{~g}$ per g.

Dextrin, starch, and sulfite-Dissolve 1.0 g of Maltose in 10 mL of water, and add 1 drop of iodine TS: a yellow color develops. Then add 1 drop of starch TS to this portion: a blue color develops.

## Assay-

Mobile phase-Use degassed water.
Resolution solution-Dissolve accurately weighed quantities of maltotriose, maltose, and glucose in water, to obtain a solution having concentrations of about 10 mg of each per g.

Standard preparation-Dissolve an accurately weighed quantity of USP Maltose Monohydrate RS in water, to obtain a solution having a concentration of about 10 mg ef per g . Calculate the exact concentration on the anhydrous basis.
Assay preparation-Dissolve about 0.10 g of Maltose, accurately weighed, in water, and dilute with water to about 10 g . Accurately record the final solution weight, and mix thoroughly.

Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatographic system is equipped with a refractive index detector maintained at a constant temperature of about $40^{\circ}$, and a $7.8-\mathrm{mm} \times 30-\mathrm{cm}$ column that contains packing $\mathrm{L} 54 \mathrm{~L} \# \#$ (See Chromatography $\langle 621\rangle$ ). The column temperature is maintained at about $80^{\circ}$, controlled to within $\pm 2^{\circ}$. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure. Adjust the flow rate to about 0.35 mL per minute such that the resolution, $R$, between maltotriose and maltose is not less than 1.6. and that between maltose and glueese is not less than 4.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for maltotriose, 1.0 for maltose, and 1.2 for glucose; and the relative standard deviation for replicate injections is not more than $2.0 \%$.

Procedure-Separately inject equal volumes (about 20 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of Maltose on the anhydrous basis, taken by the formula:

$$
\left[10,000\left(C_{S} / C_{U}\right)\left(r_{U} / r_{s}\right)\right] /(100-W)
$$

in which $C_{S}$ is the concentration, in mg per g , on the anhydrous basis of USP Maltose Monohydrate RS in the Standard preparation; $C_{U}$ is the concentration, in mg per g , of Maltose in the Assay preparation; $r_{U}$ and $r_{S}$ are the peak responses obtained from the Assay preparation and the Standard preparation, respectively; and $W$ is the percentage obtained in the test for Water. $\mathbf{U S S}_{\text {(NF22) }}$

## BRIEFING

Palmitic Acid. Because there is no existing $N F$ monograph for this product, a new monograph, based on the Palmitic Acid monograph in the European Pharmacopoeia, Fourth Edition, Supplement 1 , page 2507 , is being proposed.
(EMC: D. Bempong) RTS-40951-1

## Add the following:

## Palmitic Acid

$\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{O}_{2} \quad 256.43$
Hexadecanoic acid [57-10-3].
» Palmitic Acid is a mixture of solid organic acids obtained from fats or oils of animal or vegetable origin. The content of $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{O}_{2}$ is not less than 92.0 percent and the content of stearic acid $\left(\mathrm{C}_{18} \mathrm{H}_{36} \mathrm{O}_{2}\right)$ is not more than 6.0 percent.

Packaging and storage-Preserve in well-closed containers, and store at room temperature.

Labeling-Label it to indicate whether it is derived from animal or vegetable sources.

USP Reference standards $\langle 11\rangle$ —USP Palmitic Acid $R S$.
USP Stearic Acid RS.
Color-Heat it to about $75^{\circ}$. The resulting liquid is not more intensely colored than a solution prepared by mixing 1.2 mL of ferric chloride CS and 0.3 mL of cobaltous chloride CS with 0.3 N hydrochloric acid to make 10 mL , and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL . Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see Color and Achromicity $\langle 631\rangle$ ).

Identification-The chromatogram of the Assay preparation obtained as directed in the Assay exhibits a major peak for palmitic acid, the retention time of which corresponds to that exhibited by palmitic acid in the chromatogram of the Standard preparation, obtained as directed in the Assay.

Congealing temperature $\langle 651\rangle$ : between $60^{\circ}$ and $66^{\circ}$.
Acid value $\langle 401\rangle$ : between 216 and 220 , using about 1 g , accurately weighed.

Iodine value $\langle 401\rangle$ : not more than 1. Proceed as directed in Method I except to use 35 mL of chloroform.

Mineral acid—Shake 5 g of melted Palmitic Acid with an equal volume of hot water for 2 minutes, cool, and filter: the filtrate is not reddened by the addition of 1 drop of methyl orange TS.

Heavy metals, Method II $\langle 231\rangle$ : $\quad 0.001 \%$.
Organic volatile impurities, Method $V\langle 467\rangle$ : meets the requirements.

Solvent-Use dimethyl sulfoxide.

## Assay-

Standard preparation-Prepare the Standard preparation in the same manner as the Assay preparation, using a mixture of 50 mg of USP Palmitic Acid RS and 50 mg of USP Stearic Acid RS instead of the substance to be examined.

Assay preparation-Proceed as directed for Test Solution in Fatty Acid Composition under Fats and Fixed Oils $\langle 401\rangle$.

Chromatographic system (see Chromatography $\langle 621\rangle$ )— Prepare as directed for Fatty Acid Composition under Fats and Fixed Oils $\langle 401\rangle$. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for methyl palmitate and 1.0 for methyl stearate; the resolution, $R$ between methyl stearate and methyl palmitate is not less than 3.0.

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, identify the methyl palmitate peak in the chromatogram obtained from the Assay preparation by comparing the retention times of the peaks in that chromatogram with those in the chromatogram obtained from the Standard preparation, and measure the responses for all of the peaks, excluding the solvent peak. Calculate the percentage of $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{O}_{2}$ in the portion of Palmitic Acid taken by the formula:

100A/B,
in which $A$ is the methyl palmitate peak response; and $B$ is the sum of the responses of all the peaks in the chromatogram, except the solvent peak. Similarly, calculate the percentage of stearic acid in the portion of Palmitic Acid taken. 1 S (NF23)

## Briefing

Phenolsulfonphthalein, page 2018 of $P F$ 29(6) [Nov.-Dec. 2003]-See briefing under Copovidone.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-6

## Add the following:

## ■Phenolsulfonphthalein

$\mathrm{C}_{19} \mathrm{H}_{14} \mathrm{O}_{5} \mathrm{~S} \quad 354.38$
Phenol Red
Phenol, 4,4'-(3H-2,1-benzoxathiol-3-ylidene)bis-,( $S, S$-dioxide).

3,3-bis(4-hydroxyphenyl)-3H-2,1-benzoxathiole 1,1-dioxide [143-74-8].

## » Phenolsulfonphthalein contains not less than

 98.0 percent and not more than 102.0 percent of $\mathrm{C}_{19} \mathrm{H}_{14} \mathrm{O}_{5} \mathrm{~S}$, calculated on the dried basis.Packaging and storage-Preserve in well-closed containers. Store at $25^{\circ}$, exeursions permitted between $15^{\circ}$ and $30^{\circ}$.

No storage requirements specified.
Labeling-Where it is intended for use in nistered either intramuseularly or subeutaneously, articles administered parenterally, it is so labeled.

USP Reference standards $\langle 11\rangle$ —USP Endotoxin RS.

## Identification-

A: Transfer 5 mg of Phenolsulfonphthalein to a 100mL volumetric flask, dissolve in and dilute with sodium carbonate solution (1 in 100) to volume, and mix. Dilute 5.0 mL of the solution so obtained to 100.0 mL with sodium carbonate solution (1 in 100). Examined between 400 and 630 nm , the solution exhibits an absorption maximum at 558 nm . The specific absorbance at the maximum is between 1900 and 2100.

B: Dissolve about 10 mg of Phenolsulfonphthalein in 2 mL of 1 N sodium hydroxide, and add 8 mL of water. To 5 mL of the solution so obtained add 1 mL of 0.1 N potassium bromide-bromate and 1 mL of diluted hydrochloric acid, shake, and allow to stand for 15 minutes. Render the solution alkaline with 1 N sodium hydroxide: an intense violetblue color is produced.

Visual transition interval-Dissolve 1.0 g of potassium chloride in 100 mL of water, and adjust with 0.01 N hydrochloric acid or sodium hydroxide to a pH of 6.8 . Dissolve 0.1 g of Phenolsulfonphthalein in 100 mL of alcohol, and add 0.15 mL of this solution to the potassium chloride solution. The color of the resulting solution is yellow, with not more than a faint trace of green color. Titrate the solution with 0.01 N sodium hydroxide to a pH of 7.0 : the color of the solution becomes orange. Continue the titration to pH 8.2: the color of the solution becomes red. Not more than 0.20 mL of 0.01 N sodium hydroxide is consumed in the entire titration.

Microbial limit $\langle 61\rangle$ —The total aerobic microbial count does not exceed 1000 cfu per $g$, and the total combined molds and yeasts count does not exceed 100 cfu per g .

Bacterial endotoxins $\langle 85\rangle$-Where it is intended for use in vaceines administered either intramuseularly or subeuta nemsly, articles administered parenterally, it contains not more than 600 USP Endotoxin Units per mg.

Loss on drying $\langle 731\rangle$ —Dry 1 g of the powdered Phenolsulfonphthalein at $105^{\circ}$ to constant weight: it loses not more than $1.0 \%$ of its weight.

Residue on ignition $\langle 281\rangle$ : not more than $0.2 \%$, determined on a $0.5-\mathrm{g}$ portion.

Insoluble substances-To about 1 g of the finely powdered Phenolsulfonphthalein, accurately weighed, add a solution of 0.50 g of sodium bicarbonate in 12 mL of water. Allow to stand for 1 hour, shaking frequently. Dilute with sufficient water to make 100 mL , and allow to stand for 15 hours. Centrifuge at 2000 to $3000 g$ for 30 minutes, and decant the supernatant. Wash the residue first with 25 mL of sodium bicarbonate solution ( 1 in 100), then with 25 mL of water, and dry at $105^{\circ}$ : the weight of the insoluble residue does not exceed $0.5 \%$ of the weight of Phenolsulfonphthalein taken.

## Chromatographic purity-

Adsorbent: $\quad 0.25-\mathrm{mm}$ layer of chromatographic silica gel mixture.

Application volume: $\quad 10 \mu \mathrm{~L}$
Developing solvent system: a mixture of tert-amyl alcohol, glacial acetic acid, and water ( $100: 25: 25$ ).

Test solution-Transfer about 100 mg of Phenolsulfonphthalein to a $5-\mathrm{mL}$ volumetric flask, dissolve in and dilute with 0.1 N sodium hydroxide to volume, and mix.

Diluted test solution-Transfer 0.5 mL of the Test solution to a $100-\mathrm{mL}$ volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

Procedure-Proceed as directed for Thin-Layer Chromatography under Chromatography $\langle 621\rangle$. Allow the plate to air-dry until the solvent has evaporated, and expose the plate to ammonia vapor. Examine the plate under short-wavelength UV light. Not more than one spot, apart from the principal spot, appears in the chromatogram obtained from the Test solution. This spot is not more intense than the spot in the chromatogram obtained from the Diluted test solution: not more than $0.5 \%$ is found.

Assay-Transfer about 0.9 g of Phenolsulfonphthalein, accurately weighed, to a $250-\mathrm{mL}$ volumetric flask, dissolve in 15 mL of 1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 10.0 mL of the solution so obtained to a glass-stoppered flask, add 25 mL of glacial acetic acid, 20.0 mL of 0.1 N potassium bromate $\mathrm{VS}, 5 \mathrm{~mL}$ of potassium bromide solution ( 1 in 10 ), and 5 mL of hydrochloric acid, and immediately insert the stopper into the flask. Allow to stand protected from light for 15 minutes. Quickly add 10 mL of potassium iodide solution (1 in 10), taking care to avoid the escape of bromine vapor, immediately insert the stopper in the flask, and shake vigorously. Rinse the stopper and the neck of the flask with a small quantity of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination (see Residual Titrations under Titrimetry $\langle 541\rangle$ ), and note the difference in volumes required. Each mL of the difference in volumes of 0.1 N sodium thiosulfate is equivalent to 4.43 mg of $\mathrm{C}_{19} \mathrm{H}_{14} \mathrm{O}_{5} \mathrm{~S}$.■1S (NF23)

## Briefing

Polyisobutylene, page 3175 of the First Supplement-See briefing under Ammonium Sulfate.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40871-16

## Change to read:

Packaging and storage-Store in well-closed containers. Storeat room temperature, and avoid excessive heat and freezing. Protect from moisture.
${ }^{\bullet}$ No storage requirements specified. $\bullet$

## Briefing

Sodium Caprylate. Because there is no existing NF monograph for this excipient, a new monograph, based on the Sodium Caprylate monograph in the European Pharmacopoeia, Fourth Edition, page 1904, is being proposed.
(EMC: E. Gonikberg) RTS-40973-1

## Add the following:

## ■Sodium Caprylate

» Sodium Caprylate contains not less than 99.0 percent and not more than 101.0 percent of sodium octanoate $\left(\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{O}_{2} \mathrm{Na}\right)$, calculated on the anhydrous basis.

Packaging and storage-Store in well-closed containers. USP Reference standards $\langle 11\rangle$ —USP Caprylic Acid RS. Appearance of solution-Dissolve 2.5 g of Sodium Caprylate in 25.0 mL of freshly boiled and cooled water: the resulting solution is clear and colorless.

## Identification-

A: The retention time of the major peak in the chromatogram of Test solution 1 corresponds to the major peak in the chromatogram of the Reference solution, as directed in the test for Chromatographic purity.

B: Proceed as directed below.
Methoxyphenylacetic reagent-Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of $10 \%$ tetramethylammonium hydroxide solution in methanol, and add 20 mL of alcohol. Store in a polyethylene container.

Procedure-Dissolve about 20 mg of Sodium Caprylate in 0.5 mL of water, add 1.5 mL of Methoxyphenylacetic reagent, and cool in ice water for 30 minutes. A voluminous, white, crystalline precipitate is formed. Place in water at $20^{\circ}$, and stir for 5 minutes. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of ammonium carbonate solution (16 in 100): no precipitate is formed.
$\mathbf{p H}\langle 791\rangle$ : between 8.0 and 10.5, in a solution obtained in the test for Appearance of solution.

Water, Method $I\langle 921\rangle$ : not more than 3.0\%.
Heavy metals, Method II $\langle 231\rangle$ —Dissolve 2.0 g of Sodium Caprylate in 10 mL of glacial acetic acid, add 10 mL of alcohol, and use 12 mL of the solution obtained as the Test

Preparation. Prepare the Standard Preparation using 1 mL of Standard Lead Solution and 9 mL of a mixture of glacial acetic acid and alcohol ( $1: 1$ ). The limit is $5 \mu \mathrm{~g}$ per g .

## Chromatographic purity-

Reference solution-Transfer 10 mg of USP Caprylic Acid RS to a $10-\mathrm{mL}$ volumetric flask, and dilute with ethyl acetate to volume.

Test solution 1-Dissolve 116 mg of Sodium Caprylate in 5 mL of water, add 1 mL of dilute sulfuric acid ( 1 in 35 ), and extract with 10 mL of ethyl acetate. Separate the organic layer, and dry it over anhydrous sodium sulfate.

Test solution 2-Dilute 1.0 mL of Test solution 1 with ethyl acetate to 100 mL , transfer 5.0 mL of the solution obtained, and dilute with ethyl acetate to 50 mL .

Chromatographic system (see Chromatography $\langle 621\rangle$ )— The gas chromatograph is equipped with a flame-ionization detector, a split injection system with a split ratio of about $1: 100$, and a $0.25-\mathrm{mm} \times 30-\mathrm{m}$ fused silica column coated with a $0.25-\mu \mathrm{m}$ layer of phase G25. The carrier gas is helium, flowing at a rate of 1.5 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at $100^{\circ}$, then, 1 minute after the injection, the temperature is increased at a rate of $5^{\circ}$ per minute to $220^{\circ}$, and maintained at $220^{\circ}$ for another 10 minutes. The injection port temperature and the detector temperature are maintained at $250^{\circ}$. Chromatograph Test solution 2, and record the peak responses as directed for Procedure: the signal-to-noise ratio of the principal peak is not less than 5 .

Procedure-Separately inject equal volumes (about $1 \mu \mathrm{~L}$ ) of the Reference solution, Test solution 2, and Test solution 1 into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Disregard any peaks with an area less than half of the area of the principal
peak from Test solution 2, and any peak due to the solvent. Calculate the percentage of each impurity in the portion of Sodium Caprylate taken by the formula:

$$
100\left(r_{i} / r_{s}\right),
$$

in which $r_{i}$ is the peak response of the individual impurity, and $r_{s}$ is the sum of the responses of all the peaks: not more than $0.3 \%$ of any impurity is found, and the sum of all the impurities found is not greater than $0.5 \%$.

Assay-Transfer an accurately weighed quantity of about 150 mg of Sodium Caprylate to a $125-\mathrm{mL}$ volumetric flask, dissolve in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 16.62 mg of $\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{O}_{2} \mathrm{Na}$.■1S (NF23)

## Briefing

Anhydrized Liquid Sorbitol, page 1128 of $P F$ 29(4) [JulyAug. 2003]-See briefing under Copovidone.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-5

## Add the following:

## ■Anhydrized Liquid Sorbitol

» Anhydrized Liquid Sorbitol is a water solution containing, on the anhydrous basis, not less than 25.0 percent of D-sorbitol $\left(\mathrm{C}_{6} \mathrm{H}_{14} \mathrm{O}_{6}\right)$ and not less than 15.0 percent of 1,4 -sorbitan $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{5}\right)$. The amounts of total sugars, other polyhydric alcohols, and any other hexitol anhydrides, if detected, are not included in the requirements or in the calculated amount under Other Impurities.

Packaging and storage-Preserve in tightenters. Preserve in well-closed containers. Pe net stere below $20^{\circ}$. No storage requirements specified.

Labeling-The labeling indicates the percentage content, on the anhydrous basis, of D-sorbitol and 1,4-sorbitan.

USP Reference standards $\langle 11\rangle$ —USP Sorbitol RS. USP 1, 4-Sorbitan RS.

## Identification-

A: Dissolve 1.4 g of Anhydrized Liquid Sorbitol in 75 mL of water. Transfer 3 mL of this solution to a $15-\mathrm{cm}$ test tube, add 3 mL of freshly prepared catechol solution (1 in
10), and mix. Add 6 mL of sulfuric acid, mix again, then gently heat the tube in a flame for about 30 seconds: a deep pink or wine-red color appears.

B: The retention times of the major peaks in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.

Microbial limits $\langle 61\rangle$-The total aerobic microbial count using the Plate Method is not more than $10^{3}$ cfu per mL . The total combined molds and yeasts count is not more than $10^{2}$ cfu per mL .
$\mathbf{p H}\langle 791\rangle$ : between 4.0 and 7.0 , in a $14 \%(\mathrm{w} / \mathrm{w})$ solution of Anhydrized Liquid Sorbitol in carbon dioxide-free water.

Water, Method $I\langle 921\rangle$ : not more than $31.5 \%$.
Residue on ignition $\langle 281\rangle$ : not more than $0.20 \%$, calculated on the anhydrous basis. Determine on a $2-\mathrm{g}$ portion, accurately weighed.

Reducing sugars-To an amount of Anhydrized Liquid Sorbitol, equivalent to 3.3 g , on the anhydrous basis, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. Proceed as direeted in the test for Reduing sugans tader Mannitol, beginning with "Heat so that boiling be gins." Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than $0.3 \%$ of reducing sugars, on the anhydrous basis, as glucose. The amount determined in this test is not included in the calculated amount under Other Impurities.

## Limit of nickel-

Test solution-Dissolve 20.0 g of Anhydrized Liquid Sorbitol in diluted acetic acid, and dilute with diluted acetic acid to 100.0 mL . Add 2.0 mL of a saturated solution of ammonium pyrrolidine dithiocarbamate (about 10 g of ammonium pyrrolidine dithiocarbamate per L) and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution-Prepare as directed for the Test solution, except to omit the use of Anhydrized Liquid Sorbitol. Quantities should be increased five fold to ensure that a sufficient volume of Blank solution is available.

Standard solutions-Prepare as directed for the Test solution, except to prepare three solutions by adding $0.5 \mathrm{~mL}, 1.0$ mL , and 1.5 mL of nickel standard solution TS.

## Procedure-Proceed as directedin the test for Niekel an

der Mamitol. Set the instrument to zero using the Blank solution. Concomitantly determine the absorbances of the Standard solutions and the Test solution at least three times each, at the wavelength of maximum absorbance at 232.0 nm , with a suitable atomic absorption spectrophotometer (see Spectrophotometry and Light-Scattering $\langle 851\rangle$ ) equipped with a nickel hollow-cathode lamp and an airacetylene flame. Record the average of the steady readings for each of the Standard solutions and the Test solution. Between each measurement, aspirate the Blank solution, and ascertain that the reading returns to zero. Plot the absorbances of the Standard solutions and the Test solution versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the Test solution. Not more than $1 \mu \mathrm{~g}$ per g , calculated on the anhydrous basis, is found.

## Assay-

Mobile phase-Use degassed water.
Resolution solution-Dissolve sorbitol, 1,4-sorbitan, isosorbide, and mannitol in water to obtain a solution having concentrations of about 10 mg per $\mathrm{g}, 4 \mathrm{mg}$ per $\mathrm{g}, 4 \mathrm{mg}$ per g , and 1 mg per g , respectively.

Standard preparation-Dissolve accurately weighed quantities of USP Sorbitol RS and USP 1,4-Sorbitan RS in water to obtain a solution having concentrations of about 10 mg per g and 4 mg per g , respectively.

Assay preparation-Dissolve about 0.40 g of Anhydrized Liquid Sorbitol, accurately weighed, in water, and dilute with water to about 20 g . Accurately record the final solution weight, and mix thoroughly.
Chromatographic system (see Chromatography $\langle 621\rangle$ )The liquid chromatograph is equipped with a refractive index detector that is maintained at a constant temperature of about $35^{\circ}$, and a $7.8-\mathrm{mm} \times 10-\mathrm{cm}$ column that contains packing L34. The column temperature is maintained at about $50^{\circ}$, controlled within $\pm 2^{\circ}$, and the flow rate is about 0.6 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, $R$, between the 1,4 -sorbitan and isosorbide is not less than 2.0. Chromatograph the Standard preparation, and record the peak responses for 1,4 -sorbitan and sorbitol as directed for Procedure: the relative retention times are about 0.35 for 1,4 -sorbitan, 0.43 for isosorbide, 0.7 for mannitol, and 1.0 for sorbitol; and the relative standard deviation for replicate injections is not more than $2.0 \%$ for each analyte.
Procedure-Separately inject equal volumes (about 10 $\mu \mathrm{L}$ ) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Separately cal-
culate the percentages, on the anhydrous basis, of 1,4-sorbitan and sorbitol in the portion of Anhydrized Liquid Sorbitol taken by the formula:

$$
\left[10,000\left(C_{s} / C_{U}\right)\left(r_{U} / r_{s}\right)\right] /(100-W)
$$

in which $C_{S}$ is the concentration, in mg per g , of the appropriate USP Reference Standard in the Standard preparation; $C_{U}$ is the concentration, in mg per g , of the Anhydrized $\mathrm{Li}-$ quid Sorbitol in the Assay preparation; $r_{U}$ and $r_{S}$ are the peak responses of the corresponding analyte obtained from the Assay preparation and the Standard preparation, respectively; and $W$ is the percentage obtained in the test for Water:-1S (NF23)

Modified Starch, page 1132 of PF 29(4) [July-Aug. 2003]See briefing under Copovidone.
(EMC: C. Sheehan; PSD: C. Okeke) RTS-40873-2

## Add the following:

## ■Modified Starch

» Modified Starch is Starch modified by chemical means. Food Starch may be acid-modified, bleached, oxidized, esterified, or etherified, or treated enzymatically to change the functional properties (21 CFR 172.892).

## Packaging and storage-Preserve-Store-in-well-elesed <br> eontainers at temperattres ranging from $0^{\circ}$ to $55^{\circ}$. Preserve

 in well-closed containers. No storage requirements specified.
## Botanic characteristics-

Corn starch-Polygonal, rounded or spheroidal granules up to about $35 \mu \mathrm{~m}$ in diameter and usually having a circular or several-rayed central cleft.
Tapioca starch-Spherical granules with one truncated side, typically 5 to $35 \mu \mathrm{~m}$ in diameter and usually having a circular or several-rayed central cleft.
Potato starch-Irregularly shaped, ovoid, or pear-shaped granules, usually 30 to $100 \mu \mathrm{~m}$ in size but occasionally exceeding $100 \mu \mathrm{~m}$; or rounded, 10 to $35 \mu \mathrm{~m}$ in size. There are occasional compound granules having two to four components. The ovoid and pear-shaped granules have an eccentric hilum, and the rounded granules have accentric or slightly eccentric hilum. All granules show clearly visible concentric striations.

Wheat starch-Large and small granules, usually 10 to 60 $\mu \mathrm{m}$ in diameter. The central hilum and striations are visible or barely visible.

## Identification-

A: Prepare a smoeth mixture of 1 g of Modified Stareh
with 2 mL of cold water, stir into 15 mL of beiling water, beilgently for 2 minutes, and coolto room temperature: the product is translucent to clear. Prepare a $2 \%(\mathrm{w} / \mathrm{w})$ sodium hydroxide solution. Weigh 0.6 g of Modified Starch, and transfer to a $25-\mathrm{mL}$ glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vigorously to evenly disperse
the starch. Add 10 g of $2 \%$ sodium hydroxide solution, cap, and shake vigorously for 1 minute to create a smooth mixture. Evaluate within 1 minute. The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.

B: A water slurry of the Modified Starch is colored red dish violet orange-red to deep blue by iodine TS.

Microbial limits $\langle 61\rangle$-It meets the requirements of the tests for absence of Salmonella species and Escherichia coli. The total aerobic microbial count does not exceed 1000 cfu per g ; the total combined molds and yeasts count does not exceed 100 cfu per $g$.
$\mathbf{p H}\langle 791\rangle$ —Weigh $20.0 \pm 0.1 \mathrm{~g}$ of Modified Starch, transfer to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Stir using a magnetic stirrer at a moderate rate for about 5 minutes, and determine the pH to the nearest 0.1 unit: between 4.5 and 8.0. 3.0 and 9.0. Loss on drying $\langle 731\rangle$ —Dry it at $120^{\circ}$ for 4 hours. it loses not more than $14 \%$ its weight. Corn starch, Wheat starch, and Tapioca starch: not more than $15.0 \%$; Potato starch: not more than $21.0 \%$.

Residue on ignition $\langle 281\rangle$ : not more than $0.5 \%$, a test specimen of $2.0 \pm 0.1 \mathrm{~g}$ being used.

Iron $\langle 241\rangle$ : $0.002 \%$, the Test Preparation being prepared as follows. Dissolve the residue obtained in the test for Re sidue on ignition in 8 mL of hydrochloric acid with the aid of gentle heating. Dilute with water to 100 mL in a volumetric flask, and mix. Dilute 25 mL of this solution with water to $47 \pm 1 \mathrm{~mL}$.

Oxidizing substances-To 5g of Modiffed Stareh add 20 mL of a mixture of methanel and water ( $1: 1$ ), then add 4 mL of 6 N acetic acid, and stir untila hemogeneous suspension is obtained. Add 0.5 mL of a freshly prepared saturated selution of potassium iodide, mix, and allow to stand for 5 mintes: no distinct blte, brown, or purple color is obsed. Transfer 4.0 g to a glass-stoppered, $125-\mathrm{mL}$ conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered, $50-\mathrm{mL}$ centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, $125-\mathrm{mL}$ conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to $34 \mu \mathrm{~g}$ of oxidant, calculated as hydrogen peroxide. Not more than 12.6 mL of 0.002 N sodium thiosulfate is required ( $180 \mu \mathrm{~g}$ per g , calculated as $\mathrm{H}_{2} \mathrm{O}_{2}$ ): not more than $0.018 \%$ of oxidizing substances is found.

Limit of sulfur dioxide-Mix $20.0 \pm 0.1 \mathrm{~g}$ of Modified Starch with 200 mL of $5 \%$ alcohol until a smooth suspension is obtained, and vacuum filter through paper (Whatman No. 1 or equivalent). To 100 mL of the filtrate add 3 mL of starch TS, and titrate with 0.10 N iodine to the first perma-
nent blue color. Not more than 2.7 mL is consumed: not more than $0.008 \% 0.005 \%$ of sulfur dioxide is found.■1S (NF23)

## Briefing

〈41〉 Weights and Balances，USP 27 page 2148．In this pro－ posed revision，based in part on correspondence received，the proof of trueness of the weighing（systematic errors）is distinguished from the proof of precision（uncertainty）．The former is an issue of the calibration of the balance，while the latter is a measure of the uncertainty of the weighing．Together，they determine the ac－ curacy of the weighing．The concept of minimum weight is also introduced．
（PA4：H．Pappa）RTS－41034－1

## Change to read：

## 〈41〉 WEIGHTS AND BALANCES

The intent of this section is to bring the requirements for weights into confermity with Ameriean Natienal Standard ANSI／ASTM E617，＂Laberatery Weights and Precision Mass－Standards．＂This standard is ineorperated by reference and should be consulted for fall deseriptions and information on the tolerances and construt－ tion of weights．${ }^{+}$

Pharmacepeial tests and assays require balanees that vary in ea pacity，sensitivity，and reproducibility．Unless otherwise－speeifled， when substances are to be＂aceurately weighed＂for Assay the weighing is to be perfermed with a weighing deviee whose mea
${ }^{4}$ Copies of ASTM Standard E617 81（Reapproved 1985）may be ebtained from the American．Society for Testing and Materiats， 1916 Pace－Street，Philadelphia，PA 19103．
surement uncertainty (random plus systematic error) does not ex eeed $0.1 \%$ of the reading. Meastrement uncertainty is satisfactory if three times the standard deviation of not less than ten replicate weighings divided by the ameunt weighed, does not exeed 0.001 . Unless otherwise speeified, for titrimetrie limits tests, the weighing shall be performed to provide the number of signifiean figures in the weight of the analyte that correspends to the number of signiff ieant figures in the concentration of the titrant.

The class designations below are in order of increasing toler ances.

Class 1.1 weights are used for calibration of low eapacity, hight sensitivity balanees. They are available in various denominations from 1 to 500 mg . The toleranee for any denemination in this class is $5 \mu \mathrm{~g}$. They are recommended for calibration of balanee using eptienlor electrieal methods for aceurately weighing quantities be 1ow 20 me.

Class 1 weights are designated as high precision-standards for ealibration. They may be used for weighing aecurately quantities below 20 mg . (For weights of 10 s or less, the requirements of class 1 are met by USP KXI class M.)

Glass 2 weights are used as working standards for calibration, built in weights for analytieal balanees, and laboratory weights for routine analytical-work. (The requirements of class 2 are met by USP XXI class S. ${ }^{2}$

Glass 3 and class 4 weights are used with moderate precision taboratory balanees. (Class 3 requirements are met by USP XXI elass S 1; class-4 requirements are met by USP XXI elass P.) ${ }^{2}$

A weight class is chosen so that the tolerance of the weights used does not exeeed $0.1 \%$ of the amount weighed. Generally, class 2 may beused for quantities greater than 20 mes, class 3 for quantities of greater than 50 mg, and class 4 for quantitie of greater than 100 m. Weights should be calibrated periodically, preferably against an absolute standard weight.

## -INTRODUCTION

Measurement processes are generally subject to a wide variety of influences. Weighing is no exception and may get distorted by many factors that introduce bias and uncertainty into the results. The distortions may be caused by properties of the weighing object, the balance, the environment, and the procedure used to weigh the object.

Influences originating from the balance, itself, are manifold. They include effects introduced by the following properties of the balance: quantized digital display, limited capability to repeat, nonlinear characteristic, sensitivity to eccentric loading, deviation of sensitivity from the correct value, and temperature dependence. Among the factors that affect the weighing object, the most prominent is buoyancy,

[^96]which is caused by the fact that weighings are usually being carried out in air instead of empty space (i.e., a vacuum). Determination of the weight of objects with large surface areas is also affected by air drafts (even in the presence of draft shields), by electrostatic charge buildup (e.g., glass, plastic, or other electrically insulating materials), and by magnetic forces (e.g., stirring magnets or magnetically permeable objects).
Ambient conditions such as air temperature, humidity, pressure, and air velocity will also have an effect on the weighing object and the balance. In addition, effects caused by vibration, inclination, or other conditions may also be present.

In the following sections the requirements for weights and balances are described.

## WEIGHTS

ASTM standard E617, "Standard Specification for Laboratory Weights and Precision Mass Standards" is incorporated by reference and is to be consulted for full descriptions and information on the tolerances and construction of weights. ${ }^{1}$

Weights are periodically calibrated against standard masses. The mass of each weight thus determined is referred to as its calibration mass value, and the difference between the nominal mass value and the calibration mass value is referred to as its calibration error.

When weights are used with beam balances to weigh materials, the weight class is chosen so that the tolerances of the weights do not exceed $0.1 \%$ of the net amount weighed. If the weights meet the tolerances of the corresponding ASTM class (currently 8 classes, numbered $0-$

[^97]7), corrections for calibration errors are not required. If, however, weights are used to calibrate beam or electronic balances, different criteria apply.

The class designations below are listed in order of increasing tolerances.

- Class 0 and Class 1 weights are designated as high-precision standards for calibration. Use of Class 0 and Class 1 weights requires careful control of relative humidity and temperature and accurate monitoring of barometric pressure, as specified by the weight manufacturer.
- Class 1 and Class 2 weights may be used as laboratory weights for routine analytical work. Weights in Class 0 through Class 3 are available in denominations from 1 mg to 50 kg , and their tolerances vary with class and nominal values.
- Class 4, Class 5, and Class 6 weights may be used with moderate-precision balances, trip balances, dial scales, and platform scales; they are available in denominations from 1 mg to 5000 kg , and their tolerances vary with nominal values.
- Class 7 weights are used in rough weighing operations.

## BALANCES

Pharmacopeial procedures require balances that vary in capacity, readability, and repeatability. When substances are to be "accurately weighed", weighings have to be performed with an expanded relative uncertainty, $U_{\text {rel }}$, equal to or smaller than $0.1 \%$, observing a coverage factor, $k$, of
three. The expanded relative uncertainty is thus given by the following expression:

$$
\begin{equation*}
U_{r e l}=k u_{r e l}=3 u_{r e l}, \tag{1}
\end{equation*}
$$

in which the relative standard uncertainty, $u_{r e l}$, is given by the formula:

$$
\begin{equation*}
u_{r e l}=u / m \tag{2}
\end{equation*}
$$

in which $u$ is the (absolute) standard uncertainty of the weighing; and $m$ is the weighed sample (or net) mass to which this uncertainty applies. From statements (1) and (2) we get the following:

$$
\begin{equation*}
U_{r e l}=k u / m \tag{3}
\end{equation*}
$$

The smallest possible amount of mass that meets the aforementioned requirement is known as the "minimum weight", which can be obtained from the following formula:

$$
\begin{equation*}
m_{\text {min }}>\left(k / U_{r e l}\right) u=(3 / 0.1 \%) u=3000 u \tag{4}
\end{equation*}
$$

For cases in which a small mass (compared to the maximum capacity of the balance) is considered, it is generally sufficient to represent the standard uncertainty, $u$, of the weighing by its repeatability, $S_{R P}$, because other contributors to uncertainty (from sources such as linearity deviation, eccentric load deviation, or sensitivity offset) are much smaller and thus may be neglected. This leads to a simple
expression for $m_{\text {min }}$, whereby the minimal sample mass depends only on one property of the weighing, namely its repeatability:

$$
\begin{equation*}
m_{m i n}>\left(k / U_{r e l}\right) S_{R P}, \tag{5}
\end{equation*}
$$

in which $S_{R P}$ represents the standard deviation of not less than 10 replicate weighings obtained from the individual net readings, $R_{i}$, as follows:

$$
\begin{equation*}
S_{R P}=\sqrt{\frac{1}{n-1} \sum_{i=1}^{n}\left(R_{i}-\bar{R}\right)^{2}} \tag{6}
\end{equation*}
$$

in which

$$
\begin{equation*}
\bar{R}=\frac{1}{n} \sum_{i=1}^{n} R_{i} \tag{7}
\end{equation*}
$$

The test weighings must be performed with a weighing setup under conditions similar to those expected for later use, including the following: configuration of the balance, type of weighing object (sample and/or container), weighing procedure, environmental conditions, and the site of use. If weights are used to simulate the sample mass, they need not be calibrated.

As the standard deviation, $S_{R P}$, is reduced to a value equal or even less than the readability, $d$, of a digital balance, then the influence of the necessary rounding between two indication steps on the weighing value becomes predominant. Similarly, the standard deviation estimated from repeated weighings is influenced by the average weighing value, and it may accidentally vanish altogether, i.e., have
a value of zero. To prevent this, a replacement value for the standard uncertainty of no less than $0.4 d$ must be observed, as shown below:

$$
\begin{equation*}
S_{R P} \geq 0.4 d \tag{8}
\end{equation*}
$$

Thus the minimal weight, $m_{\text {min }}$, is greater than $3000 S_{R P}$ or greater than 1200 d , whichever is larger.

This suitability test differs from routine calibrations of the balance. It is used to determine the suitability of a weighing device initially and at established intervals thereafter. Measurement uncertainty may be determined as part of the balance maintenance and calibration, and need not be repeated with every weighing. The frequency of testing, as well as the measurement conditions, are established by the balance user and form a part of the laboratory standard operating procedures.■1S (USP28)

## Briefing

<81 $\rangle$ Antibiotics-Microbial Assays, USP 27 page 2163. In the Turbidimetric Method section under Procedure, it is proposed to replace the name of the reagent methyl sulfoxide with its synonym "dimethyl sulfoxide". The use of "dimethyl sulfoxide" will be standardized throughout the $U S P-N F$.

## PROCEDURE

## Assay Designs

Microbial assays gain markedly in precision by the segregation of relatively large sources of potential error and bias through suitable experimental designs. In a cylinder-plate assay, the essential comparisons are restricted to relationships between zone diameter measurements within plates, exclusive of the variation between plates in their preparation and subsequent handling. To conduct a turbidimetric assay so that the differences in observed turbidity will
reflect the differences in the antibiotic concentration requires both greater uniformity in the environment created for the tubes through closer thermostatic control of the incubator and the avoidance of systematic bias by use of a random placement of replicate tubes in separate tube racks, each rack containing one complete set of treatments. The essential comparisons are then restricted to relationships between the observed turbidities within racks.

NOTE-For some purposes, the practice is to design the assay so that a set of treatments consists of not fewer than three tubes for each sample and standard concentration, and each set is placed in a single rack.

Within these restrictions, the assay design recommended is a 1level assay with a standard curve. For this assay with a standard curve, prepare solutions of 5,6 , or more test dilutions, provided they include one corresponding to the reference concentration $\left(S_{3}\right)$, of the Standard and a solution of a single median test level of the Unknown as described under Preparation of the Standard and Preparation of the Sample. Consider an assay as preliminary if its computed potency with either design is less than $80 \%$ or more than $125 \%$ of that assumed in preparing the stock solution of the Unknown. In such a case, adjust its assumed potency accordingly and repeat the assay.

Microbial determinations of potency are subject to inter-assay as well as intra-assay variables, so that two or more independent assays are required for a reliable estimate of the potency of a given assay preparation or Unknown. Starting with separately prepared stock solutions and test dilutions of both the Standard and the Unknown, repeat the assay of a given Unknown on a different day. If the estimated potency of the second assay differs significantly, as indicated by the calculated standard error, from that of the first, conduct one or more additional assays. The combined result of a series of smaller, independent assays spread over a number of days is a more reliable estimate of potency than that from a single large assay with the same total number of plates or tubes.

## Cylinder-Plate Method

To prepare assay plates using Petri dishes, place 21 mL of Medium 2 in each of the required number of plates, and allow it to harden into a smooth base layer of uniform depth, except for Amphotericin B and Nystatin, where no separate base layer is used. For Erythromycin, Gentamicin, Neomycin B, Paromomycin, and Sisomicin, use Medium 11. For Bleomycin, use 10 mL of Medium 35. For Dihydrostreptomycin use Medium 5. For Vancomycin, use 10 mL of Medium 8. For Carbenicillin, Colistimethate Sodium, Colistin, and Polymyxin B, use Medium 9. For Netilmicin, use 20 mL of Medium 11. Add 4 mL of seed layer inoculum (see Preparation of Inoculum and Table 3), prepared as directed for the given antibiotic, except for Bleomycin (use 6 mL ), for Netilmicin (use 5 mL ), and for Nystatin and Amphotericin B (use 8 mL ), tilting the plate back and forth to spread the inoculum evenly over the surface, and allow it to harden. Drop 6 assay cylinders on the inoculated surface from a height of 12 mm , using a mechanical guide or other device to insure even spacing on a radius of 2.8 cm , and cover the plates to avoid contamination. After filling the 6 cylinders on each plate with dilutions of antibiotic containing the test levels specified below, incubate the plates at $32^{\circ}$ to $35^{\circ}$, or at the temperature specified below for the individual case, for 16 to 18 hours, remove the cylinders, and measure and record the diameter of each zone of growth inhibition to the nearest 0.1 mm . Incubate the plates at $29^{\circ}$ to $31^{\circ}$ for Amphotericin B and Nystatin. Incubate
at $34^{\circ}$ to $36^{\circ}$ for Novobiocin. Incubate at $36^{\circ}$ to $37.5^{\circ}$ for Carbenicillin, Colistimethate Sodium, Colistin, Dihydrostreptomycin, Gentamicin, Neomycin, Netilmicin, Paromomycin, Polymyxin B, Sisomicin, and Vancomycin.

For the 1-level assay with a standard curve, prepare dilutions representing 5 test levels of the Standard $\left(S_{1}\right.$ to $\left.S_{5}\right)$ and a single test level of the Unknown $U_{3}$ corresponding to $S_{3}$ of the standard curve, as defined under Preparation of the Standard and Preparation of the Sample. For deriving the standard curve, fill alternate cylinders on each of 3 plates with the median test dilution $\left(S_{3}\right)$ of the Standard and each of the remaining 9 cylinders with one of the other four dilutions of the Standard. Repeat the process for the three dilutions of the Standard. For each Unknown, fill alternate cylinders on each of 3 plates with the median test dilution of the Standard $\left(S_{3}\right)$, and the remaining 9 cylinders with the corresponding test dilution $\left(U_{3}\right)$ of the Unknown.

## Turbidimetric Method

On the day of the assay, prepare the necessary doses by dilution of stock solutions of the Standard and of each Unknown as defined under Preparation of the Standard and Preparation of the Sample. Add 1.0 mL of each dose, except for Gramicidin, Thiostrepton and Tylosin (use 0.10 mL ) to each of 3 prepared test tubes, and place the 3 replicate tubes in a position, selected at random, in a test tube rack or other carrier. Include similarly in each rack 1 or 2 control tubes containing 1 mL of the test diluent (see Table 1) but no antibiotic. Upon completion of the rack of test solutions (with Candicidin, within 30 minutes of the time when water is added to the methyl-sulfoxide

- dimethyl sulfoxide $_{\mathbf{m}_{1 \mathrm{~S}} \text { (USP28) }}$
stock solution), add 9.0 mL of inoculum to each tube in the rack in turn, and place the completed rack immediately in an incubator or a water bath maintained at $36^{\circ}$ to $37.5^{\circ}$, except for Candicidin (incubate at $27^{\circ}$ to $29^{\circ}$ ). Incubate the tubes for 4 to 5 hours, except for Capreomycin, Chloramphenicol, Cycloserine, Dihydrostreptomycin, Spectinomycin, Streptomycin, and Troleandomycin (incubate these for 3 to 4 hours), Tylosin (incubate for 3 to 5 hours), and Candicidin (incubate for 16 to 18 hours). After incubation add 0.5 mL of dilute formaldehyde to each tube, except for Tylosin (heat the rack in a water bath at $80^{\circ}$ to $90^{\circ}$ for 2 to 6 minutes or in a steam bath for 5 to 10 minutes, and bring to room temperature), taking one rack at a time, and read its transmittance or absorbance in a suitable spectrophotometer fitted with a $530-\mathrm{nm}$ or $580-\mathrm{nm}$ filter (see Spectrophotometer under Apparatus).
