The user of a bulk pharmaceutical excipient should always receive a COA for material to be used in the manufacture of a drug product. At a minimum, the user should perform adequate identification tests on each lot of excipient received before releasing it for use in the drug product. Specific identity tests should be used whenever possible. It is a regulatory requirement that excipients be assessed for conformity with all appropriate specifications. However, testing of all specification parameters may not be required for lot release if adequate compliance assurances are provided on the supplier's COA. Before using an excipient in a pharmaceutical product based on COA data, the user also ~~must~~ should have an understanding of the supplier's control systems and compliance with GMPs, through appropriate auditing or qualification of the supplier.

Nevertheless, it is the responsibility of the user of the excipient to verify any of the analytical data contained in the COA if knowledge of such information is deemed essential

to the use of that excipient. Such testing may go beyond the scope of the compendial methods described in the *NF*, or beyond those used to develop the information in the COA.

To use test results from a COA, the user must also establish the reliability of the supplier's COA test results by periodically performing all required tests and comparing the results obtained to the supplier's test results. Occasionally, it may not be possible to perform all the required tests because of special equipment requirements, etc., that may not be available to the user. Performing fewer than all these tests may be acceptable provided that the reliability of the supplier has been adequately determined using other appropriate supplier qualification techniques.

It is important to understand that these results may not always specifically correlate, especially when an excipient is produced as a continuous lot. However, the user's test results should demonstrate compliance with the specification requirement.

Use of Contract Facilities—Contract facilities are frequently used in the manufacture, testing, and distribution of excipients. When such facilities are used, the supplier of the excipient has the obligation to ensure that the facilities operate under appropriate quality standards (i.e., cGMP, GLP, etc.).

DESIGN AND ~~REQUIRED~~ SUGGESTED ELEMENTS OF A CERTIFICATE OF ANALYSIS

The ~~required~~ suggested elements of a COA are listed below and are included in the following *Certificate of Analysis Template* section of this chapter. Excipient suppliers may organize the ~~required~~ suggested elements presented in the COA template at their discretion; however, the parts of the template were designed to present the ~~required~~ suggested and optional information in a logical manner. For a detailed description of each element and examples of statements, see the appropriate section below in this chapter.

The origin and the identity of the excipient are typically established in a *Header* section. The manufacturer and manufacturing site ~~must~~ should be identified if different from the supplier and supplier location, enabling the user to make certain that the excipient comes from a qualified source. Although the manufacturer ~~must~~ should be made known to the user, the use of codes for manufacturers and manufacturing sites on the COA to protect confidentiality is acceptable. The identity of the excipient must be definitively established by stating the compendial and trade name, the grade of the material, and applicable compendial designations.

A lot/batch number or other means of uniquely identifying the quantity of material covered by the COA and information relating specifically to it are typically included in a *Body* section. The lot number or other unique identification of the material, its date of manufacture, and product code or number ~~must~~ should be stated and traceable to a specified lot. If applicable, the expiration date, recommended re-evaluation date, or other relevant statement regarding the stability of the excipient is typically included in this section. Any information required by the customer would also be included here.

The actual test results applicable to the quantity of material covered by the COA are included in an *Analysis* section. The test name, the result, the acceptance criteria or specifications, and a reference to the test method used ~~must~~ should be included for each characteristic listed. Reporting of actual data and observations is recommended rather than nonspecific ''passes'' or ''conforms'' statements. If the reported results are derived from a skip-lot or reduced frequency testing program, or an average or in-process test result, this ~~must~~ should be noted on the COA.

The *Certification and Compliance Statement* section is used to list various types of statements that may be required depending on the excipient and specific user needs. These statements are usually negotiated between supplier and user based on specific application requirements. Any declaration of the supplier that includes compliance of additional compendial or other regulatory requirements is typically included in this section.

Many excipients have applications other than pharmaceuticals, such as food, cosmetics, or industrial products. Any product listed as being in compliance with specific regulations ~~must~~ should meet the specifications and requirements of that regulation and must be manufactured under appropriate GMPs.

The identity of the individual approving the content of the COA ~~must~~ should appear on the COA. The page number and total number of pages ~~must~~ should also appear on the COA. This information is usually included in a *Footer* section.

CERTIFICATE OF ANALYSIS TEMPLATE

Listed below is a template for the content and format of a COA.

Header

- Titled "Certificate of Analysis"
- Company Name, Address, Phone Number, and Identity of Manufacturer and Manufacturing Site
- Name (compendial/trade) of Excipient
- Grade of Excipient
- Compendial Designation

Body

- Lot/Batch Number
- Date of Manufacture
- Product Code or Number
- Expiration Date (if required)
- Recommended Re-Evaluation Date (if required)
- Stability Statement (if required)
- Customer Required Information

Analysis

- Test Name
- Test Results
- Acceptance Criteria (i.e., specifications)
- Reference to the Test Method
- Reference to Skip-Lot Testing (if appropriate)
- Reference to Average or In-Process Test Results (if appropriate)
- Date Retested (if appropriate)
- Summary of Noncompendial Testing (if any)

Certification and Compliance Statements

- GMP Compliance ~~(IPEC excipient GMPs)~~
- Additional Regulatory References
- Potential to Meet Additional Compendial Standards
- Content Listing and Grade of Ingredients (if a mixture)
- Other Specific Compliance Statements [e.g., organic volatile impurities (OVI), residual solvents, transmissible spongiform encephalopathy (TSE), etc.]

Footer

- Identity of Authorized Individual for Approval
- Date of Approval
- Page Number (i.e., 1 of __)

COMPENDIAL DESIGNATION

For a supplier to claim a compendial grade on the COA for an excipient, two requirements ~~must~~ should be met. The first requirement is that the excipient be manufactured according to recognized principles of GMPs (see ~~*General Notices* and *Good Manufacturing Practices for Bulk Pharmaceutical Excipients* ⟨1078⟩~~ *General Notices and Requirements*). Adequate conformance to GMPs ~~must~~ should also be demonstrated for subsequent steps in the distribution of the excipient. The second requirement is that the excipient meet all the specifications contained in the appropriate compendial monograph, unless its difference is stated on its label, as defined under *General Notices and Requirements.* When an excipient is listed as compendial grade, it is understood that the above requirements have been met for the material, and the user would be able to confirm this through an appropriate audit of the supplier.

Compendial standards define what is considered an acceptable article and also give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The supplier's release specifications and compliance with GMPs are developed and followed to ensure that the article, when stored correctly, will comply with compendial standards until its expiration or recommended re-evaluation date.

Every compendial article shall be so constituted that when examined in accordance with these assay and test procedures, it meets all the requirements in the monograph defining it, as well as meeting any provisions under *General Notices and Requirements* and in the general chapters, as applicable. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for ensuring compliance with compendial standards before the batch is released for distribution.

Data derived from manufacturing process validation studies and from in-process controls may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from examination of finished units drawn from the batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the supplier when judging compliance of the batch with the compendial standards.

DATES ON A CERTIFICATE OF ANALYSIS

Part of the overall goal to standardize COA for excipients includes a provision for the consistent reporting of appropriate, meaningful, and well-defined dates. The discussion below indicates specific dates that are expected on the COA, along with definitions of the dates, in order to provide suppliers and users of excipients with a mutual understanding of their meaning. Use of the recommended terminology will be helpful in reducing the number of questions on dating information reported for excipients. Use of terminology other than that discussed below is discouraged, because the terms may be ill-defined and have different meanings for the excipient supplier and user. Examples of such terms that should **not** be used include ''shelf life'', ''use-by date'', ''warranty date'', and ''expiration period''.

In reporting dates on COA for excipients, it is important that a clear and unambiguous format be used to prevent possible misinterpretation. To accomplish this, it is recommended that an alpha designation be used for the month (may be abbreviated), rather than a numerical representation. It is also recommended that the year include all 4 digits (e.g., Jan. 1, 2005, or 1 Jan. 2005).

Date of Manufacture—The date of manufacture ~~must~~ should be included on the COA for each excipient lot and should be assigned by the suppliers on the basis of their established policies and procedures. It is recognized that excipients may be manufactured using a variety of processes (e.g., continuous or batch) that may require a period of several days or more to complete. In addition, some excipients may be mixtures or blends of other excipients, and excipient production may include reprocessing steps. Because of this diversity, the date of manufacture should be clearly defined by the supplier and consistently applied for the particular excipient and process. In reporting the date of manufacture, the excipient supplier should indicate the date of completion of the final manufacturing process (as defined by the supplier).

It is important to note that repackaging alone is not considered a processing step to be used in determining the date of manufacture. To provide traceability for a specific excipient lot, other dates may be required in addition to the date of manufacture in order to to reflect additional steps such as repackaging.

Expiration Date and Recommended Re-Evaluation Date—The stability of excipients may be an important factor in the stability of the finished pharmaceutical dosage forms that contain them. Many excipients are very stable and may not require extensive testing to demonstrate continued conformance to appropriate specifications. Other excipients may undergo chemical, physical, and microbiological changes over time that cause the material to fall outside established specifications.

Appropriate expiration and/or recommended re-evaluation dates for excipients should be established from the results of a documented stability-testing program or from historical data. The testing program should include defined and controlled storage conditions (e.g., temperature and humidity), a consideration of different packaging types that may be used as market containers, and meaningful, specific test methods to adequately assess the stability characteristics of the excipient. Stability testing should determine whether possible degradation, moisture gain or loss, viscosity changes, or other possible changes occur to make the excipient unacceptable for use (e.g., unstable or hygroscopic materials). For additional information on excipient stability, see *Good Manufacturing Practices for Bulk Pharmaceutical Excipients* ⟨1078⟩.

The expiration date for an excipient is defined as the date after which the supplier recommends that the material should not be used. Prior to the assigned expiration date, the excipient is expected to remain within established specifications, if stored according to the supplier's recommended conditions.

The recommended re-evaluation date for an excipient is the date suggested by the supplier after which the material should be re-evaluated to ensure continued compliance with specifications. Re-evaluation of the excipient may include physical inspection and appropriate chemical, physical, and microbiological testing. Prior to the re-evaluation date, the excipient is expected to remain within established specifications, provided it has been stored according to the supplier's recommended conditions. But beyond the recommended re-evaluation date, the excipient should not be used without adequate evaluation at appropriate intervals, to determine whether the material continues to be acceptable for use. The recommended re-evaluation date differs from the expiration date in that the excipient may be re-evaluated to extend the length of time the material may be used, if supported by the results of the evaluation and appropriate stability data.

In reporting the expiration and recommended re-evaluation dates, the excipient supplier is providing important information to the user about the stability of the material. As discussed previously, the assignment of an expiration date and a recommended re-evaluation date should be based on appropriate evaluation of potential changes that may occur in the material's properties. It is acceptable to report both an expiration date and a recommended re-evaluation date on the COA for excipients, if applicable, but both dates may not always be required. Expiration and recommended re-evaluation dates should not be reported by a supplier without sufficient stability data or product history to support the assigned dates.

For excipients determined to be very stable (greater than 2 years), either the specific expiration date and/or the recommended re-evaluation date should be reported on the COA for the material, or a general stability statement may be included (e.g., stability greater than 2 years). If available data indicate that an excipient has limited stability (2 years or less) under anticipated storage conditions, a specific expiration date and/or recommended re-evaluation date ~~must~~ should be reported on the COA for the material.

If long-term stability data are not available for an excipient, an appropriate statement should be included on the COA to indicate what is known about the stability of the material and whether stability studies are in progress.

Date Retested—If retesting is performed by an excipient supplier and the results are used to extend the length of time that the material may be used, the date retested should also be reported on the COA. The specific tests that were subject to retesting should be clearly identified, and the results obtained upon retesting should be reported. After retesting, a new recommended re-evaluation date should be reported on the COA.

Additional Dates—Other dates may appear on a COA, if desired by the excipient supplier or requested by the user. Examples include the release date, shipping date, date of testing, and date the COA was printed or approved. Any additional dates that appear on a COA for excipients ~~must~~ should include a clear indication of what the date represents or means.

TESTING FREQUENCY

For the excipients listed in the *USP–NF*, the product specifications are set by the supplier to include all parameters listed in the monograph. It is not required that analysis of all specification parameters be made on each lot (see *General Notices and Requirements*). However, sufficient analysis and process validation data ~~must~~ should exist to ensure that the lot meets all specifications before it is released. This is an established practice that has been successfully used in industry for many years. Periodic testing of all parameters should be performed to revalidate the control system. The frequency of these periodic tests should be determined by the suppliers on the basis of their understanding of the manufacturing control system. At a minimum, the parameters should be checked once a year.

For excipients that are not included in *USP–NF*, specifications should be set by the supplier to ensure that the quality of the material is maintained on a continuing basis and reflects both the excipient manufacturing process and inherent properties. The analytical methods used to evaluate the characteristics of noncompendial excipients may be the same as those contained in the compendia, or may be unique to the supplier or the material. The methods should be demonstrated to provide accurate, reproducible, and consistent results for the characteristic being tested. It may be appropriate for noncompendial excipients to have some tests performed at reduced frequency.

The excipient user should evaluate the supplier's specifications and methods to ensure that they are appropriate and acceptable for the quality control needed for the manufacturing process of their drug product. The user ~~must~~ should determine which of the supplier's specifications and methods are required for release of the excipient for use in their process. If additional tests or alternative methods are required by the user, appropriate specifications and methods, along with responsibility for performing the testing, must be agreed upon by the excipient supplier and user.

Reduced Frequency Testing—When analysis of some parameters is carried out at a reduced frequency (for example, every 10th lot), this ~~must~~ should be clearly stated on the COA. Each specific test subject to reduced frequency testing ~~must~~ should be indicated. Reduced frequency testing should be used only for excipients manufactured using a stable process. There ~~must~~ should be a sound technical basis and sufficient documentation to support testing any parameter at a reduced frequency. This would normally include the following points:

- Appropriate validation of the manufacturing process
- Process control—attribute charting (when appropriate)
- GMP controls

As part of the justification for reduced testing, it is important that there be assurances in place showing that the manufacturer's process complies with appropriate excipient GMP requirements.

Some tests, because of their significance, should always be performed on each lot, whereas others may be candidates for reduced frequency testing. Attribute testing results in qualitative data that provide pass/fail results or results expressed as less than or greater than a specified value. The result merely establishes compliance with a specification parameter. There are no data to indicate how well the material complies, as would be obtained from variable or quantitative test results.

Reduced frequency testing of an attribute requires that the manufacturer show that the qualitative parameter is in a state of statistical control. This necessitates tabulating the test results for consecutive lots produced.

Skip-Lot Testing—Skip-lot testing may be applied to an excipient that is made by either a batch or a continuous process. Various commonly accepted statistical sampling plans may be used to demonstrate appropriate process control. Examples of each are listed below:

EXAMPLE 1: For an average outgoing quality level (AOQL) of 1% and a test frequency of 1 in 10, the supplier ~~must~~ should find 100 consecutive lots in conformance. At a 2% AOQL and a test frequency of 1 in 10, the supplier would test 50 consecutive lots. For a 1% AOQL and a 1 in 5 test frequency, the supplier would test 70 consecutive lots. Nomographs are available to determine the test requirements.

EXAMPLE 2: When the excipient is manufactured by a continuous process, no discrete lot is produced. The sampling plan again is based upon the risk of approving a lot that was nonconforming. By testing 140 consecutive lots before going to a test frequency of 1 in 10, the plan establishes a low risk of approving a lot that is noncompliant.

Once the requirement is met, the supplier can monitor conformance to the specification parameter by testing 1 in 10 lots. Should any lot fail the analysis, the supplier ~~must~~ should return to 100% testing until the results once again meet the specification above.

Because excipients vary greatly in chemical and physical properties, the supplier of the excipient should determine which tests should be routinely performed and which tests may be appropriate for reduced frequency testing. This de-

termination must be justified and documented on the basis of the adequacy of the supplier's control system. Documentation ~~must~~ should be kept detailing the assumptions and the data supporting the skip-lot testing plan.

Type A and Type B Tests—Only certain types of tests are appropriate for reduced frequency testing. *Type A* is defined as tests that may not be easily controlled through standard process control techniques or that may change with time. These tests should normally be performed on each lot. *Type B* is defined as tests that normally can be controlled using standard process control techniques and that are not expected to change with time. These tests are candidates for reduced frequency testing. Examples of both types of tests are listed below:

Type A: Examples of Tests That Typically Need To Be Performed on Every Lot

- *Identification*—Required by GMPs for users (candidate for reduced frequency testing by suppliers)
- *Assay*—Critical quality parameter (if specified)
- *Viscosity*—Usually indicates grade
- *Loss on drying* (or moisture determination)—Indication of stability and appropriate process controls
- *Color*—Indication of stability and appropriate process controls
- *pH*—Indication of stability and appropriate process controls

Type B: Examples of Tests That May Be Candidates for Reduced Frequency Testing

- *Manufacturing impurities*—Based on starting materials and processes (e.g., Chloride, Sulfate, Nitrate, Glyoxal)
- *Heavy metals*
- *Lead*
- *Arsenic*
- *Residue on ignition*
- *Residual solvents*

This is not meant to be an exhaustive list of tests. It simply provides some direction on how a supplier can assess the importance of each test to the overall control of the process. Tests listed as possible candidates for reduced frequency testing (*Type B*) may need to be routinely tested (*Type A*), depending on the raw materials and process. Determinations can also be made for some *Type A* tests to become *Type B* tests. In a dedicated facility, identification testing by the supplier may not be necessary.

Documentation—The supplier of an excipient should develop and maintain documentation that outlines the process control systems and validation data to justify the use of reduced frequency testing. This documentation should also include procedures for handling the impact of significant changes on the reduced frequency testing program. For further information on excipient changes, see *Significant Change Guide for Bulk Pharmaceutical Excipients* ⟨1195⟩.*

The minimum number of lots to be fully tested for all specification parameters after a change has been made depends on the process and the significance of the change and should be based on sound statistical considerations.

Additionally, the documentation should contain procedures for re-evaluating the reduced frequency testing program when a testing failure occurs. Decisions regarding the continuance of reduced frequency testing ~~must~~ should be justified on the basis of the reasons for the failure and the supplier's ability to provide assurances that the reduced frequency testing program or other in-process parameters would identify these types of failures in the future.

* A draft of this new informational chapter appears elsewhere in this issue of *PF*.

Justifications for Reduced Frequency Testing—The following are examples of situations where a sound technical basis can be demonstrated and where reduced frequency testing might therefore be justified. [NOTE—There may be other such examples.]

- An impurity, by-product, or unreacted raw material could not be present in the product because the raw materials and chemical reactions used could not contain or generate such substances above the specified limits.
- The process capability index (*Cp*) on the relevant parameter is high and based on a stable process. Statistical analysis of the reduced frequency data should show that the property remains stable and within specifications. A process is considered stable when the output of the process, regardless of the nature of the processing (batch or continuous), can be demonstrated by appropriate means to show a level of variability that consistently meets all aspects of the stated specification (both Pharmacopeia-specific and customer-specific) and is thus acceptable for its intended use. For continuous processing, it is also important to demonstrate that the material has been produced under conditions in which the process has achieved a form of "steady state", i.e., in which there is minimal operator intervention and in which the in-process parameters have been stabilized (see *Appendix 2* for further definition of this concept and for determining levels of control).
- For a continuous process, the in-process analyses show that the property that is determined at reduced frequency is stable and within specification. Repeating the test on each lot would be redundant.
- An analysis that is determined on every lot has been shown to strongly correlate with an analysis that is run at a reduced frequency. The correlation shows that if a lot is within specification on the first analysis, it will be within specification on the second analysis.

USE OF ELECTRONIC SIGNATURES

Because of the growing dependence on computers and the need to accommodate paperless record systems, an electronic alternative to handwritten records and signatures is ~~required~~ suggested. Excipient suppliers have added computer information systems to enhance productivity.

The primary issue with transfer of a COA without a handwritten signature is the validation of data. There are several considerations that ~~must~~ should be met before an electronic signature or name attachment to a COA is considered acceptable.

- Computer systems access must be limited to authorized individuals: access is gained only after inputting a user name and a password. The system should require frequent changes of each individual password.
- A confirmation of the integrity and accuracy of the information stored in the system ~~must~~ should be completed.
- The operation of the system must be checked routinely to ensure that the correct information is transferred from the database to the printed record.
- Data entered into a database from which information is extracted for a COA ~~must~~ should be accompanied by time- and date-stamped audit trails.

When these criteria are met, the issuance of COAs with electronic signatures or the responsible person's name attached to the document, in lieu of a handwritten signature, is acceptable. [NOTE—Computer systems are currently regulated by 21 CFR 11 of the Food and Drug Administration (FDA). Users should monitor the FDA's approach to compliance in this area.]

DISTRIBUTOR INFORMATION

The presentation of a COA issued by a distributor presents some challenges. Because COAs are important documents characterizing the excipients and the state of their quality, the source of that information becomes very important to the end user(s). Because distributors take on different roles in fulfilling the services for which they are contracted, it is necessary to ensure that procedures and methods are appropriate for the functions performed.

Distributors may function in a number of different capacities relating to the movement of excipients and to services associated with their production. Some are simply pass-through locations in which nothing is done to the excipient with the exception of storage and handling. Others serve as extensions of the manufacturer's process by taking bulk quantities and repackaging them for the manufacturer. Still others purchase excipients and repackage them under a different label for sale and distribution. These scenarios ~~need to~~ should be understood and properly documented with programs that will protect the integrity and safety of the excipients as they move through the distribution process.

Original Manufacturer and Manufacturing Site—The identity of the original manufacturer and the manufacturing site ~~must~~ should be included on the COA for excipients. This information is important because it provides traceability for specific excipient lots and assures the excipient users that they are consistently obtaining material from the same manufacturer and site.

Reporting the identity and location of the manufacturer does not represent an issue when the original manufacturer is also the direct supplier of the excipient to the pharmaceutical customers. However, it is recognized that this information may be considered proprietary by an excipient distributor. To adequately address this issue, excipient distributors ~~must~~ should either list the specific information identifying the original manufacturer and location or provide the information by reporting an appropriate code, which is assigned in order to unambiguously identify the original manufacturer and manufacturing site. To protect the secrecy of this information, the meaning of the code does not have to be revealed to intermediary distributors.

Certificate of Analysis Data—When a distributor is primarily used as a pass-through of the excipient without any changes to the excipient and packaging, the COA that accompanies the excipient from the manufacturer can be passed on in the original form. If the data are extracted, translated, or rewritten on other letterhead, a system ~~must~~ should be in place to check the rewritten information, and justification should be demonstrated upon request. Alternatively, the source of the data should be indicated on the document.

For a distributor that takes bulk quantities of an excipient from a manufacturer and introduces the bulk quantities into a process (e.g., conveyance and storage system), analysis of the packaged excipient should be performed to demonstrate the same quality as the lot (batch) introduced. Appropriate analytical data should be included on the COA to verify the quality. The distributor ~~must~~ should use equivalent methodology and equipment for the analytical evaluation. Some data may be used from the original manufacturer's COA with appropriate justification.

In all scenarios, it is expected that the distributor will have the appropriate level of GMP in place.

APPENDIX 1

DEFINITIONS

Acceptance Criteria—The specifications and acceptance or rejection limits—such as acceptable quality level or unacceptable quality level with an associated sampling plan—

that are necessary for making a decision to accept or reject a lot or batch of raw material, intermediate, packaging material, or excipient.

Batch (or Lot)—A defined quantity of excipient processed so that it could be expected to be homogeneous. In a continuous process, a batch corresponds to a defined portion of the production, based on time or quantity (e.g., vessel's volume, 1 day's production, etc.).

Batch Number (or Lot Number)—A unique and distinctive combination of numbers and/or letters from which the complete history of the manufacture, processing, packaging, coding, and distribution of a batch can be determined.

Batch Process—A manufacturing process that produces the excipient from a discrete supply of raw materials that is present before the completion of the reaction.

Certificate of Analysis (COA)—A document relating specifically to the results of testing a representative sample drawn from the batch of material to be delivered.

Chemical Property—A quality parameter that is measured by chemical or physicochemical test methods.

Continuous Process—A manufacturing process that continually produces the excipient from a continuous supply of raw material.

Contract Facility—An internal or external facility that provides services to the manufacturer or distributor of an excipient. These can include, but are not limited to, the following: manufacturing facilities, laboratories, repackaging facilities (including labeling), and warehouses.

Date of Manufacture—A date indicating the completion of the final manufacturing process (as defined by the supplier for the particular excipient and process).

Date Retested—The date when retesting is performed by an excipient supplier to extend the length of time that the material may be used.

Distributor—A party other than the manufacturer who sells the excipient.

Excipient—Any substance, other than the active pharmaceutical ingredient or drug product, that has been appropriately evaluated for safety and is included in a drug delivery system to aid the processing of the drug delivery system during manufacture; to protect, support, or enhance stability, bioavailability, or patient acceptability; to assist in product identification; or to enhance any other attribute of the overall safety and effectiveness of the drug delivery system during storage or use.

Expiration Date—The date after which the supplier recommends that the material should not be used.

Impurity—Any component of an excipient that is not the intended chemical entity but is present as a consequence of either the raw materials used or the manufacturing process.

Lot—See *Batch*.

Lot Number—See *Batch Number*.

Manufacturer—A party who performs the final processing step.

Packaging—The container and its components that hold the excipient for storage and transport to the customer.

Periodic Testing Program—See *Skip-Lot Testing Program*.

Physical Property—A quality parameter that can be measured solely with mechanical equipment.

Process—The set of operating instructions describing how the excipient is to be synthesized, isolated, purified, etc.

Process Capability Index (*Cp*)—A statistical measurement that can be used to assess whether the process is adequate to meet specifications. A state of statistical control can be said to exist if the random variation in test results for a

process parameter is such that the calculated process capability is greater than 1.33 (see *Appendix 2* for further definition).

Process Step—An instruction to the excipient manufacturing personnel directing that an operation be done.

Recommended Re-Evaluation Date—The date suggested by the supplier when the material should be re-evaluated to ensure continued compliance with specifications. Differs from the *Expiration Date* in that the excipient may be re-evaluated to extend the length of time the material may be used, if supported by the results of the evaluation and appropriate stability data.

Reduced Frequency Testing Program—See *Skip-Lot Testing.*

Repackaging—Transfer of an excipient from one container to another.

Reprocessing—Introducing previously processed material that did not conform to standards or specifications back into the process and repeating steps that are already part of the normal manufacturing process.

Significant Change—Any change that alters an excipient's physical or chemical property from the norm or that is likely to alter the excipient's performance in the dosage form.

Site—A location where the excipient is manufactured. This may be within the facility but in a different operational area, or at a remote facility, including a contract manufacturer.

Skip-Lot Testing Program—Periodic or intermittent testing performed for a particular test parameter that is justified by historical data demonstrating a state of statistical process control.

Specification—The quality parameters to which the excipient, component, or intermediate must conform and that serve as a basis for quality evaluation.

Stable Process—A process whose output, regardless of the nature of the processing (batch or continuous), can be demonstrated by appropriate means to show a level of variability that consistently meets all aspects of the stated specification (both USP-specific and customer-specific) and is thus acceptable for its intended use.

Supplier—A manufacturer or distributor who directly provides the excipient to the user.

User—A party who uses an excipient in the manufacture of a drug product or another excipient.

APPENDIX 2

STATE OF STATISTICAL CONTROL: PROCESS CAPABILITY PARAMETERS FOR DETERMINING LEVELS OF CONTROL

A process is considered to be in a state of statistical control if variations among the observed sampling results from the process can be attributed to a constant system of chance causes. Process capability index (*Cp*) or capability index adjusted for the process average (*Cpk*) or performance index (*Pp*) or performance index adjusted for the process average (*Ppk*) can be used to assess whether the process is adequate to meet specifications. Values of these parameters exceeding 1.33 show that the process is adequate to meet specifications. Values between 1.00 and 1.33 indicate that the process, although adequate to meet specifications, will require close control. Values below 1.00 indicate that the process is not adequate to meet specifications and that the process and/or specifications ~~must~~ should be changed. *Pp/Ppk* will always be less than or equal to *Cp/Cpk*, respectively. The essential difference between the capability and the

performance indices is the data used. Capability indices require the calculation of σ, the population standard deviation, whereas the performance indices require the calculation of s, the sample standard deviation. Thus for pharmaceutical excipients a state of statistical control can be said to exist if the random variation in test results for a process parameter is such that the calculated process capability index or performance index is greater than 1.33.■2S (*USP29*)

BRIEFING

⟨1195⟩ Significant Change Guide for Bulk Pharmaceutical Excipients, page 1662 of *PF* 28(5) [Sept.–Oct. 2002]. This proposed new general information chapter, which previously appeared in *Pharmacopeial Previews,* is now forwarded with editorial changes to *In-Process Revision.* The chapter is based on the *Significant Change Guide for Bulk Pharmaceutical Excipients,* prepared by the International Pharmaceutical Excipients Council of the Americas (IPEC-Americas). The chapter defines the required elements of a significant change in process and will assist in establishing a uniform understanding of the roles and responsibilities of excipient manufacturers. This chapter, published with the permission of IPEC-Americas, is informational and contains no standards, tests, assays, or other mandatory specifications with respect to any Pharmacopeial article. On the basis of comments received, changes are added to the section *Change Risk Levels* to require customer notification for *Level 2* and *Level 3* changes.

■⟨1195⟩ SIGNIFICANT CHANGE GUIDE FOR BULK PHARMACEUTICAL EXCIPIENTS

BACKGROUND

This general information chapter was derived from an international guidance on the evaluation of the significance of changes involving the manufacture of bulk pharmaceutical excipients. It is intended to assist excipient manufacturers in determining the need for informing the excipient customer and regulatory authorities about the nature of the change.

The principles and information in this chapter can be applied to the manufacture of all bulk pharmaceutical excipients (referred to throughout this document as "excipient[s]") intended for use in human drugs, veterinary drugs, and biologics. The principles set forth here must be applied from the point in the manufacturing process at which good manufacturing practices (GMPs) begin. The chapter provides minimum recommendations when considering the effect of a change on the excipient. When deciding how to use this chapter, each manufacturer must consider how it may apply to that manufacturer's product and processes. The diversity of excipients means that some principles of this chapter may not be applicable to certain products and processes.

This chapter is divided into several parts. The first part provides the general guidance necessary for evaluating a change and determining the necessity of informing the customer and/or regulatory authorities. One part provides criteria for determining whether a change will involve a significant risk. Also included is a decision tree that is useful in considering the potential effect of a change on excipient performance.

GENERAL GUIDANCE

International regulations governing drugs require that components of the drugs be manufactured, processed, packed, and held in accordance with GMPs. Unlike other pharmaceutical products and components, until now there has been no guidance that specifically addresses the manufacture of bulk pharmaceutical excipients. Evaluating the effect of a change in the manufacture of an excipient is more difficult than evaluating the effect of change for an active pharmaceutical ingredient (API). Whereas the API is seldom used for more than a handful of therapeutic purposes, the bulk pharmaceutical excipient is often used with a broad

range of active ingredients and in a diverse range of finished dosage forms. Whereas the API is typically of high purity and well characterized by the quality control and analytical laboratory, the bulk pharmaceutical excipient is often a natural substance or a mixture of polymers whose chemical and physical properties are more difficult to quantify.

SIGNIFICANT CHANGE

Any change by the manufacturer of an excipient that causes a physical or chemical property of the excipient to deviate from the norm or that is likely to alter the excipient's performance in the dosage form is considered significant. Such changes may necessitate notifying the local regulatory authority as required. Regardless of whether there is a regulatory requirement, the manufacturer has an obligation to notify its customers of a significant change so that the customer can evaluate the effect of the change on the customer's products. There are several types of change to be considered, as listed below.

- Site
- Scale
- Equipment
- Process
- Packaging
- Specification

The requirement for evaluating the effect of change on the excipient begins at the process step from which GMP compliance begins or at a step later in the process. It is important to give careful consideration to any processing changes after the excipient has been synthesized or isolated, but before packaging. It must be recognized that a change made earlier in the process can result in a change in excipient functionality. It is therefore recommended that earlier changes also be considered.

Evaluation Criteria

The six criteria to consider when evaluating the effect of a change in excipient manufacture are as follows:

1. Has there been a change in the chemical properties of the excipient as a result of the change?
2. Has there been a change in the physical properties of the excipient as a result of the change?
3. Has there been a change in the impurity profile of the excipient as a result of the change?
4. Has there been a change in the functionality of the excipient as a result of the change?
5. Where applicable, has the moisture level changed?
6. Where applicable, has the bioburden changed?

An affirmative answer to any of these questions indicates that the effect of the change on the excipient may lead to changes in its performance in the dosage form.

Determination of Significance

Chemical Properties—The evaluation of the chemical properties of an excipient must include, at a minimum, all monograph and manufacturer specification parameters. The excipient often contains moisture, the presence of which can have an effect on excipient performance in the preparation of the pharmaceutical dosage form. Therefore, a change in the moisture level, even within the compendial or specification limit, can affect the excipient's end use.

Physical Properties—A consideration of the physical properties of an excipient should be based on the physical form of the excipient and its functionality as used by the customers. Any physical property that is part of a mutually agreed specification between the manufacturer and customer should also be evaluated. For example, a manufacturer of an excipient powder should consider measuring the effect of changes on such physical parameters as bulk density, sur-

face area, particle shape, and particle size distribution. Liquid excipients might be evaluated for changes in pH and viscosity. For all polymeric excipients, the effect of the change on the molecular weight distribution should be considered.

Impurity Profile—Objective criteria are necessary when considering changes to the impurity profile for an excipient as a result of manufacture changes. A typical impurity profile contains the following:

- All specified organic impurities
- Unidentified organic impurities at or above 0.1%, whether specified or not
- Residual solvents
- Inorganic impurities
- Toxic impurities

Unidentified impurities should be monitored as part of the impurity profile if they are present at or above 0.1%, unless the impurity has an established pharmacological effect or is known to be unsafe at a lower level.

The content of the impurity profile varies with the nature of the excipient, the raw materials used in its manufacture, and its chemical composition. Changes are considered significant whenever a new impurity, identified or not, is introduced at a concentration of 0.1%, or when an impurity previously present at or above 0.1% disappears. Changes in the quantity of an existing impurity specified in a monograph and reported on the Certificate of Analysis (COA) (see the general information chapter *Bulk Pharmaceutical Excipients—Certificate of Analysis* ⟨1080⟩ for an in-depth explanation of the required elements of a Certificate of Analysis) should be treated as a chemical property for the purposes of this evaluation.

Functionality—Objective criteria for evaluating changes to excipient functionality are desirable. However, the nature of this type of study can vary broadly on the basis of the excipient, its application in the dosage form, and the capabilities of the excipient manufacturer. Therefore, this general information chapter cannot provide objective criteria for this study but stresses the importance of such a consideration by the manufacturer.

Bioburden—Change, especially in the processing steps or equipment, can adversely affect control of microorganisms in the excipient. Therefore, the effect of the change on the bioburden should be evaluated, particularly for excipients susceptible to microbial growth.

Change Risk Levels

In the evaluation of the effect of changes to the excipient, it is recognized that even with objective criteria some judgment may be necessary. To aid in the decision about the significance of a change and its likely effect on the dosage form, the types of changes are classified into three levels, as defined below.

Level 1: Minor—The changes are fairly minor and considered unlikely to affect the excipient chemical or physical properties, impurity profile, or functionality. Such changes should be documented, but notification to the customer is not necessary.

Level 2: Might be Significant—The effect of the change should be evaluated against criteria 1, 2, and 3 (chemical properties, physical properties, and impurity profile) in the *Evaluation Criteria* subsection, to determine its potential effect on excipient functionality. ~~Notification of these types of changes to the customer is strongly suggested. However, pre-approval by the user is not normally needed unless it is shown that functionality is affected.~~ This type of change should always be communicated to the customer.

Level 3: Always Significant—~~Unless there is a sound basis for concluding the change does not impact excipient functionality, notification to the customer is strongly recommended.~~ This type of change should always be communi-

In-Process Revision

cated to the customer. Shipment of the changed excipient to the customer should not occur without consent from the user company.

Protocol Design

There should be a written protocol for the evaluation of a change to determine whether it is significant. The protocol should describe the nature of the change, the reason it may be significant, the testing to be performed to evaluate the change, and the criteria for determining the significance. The use of a minimum of three lots each of the pre- and postchange excipient is recommended for confirmation testing.

After a change has been made, the manufacturer should test the excipient for all specification properties and compare the results to the historical data. It is suggested that standard statistical tests be used to compare the average of the new data with the average of the historical data. If these averages are different at the 95% statistical confidence level, the change is considered significant. As a further check on consistency, it is also recommended that the new batch-specification properties be plotted on standard statistical quality control (SQC) charts, along with standard batch results.

Supporting Data

It is preferable to use data to measure the effect of a change on the excipient. When sufficient material exists, an acceptable evaluation should include the comparison of 3 batches of material made after the change with 10 batches manufactured before the change. It is suggested that the comparison proceed beginning with chemical and physical properties, followed where appropriate by moisture, bioburden, impurity profile, and functionality. The manufacturer should use good judgment on sample comparisons for the other evaluation.

Chemical and physical properties lend themselves to quantitative measurement. These properties are often part of the specification for the excipient. Therefore, there should be a large body of test data for the properties that might be affected by a change to compare with the corresponding data for the excipient made after the change.

Equivalence of impurity profiles is shown by tabulating the data for the prechange and postchange lots. If the following conditions are met, there has been no significant change in the impurity profile.

1. No new impurity is present at or above 0.1%, and no impurity previously present in the impurity profile at this level has disappeared.
2. Residual solvent and impurities remain within three standard deviations of the mean of the lots produced before the change.
3. All impurities are at or below the mean plus three standard deviations of the lots produced before the change.

Types of Changes

Site—A change in site can involve either the production or the packaging of the excipient or its quality control testing. If the proposed manufacturing site was never used to produce the excipient, the change poses a great risk of altering the excipient performance and is considered a *Level 3* change. If the proposed site was used to produce excipients within the past year and the process, equipment, utilities, and raw materials are all unchanged, the risk is considered minor and thus a *Level 1* change. However, if the excipient was produced more than a year ago at the proposed site with the same process, equipment, utilities, and raw materials, the risk is a moderate, or *Level 2*, change.

If the change involves the quality control laboratory, then the effect hinges on the test method. If the method remains the same, the change is designated a *Level 1* change, assum-

ing that method validation is conducted. If the new laboratory uses a different analytical technique or analytical equipment, the change should be evaluated more carefully, as required for *Level 2*.

Scale—Manufacturers often find ways to increase the scale of production. If the excipient is being scaled up from pilot to production, the change is likely to be significant and thus would generate a *Level 3* change. When the change in scale results from the use of new and larger, or smaller, production equipment using the same operating principle (often the case in batch processing), the change is considered *Level 2*. If the existing equipment is optimized to increase capacity without altering the process (often found in continuous processing), the change is considered minor and treated as *Level 1*. However, careful consideration must be given to changes that can clearly affect the physical properties of the excipient.

Equipment—The evaluation of equipment changes involves the issue of equipment equivalence. Generally, equipment that is a replacement in kind is considered a minor *(Level 1)* change. If the new equipment is not a replacement in kind, but is included in the process validation, the change is still considered *Level 1*. Otherwise, the change is considered *Level 3*.

Process—A change in process often involves changes to the processing instructions such as target levels for such parameters as temperature, pressure, and flow rate; the raw materials to be used; the sequence of operating steps; and the operation to be performed, including reprocessing. As illustrated in the decision tree in *Appendix 2,* each type of process change can be further detailed.

If there is a change in a process parameter that is included in the process validation, such as operating at a new target within the qualified range, it is a *Level 1* change. However, if the process parameter is outside the validation, the change must be evaluated as a *Level 2* change.

If minor changes are made to the processing steps, such as a small change in the rate of addition of an ingredient that falls outside the validated range, the change is considered *Level 2*. A major change, such as changing the point at which an ingredient is added—earlier or later in the process—is potentially significant, and thus *Level 3* would be appropriate.

The reprocessing of an excipient, followed by a purification step, when not typical of the process, should be evaluated as a *Level 2* change. However, if no further purification of the bulk excipient occurs, this type of change is considered *Level 3*.

Differences in raw materials can also be caused by a different supplier, that supplier's specifications, or the addition or removal of the raw material from the bulk pharmaceutical excipient process. If the new supplier provides a raw material that has essentially the same specification as the former supplier, and the raw material method of manufacture is similar, the change is minor and treated as *Level 1*. However, if there is a difference in either the specifications or the manufacturing process, the change must be evaluated as potentially significant *(Level 2)*. Finally, if the raw material change involves the addition or removal of an ingredient from the process for producing or preserving the excipient, or is otherwise used to produce the bulk excipient, the change is likely to be significant *(Level 3)*.

Packaging—These changes involve the package components for the protection and distribution of the excipient. Any change in the package or packaging components (such as the drum, box, liner, or tamper-evident seal), that is a replacement in kind is a minor *(Level 1)* change. Replacement in kind applies to containers constructed of the same materials and sealed in a similar manner, and to liners made of the same components. Any change that is not a replacement in kind should be evaluated as *Level 3*.

Specifications—Changes are sometimes made to the excipient specification or to the quality control test method. When changes are not the result of a monograph change, their significance must be evaluated. Such test or specification changes may be made to the excipient product or to an intermediate component.

Any change to an excipient specification or test method that is used to improve its quality is a *Level 3* change. For example, adding a new specification parameter for the purpose of improving the quality of the excipient through lot selection is a potentially very significant *Level 3* change. If the specification change relaxes a specification parameter, the effect on the excipient quality should be evaluated as a *Level 2* change. The additional testing of the excipient, initiated with the sole purpose of further characterizing the material without altering its quality, is a minor, low-risk, *Level 1* change.

If a specification for a raw material from the same supplier(s) is made more stringent, the change is unlikely to be significant *(Level 1)*, whereas if the specification is made less stringent, the change should be evaluated more carefully *(Level 2)*.

When a change is made that either increases or maintains the level of process control in the manufacturing process, it should be treated as a *Level 1* change. If the change in process control relaxes the control, the effect should be carefully evaluated as a *Level 2* change. An illustrative example is pH control. If a new pH meter allows for more precise measurement, the process control is improved and the change falls under *Level 1*. However, if the pH control is relaxed through the use of a less precise measuring device, the change falls under *Level 2*.

Multiple Changes—Such changes involve more than one change occurring simultaneously. The risk level that governs consideration of the effect of the changes should be the highest level for any single change.

Reporting Requirements

Documentation—It is recommended that the evaluation of all changes to the excipient be documented regardless of the level of change. The report should indicate the basis for evaluating the effect of the change on the excipient, the data used in reaching the conclusion as to its significance, and the actions taken.

Where appropriate, the process validation should be updated to reflect the changed process. This is clearly indicated when the evaluation has led to the conclusion that the change should be considered significant.

Notification—The customer should be given as much advance notification of impending change as possible. For *Level 3* changes in particular, the customer may require time to complete the evaluation of the effect of the change on the customer's formulations. During this period the customer may request inventory of the excipient produced before the change was made. The manufacturer should plan for the change with this eventuality in mind.

Regardless of the apparent level of the change, all changes that, upon evaluation, are found to meet the definition of significant change require customer notification.

Regulatory authorities often require notification of significant changes involving the manufacture of excipients. Such notification should be made as required by applicable authority.

APPENDIX 1. DEFINITIONS

Active Pharmaceutical Ingredient: a substance that is intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body of humans or other animals.

Batch Process: a manufacturing process that produces the excipient from a discrete supply of the raw materials that are present before the completion of the reaction.

Bioburden: the nature and quantity of microorganisms present in the excipient.

Chemical Property: a quality parameter that is measured by chemical or physicochemical test methods.

Confidence Level: a range, calculated from sample data, within which a population parameter, such as the population mean, is expected to lie, with a given level of confidence.

Continuous Process: a manufacturing process that continually produces the excipient from a continuous supply of raw material.

Decision Tree: a visual presentation of the sequence of events that can occur, including decision points.

Equipment: the implements used in the manufacture of an excipient.

Excipient: any substance, other than the active drug or product, that has been appropriately evaluated for safety and is included in a drug delivery system to either aid the processing of the drug delivery system during manufacture; protect, support, or enhance stability, bioavailability, or patient acceptability; assist in product identification; or enhance any other attribute of the overall safety and effectiveness of the drug delivery system during storage or use.

Functionality: the set of performance criteria that the excipient is intended to meet.

Impurity: any component of an excipient that is not the intended chemical entity but is present as a consequence of either the raw materials used or the manufacturing process.

Impurity Profile: a description of all of the impurities present in the excipient.

Packaging: the container and its components that hold the excipient for transport to the customer.

Pharmacological Effect: any therapeutic effect.

Physical Property: a quality parameter that can be measured solely with mechanical equipment.

Process: the set of operating instructions describing how the excipient is to be synthesized, isolated, purified, packaged, etc.

Process Parameter: a measurable operating condition.

Process Step: an instruction to the bulk pharmaceutical excipient manufacturing personnel directing that an operation be done.

Reprocessing: introducing previously processed material that did not conform to standards or specifications back into the process and repeating steps that are already part of the normal manufacturing process.

Replacement in Kind: manufacturing equipment that uses the same operating principle and is of similar construction. Packaging components made with the same materials of construction and sealed in a similar manner.

Scale: an increase or decrease in the batch size, whether or not different equipment is used.

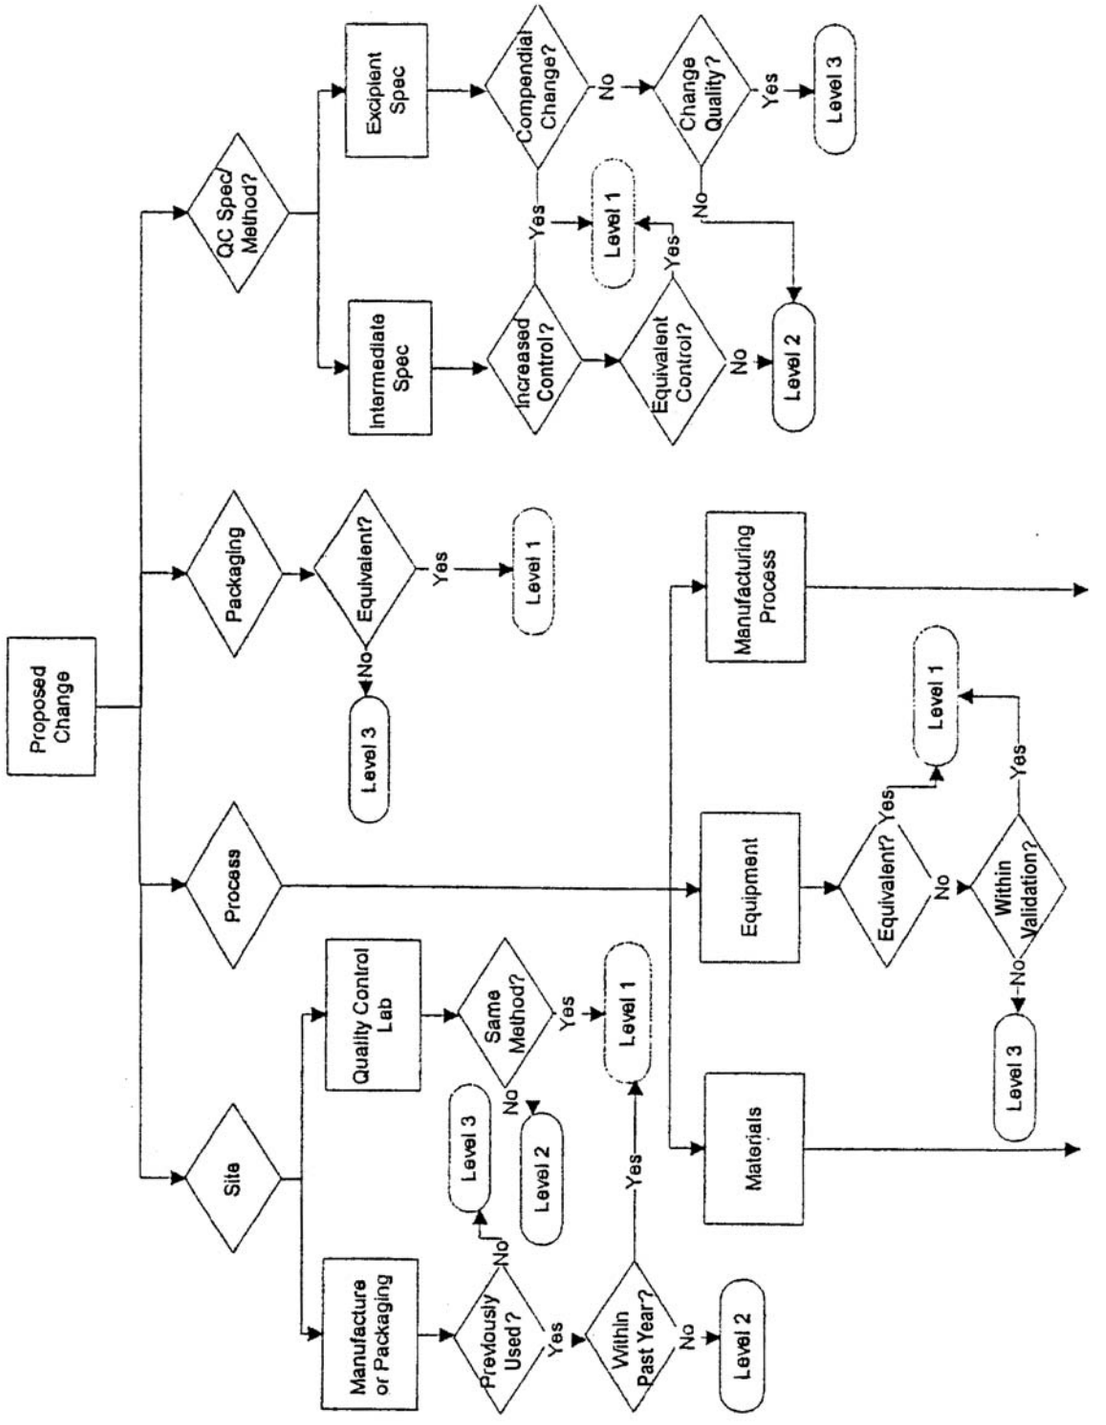
Site: a location where the excipient is manufactured; may be within the facility but in a different operational area or at a remote facility, including a contract manufacturer.

Significant Change: any change that causes a physical or chemical property of the excipient to deviate from the norm or that is likely to alter the excipient's performance in the dosage form.

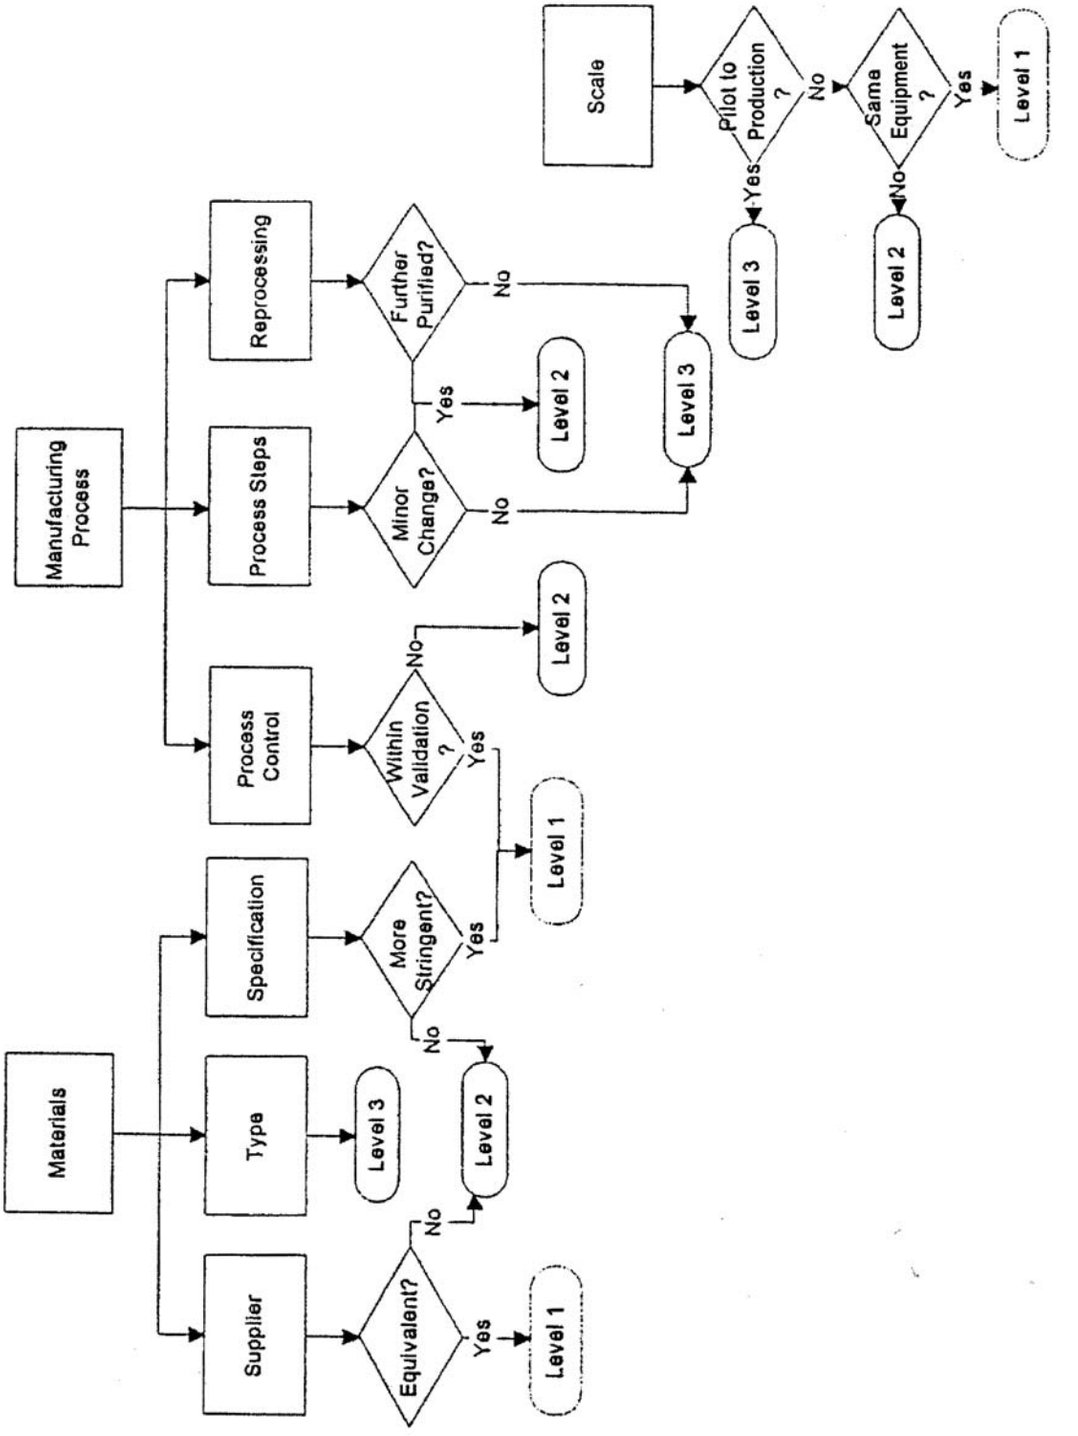
Specification: the quality parameters to which the excipient, component, or intermediate component must conform and that serve as a basis for quality evaluation.

Toxic Impurity: impurities known to have significant undesirable biological activity.

APPENDIX 2. Decision Tree



APPENDIX 2. Decision Tree *(continued)*



REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

3-Aminopropionic Acid, *USP 28* page 2798. It is proposed to include chemical information to facilitate the procurement of this reagent.

(HDQ: M. Marques) RTS—42531-1

Change to read:

3-Aminopropionic Acid~~— See *β-Alanine*~~

■(*β-Alanine),* $NH_2CH_2CH_2COOH$—**89.09** [*107-95-9*]—Use a suitable grade.■2S (*USP29*)

BRIEFING

1-Butaneboronic Acid, *USP 28* page 2804. It is proposed to delete this reagent because of its redundancy. It is a synonym of *n-Butylboronic Acid.*

(HDQ: M. Marques) RTS—42489-1

Delete the following:

~~■**1-Butaneboronic Acid,** $C_4H_{11}BO_2$— **101.94** — White flakes.~~

~~*Assay*— Dissolve about 50 mg, accurately weighed, in 2 mL of bis(trimethylsilyl)acetamide, and mix while heating to boiling. Allow the solution to cool, and inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°; the column temperature is maintained at 100° and programmed to rise 10° per minute to 250°. The area of the $C_4H_{11}BO_2$ peak is not less than 99% of the total peak area.~~

~~*Solubility*— A solution of 50 mg in 1 mL of alcohol is clear and colorless.~~

~~*Melting range* ⟨741⟩: — between 92° and 95°.~~■2S (*USP29*)

BRIEFING

Butyl Methacrylate. This new reagent is specified in the test for *Limit of monomers, Test 1* under *Amino Methacrylate Copolymer.*

(HDQ: M. Marques) RTS—39405-1; 40243-1

Add the following:

■**Butyl Methacrylate,** $C_8H_{14}O_2$—**142.20** [*97-88-1*]—Use a suitable grade.■2S (*USP29*)

BRIEFING

***n*-Butylboronic Acid,** *USP 28* page 2805. It is proposed to add the synonym and CAS number for this reagent to facilitate its procurement.

(HDQ: M. Marques) RTS—42489-1

Change to read:

***n*-Butylboronic Acid**

■(*1-Butaneboronic Acid*),■2S (*USP29*)
$C_4H_9B(OH)_2$—**101.94**

■[*4426-47-5*]■2S (*USP29*)
—Use a suitable grade.
[NOTE—This reagent is usually shipped and stored under water. Before use, remove any excess water by light vacuum filtration. A suitable grade is available from Sigma-Aldrich, www.sigma-aldrich.com.]

In-Process Revision

BRIEFING

2-Dimethylaminoethyl Methacrylate. This new reagent is specified in the test for *Limit of monomers, Test 2* under *Amino Methacrylate Copolymer.*

(HDQ: M. Marques) RTS—39405-1; 40243-1

Add the following:

■**2-Dimethylaminoethyl Methacrylate,** $H_2C = CHCO_2CH_2CH_2N(CH_3)_2$—**143.18** [*2439-35-2*]—Use a suitable grade.■2S (*USP29*)

BRIEFING

Docusate Sodium. This new reagent is used in the test for *Content of benzalkonium chloride* in the proposed new monograph for *Fluticasone Propionate Nasal Spray,* appearing elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41571-3

Add the following:

■**Docusate Sodium**—Use *Docusate Sodium* (USP monograph).■2S (*USP29*)

BRIEFING

Furfural, *USP 28* page 2820. It is proposed to harmonize the specifications for this reagent with the American Chemical Society Reagents Specifications.

(HDQ: M. Marques) RTS—42539-1

Change to read:

Furfural

■(*2-Furancarboxyaldehyde, 2-Furaldehyde*),■2S (*USP29*) C_4H_3OCHO—**96.08**

■[*98-01-1*]■2S (*USP29*)

~~—A clear, colorless liquid when freshly distilled, but soon turns reddish brown. Soluble in water. Miscible with alcohol. Store in tight, light-resistant containers. Before use it should be freshly distilled.~~

~~*Boiling range*—(Reagent test)—Not less than 95% distils between 159° and 162°.~~

■Use ACS reagent grade.■2S (*USP29*)

BRIEFING

Thioglycolic Acid, *USP 28* page 2846 and page 587 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to review the specifications for this reagent in order to be in accordance with the products currently available on the market.

(HDQ: M. Marques) RTS—42540-1

Change to read:

Thioglycolic Acid, ~~(*Thioglycolic Acid*)~~

■■2S (*USP29*)
$HSCH_2COOH$—**92.12**

■[*68-11-1*]■2S (*USP29*)
—A colorless or nearly colorless liquid. ~~having a strong, unpleasant odor.~~

▲▲*USP29*
Miscible with water. Soluble in alcohol.

~~*Residue on ignition*—(Reagent test)—not more than 0.1%.~~

~~*Solubility*—A solution of 1 mL in 10 mL of water is clear and colorless.~~

■■2S (*USP29*)
Sensitiveness—Mix 1 mL with 2 mL of stronger ammonia water, and dilute with water to 20 mL. Add 1 mL of this solution to a mixture of 20 mL of water and 0.1 mL of dilute ferric chloride TS (1 in 100), then add 5 mL of ammonia TS: a distinct pink color is produced.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 28* page 2875, page 3347 of the *First Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1), [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 2057 of *PF* 29(6) [Nov.–Dec. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], and page 861 of *PF* 31(3) [May–June 2005].

(HDQ) RTS—33667-1; 38378-5; 39405-1; 40243-1; 40762-1; 41017-1; 41201-1; 41750-1; 41818-1; 41818-3; 41818-4; 41979-1; 41979-2; 42060-1; 42082-1; 42082-2; 42601-1

Add the following:

■**Amino Methacrylate Copolymer:** Colorless to yellowish granules. Soluble in acetone, in isopropyl alcohol, and in diluted acids; practically insoluble in water. The solutions are clear to slightly cloudy. *NF category:* Coating agent; polymer membrane; tablet binder.■2S (*NF24*)

Add the following:

■**Desmopressin Acetate:** White, fluffy powder. Soluble in water, in alcohol, and in acetic acid.■2S (*USP29*)

Add the following:

■**Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion:** Milky-white liquid of low viscosity with a faint, characteristic odor. It is miscible with water in any proportion; the milky-white appearance is retained. A clear or slightly opalescent, viscous solution is obtained on mixing one part with five parts of acetone, alcohol, or isopropyl alcohol; the polymer substance first precipitates, but then dissolves in the excess organic solvent. When mixed with 1 N sodium hydroxide in a ratio of 1 : 2, the dispersion does not dissolve; the milky-white appearance is retained. *NF category:* Coating agent; polymer membrane; tablet binder.■2S (*NF24*)

Change to read:

Hyoscyamine Sulfate: White~~, odorless crystals or crystalline powder.~~

■or almost white crystalline powder or colorless needles.■2S (*USP29*)
Is deliquescent and is affected by light. The pH of a solution (1 in 100) is about 5.3. Very soluble in water; freely soluble in alcohol; practically insoluble in ether.

■Melts at a temperature not less than 200°.■2S (*USP29*)

Change to read:

Loperamide Hydrochloride: White to slightly yellow powder. Melts at about 225°, with some decomposition. Freely soluble in methanol~~, in isopropyl alcohol,~~

■■2S (*USP29*)
and in chloroform; slightly soluble in water and in dilute acids;

■very slightly soluble in isopropyl alcohol.■2S (*USP29*)

Change to read:

Magnesium Oxide: Very bulky, white powder ~~known as Light Magnesium Oxide or relatively dense, white powder known as Heavy Magnesium Oxide. Five g of Light Magnesium Oxide occupies a volume of approximately 40 to 50 mL, while 5 g of Heavy Magnesium Oxide occupies a volume of approximately 10 to 20 mL.~~

■or relatively dense, white powder or granulated powder.■2S (*USP29*)
Soluble in dilute acids; practically insoluble in water; insoluble in alcohol.

Add the following:

■**Maltitol:** White, crystalline powder. Very soluble in water; practically insoluble in ethanol. *NF Category:* Humectant; sweetening agent; tablet and/or capsule diluent.■2S (*NF24*)

Add the following:

■**Nefazodone Hydrochloride:** Nonhygroscopic, white powder. Freely soluble in chloroform; soluble in propylene glycol; slightly soluble in polyethylene glycol and in water.■2S (*USP29*)

Add the following:

■**Pamidronate Disodium:** White, crystalline powder. Soluble in water and in 2 N sodium hydroxide; sparingly soluble in 0.1 N hydrochloric acid and in 0.1 N acetic acid; practically insoluble in organic solvents.■2S (*USP29*)

Add the following:

■**Tazobactam:** White to pale yellow, nonhygroscopic, crystalline powder. Soluble in dimethylformamide; moderately soluble in water, in methanol, in acetone, and in ethanol; slightly soluble in ethyl acetate, in ethyl ether, and in chloroform; insoluble in hexane.■2S (*USP29*)

Add the following:

■**Travoprost:** Clear, colorless, viscous oil. Insoluble in water.■2S (*USP29*)

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 31(1) through 31(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Title and Proposal	***PF Volume, Issue, and Page Numbers of Pending Proposals***		
	Vol.	***No.***	***Page(s)***
General Notices—*Tests and Assays—Residual Solvents (delayed implementation to January 1, 2007); Preservation, Packaging, Storage, and Labeling—Poison Prevention Packaging Act; Storage Temperature and Humidity; Repackaging Instructions; Guidelines for Packaging and Storage Statements in USP–NF Monographs*	31	3	718
USP Monographs			
Acetaminophen Oral Suspension—*USP Reference standards [USP 4-Aminophenol RS]* (add), *Limit of 4-aminophenol* (add)	30	5	1579
Acetaminophen Extended-Release Tablets—*Packaging and storage*	30	4	1161
Acetaminophen and Aspirin Tablets—*Dissolution*	30	1	41
Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—*Dissolution*	30	1	43
Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine—*Dissolution*	30	1	42
Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—*Dissolution*	30	1	44
Acetaminophen and Codeine Phosphate Capsules—*Dissolution*	30	1	45
Acetaminophen and Diphenhydramine Citrate Tablets—*Dissolution*	30	1	47
Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	47
Acetaminophen and Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	48
Acetohydroxamic Acid—*Limit of hydroxylamine*	30	5	1579
Acetohydroxamic Acid Tablets—*Dissolution*	30	1	49
Acetylcysteine—*USP Reference standards, Assay*	31	3	726

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Acyclovir—*Assay and limit for guanine*	30	5	1580
Albendazole Oral Suspension—*Labeling* (delete)	30	4	1163
Albumin Human—*Definition, Expiration date, USP Reference standards,* (add), *Identification A, B* (add), *pH* (add), *Molecular size distribution* (add), *Prekallikrein activator* (add), *Protein content*(add), *Heme content* (add), *Potassium content* (add), *Sodium content* (add), *Packaging and storage, Labeling, Bacterial endotoxins* (add), *Sterility* (add), *Heat sterility* (add), *Safety* (add)	29	4	992
Albuterol Tablets—*Dissolution, Assay*	31	3	726
Alcohol (new)—*Harmonization*	30	5	1844
Dehydrated Alcohol (new)—*Harmonization*	30	5	1848
Alcohol in Dextrose Injection—*Assay for dextrose*	30	5	1581
Allopurinol—*USP Reference standards, Chromatographic purity* (delete), *Related compounds* (add), *Assay*	28	5	1386
Alprazolam Tablets—*Identification, Dissolution*	30	5	1582
Alumina, Magnesia, and Calcium Carbonate Tablets—*Title* (name change)	29	6	1835
Alumina, Magnesia, and Calcium Carbonate Chewable Tablets (new)	29	6	1836
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—*Title* (name change)	29	6	1837
Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets (new)	29	6	1837
Alumina, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1841
Alumina, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1842
Amantadine Hydrochloride Capsules—*Dissolution*	30	1	51
Amifostine—*Related compounds*	30	6	1974
Amifostine for Injection—*Related compounds*	30	6	1976
Aminosalicylate Sodium Tablets—*Dissolution*	30	1	53
Amoxicillin Capsules—*Dissolution*	30	5	1583
Amoxicillin Tablets—*Dissolution*	30	6	1977
Amphetamine Sulfate—*Assay*	31	2	381
Amphetamine Sulfate Tablets—*Dissolution*	30	1	54
Ampicillin Capsules—*Dissolution*	30	1	55
Ampicillin Tablets—*Dissolution*	30	1	56
Anecortave Acetate (new)	30	2	445
Anecortave Acetate Injectable Suspension (new)	30	2	447
Anticoagulant Citrate Dextrose Solution—*USP Reference standards (delayed implementation to April 1, 2009), Assay for total citrate (delayed implementation to April 1, 2009), Assay for dextrose*	31	3	727
Anticoagulant Citrate Phosphate Dextrose Adenine Solution—*USP Reference standards (delayed implementation to April 1, 2009), Assay for total citrate* (delete) *(delayed implementation to April 1, 2009), Assay for total phosphate* (delete) *(delayed implementation to April 1, 2009), Assay for total citrate and total phosphate* (add) *(delayed implementation to April 1, 2009)*	31	3	728
Anticoagulant Citrate Phosphate Dextrose Solution—*USP Reference standards (delayed implementation to April 1, 2009), Assay for total citrate* (delete) *(delayed implementation to April 1, 2009), Assay for total phosphate* (delete) *(delayed implementation to April 1, 2009), Assay for total citrate and total phosphate* (add) *(delayed implementation to April 1, 2009)*	31	3	730
Anticoagulant Sodium Citrate Solution—*USP Reference standards (delayed implementation to April 1, 2009), Assay (delayed implementation to April 1, 2009)*	31	3	731
Aprotinin (new)	31	3	732
Aprotinin Injection (new)	31	3	736
Ascorbic Acid Tablets—*Dissolution*	30	1	60
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules—*Dissolution*	30	1	60
Aztreonam for Injection—*Assay*	31	3	737
Baclofen Tablets—*Dissolution*	30	1	61
Benazepril Hydrochloride (new)	29	5	1422
Benazepril Hydrochloride Tablets (new)	29	3	606

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals*		
	Vol.	*No.*	*Page(s)*
Betahistine Hydrochloride (new)	30	5	1584
Betamethasone Acetate—*Identification B*	31	2	381
Betamethasone Tablets—*Dissolution*	30	1	62
Bethanechol Chloride—*Related compounds, Assay*	30	5	1586
Bethanechol Chloride Tablets—*Related compounds, Assay*	30	5	1587
Bicalutamide (new)	31	3	738
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers (new)	30	1	63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions (new)	30	1	66
Bismuth Subsalicylate Oral Suspension (new)	30	4	1166
Bismuth Subsalicylate Tablets (new)	31	3	741
Bretylium Tosylate in Dextrose Injection—*Assay for dextrose*	30	5	1589
Brompheniramine Maleate Tablets—*Dissolution*	30	6	1978
Budesonide (new)	30	6	1978
Bupivacaine Hydrochloride—*Limit of residual solvents*	30	5	1589
Bupivacaine Hydrochloride in Dextrose Injection—*Assay for dextrose*	30	5	1590
Bupropion Hydrochloride—*Chromatographic purity*	31	2	381
Bupropion Hydrochloride Extended-Release Tablets—*USP Reference standards, Related compounds*	31	2	384
Buspirone Hydrochloride—*Content of chloride*	31	3	742
Butalbital, Acetaminophen, and Caffeine Tablets—*Dissolution*	30	1	80
Caffeine Citrate Injection—*Definition, Related compounds, Assay*	30	5	1590
Caffeine Citrate Oral Solution—*Definition, Related compounds, Assay*	30	5	1593
Calcitonin Salmon (new)	31	2	385
Calcitonin Salmon Nasal Solution (new)	30	4	1178
Calcitonin Salmon Injection (new)	30	4	1177
Calcitriol (new)	29	5	1433
Calcitriol Injection (new)	29	5	1434
Calcium Carbonate and Magnesia Tablets—*Title* (name change)	29	6	1852
Calcium Carbonate and Magnesia Chewable Tablets (new)	29	6	1852
Calcium Carbonate, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1853
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1854
Calcium Lactate Tablets—*Dissolution*	30	1	81
Calcium Pantothenate Tablets—*Dissolution*	30	1	81
Camphor—*Water*	31	3	742
Carboxymethylcellulose Sodium Suspension (new)	30	3	812
Cefaclor Tablets (new)	29	6	1858
Cefaclor Extended-Release Tablets—*Labeling* (delete)	31	1	42
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules—*Dissolution*	30	1	83
Ciclopirox Olamine Cream—*USP Reference standards [USP Benzyl Alcohol RS], Content of benzyl alcohol*	30	5	1595
Ciclopirox Olamine Topical Suspension—*USP Reference standards [USP Benzyl Alcohol RS]*	30	5	1596
Ciprofloxacin—*USP Reference standards, Other requirements*	31	2	393
Ciprofloxacin Injection—*Definition, USP Reference standards, Pyrogen* (delete), *Bacterial endotoxins* (add), *Limit of ciprofloxacin ethylene diamine analog, Dextrose content*	31	2	393
Citalopram Hydrobromide (new)	31	3	742
Citalopram Tablets (new)	31	3	745
Anhydrous Citric Acid *(Harmonization)—Packaging and storage* (add), *Sulfate, Organic volatile impurities* (delete)	31	3	749
Citric Acid Monohydrate *(Harmonization)—Packaging and storage* (add), *Color of solution, Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid*	31	2	394
Cladribine (new)	31	2	395

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Clarithromycin—*Definition, USP Reference standards, Identification, Specific rotation, pH, Residue on ignition, Heavy metals, Related substances* (add), *Assay*	30	4	1179
Clarithromycin Tablets—*Assay*	30	4	1182
Clarithromycin Extended-Release Tablets (new)	30	4	1183
Clindamycin Injection—*USP Reference standards [USP Benzyl Alcohol RS], Assay*	30	5	1597
Clorazepate Dipotassium—*USP Reference standards, Related compounds*	30	6	1982
Clotrimazole Lozenges—*Disintegration* (delete), *Dissolution* (add)	31	2	398
Clozapine—*Chromatographic purity*	30	6	1984
Codeine Phosphate—*Packaging and storage*	30	5	1597
Colchicine Tablets—*Dissolution*	30	1	91
Cyclandelate (new)	30	6	1985
Cyclizine Hydrochloride Tablets—*Dissolution*	30	1	91
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Cysteine Hydrochloride—*Assay*	30	5	1598
Dalteparin Sodium (new)	30	5	1598
Dapsone—*Assay*	31	3	750
Cryopreserved Human Fibroblast-Derived Dermal Substitute (new)	30	4	1211
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Dextroamphetamine Sulfate Capsules—*Dissolution*	30	1	94
Dextroamphetamine Sulfate Elixir (delete monograph)	30	5	1612
Dextroamphetamine Sulfate Oral Solution (delete monograph)	30	5	1643
Dextroamphetamine Sulfate Tablets—*Dissolution*	30	1	94
Dextrose Injection—*Assay*	30	5	1614
Dextrose and Sodium Chloride Injection—*Assay for dextrose*	30	5	1614
Dibucaine—*Identification B*	31	2	399
Dibucaine Cream—*Identification, Assay*	31	2	399
Dibucaine Ointment—*Identification*	31	2	400
Dibucaine Hydrochloride—*Labeling* (add), *USP Reference standards, Identification B, Other requirements* (add)	31	2	400
Dibucaine Hydrochloride Injection—*Identification A*	31	2	401
Diclofenac Sodium Delayed-Release Tablets—*Identification, Drug release, Dissolution (delayed implementation to April 1, 2006)*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Diethylcarbamazine Citrate Tablets—*Dissolution*	30	1	97
Dihydroergotamine Mesylate—*Identification C, Related alkaloids* (delete), *Chromatographic purity* (add), *Assay*	29	6	1870
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Extended-Release Capsules—*Drug release, Test 14*	30	2	478
Dimercaprol Injection—*USP Reference standards* (add), *Bacterial endotoxins* (add)	30	6	1987
Diphenhydramine Hydrochloride Capsules—*Dissolution*	30	1	97
Diphenhydramine and Pseudoephedrine Capsules—*Dissolution*	30	1	98
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Uniformity of dosage units*	30	6	1987
Dobutamine in Dextrose Injection—*Assay for dextrose*	30	5	1615
Docusate Calcium—*Limit of bis(2-ethylhexyl)maleate*	31	3	752
Docusate Potassium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Docusate Sodium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Dopamine Hydrochloride and Dextrose Injection—*Assay for dextrose*	30	5	1615
Dorzolamide Hydrochloride—*Limit of dorzolamide hydrochloride related compound A, Assay*	31	2	401
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Doxepin Hydrochloride Capsules—*Identification*	30	6	1987
Drospirenone (new)	31	3	754

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Fosinopril Sodium (new)	30	6	2001
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Gabapentin Capsules (new)	28	7	298
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Dissolution*	29	2	418
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Glycopyrrolate Tablets—*Dissolution*	30	1	105
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	31	2	410
Guaifenesin Capsules—*Dissolution*	30	1	106
Guaifenesin Tablets—*Dissolution*	30	1	107
Helium—*USP Reference standards* and *Assay* (postponed indefinitely)	31	3	707
Hydrocodone Bitartrate—*USP Reference standards [USP Hydrocodone Bitartrate Related Compound A RS], Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Acetaminophen Tablets—*Dissolution*	30	1	109

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hydrogen Peroxide Concentrate—*Acidity*	30	5	1629
Hypromellose Ophthalmic Solution—*Identification*	31	3	771
Indocyanine Green—*Definition, Assay*	29	6	1905
Insulin Human Injection—*Limit of high molecular weight proteins* (add), *Other requirements*	30	5	1630
Iodixanol—*Labeling* (add), *USP Reference standards, Limit of calcium, Other requirements* (add)	31	1	54
Irbesartan Tablets (new)	29	4	1035
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isosorbide Dinitrate Sublingual Tablets—*Dissolution*	30	1	113
Diluted Isosorbide Mononitrate (new)	30	3	868
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	30	3	871
Kanamycin Sulfate Capsules—*Dissolution*	30	1	120
Ketoprofen—*Assay*	31	3	772
Lamivudine—*Limit of lamivudine enantiomer, Resolution solution, Limit of residual solvents*	30	3	881
Lansoprazole—*Packaging and storage, Chromatographic purity*	30	6	2010
Leuprolide Acetate (new)	30	3	882
Levothyroxine Sodium—*Assay*	30	5	1630
Lidocaine Hydrochloride—*Assay*	31	2	415
Lidocaine Hydrochloride and Dextrose Injection—*Assay for dextrose*	30	5	1631
Lidocaine Hydrochloride and Epinephrine Injection—*Assay for lidocaine hydrochloride, Assay for epinephrine*	31	2	415
Liothyronine Sodium—*Assay*	30	5	1631
Lipid Injectable Emulsion (new)	31	2	416
Liotrix Tablets—*Assay*	30	5	1632
Lisinopril Tablets—*Dissolution*	30	1	121
Loperamide Hydrochloride Tablets—*Dissolution, Assay*	30	5	1633
Loratadine—*Labeling* (add), *USP Reference standards, Related compounds*	30	6	2011
Loratadine Oral Solution—*Antimicrobial effectiveness test* (delete), *Related compounds*	31	1	56
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	419
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	26	4	1050
Magnesium Chloride—*Identification, Insoluble matter*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	421
Magnesium Oxide—*Bulk density* (add)	29	4	1047
Mangafodipir Trisodium—*Packaging and storage*	30	6	2014
Mannitol Injection—*Labeling*	28	1	73
Meclizine Hydrochloride Tablets—*Dissolution*	30	1	127
Mefloquine Hydrochloride (new)	31	2	422
Meloxicam (new)	31	1	57
Meperidine Hydrochloride—*Packaging and storage, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	62
Mephobarbital—*Assay*	30	5	1634
Mepivacaine Hydrochloride Injection—*Assay*	30	6	2017
Meprobamate Tablets—*Dissolution*	30	1	129
Mesalamine—*Related compounds*	31	2	424
Metformin Hydrochloride—*Packaging and storage*	31	1	62
Metformin Hydrochloride Extended Release Tablets (new)	31	3	772
Methenamine Tablets—*Dissolution*	30	1	130
Methenamine Hippurate Tablets—*Labeling* (add), *Dissolution*	31	1	63
Methocarbamol Tablets—*Dissolution*	30	1	130

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* Vol.	No.	Page(s)
Methscopolamine Bromide (new)	31	2	425
Methscopolamine Bromide Tablets (new)	31	2	427
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methylphenidate Hydrochloride Tablets—*Dissolution*	30	1	131
Metolazone Tablets—*Assay*	29	6	1932
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morantel Tartrate (new)	30	6	2017
Morphine Sulfate—*Packaging and storage*	30	5	1639
Morphine Sulfate Extended-Release Capsules—*Packaging and storage*	28	6	1822
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Nabumetone—*Related compounds*	31	1	63
Nabumetone Tablets—*Dissolution*	30	6	2019
Nadolol and Bendroflumethiazide Tablets—*Dissolution*	30	1	132
Nalidixic Acid—*Assay*	30	1	132
Naltrexone Hydrochloride—*Limit of total solvents*	30	6	2019
Naproxen Delayed-Release Tablets—*Packaging and storage*	30	4	1264
Neostigmine Bromide Tablets—*Dissolution*	30	1	133
Niacinamide Tablets—*Dissolution*	30	1	139
Nitrogen—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	3	708
Nitrogen 97 Percent —*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	3	708
Nitrous Oxide—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	3	707
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Nystatin—*Composition* (add)	30	1	141
Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment—*Assay for nystatin*	30	6	2020
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole Delayed-Release Capsules—*Packaging and storage*	30	1	143
Ondansetron (new)	30	6	2021
Ondansetron Oral Solution—*Packaging and storage*	30	3	905
Ondansetron Orally Disintegrating Tablets (new)	30	6	2024
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxandrolone Tablets—*Labeling* (add), *Dissolution*	31	3	781
Oxaprozin—*Packaging and storage*	29	4	1059
Oxaprozin Tablets—*Packaging and storage*	29	4	1061
Oxybutynin Chloride Extended-Release Tablets (new)	30	4	1276
Oxycodone Hydrochloride—*Limit of alcohol*	30	6	2027
Oxycodone and Acetaminophen Capsules—*Dissolution*	30	1	151
Oxycodone and Acetaminophen Tablets—*Dissolution*	30	1	151
Oxycodone and Aspirin Tablets—*Dissolution*	30	1	152
Paroxetine Tablets—*Identification A, C*	31	2	435
Paroxetine Hydrochloride—*USP Reference standards, Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, Chromatographic purity*	31	1	69
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	72
Pentobarbital Sodium—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Perflutren Protein-Type A Microspheres for Injection—*Assay for protein [Footnote 9]*	30	5	1639

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Perflutren Protein-Type A Microspheres Injectable Suspension—*Assay for protein [Footnote 9]*	30	5	1640
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phentermine Hydrochloride Capsules—*Dissolution*	30	1	159
Phentermine Hydrochloride Tablets—*Dissolution*	30	1	160
Phenylephrine Bitartrate (new)	31	3	783
Phenylethyl Alcohol—*USP Reference standards*	30	4	1290
Phenylpropanolamine Hydrochloride Capsules—*Dissolution*	30	1	161
Phenylpropanolamine Hydrochloride Tablets—*Dissolution*	30	1	162
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Phenytoin Sodium—*Related compounds, Assay*	30	6	2030
Physostigmine Salicylate Injection—*USP Reference standards, Assay*	30	6	2031
Pimozide Tablets—*Dissolution*	30	1	164
Pindolol Tablets—*Dissolution*	30	1	165
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piperazine Citrate Tablets—*Dissolution*	30	1	165
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Bromide (new)	31	2	441
Potassium Chloride in Dextrose Injection—*Definition, Assay for dextrose*	30	5	1640
Potassium Chloride in Dextrose and Sodium Chloride Injection—*Assay for dextrose*	30	5	1641
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Prednisolone—*Chromatographic purity* (add), *Ordinary impurities* (delete)	30	5	1641
Prednisolone Acetate—*Identification C*	30	5	1642
Prilocaine (new)	30	5	1643
Procyclidine Hydrochloride Tablets—*Dissolution*	30	1	169
Propantheline Bromide Tablets—*Dissolution*	30	1	170
Propofol—*Packaging and storage, Labeling, USP Reference standards, Related compounds, Assay*	30	5	1645
Propoxycaine Hydrochloride—*Identification C*	30	6	2032
Propoxyphene Hydrochloride and Acetaminophen Tablets—*Dissolution*	30	1	170
Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	172
Pyridoxine Hydrochloride Tablets—*Dissolution*	30	1	177
Pyrilamine Maleate Tablets—*Dissolution*	30	1	177
Quinapril Tablets—*Packaging and storage*	29	4	1071
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards [USP Ranitidine Resolution Mixture RS], Chromatographic purity, Assay*	30	6	2033
Ranitidine Oral Solution—*USP Reference standards, Identification, Antimicrobial effectiveness testing* (delete), *Chromatographic purity, Assay*	30	6	2036
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for dextrose, Assay for citrate*	31	2	445
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Ringer's and Dextrose Injection—*Assay for dextrose*	30	5	1647
Ritonavir (new)	31	3	788
Ropivacaine Hydrochloride (new)	30	6	2039

In-Process Revision

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Saccharin Sodium, *USP 28* page 1745 and page 612 of *PF* 31(2) [Mar.–Apr. 2005]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin Sodium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	+	+
Identification B	+	+	+
Identification C	–	+	+
Acidity or alkalinity	+	+	+
Water	+	+	+
Readily carbonizable substances	+	+	+
Limit of benzoate and salicylate	–	+	+
Assay	+	+	+

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Packaging and storage, Heavy metals, Labeling, Clarity of solution, Color of solution, Limit of toluenesulfonamides, Identification A (IR).

Specific local attributes: USP: Organic volatile impurities; JP: Description.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

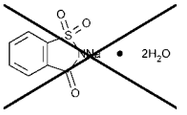
Differences between the **ADOPTION STAGE 6** document and the current *NF* monograph include the following:

(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions at room temperature are added.
(3) *Labeling*—No change.
(4) *USP Reference standards*—A reference for Saccharin Sodium is added for use in the *Identification* test *A*.
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Identification—Identification* tests *A, B,* and *D* are replaced with a more definitive IR absorption test. *Identification* test *C* is retained, but separated into two tests (*B* and *C*). Because the preparation of potassium pyroantimonate TS has changed, the preparation of the potassium pyroantimonate solution for this test is added to comply with the harmonization draft.
(8) *Water*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Selenium*—This test is deleted because it is unnecessary for this compound.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method. The *Test solution* is corrected to that of the EP. Editorial changes are made.
(12) *Heavy metals*—No change.
(13) *Limit of benzoate and salicylate*—No change.
(14) *Organic volatile impurities*—No change.
(15) *Assay*—No change.

(EMC: J. Lane) RTS—42529-1

Change to read:

~~Saccharin Sodium~~



~~$C_7H_4NNaO_3S \cdot 2H_2O$ 241.20~~
~~1,2-Benzisothiazol-3(2*H*)-one, 1,1-dioxide, sodium salt, dihydrate.~~
~~1,2-Benzisothiazolin-3-one 1,1-dioxide sodium salt dihydrate [*6155-57-3*].~~
~~Anhydrous 205.17 [*128-44-9*].~~

~~» Saccharin Sodium contains not less than 98.0 percent and not more than 101.0 percent of $C_7H_4NNaO_3S$, calculated on the anhydrous basis.~~

~~**Packaging and storage**—Preserve in well-closed containers.~~

~~**Labeling**—Where the quantity of saccharin sodium is indicated in the labeling of any preparation containing Saccharin Sodium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).~~

~~**USP Reference standards** ⟨11⟩—*USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*~~

~~**Identification—**~~

~~**A:** The residue obtained by igniting it responds to the tests for *Sodium* ⟨191⟩.~~

~~**B:** To 10 mL of a solution (1 in 10) add 1 mL of hydrochloric acid: a crystalline precipitate of saccharin is formed. Wash the precipitate with cold water until the last washing is free from chloride, and dry at 105° for 2 hours: it melts between 226° and 230°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩).~~

~~**Alkalinity**—A solution (1 in 10) is neutral or alkaline to litmus, but no red color is produced with phenolphthalein TS.~~

~~**Toluenesulfonamides—**~~

~~*Internal standard solution*, *Standard stock solution*, and *Standard preparations*—Prepare as directed for *Internal standard solution*, *Standard stock solution*, and *Standard preparations* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph).~~

~~*Test preparation*—Prepare as directed under *Column Partition Chromatography* (see *Chromatography* ⟨621⟩), employing a chromatographic tube fitted with a porous glass disk in its base, a plastic stopcock on the delivery tube, and a reservoir on the top. Add a mixture consisting of 10 g of *Solid Support* and a solution of 2.0 g, accurately weighed, of Saccharin Sodium in 8.0 mL of sodium carbonate solution (1 in 20), and proceed as directed under *Test preparation* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph), beginning with "Pack the contents."~~

~~*Chromatographic system* and *Procedure*—Proceed as directed for *Chromatographic system* and *Procedure* in the test for *Toluenesulfonamide* under *Saccharin* (see *NF* monograph).~~

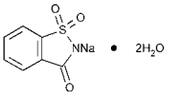
~~**Heavy metals,** *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of 1 N hydrochloric acid, mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, and then filter through a dry filter, discarding the first 10 mL of the filtrate: the limit, determined on 25 mL of the subsequent filtrate, is 0.001%.~~

~~**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements.~~

~~**Other requirements**—It responds to *Identification* tests *A* and *B*, and meets the requirements of the tests for *Water*, *Benzoate and salicylate*, *Selenium*, and *Readily carbonizable substances* under *Saccharin Calcium*.~~

~~**Assay**—Proceed with Saccharin Sodium as directed in the *Assay* under *Saccharin Calcium*. Each mL of 0.1 N sodium hydroxide is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.~~

■Saccharin Sodium



$C_7H_4NNaO_3S \cdot 2H_2O$ 241.20

1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide, sodium salt, dihydrate.

1,2-Benzisothiazolin-3-one 1,1-dioxide sodium salt dihydrate [*6155-57-3*].

Anhydrous 205.17 [*128-44-9*].

» Saccharin Sodium contains not less than 99.0 percent and not more than 101.0 percent of $C_7H_4NNaO_3S \cdot 2H_2O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. ~~Store at room temperature.~~ Store at room temperature.

Labeling—Where the quantity of saccharin sodium is indicated in the labeling of any preparation containing Saccharin Sodium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).

USP Reference standards ⟨11⟩—*USP Saccharin Sodium RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*

Clarity of solution—[NOTE—The *Test solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution—Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with ~~water~~ the same solution to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or of the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced than that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from the test for *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution,* a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or of the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Dry the specimen at 105° for 2 hours before use.

B: To a solution (1 in 10) add 2 mL of 15% potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of ~~potassium pyroantimonate TS~~ *Potassium pyroantimonate solution,* and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

Potassium pyroantimonate solution—Dissolve 2 g of potassium pyroantimonate in 95 mL of hot water. Cool quickly, and add a solution containing 2.5 g of potassium hydroxide in 50 mL of water and 1 mL of sodium hydroxide solution (8.5 in 100). Allow to stand for 24 hours, filter, and dilute with water to 150 mL.

C: Sodium salts impart an intense yellow color to a nonluminous flame.

Acidity or alkalinity—To a solution of 1.0 g in 10 mL of carbon dioxide-free water add 1 drop of phenolphthalein TS: no pink color is produced. Then add 1 drop of 0.1 N sodium hydroxide: a pink color is produced.

Water, *Method I* ⟨921⟩**:** not more than 15.0%.

Readily carbonizable substances ⟨271⟩**—**Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Heavy metals, *Method I* ⟨231⟩**—**Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit is 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—~~Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 1 10 N sodium hydroxide.~~ Dissolve 10.0 g of the substance to be examined in about 45 mL of water. If necessary, adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ~~instrument~~ gas chromatograph is equipped with a flame-ionization detector and contains a 0.53-mm × 10-m fused silica column, coated with G3 phase (film thickness 2 µm). The injector port, column, and detector temperatures are maintained at about 250°, 180°, and 250°, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1 : 2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of

the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide, and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, *Method I* ⟨467⟩**:** meets the requirements.

Assay—Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Sodium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.52 mg of $C_7H_4NNaO_3S$. ■2S (*USP29*)

MONOGRAPHS (NF)

BRIEFING

Silicon Dioxide, *NF 23* page 3073 and page 7187 of *PF* 24(6) [Nov.–Dec. 1998]. The Japanese Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of the compendial standards for the *Silicon Dioxide* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the Revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 4 draft prepared by the Japanese Pharmacopoeia.

Differences between the Revised **OFFICIAL INQUIRY STAGE 4** document and the current *NF* monograph include the following:

(1) In the opening paragraph (the Definition)—The Definition is modified to include the term, "separating," to allow for the two processes of manufacturing, gel and precipitate. An upper limit for *Assay* is added. The current EP lower limit of 98.0% is adopted.
(2) *Packaging and storage*—No change. The *USP* text is retained as a nonharmonized attribute.
(3) *Labeling*—The requirement to label the different types of silica are omitted, because the Definition is changed. A requirement to label with the bulk density is added.
(4) *Identification*—Two additional identification procedures are added to strengthen the monograph.
(5) *pH*—The limit is unchanged, but the slurry concentration is slightly less.
(6) *Loss on drying*—The drying time and temperature are changed to 2 hours and 105°, respectively, and the limit is increased to 7.0%, as related to the time and temperature change.
(7) *Loss on ignition*—The ignition time is increased from 1 hour to 2 hours.
(8) *Heavy metals*—The *USP* test is retained as a nonharmonized attribute.
(9) *Chloride*—The test is omitted, because it is not necessary.
(10) *Hydrochloric acid soluble substances*—This test is added to indirectly control levels of aluminum and calcium.
(11) *Sulfate*—The *JP* test is adopted and the limit is increased to 1.0%.
(12) *Organic volatile impurities*—This test is retained as a specific local attribute for *USP.*
(13) *Arsenic*—This test is retained as a nonharmonized attribute.
(14) *Iron*—This test is added to limit iron impurities.

(15) *Bulk density*—This physical test procedure is added with no limits.
(16) *Assay*—This test is revised, but the scientific principles are the same as the current test.

Readers are requested to review the proposal carefully and to send comments to USP; the deadline for receipt is **30 September 2005.**

(EMC: J. Lane) RTS—41934-1

Add the following:

Silicon Dioxide

SiO_2xH_2O

Anhydrous 60.08

» Silicon Dioxide is prepared by separating from a sodium silicate solution with the addition of mineral acids, purifying, drying, and pulverizing. Silicon Dioxide, when ignited, contains not less than 98.0 percent and not more than 100.5 percent of SiO_2.

Packaging and storage—Preserve in tight containers, protected from moisture.

Labeling—Label it to state the bulk density.

Identification—

A: Place 5 mg of Silicon Dioxide in a platinum crucible, and mix with 0.2 g of anhydrous potassium carbonate. Ignite the mixture in a burner flame for 10 minutes, until the crucible's bottom reddens. After cooling, dissolve the melt in 2 mL of water, warming if necessary. Add 2 mL of *Ammonium molybdate–nitric acid solution,* prepared as directed below, slowly to the solution: the solution develops a deep yellow color.

Ammonium molybdate–nitric acid solution—Dissolve 8 g of ammonium molybdate in diluted nitric acid (1 in 5) to make 100 mL. Prepare freshly before use.

B: Dissolve 0.1 g of Silicon Dioxide in 20 mL of sodium hydroxide TS by boiling, and add 12 mL of ammonium chloride TS: a white gelatinous precipitate is produced. The precipitate does not dissolve in dilute hydrochloric acid.

C: Disperse a small amount of Silicon Dioxide over water in a small beaker: it becomes wet and sinks.

pH ⟨791⟩**:** between 4.0 and 8.0, in a slurry prepared by combining about 1.0 g of Silicon Dioxide and 25 mL of carbon dioxide-free water and shaking.

Loss on drying ⟨731⟩—Dry about 1 g at 105° for 2 hours: it loses not more than 7.0% of its weight.

Loss on ignition ⟨733⟩—Ignite about 1 g of it, previously dried and accurately weighed, at 1000° for 2 hours: it loses not more than 8.5% of its weight.

Hydrochloric acid soluble substances—To about 2.5 g of Silicon Dioxide add 50 mL of dilute hydrochloric acid, and mix. Heat on a water bath for 30 minutes, stirring from time to time, and maintaining the original volume by adding dilute hydrochloric acid. Evaporate to dryness. Add to the residue a mixture of 8 mL of dilute hydrochloric acid and 24 mL of water. Heat to boiling and filter under reduced pressure through a sintered-glass filter. Wash the residue on the filter with a hot mixture of 3 mL of dilute hydrochloric acid and 9 mL of water. Wash it again with small quantities of water, combine the filtrate and washings, and dilute with water to 50 mL. In a platinum dish, evaporate 10.0 mL of the solution to dryness, and dry to a constant mass at 105°. The mass of the residue is not more than 10 mg (2.0%).

Sulfate—

Test solution—To about 1.2 g of Silicon Dioxide add 60 mL of water, shake, add 2 mL of hydrochloric acid, and boil for 10 minutes. After cooling, add water to make 100 mL, and filter. To 10 mL of the filtrate add water to make 100 mL. To 20 mL of this solution add 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL.

Standard solution—To 0.50 mL of 0.01 N sulfuric acid VS, add 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL.

Procedure—[NOTE—If the *Test solution* is not clear, filter both the *Test solution* and the *Standard solution.*] Add 2 mL of barium chloride TS to the *Test solution* and to the *Standard solution*, mix well, and allow to stand for 10 minutes. Compare the turbidity produced in both solutions against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩) by viewing downward or transversely: the turbidity of the *Test solution* is not greater than that of the *Standard solution* (not more than 1.0%).

Iron—

Test solution—To 50 mg of Silicon Dioxide add 10 mL of dilute hydrochloric acid, and heat for 10 minutes in a water bath while shaking. After cooling, add 0.5 g of tartaric acid, dissolve the tartaric acid with shaking, and add 1 drop of phenolphthalein TS. Add ammonia TS dropwise until the solution develops a pale red color. Add 20 mL of a pH 4.5 buffer solution prepared by dissolving 75.4 mL of glacial acetic acid and 111 g of sodium acetate in 1000 mL of water.

Standard solution—Add 10 mL of dilute hydrochloric acid to 1.5 mL of *Standard Iron Solution* (see *Iron* ⟨241⟩), and proceed as directed for the *Test solution* beginning with "add 0.5 g of tartaric acid."

Procedure—Dissolve 0.2 g of ascorbic acid in the *Test solution* and the *Standard solution*, and allow to stand for 30 minutes. Add 1 mL of a solution of 2,2′-bipyridine in alcohol (1 in 200), add water to make 50 mL, and allow to stand for 30 minutes. Add 2 mL of picric acid solution (3 in 1000) and 20 mL of ethylene chloride, and shake well. Collect the ethylene chloride layers, and filter through pledgets of absorbent cotton in funnels containing about 5 g of anhydrous sodium sulfate. Compare the colors of the solution from the *Test solution* and the *Standard solution*. The solution from the *Test solution* has no more color than that from the *Standard solution* (0.030%).

Arsenic, *Method I* ⟨211⟩**—**Prepare the *Test Preparation* as follows. Transfer 4.0 g to a platinum dish, add 5 mL of nitric acid and 35 mL of hydrofluoric acid, and evaporate on a steam bath. Cool, add 5 mL of perchloric acid, 10 mL of hydrofluoric acid, and 10 mL of sulfuric acid, and evaporate on a hot plate to the production of heavy fumes. Cool, cautiously transfer to a 100-mL beaker with the aid of a few mL of hydrochloric acid, and evaporate to dryness. Cool, add 5 mL of hydrochloric acid, dilute with water to about 40 mL, and heat to dissolve any residue. Cool, transfer to a 100-mL volumetric flask, dilute with water to volume, and mix. A 25.0-mL portion of this solution meets the requirements of the test. The limit is 3 ppm.

Heavy metals, *Method I* ⟨231⟩**—**Transfer 16.7 mL of the solution prepared for the test for *Arsenic* into a 100-mL beaker, and neutralize with ammonium hydroxide to litmus paper. Adjust with 6 N acetic acid to a pH of between 3 and 4.

Filter, using medium-speed filter paper, wash with water until the filtrate and washings measure 40 mL, and mix. The limit is 0.003%.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Bulk density—Place a No. 70 sieve (212 µm) at a position of about 20 cm above a tared brass or stainless steel cup, which has the capacity of 25.0 ±0.05 cm^3 and an inside diameter of 30.0 ±2.0 mm, and slowly pour Silicon Dioxide through the sieve, at a rate suitable to prevent clogging until the cup overflows. Level the excess powder with the aid of a slide glass, weigh the filled cup, and weigh accurately the content of the cup, and then calculate the bulk density by the following expression: the bulk density is within the labeled specification.

$$\text{Bulk density } (g/cm^3) = A/25$$

where A is the measured mass of the content of the cup (g).

Assay—Accurately weigh and transfer about 1 g *(m)* of Silicon Dioxide, that has been previously ignited at 1000° for 2 hours after drying at 105° for 2 hours, to a tared platinum dish (previously ignited at 1000° for 30 minutes), weigh the dish, and designate the mass as a (g). Moisten the sample with 4 drops of alcohol and 2 drops of sulfuric acid, add 15 mL of hydrofluoric acid, and evaporate to dryness on a water bath with a well-ventilated hood. After cooling, add about 5 mL of hydrofluoric acid and evaporate to dryness. Heat the residue at 550° for 1 hour, gradually increasing the temperature, and ignite at 1000° for 30 minutes. Cool in a desiccator, weigh the dish, and designate the mass as b (g). Calculate the percentage of SiO_2 using the following formula:

$$[(a - b)/m] \times 100$$

BRIEFING

Colloidal Silicon Dioxide, *NF 23* page 3074 and page 7187 of *PF* 24(6) [Nov.–Dec. 1998]. The Japanese Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of the compendial standards for the *Colloidal Silicon Dioxide* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the Revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 4 draft prepared by the Japanese Pharmacopoeia.

Differences between the Revised **OFFICIAL INQUIRY STAGE 4** document and the current *NF* monograph include the following:

(1) In the opening paragraph (the Definition)—The Definition is modified to include an example of silicon tetrachloride and the temperature at which the hydrolysis takes place.
(2) *Packaging and storage*—No change. The *USP* text is retained as a nonharmonized attribute.
(3) *Labeling*—Requirement to label with the bulk density is added.
(4) *Identification*—Two additional identification procedures are added to strengthen the monograph.
(5) *pH*—No change.
(6) *Loss on drying*—The limit is increased to 5.0%.
(7) *Loss on ignition*—The ignition time is specified as 2 hours, and the limit is increased to 6.0%.
(8) *Heavy metals*—The *USP* test is retained as a nonharmonized attribute.
(9) *Chloride*—The test is added, because chloride containing compounds may be used in the manufacture of this article.
(10) *Organic volatile impurities*—This test is retained as a specific local attribute for *USP.*
(11) *Arsenic*—This test is retained as a nonharmonized attribute.
(12) *Bulk density*—This physical test procedure is added with no limits.
(13) *Assay*—This test is revised, but the scientific principles are the same as the current test.

Readers are requested to review the proposal carefully and to send comments to USP; the deadline for receipt is **30 September 2005.**

(EMC: J. Lane) RTS—41934-2

Add the following:

Colloidal Silicon Dioxide

SiO_2 60.08

Silica.

Silica [*7631-86-9*].

» Colloidal Silicon Dioxide is prepared by hydrolyzing a silicon compound, such as silicon tetrachloride, at a temperature of at least 1000° by vapor phase hydrolysis process. When ignited at 1000°, it contains not less than 99.0 percent and not more than 100.5 percent of SiO_2.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate the bulk density.

Identification—

A: Place 5 mg of Colloidal Silicon Dioxide in a platinum crucible, and mix with 0.2 g of anhydrous potassium carbonate. Ignite the mixture in a burner flame for 10 minutes until the crucible's bottom reddens. After cooling, dissolve the melt in 2 mL of water, warming if necessary. Add 2 mL of *Ammonium molybdate–nitric acid solution,* prepared as directed below, slowly to the solution: the solution develops a deep yellow color.

Ammonium molybdate–nitric acid solution—Dissolve 8 g of ammonium molybdate in diluted nitric acid (1 in 5) to make 100 mL. Prepare freshly before use.

B: Dissolve 0.1 g of Colloidal Silicon Dioxide in 20 mL of sodium hydroxide TS by boiling, and add 12 mL of ammonium chloride TS: a white gelatinous precipitate is produced. The precipitate does not dissolve in dilute hydrochloric acid.

C: Disperse a small amount of Colloidal Silicon Dioxide over water in a small beaker: it becomes wet and sinks.

pH ⟨791⟩: between 3.5 and 5.5, in a slurry prepared by combining about 1.0 g of Colloidal Silicon Dioxide and 25 mL of carbon dioxide-free water and shaking.

Loss on drying ⟨731⟩—Dry about 1 g at 105° for 2 hours: it loses not more than 5.0% of its weight.

Loss on ignition ⟨733⟩—Ignite about 1 g of it at 1000° for 2 hours: it loses not more than 6.0% of its weight.

Arsenic, *Method I* ⟨211⟩—Prepare the *Test Preparation* as follows. Transfer 2.5 g to a flask, add 50 mL of 3 N hydrochloric acid, and reflux for 30 minutes using a water condenser. Cool, filter with the aid of suction, and transfer the filtrate to a 100-mL volumetric flask. Wash the filter and flask with several portions of hot water, and add the washings to the flask. Cool, dilute with water to volume, and mix: a 15.0-mL portion of this solution, to which 3 mL of hydrochloric acid has been added, meets the requirements of the test, the addition of the 7 N sulfuric acid being omitted. The limit is 8 µg per g.

Chloride—

Test solution—Dissolve 0.5 g in 20 mL of sodium hydroxide TS by boiling. Allow to cool, and filter, if necessary, to obtain a clear solution. Wash the filter with 10 mL of water. Combine the filtrate and the washing, add 18 mL of dilute nitric acid, and add water to make 50 mL.

Standard solution—To 0.35 mL of 0.010 N hydrochloric acid VS add 20 mL of sodium hydroxide TS and 18 mL of dilute nitric acid, and dilute with water to 50 mL.

Procedure—To the *Test solution* and the *Standard solution* add 1 mL of silver nitrate TS, mix, and allow to stand for 5 minutes, protected from direct sunlight. The opalescence, if any, developed in the *Test solution* is not more than that in the *Standard solution* (0.025%).

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Bulk density—Place a No. 70 sieve (212 μm) at a position of about 20 cm above a tared brass or stainless steel cup, which has the capacity of 25.0 ± 0.05 cm^3 and an inside diameter of 30.0 ± 2.0 mm. Slowly pour Colloidal Silicon Dioxide through the sieve, at a rate suitable to prevent clogging until the cup overflows. Level the excess powder with the aid of a slide glass, weigh the filled cup, weigh accurately the content of the cup, and then calculate the bulk density by the following expression: the bulk density is within the labeled specification.

$$\text{Bulk density } (g/cm^3) = A/25$$

where A is the measured mass of the content of the cup (g).

Assay—Accurately weigh and transfer about 0.5 g *(m)* of Colloidal Silicon Dioxide, that has been previously ignited at 1000° for 2 hours, to a tared platinum dish (previously ignited at 1000° for 30 minutes), weigh the dish, and designate the mass as a (g). Moisten the sample with 4 drops of alcohol and 2 drops of sulfuric acid, add 15 mL of hydrofluoric acid, and evaporate to dryness on a water bath with a well-ventilated hood. After cooling, add about 5 mL of hydrofluoric acid, and evaporate to dryness. Heat the residue at 550° for 1 hour, gradually increasing the temperature, and ignite at 1000° for 30 minutes. Cool in a desiccator, weigh the dish, and designate the mass as b (g). Calculate the percentage of SiO_2 using the following formula:

$$[(a - b)/m] \times 100$$

BRIEFING

⟨**429**⟩ **Light Diffraction Measurement of Particle Size.** *USP 28* page 2314 and page 895 of *PF* 28(3) [May–June 2002]. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this chapter. This proposal represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **STAGE 3** draft that appeared in *Harmonization* on page 895 of PF 28(3) [May–June 2002]. The proposed chapter is based on ISO Standards 13320-1 (1999) and 9276-1 (1998) and better reflects the main purpose of the method: monitoring batch-to-batch variability, rather than achieving absolute accuracy for the sphere-equivalent diameter. The use of the Mie theory and the Fraunhofer approximation is described more fully. This compromise should cover all comments without being too restrictive, and it provides a general guide about the often-debated topic of Fraunhofer versus Mie. Although the chapter is based on the ISO guide (0.1 to 3 mm), the range of applicability (e.g., 0.1 to 8 mm) is left open for new advances in lenses, detectors, and constructions. In *Evaluation of the Dispersion Procedure,* the sentence ''Moreover, if the manufacturing process (e.g., crystallization, milling) of the material has changed, the applicability of the method must be verified (e.g., microscopic comparison)'' has been included. In addition, in *Conversion of the Scattering Pattern into Particle Size Distribution,* the following sentences have been added: ''The algorithms used are specific to each make and model of equipment and are proprietary. The differences in the algorithms between different instruments may give rise to differences in the calculated particle size statistics.'' In the same section, to fully describe the possibilities of the existence of differences between equipment (other than random and systematic errors), the following sentence has also been added: ''The assumption of spherical particle shape is particularly important, because most algorithms use the mathematical solution for scattering from spherical particles.'' Other minor changes and editorial

changes are also included. Readers are requested to review the proposal carefully and to send comments to USP; the deadline for receipt is **30 September 2005.**

(ETM: J. Lane) RTS—42307-3

Add the following:

⟨429⟩ LIGHT DIFFRACTION MEASUREMENT OF PARTICLE SIZE

The laser light diffraction technique used for the determination of the particle size distribution is based on the analysis of the diffraction pattern produced when particles are exposed to a beam of coherent light. Historically, the early laser diffraction instruments used only scattering at small angles. However, the technique has since been broadened to include laser light scattering in a wider angular range and application of the Mie theory in addition to the Fraunhofer approximation and anomalous diffraction. Moreover, new measuring principles with incoherent light source modulated by a liquid crystal display and a photo-multiplier detector are available.

The technique cannot distinguish between scattering by single particles and scattering by clusters of primary particles, i.e., by agglomerates or aggregates. As most particulate samples contain agglomerates or aggregates and as one is generally interested in the size distribution of primary particles, the clusters are usually dispersed into primary particles before measurement.

For nonspherical particles, an equivalent sphere size distribution is obtained because the technique assumes spherical particles in its optical model. The resulting particle size distribution may differ from those obtained by methods based on other physical principles (e.g., sedimentation, sieving).

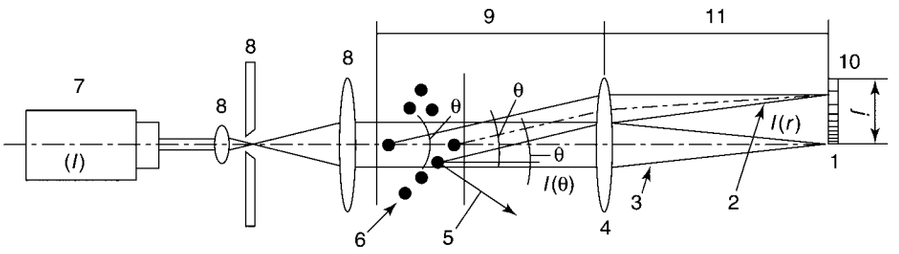
This chapter provides guidance for the measurement of size distributions of particles in different dispersed systems—for example, powders, sprays, aerosols, suspensions, emulsions and gas bubbles—in liquids through analysis of their angular light scattering patterns. It does not address specific requirements of particle size measurement of specific products.

PRINCIPLE

A representative sample, dispersed at an adequate concentration in a suitable liquid or gas, is passed through a beam of monochromatic light, usually a laser. The light scattered by the particles at various angles is measured by a multielement detector. Numerical values representing the scattering pattern are then recorded for subsequent analysis. These scattering pattern values are then transformed, using an appropriate optical model and mathematical procedure, to yield the proportion of total volume to a discrete number of size classes forming a volumetric particle size distribution.

APPARATUS

A typical setup for a laser diffraction instrument is shown in *Figure 1.*



1. Obscuration detector
2. Scattered beam
3. Direct beam
4. Fourier lens
5. Scattered light not collected by lens (4)
6. Particle ensemble
7. Light source laser
8. Beam processing unit
9. Working distance of lens (4)
10. Multi-element detector
11. Focal distance of lens (4)

Figure 1. Typical setup for a laser diffraction instrument.

The instrument comprises a laser light source, beam processing optics, a sample measurement region (or cell), a Fourier lens, and a multi-element detector for measuring the scattered light pattern. A data system is also required for deconvolution of the scattering data into a volumetric size distribution and associated data analysis and reporting.

The particles can enter the laser beam in two positions. In the conventional case the particles enter the parallel beam before and within the working distance of the collecting lens. In so-called reversed Fourier optics the particles enter behind the collecting lens and thus in a converging beam. The advantage of the conventional setup is that a reasonable path length for the sample is allowed within the working distance of the lens. The second setup allows only small path lengths but enables measurement of scattered light at larger angles, which is useful when submicron particles are present.

The interaction of the incident light beam and the ensemble of dispersed particles results in a scattering pattern with different light intensities at various angles. The total angular intensity distribution, consisting of both direct and scattered light, is then focused by a lens or a series of lenses onto a multi-element detector. The lens(es) create(s) a scattering pattern which, within limits, does not depend on the location of the particles in the light beam. Hence, the continuous angular intensity distribution is converted into a discrete spatial intensity distribution on a set of detector elements.

It is assumed that the measured scattering pattern of the particle ensemble is identical to the sum of the patterns from all individual single scattering particles presented in random relative positions. Note that only a limited angular range of scattered light is collected by the lens(es) and, therefore, by the detector.

DEVELOPMENT OF THE METHOD

Traditionally, the measurement of particle size using laser diffraction has been limited to particles in the range from approximately 0.1 μm to 3 mm. Because of recent advances in lens and equipment design, newer instruments are capable of exceeding this range routinely (e.g., 0.1 μm to 8 mm). With the validation report the user demonstrates the applicability of the method for its intended use.

Sampling

The sampling technique must be adequate to obtain a representative sample of a suitable volume for the particle size measurement.

Evaluation of the Dispersion Procedure

The dispersion procedure must be adjusted to the purpose of the measurement. The purpose may be such that it is preferable to deagglomerate clusters into primary particles as far as possible, or it may be desirable to keep clusters as intact as possible. In this sense, the particles of interest may be either primary particles or clusters.

For the development of a method it is highly advisable to check that comminution of the particles is minimized, and conversely, that dispersion of particles or clusters is satisfactory. This can usually be done by changing the dispersing energy and monitoring the change of the particle size distribution. The measured size distribution must not change significantly when the sample is well dispersed and the particles are neither fragile nor soluble. In addition, the particles of interest can be inspected visually or with the aid of a microscope. Moreover, if the manufacturing process (e.g., crystallization, milling) of the material has changed, the applicability of the method must be verified (e.g., microscopic comparison).

Sprays, aerosols, and gas bubbles in a liquid should be measured directly, provided that their concentration is adequate, because sampling or dilution generally alters the particle size distribution.

In other cases (as with emulsions, pastes, and powders), representative samples may be dispersed in suitable liquids. Often dispersing aids (wetting agents, stabilizers) and/or mechanical forces (e.g., agitation, ultrasonication) are applied for deagglomeration or deaggregation of clusters and stabilization of the dispersion. For these liquid dispersions, a recirculating system is most commonly used, consisting of an optical measuring cell; a dispersion bath, usually equipped with stirrer and ultrasonic elements; a pump; and tubing. Nonrecirculating, stirred cells are useful when only small amounts of a sample are available or when special dispersion liquids are used.

Dry powders can also be converted into aerosols through the use of suitable dry powder dispersers, which apply mechanical force for deagglomeration or deaggregation. Generally the dispersers use the energy of compressed gas or the differential pressure of a vacuum to disperse the particles to an aerosol, which is blown through the measuring zone, usually into the inlet of a vacuum unit that collects the particles. However, for free-flowing, coarser particles or granules, the effect of gravity may be sufficient to disperse the particles adequately.

Optimization of the Liquid Dispersion

Liquids, surfactants, and dispersing aids used to disperse powders must

- be transparent at the laser wavelength and practically free from air bubbles or particles;
- have a refractive index that differs from that of the test material;
- be nonsolvent of the test material (pure liquid or pre-filtered saturated solution);
- not alter the size of the test materials (e.g., by solubility, solubility enhancement, or recrystallization effects);
- favor easy formation and stability of the dispersion;
- be compatible with the materials used in the instrument (such as O-rings, gaskets, tubing, etc.); and
- possess a suitable viscosity to facilitate recirculation, stirring, and filtration.

Quite often, surfactants and/or dispersing aids are used to wet the particles and to stabilize the dispersion. For weak acids and weak bases, buffering of the dispersing medium at a low or a high pH, respectively, can assist in identifying a suitable dispersant.

The quality of a dispersion can be checked preliminarily by visual or microscopic inspection. It is also possible to take fractional samples out of a well-mixed stock dispersion. Such stock dispersions are formed by adding a liquid to the sample while mixing it with, for example, a glass rod, a spatula, or a vortex mixer. Care must be taken to ensure a representative transfer of the sample and to ensure that settling of larger particles does not occur.

Optimization of the Gas Dispersion

For dry dispersion and sprays, a compressed gas free from oil, water, and particles may be used. To remove such materials from the compressed gas, a dryer with a filter can be used. Any vacuum unit should be located away from the measurement zone so that its output does not disturb the measurement.

Determination of the Concentration Range

In order to produce an acceptable signal-to-noise ratio in the detector, the particle concentration in the dispersion must exceed a minimum level. Likewise, it must be below a maximum level in order to avoid multiple scattering. The concentration range is influenced by the width of the laser beam, the path length of the measurement zone, the optical properties of the particles, and the sensitivity of the detector elements.

In view of the above, measurements must be performed at different particle concentrations to determine the appropriate concentration range for any typical sample of material. [NOTE—In different instruments, particle concentrations are usually represented by differently scaled and differently named numbers (e.g., obscuration, optical concentration, proportional number of total mass).]

Selection of an Appropriate Optical Model

Most instruments use either the Fraunhofer approximation or the Mie theory, although other approximation theories are sometimes applied for calculation of the scattering matrix. The choice of the theoretical model depends on the intended application by the user and the different assumptions (e.g., size, absorbance, refractive index, roughness, crystal orientation, mixture) made for the test material. If the refractive index values (real and imaginary parts for the wavelength used) are not exactly known, then the Fraunhofer approximation or the Mie theory with a realistic estimate of the refractive index can be used. The former has the advantages that it is simple, it does not need refractive index values, and it is extremely useful for analysis of powders coarser than about 1–2 μm; the latter usually provides less biased particle size distributions for small particles. In order to obtain traceable results, it is essential to document the refractive index values used, because small differences in the values assumed for the real and imaginary part of the complex refractive index may cause significant differences in the measured particle size distributions. Small values of the imaginary part of the refractive index (about 0.01i–0.1i) are often applied to allow the correction of the absorbance for the surface roughness of the particles.

Repeatability

The attainable repeatability of the method mainly depends on the characteristics of the material (milled/not milled, robust/fragile, width of its size distribution, etc.), whereas the required repeatability depends on the purpose of the measurement. Mandatory limits cannot be specified because repeatabilities (different sample preparations) may strongly vary from one substance to another. However, it is good practice to aim at acceptance criteria for repeatability like $s_{rel} \leq 10\%$ [$n = 6$] for any central value of the distribution (e.g.,

for x_{50}). Values at the trailing sides of a distribution (e.g., x_{10} and x_{90}) are oriented toward less stringent acceptance criteria like $s_{rel} \leq 15\%$ [$n = 6$]. Below 10 µm, these values must be doubled.

MEASUREMENT

Precautions

The instructions given in the apparatus manual are followed:

- Never look into the direct path of the laser beam or its reflections;
- ground all apparatus components to prevent ignition of solvents or dust explosions;
- check the apparatus setup (e.g., warm-up, required measuring range and lens, appropriate working distance, position of the detector, no direct bright daylight);
- in the case of wet dispersions, avoid air bubbles, evaporation of liquid, and schlieren or other inhomogeneities in the dispersion. Similarly, avoid improper mass flow from the disperser or turbulent airflow in the case of dry dispersions. Such effects can cause erroneous particle size distributions.

Measurement of the Scattering of Dispersed Sample(s)

After proper alignment of the optical part of the instrument, a blank measurement of the particle-free dispersion medium must be performed. The background signal must be below an appropriate threshold.

Generally, the time for measurement permits a large number of detector scans or sweeps at short time intervals. For each detector element, an average signal is calculated, sometimes together with its standard deviation. The magnitude of the signal from each detector element depends on the detection area, the light intensity, and the quantum efficiency. The coordinates (size and position) of the detector elements, together with the focal distance of the lens, determine the range of scattering angles for each element. Most instruments also measure the intensity of the central (unscattered) laser beam. The ratio of the intensity of a dispersed sample to that in its absence (a blank measurement) indicates the proportion of scattered light and hence the particle concentration.

Conversion of the Scattering Pattern into Particle Size Distribution

This deconvolution step is the inverse of the calculation of a scattering pattern for a given particle size distribution. The assumption of spherical particle shape is particularly important, because most algorithms use the mathematical solution for scattering from spherical particles. Furthermore, the measured data always contain some random and systematic errors that may vitiate the size distributions. Several mathematical procedures have been developed for use in the available instruments. They contain some weighting of deviations between measured and calculated scattering patterns (e.g., least squares), some constraints (e.g., non-negativity for amounts of particles), and/or some smoothing of the size distribution curve. The algorithms used are specific to each make and model of equipment and are proprietary. The differences in the algorithms between different instruments may give rise to differences in the calculated particle size statistics.

Replicates

It is recommended that the number of replicate measurements (with individual sample preparations) to be performed per sample, in a substance-specific method, be defined.

REPORTING OF RESULTS

The particle size analysis data are usually reported as cumulative undersize distribution by volume. The symbol x is used to denote the particle size, which in turn is defined as the diameter of a volume equivalent sphere. *Q3(x)* denotes the volume fraction undersize at the particle size x. In a graphical representation, x is plotted on the abscissa and the dependent variable *Q3* on the ordinate. Most common characteristic values are calculated from the particle size distribution by interpolation. Frequently used are the particle sizes at the undersize values of 10%, 50%, and 90%, denoted as x_{10}, x_{50}, and x_{90}, respectively. The size x_{50} is also known as the median particle size. It is recognized that the symbol d is also widely used to designate the particle size; thus the symbol x may be replaced by d.

Moreover, sufficient information must be documented about the sample, the sample preparation, the dispersion conditions, and cell type. Becauses the results depend on the particular instrument, data analysis program, and optical model used, the respective information must also be documented.

CONTROL OF THE APPARATUS PERFORMANCE

Use the apparatus according to the manufacturer's instructions and carry out the prescribed verifications at appropriate frequency, according to the use of the apparatus and substances to be tested.

Calibration

Laser diffraction systems are based on first principles of laser light scattering, although assuming idealized properties of the particles. Thus, calibration in the strict sense is not required. However, it is still necessary to confirm that the instrument is operating correctly. This can be undertaken using any certified or standard reference material acceptable in industrial practice. The entire measurement procedure is examined, including sample collection, sample dispersion, sample transport through the measuring zone, measurement, and the deconvolution procedure. It is essential that the total operational procedure be fully described.

The preferred certified or standard reference materials consist of spherical particles of a known distribution ranging over one decade of size. They must be certified as to the mass percentage size distribution by an absolute technique, if available, and used in conjunction with an agreed-upon, detailed operation procedure. It is essential that the real and imaginary parts of the complex refractive index of the material be indicated if the Mie theory is applied in data analysis. The representation of the particle size distribution by volume will equal that of the distribution by mass, provided that the density of the particles is the same for all size fractions.

The response of a laser diffraction instrument is considered to meet the requirements if the mean value of x_{50} from at least three independent measurements does not deviate by more than 3% from the certified range of values of the certified or standard reference material; that is, the mean value together with its standard deviation. The mean values for x_{10} and x_{90} must not deviate by more than 5% from the certified range of values. For repeatability, the coefficient of variation must not exceed 3% for x_{50} and 5% for x_{10} and x_{90}. Below 10 μm, these values must be doubled.

Although use of materials consisting of spherical particles is preferable, nonspherical particles may also be employed. Preferably, these particles have certified or typical values from laser diffraction analyses performed according to an agreed-upon, detailed operating procedure. Use of reference values from methods other than laser diffraction may cause

a significant bias. The reason for this bias is that the different principles inherent in the various methods may lead to different sphere-equivalent diameters for the same nonspherical particle.

In addition to the certified reference materials mentioned above, product samples of typical composition and particle size distribution for a specified class of products can also be used, provided their particle size distribution has proven to be stable over time. The results must comply with previously determined data with the same precision and bias as those for the certified reference material.

Verification of the System

In addition to the calibration, the performance of the apparatus must be verified at regular time intervals or as frequent as appropriate. This can be undertaken using any suitable material as mentioned in the previous paragraph.

The verification of the system is based on the concept that the equipment, electronics, software and analytical operations constitute an integral system, which can be evaluated as an entity. Thus the entire measurement procedure is examined, including sample collection, sample dispersion, sample transport through the measuring zone, and the measurement and deconvolution procedure. It is essential that the total operational procedure is fully described.

In the general case, unless otherwise specified in the individual monograph, the response of a laser diffraction instrument is considered to meet the requirements if the x_{50} value does not deviate by more than 10% from the range of values of the reference material, i.e., the mean value together with its standard deviation. If optionally the values at the trailing sides of the distribution are evaluated (e.g., x_{10} and x_{90}), then these values must not deviate by more than 15% from the certified range of values. Below 10 μm, these values must be doubled.

Physical Tests and Determinations

BRIEFING

⟨**941**⟩ **X-Ray Diffraction.** *USP 28* page 2513. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this chapter. This proposal represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **STAGE 3** draft. The proposal elaborates on the USP chapter. New figures are added, and multiple footnotes are added for clarity. Other changes, including minor editorial changes, have been made. Add the following:

⟨941⟩ X-RAY DIFFRACTION

Every crystalline phase of a given substance produces a characteristic X-ray diffraction pattern. Diffraction patterns can be obtained from a randomly oriented crystalline powder composed of crystallites or crystal fragments of finite size of the substance. Essentially three types of information can be derived from a powder diffraction pattern: the angular position of diffraction lines (depending on geometry and size of the unit cell), the intensities of diffraction lines (depending mainly on atom type and arrangement and particle orientation within the sample), and diffraction line profiles (depending on instrumental resolution, crystallite size, strain, and specimen thickness).

Experiments giving angular positions and intensities of lines can be used for applications such as qualitative phase analysis (e.g., identification of crystalline phases) and quantitative phase analysis of crystalline materials. An estimate of the amorphous and crystalline fractions[1] can also be made.

In addition, analysis of line profile broadening can also allow for determination of crystallite size (size of coherently scattering domains) and micro-strain.

The X-ray powder diffraction (XRPD) method provides an advantage over other means of analysis in that it is usually nondestructive in nature (to ensure a randomly oriented sample, specimen preparation is usually limited to grinding). XRPD investigations can also be carried out under in situ conditions on specimens exposed to nonambient conditions such as low or high temperature and humidity.

PRINCIPLES

X-ray diffraction results from the interaction between X-rays and electron clouds of atoms. Depending on atomic arrangement, interferences arise from the scattered X-rays. These interferences are constructive when the path difference between two diffracted X-ray waves differs by an integral number of wavelengths. This selective condition is described by the Bragg equation, also called Bragg's law *(Figure 1).*

$$2d_{hkl}\sin\theta_{hkl} = n\lambda$$

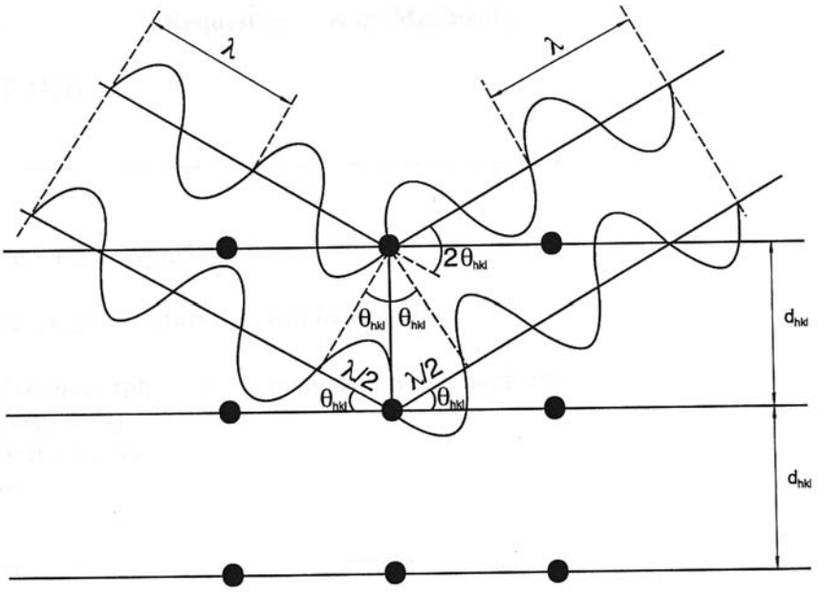

Figure 1. Diffraction of X-rays by a crystal according to Bragg's law.

[1] There are many other applications of the X-ray powder diffraction technique that can be applied to crystalline pharmaceutical substances, such as determination of crystal structures, refinement of crystal structures, determination of the crystallographic purity of crystalline phases, and characterization of crystallographic texture. These applications are not described in this chapter.

The wavelength, λ, of the X-rays is of the same order of magnitude as the distance between successive crystal lattice planes, or d_{hkl} (also called *d*-spacings). θ_{hkl} is the angle between the incident ray and the family of lattice planes, and $\sin\theta_{hkl}$ is inversely proportional to the distance between successive crystal planes or *d*-spacings.

The direction and spacing of the planes with reference to the unit cell axes are defined by the Miller indices {*hkl*}. These indices are the reciprocals, reduced to the smallest integers, of the intercepts that a plane makes with the unit cell axes. The unit cell dimensions are given by the spacings *a*, *b,* and *c,* and the angles between them by α, β, and γ.

The interplanar spacing for a specified set of parallel *hkl* planes is denoted by d_{hkl}. Each such family of planes may show higher orders of diffraction where the *d* values for the related families of planes *nh, nk, nl* are diminished by the factor 1/*n* (*n* being an integer: 2, 3, 4, etc.).

Every set of planes throughout a crystal has a corresponding Bragg diffraction angle, θ_{hkl}, associated with it (for a specific λ).

A powder specimen is assumed to be polycrystalline so that at any angle θ_{hkl} there are always crystallites in an orientation allowing diffraction according to Bragg's law.[2] For a given X-ray wavelength, the positions of the diffraction peaks (also referred to as ''lines'', ''reflections'', or ''Bragg reflections'') are characteristic of the crystal lattice (*d*-spacings), their theoretical intensities depend on the crystallographic unit cell content (nature and positions of atoms), and the line profiles depend on the perfection and extent of the crystal lattice. Under these conditions, the diffraction peak has a finite intensity arising from atomic arrangement, thermal motion, and structural imperfections, as well as from instrument characteristics.

The main characteristics of diffraction line profiles are 2θ position, peak height, peak area, and shape (characterized by, e.g. peak width, asymmetry or by analytical function, empirical representation). An example of the type of powder patterns obtained for five different solid phases of a substance[3] are shown in *Figure 2.*

[2] An ideal powder for diffraction experiments consists of a large number of small, randomly oriented spherical crystallites (coherently diffracting crystalline domains). If this number is sufficiently large, there are always enough crystallites in any diffracting orientation to give reproducible diffraction patterns. To obtain a precise measurement of the intensity of diffracted X-rays, it is recommended that the crystallite size be small—that is, typically 10 μm or less, depending on the characteristics of the specimen (X-ray absorption, shape, etc.) and the diffraction geometry.

[3] These diffraction patterns were collected on a Siemens D500 diffractometer (Bragg-Brentano geometry) using a pure monochromatic CuKα1 radiation (λ = 0.1540598 nm) selected with an incident-beam curved-crystal germanium monochromator with asymmetric focusing (short focal distance 124 mm, long focal distance 216 mm). Detection of signal was achieved using a scintillation detector. To reduce the effect of transparency of the specimens, a thin layer of powder was deposited on an oriented single crystal silicon wafer. The alignment of the diffractometer was checked by means of the OOI reflections of fluorophlogopite mica (NIST SRM 675). The zero error was estimated as less than 0.01° (2θ). The instrumental resolution function of the setup exhibits a shallow minimum of 0.065° (2θ) at about 40° (2θ) and has twice this value at 130° (2θ). For each phase, the diffraction pattern was scanned with the same step length of 0.02° (2θ), but with different fixed counting times [form A: 30 seconds; form B: 48 seconds; form C: 48 seconds; form D: 40 seconds; amorphous phase: 10 seconds].

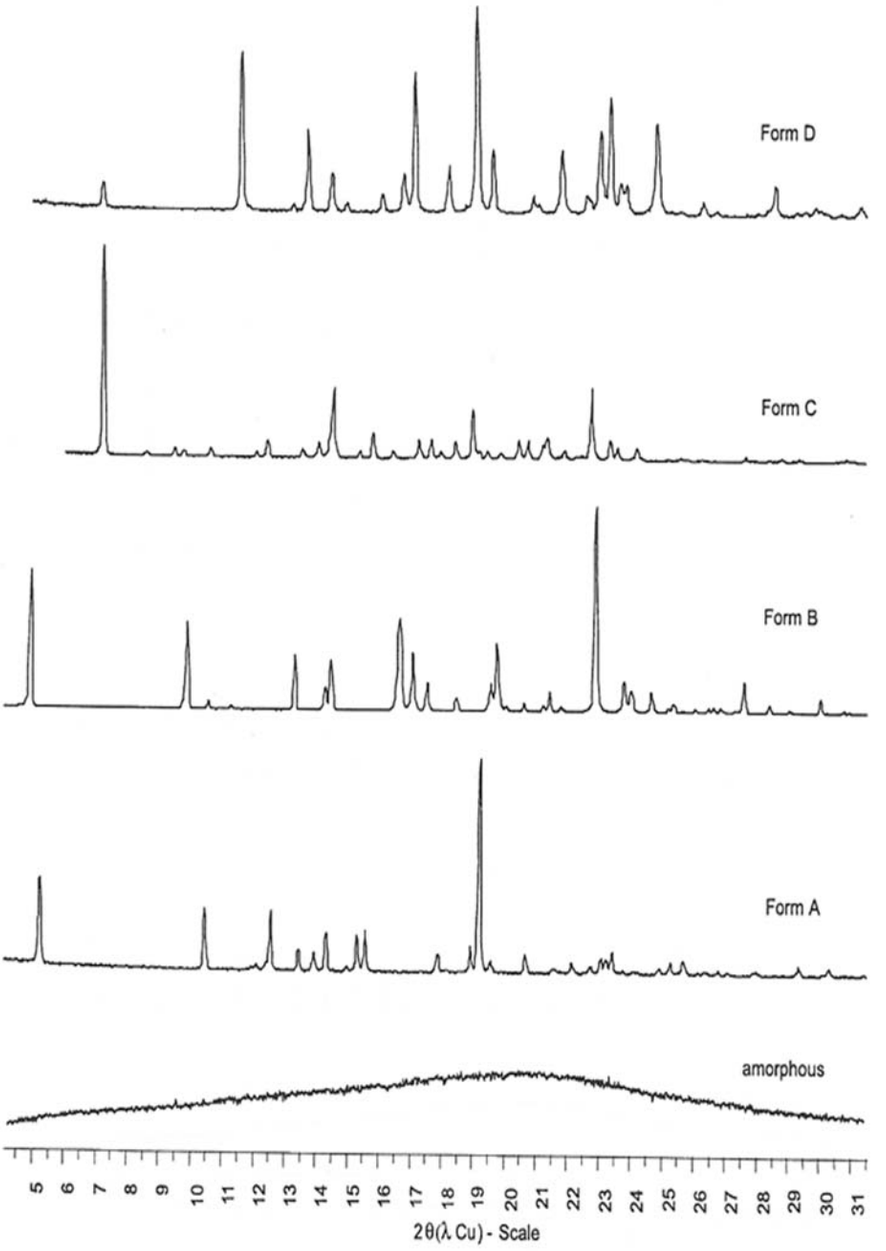

Figure 2. X-ray powder patterns collected for five different solid phases of a substance. The intensities are normalized.

In addition to the diffraction peaks, an X-ray diffraction experiment also generates a more or less uniform background, upon which the peaks are superimposed. Besides specimen preparation, other factors contribute to the background—for example, sample holder, diffuse scattering from air and equipment, other instrumental parameters such as detector noise, and general radiation from the X-ray tube. The peak-to-background ratio can be increased by minimizing background and by choosing prolonged exposure times.

APPARATUS

Instrument Setup

X-ray diffraction experiments are usually performed using powder diffractometers or powder cameras.

A powder diffractometer generally comprises five main equipment parts: an X-ray source; the incident beam optics, which may include monochromatization, filtering, collimation, and/or focusing of the beam; a goniometer; the diffraction beam optics, which may include monochromatization, filtering, collimation, and focusing or parallelizing of beam; and a detector. Data collection and data processing systems are also required and are generally included in current diffraction measurement equipment.

Depending on the type of analysis to be performed (phase identification, quantitative analysis, lattice parameters determination, etc.), different XRPD instrument configurations and performance levels are required. The simplest instruments used to measure powder patterns are powder cameras. Of the various camera types available, three are commonly employed: the Debye-Scherrer, the Gandolfi, and the Guinier focusing cameras. Replacement of photographic film by photon detectors as a detection method has led to the design of diffractometers in which the geometric arrangement of the optics is not truly focusing, but parafocusing, as in Bragg-Brentano geometry. The Bragg-Brentano parafocusing configuration is currently the most widely used and is therefore briefly described here.

A given instrument may provide a horizontal or vertical $\theta/2\theta$ geometry or a vertical θ/θ geometry. For both geometries, the incident X-ray beam forms an angle θ with the specimen plane, and the diffracted X-ray beam forms an angle 2θ with the direction of the incident X-ray beam (an angle θ with the specimen plane). The basic geometric arrangement is represented in *Figure 3*. The divergent beam of radiation from the X-ray tube (the so-called primary beam) passes through the parallel plate collimators and a divergence slit assembly and illuminates the flat surface of the specimen. All the rays diffracted by suitably oriented crystallites in the specimen at an angle 2θ converge to a line at the receiving slit. A second set of parallel plate collimators and a scatter slit may be placed either behind or before the receiving slit. The axes of the line focus and of the receiving slit are at equal distances from the axis of the goniometer. The X-ray quanta are counted by a radiation detector, usually a scintillation counter, a sealed-gas proportional counter, or a position-sensitive detector or solid-state detector. The receiving slit assembly and the detector are coupled together and move tangentially to the focusing circle. For $\theta/2\theta$ scans, the goniometer rotates the specimen around the same axis as that of the detector, but at half the rotational speed, in a $\theta/2\theta$ motion. The surface of the specimen thus remains tangential to the focusing circle. The parallel plate collimator limits the axial divergence of the beam and hence partially controls the shape of the diffracted line profile.

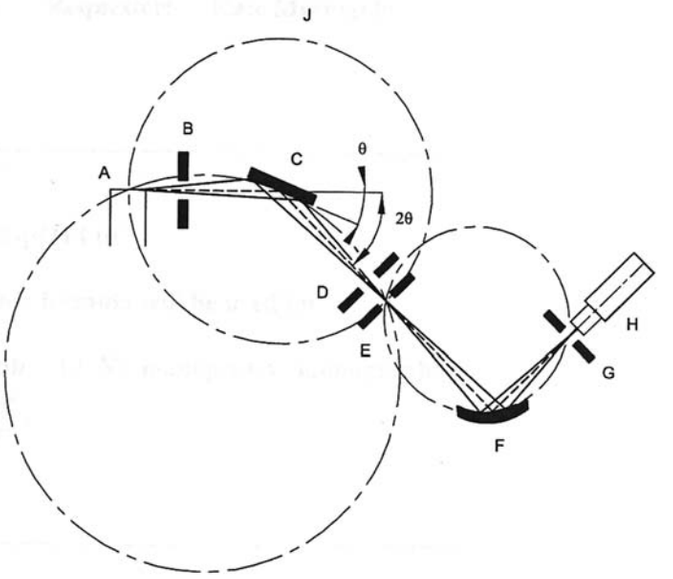

Figure 3. Diffraction of X-rays by a crystal according to Bragg's law.

A Bragg-Brentano diffractometer may also be used in transmission mode. The advantage with this technology is that there are fewer effects of the preferred orientation. A mounted capillary of about 0.5–2 mm thickness can also be used for small sample amounts.

X-Ray Radiation

In the laboratory, X-rays are obtained by bombarding a metal anode with electrons emitted by the thermionic effect and accelerated in a strong electric field (using a high-voltage generator). Most of the kinetic energy of the electrons is converted to heat, which limits the power of the tubes and requires efficient anode cooling. A 20- to 30-fold increase in brilliance can be obtained by using rotating anodes and by using X-ray optics. Alternatively, X-ray photons may be produced in a large-scale facility (synchrotron).

The spectrum emitted by an X-ray tube operating at sufficient voltage consists of a continuous background of polychromatic radiation and additional characteristic radiation that depends on the type of anode. Only this characteristic radiation is used in X-ray diffraction experiments. The principal radiation sources used for X-ray diffraction are vacuum tubes using copper, molybdenum, iron, cobalt, or chromium as anodes; copper, molybdenum, or cobalt X-rays are employed most commonly for organic substances (the use of a cobalt anode can especially be preferred to separate distinct X-ray lines). The choice of radiation to be used depends on the absorption characteristics of the specimen and possible fluorescence by atoms present in the specimen. The wavelengths used in powder diffraction generally correspond to the K_α radiation from the anode. Consequently, it is advantageous to make the X-ray beam "monochromatic" by eliminating all the other components of the emission spectrum. This can be partly obtained using

K_β filters—that is, metal filters selected as having an absorption edge between the K_β and K_α wavelengths emitted by the tube. Such a filter is usually inserted between the X-ray tube and the specimen. Another more commonly used way to obtain a monochromatic X-ray beam is via a large monochromator crystal (usually referred to as a "monochromator"). This crystal is placed before or behind the specimen and diffracts the different characteristic peaks of the X-ray beam (i.e., K_β and K_α) at different angles so that only one of them may be selected to enter into the detector. It is even possible to separate $K_{\alpha1}$ and $K_{\alpha2}$ radiations by using a specialized monochromator. Unfortunately, the gain in getting a monochromatic beam by using a filter or a monochromator is counteracted by a loss in intensity. Another way of separating K_α and K_β wavelengths is by using curved X-ray mirrors that can simultaneously monochromate and focus or parallelize the X-ray beam.

Radiation Protection

Exposure of any part of the human body to X-rays can be injurious to health. It is therefore essential that whenever X-ray equipment is used, adequate precautions be taken to protect the operator and any other person in the vicinity. Recommended practice for radiation protection and limits to levels of X-radiation exposure are those established by national legislation in each country. If there are no official regulations or recommendations in a country, the latest recommendations of the International Commission on Radiological Protection should be applied.

SPECIMEN PREPARATION AND MOUNTING

The preparation of the powdered material and the mounting of the specimen in a suitable holder are critical steps in many analytical methods, particularly for X-ray powder diffraction analysis, because preparation and mounting can greatly affect the quality of the data to be collected.[4] The main sources of errors due to specimen preparation and mounting are briefly discussed in the following section for instruments in Bragg-Brentano parafocusing geometry.

SPECIMEN PREPARATION

In general, the morphology of many crystalline particles tends to produce a specimen that exhibits some degree of preferred orientation in the specimen holder. This is particularly evident for needle-like or platelike crystals when size reduction yields finer needles or platelets. Preferred orientation in the specimen influences the intensities of various reflections so that some are more intense and others less, compared to what would be expected from a completely random specimen. Several techniques can be employed to improve randomness in the orientation of crystallites (and therefore to minimize preferred orientation), but further reduction of particle size is often the best and simplest approach. The optimum number of crystallites depends on the diffractometer geometry, the required resolution, and the specimen attenuation of the X-ray beam. In some cases, particle sizes as large as 50 μm will provide satisfactory results in phase identification. For quantitative XRPD analysis, it is often recommended that the specimen have coherent domains (crystallites) with a size < 10 μm. However, excessive milling (crystallite sizes approximately < 0.5 μm) may cause line broadening and significant changes to the sample itself, such as the following:

- specimen contamination by particles abraded from the milling instruments (mortar, pestle, balls, etc.),
- reduced degree of crystallinity,
- solid-state transition to another polymorph,
- chemical decomposition,

[4] Similarly, changes in the specimen can occur during data collection in the case of a nonequilibrium specimen (temperature, humidity).

- introduction of internal stress, and
- solid-state reactions.

Therefore, it is advisable to compare the diffraction pattern of the nonground specimen with that corresponding to a specimen of smaller particle size (e.g., a milled specimen). If the X-ray powder pattern obtained is of adequate quality considering its intended use, then grinding may not be required.

It should be noted that if a sample contains more than one phase and if sieving is used to isolate particles to a specific size, the initial composition may be altered.

SPECIMEN MOUNTING

Effect of Specimen Displacement

A specimen surface that is offset by D with reference to the diffractometer rotation axis[5] causes systematic errors that are very difficult to avoid entirely, resulting in absolute $D \cdot \cos\theta$ shifts[6] in 2θ positions (typically of the order of 0.01° in 2θ at low angles [$\cos\theta \cong 1$] for a displacement D = 15 μm) and asymmetric broadening of the profile toward low 2θ values. Use of an appropriate internal standard allows the detection and correction of this effect simultaneously with that arising from specimen transparency. This effect is by far the largest source of errors in data collected on well-aligned diffractometers.

Effect of Specimen Thickness and Transparency

When the XRPD method in reflection mode is applied, it is often preferable to work with specimens of ''infinite thickness''. This means that, for a given mass attenuation and bulk density of the specimen and a given range of diffraction angles, the diffracted intensity from the back of the specimen is negligible. For quantitative analysis, to ensure that the diffracted intensity is at least 99.9% of the maximum attainable by increasing the specimen thickness, *t,* the thickness, must be at least:

$$t = 3.45\sin\theta/\mu'\rho'$$

where μ' is the mass attenuation coefficient (often referred to as the mass absorption coefficient) and ρ' is the bulk density of the specimen. μ' is additive for the mass attenuation coefficients of the individual elements that constitute the material. It is independent of the physical state of the material.

For specimens with low attenuation (such as organic materials where the linear absorption coefficients are very small), the diffracted intensity appears to originate from a position below the surface, resulting in line shifts and changes in line widths. This effect, referred to as the transparency effect, is large for thick specimens with low attenuation and can lead to angular errors of as much as 0.1°. For such specimens, a precise measurement of line positions can be carried out on a specimen that is as thin as possible, but that still gives acceptable diffraction intensities. It is advisable to use a nondiffracting substrate (zero background holder)—for example, a plate of single crystalline silicon cut parallel to the 510 lattice planes.[7] One advantage of the transmission mode is that problems with sample height and specimen transparency are less important.

Use of an appropriate internal standard allows the detection and correction of this effect simultaneously with that arising from specimen displacement.

[5] D is the specimen surface displacement (offset of the specimen surface with reference to the diffractometer axis).

[6] Note that a goniometer zero alignment shift would result in a constant shift on all observed 2θ-line positions; in other words, the whole diffraction pattern is, in this case, translated by an offset of Z° in 2θ.

[7] In the case of a thin specimen with low attenuation, accurate measurements of line positions can be made with focusing diffractometer configurations in either transmission or reflection geometry. Accurate measurements of line positions on specimens with low attenuation are preferably made using diffractometers with parallel beam optics. This helps to reduce the effects of specimen thickness.

DIFFRACTOMETER ALIGNMENT

Goniometers and the corresponding incident and diffracted X-ray beam optics have many mechanical parts that need adjustment. The degree of alignment or misalignment directly influences the quality of the results of an XRPD investigation. Therefore, the different components of the diffractometer must be carefully adjusted (optical and mechanical systems, etc.) to adequately minimize systematic errors, while optimizing the intensities received by the detector. The search for maximum intensity and maximum resolution is always antagonistic when aligning a diffractometer. Hence, the best compromise must be sought while performing the alignment procedure. There are many different configurations, and each supplier's equipment requires specific alignment procedures.

CALIBRATION, PERFORMANCE TESTING, AND MONITORING OF DIFFRACTOMETERS

To establish the magnitude of potential errors in the diffractometer, a calibration curve, using a proper calibrant, whether internal or external, can be prepared after the alignment of the diffractometer for each of the following: angular calibration, intensity calibration, and line shape calibration. Calibration is usually performed using certified reference standards (the choice depends on the type of analysis). The overall diffractometer performance should be tested and monitored periodically, using working standards and/or reference standards (depending on the type of analysis).

QUALITATIVE PHASE ANALYSIS (IDENTIFICATION OF PHASES)

The identification of the phase composition of an unknown sample by XRPD is usually based on the visual or computer-assisted comparison of a portion of its X-ray powder pattern to the experimental or calculated pattern of a reference material. Ideally, these reference patterns are collected on well-characterized single-phase specimens. This approach makes it possible in most cases to identify a crystalline substance by its 2θ-diffraction angles or d-spacings and by its relative intensities. The computer-aided comparison of the diffraction pattern of the unknown sample to the comparison data can be based on either a more or less extended 2θ-range of the whole diffraction pattern or a set of reduced data derived from the pattern. For example, the list of d-spacings and normalized intensities, I_{norm}, a so-called (d, I_{norm}) list extracted from the pattern, is the crystallographic fingerprint of the material and can be compared to (d, I_{norm}) lists of single-phase samples compiled in databases.

For most organic crystals, when using Cu Kα radiation, it is appropriate to record the diffraction pattern in a 2θ-range from as near 0° as possible to at least 40°. The agreement in the 2θ-diffraction angles between specimen and reference is at least 0.1° for the same crystal form, while relative intensities between specimen and reference may vary considerably due to preferred orientation effects. For other types of samples (e.g., inorganic salts), it may be necessary to extend the 2θ region scanned to well beyond 40°. It is generally sufficient to scan past the 10 strongest reflections identified in single-phase X-ray powder diffraction database files.

It is sometimes difficult or even impossible to identify phases in the following cases:

- noncrystallized or amorphous substances,
- the presence of the components to be identified in low mass fraction of the analyte amounts (less than 10% *m/m*, except in favorable cases),
- pronounced preferred orientation effects,
- the phase has not been filed in the database used,
- formation of solid solutions,

- the presence of disordered structures that alter the unit cell,
- the specimen comprises too many phases,
- the presence of lattice deformations,
- structural similarity of different phases.

QUANTITATIVE PHASE ANALYSIS

If the sample under investigation is a mixture of two or more known phases, of which not more than one is amorphous, the percentage (by volume or by mass) of each crystalline phase and of the amorphous phase can in many cases be determined. Quantitative phase analysis can be based on the integrated intensities, on the peak heights of several individual diffraction lines,[8] or on the full pattern. These integrated intensities, peak heights, or full-pattern data points are compared to the corresponding values of reference materials. These reference materials must be single phase or a mixture of known phases. The difficulties encountered during quantitative analysis are due to specimen preparation (the accuracy and precision of the results require, in particular, homogeneity of all phases and a suitable particle size distribution in each phase) and to matrix effects.

MATRIX EFFECTS

Matrix effects corrections consist of eliminating or estimating the absorption phenomenon, except in the case of mixtures of polymorphic samples in which all phases have the same absorption coefficients. However, it should be noted that in the case of organic systems, such effects are rather limited; hence, corrections can in many such cases be neglected.

[8] If the crystal structures of all components are known, the Rietveld method can be used to quantify them with good accuracy. If the crystal structures of the components are not known, the Pawley method or the partial least-squares (PLS) method can be used.

POLYMORPHIC SAMPLES

For a sample composed of two polymorphic phases *a* and *b*, the following relationship can be written for the concentration C_a of phase *a*:

$$C_a = \frac{1}{1 + K(I_b / I_a)}$$

The concentration is derived by measuring the intensity ratio between the two phases, knowing the value of the constant K. K is the ratio of the absolute intensities of the two pure polymorphic phases I_{oa} / I_{ob}. Its value can be determined by measuring standard samples.

METHODS USING A STANDARD

The most commonly used methods for quantitative analysis are

- the external standard method,
- the internal standard method, and
- the spiking method (also often called the standard addition method).

The external standard method is the most general method and consists of comparing the X-ray diffraction pattern of the mixture, or the respective line intensities, with those measured in a reference mixture or with the theoretical intensities of a structural model, if it is fully known.

To limit errors due to matrix effects, an internal reference material can be used that has a crystallite size and X-ray absorption coefficient comparable to those of the components of the sample and that has a diffraction pattern that does not overlap at all that of the sample to be analyzed. A known quantity of this reference material is added to the sample to be analyzed and to each of the reference mixtures. Under these conditions, a linear relationship between line intensity

and concentration exists. This application, called the internal standard method, requires precise measurement of diffraction intensities.

In the spiking method (or standard addition method), some of the pure phase *a* is added to the mixture containing the unknown concentration of *a*. Multiple additions are made to prepare an intensity-versus-concentration plot in which the negative *x*-intercept is the concentration of the phase *a* in the original sample.

ESTIMATE OF THE AMORPHOUS AND CRYSTALLINE FRACTIONS

In a mixture of crystalline and amorphous phases, the crystalline and amorphous fractions can be estimated in several ways. The choice of the method used depends on the nature of the sample:

- If the sample consists of crystalline fractions and an amorphous fraction of different chemical compositions, the amounts of each of the individual crystalline phases may be estimated using appropriate standard substances, as described above. The amorphous fraction is then deduced indirectly by subtraction.
- If the sample consists of one amorphous and one crystalline fraction, either as a 1-phase or a 2-phase mixture, with the same elemental composition, the amount of the crystalline phase (the "degree of crystallinity") can be estimated by measuring three areas of the diffractogram:

  A = total area of the peaks arising from diffraction from the crystalline fraction of the sample,

  B = total area below area A,

  C = background area (due to air scattering, fluorescence, equipment, etc).

When these areas have been measured, the degree of crystallinity can be roughly estimated as:

$$\% \text{ crystallinity} = 100A/(A + B - C)$$

It is noteworthy that this method does not yield an absolute degree of crystallinity values and hence is generally used for comparative purposes only. More sophisticated methods are also available, such as the Ruland method.

OBTAINING STRUCTURAL INFORMATION FROM AN XRPD PATTERN

XRPD has been an important standard tool for many decades for the identification and characterization of crystalline materials. The recent development of XRPD methods also allows some relevant structural information to be extracted from accurate XRPD data, as briefly described below.

Determination of Lattice Parameters

In an XRPD, each line can be associated with a *d*-spacing and the Miller indices {*hkl*} of the corresponding family or families of planes if the unit cell of the lattice is known (crystal system, Bravais lattice, approximate lattice parameters). The *d*-spacings measured from the diffractogram are related to the lattice parameters by geometric relations involving the Miller indices of the planes considered. If the material studied consists of crystalline phases for which the corresponding lattice parameters are approximately known, the lattice parameters can be refined by a least-squares method, using the whole powder pattern or a list of indexed *d*-spacings.

If the material studied consists of an unknown crystalline phase, the determination of the lattice parameters requires ab initio indexing of the XRPD pattern. This results in Mil-

ler indices being attributed to each line of the observed diffractogram. It can be accomplished by comparison with a reference pattern or by automatic indexing programs. Whether the mathematical solution found by an automatic indexing program is the true crystallographic unit cell or only a "pseudocell" depends on the completeness and uncertainty of the experimental data and on the size and symmetry of the unit cell.

Structure Solution

In general, the determination of crystal structures is performed from X-ray diffraction data obtained using single crystals. However, when substances cannot be prepared in the appropriate pure crystallographic form, this conventional approach cannot be employed. Recent developments based on high-resolution X-ray diffraction techniques using powders have led to significant progress in crystal structure determination. Crystal structures can sometimes be determined from sufficiently well-resolved powder diffraction data by applying trial and error, Patterson methods, and/or direct methods. However, crystal structure analysis of organic crystals is a challenging task, because the lattice parameters are comparatively large, the symmetry is low, and the scattering properties are normally very low. For any given crystalline form of a substance, the knowledge of the crystal structure allows for calculating the corresponding XRPD pattern, thereby providing a preferred orientation-free reference XRPD pattern, which can then be used for batch comparisons.

Refinement of Crystal Structures

Refinement of crystal structures consists of minimizing the difference between the intensities of the experimental diffraction pattern of a crystalline substance and the intensities calculated from a structural model sufficiently close to the true structure. The minimization is carried out using a least-squares method (or other procedure) to refine the structural parameters of the model (unit cell dimensions, atom coordinates, site occupancies) and the atomic displacement parameters until a satisfactory agreement between calculated and observed intensities is obtained. This application requires accurate diffraction data (intensity and position), containing sufficient information to estimate the structural parameters concerned. Structure refinement is most often carried out by methods of the Rietveld type, but the integrated-intensity method can also be applied.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 31(4) [July–Aug. 2005]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Microbial Testing for Orally Inhaled and Nasal Drug Products

USP Project Team 7: Lex Adjei, Ph.D., Anton Amann, Ph.D., Jeff Blumenstein, Ph.D., Peter Byron, Ph.D., Roger Dabbah, Ph.D., Roger Deschenes, Jeffrey Ferguson (Chair), Edward Fitzgerald, Ph.D., Keith Horspool, Ph.D., Stephen Indelicato, Angel Janney, Michael Korczynski, Bonnie Layton, Svetlana Lyapustina, Ph.D., Richard Malcolmson, Ph.D., Deborah Mentel, Julia Mottishaw, Bo Olsson, Ph.D., Guirag Poochikian, Ph.D., David Porter, Ph.D., James Pfeiffer, Erwin Post, Bryan Riley, Ph.D., Dar Rosario, Betsy Sawyer, Donald Singer, Terry Tougas, Ph.D., Roberta Tracy, Patti Valan, and Paul Wright, Ph.D.; *USP Aerosols Expert Committee:* Michael J. Brubaker, Ph.D., Donald W. Buckmaster, B.S., Peter Byron, Ph.D. (Chair), Harris Cummings, Ph.D., Paul D. Curry, Jr., Ph.D., Bo Olsson, Ph.D., Guirag Poochikian, Ph.D., Michael T. Riebe, Ph.D., Charles G. Thiel, B.A., and Caroline C. Vanneste, B.S.

ABSTRACT The Aerosols Expert Committee proposes adding the following text to a future version of General Chapter ⟨601⟩ *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* to provide microbiological sampling methods and accompanying specifications for orally inhaled and nasal drug products (OINDP) that are not required to be sterile. Note that *Aqueous OINDP* (e.g., single-dose inhalation solutions or aqueous solutions for inhalation) are required to be sterile, and these products are not addressed here except that certain general principles concerning aseptic sampling, as described below, may also apply to sterile OINDP during opening and testing of finished products. These procedures have been developed with the assistance of USP's Project Team 7.

MICROBIAL TESTING FOR ORALLY INHALED AND NASAL DRUG PRODUCTS (OINDP)

OINDP microbial testing involves Microbial Enumeration Tests (e.g., to determine the number of colony-forming units, CFU, per unit of measure) and Tests for Specified Microorganisms (e.g., Absence of *Staphylococcus aureus*). Each type of OINDP has its own challenges, and therefore test recommendations are divided into two groups: (1) *Low-Content OINDP* and (2) *High-Content OINDP.* These two groups are defined based on the target fill of the *primary container unit* (hereafter referred to as *unit*), which is the immediate enclosure containing the formulation in the finished product (e.g., canister, foil blister, capsule, vial, spray container, etc.).

Low-Content OINDP are those with a target fill of no more than (NMT) 100 mg of powder or 1 mL of liquid formulation per unit. Examples are premetered dry powder inhalers (DPIs) and single-dose nasal sprays.

High-Content OINDP are multidose drug products with a target fill of more than 100 mg of powder or more than 1 mL of liquid formulation per unit. Examples are pressurized metered-dose inhalers (MDIs) for oral inhalation and intranasal delivery, reservoir DPIs, and multidose nasal sprays.

Following sampling using one or more of the methods described below, testing should be performed in accord with General Chapter ⟨61⟩ and products should comply with the *Acceptance Criteria (Table 1)*. Testing may be performed on the unpackaged bulk or the finished product according to *Microbial Limit Tests* ⟨61⟩. However, if testing is performed on bulk alone, then the process leading from the bulk to the finished product must be validated to confirm its ability to prevent microbial contamination. Testing of the finished product must be performed if that process is not validated.

Correspondence should be addressed to: Kahkashan Zaidi, Ph.D., Drug Standards Division, USP, 12601 Twinbrook Parkway, Rockville, MD, 20852-1790; e-mail: kxz@usp.org.

Table 1. Acceptance Criteria for Microbiological Quality of Orally Inhaled and Nasal Drug Products*

Dosage Form and Type of Testing	Total Aerobic Microbial Count†	Total Combined Yeasts and Molds Count	Specified Organisms
Bulk loose powder or bulk filled capsules for low-content OINDP for pulmonary delivery	NMT 100 CFU/g	NMT 10 CFU/g	Absence (per 1 g) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria
Bulk formulation for low-content nasal products	NMT 100 CFU/g or mL	NMT 10 CFU/g or mL	Absence (per 1 g or mL) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria
Finished product–low-content OINDP for pulmonary delivery	NMT 10 CFU/unit§	NMT 10 CFU/unit	Absence (per 10 units§) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria
Finished product–low-content OINDP for nasal delivery	NMT 10 CFU/unit	NMT 10 CFU/unit	Absence (per 10 units§) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria
Finished product–inhalation and nasal products in pressurized MDIs and reservoir DPIs	NMT 100 CFU/unit	NMT 10 CFU/unit	Absence (per 1 unit§) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria
Finished product–multidose nasal sprays	NMT 100 CFU/g or mL	NMT 10 CFU/g or mL	Absence (per 1 g or mL) of *Staphylococcus aureus, Pseudomonas aeruginosa,* and bile-tolerant Gram-negative bacteria

* OINDP not required to be sterile.
† The exact limits provided in this table may not be acceptable to FDA for all products.
§ The term *unit* refers to the primary container unit, described above. When microbial counts are expressed in CFU/g, *gram* refers to the formulation—including active ingredient(s), propellant(s), excipient(s), co-solvent(s), surfactant(s), etc.—together with soluble capsules when used. As explained in USP chapter ⟨61⟩, an ''error factor'' of 2 may be applied to the stated acceptance criteria, meaning that an experimentally determined total count of up to twice the stated value can be considered acceptable.

SAMPLE SIZE

Select a sample size as follows:
Finished Product Low- and High-Content OINDP

Sample ten (10) drug product containers or units representative of the batch for each microbiological test. For batch sizes smaller than 200 units (e.g., batches used in clinical trials), sample size may be reduced to 1% of the units or 1 unit, respectively, whichever is greater. The contents of individual containers may be pooled for testing. In cases where the primary product container is demonstrated to be soluble in the microbiological testing media (e.g., soluble capsules), the test may be done on the unopened filled capsules to minimize potential for microbial contamination during opening. When testing filled capsules, include the weight of both the capsules and formulation contained therein in the weight of the material and the calculation of CFU/g.

Bulk Testing for Low-Content OINDP

Bulk-lot testing may be preferable for Low-Content OINDP in lieu of finished-product testing to allow for larger sample sizes representative of the batch without unduly increasing the risk of inadvertent microbial contamination. Bulk testing can be performed on the bulk powder or liquid formulation just prior to filling or on bulk filled capsules if the capsule is soluble in the microbiological media. If bulk testing is performed in lieu of finished-product testing, then manufacturing processes subsequent to bulk sampling (e.g., filling and packaging) must be validated in accordance with cGMP for their ability to prevent microbial contamination. It is further recommended that a program of periodic, but intermittent, testing of the finished product be implemented (e.g., skip-lot testing), the frequency of which is based on the product's manufacturing and microbiological history. Sample at least 10 g or 10 mL of bulk material for microbial enumeration tests and 1 g or 1 mL of bulk material for the

tests for specified microorganisms. When testing filled capsules, include the weight of both the capsules and formulation contained therein in the weight of the material and the calculation of CFU/g. For small batch sizes (i.e., less than 1000 g or 1000 mL), the recommended sample size is 1% of the batch for enumeration tests and 0.1% of the batch for tests for specified microorganisms.

SAMPLING PROCEDURES FOR HIGH-CONTENT OINDP

Select a sampling procedure from the list below. In all cases, employ aseptic techniques whenever necessary to avoid contamination of samples.

Propellant-Based Pressurized MDIs

1. Automatic Actuation Method

The contents of MDI containers may be collected by automatically actuating each MDI and collecting the delivered formulation on a suitable sterile filter.

2. Room-Temperature Method

Disinfect the outside of the test containers with an appropriate disinfectant and allow the containers to dry in an aseptic environment.

Using a needle apparatus or similar device, empty the MDI into a sterile vessel. If it has been demonstrated during Preparatory Testing (⟨USP 61⟩) that the propellant does not inhibit the growth of microorganisms, the contents of the sterile vessel may be added directly to the liquid media or buffer. Otherwise, allow the propellant to evaporate from the vessel by leaving the vessel at room temperature for several minutes and "pouring off" the gaseous propellant by tilting the vessel slightly, or by allowing a slow stream of microbiologically inert sterile gas to pass over the surface. For some less volatile propellants, such as CFC 11–CFC 12 combinations, heating the vessel slightly (to temperatures $\leq$45 °C) may be used to assist with evaporation. After evaporation, add the liquid media or buffer and mix the contents to prepare for testing.

If a needle apparatus is available and is thin and strong enough to puncture the container and allow slow removal of the contents, direct expulsion into the broth media or buffer may be feasible. In this case, the contents may be expelled into and mixed with the aqueous medium. Layering of the propellant and aqueous medium may occur, in which case a longer time period and slight heating (not to exceed 45 °C) may be required for propellant evaporation.

3. Chilling Method

Disinfect the outside of the test containers with an appropriate disinfectant and allow the containers to dry in an aseptic environment. Place the disinfected MDI containers in dry ice or dry ice slurry (ensure the microbial quality of the dry ice and slurry-forming liquid) or cryofreezer for the period required to liquefy the contents. Aseptically open the MDI containers using an appropriate tool.

For CFC-based products, pour the contents of containers into sterile vessels. Allow the propellant to escape, and combine residues with an appropriate diluent for the drug product. Other drug-specific procedures may also be employed.

For HFA-based products, pour the contents of the containers into sterile vessels partially immersed in larger vessels containing dry ice. Drive off the propellant, for example by allowing a slow stream of sterile, filtered, oil-free compressed air to evaporate the material to dryness. Combine residues with an appropriate diluent for the drug product.

An alternative procedure when testing the entire contents of a previously chilled container is to pour the contents of the opened container onto a sterile membrane filtration unit, allow the propellant to escape, then rinse with an appropriate amount of sterile diluent.

Reservoir DPIs

If the reservoir DPI has a fill plug, appropriate procedures used to sample a nonsterile drug product container should be employed.

Multidose Nasal Sprays

The container usually has a cap that is screwed on, crimped on, or forms a "snap-fit." The container can be opened by unscrewing the cap, cutting the seal, or using a decrimping tool, taking care to avoid microbial contamination during the process.

Specification Justification

The recommended acceptance criteria outlined in *Table 1* are based on Project Team 7's assessment of clinical relevance, test method sensitivity and variability, process capability for currently marketed products, and a desire to promote harmonization with the limits proposed in the *European Pharmacopoeia*.

The potential clinical impact on immunocompromised patients was assessed by considering the scientific data developed by the Centers for Disease Control (CDC) and published in the 2001 draft *Guideline for Environmental Infection Control in Health-Care Facilities.* That CDC draft guidance advises an upper limit of 15 CFU/m^3 of environmental air for gross colony counts of fungal organisms and 0.1 CFU/m^3 of environmental air for *A. fumigatus* and other potentially opportunistic fungi in heavily filtered air in critical-care areas. The CDC article further states that there is a lack of correlation between fungal species in the environment and clinical specimens. The upper limit of 15 CFU/m^3 equates to an exposure of 120 CFU/24 h, which is greater than the potential exposure from an MDI or DPI product with a limit of NMT 100 CFU/g or NMT 100 CFU/unit. However, FDA cautions that microbial limits developed for ambient air may not be appropriate for orally inhaled drug products. This uncertainty is due to the question of what specific data were used to support the safety of those environmental limits and whether such data can be extrapo-

lated to the setting of an orally inhaled drug product. These products are intended, by both design and by method of use, specifically to reach deep into the lung, potentially in patients with pre-existing lung disease.

The total aerobic microbial count specification of 100 CFU/g also takes into account the test method sensitivity and variability. USP Chapter ⟨61⟩ *Microbial Limit Tests* acknowledges that it provides an "estimation" of viable microorganisms in pharmaceutical items. Furthermore USP General Chapter *Validation of Microbial Recovery from Pharmacopeial Articles* ⟨1227⟩ under the section *Estimating the Number of Colony-Forming Units* states "as the number decreases, random error plays an increasing role in the estimate [of total aerobic microbial count]." The USP Chapter ⟨61⟩ test normally requires a 1:10 or 1:100 dilution that correlates to a limit of detection of <10 CFU/g and <100 CFU/g, respectively. Thus a limit tighter than 100 CFU/g is not practical for all currently marketed MDI and DPI products.

The microbial quality of MDIs and DPIs is greatly influenced by nonsterile raw materials, components, and manufacturing environments (e.g., Class 10,000 or 100,000) used to produce these products. An industry survey indicates that although producers implement manufacturing controls to minimize microbial contamination, the air classification of the manufacturing areas and microbiology testing facilities and procedures may account for low-level microbial contamination. Because many companies do not manufacture sterile products at the same facilities as MDI and DPI products, costly microbiology laboratory upgrades are not justified for nonsterile inhalation products. However, companies are expected to monitor and investigate microbial results that fall outside expected trends for the product.

The collective evaluations of test method sensitivity/variability and process capability indicate that the proposed limits are appropriate for nonsterile inhalation products. However, cGMPs dictate that appropriate controls to minimize microbial contamination should be incorporated into the manufacture of all nonsterile OINDPs.

COMMENTS

Comments regarding these proposals are solicited from all interested parties. These should be sent to arrive on or before October 7, 2005, and should be addressed to Kahkashan Zaidi, Ph.D., Drug Standards Division, USP, 12601 Twinbrook Parkway, Rockville, MD, 20852-1790; e-mail: kxz@usp.org. Comments will be debated prior to the publication of a revised form of this text in the *In-Process Revision* section of *Pharmacopeial Forum*.

USP-International: Responses to Comments on *Stimuli* Article

United States Pharmacopeia Staff[*]

ABSTRACT In the September–October 2004 issue of *Pharmacopeial Forum—PF* 30(5)—USP published a *Stimuli* article titled "Development of a New Official Compendium, Separate from *USP–NF,* for Articles Not Legally Marketed in the U.S." (*1*). That *Stimuli* article specifically solicited public comment about the prospective launch of a new compendium, *USP-International,* and on 10 December 2004, USP also convened an invitational meeting regarding *USP-International*. The present *Stimuli* article summarizes and responds to all comments received following publication of the original article.

BACKGROUND

In the September–October 2004 issue of *Pharmacopeial Forum—PF* 30(5)—USP published a *Stimuli* article titled "Development of a New Official Compendium, Separate from *USP–NF,* for Articles Not Legally Marketed in the U.S." (*Stimuli* article) (*1*). The *Stimuli* article was published at the request of the Task Force on Public Health Program #1 ("Task Force"), which was formed by the USP Board of Trustees following a Council of Experts Executive Committee vote in July 2003 to include in *USP–NF* monographs for articles not legally marketed in the United States but available in international commerce. The purpose of the *Stimuli* article was to solicit input regarding how this Council of Experts Executive Committee vote might be implemented and to offer a proposal for effectuating the Committee's decision through publication of a separate compendium (referred to herein as *USP-International* or *USP-I*). On November 16, 2004, again at the request of the Task Force, Dr. Roger Williams issued a letter to members of the USP Convention and Executive Officers of Eligible Organizations, members of the Council of Experts and Expert Committees, and USP stakeholders requesting responses and feedback to the *Stimuli* article.

In addition to the publication of the *Stimuli* article and the solicitation of comments, an invitational meeting regarding *USP-International* was held on December 10, 2004, to meet directly with trade organizations and representatives of the government. Dr. Edwin T. Bransome, USP Past President and Chair of the Task Force led the meeting. The following representatives attended:

- Gordon Johnston, R.Ph., Vice President, Regulatory Affairs, Generic Pharmaceutical Association
- Janeen Kincaid, Corporate Compendial Liaison, Pfizer
- Thomas McGinnis, R.Ph., Chief Pharmacist, FDA Office of Policy
- Yana R. Mille, R.Ph., Director, Regulatory, Office of Pharmaceutical Sciences, FDA Center for Drug Evaluation and Research
- Sara Radcliffe, M.P.H., Managing Director, Scientific and Regulatory Affairs, Biotechnology Industry Organization
- Fred Razzaghi, Director of Technical Affairs, Consumer Healthcare Products Association
- Andreas Seiter, M.D., Global Pharmaceutical Industry Fellow, World Bank
- Alice E. Till, Ph.D., Vice President, Science Policy and Technical Affairs, PhRMA
- Richard Walling, R.Ph., M.H.A., Office of Global Health Affairs, Rear Admiral, Assistant Surgeon General, Director of the Office of the Americas and Middle East.

Invitations to the December 10, 2004, meeting also were extended to the International Federation of Pharmaceutical Manufacturers and Associations, the International Generic Pharmaceutical Alliance, and the Pan American Health Organization, although representatives of those organizations were unable to attend.

Along with the feedback provided during the December 10, 2004, meeting, written comments responding to the *Stimuli* article were received from many constituencies, including USP Convention members, Council of Experts members, pharmaceutical manufacturers, trade associations, and government representatives.

Seventy-one Convention and Council of Experts members responded to the call for comments for a response rate of approximately 5%. The majority of these respondents expressed support for the general approach proposed in the *Stimuli* article, noting USP's unique position as a recognized leader in national and international standards-setting, its perceived ability to implement such an effort, and the timeliness of the initiative. Several specifically noted the public health need for such a compendium, given the international nature of modern pharmaceutical research and manufacturing and the increasingly global distribution and use of pharmaceutical products. The respondent breakdown among

[*] Susan de Mars, J.D., Eric Sheinin, Ph.D., Elizabeth Singh, Stefan Schuber, Ph.D., Roger L. Williams, M.D. Correspondence should be addressed to: Roger L. Williams, M.D., executive vice president and chief executive officer, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; telephone 301.816.8225.

Convention and Council of Experts members was as follows: 17 (24%) were Convention members; 12 (17%) were members of the Council of Experts (Expert Committee chairs); 40 (56%) were Expert Committee members; and two (2%) did not indicate their affiliation. Of the comments, 60 (85%) were supportive. Of the remaining responses, one (1%) indicated conditional support, and 10 (14%) did not indicate whether or not they supported the concept but provided comments.

Responses from 13 stakeholders also were received. Respondents included: the Center for Drug Evaluation and Research of the Food and Drug Administration, Consumer Healthcare Products Association, Eli Lilly & Company, Hoffmann–La Roche, Inc., Generic Pharmaceutical Association, J.B. Chemicals and Pharmaceuticals Limited, New Jersey Pharmaceutical Quality Control Association, Pfizer, Inc., Pharmaceutical Research and Manufacturers of America, Purdue Pharma, L.P., World Bank, World Health Organization (WHO), and Wyeth. The comments of the Center for Drug Evaluation and Research, the Consumer Healthcare Products Association, the Generic Pharmaceutical Association, WHO, and World Bank were supportive and offered constructive comments. The remainder of these stakeholder respondents generally voiced strong concerns about or disagreement with the concept of *USP-I*.

In the following summary, USP has organized the issues and concerns raised by respondents in both Convention/Council of Experts and stakeholder groups into major categories and has responded to each of these categories.

SUMMARY OF, AND RESPONSES TO, ISSUES RAISED BY COMMENTATORS

A. Resource Limitations and Constraints

Issues

The concern most frequently voiced by respondents was whether USP would have sufficient financial and other resources to undertake *USP-I* without detracting from or consuming resources necessary for the continued maintenance of *USP–NF*. In some cases, respondents noted the large number of missing or outdated monographs in *USP–NF* as evidence of the need to concentrate resources first on closing these gaps within *USP–NF*. One respondent noted the cessation of *USP-DI* activities and expressed hope that if *USP-International* were pursued, the same fate would not befall it.

Response

USP has no intention of diverting resources away from *USP–NF* to support *USP-I* or to allow *USP-I* in any way to detract from USP's ongoing commitment to maintain *USP–NF* as the official compendia of the United States of America produced through USP's standards-setting activities. Rather, it is the expectation that, over time, *USP-I* coupled with official USP Reference Standards could become self-sustaining just as *USP–NF* has been. However, USP fully recognizes the need for careful, comprehensive business planning to ensure that the development of *USP-I* can proceed in a financially responsible and feasible manner. USP also acknowledges that there are specific resource issues that need to be addressed, such as whether Council of Experts members have sufficient time and expertise to devote to *USP-I*; some of these are discussed further below, and others will be addressed as planning for the project continues.

USP also has no intention of lessening its efforts to obtain missing monographs for articles marketed in the U.S. or to update existing monographs. However, the primary barrier to resolving these issues is not a lack of resources on USP's part; rather, as discussed in the *Stimuli* article, it is more often reluctance on the part of pharmaceutical manufacturers to provide the necessary information. Given the voluntary nature of donation of the information required to develop and update monographs, it is unlikely that these issues can be resolved soon. Meanwhile, USP believes it can make a significant contribution to public health by developing standards for articles marketed outside the U.S. via *USP-International*. There is no expectation that resources for *USP-I* should result in an increase in prices for USP's current line of products and services.

B. USP's Ability to Develop Sound Monographs for Products Not Approved in the U.S.

Issues

Several respondents raised questions regarding whether USP would have the ability to develop high-quality monographs for drugs not approved in the U.S., given 1) the possibility that foreign manufacturers might also be reluctant to provide information; 2) the absence of competent regulatory authorities in some countries to provide review and oversight; and 3) the potential lack of scientific expertise and capabilities within USP and its Council of Experts that might be needed to develop the requisite information, especially in the absence of a competent regulatory authority. Some respondents were concerned generally about how USP could assure safety of products in international commerce. Others wondered—especially given the suggestion in the *Stimuli* article that *USP-I* could use WHO's model of providing classical procedures—whether *USP-International* might represent 4) a departure from USP's tradition of providing the most rigorous, science-based standards or an intent to create a "double standard" based on whether products were approved and marketed inside or outside of the U.S. Each of these sub-issues is specifically addressed below.

Response

1. Foreign Manufacturers' Willingness to Provide Monograph Information. USP recognizes that some foreign manufacturers may have the same reservations as some U.S. manufacturers do today with regard to furnishing monograph information. Having said that, USP believes there will

be a sufficient number of manufacturers who will be willing to provide information. Manufacturers of drugs in international commerce may see more value in the creation of a monograph than do U.S. manufacturers and so may be more likely to be willing to donate information and materials.

2. Lack of Regulatory Oversight; Safety Concerns. USP acknowledges that public monographs in *USP–NF* today rest on excellent work by highly committed pharmaceutical manufacturers as well as FDA. USP would point out that there now exist highly competent regulatory authorities in many '802 countries—countries that the U.S. government has evaluated as competent to receive unapproved drugs exported from the U.S. These authorities today allow market access in their respective countries based on review and acceptance of private or public standards to ensure the strength, quality, and purity of an article. This reflects the evolution of capability throughout the world, which arises in part as a result of the efforts of the International Conference on Harmonization (ICH). In this context, it seems appropriate for USP to begin its efforts on *USP-I* by working with competent regulatory agencies in other countries. With the experience gained in this initial phase, USP will be able to begin to develop expertise in obtaining and reviewing the kind of information needed to support a sound monograph.

USP also believes that it is important to not confuse clinical safety and efficacy of the drug substance and dosage form with some specific safety issues pertinent to a monograph. USP has no intention of engaging in the safety and efficacy evaluations that allow market access for a new drug or biologic. That evaluation is much better left to highly competent authorities such as those who participate actively in ICH.

There are, of course, issues of safety and/or efficacy for a public monograph that do not devolve directly on the drug substance, be it a drug or biologic. These relate primarily to limits for impurities, as reflected in the USP *Impurity* test (safety) and dosage form performance (safety and efficacy), as reflected in the USP *Performance* test. Again, for '802 countries, or some subset thereof, USP intends to work with a regulatory agency, specified by the Sponsor of the Request for Revision to *USP-I,* to gain needed information to support provisions of the monograph. For non-'802 countries, USP would have to develop capability to review impurity isolation, characterization, and qualification data to gain acceptance criteria for the *Impurity* test. For the acceptance criterion for the USP *Performance* test (e.g., dissolution *Q* value), USP would have to review bioavailability-bioequivalence (BA/BE) studies.

Finally, USP notes the approach of the European Department for the Quality of Medicines (EDQM) wherein an administrative unit of that organization, working with Member State regulators, reviews impurity data to reach a community-wide decision on impurity limits and other safety issues for a drug substance.

3. Expertise of Council of Experts and Expert Committees. Although some of the areas identified above are of course new areas for USP, they are not beyond the knowledge base and capability of its Council of Experts and its Expert Committees. The Council of Experts Executive Committee has already begun to consider how it might formulate guidance for the development of *USP-I* monographs. Certainly, there would be one set of criteria for '802 countries with established and credible regulatory authorities, but the creation of criteria for countries with reduced regulatory resources would be more complex. Although tackling these issues may be challenging, it would also ultimately strengthen the scientific knowledge of the Council of Experts and Expert Committees and allow USP to become more self-reliant. The development of *USP-International* may also provide USP with opportunities to bring additional distinguished scientists from around the world into the Council of Experts and Expert Committees, further strengthening and supplementing the already considerable scientific capabilities within these bodies.

4. Use of Less Rigorous Standards for USP-I Monographs. USP does not intend to lower its quality standards in developing *USP-I.* In fact, as noted in the *Stimuli* article, the monographs in *USP-I* may be more relevant and science-based initially than the monographs in *USP–NF* because of the challenges of updating current monographs. USP also does not intend to create different monographs for the same material. However, this does not mean that the standards for articles under the same name are identical. The work of ICH as well as many other factors has resulted in what USP now terms the *flexible monograph.* This approach was developed with careful input from knowledgeable representatives of many U.S. manufacturers and acknowledges that tests within a monograph may be associated with different procedures and acceptance criteria. This is already an established position in *USP–NF,* where different dosage forms may require different Performance test procedures and acceptance criteria (e.g., for dissolution, the *Q* value). For the ingredient Impurity test, USP acknowledges the outcome of the ICH approach may require different Impurity test procedures and acceptance criteria for impurities arising from different routes of synthesis. This too is already an established position in *USP–NF.*[1] USP generally supports the goals of the Pharmacopeial Discussion Group (PDG) harmonization that speak to the best, most relevant compendial standards for all articles in commerce.

USP will always maintain its commitment to providing the most modern, relevant, and science-based monograph. However, within *USP-International,* it is possible that less demanding tests, including WHO screening/basic tests, could be placed in the informational section of monographs. Such tests have significant value in ensuring basic drug safety and quality in areas with only very rudimentary testing equipment and thus serve a critical public health need in

[1] For a more detailed discussion, please see the *USP Guideline for Submitting Requests for Revision to* USP–NF at www.usp.org/USPNF/submitMonograph/subGuide.html

underdeveloped and developing countries. Again, these are issues that can be further considered and refined by USP and its Council of Experts as development of *USP-I* progresses.

C. Intellectual Property

Issue

Some commentators from the pharmaceutical industry expressed concern that innovators' U.S. intellectual property rights might be compromised or jeopardized by USP's publication of monographs for articles not legally marketed in the U.S. In these commentators' views, *USP-I* could be used to circumvent the existing *USP–NF* monograph development process or allow generic manufacturers to prematurely gain access to monograph information.

Response

To some extent these comments reflect a larger disagreement between certain innovators and USP regarding the appropriate timing of the publication of a monograph for a product protected by a U.S. patent. USP has always believed that a public monograph (relating to quality) should accompany FDA-approved product labeling (relating to safety and efficacy) at the time of New Drug Application/Biologic License Application (NDA/BLA) approval. With this approach, practitioners, patients, and purchasers may view the triad of information needed for informed decision-making. The need was envisioned in the Federal Food, Drug, and Cosmetic Act (FDCA), which states that a firm may claim that an article is not "USP" or not "NF" if it differs from the standards of strength, quality, or purity established for the article in *USP* and if the difference is stated in the firm's product label. These statements are clearly separate and distinct from those portions of the FDCA that relate to generic substitution. USP also believes that an official Reference Standard allows FDA and other enforcing bodies to monitor the integrity of a manufacturer's manufacturing processes. Although candidate material for a product may come from the manufacturer, the subsequent work in USP, FDA, and other collaborating laboratories becomes a way to confirm, check, monitor over time, and—ultimately—endorse that manufacturer's manufacturing operations. In today's environment more than ever, the independent character of these processes is critical to the public health and in maintaining public trust.

Nevertheless, USP emphasizes that *USP-International* will provide monographs based on voluntary submission of information by a Sponsor in a Request for Revision, just as now occurs in Requests for Revision to *USP–NF*. Thus transmission of trade secret information, such as validated analytical procedures, as always, will continue to be the choice and the responsibility of the Sponsor.

USP acknowledges that intellectual property protection is an important concern for innovators and one that is heightened by the fact that other countries do not necessarily follow the intellectual property approaches of the U.S. However, it is not within USP's province or mission to ensure the protection of manufacturers' intellectual property or to promote or advocate certain intellectual property laws and approaches over others. These issues will continue to be determined by the respective governments of individual countries, working within the broader context of the World Trade Organization and influenced by other associations and organizations whose mission it is to advance these issues. Those governments will also continue to determine issues of market access within their individual countries.

Certainly, USP will continue to respect the laws—including intellectual property laws—of the various nations and regions in which it operates. USP has always endeavored to abide by such laws. However, USP's mission and vision, as shaped by its charter and Board of Trustees, is to assure the quality of drugs already in commerce throughout the world. Publication of *USP-I* fits squarely within this mission and vision and should not be derailed by intellectual property concerns that are beyond the purview or control of USP.

D. Counterfeit and Substandard Drugs

Issue

Somewhat related to the intellectual property issues discussed above are questions raised by some respondents about whether USP's publication of monographs for articles not approved in the U.S. might be perceived as legitimizing or validating such articles in this country or might otherwise facilitate the illegal entry of such articles into the U.S.

Response

As noted above and stated clearly in the *Stimuli* article, *USP-International* is not intended to be a mechanism for market access in the U.S. That responsibility lies with the U.S. government through its work with FDA and other agencies. Indeed, as outlined in the *Stimuli* article, *USP-I* should be seen in this regard as a means to keep certain articles out of the U.S. market by appropriate surveillance testing.

With regard to substandard products, USP maintains, as noted in the *Stimuli* article, that monographs in a separate compendium might in fact assist foreign regulatory bodies, customs officials, purchasing agents, and other groups and individuals in understanding how to test articles legitimately marketed within a country or in international commerce. USP believes it is in the interest of public health and its stakeholders, as well as USP, to ensure that articles in international and national commerce are of acceptable quality. Substandard products, even when made by well-intentioned manufacturers, do nothing to serve legal and legitimate interests, detracting as they do from public trust in acceptably manufactured articles. The absence of public procedures to test counterfeit medicines raises an even larger challenge for affected countries. Although USP acknowledges that *USP-I* monographs might not in every case allow officials to distinguish between acceptable and substandard products, these limitations should not deter USP from doing what it can to assist in the effort to combat the introduction of sub-

standard drugs globally. As noted above, even basic tests can be of value in the battle against substandard and counterfeit drugs. And over time, USP and its Council of Experts can continue to consider how additional tests and information might be used to detect more sophisticated counterfeit drugs. Again, through directives of this and prior USP Boards of Trustees and Conventions, USP is charged with using its capabilities to help assure the good quality of safe and effective products not only in the U.S. marketplace but throughout the world, and *USP–International* represents an important step in fulfilling this charge.

E. Acceptance by the International Community; Coordination with Existing International Efforts

Issues

Some commentators raised issues regarding USP's outreach to the international health community to validate the need for and acceptance of the new publication. They also questioned whether USP should instead be focusing on supporting WHO's *International Pharmacopoeia* and/or international harmonization efforts. Each of these issues is addressed below.

Response

1. Acceptance of USP-I by the International Community. Based on its outreach to and discussions with constituents in other countries, including regulatory authorities, manufacturers, and practitioners, USP believes that much of the international health community will welcome the standards and information made available in *USP-International*. More generally, USP firmly believes that the proposed separate compendium will amplify USP's international public health opportunities and contributions, not only with WHO and manufacturers but also with professional associations such as the World Medical Association, FIP, and the International Council of Nurses—practitioner-based constituencies operating globally. In building and expanding its scientific capabilities to support *USP-International,* USP will pursue a multilateral approach, working with responsible and sophisticated pharmaceutical scientists throughout the world. In this regard, the effort should be viewed in the finest traditions of international assistance.

2. Support for WHO's International Pharmacopoeia. USP is proud of its record of supporting WHO's work (one indication of which is the four-drug tuberculosis monograph now included in *USP–NF,* which arose as a result of a request from WHO staff). As indicated in the *Stimuli* article, the development of *USP-International* would allow USP to support WHO's activities to an even greater extent. Generally, it is anticipated that *USP-International* would focus on monographs for legally marketed medicines in non-U.S. countries other than medicines on WHO's Essential Medicines List (EML), and WHO would continue to provide monographs for medicines on the EML. However, there are special cases in which USP could provide assistance even for EML medicines. For example, USP's Global Assistance Initiatives (GAI) staff, working under a USAID grant and at the request of WHO and the United Nations International Children's Emergency Fund (UNICEF), developed monographs for Zinc Sulfate Tablets and Zinc Sulfate Oral Solution [*PF* 31(1) and 31(2), respectively]. Pending USAID approval, USP may also develop reference standards for these zinc products. GAI also has initiated activity to develop a monograph on nevirapine oral suspension for pediatric use, and recently WHO has asked USP to develop monographs for certain first-line antituberculosis drugs. There are other opportunities for synergy and collaboration as well. In some cases, it may be appropriate for monograph submissions to *USP-International,* which will be reviewed and considered by USP's Council of Experts, to also be evaluated through the WHO consultative process. Based on the two "consultations"—one in the USP Council of Experts and one in WHO—the monographs could appear both in *USP-International* and in the WHO *International Pharmacopoeia,* perhaps with certain justifiable differences. As mentioned, USP has previously engaged in this kind of joint effort with WHO in developing a four-drug tuberculosis dosage form monograph, working with WHO staff and consultants.[2]

3. International Harmonization Efforts. USP continues to support international harmonization efforts and expects that development of *USP-International* would have little, if any, impact on its current harmonization efforts through PDG. PDG focuses on harmonization of excipient monographs and General Chapters. Any excipient monographs and General Chapters that have been harmonized and are applicable to *USP-International* could appear in both compendia. USP recognizes the need for additional resources to allow USP to continue to develop monographs for *USP–NF* and the new compendia as well as for its PDG efforts and is prepared to make these resources available. At its Convention 2005, USP adopted Resolution 7, which calls on USP "to continue its efforts to harmonize compendial standards with the Pharmacopeial Discussion Group (PDG) amd other pharmacopeias."

F. Additional Implementation Issues and Considerations

Issues and Responses

Respondents submitted miscellaneous comments and questions on a variety of issues related to the implementation of *USP-International.* Some of these related to the naming of the *USP-I* publication, and others voiced concerns regarding potential confusion with *USP–NF.* Specifically, some respondents urged USP to refine the publication's name to clearly identify the market in which it is intended to be used and to be clear regarding the scope that it intends

[2] Indeed, should *USP-International* come into being, perhaps a first task would be to transfer this and the zinc products monographs out of *USP–NF* and into *USP-International,* given that these products are not legally marketed in the U.S.

to cover (e.g., drugs, biologics, etc.). USP agrees that these issues require further consideration and will be examined in the business-planning process.

There were also comments regarding the appropriate placement of certain monographs, and a few commentators were not convinced that a separate compendium was the optimal way to publish monographs for articles not approved in the U.S. USP continues to believe, as does FDA, that a separate compendium is the clearest way to distinguish between *USP–NF* and *USP-International.* However, USP acknowledges the need for further discussion of issues regarding where to place individual monographs and intends to more fully evaluate these issues.

Some respondents questioned the use of the *Pharmacopeial Forum* (*PF*) to solicit comments on *USP-International* monographs, again wondering about the possibility of confusion between the compendia. Others suggested that the use of *PF* for this purpose was appropriate but advocated clearly delineating a separate section within *PF* for *USP-I* monographs. USP believes this is a useful comment for further discussion. One way to handle these comments would be to demarcate a separate section of *PF.*

At times, respondents requested that USP provide more in-depth justification for *USP-I* monographs. USP believes that the availability of science-based, relevant monographs for therapeutic articles moving in international and national commerce speaks for itself, given that this is USP's primary activity.

Respondents also raised a question about whether monographs in *USP-I* would solve the backlog of monographs in *USP–NF.* The answer to this question is negative, given that there is no direct relationship between monographs in *USP–NF* and *USP-I.*

There were miscellaneous specific science-related issues raised by individual commentators, such as nomenclature, compounding, the availability of reference standards, and the treatment of botanicals and herbs. Although responding to each of these requires a level of detail not appropriate for this summary, USP appreciates these comments and agrees that these issues warrant further consideration and discussion as the project evolves.[3]

Finally, a few respondents raised issues of USP's governance documents and structure and whether these would allow pursuit of the *USP-I* initiative. Again, it is not appropriate to respond to these in detail here, but USP emphasizes that the development of *USP-International* falls squarely within USP's mission, which also allows USP's structure and membership to evolve to facilitate and support this endeavor.

REFERENCES

1. Council of Experts Executive Committee, Ad Hoc Council of Experts Committee, and USP Staff. Development of a new official compendium, separate from *USP–NF,* for articles not legally marketed in the U.S. *Pharm Forum.* 2004;30(5):1877–1883.
2. Saper RB, Kales SN, Paquin, J., et al. Heavy metal content of Ayurvedic herbal medicine products. *JAMA.* 2004;292:2868–2873.

[3] With regard to botanicals and herbs (including traditional medicines), USP notes that these articles especially may benefit from up-to-date monographs in *USP-I,* given the frequent absence of strong regulatory oversight (as in the U.S.). For example, recent literature articles document the presence of heavy metals in Chinese Traditional and Ayurvedic medicines; this is an example of a case in which harm might arise but could be alleviated by a modern monograph using the inductively coupled plasma analytic technique (*2*).

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 2

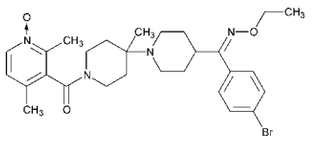
IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

Newly Approved United States Adopted Names (USAN), Released for Publication

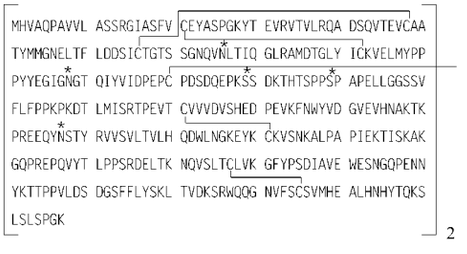
The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

Nomenclature

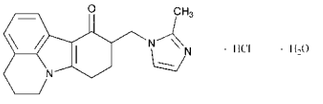
Ancriviroc [*2005*] (an″ kri vir′ ok). $C_{28}H_{37}BrN_4O_3$. 557.52. (1) [1,4′-Bipiperidine]-4-methanimine, α-(4-bromophenyl)-1′-[(2,4-dimethyl-1-oxido-3-pyridinyl)carbonyl]-*N*-ethoxy-4′-methyl-, (α*Z*)-; (2) 4-[(*Z*)-(4-Bromophenyl)(ethoxyimino)-methyl]-1′-[(2,4-dimethyl-1-oxidopyridin-3-yl)carbonyl]-4′-methyl[1,4′-bipiperidinyl].*CAS-370893-06-4*. INN. *Antiviral; treatment of autoimmune conditions* (*CCR5 antagonist*). (Schering-Plough Research) ✧*SCH351125*



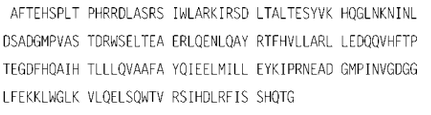
Belatacept [*2005*] (bel a ta′ sept). $C_{3508}H_{5440}N_{922}O_{1096}S_{32}$. 91,500 daltons. (1) CTLA-4 (antigen) [29-tyrosine,104-glutamic acid] (human extracellular domain-containing fragment) fusion protein with immunoglobulin G1 (human monoclonal Fc domain-containing fragment), bimol. (120→120′)-disulfide; (2) [Tyr;S2;S9,Glu;S1;S0;S4,Gln;S1;S2;S5,-Ser;S1;S3;S0,Ser;S1;S3;S6,Ser;S1;S3;S9,Ser;S1;S4;S8](CTLA-4 (antigen)-[3-126]-peptide (human extracellular domain-containing fragment) fusion protein with immunoglobulin G1-[233 *C*-terminal residues of the heavy chain]-peptide (human monoclonal Fc domain-containing fragment)) bimolecular (120→120′)-disulfide. *CAS-706808-37-9*. *Prevention of allograft rejection in recipients of solid organ transplants; prevention of graft-vs.-host disease following bone marrow transplantation; treatment of autoimmune diseases and conditions such as rheumatoid arthritis and Type 1 diabetes.* (Bristol-Myers Squibb) ✧*BMS-224818*



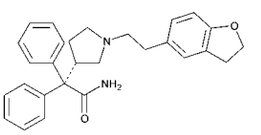
Cilansetron Hydrochloride [*2005*] (sil an se′ tron). $C_{20}H_{21}N_3O.HCl.H_2O$. 373.88. [Cilansetron is INN.] (1) 4*H*-Pyrido[3,2,1-jk] carbazol-11-(8*H*)-one, 5,6,9,10-tetrahydro-10-[(2-methyl-1*H*-imidazol-1-yl) methyl]-, monohydrochloride monohydrate (10*R*)-; (2) (10*R*)-5,6,9,10-Tetrahydro-10[(2-methylimidazol-1-yl)methyl)-4*H*-pyrido[3,2,1-jk]carbazol-11(8*H*)-one monohydrochloride, monohydrate. *CAS-209859-87-0; CAS-120635-74-7* [cilansetron]. *Treatment of Irritable Bowel Syndrome* (*IBS*) *with diarrhea predominance.* (Solvay Pharmaceuticals B.V., Weesp, Netherlands) ✧*DU123265; KC-9946*



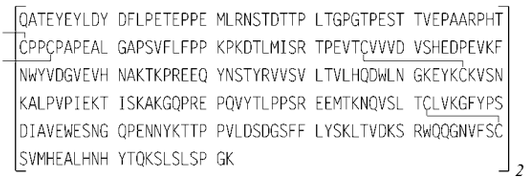
Dapiclermin [*2005*] (da′ pi kler min). $C_{945}H_{1482}N_{266}O_{278}S_3$. 21,114. (1) 2-185-Ciliary neurotrophic factor [17-alanine,63-arginine] (human isoform AXOKINE); (2) 2-185-[17-Alanine,63-arginine]ciliary neurotrophic factor-(2,185)-peptide (human isoform AXOKINE). *CAS-444069-80-1*. *Treatment of overweight and obesity.* Axokine (Regeneron)



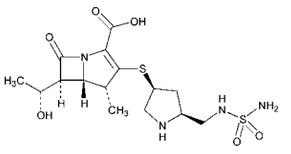
Darifenacin [*2005*] (dar ee fen′ a sin). $C_{28}H_{30}N_2O_2$. 426.60. (1) 3-Pyrrolidineacetamide, 1-[2-(2,3-dihydro-5-benzofuranyl)-ethyl]-α,α-diphenyl-, (3*S*)-; (2) 2-[(3*S*)-1-[2-(2,3-Dihydrobenzofuran-5-yl)ethyl]pyrrolidin-3-yl]-2,2-diphenylacetamide. *CAS-133099–04-4*. *Treatment for an overactive bladder.* (Novartis) ✧*UK-88525*



Darunavir [*2005*] (dar ue′ na vir). $C_{27}H_{37}N_3O_7S$. 547.66. (1) [(1*S*,2*R*)-3-[[(4-Aminophenyl)sulfonyl](2-methylpropyl)amino]-2-hydroxy-1-(phenylmethyl)propyl]-carbamic acid (3*R*,3a*S*,6a*R*)-hexahydrofuro[2,3-*b*]furan-3-yl ester; (2) Carbamic acid, [(1*S*,2*R*)-3-[[(4-aminophenyl)sulfonyl](2-methylpropyl)amino]-2-hydroxy-1-(phenylmethyl)propyl]-, (3*R*,3a*S*,6a*R*)-hexahydrofuro[2,3-*b*]furan-3-yl ester. *CAS-206361-99-1*. INN. *Treatment of HIV infection.* (Janssen); (Tibotec) ✧*TMC 114*

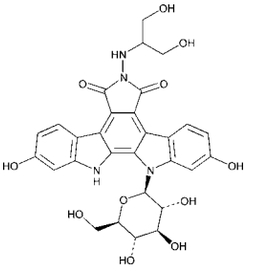


Doripenem [*2005*] (dore i pen′ em). $C_{15}H_{24}N_4O_6S_2$. 420.50. (1) 1-Azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid, 3-[[(3*S*,5*S*)-5-[[(aminosulfonyl)amino]methyl]-3-pyrrolidinyl]thio]-6-[(1*R*)-1-hydroxyethyl]-4-methyl-7-oxo-, (4*R*,5*S*,6*S*)-; (2) (+)-(4*R*,5*S*,6*S*)-6-[(1*R*)-1-Hydroxyethyl]-4-methyl-7-oxo-3-[[(3*S*,5*S*)-5-[(sulfamoylamino)methyl]-3-pyrrolidinyl]thio]-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid. *CAS-148016-81-3*. INN. *Antibiotic.* (Shionogi, Japan) ✧*S-4661*



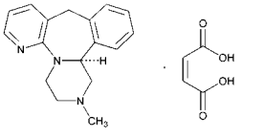
Ecallantide [*2005*] (ee kal′ lan tide). $C_{305}H_{442}N_{88}O_{91}S_8$. 7054. (1) Protein (synthetic human plasma kallikrein-inhibiting); (2) [Glu^{20},Ala^{21},Arg^{36},Ala^{38},His^{39},Pro^{40},Trp^{42}]tissue factor pathway inhibitor (human)-(20 79)-peptide (modified on reactive bond region Kunitz inhibitor 1 domain containing fragment); (3) Human plasma kallikrein-inhibitor (synthetic protein). *CAS-460738-38-9*. *Treatment of hereditary angioedema; reduction of blood loss during cardiothoracic surgery* (*plasma kallikrein inhibitor*). (Dyax) ✧*DX-88*

Edotecarin [*2005*] (ed oh tek′ ar in). $C_{29}H_{28}N_4O_{11}$. 608.55. (1) 5*H*-Indolo[2,3-*a*]pyrrolo[3,4-*c*]carbazole-5,7(6*H*)-dione,12-β-D-glucopyranosyl-12,13-dihydro-2,10-dihydroxy-6-[[2-hydroxy-1-(hydroxymethyl)ethyl]amino]-; (2) 12-β-D-Glucopyranosyl-2,10-dihydroxy-6-[[2-hydroxy-1-(hydroxymethyl)ethyl]amino]-12,13-dihydro-6*H*-indolo[2,3-*a*]pyrrolo[3,4-*c*]carbazole-5,7-dione. *CAS-174402-32-5*. INN. *Treatment of cancer.* (Pfizer) ✧*PF-804950*

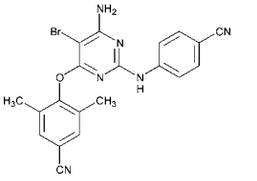


Eprodisate Disodium [*2005*] (e proe′ di sate). $C_3H_6Na_2O_6S_2$. 248.20. (1) 1,3-Propanedisulfonic acid, disodium salt; (2) Disodium propane-1,3-disulfonate. *CAS-36589-58-9*. *Treatment of secondary* (*AA*) *amyloidosis.* (Neurochem, Canada) ✧*NC-503*

Esmirtazapine Maleate [*2005*] (es mir taz′ a peen). $C_{17}H_{19}N_3.C_4H_4O_4$. 381.43. (1) Pyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepine, 1,2,3,4,10,14b-hexahydro-2-methyl-, (14b*S*)-, (2*Z*)-butenedioate (1:1); (2) (+)-(14b*S*)-2-Methyl-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepine (2*Z*)-butenedioate. *CAS-680993-85-5*. *Treatment of moderate to severe vasomotor symptoms associated with menopause; treatment of primary insomnia.* (Organon, Netherlands) ✧*Org 50081*

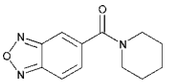


Etravirine [*2005*] (et′′ ra vir′ een). $C_{20}H_{15}BrN_6O$. 435.28. (1) Benzonitrile, 4-[[6-amino-5-bromo-2-[(4-cyanophenyl)amino]-4-pyrimidinyl]oxy]-3,5-dimethyl-; (2) 4-[[6-Amino-5-bromo-2-[(4-cyanophenyl)amino]-4-pyrimidinyl]oxy]-3,5-dimethyl-benzonitrile.*CAS-269055-15-4*. INN. *Treatment of HIV infection.* (Janssen); (Tibotec) ✧*TMC 125*

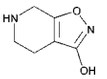


Nomenclature

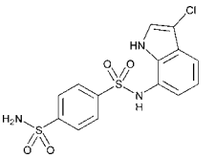
Farampator [*2005*] (far am′ pa tore). $C_{12}H_{13}N_3O_2$. 231.30. (1) Piperidine, 1-(2,1,3-benzoxadiazol-5-ylcarbonyl)-; (2) 1-(2,1,3-Benzoxadiazol-5-ylcarbonyl)piperidine. *CAS-211735-76-1*. INN. *Treatment of schizophrenia.* (N.V. Organon, Netherlands) *Org 24448; CX691*



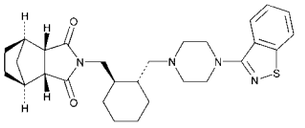
Gaboxadol [*2005*] (gab ox′ a dol). $C_6H_8N_2O_2$. 140.14. (1) Isoxazolo[5,4-*c*]pyridin-3(2*H*)-one, 4,5,6,7-tetrahydro-; (2) 4,5,6,7-Tetrahydroisoxazolo[5,4-*c*]pyridin-3(2*H*)-one. *CAS-64603-91-4*. INN. *Treatment of insomnia.* (H. Lundbeck, A/S) ✧*Lu 02-030; MK-0928*



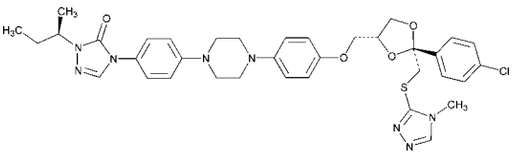
Indisulam [*2005*] (in″ di soo′ lam). $C_{14}H_{12}ClN_3O_4S_2$. 385.85. (1) *N*-(3-Chloro-1*H*-indol-7-yl)benzene-1,4-disulfonamide; (2) 1,4-Benzenedisulfonamide, *N*-(3-chloro-1*H*-indol-7-yl). *CAS-165668-41-7*. INN; BAN. *Antineoplastic.* (Eisai Medical Research) ✧*E7070*



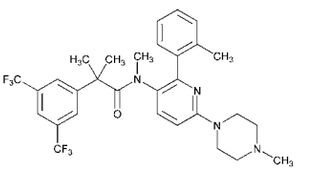
Lurasidone Hydrochloride [*2005*] (loo ras′ i done). $C_{28}H_{36}N_4O_2S.HCl$. 529.14. [Lurasidone is INN.] (1) 4,7-Methano-1*H*-isoindole-1,3(2*H*)-dione, 2-[[(1*R*,2*R*)-2-[[4-(1,2-benzisothiazol-3-yl)-1-piperazinyl]methyl]cyclohexyl]-methyl]hexahydro-, monohydrochloride (3a*R*,4*S*,7*R*,7a*S*)-; (2) (3a*R*,4*S*,7*R*,7*S*)-2-{(1*R*,2*R*)-2-[1,2-Benzisothiazol-3-yl)-piperazin-1-ylmethyl]cyclohexylmethyl}hexahydro-4,7-methano-2*H*-isoindole-1,3-dione, hydrochloride. *CAS-367514-88-3; CAS-367514-87-2* [lurasidone]. *Treatment of schizophrenia* (*high-affinity agonist of serotonin 5-HT1A, 5-HT2, and 5-HT7 receptors as well as dopamine D2 receptors*). (Sumitomo) ✧*SM-13496*



Mitratapide [*2005*] (mit rat′ a pide). $C_{36}H_{41}ClN_8O_4S$. 717.30. (1) 3*H*-1,2,4-Triazol-3-one, 4-[4-[4-[4-[[(2*S*,4*R*)-2-(4-chlorophenyl)-2-[[(4-methyl-4*H*-1,2,4-triazol-3-yl)thio]methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-1-piperazinyl]phenyl]-2,4-dihydro-2-[(1*R*)-1-methylpropyl]-; (2) (–)-4-[4-[4-[4-[[(2*S*,4*R*)-2-(4-Chlorophenyl)-2-[[(4-methyl-4*H*-1,2,4-triazol-3-yl)sulfanyl]methyl-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-(1*R*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one. *CAS-179602-65-4*. INN. *Management of obesity in dogs.* (Janssen) ✧*R103757*

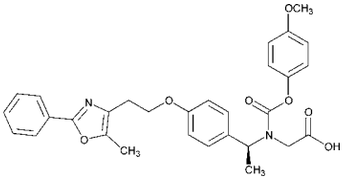


Netupitant [*2005*] (net ue′ pi tant). $C_{30}H_{32}F_6N_4O$. 478.61. (1) Benzeneacetamide, *N*,α,α-trimethyl-*N*-[4-(2-methylphenyl)-6-(4-methyl-1-piperazinyl)-3-pyridinyl]-3,5-bis(trifluoromethyl)-; (2) 2-[3,5-Bis(trifluoromethyl)phenyl]-*N*,2-dimethyl-*N*-[4-(2-methylphenyl)-6-(4-methylpiperazin-1-yl)-pyridin-3-yl]propanamide.*CAS-290297-26-6*. INN. *Antiemetic.* (Hoffmann-LaRoche) ✧*Ro 67-3189/000*

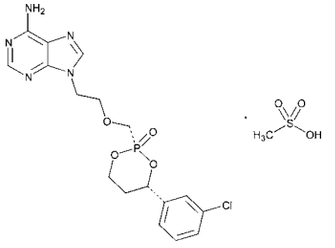


Ocrelizumab [*2005*] (oh kre liz oo mab). $C_{6494}H_{9978}N_{1718}O_{2014}S_{46}$. 148,000 daltons. Immunoglobulin G1, anti-(human CD20 (antigen)) (human-mouse monoclonal 2H7 γ1-chain), disulfide with human-mouse monoclonal 2H7 κ-chain, dimer. *CAS-637334-45-3*. *Treatment of rheumatoid arthritis.* (Genentech) ✧*PR070769*

Peliglitazar [*2005*] (pel ee gli′ ta zar). $C_{30}H_{30}N_2O_7$. 530.60. (1) Glycine,*N*-[(4-methoxyphenoxy)carbonyl]-*N*-[(1*S*)-1-[4-[2-(5-methyl-2-phenyl-4-oxazolyl)ethoxy]phenyl]ethyl]-; (2) [[(4-Methoxyphenoxy)carbonyl][(1*S*)-1-[4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]phenyl]ethyl]amino]acetic acid. *CAS-331744-64-0*. INN. *Treatment of Type II diabetes mellitus, mixed dyslipidemia, atherosclerosis, and metabolic syndrome.* (Bristol-Myers Squibb) ✧*BMS-426707-1*

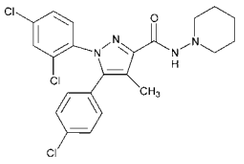


Pradefovir Mesylate [*2005*] (prad e foe′ veer). $C_{17}H_{19}ClN_5O_4P.CH_4O_3S$. 519.90. (1) 9*H*-Purin-6-amine, 9-[2-[[(2*R*,4*S*)-4-(3-chlorophenyl)-2-oxido-1,3,2-dioxaphosphorinan-2-yl]-methoxy]ethyl]-, monomethanesulfonate; (2) (2*R*,4*S*)-2-[[2-(6-Amino-9*H*-purin-9-yl)ethoxy]methyl]-4-(3-chlorophenyl)-1,3,2λ^5-dioxaphosphinan-2-one monomethanesulfonate. *CAS-625095-61-6*. *Antiviral.* (Valeant)

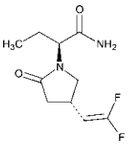


Prussian Blue Insoluble [*2005*] (prush′ un). $C_{18}Fe_7N_{18}$. 859.30. (1) Ferrate(4-), hexakis(cyano-κC)-, iron(3+) (3:4) (OC-6-11)-; (2) Ferric hexacyanoferrate (II). *CAS-14038-43-8*. *Antidote indicated in the treatment of patients with known or suspected internal contamination with radioactive cesium and/or nonradioactive thallium to increase their rates of elimination.* Antidotum-Thallii-Heyl (Heyl, Germany); Radiogardase-Cs (Fabrik GmbH & Co. KG, Germany)

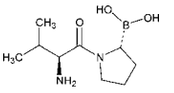
Rimonabant [*2005*] (rim′′ oh nab′ ant). $C_{22}H_{21}Cl_3N_4O$. 463.79. (1) 5-(*p*-Chlorophenyl)-1-(2,4-dichlorophenyl)-4-methyl-*N*-piperidinopyrazole-3-carboxamide; (2) 1*H*-Pyrazole-3-carboxamide, 5-(4-chlorophenyl)-1-(2,4-dichlorophenyl)-4-methyl-*N*-piperidinyl. *CAS-168273-06-1*. INN. *Smoking cessation; treatment of obesity.* Acomplia (Sanofi-Synthelabo) ✧*SR141716*



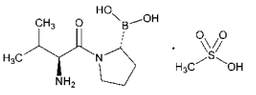
Seletracetam [*2005*] (sel′′ e tra′ se tam). $C_{10}H_{14}F_2N_2O_2$. 232.20. (1) 1-Pyrrolidineacetamide, 4-(2,2-difluoroethenyl)-α-ethyl-2-oxo-, (α*S*,4*S*)-; (2) (2*S*)-2-[(4*S*)-4-(2,2-Difluoroethenyl)-2-oxopyrrolidin-1-yl]butanamide.*CAS-357336-74-4*. *Treatment of epilepsy, hyperkinetic movement disorders.* (UCB Pharma, SA) ✧*ucb 44212*



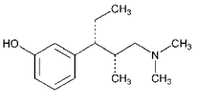
Talabostat [*2005*] (tal ab′ oh stat). $C_9H_{19}BN_2O_3$. 214.20. (1) Boronic acid, [(2*R*)-1-[(2*S*)-2-amino-3-methyl-1-oxobutyl]-2-pyrrolidinyl]-; (2) [(2*R*)-1-[(2*S*)-2-Amino-3-methylbutanoyl]pyrrolidin-2-yl]boronic acid. *CAS-149682-77-9*. INN. *Treatment of cancer; hematopoietic stimulant.* (Point Therapeutics) ✧*PT-100*



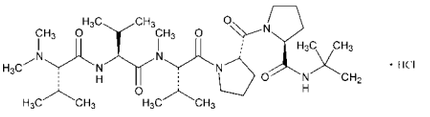
Talabostat Mesylate [*2005*] (tal ab′ oh stat). $C_9H_{19}BN_2O_3.CH_4O_3S$. 310.20. (1) Boronic acid, [(2*R*)-1-[(2*S*)-2-amino-3-methyl-1-oxobutyl]-2-pyrrolidinyl]-monomethanesulfonate; (2) [(2*R*)-1-[(2*S*)-2-Amino-3-methylbutanoyl]pyrrolidin-2-yl]boronic acid methanesulfonate. *CAS-150080-09-4*. *Treatment of cancer; hematopoetic stimulant.* (Point Therapeutics) ✧*PT-100*



Tapentadol [*2005*] (ta pen′ ta dol). $C_{14}H_{23}NO$. 221.34. (1) Phenol, 3-[(1*R*,2*R*)-3-(dimethylamino)-1-ethyl-2-methylpropyl]-; (2) 3-[(1*R*,2*R*)-3-(Dimethylamino)-1-ethyl-2-methylpropyl]phenol. *CAS-175591-23-8*. INN. *Analgesic* (μ-*agonist*). (Grünenthal GmbH, Germany) ✧*CG5503* (*base*); *BN 200* (*base*)



Tasidotin Hydrochloride [*2005*] (ta′′ si doe′ tim). $C_{32}H_{58}N_6O_5.HCl$. 643.30. (1) L-Prolinamide, *N*,*N*-dimethyl-L-valyl-L-valyl-*N*-methyl-L-valyl-L-prolyl-*N*-(1,1-dimethylethyl)-, monohydrochloride; (2) *N*,*N*-Dimethyl-L-valyl-L-valyl-*N*-methyl-L-valyl-L-prolyl-*N*-(1,1-dimethylethyl)-L-prolinamide monohydrochloride. *CAS-623174-20-9*. *Treatment of patients with advanced, refractory neoplasms* (*microtubule stabilizing agent*). (Ilex) ✧*ILX651*



Zanolimumab [*2005*] (zan oh lim′ ue mab). Immunoglobulin, anti-(human CD4 antigen) (human monoclonal 6G5 heavy chain), disulfide with human monoclonal 6G5 light chain, dimer. Molecular weight is approximately 147,000 daltons. *CAS-652153-01-0*. INN. *Treatment of rheumatoid arthritis, psoriasis, cutaneous and peripheral T-cell lymphoma.* (DSM Biologics, Netherlands); (Statens Serum Institute, Denmark) ✧*MDX-016; HuMax-CD4*

Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Recommended International Nonproprietary Names

The following 68 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 19, No. 1, 2005.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Abatacept	Exbivirumab	Maraviroc	Revaprazan
Acotiamide	Fampronil	Mecasermin Rinfabate	Rilpivirine
Alagebrium Chloride	Fidexaban	Milataxel	Ritobegron
Alglucosidase Alfa	Fingolimod	Mirococept	Robenacoxib
Armodafinil	Gadodenterate	Paclitaxel Ceribate	Rostafuroxin
Bamirastine	Gantacurium Chloride	Palosuran	Selodenoson
Befetupitant	Golimumab	Panitumumab	Taltobulin
Belotecan	Idronoxil	Pegamotecan	Tandutinib
Carmoterol	Imiglitazar	Pelitinib	Teglicar
Cetilistat	Indacaterol	Perflubutane	Telavancin
Dasantafil	Indibulin	Perzinfotel	Tifuvirtide
Delucemine	Ismomultin Alfa	Prasugrel	Tilarginine
Denufosol	Lanimostim	Radafaxine	Topilutamide
Depelestat	Lemuteporfin	Ranirestat	Torapsel
Dirlotapide	Lenalidomide	Regadenoson	Trodusquemine
Edaglitazone	Lestaurtinib	Reparixin	Vandetanib
Eslicarbazepine	Libivirumab	Retapamulin	Vestipitant

United States Adopted Names (USAN) Under Consideration

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary*. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category,* are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Associate Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Vatuxumab Vicatuximab Voratuximab	*Anticancer*

International Nonproprietary Names (INN) Under Consideration

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which ensures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category,* are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

(INN) Under Consideration	Category
Acaftadine	*H1 receptor antagonist*
Adatrioxolane Bispiroxolane Synperoxolane	*Antimalaria*
Adsoferan Curbosfal Spherical Adsorptive Carbon	*Adsorption of uremic toxins in the treatment of patients with chronic renal failure*
Akunatrib Atulinotrib Poladritrib	*Inhibition of PARP for the treatment of cancer*
Albagovomab	*Ovarian tumors*
Altabegron Amibegron Tanabegron Valabegron Zalibegron	*Antidepressant*
Altricinod Endakucinod Pranacinod	*Treatment of osteoarthritis*
Aposartan Famasartan Suprosartan	*Antihypertensive effect by blockade of the Angiotensin AT1 receptor*
Aptacept Aptranacept Trancacept	*Treatment of systemic lupus*
Arpadeporfin Azopadporfin Padeliporfin Stapadeporfin Zepadporfin	*Ophthalmology*
Avasizotine Mesylate	*Antidepressant*
Axitinib	*Antineoplastic-inhibitor of VEGF/PDGF receptor tyrosine kinases*
Bicamilast Sodium Glemilast Sodium Indomilast Sodium	*Treatment of inflammatory diseases*
Bosatinib	*Treatment of cancer*
Brilapladib	*Treatment of atherosclerosis*
Casarabine Cyclarabine Saparabine	*Treatment of cancer*
Casipitant Mesylate	*Treatment of depression, anxiety, sleep disorders, nausea and vomiting, functional dyspepsia, Irritable Bowel Syndrome, gastro-esophageal reflux disease, and overactive bladder disease*
Citilimumab	*Treatment of cancer*
Collacatib Duracatib Selcatib	*Antibone resorption agent*
Corglitazar Evoglitazar Vedaglitazar	*Dyslipidemic, antidiabetic, and anti-obesity*
Darlapladib	*Treatment of atherosclerosis*
Dasatinib	*Treatment of cancer*
Denogliptin Tosylate	*Treatment of type 2 diabetes*
Dimethyl Fumarate	*Immunomodulator*
Disomevatide	*Melanoma peptide vaccine*
Elzivadose Hydrochloride	*Treatment of Fabry disease*
Flipovudine Livudine Thymivudine	*Treatment of HIV*

(INN) Under Consideration	Category
Flocaltrol Secorol Urocaltrol	*Treatment of BPH*
Fosaprepitant Dimeglumine	*Antiemetic; substance P antagonist (neurokinin NK1 antagonist)*
Fospropofol Disodium	*Sedative-hypnotic*
Fungictumab Hesptumab Myctumab	*Treatment of Disseminated Candidal Infection*
Goxalapladib	*Treatment of atherosclerosis*
Incyplemib	*Treatment of rosacea and acute respiratory stress*
Isovaleramide	*Anxiolytic, anticonvulsant, antispastic, antimigraine, mood stabilizer, analgesic*
Larataxel Motitaxel Potetaxel	*Antineoplastic agent*
Lidetamine Dimesylate	*Treatment of ADHD*
Lifafil Lifanafil Lifanfil	*Erectile dysfunction*
Lifindol	*Inhibitor of platelet adhesion to collagen/antithrombotic*
Masutilukast Moderlukast Simalukast	*Treatment of asthma*
Mavacoxib	*Treatment of pain, inflammation, and fever*
Misotaxel	*Treatment of breast cancer*
Motovizumab	*Prevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in pediatric patients at high risk*
Nifiprevir Taliprevir Traliprevir	*Treatment of hepatitis C*
Noxad Noxal Xadiz	*Treatment of Alzheimer's disease*
Omevatide	*Melanoma peptide vaccine*
Oraptoclax Mesylate	*Antitumor*
Orvepitant Hydrochloride	*Treatment of depression, anxiety, and insomnia disorders*
Paladenoson	*Adjunct to nuclear myocardial perfusion imaging in patients unable to exercise adequately*
Pazopanib Hydrochloride	*Antineoplastic agent*
Pelaviroc Hydrochloride	*Treatment of HIV infection*
Prexanavir	*Treatment of HIV infection*
Prorelix Acetate	*Prostatic carcinoma, mammary carcinoma, uterine fibroids, endometriosis, benign prostate hyperplasia; GnRH antagonist*
Relamostat	*Treatment of osteoporosis*
Rotiregap	*Treatment of ventricular tachycardia*
Sitagliptin	*Treatment of type 2 diabetes mellitus and related disorders*
Sotirimod	*Treatment of dermatologic diseases, including actinic keratosis, infections, cancer*
Stamulumab	*Treatment of muscular dystrophy and age-related sarcopenia or frailty*
Tiratumumab	*Treatment of relapsed or refractory CD30 positive lymphoma*
Velafermin	*Treatment and/or prevention of mucositis*
Zendifentan Zibotentan Zifobentan	*Prostate cancer*

PHARMACOPEIAL FORUM VOL. 31 NO. 5 SEPT.–OCT. 2005

* The *USP–NF* (*USP29–NF24*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

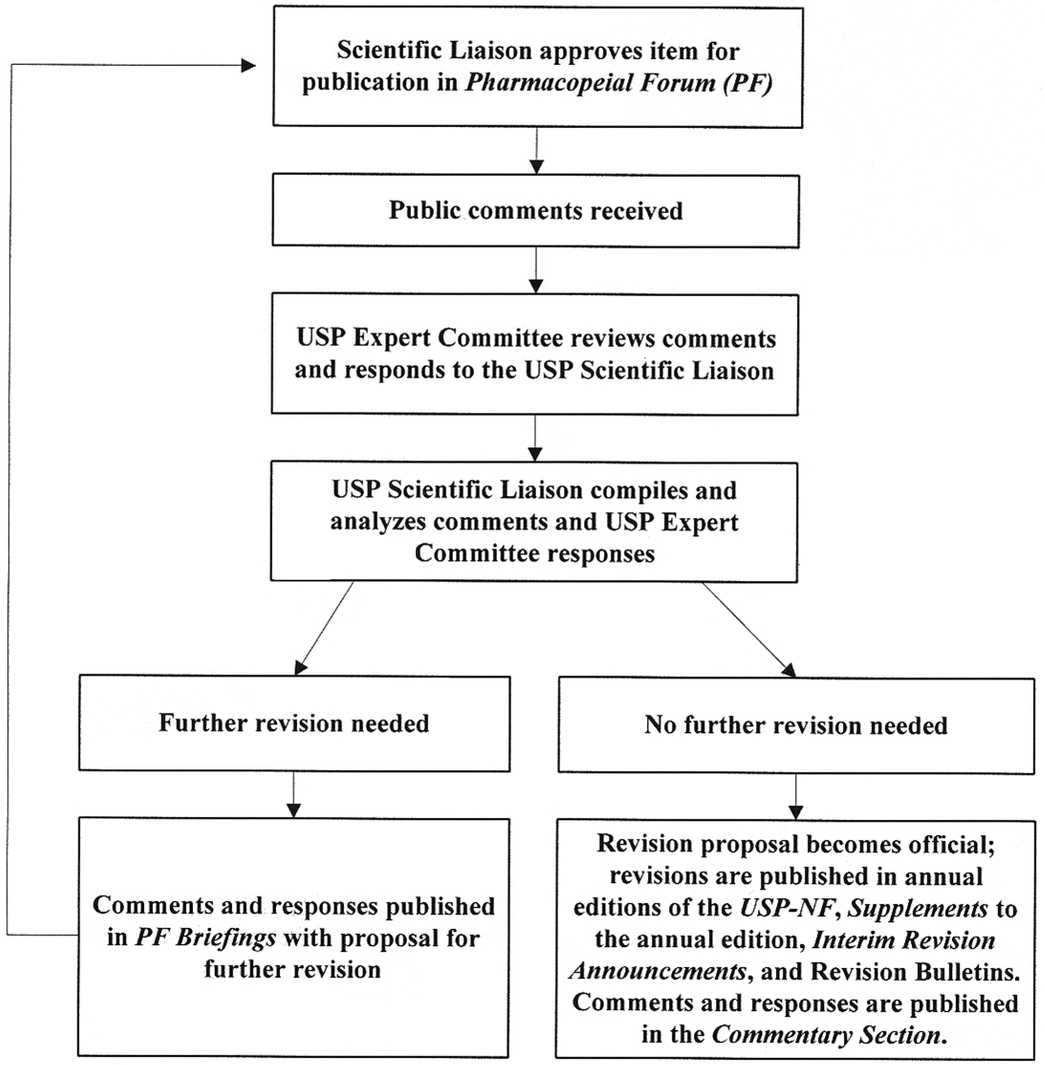
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP-NF* on the USP website (http://www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP-NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

2000—2005

AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

***PHARMACOPEIAL FORUM* COMMENT PERIOD EXTENDED.** USP is pleased to announce that the comment periods for *PF* proposals targeted for the *USP–NF* and its *Supplements* have been extended. The change in comment period timing is in response to stakeholder requests (see the *PF* 31(2) *Stimuli* article, *"The USP Revision Process: Recommendations for Enhancements"*). As a result of this change, industry now will have at least 90 days to comment on PF proposals, as opposed to the 60 day period previously provided.

Please note, however, that as a result of this transition, there will be a change to the comment deadline for *First Supplement* to *USP 29–NF 24,* which is being moved from October 15, 2005 to **August 15, 2005.** The original deadline of October 15, 2005 was based on the fact that both *PF* 31(3) and *PF* 31(4) would be included in the *First Supplement,* and the need to provide a sufficient comment period for the monographs contained in *PF* 31(4). With the transition to the 90-day review period, *PF* 31(4) is now being moved to the *Second Supplement* (with a comment deadline of December 16, 2005), and only *PF* 31(3) will be included in the *First Supplement.* Changing the deadline for the *First Supplement* to August 15, 2005 will still allow for a 90-day comment period for the monographs in *PF* 31(3), yet also will ensure that USP has enough time internally to fully review and consider all comments we receive and conduct the appropriate balloting process with USP's Expert Committees.

The complete revised Publication and Comment Schedule for *USP 29–NF 24* is outlined below, and includes the PFs, their corresponding targeted official publication, and the comment deadline.

Pharmacopeial Forum	Targeted Official Publication	Comment Deadline
PF 31(3)	*First Supplement to USP 29–NF 24*	August 15, 2005
PF 31(4) and *PF* 31(5)	*Second Supplement to USP 29–NF 24*	December 16, 2005
PF 31(6) and *PF* 32(1)	*USP 30–NF 25*	To be announced
PF 32(2) and *PF* 32(3)	*First Supplement to USP 30–NF 25*	To be announced
PF 32(4) and *PF* 32(5)	*Second Supplement to USP 30–NF 25*	To be announced
PF 32(6) and *PF* 33(1)	*USP 31–NF 26*	To be announced

If you have any difficulties in meeting the change in the deadline, please forward an "Intent to Comment" form (attached) to the USP Executive Secretariat or send an e-mail to the assigned Scientific Liaison.

Please direct any comments and questions on this topic to Todd L. Cecil, Ph.D., Vice President, Standards Development (301-816-8234 or tlc@usp.org) or Angela G. Long, Vice President, Volunteer and Organizational Affairs/Executive Secretariat (301-816-8382 or agl@usp.org).

USP TO DISCONTINUE POSTING LABELING CHANGES TO ⟨11⟩ *USP REFERENCE STANDARDS* IN *IRAS.* Beginning with this issue of *Pharmacopeial forum* [31(5)], USP will no longer print labeling changes to General Chapter ⟨11⟩ *USP Reference Standards* as an *Interim Revision Announcement*. The reason for the change is that, as stated in the General Chapter ⟨11⟩ *Reference Standards,* "Where, in an isolated instance, the specific label instruction differs from the text [presented in the chapter], the instructions on the label of the item from the current lot takes precedence. A situation may be infrequently encountered where it is necessary, on scientific grounds, to effect immediately a change in the instructions. This change can be made easily on the label of the Reference Standard, whereas the formal process for revising the compendial text requires more time." To summarize, the actual label text always takes precedence over General Chapter ⟨11⟩.

This change is a result of stakeholder comments that this USP practice causes confusion among *USP–NF* users. USP is exploring the potential of posting such information to the website on an information-only basis. USP welcomes user comments. Please submit them to the USP Executive Secretariat (execsec@usp.org).

USP REVISION CYCLE CHANGE. The 2005–2010 USP Revision Cycle has begun, and you will notice several changes in the *PF.* First of all, new Standards Expert Committees have been elected and are in the process of holding their first meetings. The list of chairs and members appears on USP's website at http://www.usp.org/aboutUSP/governance/expertList.html. Several Expert Committee names (and acronyms) have changed (see the list on page 1301). You also will note new Scientific Liaison assignments. This list appears on pages 1303–1305.

PQRI TO SURVEY CURRENT EXCIPIENT CONTROL PRACTICES. A working group of the Product Quality Research institute (PQRI), the joint government/industry/academia research consortium, plans to separately survey U.S. pharmaceutical manufacturers, excipient producers, and excipient distributors for information regarding companies' current excipient control practices to assure excipient safety, quality, and processability. Each survey will be confidential and respondents will not be asked to identify themselves, only their area of business, e.g., finished drug manufacturer, excipient manufacturer, or distributor. information received will be compiled by the PQRI Executive Secretariat and survey replies will not be reviewed by working group members, regardless of their affiliation.

It is hoped that information gathered will provide a more comprehensive view of the types of testing, compendial and noncompendial, which are currently in use throughout the different industry segments to control the chemical and physical properties of materials used in pharmaceutical manufacturing. It is anticipated that this information might be useful in connection with ongoing global harmonization efforts related to setting excipient specifications and determination of an excipient's processability. If so, all parties involved in PQRI activities will benefit, e.g., industry groups, the USP, and the FDA.

Subscribers to *Pharmacopeial Forum* and *USP–NF* are asked to watch for the forthcoming survey and to respond. As noted above, all responses will be blinded and confidential.

CORRECTION. *The Stimuli to the Revision Process* article (see page 2254 of *PF* 30(6) [Nov.–Dec. 2004]): *The FDA Process Analytical Technology (PAT) Initiative—An Alternative Pharmaceutical Manufacturing Practice (aPMP),* inadvertently included the acknowledgements section in the Author byline; the author byline and the acknowledgements sections should be: Authors: Walter Dziki and Gary E. Ritchie* Acknowledgements: USP Project Team 18—Process Analytical Technology (PAT)-Zhijun Jiang, David A. Radspinner, Michael Miller, Roger Deschenes, Paul Newby, Jeanne Moldenhauer, Claude Anger, Scott Sutton, Tony Cundell, Patrick McCarthy, Amy McDaniel, Stacy Montgomery, Claudio Denoya, Emil W. Ciurczak.

CALL FOR HIGH PRIORITY MONOGRAPHS FOR DRUG SUBSTANCES AND PRODUCTS, AND EXCIPIENTS. USP is seeking monographs for the following drug substances and drug products that are or, soon will be, off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monograph sponsors should consult USP's *Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/standards/revisionguideline/index.html.

For further information, contact Karen Russo, Ph.D., kar@usp.org.

Noncomplex Actives (Drug Substances and Products)

Noncomplex Actives (Drug Substances)		
Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine	Anagrelide Hydrochloride ***(Received)***	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bicalutamide ***(Received)***	Bivalirudin
Budesonide ***(Received)***	Cabergoline	Calcipotriene
Calcium Trisodium Pentetate	Calfactant	Candesartan Cilexetil
Carmustine ***(Received)***	Carvedilol	Cefdinir
Cefditoren Pivoxil	Ceftibuten	Cetirizine Hydrochloride
Cetrorelix	Cevimeline	Chloroxine
Cilostazol ***(Received)***	Citalopram Hydrobromide ***(Received)***	Colfosceril
Cytarabine Liposome	Dalfopristin	Dantrolene Sodium ***(Received)***
Dapirazole Hydrochloride	Desirudin	Dexrazoxane
Didanosine ***(Received)***	Difloxacin Hydrochloride	Divalproex Sodium ***(Received)***
Docosanol	Entacapone	Epoprostenol
Erythromycin Phosphate	Erythromycin Thiocyanate	Esomeprazole Magnesium
Esmolol	Estazolam	Estramustine Phosphate Sodium
Estradiol Benzoate	Ethanolamine Oleate	Etomidate
Etoposide Phosphate	Exemestane	Felbamate

Noncomplex Actives (Drug Substances and Products) *(Continued)*		
Fentanyl ***(Received)***	Fluoromethane F 18	Foscarnet Sodium
Fosfomycin Tromethamine	Gadobenate Dimeglumine	Galantamine
Gadopentetic Acid	Gallium Nitrate	Ganirelix
Glyceryl Aminobenzoate	Granisetron	Halobetasol Propionate
Haloperidol Decanoate	Hydrocodone Polistirex	Hydrocortisone ***(Received)***
Ibandronate Sodium	Imipramine Pamoate	Imiquimod
Irinotecan	Isosulfan Blue	Itraconazole
Lamotrigine	Latanoprost	Lawsone
Levetriacepam	Levobetaxolol	Levocabastine Hydrochloride
Levofloxacin ***(Received)***	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Miglitol	Mifepristone	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide	Nedocromil
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium	Orbifloxacin
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pancuronium Bromide ***(Received)***
Pantoprazole Sodium	Pemoline	Pentamidine Isethionate
Piperonyl Butoxide	Pirbuterol Acetate	Poractant Alpha
Prednicarbate ***(Received)***	Proguanil	Quetiapine Fumarate
Risperidone ***(Received)***	Rose Bengal	Salmeterol Xinafoate
Simethicone ***(Received)***	Sodium Phenylbutyrate	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride	Terconazole	Tiludronate Disodium
Tiopronin	Tranexamic Acid	Trimipramine Maleate
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate
Noncomplex Actives (Drug Products)		
Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Amlodipine and Benazepril Hydrochloride Capsules	Aminopterin Sodium Tablets
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution
Bivalirudin Injection	Budesonide Metered-Dose Inhalation Aerosol	Budesonide Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochlorides Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules

Noncomplex Actives (Drug Substances and Products) *(Continued)*

Butalbital and Acetaminophen Tablets	Butorphanol Tartrate Nasal Solution ***(Received)***	Calcipotriene Topical Solution
Cabergoline Tablets	Calcipotriene Cream	Calcipotriene Ointment
Calcitriol Capsules	Calcitriol Oral Solution	Calcium Acetate Capsules
Calfactant Intratracheal Suspension	Calcium Trisodium Pentetate Injection	Carbidopa and Levodopa Extended-Release Tablets
Carbidopa and Levodopa Tablets for Oral Suspension	Carbidopa, Levidopa, and Entacapone Tablets	Carmustine Implant
Carmustine for Injection	Carvedilol Tablets	Cefditoren Pivoxil Tablets
Cefdinir Tablets	Ceftibuten Capsules	Ceftibuten for Oral Suspension
Cetirizine Hydrochloride Oral Solution	Ceftiofur Hydrochloride Oral Suspension	Cetrorelix Injection
Cetirizine Hydrochloride Tablets	Cevimeline Hydrochloride Capsules	Choline and Magnesium Salicylates Oral Solution
Chloroxine Cream	Chlorpromazine Hydrochloride Extended-Release Capsules	Ciclopirox Shampoo
Choline and Magnesium Salicylates Tablets	Choline Salicylate Oral Solution	Ciclopirox Topical Gel
Ciclopirox Topical Solution	Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Cilostazol Tablets
Cimetidine Oral Solution	Citalopram Hydrobromide Oral Solution	Citalopram Hydrobromide Tablets ***(Received)***
Ciprofloxacin Otic Solution	Cladribine Injection	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation
Clonazepam Orally-Disintegrating Tablets	Clemastine Fumarate Syrup	Clobetasol Propionate Gel
Clotrimazole and Betamethasone Dipropionate Lotion	Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets
Colfosceril and Tyloxapol Suspension	Colestipol Hydrochloride Tablets	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets
Compound Undecylenic Acid Cream	Compound Undecylenic Acid Topical Powder	Cyclosporine Modified Oral Solution
Cromolyn Sodium Metered-Dose Nasal Solution	Cyclosporine Modified Capsules	Cysteamine Bitartrate Capsules
Cyclosporine Ointment	Cyclosporine Topical Solution	Cytarabine Liposome Injection
Dantrolene Sodium Capsules ***(Received)***	Dalfopristin and Quinupristin Injection	Dapiprazole for Ophthalmic Solution
Dantrolene Sodium for Injection ***(Received)***	Dantrolene Sodium Oral Suspension	Desirudin for Injection
Desonide ***(Received)***	Desonide Cream	Dexrazoxane for Injection
Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable Emulsion
Diclofenac Sodium Ophthalmic Solution	Didanosine Chewable Tablets ***(Received)***	Didanosine for Oral Solution ***(Received)***
Diethylpropion Hydrochloride Extended-Release Tablets	Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets
Dihydroergotamine Mesylate Metered Spray	Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories
Diphenhydramine Hydrochloride and Acetaminophen Tablets	Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution
Dorzolamide Ophthalmic Solution	Doxacurium Chloride Injection	Doxepin Hydrochloride Cream
Doxycycline Oral Gel	Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection
Enalaprilat Injection	Enalapril Maleate and Diltiazem Maleate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Entacapone Tablets	Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection
Epoprostenol Injection	Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules
Estazolam Tablets	Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection

Noncomplex Actives (Drug Substances and Products) *(Continued)*

Etomidate Injection	Etidronate Disodium Injection Concentrate	Exemestane Tablets
Famotidine Injection	Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension
Felbamate Tablets	Fentanyl Lozenges	Fentanyl Transdermal System
Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets
Fluconazole Injection	Flunisolide Nasal Spray	Fluconazole Tablets
Flunisolide Inhalation Aerosol	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluticasone Propionate Inhalation Powder	Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets
Gadobenate Dimeglumine Injection	Gallium Nitrate Injection	Galantamine Hydrobromide Tablets
Ganirelix Acetate Injection	Ganciclovir Capsules	Gentamicin Sulfate Oral Solution
Gatifloxacin Injection	Gatifloxacin Tablets	Glipizide Extended-Release Tablets
Gentamicin Sulfate Soluble Powder	Glimepiride Tablets	Granisetron Tablets
Granisetron Injection	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution
Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Ointment
Halobetasol Propionate Cream	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution
Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrochlorothiazide Capsules
Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets	Hydrocortisone Butyrate Lotion
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets	Hydrocortisone Acetate Rectal Foam Aerosol	Hydroquinone Lotion
Hydrocortisone Acetate Dental Paste	Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution
Ibuprofen Capsules	Ibandronate Sodium Tablets	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules
Ketoprofen Extended-Release Capsules	Ketotifen Fumarate	Ketotifen Fumarate Ophthalmic Solution
Ketoprofen Tablets	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Levetriacepam Tablets	Levobetaxolol Ophthalmic Suspension
Levocabastine Ophthalmic Suspension	Leucovorin Calcium for Injection	Levomethadyl Acetate Hydrochloride Oral Concentrate
Levofloxacin Solution	Lidocaine and Prilocaine Cream ***(Received)***	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder
Liothyronine Injection	Lisinopril and Hydrochlorothiazide Tablets	Lomustine Capsules
Lopinavir Capsule	Lopinavir Solution	Lopinavir and Ritonavir Solution
Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***	Loratadine Orally Disintegrating Tablets	Losartan Potassium Tablets
Mesalamine Suppositories	Methacholine Chloride for Inhalation Solution	Mesoridazine Besylate Concentrate
Mefloquine Hydrochloride Tablets	Methoxsalen Softgels	Methadone Hydrochloride Oral Concentrate
Melphalan for Injection	Metaraminol Bitartrate Injection	Methyclothiazide and Deserpidine Tablets
Methocarbamol and Aspirin Tablets	Metipranolol Ophthalmic Solution	Metronidazole Cream
Metronidazole Lotion	Metronidazole Extended-Release Tablets	Methylphenidate Hydochloride Chewable Tablets
Metronidazole Capsules	Midazolam Hydrochloride Injection	Metronidazole Hydrochloride for Injection

Noncomplex Actives (Drug Substances and Products) *(Continued)*

Miconazole Nitrate Topical Aerosol	Mifepristone Tablets	Miglitol Tablets
Milrinone Injection	Misoprostol Dispersion ***(Received)***	Misoprostol Tablets ***(Received)***
Mivacurium in Dextrose Injection	Mivacurium Injection	Moexipril Hydrochloride and Hydrochlorothiazide Tablets
Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution	Morphine Sulfate for Injection Concentrate
Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate	Morphine Sulfate Tablets
Mycophenolate Mofetil Tablets	Mycophenolate Mofetil Oral Solution	Mycophenolate Mofetil Capsules
Nalbuphine Hydrochloride Injection	Naproxen Extended-Release Tablets	Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution
Nalmefene Hydrochloride Injection	Nateglinide Tablets	Nedocromil Sodium Inhalation Aerosol
Neomycin Sulfate Oral Powder	Nevirapine Oral Suspension	Nicardipine Hydrochloride Capsules
Nilutamide Tablets	Nimodipine Capsules	Nisoldipine Extended-Release Tablets
Nitroglycerin Solution in Acrylic Adhesive	Nizatidine Tablets	Ofloxacin Injection
Ofloxacin in Dextrose Injection	Olopatadine Ophthalmic Solution	Olsalazine Sodium Capsules
Ondansetron Oral Solution	Ondansetron Tablets	Orbifloxacin Tablets
Orlistat Capsule ***(Received)***	Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Orphenadrine Citrate Extended-Release Tablets
Oxcarbazepine Suspension	Oxcarbazepine Tablets	Oxiconazole Cream
Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium Tablets	Pantoprazole Sodium for Injection
Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension	Pemirolast Potassium Ophthalmic Solution
Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution	Pentaerythritol Tetranitrate Extended-Release Capsules
Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation	Pentamidine Isethionate for Injection
Pentazocine Hydrochloride and Acetaminophen Tablets	Permethrin Cream	Phendimetrazine Tartrate Extended-Release Capsules
Phenobarbital Capsules	Phentermine Resin Complex	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Phentermine Resin Complex Capsules	Phosphate Oral Solution
Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment	Pilocarpine Hydrochloride Tablets
Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol	Povacrylate Solution
Poractant Alpha Supension	Porfimer Sodium for Injection	Povacrylate-Iodine Topical Solution
Povidone-Iodine Gauze	Povidone-Iodine Swabsticks	Povidone-Iodine Topical Aerosol Foam
Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets	Prazosin Hydrochloride and Polythiazide Capsules
Prednicarbate Cream	Prednicarbate Ointment ***(Received)***	Prednisolone Sodium Phosphate Oral Solution
Prochlorperazine Maleate Extended-Release Capsules	Progesterone Capsules	Promethazine Hydrochloride and Codeine
Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup
Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pyrilamine Maleate Injection
Quinidine Sulfate Injection	Ramipril Capsules	Ranitidine Capsules

Tamsulosin Hydrochloride Capsules	Technetium Tc 99m Teboroxime Injection	Tenofovir Disoproxil Fumarate Tablets
Terbinafine Hydrochloride Cream	Terbinafine Tablets	Terbinafine Topical Solution
Terconazole Vaginal Cream	Terconazole Vaginal Suppositories	Testosterone Transdermal System
Tetracycline Hydrochloride Periodontal Fiber	Theophylline Extended-Release Tablets	Tioconazole Vaginal Ointment
Tiopronin Tablets	Tolnaftate Topical Aerosol Solution	Topiramate Capsules
Topiramate Tablets	Torsemide Injection	Torsemide Tablets
Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	Trandolapril Tablets	Tranexamic Acid Injection
Tranylcypromine Sulfate	Tranylcypromine Sulfate Tablets	Tretinoin Capsules
Tretinoin Microsphere Gel	Triamcinolone Acetonide Metered-Dose Nasal Suspension	Trifluridine Ophthalmic Solution
Trimetrexate for Injection	Trimipramine Maleate Capsules	Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup
Trolamine Salicylate Cream	Trolamine Salicylate Gel	Trolamine Salicylate Topical Emulsion
Trovafloxacin Injection	Trovafloxacin Mesylate for Injection	Undecylenic Acid Topical Foam Aerosol
Unoprostone Isopropyl Ophthalmic Solution	Urea Cream	Valproic Acid Injection ***(Received)***
Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules	Venlafaxine Tablets
Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection
Voriconazole Oral Suspension	Voriconazole Tablets	Yttrium Y-90 Chloride Solution
Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection	Ziprasidone Hydrochloride Capsules
Zidovudine and Lamivudine Tablets	Zinc Acetate Capsules	Zoledronic Acid for Injection
Zinc Tridosium Pentetate Injection		

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	*N*-Acetyl Methionine
Aconitic Acid (Achilleic Acid)	Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal
Aliphatic Polyesters	Aluminum Ammonium Sulfate	Aluminum Hydroxide
Aluminum Lactate	Aluminum Oxide	Aluminum Ammonium Sulfate
Aluminum Potassium Sulfate	Aluminum Silicate	Aluminum Sodium Sulfate
Aluminum Stearate	Allantoin-Sodium Pyrrolidone Carboxylate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	Ascorbyl Stearate
Batylalcohol Monostearate	Benzododecinium Bromide	Benzyl Chloride
Benzyl Nicotinate	Brominated Vegetable Oil	Butadiene-Styrene Rubber
Beta Naphthol	Butylene Glycol	Butylphthalyl Butylglycolate
Butylated Hydromethylphenol	Calcium Alginate	Calcium Alginate and Ammonium Alginate
Calcium Acid Pyrophosphate	Calcium Chloride Solution	Calcium Glycerophosphate
Calcium Bromide	Calcium Phospahte Dibasic, Monohydrate	Calcium Phosphate Monobasic
Calcium Phosphate Dibasic, Anhydrous	Calcium Pyrophosphate	Calcium Sorbate
Calcium Propionate	Calcium Sulfate Dihydrate	Calcium Sulfate, Anhydrous
Calcium Stearoyl Lactylate	Calteridol Calcium	Canola Oil ***(Received)***
Caldiamide Sodium	Caprylic/Capric Diglyceril Succinate	Carbon
Capric Acid	Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium
Carboxymethyl Starch	Cetostearyl Isononanoate	Cholic Acid
Cinnamaldehyde	Chlorodifluoroethane	Cocamide Diethanolamine
Cocamide Oxide	Coconut Oil Hydrogenated	Cocoyl Caprylocaprate
Coconut Oil	Copper Sulfate	Crystal Gum
Cutina	Cystine	Cysteine Hydrochloride
Dammar Gum	Decanoic Acid	Decyl Oleate
Dehydroacetic Acid	Desoxycholic Acid	Dextrin Palmitate
Dextrins Modified	Diacetyl Tartaric Acid Esters of Mono- and Diglycerides	Dicetyl Phosphate
Dichlorofluoromethane	Diethylene Glycol Monopalmitostearate	Diethyl Sebacate
Difluoroethane	Diglycol Stearate	Diisopropanolamine ***(Received)***
Diisobutyl Adipate	Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide
Dilauryl Thiodipropionate	Dimethyl Dicarbonate	Dimyristoyl Lecithin
Dimyristoyl Phosphatidylglycerol	Dioctyl Sodium Sulfosuccinate	Dipropylene Glycol
Disodium Edisylate	Disodium Guanylate	Disodium Inosinate
Disodium Monooleamide Sulfasuccinate	Erythritol ***(Received)***	Erythorbic Acid
Erythrosine	Ethoxylated Mono- and Diglycerides	Ethoxyquin
Ethyl Hexanediol	Ethyl Linoleate	Ethyl Maltol
Ethylene Dichloride	Ethylene Glycol Monopalmitostearate	Ethylurea
Ferric Ammonium Citrate	Ferric Citrate	Ferric Oxide, Brown
Ferric Phosphate	Ferric Pyrophosphate	Ferrous Citrate
Ferrous Glycinate	Ferrous Lactate	Fluorochlorohydrocarbons
Formic Acid	Furcelleran	Gamma-Cyclodextrin
Gentistic Acid	Geraniol	Glutamic Acid
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydrogenated Starch Hydrolysate	Hydroxyethylmethylcellulose
Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin	Indigotine
Inositol	Iron Carbonyl	Iron Subcarbonate
Isobutylated-Isoprene Copolymer	Isooctylacrylate	Isopropyl Isostearate
Isopropyl Stearate	Isostearic Acid	Isostearyl Alcohol

Excipients *(Continued)*

Lactobionic Acid	Lactose Ferrin, Bovine	Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol
Lactylic Esters of Fatty Acids	Lanolin Anhydrous	Lanolin Alcohols, Acetylated
Lanolin (Wool Fat), Hydrogenated	Lanolin Hydrous	Lauramine Oxide
Lauric Acid	Lauric Diethanolamide	Lauric Myristic Diethanolamide
Lavender Oil	Lecithin, Hydroxylated	Leucine
Linoleic Acid	Macrogol Lauryl Ether	Macrogol Oleate
Macrogol Sorbitan Tristearate	Macrogol Stearyl Ether	Macrogolgrycerol Cocoates
Macrogolgrycerol Triisostearate	Magnesium Aluminum Silicate Hydrate	Magnesium Aspartate
Magnesium Aspartame Dihydrate	Magnesium Phosphate, Diabasic, Trihydrate	Magnesium Tartrate
Maltitol ***(Received)***	Maltitol Syrup	Maltol Isobutyrate
Malt Syrup	Manganese Chloride	Manganese Citrate
Manganese Glycerophosphate	Manganese Hypophosphite	Mannose
Medical Antifoam Emulsion C	Medronate Disodium	Medronic Acid
Methyl Chloride	Methylchloroisothiazolinone	Methyl Hydroxyethyl Cellulose
Methylisothiazolinone	*N*-Methylpyrrolidone ***(Received)***	Microcrystalline Cellulose, Silicified
Mineral Spirits	Monoisostearyl Glyceryl Ester	Monopotassium Glutamate Monohydrate
Monosodium Citrate	Mullein Leaf	Myristyl Gamma-Picolinium Chloride
Myristyl Lactate	*N*,*N*-Bis(2-Hydroxyethyl)Stearamide	Naphtha
Nonpareil Seeds	Nutmeg Oil	Octanoic Acid
Oleyl Oleate	Oxystearin	Palm Kernel Oil
Palm Oil	Pentasodium Triphosphate	Pentetate Calcium Trisodium
Pentetate Pentasodium	Phenprobamate	Phenylmercuric Borate
Pine Oil	Polacrilin	Polyacrylate Dispersion 30 Percent ***(Received)***
Polydextrose	Polydextrose Solution	Polyglycerol Esters of Fatty Acids
Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil—(USP has 35)	Polyoxyl Stearate -(USP has 40)
Polypropylene Oleate	Polyvinyl Acetate	Polyvinylacetal
Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone	Polypropylene Stearyl Ether
Polyvinylpyrrolidone Ethylcellulose	Polysorbate 65	Potassium Acid Tartrate
Potassium Alginate ***(Received)***	Potassium Bromate	Potassium Carbonate Solution
Potassium Dichloroisocyanurate	Potassium Gibberellate	Potassium Glycerophospate
Potasssium Iodate	Potassium Nitrite	Potassium Phosphate
Potassium Phosphate Tribasic	Potassium Polymetaphosphate	Potassium Pyrophosphate
Potassium Stearate	Potassium Sulfate	Potassium Sulfite
Potassium Tripolyphosphate	Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters
Propylene Glycol Monolaurate ***(Received)***	Propyl Propionate	Purified Polyoxyl 35 Castor Oil ***(Received)***
Rapeseed Oil, Hydrogenated	Rapeseed Oil, Superglycerinated	Rice Bran Wax
Rosin	Silicone	Sodium Acid Pyrophosphate
Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic	Sodium Aluminum Phosphate Basic
Sodium Aspartate	Sodium Bisulfate	Sodium Bisulfite
Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan	Sodium Caseinate
Sodium Chlorate	Sodium Citrate, Dibasic	Sodium Dehydroacetate
Sodium Diacetate	Sodium Erythorbate	Sodium Ferric Pyrophosphate
Sodium Ferrocianide	Sodium Ferrocyanide	Sodium Hypophosphite
Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate
Sodium Magnesium Silicate	Sodium Malate	Sodium Metaphosphate, Insoluble
Sodium Metasilicate	Sodium Methylate	Sodium Polyphosphates Glassy
Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate
Sodium Sesquicarbonate	Sodium Sesquinoleate	Sodium Stearoyl Lactylate
Sodium Thiomalate	Sodium Trimetaphosphate	Sodium Trioleate
Sodium Tripolyphosphate	Soy Polysaccharides	Stannous Chloride

Excipients *(Continued)*

Stannous Tartrate	Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca
Stearalkonium Chloride	Stearyl Citrate	Stearyl Monoglyceridyl Citrate
Succinylated Monoglycerides	Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters
Sucrose Stearate	Sucrose Syrup	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tall Oil	Tallow
Tallow Glycerides	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetereth-4 Phosphate
Trichloethylene	Trichloroethylene	Trimyristin
Trisidium Citrate	Trolamine Lauryl Sulfate	Vegetable Oil
Wheat Flour	Wheat Germ Oil	Wheat Gluten
Whey		

USP ANNUAL SCIENTIFIC MEETING, SEPTEMBER 27–30, 2005: IMPACT THE FUTURE OF PHARMACOPEIAL STANDARDS. The USP Annual Scientific Meeting will be held in the Hotel del Coronado, Coronado, California, September 27–30, 2005.

Spread the word. Tell your colleagues and register at: www.usp.org/conferences, 301-816-8134.

The USP 2005 Annual Scientific Meeting is your opportunity to directly contribute to USP's standards-setting processes. Through interaction with USP's scientific staff and Council of Experts, you will help establish standards-setting priorities for the organization and help shape the quality requirements that you must, by law, follow.

Meeting tracks include:

Analytical Validation and Verification of Compendial Methods

Learn about the new USP information in General Information Chapter ⟨1226⟩ *Verification of Compendial Procedures.* This track also includes presentations and workshops on the requirements for evolving analytical validation procedures, including spectroscopic and other physical test methods.

Biologics and Biotechnology Derived Therapies

Interactive discussion on cross-cutting, standards-setting activities currently being undertaken by USP, including validation of bioassays, development of standards for ancillary materials and international activities in biological standardization.

Dietary Supplements

Learn about the current and future impact of dietary supplement verification and new FDA regulatory initiatives on the marketplace; expansion of General Information Chapter ⟨2030⟩ *Supplemental Information for Botanicals;* technologies for botanical classification; and identification and analysis of new/emerging/potential dietary supplement ingredients.

Excipients

Interact with USP scientific experts, FDA, industry, and academic experts to discuss the science and related issues of excipients quality, including additives, excipient functionality and its impact on formulation, and multisource excipient equivalence, as well as recent advances in the development of novel excipients.

Making *USP–NF* Work for You

Be among the first to learn about future directions and updates based on resolutions adopted at the 2005 USP Convention and through other USP initiatives.

Annual Scientific Meeting 2005 Exhibit Program

Network with your colleagues as they showcase what's new and upcoming in the industry.

WHO SHOULD ATTEND:

- *USP–NF* and USP Reference Standards Users
- Scientists focusing on chemistry, biologics and biotechnology, analytical validation, excipients, and dietary supplements
- Government representatives
- Academia and association representatives
- Regulatory Affairs personnel
- R&D and QC personnel
- Lab supervisors/managers
- Compendial Affairs personnel
- Statisticians
- Technical consultants
- Healthcare practitioners

New and experienced bench chemists who want to better understand the USP process also may wish to attend the "Making *USP–NF* Work for You" track.

SCHEDULE:

Day 1—	September 27, 2005:	Registration
Day 2—	September 28, 2005:	The Annual Scientific Meeting starts with an opening session in the morning followed by Track Session I in the afternoon
Day 3—	September 29, 2005:	Track Session II (morning) and Track Session III (afternoon)
Day 4—	September 30, 2005:	Track Session IV in the morning followed by a "Town Hall" discussion. Meeting adjourns at 12:30 p.m.

Continuing Education

Extension Services in Pharmacy at the University of Wisconsin-Madison School of Pharmacy is accredited by the Accreditation Council on Pharmacy Education (ACPE, formerly the American Council on Pharmaceutical Education) as a provider of continuing pharmaceutical education. This program is approved for 14.5 hours or 1.45 continuing education units (CEUs).

In order to receive credit, pharmacists will be required to complete an Annual Scientific Meeting evaluation form. in addition, pharmacists must complete a statements of credit form for continuing pharmaceutical education participation which will be mailed (by USP) within one month after the meeting. ACPE numbers: 073-999-05-076-L04 through 073-999-05-081-L04.

ADVANCE NOTICE OF UPCOMING OFFICIAL REVISIONS TO THE *USP–NF*. In order to provide as much time as possible for industry to adopt revisions made to the compendia, upcoming official revisions to the *USP–NF* are now being announced on the USP website as soon as they are voted on to become official by the appropriate Expert Committees of the Council of Experts.

Readers are directed to the "Notices" section found in the top right corner of the USP homepage at www.usp.org. By clicking on "Upcoming official Revisions to the *USP–NF:* Reference Standards Required But Not Available," you are taken to a page where upcoming revisions to the compendia are listed. The information posted includes the title of the item being revised, the *PF* citation where the revision was proposed, and a description of the proposal. in addition, an e-mail link to the USP Scientific Liaison for each revision is listed in parentheses after the item. The actual content and official date of each revision will be published in either an annual edition, *Supplement,* or *Interim Revision Announcement* and the items are sorted according to the publication in which they are to appear.

In addition, readers will also find a list of new USP Reference Standards that correspond to new *USP–NF* monographs but unfortunately are not yet available. The official dates of any *USP–NF* Standards, tests, or assays that require the use of these Standards are postponed until further notice pending availability of the Standards.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF*. The *USP Guideline for Submitting Requests for Revision to the USP–NF* is available on USP's website at www.usp.org. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Noncomplex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format on the USP website at www.usp.org/USPNF/submitmonograph/subGuide.html. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2005 are listed below. for more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

2005 Calendar of Pharmacopeial Education Courses

Date	Name of Course	Location
Sept 19	Effectively Using the USP–NF	Royal College of Surgeons of Ireland (RCSI), Dublin
Sept 20	Analytical Method Validation	RCSI, Dublin, Ireland
Sept 21	Fundamentals of Microbiology	RCSI, Dublin, Ireland
Sept 21–22	Fundamentals of Dissolution, Lecture	RCSI, Dublin, Ireland
Sept 28–29	Fundamentals of Dissolution	Mexico City, Mexico
October (date TBD)	Fundamentals of Microbiology	Chicago, IL
October 13–14	Effectively Using the USP–NF	Munich, Germany
October 18–19	Fundamentals of Dissolution (Italian)	Basel, Switzerland
October 19–20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
October 20–21	Fundamentals of Dissolution (French)	Basel, Switzerland
November 2–3	Fundamentals of Dissolution	USP Headquarters
November 4	Fundamentals of Microbiology	Southern California (location TBD)
December 5–6	Effectively Using the USP-NF	Brussels, Belgium
December 7	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 8	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
December 8–9	Effectively Using the USP–NF	Basel, Switzerland

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

***USP–NF* AVAILABLE IN PRINT, ONLINE, AND CD.** *USP–NF,* the authoritative reference for official pharmaceutical standards is available in three convenient formats—print, online, and CD. One main edition and two *Supplements* are published each year. The current edition, *USP 28–NF 23*, is official through 2005. Starting with the *Second Supplement* to *USP 28–NF 23,* the *USP–NF* Online and CD versions feature several enhancements. The enhancements include ''My *USP–NF,*'' an exciting new option that lets subscribers customize their use of *USP–NF* by saving frequent searches, creating a unique table of contents, and using other personalization options. The *USP29–NF24* will be published on November 1, 2005. Orders will be accepted starting on September 1. To order *USP–NF,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

CHROMATOGRAPHIC REAGENTS. Official and proposed chromatographic procedures in the *USP–NF* and *Pharmacopeial Forum (PF)* refer to column reagents only by 'L,' 'S,' or 'G' designations. The brand names of these reagents are listed in *Chromatographic Reagents.* This book also provides an index of column manufacturers and lists alternative columns that may be used to carry out official procedures. *Chromatographic Reagents* saves chemists and scientists valuable laboratory time spent searching for the right columns to use in testing. *Chromatographic Reagents* is available in print format. The online format of the *USP–NF* includes the latest *Chromatographic Reagents*. To order *Chromatographic Reagents,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the official inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year.

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements,* official revisions are published in *PF* in the *interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2005	Apr. 1, 2005
PF 31(2) [Mar.–Apr. 2005]	Mar. 2005	Not Applicable
2nd IRA [published in *PF* 31(2)]	Mar. 2005	Apr. 1, 2005
PF 31(3) [May–June 2005]	May 2005	Not Applicable
3rd IRA [published in *PF* 31(3)]	May 2005	June 1, 2005
2nd Supplement	June 2005	Aug. 1, 2005
PF 31(4) [July–Aug. 2005]	July 2005	Not Applicable
4th IRA [published in *PF* 31(4)]	July 2005	Aug. 1, 2005
PF 31(5) [Sept.–Oct. 2005]	Sept. 2005	Not Applicable
5th IRA [published in *PF* 31(5)]	Sept. 2005	Oct. 1, 2005
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005*	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005*	Dec. 1, 2005*
PF 32(1) [Jan.–Feb. 2006]	Jan. 2006*	Not Applicable
1st IRA [published in *PF* 32(1)]	Jan. 2006*	Feb. 1, 2006*
1st Supplement	Feb. 2006*	Apr. 1, 2006*
PF 32(2) [Mar.–Apr. 2006]	Mar. 2006*	Not Applicable
2nd IRA [published in *PF* 32(2)]	Mar. 2006*	Apr. 1, 2006*
PF 32(3) [May–June 2006]	May 2006*	Not Applicable
3rd IRA [published in *PF* 32(3)]	May 2006*	June 1, 2006*
2nd Supplement	June 2006*	Aug. 1, 2006*
PF 32(4) [July–Aug. 2006]	July 2006*	Not Applicable
4th IRA [published in *PF* 32(4)]	July 2006*	Aug. 1, 2006*
PF 32(5) [Sept.–Oct. 2006]	Sept. 2006*	Not Applicable
5th IRA [published in *PF* 32(5)]	Sept. 2006*	Oct. 1, 2006*
PF 32(6) [Nov.–Dec. 2006]	Nov. 2006*	Not Applicable
6th IRA [published in *PF* 32(6)]	Nov. 2006*	Dec. 1, 2006*

*Tenative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP27*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 27*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FIFTH INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Eric B. Sheinin, Ph.D., *Chief Science Officer*

Official October 1, 2005 **Released September 1, 2005**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of *USF–NF* users.

USP Ademetione Disulfate Tosylate RS (January 1, 2006)
USP Adipic Acid RS (September 1, 2005)
USP Agnuside RS (November 1, 2005)
USP Aluminum Sulfate (AS)
USP Ammonium Phosphate Dibasic (AS)
USP Ascorbyl Palmitate RS (September 1, 2005)
USP Asparagine Anhydrous RS (November 1, 2005)
USP Asparagine Monohydrate RS (November 1, 2005)
USP Bismuth Subcarbonate RS (September 1, 2005)
USP Bismuth Subgallate RS (September 1, 2005)
USP Bismuth Subnitrate RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound A RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound B RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound C RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound F RS (January 1, 2006)
USP Calcium Stearate (AS)
USP Carboxymethylcellulose Calcium (AS)
USP Carboxymethylcellulose Sodium RS (September 1, 2005)
USP Carprofen RS (September 1, 2005)
USP Casticin RS (November 1, 2005)
USP Microcrystalline Cellulose (AS)
USP Powdered Cellulose (AS)
USP Ciclopirox RS (January 1, 2006)
USP Ciclopirox Related Compound A RS (January 1, 2006)
USP Ciclopirox Related Compound B RS (January 1, 2006)
USP Clopidogrel Bisulfate RS
USP Clopidogrel Bisulfate Related Compound A RS
USP Clopidogrel Bisulfate Related Compound B RS
USP Clopidogrel Bisulfate Related Compound C RS
USP Cromolyn Sodium Related Compound A (AS)

NOTICE OF POSTPONEMENT

Assay under *Vinorelbine Injection (First Supplement* to *USP 28–NF 23,* page 3281), pending development of a Vinorelbine Tartrate Reference Standard (RS) lot suitable for all official USP compendial applications

USP has **postponed indefinitely** the official date of the *Assay* under the *Vinorelbine Injection* monograph, which was published on page 3281 of the *First Supplement to USP 28–NF 23*. This postponement applies retroactively to the monograph's official date, April 1, 2005. All other portions of the monograph remain official.

This postponement allows USP to develop a lot of USP Vinorelbine Tartrate Reference Standard (RS) that is suitable for all official USP compendial applications. The current lot of USP Vinorelbine Tartrate RS (Lot F0C243) is suitable for qualitative testing purposes (including the qualitative testing required by the *Vinorelbine Tartrate* monograph) but is known to be unsuitable as currently labeled for the quantitative testing specified in the *Assay* under *Vinorelbine Injection.*

This postponement is consistent with the *General Notices* section of *USP 28–NF 23* relating to USP Reference Standards, which states the following:

> The requirements for any new *USP* or *NF* standards, tests, or assays for which a new USP Reference Standard is specified are not in effect until the specified USP Reference Standard is available. The availability of new USP Reference Standards and the official dates of the *USP* or *NF* standards, tests, or assays requiring their use are announced via *Supplements* or *Interim Revision Announcements.*

The *Assay* portion of the monograph will become official when the new lot of USP Vinorelbine Tartrate RS becomes available. We anticipate that this will occur on or around September 1, 2005. USP will announce the availability of the new lot and the new official date of the *Assay* in a *Supplement* or an *Interim Revision Announcement.*

The valid use date of USP Vinorelbine Tartrate RS Lot F0C243 will expire at the time that the new lot becomes available. At that time, USP will provide all customers with vials of the new lot in exchange for unopened vials from Lot F0C243.

If you have any questions or concerns, please contact Lawrence Evans III, Ph.D., Scientist, DSD and scientific liaison to the Pharmaceutical Analysis 6 Expert Committee/ Monograph Development: Ophthalmology, Oncology and Dermatology (301-816-8389 or le@usp.org).

Vinorelbine Injection

Change to read:

•**Assay—**

Phosphate buffer, Mobile phase, and *System suitability solution*—Proceed as directed in the test for *Related compounds* under *Vinorelbine Tartrate*.

Standard preparation—Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in water to obtain a solution having a known concentration of about 0.10 mg of vinorelbine (base) per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of vinorelbine, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a diode-array detector and a 3.9-mm × 15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and about 1.2 for vinorelbine related compound A; and the relative retention, α, between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine peaks, using a diode-array detector. Calculate the quantity, in mg, of vinorelbine ($C_{45}H_{54}N_4O_8$) in each mL of the Injection taken by the formula:

$$C(L/D)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Vinorelbine Tartrate RS in the *Standard preparation; L* is the labeled quantity, in mg, of vinorelbine in each mL of Injection taken; D is the concentration, in mg per mL, of vinorelbine in the *Assay preparation;* and r_U and r_S are the peak responses at 267 nm obtained from the *Assay preparation* and the *Standard preparation,* respectively.

(Postponed indefinitely)●5

NOTICE OF POSTPONEMENT

USP General Chapter *Injections* ⟨1⟩, *Printing on Ferrules and Cap Overseals*

USP has **postponed indefinitely** the official date of *Printing on Ferrules and Cap Overseals* that is published in *USP 28–NF 23* on page 2203. This section was originally slated to become official on October 5, 2005. The postponement is to allow for a revision for printing on ferrules and cap overseals that was approved by the Parenteral Products—Industrial, Nomenclature and Labeling, and Safe Medication Use Expert Committees to be published under *In-Process Revision* in this *Pharmacopeial Forum.* The Parenteral Products—Industrial Expert Committee will review comments concerning this revision. USP proposes that this General Chapter revision go forward to official text once public comments have been considered.

Should you have any questions, please contact James Kelly, Ph.D., Scientist, General Policies and Requirements Division and liaison to the Parenteral Products—Industrial Expert Committee (301-816-8167 or jwk@usp.org).

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

(Official October 1, 2005)

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. The contents of up to five 1- or 2-mL containers may be pooled for the measurement, provided that a separate dry syringe assembly is used for each container. The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. Cool to 25° before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

Printing on Ferrules and Cap Overseals

Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: "Warning", "Dilute Before Using", "Paralyzing Agent", "I.M. Use Only", "Chemotherapy", etc.

The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.

•(Postponed indefinitely)•S

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.

Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

MONOGRAPHS (USP)

Etodolac Extended-Release Tablets

Add the following:

•**Labeling**—When more than one *Dissolution* test is provided, the labeling states the *Dissolution* test used only if *Test 1* is not used.•5

Change to read:

•**Dissolution** ⟨711⟩—

TEST 1—•5

Medium: 0.05 M phosphate buffer, pH 7.4; 1000 mL.

Apparatus 2: 75 rpm, with USP sinker.

Times: 3, 6, 10, and 16 hours.

Procedure—Determine the amount of $C_{17}H_{21}NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 279 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Etodolac RS in the same *Medium.* Use *Medium* as the blank.

Tolerances—The percentages of the labeled amount of $C_{17}H_{21}NO_3$ dissolved at the times specified conform to •*Acceptance Table 2.*•5

Time (hours)	Amount dissolved
3	between 15% and 40%
6	between 35% and 70%
10	between 60% and 95%
16	not less than 80%

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 0.05 M phosphate buffer, pH 7.5; 1000 mL.

Apparatus 2: 100 rpm.

Times: 2, 4, 8, and 14 hours.

Procedure—Determine the amount of $C_{17}H_{21}NO_3$ dissolved by comparing the difference between the absorbances of the filtered portions of the solution under test determined at 278 nm and 245 nm with the difference between the absorbances of a Standard solution having a known concentration of USP Etodolac RS in the same *Medium* determined at the same wavelengths. Use *Medium* as the blank, and use a 0.05-cm silica cell.

Tolerances—The percentages of the labeled amount of $C_{17}H_{21}NO_3$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 10% and 35%
4	between 30% and 55%
8	between 60% and 90%
14	not less than 85%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium: 0.05 M phosphate buffer, pH 6.8; 1000 mL.

Apparatus 2: 75 rpm.

Times: 2, 4, 8, and 14 hours.

Procedure—Determine the amount of $C_{17}H_{21}NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on portions of the solution under test passed through a 10-µm polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Etodolac RS in the same *Medium.* Use *Medium* as the blank, and use a 0.05-cm silica cell.

Tolerances—The percentages of the labeled amount of $C_{17}H_{21}NO_3$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 10% and 30%
4	between 30% and 50%
8	between 55% and 75%
14	not less than 80%

•5

Oxandrolone Tablets

Add the following:

•**Labeling**—When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•5

Change to read:

■**Dissolution** ⟨711⟩—

•TEST 1—•5

Medium: a solution of water and isopropanol (7 : 3); 500 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17α-methyltestosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for tablets with a 2.5-mg label claim) and about 0.8 mg per mL (for tablets with a 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—Combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polytef filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 µL of the *Internal standard solution,* 40 mL of a 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for tablets with a 2.5-mg label claim) or with 8 mL of acetonitrile (for tablets with a 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are

maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5. Make two injections of the *Working standard solution,* and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution, *R,* between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_S \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC}$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard solution;* sample ratio is the area ratio of oxandrolone to 17α-methyltestosterone in the sample injection for each *Test solution;* V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17α-methyltestosterone in all injections of the *Working standard solution;* V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.■2S (*USP28*)

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 1% polysorbate 80 in water; 500 mL, deaerated.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 20 mg of USP Oxandrolone RS, accurately weighed, to a 200-mL volumetric flask. Add about 20 mL of acetonitrile, and sonicate to dissolve. Dilute with *Medium* to volume, and mix.

Working standard solution—Quantitatively dilute the *Standard stock solution* with *Medium* to obtain a solution having a final concentration of about 5 µg per mL for Tablets with a label claim of 2.5 mg, or a final concentration of about 20 µg per mL for Tablets with a label claim of 10 mg.

Test solution—Withdraw about 10 mL of the solution under test from the vessel. Centrifuge in a glass tube at 2000 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a reflective index detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{r_U \times C_S \times D \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution;* *D* is the dilution factor of the *Test solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim in mg.

Tolerances—Not less than 65% *(Q)* of the labeled amount of $C_{19}H_{30}O_3$ is dissolved in 120 minutes.•5

Sodium Polystyrene Sulfonate Suspension

Change to read:

» Sodium Polystyrene Sulfonate Suspension is a suspension of Sodium Polystyrene Sulfonate in an aqueous vehicle •that may contain suitable suspending or stabilizing agents. It•5 exchanges not less than 110 mg and not more than 135 mg of potassium for each g of the labeled amount of sodium polystyrene sulfonate.

Delete the following:

•**Labeling—**Label it to state the quantity of sorbitol in a given volume of Suspension.•5

Delete the following:

•**USP Reference standards** ⟨11⟩—*USP Sorbitol RS.*•5

Delete the following:

•**Assay for sorbitol—**

Mobile phase, Resolution solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Sorbitol* (see *NF* monograph).

Interim Revision Announcement

Assay preparation—Dilute an accurately measured volume of Suspension, freshly mixed and free from air bubbles, quantitatively with water to obtain a solution containing about 4.8 mg of sorbitol per mL. Filter, and use the filtrate as the *Assay preparation*.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Proceed as directed for *Procedure* in the *Assay* under *Sorbitol* (see *NF* monograph). Calculate the quantity, in g, of $C_6H_{14}O_6$, in each mL of the Suspension taken by the formula:

$$(L / D)(C)(r_U / r_S),$$

in which L is the labeled quantity, in g, of sorbitol in each mL of Suspension; D is the quantity, in mg, of sorbitol in each mL of the *Assay preparation* based on the labeled quantity and the extent of dilution; C is the concentration, in mg per mL, of *USP Sorbitol RS* in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.●5

ERRATA

Following is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP 28–NF 23*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
123	*Aminocaproic Acid*	*Assay*	Lines 5 and 6 under *Procedure:* Change "Calculate the quantity, in mg," to: Calculate the quantity, in g,
208	*Azithromycin*	*Labeling*	Line 5: Change "($C_{28}H_{72}N_2O_{12}$)" to: ($C_{38}H_{72}N_2O_{12}$)
884	*Gadoteridol Injection*	*Limit of free gadolinium (III)*	Line 7 under *Procedure:* Change ''500(157.25/334.38)(C/VP)($r_U r_S$)" to: 500(157.25/334.38)(C/VP)(r_U / r_S)
1235	*Methadone Hydrochloride Oral Solution*	*Assay*	Line 12 under *Procedure:* Change "R_U and R_S are the peak response ratios of the internal standard and methadone hydrochloride peaks" to: R_U and R_S are the peak response ratios of the methadone hydrochloride to the internal standard peaks
2578	⟨1047⟩ *Biotechnology-Derived Articles—Tests*	*Table 1*	Change ''Pepsin (EC 3.4.23.122)" to: Pepsin (EC 3.4.23.1) Change "(EC 23.4.21.19)" to: (EC 3.4.21.19) Change "(Clostripan)" to: (Clostripain)
Supplement 2			
3505	*Metolazone Tablets*	*Assay*	Line 6 under *Chromatographic system:* Change "replicate injections is not less than 2.0%" to: replicate injections is not more than 2.0%
3632	*Reagents, Indicators, and Solutions*	*Volumetric Solutions*	Under Iodine, Hundredth-Normal (0.01 N): Change denominator from "25" to: 100

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 28*) indicates that the proposed revision is slated for the *Second Supplement to USP 28*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Albumin Human, *USP 28* page 57 and page 992 of *PF* 29(4) [July–Aug. 2003]. On the basis of comments received, it is proposed to use the atomic absorption spectroscopic method instead of the flame photometric method for the estimation of *Potassium content* and *Sodium content.* A new section on *Incubation* of the final product has also been added.

(BBP: R. Tirumalai) RTS—42998-1

Change to read:

~~» Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.80 to 640.86) (see *Biologics* ⟨1041⟩). It is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen.~~

~~■» Albumin Human is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen, hepatitis C, and HIV by antibody and nucleic acid assay, and other disease causative agents that are not destroyed or removed by the processing method, as determined by the medical history of the donor, and from such physical examination and approved clinical tests as may appear necessary for each donor at the time the blood was obtained.~~ ~~■1S *(USP27)*~~

■» Albumin Human is a sterile, nonpyrogenic preparation of serum albumin. The source material of Albumin (Human) shall be plasma derived from Whole Blood from healthy human donors. The source material is tested for syphilis, hepatitis B virus, human T-cell virus (HTLV) type I and type II using FDA licensed commercially available test kits. In addition, the source material must also be tested for hepatitis C and HIV using FDA approved nucleic acid assays, and other disease-causative agents that may not be destroyed or removed by the processing method, as determined by the medical history of the donor, and from such physical examination and approved clinical tests as may appear necessary for each donor at the time the blood is obtained. ■2S *(USP29)*

~~It is made by a process that yields a product that is safe for intravenous use. Not less than 96 percent of its total protein is albumin~~

~~■, as determined by an approved and validated method.~~ ~~■1S *(USP27)*~~

■Albumin Human is manufactured by a process that yields a product that is safe for intravenous use. Not less than 96 percent of its total protein is albumin, as determined by an approved and validated method (or as determined by a method that has been approved for each manufacturer). ■2S *(USP29)*

It is a solution containing, in each 100 mL, either 25 g of serum albumin osmotically equivalent to 500 mL of normal human plasma, or 20 g equivalent to 400 mL, or 5 g equivalent to 100 mL, or 4 g equivalent to 80 mL thereof, and contains not less than 93.75 percent and not more than 106.25 percent of the labeled amount in the case of the solution containing 4 g in each 100 mL, and not less than 94.0 percent and not more than 106.0 percent of the labeled amount in the other cases. ~~It contains no added antimicrobial agent, but may contain sodium acetyltryptophanate with or without sodi-~~

In-Process Revision

~~um caprylate as a stabilizing agent. It has a sodium content of not less than 130 mEq per liter and not more than 160 mEq per liter. It has a heme content such that the absorbance of a solution, diluted to contain 1 percent of protein, in a 1-cm holding cell, measured at a wavelength of 403 nm, is not more than 0.25. It meets the requirements of the tests for heat stability and for pH.~~

■■2S (*USP29*)

■It contains no added antimicrobial agent. Either 0.08 ± 0.016 millimole sodium caprylate, or 0.08 ± 0.016 millimole sodium acetyltryptophanate and 0.08 ± 0.016 millimole sodium caprylate per gram of protein may be present as a stabilizer(s).■2S (*USP29*)

Change to read:

Packaging and storage—Preserve in tight containers, and store at the temperature ~~recommended by the manufacturer~~

■■2S (*USP29*)
indicated on the label.

Change to read:

Expiration date—~~The expiration date is not later than 5 years after issue from manufacturer's cold storage (5°, 3 years) (at 5° for not more than 3 years)if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage (5°, 3 years)if labeling recommends storage at temperatures not higher than 37°; and not later than 10 years after date of manufacture if in a hermetically sealed metal container and labeling recommends storage between 2° and 10°.~~

■The expiration date is not later than 5 years after the date of final sterile filtration of a uniform pool of the bulk solution.■2S (*USP29*)

Change to read:

Labeling—~~Label it to state that it is not to be used if it is turbid and that it is to be used within 4 hours after the container is entered. Label it also to state the osmotic equivalent in terms of plasma, the sodium content, and the type of source material (venous plasma, placental plasma, or both) from which it was prepared. Label it also to indicate that additional fluids are needed when the 20-g per 100-mL or 25-g per 100-mL product is administered to a markedly dehydrated patient.~~

■Label it to state (1) the osmotic equivalent in terms of plasma, and the sodium content in terms of a value or a range in mEq per liter, (2) the need for additional fluids when 20% or 25% albumin is administered to a patient with marked dehydration, and (3) the protein content, expressed as a 4%, 5%, 20%, or 25% solution. Include on the label in a prominent position the following cautionary statements: "Do Not Use if Turbid. Do Not Begin Administration More Than 4 Hours After the Container Has Been Entered." Indicate on either the container or package label, or in the package insert, the type of source material, expressed as venous plasma, placental plasma, or both, used to manufacture the final product. Label it to indicate the volume of the preparation, storage conditions, the expiration date, and the name and concentration of any added substance (for example, stabilizer). Where applicable, the label indicates that the preparation is suitable for administration to patients undergoing dialysis and to premature infants.■2S (*USP29*)

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Albumin Human RS. USP Endotoxin RS.*■2S (*USP29*)

Add the following:

■**Identification—**

A: *Immunodiffusion—*

pH 8.0 buffer—Dissolve 1.98 g of barbituric acid, 1.03 g of sodium barbital, and 8.7 g of sodium chloride in 900 mL of water. Adjust with a sodium hydroxide solution to a pH of 8.0, dilute with water to make up to 1 L, and mix.

Procedure—Prepare agar-gel immunodiffusion plates each containing one central well and 5 or 6 outer wells concentric with the central well using 1.9 g of agar in 150 mL *pH 8.0 buffer*. Place 5 µL of Albumin Human in the central well of one plate and 5 µL of USP Albumin Human RS in the central well of another plate. Add 5 µL of an antiserum

In-Process Revision

specific to human plasma proteins from a suitable commercial source in one of the appropriately marked outer wells of each plate. Place 5 µL each of antisera specific to plasma proteins of animals commonly used in the preparation of materials of biological origin in other appropriately marked outer wells of each plate. [NOTE—At the minimum, antisera against plasma proteins of bovine, porcine, and ovine must be used.] Incubate the plates at 2° to 8° for at least 24 hours. The plate containing Albumin Human observed in a bright white light shows a sharp white arc between the central well and the well containing antiserum specific to human plasma proteins, and no arc between the central well and the wells containing antisera specific to plasma proteins of other animals. The test is valid if the plate containing USP Albumin Human RS shows an arc between the central well and the well containing antiserum specific to human plasma proteins, and no arc between the central well and the wells containing antisera specific to plasma proteins of other animals.

B: *Immunoelectrophoresis—*

Electrophoretic buffer—Dissolve 2.5 g of barbituric acid, 16.7 g of sodium barbital, 1.0 g of sodium chloride, and 0.7 g of edetate disodium in about 1.9 L of water, and adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.6. Dilute with water to obtain a final volume of 2 L, and mix.

Reference solution—Dilute normal human serum from a suitable commercial source with *Electrophoretic buffer* to obtain a total protein concentration of about 10 mg per mL.

Test solution—Dilute Albumin Human with *Electrophoretic buffer* to obtain a total protein concentration of about 10 mg per mL.

Procedure—Mount a suitable immunoelectrophoresis microslide strip containing 1% agar gel between the two buffer reservoirs of a suitable microelectrophoresis apparatus. Place suitable volumes of *Electrophoretic buffer* in the buffer reservoirs. Cut two pieces of blotting paper of suitable lengths such that the widths are approximately equal to that of the agar gel, and soak them in *Electrophoretic buffer*. Place the pieces such that one end of each dips into the *Electrophoretic buffer* while the other ends of the pieces are placed on the two ends of the agar-gel strip such that they extend for about 1 cm at both ends. Using a suitable commercial device dig two wells about 1.5 cm apart near one end of the agar-gel strip such that they are about 0.5 cm away from the nearest blotting paper and at the same level perpendicular to the direction of the electrophoresis, and dig a central slot of suitable length between the two wells, and equidistant from them, along the direction of electrophoresis. Place 1 µL of *Reference solution* into one well and an equal volume of *Test solution* into the other. Electrophorese the samples for about 35 minutes applying 90 volts across the agar-gel strip. Remove the blotting papers, and place in the central slot about 25 µL of the same antiserum specific to human plasma proteins as is used in *Identification* test *A*. Incubate the microslide at 2° to 8° for at least 24 hours. Observed in a bright white light, the microslide shows an arc for *Test solution* that corresponds to the major arc obtained with the *Reference solution*. The test is not valid if *Identification* test *A* is not valid.■2S (*USP29*)

Add the following:

■**Bacterial endotoxins** ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.■2S (*USP29*)

Add the following:

■**Safety**—It meets the requirements when tested as directed for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩■2S (*USP29*)

Add the following:

■**Sterility** ⟨71⟩—It meets the requirements.■2S (*USP29*)

In-Process Revision

Add the following:

■**pH** ⟨791⟩: between 6.4 and 7.4, when diluted with 0.15 M sodium chloride to obtain a solution containing 1% protein.■2S (*USP29*)

Add the following:

■**Molecular size distribution—**

Mobile phase—Prepare a suitable degassed and filtered solution containing 7.337 g of dibasic sodium phosphate heptahydrate, 1.741 g of monobasic sodium phosphate monohydrate, and 11.688 g of sodium chloride per liter in water.

Reference solution—Dilute a solution of USP Albumin Human RS in *Mobile phase* to obtain a solution having a concentration of about 10 mg per mL of protein, and mix.

Test solution—Dilute a solution of Albumin Human in *Mobile phase* to obtain a solution having about the same concentration of protein as the *Reference solution*, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a UV/visible detector set at 280 nm, a 7.5- × 600-mm analytical column, a 7.5- × 75-mm guard column, both containing ~~L58~~ L## (see *Chromatography* ⟨621⟩) packing, and maintained at ambient temperature. The flow rate is constant and is maintained at 0.5 mL per minute ±1%.

Procedure—Separately inject 25 µL of the *Reference solution* and the *Test solution*, and record the chromatograms. The area of the major peak is not less than 85% of the total peak area in the chromatogram. The test is not valid unless the value obtained for USP Albumin Human RS is within the value stated in the USP Albumin Human RS Data Sheet.■2S (*USP29*)

Add the following:

■**Heat stability—**A final container sample of Albumin Human shall remain unchanged, as determined by visual inspection, after heating at 57° for 50 hours, when compared to its control consisting of a sample, from the same lot, which has not undergone the heat treatment.■2S (*USP29*)

Add the following:

■**Incubation—**All final containers of Albumin Human shall be incubated at 20° to 35° for at least 14 days following the heat treatment. At the end of this incubation period, each final container shall be examined and all containers showing any indication of turbidity or microbial contamination shall not be issued. The contents of turbid final containers shall be examined microscopically and tested for sterility. If growth occurs, organisms shall be identified as to genus, and the material from such containers shall not be used for further manufacturing.■2S (*USP29*)

Add the following:

■**Prekallikrein activator—**

Buffer A—Dissolve 6.1 g of tris(hydroxymethyl)aminomethane, 1.2 g of sodium chloride, 50 mg of hexadimethrine bromide, and 0.1 g of sodium azide in 800 mL water. Adjust with 2 M hydrochloric acid at 20° to 25° to a pH of 7.8, and dilute with water to 1000 mL.

Buffer B—Dissolve 6.1 g of tris(hydroxymethyl)aminomethane and 0.7 g of sodium chloride in 800 mL of water. Adjust with 2 M hydrochloric acid at 20° to 25° to a pH of 7.8, and dilute with water to 1000 mL.

Chromogenic substrate solution A—Prepare a solution of a suitable *Chromogenic Substrate for Amidolytic Test* (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) specific for kallikrein in water to obtain a solution having a concentration of about 6 mM.

Chromogenic substrate solution B—Dilute 1 volume of *Chromogenic substrate solution A* with 9 volumes of *Buffer B*.

Prekallikrein substrate—[NOTE—To avoid coagulation activation, blood or plasma used for the preparation of *Prekallikrein substrate* must only come into contact with plastic or silicone-treated glass surfaces.] Draw 9 volumes of human blood into 1 volume of a suitable anticoagulant solution containing 1 mg per mL of hexadimethrine bromide. Centrifuge the mixture at 3600 *g* for 5 minutes. Centrifuge the plasma fraction again at 6000 *g* for 20 minutes to sediment platelets. Dialyze the platelet-reduced plasma against 10 volumes of *Buffer A* for 20 hours. Apply the dialyzed plasma to a DEAE-agarose column equilibrated in *Buffer A*, such that the volume of DEAE-agarose is twice the volume of the plasma. Elute from the column with *Buffer A* at 20 mL per cm^2 per hour. Collect the eluate in fractions, and record the absorbance at 280 nm. Pool the fractions containing the first protein peak so that the volume of the pool is about 1.2 times the volume of the platelet-reduced plasma. Add solid sodium chloride to the pooled solution, and dissolve such that the final concentration of sodium chloride is 7.0 mg per mL. Pass the solution through a membrane filter having a 0.45-µm porosity, freeze the filtrate in portions, and store at –70°; the substrate is stable at –70° for 1 year. [NOTE—Carry out all steps from the beginning of the chromatography to freezing in portions during a single working day.] Test the substrate pool for absence of kallikrein activity by mixing 1 part with 20 parts of the *Chromogenic substrate solution B* prewarmed at 37°, and incubate at 37° for 2 minutes. The substrate is suitable if the increase in absorbance is less than 0.001 per minute.

Standard solutions—Dilute USP Albumin Human RS with *Buffer B* to prepare four solutions corresponding to a suitable range of prekallikrein activator concentration in IU per mL.

Test solution—Dilute Albumin Human with an equal volume of *Buffer B*.

Procedure—To suitably capped tubes transfer 25 µL each of *Buffer B* (to be used as the blank), four *Standard solutions*, and the *Test solution*. To each tube add 100 µL of *Prekallikrein substrate*, and incubate at 37° for 45 minutes. Transfer 25 µL of each solution to a suitable cuvette (1-cm path length) containing 1000 µL of *Chromogenic substrate solution B* and prewarmed and maintained at 37°. Mix, and measure the change of absorbance (ΔA) for 10 minutes spectrophotometrically at 405-nm wavelength at 37°. Subtract ΔA per minute for the blank from ΔA per minute for each of the *Standard solutions*, and the *Test solution*. Plot the corrected ΔA per minute for each of the *Standard solutions* versus its respective prekallikrein activator concentration. Calculate the prekallikrein activator concentration of the *Test solution* from the standard curve, and multiply the value by 2. The prekallikrein activator concentration of Albumin Human is not more than 35 IU per mL.■2S (*USP29*)

Add the following:

■Protein content—

Sodium molybdate solution—Dissolve 9.0 g of disodium molybdate dihydrate in 115 mL of water in a suitable container. Add 4 mL of sulfuric acid, and mix.

Test solution—Dilute Albumin Human with 0.15 M sodium chloride to obtain a solution containing about 7.5 mg of protein per mL of the solution.

Blank: 0.15 M sodium chloride used to make the *Test solution*.

In-Process Revision

Procedure—To 2.0 mL of the *Test solution* and the *Blank* in suitable centrifuge tubes, add 2.0 mL of *Sodium molybdate solution*. Mix, allow to stand for about 10 minutes, centrifuge for 5 minutes, and decant the supernatant. Resuspend the precipitates in 2.0 mL of *Sodium molybdate solution*, centrifuge for 5 minutes, decant the supernatant, and hold the tubes inverted to drain on a filter paper. Transfer the residues quantitatively with a minimum quantity of water to a micro-Kjeldahl flask, and determine the nitrogen in the residues using *Method II* under *Nitrogen Determination* ⟨461⟩. Multiply the result, corrected for the *Blank*, by 6.25 to calculate the quantity of protein.■2S (*USP29*)

Add the following:

■**Heme content**—Dilute Albumin Human using 0.15 M sodium chloride to obtain a solution having a concentration of 10 mg per mL of protein. The absorbance (see *Spectrophotometry and Light-Scattering* ⟨851⟩) of the solution measured at 403 nm using 0.15 M sodium chloride as the blank, is not greater than 0.25.■2S (*USP29*)

Add the following:

■**Potassium content**—

Standard solutions 1, 2, 3, 4, 5, 6, and *7*—~~Prepare four standard solutions containing 0, 1.0, 2.0, and 3.0 mg of potassium, in the form of the chloride, per L, respectively, in 0.1 N hydrochloric acid and 25 mEq of sodium (1.46 g of sodium chloride) per L.~~ Prepare seven standard solutions containing 0, 0.25, 0.5, 1.0, 2.0, 4.0, and 8.0 µg of potassium, in the form of the chloride, per mL, respectively, in cesium chloride diluent.

Test solution—~~Transfer 3.5 mL of Albumin Human, 5.0 mL of 0.15 M sodium chloride, and 5.0 mL of 1 N hydrochloric acid to a 50-mL volumetric flask, dilute with water to volume, and mix.~~ Dilute the albumin samples to approximately 5% using water and further dilute the 5% protein solutions 5 mL to 50 mL using cesium chloride diluent.

Procedure—~~Set a suitable flame photometer to a wavelength of 766 nm. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of *Standard solutions 2* and *3*. Plot the observed transmittance of *Standard solutions 2, 3,* and *4* versus their respective potassium concentrations. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of the *Test solution*, and from the standard curve calculate the potassium content in mg per liter of the *Test solution*. Multiply the value by 0.365 (multiplication by the dilution factor and division by the equivalent weight of potassium, 39.1) to obtain the potassium concentration in mEq per L in the sample. Albumin Human contains between 0 and 1 mEq of potassium per L of sample.~~ Set a suitable atomic absorption spectrophotometer capable of analyzing in emission mode to a wavelength of 766.5 nm. Operate the atomic emission spectrometer in accordance with the manufacturer's instructions. Introduce a blank solution (using cesium chloride diluent) into the atomic generator, and adjust the instrument reading to zero. Determinations are made by comparison with reference solutions with known concentrations. Use the 1 µg/mL standard as the check standard. The result must be 1.0 ± 0.05 µg/mL. If outside this range recalibrate the instrument. If the sample solution emission exceeds that of the highest standard, dilute the sample using cesium chloride diluent. Read the emission of *Standard solutions 2–7*. Plot the observed emission of *Standard solutions 2–7* against their respective potassium concentrations. From the standard curve calculate the potassium content in µg per mL of the *Test solution*. Convert the value to obtain potassium concentration in mEq per L in the sample. Albumin Human contains not more than 2 mEq/L of potassium.■2S (*USP29*)

In-Process Revision

Add the following:

■**Sodium content**—

Standard solutions 1, 2, 3, 4,5,6, and *7*—~~Prepare four standard solutions containing 0, 2.0, 3.0, and 4.0 mg of sodium, in the form of the chloride, per L, respectively, in 0.1 N hydrochloric acid and 6.0 mEq of potassium (447.6 mg of potassium chloride) per L.~~ Prepare seven standard solutions containing 0, 0.25, 0.5, 1.0, 2.0, 4.0, and 8.0 µg of sodium, in the form of the chloride, per mL, respectively, in cesium chloride diluent.

Test solution—~~Transfer 75 µL of Albumin Human, 4.0 mL of 0.15 M potassium chloride, and 10.0 mL of 1 N hydrochloric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.~~ Dilute the albumin samples to approximately 5% using water, and further dilute the 5% protein solutions 5 mL to 50 mL using cesium chloride diluent.

Procedure—~~Set a suitable flame photometer to a wavelength of 589 nm. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of *Standard solutions 2* and *3*. Plot the observed transmittance of *Standard solutions 2, 3,* and *4* versus their respective sodium concentrations. Adjust the instrument to zero transmittance with *Standard solution 1* and to 100% transmittance with *Standard solution 4*. Read the percent transmittance of the *Test solution*, and from the standard curve calculate the sodium content in mg per liter in the *Test solution*. Multiply the value by 57.97 (multiplication by the dilution factor and division by the equivalent weight of sodium, 23.0) to obtain the sodium concentration in mEq per L. Albumin Human contains between 130 and 160 mEq of sodium per L of sample.~~ Set a suitable atomic absorption spectrophotometer capable of analyzing in emission mode to a wavelength of 589 nm. Other details are as described under *Potassium content*. From the standard curve calculate the sodium content in µg per mL of the *Test solution*. Convert the value to obtain the sodium concentration in mEq per L in the sample. Albumin Human contains between 130 to 160 mEq/L of sodium.■2S (*USP29*)

BRIEFING

Alendronate Sodium, *USP 28* page 63. It is proposed to revise the *Packaging and storage* statement to indicate storage at room temperature rather than restricting the storage temperature to between 15° and 30°.

(PA4: E. Gonikberg; PSD: C. Okeke) RTS—42722-1

Change to read:

Packaging and storage—Preserve in well-closed containers. ~~Store between 15° and 30°.~~

■Store at room temperature.■2S (*USP29*)

BRIEFING

Amantadine Hydrochloride, *USP 28* page 111. It is proposed to revise the *Chromatographic system* in the test for *Chromatographic purity* to identify the peak as amantadine (the base) rather than amantadine hydrochloride (the salt). The base is the chemical entity being chromatographed in this procedure.

(PA7b: B. Davani) RTS—42338-1

Change to read:

Chromatographic purity—

Internal standard solution—Transfer about 500 mg of adamantane, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with dichloromethane to volume, and mix.

Test solution—Transfer about 1.0 g of Amantadine Hydrochloride, accurately weighed, to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 minutes. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few minutes to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution,* and dilute with dichloromethane to volume.

Standard solution—Transfer about 10 mg of USP Amantadine Hydrochloride RS, accurately weighed, to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 minutes. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few minutes to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution,* and dilute with dichloromethane to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused-silica column coated with 1.0-µm G27 stationary phase. The carrier gas is helium, flowing at a rate of about 4 mL per minute, and the split flow is about 200 mL per minute with a split flow ratio of 50 : 1. Initially, the temperature of the column is equilibrated at 70° for 5 minutes, then the temperature is increased linearly at a rate of 10° per minute to 250°, and maintained at 250° for at least 17 minutes. The injection port temperature is maintained at 220°, and the detector temperature is maintained at 300°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for adamantane and 1.0 for amantadine; ~~hydrochloride~~

■ ■2S (*USP29*)
the resolution, *R,* between adamantane and amantadine ~~hydrochloride~~

■ ■2S (*USP29*)
is not less than 20; and the relative standard deviation for replicate injections determined from the peak response ratios of amantadine to adamantane is not more than 5.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Amantadine Hydrochloride taken by the formula:

$$100(R_i/R_S)(W_S/W_U)$$

in which R_i is the peak response ratio of each impurity to adamantane obtained from the *Test solution;* R_S is the peak response ratio of amantadine to adamantane obtained from the *Standard solution;* W_S is the weight, in mg, of USP Amantadine Hydrochloride RS taken to prepare the *Standard solution;* and W_U is the weight, in mg, of Amantadine Hydrochloride taken to prepare the *Test solution*: not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities is found.

BRIEFING

Aspartic Acid, *USP 28* page 179 and page 3212 of the *First Supplement.* In the test for *Chloride,* it is proposed to increase the volume of nitric acid used to improve the solubility of the sample.

(DSN: L. Evans) RTS—42190-1

Change to read:

Chloride ⟨221⟩**—**Dissolve 0.7 g in ~~3~~

■10 ■2S (*USP29*)
mL of diluted nitric acid, and dilute with water to make 15 mL: the solution shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.02%).

BRIEFING

Atenolol, *USP 28* page 193. It is proposed to revise the formula in the *Assay.*

(PA5: A. Wilk) RTS—42824-1

Change to read:

Assay—

Mobile phase—Dissolve 1.1 g of sodium 1-heptanesulfonate and 0.71 g of anhydrous dibasic sodium phosphate in 700 mL of water. Add 2 mL of dibutylamine, and adjust with 0.8 M phosphoric acid to a pH of 3.0. Add 300 mL of methanol, mix, and pass through a filter having a 0.5-µm or finer porosity. Degas this solution before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Atenolol RS in *Mobile phase* to obtain a solution having a known concentration of about 0.01 mg per mL.

Assay preparation—Transfer about 100 mg of Atenolol, accurately weighed, to a 100-mL volumetric flask, add 50 mL of *Mobile phase,* and sonicate for about 5 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a second 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 226-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:*

In-Process Revision

the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{14}H_{22}N_2O_3$ in the portion of Atenolol taken by the formula:

~~$100C(r_U/r_S),$~~

■$10{,}000C(r_U/r_S)$■2S *(USP29)*

in which C is the concentration, in mg per mL, of USP Atenolol RS in the *Standard preparation;* and r_U and r_S are the atenolol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Bromocriptine Mesylate, *USP 28* page 282. On the basis of comments received and submitted data, it is proposed to revise the impurities specification in the test for *Chromatographic purity.*

(PA1: C. Anthony) RTS—42995-1

Change to read:

Chromatographic purity—

Citrate buffer—Prepare a 0.1 N citric acid solution, adjust with hydrochloric acid to a pH of 2.0, and mix.

Diluting solution—Prepare a mixture of methanol and *Citrate buffer* (1 : 1).

Solution A—Mix 57 mL of 0.01 M phosphate buffer having a pH of 7.0 and 43 mL of acetonitrile.

Solution B—Mix 40 mL of 0.01 M phosphate buffer having a pH of 7.0 and 60 mL of acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of α-ergocryptine and Bromocriptine Mesylate in *Diluting solution* to obtain a solution containing about 2.0 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Bromocriptine Mesylate RS in methanol, dilute quantitatively with an equal volume of *Citrate buffer*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 4.6 µg per mL.

Test solution—Transfer about 46 mg of Bromocriptine Mesylate, accurately weighed, to a 10-mL volumetric flask, dissolve in 5.0 mL of methanol, dilute with *Citrate buffer* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–18	100	0	isocratic
18–30	100→0	0→100	linear gradient
30–40	0	100	isocratic
40–41	0→100	100→0	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.46 for α-ergocryptine and 1.0 for bromocriptine mesylate; the resolution, *R,* between α-ergocryptine and bromocriptine mesylate is not less than 15; and the tailing factor is not more than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the retention time for the bromocriptine mesylate peak is between 17 and 20 minutes; and the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Bromocriptine Mesylate taken by the formula:

$$1000F(C/W)(r_i/r_S)$$

in which F, the relative response factor, is equal to 0.7 for any peaks eluting at a relative retention time of about 0.9 or less, and is equal to 1.0 for all other peaks; C is the concentration, in mg per mL, of USP Bromocriptine Mesylate RS in the *Standard solution;* W is the weight, in mg, of Bromocriptine Mesylate taken for the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for bromocriptine obtained from the *Standard solution:*

■not more than 0.4% bromcriptinin is found;■2S *(USP29)*
not more than 0.1% of any individual impurity is found; and not more than ~~0.5%~~

■1.0%■2S *(USP29)*
of total impurities is found.

BRIEFING

Butorphanol Tartrate Nasal Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analysis performed with the Symmetry brand of L11 column. The typical retention time is about 8.7 minutes for butorphanol tartrate.

(PA2: C. Anthony) RTS—42160-1

In-Process Revision

Add the following:

■Butorphanol Tartrate Nasal Solution

» Butorphanol Tartrate Nasal Solution is an aqueous solution of butorphanol tartrate for administration as a metered spray to the nasal mucosa. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butorphanol tartrate, ($C_{21}H_{29}NO_2 \cdot C_4H_6O_6$)

Packaging and storage—Preserve in tight containers at controlled room temperature. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Butorphanol Tartrate RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: *Thin-layer chromatographic identification test* ⟨201⟩—

Test solution—Prepare one sample composite solution by pooling the contents of three packages into a suitable vessel. Transfer 1.0 mL of pooled sample to a 10-mL volumetric flask, and dilute with methanol to volume.

Standard solution—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in methanol to obtain a solution having a known concentration of about 1.0 mg per mL.

Developing solvent system—Prepare a mixture of chloroform, methanol, benzene, and ammonium hydroxide (17 : 5 : 4 : 1). Mix thoroughly. *[Caution—Prepare in a hood while wearing appropriate safety gloves, lab coat, and protective eyewear.]*

Spray reagent—Prepare a 1 in 10 solution of chloroplatinic acid in water. To 0.5 mL of this solution, add 33 mL of water and 1 g of potassium iodide. Prepare fresh daily.

Procedure—Proceed as directed in the chapter, except to spray the plate with the *Spray reagent*. The typical R_F value is about 0.7 for butorphanol tartrate.

Osmolality ⟨785⟩**:** between 252 and 292 mOsmol per kg.

Microbial limits ⟨61⟩**—**The total aerobic count is not more than 100 cfu per mL, and the total combined molds and yeasts count is not more than 100 cfu per mL. It meets the requirements of the tests for absence of *Coliforms, Staphylococcus aureus,* and *Pseudomonas aeruginosa*.

pH ⟨791⟩**:** between 4.0 and 6.0.

Delivered dose uniformity over the entire contents: meets the requirements for *Metered-Dose Inhalers* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩.

Related compounds—

Phosphate buffer (0.025 M)—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine (85 : 15 : 5). Thoroughly mix. Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in water, and quantitatively dilute in water as necessary to obtain a solution having a known concentration of about 0.005 mg per mL.

Sensitivity solution—Transfer 2.5 mL of the *Standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix. Do not filter.

Test solution—Prepare a sample composite solution by pooling a minimum of four containers into a suitable glass vessel. Transfer the equivalent of 50 mg of butorphanol tartrate into a 50-mL volumetric flask. Dilute with water to volume, and mix. Do not filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6- × 250-mm column that contains 5-µm packing L11, and a 4.6- × 10-mm guard column packed with 5-µm packing L11. The column temperature is maintained at 40°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not more than 10.0%. Chromatograph the *Sensitivity solution,* and record the peak responses as directed for *Procedure:* the peak height for butorphanol tartrate is greater than or equal to three times the base line noise.

Procedure—Separately inject equal volumes (about 60 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak in the *Standard solution* and all known and unknown related compounds in the *Test solution*. The chromatographic run time is about 40 minutes. Calculate the percentage of each related compound (see *Table 1*) and unknown impurity in the sample of Nasal Solution taken by the formula:

$$5000(C/VLA)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard solution; V* is the volume of sample taken; *LA* is the labeled amount, in mg per mL, of butorphanol tartrate in the sample; r_i is the peak response of the known or unknown related compound in the *Test solution;* and r_S is the peak response of butorphanol tartrate in the *Standard solution:* the impurities meet the requirements specified below.

Table 1

Compounds	Relative Retention Time	Limit (%)
3,14-Dihydroxymorphinan	0.3	0.3
Δ6-Butorphanol	0.7	0.5
Butorphanol tartrate	1.0	—
Unknown impurity	—	0.3
Total impurities	—	1.0

Assay—

Phosphate buffer (0.025 M)—Transfer 3.4 g of monobasic potassium phosphate into a 1000 mL volumetric flask. Dilute with water to volume, and filter. Mix, and adjust with phosphoric acid to a pH of 3.0 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine (85 : 15 : 2). Thoroughly mix. Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of 0.2 mg per mL. Mix, and filter discarding the first 2 mL of the filtrate. The *Standard preparation* is stable for at least 108 hours.

Assay preparation—Prepare a sample composite solution by pooling a minimum of four containers into a suitable glass vessel. Transfer the equivalent of 20 mg of butorpha-

In-Process Revision

nol tartrate into a 100-mL volumentric flask. Dilute with *Mobile phase* to volume, mix, and filter discarding the first 2 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a 4.6- × 250-mm column that contains 5-µm packing L11, and a 4.6- × 10-mm guard column that contains 5-µm packing L11. The column temperature is maintained at 30°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the butorphanol tartrate peak is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* in the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak in the *Standard preparation* and the *Assay preparation*. Calculate the quantity, in mg, of butorphanol tartrate ($C_{21}H_{29}NO_2 \cdot C_4H_6O_6$) in the portion of the Nasal Solution taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard preparation;* and r_U and r_S are the peak responses of butorphanol tartrate in the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Carboxymethylcellulose Sodium, *USP 28* page 358. It is proposed to revise the sample preparation in the test for *Heavy metals* to align it with recent changes to USP general chapter *Heavy Metals* ⟨231⟩.

(EMC: J. Lane) RTS—42876-2

Change to read:

Heavy metals, *Method II* ⟨231⟩: ~~Determine as directed in the test for *Heavy metals* under *Methylcellulose,* using a 1.0-g specimen: the limit is 20 µg per g.~~

■0.005%, using an 800-mg specimen and adding 1 mL of hydroxylamine hydrochloride solution (1 in 5) to the solution of the residue.■2S (*USP29*)

In-Process Revision

BRIEFING

Clindamycin Hydrochloride Oral Solution, *USP 28* page 494. On the basis of data received, it is proposed to widen the acceptable range of pH from between 3.0 and 5.5 to between 2.5 and 6.0. Interested parties are invited to submit comments.

(PA7a: B. Gilbert) RTS—42518-1

Change to read:

pH ⟨791⟩: between ~~3.0 and 5.5.~~

■2.5 and 6.0.■2S (*USP29*)

BRIEFING

Cyanocobalamin, *USP 28* page 554. It is proposed to specify the type of cresol reagent used in the test for *Pseudo cyanocobalamin.*

(DSN: L. Evans) RTS—42708-1

Change to read:

Pseudo cyanocobalamin—Dissolve 1.0 mg in 20 mL of water contained in a small separator, add 5 mL of a mixture of equal volumes of carbon tetrachloride and ~~cresol~~

■*m*-cresol,■2S (*USP29*)
and shake well for about 1 minute. Allow to separate, draw off the lower layer into a second small separator, add 5 mL of 5 N sulfuric acid, shake well, and allow to separate completely (the complete separation of the layer may be facilitated by centrifuging): the separated upper layer is colorless or has no more color than a mixture of 0.15 mL of 0.10 N potassium permanganate and 250 mL of water.

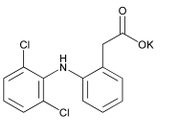
BRIEFING

Diclofenac Potassium. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* are based on analyses performed with the Ultrasphere C8 brand of L7 column. Typical retention times are about 11.1 minutes for diclofenac potassium and about 6.8 minutes for diclofenac potassium related compound A.

(PA2: C. Anthony) RTS—39091-1

Add the following:

■Diclofenac Potassium



$C_{14}H_{10}Cl_2KNO_2$ 334.24

(1) Benzeneacetic acid, 2-[(2,6-dichlorophenyl)amino]-, monopotassium salt.

(2) Potassium [*o*-(2,6-dichloroanilino)phenyl]acetate [*15307-81-0*].

» Diclofenac Potassium contains not less than 99.0 percent and not more than 101.0 percent of $C_{14}H_{10}Cl_2KNO_2$, calculated on the dried basis.

Packaging and storage—Preserve in light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Diclofenac Potassium RS. USP Diclofenac Related Compound A RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 0.1 mg per mL.

Medium: methanol.

C: It meets the requirements of the flame test for *Potassium* ⟨191⟩.

pH ⟨791⟩**:** between 7.0 and 8.5, in a 1% aqueous solution.

Loss on drying ⟨731⟩**—**Dry it at 105° under vacuum for three hours: it loses not more than 0.5% of its weight.

Heavy metals, *Method II* ⟨231⟩**:** not more than 10 ppm.

Related compounds—

pH 2.5 Phosphate buffer—Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate components to a pH of 2.5 ± 0.2.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *pH 2.5 Phosphate buffer* (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of methanol and water (70 : 30).

Standard solution—Prepare a solution of USP Diclofenac Related Compound A RS in methanol having a known concentration of about 0.25 mg per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Diluent* to obtain a solution having a known concentration of about 1.5 µL per mL.

Resolution solution—Prepare a solution in *Diluent* containing 40 µg per mL of diethyl phthalate, 0.5 mg per mL of USP Diclofenac Potassium RS, and 22.5 µg per mL of USP Diclofenac Related Compound A RS.

Test solution—Transfer about 50 mg of Diclofenac Potassium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for diethyl phthalate, 0.7 for diclofenac related compound A, and 1.0 for diclofenac potassium; and the resolution, *R,* between diethyl phthalate and diclofenac related compound A is not less than 4.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses. Calculate the percentage of diclofenac related compound A in the portion of Diclofenac Potassium taken by the formula:

$$10(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Diclofenac Related Compound A RS in the *Standard solution;* W is the quantity, in mg, of Diclofenac Potassium taken to prepare the *Test solution;* and r_U and r_S are the diclofenac related compound A peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of diclofenac related compound A is found. Calculate the percentage of each other impurity in the portion of Diclofenac Potassium taken by the formula:

$$10(C/W)(r_i/r_S)$$

in which r_i is the individual peak response of each impurity obtained from the *Test solution;* and the other terms are as

In-Process Revision

defined above: not more than 0.1% of each individual impurity is found, and not more than 0.3% of total impurities is found.

Assay—

Procedure—Dissolve about 300 mg of Diclofenac Potassium, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1N perchloric acid is equivalent to 33.424 mg of $C_{14}H_{10}Cl_2KNO_2$. ■2S (*USP29*)

BRIEFING

Diclofenac Potassium Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the Symmetry brand of L7 column. The typical retention time for diclofenac potassium is about 10.2 minutes.

(PA2: C. Anthony; BPC: M. Marques) RTS—39091-2; 39091-3

In-Process Revision

Add the following:

■Diclofenac Potassium Tablets

» Diclofenac Potassium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{10}Cl_2KNO_2$.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Diclofenac Potassium RS. USP Diclofenac Related Compound A RS.*

Identification—

A: The retention time of the diclofenac peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

B: It meets the requirements of the flame test for *Potassium* ⟨191⟩.

Dissolution ⟨711⟩—

Medium: simulated intestinal fluid (without enzyme); 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{14}H_{10}Cl_2NKO_2$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 276 nm on portions of the solution under test passed through a 0.45 µm filter, suitably diluted with *Medium,* if necessary, in comparison with a standard solution having a known concentration of USP Diclofenac Potassium RS in the same *Medium*. Calculate the percentage of diclofenac potassium $C_{14}H_{10}Cl_2NKO_2$ dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and LC is the Tablet label claim, in mg, of diclofenac potassium.

Tolerances —Not less than 80% (Q) of the labeled amount of $C_{14}H_{10}Cl_2KNO_2$ is dissolved in 60 minutes.

Loss on drying ⟨731⟩—Dry it at 105° ± 2° for 3 hours : it loses not more than 5.0% of its weight.

Limit of potassium—

Standard—Accurately transfer about 50.00 mg of potassium chloride into a fused quartz crucible.

Sample—Transfer not fewer than five diclofenac potassium 50-mg Tablets, accurately weighed, into a fused quartz crucible.

Blank—Prepare a dilution of 10% cesium chloride (1 in 50).

Test solutions—Place crucibles containing the *Standard, Sample,* and *Blank* in a muffle furnace at 550° for 8 hours to ash the contained material. Pipet 1.0 mL of concentrated hydrochloric acid and 1.0 mL of concentrated nitric acid into each cooled crucible. Heat each crucible on a hot plate to dissolve the residue. Ttransfer quantitatively, without filtering, the contents of each crucible to 100-mL volumetric flasks, and dilute with water to volume. Pipet 1.0 mL from each volumetric flask into separate 100-mL volumetric flasks, pipet 2.0 mL of 10% cesium chloride solution into each flask, and dilute with water to volume.

Procedure—Concomitantly determine the absorbances of the *Test solutions* and *Blank* at the potassium emission line at 766.5 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with an air–acetylene flame. Plot the absorbances of the *Test solutions* versus their potassium content. Calculate the weight percentage of potassium in each Tablet: not less than 2.40% and not more than 2.94% is found; and not less than 90.0% and not more than 110.0% of the calculated theoretical amount of potassium is found.

Uniformity of dosage units: meets the requirements.

Related compounds—

pH 2.5 Phosphate buffer, Mobile phase, Diluent, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Diclofenac Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of diclofenac related compound A in the portion of Diclofenac Potassium Tablets taken by the formula:

$$10(C/A)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of diclofenac related compound A in the *Standard solution; A* is the quantity, in mg, of diclofenac potassium in the portion of Tablets taken to prepare the *Assay preparation,* as determined in the *Assay;* and r_U and r_S are the diclofenac related compound A peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of diclofenac related compound A is found. Calculate the percentage of each of the other impurities, other than diethyl phthalate, if

present, in the portion of Diclofenac Potassium Tablets taken by the formula:

$$10(C/A)(r_i / r_S)$$

in which r_i is the response of an individual impurity peak obtained from the *Test solution,* and the other terms are as defined above: not more than 0.1% of each individual impurity is found, and not more than 0.3% of total impurities is found.

Assay—

pH 2.5 Phosphate buffer—Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate components to a pH of 2.5 ± 0.2.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *pH 2.5 Phosphate buffer* (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of methanol and water (70 : 30).

Standard preparation—Dissolve an accurately weighed quantity of USP Diclofenac Potassium RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of diclofenac potassium, to a 100-mL volumetric flask. Add about 70 mL of *Diluent,* stir for 60 minutes, dilute with *Diluent* to volume, mix, and centrifuge.

Resolution solution—Prepare a solution in *Diluent* containing 40 µg per mL of diethyl phthalate, 0.5 mg per mL of USP Diclofenac Potassium RS, and 37.5 µg per mL of USP Diclofenac Potassium Related Compound A RS.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between diethyl phthalate and diclofenac related compound A is not less than 2.5, and the resolution, *R,* between diclofenac related compound A and diclofenac is not less than 3.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diclofenac potassium ($C_{14}H_{10}Cl_2KNO_2$) in each Tablet taken by the formula:

$$(VC/20)(r_U / r_S)$$

in which V is the volume of the flask used to prepare the *Assay preparation*; C is the concentration, in mg per mL, of USP Diclofenac Potassium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

In-Process Revision

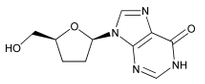
BRIEFING

Didanosine; Didanosine for Oral Solution; Didanosine Tablets. Because there are no existing *USP* monographs for this drug substance and dosage forms, new monographs based on submitted data are being proposed. For Didanosine and Didanosine for Oral Solution, the liquid chromatographic procedures in the *Related compounds* test and the *Assay* are based on analyses performed with the LC-18-DB (base deactivated; from Supelco) brand of L1 column. For Didanosine Tablets, the liquid chromatographic procedure used in the *Assay* and in the *Dissolution* and *Related compounds* tests is based on analyses performed with the LiChrospher 60 RP-Select B brand of L7 column.

(PA7b: B. Davani) RTS—42596-1

Add the following:

■Didanosine



$C_{10}H_{12}N_4O_3$ 236.23

2′,3′-Dideoxyinosine.

Dideoxyinosine [*69655-05-6*].

» Didanosine contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}N_4O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Didanosine RS. USP Didanosine Related Compound A RS. USP Didanosine Related Compound B RS. USP Didanosine System Suitability Mixture RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water, *Method I* ⟨921⟩**:** not more than 2.0%.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 20 ppm.

Optical rotation ⟨781⟩**:** between –28° and –24°, anhydrous.

Test solution: 10 mg per mL solution in water.

Related compounds—

Ammonium acetate buffer solution 0.01 M—Prepare as directed in the *Assay.*

Solution A—Prepare a filtered and degassed mixture of *Ammonium acetate buffer solution 0.01 M* and acetonitrile (19 : 1).

Solution B—Prepare a filtered and degassed mixture of *Ammonium acetate buffer solution 0.01 M* and acetonitrile (3 : 1).

Diluent—Adjust the pH of *Ammonium acetate buffer solution 0.01M* with sodium hydroxide to 9, and mix. Prepare a degassed mixture of *Ammonium acetate solution 0.01 M* and acetonitrile (19 : 1).

Standard stock solution A—Dissolve an accurately weighed quantity of USP Didanosine Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.05 mg per mL.

In-Process Revision

Standard stock solution B—Dissolve an accurately weighed quantity of USP Didanosine RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Standard stock solution C—Dissolve an accurately weighed quantity of USP Didanosine Related Compound B RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Standard solution—Transfer 5.0 mL of *Standard stock solution A*, 3.0 mL of *Standard stock solution B,* and 3.0 mL of *Standard stock solution C* into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

System suitability solution—Dissolve an accurately weighed quantity of USP Didanosine System Suitability Mixture RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL.

Test solution—Transfer about 50 mg of Didanosine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 25-cm × 4.6-mm column containing 5-µm diameter packing L1. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–20	100→0	0→100	linear gradient
20–30	0	100	isocratic
30–35	0→100	100→0	linear gradient
35–45	100	0	equilibrium

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* didanosine elutes between 6 and 7.5 minutes; the relative retention times are about 1.0 for didanosine, 0.28 for didanosine related compound A, and 2.11 for didanosine related compound B; and the relative standard deviation for replicate injections determined on the didanosine related compound A peak is not more than 2.0%. [NOTE—5′-Deoxydideoxyadenosine, a potential impurity not added to the solution, elutes at a relative retention time of 3.1 minutes.] Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are 1.0 for didanosine, 0.39 for inosine, 0.45 for 2′-deoxyinosine, 0.51 for 3′-deoxyinosine, 0.59 for 2′,3′-anhydroinosine, and 0.81 for dideoxydidehydroinosine; the resolution, *R,* between didanosine and dideoxydidehydroinosine is not less than 3.0; and the column efficiency determined on the dideoxydidehydroinosine peak is not less than 6000 theoretical plates.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 30 minutes, and measure all the peak responses. Calculate the percentage of didanosine related compound A, 5′-deoxydideoxyadenosine, and each other impurity in the portion of Didanosine taken by the formula:

$$10{,}000(C/W(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Didanosine RS or USP Didanosine Related Compound A RS in the *Standard solution; W* is the weight, in mg, of the sample; r_i is the peak response of the *Test solution;* and r_S is the peak response of USP Didanosine RS or USP Didanosine Related Compound A RS in the *Standard solution.* Use the peak response of Didanosine in the *Standard solution*

In-Process Revision

to calculate other individual impurities: not more than 0.5% of didanosine related compound A is found; not more than 0.2% of each specified impurity at the relative retention times of 0.39, 0.45, 0.51, 0.59, 0.81, 2.1, and 3.1 is found; not more than 0.1% of each other impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Ammonium acetate buffer solution 0.01M—Dissolve 1.54 g of ammonium acetate in a 2000-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Ammonium acetate buffer solution 0.01 M* and acetonitrile (21 : 1).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution containing 0.1 mg per mL.

Assay preparation—Accurately weigh 50 mg of Didanosine, and place in a 500-mL volumetric flask. Dissolve in and dilute with water to volume. Mix the sample for 1 hour to dissolve completely before use.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention time of didanosine is between 7 and 11 minutes, the column efficiency is not less than 6000 theoretical plates, the tailing factor is not more than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{12}N_4O_3$ in the portion of Didanosine taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP29*)

BRIEFING

Didanosine for Oral Solution—See briefing under *Didanosine.*

(PA7b: B. Davani) RTS—42596-3

Add the following:

■Didanosine for Oral Solution

» Didanosine for Oral Solution, when reconstituted as directed in the labeling, yields a 10 mg per mL solution that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of didanosine ($C_{10}H_{12}N_4O_3$).

Packaging and storage—Preserve in tight containers, and store at a temperature between 15° and 30°.

In-Process Revision

Labeling—The label contains directions for constitution of the powder and states the equivalent amount of $C_{10}H_{12}N_4O_3$ in a given volume of Oral Solution obtained after constitution.

USP Reference standards ⟨11⟩—*USP Didanosine RS*. *USP Didanosine Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water, *Method Ia* ⟨921⟩**:** not more than 3%.

Deliverable volume ⟨698⟩**:** meets the requirements.

Related compounds—

Mobile phase, Chromatographic system, and *Procedure*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Didanosine Related Compound A RS in water to obtain a solution containing 5 µg per mL. Make stepwise dilutions if necessary. [NOTE—Use this solution within 48 hours of preparation.]

Test solution—Transfer the contents of 1 container of Didanosine for Oral Solution to a suitable volumetric flask, and dissolve in water to obtain a solution having a concentration of approximately 4 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Diluted test solution—Dilute the *Test solution* quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.1 mg per mL.

Calculate the percentage of didanosine related compound A (hypoxanthine) in the Didanosine for Oral Solution as compared to the didanosine label claim by the formula:

$$[100(C/1000)(r_U/r_S)VD]/L$$

in which 100 is the conversion factor to percent; C is the concentration of didanosine related compound A in the *Standard solution,* in µg per mL; 1000 is the conversion factor (µg to mg); r_U and r_S are the peak responses of didanosine related compound A in the *Diluted test solution* and the *Standard solution,* respectively; V is the volume, in mL, of Didanosine for Oral Solution used to prepare the *Test solution; D* is the dilution factor of the *Diluted test solution;* and L is the didanosine label claim expressed in mg: not more than 1% is found.

Assay—

0.01 M Ammonium acetate buffer solution—Dissolve 1.54 g of ammonium acetate into a 2000-mL volumetric flask, dilute with water to volume, mix, and pass through a 0.45-µm filter.

Mobile phase—Prepare a filtered degassed mixture of *0.01 M Ammonium acetate buffer solution* and acetonitrile (24 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution containing 0.1 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Assay preparation—Transfer the contents of 1 bottle of Didanosine for Oral Solution to a suitable volumetric flask and dilute stepwise, if necessary, to obtain a solution in water of about 0.1 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, a 4-mm × 25-cm analytical column containing packing

In-Process Revision

L1, and a 4.6- × 20-mm guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for didanosine is between 7 and 11 minutes; the column efficiency is not less than 6000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of didanosine ($C_{10}H_{12}N_4O_3$) in the portion of Didanosine for Oral Solution taken by the formula:

$$(C)(D)r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation; D* is the volume, in mL, of Didanosine for Oral Solution used to prepare the *Assay preparation* multiplied by the dilution factor of the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP29)*

BRIEFING

Didanosine Tablets—See briefing under *Didanosine.*

(PA7b: B. Davani) RTS—42596-2

Add the following:

■Didanosine Tablets

» Didanosine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of didanosine ($C_{10}H_{12}N_4O_3$).

Packaging and storage—Preserve in tight containers, and store between 15° and 30°.

Labeling—Label chewable Tablets to indicate that they are to be chewed before swallowing or dispersed in liquid before administration.

USP Reference standards ⟨11⟩—*USP Didanosine RS. USP Didanosine Related Compound A RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent—Merck silica gel 60 with fluorescent indicator, or equivalent.

Test solution—Place 1 Tablet in sufficient methanol to make a 1 mg per mL solution. Stir to dissolve, and pass through a 0.45-µm filter.

Standard solution—Transfer 10 mg of USP Didanosine RS into a 10-mL volumetric flask. Dissolve in and dilute with methanol to volume.

Developing solvent solution: A mixture of 1-butanol, methanol, ethyl acetate, and ammonium hydroxide (11 : 3 : 3 : 3).

Procedure—Spot 10 µL each of the *Test solution* and the *Standard solution* onto the chromatographic plate, approximately 2 cm from the bottom and 2 cm apart. Allow the plate to air-dry. Place in a chromatographic chamber, and develop, allowing the developing solution to travel at least

In-Process Revision

10 cm from the spotting line. Allow the plate to air-dry. View under shortwave light (254 nm). Didanosine appears as a blue spot.

B: The retention time of the major peak in the chromatogram of the *Diluted assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—[To come.]

Loss on drying ⟨731⟩—Dry 4 Tablets for 16 hours at 130°: they lose not more than 6% of their weight.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

0.01 M Ammonium acetate buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of 0.01 M ammonium acetate and methanol (99 : 1).

Standard stock solution—Transfer 25 mg of USP Didanosine Related Compound A RS to a 200-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation.]

Standard solution—Transfer 3 mL of the *Standard stock solution* to a 250-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation.]

Test solution—Proceed as directed for *Assay preparation.*

Diluted test solution—Dilute the *Test solution,* quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution* as directed for *Procedure:* the retention time of didanosine related compound A is between 1.5 and 2.5 minutes; the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injection is not more than 5.0%. [NOTE—Didanosine related compound A is hypoxanthine.]

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the responses of the major peaks, carrying out the chromatography for approximately 30 minutes. Calculate the percentage of didanosine related compound A in the portion of Tablets taken by the formula:

$$100(CVDL/N)(r_U / r_S)$$

in which C is the concentration of the USP Didanosine Related Compound A RS, in mg per mL, in the *Standard solution; V* is the volume, in mL, of the *Test solution; D* is the dilution factor of the *Diluted test solution; L* is the label claim of didanosine, in mg per Tablet; N is the number of the Tablets used to prepare the *Test solution;* and r_U and r_S are the peak responses obtained from the *Diluted test solution* and the *Standard solution,* respectively. Not more than 0.7% is found. Calculate the percentage of any other impurities by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of any other individual impurity obtained upon chromatographing the *Diluted test solution;* and r_s is the sum of the responses of all the peaks in the chromatogram of the *Diluted test solution,* including those of didanosine and hypoxanthine: not more than 0.2% of any other individual impurity is found; and not more than 1.2% of total impurities, excluding hypoxanthine, is found.

In-Process Revision

Assay—

0.01 M Ammonium acetate buffer solution—Dissolve 1.54 g of ammonium acetate in a 2000-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of 0.01 M ammonium acetate and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution containing 0.1 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Assay preparation—Transfer not fewer than 5 crushed Tablets to a 500-mL volumetric flask. Dissolve in 250 mL of water, dilute with water to volume, and shake for about 10 minutes.

Diluted assay preparation—Dilute the *Assay preparation,* quantitatively and stepwise, if necessary, with water to obtain a solution containing about 0.1 mg per mL of didanosine. [NOTE—Use this solution within 72 hours of preparation; because of the buffering agents in the Tablets, the *Assay preparation* is stable longer than the *Standard preparation.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time of didanosine is greater than 3.0 minutes; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Diluted assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of didanosine ($C_{10}H_{12}N_4O_3$) by the formula:

$$[CVD(r_U / r_S)] / N$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation; D* is the dilution factor of the *Diluted assay preparation;* r_U and r_S are the peak responses of the *Diluted assay preparation* and the *Standard preparation,* respectively; and N is the number of Tablets used to prepare the *Assay preparation.* ■2S (*USP29*)

BRIEFING

Digoxin Oral Solution, *USP 28* page 646. It is proposed to correct an error in the calculation in the *Assay.*

(DSB: G. Giancaspro) RTS—42834-1

In-Process Revision

Digoxin Oral Solution

Former title: **Digoxin Elixir**

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and isopropyl alcohol (70 : 27.5 : 2.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Digoxin RS in diluted alcohol, and dilute quantitatively and stepwise with diluted alcohol to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Transfer an accurately measured volume

■of 10.0 mL■2S *(USP29)* of Elixir, equivalent to about 500 µg of digoxin, to a 25-mL volumetric flask, dilute with diluted alcohol to volume, and mix.

System suitability preparation—Prepare as directed in the *Assay* under *Digoxin*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between digoxin and digoxigenin bisdigitoxoside is not less than 2.0; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of digoxin ($C_{41}H_{64}O_{14}$) in each mL of the Oral Solution taken by the formula:

~~$(100C/V)(r_U/r_S)$~~

■$2.5C(r_U / r_S)$■2S *(USP29)*

in which C is the concentration, in µg per mL, of USP Digoxin RS in the *Standard preparation;* ~~*V* is the volume, in mL, of Elixir taken;~~

■■2S *(USP29)* and r_U and r_S are the digoxin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

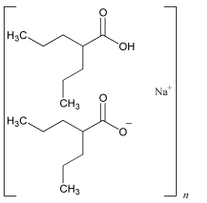
BRIEFING

Divalproex Sodium. Because there is no existing *USP* monograph for this drug substance, a new monograph is proposed. The proposed liquid chromatographic assay is based on analyses performed with the Agilent Eclipse XDB C8 brand of L7 column. Typical retention times are about 3 minutes for valproic acid related compound A and 5.2 minutes for valproic acid.

(PA3: R. Ravichandran; NL: L. Paul; PSD: C. Okeke) RTS—42281-1; 42281-2

Add the following:

■Divalproex Sodium



$(C_{16}H_{31}NaO_4)_n$ 310.41

Pentanoic acid, 2-propyl-, sodium salt (2 : 1).

Sodium hydrogen bis(2-propylvalerate), oligomer [*76584-70-8*].

» Divalproex Sodium contains not less than 98.0 percent and not more than 102.0 percent of $(C_{16}H_{31}NaO_4)_n$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Divalproex Sodium RS. USP Valproic Acid RS. USP Valproic Acid Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

Water, *Method I* ⟨921⟩**:** not more than 1.0%, determined on 3.0 g.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Residual solvents ⟨467⟩**:** meets the requirements.

In-Process Revision

Assay—

Buffer—Dissolve 3.5 g of monobasic sodium phosphate monohydrate in 900 mL of water. Adjust with *o*-phosphoric acid to a pH of 3.5. Dilute with water to 1 L.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a 0.5% solution of sodium dodecyl sulfate in water.

Stock solution A—Transfer an accurately weighed amount of USP Valproic Acid RS to a suitable volumetric flask, first dissolve in methanol, using 10% of the final volume, then dilute with *Diluent* to volume, and mix to obtain a solution having a known concentration of about 5.0 mg per mL.

Stock solution B—Dissolve an accurately weighed amount of USP Valproic Acid Related Compound A RS in 2-propanol to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard preparation—Accurately transfer 20 mL of *Stock solution A* and 1 mL of *Stock solution B* into a 100-mL volumetric flask, and dilute with *Mobile phase* to obtain a solution having 1.0 mg per mL of valproic acid and 0.005 mg per mL of valproic acid related compound A.

Assay preparation—Transfer about 50 mg of Divalproex Sodium, accurately weighed, to a 100-mL volumetric flask; dissolve in 10 mL of methanol; and dilute with *Diluent* to volume. This solution has a concentration of about 0.5 mg per mL of divalproex sodium.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention time for valproic acid related compound A is about 0.69, and that for valproic acid is 1.0; the resolution, *R,* between valproic acid related compound A and valproic acid is not less than 5.0; for the valproic acid peak, the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $(C_{16}H_{31}NaO_4)_n$ in the portion of Divalproex Sodium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(310.41/144.21)(1/2)$$

in which C_S is the concentration, in mg per mL, of valproic acid in the *Standard preparation;* C_U is the concentration of Divalproex Sodium, in mg per mL, in the *Assay preparation;* r_U and r_S are the peak areas for valproic acid obtained from the *Assay preparation* and the *Standard preparation;* 310.41 and 144.21 are the molecular weights for divalproex sodium and valproic acid, respectively; and 2 is the number of moles of valproic acid per mole of divalproex sodium.■2S (*USP29*)

BRIEFING

Ensulizole, *USP 28* page 735 and page 3221 of the *First Supplement.* It is proposed to replace the name of USP Ensulizole RS with USP Phenylbenzimidazole Sulfonic Acid RS to be consistent with the name used on the label for this Reference Standard.

BRIEFING

Estradiol and Norethindrone Acetate Tablets, page 1989 of *PF* 30(6) [Nov.–Dec. 2004]. On the basis of comments received, it is proposed to revise the *Chromatographic purity* test to increase each individual impurity limit in *Table 1* from 0.1% to 0.5% and in *Table 2* from 0.05% to 0.5%.

(PA1: C. Anthony; PSD: C. Okeke) RTS—43018-1

Add the following:

■Estradiol and Norethindrone Acetate Tablets

» Estradiol and Norethindrone Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol ($C_{18}H_{24}O_2$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norethindrone acetate ($C_{22}H_{28}O_3$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Estradiol RS. USP Estrone RS. USP Norethindrone Acetate RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Place 2 Tablets into a 10-mL vial, and add 0.2 mL of water. When the Tablets are partially disintegrated, add a few glass beads, and shake vigorously to disintegration. Add 4.0 mL of dehydrated alcohol, and shake. Centrifuge until the supernatant is clear before application to the plate.

Standard solution—Dissolve accurately weighed quantities, of USP Estradiol RS and USP Norethindrone Acetate RS in dehydrated alcohol to obtain a solution having known concentrations of 0.5 mg per mL and 0.25 mg per mL, respectively.

Application volume: 2 µL.

Developing solvent solution: a mixture of chloroform and acetone (9 : 1).

Procedure—Proceed as directed in the chapter, using the *Developing solvent system*. After removal of the plate, mark the solvent front, and allow the solvent to evaporate. Place the plate on a heating plate at 100° for 15 minutes. Allow the plate to cool, and then immerse it in a mixture of dehydrated alcohol and concentrated sulfuric acid (95 : 5). Place the plate on a piece of thick horizontal paper until it is almost dry. Heat the plate at 100° until it has fully developed. Examine under UV light at 365 nm. The color and R_F value of the principal spots obtained from the *Test solution* correspond to those obtained from the *Standard solution*.

B: The retention time and UV spectrum of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g. The Tablets meet the requirements of the tests for the absence of *Salmonella species* and *Escherichia coli*.

Dissolution—[To come.]

Loss on drying ⟨731⟩—Dry about 1200 mg of finely powdered Tablets in a tared evaporating dish at a pressure not exceeding 25 mm of mercury at 60° for 3 hours: it loses not more than 7.5% of its weight.

Chromatographic purity—

Solution A—Prepare a mixture of water and tetrahydrofuran (200 : 1).

Solution B—Prepare a degassed solution of acetonitrile, water, and tetrahydrofuran (160 : 40 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of water and dehydrated alcohol (1 : 1).

System suitability solution—Dissolve accurately weighed quantities of USP Estradiol RS, USP Norethindrone Acetate RS, and USP Estrone RS in *Diluent* to obtain a solution having known concentrations of about 240 µg per mL, 60 µg per mL, and 1 µg per mL, respectively.

Test solution—Accurately weigh and finely powder 20 Tablets. Transfer the equivalent of 12 Tablets to an appropriate flask, and dissolve in a known volume of *Diluent* to obtain a solution having known concentrations of estradiol and norethindrone acetate of about 240 µg per mL and 120 µg per mL, respectively. Filter the solution, if necessary.

Estradiol standard stock solution—Dissolve an accurately weighed quantity of USP Estradiol RS in alcohol to obtain a solution having a known concentration of estradiol of about 250 µg per mL.

Norethindrone acetate standard stock solution—Dissolve an accurately weighed quantity of USP Norethindrone Acetate RS in alcohol to obtain a solution having a known concentration of norethindrone acetate of about 150 µg per mL.

Standard solution—Combine 250 µL of *Estradiol standard stock solution* and 100 µL of *Norethindrone acetate standard stock solution,* and dilute with 50.0 mL of *Diluent*.

Chromatographic system—The liquid chromatograph is equipped with a dual wavelength detector (235 nm and 254 nm) and a 3.9- × 30-cm column that contains 4-µm packing L1. The flow rate is about 0.8 mL per minute. Program the chromatogram as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–2	80→65	20→35	linear gradient
2–35	65→20	35→80	linear gradient
35–49	20	80	isocratic
49–50	20→80	80→20	linear gradient
50–60	80	20	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.4 for estrone, about 3.0 for norethindrone acetate, and 1.0 for estradiol. The resolution, *R,* between estrone and estradiol is not less than 1.3, measured at 254 nm.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

peak responses. Calculate the percentage of any estradiol impurity in the portion of Tablets taken by the formula:

$$100F(C_S / C_T)(r_i / r_S)$$

in which F is the relative response factor of any estradiol impurity relative to estradiol; C_S and C_T are the concentrations of the *Standard solution* and the *Test solution,* respectively; r_i is the peak area at 235 nm for each impurity obtained from the *Test solution;* and r_S is the peak area at 235 nm obtained from the *Standard solution*. The Tablets meet the requirements given in *Table 1*. Not ~~more than 0.1% of any other impurity is found, and~~ more than 1.0% of total impurities is found. Calculate the percentage of any norethindrone acetate related impurities in the portion of Tablets taken by the formula:

$$100F(C_S / C_T)\ (r_i / r_S)$$

in which F is the relative response factor of any norethindrone acetate related impurity relative to norethindrone acetate; C_S and C_T are the concentrations of the *Standard solution* and the *Test solution,* respectively; r_i is the peak area at 254 nm for each impurity obtained from the *Test solution;* and r_S is the peak area at 254 nm obtained from the *Standard solution*. The Tablets meet the requirements given in *Table 2*. Not ~~more than 0.5% of any other impurity is found, and not~~ more than 1.0% of total impurities is found.

Table 1

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
6-α Hydroxyl estradiol	about 0.47	1.0	~~0.1~~ 0.5
6-β Hydroxyl estradiol	about 0.51	1.0	~~0.1~~ 0.5
6-Keto estradiol	about 0.62	1.0	~~0.1~~ 0.5
16-Keto estradiol	about 0.65	1.0	~~0.1~~ 0.5
6-Keto estrone	about 0.75	1.0	~~0.1~~ 0.5
β-Equilenol	about 0.88	0.04	~~0.1~~ 0.5
6-Dehydro estradiol	about 0.95	1.0	~~0.1~~ 0.5
Estradiol	1.0	1.0	~~0.1~~ 0.5
α-Estradiol	about 1.06	1.0	~~0.1~~ 0.5
Estrone	about 1.17	1.0	~~0.1~~ 0.5
4-Methyl estradiol	about 1.24	1.0	~~0.1~~ 0.5

In-Process Revision

Table 2

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
6-β Hydroxy-norethindrone acetate	about 0.58	1.0	~~0.05~~ 0.5
Norethindrone	about 0.66	1.0	~~0.05~~ 0.5
6-Keto-norethindrone acetate	about 0.79	1.8	~~0.05~~ 0.5
19-Nor-17-alpha-preg-4-ene-3,20-dione	about 0.90	1.0	~~0.05~~ 0.5
6-Dehydro-norethindrone acetate	about 0.97	2.2	~~0.05~~ 0.5
Norethindrone acetate	about 1.0	1.0	~~0.05~~ 0.5

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (55 : 45) (see *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of water and dehydrated alcohol (1 : 1).

Estrone standard stock solution—Transfer about 6.00 mg of USP Estrone RS, accurately weighed, to a 50-mL volumetric flask, and dissolve in 10 mL of dehydrated alcohol. Dilute with dehydrated alcohol to volume, and mix.

Estradiol standard stock solution—Prepare a solution of USP Estradiol RS in dehydrated alcohol having a known concentration of 0.25 mg per mL.

Norethindrone acetate standard stock solution—Prepare a solution of USP Norethindrone Acetate RS in dehydrated alcohol having a known concentration of 0.15 mg per mL.

System suitability preparation—Transfer 800 µL of *Estradiol standard stock solution,* 600 µL of *Norethindrone acetate standard stock solution,* and 200 µL of *Estrone standard stock solution* to a suitable flask containing 10.0 mL of *Diluent*.

Standard preparation—Prepare a solution of *Estradiol standard stock solution* and *Norethindrone acetate standard stock solution* in *Diluent* having an accurately known concentration of about 20 µL per ml and 10 µL per mL, respectively.

Assay preparation—Add 12 Tablets into a measured amount of *Diluent,* to obtain a solution having an estradiol concentration of about 20 µL per mL and a norethindrone acetate concentration of about 10 µL per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a diode array detector and a 4.6- × 150-mm column that contains packing L1. The flow rate is about 1.0 mL per minute. Perform an investigational run to determine the retention times for estradiol and norethindrone acetate. Thus, the absorption of estradiol at 280 nm and norethindrone acetate at 254 nm can be included in a single run by altering the wavelength. Chromatograph the *System suitability preparation,* and record the peak areas as directed for *Procedure:* the resolution, *R,* between estradiol and estrone acetate is not less than 1.8. Chromatograph the *Standard preparation,* and record the peak area as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the estradiol and norethindrone acetate peaks. Calculate the quantity, in mg, of estradiol ($C_{18}H_{24}O_2$) in each of the Tablets taken by the formula:

$$(VC/12)(r_U/r_S)$$

in which V is the volume, in mL, of *Diluent* taken to prepare the *Assay preparation; C* is the concentration, in mg per mL, of USP Estradiol RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the quantity, in mg, of norethindrone acetate ($C_{22}H_{28}O_3$) in each of the Tablets taken by the formula:

$$(VC/12)(r_U/r_S)$$

in which V is the volume, in mL, of *Diluent* used in the *Assay preparation; C* is the concentration, in mg per mL, of USP Norethindrone Acetate RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Ethyl Chloride, *USP 28* page 796. It is proposed to delete the test for *Alcohol* because it includes an odor test that has potential safety concerns.

(PA1: K. Russo) RTS—42915-2

Delete the following:

■~~**Alcohol**—To the liquid obtained in the test for *Reaction* add a few drops of potassium dichromate TS and 2 mL of 2 N sulfuric acid, and boil the mixture: no odor of acetaldehyde is perceptible, and no greenish or purplish color is produced.~~■2S (*USP29*)

BRIEFING

Fluconazole, *USP 28* page 828 and page 408 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to delete the test for *Melting range* because this test is not specific to compounds exhibiting polymorphism. Additionally, there are already adequate tests for *Identification* (IR and UV) in this monograph.

In-Process Revision

Change to read:

Related compounds—

▲[NOTE—On the basis of information regarding the manufacturing process, perform either *Test 1* or *Test 2* and *Test 3*.]

TEST 1—▲*USP29*

Mobile phase—Prepare a mixture of water and acetonitrile (80 : 20).

System suitability solution—Use the *Standard solution*.

Standard solution—Transfer accurately weighed quantities of USP Fluconazole RS, USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS to a suitable volumetric flask, dissolve in acetonitrile, dilute quantitatively, and stepwise if necessary, with *Mobile phase* to volume, and mix to obtain a solution having known concentrations of 10 µg of each per mL.

Test solution—Transfer about 30 mg of Fluconazole, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 0.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* typical retention times are about 4.9 minutes for fluconazole related compound A, 8.0 minutes for fluconazole related compound B, 8.5 minutes for fluconazole related compound C, and 9.9 minutes for fluconazole; the resolution, *R,* between fluconazole related compound B and fluconazole related compound C is not less than 1.5; and the relative standard deviation of each peak for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, and any other impurities in the portion of Fluconazole taken by the formula:

$$1000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, USP Fluconazole Related Compound C RS, or USP Fluconazole RS, respectively, in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* r_U is the peak response obtained from the *Test solution;* and r_S is the average peak response of fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, or fluconazole obtained from replicate injections of the *Standard solution:* ~~not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.~~

▲not more than 1.0% of any impurity with a relative retention time (RRT) of about 0.6 is found; not more than 0.2% of any impurity with an RRT of 0.5 or an RRT of about 0.9 is found; not more than 0.1% of any other individual impurity is found; not more than 0.2% of total other impurities is found; and not more than 1.2% of total impurities is found.

TEST 2—

Acetate buffer—Prepare a 0.04 M anhydrous sodium acetate solution, adjust with 1 N acetic acid to a pH of 5.0, and mix.

Solution A: filtered and degassed *Acetate buffer*.

Solution B: acetonitrile.

Solution C: methanol.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of *Acetate buffer* and methanol (84 : 16).

Standard solution—Dissolve an accurately weighed quantity of USP Fluconazole RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.01 mg per mL.

System suitability solution—Dissolve suitable quantities of USP Fluconazole RS and USP Desacetyl Diltiazem Hydrochloride RS in *Diluent.* Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution containing about 0.02 mg per mL and 0.006 mg per mL, respectively.

Test solution—Transfer about 200 mg of Fluconazole, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 261-nm detector and a 4.0-mm × 10-cm column that contains packing L1. The flow rate is 1 mL per minute. The chromatograph is programmed as follows.

In-Process Revision

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–10	80	5	15	isocratic
10–20	80→30	5→55	15	linear gradient (*A* and *B*)
20–23	30	55	15	isocratic
23–25	30→80	55→5	15	reset composition
25–30	80	5	15	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for fluconazole and about 1.2 for desacetyl hydrochloride; the resolution, *R,* between fluconazole and desacetyl diltiazem hydrochloride is not less than 10.0; the column efficiency for fluconazole is not less than 30,000 theoretical plates; and the tailing factor, *T,* is not more than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is less than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fluconazole taken by the formula:

$$10{,}000(r_i / r_S)(C/W)(1/F)$$

in which r_i is the peak response of each impurity obtained from the *Test solution;* r_S is the peak response of fluconazole obtained from the *Standard solution; C* is the concentration, in mg per mL, of USP Fluconazole RS in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* and *F* is the relative response factor as determined from the following table.

Relative Response Factor (*F*)	Relative Retention Time (RRT)
0.72	0.17–0.37
0.85	1.20–1.32
1.21	0.48–0.60
0.96	1.14–1.18
0.97	0.67–0.79
1.0	all other peaks

Not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

TEST 3—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve an accurately weighed quantity of Fluconazole in methanol to obtain a solution containing approximately 50 mg per mL.

Standard solutions—Dissolve an accurately weighed quantity of USP Fluconazole RS in methanol to obtain *Standard solution A* having a known concentration of about 1 mg per mL (2.0%). Quantitatively dilute portions of this solution with methanol to obtain *Standard solution B* and *Standard solution C* having known concentrations of about 0.1 mg per mL (0.2%) and 0.05 mg per mL (0.1%), respectively.

Developing solvent system—Prepare a mixture of chloroform, methanol, and ammonium hydroxide (80 : 20 : 1).

Application volume: 10 µL.

Spray reagent A—Dissolve about 170 mg of silver nitrate in 100 mL of water.

In-Process Revision

Spray reagent B (Potassium iodoplatinate solution)—Dissolve about 375 mg of chloroplatinic acid in 5 mL of 1 N hydrochloric acid. Dissolve about 5 g of potassium iodide in 50 mL of water, and store in a light-resistant container. Prepare a mixture of water, the potassium iodide solution, and the chloroplatinic acid solution (20 : 9 : 1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Spray the dry plate with *Spray reagent A,* and expose the plate to 365-nm UV light for 10 to 20 minutes. Dry the plate for 20 minutes between 80° and 90°, then spray the plate with *Spray reagent B*. Allow the plate to dry. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* no spot from the chromatogram of the *Test solution* with an R_F value of between 0.10 to 0.25 and 0.27 to 0.41 is larger or more intense than that obtained from *Standard solution B* (0.2%).▲*USP29*

BRIEFING

Fluorometholone Acetate. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Merck Hibar 11 C18 brand of L1 column.

(PA1: C. Anthony) RTS—13634-1

Add the following:

■Fluorometholone Acetate

$C_{24}H_{31}FO_5$ 418.50

» Fluorometholone Acetate contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{31}FO_5$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩**—***USP Fluorometholone RS. USP Fluorometholone Acetate RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩.

Solution: 10 µg per mL.

Medium: methanol.

Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩.

Adsorbent: 0.20-mm layer of chromatographic silica gel mixture containing a fluorescent indicator.

Application volume: 2 µL.

Developing solvent system: chloroform and methanol (19 : 1).

Specific rotation ⟨781S⟩**:** between +25.0° and +31.0°.

Test solution: 20 mg per mL, in chloroform.

Loss on drying ⟨731⟩—Dry in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

Chromatographic purity—

Mobile phase, Standard preparation, Resolution solution, Assay preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

In-Process Revision

Procedure—Proceed as directed for *Procedure* in the *Assay.* [NOTE—Allow the elution to continue for about four times the elution time of the fluorometholone acetate peak before making the next injection.] Calculate the percentage of each impurity in the portion of Fluorometholone Acetate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area for each impurity, and r_s is the sum of the peak areas of all the peaks: not more than 1.0% of fluorometholone and not more than 0.5% of any other individual impurity is found, and not more than 2.0% total impurities is found.

Residual solvents ⟨467⟩**:** meets the requirements.

Solvent: dimethyl sulfoxide.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (50 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Fluorometholone Acetate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL.

Resolution solution—Prepare a solution of USP Fluorometholone RS in acetonitrile having a concentration of about 1 mg per mL. Mix equal volumes of this solution and the *Standard preparation.*

Assay preparation—Transfer about 50 mg of Fluorometholone Acetate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention time is about 0.6 for fluorometholone and 1.0 for fluorometholone acetate; the resolution, *R,* between fluorometholone and fluorometholone acetate is not less than 4.0. Chromatograph the *Standard preparation* and record the peak responses as directed for *Procedure:* the tailing factor for fluorometholone acetate is not more than 2.0; the relative standard deviation for replicate injections is not more than 2.0% in the *Standard preparation.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{31}FO_5$, in the portion of Fluorometholone Acetate taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluorometholone Acetate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Hyoscyamine Sulfate Elixir, *USP 28* page 987 and page 3245 of the *First Supplement;* **Hyoscyamine Sulfate Injection,** *USP 28* page 987 and page 3245 of the *First Supplement;* **Hyoscyamine Sulfate Oral Solution,** *USP 28* page 988 and page 3246 of the *First Supplement;* **Hyoscyamine Sulfate Tablets,** *USP 28* page 988 and page 3246 of the *First Supplement.* It is proposed to revise the *Identification* tests by replacing the wet chemistry tests with

In-Process Revision

HPLC retention time agreement of the major peak in the *Assay preparation* and the *Standard preparation*. The proposed revision is consistent with current pharmaceutical industry practice.

(PA4: E. Gonikberg) RTS—42756-1

Change to read:

Identification—

~~**A:** Transfer a quantity of Elixir, equivalent to about 1.25 mg of hyoscyamine sulfate, to a separator. Render alkaline with 6 N ammonium hydroxide, and extract with 50 mL of methylene chloride, filtering the extract into a beaker. Evaporate to dryness. Add 2 drops of nitric acid to the dry residue, and evaporate on a steam bath to dryness. Add a few drops of alcoholic potassium hydroxide TS: a violet color appears.~~

~~**B:** Transfer a quantity of Elixir, equivalent to about 2.5 mg of hyoscyamine sulfate, to a separator. Render acidic with 3 N sulfuric acid, and extract with methylene chloride. Discard this extract. Render the solution alkaline with 6 N ammonium hydroxide, and extract with methylene chloride, filtering the extract into a beaker. Evaporate to dryness. Dissolve the residue in a small amount of 0.1 N hydrochloric acid, and add gold chloride TS, with shaking, until a definite precipitate separates. Slowly heat until the precipitate dissolves, and allow the solution to cool: lustrous golden yellow scales are formed.~~

BRIEFING

Ibuprofen Tablets, *USP 28* page 993. To obtain the specified concentration of 4-isobutylacetophenone, it is proposed to revise the *Assay* to adjust the volume of the *Internal standard solution* used to prepare the *4-Isobutylacetophenone standard solution*.

(PA2: C. Anthony) RTS—42727-1

Change to read:

Assay—

Mobile phase, Internal standard solution, and *Standard preparation*—Prepare as directed in the *Assay* under *Ibuprofen*.

4-Isobutylacetophenone standard solution—Quantitatively dissolve an accurately weighed quantity of 4-isobutylacetophenone in acetonitrile to obtain a solution having a known concentration of about 0.6 mg per mL. Add 2.0 mL of this stock solution to ~~100 mL of *Internal standard solution,*~~

■a 100-mL volumetric flask, dilute with *Internal standard solution* to volume,■2S (*USP29*)
and mix to obtain a solution having a known concentration of about 0.012 mg ~~of 4-isobutylacetophenone~~

■■2S (*USP29*)
per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1200 mg of ibuprofen, to a suitable container, add 100.0 mL of *Internal standard solution,* and shake for 10 minutes. [NOTE—Where the Tablets are coated, place an accurately counted number of Tablets, equivalent to not less than 1200 mg of ibuprofen, in a container, add an accurately measured volume of *Internal standard solution*, sufficient to obtain an *Assay preparation* containing about 12 mg of ibuprofen per mL, and about 15 glass beads, and shake until the Tablets are completely disintegrated.] Centrifuge a portion of the suspension so obtained, and use the clear supernatant as the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 for ibuprofen and 1.0 for valerophenone; the tailing factors for the individual peaks are not more than 2.5; the resolution, *R,* between the ibuprofen peak and the valerophenone peak is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *4-Isobutylacetophenone standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for valerophenone and 1.2 for 4-isobutylacetophenone; the tailing factors for the individual peaks are not more than 2.5; the resolution, *R,* between valerophenone and 4-isobutylacetophenone is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation,* the *Assay preparation,* and the *4-Isobutylacetophenone standard solution* into the chromatograph, record the

In-Process Revision

chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ibuprofen ($C_{13}H_{18}O_2$) in each Tablet taken by the formula:

$$100C(A/W)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard preparation; A* is the average weight, in mg, of a Tablet; W is the weight, in mg, of Tablet powder taken to prepare the *Assay preparation;* and R_U and R_S are the ratios of the ibuprofen peak response to the valerophenone peak response obtained from the *Assay preparation* and the *Standard preparation,* respectively. Where intact Tablets were taken, calculate the quantity, in mg, of $C_{13}H_{18}O_2$ in each Tablet by the formula:

$$(CV/N)(R_U/R_S)$$

in which V is the volume, in mL, of *Internal standard solution* used to prepare the *Assay preparation; N* is the number of Tablets taken; and the other terms are as defined above.

BRIEFING

Insulin, *USP 28* page 1020; **Insulin Human,** *USP 28* page 1022. Because of difficulties in obtaining proinsulin reference materials and the lack of specific tests, it is proposed that references to *USP Proinsulin (Beef) RS* and *USP Proinsulin (Pork) RS* be deleted from the monograph.

BRIEFING

Ketoprofen Extended-Release Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the Prodigy ODS(3) brand of L1 column. Typical retention times are about 11.4 minutes for ketoprofen and about 17.2 minutes for ketoprofen related compound A.

(PA2: C. Anthony) RTS—39383-1

In-Process Revision

Add the following:

■Ketoprofen Extended-Release Capsules

» Ketoprofen Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Ketoprofen RS. USP Ketoprofen Related Compound A RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: The UV spectrum obtained from the *Sample preparation* of the drug release procedure corresponds to the spectrum obtained from the *Standard preparation.*

Water, *Method I* ⟨921⟩**:** not more than 3.0%.

Drug release, *Method B* ⟨724⟩**—**[To come].

Uniformity of dosage units ⟨905⟩**:** meets the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—[NOTE—The *Standard solution* and *Test solution* must be protected from light.]

Mobile phase and *Resolution*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Transfer the contents of 10 Capsules, 1 Capsule each, to each of ten 250-mL volumetric flasks, add about 150 mL of *Mobile phase* to each flask, and stir for 2 hours. Dilute with *Mobile phase* to volume, and mix. Centrifuge, and pipet a volume of clear supernatant that contains about 2.4 mg of ketoprofen into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *Reso-*

lution solution, and record the responses as directed for *Procedure*: the resolution, *R,* between ketoprofen and ketoprofen related compound A is not less than 3.0; and the tailing factor for the ketoprofen peak is not more than 1.5. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the major peak responses. Calculate the percent of $C_{16}H_{14}O_3$ in each Capsule by the formula:

$$(TC/D)(r_U / r_S)$$

in which T is the labeled quantity, in mg, of ketoprofen in the Capsule; C is the concentration, in mg per mL, of ketoprofen in the *Standard solution; D* is the concentration, in mg per mL, of ketoprofen in the *Test solution* based upon the labeled quantity per Capsule and the extent of dilution; and r_U and r_S are the ketoprofen peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Assay—[NOTE—The *Standard preparation* and *Assay preparation* must be protected from light.]

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (110 : 90 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution containing about 0.25 mg per mL of USP Ketoprofen RS and 0.5 mg per mL of USP Ketoprofen Related Compound A RS in *Mobile phase.* Pipet 4.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer about 24 mg of USP Ketoprofen RS, accurately weighed, to a 100-mL volumetric flask, add 25 mL of *Mobile phase,* and mix. Dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Remove completely the contents of not fewer than 20 Capsules, and accurately transfer a quantity of the beads equal to about 200 mg of ketoprofen to a 250-mL volumetric flask. Add 150 mL of *Mobile phase* to volume, and mix. Centrifuge, and pipet 3.0 mL of clear supernatant that contains about 2.4 mg of ketoprofen into a 200-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm L1 packing. The flow rate is about 1.2 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ketoprofen and ketoprofen related compound A is not less than 3.0; and the tailing factor for the ketoprofen peak is not more than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ketoprofen ($C_{16}H_{14}O_3$) in the portion of Capsules taken by the formula:

$$CD(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ketoprofen RS in the *Standard preparation; D* is the dilution

factor used in preparing the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

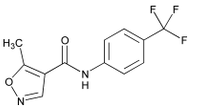
BRIEFING

Leflunomide. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Symmetry brand of L1 column.The typical retention time is about 28 minutes for leflunomide.

(PA2: C. Anthony) RTS—41078-1

Add the following:

■Leflunomide



$C_{12}H_9F_3N_2O_2$ 270.21

4-Isoxazolecarboxamide, 5-methyl-*N*-[4-(trifluoromethyl)-phenyl]-.

α,α,α-Trifluoro-5-methyl-4-isoxazolecarboxy-*p*-toluidide. [*75706-12-6*].

» Leflunomide contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_9F_3N_2O_2$, calculated on the dried basis.

Packaging and storage—Preserve in a well-closed container. Store at a temperature not exceeding 25°.

USP Reference standards ⟨11⟩**—***USP Leflunomide RS. USP Leflunomide Related Compound A RS. USP Leflunomide Related Compound B RS. USP Leflunomide Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Dry the substance for 10 minutes at 130°.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Melting range ⟨741⟩**:** between 165° and 168°.

Loss on drying ⟨731⟩**—**Dry it in vacuum over diphosphorus pentoxide at 60° for 4 hours. It loses not more than 0.3% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%.

Limit of leflunomide related compound A—

Mobile phase, System suitability preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

Test solution—Transfer about 125.0 mg of Leflunomide, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix.

In-Process Revision

Standard solution—Transfer about 12.5 mg of USP Leflunomide Related Compound A RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 5 mL of acetonitrile, and dilute with *Mobile phase* to volume. Quantitatively dilute this solution with *Mobile phase* to obtain a final solution having a known concentration of about 0.25 µg per mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses for leflunomide related compound A. Calculate the percentage of leflunomide related compound A in the portion of Leflunomide taken by the formula:

$$5000(C_S / W)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Leflunomide Related Compound A RS in the *Standard solution; W* is the weight, in mg, of USP Leflunomide Related Compound A RS taken to prepare the *Standard solution;* and r_U and r_S are the peak areas of leflunomide related compound A obtained from the *Test solution* and the *Standard solution,* respectively.

Chromatographic purity—

Mobile phase, System suitability preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Standard solution—Dilute a volume of the *Standard preparation,* prepared as directed in the *Assay,* with *Mobile phase* to obtain a final solution having a concentration of about 0.5 µg per mL.

System sensitivity solution—Dilute a volume of the *Standard solution* with *Mobile phase* to obtain a final solution having a concentration of about 0.25 µg per mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution,* the *Standard solution,* and the *System sensitivity solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The signal-to-noise ratio for the peak corresponding to leflunomide in the *System sensitivity solution* is not less than 10. Disregard any peak with an area less than the leflunomide peak in the chromatogram obtained from the *System sensitivity solution.* Continue the elution for two times the retention time of the leflunomide peak. Calculate the percentage of each related compound and any unknown impurity (see *Table 1*) in the portion of Leflunomide taken by the formula:

$$5000(C_S / W)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Leflunomide RS in the *Standard solution; W* is the weight, in mg, of Leflunomide taken to prepare the *Test solution;* r_i is the peak area response for each impurity obtained from the *Test solution;* and r_S is the leflunomide peak area response obtained from the *Standard solution*.

Table 1

Name	Relative Retention Time	Response Factor	Limit (%)
5-Methylisoxazole-carboxylic acid	0.05	1.0	0.1
Leflunomide related compound B	0.22	1.0	0.3
N-(2′-Trifluoromethylphenyl)-5-methylisoxazole-4-carboxomide	0.29	1.0	0.1
2-Cyano-acetic acid-(4′-trifluoromethyl)-anilide	0.36	1.0	0.1
4-Trifluoromethyl-aniline	0.39	1.0	0.1
Leflunomide related compound C	0.94	1.0	0.1
Any other individual impurity	—	—	0.1
Total impurities, excluding leflunomide related compound B and leflunomide related compound C	—	—	0.2
Total impurities	—	—	0.4

Organic volatile impurities ⟨467⟩**:** meets the requirements.

Residual solvents ⟨467⟩**:** meets the requirements.

(Official January 1, 2007)

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and triethylamine (65 : 35 : 0.5). Adjust with phosphoric acid to a pH of 4. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Leflunomide RS in 5 mL of acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

System suitability preparation—Dissolve accurately weighed quantities of USP Leflunomide Related Compound B RS and USP Leflunomide Related Compound C RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.15 mg per mL and 0.05 mg per mL, respectively.

Assay preparation—Transfer about 25.0 mg of Leflunomide, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix. [NOTE—Protect solutions from light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.2 for leflunomide related compound B and 0.9 for leflunomide related compound C; and the resolution, *R,* between the leflunomide and leflunomide related compound C peaks is not less than 1.0.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the leflunomide peak. Calculate the quantity, in mg, of $C_{12}H_9F_3N_2O_2$ in the portion of Leflunomide taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Leflunomide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Leflunomide Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Symmetry brand of L1 column. The typical retention time for leflunomide is about 28 minutes.

(PA2: C. Anthony) RTS—41078-2

Add the following:

■Leflunomide Tablets

» Leflunomide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of leflunomide ($C_{12}H_9F_3N_2O_2$).

Packaging and storage—Preserve in tight, light- and humidity-resistant containers.

USP Reference standards ⟨11⟩**—***USP Leflunomide RS. USP Leflunomide Related Compound A RS. USP Leflunomide Related Compound B RS. USP Leflunomide Related Compound C RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Spectral range: 220 to 360 nm.

Solution: 0.01 mg per mL.

Medium: methanol.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Mobile phase, Standard preparation, System suitability preparations, and *Chromatographic system*—Prepare as directed in the *Assay.*

Test solution—Transfer 1 Tablet to a suitable volumetric flask, and prepare a solution having a concentration of about 1 mg of leflunomide per mL. Add *Mobile phase* 50% by volume, and shake to disintegrate the Tablet. After the Tablet is completely disintegrated, add acetonitrile 20% by volume, dilute with *Mobile phase* to volume, and shake again. Pass through a membrane filter.

Procedure—Proceed as directed in the *Assay,* except to use the *Test solution* instead of the *Assay preparation.*

Water, *Method Ic* ⟨921⟩**:** not more than 9.0%.

Related compounds—

Mobile phase, System suitability preparations, and *Chromatographic system*—Proceed as directed in the *Assay.*

In-Process Revision

Standard solution and *Test solution*—Prepare as directed for *Standard preparation* and *Assay preparation,* respectively, in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each individual impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of each individual impurity in the chromatogram obtained from the *Test solution;* and r_s is the sum of all the related compounds and the leflunomide peak responses in the chromatogram obtained from the *Test solution:* not more than 0.1% of leflunomide related compound A is found; not more than 3.5% of leflunomide related compound B is found; not more than 0.1% of any other individual impurity is found; and not more than 4.0% of total impurities is found.

Assay—

Mobile phase—Prepare a mixture of water, acetonitrile, and triethylamine (65 : 35 : 05), filter, and degas. Adjust with phosphoric acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Leflunomide RS in a minimum volume of acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL.

System suitability preparation 1—Transfer 20.0 mg of USP Leflunomide Related Compound A RS, accurately weighed, to a 20-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

System suitability preparation 2—Transfer 100.0 mg of USP Leflunomide Related Compound B RS and 10.0 mg of USP Leflunomide Related Compound C RS, each accurately weighed, to a 100-mL volumetric flask. Add 1 mL of *System suitability preparation 1,* 5 mL of acetonitrile, and 80 mL of *Mobile phase,* and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix.

System suitability preparation 3—Transfer about 100.0 mg of USP Leflunomide RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in 2 mL of acetonitrile, add 1 mL of *System suitability preparation 2* and 80 mL of *Mobile phase,* and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of leflunomide, to a 100.0-mL volumetric flask. Add 20 mL of acetonitrile, dilute with *Mobile phase* to volume, and shake by mechanical means for 10 minutes. Pass through a membrane filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.0-mm × 12.5-cm column containing packing L1. The flow rate is about 1 mL per minute. Chromatograph *System suitability preparation 3* and the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times for leflunomide related compound A, leflunomide related compound B, leflunomide related compound C, and leflunomide are about 0.4, 0.2, 0.9, and 1.0, respectively; the resolution, *R,* between leflunomide related compound C and leflunomide is not less than 1.5; the tailing factor for leflunomide is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of leflunomide ($C_{12}H_9F_3N_2O_2$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Leflunomide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Lithium Carbonate Extended-Release Tablets, *USP 28* page 1142 and page 3499 of the *Second Supplement.* It is proposed to delete *Dissolution Test 3* because there are no approved products using this test. Also, it is proposed to make some changes in the *Tolerances* in *Dissolution Test 4* and to add a *Dissolution Test 5* for a new generic product recently approved by the FDA. In the absence of any adverse comments, it is proposed to implement all these revisions via the *First Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of February 1, 2006.

■(Official April 1, 2006)■2S (*USP28*)

BRIEFING

Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The procedure in the *Assay for anhydrous citric acid* is based on analyses performed with an IonPac AS11 brand of L61 column. The typical retention time for citrate is about 6 minutes. The proposal previously published in *PF* 26(4) is now being canceled.

(PA4: E. Gonikberg; NL: L. Paul; PSD: C. Okeke; AMB: R. Tirumalai) RTS—42804-1

Add the following:

■Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution

» Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution contains a dry mixture of Magnesium Carbonate, Citric Acid, and Potassium Citrate that when constituted as directed in the labeling yields a solution that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

Packaging and storage—Preserve in tight, single-dose containers. Store at controlled room temperature.

Labeling—The label specifies the directions for the constitution of the powder and states the equivalent amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

USP Reference standards ⟨11⟩—*USP Citric Acid RS.*

Microbial limits ⟨61⟩—The total aerobic microbial count is not more than 1000 cfu per g. The total combined molds and yeasts count is not more than 100 cfu per g. It meets the requirements of the tests for absence of *Escherichia coli*.

Uniformity of dosage units ⟨905⟩**:** meets the requirements.

pH ⟨791⟩**:** between 3.3 and 4.3, determined in a solution constituted as directed in the labeling.

Other requirements—Constitute as directed in the labeling: it meets the requirements of the tests for *Identification, Chloride, Sulfate,* and *Tartaric acid* under *Magnesium Citrate Oral Solution.*

In-Process Revision

Assay for anhydrous citric acid—

Mobile Phase and *Chromatographic System*—Proceed as directed in the general test chapter *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Standard preparation—Dissolve USP Citric Acid RS in a freshly prepared 1 mM sodium hydroxide to prepare a solution having a known concentration of about 0.02 mg of anhydrous citric acid per mL.

Assay preparation—Constitute the Oral Solution as directed in the labeling. Transfer the amount of the constituted Oral Solution, equivalent to about 500 mg of magnesium citrate, to a suitable volumetric flask, and dilute quantitatively, and stepwise if necessary, with a freshly prepared 1 mM sodium hydroxide to obtain a solution containing about 0.02 mg per mL of magnesium citrate, based on the label claim. Pass the resulting solution through a filter having a 0.5-µm or finer porosity, and use the filtrate.

Procedure—Proceed as directed for *Procedure* in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩, and calculate the content, in g, of anhydrous citric acid ($C_6H_8O_7$) by the formula:

$$0.001(C_S\ D\ V_T\ /V)(r_U/r_S)$$

in which 0.001 is the conversion factor from mg to g; C_S is the concentration, in mg per mL, of anhydrous citric acid in the *Standard preparation; D* is the dilution factor for the *Assay preparation;* V_T is the total volume of constituted Oral Solution, as measured, when constituted as directed; V is the volume, in mL, of the constituted Oral Solution taken to prepare the *Assay preparation;* and r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. The content of anhydrous citric acid is between 126.1% and 154.4% of the labeled amount of magnesium citrate.

Assay for magnesium oxide—Transfer an accurately measured volume of the constituted Oral Solution, equivalent to about 0.5 g of magnesium oxide, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a beaker. While stirring, add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, 0.3 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS until the last hint of violet disappears (blue endpoint). Each mL of 0.05M edetate disodium is equivalent to 7.520 mg of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$). ■2S *(USP29)*

BRIEFING

Megestrol Acetate Oral Suspension, *USP 28* page 1200 and page 3502 of the *Second Supplement.* It is proposed to correct the final concentration of the *Standard solution* used in *Dissolution Test 1.*

(BPC: M. Marques) RTS—42694-1

Change to read:

Dissolution ⟨711⟩—

■TEST 1—

Medium: 0.5% sodium lauryl sulfate in water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask, add about 12 mL of methanol, and put the flask in a warm water bath until the solid is dissolved. Dilute with *Medium* to volume. The final concentration is about ~~18 µg~~

■180 µg■2S *(USP29)* of megestrol acetate per mL.

Procedure—Transfer to the surface of the *Medium* in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 160 mg of megestrol acetate. Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm on filtered portions of the

In-Process Revision

solution under test, in comparison with the *Standard solution.* Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times V \times LC}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; V* is the sample volume, in mL, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% sodium lauryl sulfate in water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask. Add about 5 mL of methanol, and mix. Dilute with *Medium* to volume. Transfer 10 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. The final concentration is about 18 µg per mL.

Test solution—[NOTE—Use a separate syringe for each vessel.] Withdraw more than 10 mL of the Oral Suspension, using a 10-mL syringe with a long cannula. Remove air bubbles from the syringe. Adjust the volume to the 10-mL mark on the syringe, and remove the needle. Wipe the tip of the syringe, and accurately weigh (gross weight). Operate the apparatus, and rapidly dispense the Oral Suspension to the side of the vessel at about halfway from the bottom. Similarly dispense the Oral Suspension into other vessels. Accurately weigh each syringe after dispensing the sample (tare weight). Record sample weights. After completion of the dissolution, pass an aliquot through a nylon filter having a 0.45-µm porosity, and dilute 2.0 mL of the filtrate with *Medium* to 50.0 mL to obtain a solution having a theoretical concentration of about 18 µg per mL.

Procedure—Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm, using 0.5-cm pathlength cuvettes, on the *Test solution* in comparison with the *Standard solution*. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times d \times 100}{A_S \times W_U \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% sodium lauryl sulfate in degassed water; 900 mL. Use ultrapure sodium lauryl sulfate with an assay content of not less than 99.0%.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—Transfer about 11.5 mg, accurately weighed, of USP Megestrol Acetate RS to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Proceed as directed for *Test 2,* introducing the sample into the vessel over a 10- to 15-second period (about 1 mL per second).

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{r_U \times C_S \times 900 \times d \times 100}{r_S \times W_U \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.■2S (*USP28*)

BRIEFING

Methoxyflurane, *USP 28* page 1252. It is proposed to delete the test for *Foreign odor* because it is an odor test, and there are potential safety concerns.

(PA1: K. Russo) RTS—42915-4

Delete the following:

■~~**Foreign odor**—Place 10 mL on a dry watch glass, and allow it to evaporate spontaneously to about 1 mL: no foreign odor is perceptible during the evaporation. To the remaining test specimen add a piece of odorless filter paper, and allow the paper to dry, checking it for foreign odor every few seconds during the drying period. As the last traces of odor leave the paper, a faint, characteristic odor may be detected for a few seconds, but no residual foreign odor is detected.~~■2S (*USP29*)

In-Process Revision

BRIEFING

Miconazole Nitrate Vaginal Suppositories, *USP 28* page 1296. In the *Assay,* the *Internal standard solution, Standard preparation, Chromatographic system,* and *Procedure* are currently cross-referenced to the corresponding sections in the *Assay* under Miconazole Nitrate Cream. However, the gas chromatographic method used in the *Assay* under Miconazole Nitrate Cream has been changed to an HPLC method. Therefore, it is proposed to specify the *Internal standard solution, Standard preparation, Chromatographic system,* and *Procedure* used for the gas chromatographic procedure in the *Assay* under Miconazole Nitrate Vaginal Suppositories.

(PA7b: B. Davani) RTS—42729-1

Change to read:

Assay—

~~*Internal standard solution, Standard preparation*, and *Chromatographic system*: Prepare as directed in the *Assay* under *Miconazole Nitrate Cream*.~~

■*Internal standard solution*—Dissolve a suitable quantity of cholestane in a mixture of chloroform and methanol (1 : 1) to obtain a solution having a concentration of about 1 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Miconazole Nitrate RS in methanol to obtain a solution having a known concentration of about 500 µg per mL. Transfer 10.0 mL of this solution to a test tube, and evaporate on a steam bath to dryness with the aid of a current of filtered air. Dissolve the residue in 2.0 mL of *Internal standard solution* to obtain a solution having a concentration of about 2500 µg per mL.■2S (*USP29*)

Assay preparation—Transfer 1 Suppository to a stoppered, 50-mL centrifuge tube. Add 30 mL of pentane, and shake by mechanical means for 20 minutes to dissolve the suppository base and to disperse the miconazole nitrate. Centrifuge to obtain a clear supernatant. Aspirate, and discard the clear liquid. Wash the residue with three 20-mL portions of pentane, shaking, centrifuging, and aspirating in the same manner. Discard the pentane washings. Evaporate the residual pentane from the residue with the aid of a current of filtered air. Using small portions of methanol, transfer the residue to a 100-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix. Transfer an accurately measured volume of this stock solution, equivalent to about 5 mg of miconazole nitrate, to a suitable container, and evaporate to dryness on a steam bath with the aid of a current of filtered air. Dissolve the residue in 2.0 mL of *Internal standard solution*.

■*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.2-m column packed with 3% phase G32 on support S1A. The carrier gas is helium, flowing at a rate of about 50 mL per minute. The injection port, detector, and column temperatures are maintained at about 250°, 300°, and 250°, respectively. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times for cholestane and miconazole nitrate are about 0.44 and 1.0, respectively; the resolution, *R,* between cholestane and miconazole nitrate is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.■2S (*USP29*)

Procedure—~~Proceed as directed for *Procedure* in the *Assay* under *Miconazole Nitrate Cream*.~~

■Separately inject equal volumes (about 1 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses.■2S (*USP29*)

Calculate the quantity, in mg, of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) in the portion of Suppository taken by the formula:

$$(0.2C/V)(R_U/R_S)$$

in which ~~*V* is the volume, in mL, of stock solution used to prepare the Assay preparation, and the other terms are as defined therein.~~

■*C* is the concentration, in µg per mL, of the USP Miconazole Nitrate RS in the *Standard preparation; V* is the volume, in mL, of stock solution used to prepare the *Assay preparation;* and R_U and R_S are the ratios of the peak responses of miconazole nitrate to that of cholestane obtained from the *Assay preparation* and *Standard preparation,* respectively.■2S (*USP29*)

In-Process Revision

BRIEFING

Norgestimate, *USP 28* page 1401. It is proposed to add system suitability requirements to *Test 1* of the tests for *Chromatographic purity* and to revise *USP Reference standards* by adding the associated Reference Standards. In the test for *Limit of residual solvents,* it is proposed to add requirements for *Option 1* and *Option 2* from general chapter ⟨467⟩. Minor changes in the *Assay* are also proposed.

USP Reference standards ⟨11⟩—*USP Norgestimate RS.*

■*USP Norgestimate Related Compound A RS. USP Norgestimate Oxime Mixture RS.*■2S (*USP29*)

Change to read:

Limit of residual solvents ⟨467⟩—

Internal standard solution—Prepare a solution of isobutyl alcohol in dimethylformamide containing 2 µL of isobutyl alcohol per 100 mL of solution.

Standard solution—Prepare a solution of *Internal standard solution* and 5 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

System suitability solution—Dilute a portion of the *Standard solution* with *Internal standard solution* to obtain a solution containing 0.05 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

Test solution—Transfer about 40 mg of Norgestimate and 2 mL of *Internal standard solution* to a 5-mL volumetric flask or a suitable vial, and shake well to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica capillary column bonded with a 1-µm layer of phase G16, and a split injection system. The detector temperature is about 250°, and the injection port temperature is about 180°. The column temperature is programmed as follows. It is maintained at about 65° for 2.5 minutes, increased at a rate of 35° per minute to 100°, maintained for 2 minutes, then at a rate of 30° per minute increased to 160°, and maintained for 2.5 minutes. The carrier gas is helium, flowing at a rate of about 6 mL per minute, and the split flow rate is about 16 mL per minute. Chromatograph the *Internal standard solution,* the *Standard solution,* and the *System suitability solution,* and record the peak responses as directed for *Procedure:* there are no interfering peaks due to dimethylformamide; the retention time of isobutyl alcohol in the chromatogram of the *Internal standard solution* is between 4 and 5 minutes; the signal-to-noise ratio for alcohol obtained from the *System suitability solution* is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard solution,* determined from the peak response ratios of each solvent to the internal standard, is not more than 3.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each solvent in the portion of Norgestimate taken by the formula:

$$200(CD/W)(R_U/R_S)$$

in which C is the concentration, in mL per mL, of each solvent in the *Standard solution; D* is the density, in mg per mL, of each solvent; W is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios of the appropriate analyte to the internal standard obtained from the *Test solution* and the *Standard solution,* respectively.

■*Option 1:* not■2S (*USP29*)
more than 0.5% each of acetone and alcohol is found, not more than 0.05% of diisopropyl ether is found, not more than 0.006% of chloroform is found, and not more than 0.3% of methanol is found;

■or *Option 2:* meets the requirements.■2S (*USP29*)

Test solution—Use the *Assay preparation.*

■*System suitability solution*—Dissolve accurately weighed quantities of USP Norgestimate RS, USP Norgestimate Related Compound A RS and USP Norgestimate Oxime Mixture RS in *Diluent* to obtain a solution containing about 0.5 mg per mL of each.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 244-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.50 for syn-17-deacetyl norgestimate, about 0.56 for anti-17-deacetyl norgestimate, about 0.72 for norgestimate related compound A, and 1.0 for norgestimate; the resolution, *R,* between syn-17-deacetyl norgestimate and anti-17-deacetyl norgestimate is not less than 1.5; and that between anti-17-deacetyl norgestimate and norgestimate related compound A is not less than 1.5.■2S (*USP29*)

In-Process Revision

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Norgestimate taken by the formula:

$$5000(CP/W)(r_i/Fr_S)$$

in which C is the concentration, in mg per mL, of USP Norgestimate RS in the *Standard solution; P* is the fraction of *(E)*-norgestimate in USP Norgestimate RS; W is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* r_i is the peak area for each impurity obtained from the *Test solution; F* is the relative response factor ~~and it is equal to 0.83 for any peak having a relative retention time of 0.50, 1.13 for any peak having a relative retention time of 0.56, 0.85 for any peak having a relative retention time of 0.72, and 1.0 for any other peak;~~

■for each impurity;■2S (*USP29*)
and r_S is the peak area of *(E)*-norgestimate,

■eluting at about 13.5 minutes,■2S (*USP29*)
obtained from the *Standard solution.* ~~Not more than 0.3% of total impurities having relative retention times of 0.50 and 0.56 is found; not more than 0.3% of the impurity having a relative retention time of 0.72 is found; and not more than 0.1% of any other impurity is found.~~

■The impurities meet the requirements specified in the table below.

Impurities	Relative Response Time	Relative Response Factor	Limit (not more than)
syn-17-Deacetyl norgestimate*	0.50	0.83	0.3
anti-17-Deacetyl norgestimate*	0.56	1.13	0.3
Norgestimate related compound A (levonorgestrel acetate)	0.72	0.85	0.3%
Any other impurity	—	1.0	0.1%

* Provided as a mixture called USP Norgestimate Oxime Mixture RS; their combined limits are not more than 0.3%.■2S (*USP29*)

TEST 2—
Mobile phase—Prepare a filtered and degassed mixture of cyclohexane and absolute alcohol (50 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Dissolve an accurately weighed quantity of USP Norgestimate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.
System suitability solution—Dilute a portion of the *Standard solution,* quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 µg per mL.
Test solution—Transfer about 10 mg of Norgestimate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L20. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for *(E)*-norgestimate is not less than 3.0. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the retention time is about 18.6 minutes for *(E)*-norgestimate; the relative retention times are about 1.0 for *(E)*-norgestimate and 1.1 for *(Z)*-norgestimate; the tailing factor is not more than 1.5; the resolution, *R,* between *(Z)*-norgestimate and *(E)*-norgestimate is not less than 1.5; and the relative standard deviation for replicate injections, determined from the peak area of *(Z)*-norgestimate to *(E)*-norgestimate, is not more than 2.0%.
Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity in the portion of Norgestimate taken by the formula:

$$1000(CP/W)(r_i/Fr_S)$$

in which C is the concentration, in mg per mL, of USP Norgestimate RS in the *Standard solution; P* is the fraction of *(E)*-norgestimate in USP Norgestimate RS; W is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* r_i is the peak area for each impurity obtained from the *Test solution; F* is the relative response factor and is equal to 1.4 for any peak having a relative retention time of 0.74, 1.5 for any peak having a relative retention time of 0.78, and 1.2 for any peak having a relative retention time of 0.91; and r_S is the peak area of *(E)*-norgestimate obtained from the *Standard solution.* Not more than 0.2% of the impurity having a relative retention time of 0.74 is found; and not more than 0.1% each of the impurities having relative retention times of 0.78 and 0.91 is found. Not more than 1.0% of total impurities is found, the results for *Test 1* and *Test 2* being added.

BRIEFING

PEG 3350 and Electrolytes for Oral Solution, *USP 28* page 1575. It is proposed to change the official title of this monograph to Polyethylene Glycol 3350 and Electrolytes for Oral Solution. In accordance with the procedures of the USP Nomenclature and Labeling Expert Committee, the term "PEG" is not appropriate for official titles; the proposed revision eliminates its use. In addition, minor editorial style changes have been made. In the absence of any significant adverse comments, the revision to the official title will appear in the *Second Supplement to USP 29–NF 24,* but with a delayed implementation date of **February 1, 2009**.

Change to read:

» ~~PEG 3350 and Electrolytes for Oral Solution~~

■Polyethylene Glycol 3350 and Electrolytes for Oral Solution■2S (*USP29*)
is a mixture of Polyethylene Glycol 3350, Sodium Bicarbonate, Sodium Chloride, Sodium Sulfate (anhydrous), and Potassium Chloride. When constituted as directed in the labeling, it contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of polyethylene glycol 3350, potassium (K^+), sodium (Na^+), bicarbonate (HCO_3^-), chloride (Cl^-), and sulfate (SO_4^{-2}), the labeled amounts per L being 10 mmol (10 mEq) of potassium, 125 mmol (125 mEq) of sodium, 20 mmol (20 mEq) of bicarbonate, 35 mmol (35 mEq) of chloride, and 40 mmol (80 mEq) of sulfate.

Change to read:

Assay for potassium and sodium—

Mobile phase—Dilute 0.5 mL of nitric acid with water to obtain 4000 mL of solution. Degas, and place the solution in a suitable plastic container. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve a suitable quantity of ammonium bromide in water to obtain a solution having a concentration of about 2 mg per mL.

Standard preparation—To a 100-mL volumetric flask transfer about 90 mg of potassium chloride, previously dried at 105° for 2 hours and accurately weighed, and about 880 mg of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, add 10.0 mL of *Internal standard solution,* dilute with water to volume, and mix. Pass this solution through a filter having a 0.5-µm or finer porosity, and store the filtrate in a suitable plastic container. This *Standard preparation* contains about 9 µg (0.00012 mEq) of potassium chloride and about 88 µg (0.0015 mEq) of sodium chloride per mL.

Assay preparation—Constitute the contents of a container of ~~PEG 3350 and Electrolytes for Oral Solution~~

■Polyethylene Glycol 3350 and Electrolytes for Oral Solution■2S (*USP29*)

In-Process Revision

with an accurately measured volume of water, as specified in the labeling. Transfer 6.0 mL of this stock solution, equivalent to about 0.06 mEq of potassium, to a 500-mL volumetric flask, add 10 mL of *Internal standard solution*, dilute with water to volume, and mix. This solution contains about 0.00012 mEq of potassium and 0.0015 mEq of sodium per mL. [NOTE—Reserve the remaining portion of the stock solution for the *Assay for bicarbonate*, and reserve the remaining portion of the *Assay preparation* for the *Assay for chloride and sulfate* and the *Assay for polyethylene glycol 3350*.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector, a 4-mm × 5-cm guard column containing packing L22, and a 4-mm × 30-cm analytical column maintained at 35 ± 1° containing packing L22. The flow rate is about 0.9 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the relative retention times are about 0.6 for sodium, 0.8 for ammonium, and 1.0 for potassium; and the resolution, *R,* between sodium and ammonium is not less than 1.1 and the resolution, *R,* between ammonium and potassium is not less than 0.9. [NOTE—Maintain column backpressure at less than 1000 pounds per square inch. Backpressure may be reduced by changing the in-line filters and frits in the columns. Column efficiency may be improved by backflushing the analytical column with 30 mL of 0.1 N nitric acid or by injecting four successive 100-µL portions of 0.1 N nitric acid into the chromatograph.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the mEq of potassium per L of constituted Oral Solution taken by the formula:

$$(500 / 74.55)(C / 6)(R_U / R_S)$$

in which 74.55 is the molecular weight of potassium chloride; C is the concentration, in µg per mL, of potassium chloride in the *Standard preparation;* and R_U and R_S are the peak area response ratios of potassium to ammonium obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the mEq of sodium per L of constituted Oral Solution taken by the formula:

$$(500 / 58.44)(C / 6)(R_U / R_S)$$

in which 58.44 is the molecular weight of sodium chloride; C is the concentration, in µg per mL, of sodium chloride in the *Standard preparation;* and R_U and R_S are the peak area response ratios of sodium to ammonium obtained from the *Assay preparation* and the *Standard preparation,* respectively.

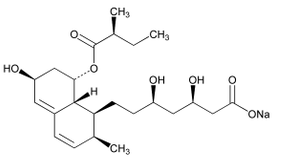
BRIEFING

Pravastatin Sodium. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Chromatographic purity* are based on analyses performed with the 3.5-µm Zorbax SB C18 brand of L1 column. Alternatively, the 3-µm Hypersil ODS brand of L1 column can be used for this test. The typical retention time for pravastatin is about 8 minutes. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the 3-µm Hypersil ODS brand of L1 column. The typical retention time for pravastatin is 7 minutes. The gas chromatographic procedures in the test for *Limit of alcohol* are based on the analyses performed with the Supelco OVI-G43 brand of G43 column.

(PA4: E. Gonikberg; NL: L. Paul) RTS—36919-1

Add the following:

■Pravastatin Sodium



$C_{23}H_{35}NaO_7$ 446.51

1-Napththaleneheptanoic acid, 1,2,6,7,8,8a-hexahydro-β,δ,6-trihydroxy-2-methyl-8-(2-methyl-1-oxobutoxy)-, monosodium salt, [1*S*-[1α(β*S**,δ*S**),2α,6α,8β(*R**),8aα]]-.

Sodium (β*R*,δ*R*,1*S*, 2*S*,6*S*,8*S*,8a*R*)-1,2,6,7,8,8a-hexahydro-β,δ,6,8-tetrahydroxy-2-methyl-1-naphthaleneheptanoate, 8-[(2*S*)-2-methylbutyrate] [*81131-70-6*].

» Pravastatin Sodium contains not less than 98.0 percent and not more than 102.0 percent of $C_{23}H_{35}NaO_7$, calculated on the anhydrous and solvent-free basis.

Packaging and storage—Preserve in tight containers. Store under nitrogen in a cold place.

USP Reference standards ⟨11⟩**—***USP Pravastatin Sodium RS. USP Pravastatin Related Compound A RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements of the pyroantimonate precipitation test for *Sodium* ⟨191⟩.

Specific rotation ⟨781⟩**:** between +150° and +160° (at 20°), calculated on the anhydrous and solvent-free basis.

Test solution: 5 mg per mL in water.

pH ⟨791⟩**:** between 7.2 and 9.0, in a solution (1 in 20).

Water, *Method I* ⟨921⟩**:** not more than 4.0%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Chromatographic purity—[NOTE—The *Standard solution* and the *Test solution* are maintained at 15° until injected into the chromatograph.]

Diluent—Prepare a mixture of methanol and water (1 : 1).

Buffer pH 7.0—Prepare a 0.08 M phosphoric acid solution, adjust with triethylamine to a pH of 7.0, and mix.

Solution A—Prepare a filtered and degassed mixture of water, *Buffer pH 7.0,* and acetonitrile (52 : 30 : 18).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, *Buffer pH 7.0,* and water (60 : 30 : 10).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Pravastatin Sodium RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

System suitability solution—Dissolve accurately weighed quantities of USP Pravastatin Sodium RS and USP Pravastatin Related Compound A RS in *Diluent* to obtain a solution containing about 0.5 mg of USP Pravastatin Sodium RS and 0.001 mg of USP Pravastatin Related Compound A RS per mL. [NOTE—USP Pravastatin Related Compound A RS is a sodium salt of 6α-hydroxyisocompactin acid.]

Test solution—Transfer about 50 mg of Pravastatin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 7.5-cm column that contains 3.5-µm packing L1. Alternatively, a 4.0-mm × 10-cm column that contains 3-µm packing L1 can be used. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–3.0	100	0	isocratic
3.0–26.5	100→0	0→100	linear gradient
26.5–26.6	0→100	100→0	linear gradient
26.6–30.0	100	0	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for pravastatin and 1.1 for pravastatin related compound A; and the resolution, *R,* between pravastatin and pravastatin related compound A is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into a chromatograph, record the chromatograms, identify the impurities listed in *Table 1,* and measure the peak responses.

Calculate the percentage of each impurity in the portion of Pravastatin Sodium taken by the formula:

$$100C(V/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Pravastatin Sodium RS in the *Standard solution; V* is the volume, in mL, of the *Test solution; W* is the weight, in mg, of Pravastatin Sodium taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the pravastatin peak response obtained from the *Standard solution*. In addition to not exceeding the limits for each impurity specified in *Table 1,* not more than 0.1% of any other individual impurity is found, and not more than 0.6% of total impurities is found.

Table 1

Name	Relative Retention Time	Limit (%)
3″-Hydroxypravastatin	0.33	0.2
6′-Epipravastatin	0.92	0.3
6α-Hydroxyisocompactin[1]	1.1	0.2
Pentanoyl impurity[2]	1.2	0.2
Pravastatin lactone	1.8	0.2
Compactin	3.1	0.2

[1] USP pravastatin related compound A.
[2] (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylpentanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoic acid.

Limit of alcohol *(if present)*—

Standard solution—Pipet 2 mL of dehydrated alcohol into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 1 mL of this solution into a vial fitted with a septum and a crimp cap, and calculate the amount of alcohol, W_A, added, in g, the specific gravity of dehydrated alcohol being 0.79 g per mL. Add 5 mL of the *Test solution* to the same vial, seal the vial, and mix. Heat the sealed vial at 80° for 60 minutes.

Test solution—Transfer about 0.2 g of Pravastatin Sodium, accurately weighed, to a 20-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a vial fitted with a septum and a crimp cap, add 1 mL of water, seal the vial, and mix. Heat the sealed vial at 80° for 60 minutes.

Blank solution—Pipet 6 mL of water into a vial fitted with a septum and a crimp cap, and seal the vial. Heat the sealed vial at 80° for 60 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused silica capillary column coated with a 3-µm film of stationary phase G43. The carrier gas is helium, with a split ratio of 1 : 5, and flowing with a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at 40° for 20 minutes, then the temperature is increased at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The transfer line temperature is maintained at 85°, the injection port temperature is maintained at 140°, and the detector is maintained at 250°. Chromatograph the *Blank solution,* and record the peak responses as directed for *Procedure:* no interfering peaks are observed.

Procedure—Separately inject equal volumes (about 1 mL) of headspace gas of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms,

In-Process Revision

and measure the area responses for the major peaks. Calculate the percentage (w/w) of alcohol in the portion of Pravastatin Sodium taken by the formula:

$$100\ (W_A / W)(V/5)[r_U / (r_S - r_U)]$$

in which W_A is as defined above; W is the weight, in g, of Pravastatin Sodium taken to prepare the *Test solution;* V is the volume, in mL, of the *Test solution;* 5 is the volume, in mL, of the *Test solution* taken; and r_U and r_S are the peak area responses of alcohol obtained from the *Test solution* and the *Standard solution,* respectively: not more than 3.0% is found.

Assay—

Solution A—Prepare a 0.05 M phosphoric acid solution, adjust with a 25% sodium hydroxide solution to a pH of 5.0, mix, filter, and degas.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Pravastatin Sodium RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.2 mg per mL.

System suitability preparation—Dissolve accurately weighed quantities of USP Pravastatin Sodium RS and USP Pravastatin Related Compound A RS in methanol to obtain a solution containing about 0.2 mg of USP Pravastatin Sodium RS and 0.001 mg of USP Pravastatin Related Compound A RS per mL.

Assay preparation—Transfer about 20 mg of Pravastatin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.0-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–7.0	80→72	20→28	linear gradient
7.0–10.0	72→50	28→50	linear gradient
10.0–17.0	50	50	isocratic
17.0–17.1	50→80	50→20	linear gradient
17.1–20.0	80	20	re-equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for pravastatin and 1.2 for pravastatin related compound A; the resolution, *R,* between pravastatin and pravastatin related compound A is not less than 1.2; and the relative standard deviation for replicate injections for the pravastatin peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pravastatin peaks. Calculate the quantity, in mg, of $C_{23}H_{35}NaO_7$ in the portion of Pravastatin Sodium taken by the formula:

$$VC(r_U / r_S)$$

in which V is the volume, in mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Pravastatin Sodium RS in the *Standard preparation;* and r_U and r_S are the responses of the pravastatin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP29*)

In-Process Revision

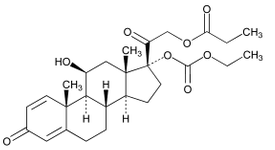
BRIEFING

Prednicarbate. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the Zorbax C8 brand of L7 column. Typical retention times are about 17 minutes for prednicarbate and about 19 minutes for prednicarbate related compound A.

(PA1: C. Anthony) RTS—42709-1

Add the following:

■Prednicarbate



$C_{27}H_{36}O_8$ 488.57

(1) Pregna-1,4-diene-3,20-dione, 17-[(ethoxycarbonyl) oxy]-11-hydroxy-21-(1-oxopropoxy)-, (11*β*)-.

(2) 11*β*,17,21-Trihydroxypregna-1,4-diene-3,20-dione 17-(ethyl carbonate) 21-propionate [*73771-04-7*].

» Prednicarbate contains not less than 97.0 percent and not more than 102.0 percent of $C_{27}H_{36}O_8$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Prednicarbate RS. USP Prednicarbate Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** between +60° and +66°.

Test solution: 10 mg per mL, in alcohol.

Loss on drying ⟨731⟩—Dry it at 105° for 6 hours: it loses not more than 0.5% of its weight.

Chromatographic purity—

Mobile phase, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Test preparation—Use the *Assay preparation*.

Diluted test preparation—Transfer 1 mL of the *Test preparation* to a 200-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes, about 20 µL of the *Test preparation* and the *Diluted test preparation,* into the chromatograph, record the chromatograms, and measure the response for the prednicarbate peak obtained from the *Diluted test preparation.* Obtain from the *Test preparation* the peak responses for prednicarbate related compound A and for all peaks other than prednicarbate. Continue the chromatography for twice the retention time of prednicarbate. Calculate the percentage of the related compound and all the impurities in the portion of Prednicarbate taken by the formula:

$$0.5(R_T / R_{DT})$$

in which R_T is the peak response for each individual impurity peak obtained from the *Test preparation,* and R_{DT} is the peak response of the main peak in the chromatogram of the *Diluted test preparation:* not more than 1.0 percent of prednicarbate related compound A is found; not more than 0.5 percent of any other individual impurity is found, with the

In-Process Revision

exception of the main peak and the peak corresponding to prednicarbate related compound A; and not more than 2.0 percent of total impurities is found. Disregard any peak (0.0125%) with an area less than 0.025 times the area of the main peak in the chromatogram obtained with the *Diluted test solution*.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (60 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve suitable quantities of USP Prednicarbate Related Compound A RS and Prednicarbate in *Mobile phase* to obtain a solution containing about 3 µg per mL each. [NOTE—Prepare all solutions just prior to use.]

Standard preparation—Dissolve an accurately weighed quantity of USP Prednicarbate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.6 mg per mL.

Assay preparation—Transfer about 30 mg of Prednicarbate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 243-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 0.7 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 1.1 for USP Prednicarbate Related Compound A RS and 1.0 for USP Prednicarbate RS; the resolution, *R,* between Prednicarbate and USP Prednicarbate Related Compound A RS is not less than 3.0.

Procedure—Separately inject equal volumes, about 20 µL of the *Assay preparation* and the *Standard preparation,* into the chromatograph, record the chromatograms, and measure the responses for the prednicarbate peaks. Continue the chromatography for twice the retention time of prednicarbate. Calculate the quantity, in mg, of $C_{27}H_{36}0_8$ in the portion of Prednicarbate taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Prednicarbate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S *(USP29)*

BRIEFING

Oral Rehydration Salts, *USP 28* page 1708, page 3531 of the *Second Supplement,* and page 445 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to delete *Identification* test *F* because it is an odor test, and there are potential safety concerns.

(PA1: K. Russo) RTS—42915-5

BRIEFING

Sodium Chloride, *USP 28* page 1779 and page 795 of *PF* 31(3) [May–June 2005]. In order to align the monograph with the harmonization text presented by the Pharmacopeial Discussion Group, it is proposed to revise the test for *Limit of phosphates* to include solution information from the harmonization draft.

(PA1: J. Lane) RTS—42831-1

Change to read:

Identification—~~It responds to the tests for *Sodium* ⟨191⟩ and for *Chloride.*~~

■**A:** Dissolve in 2 mL of water a quantity of the substance to be examined equivalent to about 2 mg of chloride. Acidify with diluted nitric acid, and add 0.4 mL of a silver nitrate solution containing about 42.5 g per L. Shake, and allow to stand. A curdled white precipitate is formed. Centrifuge, and wash the precipitate with three quantities, each 1 mL, of water. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant may not become perfectly clear. Suspend the precipitate in 2 mL of water, and add 1.5 mL of ammonium hydroxide. The precipitate dissolves easily with the possible exception of a few large particles that dissolve slowly.

B: Introduce into a test tube a quantity of the substance to be examined equivalent to about 15 mg of chloride. Add 0.2 g of potassium dichromate and 1 mL of sulfuric acid. Place a filter-paper strip impregnated with 0.1 mL of *Diphenylcarbazide solution* over the opening of the test tube. The paper turns violet-red. The impregnated paper must not come into contact with the potassium dichromate.

Diphenylcarbazide solution—Dissolve 0.2 g of diphenylcarbazide in 10 mL of glacial acetic acid, and dilute with alcohol to 100 mL. Prepare immediately before use.

C: Dissolve 0.1 g of the substance to be examined in 2 mL of water. Add 2 mL of a 150 g per L solution of potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of *Potassium pyroantimonate solution,* and heat to boiling. Allow to cool in iced water, and if necessary rub the inside of the test tube with a glass rod. A dense white precipitate is formed.

Potassium pyroantimonate solution—Dissolve 2 g of potassium pyroantimonate in 95 mL of hot water. Cool quickly, and add a solution containing 2.5 g of potassium hydroxide in 50 mL of water and 1 mL of sodium hydroxide solution containing 8.5 g of sodium hydroxide in 100 mL of water. Allow to stand for 24 hours, filter, and dilute with water to 150 mL.

D: Dissolve a quantity of the substance to be examined equivalent to about 2 mg of sodium in 0.5 mL of water. Add 1.5 mL of *Methoxyphenylacetic reagent,* and cool in ice water for 30 minutes. A voluminous, white, crystalline precipitate is formed. Place in water at 20°, and stir for 5 minutes. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of ammonium carbonate solution (158 g per L). No precipitate is formed.

Methoxyphenylacetic reagent—Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of 10% tetramethylammonium hydroxide solution in methanol, and add 20 mL of alcohol. Store in a polyethylene container.■1S (*USP29*)

Change to read:

Loss on drying ⟨731⟩—Dry the test material at 105° for 2 hours: it loses not more than 0.5% of its weight, determined on ~~a 1.000-g sample.~~

■about 1.000 g of sample.■1S (*USP29*)

Limit of phosphates—

Phosphate stock standard solution—Dissolve an accurately weighed quantity of monobasic potassium phosphate in water to obtain a solution having a concentration of about 0.716 mg per mL.

Phosphate standard solution—Dilute 1 mL of the *Phosphate stock standard solution* with water to 100 mL. Prepare this solution fresh.

Standard solution—Dilute 2 mL of the *Phosphate standard solution* with water to 100 mL.

Test solution—Dilute 2 mL of the solution prepared in the test for *Appearance of solution* with water to 100 mL.

Procedure—To the *Standard solution* and the *Test solution,* add 4 mL of ~~sulfomolybdic acid TS,~~

■*Sulfomolybdic acid solution,*■2S (*USP29*) and add 0.1 mL of a mixture of 1 mL of stronger acid stannous chloride TS and 10 mL of 2 N hydrochloric acid. After 10 minutes, compare the colors of 20 mL of each solution: any color in the *Test solution* is not more intense than that in the *Standard solution* (0.0025%).

■*Sulfomolybdic acid solution*—Dissolve with heating 2.5 g of ammonium molybdate in 20 mL of water. Dilute 28 mL of sulfuric acid with 50 mL of water, then cool. Mix the two solutions, and dilute with water to 100 mL.■2S (*USP29*)

Change to read:

Limit of potassium (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)—

Test solution—Transfer 1.00 g of Sodium Chloride to a 100-mL volumetric flask, add water and swirl to dissolve, dilute with water to volume, and mix.

Standard solution—[NOTE—The *Standard solution* and the *Test solution* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.] Dissolve 1.144 g of potassium chloride, previously dried at 105° for 3 hours, in water; dilute with water to 1000 mL; and mix. This solution contains the equivalent of 600 µg of potassium per mL. Dilute as required to obtain not fewer than three solutions at concentrations that span the expected value in the *Test solution*.

Procedure—Using atomic ~~absorption~~

■emission■1S (*USP29*) spectrophotometry (see *Spectrophotometry and Light-Scattering* ⟨851⟩), measure, at least three times, the emission intensity of the *Test solution* and the *Standard solution* using an air–acetylene flame and a wavelength of 766.5 nm. Prepare a calibration curve from the mean of the readings obtained with the *Standard solution,* and determine the concentration of potassium in the *Test solution:* not more than 0.05% is found.

BRIEFING

Sodium Lactate Injection, *USP 28* page 1787. It is proposed to delete *Identification* test *B* because it is an odor test, and there are potential safety concerns.

BRIEFING

Sodium Phosphates Rectal Solution, *USP 28* page 1792. It is proposed to add a blank determination to the *Assay,* to be consistent with USP general chapter *Titrimetry* ⟨541⟩. This change will also affect the *Assay* under *Sodium Phosphates Oral Solution*.

(PA4: E. Gonikberg) RTS—42990-1

Change to read:

Assay—Pipet 5.0 mL of Rectal Solution into a 250-mL beaker, and add 15.0 mL of 0.5 N sodium hydroxide VS and 95 mL of water. Titrate the excess base potentiometrically with 0.5 N hydrochloric acid VS to the first inflection point, at a pH of about 9.2. Record the volume, *A,* in mL, of 0.5 N hydrochloric acid consumed. Continue the titration to the second inflection point, at a pH of about 4.4, and record the total volume, *B,* in mL, of 0.5 N hydrochloric acid required in the titration.

■For a blank determination, transfer 15.0 mL of 0.5 N sodium hydroxide into a 250-mL beaker, add 100 mL of water, and immediately titrate potentiometrically with 0.5 N hydrochloric acid VS. Record the volume, *C,* in mL, of 0.5 N hydrochloric acid consumed.■2S *(USP29)*
Each mL of the volume ~~(15.0 − *A*)~~

■$(C - A)$■2S *(USP29)*
of 0.5 N hydrochloric acid is equivalent to 69.0 mg of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$). Each mL of the volume ~~(*B* − 15.0)~~

■$(B - C)$■2S *(USP29)*
of 0.5 N hydrochloric acid is equivalent to 134.0 mg of dibasic sodium phosphate ($Na_2HPO_4 \cdot 7H_2O$).

BRIEFING

Stavudine Capsules, page 3275 of the *First Supplement.* In the *Assay,* it is proposed to specify the *Standard preparation* in terms of concentration of the Reference Standard rather than specifying the exact quantity, in mg, of Reference Standard needed. This proposal provides flexibility in using an appropriate quantity of the Reference Standard to obtain the desired concentration of the *Standard preparation.*

(PA7b: B. Davani) RTS—42674-1

Change to read:

Assay—[NOTE—All solutions must be prepared immediately prior to use and remain refrigerated until use.]

0.01 M Ammonium acetate—Dissolve 0.77 g of ammonium acetate in about 900 mL of water in a 1000-mL volumetric flask. Dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate* and acetonitrile (95 : 5).

Resolution solution—Dissolve accurately weighed quantities of thymine and thymidine in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of 0.1 µg of each component per mL.

Standard preparation— ~~Transfer about 50 mg of USP Stavudine RS, accurately weighed, to a 500-mL volumetric flask, and dissolve in about 200 mL of water, sonicate, dilute with water to volume, and mix.~~

■Using sonication, dissolve an accurately weighed quantity of USP Stavudine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.1 mg per mL.■2S *(USP29)*

Assay preparation—Open not fewer than 3 Capsules, and dissolve the contents quantitatively in water. Dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a concentration of about 0.1 mg of stavudine per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 268-nm detector and a 4.6-mm × 3.3-cm column that contains packing L1. The flow rate is about 0.7 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between thymine and thymidine is not less than 2.0, and thymine is resolved from the void volume. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for the stavudine peak is between 2.8 and 5.0 minutes; the column efficiency is not less than 800 theoretical plates; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of stavudine ($C_{10}H_{12}N_2O_4$) in each Capsule taken by the formula:

$$C(V/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Stavudine RS in the *Standard preparation; V* is the volume, in mL, used to prepare the *Assay preparation; N* is the number of Capsules taken to prepare the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Succinylcholine Chloride, *USP 28* page 1807 and page 74 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to delete the test for *Limit of ammonia salts* because it is an odor test, and there are potential safety concerns. The procedure for *Chromatographic purity, Test 1* is revised to clarify the data obtained from the *System suitability solution* and the *Standard solution.*

(PA1: K. Russo) RTS—42915-1; 42936-1

Delete the following:

■~~**Limit of ammonium salts**—To about 200 mg add 5 mL of sodium carbonate TS, and bring to a boil: no odor of ammonia is evolved.~~■2S (*USP29*)

Change to read:

Chromatographic purity—

TEST 1—

Buffer solution—Prepare a solution in water containing 3.85 g per L of 1-pentanesulfonic acid, 2.9 g per L of sodium chloride, and 1% (v/v) of 1 N sulfuric acid.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (5 : 95).

System suitability solution—Dissolve accurately weighed quantities of citric acid and succinic acid in *Mobile phase* to obtain a solution containing about 0.5 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Succinylmonocholine Chloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Test solution—Transfer about 100 mg of Succinylcholine Chloride, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Samples are maintained at a temperature of about 4° during the analysis. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.22 for succinic acid, 0.32 for the doublet of peaks quantitated as a single component, 0.49 for succinylmonocholine chloride, and 1.0 for succinylcholine chloride; the resolution, *R,* between citric acid and succinic acid is not less than 2.9; and the relative standard deviation for replicate injections is not more than 3.0%.~~

■the resolution, *R,* between citric acid and succinic acid is not less than 2.9. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3.0%.■2S (*USP29*)

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Begin integration after the edetate disodium peak, if present (retention time is about 3.5 minutes).

■The relative retention times are about 0.22 for succinic acid, 0.32 for the doublet of peaks quantitated as a single component, 0.49 for succinylmonocholine chloride, and 1.0 for succinylcholine chloride.■2S (*USP29*)

Calculate the percentage of each impurity in the portion of Succinylcholine Chloride taken by the formula:

$$10C(r_i / r_S)F$$

in which C is the concentration, in mg per mL, of USP Succinylmonocholine Chloride RS in the *Standard solution;* r_i is the peak area for each impurity obtained from the *Test solution;* r_S is the succinylmonocholine chloride peak area obtained from the *Standard solution;* and F is the response factor (0.63 for succinic acid): not more than 0.1% of succinic acid is found; not more than 0.4% of the doublet of peaks quantitated as a single component is found; not more than 0.4% of succinylmonocholine chloride is found; and not more than 0.2% of any other individual impurity is found.

TEST 2 (LIMIT OF CHOLINE)—

Solution A—Prepare a solution in water containing 5% (v/v) of acetonitrile and 5% (w/v) of 0.1 M 1-hexanesulfonic acid.

Solution B—Prepare a solution of acetonitrile and water (1 : 1).

Mobile phase—Use variable amounts of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS and sodium chloride in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.05 mg per mL and ~~0.5~~ ▲0.01▲*USP29* mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.5 mg per mL.

Standard solution—Dilute 1 mL of the *Standard stock solution* with water to 50 mL.

Test solution—Transfer an accurately weighed quantity of Succinylcholine Chloride, about 50 mg, to a 25-mL flask. Dissolve in and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a suitable device for chemical suppression, a conductivity detector at 30 µS and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The eluant flow is about 1 mL per minute, and uses a suitable regenerant flow rate at 50 mA output. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–16	100→0	0→100	linear gradient
16–25	0	100	isocratic
25–27	0→100	100→0	linear gradient
27–40	100	0	isocratic

In-Process Revision

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between sodium and choline is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of choline in the portion of Succinylcholine Chloride taken by the formula:

$$37.5C(r_C / r_S),$$

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* and r_C and r_S are the choline peak areas obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% of choline is found, ~~Calculate the percentage of any other impurity present by the formula:~~

~~$50C(r_i / r_s),$~~

~~in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_s is the choline peak area obtained from the *Standard solution:*~~

▲and▲*USP29*
not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being added.

BRIEFING

Technetium Tc 99m Fanolesomab Injection, page 448 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to revise the *Packaging and storage* section in accordance with the current policies of the Packaging, Storage and Distribution Expert Committee.

(PA5: A.Wilk) RTS—42996-1

Add the following:

▲Technetium Tc 99m Fanolesomab Injection

» Technetium ^{99m}Tc Fanolesomab Injection is a sterile, nonpyrogenic preparation of anti-CD15 antibody, a partially reduced murine IgM monoclonal antibody that is labeled with ^{99m}Tc and is suitable for intravenous administration. It may contain reducing agents, buffers, and stabilizers. It contains no antimicrobial agents. Other chemical forms of radioactivity do not exceed 10 percent of the total radioactivity. *[Caution—Components of the commercial kit that are used to prepare the Injection are not to be administered directly to the patient.]*

Change to read:

Packaging and storage—Preserve in single-dose containers. ■Store in the refrigerator. [NOTE—After radiolabeling, the Technetium Tc 99m Fanolesomab Injection can be kept at room temperature.]■2S *(USP29)*

Labeling—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* ⟨1⟩: the time and date of calibration; the amount of ^{99m}Tc as labeled fanolesomab expressed in MBq (or mCi) per mL at the time of calibration; the expiration date and time; the storage temperature; and the statement "Caution—Radioactive Material". The labeling indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours and that, in making dosage calculations, correction is to be made for radioactive decay. The labeling also states that the Injection is to be used within 6 hours following constitution.

USP Reference standards ⟨11⟩—*USP Endotoxin RS.*

Bacterial endotoxins ⟨85⟩**:** not more than 0.1 Endotoxin Unit per µg of fanolesomeb in the prepared Injection.

pH ⟨791⟩**:** between 5.8 and 6.6.

Particulate matter ⟨788⟩—It meets the requirements for particulate matter specified for small-volume injections.

In-Process Revision

Radiochemical purity—

SYSTEM 1: *(free pertechnetate ^{99m}Tc)*

Adsorbent: instant thin-layer chromatography (ITLC) strips[1], heat-treated at 110° for 30 minutes.

Test solution—Use the Injection.

Application volume—Apply 3 µL of the *Test solution* to the origin.

Developing solvent system: methyl ethyl ketone (MEK).

Procedure—Apply the *Test solution* about 2 cm from the bottom of the *Adsorbent* strip. Immediately develop by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm from the origin. The radiochemical impurity, free pertechnetate ^{99m}Tc, migrates to the top section, while colloidal ^{99m}Tc and technetium ^{99m}Tc fanolesomab remain near the origin on the bottom section. Allow the chromatogram to air-dry. Determine the distribution of radioactivity on the chromatogram by cutting the developed strip at 4 cm from the bottom and then separately measuring and recording the net radioactivity in the top and bottom sections using a suitable radiation detector. Calculate the percentage of free pertechnetate ^{99m}Tc in the Injection by the formula:

$$100\,A_T/(A_T + A_B),$$

in which A_T is the radioactivity measured on the top section; and A_B is the radioactivity measured on the bottom section.

SYSTEM 2: *(colloidal ^{99m}Tc)*

Adsorbent—Use affinity thin-layer chromatography (ATLC) strips[2] that have been soaked in a solution of 50% newborn calf serum (NBCS)[3] in water and allowed to air-dry overnight.

Test solution—Use the Injection.

Developing solvent system: 4% alcohol in 0.3 M sodium chloride.

Application volume—Prespot the point of origin with 3 µL of *Developing solvent system* followed immediately by 3 µL of the *Test solution*.

Procedure—Apply the *Test solution* about 2 cm from the bottom of the *Adsorbent* strip. Immediately develop the strip by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm above the origin. The radiochemical impurity, colloidal ^{99m}Tc, will remain at the origin, while free pertechnetate ^{99m}Tc and technetium ^{99m}Tc fanolesomab migrate close to the solvent front. Remove the strip, and allow to air-dry. Cut the strip 4 cm from the bottom, and separately measure and record the background-corrected radioactivity found in the top and bottom sections, using a suitable radiation detector. Calculate the percentage of colloidal ^{99m}Tc by the formula:

$$100\,A_B/(A_B + A_T)$$

in which A_B is the radioactivity measured in the bottom section; and A_T is the radioactivity measured in the top section. The sum of the result for free pertechnetate ^{99m}Tc in *System 1* and for colloidal ^{99m}Tc measured in *System 2* is not more than 10%.

[1] ITLC strips for free pertechnetate ^{99m}Tc may be obtained from Sunset Scientific Strips LLC (product number 10503), P.O. Box 3895, Albuquerque, NM 87190-3895.

[2] ATLC strips for colloidal ^{99m}Tc may be obtained from Sunset Scientific Strips LLC (product number 10506), P.O. Box 3895, Albuquerque, NM 87190-3895.

[3] NBCS (heat inactivated) may be obtained from GIBCO/Invitrogen Corp. (catalog number 26010-074), 1600 Faraday Avenue, P.O. Box 6482, Carlsbad, CA 92008.

Immunoreactivity—

Adsorbent—Use affinity thin-layer chromatography (ATLC) strips[2] that have been soaked in a solution of 50% newborn calf serum (NBCS)[3] in water and allowed to air-dry overnight.

Diluent—Prepare a mixture of NBCS and pH 7.4 phosphate-buffered saline (PBS) (1 : 1).

Test solution—Use the Injection diluted with *Diluent* (1 in 4).

REFERENCE MATERIALS—

Positive control: CD15 positive HL-60 (ATCC No. CCL240) formalin fixed-cell suspension (12×10^6 cells per mL).

Negative control: CD15 negative Raji (ATCC No. CCL86) formalin fixed-cell suspension (12×10^6 cells per mL).

Application volume—Thaw, and mix the HL-60 and Raji cell stock suspensions. Dispense 90-µL aliquots into individual incubation tubes. Add 3 µL of the *Test solution* to each incubation tube, and mix on a vortex mixer for 5 seconds. Incubate for 30 minutes with gentle rocking at $37 \pm 2^\circ$.

Developing solvent system—Prepare a solution containing 0.05% sodium azide and 4% alcohol in 10 mM phosphate-buffered saline, pH 7.4 (PBS). Pass through a filter having a porosity of 0.22 µm.

Procedure—Mix each incubation tube on a vortex mixer. Immediately remove, and apply 10 µL of sample to the origin of the *Adsorbent* ATLC strip (2 cm from bottom). Allow the sample to adsorb onto the strip, and immediately develop the strip by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm from the origin. Remove the strips, and allow to air-dry. Cut both strips 4 cm above the origin. Separately measure and record the background-corrected radioactivity found on the top and bottom sections of each strip, using a suitable radiation detector. Immunoreactive technetium ^{99m}Tc fanolesomab, bound to the HL-60 cells, remains at the origin, while nonbound forms of ^{99m}Tc migrate away from the origin. Nonspecific binding is measured using the Raji negative control cells. Calculate the specific immunoreactive binding by the formula:

$$[100A_{B(HL\text{-}60)}/(A_{B(HL\text{-}60)} + A_{T(HL\text{-}60)})] - [100A_{B(Raji)}/(A_{B(Raji)} + A_{T(Raji)})]$$

in which $A_{B(HL\text{-}60)}$ and $A_{B(Raji)}$ are the radioactivity of the HL-60 positive control cells and Raji negative control cells, respectively, measured on the bottom section of each strip; and $A_{T(HL\text{-}60)}$ and $A_{T(Raji)}$ are the radioactivity of the HL-60 positive control cells and Raji negative control cells measured on the top section of each strip. A minimum specific immunoreactive binding of 40% is required for the CD15-positive HL-60 cells.

Other requirements—It meets the requirements for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It also meets the requirements under *Injections* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility,* the latter test being started on the date of manufacture.

Assay for radioactivity ⟨821⟩**—**Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in MBq (or mCi) per mL, of Injection by use of a calibrated system.▲*USP29*

In-Process Revision

BRIEFING

Triclosan, *USP 28* page 1971 and page 2054 of *PF* 30(6) [Nov.–Dec. 2004]. It is proposed to revise the *Standard preparation* and the *Assay preparation* in the *Assay* to replace dichloromethane, a potential occupational carcinogen, with ethyl acetate. It is also proposed in the *Assay* to further dilute the *Standard preparation* and the *Assay preparation* and to increase the injected volume in the *Procedure* to minimize column deterioration.

Limit of monochlorophenols and 2,4-dichlorophenol—

Phosphate buffer—Transfer about 1.38 g of anhydrous monobasic sodium phosphate and about 1.42 g of dibasic sodium phosphate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Phosphate buffer* (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Quantitatively dissolve accurately weighed quantities of ~~4-chlorophenol and 2,4-dichlorophenol~~

▲USP Parachlorophenol RS and USP 2,4-Dichlorophenol RS▲*USP29*
in acetonitrile, dilute with an equal volume of water, and mix. Transfer a portion of this solution to a suitable container, and dilute quantitatively, and stepwise if necessary, with a mixture of acetonitrile and water (1 : 1) to obtain a solution having known concentrations of about 0.5 µg of ~~4-chlorophenol~~

▲parachlorophenol▲*USP29*
and 0.1 µg of 2,4-dichlorophenol per mL.

Test solution—Transfer about 250 mg of Triclosan, accurately weighed, to a 25-mL low-actinic volumetric flask, dissolve in 20 mL of acetonitrile, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a coulometric electrochemical detector with electrode 1 set at 0.45 V and electrode 2 set at 0.75 V, both having a positive (oxidative) polarity, and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 9.0% for 2,4-dichlorophenol.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The peak responses for ~~4-chlorophenol~~

▲parachlorophenol▲*USP29*
and 2,4-dichlorophenol in the chromatogram of the *Test solution* are not greater than the corresponding peaks in the chromatogram of the *Standard solution*.

Change to read:

Limit of 1,3,7-trichlorodibenzo-*p*-dioxin, 2,8-dichlorodibenzo-*p*-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (70 : 30 : 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Standard solution*—Transfer accurately weighed quantities of 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran to a volumetric flask, add accurately measured volumes of 1,3,7-trichlorodibenzo-*p*-dioxin and 2,8-dichlorodibenzo-*p*-dioxin, and dissolve in methanol. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having concentrations of about 0.5, 1.0, 0.5, and 1.0 µg per mL, respectively.~~

▲▲*USP29*
Test solution—Transfer about 2.0 g of Triclosan, accurately weighed, to a screw-capped centrifuge tube, add 5 mL of 2 N potassium hydroxide, and shake for 10 minutes to dissolve. Add 3 mL of *n*-hexane, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, add another 3 mL of *n*-hexane to the aqueous layer, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to the previous extract, discard the aqueous layer, add 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 minutes, and allow the phases to separate. Discard the aqueous layer, add another 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of methanol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the ~~*Standard solution,*~~

▲USP Triclosan Related Compounds Mixture A RS,▲*USP29*
and record the peak responses as directed for *Procedure:* the relative retention times are about 0.59 for 2,8-dichlorodibenzofuran, 0.71 for 2,8-dichlorodibenzo-*p*-dioxin, 0.88 for 2,4,8-trichlorodibenzofuran, and 1.0 for 1,3,7-trichlorodibenzo-*p*-dioxin; and the relative standard deviation for replicate injections is not more than 15.0%, determined from the 2,8-dichlorodibenzo-*p*-dioxin peak.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. ~~The peak responses for 2,8-dichlorodibenzofuran, 2,8-dichlorodibenzo-*p*-doxin, 2,4,8-trichlorodibenzofuran, and 1,3,7-trichlorodibenzo-*p*-dioxin obtained from the *Test solution* are not greater than the corresponding peaks obtained from the *Standard solution*~~

In-Process Revision

▲Calculate the concentration of each analyte in the portion of Triclosan taken by the formula:

$$(C/W)(r_i/r_S)$$

in which C is the concentration, in µg per mL, of the respective analyte in the USP Triclosan Related Compounds Mixture A RS; W is the weight, in g, of Triclosan taken; and r_i and r_S are the peak responses for the respective analyte obtained from the *Test solution* and the USP Triclosan Related Compounds Mixture A RS, respectively: not more than 0.25 ppm of 2,8-dichlorodibenzofuran is found; not more than 0.5 ppm of 2,4,8-trichlorodibenzofuran is found; not more than 0.25 ppm of 1,3,7-trichlorodibenzo-*p*-dioxin is found; and not more than 0.5 ppm of 2,8-dichlorodibenzo-*p*-dioxin is found.▲*USP29*

to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 15-m capillary column with phase G3. The carrier gas is helium maintained at about 6 psi. The injection port temperature is maintained at 34° and is increased rapidly to 200° immediately after the injection, the column temperature is maintained at 34°, and the detector temperature is maintained at 260°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about ~~0.5~~

■2.0■2S (*USP29*)
µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, increase the column temperature by 20° per minute to 140°, then increase column temperature by 4° per minute to 240°, maintain this temperature for not less than 5 minutes, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_7Cl_3O_2$ in the portion of Triclosan taken by the formula:

~~$10C(r_U/r_S)$~~

■$100C(r_U/r_S)$■2S (*USP29*)

in which C is the concentration, in mg per mL, of USP Triclosan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Trimethoprim, *USP 28* page 1987. On the basis of new stability data received, it is proposed to change the storage condition in *Packaging and storage* to room temperature.

(PA7b: B. Davani) RTS—42999-1

Change to read:

Packaging and storage—Preserve in tight, light-resistant containers. ~~Store at 25°, excursions permitted between 15° and 30°.~~

■Store at room temperature.■2S (*USP29*)

In-Process Revision

BRIEFING

Tryptophan, *USP 28* page 1999. It is proposed to revise the tests for *Chloride* and for *Sulfate* to add a *Note* indicating that heating of the sample preparation may be necessary to assist in dissolution of the sample.

(DSN: L. Evans) RTS—42190-2

Change to read:

Chloride ⟨221⟩—A 0.73-g portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.05%).

■[NOTE—Gently heat the sample preparation to dissolve, if necessary.]■2S (*USP29*)

Change to read:

Sulfate ⟨221⟩—A 0.33-g portion shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.03%).

■[NOTE—Gently heat the sample preparation to dissolve, if necessary.]■2S (*USP29*)

BRIEFING

Tylosin Tartrate. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The *Content of tylosins* test is an HPLC method utilizing a 4.6-mm × 20-cm column that contains 5-µm packing L1. USP has received validation data indicating that a Zorbax SB C18 column is suitable for this method. Interested parties are encouraged to submit comments.

(VET: I. DeVeau) RTS—41977-1

In-Process Revision

Add the following:

■Tylosin Tartrate

(10*E*,12*E*)-(3*R*,4*S*,5*S*,6*R*,8*R*,14*S*,15*R*)-14-[(6-deoxy-2,3-di-*O*-methyl-β-D-allopyranosyl)oxymethyl]-5-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-ribo-hexopyranosyl)-3-dimethylamino-β-D-glucopyranosyl]oxy]-6-formylmethyl-3-hydroxy-4,8,12-trimethyl-9-oxoheptadeca-10,12-dien-15-olide.

Tylosin A (Tylosin) 916.10 [*1401-69-0*].

» Tylosin Tartrate is a tartrate of a mixture of macrolide antibiotic substances, or the mixture of such substances, produced by the growth of *Streptomyces fradiae,* or by any other means. Its potency is not less than 800 µg of tylosin per mg, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, protected from light, moisture, and excessive heat. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—*USP Tylosin RS*. *USP Tylosin Tartrate RS*.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak for tylosin A in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the test for *Content of tylosins*.

C: It responds to the test for *Tartrate* ⟨191⟩.

pH ⟨791⟩**:** between 5.0 and 7.2 in a solution prepared by dissolving 0.25 g in 10 mL of carbon dioxide-free water.

Loss on drying ⟨731⟩—Dry about 1 g, accurately weighed, in vacuum at a pressure of not more than 5 mm of mercury at 60° for 3 hours: it loses not more than 4.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 2.5%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Limit of tyramine—In a 25.0 mL volumetric flask, dissolve 50.0 mg of tylosin in 5.0 mL of a 3.4 g per L solution of phosphoric acid. Add 1.0 mL of pyridine and 2.0 mL of a saturated solution of ninhydrin (about 40 g per L). Close the flask with aluminum foil, and heat in a water bath at 85° for 30 minutes. Cool the solution rapidly to room temperature, and dilute with water to volume. Mix, and measure immediately the absorbance (see *Spectrophotometry and Light-Scattering* ⟨851⟩) of the solution at 570 nm against a blank solution prepared in a similar manner. The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 mL of a 35 mg per L solution of tyramine in a 3.4 g per L solution of phosphoric acid. If intended for use in the manufacture of parenteral dosage forms, the absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 mL of a 15 mg per L solution of tyramine in a 3.4 g per L solution of phosphoric acid.

Content of tylosins—

Mobile phase—Prepare a mixture of filtered 200 g per L of sodium perchlorate, previously adjusted with 1 N hydrochloric acid to a pH of 2.5 ± 0.1, and acetonitrile (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Tylosin RS in a mixture of acetonitrile and water (1 : 1) to obtain a solution having a known concentration of about 0.2 mg per mL. [NOTE—Prepare the *Standard solution* immediately before use.]

Test solution—Dissolve an accurately weighed quantity of Tylosin in a mixture of acetonitrile and water (1 : 1) to obtain a solution having a known concentration of about 0.2 mg per mL. [NOTE—Prepare the *Test solution* immediately before use.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 290-nm detector and a 4.6-mm × 20-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute and the column temperature is maintained at 35°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the order of elution is tylosin C, tylosin B, tylosin D, and tylosin A with relative retention times of about 0.5, 0.6, 0.8, and 1.0 minutes, respectively; the resolution of the peaks representing tylosin D and tylosin A is not less than 2.0; the tailing factors are not more than 1.5; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms over a period of time equivalent to 1.5 times the elution time of the main tylosin A peak, and measure the peak areas for all the peaks. Calculate the percentages of tylosin A, tylosin B, tylosin C, and tylosin D in the Tylosin taken by the formula:

$$100(r_I / r_S)$$

in which r_I is the area of the tylosin A peak, the tylosin B peak, tylosin C peak, or the tylosin D peak, as appropriate, in the chromatogram obtained from the *Test solution;* and r_S

is the sum of the areas of all of the peaks in the chromatogram obtained from the *Test solution:* the content of tylosin A is not less than 80%; and the sum of the contents of tylosin A, tylosin B, tylosin C, and tylosin D is not less than 95%.

Assay—Proceed as directed for Tylosin under *Antibiotics—Microbial Assays* ⟨81⟩. Prepare the *Test Dilution* as follows. Transfer an accurately weighed quantity of Tylosin Tartrate, equivalent to about 250 mg of tylosin, to a 500-mL volumetric flask, add 50 mL of methanol, and swirl to dissolve. Dilute with *Buffer No. 3* to volume, and mix. Transfer 4.0 mL of this solution to a second 500-mL volumetric flask, dilute with a mixture of *Buffer No. 3* and methanol (1 : 1), and mix. This solution contains about 4 µg of tylosin per mL.■2S (*USP29*)

BRIEFING

Valproic Acid Injection, page 801 of *PF* 31(3) [May–June 2005]. *Valproic Acid Injection,* the title of the proposed monograph for this dosage form, is proposed to be included in the *First Supplement* to *USP 29–NF 24* along with the monograph. However, it is proposed that the title have an official date of October 1, 2007, which is 18 months later than the official date of the *First Supplement,* April 1, 2006. The use of this title would be permitted as of April 1, 2006, but it would not become mandatory until October 1, 2007. The 18-month extension is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the terminology.

(NL: L. Paul) RTS—22708-2

In-Process Revision

Add the following:

■Valproic Acid Injection

•***(Title for this new monograph—to become official October 1, 2007)***•2

» Valproic Acid Injection is a sterile aqueous solution of sodium valproate, formed from the interaction of Valproic Acid and Sodium Hydroxide, in Water for Injection, and one or more suitable buffering or sequestering agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of valproic acid ($C_8H_{16}O_2$). Valproic Acid Injection contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose *Containers for Injection* as described under *Injections* ⟨1⟩, preferably of Type I glass. Store at controlled room temperature, excursions allowed between 15° and 30°.

Labeling—Label it to state the name and quantity of any buffering or sequestering agent used.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Valproic Acid RS.*

Identification—

A: The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: It meets the requirements of the tests for *Sodium* ⟨191⟩.

Bacterial endotoxins ⟨85⟩—It contains not more than 23 USP Endotoxin Units per mL of Injection.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* in *Test for Sterility of the Product To Be Examined.*

pH ⟨791⟩**:** between 7.0 and 9.0.

Particulate matter ⟨788⟩—It meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Internal standard solution—Dissolve a quantity of biphenyl in methylene chloride to obtain a solution containing 5 mg per mL.

Standard stock preparation—Prepare a solution of USP Valproic Acid RS in *Internal standard solution* having a concentration of about 8 mg per mL.

Standard preparation—Transfer 5.0 mL of *Standard stock preparation* into a 50-mL volumetric flask, and dilute with methylene chloride to volume.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to 400 mg of valproic acid, into a suitable container; add about 20 mL of 5% (v/v) hydrochloric acid; shake by mechanical means for 2 minutes; add 50.0 mL of *Internal standard solution;* and shake by mechanical means for 1 hour. Allow the phase to separate (approximately 1 hour). The bottom organic layer remains cloudy, and at times a slight emulsion may persist. The emulsion is easily broken up with the aid of a glass rod. Pipet 5 mL of the extract from the bottom organic layer into a 50-mL volumetric flask, and dilute with methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with 10% phase G34 on 80- to 100-mesh support S1A. The column temperature is maintained at about 155°, the injection port temperature is maintained at about 275°, and the detector block temperature is maintained at about 300°. Dry helium is used as the carrier gas, at a flow rate of about 20 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the resolution, *R,* between the valproic acid and biphenyl peaks is not less than 3.0; and the relative standard deviation of the peak area ratios for replicate injections is not more than 2.0%.

Procedure—Separately inject equal amounts (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the valproic acid and biphenyl peaks. Calculate the quantity, in mg, of valproic acid in the portion of Injection taken by the formula:

$$C(R_U / R_S) D$$

in which C is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard preparation;* R_U and R_S are the peak area ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively; and D is the appropriate dilution factor used to prepare the *Assay preparation.*■1S (*USP29*)

MONOGRAPHS (NF)

BRIEFING

Calcium Silicate, *NF 23* page 2970 and page 595 of *PF* 30(2) [Mar.–Apr. 2004]. On the basis of comments received, it is proposed to replace the current test for *Limit of lead* with a revised version using a graphite furnace atomic absorption method with Zeeman background correction. Additional changes have been added in the revised test proposal for *Limit of fluoride.* It is also proposed to add a new *USP Reference standards* section to include USP Sodium Fluoride RS.

(EMC: C. Sheehan) RTS—41797-1; 41797-2; 41593-1

Change to read:

» Calcium Silicate,

▲crystalline or amorphous,▲*NF24*
is a compound of calcium oxide and silicon dioxide. It contains not less than 4.0 percent of calcium oxide and not less than ~~45.0~~

▲35.0▲*NF24*
percent of silicon dioxide.

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Sodium Fluoride RS.*■2S (*NF24*)

Change to read:

pH ⟨791⟩**:** between 8.4 and ~~10.2,~~

▲11.2,▲*NF24*
determined in a well-mixed aqueous suspension (1 in 20).

Delete the following:

■~~**Lead** ⟨251⟩—Dissolve 1.0 g in 20 mL of 3 N hydrochloric acid, evaporate on a steam bath to about 10 mL, dilute with water to about 20 mL, and cool: the limit is 0.001%.~~■2S (*NF24*)

Add the following:

■**Limit of lead—**

Nitric acid diluent—Transfer 42 mL of nitric acid, 65 percent to a 1000-mL volumetric flask. Dilute with water to volume, and mix.

Test solution—Accurately weigh 2.0 g of Calcium Silicate into a 150-mL beaker. Mix with 50 mL of *Nitric acid diluent.* Cover with a watch glass, and boil for 20 minutes. Allow to cool. With the aid of a vacuum, pass through a glass filter[1] and wash the filter several times with water. Transfer the filtrate into a 100-mL volumetric flask. Dilute with water to volume, and mix.

Matrix modifier solution—Transfer 1.0 mL of palladium matrix modifier and 100 uL of magnesium matrix modifier to a 20-mL volumetric flask. Dilute with water to volume, and mix.

Standard lead solution—Transfer 100 uL of lead standard solution to a 100-mL volumetric flask. Dilute with water to volume, and mix. This solution contains the equivalent of 1.0 µg of lead per mL.

Calibration solutions—To a series of 100-mL volumetric flasks, pipette 0, 1, and 5 mL of the *Standard lead solution*, and dilute with 50 mL of *Nitric acid diluent*. Dilute with water to volume, and mix. These solutions contain 0, 0.01, and 0.05 µg of lead per mL, respectively.

System suitability solution—Transfer 5 mL of *Standard lead solution* and 50 mL of *Nitric acid diluent* into a 100-mL volumetric flask. Dilute with water to volume, and mix. This solution contains the equivalent of 0.05 µg of lead per mL.

Procedure—Concomitantly determine the absorbances of the *Calibration solutions, Test solution,* and *System suitability solution* at the lead emission line at 283.3 nm with a suitable graphite furnace atomic absorption spectrophotometer equipped with a lead hollow-cathode lamp using argon as the carrier gas and an adequate means of Zeeman background correction. Under typical conditions, the *Test solution* and *Calibration solutions* volumes are 20 µL, the

[1] Glass filter: Whatman GF/B glass microfiber filters, 1.0 µm, Watman no. 1821-090. Available as catalog number 28497-492, from VWR, www.vwr.com.

volume of the *Matrix modifier solution* is 10 µL, the injection temperature is 20°, and the oven conditions are as follows (see *Table 1*). [NOTE—These conditions may be optimized for each instrument.]

Table 1.

Step	Temperature
Drying 1	110°
Drying 2	130°
Pyrrolysis	950°
Read	1800°
Clean out	2450°

Run the calibration curve; the correlation coefficient is not less than 0.99; and the recovery for the *System suitability solution* is between 85% and 115%. Calculate the percentage of lead concentration in the *Test solution:* not more than 0.001%, is found.■2S *(NF24)*

Change to read:

Limit of fluoride—

~~NOTE—Store all solutions in plastic containers.~~

~~*Buffer solution*—Add 800 mL of hot water to 74.4 g of edetate disodium and 24.2 g of tris(hydroxymethyl)aminomethane, and stir until dissolved. Adjust with 5 N sodium hydroxide to a pH of 7.5 to 7.6. Allow the solution to cool, and adjust with 5 N sodium hydroxide to a pH of 8.0. Dilute with water to 1000 mL, and mix.~~

~~*Electrode system*—Use a fluoride specific, ion indicating electrode and a calomel reference electrode connected to a pH meter capable of measuring potentials with a reproducibility of ± 0.2 mV (see *pH* ⟨791⟩).~~

~~*Standard stock solution*—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS quantitatively in water to obtain a solution containing 221 µg per mL. Each mL of this stock solution contains 100 µg of fluoride ion.~~

~~*Standard solutions*[NOTE—Prepare on the day of use.] Transfer 10.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains 10 µg of fluoride ion per mL *(Standard solution A).* Transfer 1.0 mL of *Standard stock solution* to a second 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains 1.0 µg of fluoride ion per mL *(Standard solution B).*~~

~~*Test solution*—Transfer 5.0 g of Calcium Silicate to a 150-mL polytef beaker. Add 40 mL of water and 20 mL of 1 N hydrochloric acid. Heat to near boiling for 1 minute, stirring continuously. Cool in an ice bath, transfer the suspension to a 100-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Procedure*—Transfer 20.0 mL of *Standard solution A, Standard solution B,* and the *Test solution* to separate polytef beakers, add 10.0 mL of *Buffer solution* to each beaker, and stir with a plastic-coated stirring bar. Concomitantly measure the potentials, in mV, of the solutions. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the ion-specific electrode.] Plot the logarithms of the fluoride ion concentrations, in µg per mL, of the *Standard solutions* versus potential, in mV. From the measured potential of the *Test solution* and the standard response line, determine the concentration, *C,* in µg per mL, of fluoride ion in the *Test solution.* Calculate the quantity, in µg of fluoride per g of Calcium Silicate by multiplying *C* by 20. The limit is 10 µg per g.~~

■NOTE—Store all solutions in plastic containers.

Buffer solution—Transfer 147 g of sodium citrate to a 500-mL volumetric flask, dissolve in and dilute with water to volume.

Ionic strength adjustment buffer—Transfer 42 mL of hydrochloric acid, 121 g of tris(hydroxymethyl)aminomethane, and 115 g of sodium tartrate to a 500-mL volumetric flask containing 250 mL of water. Stir to dissolve, and dilute with water to volume.

Electrode system—Use a fluoride-specific, ion-indicating electrode and a ~~calomel~~ suitable reference electrode connected to a pH meter capable of measuring potentials with a reproducibility of ± 0.2 mV (see *pH* ⟨791⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS in water to obtain a solution containing 221 µg per mL. Each mL of this stock solution contains 100 µg of fluoride ion.

Test solution—Transfer about 2.0 g of Calcium Silicate, accurately weighed, to a 100-mL ~~plastic~~ polytef beaker containing a magnetic stir bar. Add 20 mL of water and 2.0 mL of hydrochloric acid. Cover with a watch glass, and heat ~~with stirring~~ to a vigorous boil for 1 minute, stirring continuously. Remove from heat, and cool. Transfer the cooled suspension to a 100-mL ~~plastic~~ polytef beaker. Add 25 mL of *Buffer solution,* and adjust with ammonium hydroxide or hydrochloric acid to a pH between 5 and 6. Add 50 mL of *Ionic strength adjustment buffer* and water to make 100 mL of solution.

In-Process Revision

Standard response line—Obtain a standard response line with four standard solutions containing 0, 0.10, 0.20, and 0.40 µg per mL of fluoride as follows. Add 23 mL of water, 2 mL of hydrochloric acid, and 25 mL of *Buffer solution* to a 100-mL plastic beaker. Adjust with ammonium hydroxide to a pH between 5 and 6, and add *Ionic strength adjustment buffer* to obtain 100 mL of solution. Insert the electrode into the solution, stir for at least 15 minutes, and record the potential for the *Standard solution* containing 0 µg of fluoride per mL. When the electrode has stabilized, add 100 µL of the *Standard stock solution* to the beaker, and stir. Allow the electrode to stabilize for 5 minutes, and measure the potential for the *Standard solution* containing 0.10 µg of fluoride per mL. Similarly add another 100 µL and 200 µL of the *Standard stock solution* and record the potential for the *Standard solutions,* containing 0.20 µg per mL of fluoride and 0.40 µg per mL of fluoride, respectively. After each addition, continue to stir for 5 minutes before recording the reading.

Procedure—Insert the calibrated electrode into the *Test solution,* stir for 5 minutes, and record the measurement. From the measured potential of the *Test solution* and the standard response line, determine the concentration, *C,* in µg per mL, of fluoride ion in the *Test solution.* Calculate the quantity, in µg per g of fluoride in Calcium Silicate by the formula:

$$100C/W$$

in which *W* is the weight, in g, of Calcium Silicate taken. The limit is 10 µg per g.■2S *(NF24)*

■*Infrared Absorption* ⟨197F⟩.■2S (*NF24*)

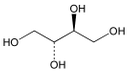
BRIEFING

Erythritol. Because there is no existing monograph for this excipient, a new monograph, based on the monograph appearing in the *European Pharmacopoeia* 5.0, is proposed. The liquid chromatographic procedure in the *Assay* is based on analysis performed with a brand of L17 column or equivalent.The typical retention time for erythritol is about 11 minutes. Interested parties are encouraged to comment on the proposal.

(EMC: C. Sheehan; AMB: R. Tirumalai; NL: L. Paul) RTS—42741-1

Add the following:

■Erythritol



$C_4H_{10}O_4$ 122.12

1,2,3,4-Butanetetrol.

Butane1,2,3,4-tetrol (*meso*-erythritol) [*149-32-6*].

» Erythritol is obtained by fermentation of starch enzyme hydrolysate (from starches such as wheat and corn). It is obtained from the fermentation broth of suitable osmophilic yeasts such as *Moniliella pollinis* or *Trichosporonoides megachilien-*

In-Process Revision

sis. It contains not less than 96.0 percent and not more than 102.0 percent of $C_4H_{10}O_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Erythritol RS.*

Identification—

A: *Infrared Absorption* ⟨191K⟩.

B: *Melting range* ⟨741⟩: between 119° and 123°.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours; it loses not more than 0.2% of its weight. Use about 8 g of sample.

Water, *Method I* ⟨921⟩**:** 0.5%.

Conductivity—Dissolve 20.0 g of Erythritol in a 100-mL volumetric flask, and dilute with the same solvent to volume. Using an appropriate conductivity meter, choose a conductivity cell that is appropriate for the properties and conductivity of the solution to be examined. Use a certified reference material[1] —for example, a solution of potassium chloride—that is appropriate for the measurement. The conductivity value of the certified reference material should be near the expected conductivity value of the solution to be examined. After calibrating the apparatus with a certified reference material solution, rinse the conductivity cell several times with water and at least twice with the aqueous solution to be examined. Measure the conductivity of the solution at a temperature of 20° while stirring gently with a magnetic stirrer: the conductivity is not more than 20 µS per cm.

[1] Commercially available conductivity calibration solutions for conductivity meter standardization, standardized by methods traceable to the National Institute of Standards and Technology (NIST), may be used. Solutions prepared according to instructions given in the American Society for Testing and Materials (ASTM) Standard D1125 may be used, provided that the conductivity of the resultant solution is the same as that of the solution prepared from the NIST-certified material.

Microbial limits ⟨61⟩—The total aerobic microbial count using the *Plate Method* is not more than 10^3 cfu per g, and the total combined molds and yeasts count is not more than 102 cfu per g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Limit of lead—

Standard lead solution—Prepare as directed for *Special Reagents* under *Heavy Metals* ⟨231⟩.

Test solution—Dissolve 20.0 g of Erythritol in diluted acetic acid, and dilute with diluted acetic acid to 100 mL. Add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (containing about 10 g of ammonium pyrrolidinedithiocarbamate per L) and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution—Prepare as directed for *Test solution,* except to omit the use of Erythritol.

Standard solutions—Prepare as directed for *Test solution*, except to prepare three solutions by adding 0.5 mL, 1.0 mL, and 1.5 mL of *Standard lead solution* in addition to the 20.0 g of Erythritol.

Procedure—Set the atomic absorption spectrophotometer to zero, using methyl isobutyl ketone previously treated as described under *Test solution,* but without sample added. Use a lead hollow-cathode lamp as source of radiation, an air–acetylene flame, and an analysis wavelength of 283.3 nm. Introduce the *Test solution* and each of the three *Standard solutions* into the instrument. Record the steady absorbance reading. Plot the absorbance readings against the known concentrations of added lead (in µg), and draw a straight line. Extrapolate the line until it meets the concen-

tration axis, which is equal to the concentration, in mg per kg, of nickel in the sample. Not more than 0.5 mg per kg is found.

Related compounds—

Mobile phase, Assay preparation, Standard preparation, System suitability preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Standard solution—Transfer 2.0 mL of the *Standard preparation* to a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 1 mg of erythritol per mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity found by the formula:

$$VC/W\,(r_i/r_S)$$

in which V is the volume, in mL, of the *Test solution;* C is the concentration, in mg per mL, of Erythritol in the *Standard solution;* W is the amount of Erythritol, in mg, taken to prepare the *Test solution;* r_i is the peak response for the *Test preparation;* and r_S is the response of the erythritol peak in the *Standard solution:* not more than 2.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

Assay—

Mobile phase—Use filtered and degassed 0.01% sulfuric acid.

Standard preparation—Dissolve an accurately weighed quantity of USP Erythritol RS in water to obtain a solution having a known concentration of about 50 mg per mL.

Assay preparation—Transfer 500 mg of Erythritol, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

System suitability preparation—Transfer accurately weighed amounts of USP Erythritol RS and glycerol to a suitable volumetric flask, and dissolve in and dilute with water to obtain a solution having concentrations of about 0.05 mg per mL each.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.8-mm × 30-cm column or equivalent that contains packing L17. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 70°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for erythritol and 1.1 for glycerol; and the resolution, R, between erythritol and glycerol is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) each of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms over a period of three times the retention time of erythritol, and measure the peak responses. Calculate the amount, in mg, of $C_4H_{10}O_4$ in the portion of Erythritol taken by the formula:

$$VC(r_U/r_S)$$

in which V is the volume, in mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Erythritol RS in the *Standard preparation;* and r_U and r_S are the peak responses for erythritol obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*NF24*)

Identification—

~~**A:** Add about 1 g to 100 mL of water, previously heated to 60°, and stir: a slurry is formed that swells and disperses on cooling to form a colloidal solution.~~

~~**B:** Heat 10 mL of the solution prepared in *Identification* test *A* on a water bath while stirring: at a temperature of 45° the solution becomes cloudy, or a flocculant precipitate is formed, which disappears on cooling.~~

~~**C:** Place 1 mL of the solution prepared in *Identification* test *A* on a glass plate, and allow the water to evaporate: a thin, self sustaining film is formed.~~

■*Infrared Absorption* ⟨197K⟩.■2S (*NF24*)

BRIEFING

Isobutane, *NF 23* page 3021. It is proposed to delete the test for *Limit of sulfur compounds* because it is an odor test, and there are potential safety concerns.

(PA1: K. Russo) RTS—42915-3

Delete the following:

■~~**Limit of sulfur compounds**—Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose: the odor is free from the characteristic odor of sulfur compounds.~~■2S (*NF24*)

BRIEFING

Maltol, page 3358 of the *First Supplement*. It is proposed to revise the monograph to add a *Packaging and storage* section.

(EMC: D. Bempong) RTS—42704-1

Add the following:

■**Packaging and storage—**Preserve in tight containers, protected from light. No storage requirements specified.■2S (*NF24*)

BRIEFING

Monoethanolamine, *NF 23* page 3040. It is proposed to add a spectrophotometric identification test to this monograph employing *Infrared Absorption* ⟨197F⟩ and to include a new Reference Standard, USP Monoethanolamine RS, to be used to perform this test.

(EMC: C. Sheehan) RTS—42836-2

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Monoethanolamine RS.*■2S (*NF24*)

Add the following:

■**Identification,** *Infrared Absorption* ⟨197F⟩.■2S (*NF24*)

BRIEFING

Paraffin, *NF 23* page 3045. On the basis of comments received, it is proposed to revise the current test tube specifications as described in the test for *Readily carbonizable substances.*

(EMC: C. Sheehan) RTS—42641-1

Change to read:

Readily carbonizable substances ⟨271⟩—Use a clean, dry, heat-resistant, glass-stoppered test tube, ~~140 ± 3 mm in length and 14 ± 1 mm in diameter, with a capacity of 16 ± 1 mL when the stopper is inserted,~~

■140 ± 2 mm in length and between 14.5 and 15.0 mm in outside diameter,■2S *(NF24)* and calibrated at the 5- and 10-mL liquid levels.

■The capacity of the tube with stopper inserted is between 13.6 and 15.6 mL.[1]■2S *(NF24)* Place in the test tube 5 mL of Paraffin, at a temperature just above the melting point, add 5 mL of sulfuric acid containing 94.5% to 94.9% of H_2SO_4, and heat in a water bath at 70° for 10 minutes. When 5 minutes have elapsed, and at each successive minute thereafter, remove the tube from the bath, place a finger over the stopper, and give the tube three vigorous vertical shakes over an amplitude of about 12 cm, returning the tube to the bath within 3 seconds after the time when it was removed therefrom. At the end of 10 minutes from the time the tube was placed in the bath, the acid has no more color than a mixture of 3 mL of ferric chloride CS, 1.5 mL of cobaltous chloride CS, and 0.50 mL of cupric sulfate CS, overlaid with 5 mL of mineral oil. If the sulfuric acid remains dispersed in the molten paraffin, the color of the emulsion is not darker than that of the standard mixture when shaken vigorously.

BRIEFING

Potassium Alginate. Because there is no existing *NF* monograph for this article, a new monograph, based on the Potassium Alginate monograph in the *Food Chemicals Codex,* Fifth Edition, page 354 and the *Sodium Alginate* monograph in *NF 23,* page 3074, is being proposed.

(EMC: D. Bempong) RTS—42813-1

[1] A suitable test tube is available from Kimble Kontes. Item number: 34-19426. Description: Nessler Tube. Contact: phone 800-682-6644, fax 856-692-6644, customglass@kimkon.com.

Add the following:

■Potassium Alginate

Alginic acid, potassium salt.

Potassium alginate [*9005-36-1*].

» Potassium Alginate is the purified carbohydrate product extracted from various species of brown seaweeds by the use of dilute alkali. It consists chiefly of the potassium salt of Alginic Acid, a linear glycuronoglycan consisting of β-1,4 linked D-mannuronic acid and L-guluronic acid units in the pyranose ring form. It yields not less than 16.5 percent and not more than 19.5 percent of carbon dioxide (CO_2), equivalent to not less than 89.2 percent and not more than 105.5 percent of potassium alginate, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. No storage requirements specified.

Identification—

A: To 5 mL of a 1 in 100 solution in 0.1 N sodium hydroxide, add 1 mL of calcium chloride TS: a voluminous, gelatinous precipitate is formed.

B: To 10 mL of a 1 in 100 solution in 0.1 N sodium hydroxide, add 1 mL of 2 N sulfuric acid: a heavy, gelatinous precipitate is formed.

C: To about 5 mg in a test tube add 5 mL of water, 1 mL of a freshly prepared 1 in 100 solution of 1,3-naphthalenediol in alcohol, and 5 mL of hydrochloric acid. Heat the mixture to boiling, boil gently for 3 minutes, then cool to about 15°. Transfer the contents of the test tube to a 30-mL separator with the aid of 5 mL of water, and extract with

In-Process Revision

15 mL of isopropyl ether: the isopropyl ether extract exhibits a deeper purplish hue than that from a blank, similarly prepared.

D: Ignite completely 0.2 g at as low a temperature as possible: a solution of the residue responds to the tests for *Potassium* ⟨191⟩.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 15% of its weight.

Total ash ⟨561⟩—Proceed as directed for *Total Ash* under *Methods of Analysis,* carefully igniting about 3 g, accurately weighed, in a tared platinum dish, until the residue is thoroughly carbonized (about 5 minutes), and then igniting in a muffle furnace at a temperature of 800 ±25° until the carbon is completely burned off (approximately 75 minutes): between 24.0% and 32.0% of ash is found, calculated on the as-is basis.

Arsenic, *Method II* ⟨211⟩**:** 1.5 µg per g.

Lead ⟨251⟩**:** Add 1.0 g to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat carefully until the Potassium Alginate is dissolved. Continue the heating until the volume is reduced to about 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, and dilute with water to volume. A 50.0-mL portion of this solution contains not more than 5 µg of lead (corresponding to not more than 0.001% of lead), 15 mL of ammonium citrate solution, 3 mL of potassium cyanide solution, and 0.5 mL of hydroxylamine hydrochloride solution being used for the test. After the first dithizone extractions, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of 0.2 N nitric acid.

Heavy metals, *Method II* ⟨231⟩—Conduct the ignition in a platinum crucible, and use nitric acid in place of sulfuric acid to wet the test specimen: the limit is 0.004%.

Assay—Proceed as directed under *Alginate Assay* ⟨311⟩.■2S (*NF24*)

BRIEFING

Trolamine, *NF 23* page 3103. It is proposed to revise the current *Identification* test by deleting the current *Identification* test *C* and replacing with a spectrophotometric *Identification* test *A* employing *Infrared Absorption* ⟨197F⟩. It is also proposed to include a new USP Reference Standard, USP Trolamine RS, to be used in *Identification* test *A*.

(EMC: C. Sheehan) RTS—42836-3

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

〈**1**〉 **Injections,** *USP 28* page 2201 and page 1149 of *PF* 31(4) [July–Aug. 2005]. The Parenteral Products—Industrial, Nomenclature and Labeling, and Safe Medication Use Expert Committees have agreed on the appearance of identifying numbers or letters on the side (skirt) surface of the ferrule on vials that contain injectable products. For the prevention of counterfeiting, an additional statement that allows any anti-counterfeit scheme to be present if it does not detract from or interfere with cautionary statements is included in the new proposed text for *Labeling on Ferrules and Cap Overseals.* The new text proposed in this *PF* under *In-Process Revision* will be targeted for the *Second Supplement* to *USP 29* with a 30-month delayed implementation date of February 1, 2009. The previous text for this section that appears in *USP 28* with an official date of October 1, 2005 is postponed indefinitely by a *Notice of Postponement* appearing in the *Fifth Interim Revision Announcement* also in this issue of *PF.*

(PPI: J. Kelly) RTS—42550-1

In-Process Revision

Change to read:

LABELS AND LABELING

Labeling

NOTE—See definitions of "label" and "labeling" under *Labeling* in the section *Preservation, Packaging, Storage, and Labeling* of the *General Notices and Requirements.*

The label states the name of the preparation; in the case of a liquid preparation, the percentage content of drug or amount of drug in a specified volume; in the case of a dry preparation, the amount of *active* ingredient; the route of administration; a statement of storage conditions and an expiration date; the name and place of business of the manufacturer, packer, or distributor; and an identifying lot number. The lot number is capable of yielding the complete manufacturing history of the specific package, including all manufacturing, filling, sterilizing, and labeling operations.

Where the individual monograph permits varying concentrations of active ingredients in the large-volume parenteral, the concentration of each ingredient named in the official title is stated as if part of the official title, e.g., Dextrose Injection 5%, or Dextrose (5%) and Sodium Chloride (0.2%) Injection.

The labeling includes the following information if the complete formula is not specified in the individual monograph: (1) In the case of a liquid preparation, the percentage content of each ingredient or the amount of each ingredient in a specified volume, except that ingredients added to adjust to a given pH or to make the solution isotonic may be declared by name and a statement of their effect; and (2) in the case of a dry preparation or other preparation to which a diluent is intended to be added before use, the amount of each ingredient, the composition of recommended diluent(s) [the name(s) alone, if the formula is specified in the individual monograph], the amount to be used to attain a specific concentration of active ingredient and the final volume of solution so obtained, a brief description of the physical appearance of the constituted solution, directions for proper storage of the constituted solution, and an expiration date limiting the period during which the constituted solution may be expected to have the required or labeled potency if it has been stored as directed.

Containers for Injections that are intended for use as dialysis, hemofiltration, or irrigation solutions and that contain a volume of more than 1 L are labeled to indicate that the contents are not intended for use by intravenous infusion.

Injections intended for veterinary use are labeled to that effect.

The container is so labeled that a sufficient area of the container remains uncovered for its full length or circumference to permit inspection of the contents.

▪STRENGTH AND TOTAL VOLUME FOR SINGLE- AND MULTIPLE-DOSE INJECTABLE DRUG PRODUCTS

For single-dose and multiple-dose injectable drug products, the strength per total volume should be the primary and prominent expression on the principal display panel of the label followed in close proximity by strength per mL enclosed by parentheses. For containers less than 1 mL, the strength per fraction of a mL should be the only expression of strength. Strength per single mL should be expressed as mg/mL not mg/1 mL.

The following format would be acceptable for contents greater than 1 mL:

Total Strength/Total Volume: 500 mg/10 mL

Strength/mL: (50 mg/mL) or

Total Strength/Total Volume: 25,000 Units/5 mL

Strength/mL: (5,000 Units/mL)

The following format would be acceptable for contents less than 1 mL: 12.5 mg/0.625 mL

There are, however, some exceptions to expressing strength per total volume. In certain cases, the primary and prominent expression of the total drug content per container would not be practical in preventing medication errors (e.g., insulin). An example is the use of lidocaine or other similar drugs used as a local anesthetic where the product is ordered and administered by percent (e.g., 1%, 2%) or a local anesthetic in combination with epinephrine which is expressed as a ratio (e.g., 1 : 100,000). In such cases, the total strength should be expressed (e.g., 1% (100 mg/10 mL). Dry solids, which need to be reconstituted, should follow the same format, with the exception that only the total strength of the drug is listed (not the strength/total volume or strength/mL).■2S (*USP29*)

(Official February 1, 2009)

~~Aluminum in Large and Small Volume Parenterals Used in Total Parenteral Nutrition~~

~~(a) The aluminum content of large volume parenteral (LVP) drug products used in total parenteral nutrition (TPN) therapy must not exceed 25 micrograms per liter (µg/L).~~

~~(b) The package insert of LVPs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per liter. This information must be contained in the "Precautions" section of the labeling of all large volume parenterals used in TPN therapy.~~

~~(c) The maximum level of aluminum present at expiry must be stated on the immediate container label of all small volume parenteral (SVP) drug products and pharmacy bulk packages (PBPs) used in the preparation of TPN solutions. The aluminum content must be stated as follows: "Contains no more than ___ µg of aluminum per liter." The immediate container label of all SVPs and PBPs that are lyophilized powders used in the preparation of TPN solutions must contain the following statement: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than ____ µg per liter." This maximum level of aluminum must be stated as the highest of the following:~~

~~(1) The highest level for the batches produced during the last 3 years;~~

~~(2) The highest level for the latest five batches, or~~

~~(3) The maximum historical level, but only until completion of production of the first five batches after January 26, 2001.~~

~~(d) The package insert for all LVPs, all SVPs, and PBPs used in TPN must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling. The warning must state the following:~~

~~WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions that contain aluminum.~~

~~Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration.~~

▲Aluminum in Large-Volume Injections (LVIs), Small-Volume Injections (SVIs), and Pharmacy Bulk Packages (PBPs) Used in Total Parenteral Nutrition (TPN) Therapy

(a) The aluminum content of LVIs used in TPN therapy must not exceed 25 µg per L.

(b) The package insert of LVIs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per L. This information must be contained in the "Precautions" section of the labeling of all LVIs used in TPN therapy.

(c) If the maximum amount of aluminum in SVIs and PBPs is 25 µg per L or less, instead of stating the exact amount of aluminum that each may contain, as in paragraph (d), the immediate container label for SVIs and PBPs used in the preparation or in the administration of TPN injections (with exceptions as noted below) and injectable emulsions may state: "Contains no more than 25 µg/L of aluminum." If the SVI or PBP is a lyophilized powder, the immediate container label may state the following; if the SVI or PBP is a lyophilized powder used in the preparation of TPN injections and injectable emulsions, the immediate container label must state the following: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than 25 µg/L."

(d) The maximum level of aluminum at expiry must be stated on the immediate container label of all SVIs and PBPs used in the preparation or the administration of TPN injections and injectable emulsions. The aluminum content must be stated as follows: "Contains no more than __ µg/L of aluminum." This maximum amount of aluminum may be stated as the highest one of the following three levels:

1. The highest level for the batches produced during the last three years,
2. The highest level for the latest five batches, or
3. The maximum level in terms of historical levels, but only until completion of production of the first five batches after the effective date of July 26, 2004.

The package insert for all LVIs, SVIs, and PBPs used in the preparation or administration of TPN products must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling and must state the following: "WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions which contain aluminum. Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration of TPN products and of the lock-flush solutions used in their administration."▲*USP29*

Change to read:

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

In-Process Revision

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

(Official October 1, 2005)

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. The contents of up to five 1- or 2-mL containers may be pooled for the measurement, provided that a separate dry syringe assembly is used for each container. The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. Cool to 25° before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

~~Printing~~

■Labeling■2S (*USP29*)

on Ferrules and Cap Overseals

~~Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: "Warning", "Dilute Before Using", "Paralyzing Agent", "I.M. Use Only", "Chemotherapy", etc.~~

In-Process Revision

~~The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.~~
~~(Official October 1, 2005)~~

■Only cautionary statements are to appear on the top (circle) surface of the ferrule or cap overseal of a vial containing an injectable product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements include but are not limited to the following: "Warning", "Dilute Before Using", "Paralyzing Agent", "I.M. Use Only", and "Chemotherapy".

The text must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may appear solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement beneath the cap to be readily legible.

Identifying numbers or letters, such as code numbers, lot numbers, etc., may appear on the side (skirt) surface of the ferrule on vials containing injectable products. The appearance of such identifying data on the skirt surface of the ferrule, placed where it does not detract from, or interfere with, the cautionary statement on the top surface, should be considered to be a beneficial attribute of the in-process quality control of a product throughout the manufacturing process. Any anti-counterfeiting scheme must not detract from or interfere with the cautionary statements.

Under no circumstances would advertising such as company names, logos, or product names be permitted to appear on the top (circle) surface of any ferrule or cap overseal.■2S (*USP29*)

(Official February 1, 2009)

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.

Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

Change to read:

~~FOREIGN MATTER AND PARTICLES~~

▲FOREIGN AND PARTICULATE MATTER▲*USP29*

~~Foreign Matter~~

~~Every care should be exercised in the preparation of all products intended for injection to prevent contamination with microorganisms and foreign material. Good pharmaceutical practice requires also that each final container of Injection be subjected individually to a physical inspection, whenever the nature of the container permits, and that every container whose contents shows evidence of contamination with visible foreign material be rejected.~~

~~Particulate Matter~~

~~All large-volume Injections for single-dose infusion, and those small-volume Injections for which the monographs specify such requirements, are subject to the particulate matter limits set forth under *Particulate Matter in Injections* ⟨788⟩. An article packaged as both a large-volume and a small-volume Injection meets the requirements set forth for small-volume Injections where the container is labeled as containing 100 ml or less if the individual monograph includes a test for *Particulate Matter*; it meets the requirements set forth for large-volume Injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter*.~~

▲All articles intended for parenteral administration shall be prepared in a manner designed to exclude particulate matter as defined in *Particulate Matter in Injections* ⟨788⟩ and other foreign matter. Each final container of all parenteral preparations shall be inspected to the extent possible for the presence of observable foreign and particulate matter (hereafter termed "visible particulates") in its contents. The inspection process shall be designed and qualified to ensure that every lot of all parenteral preparations is essentially free from visible particulates. Qualification of the inspection

In-Process Revision

process shall be performed with reference to particulates in the visible range of a type that might emanate from the manufacturing or filling process. Every container whose contents shows evidence of visible particulates shall be rejected. The inspection for visible particulates may take place when inspecting for other critical defects, such as cracked or defective containers or seals, or when characterizing the appearance of a lyophilized product.

Where the nature of the contents or the container–closure system permits only limited capability for the inspection of the total contents, the 100% inspection of a lot shall be supplemented with the inspection of constituted (e.g., dried) or withdrawn (e.g., dark amber container) contents of a sample of containers from the lot.

All large-volume injections for single-dose infusion and small-volume injections are subject to the light obscuration or microscopic procedures and limits for subvisible particulate matter set forth in *Particulate Matter in Injections* ⟨788⟩, unless otherwise specified in the individual monograph. An article packaged as both a large-volume and a small-volume injection meets the requirements set forth for small-volume injections where the container is labeled as containing 100 mL or less, if the individual monograph states a test for *Particulate Matter in Injections* ⟨788⟩; it meets the requirements set forth for large-volume injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections administered exclusively by the intramuscular or subcutaneous route or packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter in Injections* ⟨788⟩.▲*USP29*

BRIEFING

METHOD II

■NOTE—This method does not recover mercury.■1S (*USP28*)

pH 3.5 Acetate Buffer—Prepare as directed for *Method I.*

Standard Preparation—■Pipet 4 mL of the *Standard Lead Solution* into a suitable test tube, and add 10 mL of 6 N hydrochloric acid.■1S (*USP28*)

Test Preparation—Use a quantity, in g, of the substance to be tested as calculated by the formula:

■4.0/(1000*L*)■1S (*USP28*)

in which *L* is the heavy metals limit, ■as a■1S (*USP28*) percentage. Transfer the weighed quantity of the substance to a suitable crucible, add sufficient sulfuric acid to wet the substance, and carefully ignite at a low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off ■(no longer than 2 hours). If carbon remains, allow the residue to cool, add a few drops of sulfuric acid, evaporate, and ignite again.■1S (*USP28*) Cool, add ■5 mL■1S (*USP28*) of 6 N hydrochloric acid, cover, ■and■1S (*USP28*) digest on a steam bath for ■10 minutes. Cool, and quantitatively transfer the solution to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.

~~**Monitor Preparation**—Pipet 4 mL of the *Standard Lead Solution* into a crucible identical to that used for the *Test Preparation* and containing a quantity of the substance under test that is equal to 10% of the amount required for the *Test Preparation.* Evaporate on a steam bath to dryness. Ignite at the same time, in the same muffle furnace, and under the same conditions used for the *Test Preparation.* Cool, add 5 mL of 6 N hydrochloric acid, cover, and digest on a steam bath for 10 minutes. Cool, and quantitatively transfer to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.~~■1S (*USP28*)

■■2S (*USP29*)

Procedure—■Adjust the solution in■1S (*USP28*) each of the tubes containing the *Standard Preparation* ■■1S (*USP28*)

■and■2S (*USP29*)
the *Test Preparation* ■~~and the *Monitor Preparation*~~

■■2S (*USP29*)
with ammonium hydroxide, added cautiously and dropwise, to a pH of 9.

■Thoroughly mix the solution after each addition of ammonium hydroxide.■2S (*USP29*)
Cool, and adjust with glacial acetic acid, added dropwise, to a pH of 8, then add 0.5 mL in excess. Using a pH meter, ~~or short range pH indicator paper as external indicator, check the pH,and adjust,~~

■check and adjust the pH,■2S (*USP29*)
if necessary, with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0 . Filter, if necessary, washing the filter with a few mL of water, into a 50-mL color-comparison tube, and then dilute with water to 40 mL.■1S (*USP28*) Add 2 mL of *pH 3.5 Acetate Buffer,* then add 1.2 mL of thioacetamide–glycerin base TS, dilute with water to 50 mL, mix, allow to stand for 2 minutes, and view downward over a white surface*: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation.* ~~■and the color of the solution from the *Monitor Preparation* is equal to or darker than that of the solution from the *Standard Preparation.* [NOTE—If the color of the solution from the *Monitor Preparation* is lighter than that of the solution from the *Standard Preparation,* proceed as directed for *Method III* for the substance being tested.]~~■1S (*USP28*)

■■2S (*USP29*)

BRIEFING

⟨**467**⟩ **Organic Volatile Impurities,** *USP 28* page 2322. It is proposed to change the chapter title to *Residual Solvents* and to delete the *Other Analytical Procedures* section (*Methods I, IV, V,* and *VI*). These proposals are consistent with revisions to individual monographs. The *Organic volatile impurities* ⟨467⟩ requirement will be deleted from all *USP, NF,* and *Dietary Supplements* monographs that currently contain it, and a new requirement for *Residual solvents* ⟨467⟩ will be added to all appropriate drug substance, excipient, drug product, and dietary supplement monographs. These individual monograph changes will appear in *USP 29–NF 24,* with a delayed implementation date of January 1, 2007.

Changes to the chapter text regarding submission of alternative methods to the USP are intended to clarify that these procedures will be reviewed by USP but will not necessarily be considered for incorporation into an individual monograph. Proposed changes to the chromatographic *Procedure* sections are intended to (1) compensate for possible matrix effects by providing spiked test solutions and (2) align the procedures with the composition of the Class 2 Residual Solvents Mixture Reference Standards.

In the absence of any significant adverse comment, it is proposed to implement these revisions via the *First Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of February 1, 2006, for the procedure changes and an official date of January 1, 2007, for the new chapter title and the deletion of the *Other Analytical Procedures* section.

~~RESIDUAL SOLVENTS LIMITS~~

••1

For pharmacopeial purposes, residual solvents in pharmaceuticals are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The residual solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance or an excipient may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical element in the synthetic process. This General Chapter does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Because residual solvents do not provide therapeutic benefit, they should be removed, to the extent possible, to meet ingredient and product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. Solvents that are known to cause unacceptable toxicities (Class 1, *Table 1*) should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment. Solvents associated with less severe toxicity (Class 2, *Table 2*) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, *Table 3*) should be used where practical. The complete list of solvents included in this General Chapter is given in *Appendix 1*. These tables and the list are not exhaustive. Where other solvents have been used, based on approval by the competent regulatory authority, such solvents may be added to the tables and list.

Testing of drug substances, excipients, and drug products for residual solvents should be performed when production or purification processes are known to result in the presence of such residual solvents. It is only necessary to test for residual solvents that are used or produced in the manufacture or purification processes.

Although manufacturers may choose to test the drug product, a cumulative procedure may be used to calculate the residual solvent levels in the product from the levels in its ingredients. If the calculation results in a level equal to or below that recommended in this General Chapter, no testing of the drug product for residual solvents needs to be considered. If, however, the calculated levels are above the recommended level, the drug product should be tested to ascertain whether the formulation process has reduced the relevant solvent levels to within acceptable amounts. A drug product should also be tested if a residual solvent is used during its manufacture.

See *Appendix 2* for additional background information related to residual solvents.

Change to read:

LIMITS OF RESIDUAL SOLVENTS

Ethylene Oxide

[NOTE—The test for ethylene oxide is conducted only where specified in the individual monograph.] The standard solution parameters and the procedure for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 µg per g.

Class 1

Class 1 residual solvents *(Table 1)* should not be employed in the manufacture of drug substances, excipients, and drug products because of the unacceptable toxicities or deleterious environmental effects of these residual solvents. However, if ~~Class 1 residual solvents are used,~~

•their use in order to produce a medicinal product is unavoidable,•1
their levels should be restricted as shown in *Table 1,* unless otherwise stated in the individual monograph. The solvent 1,1,1-trichloroethane is included in *Table 1* because it is an environmental hazard. The stated limit of 1500 ppm is based on safety data.

When Class 1 residual solvents are used ~~in the manufacture of a drug substance, excipient, or drug product, the methodology described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter is to be applied wherever possible.~~

•or produced in the manufacture or purification of a drug substance, excipient, or drug product, these solvents should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible.•1
Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for ~~inclusion in the relevant individual monograph.~~

•evaluation.•1

Table 1. Class 1 Residual Solvents

Solvent	Concentration Limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

In-Process Revision

Class 2

Class 2 residual solvents *(Table 2)* should be limited in drug substances, excipients, and drug products because of the inherent toxicities of the residual solvents. PDEs are given to the nearest 0.1 mg per day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of the determination procedure. Precision should be determined as part of the procedure validation.

If Class 2 residual solvents are present at greater than their *Option 1* limits, they should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for ~~inclusion in the relevant individual monograph.~~

•evaluation.•

NOTE—The following Class 2 residual solvents are not readily detected by the headspace injection conditions described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter: formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone, and sulfolane. Other appropriate validated procedures are to be employed for the ~~control~~

•quantification•
of these residual solvents. Such procedures shall be submitted to the USP for

•review and possible•
inclusion in the relevant individual monograph.

Table 2. Class 2 Residual Solvents

Solvent	PDE (mg/day)	Concentration limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
1,2-Dimethoxyethane	1.0	100
N,N-Dimethylacetamide	10.9	1090
N,N-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethylene glycol	6.2	620
Formamide	2.2	220
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
Methylene chloride	6.0	600
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890
~~Trichloroethene~~	0.8	80
•Trichloroethylene•		
Xylene*	21.7	2170

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene.

Class 3

Class 3 residual solvents *(Table 3)* may be regarded as less toxic and of lower risk to human health than Class 1 and Class 2 residual solvents. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the residual solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies.

Unless otherwise stated in the individual monograph, Class 3 residual solvents are limited to not more than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*). If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day, that residual solvent should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter,

•with appropriate modifications to the standard solutions,• are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for ~~inclusion in the relevant individual monograph.~~

•evaluation. USP Reference Standards, where available, should be used in these procedures.•

Table 3. Class 3 Residual Solvents
(limited by GMP or other quality-based requirements in drug substances, excipients, and drug products)

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulfoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

Other Residual Solvents

The residual solvents listed in *Table 4* may also be of interest to manufacturers of drug substances, excipients, or drug products. However, no adequate toxicological data on which to base a PDE was found. ~~Specifications for these residual solvents will be provided in the respective individual monograph.~~

••

Table 4. Other Residual Solvents
(for which no adequate toxicological data were found)

1,1-Diethoxypropane	Methyl isopropyl ketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Solvent Hexane
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.

Class 1 and Class 2 Residual Solvents

WATER-SOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, add 9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

~~*Class 2 Standard Stock Solution*—Transfer 1.0 mL of USP Class 2 Residual Solvents Mixture RS to a 100-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Class 2 Standard Solution*—Transfer 1.0 mL of *Class 2 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply stopper, cap, and mix.~~

•*Class 2 Standard Stock Solutions*—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture B RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 5.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.•

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2*

•*Mixture A*•
Standard Solution, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2*

•*Mixture A*•
Standard Solution is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* ~~*Class 2 Standard Solution,*~~

•*Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,*•
and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or ~~the *Class 2 Standard Solution,*~~

•either of the two *Class 2 Mixture Standard Solutions,*•

In-Process Revision

proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Table 5. Headspace Operating Parameters

	Headspace Operating Parameter Sets		
	1	2	3
Equilibration temperature (°)	80	105	80

respectively.

Class 3 Residual Solvents

If only Class 3 solvents are present, the level of residual solvents is to be determined as directed under *Loss on Drying* ⟨731⟩. If the loss on drying value is greater than 0.5%, a water determination should be performed on the test sample as directed under *Water Determination* ⟨921⟩. Determine the water by *Method Ia*, unless otherwise specified in the individual monograph. If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*), that residual solvent should be identified and quantified, and the procedures as described above,

•with appropriate modifications to the standard solutions,• are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for ~~inclusion in the relevant individual monograph.~~

•evaluation. USP Reference Standards, where available, should be used in these procedures.•
A flow diagram for the application of residual solvent limit tests is shown in *Figure 1*.

In-Process Revision

In-Process Revision

Delete the following:

•~~OTHER ANALYTICAL PROCEDURES~~

~~The following procedures, with any necessary variations, are used where specified in the individual monographs.~~

~~Method I~~

~~A gas chromatograph capable of temperature programming and equipped with a wide-bore, wall-coated open tubular column and a flame-ionization detector is used in the following procedure.~~

~~**Standard Solution**—Prepare a solution, in organic-free water, or the solvent specified in the monograph, containing in each mL, 12.0 µg of methylene chloride, 7.6 µg of 1,4-dioxane, 1.6 µg of trichloroethylene, and 1.2 µg of chloroform. [NOTE—Prepare fresh daily.]~~

Test Solution— Dissolve in organic-free water, or the solvent specified in the monograph, an accurately weighed portion of the material to be tested to obtain a final solution having a known concentration of about 20 mg of the test material per mL.

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 5-µm chemically cross-linked G27 stationary phase and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. [NOTE—When a makeup gas is used, nitrogen is recommended.] The injection port temperature and the detector temperature are maintained at 70° and 260°, respectively. The column temperature is programmed as follows. Initially, the column temperature is maintained at 35° for 5 minutes, then increased at a rate of 8° per minute to 175°, followed by an increase at a rate of 35° per minute to 260°, and maintained at 260° for at least 16 minutes.

Inject the *Standard Solution,* and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R,* between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Separately inject equal volumes (about 1 µL) of the *Standard Solution* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the peak responses.

Identify, on the basis of retention time, any peaks present in the chromatogram of the *Test Solution.* The identity and peak response in the chromatogram may be established as being from any of the organic volatile impurities listed in the table shown below or from some other volatile impurity eluting with a comparable retention time as determined by mass spectrometric relative abundance procedures or by the use of a second validated column containing a different stationary phase.

Unless otherwise specified in the individual monograph, the amount of each organic volatile impurity present in the material does not exceed the limit given in the table shown below.

Organic Volatile Impurity	Limit (µg per g)
Chloroform	60
1,4-Dioxane	380
Methylene Chloride	600
Trichloroethylene	80

Method IV

Standard Solution— Prepare as directed for *Standard Solution* in *Method I.* Pipet 5 mL of the solution into a vial fitted with a septum and crimp cap, containing 1 g of anhydrous sodium sulfate, and seal. Heat the sealed vial at 80° for 60 minutes.

Test Solution— Transfer 100 mg, accurately weighed, of the material under test to a vial, add 5.0 mL of water, or the solvent specified in the monograph, and 1 g of anhydrous sodium sulfate, and seal with a septum and crimp cap. Heat the sealed vial at 80° for 60 minutes, or as specified in the individual monograph.

Chromatographic System and Procedure— [NOTE—The use of headspace apparatuses that automatically transfer a measured amount of headspace is allowed. Also, the use of a guard column in this headspace procedure is not necessary.] Proceed as directed for *Method V,* except to inject, using a heated gas-tight syringe, 1 mL of the headspace.

Method V

Standard Solution and Test Solution— Prepare as directed for *Method I.*

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 3.0-µm G43 stationary phase, and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. The injection port and detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps. It is maintained at 40° for 20 minutes, then increased rapidly to 240°, and maintained at 240° for 20 minutes.

Inject the *Standard Solution,* and record the peak responses as directed for *Procedure:* a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R,* between any two components is not less than 3; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Proceed as directed for *Method I,* the injection volume being about 1 µL.

Method VI

Standard Solution and Test Solution— Prepare as directed for *Method I.*

Chromatographic System (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector. The column and column temperature conditions, as chosen from the list below (see *Table 6*), are specified in the individual monograph. The carrier gas, linear velocity or flow rate, and detector and injection port temperatures are appropriate to the column dimensions and column temperatures chosen from the list below.

Inject the *Standard Solution,* and record the peak responses as directed for *Procedure:* a suitable system is one that yields the chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R,* between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Proceed as directed for *Method I,* the injection volume being about 1 µL.

Table 6. Chromatographic Conditions for Method VI

Physical Tests and Determinations

BRIEFING

⟨729⟩ Globule Size Distribution in Lipid Injectable Emulsions, page 2235 of *PF* 30(6) [Nov.–Dec. 2004]. This new general chapter, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision,* with proposed revisions based on comments received. Importantly, the mean size of lipid droplets must be submicron; and the population of large-diameter fat globules, expressed as the percentage of fat greater than 5 μm (i.e., PFAT5), must be kept at a minimum to avoid obstruction of the microvasculature, particularly the capillaries of the lungs. Therefore, these two regions of the globule size distribution (mean droplet size and large-diameter tail) must be controlled within specified limits.

It is proposed that two methods be employed for testing. *Method I* via classical (''Mie'') or dynamic light scattering will be designated for the mean diameter of the lipid droplets and for the range of the various droplet diameters distributed around the mean diameter, expressed as the standard deviation. *Method II,* light obscuration, will be designated for determining the amounts of fat globules composing the large-diameter tail of the globule size distribution. The revised chapter proposes universal limits for (1) mean droplet size not exceeding 500 nm or 0.5 μm and (2) the population of large-diameter fat globules, expressed as the volume-weighted percentage of fat great than 5 μm (PFAT5) not exceeding 0.05%, irrespective of the final lipid concentration.

(PPI: J. Kelly) RTS—42698-1

Add the following:

■⟨729⟩ GLOBULE SIZE DISTRIBUTION IN LIPID INJECTABLE EMULSIONS

INTRODUCTION

Lipid injectable emulsions used in total parenteral nutrition (TPN) therapy are sterile oil-in-water emulsions of soybean oil, used to provide an ample supply of essential fatty acids, linoleic and linolenic, dispersed with the aid of an emulsifying agent in *Water for Injection*. Alternatively, soybean oil can be mixed with other suitable oils (neutral triglycerides), such as safflower oil, medium-chain triglycerides (MCT) derived from coconut or palm kernel oils, olive oil, or a marine oil, such as menhaden oil. The size of the lipid droplets is critical: because of mechanical filtration, larger-size fat globules (> 5 μm) can be trapped in the lungs. The essential size characteristics of a lipid injectable emulsion for intravenous use includes the mean diameter of the lipid droplets and the range of the various droplet diameters distributed around the mean diameter, expressed as the standard deviation. In particular, the amounts of fat globules comprising the large-diameter tail of the globule size distribution are especially important with respect to infusion safety. These two regions of the globule size distribution (mean droplet size and large-diameter tail) must be controlled within specified limits.

The two methods described below are used for determination of the mean lipid droplet diameter and the distribution of large-diameter globule sizes in *Lipid Injectable Emulsion*. These methods must be employed for testing, following the requirements specified in the limits summarized in *Lipid Injectable Emulsion* (to come). *Method I* and *Method II* must be validated. The methods described below to assess the quality of lipid injectable emulsions are to be performed in two stages.

METHOD I—LIGHT-SCATTERING METHOD

For the determination of the mean droplet size of lipid injectable emulsions, either of two common light-scattering techniques may be employed: (1) dynamic light scattering (DLS), also known as photon correlation spectroscopy (PCS), or (2) classical light scattering, based on Mie scattering theory. The DLS, or PCS, technique is based on analyzing the rapid temporal fluctuations in the scattered light intensity that occur due to the random Brownian motion, or diffusion, of any particles, including lipid droplets, sus-

In-Process Revision

pended in liquid. The intensity is measured at a given angle (usually 90°) by a suitable detector (e.g., photomultiplier tube) able to measure the rapidly fluctuating scattered light intensity produced by the suspended, diffusing droplets. These scattered intensity data are typically used to calculate the intensity autocorrelation function, which is a simple decaying exponential function in time for droplets of uniform size. A distribution of droplet sizes expresses itself by exponential functions of different decay times. The autocorrelation function generated by the scattered intensity data obtained from a given emulsion can be ''inverted'' by means of an appropriate deconvolution algorithm in order to obtain the approximate distribution of intensity-weighted diffusion coefficients. From the latter, the distribution of small-diameter droplets is calculated, using the Stokes-Einstein equation and the rules of classical (Mie) light scattering.

By contrast, classical light scattering based on Mie theory analyzes the spatial, rather than temporal, variation of the scattered light intensity by measuring the latter as a function of the scattering angle, typically over a large range of detected angles. The temporal fluctuations in the scattering intensity due to Brownian motion are averaged out in time for each angular measurement. This angular variation occurs as a consequence of the mutual interference of individual scattered waves arriving at the detector with different phases from different points within a given lipid droplet, as well as from different particles. The extent of the angular variation is significant whenever the droplet diameter is not small compared with the wavelength of the laser light (typically 635 nm). Droplets of a given size and refractive index yield a unique curve of scattering intensity vs. angle. A distribution of droplet sizes gives rise to a final angular dependence that represents the superposition, or summation, of individual (different) intensity vs. angle curves. The measured angular dependence of the scattering intensity obtained from a given emulsion sample can be inverted by means of an appropriate deconvolution algorithm and Mie scattering theory in order to obtain the approximate droplet size distribution.

Thus, light scattering, using either dynamic light scattering (i.e., temporal fluctuations due to droplet diffusion) or classical light scattering/Mie theory (i.e., average intensity vs. angle), can provide acceptable results for both the mean diameter and standard deviation of the droplet size distribution. For purposes of illustrating the method used in *Method I,* a dynamic light-scattering technique is described. For guidance regarding instruments employing classical Mie-theory light scattering, see *Light Diffraction Measurement of Particle Size* ⟨429⟩.

Apparatus—A suitable DLS/PCS instrument with or without the capability of automatic sample dilution is controlled by validated software and is used to perform the measurement, with the scattering angle typically set at 90°. The intensity-weighted results (mean diameter and standard deviation) are reported, provided it is clearly stated which values are given and that the necessary parameter values required for all requisite calculations are also given.

Water—Pass distilled water through a filter having a 0.2-µm porosity, and degas by sonication, or use *Sterile Water for Injection* stored in a glass container.

Standard Preparation—To a pre-established volume of *Water* add an appropriate amount of concentrated suspension, containing NIST-traceable polystyrene latex standard particles or other suitable nanospheres. Gently mix the fluids to achieve a homogeneous suspension. The diluted suspension will be slightly turbid in appearance. If the DLS/PCS instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe, with further dilution occurring automatically to optimize the

droplet concentration for analysis. Alternatively, the sample would require greater manual dilution with *Water* (typically by at least a factor of 10 over the first dilution), and then this sample would be instilled into a "drop-in" cuvette. The optimum dilution scheme that achieves the proper scattering intensity for the cuvette-based analysis will be determined by the instrument specifications. Thus, the concentration of latex in the final sample must be optimized for the DLS/PCS instrument used. This should be performed separately for three different size standards of approximately 100, 250, and 400 nm (triplicate analyses per size), and the corresponding results of intensity-weighted mean diameter and standard deviation should coincide with the expected values within acceptable errors.

Test Preparation—To a pre-established volume of *Water* add an appropriate volume of sample from the lipid injectable emulsion. Gently mix the fluids to achieve a homogeneous suspension. The diluted suspension will be slightly turbid in appearance. Gently mix the fluids. If the DLS/PCS instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe. Further dilution of the sample then occurs automatically to optimize the droplet concentration for analysis, ensuring that it is not so high as to cause artifacts due to multiple scattering or interdroplet interactions. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution), and then this sample would be instilled into a "drop-in" cuvette. The optimum dilution scheme that achieves the proper scattering intensity for the cuvette-based analysis will be determined by the instrument specifications. Thus, the concentration of lipid injectable emulsion in the final sample must be optimized for the DLS/PCS instrument used.

System Suitability—Using the *Standard Preparation,* measure the intensity-weighted mean particle diameter and the corresponding standard deviation. The system is suitable once the sample temperature has reached equilibration and the results have stabilized and triplicate mean droplet diameter measurements are obtained. ~~within 15% of each other.~~ The coefficient of variation (CV) should not exceed ~~20%~~ 10% of the NIST-traceable mean droplet diameter. A larger CV value indicates that the latex microspheres are not suitable as a standard because they either inherently lack uniformity or have become agglomerated to an unacceptable extent. In this case, another standard latex suspension must be selected and tested.

Procedure and Interpretation—If the DLS/PCS instrument is equipped with an automatic dilution system, use a disposable syringe to load the *Standard Preparation* or *Test Preparation*. If no automatic dilution system is used, transfer the appropriately diluted preparation to a cuvette and place the cuvette in the spectrometer. Allow the sample to equilibrate to a preset controlled temperature close to ambient (between 20° and 25°, as in the USP definition found in the *General Notices* under *Preservation, Packaging, Storage, and Labeling*). Set the instrument scattering angle to 90°, and carry out the measurements. As long as the chi-square (χ^2) goodness-of-fit parameter remains acceptably low (per instrument specifications), the results for the *Test Preparation* are acceptable. Excessive values of the χ^2 parameter suggest that the droplet distribution is not normal and may indicate an unstable emulsion. The intensity-weighted mean droplet diameter (MDD) for lipid injectable

In-Process Revision

emulsions ~~of various concentrations must be met:~~ must be less than 500 nm or 0.5 μm, irrespective of the concentration of the dispersed lipid phase.

~~Concentration of Dispersed Phase (% w/v)~~			
	~~10~~	~~20~~	~~30~~
~~MDD (nm)~~	~~<300~~	~~<400~~	~~<500~~

METHOD II—~~LIGHT OBSCURATION OR EXTINCTION METHOD~~ MEASUREMENT OF LARGE GLOBULE CONTENT BY LIGHT OBSCURATION OR EXTINCTION METHOD

For determination of the extent of the large-diameter droplet tail (>5 μm) of lipid injectable emulsions a light obscuration (LO) or light extinction (LE) method that employs a single-particle (globule) optical sizing (SPOS) technique is used. During application of the LE/SPOS technique, passage of a droplet through a thin optical sensing zone results in blockage of a portion of the incident light beam, causing a momentary decrease in the light intensity reaching the "extinction" detector. The magnitude of this decrease in the signal is ideally proportional to the cross-sectional area of the droplet (assumed smaller than the sensing zone thickness), i.e., to the square of the droplet diameter. During optimization of the LE/SPOS instrument for a given emulsion sample, a series of dilutions should be tested to achieve an acceptably low coefficient of variation (i.e., <10%) between samples. The goal is to identify a standard range of dilutions that yield consistent data and are most applicable to the formulation tested. Ideally, when comparing different emulsions, the same approximate number of globules are sized each time, and once a standard is achieved, it should be incorporated into the routine sampling plan for validation testing. As long as the fat globule concentration is below the "coincidence limit" of the sensor (determined by the flow cell and optical design), only one globule at most will pass through the sensing zone at any given time, allowing it to be counted and accurately sized (with less than 1% coincidence events). Both the coincidence limit and the optimal flow rate must be known for the LE/SPOS sensor used. Furthermore, it is prudent to perform the large-diameter measurements at a reduced emulsion concentration such that the measurable droplet concentration (i.e., >1.8 μm) is only approximately one-third of the nominal coincidence limit for the sensor used. The resulting single pulse heights are converted to droplet diameters using a standard calibration curve previously constructed from NIST-traceable monosized polystyrene microspheres of known diameters. For additional guidance in the use of the light obscuration methodology, see the general chapter *Particulate Matter in Injections* ⟨788⟩.

Apparatus—A suitable light obscuration instrument with or without the capability of automatic sample dilution and controlled by a personal computer (PC) is used for the measurement. The number- and volume-weighted particle size distribution data are reported, provided it is clearly stated which values are given and that the necessary parameter values required for all necessary calculations are also given.

Water—Pass distilled water through a filter having a 0.2-μm porosity, and degas by sonication, or use *Sterile Water for Injection* stored in a glass container.

Standard Preparation—To a pre-established volume of *Water* add an appropriate amount of concentrated suspension, containing NIST-traceable polystyrene latex standard particles or other suitable microspheres. Gently mix the fluids to achieve a homogeneous suspension. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or Teflon sample line. Further dilution of the sample

then occurs automatically to optimize the particle concentration for analysis. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container, such as a sterile Type I glass container, before being passed through the sensor. In either case the final particle concentration is caused to lie below the coincidence limit of the sensor. The sizing and counting accuracy of the light obscuration instrument should be obtained using three different size standards of approximately 5 µm, 10 µm, and 25 µm (triplicate analyses per size). The corresponding results for the mean diameter should coincide with the expected values, within a 10% acceptable error. In addition, the number of particle counts obtained per unit volume of diluted sample suspension should also agree, within a 10% acceptable error, with the concentration values certified in the documentation provided with each NIST-traceable size standard.

Test Preparation—To a pre-established volume of *Water* add an appropriate volume of sample from the lipid injectable emulsion. Gently mix the fluids to achieve a homogeneous suspension. The diluted emulsion will be slightly turbid in appearance. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or nonreactive* Teflon sample line. Further dilution then occurs automatically to optimize the droplet/globule concentration for analysis. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container such as a sterile Type I glass container. In either case the final droplet/globule concentration is caused to lie below the coincidence limit of the sensor.

System Suitability—Using the *Standard Preparation,* measure the number-weighted particle diameter and the corresponding standard deviation. The system is suitable once the sample has equilibrated and the results have stabilized and triplicate mean number-weighted particle diameter measurements are obtained within 10% of each other. The measured coefficient of variation (CV) for the number-weighted particle size distribution should not deviate by more than 25% from the CV value stipulated for the NIST-traceable standard. The latter value is usually very small, assuming nearly uniform-size standard particles. Therefore, in practice the measured CV value is usually considerably larger than this ideal value, being dictated instead by the resolution of the LE/SPOS sensor. The resolution of the sensor should be sufficiently good that the measured CV value does not exceed 15% of the mean diameter of the NIST-traceable standard. A larger CV value indicates that the latex microspheres are not suitable as a standard because they either inherently lack uniformity or have become agglomerated to an unacceptable extent. In this case, another standard latex suspension must be selected and tested.

Procedure and Interpretation—If the light obscuration instrument is equipped with an automatic dilution system, use a disposable syringe or Teflon sample line to load the *Standard Preparation* or *Test Preparation.* If no automatic dilution system is used, transfer the sample to an appropriate large-volume, clean container such as a sterile Type I glass vessel containing an appropriate volume of *Water.* Allow the sample and *Water* to mix thoroughly to achieve a homogeneous suspension. Set the instrument threshold of detection at 1.8 µm, extended to an upper limit of 50 µm, and employ measurement times of 120, 180, and 240 seconds

* Polyvinyl chloride (PVC) with diethylhexylphthalate (DEHP) has been shown to induce breakdown of lipid injectable emulsions (Drug Product Problem Reporting System. USP File Access No. 11173, May 15, 1991).

In-Process Revision

for each run of each replicate of the sample (n = 3 runs per sample). As long as the three measurements of the volume-weighted percentage of fat greater than 5 µm (PFAT5) for each sample fall within 10% of each other (irrespective of run time), the results for the *Test Preparation* are acceptable. Values exceeding this reproducibility tolerance suggest either that the sample is unstable or that the dilution has not been optimized. The volume-weighted, large-diameter fat globule limits of the dispersed phase, expressed as the percentage of fat residing in globules larger than 5 µm (PFAT5) for a given lipid injectable emulsion, must be less than 0.05%.■2S (*USP29*)

Add the following:

■⟨1058⟩ ANALYTICAL INSTRUMENT QUALIFICATION

INTRODUCTION

A large variety of instruments and tools, ranging from simple nitrogen evaporators to complex multiple-function technologies, are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use. ~~and that they do not pose high safety risks~~ The analyst's objective is to consistently obtain reliable and valid data suitable for the intended purpose. Depending on the applications, users validate their procedures and perform system suitability tests and in-process quality control checks to help ensure that the acquired data are reliable. These activities help enhance the quality of data, and there are specific guidances and procedures for performing these activities. With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions abound regarding instrument qualification and validation procedures and the roles and responsibilities of those who perform them. Consequently, various approaches have been used for instrument qualification, approaches that require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data. Note that a risk-based approach to provide flexibility in the qualification process, commensurate with the complexity and intended use of the instrumentation, is acceptable.

Validation versus Qualification

Because there is ambiguity in the use of the terms "validation" and "qualification", in this chapter the term "validation" will be used for processes and software, and the term "qualification" will be used for instruments. Thus, the phrase "analytical instrument qualification" (AIQ) is used for the process of ensuring that an instrument is suit-

In-Process Revision

able for its intended application. The term "validation" is reserved for processes including analytical procedures and software procedures.

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the base for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control checks. These quality components are described below.

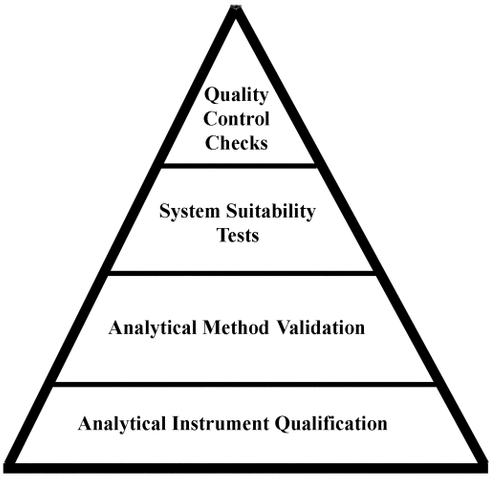

Figure 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose and that it is properly maintained and calibrated. Use of a qualified instrument in analyses contributes to confidence in the veracity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure does what it purports to do and addresses the required attributes of the procedure. Use of a validated procedure with qualified analytical instruments provides confidence that the procedure will generate test data of acceptable quality. Users of compendial procedures perform validation using the criteria provided in general information chapter *Validation of Compendial Methods* ⟨1225⟩.

System Suitability Tests

System suitability tests verify that the system will perform according to the analyst's expectations and according to the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure that the system's performance is acceptable at the time of the test. USP general chapter *Chromatography* ⟨621⟩ presents a more detailed discussion of system suitability tests.

Quality Control Checks

Most analyses are performed on instruments calibrated or standardized using reference materials or calibration standards. The calibration or standardization process uses a single- or multiple-point calibration, depending on the instrument and the intended application. The calibration or standardization of an instrument during analysis ensures

that the instrument response correlates with the known quantity or quality of the calibration standard or reference material. In addition to calibration or standardization, some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance.

The extent of system suitability tests or quality control checks varies for different analyses, depending on their intended use. Chemical analyses, which are largely subject to Good Manufacturing Practices (GMP) regulations and require tighter precision and accuracy, may require more system suitability tests than bioanalytical work, which is largely subject to Good Laboratory Practice (GLP) regulations. Bioanalytical work requires sensitive, specific, broad-range analysis and therefore is generally performed with more quality control checks during sample analysis. Control check samples are also appropriate when high-variability tests or instruments (i.e., those with a relative standard deviation [RSD] higher than 5%) are considered. Other use-specific considerations may also determine the extent of system suitability tests or quality-control-check sample analysis. Whatever the case, the sum total of such controls provides an important step in delivering quality data for the intended purpose.

In summary, analytical instrument qualification and analytical method validation ensure the quality of analysis *before* conducting the tests. System suitability tests and quality control checks ensure the quality of analytical results *immediately before* or *during* sample analysis.

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical data—analytical method validation, system suitability tests, and quality control checks—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process, but instead results from several discrete activities. For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

Some of these qualification terms have their roots in manufacturing-process validation. Note, however, that adoption of process validation terms does not imply that all process validation activities are necessary for AIQ. Also, some AIQ activities cover more than one qualification phase and could arguably be performed within any of the phases. It is important that the required AIQ activities be performed; however, within which qualification phase an activity is performed or reported is not as important. *Table 1* accommodates these overlapping activities by letting users perform them under one or another phase as necessary. The user should describe where the activity is performed and reported.

Table 1. Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification*

DQ	IQ		OQ		PQ
Timing and applicability					
Prior to purchase of a new type of instrument	At installation of each instrument (new, old, or existing unqualified)		After installation or major repair of each instrument		Periodically at specified intervals for each instrument
Activities					
Assurance of vendor's DQ	System description	⇆	Fixed parameters		Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery				SOPs for operation, calibration, maintenance and change control
Instrument's fitness for use in laboratory	Utilities/facility/environment				
	Network and data storage	⇆	Secure data storage, backup, and archive		
	Assembly and installation				
	Installation verification	⇆	Instrument function tests	⇆	Performance checks

* Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.

DESIGN QUALIFICATION

Design qualification (DQ) is most suitably performed by the instrument developer or manufacturer. Because the instrument design is already in place for commercial off-the-shelf (COTS) systems, users do not need to repeat all aspects of DQ. However, users should ensure that COTS instruments are suitable for their intended applications and that the manufacturer has adopted a quality system for developing, manufacturing, and testing. Users should also establish that manufacturers and vendors adequately support installation, service, and training. Methods for ascertaining the manufacturer's design qualification and an instrument's suitability for its intended use depend on the nature of the instrument, the complexity of the proposed application, and the extent of the user's previous interaction with the manufacturer. Vendor audits or required vendor-supplied documentation satisfy part of the DQ requirements. The required scope and comprehensiveness of the audits and documentation vary with users' familiarity with the instrument and their previous interactions with the vendor.

Informal processes also form an important part of DQ. Informal personal communications and networking with peers at technical or user-group meetings significantly inform users about the suitability of instrument design for various applications and the quality of vendor support services. Informal site visits to other users' and vendors' facilities to obtain data on representative samples that used the specified instrument are another good source of information about suitability for intended use. In many instances an assessment of the quality of vendor support, gleaned from informal discussions with peer users, significantly influences instrument selection.

INSTALLATION QUALIFICATION

Installation qualification (IQ) is the documented collection of activities necessary for installing an instrument in the user's environment. IQ applies to an instrument that is new or was pre-owned, or to any instrument that exists on site but has not been previously qualified. Relevant parts of IQ would also apply to a qualified instrument that has been packed and transported to another location. The activities and documentation associated with IQ are as follows.

System Description—Provide a description of the instrument, including its manufacturer, model, serial number, software version, etc. Use drawings and flow charts where appropriate.

Instrument Delivery—Ensure that the instrument, software, manuals, supplies, and any other accessories arrive with the instrument as the purchase order specifies and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

Utilities/Facility/Environment—Verify that the installation site satisfactorily meets vendor-specified environmental requirements. A commonsense judgment for the environment suffices: one need not measure the exact voltage for a standard-voltage instrument or the exact humidity reading for an instrument that will operate at ambient conditions.

Network and Data Storage—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.

Assembly and Installation—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation of a complex instrument are best done by the vendor, specialized engineers, or qualified in-house personnel,* whereas users can assemble and install simple ones. For complex instruments, vendor-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. If the pre-owned, unqualified existing instrument or transported instrument requires assembly and installation, perform the tasks as specified above, then perform the installation verification procedure, described below.

Installation Verification—Perform the initial diagnostics and testing of the instrument after installation. On obtaining acceptable results, the user and, when present, the installing engineer should confirm that the installation was successful before proceeding with the next qualification phase.

OPERATIONAL QUALIFICATION

After a successful IQ, the instrument is ready for OQ testing. The OQ phase may consist of these test parameters.

Fixed Parameters—These tests measure the instrument's nonchanging parameters such as length, height, weight, voltage inputs, acceptable pressures, and loads. If the ven-

dor-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination. [NOTE—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be redetermined as part of OQ testing.]

Secure Data Storage, Backup, and Archiving—When required, test secure data handling such as storage, backup, and archiving at the user's site according to written procedures.

Instrument Function Tests—Important instrument functions should be tested to verify that the instrument operates as intended by the manufacturer and required by the user. The user should select important instrument parameters for testing according to the instrument's intended use. Vendor-supplied information is useful in identifying specifications for these parameters. Tests should be designed to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets vendor and user specifications.

The extent of OQ testing that an instrument undergoes depends on its intended applications. Therefore, no specific OQ tests for any instrument or application are offered in this chapter. Nevertheless, as a guide to the types of tests possible during OQ, consider the following, which apply to an HPLC unit:

- pump flow rate
- gradient linearity
- detector wavelength accuracy
- detector linearity
- column oven temperature
- injector precision and accuracy
- peak retention time precision

Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment, and repeating the testing at regular intervals may not be required. However, when the instrument undergoes major repairs or modifications, relevant OQ tests should be repeated to verify whether the instrument continues to operate satisfactorily. Relevant OQ tests should also be repeated for an instrument that has been transported to another location, although a move within the laboratory, or from one room to another, that does not disturb instrument operation may not require requalification.

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification. ~~and should be performed whenever possible.~~ Holistic tests, which involve the entire system, are also acceptable. ~~in lieu of modular testing.~~ Having successfully completed OQ testing, the instrument is qualified for use in regulated samples analysis.

PERFORMANCE QUALIFICATION

After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification (PQ). The PQ phase includes the following parameters.

Performance Checks—Set up a test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications~~. Some~~ and may consist of analyzing known components or standards. The tests should be based on good science and reflect the general intended use of the instrument. These tests may resemble those performed during OQ, but the specifications for their results

In-Process Revision

can be set differently if required. ~~PQ tests should be performed routinely on a working instrument, not only on a new instrument at installation. Therefore, PQ specifications can be slightly less rigorous than OQ specifications.~~ Nevertheless, user specifications for PQ tests should evince trouble-free instrument operation for the intended applications. ~~PQ tests should be performed independently of the routine analytical testing performed on the instrument.~~ As is the case with OQ testing, PQ tests can be modular or holistic. However, because many modules within a system interact, holistic tests generally prove to be more effective because they evaluate the entire system, not simply the system's individual modules.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. It may also be scheduled for regular intervals, such as weekly or monthly. Experience with the instrument can influence this decision. ~~Generally, the same PQ tests are repeated~~ It may be useful to repeat the same PQ tests each time so that a history of the instrument's performance can be compiled. Alternatively, the instrument may be incorporated into an integrated support system to assure that it remains continually qualified. Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably. ~~However, although system suitability tests can supplement periodic PQ tests, they cannot replace them.~~

Preventive Maintenance and Repairs—When an instrument fails to meet PQ test specifications, it requires maintenance or repair. A periodic preventive maintenance may also be recommended for many instruments. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.

Standard Operating Procedure[s] for Operation, Calibration, ~~and~~ Maintenance and Change Control—Establish standard operating procedures to maintain and calibrate the instrument. ~~Use a logbook, binder, or electronic record to document each~~ Each maintenance and calibration activity should be documented.

Roles and Responsibilities

USERS

Users are ultimately responsible for instrument operations and data quality. The user's group encompasses analysts, their supervisors, and organization management. Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments, because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. Consultants, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.

QUALITY ASSURANCE

The QA role in AIQ remains the same as for any other regulated study. QA personnel should understand the instrument qualification process, and they should learn about the instrument's application by working with the users. Finally, they should review the AIQ process to determine whether it

meets regulatory requirements, and they should make certain that the users attest to the scientific validity of the process.

MANUFACTURERS

Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the hardware and for software associated with the instrument. Manufacturers and developers are also responsible for writing stand-alone software for analytical work in a documented quality manner and for the validation of this software. Manufacturers should test the assembled instruments before shipping them to users.

Manufacturers and vendors should make available to users a summary of their validation efforts and the results of final instrument and software tests, and they should provide the critical functional test scripts that can be used to qualify the instrument and software at the user site. For instance, manufacturers and vendors can provide a large database and scripts for functional testing of the network's bandwidth for laboratory information management system (LIMS) software.

Finally, manufacturers and vendors should notify all known users about hardware or software defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

SOFTWARE VALIDATION

Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software.

Firmware—Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and users generally cannot alter firmware design or function. Firmware is therefore considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware. Thus, when the hardware (that is, the analytical instrument) is qualified at the user's site, the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control,* below).

Instrument Control, Data Acquisition, and Processing Software—Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and postacquisition calculations. Thus both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire instrument and software system, is more efficient than modular validation of the software alone. Thus the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.

Stand-Alone Software—An authoritative guide for validating stand-alone software, such as LIMS, is available.[1] The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.

The software validation guide cited in the previous paragraphs indicates that user-site testing is an essential part of the software development cycle. Note, however, that user-site testing, though essential, is only part of the validation process for stand-alone software and does not constitute complete validation. Refer to the software validation guide for activities that must be performed at the user site for testing stand-alone software used in analytical work.

Change Control

Changes to the instrument and software become inevitable as manufacturers add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control follows the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below:

Operational Qualification—Revise OQ tests as necessitated by the change. Perform the revised OQ testing. If the OQ did not need revision, repeat only the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification—Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In the future, perform the revised PQ testing.

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. Change control for stand-alone software requires user-site testing of changed functionality.

AIQ Documentation

Two types of documents result from AIQ: static and dynamic.

STATIC DOCUMENTS

Static documents are obtained during the DQ, IQ, and OQ phases and should be ~~kept in a "Qualification" binder~~ retained in an accessible manner. Where multiple instruments of one kind exist, documents common to all instruments ~~should go into one binder or section,~~ and documents specific to an instrument ~~should go into that instrument's binder or section~~ may be retained separately. During change control, additional documents ~~can be placed with~~ may supplement

[1] *General Principles of Software Validation: Final Guidance for Industry and FDA Staff,* U.S. Department of Health and Human Services, Food and Drug Administration, Rockville, MD, January 11, 2002. http://www.fda.gov/cdrh/comp/guidance/938.html (accessed September 2004).

the static ones, but previous documents should not be ~~removed~~ discarded. When necessary, such documents may be archived.

DYNAMIC DOCUMENTS

Dynamic documents are generated during the OQ and PQ phases when the instrument is maintained or tested for performance. Arranged in a binder or logbook, they provide a running record for the instruments and should be kept with them. These documents ~~may~~ should also be archived as necessary.

Instrument Categories

Modern laboratories typically include a suite of tools varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of principles to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Examples of instruments in each group are provided. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site. That category should be determined by users for their specific instruments or applications.

GROUP A

Conformance of Group A instruments to user requirements is determined by visual observation. No independent qualification process is required. Examples of instruments in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, mortar and pestle sets, water baths, and glass pipets.

GROUP B

Conformance of Group B instruments to user requirements is determined according to an instrument's standard operating procedures. Conformity assessments are generally unambiguous. Installation of Group B instruments is relatively simple, and causes of their failure are readily discernible by simple observation. Examples of instruments in this group are balances, incubators, ~~IR spectrometers,~~ melting point apparatus, muffle furnaces, light microscopes, pH meters, variable pipets, refractometers, refrigerator-freezers, thermocouples, thermometers, titrators, ovens, and viscosimeters.

GROUP C

Conformance of Group C instruments to user requirements is complex and highly method-specific; conformity bounds are determined by the application. Installing these instruments can be a complicated undertaking and may require the assistance of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Examples of instruments in this group include the following:

- atomic absorption spectrometers
- differential scanning calorimeters
- electron microscopes
- flame absorption spectrometers
- high-pressure liquid chromatographs
- mass spectrometers
- microplate readers
- thermal gravimetric analyzers

- X-ray fluorescence spectrometers
- X-ray powder diffractometers
- densitometers
- diode-array detectors
- elemental analyzers
- gas chromatographs
- IR spectrometers
- near IR spectrometers
- Raman spectrometers
- UV/Vis spectrometers
- inductively coupled argon–plasma emission spectrometers

Again, it must be emphasized that the placement of these instruments in the given three groups is for illustrative purposes only. The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

CONCLUSION

The purpose of the use of analytical instruments is to generate reliable data. Analytical instrument qualification helps fulfill this purpose. No authoritative guide existed that considered the risk of instrument nonperformance and combined that risk with users' scientific knowledge and ability to use the instrument to deliver reliable and consistent data. In the absence of such a guide, the qualification of analytical instruments became a subjective and often fruitless document-generating exercise.

This chapter is based on the outcome of a user workshop-conference on the subject and provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The process provided in this chapter focuses on scientific value rather than on producing documents. Implementing such a process should increase efficiency and remove ambiguous or varying interpretations by different groups.■2S (*USP29*)

BRIEFING

⟨1092⟩ The Dissolution Procedure: Development and Validation, page 351 of *PF* 30(1) [Jan.–Feb. 2004]. This proposed new general information chapter, which previously appeared in *Pharmacopeial Previews,* is now forwarded with changes to *In-Process Revision.* The chapter provides several needed types of information. Currently, aspects of method development are mentioned only superficially in the general information chapter *In Vitro and In Vivo Evaluation of Dosage Forms* ⟨1088⟩; the present chapter goes into greater detail and gives guidance to the analyst on developing meaningful dissolution methods. Similarly, the general information chapter *Validation of Compendial Methods* ⟨1225⟩ touches only on special considerations for validation of dissolution testing, whereas this proposed chapter provides a typical detailed step-by-step approach to designing and validating a dissolution test. Last, this new general information chapter provides guidance to the analyst on validation and the use of new technologies and equipment in dissolution testing. The chapter is loosely based on a stimuli article, "A New General Information Chapter on Dissolution," by V.A. Gray, C.K. Brown, J.B. Dressman, and L.J. Leeson that appeared on page 3432 of *PF* 27(6) [Nov.–Dec. 2001]. The information provided here was revised, in part, on the basis of comments from experts in the pharmaceutical industry. The participation of the PhRMA Dissolution Expert Team is gratefully acknowledged.

(BPC: W. Brown) RTS—42981-1

Add the following:

■⟨1092⟩ THE DISSOLUTION PROCEDURE: DEVELOPMENT AND VALIDATION

The USP dissolution procedure is a performance test applicable to many dosage forms. It is one test in a series of tests that constitute the dosage form's public specification (tests, procedures for the tests, acceptance criteria). To satisfy the performance test, USP provides the general test chapters *Disintegration* ⟨701⟩, *Dissolution* ⟨711⟩, and *Drug*

Release ⟨724⟩. These chapters provide information about conditions of the procedure. For dissolution, these include information about (1) medium, (2) apparatus/agitation rate, (3) study design, (4) assay, and (5) acceptance criteria. Overall the dissolution procedure yields data to allow an accept/reject decision relative to the acceptance criteria, which are frequently based on a regulatory decision. This chapter provides recommendations on how to develop and validate a dissolution procedure.

GENERAL COMMENTS

The dissolution procedure requires an apparatus, a dissolution medium, and test conditions that provide a method that is discriminating yet sufficiently rugged and reproducible for day-to-day operation and capable of being transferred between laboratories.

The acceptance criteria should be representative of multiple batches with the same nominal composition and manufacturing process, typically including key batches used in pivotal studies, and representative of performance in stability studies.

The procedure should be appropriately discriminating, capable of distinguishing significant changes in a composition or manufacturing process that might be expected to affect in vivo performance. It is also possible for the procedure to show differences between batches when no significant difference is observed in vivo. This situation requires careful evaluation of whether the procedure is too sensitive or appropriately discriminating. Assessing the results from multiple batches that represent typical variability in composition and manufacturing parameters may assist in this evaluation. It is sometimes valuable to intentionally vary manufacturing parameters, such as lubrication, blend time, compression force, or drying parameters, to further characterize the discriminatory power of the procedure.

With regard to stability, the dissolution test should appropriately reflect relevant changes in the drug product over time that are caused by temperature, humidity, photosensitivity, and other stresses.

A properly designed test should result in data that are not highly variable and should not be associated with significant analytical solution stability problems. High variability in results can make it difficult to identify trends or effects of formulation changes. Dissolution results may be considered highly variable if the relative standard deviation (RSD) is greater than 20% at time points of 10 minutes or less and greater than 10% RSD at later time points.[1] However, most dissolution results exhibit less variability than this. The source of the variability should be investigated when practical and attempts should be made to reduce variability whenever possible. The two most likely causes are the formulation itself (e.g., drug substance, excipients, or manufacturing process) or artifacts associated with the test procedure (e.g., coning, tablets sticking to the vessel wall or basket screen). Visual observations are often helpful for understanding the source of the variability and whether the dissolution test itself is contributing to the variability. Any time the dosage contents do not disperse freely throughout the vessel in a uniform fashion, aberrant results can occur. Depending on the problem, the usual remedies include changing the apparatus type, speed of agitation, or deaeration; consideration and/or examination of sinker type; and changing the composition of the medium. Modifications to the apparatus may also be useful, with proper justification and validation.

[1] The Biopharmaceutics Classification System is outlined in the FDA *Guidance for Industry: Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate-Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System,* August 2000; http://www.fda.gov/cder/guidance/3618fnl.htm, accessed 6/22/2005.

Many causes of variability can be found in the formulation and manufacturing process. For example, poor content uniformity, process inconsistencies, a reaction taking place at different rates during dissolution, excipient interactions or interference, film coating, capsule shell aging, and hardening or softening of the dosage form on stability may be sources of variability and interferences. During routine testing of the product, variability outside the expected range should be investigated from analytical, formulation, and processing perspectives.

MEDIUM

Physical and chemical data for the drug substance and dosage unit need to be determined before selecting the dissolution medium. Two key properties of the drug are the solubility and solution state stability of the drug as a function of the pH value. When selecting the composition of the medium, the influence of buffers, pH value, and surfactants on the solubility and stability of the drug need to be evaluated. Key properties of the dosage unit that may affect dissolution include release mechanism (immediate, delayed, or modified) and disintegration rate as affected by hardness, friability, presence of solubility enhancers, and presence of other excipients.

Generally, when developing a dissolution procedure, one goal is to have *sink conditions,* defined as the volume of medium at least three times that required in order to form a saturated solution of drug substance. When sink conditions are present, it is more likely that dissolution results will reflect the properties of the dosage form. A medium that fails to provide sink conditions may be acceptable if it is shown to be more discriminating or otherwise appropriately justified.

Using an aqueous–organic solvent mixture as a dissolution medium is discouraged; however,with proper justification this type of medium may be acceptable.

Purified water is often used as the dissolution medium, but is not ideal for several reasons. First, the quality of the water can vary depending on the source of the water, and the pH value of the water is not controlled. Second, the pH value can vary from day to day and can also change during the run, depending on the active substance and excipients. Despite these limitations, water is inexpensive, readily available, easily disposed of, ecologically acceptable, and suitable for products with a release rate independent of the pH value of the medium.

The dissolution characteristics of an oral formulation should be evaluated in the physiologic pH range of 1.2 to 6.8 (1.2 to 7.5 for modified-release formulations). During method development, it may be useful to measure the pH before and after a run to discover whether the pH changes during the test. Selection of the most appropriate conditions for routine testing is then based on discriminatory capability, ruggedness, stability of the analyte in the test medium, and relevance to in vivo performance, where possible.

Typical media for dissolution may include the following (not listed in order of preference): dilute hydrochloric acid, buffers in the physiologic pH range of 1.2 to 7.5, simulated gastric or intestinal fluid (with or without enzymes), water, and surfactants (with or without acids or buffers) such as polysorbate 80, sodium lauryl sulfate, and bile salts.

The molarity of the buffers and acids used can influence the solubilizing effect, and this factor may be evaluated.

For compounds with high solubility and high permeability (as defined by the Biopharmaceutics Classification System), the choice of medium and apparatus may be influenced by the referenced FDA Guidance[1].

For very poorly soluble compounds, aqueous solutions may contain a percentage of a surfactant (e.g., sodium lauryl sulfate, polysorbate, or lauryldimethylamine oxide) that is used to enhance drug solubility. The need for surfactants and the concentrations used can be justified by showing profiles at several different concentrations. Surfactants can be used either as wetting agents or to solubilize the drug substance.

Volume

Normally, for basket and paddle apparatus, the volume of the dissolution medium is 500 mL to 1000 mL, with 900 mL as the most common volume. The volume can be raised to between 2 and 4 L, using larger vessels and depending on the concentration and sink conditions of the drug; justification for this procedure is expected.

Deaeration

The significance of deaeration of the medium should be determined, because air bubbles can interfere with the test results, acting as a barrier to dissolution if present on the dosage unit or basket mesh. Further, bubbles can cause particles to cling to the apparatus and vessel walls. On the other hand, bubbles on the dosage unit may increase buoyancy, leading to an increase in the dissolution rate, or may decrease the available surface area, leading to a decrease in the dissolution rate. A dearation method is described as a footnote in the *Procedure* section under *Dissolution* ⟨711⟩. Typical steps include heating the medium, filtering, and drawing a vacuum for a short period of time. Other methods of deaeration are available and in routine use throughout the industry. Media containing surfactants are not usually deaerated because the process results in excessive foaming. To determine whether deaeration of the medium is necessary, results from dissolution samples run in nondeaerated medium and deaerated medium should be compared.

Enzymes

The use of enzymes in the dissolution medium is permitted in accordance with *Dissolution* ⟨711⟩ when dissolution failures occur as a result of cross-linking with gelatin capsules or gelatin-coated products.

In Vitro–In Vivo Correlation (IVIVC)

An in-depth discussion on IVIVC can be found in *In Vitro and In Vivo Evaluation of Dosage Forms* ⟨1088⟩. A brief discussion follows.

Biorelevant medium is a medium that has some relevance to the in vivo performance of the dosage unit. Choice of a biorelevant medium is based on (1) a mechanistic approach that considers the absorption site, if known, and (2) whether the rate-limiting step to absorption is the dissolution or permeability of the compound. In some cases, the biorelevant medium will be different from the test conditions chosen for the regulatory test, and the time points are also likely to be different. If the compound dissolves quickly in the stomach and is highly permeable, gastric emptying time may be the rate-limiting step to absorption. In this case, the dissolution test should demonstrate that the drug is released quickly under typical gastric (acidic) conditions. On the other hand, if dissolution occurs primarily in the intestinal tract (e.g., for a poorly soluble, weak acid), a higher pH range (e.g., simulated intestinal fluid with a pH of 6.8) may be more appropriate. The fed and fasted states may also have significant effects on the absorption or solubility of a compound. Compositions of media that simulate the fed and fasted states can be found in the literature. These media reflect changes in

pH, bile concentrations, and osmolarity after meal intake and therefore have a composition different from that of typical compendial media. They are primarily used to establish in vitro–in vivo correlations during formulation development and to assess potential food effects and are not intended for quality control purposes. For quality control purposes, the substitution of natural surfactants (bile components) with appropriate synthetic surfactants is permitted and encouraged because of the expense of the natural substances and the labor-intensive preparation of the biorelevant media.

APPARATUS/AGITATION

Apparatus

The choice of apparatus is based on knowledge of the formulation design and the practical aspects of dosage form performance in the in vitro test system. For solid oral dosage forms, *Apparatus 1* and *Apparatus 2* are used most frequently.

When *Apparatus 1* or *2* is not appropriate, another official apparatus may be used. *Apparatus 3 (Reciprocating Cylinder)* has been found to be especially useful for bead-type modified-release dosage forms. *Apparatus 4 (Flow-Through Cell)* may offer advantages for modified-release dosage forms that contain active ingredients with limited solubility. In addition, *Apparatus 3* or *Apparatus 4* may have utility for soft gelatin capsules, bead products, suppositories, or poorly soluble drugs. *Apparatus 5 (Paddle* over *Disk)* and *Apparatus 6 (Rotating Cylinder)* have been shown to be useful for evaluating and testing transdermal dosage forms. *Apparatus 7 (Reciprocating Holder)* has been shown to have application to nondisintegrating oral modified-release dosage forms, as well as to transdermal dosage forms.

Some changes can be made to the apparatus; for example, a basket mesh size other than the typical 40-mesh basket (e.g., 10, 20, 80 mesh) may be used when the need is clearly documented by supporting data. In countries where available mesh sizes vary from the USP specified mesh value, basket material with the nearest metric dimension should be used. Care must be taken that baskets are uniform and meet the dimensional requirements specified under *Dissolution* ⟨711⟩. If the basket screens become clogged during dissolution of capsule or tablet formulations, it may be advisable to switch to the paddle method. The volume can be increased from the typical 900 to 1000 mL by using 2- and 4-L vessels to assist in meeting sink conditions for poorly soluble drugs.

A noncompendial apparatus may have some utility with proper justification, qualification, and documentation of superiority over the standard equipment. For example, a small-volume apparatus with mini paddles and baskets may be considered for low-dosage strength products. The rotating bottle or static tubes (jacketed stationary tubes enclosed with a water jacket and equipped with a magnetic stirrer) may also have utility for microspheres and implants, peak vessels for eliminating coning, and modified flow through cells for special dosage forms, including powders and stents.

Sinkers

When sinkers are used, a detailed description of the sinker must be stated in the written procedure. It may be useful to evaluate different sinkers, recognizing that sinkers can significantly influence the dissolution profile of a dosage unit. When transferring the procedure, the sinkers should be duplicated as closely as possible in the next facility. There are several types of commercially available sinkers. A method

for making sinkers by hand, sinkers that are similar to "a few turns of wire helix" as described in *Apparatus 2 (Paddle Apparatus)* under *Dissolution* ⟨711⟩, is described below.

Materials—Use 316 stainless steel wire or other inert material, typically 0.032 inch/20 gauge; and cylinders of appropriate diameter (e.g., cork borers). Sizes are shown in the table.

Capsule Shell Type	Length of Wire (cm)	Diameter Size (cm)	Cork Bore Number
#0, elongated	12	0.8	4
#1 and #2	10	0.7	3
#3 and #4	8	0.55	2

Procedure—Cut the specified length of wire, coil around a cylinder of the appropriate size, and use small pliers to curve in the ends. Use caution, because wire ends may be rough and may need to be filed.

If the sinker is handmade, the sinker material and construction procedure instructions should be documented; if a commercial sinker is used, the vendor part number should be reported.

Agitation

For immediate-release capsule or tablet formulations, *Apparatus 1* (baskets) at 100 rpm or *Apparatus 2* (paddles) at 50 or 75 rpm are most commonly used. Other agitation speeds and apparatus are acceptable with appropriate justification.

Rates outside 25 to 150 rpm are usually inappropriate because of the inconsistency of hydrodynamics below 25 rpm and because of turbulence above 150 rpm. Agitation rates between 25 and 50 rpm are generally acceptable for suspensions. For dosage forms that exhibit coning (mounding) under the paddle at 50 rpm, the coning can be reduced by increasing the paddle speed to 75 rpm, thus reducing the artifact and improving the data. If justified, 100 rpm may be used, especially for extended-release products. Decreasing or increasing the apparatus rotation speed may be justified if the profiles better reflect in vivo performance and/or the method results in better discrimination without adversely affecting method reproducibility.

Selection of the agitation and other study design elements for modified-release dosage forms is similar to that for immediate-release products. These elements should conform to the requirements and specifications given in *Dissolution* ⟨711⟩ when the apparatus has been appropriately calibrated.

STUDY DESIGN

Time Points

For immediate-release dosage forms, the duration of the procedure is typically 30 to 60 minutes; in most cases, a single time point specification is adequate for Pharmacopeial purposes. Industrial and regulatory concepts of product comparability and performance may require additional time points, which may also be required for product registration or approval. A sufficient number of time points should be selected to adequately characterize the ascending and plateau phases of the dissolution curve. According to the Biopharmaceutics Classification System referred to in several FDA Guidances, highly soluble, highly permeable drugs formulated with rapidly dissolving products need not be subjected to a profile comparison if they can be shown to release 85% or more of the active drug substance within 15 minutes. For these types of products a one-point test will suffice. However, most products do not fall into this category. Dissolution profiles of immediate-release products typically show a gradual increase reaching 85% to 100% at

about 30 to 45 minutes. Thus, dissolution time points in the range of 15, 20, 30, 45, and 60 minutes are usual for most immediate-release products. For rapidly dissolving products, including suspensions, useful information may be obtained from earlier points, e.g., 5 to 10 minutes. For slower-dissolving products, time points later than 60 minutes may be useful. Dissolution test times for compendial tests are usually established on the basis of an evaluation of the dissolution profile data.

So-called infinity points can be useful during development studies. To obtain an infinity point, the paddle or basket speed is increased at the end of the run for a sustained period (typically 15 to 60 minutes), after which time an additional sample is taken. Although there is no requirement for 100% dissolution in the profile, the infinity point can provide data that may supplement content uniformity data and may provide useful information about formulation characteristics during initial development or about method bias.

For an extended-release dosage form, at least three test time points are chosen to characterize the in vitro drug release profile for Pharmacopeial purposes. Additional sampling times may be required for drug approval purposes. An early time point, usually 1 to 2 hours, is chosen to show that there is little probability of dose dumping. An intermediate time point is chosen to define the in vitro release profile of the dosage form, and a final time point is chosen to show the essentially complete release of the drug. Test times and specifications are usually established on the basis of an evaluation of drug release profile data. For products containing more than a single active ingredient, drug release is to be determined for each active ingredient.

Observations

Visual observations and recordings of product dissolution and disintegration behavior are very useful because dissolution and disintegration patterns can be indicative of variables in the formulation or manufacturing process. To accomplish visual observation, proper lighting (with appropriate consideration of photodegradation) of the vessel contents and clear visibility in the bath are essential. Documenting observations by drawing sketches and taking photographs or videos can be instructive and helpful for those who are not able to observe the real time dissolution test. Observations are especially useful during method development and formulation optimization. Examples of typical observations include, but are not limited to, the following:

1. Uneven distribution of particles throughout the vessel. This can occur when particles cling to the sides of the vessel, when there is coning or mounding directly under the apparatus, when particles float at the surface of the medium, when film-coated tablets stick to the vessel, and/or when off-center mounds are formed.
2. Air bubbles on the inside of the vessel or on the apparatus or dosage unit. Sheen on the apparatus is also a sign of air bubbles. This observation would typically be made when assessing the need to deaerate the medium.
3. Dancing or spinning of the dosage unit, or the dosage unit being hit by the paddle.
4. Adhesion of particles to the paddle or the inside of the basket, which may be observed upon removal of the stirring device at the end of the run.
5. Pellicles or analogous formations, such as transparent sacs or rubbery, swollen masses surrounding the capsule contents.

6. Presence of large floating particles or chunks of the dosage unit.
7. Observation of the disintegration rate (e.g., percentage reduction in size of the dosage unit within a certain time frame).
8. Complex disintegration of the coating of modified or enteric-coated products—for example, the partial opening and splitting apart (like a clamshell) or incomplete opening of the shell accompanied by the release of air bubbles and excipients.

Sampling

Manual—Manual sampling uses plastic or glass syringes, a stainless steel cannula that is usually curved to allow for vessel sampling, a filter, and/or a filter holder. The sampling site must conform to specifications under *Dissolution* ⟨711⟩.

Autosampling—Autosampling is a useful alternative to manual sampling, especially if the test includes several time points. However, because regulatory labs may perform the dissolution test using manual sampling, autosampling requires validation with manual sampling.

There are many brands of autosamplers, including semi-automated and fully automated systems. Routine performance checks, cleaning, and maintenance as described in the pertinent standard operating procedures or metrology documents are useful for reliable operation of these devices.

Some instruments are equipped with sampling through the basket or paddle shaft. Proper validation (e.g., demonstrated equivalence to results with the usual sampling procedure) may be required.

The disturbance of the hydrodynamics of the vessel by sampling probes should be considered and adequate validation performed to ensure that the probes are not introducing a significant change in the dissolution rate.

Comparison of manual and automated procedures should be performed to evaluate the interchangeability of the procedures. This can be accomplished by comparing data from separate runs or, in some cases, by sampling both ways from the same vessel. Results should be consistent with the requirements for intermediate precision (described in this chapter in *Validation*) if the procedures are to be considered interchangeable.

Other aspects of automation validation may include carryover of residual drug, effect of an in-residence probe (simultaneous sampling as mentioned above may not be suitable in this case), adsorption of drug, and cleaning and/or rinse cycles.

Filters

Filtration of the dissolution samples is usually necessary to prevent undissolved drug particles from entering the analytical sample and further dissolving. Also, filtration removes insoluble excipients that may otherwise cause high background or turbidity. Prewetting of the filter with the medium may be necessary.

Filters can be in-line or at the end of the sampling probe or both. The pore size can range from 0.45 to 70 μm. The usual types of filters are depth, disk, and flow-through. However, if the excipient interference is high, if the filtrate has a cloudy appearance, or if the filter becomes clogged, an alternative type of filter or pore size should be evaluated.

Adsorption of the drug(s) onto the filter needs to be evaluated. If drug absorption occurs, the amount of initial filtrate discarded may need to be increased. If results are still unsuitable, an alternative filter material may be sought.

Filter validation may be accomplished by preparing a suitable standard solution or a completely dissolved sample solution (e.g., prepared as a typical sample in a vessel or a sample put in a beaker and stirred with a magnetic stirrer for 1 hour). For standard solutions, compare the results for filtered solutions (after discarding the appropriate volume) to those for the unfiltered solutions. For sample solutions, compare the results for filtered solutions (after discarding the appropriate volume) to those for centrifuged, unfiltered solutions.

Centrifugation

Centrifugation of samples is not preferred, because dissolution can continue to occur and because there may be a concentration gradient in the supernatant. A possible exception might be for compounds that adsorb onto all common filters.

ASSAY

The usual assay for a dissolution sample is either spectrophotometric determination or HPLC. The preferred method of analysis is spectrophotometric determination because results can be obtained faster, the analysis is simpler, and fewer solvents are used. HPLC methods are used when there is significant interference from excipients or among drugs in the formulation to improve analytical sensitivity and/or when the analysis can be automated. It may be useful to obtain data for the drug with a stability-indicating assay (e.g., HPLC chromatograms) in the medium of choice, even if the primary assay is based on a spectrophotometric method.

VALIDATION

The validation topics described in this section are typical but not all-inclusive. The validation elements addressed may vary, depending on the phase of development or the intended use for the data.[2] The acceptance criteria are presented as guidelines only and may differ for some products. Firms should document the appropriate acceptance criteria for their products in pertinent SOPs. Other considerations may be important for special dosage forms. The extent of validation depends on the phase of the product development. Full validation takes place by the time of Phase III clinical studies. Validation studies should address the variations associated with different profile time points. For products containing more than a single active ingredient, the dissolution method needs to be validated for each active ingredient.

Specificity/Placebo Interference

It is necessary to demonstrate that the results are not unduly affected by placebo constituents, other active drugs, or degradates.

The placebo consists of all the excipients and coatings (inks, sinker, and capsule shell are also included when appropriate) without the active ingredient. Placebo interference may be determined by weighing samples of the placebo blend and dissolving or dispersing them in dissolution medium at concentrations that would be encountered during testing. It may be desirable to perform this experiment at 37° by comparing it to the 100% standard by the formula:

$$100C(A_P / A_S)(V/L)$$

in which C is the concentration, in mg per mL, of the standard; A_P and A_S are the absorbances of the placebo and the

[2] Boudreau, S.P., McElvain, J.S., Martin, L.D., Dowling, T., Fields, S.M. Method Validation by Phase of Development, an Acceptable Analytical Practice. *Pharmaceutical Technology* 2004; 28(11):54–66.

standard, respectively; V is the volume, in mL, of the medium; and L is the label claim, in mg. The interference should not exceed 2%.

NOTE—For extended-release products, a placebo version of the finished dosage form may be more appropriate to use than blends, because this placebo formulation will release the various excipients in a manner more nearly reflecting the product than will a simple blend of the excipients. In this case, it may be appropriate to evaluate potential interference at multiple sampling points in the release profile.

If the placebo interference exceeds 2%, then method modification—such as (1) choosing another wavelength, (2) baseline subtraction using a longer wavelength, or (3) using HPLC—may be necessary in order to avoid the interference. When other active drugs or significant levels of degradates are present, it is necessary to demonstrate that these do not significantly affect the results. One procedure for doing this is to measure the matrix in the presence and absence of the other active drug or degradate: any interference should not exceed 2%.

Linearity and Range

Linearity and range are typically established by preparing solutions of the drug, ranging in concentration from below the lowest expected concentration to above the highest concentration during release. This may be done in conjunction with accuracy/recovery determination. The scheme may be altered if different flow-cell sizes or injection volumes are used.

Typically, solutions are made from a common stock if possible. For the highest concentration, the determination may not exceed the linearity limits of the instrument.

Organic solvents may be used to enhance drug solubility for the preparation of the standard solutions; however, no more than 5% (v/v) of organic solvent in the final solution should be used, unless validated.

Linearity is typically calculated by using an appropriate least-squares regression program. Typically, a square of the correlation coefficient ($r^2 \geq 0.98$) demonstrates linearity. In addition, the y-intercept must not be significantly different from zero.

Accuracy/Recovery

Accuracy/recovery are typically established by preparing multiple samples containing the drug and any other constituents present in the dosage form (e.g., excipients, coating materials, capsule shell) ranging in concentration from below the lowest expected concentration to above the highest concentration during release.

In cases of poor drug solubility, it may be appropriate to prepare a stock solution by dissolving the drug substance in a small amount of organic solvent (typically not exceeding 5%) and diluting to the final concentration with dissolution medium. An amount of stock solution equivalent to the targeted label claim may be added to the vessel instead of the drug powder. Similarly, for very low strengths, it may be more appropriate to prepare a stock solution than to attempt to weigh very small amounts. The measured recovery is typically 95% to 105% of the amount added. Bracketing or matrixing of multiple strengths may be useful.

A special case for validation is the *Acid Stage* procedure described in *Delayed-Release Dosage Forms* under *Dissolution* ⟨711⟩. The limit of not more than 10% needs to be validated. If the compound degrades in acid, the validation experiment must address this fact.

Precision

Repeatability—Repeatability is determined by replicate measurements of standard and/or sample solutions. It can be measured by calculating the RSD of the multiple injections or spectrophotometric readings for each standard solution, or from the accuracy or linearity data.

Intermediate Precision—Intermediate precision may be evaluated to determine the effects of random events on the precision of the analytical procedure. This evaluation is typically done later in the development of the drug product. The precision can be across the range of product strengths. Typical variations to study include days, analysts and equipment. The use of an experimental matrix design is encouraged for evaluation of intermediate precision. If possible, intermediate precision can be evaluated using a well-characterized lot of drug product of tight content uniformity. In cases where a well-characterized product is not available, placebo and active ingredient may be used to identify intermediate precision.

The dissolution profiles on the same sample may be run by at least two different analysts, each analyst preparing the standard solutions and the medium. Typically, the analysts use different dissolution baths, spectrophotometers or HPLC equipment (including columns), and autosamplers; and they perform the test on different days. This procedure may not need to be performed for each strength; instead, bracketing with high and low strengths may be acceptable.

A typical acceptance criterion is that the difference in the mean value between the dissolution results at any two conditions using the same strength does not exceed an absolute 10% at time points with less than 85% dissolved and does not exceed 5% for time points above 85%. Acceptance criteria may be product specific, and other statistical tests and limits may be used.

Robustness

The evaluation of robustness, which assesses the effect of making small, deliberate changes to the dissolution conditions, typically is done later in the development of the drug product. The number of replicates (typically 3 or 6) is dependent on the intermediate precision.

Parameters to be varied are dependent on the dissolution procedure and analysis type. They may include medium composition (e.g., buffer or surfactant concentration), pH, volume, agitation rate, and temperature. For HPLC analysis, parameters may include mobile phase composition (percentage organic, buffer concentration, pH), flow rate, wavelength, column temperature, and multiple columns (of the same type). For spectrophotometric analysis, the wavelength may be varied.

Standard and Sample Solution Stability

The standard solution is stored under conditions that ensure stability. The stability of the standard is analyzed over a specified period of time, using a freshly prepared standard solution at each time interval for comparison. The acceptable range for standard solution stability is typically between 98% and 102%.

The sample solution is typically stored at room temperature. The sample is analyzed over a specified period of time using the original sample solution response for comparison. The typical acceptable range for sample solution stability may be between 98% and 102% compared with the initial analysis of the sample solutions. If the solution is not stable, aspects to consider could be temperature (refrigeration may be needed), light protection, and container material (plastic or glass).

The procedure may state that the standards and samples need to be analyzed within a time period demonstrating acceptable standard and sample solution stability.

Spectrophotometric Analysis

Samples may be automatically introduced into the spectrophotometer using autosippers and flow cells. Routine performance checks, cleaning, and maintenance as described in the standard operating procedures or metrology documents are useful for reliable operation of these instruments. Cells with path lengths ranging from 0.02 to 1 cm are typically used. Cell alignment and air bubbles could be sources of error. The smaller path length cells are used to avoid diluting the sample; however, acceptable linearity and standard error need to be demonstrated.

During analysis, standard solutions are typically prepared and analyzed at just one concentration at 100% (or the selected *Q* value) of the dosage strength. During profile analysis, other concentrations may be useful. A typical blank, standard, and sample may be analyzed in a sequence that brackets the sample with standards and blanks, especially at the beginning and end of the analysis.

In most cases, the mean absorbance of the dissolution medium blank may not exceed 1% of the standard. Values higher than 1% must be evaluated on a case-by-case basis. The typical RSD for UV analysis is usually not more than 2%.

The absorptivity is calculated by dividing the mean standard absorbance by the concentration, in mg per mL, divided by the flow-cell path length in cm. After enough historical data are accumulated, an acceptable absorptivity range for the analyte (using the appropriate flow cell) may be determined. This value may be useful in troubleshooting aberrant data.

Fiber optics as a sampling and determinative method, with proper validation, is an option.

It may be useful to examine the UV spectrum of the drug in solution to select the optimum wavelength.

HPLC

For HPLC analysis, the compatibility of dissolution media and mobile phase may be examined, especially if large injector volumes (over 100 µL) are needed. Samples are normally analyzed with HPLC using a spectrophotometric detector and an autoinjector. Single injections of each vessel time point with standards throughout the run constitute a typical run design. System suitability tests include, at a minimum, the retention window and injection precision. Typically, the repeatability of an HPLC analysis should be less than or equal to 2% RSD for five or six standard determinations. The standard level is typically at the 100% label claim level, especially for a single-point analysis.

Preparation of the placebo samples for the HPLC analysis is to be performed in the same way as in the spectrophotometric analysis. Examine the chromatogram for peaks eluting at the same retention time as the drug. If there are extraneous peaks, inject the standard solution, and compare retention times. If the retention times are too close, spike the placebo solution with the drug. Chromatograms may also be obtained over an extended run time using the blank (dissolution medium), standard, and sample solution to identify late eluters that may interfere with subsequent analyses.

The validation documentation may include overlaid representative chromatograms or spectra of blank dissolution medium, a filtered placebo solution, a standard solution, and a filtered dissolution sample. Absence of interfering peaks in the placebo chromatogram or lack of absorbance by the placebo at the analytical wavelength demonstrates specificity.

ACCEPTANCE CRITERIA

Typical acceptance criteria for the amount of active ingredient dissolved, expressed as a percentage of the labeled content *(Q),* are in the range of 75% to 80% dissolved. A *Q* value in excess of 80% is not generally used, because allowance needs to be made for assay and content uniformity ranges.[3] Acceptance criteria including test times are usually established on the basis of an evaluation of the dissolution profile data. Acceptance criteria should be consistent with historical data, and there is an expectation that acceptable batches (e.g., no significant differences in in vivo performance, composition, or manufacturing procedure) will have results that fall within the acceptance criteria.■2S (*USP29*)

BRIEFING

⟨1223⟩ Validation of Alternative Microbiological Methods, page 256 of *PF* 29(1) [Jan.–Feb. 2003]. On the basis of comments received, it is proposed to rewrite this general information chapter. The qualitative and quantitative aspects will form the content of the proposed chapter, while the section on identification has been removed.

(AMB: R. Tirumalai) RTS—43020-1

Add the following:

■⟨1223⟩ VALIDATION OF ALTERNATIVE MICROBIOLOGICAL METHODS

INTRODUCTION

~~Microbiological testing laboratories sometimes use test methods other than those described in the general chapters for microbial recovery and identification for a variety of reasons such as economics, higher throughput, and convenience. Validation of these substitute methods is required. The *Tests and Assays* section in the *General Notices and Requirements* provides some guidance on the validation of alternate methods, citing that the method under consideration must provide an advantage in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or other special circumstances. The section also notes that in the event of a dispute, only the result obtained by the compendial test is conclusive.~~

~~Proposed alternative tests must be adequately validated. General information chapter *Validation of Compendial Methods* ⟨1225⟩ provides guidance on the validation of chemical assays proposed for adoption as compendial assays. It is the purpose of this general information chapter to provide guidance on the demonstration of the suitability of alternative microbiological methods to be used as part of, or in lieu of, compendial assays.~~

~~The purpose of this chapter is to provide guidance for the validation of methods for use as alternatives to official compendial microbiological methods. For microbial recovery and identification, microbiological testing laboratories sometimes use alternative test methods to those described in the general chapters for a variety of reasons such as economies, throughput, and convenience. Validation of these methods is required. Some guidance on validation is provided in the *Tests and Assays* section in the *General Notices and Requirements* on the use of alternative methods. The section also notes that in the event of a dispute, only the result obtained by the compendial test is conclusive.~~

The purpose of this chapter is to provide guidance for validating methods for use as alternatives to the official compendial microbiological methods. For microbial recovery and identification, microbiological testing laboratories

[3] See the FDA Guidance for Industry: *Dissolution Testing of Immediate-Release Solid Oral Dosage Forms,* August 1997; http://www.fda.gov/cder/guidance/1713bp1.pdf, accessed 6/22/2005.

sometimes use alternative test methods to those described in the general chapters for a variety of reasons, such as economics, throughput, and convenience. Validation of these methods is required. Some guidance on validation is provided in the *Tests and Assays* section in the *General Notices and Requirements* on the use of alternate methods. This section also notes that in the event of a dispute, only the result obtained by the compendial test is conclusive.

Validation studies of alternate microbiological methods should take a large degree of variability into account. When conducting microbiological testing by conventional plate count, for example, one frequently encounters a range of results that is broader (%RSD 15 to 35) than ranges in commonly used chemical assays (%RSD 1 to 3). Many conventional microbiological methods are subject to sampling error, dilution error, plating error, incubation error, and operator error.

Validation of Compendial Methods ⟨1225⟩ defines characteristics such as accuracy, precision, specificity, detection limit, quantification limit, linearity, range, ruggedness, and robustness in their application to analytical methods. These definitions are less appropriate for alternate microbiological method validation as "at least equivalent to the compendial method" given the comparative nature of the question (see *Test and Assay—Procedures* section in *General Notices and Requirements*). The critical question is whether or not the alternate method will yield results equivalent to, or better than, the results generated by the conventional method.

Other industry organizations have provided guidance for the validation of alternate microbiological methods.[1] The suitability of a new or modified method should be demonstrated in a comparison study between the USP compendial method and the alternate method. The characteristics defined in this chapter may be used to establish this comparison.

~~Validation studies of microbiological methods must take into account a large degree of variability. When conducting microbiological testing by conventional plate count, for example, one frequently encounters a range of results that is broader than ranges in commonly used chemical assays. Many conventional microbiological methods are subject to sampling error, dilution error, plating error, and operator error.~~

~~*Validation of Compendial Methods* ⟨1225⟩ defines characteristics such as accuracy, precision, specificity, detection limit, quantification limit, linearity, range, ruggedness, and robustness in their application to chemical and physical testing. These definitions are not appropriate for microbiological method validation as "at least equivalent to the compendial method" because of the comparative nature of the question. For example, while the concept of "detection limit" has merit in quantitative microbial assays, the critical question is whether the alternate method will yield data equal to, or of higher quality than, the data generated by the conventional method.~~

~~The value of a new or modified method should be demonstrated in a comparison study between the USP compendial method and the alternate method. The characteristics defined in this chapter should be used to establish this comparison.~~

TYPES OF MICROBIOLOGICAL TESTS

It is critical to the validation effort to identify the portion of the test addressed by that alternate technology. For example, there is a variety of technologies available to detect the presence of viable cells. These techniques may have application in a variety of tests (e.g., bioburden, sterility test) but

[1] PDA Technical Report No. 33. The Evaluation, Validation and Implementation of New Microbiological Testing Methods. *PDA Journal of Pharmaceutical Science & Technology.* 54 Supplement TR#33 (3) 2000 and Official Methods Programs of AOAC International.

In-Process Revision

may not, in fact, replace the critical aspects of the test entirely. For example, a sterility test by membrane filtration may be performed according to the compendial procedure up to the point of combining the processed filter with the recovery media, and after that the presence of viable cells might then be demonstrated by use of some of the available technologies ~~(see *Table 1*)~~. Validation of this application would, therefore, require validation of the recovery system employed rather than the entire test.

~~**Table 1. Examples of Technologies to Demonstrate the Presence of Viable Organisms**~~

~~Technology~~	~~Application~~
~~growth in liquid culture~~	~~qualitative determination~~
~~impedance~~	~~qualitative determination~~
~~ATP bioluminescence~~	~~qualitative determination~~
~~flow cytometry~~	~~qualitative determination~~
~~head space gas measurement~~	~~qualitative determination~~
~~plate counts~~	~~quantitative determination~~
~~epifluorescent vital dye~~	~~quantitative determination~~

There are three major types of determinations specific to microbiological tests. These include tests to determine whether microorganisms are present in a sample, tests to quantify the number of microorganisms (or to enumerate a specific subpopulation of the sample), and tests designed to identify microorganisms. This chapter does not address microbial identification.

Qualitative Tests for the Presence or Absence of Microorganisms

~~The sterility test is the most common example of this test; the turbidity of a liquid growth medium is taken as evidence of the presence of viable microorganisms in the test sample.~~ This type of test is characterized by the use of turbidity in a liquid growth medium as evidence of the presence of viable microorganisms in the test sample. The most common example of this test is the sterility test. Other examples of this type of testing are those tests designed to evaluate the presence or absence of a particular type of microorganism in a sample (e.g., coliforms in potable water, ~~*Listeria monocytogenes* in food,~~ *E. coli* in oral dosage forms, etc.).

Quantitative Tests for ~~Enumeration of~~ Microorganisms

~~The standard plate count method is the archetype of this class of tests used to estimate the number of viable microorganisms present in a sample. The Most Probable Number (MPN) method is another of these tests. MPN was developed as a means to estimate the number of viable microorganisms present in a sample not amenable to direct plating.~~ The plate count method is the most common example of this class of tests used to estimate the number of viable microorganisms present in a sample. The membrane filtration and Most Probable Number (MPN) multiple-tube methods are other examples of these tests. The latter was developed as a means to estimate the number of viable microorganisms present in a sample not amenable to direct plating or membrane filtration.

~~Identification Tests~~

~~The classical methods of identification used in compendial tests are biochemical and morphological characterization of an unknown microorganism. Biochemical and morphological characterization of an unknown microorganism is the classical method of identification used in compendial tests. Recently developed methods have streamlined and automated aspects of this identification test, especially in the areas of data handling, analysis, and storage. Several~~

~~new approaches that have been integrated into these methods include biochemical reactions, carbon substrate utilization, characterization of fatty acid composition, and restriction endonuclease banding patterns of 16S rDNA.~~

General Concerns

~~Validation of a microbiological method is the process by which it is experimentally established that the performance characteristics of the method meet the requirements for the intended application. Since microbiological tests have three basic applications, three separate sets of validation criteria are required. These concerns are described below, and summarized in *Table 2*.~~

~~Table 2. Validation Parameters by Type of Microbiological Test~~

~~Parameter~~	~~Qualitative Tests~~	~~Quantitative Tests~~	~~Identification Tests~~
~~accuracy~~	~~yes~~	~~yes~~	~~yes~~
~~precision~~	~~no~~	~~yes~~	~~no~~
~~specificity~~	~~yes~~	~~yes~~	~~yes~~
~~detection limit~~	~~yes~~	~~yes~~	~~no~~
~~quantification limit~~	~~no~~	~~yes~~	~~no~~
~~linearity~~	~~no~~	~~yes~~	~~no~~
~~range~~	~~no~~	~~yes~~	~~no~~
~~robustness~~	~~yes~~	~~yes~~	~~yes~~
~~ruggedness~~	~~yes~~	~~yes~~	~~yes~~

Validation of a microbiological method is the process by which it is experimentally established that the performance characteristics of the method meet the requirements for the intended application, in comparison to the traditional method. For example, it may not be necessary to fully validate the equivalence of a new quantitative method for use in the antimicrobial efficacy test by comparative studies, as the critical comparison is between the new method of enumeration and the plate count method (the current method for enumeration). As quantitative tests, by their nature, yield numerical data, they allow for the use of parametric statistical techniques. In contrast, qualitative microbial assays, e.g. the sterility test in the example above, may require analysis by nonparametric statistical methods. The validation of analytical methods for chemical assays follows well-established parameters as described in *Validation of Compendial Methods* ⟨1225⟩. Validation of microbiological methods share some of the same concerns, although consideration must be given to the unique nature of microbiological assays (see *Table 1*).

Table 1. Validation Parameters by Type of Microbiological Test

Parameter	Qualitative Tests	Quantitative Tests
Accuracy	No	Yes
Precision	No	Yes
Specificity	Yes	Yes
Detection limit	Yes	Yes
Quantification limit	No	Yes

In-Process Revision

VALIDATION OF QUALITATIVE TESTS FOR ~~RECOVERY OF MICROORGANISMS IN A SAMPLE~~ DEMONSTRATION OF VIABLE MICROORGANISMS IN A SAMPLE

~~Accuracy and Precision~~

~~*Definition*— The accuracy of a qualitative microbiological method is described as the closeness of the test results obtained by the test method to the value obtained by the compendial method.~~

~~*Determination*— An example of accuracy is shown in the case of a sterility test comparing the rate products produce positive and negative results using the alternative method versus the compendial method.~~

~~**Precision**—~~

~~*Definition*— The precision of a qualitative microbiological method is the degree of agreement between the alternate method and the compendial method when the procedures are performed repeatedly on different lots of the same product.~~

~~A direct method to show the equivalence of two qualitative assays would be to run them side by side and determine the degree to which the method under evaluation shows equivalence to the compendial method. An example of this could be the sterility test where this would translate into a comparison of the rate of positive and negative results produced by the alternative method versus the compendial method for identical samples. However, in a case such as the sterility test, the low number of failures would required thousands of comparison tests to establish equivalency and thus would be problematic.~~

~~A more feasible method for evaluating the precision of a qualitative microbiological method compared to a compendial method might be to observe the degree of agreement between the two when the procedures are performed repeatedly on different lots of the same product. The precision of an alternative qualitative microbiological method is may be expressed as the relative rates of false positive and false negative results between the new method and the compendial method using a standardized, low level inoculum.~~

~~*Determination*—~~

~~The rate of occurrence of false negative results in the presence of the sample for the two methods is can be estimated using low levels of standard challenge organisms. This design is similar to the standard bacteriostasis/fungistasis test; however, the level of microorganisms inoculated must be very low (not more than 5 cfu per unit). This low level of inoculum will ensure a frequency of failure rates high enough to provide a means to compare the two methods. The alternate method must provide at least as high a recovery as the compendial method.~~

Specificity

~~*Definition*—~~

The specificity of an alternate qualitative microbiological method is its ability to detect a range of microorganisms that may be present in the test article. This concern is adequately addressed by growth promotion of the media for qualitative methods that rely upon growth to demonstrate presence or absence of microorganisms. However, for those methods that do not require growth as an indicator of microbial presence, the specificity of the assay for microbes assures that extraneous matter in the test system does not interfere with the test.

~~*Determination*— This concern is adequately addressed by growth promotion of the media for qualitative methods that rely upon growth to demonstrate microbial presence or absence of microorganisms. However, for those methods that do not require growth as an indicator of microbial presence,~~

~~the specificity of the assay for microbes assures that extraneous matter in the test system does not interfere with the test.~~

~~Detection Limit~~ Limit of Detection

~~*Definition*~~

The limit of detection is the lowest number of microorganisms in a sample that can be detected under the stated experimental conditions. A microbiological ~~detection~~ limit test determines the presence or absence of microorganisms, e.g., absence of *Salmonella* spp. in 10 g. Due to the nature of microbiology, the limit of detection refers to the number of organisms present in the original sample before any dilution or incubation steps; it does not refer to the number of organisms present at the point of assay.

~~*Determination*~~

~~The two methods (alternative and compendial) are should be assessed by inoculation with a low number of standard challenge microorganisms (not more than 5 cfu per unit) followed by a measurement of recovery. The level of inoculation must should be adjusted until at least 50% of the samples show growth in the compendial test. It is necessary to repeat this determination several times, as the limit of detection of an assay is determined from a number of replicates (not less than 5). The ability of the two methods to detect the presence of single organisms can be demonstrated using the Chi square test.~~ One method to demonstrate the limit of detection for a quantitative assay would be to evaluate the two methods (alternative and compendial) by inoculation with a low number of challenge microorganisms (not more than 5 cfu per unit) followed by a measurement of recovery. The level of inoculation should be adjusted until at least 50% of the samples show growth in the compendial test. It is necessary to repeat this determination several times, as the limit of detection of an assay is determined from a number of replicates (not less than 5). The ability of the two methods to detect the presence of low numbers of microorganisms can be demonstrated using the Chi square test. A second method to demonstrate equivalence between the two quantitative methods could be through the use of the Most Probable Number technique. In this method, a 5-tube design in a ten-fold dilution series could be used for both methods. These would then be challenged with equivalent inoculums (for example, a 10^{-1}, 10^{-2}, and 10^{-3} dilution from a stock suspension of approximately 50 cfu per mL to yield target inocula of 5, 0.5, and 0.05 cfu per tube) and the MPN of the original stock determined by each method. If the 95% confidence intervals overlapped, then the methods would be considered equivalent.

~~**Quantification Limit, Linearity, and Range**~~ ~~Not applicable to qualitative assays.~~

Ruggedness

~~*Definition*~~

The ruggedness of a qualitative microbiological method is the degree of precision of test results obtained by analysis of the same samples under a variety of normal test conditions, such as different analysts, instruments, lots of reagents, laboratories, etc. Ruggedness can be defined as the intrinsic resistance to the influences exerted by operational and environmental variables on the results of the microbiological method. Ruggedness is a validation parameter best suited to determination by the supplier of the test method who has easy access to multiple instruments and batches of components.

~~*Determination*~~ ~~One method to demonstrate ruggedness is to prepare a suspension of microorganisms and test at least several replicates against each assay variable in order~~

In-Process Revision

~~to compare values among laboratories. Attention must be paid to the inherent instability of microbiological suspensions, and experimental protocols must be randomized to eliminate bias. As there are no agreed upon standards for current methods, acceptance criteria are problematic. It is essential, however, that an estimate of the ruggedness of the alternate procedure be developed.~~

Robustness

~~*Definition*—~~

~~The robustness of a qualitative microbiological method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters, and provides an indication of the method's reliability during normal usage. Robustness is a validation parameter best suited to determination by the supplier of the test method. As there are no agreed upon standards for current methods, acceptance criteria are problematic and must be tailored to the specific technique. It is essential, however, that an estimate of the robustness of the alternate procedure be developed.~~ The robustness of a microbiological method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters, and provides an indication of its reliability during normal usage. Robustness is a validation parameter best suited to determination by the supplier of the test method. As there are no agreed upon standards for current methods, acceptance criteria are problematic and must be tailored to the specific technique. It is essential, however, that an estimate of the ruggedness of the alternate procedure be developed. The measure of robustness is not necessarily a comparison between the alternate method and the traditional, but rather a necessary component of validation of the alternate method so that the user knows the operating parameters of the method.

~~*Determination*—Robustness is a validation parameter best suited to determination by the supplier of the test method. As there are no agreed upon standards for current methods, acceptance criteria are problematic and must be tailored to the specific technique. It is essential, however, that an estimate of the robustness of the alternate procedure be developed.~~

VALIDATION OF QUANTITATIVE ESTIMATION OF VIABLE MICROORGANISMS IN A SAMPLE

As colony-forming units follow a Poisson distribution, the use of statistical tools appropriate to the Poisson rather than those used to analyze normal distributions is encouraged. If the user is more comfortable using tools geared towards normally distributed data, the use of a data transformation is frequently useful. Two techniques are available and convenient for microbiological data. Raw counts can be transformed to normally distributed data either by taking the $\log_{10}$ unit value for that count, or by taking the square root of count +1. The latter transformation is especially helpful if the data contain zero counts.

Accuracy

~~*Definition*—~~

~~The accuracy of a quantitative microbiological method is the closeness of the test results obtained by the alternate method to the value obtained by the compendial method. Accuracy must should be demonstrated across the practical range of the test. Accuracy is usually expressed as the percentage of recovery of microorganisms by the assay method.~~ The accuracy of this type of microbiological method is the closeness of the test results obtained by the alternate test method to the value obtained by the traditional method. It

In-Process Revision

should be demonstrated across the operational range of the test. Accuracy is usually expressed as the percentage of recovery of microorganisms by the assay method.

~~*Determination* —~~

Accuracy ~~is demonstrated~~ in a quantitative microbiological test may be shown by preparing a suspension of microorganisms at the upper end of the range of the test, serially diluted down to the lower end of the range of the test. The operational range of the alternate method should overlap that of the traditional method. For example, if the alternate method is meant to replace the traditional plate count method for viable counts, then a reasonable range might be from 10^0 to 10^6 cfu per mL. ~~If it is, instead, a replacement for the MPN method, a much more narrow range may be used.~~ At least five suspensions across the range of the test ~~must~~ should be analyzed for each challenge organism. The alternate method ~~must~~ should provide an estimate of viable microorganisms not less than 70% of the estimate provided by the ~~compendial method.~~ traditional method, or the new method should be shown to recover at least as many organisms as the traditional method by appropriate statistical analysis. An example being an ANOVA analysis of the $\log_{10}$ unit transforms of the data points. Note that the possibility exists that an alternate method may recover an apparent higher number of microorganisms if it is not dependent on the growth of the microorganisms to form colonies or develop turbidity. This is determined in the *Specificity* evaluation.

Precision

~~*Definition* —~~

The precision of a quantitative microbiological method is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of suspensions of laboratory microorganisms across the range of the test. The precision of a microbiological method is usually expressed as the standard deviation or relative standard deviation (coefficient of variation). However, other appropriate measures may be applied.

~~*Determination* —~~

~~Precision is demonstrated by preparing One method to demonstrate precision uses a suspension of microorganisms at the upper end of the range of the test that has been serially diluted down to the lower end of the range of the test. At least 5 suspensions across the range of the test must should be analyzed. For each suspension at least 10 replicates must should be assayed in order to allow for the calculation of statistically significant estimates of the standard deviation or relative standard deviation (coefficient of variation). Generally, a coefficient of variation in the 10% to 15% range is acceptable. Irrespective of the specific results, the alternate method must have a coefficient of variation that is not larger than that of the compendial method. Results ± 0.5 log are considered precise in microbiological testing.~~ One method to demonstrate precision uses a suspension of microorganisms at the upper end of the range of the test that has been serially diluted down to the lower end of the range of the test. At least 5 suspensions across the range of the test should be analyzed. For each suspension at least 10 replicates should be assayed in order to be able to calculate statistically significant estimates of the standard deviation or relative standard deviation (coefficient of variation). Generally, a RSD in the 15% to 35% range would be acceptable. Irrespective of the specific results, the alternate method should have a coefficient of variation that is not larger than that of the traditional method. For example, a plate count method might have the RSD ranges as shown in the following table.

In-Process Revision

Table 2. Expected RSD as a Function of CFU per Plate

CFU per Plate	Expected RSD
30–300	< 15%
10–30	< 25%
< 10	< 35%

Specificity

~~*Definition*~~

~~The specificity of a quantitative microbiological method is its ability to detect a range of microorganisms that demonstrate that the method is fit for its intended purpose. This is demonstrated using the compendial organisms appropriate for the purpose of the alternate method.~~ The specificity of a microbiological method is its ability to detect a panel of microorganisms suitable to demonstrate that the method is fit for its intended purpose. This is demonstrated using the organisms appropriate for the purpose of the alternate method. It is important to challenge the alternate technology in a manner that would encourage false positive results (specific to that alternate technology) to demonstrate the suitability of the alternate method in comparison to the traditional method. This is especially important with those alternate methods that do not require growth for microbial enumeration (for example, any that do not require enrichment or can enumerate microorganisms into the range of 1–50 cells).

~~*Determination*~~ ~~Specificity is demonstrated using the compendial organisms.~~

~~**Detection Limit**~~ ~~Not applicable to quantitative assays.~~

~~Quantification Limit~~ Limit of Quantification

~~*Definition*~~

~~The limit of quantification is a parameter of quantitative assays for low levels of microorganisms in sample matrices.~~ It ~~is the lowest number of microorganisms that can be determined with acceptable precision and accuracy under the stated experimental conditions accurately counted. As it is not possible to obtain a reliable sample containing a known number of microorganisms, it is essential that the quantification limit of an assay is determined from a number of replicates ($n > 5$) at each of at least five different points across the range of the assay. The limit of quantification should not be a number greater than that of the compendial method.~~ The limit of quantification is the lowest number of microorganisms that can be accurately counted. As it is not possibleto obtain a reliable sample containing a known number of microorganisms, it is essential that the limit of quantification of an assay is determined from a number of replicates ($n > 5$) at each of at least five different points across the operational range of the assay. The limit of quantification should not be a number greater than that of the traditional method. Note that this may have an inherent limit due to the nature of bacterial enumeration and the Poisson distribution of bacterial counts (see *Validation of Microbial Recovery From Pharmacopeial Articles* ⟨1227⟩). Therefore, the alternate method need only demonstrate that it is at least as sensitive as the traditional method to similar lower limits.

~~*Determination*~~ ~~As it is not possible to obtain a reliable sample containing a known number of microorganisms, it is essential that the quantification limit of an assay is determined from a number of replicates ($n > 5$) at each of at least five different points across the range of the assay. The limit of quantification is not greater than the compendial method.~~

Linearity

~~*Definition*~~

The linearity of a quantitative microbiological test is its ability to produce results that are proportional to the concentration of microorganisms present in the sample within a

In-Process Revision

given range. The linearity should be determined over the range of the test. A method to determine this would be to select at least five concentrations of each standard challenge microorganism and conduct at least five replicate readings of each concentration. ~~The appropriate measure of linearity is the F-test, demonstrating that deviations from linearity do not exceed the variability of the data. This is done by determining the ratios of deviations from the linearity mean square to the within-groups mean square. The F-ratio for the alternate method should not exceed that of the compendial test. The ratio of deviations from the linearity mean square to the within-groups mean square will equal 1 if the data are described by a straight line; if the data are not described by a straight line, this ratio will be greater than 1, as the deviations from linearity will exceed the variability of the data. The probability of the data variations can then be derived from a table of critical F values. Alternatively (or in addition), a graphic depiction of deviations from linearity can be plotted as residuals from the regression against the estimate. An unequal distribution of the residual values around zero would indicate nonlinearity. An alternate measure would be to calculate the correlation coefficient from a linear regression analysis of the data generated above.~~ An appropriate measure would be to calculate the square of the correlation coefficient, r^2, from a linear regression analysis of the data generated above. While the correlation coefficient does not provide an estimate of linearity, it is a convenient and commonly applied measure to approximate the relationship. The alternate method should not have an r^2 value less than 0.95.

~~*Determination*— The linearity must be determined over the range of the test. A method to determine this is to select at least five concentrations of each standard challenge microorganism and conduct at least five replicate readings of each concentration. The appropriate measure of linearity is the F-test, demonstrating that deviations from linearity do not exceed the variability of the data. This is done by determining the ratios of deviations from the linearity mean square to the within-groups mean square. The F-ratio for the alternate method not exceed that of the compendial test. The ratio of deviations from the linearity mean square to the within-groups mean square will equal 1 if the data are described by a straight line. This ratio will be greater than 1 if they are not a straight line, as the deviations from linearity will exceed the variability of the data. The probability of the data variations are derived from a table of critical F values. A graphic depiction of deviations from linearity can also be plotted as residuals from the regression against the estimate. An unequal distribution of the residual values around zero would indicate non-linearity.~~

Limit of Detection

See *Limit of Detection* under *Validation of Qualitative Tests for Demonstration of Viable Microorganisms in a Sample*.

Range

~~*Definition*—~~

~~The range of a quantitative microbiological method is the interval between the upper and lower levels of microorganisms that have been determined with precision, accuracy, and linearity using the method as written. The range of the method is demonstrated by verifying that the method provides acceptable precision, accuracy, and linearity when applied to samples throughout the range.~~ The operational range of a microbiological method is the interval between the upper and lower levels of microorganisms that have been demonstrated to be determined with precision, accuracy, and linearity.

In-Process Revision

~~*Determination*—The range of the method is demonstrated by verifying that the method provides acceptable precision, accuracy, and linearity when applied to samples throughout the range.~~

Ruggedness

~~*Definition*—~~

~~The ruggedness of a quantitative microbiological method is the degree of precision of test results obtained by analysis of the same samples under a variety of normal test conditions, such as different analysts, instruments, lots of reagents, etc. Ruggedness is normally expressed as the lack of influence of operational and environmental variables of the microbiological method on test results. Ruggedness is a validation parameter best suited to determination by the supplier of the test method with easy access to multiple instruments and batches of components.~~ See *Ruggedness* under *Validation of Qualitative Tests for Demonstration of Viable Microorganisms in a Sample*.

~~*Determination*—Ruggedness is a validation parameter best suited to determination by the supplier of the test method with easy access to multiple instruments and batches of components.~~

Robustness

~~*Definition*—~~

~~The robustness of a microbiological method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters and provides an indication of its reliability during normal usage. Robustness is a validation parameter best suited to determination by the supplier of the test method.~~

See *Robustness* under *Validation of Qualitative Tests for Demonstration of Viable Microorganisms in a Sample*.

~~*Determination*—Robustness is a validation parameter best suited to determination by the supplier of the test method.~~

~~VALIDATION OF ALTERNATIVE MICROBIAL IDENTIFICATION METHODS~~

~~There is a large body of evidence that different methods vary considerably in their ability to identify microorganisms in compendial articles. It must be accepted that a method of identification systematics needs to be internally consistent, but may differ from others in identification of unknown isolates. In other words, identification of an isolate based on biochemical activity may lead to one conclusion, identification by fatty acid analysis to another, identification by DNA analysis may lead to a third, and other methods may lead to alternate conclusions. Microbiological identifications by a particular system flow directly from previous experience with that system, and therefore may well differ from identifications by another system. It is critical that each system provide a consistent identification of isolates from compendial articles, but it is not required that each agree with all other methods.~~

~~Accuracy~~

~~*Definition*—~~

~~Not applicable beyond standard organisms. The accuracy of a microbiological identification method is the closeness of the test results obtained by the test alternative method to the value obtained by the compendial method. Accuracy should be demonstrated with a series of well-defined stock culture organisms.~~

~~*Determination*—Accuracy is demonstrated with a series of well-defined stock culture organisms.~~

In-Process Revision

~~**Precision**~~

~~*Definition*—~~

~~The precision of a microbiological identification method is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of suspensions of laboratory microorganisms across the range of the test.~~

~~**Specificity, Detection Limit, Quantification Limit, Linearity, and Range**—Not applicable to microbiological identification methods.~~

~~**Ruggedness**~~

~~*Definition*—~~

~~Ruggedness is normally expressed as the lack of influence of operational and environmental variables of the microbiological identification method on test results.~~

~~Ruggedness is normally expressed as the lack of influence on test results of operational and environmental variables of the microbiological method. Ruggedness is a validation parameter best suited to determination by the supplier of the test method with easy access to multiple instruments and batches of components.~~

~~*Determination*—Ruggedness is a validation parameter best suited to determination by the supplier of the test method with easy access to multiple instruments and batches of components.~~

~~**Robustness**~~

~~*Definition*—~~

~~The robustness of a microbiological method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters, robustness and provides an indication of its reliability during normal usage. Robustness is a validation parameter best suited to determination by the supplier of the test method, but in any event should not be less than that of the compendial method.~~

~~*Determination*—Robustness is a validation parameter best suited to determination by the supplier of the test method, but in any event does not exceed that of the compendial method.~~ ■2S (*USP29*)

BRIEFING

⟨**1230**⟩ **Water for Health Applications,** *USP 28* page 2754 and page 3333 of the *First Supplement.* It is proposed to revise the microbial culture media terminology in *Microbial Considerations* so that it conforms to that used in *Buffer Solution and Media* under *Microbial Limit Tests* ⟨61⟩.

(PW: F. Barletta) RTS—42974-1

Change to read:

MICROBIAL CONSIDERATIONS

The *Water for Hemodialysis* monograph includes microbial limits of 100 cfu per mL and endotoxin limits of 2 USP Endotoxin Units per mL. Culture media should be ~~tryptic soy agar~~

■Soybean–Casein Digest Agar Medium■2S (*USP29*) or equivalent, and colonies should be counted after incubation at a temperature range between 30° and 35°, for no less than 48 hours. Sampling the water should be done at the end of the water purification cascade at the point where the water enters the ■dialysis equipment. Samples should be assayed within 30 minutes of collection or immediately refrigerated and then assayed within 24 hours of collection.■1S (*USP28*) Quantification of bacterial endotoxins is performed using the Limulus Amebocyte Lysate (LAL) clotting method ■or any other LAL test■1S (*USP28*) found in the USP general test chapter *Bacterial Endotoxins Test* ⟨85⟩.

Because of the incubation time required to obtain definitive microbiological results, water systems should be microbiologically monitored to confirm that they continue to produce water of acceptable quality. Alert Levels and Action Levels are therefore necessary for the monitoring and control of the system. An Alert Level constitutes a warning and does not require a corrective action. An Action Level indicates a drift from normal operating conditions and requires that corrective action be taken ■to bring the process back into the normal operating range. Exceeding an Alert Level or Action Level does not imply that water quality has been compromised.■1S (*USP28*) The recommended Action Level for a total viable microbial count in the product water is 50 cfu per mL, and the recommended Alert Level for bacterial endotoxins is 0.5 USP Endotoxin Unit per mL (also see *Microbial Considerations* under *Water for Pharmaceutical Purposes* ⟨1231⟩).

~~*Water, Method I* ⟨921⟩: not more than 0.5%.~~

~~*Residue on ignition* ⟨281⟩: not more than 0.1%.~~ ■2S (*USP29*)

BRIEFING

Lead Standard Solution. This new reagent is used to prepare the *Standard lead solution* in the test for *Limit of lead* under *Calcium Silicate,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41797-2

Add the following:

■**Lead Standard Solution**—A solution containing $Pb(NO_3)_2$ in 0.5 M Nitric acid corresponding to 1000 mg of lead/mL.

[NOTE—A suitable grade is available as catalog number 1.19776 from EMD Chemicals, www.emdchemicals.com.]■2S (*USP29*)

BRIEFING

Magnesium Matrix Modifier. This new reagent is used to prepare the *Matrix modifier solution* in the test for *Limit of lead* under *Calcium Silicate,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41797-2

Add the following:

■**Magnesium Matrix Modifier**—Magnesium Nitrate (2% MG).

[NOTE—Available as catalog number RCMMMG20KN-50, from VWR, www.vwr.com.]■2S (*USP29*)

BRIEFING

Nitric Acid, 65 Percent. This new reagent is used to prepare the *Nitric acid diluent* in the test for *Limit of lead* under *Calcium Silicate,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41797-2

Add the following:

■**Nitric Acid, 65 Percent**—[*7697-37-2*]—Use a suitable grade with a content of not less than 65.0%.

[NOTE—A suitable grade is available as catalog number 441-2 from EMD Chemicals, www.emdchemicals.com.]■2S (*USP29*)

BRIEFING

Palladium Matrix Modifier. This new reagent is used to prepare the *Matrix modifier solution* in the test for *Limit of lead* under *Calcium Silicate,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41797-2

Add the following:

■**Palladium Matrix Modifier**—Palladium Nitrate (1% PD).

[NOTE—A suitable grade is available as catalog number RCMMPD10KN-50 from VWR, www.vwr.com.]■2S (*USP29*)

In-Process Revision

Test Solutions

BRIEFING

Test Solutions, *USP 28* page 2855, page 3338 of the *First Supplement,* and page 859 of *PF* 31(3) [May–June 2005]. It is proposed to correct the procedure used in the preparation of Sodium Tetraphenylboron TS.

(HDQ: M. Marques) RTS—42679-1

Add the following:

■**Phenol TS**—Dissolve 1.2 g of phenol in alcohol to make 10 mL. Prepare weekly.■1S (*USP29*)

Add the following:

■**Sodium Citrate TS, Alkaline**—Dissolve 50 g of sodium citrate dihydrate and 2.5 g of sodium hydroxide in water to make 250 mL.■1S (*USP29*)

Change to read:

Sodium Tetraphenylboron TS—Dissolve 1.2 g of sodium tetraphenylboron in water to make 200 mL. If necessary, stir for 5 minutes with 1 g of ~~freshly prepared hydrous~~

■■2S (*USP29*)
aluminum oxide, and filter to clarify.

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 28* page 2862, page 3630 of the *Second Supplement,* and page 108 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to revise the formula for calculation of the normality of 0.01 N Iodine VS. It is also proposed to change the 50% (w/w) sodium hydroxide solution used to prepare 0.1 N Alcoholic Sodium Hydroxide VS to a 50% (w/v) solution.

(HDQ: M. Marques) RTS—42675-1; 42676-1

Change to read:

Iodine, Hundredth-Normal (0.01 N)
I, **126.90**

1.269 g in 1000 mL

Dissolve about 1.4 g of iodine in a solution of 3.6 g of potassium iodide in 100 mL of water, add 3 drops of hydrochloric acid, dilute with water to 1000 mL, and standardize the solution as follows.

Transfer 100.0 mL of iodine solution to a 250-mL flask, add 1 mL of 1 N hydrochloric acid, swirl gently to mix, and titrate with 0.1 N sodium thiosulfate VS until the solution has a pale yellow color. Add 2 mL of starch TS, and continue titrating until the solution is colorless. ■■1S (*USP28*)

Preserve in amber-colored, glass-stoppered bottles.

~~■$N = \frac{\text{mL } Na_2S_2O_3 \times \text{N } Na_2S_2O_3}{25}$■1S (*USP28*)~~

■$N = \frac{\text{mL } Na_2S_2O_3 \times \text{N } Na_2S_2O_3}{100}$■2S (*USP29*)

Add the following:

▲**Lithium Methoxide, Tenth-Normal (0.1 N) in Methanol**
CH_3OLi, **37.97**

3.798 g in 1000 mL

Dissolve 500 mg of freshly cut lithium metal in 150 mL of methanol, cooling the flask during addition of the metal. When reaction is complete, add 850 mL of methanol. If cloudiness or precipitation occurs, add sufficient methanol to clarify the solution. Store preferably in the reservoir of an automatic delivery buret suitably protected from carbon dioxide and moisture. Standardize the solution by titration against benzoic acid as described under *Sodium Methoxide, Tenth-Normal (0.1 N) in Toluene*.

NOTE—Restandardize the solution frequently.

$N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL lithium methoxide (corrected for the blank)}}$ ▲*USP29*

In-Process Revision

Change to read:

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)
NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% ~~(w/w)~~ ■(w/v)■2S (*USP29*) solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced.

$$\text{■N} = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}}\ \text{■1S (}USP28\text{)}$$

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 28* page 2869, page 3639 of the *Second Supplement,* and page 1191 of *PF* 31(4) [July–Aug. 2005].

(HDQ) RTS—39091-2; 39091-3; 39383-1; 41465-1; 42596-2

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 28* page 2875, page 3640 of the *Second Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], and page 1193 of *PF* 31(4) [July–Aug. 2005].

(HDQ) RTS—36919-1; 41977-1; 42281-1; 42281-2; 42596-1; 42709-1; 42741-1; 42813-1

Add the following:

■**Didanosine:** White to off-white, crystalline powder. Very soluble in dimethyl sulfoxide; practically insoluble or insoluble in acetone and in methanol.■2S *(USP29)*

In-Process Revision

Add the following:

■**Divalproex Sodium:** White to off-white powder. Very soluble in chloroform; freely soluble in methanol and in ethyl ether; soluble in acetone; practically insoluble in acetonitrile.■2S (*USP29*)

Add the following:

■**Erythritol:** White or almost white, crystalline powder or free-flowing granules. It is stable to heat and is nonhygroscopic. Freely soluble in water; very slightly soluble in alcohol. *NF category:* Humectant; sweetening agent.■2S (*NF24*)

Add the following:

■**Leflunomide:** White to almost white powder. Freely soluble in methanol, in alcohol, in 2-propanol, in ethyl acetate, in acetone, in acetonitrile, and in chloroform; practically insoluble in water.■2S (*USP29*)

Add the following:

■**Potassium Alginate:** White to yellow, fibrous or granular powder. Dissolves in water to form a viscous, colloidal solution; insoluble in alcohol and in hydroalcoholic solutions in which alcohol content is greater than 30% by weight; insoluble in chloroform, in ether, and in acids having a pH lower than about 3.■2S (*NF24*)

Add the following:

■**Pravastatin Sodium:** White to yellowish white, hygroscopic powder. Freely soluble in water and in methanol; soluble in alcohol; very slightly soluble in acetonitrile; practically insoluble in ether, in ethyl acetate, and in chloroform.■2S (*USP29*)

Add the following:

■**Prednicarbate:** White to almost white, crystalline powder. Freely soluble in acetone and in alcohol; sparingly soluble in propylene glycol; practically insoluble in water.■2S (*USP29*)

Add the following:

■**Tylosin Tartrate:** Almost white or slightly yellow, hygroscopic powder. Freely soluble in water and in dichloromethane; slightly soluble in alcohol. It dissolves in dilute solutions of mineral acids.■2S (*USP29*)

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 31(1) through 31(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF*.

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
General Notices—*Tests and Assays—Foreign Substances and Impurities; Preservation, Packaging, Storage, and Labeling—Storage Temperature and Humidity; Repackaging Instructions; Guidelines for Packaging and Storage Statements in USP–NF Monographs* (*Controlled Cold Temperature*-added)	31	3	718
<u>*USP Monographs*</u>			
Acetaminophen—*Packaging and storage*	31	4	1024
Acetaminophen Oral Suspension—*USP Reference standards [USP4-Aminophenol RS]* (add), *Limit of 4-aminophenol* (add)	30	5	1579
Acetaminophen Extended-Release Tablets—*Packaging and storage*	30	4	1161
Acetaminophen and Aspirin Tablets—*Dissolution*	30	1	41
Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—*Dissolution*	30	1	43
Tablets Containing at Least Three of the Following—Acetaminophenand Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine—*Dissolution*	30	1	42
Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—*Dissolution*	30	1	44
Acetaminophen and Codeine Phosphate Capsules—*Dissolution*	30	1	45
Acetaminophen and Diphenhydramine Citrate Tablets—*Dissolution*	30	1	47
Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	47
Acetaminophen and Pseudoephedrine Hydrochloride Tablets— *Dissolution*	30	1	48
Acetohydroxamic Acid Tablets—*Dissolution*	30	1	49
Acetylcysteine—*USP Reference standards, Assay*	31	3	726
Acyclovir—*Assay and limit for guanine*	30	5	1580
Medical Air—*Definition, Packaging and storage*	31	4	1024
Albendazole Oral Suspension—*Labeling* (delete)	30	4	1163

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Albumin Human—*Definition, Expiration date, USP Reference standards,* (add), *Identification A, B* (add), *pH* (add), *Molecular size distribution* (add), *Prekallikrein activator* (add), *Protein content* (add), *Heme content* (add), *Potassium content* (add), *Sodium content* (add), *Packaging and storage, Labeling, Bacterial endotoxins* (add), *Sterility* (add), *Heat sterility* (add), *Safety* (add)	29	4	992
Albuterol Tablets—*Dissolution, Assay*	31	3	726
Allopurinol—*USP Reference standards, Chromatographic purity* (delete), *Related compounds* (add), *Assay*	28	5	1386
Alprazolam Tablets—*Dissolution*	30	5	1582
Alumina, Magnesia, and Calcium Carbonate Tablets—*Title* (namechange)	29	6	1835
Alumina, Magnesia, and Calcium Carbonate Chewable Tablets (new)	29	6	1836
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—*Title* (name change)	29	6	1837
Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets (new)	29	6	1837
Alumina, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1841
Alumina, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1842
Amantadine Hydrochloride Capsules—*Dissolution*	30	1	51
Amiloride Hydrochloride and Hydrochlorothiazide Tablets—*Dissolution*	31	4	1025
Aminosalicylate Sodium Tablets—*Dissolution*	30	1	53
Amoxicillin and Clavulanate Potassium for Oral Suspension—*Water* (delete)	31	4	1026
Amphetamine Sulfate—*Assay*	31	2	381
Amphetamine Sulfate Tablets—*Dissolution*	30	1	54
Ampicillin Capsules—*Dissolution*	30	1	55
Ampicillin Tablets—*Dissolution*	30	1	56
Anecortave Acetate (new)	30	2	445
Anecortave Acetate Injectable Suspension (new)	30	2	447
Aprotinin (new)	31	3	732
Aprotinin Injection (new)	31	3	736
Ascorbic Acid Tablets—*Dissolution*	30	1	60
Aspirin Boluses—*Dissolution*	31	4	1026
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules—*Dissolution*	30	1	60
Aztreonam for Injection—*Assay*	31	3	737
Baclofen Tablets—*Dissolution*	30	1	61
Benazepril Hydrochloride (new)	31	4	1027
Benazepril Hydrochloride Tablets (new)	29	3	606
Betamethasone Oral Solution—*Thin-layer chromatographic identification test*	31	4	1032
Betamethasone Tablets—*Dissolution*	30	1	62
Betamethasone Acetate—*Identification B*	31	2	381
Bicalutamide (new)	31	3	738
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers (new)	30	1	63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions (new)	30	1	66
Biphasic Isophane Insulin Human Suspension (new)	31	4	1033
Bismuth Subsalicylate Oral Suspension (new)	31	4	1035
Bismuth Subsalicylate Tablets (new)	31	3	741
Budesonide (new)	30	6	1978
Bupropion Hydrochloride—*Chromatographic purity*	31	2	381
Bupropion Hydrochloride Extended-Release Tablets—*USP Reference standards, Related compounds*	31	2	384
Buspirone Hydrochloride—*Content of chloride*	31	3	742

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Butalbital, Acetaminophen, and Caffeine Tablets—*Dissolution*	30	1	80
Calcitonin Salmon (new)	31	4	1036
Calcitonin Salmon Nasal Solution (new)	30	4	1178
Calcitonin Salmon Injection (new)	30	4	1177
Calcitriol (new)	29	5	1433
Calcitriol Injection (new)	29	5	1434
Calcium Carbonate and Magnesia Tablets—*Title* (name change)	29	6	1852
Calcium Carbonate and Magnesia Chewable Tablets (new)	29	6	1852
Calcium Carbonate, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1853
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1854
Calcium Lactate Tablets—*Dissolution*	30	1	81
Calcium Pantothenate Tablets—*Dissolution*	30	1	81
Camphor—*Water*	31	3	742
Carbamazepine Tablets—*Dissolution*	31	4	1044
Carbon Dioxide—*Definition, Packaging and storage*	31	4	1045
Carboxymethylcellulose Sodium Suspension (new)	30	3	812
Cefaclor Tablets (new)	29	6	1858
Cefadroxil for Oral Suspension—*Water*	31	4	1045
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules—*Dissolution*	30	1	83
Ciprofloxacin—*USP Reference standards, Other requirements*	31	2	393
Ciprofloxacin Injection—*Definition, USP Reference standards, Pyrogen* (delete), *Bacterial endotoxins* (add)	31	2	393
Citalopram Hydrobromide (new)	31	3	742
Citalopram Tablets (new)	31	4	1046
Anhydrous Citric Acid *(Harmonization), Sulfate*	31	3	749
Citric Acid Monohydrate *(Harmonization), Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid*	31	2	394
Cladribine (new)	31	2	395
Clotrimazole Lozenges—*Disintegration* (delete), *Dissolution* (add)	31	2	398
Cloxacillin Benzathine—*Assay*	31	4	1050
Cloxacillin Benzathine Intramammary Infusion—*Assay*	31	4	1051
Colchicine Tablets—*Dissolution*	30	1	91
Cyclizine Hydrochloride Tablets—*Dissolution*	30	1	91
Cyclopropane—*Definition, Packaging and storage*	31	4	1052
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Dalteparin Sodium (new)	30	5	1598
Dapsone—*Assay*	31	3	750
Desmopressin Acetate (new)	31	4	1052
Desmopressin Injection (new)	31	4	1057
Desmopressin Nasal Spray Solution (new)	31	4	1059
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Dextroamphetamine Sulfate Capsules—*Dissolution*	30	1	94
Dextroamphetamine Sulfate Tablets—*Dissolution*	30	1	94
Dibucaine—*Identification B*	31	2	399
Dibucaine Cream—*Identification, Assay*	31	2	399
Dibucaine Ointment—*Identification*	31	2	400
Dibucaine Hydrochloride—*Labeling* (add), *USP Reference standards, Identification B, Other requirements* (add)	31	2	400
Dibucaine Hydrochloride Injection—*Identification A*	31	2	401
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Diethylcarbamazine Citrate Tablets—*Dissolution*	30	1	97
Dihydroergotamine Mesylate—*Identification C, Related alkaloids* (delete), *Chromatographic purity* (add), *Assay*	29	6	1870
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diphenhydramine Hydrochloride Capsules—*Dissolution*	30	1	97
Diphenhydramine and Pseudoephedrine Capsules—*Dissolution*	30	1	98
Docusate Calcium—*Limit of bis(2-ethylhexyl)maleate*	31	3	752
Docusate Potassium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Docusate Sodium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Dorzolamide Hydrochloride—*Limit of dorzolamide hydrochloride related compound A, Assay*	31	2	401
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Drospirenone (new)	31	3	754
Dyclonine Hydrochloride—*Identification B*	31	1	42
Dyphylline and Guaifenesin Tablets—*Dissolution*	30	1	100
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Epinephrine Injection—*Identification A, B*	31	1	43
Estradiol and Norethindrone Acetate Tablets (new)	30	6	1989
Estradiol Transdermal System (new)	31	4	1063
Conjugated Estrogens—*Definition*	30	3	840
Ethinyl Estradiol Tablets—*Disintegration* (delete), *Dissolution* (add),*Related compounds*	31	4	1067
Ethosuximide Capsules—*Dissolution*	30	1	102
Etodolac Extended-Release Tablets—*Labeling* (add), *Dissolution*	31	4	1068
Fenofibrate (new)	31	3	763
Fexofenadine Hydrochloride (postponed indefinitely)	31	3	703
Fexofenadine Hydrochloride Capsules (postponed indefinitely)	31	3	705
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine HydrochlorideExtended-Release Tablets (new)	31	2	403
Fluconazole—*Definition, Labeling* (add), *USP Reference standards, Related compounds*	31	2	408
Fluoxetine Delayed-Release Capsules (new)	30	3	849
Flurazepam Hydrochloride—*Identification*	31	3	766
Flurbiprofen—*Identification*	31	4	1069
Fluticasone Propianate—*Chemical information, Definition, Content of acetone, Assay*	31	4	1070
Fluticasone Propianate Nasal Spray (new)	31	4	1071
Fluvastatin Capsules (new)	31	1	47
Fluvastatin Sodium (new)	31	1	43
Fluvoxamine Maleate Tablets (new)	30	5	1622
Fosinopril Sodium (new)	30	6	2001
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Gabapentin Capsules (new)	28	7	298
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Dissolution*	29	2	418
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Glycopyrrolate Tablets—*Identification, Dissolution*	31	4	1077
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	31	2	410
Guaifenesin Capsules—*Dissolution*	30	1	106

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Guaifenesin Tablets—*Dissolution*	30	1	107
Helium—*USP Reference standards* and *Assay* (postponed indefinitely)	31	4	1014
Helium—*Definition, Packaging and storage*	31	4	1077
Hydrocodone Bitartrate—*USP Reference standards [USP Hydrocodone Bitartrate Related Compound A RS], Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Acetaminophen Tablets—*Dissolution*	30	1	109
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hyoscyamine Sulfate—*USP Reference standards, Identification, Melting temperature* (delete), *Loss on drying* (delete), *Water* (add), *Residue on ignition, Other alkaloids* (delete), *Readily carbonizable substances* (delete), *Chromatographic purity* (add), *Assay*	31	4	1078
Hypromellose Ophthalmic Solution—*Identification*	31	3	771
Indocyanine Green—*Definition, Assay*	29	6	1905
Iodixanol—*Labeling* (add), *USP Reference standards, Limit of calcium, Other requirements* (add)	31	1	54
Irbesartan Tablets (new)	31	4	1080
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isosorbide Dinitrate Sublingual Tablets—*Dissolution*	30	1	113
Diluted Isosorbide Mononitrate—*pH*	31	4	1060
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Kanamycin Sulfate Capsules—*Dissolution*	30	1	120
Ketoprofen—*Assay*	31	3	772
Leuprolide Acetate (new)	30	3	882
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lidocaine Hydrochloride—*Assay*	31	2	415
Lidocaine Hydrochloride and Epinephrine Injection—*Assay for lidocaine hydrochloride, Assay for epinephrine*	31	2	415
Lipid Injectable Emulsion (new)	31	2	416
Lisinopril Tablets—*Dissolution*	31	4	1090
Loratadine Oral Solution—*Antimicrobial effectiveness test* (delete)	31	1	56
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	419
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	26	4	1050
Magnesium Chloride—*Identification, Insoluble matter*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	421
Magnesium Oxide—*Labeling, Bulk density* (add)	31	4	1091
Mannitol Injection—*Labeling*	28	1	73
Meclizine Hydrochloride Tablets—*Dissolution*	30	1	127
Mefloquine Hydrochloride—*Related compounds*	31	4	1091
Meloxicam (new)	31	1	57
Meperidine Hydrochloride—*Packaging and storage, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	62
Meprobamate Tablets—*Dissolution*	30	1	129
Mesalamine—*Related compounds*	31	2	424
Metformin Hydrochloride—*Packaging and storage* (add), *Related compounds*	31	4	1092

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Metformin Hydrochloride Tablets—*Identification, Related compounds*	31	4	1093
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methenamine Tablets—*Dissolution*	30	1	130
Methenamine Hippurate Tablets—*Labeling* (add), *Dissolution*	31	1	63
Methocarbamol Tablets—*Dissolution*	30	1	130
Methscopolamine Bromide (new)	31	2	425
Methscopolamine Bromide Tablets (new)	31	2	427
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methylphenidate Hydrochloride Tablets—*Dissolution*	30	1	131
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Nabumetone—*Related compounds*	31	1	63
Nadolol and Bendroflumethiazide Tablets—*Dissolution*	30	1	132
Nalidixic Acid—*Assay*	30	1	132
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage*	30	4	1264
Nefazodone Hydrochloride (new)	31	4	1094
Nefazodone Hydrochloride Tablets (new)	31	4	1096
Neostigmine Bromide Tablets—*Dissolution*	30	1	133
Niacinamide Tablets—*Dissolution*	30	1	139
Nitrous Oxide—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	4	1014
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100
Ondansetron Oral Solution—*Packaging and storage*	30	3	905
Ondansetron Orally Disintegrating Tablets (new)	31	4	1101
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete),*Related compounds* (add), *Assay*	31	1	64
Oxandrolone Tablets—*Labeling* (add), *Dissolution*	31	3	781
Oxaprozin—*Packaging and storage*	29	4	1059
Oxaprozin Tablets—*Packaging and storage*	29	4	1061
Oxybutynin Chloride Extended-Release Tablets (new)	30	4	1276
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxycodone and Acetaminophen Capsules—*Dissolution*	30	1	151
Oxycodone and Acetaminophen Tablets—*Dissolution*	30	1	151
Oxycodone and Aspirin Tablets—*Dissolution*	30	1	152
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Paroxetine Tablets—*Identification A, C*	31	2	435
Paroxetine Hydrochloride—*USP Reference standards, Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, Chromatographic purity*	31	4	1112
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	72

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Pentobarbital Sodium—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phentermine Hydrochloride Capsules—*Dissolution*	30	1	159
Phentermine Hydrochloride Tablets—*Dissolution*	30	1	160
Phenylpropanolamine Hydrochloride Capsules—*Dissolution*	30	1	161
Phenylpropanolamine Hydrochloride Tablets—*Dissolution*	30	1	162
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Pimozide Tablets—*Dissolution*	30	1	164
Pindolol Tablets—*Dissolution*	30	1	165
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piperazine Citrate Tablets—*Dissolution*	30	1	165
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Bromide (new)	31	2	441
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Procyclidine Hydrochloride Tablets—*Dissolution*	30	1	169
Propantheline Bromide Tablets—*Dissolution*	30	1	170
Propoxyphene Hydrochloride and Acetaminophen Tablets—*Dissolution*	30	1	170
Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	172
Pyridoxine Hydrochloride Tablets—*Dissolution*	30	1	177
Pyrilamine Maleate Tablets—*Dissolution*	30	1	177
Quinapril Tablets—*Packaging and storage*	29	4	1071
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards [USP Ranitidine Resolution Mixture RS], Chromatographic purity, Assay*	30	6	2033
Ranitidine Oral Solution—*USP Reference standards, Identification, Chromatographic purity, Assay*	30	6	2036
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate*	31	2	445
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Ritonavir (new)	31	3	788
Saccharin Calcium (new)—*Harmonization*	31	2	607
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Scopolamine Hydrobromide—*Identification A*	31	1	73
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	31	3	792
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bromide (new)	31	2	446
Sodium Chloride—*Identification, Loss on drying, Limit of potassium*	31	3	795
Sodium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for sodium citrate (delayed implementation to April 1, 2009)*	31	3	797

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Sodium Polystyrene Sulfonate Suspension—*Definition, Labeling* (delete), *USP Reference standards* (delete), *Assay for sorbitol* (delete)	31	4	1115
Sodium Salicylate Tablets—*USP Reference standards* (add)	31	4	1116
Sorbitol Solution—*Microbial limits* (add)	29	4	1078
Spironolactone Oral Suspension (new)	30	3	929
Spironolactone Tablets—*Assay*	31	1	74
Spironolactone and Hydrochlorothiazide Oral Suspension (new)	30	3	930
Succinylcholine Chloride—*Chromatographic purity*	31	1	74
Sulfamethazine Granulated—*Assay*	31	3	797
Tazobactam (new)	31	4	1116
Technetium 99Tc Fanolesomab Injection (new)	31	2	448
Terbutaline Sulfate—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	75
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Terbutaline Sulfate Tablets—*USP Reference standards, Dissolution*	31	1	76
Tetracaine Hydrochloride—*Identification A*	31	2	451
Thalidomide—*Chromatographic purity*	31	2	452
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets—*Dissolution*	30	1	189
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thiamine Hydrochloride Tablets—*Dissolution*	30	1	190
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Chromatographic purity*	30	5	1649
Tiamulin (new)	31	1	77
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Timolol Maleate Tablets—*Dissolution*	30	1	191
Titanium Dioxide—*Definition, Packaging and storage, Labeling, Loss on ignition, Water-soluble substances, Acid-soluble substances, Limit of lead* (add), *Limit of antimony* (add), *Limit of mercury* (add), *Organic volatile impurities* (delete), *Assay*	30	4	1301
Titanium Dioxide (NL to come)—*New Monograph [UV Attenuation]*	30	4	1304
Tizanidine Tablets (new)	31	2	456
Tizanidine Hydrochloride (new)	31	2	452
Tolazamide—*Chromatographic purity*	31	4	1118
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	31	4	1119
Travoprost Ophthalmic Solution (new)	31	4	1121
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay forcitrate*	31	2	465
Triclosan—*USP Reference standards, Limit of monochlorophenols and 2,4-dichlorophenol, Limit of 1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran*	30	6	2054
Triprolidine and Pseudoephedrine Hydrochlorides Tablets—*Dissolution*	30	1	192
Ursodiol Capsules—*Dissolution*	31	3	800
Valsartan (new)	29	6	1996
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valpoic Acid Injection (new)	31	3	801
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127

Pending Proposals (*continued*)

In-Process Revision

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

BRIEFING

Sodium Starch Glycolate, *NF 23* page 3080 and page 1454 of *PF* 30(4) [July–Aug. 2004]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Sodium Starch Glycolate* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Sodium Starch Glycolate that was prepared by the U.S. Pharmacopeia. This draft was based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	+	+
Identification A	+	+	+
Identification B	+	+	+
pH	+	+	+
Loss on drying	+	+	+
Limit of iron	+	+	+
Limit of sodium chloride	+	+	+
Limit of sodium glycolate	+	+	+
Assay	+	+	+

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Characters, Packaging and storage, Labeling, Microbial limits, Heavy metals, Identification by IR absorption.

Specific local attributes: Appearance of solution (EP), ID (sodium flame test) (USP), ID (complies with pH test) (EP).

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Differences between the Adoption Stage 6 document and the current *NF* monograph include the following:

1. Definition—Modified to be more specific in terms of Type A and Type B.
2. *Packaging and storage*—No change.
3. *Labeling*—Requirements to label indicating Type A or Type B, the botanical source of the starch from which it was derived, and the cross-linking agent are added.
4. *USP Reference standards*—Reference standards for sodium starch glycolate Type A and Type B are added for use with *Identification* test *A*.
5. *Identification*—An IR absorption test and tests for sodium are added.
6. *Microbial limits*—No change.
7. *pH*—Clarification of the requirements for Type A and Type B is added.
8. *Loss on drying*—No change.
9. *Limit of iron*—The test from the EP is adopted.
10. *Heavy metals*—No change.
11. *Limit of sodium chloride*—A simpler procedure using a silver nitrate titration is adopted.
12. *Limit of sodium glycolate*—This test is added to comply with EP standards.
13. *Assay*—No change.

(EMC: J. Lane) RTS—42822-1

Change to read:

~~Sodium Starch Glycolate~~

~~Starch carboxymethyl ether, sodium salt.~~

~~» Sodium Starch Glycolate is the sodium salt of a carboxymethyl ether of starch. It contains not less than 2.8 percent and not more than 4.2 percent of sodium (Na) on the dried, alcohol-washed basis. It may contain not more than 7.0 percent of Sodium Chloride.~~

~~**Packaging and storage**—Preserve in well-closed containers, preferably protected from wide variations in temperature and humidity, which may cause caking.~~

~~**Labeling**—The labeling indicates the pH range.~~

~~**Identification**—A slightly acidified solution of it is colored blue by iodine and potassium iodide TS.~~

~~**Microbial limits** ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*~~

~~**pH** ⟨791⟩—Disperse 1 g in 30 mL of water: the pH of the resulting suspension is either between 3.0 and 5.0 or between 5.5 and 7.5.~~

~~**Loss on drying** ⟨731⟩—Dry it at 130° for 90 minutes: it loses not more than 10.0% of its weight.~~

~~**Iron** ⟨241⟩**:** 0.002%, the *Test preparation* being prepared as directed for *Test preparation* under *Heavy metals, Method III* ⟨231⟩, a 0.5-g test specimen being used and the final solution being diluted with water to 47 mL.~~

~~**Heavy metals,** *Method II* ⟨231⟩**:** 0.002%.~~

~~**Sodium chloride**—Weigh accurately about 1 g, transfer to a conical flask, add 20 mL of 80% alcohol, 0.1 mL of phenolphthalein TS, and 1 N sodium hydroxide solution until the suspension becomes faintly pink, stir for 10 minutes, and filter. Repeat the extraction until chloride has been completely extracted, as shown by a test with silver nitrate TS. Dry the insoluble portion at 105° to constant weight (*A* mg), and reserve it for the *Assay.* Evaporate the combined filtrates, and dry the residue at 105° to constant weight. The weight of the dried residue is not greater than 15% of the weight of Sodium Starch Glycolate taken. If the weight of the dried residue is not more than 7.0% of the weight of Sodium Starch Glycolate taken, the requirement is met. If the weight is greater than 7.0% of the weight of Sodium Starch Glycolate taken, transfer it with the aid of water to a 200-mL volumetric flask, add 5 mL of nitric acid and 40.0 mL of 0.1 N silver nitrate VS, mix, and dilute with water to volume. Allow it to stand in the dark for 30 minutes, and filter. To 100.0 mL of the filtrate add 5 mL of ferric ammonium~~

~~sulfate TS, and titrate with 0.1 N ammonium thiocyanate VS (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Calculate the percentage of sodium chloride by the formula:~~

$$5.844(40N_1 - 2VN_2)/W$$

~~in which N_1 and N_2 are the normalities of the silver nitrate VS and the ammonium thiocyanate VS, respectively, V is the volume, in mL, of ammonium thiocyanate VS used in the titration, and W is the weight, in g, of Sodium Starch Glycolate taken.~~

~~**Assay**—Transfer an accurately weighed portion, *B*, (about 700 mg) of the dried 80% alcohol-insoluble portion obtained in the test for *Sodium chloride*, to a suitable flask, add 80 mL of glacial acetic acid, heat the mixture under reflux, on a boiling water bath, for 2 hours, cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Calculate the percentage of sodium combined in the form of sodium starch glycolate by the formula:~~

$$100(22.99)V_2N_2/B$$

~~in which V_2 is the volume, in mL, of the perchloric acid VS, N_2 is the normality of the perchloric acid VS, and B is the weight, in mg, of the dried alcohol-insoluble residue taken for the *Assay*.~~

■Sodium Starch Glycolate

Starch carboxymethyl ether, sodium salt.

» Sodium Starch Glycolate is the sodium salt of a carboxymethyl ether of starch or of a cross-linked carboxymethyl ether of starch. It may contain not more than 7.0 percent of sodium chloride. The pH and assay requirements for Type A and Type B are set forth in the accompanying table.

	pH		% Sodium, combined as sodium starch glycolate	
Type	Min.	Max.	Min.	Max.
A	5.5	7.5	2.8	4.2
B	3.0	5.0	2.0	3.4

Packaging and storage—Preserve in well-closed containers, preferably protected from wide variations in temperature and humidity, which may cause caking.

Labeling—Label it to indicate the botanical source of the starch from which it was derived, the cross-linking agent (if used), the pH range, and whether it is Type A or Type B.

USP Reference standards ⟨11⟩—*USP Sodium Starch Glycolate Type A RS*. *USP Sodium Starch Glycolate Type B RS*.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: An acidified solution of it is colored blue to violet by the addition of iodine and potassium iodide TS1.

C: To a 2-mL portion of the solution prepared for the test for *Limit of iron,* add 4 mL of *Potassium pyroantimonate solution*. If necessary, rub the inside of the test tube with a glass rod. A white, crystalline precipitate is formed.

Potassium pyroantimonate solution—To 2 g of potassium pyroantimonate add 100 mL of water. Boil the solution for about 5 minutes, cool quickly, and add 10 mL of a solution of potassium hydroxide (3 in 20). Allow to stand for 24 hours, and filter.

D: Sodium starch glycolate imparts an intense yellow color to a nonluminous flame.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*

pH ⟨791⟩—Disperse 1 g in 30 mL of water. The pH of the resulting suspension is either between 5.5 and 7.5 for Type A or between 3.0 and 5.0 for Type B.

Loss on drying ⟨731⟩—Dry it at 130° for 90 minutes: it loses not more than 10.0% of its weight.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Limit of iron—

Standard solution—Dissolve 863.4 mg of ferric ammonium sulfate [$FeNH_4(SO_4)_2 \cdot 12H_2O$] in water, add 25 mL of 2 N sulfuric acid, dilute with water to 500.0 mL, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 1.0 µg of iron per mL.

Test solution—[NOTE—Reserve a portion of this solution for *Identification* test *C.*] Place 2.5 g in a silica or platinum crucible, and add 2 mL of 10 N sulfuric acid. Heat on a water bath, then cautiously raise the temperature progressively over an open flame. Ignite, preferably in a muffle furnace, at 600 ± 25°. Continue heating until all black particles have disappeared. Cool, add a few drops of 2 N sulfuric acid, and heat and ignite as above. Add a few drops of 2 M ammonium carbonate, evaporate to dryness, and ignite as above. Cool, dissolve the residue in 50 mL of water, and mix.

Procedure—Treat the *Test solution* and the *Standard solution* as follows. Transfer 10 mL of the solution to a suitable beaker, add 2 mL of citric acid solution (1 in 5) and 0.1 mL of thioglycolic acid, and mix. Render the solution alkaline, using litmus paper as an external indicator, by the addition of ammonium hydroxide, dilute with water to 20 mL, and mix. Allow the solutions to stand for 5 minutes: the color of the solution obtained from the *Test solution* is a shade of pink no deeper than that of the solution obtained from the *Standard solution* (0.002%).

Limit of sodium chloride—Transfer to a beaker about 500 mg of Sodium Starch Glycolate, accurately weighed, and suspend in 100 mL of water. Add 1 mL of nitric acid. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a suitable silver-based indicator electrode and a double-junction reference electrode containing a 10% potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

Limit of sodium glycolate—[NOTE—Conduct this test without exposure to daylight. Use low-actinic glassware.]

Standard solution—Transfer 310 mg of glycolic acid, previously dried over phosphorus pentoxide in a desiccator at room temperature overnight, to a 500-mL volumetric flask, and dissolve in and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL beaker, add 4 mL of 6 N acetic acid, and allow to stand for about 30 minutes. Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker and filter paper with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 hours without shaking. Use the clear supernatant as the *Standard solution.*

Test solution—Transfer 200 mg, accurately weighed, to a 100-mL beaker. Add 4 mL of 6 N acetic acid and 5 mL of water. Stir until dissolution is complete (about 10 minutes). Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker, and filter with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 hours without shaking. Use the clear supernatant as the *Test solution*.

Procedure—Treat the *Test solution* and the *Standard solution* as follows. Heat 2.0 mL of the solution on a water bath for 20 minutes to remove acetone. Cool to room temperature. Prepare a 2,7-dihydroxynaphthalene solution as follows. Dissolve 10 mg of 2,7-dihydroxynaphthalene in

100 mL of sulfuric acid, allow to stand until decolorized, and use within 2 days. Add 20.0 mL of this 2,7-dihydroxynaphthalene solution to the solution under test, mix, and heat on a water bath for 20 minutes. Cool under running water, and transfer quantitatively to a 25-mL volumetric flask. Maintain the flask under running water, and dilute with sulfuric acid to volume. Within 10 minutes determine the absorbance of the solution at 540 nm with a suitable spectrophotometer, using water as the blank: the absorbance of the solution obtained from the *Test solution* is not more than that of the solution obtained from the *Standard solution* (2.0%).

Assay—Transfer about 1 g to a conical flask, add 20 mL of 80% alcohol, stir for 10 minutes, and filter. Repeat the extraction until the chloride has been completely extracted, as shown by a test with silver nitrate. Dry the insoluble portion at 105° to constant weight, and transfer an accurately weighed portion (about 700 mg) of the dried 80% alcohol-insoluble portion to a suitable flask, add 80 mL of glacial acetic acid, heat the mixture under reflux on a boiling water bath for 2 hours, cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Calculate the percentage of sodium combined in the form of sodium starch glycolate by the formula:

$$100(22.99)VN/W$$

in which V is the volume, in mL, of the perchloric acid consumed; N is the normality of the perchloric acid; and W is the weight, in mg, of the dried alcohol-insoluble residue taken for the *Assay*.■2S (*NF24*)

GENERAL CHAPTERS

General Tests and Assays

Chemical Tests and Assays

LIMIT TESTS

BRIEFING

⟨**281**⟩ **Residue on Ignition,** *USP 28* page 2303. The Japanese Pharmacopoeia is the coordinating pharmacopeia in the efforts toward international harmonization of the specifications provided in this general test chapter. The **ADOPTION STAGE 6** text is presented here.

During the development of the Stage 5B Consensus harmonization draft, some differences were noted among the three Pharmacopeial Discussion Group pharmacopeias regarding ignition to constant weight conditions. The *USP–NF* General Notices currently specify 15-minute ignition periods between weighings and a weighing agreement of 0.50 mg per g (of substance taken). The *Japanese Pharmacopoeia* General Notices specify 1-hour ignition periods and a weighing agreement of 0.10%. The *European Pharmacopoeia* specifies an ignition period "appropriate to the nature and quantity of the residue" and a weighing agreement of 0.5 mg. For the purpose of this general chapter only and not for the *USP–NF* General Notices, ignition to constant weight conditions was revised in the Stage 5B Consensus draft to harmonize the ignition time period and weighing agreement parameters for "constant weight" judgment. In the Stage 5B Consensus draft revision, the current *USP–NF* chapter wording of "until constant weight is obtained" has been replaced with the new wording "using a 30-minute ignition period, until two consecutive weighings of the residue do not differ by more than 0.5 mg". That draft revision is contained in the **ADOPTION STAGE 6** text presented herein. This **ADOPTION STAGE 6** text is scheduled for publication in the *Second Supplement* to *USP 29–NF 24,* with a scheduled implementation date of **1 August 2006**.

⟨~~281~~⟩ ~~RESIDUE ON IGNITION~~

~~The *Residue on Ignition / Sulfated Ash* test utilizes a procedure to measure the amount of residual substance not volatilized from a sample when the sample is ignited in the presence of sulfuric acid~~

~~according to the procedure described below. This test is usually used for determining the content of inorganic impurities in an organic substance.~~

~~**Procedure**—Weigh accurately 1 to 2 g of the substance, or the amount specified in the individual monograph, in a suitable crucible (silica, platinum, quartz, or porcelain) that previously has been ignited at 600 ± 50° for 30 minutes, cooled in a desiccator (silica gel or other suitable desiccant), and weighed. Moisten the sample with a small amount (usually 1 ml) of sulfuric acid, then heat gently at a temperature as low as practicable until the sample is thoroughly charred. Cool, then, unless otherwise directed in the individual monograph, moisten the residue with a small amount (usually 1 mL) of sulfuric acid, heat gently until white fumes are no longer evolved, and ignite at 600 ± 50°, unless another temperature is specified in the individual monograph, until the carbon is consumed. Ensure that flames are not produced at any time during the procedure. Cool the crucible in a desiccator (silica gel or other suitable desiccant), weigh accurately, and calculate the percentage of residue. Unless otherwise specified, if the amount of the residue so obtained exceeds the limit specified in the individual monograph, repeat the moistening with sulfuric acid, heating and igniting as before, until constant weight is attained or until the percentage of residue complies with the limit in the individual monograph.~~

~~Conduct the ignition in a well-ventilated hood, but protected from air currents, and at as low a temperature as is possible to effect the complete combustion of the carbon. A muffle furnace may be used, if desired, and its use is recommended for the final ignition at 600 ± 50°.~~

~~Calibration of the muffle furnace may be carried out using an appropriate digital temperature meter and a working thermocouple probe calibrated against a standard thermocouple traceable to the National Institute of Standards and Technology.~~

~~Verify the accuracy of the measuring and controlling circuitry of the muffle furnace by checking the positions in the furnace at the control set point temperature of intended use. Select positions that reflect the eventual method of use with respect to location of the specimen under test. The tolerance is ± 25° at each position measured.~~

~~Sulphated Ash tests found in the *European* and *Japanese Pharmacopoeias* are considered equivalent to this test, except where noted.~~

■⟨281⟩ RESIDUE ON IGNITION

Portions of this general chapter have been harmonized with the corresponding texts of the *European Pharmacopoeia* and the *Japanese Pharmacopoeia*. The portions that are not harmonized are marked with symbols (◆ ◆). The harmonized texts of these pharmacopeias are therefore interchangeable, and the methods of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* may be used for demonstration of compliance instead of the present *United States Pharmacopeia* general chapter. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

The *Residue on Ignition / Sulfated Ash* test uses a procedure to measure the amount of residual substance not volatilized from a sample when the sample is ignited in the presence of sulfuric acid according to the procedure described below. This test is usually used for determining the content of inorganic impurities in an organic substance.

Procedure—Ignite a suitable crucible (for example, silica, platinum, quartz, or porcelain) at 600 ± 50° for 30 minutes, cool the crucible in a desiccator (silica gel or other suitable desiccant), and weigh it accurately. Weigh accurately ◆1 to 2 g of the substance, or ◆ the amount specified in the individual monograph, in the crucible.

Moisten the sample with a small amount (usually 1 mL) of sulfuric acid, then heat gently at a temperature as low as practicable until the sample is thoroughly charred. Cool; then, ◆unless otherwise directed in the individual monograph, ◆ moisten the residue with a small amount (usually 1 mL) of sulfuric acid; heat gently until white fumes are no longer evolved; and ignite at 600 ± 50°, ◆unless another temperature is specified in the individual monograph, ◆ until the residue is completely incinerated. Ensure that flames are not produced at any time during the procedure. Cool the crucible in a desiccator (silica gel or other suitable desiccant), weigh accurately, and calculate the percentage of residue.

Unless otherwise specified, if the amount of the residue so obtained exceeds the limit specified in the individual monograph, repeat the moistening with sulfuric acid, heating and igniting as before, using a 30-minute ignition period, until two consecutive weighings of the residue do not differ by more than 0.5 mg or until the percentage of residue complies with the limit in the individual monograph.

◆Conduct the ignition in a well-ventilated hood, but protected from air currents, and at as low a temperature as is possible to effect the complete combustion of the carbon. A muffle furnace may be used, if desired, and its use is recommended for the final ignition at 600 ± 50°.

Calibration of the muffle furnace may be carried out using an appropriate digital temperature meter and a working thermocouple probe calibrated against a standard thermocouple traceable to the National Institute of Standards and Technology.

Verify the accuracy of the measuring and controlling circuitry of the muffle furnace by checking the positions in the furnace at the control set point temperature of intended use. Select positions that reflect the eventual method of use with respect to location of the specimen under test. The tolerance is ±25° at each position measured.◆■2S (*USP29*)

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

The Development of Chapter ⟨1235⟩ *Vaccines and Vaccine Test Methods*

Barry D. Garfinkle, John D. Grabenstein, and Joan C. May, *USP Vaccines and Virology Expert Committee;* Roger Dabbah and Tina S. Morris,* *USP Department of Standards Development, Complex Actives Division*

ABSTRACT This *Stimuli* article provides introductory sections and the intended scope of a comprehensive *USP* General Information Chapter on vaccines and vaccine test methods currently under development by the USP Vaccines, Virology, and Immunology Expert Committee. The authors publish this information as a *Stimuli* article with the intent of initiating discussion and public comment. Volunteers to develop these sections and/or review completed sections are welcome and are invited to contact Tina S. Morris, Ph.D., at tsm@usp.org.

VACCINES FOR HUMAN USE: GENERAL INFORMATION CHAPTER ON VACCINES AND VACCINE TEST METHODS

This General Information Chapter provides information about the historical development of the vaccine field, the different types of vaccines currently in use, the most important aspects of vaccine manufacturing processes, and a detailed discussion of vaccine quality control and the tests necessary for the evaluation of the different types of vaccines currently licensed. The chapter is intended to provide useful and relevant background information about vaccines that will amplify information about individual vaccine monographs in the *United States Pharmacopeia (USP).*

INTRODUCTION

Vaccines are among the oldest pharmacologic classes of medications used to combat disease. The first written records on attempts to prevent smallpox by intentional administration of variola virus are attributed to a Buddhist nun practicing in China during the reign of Jen Tsung (1022–1063 AD). In the 7th century, Indian Buddhists attempted to induce immunity through the consumption of snake venom and may have been the first to demonstrate toxoid-like immunity this way. Jenner in 1798 used a preparation from cows infected with cowpox virus to prevent smallpox in humans. His treatise on the causes and effects of the *Variolae vaccinae* is the first scientific and deliberate approach to infection control by systematic inoculation.

A further 87 years elapsed before Pasteur successfully vaccinated humans against rabies. During this period, ideas of microbial attenuation and virulence were developed. Because Jenner himself had shown that immunity through vaccination was not necessarily life long, the idea of revaccination was established and discussed within the scientific community. Two important contributions of Koch were crucial for the further advancement of the field: the conclusive proof of a causal relationship between a bacillus and anthrax disease, and the ability to grow pure cultures of the bacteria. These achievements paved the way for the modern science of vaccination by administration of a specific antigen or infectious agent. The field of vaccinology could not have progressed further without an improved understanding of immunology. In this area Metchnikoff's theory of cellular immunity, published in 1884, as well as Ehrlich's receptor theory of immunity, developed in 1897, were key contributions to the field. Ehrlich also established the difference between active and passive immunity. Thus the major concepts in vaccinology evolved in the late 19th century.

Work in the early 20th century refined these cornerstone theories but advanced dramatically only with the advent of modern cell and tissue culture in the 1930s. The introduction of chorioallantoic membranes of fertilized eggs as a viral growth medium presented a major advance and allowed development of the first killed virus influenza vaccine in 1936, after Laidlaw isolated the influenza A virus from ferrets. The ability to propagate viruses in stationary cell cultures initiated a golden age of viral vaccine development, beginning in 1949. The first licensed vaccine developed by a cell culture technique was Salk's trivalent, formalin-inactivated poliovirus vaccine. It preceded poliovirus vaccines based on live attenuated virus grown in cell culture by several years. However, development of killed or live whole-virus vaccines was often limited by the inability to grow viruses in cell culture in sufficient quantities. For a long time this was the case for hepatitis A virus.

In parallel with rapid developments in vaccines based on whole infectious agents, significant progress was made in subunit or purified antigen vaccines, spearheaded by rapid developments in the area of polysaccharide antigens, probably most notably Pittman's experiments with *Haemophilus influenzae* polysaccharides in the 1930s. Recombinant DNA technology finally allowed the manufacture of vaccines, such as the second-generation hepatitis B vaccine, based on the virus's surface antigen expressed in yeast cells, a development that opened a new era of further technological development in vaccines. Modern vaccines have now been developed for a large number of infectious diseases. The array of technologies available for the development and

manufacture of vaccines, as well as the range of applications, has expanded. Several vaccines currently licensed or under development are not primarily administered to prevent an infectious disease but to fight severe illnesses like cancer, e.g., Bacillus Calmette-Guérin (BCG) live for bladder cancer.

Definitions and Classes

An antigen is a substance capable of inducing an immune response. Vaccines are drug products containing antigenic materials that evoke an acquired immune response in the body. Any macromolecule, as long as it is foreign to the recipient, can function as an antigen. Immune responses may be humoral, cell-mediated, or a combination of both. The antigenic components present in vaccines are processed by the body's immune system, resulting in the development of either serum proteins termed antibodies (i.e., humoral immunity) or specialized lymphocytes (i.e., cell-mediated response). Antibodies are serum proteins able to specifically bind to antigen molecules.

The antibody–antigen binding facilitates the ingestion of the antigen by phagocytic cells and may also activate the complement system that helps destroy the antigen. Antibodies are found primarily in the γ-globulin fraction of plasma and are also referred to as immunoglobulin (Ig). Immunoglobulins are divided into five classes: IgA, IgD, IgE, IgG, and IgM. The Ig classes differ in their structure and primary function and often more than one category of Ig participates in the response to an infectious agent. IgG is a Y-shaped molecule that is comprised of two identical heavy and two identical light chains that are connected by disulfide linkage. Digestion of IgG molecules with the proteinase papain yields two fragments. One fragment, termed Fab, is capable of antigen recognition; the other, called Fc, binds to Fc receptors that are found on the surface of macrophages, neutrophils, and other cells, most notably phagocytes that help eliminate infectious agents. Fc receptor interaction also triggers activation of the complement system via its component C3. The IgA monomer molecule is most important as a secretory antibody, especially at mucosal surfaces. Although the monomer is structurally similar to the IgG molecule, IgA functionally is a dimer linked by a joining (J) chain. IgM is a pentameric molecule, lined by J chains. J chains are additional polypeptide chains of approximately 20 kDa that are produced by IgM-secreting cells. They are covalently inserted between adjacent Fc regions. The pentameric structure allows IgM to recognize antigens composed of identical subunits, like the capsids of viruses. IgM is also a very efficient complement activator. IgD is found in large quantities on the surface of B cells, but it amounts to less than 1% of total serum Ig. An effector function for IgD is not known. IgE is involved in anaphylaxis or immediate hypersensitivity because it occurs with allergies and asthma. IgE is generally found in only small amounts in serum.

All immunoglobulin is secreted by plasma cells. The precursors of these are B-lymphocytes. Each B cell carries a specific Ig receptor for a particular antigen. Once the antigen binds and thus activates this specific cell, it rapidly proliferates, a process that is also called clonal expansion. Clonal expansion results in antibody production, a process that is facilitated by other lymphocytes known as T helper cells. Specific immunoglobulin is mainly produced by plasma cells in the spleen, lymph nodes, and in mucosa-associated lymphoid tissue.

Cell-mediated immune responses are driven by specialized cells that are produced to react with foreign antigens mainly on the surface of host cells. They either directly kill the host cell if the antigen is an infectious agent like a virus, or they recruit other host cells, such as macrophages, to destroy the antigen. The cells responsible for cell-mediated immunity are lymphocytes. They circulate in the blood in very large numbers and are also found in the lymphatic system. A total number of approximately 2×10^{12} lymphocytes circulate the human body. Cellular immune responses are often also mediated by secreted molecules called cytokines (e.g., interleukins and interferons). T lymphocytes can both produce and carry receptors to these factors.

The two major types of immune response, humoral and cellular, are driven by two different classes of lymphocytes. Whereas T cells that develop in the thymus are responsible for cell-mediated immune responses, B cells produce antibodies. All lymphocytes differentiate from pluripotent hematopoietic stem cells. The infection and disease susceptibility of patients with congenital B-cell deficiencies powerfully illustrates the importance of the humoral immune response in fighting infectious diseases.

Cell-mediated immune responses, guided by T cells, are just as antigen-specific as humoral responses, but they do not involve the secretion of antibodies. Different T-cell subpopulations are responsible for different T-cell responses. Once T cells are activated by specific antigens, they begin to divide and differentiate. At least three different responses are possible: (1) T cells directly and specifically kill an infected cell; (2) they help other T or B cells to respond to antigen by recruiting and activating nonlymphocyte cells like macrophages; or (3) they suppress specific T or B lymphocyte responses. Different subpopulations of T cells are responsible for these processes: cytotoxic T cells or killer cells, helper T cells, and suppressor T cells, respectively. T helper and suppressor cells act as regulators of the immune response and hence are often also referred to as regulatory T cells.

Vaccines for human use may contain whole organisms (e.g., bacteria or viruses) or extracts or specific cell products from these organisms as antigens. In addition to antigen(s), vaccines may contain several other components, such as excipients needed for pharmaceutical manufacturing or an adjuvant. Adjuvants help enhance the body's response to a vaccine. Adjuvants come in many forms and may include

* Correspondence should be addressed to: Tina S. Morris, Ph.D., Senior Scientist, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8397; fax 301.816.8373; e-mail tsm@usp.org.

aluminum salts, oil emulsions, and protein conjugates, to name a few. Tests for the most commonly used adjuvants in vaccines today are discussed in the test section of this chapter; for others, the reader is referred to the specific vaccine monograph. Three major types of vaccines—viral, bacterial, and recombinant—are discussed in the following sections.

VIRAL VACCINES

Viral vaccines represent one of the oldest categories of vaccines and include Jenner's live attenuated smallpox vaccine (1798) and Pasteur's rabies vaccine for postexposure treatment (1885). In the modern era, a live poliovirus vaccine was first tested in 1950 but was not licensed until 1960 in the U.S. A cell culture–derived inactivated polio vaccine was licensed in the U.S. in 1955. These polio vaccines are illustrative of the two main types of viral vaccines: live attenuated and killed/inactivated vaccines. Additionally, inactivated virus vaccines may be either whole virus or subunits/substructures of the whole virus. New types of viral vaccines are virosome-based vaccines. An influenza virosome vaccine can be used as an example: antigens (e.g., the influenza virus surface glycoproteins haemagglutinin and neuraminidase) are packaged in a membrane consisting of phospholipids. This virus-like, yet completely replication-incompetent vesicle serves as a delivery device that will fuse with cells of the immune system, where it releases the desired antigen directly. A virosome-based hepatitis A vaccine is licensed in several countries. For traditional viral vaccines, the viruses generally are propagated either in embryonated eggs or various types of tissue culture, including human diploid cells, as well as animal-derived continuous cell lines. Establishment, maintenance, and testing regimens for these cells and cell lines will be described in the respective sections of this chapter.

Live attenuated virus vaccines are based on infection- and replication-competent viruses that will not cause the disease condition in the vaccine recipient. They can confer decades-long immunity after one immunization series but often require repeat doses. They generally are more potent than killed-virus vaccines; however there is a remaining small possibility that after administration they may potentially revert to a more pathogenic form because they can replicate. This risk is very small and can be further reduced by the use of recombinant DNA technology and reverse genetics, for example in the case of live attenuated influenza vaccines. The traditional way to attenuate a virus is by sequential passage in animal cell culture, but there now are more deliberate strategies to achieve attenuation. These include the use of temperature-sensitive strains that do not grow very well in the body, using similar viruses from other species that do not cause the disease in humans, and recombinant viruses developed by infecting cells with several types of viruses simultaneously, resulting in recombinant viruses.

Inactivated virus vaccines are produced by growing the disease-causing strain of virus and then inactivating it so it will not cause infection and replicate in humans. Inactivation may be achieved by treating with heat or chemicals such as formalin, beta propriolactone, or other agents that render the virus replication incompetent. Inactivated viral vaccines include whole virus and subunit vaccines. Inactivated viral vaccines require successful cultivation of the virus in a human or animal cell line to achieve sufficient quantities, which is crucial and not always easy to achieve. An inactivated hepatitis A vaccine remained elusive for a long time for this reason. Many subunit vaccines, on the other hand, have become easier and less expensive to manufacture since the advent of recombinant DNA technology. The second-generation hepatitis B vaccine (HBV) is a good example. In this case the HBV surface antigen is expressed in recombinant yeast cells. The success of a subunit vaccine, however, generally depends on a good understanding of the immunogenic properties of the different components of the virus. Especially in the case of emerging diseases this is not always the case.

BACTERIAL VACCINES

The development of bacterial vaccines dates to the late 19th century, when experimental typhoid, plague, and cholera vaccines were first made. As with viral vaccines, both live attenuated and inactivated or killed bacterial vaccines have been developed. The first bacterial vaccines that were developed were all killed vaccines. Bacterial toxins of tetanus and diphtheria were detoxified and turned into toxoid vaccines in the 1920s. BCG vaccine was the first attenuated live bacterial vaccine (1927). Attenuation was achieved over 13 years and 230 passages in beef bile. After the 2nd World War an attenuated *Salmonella typhi* strain became available. Just as in the case of viral attenuated vaccines, live attenuated bacterial vaccines are strains of bacteria that are very similar to the disease-causing strain but do not produce disease. This may be because they contain antigens similar to those in the disease-causing strain but do not produce a disease-causing toxin or because they are an entirely different organism that contains antigens that cross-react with the virulent strain of bacteria.

Inactivated bacterial vaccines are produced by growing cells of the disease-causing bacteria and subsequently inactivating them to prevent replication in the body of the recipient. The bacteria may be inactivated with heat or chemicals. There are many types of inactivated bacterial vaccines, including whole-cell and subunit vaccines. Whole-cell vaccines consist of the entire microorganism once it has been inactivated. These preparations may or may not be purified or partially purified. Subunit vaccines are extracts from the inactivated bacteria consisting of cell complexes, extracted polysaccharides, proteins, lipids, or toxins produced by the microorganisms in question. The subunit-type vaccines generally undergo some degree of purification. These extracts are normally produced using different types of chemical or physical separation. A specific type of vaccine is made from the toxins from the bacteria, which are treated chemically to render the toxin inactive but still immunogenic, allowing this so-called toxoid to stimulate an immune

response so the body will inactivate toxin produced by the disease-causing microorganisms. Another very common type of bacterial subunit vaccine is the polysaccharide vaccine, for which different cell surface and cell wall polysaccharides of disease-causing bacteria are purified and used as antigenic material. Especially during the 1970s and 1980s several bacterial vaccines consisting of purified capsular polysaccharides were developed, for example meningococcal group A and C vaccines. Pneumococcal polysaccharide vaccine development started in the early 1940s and continues to this day, resulting in vaccines that contain more than twenty different antigen types.

BIOTECHNOLOGY-DERIVED VACCINES

Several types of vaccines against viral or bacterial infections are derived by these techniques.

Recombinant Cellular Factories

The first category uses genetically modified bacteria or yeast cells for the recombinant expression of antigenic material. These host cells have been transformed with expression vectors carrying genes that encode antigenic material from either viral or bacterial infectious agents. The expression cells are grown in bioreactors to produce the recombinant antigenic material. This antigenic material is purified from the culture media using a variety of chemical and physical separations. Purified recombinant antigens can be proteins, glycoproteins, or protein–lipid complexes. Further, they may be either soluble preparations or may assemble/be assembled into structures such as empty viral capsids. These capsids consist of a viral shell structure but do not contain any viral genetic material. An advantage of this type of vaccine is that it does not have to contain the entire viral genome, hence avoiding the risk of the vaccine containing replication-competent disease-causing virus. Subunit or recombinant protein vaccines derived by biotechnology processes have the advantage that the components contained in the vaccine as well as the materials used in the cell culture of the hosts are very well defined and can be extensively characterized. However, to be successful they require extensive research and knowledge of the antigenic properties of the target infectious agent.

Nucleic-Acid Vaccines

A second type of vaccine strategy, the DNA vaccine, involves the creation of a DNA plasmid that contains one or several, but not an entire set, of genes from the disease-causing agent. The plasmid vector contains genes encoding the antigenic material from the infectious agent, along with necessary promoters and other genetic controls. The plasmid is produced in an expression host such as a bacterial culture and is purified. Once purified DNA is introduced into the body of the vaccine recipient, it enters selected cells and begins to express the genes encoded by the expression plasmid and stimulates the immune system in a manner similar to using the viral vector described previously. This type of vaccine is not yet commercially available.

Viral Vectors

A third type of biotechnology-derived vaccine involves modifying a virus by insertion of one or several—but not an entire set—of genes from a disease-causing virus. This modified virus is a so-called viral vector for the expression of antigens from a different infectious agent. The modified virus can then infect an individual and in replicating within the cells of the body produces the foreign antigens from the disease-causing virus. The viral vector used is itself often replication-deficient. The immune system then responds to these antigens with a humoral and/or cell-mediated response.

Conjugate Vaccines

Conjugate vaccines are often utilized as a strategy when the immune response to the antigen itself is weak and the conjugation provides a method to increase the antigenicity and therefore the immune response to the antigen. Conjugate vaccines take advantage of the knowledge that often both B cells and T cells need to work together to stimulate a sufficient immune response. This strategy has been utilized primarily in combining bacterial polysaccharides, e.g., *H. influenzae,* pneumococcal, or meningococcal polysaccharides, with various bacterial proteins. These proteins have come from tetanus toxoid, modified diphtheria toxin, and meningococcal outer membrane protein. The conjugation results in a binding of the polysaccharide antigen to one of these carrier materials. Conjugate vaccines are a direct development of research conducted with both purified antigens as well as bacterial capsule polysaccharides. These vaccines are manufactured by combining an antigen with additional materials extracted from microorganisms to render the material more immunogenic.

Multivalent Vaccines

Early vaccines typically were univalent in nature, which means that they contained only one particular antigen. However, many current vaccines contain multiple antigens from different strains of the organism that causes a clinical disease. Most notable are influenza vaccine (three types), poliovirus vaccine (three serotypes), meningococcal vaccine (four serogroups), and pneumococcal vaccines (7 or 23 types). The multivalency normally is utilized when a disease is caused by a number of different strains of an organism and no common antigen results in strong immunity. Therefore, a vaccine is developed to contain strain-specific antigens to convey immunity to the disease.

Combination Vaccines

These vaccines are the result of combining vaccines against two or more infectious diseases into a single drug product. Positive aspects of these products are improved compliance because fewer visits to a health professional are required, and economic advantages accrue because only one administration, i.e., injection, is required. Parents also appreciate that fewer visits are required to implement the vaccination schedules that have become more complicated as more vaccines have become available. The majority of combination vaccines are aimed at the pediatric market, e.g. MMR (measles, mumps, and rubella), DTP (diphtheria, tetanus, and pertussis), etc.

Adjuvants

These are compounds with which antigens are combined to improve the immune response. Numerous adjuvants exist and include aluminum hydroxide, aluminum phosphate, aluminum hydroxyphosphate, aluminum potassium sulfate, mineral oil/aqueous emulsions, and protein conjugates, to name a few.

PLANNED CHAPTER SECTIONS CURRENTLY UNDER DEVELOPMENT

The following outline provides an overview of the sections of proposed General Information Chapter ⟨1235⟩ *Vaccines and Vaccine Test Methods.*

General considerations for vaccine development, manufacturing, and quality control

- Production
  - — General provisions
  - — Substrates for propagation
  - — Seed lots
  - — Culture media
  - — Propagation and harvest
  - — Purification
  - — Inactivation
  - — Intermediates
  - — Final bulk
  - — Adjuvants
  - — Antimicrobial preservatives
  - — Stabilizer
  - — Surface-active agents
  - — Final lot
  - — Stability
  - — Packaging and storage
  - — Expiration
  - — Nomenclature and labeling

General vaccine tests applicable to all types of vaccines

- Tests for antimicrobials
- Tests for adjuvants
- Tests for inactivating agents
- Tests for stabilizers
- Tests for surface-active agents
- Tests for dyes
- Tests for medium components and ancillary materials
- Tests for miscellaneous excipients and residuals

Protein Vaccines

- Introduction
- Simple and complex proteins: description and definition
  - — Recombinant antigens, inactivated toxins/toxoids
  - — Multicomponent vaccines (e.g., acellular pertussis vaccine)
  - — Brief principles of manufacturing methods; different steps (general)
    - — Development and maintenance of master and working seeds
    - — Fermentation
      - — Different cell lines
    - — Purification
      - — Precipitation
      - — Chromatography
      - — Other methods
    - — Detoxification (inactivated toxins and toxoids)
    - — Formulation: stability and other considerations (such as long-term stability, stinging, allergic reaction, preservative, etc.)
  - — Stability and storage
- Tests
  - — Total protein
  - — SDS-PAGE
  - — Western blot
  - — Capillary electrophoresis
  - — Chromatographic procedures
  - — Immunochemical methods
  - — ELISA
  - — Antigen-to-mass ratio
  - — Potency

Polysaccharide Vaccines

- Special characteristics
  - — Bacterial
  - — Ti, IgM, little immunity in infants
    - — Different types
    - — Brief principles of manufacturing methods; different steps (general)
  - — Development and maintenance of master and working seeds
    - — Cell growth
    - — Purification
      - — Solvent fractionation
      - — Chromatography
      - — Other methods
    - — Formulation: stability and other considerations
  - — Stability and storage
- Tests

Polysaccharide–Protein Conjugate Vaccines
- Purpose of conjugation: target population
- Different types of proteins/peptides used in conjugation
- Manufacturing methods (outline)
  - — Spacer arm
  - — Activation
  - — Conjugation; polysaccharide to protein ratio
  - — Capping
  - — Removal of unconjugated polysaccharide
  - — Formulation: stability and other considerations
  - — Stability and storage
- Tests

Viral Vaccines
- Live attenuated vaccines
  - — Attenuation strategies
  - — Manufacturing methods
  - — Stability and storage
  - — Tests
  - — Safety
- Inactivated vaccines
  - — Inactivation strategies
  - — Manufacturing methods
  - — Stability and storage
  - — Tests
  - — Safety

Bacterial Vaccines
- Live attenuated vaccines
  - — Attenuation strategies
  - — Manufacturing methods
  - — Stability and storage
  - — Tests
  - — Safety
- Inactivated vaccines
  - — Inactivation strategies
  - — Manufacturing methods
  - — Stability and storage
  - — Tests
  - — Safety

Combination Vaccines

DNA Vaccines

Viral Vectors

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

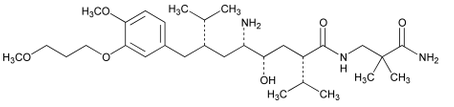
USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 2

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

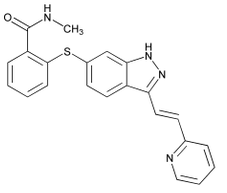
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

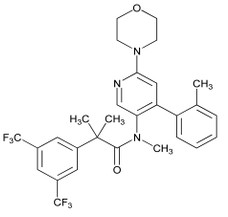
Aliskiren [*2005*] (a lis′ kir en″). $C_{30}H_{53}N_3O_6$. 551.76. (1) Benzeneoctanamide, δ-amino-*N*-(3-amino-2,2-dimethyl-3-oxopropyl)-γ-hydroxy-4-methoxy-3-(3-methoxypropoxy)-α,ζ-bis(1-methylethyl)-, (α*S*, γ*S*, δ*S*, ζ*S*)-; (2) (2*S*,4*S*,5*S*,7*S*)-5-Amino-*N*-(2-carbamoyl-2-methylpropyl)-4-hydroxy-2-isopropyl-7-[4-methoxy-3-(3-methoxypropoxy)benzyl]-8-methylnonamide.*CAS-173334-57-1*. INN. *Treatment of essential hypertension* (*renin inhibitor*). (Novartis Pharma AG, Switzerland) ✧*SPP100*



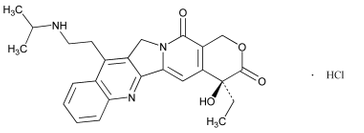
Axitinib [*2005*] (ax″ i ti′ nib). $C_{22}H_{18}N_4OS$. 386.50. (1) Benzamide, *N*-methyl-2-[[3-[(1*E*)-2-(2-pyridinyl)ethenyl]-1*H*-indazol-6-yl]thio]-; (2) *N*-Methyl-2-[[3-[(1*E*)-2-(pyridin-2-yl)ethenyl]-1*H*-indazol-6-yl]sulfanyl]benzamide. *CAS-319460-85-0*. *Antineoplastic, inhibitor of VEGF/PDGF tyrosine kinases.* (Pfizer) ✧*AG-013736*



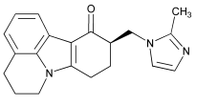
Befetupitant [*2005*] (bef″ et ue′ pi tant). $C_{29}H_{29}F_6N_3O_2$. 565.60. (1) Benzeneacetamide, *N*,α,α-trimethyl-*N*-[4-(2-methylphenyl)-6-(4- morpholinyl)-3-pyridinyl]-3,5-bis(trifluoromethyl)-; (2) 2-(3,5-Bis(trifluoromethyl)phenyl)-*N*-[4-[2-methylphenyl]-6-(morpholin-4-yl)pyridin-3-yl]-*N*-methylisobutyramide. *CAS-290296-68-3*. INN. *Treatment of depression.* (Hoffmann-LaRoche) ✧*Ro 67-5930*



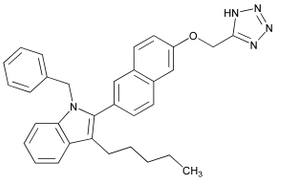
Belotecan Hydrochloride [*2005*] (bel″ oh tee′ han). $C_{25}H_{27}N_3O_4$.HCl. 469.97. [Belotecan is INN.] (1) 1*H*-Pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione, 4-ethyl-4-hydroxy-11-[2-[(1-methylethyl)amino]ethyl]-, monohydrochloride, (4*S*)-; (2) (4*S*)-4-Ethyl-4-hydroxy-11-[2-[(1-methylethyl)amino]ethyl]-1,12-dihydro-14*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinoline-3,14(4*H*)-dione hydrochloride. *CAS-213819-48-8; CAS-256411-32-2* [belotecan]. *Antineoplastic* (*DNA topoisomerase I inhibitor*). (Boehringer Ingelheim Chemicals) ✧*CKD-602*



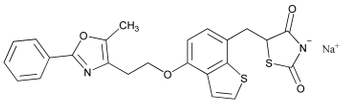
Cilansetron [*2005*] (sil an se′ tron). $C_{20}H_{21}N_3O$. 319.40. (1) 4*H*-Pyrido[3,2,1-jk] carbazol-11 (8*H*)-one, 5,6,9,10-tetrahydro-10-[(2-methyl-1*H*-imidazol-1-yl) methyl]-, (10*R*)-; (2) (10*R*)-5,6,9,10-Tetrahydro-10[(2-methylimidazol-1-yl)-methyl]-4*H*-pyrido[3,2,1-jk]carbazol-11(8*H*)-one. *CAS-120635-74-7*. INN. *Treatment of irritable bowel syndrome.* (Solvay Pharmaceuticals) ✧*KC-9946*



Diaplasinin [*2005*] (dye a plas′ in in). $C_{32}H_{31}N_5O$. 501.60. (1) 1*H*-Indole, 3-pentyl-1-(phenylmethyl)-2-[6-(1*H*-tetrazol-5-ylmethoxy)-2-naphthalenyl]-; (2) 1-Benzyl-3-pentyl-2-[6-(1*H*-tetrazol-5-ylmethoxy)naphthalen-2-yl]-1*H*-indole. *CAS-481631-45-2*. *Treatment of fibrinolytic impairment diseases.* (Wyeth) ✧*PAI-749*



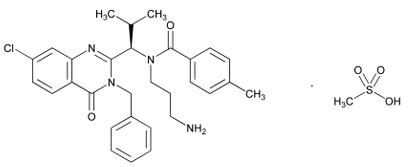
Edaglitazone Sodium [*2005*] (ed″ a gli′ ta zone).
$C_{24}H_{19}N_2NaO_4S_2$. 486.50. [Edaglitazone is INN.] (1) 2,4-Thiazolidinedione, 5-[[4-[2-(5-methyl-2-phenyl-4-oxazolyl)ethoxy]benzo[b]thien-7-yl]methyl]-, sodium salt; (2) Sodium(5*RS*)-5-[[4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]-1-benzothiophen-7-yl]methyl]-2,4-dioxothiazolidin-3-ide.-*CAS-369631-81-2; CAS-213411-83-7* [edaglitazone]. *Treatment of Type 2 diabetes.* (Hoffmann-LaRoche) ✧*RO2052349-602*



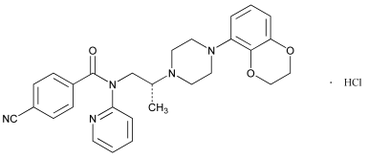
Ipilimumab [*2005*] (i pi lim′ ue mab). $C_{6472}H_{9972}N_{1732}O_{2004}S_{40}$. Immunoglobulin G1, anti-(human CTLA-4 (antigen)) (human γ1-chain), disulfide with human κ-chain, dimer. Molecular weight is approximately 145,400 daltons. *CAS-477202-00-9. Treatment of oncology disease and HIV infection.* (Medarex) ✧*MDX-010; MDX-CTLA-4*

Isovaleramide [*2005*] (eye″ soe val er′ a mide). $C_5H_{11}NO$. 101.15. (1) Butanamide, 3-methyl-; (2) 3-Methylbutanamide. *CAS-541-46-8. Anxiolytic, anticonvulsant, antispastic, antimigraine, mood stabilizer and analgesic.* (NPS) ✧*NFS1776*

Ispinesib Mesylate [*2005*] (is pin′ es ib). $C_{30}H_{33}ClN_4O_2.CH_4O_3S$. 613.20. [Ispinesib is INN.] (1) Benzamide, *N*-(3-aminopropyl)-*N*-[(1*R*)-1-[7-chloro-3,4-dihydro-4-oxo-3-(phenylmethyl)-2-quinazolinyl]-2-methylpropyl]-4-methyl-, monomethanesulfonate; (2) *N*-(3-Aminopropyl)-*N*-[(1*R*)-1-(3-benzyl-7-chloro-4-oxo-3,4-dihydroquinazolin-2-yl)-2-methylpropyl]-4-methylbenzamide monomethanesulfonate. *CAS-514820-03-2; CAS-336113-53-2* [ispinesib]. *Antineoplastic* (*kinesin inhibitor*). (GlaxoSmithKline) ✧*SB-715992-S; CK0238273*



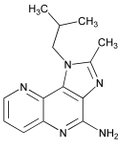
Lecozotan Hydrochloride [*2005*] (le koe′ zoe tan).
$C_{28}H_{29}N_5O_3.HCl$. 520.00. (1) Benzamide, 4-cyano-*N*-[(2*R*)-2-[4-(2,3-dihydro-1,4-benzodioxin-5-yl)-1-piperazinyl]propyl]-*N*-2-pyridinyl-, monohydrochloride; (2) 4-Cyano-*N*-[(2*R*)-2-[4-(2,3-dihydro-1,4-benzodioxin-5-yl)piperazin-1-yl]propyl]-*N*-(pyridin-2-yl)benzamide monohydrochloride. *CAS-433282-68-9. Treatment of cognitive deficits associated with Alzheimer's disease* (5-HT_{1A} receptor antagonist). (Wyeth) ✧*SRA-333*



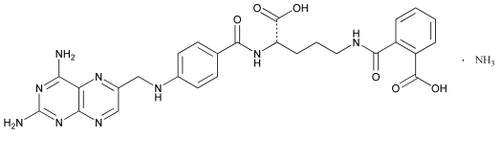
Mapatumumab [*2005*] (map″ a toom′ ue mab).
$C_{6388}H_{9856}N_{1712}O_{1998}S_{46}$. (1) Immunoglobulin G1, anti-(human cytokine receptor DR4 (death receceptor 4)) (human monoclonal TRM-1 heavy chain), disulfide with human monoclonal TRM-1 λ-chain, dimer; (2) Immunoglobulin G1, anti-(human TRAIL-R1) (human monoclonal TRM-1 heavy chain), disulfide with human monoclonal TRM-1 λ-chain, dimer. *CAS-658052-09-6. Treatment of cancer.* (Human Genome Sciences) ✧*TRAIL-R1 mAb; TRM-1; HGS-ETR1*

Perflubutane [*2005*] (per floo′ bue tane). C_4F_{10}. 238.00. (1) Butane, decafluoro-; (2) Decafluorobutane. *CAS-355-25-9*. INN. *Ultrasound contrast agent intended for assessing myocardial perfusion in patients with coronary artery disease.* (Acusphere) ✧*AI-700*

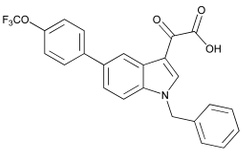
Sotirimod [*2005*] (soe tir′ i mod). $C_{14}H_{17}N_5$. 255.30. (1) 1*H*-Imidazo[4,5-*c*][1,5]naphthyridin-4-amine, 2-methyl-1-(2-methylpropyl)-; (2) 2-Methyl-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine. *CAS-227318-75-4. Treatment of dermatologic diseases, including actinic keratosis, infections, cancer.* (3M Pharmaceuticals) ✧*R-850; S-30594*



Talotrexin Ammonium [*2005*] (tal oh trex′ in). $C_{27}H_{27}N_9O_6.H_3N$. 590.60. (1) Benzoic acid, 2-[[[(4*S*)-4-carboxy-4-[[4-[[(2,4-diamino-6-pteridinyl)methyl]amino]benzoyl]amino]butyl]amino]carbonyl]-, monoammonium salt; (2) 2-[[(4*S*)-4-Carboxy-4-[[4-[[(2,4-diaminopteridin-6-yl)methyl]amino]benzoyl]amino]butyl]carbamoyl]benzoic acid monoammonium salt. *CAS-648420-92-2. Antineoplastic.* (HANA Biosciences) ✧*PT-523; PT523; NSC-712783*



Tiplasinin [*2005*] (ti plas′ in in). $C_{24}H_{16}F_3NO_4$. 439.38. (1) 1*H*-Indole-3-acetic acid, α-oxo-1-(phenylmethyl)-5-[4-(trifluoromethoxy)phenyl]-; (2) [1-Benzyl-5-[4-(trifluoromethoxy)-phenyl]-1*H*-indol-3-yl]oxoacetic acid. *CAS-393105-53-8. Treatment of fibrinolytic impairment diseases.* (Wyeth) ✧*PAI-039*



Tramiprosate [*2005*] (tram ip′ roe sate). $C_3H_9NO_3S$. 139.20. (1) 1-Propanesulfonic acid, 3-amino-; (2) 3-Aminopropane-1-sulfonic acid. *CAS-3687-18-1. Treatment of mild-to-moderate Alzheimer's disease, treatment of cerebral amyloid angiopathy.* (Neurochem) ✧*NC-758*

Velafermin [*2005*] (vel′′ a fer′ min). $C_{1047}H_{1632}N_{306}O_{302}S_5$. Fibroblast growth factor?20 (human recombinant CG53135). Molecular weight is approximately 23,500 daltons. *CAS-697766-75-9. Treatment and/or prevention of mucositis.* (CuraGen) ✧*CG53135-05*

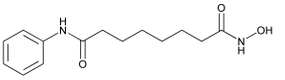
PELYKDLLMY T

Volociximab [*2005*] (voe loe six′ i mab). $C_{6434}H_{9942}N_{1706}O_{2040}S_{52}$. Immunoglobulin G4, anti-(human α5β1 integrin) (human-mouse clone p200-M heavy chain), disulfide with human-mouse clone p200-M κ-chain, dimer. *CAS-558480-40-3. Antiangiogenic agent to treat solid tumors and age-related macular degeneration.* (ICOS) ✧*M200*

Vorinostat [*2005*] (vore in′ oh stat). $C_{14}H_{20}N_2O_3$. 264.32. (1) Octanediamide, *N*-hydroxy-*N′*-phenyl-; (2) *N*-Hydroxy-*N′*-phenyloctanediamide. *CAS-149647-78-9. Antineoplastic, histone deacetylase inhibitor.* (Merck)



United States Adopted Names (USAN) Under Consideration

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary*. A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category,* are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

USAN Under Consideration	Category
Acaftadine	*H1 receptor antagonist*
Afavatadine	
Alacaftadine	
Alcaftadine	
Avnactadine	
Adariconazole	*Antifungal agent*
Alconazole	
Camaconazole	
Peloconazole	
Pirconazole	
Zoconazole	
Adopanib Hydrochloride	*Antineoplastic*
Balitanib Hydrochloride	
Pazopanib	
Pazopanib Hydrochloride	
Afetegrant	*Treatment of multiple sclerosis, inflammatory bowel disease*
Alfortegral	
Alitegrant	
Firategrant	
Fortegratag	
Afinoxifene	*Treatment of breast cancer*
Quatroxifene

Diaplaginin	*Treatment of fibrinolytic impairment disease*
Diaplasginin	
Diaplasinin	
Diaplastinin	
Diaplaxtinin	
Difirolimus	*Antineoplastic*
Dofosirolimus	
Gifosirolimus	
Safosirolimus	
Torolimus	
Eiriflapon	*Prevention of acute cardiovascular events*
Eriflapon	
Loxiflapon	
Veliflapon	
Eltrombopag	*Treatment of chemotherapy-induced thrombocytopenia and iodiopathic thrombocytopenic purpura*
Eltrombopan Diolamine	
Etrobopan Diolamine	
Gemcaristim	
Getrobopan Diolamine	
Megprocaristim	
Recepcaristim	
Retrombopan Diolamine	
Xelcaristim	
Zexcaristim	
Elzivadose Hydrochloride	*Treatment of Fabry disease*
Elzydavose Hydrochloride	
Fabenimose Hydrochloride	
Migalastat	
Emevatide	*Melanoma peptide vaccine; treatment of cancer*
Omatide	
Omevatide	
Ovemotide	
Vamevatide	
Fingolimod	*Prevention of organ rejection in patients receiving allogenic renal transplants*
Fingolimod Hydrochloride	
Fosaprepitant	*Antiemetic; substance P antagonist (neurokinin NK1 antagonist)*
Fosaprepitant Dimeglumine	
Fulvotaxel	*Treatment of NSCLC and metastatic breast cancer*
Misotaxel	
Naltotaxel	
Simotaxel	
Hioxifilcon D	*Contact lens*

USAN Under Consideration	Category
Imicrocidem	*Treatment of malaria, African Sleeping Sickness, and Pneumocystis Pneumonia*
Muramidem Maleate	
Muramidine Maleate	
Prilamidem Maleate	
Prilamidine Maleate	
Proparacidem	
Tripicidem	
Tropamidem Maleate	
Tropamidine Maleate	
Iobomipic acid I 123	*Diagnostic imaging agent*
Iodofazic acid I 123	
Iodofenate	
Iodofenoate	
Iofantic acid I 123	
Iofenoate	
Iofofiltic acid I 123	
Iratumumab	*Treatment of oncologic diseases; treatment of relapsed or refractory CD30 positive lymphoma including Hodgkin's disease*
Resatumumab	
Restumumab	
Rosutumumab	
Tiratumumab	
Tritumumab	
Lacosamide	*Treatment of epilepsy and pain*
Levamlodipine Maleate	*Treatment of hypertension*
Lexitumumab	*Antineoplastic*
Trixatumumab	
Vexatumumab	
Mamotide Sodium	*Treatment of osteosarcoma*
Memotide Sodium	
Mepactide	
Mepactide Sodium	
Muratide	
Muratide Sodium	
Murimotide Sodium	
Mepactide	*Treatment of osteosarcoma*
Muratide	
Motavizumab	*Prevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in pediatric patients at high risk*
Motovizumab	
Nolovizumab	
Numavizumab	
Ralivizumab	
Reslivizumab	
Resyvizumab	
Umavizumab	
Obatoclax	*Treatment of cancer*
Oraptoclax Mesylate	
Raptobeclib Mesylate	
Pasomilast	*Treatment of atopic dermatitis*
Pramilast	
Primilast	
Promilast	
Rimilast	
Zomilast	
Recipanib	*Age-related macular degeneration*
Versanib	
Visrefanib	

USAN Under Consideration	Category
Rotigaptide	*Treatment of ventricular tachycardia or ventricular fibrillation*
Rotiregap	
Sapropterin Hydrochloride	*Treatment of PKU*
Sarizotan Hydrochloride	*Schizophrenia, Parkinson's disease*

International Nonproprietary Names (INN) Under Consideration

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which ensures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category,* are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

(INN) Under Consideration	Category
Acaftadine Alcaftadine	*H1 receptor antagonist*
Adarolimus Tezorolimus Zotarolimus Zoterolimus	*Antifungal macrolide (drug component of an investigational phosphoryl choline polymer coated eluting stent, currently under evaluation for the prevention of coronary restenosis following stent replacement)*
Apadenoson Paladenoson	*Adjunct to nuclear myocardial perfusion imaging in patients unable to exercise adequately*
Aplaviroc Pelaviroc Hydrochloride	*Treatment of HIV infection*
Arblurbifenil Arflurbiprofen	*Antineoplastic; treatment of Alzheimer's disease*
Brilapladib Bripladib	*Treatment of atherosclerosis*
Casipitant Mesylate Casopitant	*Treatment of depression, anxiety, sleep disorders, nausea and vomiting, functional dyspepsia, irritable bowel syndrome, gastro-esophageal reflux disease, and overactive bladder disease*
Citilimumab Ticilimumab	*Treatment of cancer*
Darapladib Darlapladib	*Treatment of atherosclerosis*
Denagliptin Denogliptin Tosylate	*Treatment of type II diabetes*
Denosumab	*Treatment of osteoporosis*
Diaplaginin Diaplasginin Diaplasinin Diaplastinin Diaplaxtinin	*Treatment of fibrinolytic impairment disease*
Eltrombopag	*Treatment of chemotherapy-induced thrombocytopenia and treatment of idiopathic thrombocytopenic purpura*
Elzivadose Hydrochloride Migalastat	*Treatment of Fabry disease*
Fosaprepitant Fosaprepitant Dimeglumine	*Antiemetic; substance P antagonist (neurokinin NK1 antagonist)*
Fospropofol Fospropofol Disodium	*Sedative-hypnotic*
Incyclinide Incyplemib	*Treatment of rosacea and acute respiratory stress*
Insopasem Manganese Sopasemim Manganese	*Treatment of pain and inflammation (superoxide dismutase mimetic)*
Iratumumab Tiratumumab	*Treatment of relapsed or refractory CD30 positive lymphona*
Lidetamine Dimesylate Lisdexamfetamine	*Treatment of ADHD*
Misotaxel Simotaxel	*Treatment of NSCLC and metastatic breast cancer*
Motavizumab Motovizumab	*Prevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in pediatric patients at high risk*

Nomenclature

(INN) Under Consideration	Category
Obatoclax Oraptoclax Mesylate	*Treatment of cancer*
Omevatide Ovemotide	*Melanoma peptide vaccine; treatment of cancer*
Relacatib Relamostat	*Treatment of osteoporosis*
Rotigaptide Rotiregap	*Treatment of ventricular tachycardia or ventricular fibrillation*
Tepribavirin Vabavirin	*Antiviral, pro-drug of ribavirin*
Tiplactinin Tiplasinin Tiplastinin Tiplaxtinin	*Treatment of fibrinolytic impairment diseases*
Tucotuzumab Celmoleukin	*Treatment of cancers of epithelial origin*
Vicriviroc	*Antiviral; CCR5 antagonist; treatment of autoimmune conditions*

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

[*Note—This index covers Vol. 31 No. 1, pp. 1–288, Vol. 31, No. 2, pp. 289–669, Vol. 31, No. 3, pp. 671–980, Vol. 31, No. 4, pp. 981–1287, Vol. 31, No. 5, pp. 1289–1556*]

NOTICE TO THE EXECUTIVE SECRETARIAT OF INTENT TO COMMENT

Date _____

Mail to: Executive Secretariat, USP–NF
12601 Twinbrook Parkway
Rockville, MD 20852

Title(s)	With Reference to the Proposal(s) in *Pharmacopeial Forum:* Vol.	No.	Page(s)	Estimated Date of Sending Comments*

I am unable to comment at present, but please be informed of my intent to comment later, as indicated above.

Name _____
(Please type or print)

Company _____

Address _____

_____

_____

Telephone No. ( ) _____
(area code)

*NOTE—Specifying date(s) when you expect to submit comments to the Executive Secretariat will not necessarily result in a deferment of the implementation of the proposal(s) referred to.

[*Please fold before mailing.*]

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is a update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP–NF* and *Pharmacopeial Forum*

Sept.–Oct. 2005

No records shown for this month.

Table of Contents*

PHARMACOPEIAL FORUM VOL. 31 NO. 6 NOV.–DEC. 2005

* The *USP–NF* (*USP29–NF24*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

Moving?
Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

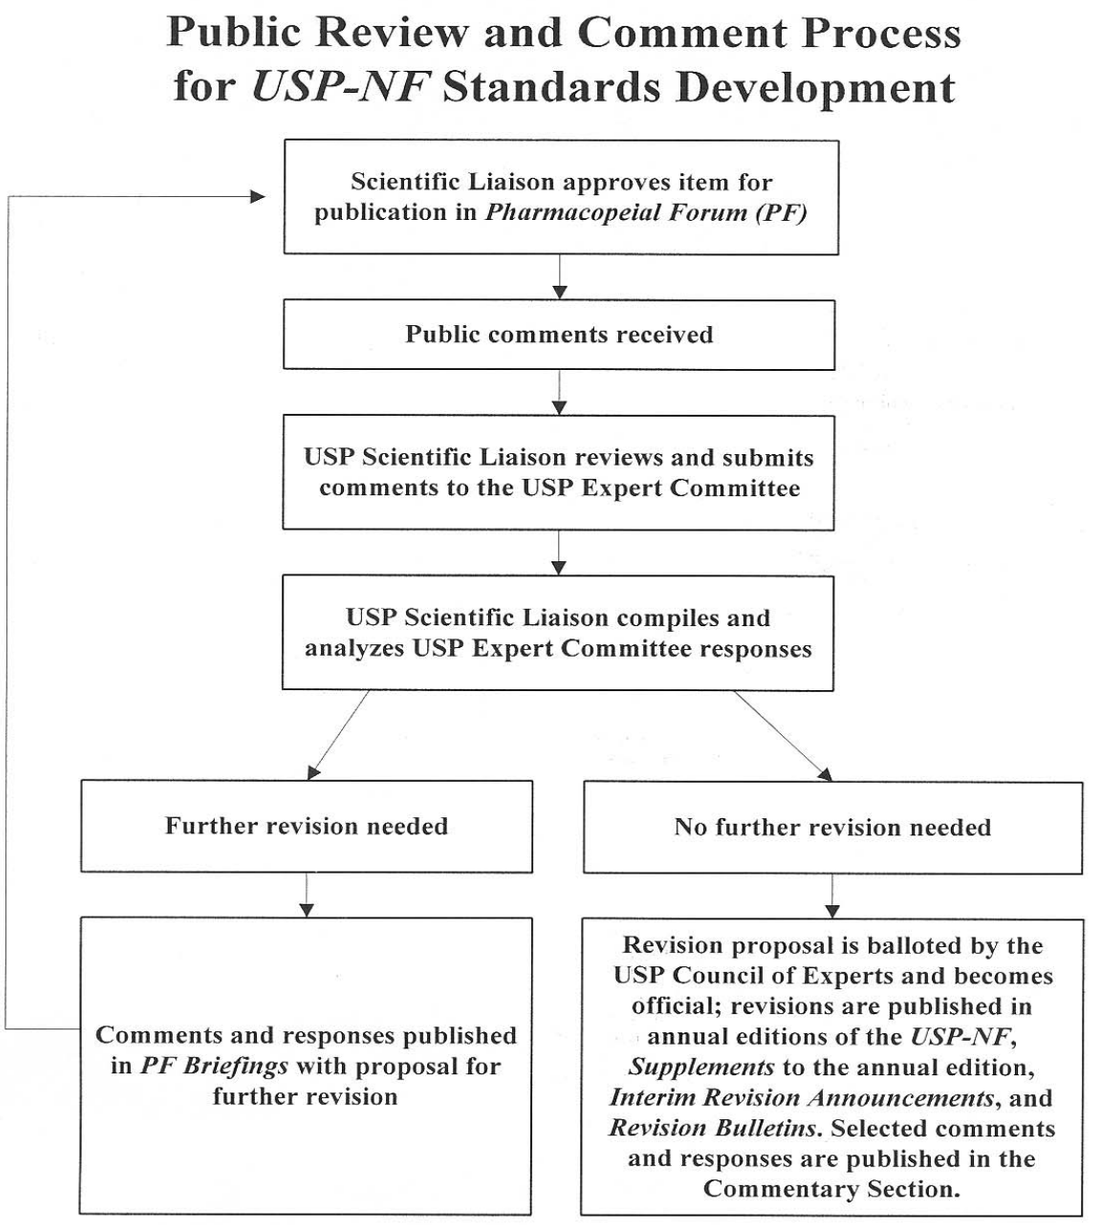
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP-NF* on the USP website (http://www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP-NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

2000—2005

AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7a—Antibiotics; 7b—Antimicrobials and Antivirals
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

2005—2010

AER	Aerosols
BB BBP	B&B Blood and Blood Products
BB CGT	B&B Cell and Gene Therapy
BB PP	B&B Proteins and Polysaccharides
BB VV	B&B Vaccines and Virology
BPC	Biopharmaceutics
CRX	Compounding Pharmacy
DS-BA	Dietary Supplements—Bioavailability
DSB	Dietary Supplements—Botanicals
DS-GC	Dietary Supplements—General Chapters
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EM1	Excipient Monographs 1
EM2	Excipient Monographs 2
EGC	Excipient General Chapters
GC	General Chapters
GTMDB	General Toxicity and Medical Device Biocompatibility
IH	International Health
MSA	Microbiology and Sterility Assurance
MD-ANT	Monograph Development—Antibiotics
MD-AA	Monograph Development—Antivirals and Antimicrobials
MD-CV	Monograph Development—Cardiovascular
MD-CCA	Monograph Development—Cough, Cold, and Analgesics
MD-GRE	Monograph Development—Gastrointestinal, Renal, and Endocrine
MD-OOD	Monograph Development—Ophthalmology, Oncology, and Dermatology
MD-PP	Monograph Development—Psychiatrics and Psychoactives
MD-PS	Monograph Development—Pulmonary and Steroids
NOM	Nomenclature
P&S	Packaging and Storage
PPI	Parenteral Products—Industrial
PDF	Pharmaceutical Dosage Forms
PW	Pharmaceutical Waters
SMU	Safe Medication Use
SCC	Sterile Compounding

2005—2010 (*Continued*)

RMI	Radiopharmaceuticals and Medical Imaging Agents
RI	Radiopharmaceutical Information
RS	Reference Standards
STAT	Statistics
VET	Veterinary Drugs
VMI	Veterinary Medicine Information

* **HDQ** Indicates USP Headquarters items.

STAFF DIRECTORY

This updated directory reflects assignment changes based on 2005–2010 Expert Committees. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Expert Committee is not identified. The fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Ph.D., Scientist	cma@usp.org	(301) 816-8139	Monograph Development—Cough, Cold, and Analgesics (MD-CCA)
Shawn C. Becker, BSN., Director, Patient Safety	scb@usp.org	(301) 816-8216	Safe Medication Use
Daniel K. Bempong, Ph.D., Scientist	dkb@usp.org	(301) 816-8143	Monograph Development—Cardiovascular (MD-CV); Pulmonary and Steroids (MD-PS)
Lokesh Bhattacharyya, Ph.D., Director, Non-Complex Actives and Excipients	lb@usp.org	(301) 816-8201	
Barbara A. Bowman, Manager, Administrative Services	bab@usp.org	(301) 816-8278	USP Correspondence

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP. This section also includes publication and comment schedules.

USP SEEKS SUBMISSION OF PROPOSALS FOR STABILITY INDICATING ASSAY PROCEDURES FOR STEROIDS. The procedures for assay for steroids in many *USP–NF* monographs are not stability indicating. In an effort to update the monographs, the Monograph Development—Pulmonary and Steroids Expert Committee is seeking submission of proposals of stability indicating assay procedures for steroids, preferably HPLC- or GC-based, for inclusion in the following *USP–NF* monographs to replace the current procedures that are not stability indicating. The submissions should include data and other information recommended in the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf. Each submission should include analytical validation data, data demonstrating that the procedure is stability indicating, and results of analysis from three commercial batches.

Please submit proposals for steroid assay procedures for the following *USP–NF* monographs to Dr. Daniel Bempong or contact him for the details at 301-816-8143 or dkb@usp.org.

Drug Substance:

Clocortolone Pivalate
Danazol
Desoxycorticosterone Acetate
Estriol
Fludrocortisone Acetate
Flumethasone Pivalate
Hydrocortisone Sodium Phosphate
Hydrocortisone Sodium Succinate
Hydroxyprogesterone Caproate
Levonorgestrel
Meprednisone
Mestranol
Methylprednisolone Sodium Succinate
Nandrolone Phenpropionate
Norethindrone
Norethindrone Acetate
Norethynodrel
Norgestrel
Oxandrolone
Oxymetholone
Paramethasone Acetate
Prednisolone Hemisuccinate
Prednisolone Sodium Phosphate
Testosterone
Testosterone Enanthate
Testosterone Propionate

Dosage Form:

Betamethasone Oral Solution
Clocortolone Pivalate Cream
Desoxycorticosterone Acetate Injection
Desoxycorticosterone Acetate Pellets
Dexamethasone Gel
Dexamethasone Sodium Inhalation Aerosol
Dexamethasone Tablets
Dexamethasone Topical Aerosol
Estradiol Injectable Suspension
Estradiol Tablets
Estrone Injection
Flumethasone Pivalate Cream
Hydrocortisone Acetate Injectable Suspension
Hydrocortisone Acetate Ophthalmic Ointment
Hydrocortisone Acetate Ophthalmic Suspension
Hydrocortisone Injectable Suspension
Hydrocortisone Sodium Phosphate Injection
Hydroxyprogesterone Caproate Injection
Methylprednisolone Acetate Cream
Methyltestosterone Capsules
Methyltestosterone Tablets
Nandrolone Phenpropionate Injection
Norethindrone Acetate Tablets
Norethindrone Acetate and Ethinyl Estradiol Tablets (assay for both steroids)
Norethindrone Tablets
Norgestrel Tablets
Oxymetholone Tablets
Paramethasone Acetate Tablets
Penicillin G Procaine, Dihydrostreptomycin Sulfate, and Prednisolone Injectable Suspension (assay for Prednisolone)
Neomycin Sulfate, Sulfacetamide Sodium, and Prednisolone Acetate Ophthalmic Ointment (assay for Prednisolone Acetate)
Prednisolone Sodium Phosphate Injection
Prednisolone Sodium Phosphate Ophthalmic Solution
Neomycin Sulfate and Prednisolone Sodium Phosphate Ophthalmic Ointment (assay for Prednisolone Sodium Phosphate)
Prednisolone Sodium Succinate for Injection
Prednisolone Cream
Progesterone Intrauterine Contraceptive System
Testosterone Enanthate Injection
Testosterone Injectable Suspension
Testosterone Propionate Injection

CALL FOR HIGH PRIORITY MONOGRAPHS FOR DRUG SUBSTANCES AND PRODUCTS AND EXCIPIENTS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below (updated as of September 1, 2005).

Monograph sponsors should consult the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf.

For further information, contact Karen Russo, Ph.D., kar@usp.org.

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine	Anagrelide Hydrochloride ***(Received)***	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bicalutamide ***(Received)***	Bivalirudin
Budesonide ***(Received)***	Cabergoline	Calcipotriene
Calcium Trisodium Pentetate	Calfactant	Candesartan Cilexetil
Carmustine	Carvedilol	Cefdinir
Cefditoren Pivoxil	Ceftibuten	Cetirizine Hydrochloride
Cetrorelix	Cevimeline	Chloroxine
Cilostazol ***(Received)***	Citalopram Hydrobromide ***(Received)***	Colfosceril
Cytarabine Liposome	Dalfopristin	Dantrolene Sodium ***(Received)***
Dapirazole Hydrochloride	Desirudin	Dexrazoxane
Didanosine ***(Received)***	Difloxacin Hydrochloride	Divalproex Sodium ***(Received)***
Docosanol	Entacapone	Epoprostenol
Erythromycin Phosphate	Erythromycin Thiocyanate	Esomeprazole Magnesium
Esmolol	Estazolam	Estramustine Phosphate Sodium
Estradiol Benzoate	Ethanolamine Oleate	Etomidate
Etoposide Phosphate	Exemestane	Felbamate
Fentanyl ***(Received)***	Fluoromethane F 18	Foscarnet Sodium
Fosfomycin Tromethamine	Gadobenate Dimeglumine	Galantamine
Gadopentetic Acid	Gallium Nitrate	Ganirelix
Glyceryl Aminobenzoate	Granisetron	Halobetasol Propionate
Haloperidol Decanoate ***(Received)***	Hydrocodone Polistirex	Hydrocortisone ***(Received)***
Ibandronate Sodium	Imipramine Pamoate	Imiquimod
Irinotecan	Isosulfan Blue	Itraconazole
Lamotrigine	Latanoprost	Lawsone
Levetriacepam	Levobetaxolol	Levocabastine Hydrochloride
Levofloxacin ***(Received)***	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Miglitol	Mifepristone	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide	Nedocromil
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium	Orbifloxacin
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pancuronium Bromide ***(Received)***
Pantoprazole Sodium	Pemoline	Pentamidine Isethionate
Piperonyl Butoxide	Pirbuterol Acetate	Poractant Alpha
Prednicarbate ***(Received)***	Proguanil	Quetiapine Fumarate
Risperidone ***(Received)***	Rose Bengal	Salmeterol Xinafoate
Sodium Phenylbutyrate	Simethicone ***(Received)***	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride	Terconazole	Tiludronate Disodium

Noncomplex Actives (Drug Substances) *(Continued)*

Tiopronin	Tranexamic Acid	Trimipramine Maleate
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate, and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Amlodipine and Benazepril Hydrochloride Capsules	Aminopterin Sodium Tablets
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution
Bivalirudin Injection	Budesonide Metered-Dose Inhalation Aerosol	Budesonide Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochlorides Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules
Butalbital and Acetaminophen Tablets	Butorphanol Tartrate Nasal Solution ***(Received)***	Calcipotriene Topical Solution Cabergoline Tablets
Calcipotriene Cream	Calcipotriene Ointment	Calcitriol Capsules
Calcitriol Oral Solution	Calcium Acetate Capsules	Calfactant Intratracheal Suspension
Calcium Trisodium Pentetate Injection	Carbidopa and Levodopa Extended-Release Tablets	Carbidopa and Levodopa Tablets for Oral Suspension
Carbidopa, Levidopa, and Entacapone Tablets	Carmustine Implant	Carmustine for Injection
Carvedilol Tablets	Cefditoren Pivoxil Tablets	Cefdinir Tablets
Ceftibuten Capsules	Ceftibuten for Oral Suspension	Cetirizine Hydrochloride Oral Solution
Ceftiofur Hydrochloride Oral Suspension	Cetrorelix Injection	Cetirizine Hydrochloride Tablets
Cevimeline Hydrochloride Capsules	Choline and Magnesium Salicylates Oral Solution	Chloroxine Cream
Chlorpromazine Hydrochloride Extended-Release Capsules	Ciclopirox Shampoo	Choline and Magnesium Salicylates Tablets
Choline Salicylate Oral Solution	Ciclopirox Topical Gel	Ciclopirox Topical Solution
Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Cilostazol Tablets	Cimetidine Oral Solution
Citalopram Hydrobromide Oral Solution	Citalopram Hydrobromide Tablets ***(Received)***	Ciprofloxacin Otic Solution
Cladribine Injection	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Clonazepam Orally Disintegrating Tablets
Clemastine Fumarate Syrup	Clobetasol Propionate Gel	Clotrimazole and Betamethasone Dipropionate Lotion

Noncomplex Actives (Drug Products) *(Continued)*

Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets	Colfosceril and Tyloxapol Suspension
Colestipol Hydrochloride Tablets	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Compound Undecylenic Acid Cream
Compound Undecylenic Acid Topical Powder	Cyclosporine Modified Oral Solution	Cromolyn Sodium Metered-Dose Nasal Solution
Cyclosporine Modified Capsules	Cysteamine Bitartrate Capsules	Cyclosporine Ointment
Cyclosporine Topical Solution	Cytarabine Liposome Injection	Dantrolene Sodium Capsules ***(Received)***
Dalfopristin and Quinupristin Injection	Dapiprazole for Ophthalmic Solution	Dantrolene Sodium for Injection ***(Received)***
Dantrolene Sodium Oral Suspension	Desirudin for Injection	Desonide ***(Received)***
Desonide Cream	Dexrazoxane for Injection	Dextroamphetamine Sulfate Extended-Release Capsules
Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable	Diclofenac Sodium Ophthalmic Solution
Didanosine Chewable Tablets ***(Received)***	Didanosine for Oral Solution ***(Received)***	Diethylpropion Hydrochloride Extended-Release Tablets
Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray
Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution
Doxacurium Chloride Injection	Doxepin Hydrochloride Cream	Doxycycline Oral Gel
Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection	Emulsion
Enalaprilat Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Entacapone Tablets	Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection
Epoprostenol Injection	Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules
Estazolam Tablets	Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection
Etomidate Injection	Etidronate Disodium Injection Concentrate	Exemestane Tablets
Famotidine Injection	Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension
Felbamate Tablets	Fentanyl Lozenges	Fentanyl Transdermal System
Ferrous Fumarate and Docusate Sodium Extended- Release Capsules	Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets
Fluconazole Injection	Flunisolide Nasal Spray	Fluconazole Tablets
Flunisolide Inhalation Aerosol	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluticasone Propionate Inhalation Powder	Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets
Gadobenate Dimeglumine Injection	Gallium Nitrate Injection	Galantamine Hydrobromide Tablets
Ganirelix Acetate Injection	Ganciclovir Capsules	Gentamicin Sulfate Oral Solution
Gatifloxacin Injection	Gatifloxacin Tablets	Glipizide Extended-Release Tablets
Gentamicin Sulfate Soluble Powder	Glimepiride Tablets	Granisetron Tablets
Granisetron Injection	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution
Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Ointment
Halobetasol Propionate Cream	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution

Noncomplex Actives (Drug Products) *(Continued)*

Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrochlorothiazide Capsules
Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets	Hydrocortisone Butyrate Lotion
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets	Hydrocortisone Acetate Rectal Foam Aerosol	Hydroquinone Lotion
Hydrocortisone Acetate Dental Paste	Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution
Ibuprofen Capsules	Ibandronate Sodium Tablets	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules
Ketoprofen Extended-Release Capsules	Ketotifen Fumarate	Ketotifen Fumarate Ophthalmic Solution
Ketoprofen Tablets	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Levetriacepam Tablets	Levobetaxolol Ophthalmic Suspension
Levocabastine Ophthalmic Suspension	Leucovorin Calcium for Injection	Levomethadyl Acetate Hydrochloride Oral Concentrate
Levofloxacin Solution	Lidocaine and Prilocaine Cream ***(Received)***	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder
Liothyronine Injection	Lisinopril And Hydrochlorothiazide Tablets	Lomustine Capsules
Lopinavir Capsules	Lopinavir Solution	Lopinavir and Ritonavir Solution
Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***	Loratadine Orally Disintegrating Tablets	Losartan Potassium Tablets
Mesalamine Suppositories	Methacholine Chloride for Inhalation Solution	Mesoridazine Besylate Concentrate
Mefloquine Hydrochloride Tablets	Methoxsalen Softgels	Methadone Hydrochloride Oral Concentrate
Melphalan for Injection	Metaraminol Bitartrate Injection	Methyclothiazide and Deserpidine Tablets
Methocarbamol and Aspirin Tablets	Metipranolol Ophthalmic Solution	Metronidazole Cream
Metronidazole Lotion	Metronidazole Extended-Release Tablets	Methylphenidate Hydochloride Chewable Tablets
Metronidazole Capsules	Midazolam Hydrochloride Injection	Metronidazole Hydrochloride for Injection
Miconazole Nitrate Topical Aerosol	Mifepristone Tablets	Miglitol Tablets
Milrinone Injection	Misoprostol Dispersion ***(Received)***	Misoprostol Tablets ***(Received)***
Mivacurium in Dextrose Injection	Mivacurium Injection	Moexipril Hydrochloride and Hydrochlorothiazide Tablets
Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution	Morphine Sulfate for Injection Concentrate
Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate	Morphine Sulfate Tablets
Mycophenolate Mofetil Tablets	Mycophenolate Mofetil Oral Solution	Mycophenolate Mofetil Capsules
Nalbuphine Hydrochloride Injection	Naproxen Extended-Release Tablets	Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	Nalmefene Hydrochloride Injection	Nateglinide Tablets
Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder	Nevirapine Oral Suspension
Nevirapine Tablets ***(Received)***	Nicardipine Hydrochloride Capsules	Nilutamide Tablets
Nimodipine Capsules	Nisoldipine Extended-Release Tablets	Nitroglycerin Solution in Acrylic Adhesive
Nizatidine Tablets	Ofloxacin Injection	Ofloxacin in Dextrose Injection
Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution	Olsalazine Sodium Capsules
Ondansetron Oral Solution	Ondansetron Tablets	Orbifloxacin Tablets
Orlistat Capsules ***(Received)***	Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Orphenadrine Citrate Extended-Release Tablets
Oxcarbazepine Suspension	Oxcarbazepine Tablets	Oxiconazole Cream

Noncomplex Actives (Drug Products) *(Continued)*

Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium Tablets	Pantoprazole Sodium for Injection
Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension	Pemirolast Potassium Ophthalmic Solution
Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution	Pentaerythritol Tetranitrate Extended-Release Capsules
Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation	Pentamidine Isethionate for Injection
Pentazocine Hydrochloride and Acetaminophen Tablets	Permethrin Cream	Phendimetrazine Tartrate Extended-Release Capsules
Phenobarbital Capsules	Phentermine Resin Complex	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Phentermine Resin Complex Capsules	Phosphate Oral Solution
Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment	Pilocarpine Hydrochloride Tablets
Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol	Povacrylate Solution
Poractant Alpha Supension	Porfimer Sodium for Injection	Povacrylate-Iodine Topical Solution
Povidone-Iodine Gauze	Povidone-Iodine Swabsticks	Povidone-Iodine Topical Aerosol Foam
Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets	Prazosin Hydrochloride and Polythiazide Capsules
Prednicarbate Cream ***(Received)***	Prednicarbate Ointment ***(Received)***	Prednisolone Sodium Phosphate Oral Solution
Prochlorperazine Maleate Extended-Release Capsules	Progesterone Capsules	Promethazine Hydrochloride and Codeine
Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup
Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pyrilamine Maleate Injection
Quinidine Sulfate Injection	Ramipril Capsules	Ranitidine Capsules
Rauwolfia Serpentina and Endroflumethiazide Tablets	Reserpine and Polythiazide Tablets	Rimantadine Hydrochloride Oral Solution
Risperidone Oral Solution	Risperidone Orally Disintegrating Tablets	Risperidone Tablets
Rivastigmine Tartrate Capsules	Rivastigmine Tartrate Oral Solution	Rocuronium Bromide Injection
Ropinirole Hydrochloride Tablets	Rose Bengal Ophthalmic Solution	Rosiglitazone Maleate Tablets
Salicylic Acid and Sulfur Cleansing Lotion	Salicylic Acid and Sulfur Lotion	Salicylic Acid and Sulfur Shampoo
Salicylic Acid Cream	Salicylic Acid Ointment	Salmeterol Inhalation Aerosol
Salmeterol Xinafoate Inhalation Powder	Scopolamine Transdermal System	Selegiline Hydrochloride Capsules
Serpacwa Topical Cream	Sertraline Hydrochloride Oral Solution	Sibutramine Hydrochloride Capsules
Sodium Bicarbonate and Sodium Citrate for Oral Solution	Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	Sodium Chlorophyllin Copper Complex Tablets
Sodium Iodide Injection	Sodium Phenylbutyrate Oral Powder	Sodium Phenylbutyrate Tablets
Sodium Phosphates for Oral Suspension	Sodium Phosphates Tablets	Sodium Salicylate and Sulfur Shampoo
Sterile Talc Aerosol	Streptozocin for Injection	Sucralfate Oral Suspension
Sulconazole Nitrate Cream	Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension

Noncomplex Actives (Drug Products) *(Continued)*

Sulfacytine Tablets	Sulfanilamide Vaginal Cream	Sulfasalazine Oral Suspension
Sumatriptan Tablets	Sulisobenzone Lotion	Sumatriptan Injection
Tacrolimus Capsules	Tacrolimus Ointment	Tacrolimus Injection
Tamsulosin Hydrochloride Capsules	Technetium Tc 99M Teboroxime Injection	Tenofovir Disoproxil Fumarate Tablets
Terbinafine Hydrochloride Cream	Terbinafine Tablets	Terbinafine Topical Solution
Terconazole Vaginal Cream	Terconazole Vaginal Suppositories	Testosterone Transdermal System
Tetracycline Hydrochloride Periodontal Fiber	Theophylline Extended-Release Tablets	Tioconazole Vaginal Ointment
Tiopronin Tablets	Tolnaftate Topical Aerosol Solution	Topiramate Capsules
Topiramate Tablets	Torsemide Injection	Torsemide Tablets
Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	Trandolapril Tablets	Tranexamic Acid Injection
Tranylcypromine Sulfate	Tranylcypromine Sulfate Tablets	Tretinoin Capsules
Tretinoin Microsphere Gel	Triamcinolone Acetonide Metered-Dose Nasal Suspension	Trifluridine Ophthalmic Solution
Trimetrexate for Injection	Trimipramine Maleate Capsules	Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup
Trolamine Salicylate Cream	Trolamine Salicylate Gel	Trolamine Salicylate Topical Emulsion
Trovafloxacin Injection	Trovafloxacin Mesylate for Injection	Undecylenic Acid Topical Foam Aerosol
Unoprostone Isopropyl Ophthalmic Solution	Urea Cream	Valproic Acid Injection ***(Received)***
Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules	Venlafaxine Tablets
Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection
Voriconazole Oral Suspension	Voriconazole Tablets	Yttrium Y-90 Chloride Solution
Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection	Ziprasidone Hydrochloride Capsules
Zidovudine and Lamivudine Tablets	Zinc Acetate Capsules	Zoledronic Acid for Injection
Zinc Tridosium Pentetate Injection		

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	*N*-Acetyl-L- Methionine
Aconitic Acid (Achilleic Acid)	Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal
Aliphatic Polyesters	Aluminum Ammonium Sulfate	Aluminum Hydroxide
Aluminum Lactate	Aluminum Oxide	Aluminum Ammonium Sulfate
Aluminum Potassium Sulfate	Aluminum Silicate	Aluminum Sodium Sulfate
Aluminum Stearate	Allantoin-Sodium Pyrrolidone Carboxylate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	L-Ascorbyl Stearate
L-Asparagine	Batylalcohol Monostearate	Beeswax, Synthetic
Benzododecinium Bromide	Benzyl Chloride	Benzyl Nicotinate
Brominated Vegetable Oil	Butadiene- Styrene Rubber	Beta Naphthol
Butylene Glycol	Butylphthalyl Butylglycolate	Butylated Hydromethylphenol
Calcium Alginate	Calcium Alginate and Ammonium Alginate	Calcium Acid Pyrophosphate
Calcium Chloride Solution	Calcium Glycerophosphate	Calcium Bromide
Calcium Phosphate Dibasic, Monohydrate	Calcium Phosphate Monobasic	Calcium Phosphate Dibasic, Anhydrous
Calcium Pyrophosphate	Calcium Sorbate	Calcium Propionate
Calcium Sulfate Dihydrate	Calcium Sulfate, Anhydrous	Calcium Stearoyl Lactylate
Calteridol Calcium	Canola Oil	Caldiamide Sodium
Caprylic/Capric Diglyceril Succinate	Carbon	Capric Acid
Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium	Carboxymethyl Starch
Cetostearyl Isononanoate	Cholic Acid	Cinnamaldehyde
Chlorodifluoroethane	Cocamide Diethanolamine	Cocamide Oxide

Excipients *(Continued)*

Coconut Oil Hydrogenated	Cocoyl Caprylocaprate	Coconut Oil
Crystal Gum	Cutina	Copper Sulfate
L-Cysteine Monohydrochloride	Dammar Gum	Cystine
Decanoic Acid	Decyl Oleate	Dehydroacetic Acid
Desoxycholic Acid	Dextrin Palmitate	Dextrins Modified
Diacetyl Tartaric Acid Esters of Mono- and Diglycerides	Dicetyl Phosphate	Dichlorofluoromethane
Diethylene Glycol Monopalmitostearate	Diethyl Sebacate	Difluoroethane
Diglycol Stearate	Diisopropanolamine ***(Received)***	Diisobutyl Adipate
Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate
Dimethyl Dicarbonate	Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol
Dioctyl Sodium Sulfosuccinate	Dipropylene Glycol	Disodium Edisylate
Disodium Guanylate	Disodium Inosinate	Disodium Monooleamide Sulfasuccinate
Docusate Sodium/Sodium Benzoate	Erythritol ***(Received)***	Erythorbic Acid
Erythrosine	Ethoxylated Mono- and Diglycerides	Ethoxyquin
Ethyl Hexanediol	Ethyl Linoleate	Ethyl Maltol
Ethylene Dichloride	Ethylene Glycol Monopalmitostearate	Ethylurea
Ferric Ammonium Citrate	Ferric Citrate	Ferric Oxide, Brown
Ferric Phosphate	Ferric Pyrophosphate	Ferrous Citrate
Ferrous Glycinate	Ferrous Lactate	Fluorochlorohydrocarbons
Formic Acid	Furcelleran	Gamma-Cyclodextrin
Gentistic Acid	Geraniol	L-Glutamic Acid
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydrogenated Starch Hydrolysate	Hydroxyethylmethylcellulose
Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin	Indigotine
Inositol	Iron Carbonyl	Iron Subcarbonate
Isobutylated-Isoprene Copolymer	Isooctylacrylate	Isopropyl Isostearate
Isopropyl Stearate	Isostearic Acid	Isostearyl Alcohol
Lactobionic Acid	Lactose Ferrin, Bovine	Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol
Lactylic Esters of Fatty Acids	Lanolin Anhydrous	Lanolin Alcohols, Acetylated
Lanolin (Wool Fat), Hydrogenated	Lanolin Hydrous	Lauramine Oxide
Lauric Acid	Lauric Diethanolamide	Lauric Myristic Diethanolamide
Lavender Oil	Lecithin, Hydroxylated	L-Leucine
Linoleic Acid	Macrogol Lauryl Ether	Macrogol Oleate
Macrogol Sorbitan Tristearate	Macrogol Stearyl Ether	Macrogolglycerol Cocoates
Macrogolglycerol Triisostearate	Magnesium Aluminum Silicate Hydrate	Magnesium Aspartate
Magnesium Aspartame Dihydrate	Magnesium Phosphate, Dibasic, Trihydrate	Magnesium Phosphate Tribasic
Magnesium Tartrate	Maltitol ***(Received)***	Maltitol Syrup
Maltol Isobutyrate	Malt Syrup	Manganese Chloride
Manganese Citrate	Manganese Glycerophosphate	Manganese Hypophosphite
D-Mannose	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methyl Hydroxyethyl Cellulose	Methylisothiazolinone	*N*-Methylpyrrolidone ***(Received)***
Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits	Monoisostearyl Glyceryl Ester
Monopotassium Glutamate Monohydrate	Monosodium Citrate	Mullein Leaf
Myristyl Gamma-Picolinium Chloride	Myristyl Lactate	*N*,*N*-Bis(2-Hydroxyethyl)Stearamide
Naphtha	Non-Pareil Seeds	Nutmeg Oil

Excipients *(Continued)*		
Octanoic Acid	Oleyl Oleate ***(Received)***	Oxystearin
Palm Kernel Oil	Palm Oil	Pentasodium Triphosphate
Pentetate Calcium Trisodium	Pentetate Pentasodium	Phenprobamate
Phenylmercuric Borate	Pine Oil	Polacrilin
Polyacrylate Dispersion 30 Percent ***(Received)***	Polydextrose	Polydextrose Solution
Polyglycerol Esters of Fatty Acids	Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil (USP has 35)
Polyoxyl Stearate (USP has 40)	Polypropylene Oleate	Polyvinyl Acetate
Polyvinylacetal	Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone
Polypropylene Stearyl Ether	Polyvinylpyrrolidone Ethylcellulose	Polysorbate 65
Potassium Acid Tartrate	Potassium Alginate ***(Received)***	Potassium Bromate
Potassium Carbonate Solution	Potassium Dichloroisocyanurate	Potassium Gibberellate
Potassium Glycerophospate	Potasssium Iodate	Potassium Nitrite
Potassium Phosphate	Potassium Phosphate Tribasic	Potassium Polymetaphosphate
Potassium Pyrophosphate	Potassium Stearate	Potassium Sulfate
Potassium Sulfite	Potassium Tripolyphosphate	Propylene Glycol Diacetate
Propylene Glycol Mono- and Diesters	Propylene Glycol Monolaurate ***(Received)***	Propyl Propionate
Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil, Hydrogenated	Rapeseed Oil, Superglycerinated
Rice Bran Wax	Rosin	Silicone
Sodium Acid Pyrophosphate	Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic
Sodium Aluminum Phosphate Basic	Sodium Aspartate	Sodium Bisulfate
Sodium Bisulfite	Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan
Sodium Caseinate	Sodium Chlorate	Sodium Citrate, Dibasic
Sodium Citrate, Monobasic	Sodium Cyclamate	Sodium Dehydroacetate
Sodium Diacetate	Sodium Erythorbate	Sodium Ferric Pyrophosphate
Sodium Ferrocyanide	Sodium Hypophosphite	Sodium Laureth Sulfate
Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate
Sodium Magnesium Silicate	Sodium Malate	Sodium Metaphosphate, Insoluble
Sodium Metasilicate	Sodium Methylate	Sodium Polyphosphates Glassy
Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate
Sodium Sesquicarbonate	Sodium Sesquinoleate	Sodium Stearoyl Lactylate
Sodium Thiomalate	Sodium Trimetaphosphate	Sodium Trioleate
Sodium Tripolyphosphate	Soy Polysaccharides	Stannous Chloride
Stannous Tartrate	Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca
Stearalkonium Chloride	Stearyl Citrate	Stearyl Monoglyceridyl Citrate
Succinylated Monoglycerides	Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters
Sucrose Stearate	Sucrose Syrup	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tallow	Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetеareth-4 Phosphate
Trichloroethylene	Trimyristin	Trisidium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Gluten	Wheat Germ Oil	Whey

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2005 and 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

2005-2006 Calendar of Pharmacopeial Education Courses

Date	Name of Course	Location
2-Nov-05	Fundamentals of Dissolution—Lecture	USP Headquarters
3-Nov-05	Fundamentals of Dissolution—Laboratory	USP Headquarters
4-Nov-05	Fundamentals of Microbiological Testing	California State University—Fullerton
15-Nov-05	Basic Statistics and their Practical Applications to the *USP–NF*	North Carolina State University—Raleigh
7-Dec-05	Effectively Using the *USP–NF*—Session I	Brussels, Belgium
8-Dec-05	Effectively Using the *USP–NF*—Session II	Brussels, Belgium
14-Feb-06	Fundamentals of Dissolution—Lecture	USP Headquarters
15-Feb-06	Fundamentals of Dissolution—Laboratory	USP Headquarters
23-Feb-06	Effectively Using the *USP–NF*—Session I and Session II (one day)	North Carolina State University—Raleigh

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines. In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment. For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-816-8373.

Publication and Comment Schedule for *USP 29–NF 24*

Pharmacopeial Forum	Targeted Official Publication	Comment Deadline
PF 31(1) and *PF* 31(2)	*USP 29–NF 24*	May 15, 2005
PF 31(3)	*USP 29–NF 24 1st Supplement*	August 15, 2005
PF 31(4) and *PF* 31(5)	*USP 29–NF 24 2nd Supplement*	December 16, 2005
PF 31(6) and *PF* 32(1)	*USP 30–NF 25*	To be announced
PF 32(2) and *PF* 32(3)	*USP 30–NF 25 1st Supplement*	To be announced
PF 32(4) and *PF* 32(5)	*USP 30–NF 25 2nd Supplement*	To be announced
PF 32(6) and *PF* 33(1)	*USP 31–NF 26*	To be announced

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.*

Publication Schedules

Publication	Publication Date	Official Date
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005	Dec. 1, 2005
PF 32(1) [Jan.–Feb. 2006]	Jan. 2006*	Not Applicable
1st IRA [published in *PF* 32(1)]	Jan. 2006*	Feb. 1, 2006*
1st Supplement	Feb. 2006*	Apr. 1, 2006*
PF 32(2) [Mar.–Apr. 2006]	Mar. 2006*	Not Applicable
2nd IRA [published in *PF* 32(2)]	Mar. 2006*	Apr. 1, 2006*
PF 32(3) [May–June 2006]	May 2006*	Not Applicable
3rd IRA [published in *PF* 32(3)]	May 2006*	June 1, 2006*
2nd Supplement	June 2006*	Aug. 1, 2006*
PF 32(4) [July–Aug. 2006]	July 2006*	Not Applicable
4th IRA [published in *PF* 32(4)]	July 2006*	Aug. 1, 2006*
PF 32(5) [Sept.–Oct. 2006]	Sept. 2006*	Not Applicable
5th IRA [published in *PF* 32(5)]	Sept. 2006*	Oct. 1, 2006*
PF 32(6) [Nov.–Dec. 2006]	Nov. 2006*	Not Applicable
6th IRA [published in *PF* 32(6)]	Nov. 2006*	Dec. 1, 2006*

*Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP28*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 28*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

SIXTH INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Eric B. Sheinin, Ph.D., *Chief Science Officer*

Official December 1, 2005 **Released November 1, 2005**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Ademetione Disulfate Tosylate RS (January 1, 2006)
USP Agnuside RS (November 1, 2005)
USP Asparagine Anhydrous RS (November 1, 2005)
USP Asparagine Monohydrate RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound A RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound B RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound C RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound F RS (January 1, 2006)
USP Casticin RS (November 1, 2005)
USP Ciclopirox RS (January 1, 2006)
USP Ciclopirox Related Compound A RS (January 1, 2006)
USP Ciclopirox Related Compound B RS (January 1, 2006)
USP Clopidogrel Bisulfate RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound A RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound B RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound C RS (March 1, 2006)
USP 2-Deoxy-D-glucose RS (November 1, 2005)
USP Desoaminylazithromycin RS (January 1, 2006)
USP Diethanolamine RS (November 1, 2005)
USP Eleutheroside B RS (January 1, 2006)
USP Eleutheroside E RS (January 1, 2006)
USP Fluvoxamine Maleate RS (November 1, 2005)
USP L-Fucose RS (November 1, 2005)
USP Galactitol RS (January 1, 2006)
USP Hydrastine RS (May 1, 2006)
USP Insulin Lispro RS (March 1, 2006)
USP Maltose Monohydrate RS (January 1, 2006)
USP Mefloquine Hydrochloride RS (May 1, 2006)
USP Mefloquine Related Compound A RS (May 1, 2006)
USP Monoethanolamine RS (November 1, 2005)
USP Norphenylephrine Hydrochloride RS (May 1, 2006)
USP Oleic Acid RS (November 1, 2005)
USP Phenylethyl Alcohol RS (November 1, 2005)
USP Polyoxyl 20 Cetostearyl Ether RS (March 1, 2006)
USP Polyoxyl 20 Stearyl Ether RS (March 1, 2006)
USP Prilocaine RS (January 1, 2006)
USP Prilocaine Related Compound A RS (January 1, 2006)
USP Propofol RS (January 1, 2006)
USP Propofol Related Compound A RS (January 1, 2006)
USP Propofol Related Compound B RS (January 1, 2006)
USP Propofol Related Compound C RS (January 1, 2006)
USP Propofol Resolution Mixture C RS (January 1, 2006)
USP Ramipril Related Compound D RS (November 1, 2005)
USP Residual Solvent Class 2—Hexane RS (November 1, 2005)
USP Residual Solvents Class 2—Mixture B RS (January 1, 2006)
USP Sodium Benzoate RS (January 1, 2006)
USP Stavudine RS (January 1, 2006)
USP Stavudine System Suitability Mixture RS (January 1, 2006)
USP Sulfaquinoxaline Related Compound A RS (January 1, 2006)
USP Sumatriptan Succinate Related Impurities RS (November 1, 2005)
USP Tiagabine Related Compound A RS (May 1, 2006)
USP Racemic Tiagabine Hydrochloride Mixture RS (May 1, 2006)
USP Tiagabine Hydrochloride RS (May 1, 2006)
USP Tagatose RS (January 1, 2006)
USP Thymol RS (November 1, 2005)
USP Tilmicosin RS (November 1, 2005)
USP Trenbolone CIII RS (November 1, 2005)
USP Trenbolone Acetate CIII RS (November 1, 2005)
USP Trolamine RS (November 1, 2005)

Unavailable First-Time Official Reference Standards

The official dates of any *USP 28* or *NF 23* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of September 1, 2005.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Berberine Chloride RS
USP Budesonide RS
USP Cetrimonium Bromide RS
USP Copolymer Polypropylene RS
USP Cytosine RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Escin RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Fluticasone Propionate RS
USP Fluticasone Propionate Resolution Mixture RS
USP Fluticasone Propionate System Suitability Mixture RS
USP Fluvastatin Sodium RS
USP Fluvastatin Related Compound A RS
USP Fluvastatin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Distearate RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Hexacosanol RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Lamivudine Resolution Mixture B RS
USP Alpha Lipoic Acid RS
USP Mecamylamine Related Compound A RS
USP Menotropins RS
USP Methyldopa-glucose Reaction Product RS
USP Miboleron RS
USP Narasin RS
USP Naratriptan Resolution Mixture RS
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Ondansetron RS
USP Paricalcitol Solution RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS

USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Maritime Pine Extract RS
USP Polyisobutylene RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Propofol for System Suitability RS
USP Pygeum Extract RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Ramipril Related Compound B RS
USP Ropivacaine Hydrochloride RS
USP Ropivacaine Related Compound A RS
USP Ropivacaine Related Compound B RS
USP Powdered St John's Wort Extract RS
USP Sargramostim RS
USP Sincalide RS
USP Sulisobenzone RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Tinidazole Related Compound B RS
USP Powdered Valerian RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

NOTICE OF OFFICIAL STATUS

Assay under _Vinorelbine Injection_ (_First Supplement_ to _USP 28–NF 23,_ page 3281 and the _Fifth Interim Revision Announcement_ to _USP 28–NF 23_ on page 1326 of _PF_ 31(5) [Sept.–Oct. 2005]).

USP is making the *Assay* test in the *Vinorelbine Injection* monograph official, thus removing the recent retroactive postponement of this test published in the *5th IRA.* This NOTICE OF OFFICIAL STATUS applies as of November 1, 2005.

The retroactive postponement was applied to allow USP to develop a lot of USP Vinorelbine Tartrate Reference Standard (RS) that is suitable for all official USP compendial applications. A new lot of USP Vinorelbine Tartrate RS has been developed, is suitable for both quantitative and qualitative testing purposes required by the *Vinorelbine Injection* monograph, and is currently available.

This notification is consistent with the *General Notices* section of *USP 28–NF 23* relating to USP Reference Standards, which states the following:

> The requirements for any new *USP* or *NF* standards, tests, or assays for which a new USP Reference Standard is specified are not in effect until the specified USP Reference Standard is available. The availability of new USP Reference Standards and the official dates of the *USP* or *NF* standards, tests, or assays requiring their use are announced via *Supplements* or *Interim Revision Announcements.*

If you have any questions or concerns, please contact Lawrence Evans III, Ph.D., Scientist, DSD and Scientific Liaison to the Monograph Development: Ophthalmology, Oncology, and Dermatology Expert Committee (formerly Pharmaceutical Analysis 6 Expert Committee) (301-816-8389 or le@usp.org).

Interim Revision Announcement

Vinorelbine Injection

Change to read:

•**Assay**—

Phosphate buffer, Mobile phase, and *System suitability solution*—Proceed as directed in the test for *Related compounds* under *Vinorelbine Tartrate*.

Standard preparation—Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in water to obtain a solution having a known concentration of about 0.10 mg of vinorelbine (base) per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of vinorelbine, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a diode-array detector and a 3.9-mm × 15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and about 1.2 for vinorelbine related compound A; and the relative retention, α, between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine peaks, using a diode-array detector. Calculate the quantity, in mg, of vinorelbine ($C_{45}H_{54}N_4O_8$) in each mL of the Injection taken by the formula:

$$C(L/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Vinorelbine Tartrate RS in the *Standard preparation; L* is the labeled quantity, in mg, of vinorelbine in each mL of Injection taken; D is the concentration, in mg per mL, of vinorelbine in the *Assay preparation;* and r_U and r_S are the peak responses at 267 nm obtained from the *Assay preparation* and the *Standard preparation,* respectively.•6

NOTICE OF POSTPONEMENT

⟨905⟩ *Uniformity of Dosage Units*

USP has **postponed the official date from April 1, 2006, until January 1, 2007,** for the revised, harmonized general chapter *Uniformity of Dosage Units* ⟨905⟩ that was published on pages 2505–2510 of *USP 28–NF 23.* The postponement is intended to provide additional time for the Pharmacopeial Discussion Group to evaluate comments received concerning this revision.

Comments were received regarding that portion of the unofficial, harmonized general chapter text that provides for the use of the *Weight Variation* test in place of the *Content Uniformity* test in cases where "the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%, based on process validation data and development data." The comments indicated that dosage unit uniformity should be independent of process validation data and product development data because these data may not always be available to regulatory agencies. The comments indicated further that the proposed wording would therefore require regulatory agencies and others that conduct dosage unit uniformity testing to obtain data from the sponsoring firm to determine whether to use a weight variation test or a content uniformity test in certain cases. Therefore, the proposed wording creates a private standard, because an analyst would need information outside that provided in the *USP–NF* to conduct the compendial test. The proposed standard would allow for different standards based on proprietary data held only by the drug sponsor.

Should you have any questions, please contact W. Larry Paul, Ph.D., Scientific Fellow, General Policies and Requirements Division (301-816-8331 or wlp@usp.org).

Change to read:

⟨905⟩ UNIFORMITY OF DOSAGE UNITS

[NOTE—In this chapter, *unit* and *dosage unit* are synonymous.]

To ensure the consistency of dosage units, each unit in a batch should have a drug substance content within a narrow range around the label claim. Dosage units are defined as dosage forms containing a single dose or a part of a dose of drug substance in each unit.

The term "uniformity of dosage unit" is defined as the degree of uniformity in the amount of the drug substance among dosage units. Therefore, the requirements of this chapter apply to each drug substance being comprised in dosage units containing one or more drug substances, unless otherwise specified in the individual monograph.

The uniformity of dosage units can be demonstrated by either of two methods, *Content Uniformity* or *Weight Variation* (see *Table 1*). The test for *Content Uniformity* is based on the assay of the individual content of drug substance(s) in a number of individual dosage units to determine whether the individual content is within the limits set. The *Content Uniformity* method may be applied in all cases. The test for *Content Uniformity* is required for those dosage forms described in *(C1)–(C6)* below:

NOTICE OF POSTPONEMENT (*continued*)

Table 1. Application of Content Uniformity (CU) and Weight Variation (WV) Tests for Dosage Forms

Dosage Form	Type	Subtype	Dose & Ratio of Drug Substance	
			≥25 mg & ≥25%	<25 mg or <25%
Tablets	Uncoated		WV	CU
	Coated	Film	WV	CU
		Others	CU	CU
Capsules	Hard		WV	CU
	Soft	Suspension, emulsion, or gel	CU	CU
		Solutions	WV	WV
Solids in single-unit containers	Single component		WV	WV
	Multiple components	Solution freeze-dried in final container	WV	WV
		Others	CU	CU
Suspension, emulsion, or gel for systemic use only, packaged in single-unit containers			CU	CU
Solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers, and oral solutions packaged in unit-dose containers and into soft capsules			WV	WV
Inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units			CU	CU
Transdermal systems			CU	CU
Suppositories			CU	CU
Others			CU	CU

(C1) coated tablets, other than film-coated tablets containing 25 mg or more of a drug substance that comprises 25% or more (by weight) of one tablet;
(C2) transdermal systems;
(C3) suspensions or emulsions or gels in unit-dose containers or in soft capsules that are intended for systemic administration only (not for those drug products that are intended for external, cutaneous administration);
(C4) inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units. For inhalers and premetered dosage units labeled for use with a named inhalation device, also see *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩;
(C5) solids (including sterile solids) that are packaged in single-unit containers and that contain active or inactive added substances, except that the test for *Weight Variation* may be applied in the special situations stated in *(W2)* and *(W3)* below; and
(C6) suppositories.

The test for *Weight Variation* is applicable for the following dosage forms:

(W1) solutions for inhalation that are packaged in glass or plastic ampuls and intended for use in nebulizers, and oral solutions packaged in unit-dose containers and into soft capsules;
(W2) solids (including sterile solids) that are packaged in single-unit containers and contain no added substances, whether active or inactive;
(W3) solids (including sterile solids) that are packaged in single-unit containers, with or without added substances, whether active or inactive, that have been prepared from true solutions and freeze-dried in the final containers and are labeled to indicate this method of preparation; and
(W4) hard capsules, uncoated tablets, or film-coated tablets, containing 25 mg or more of a drug substance comprising 25% or more, by weight, of the dosage unit or, in the case of hard capsules, the capsule contents, except that uniformity of other drug substances present in lesser proportions is demonstrated by meeting *Content Uniformity* requirements.

Interim Revision Announcement

NOTICE OF POSTPONEMENT (*continued*)

The test for *Content Uniformity* is required for all dosage forms not meeting the above conditions for the *Weight Variation* test. Alternatively, products listed in item (W4) above that do not meet the 25 mg/25% threshold limit may be tested for uniformity of dosage units by *Weight Variation* instead of the *Content Uniformity* test if the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%, based on process validation data and development data. The concentration RSD is the RSD of the concentration per dosage unit (w/w or w/v), where concentration per dosage unit equals the assay result per dosage unit divided by the individual dosage unit weight. See the RSD formula in *Table 2*.

Table 2

Variable	Definition	Conditions	Value
$\overline{X}$	Mean of individual contents ($\chi_1, \chi_2, \ldots, \chi_n$), expressed as a percentage of the label claim		
$\chi_1, \chi_2, \ldots, \chi_n$	Individual contents of the units tested, expressed as a percentage of the label claim		
n	Sample size (number of units in a sample)		
k	Acceptability constant	If $n = 10$, then $k =$	2.4
		If $n = 30$, then $k =$	2.0
s	Sample standard deviation		$\left[\frac{\sum_{i=1}^{n}\left(\chi_i - \overline{X}\right)^2}{n-1}\right]^{\frac{1}{2}}$
RSD	Relative standard deviation (the sample standard deviation expressed as a percentage of the mean)		$\frac{100s}{\overline{X}}$
M (case 1) to be applied when $T \leq 101.5$	Reference value	If $98.5\% \leq \overline{X} \leq 101.5\%$, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X} < 98.5\%$, then	$M = 98.5\%$ $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X} > 101.5\%$, then	$M = 101.5\%$ $(AV = \overline{X} - 101.5 + ks)$
M (case 2) to be applied when $T > 101.5$	Reference value	If $98.5 \leq \overline{X} \leq T$, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X} < 98.5\%$, then	$M = 98.5\%$ $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X} > T$, then	$M = T\%$ $(AV = \overline{X} - T + ks)$
Acceptance value *(AV)*			general formula: $\left\lvert M - \overline{X} \right\rvert + ks$ (Calculations are specified above for the different cases.)
L1	Maximum allowed acceptance value		*L1* = 15.0 unless otherwise specified in the individual monograph/tbody>

NOTICE OF POSTPONEMENT (*continued*)

Table 2 *(Continued)*

Variable	Definition	Conditions	Value
L2	Maximum allowed range for deviation of each dosage unit tested from the calculated value of *M*	On the low side, no dosage unit result can be less than $(1 - L2*0.01)M$, while on the high side no dosage unit result can be greater than $(1 + L2*0.01)M$. (This is based on an *L2* value of 25.0.)	*L2* = 25.0 unless otherwise specified in the individual monograph
T	Target test sample amount at time of manufacture. For purposes of this Pharmacopeia, unless otherwise specified in the individual monograph, *T* is 100.0%, and for manufacturing purposes, *T* is the manufacturer's approved target test amount value at the time of manufacture.		

CONTENT UNIFORMITY

Select not less than 30 units, and proceed as follows for the dosage form designated. Where the amount of drug substance in a single dosage unit differs from that required in the *Assay,* adjust the degree of dilution of the solutions and/or the volume of aliquots so that the concentration of the drug substances in the final solution is of the same order as that obtained in the *Assay* procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see *Titrimetry* ⟨541⟩); see also *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. If any such modifications are made in the *Assay* procedure set forth in the individual monograph, make the appropriate corresponding changes in the calculation formula and titration factor.

Where a special *Procedure for content uniformity* is specified in the test for *Uniformity of dosage units* in the individual monograph, make any necessary correction of the results obtained as follows.

(1) Prepare a composite specimen of a sufficient number of dosage units to provide the amount of specimen called for in the *Assay* in the individual monograph plus the amount required for the special *Procedure for content uniformity* in the monograph by finely powdering tablets or mixing the contents of capsules or oral solutions, suspensions, emulsions, gels, or solids in single-unit containers to obtain a homogeneous mixture. If a homogeneous mixture cannot be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the drug substance, and use appropriate aliquot portions of this solution for the specified procedures.

(2) Assay separate, accurately measured portions of the composite specimen of capsules or tablets or suspensions or inhalations or solids in single-unit containers, both (a) as directed in the *Assay,* and (b) using the special *Procedure for content uniformity* in the monograph.

(3) Calculate the weight of drug substance equivalent to 1 average dosage unit, by (a) using the results obtained by the *Assay* procedure, and by (b) using the results obtained by the special procedure.

(4) Calculate the correction factor, *F,* by the formula:

$$F = W/P,$$

in which *W* is the weight of drug substance equivalent to 1 average dosage unit obtained by the *Assay* procedure, and *P* is the weight of drug substance equivalent to 1 average dosage unit obtained by the special procedure. If

$$\frac{100|W - P|}{W}$$

is greater than 10, the use of a correction factor is not valid.

(5) The correction factor is to be applied only if *F* is not less than 1.030 nor greater than 1.100, or not less than 0.900 nor greater than 0.970. If *F* is between 0.970 and 1.030, no correction is required.

(6) If *F* lies between 1.030 and 1.100, or between 0.900 and 0.970, calculate the weight of drug substance in each dosage unit by multiplying each of the weights found using the special procedure by *F.*

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers, and Solids (including Sterile Solids) in Single-Unit Containers—Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity* in the individual monograph. Calculate the acceptance value as directed below.

For oral solutions, oral suspensions, oral emulsions, or oral gels in single-unit containers, conduct the *Assay* on the amount of well-mixed material that drains from an individual container in not more than 5 seconds, or for highly viscous products, conduct the *Assay* on the amount of well-mixed material that is obtained by quantitatively removing the contents from an individual container, and express the results as the delivered dose.

Interim Revision Announcement

NOTICE OF POSTPONEMENT (*continued*)

Calculation of Acceptance Value—Calculate the acceptance value by the formula:

$$\left|M - \overline{X}\right| + ks,$$

in which the terms are as defined in *Table 2*.

Suppositories, Transdermal Systems, and Inhalations Packaged in Premetered Dosage Units—[NOTE—Acceptance value calculations are not required for these dosage forms.] Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity.*

WEIGHT VARIATION

Select not less than 30 dosage units, and proceed as follows for the dosage form designated. The result of the *Assay,* obtained as directed in the individual monograph, is designated as result *A,* expressed as % of label claim (see *Calculation of the Acceptance Value*). Assume that the concentration (weight of drug substance per weight of dosage unit) is uniform. [NOTE—Specimens other than these test units may be drawn from the same batch for assay determinations.]

Uncoated or Film-Coated Tablets—Accurately weigh 10 tablets individually. Calculate the drug substance content, expressed as % of label claim, of each tablet from the weight of the individual tablet and the result of the *Assay.* Calculate the acceptance value.

Hard Capsules—Accurately weigh 10 capsules individually, taking care to preserve the identity of each capsule. Remove the contents of each capsule by a suitable means. Accurately weigh the emptied shells individually, and calculate for each capsule the net weight of its contents by subtracting the weight of the shell from the respective gross weight. Calculate the drug substance content, expressed as % of label claim, of each capsule from the net weight of the individual capsule content and the result of the *Assay.* Calculate the acceptance value.

Soft Capsules—Accurately weigh 10 intact capsules individually to obtain their gross weights, taking care to preserve the identity of each capsule. Then cut open the capsules by means of a suitable clean, dry cutting instrument such as scissors or a sharp open blade, and remove the contents by washing with a suitable solvent. Allow the occluded solvent to evaporate from the shells at room temperature over a period of about 30 minutes, taking precautions to avoid uptake or loss of moisture. Weigh the individual shells, and calculate the net contents. Calculate the drug substance content, expressed as % of label claim, in each capsule from the net weight of product removed from the individual capsules and the result of the *Assay.* Calculate the acceptance value.

Solids (Including Sterile Solids) in Single-Unit Containers—Proceed as directed for *Hard Capsules,* treating each unit as described therein. Calculate the acceptance value.

Oral Solutions Packaged in Single-Unit Containers—Accurately weigh the amount of liquid that drains in not more than 5 seconds from each of 10 individual containers. If necessary, compute the equivalent volume after determining the density. Calculate the drug substance content, expressed as % of label claim, in the liquid drained from each unit from the net weight of the individual container content and the result of the *Assay.* Calculate the acceptance value.

Calculation of Acceptance Value—Calculate the acceptance value as shown in *Content Uniformity,* except that the individual contents of the units are replaced with the individual estimated contents defined below.

$\chi_1, \chi_2, \ldots, \chi_n$	=	individual estimated contents of the units tested, where $\chi_i = w_i \times A / \overline{W}$,
$w_1, w_2, \ldots, w_n$	=	individual weights of the units tested,
A	=	content of drug substance (% of label claim) determined as described in the *Assay,* and
$\overline{W}$	=	mean of individual weights $(w_1, w_2, \ldots, w_n)$.

Solutions for Inhalation Packaged in Glass or Plastic Ampuls and Intended for Use in Nebulizers—[NOTE—Acceptance value calculations are not required for these dosage forms.] Accurately weigh 10 containers individually, taking care to preserve the identity of each container. Remove the contents of each container by a suitable means. Accurately weigh the emptied containers individually, and calculate for each container the net weight of its contents by subtracting the weight of the container from the respective gross weight. From the results of the *Assay,* obtained as directed in the individual monograph, calculate the drug substance content, expressed as % of label claim, in each of the containers.

CRITERIA

Apply the following criteria, unless otherwise specified in the individual monograph.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers, and Solids (Including Sterile Solids) in Single-Unit Containers—The requirements for dosage uniformity are met if the acceptance value of the first 10 dosage units is less than or equal to *L1*%. If the acceptance value is greater than *L1*%, test the next 20 units and calculate the acceptance value. The requirements are met if the final acceptance value of the 30 dosage units is less than or equal to *L1*%, and no individual content of any dosage unit is less than $(1 - L2*0.01)M$ nor more than $(1 + L2*0.01)M$ as specified in the *Calculation of Acceptance Value* under *Content Uniformity* or under *Weight Variation.* Unless otherwise specified in the individual monograph, *L1* is 15.0 and *L2* is 25.0.

Suppositories—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in each of the 10 dosage units as determined from the *Content Uniformity* method lies within the range of 85.0% to 115.0% of the label claim, and the RSD is less than or equal to 6.0%.

If 1 unit is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0%, or if both conditions prevail, test 20 additional units. The requirements are met if not more than 1 unit of the 30 is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim and the RSD of the 30 dosage units does not exceed 7.8%.

NOTICE OF POSTPONEMENT (*continued*)

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*
(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100".
(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100".

Transdermal Systems and Inhalations Packaged in Premetered Dosage Units—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in not less than 9 of the 10 dosage units as determined from the *Content Uniformity* method (or, in the case of solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers, from either the *Content Uniformity* or the *Weight Variation* method) lies within the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 10 dosage units is less than or equal to 6.0%.

If 2 or 3 dosage units are outside the range of 85.0% to 115.0% of label claim, but not outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0% or if both conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30 are outside the range of 85.0% to 115.0% of label claim and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 30 dosage units does not exceed 7.8%.

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*
(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100".
(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100".

•(Official January 1, 2007)•6

Interim Revision Announcement

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨1⟩ INJECTIONS

Change to read:

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. •For containers with a nominal volume of 2 mL or less, the contents of a sufficient number of containers may be pooled to obtain the volume required for the measurement, pro-

Interim Revision Announcement

vided that a separate, dry syringe assembly is used for each container.•6 The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. •Cool to between 20 and 25°•6 before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

Printing on Ferrules and Cap Overseals

Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: "Warning", "Dilute Before Using", "Paralyzing Agent", "I.M. Use Only", "Chemotherapy", etc.

The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.

•(Postponed indefinitely)•5

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.

Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

ERRATA

Following is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP 28–NF 23*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
269	*Bisoprolol Fumarate Tablets*	*Thin-layer chromatographic identification test* ⟨201⟩	Line 2 under *Developing solvent system:* Change "ammonia TS" to: ammonia TS, stronger
1647	*Propofol*	*Limit of propofol related compound A*	Line 1 under *Procedure:* Change "Separately inject equal volumes (about 20 mL)" to: Separately inject equal volumes (about 20 µL)
2450	⟨788⟩ *Particulate Matter in Injections*	*Instrument Standardization, Sensor Resolution*	Equation under *Manual Method:* Change $100\left[\left(\sqrt{S_O^{\,2} - S_S^{\,2}}\right) ID\right],$ to: $100\left(\sqrt{S_O^{\,2} - S_S^{\,2}/D}\right)$
2509	⟨905⟩ *Uniformity of Dosage Units*	*Criteria*	Under *Suppositories, Limit B*, re-insert text to the list. List should read as follows: (1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A*. (2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100". (3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100".
Supplement 2			
3476	*Diclofenac Sodium Delayed-Release Tablets*	*Drug Release, Method B* ⟨724⟩, *Acid Stage*	Line 12 under *Procedure:* Change "Transfer 3.0 mL of this solution to a second 100-mL volumetric flask" to: Transfer 2.0 mL of this solution to a second 100-mL volumetric flask

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24* or for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Amitriptyline Hydrochloride, *USP 28* page 135. It is proposed to replace the UV *Identification* test with HPLC retention time. It is proposed to delete the test for *Chromatographic purity,* using TLC, and add a test for *Related compounds,* using HPLC. It is proposed to replace the titrimetric method in the *Assay* with HPLC; it is also proposed to add the associated *USP Reference standards* used in the *Assay.* The HPLC method uses a Phenomenex brand Luna C8 column. The retention time of amitriptyline is about 16.5 minutes.

(MD-PP: R. Ravichandran) RTS—42021-1

USP Reference standards ⟨11⟩—*USP Amitriptyline Hydrochloride RS.*

▲*USP Amitriptyline Related Compound A RS. USP Amitriptyline Related Compound B RS. USP Cyclobenzaprine Hydrochloride RS. USP Nortriptyline Hydrochloride RS.*▲*USP30*

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

~~**B:** *Ultraviolet Absorption* ⟨197U⟩—~~

~~*Solution:* 10 µg per mL.~~

~~*Medium:* methanol.~~

~~Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.~~

▲**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*▲*USP30*

C: It responds to the tests for *Chloride* ⟨191⟩.

Delete the following:

▲~~**Chromatographic purity**—~~

~~*Standard solutions*—Dissolve USP Amitriptyline Hydrochloride RS in methanol, and mix to obtain a solution having a known concentration of 0.8 mg per mL. Quantitatively dilute this solution with methanol to obtain *Standard solutions*, designated below by letter, having the following compositions:~~

~~Standard Preparation~~	~~Dilution~~	~~Concentration (µg RS per mL)~~	~~Percentage (%, for comparison with test specimen)~~
~~*A*~~	~~(1 in 2)~~	~~400~~	~~1.0~~
~~*B*~~	~~(1 in 4)~~	~~200~~	~~0.5~~
~~*C*~~	~~(1 in 5)~~	~~160~~	~~0.4~~
~~*D*~~	~~(1 in 10)~~	~~80~~	~~0.2~~
~~*E*~~	~~(1 in 20)~~	~~40~~	~~0.1~~

~~*Test solution*—Dissolve an accurately weighed quantity of Amitriptyline Hydrochloride in methanol to obtain a solution containing 40 mg per mL.~~

~~*Procedure*—Apply separately 10 µL of the *Test solution* and 10 µL of each *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the applications to dry, position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (135 : 15 : 1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short wavelength UV light. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*. [NOTE—Disregard any spots observed at the origins of the chromatograms.] No secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Test solution* corresponds to not more than 1.0%. Disregard any spot in the chromatogram of the *Test solution* that is smaller or less intense than the principal spot obtained from *Standard solution E* (0.1%).~~▲*USP30*

Add the following:

▲**Related compounds**—

Diluted phosphoric acid, Buffer, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *System suitability preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation*.

In-Process Revision

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentages of individual amitriptyline related compounds in the portion of Amitriptyline Hydrochloride taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which r_U is the individual peak response for each amitriptyline related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* C_S is the concentration, in mg per mL, of each of the amitriptyline related compounds in the *Standard solution;* and C_T is the concentration, in mg per mL, of amitriptyline hydrochloride in the *Test solution*. The related compound requirements are listed in *Table 1.*

Table 1

Related Compound	Relative Retention Time	Limit (%)
Amitriptyline related compound A	0.35	0.05
Amitriptyline related compound B	0.52	0.15
Nortriptyline hydrochloride	0.60	0.15
Cyclobenzaprine hydrochloride	0.76	0.15
Amitriptyline hydrochloride	1.0	—
Unknown	—	0.10 each
Total known and unknown	—	1.0

[NOTE—Discard any peak with a relative retention time of less than 0.22. Use the response of the amitriptyline hydrochloride peak obtained from the *Standard solution* and the concentration of amitriptyline hydrochloride in the *Standard solution* to calculate the percentage of unknown individual impurities.]▲*USP30*

Change to read:

Assay— ~~Dissolve about 1 g of Amitriptyline Hydrochloride, accurately weighed, in 30 mL of glacial acetic acid, warming slightly if necessary to effect solution. Cool, add 10 mL of mercuric acetate TS, then add crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.39 mg of $C_{20}H_{23}N \cdot HCl$.~~

▲*Diluted phosphoric acid*—Prepare a mixture of phosphoric acid and water (1 : 10), and mix well.

Buffer—Dissolve 1.42 g of dibasic sodium phosphate (Na_2HPO_4) in 1 L of water, and adjust with *Diluted phosphoric acid* to a pH of 7.7.

Mobile phase—Prepare a mixture of filtered and degassed methanol and *Buffer* (7 : 3).

Assay stock preparation—Dissolve an accurately weighed amount of Amitriptyline Hydrochloride in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL of amitriptyline hydrochloride.

Standard preparation—Dissolve an accurately weighed amount of USP Amitriptyline Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 0.2 mg per mL of amitriptyline hydrochloride.

Assay preparation—Dilute the *Assay stock preparation* with *Mobile phase* (1 : 5).

Stock solution A—Dissolve an accurately weighed amount of USP Amitriptyline Related Compound A RS in methanol to obtain a solution having a known concentration of about 1 mg per mL of amitriptyline related compound A.

Stock solution B—Dissolve accurately weighed amounts of USP Amitriptyline Hydrochloride RS, USP Amitriptyline Related Compound B RS, USP Cyclobenzaprine Hydro-

chloride RS, and USP Nortriptyline Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL of amitriptyline hydrochloride and about 0.6 mg per mL each of amitriptyline related compound B, cyclobenzaprine hydrochloride, and nortriptyline hydrochloride.

System suitability preparation—Dilute suitable volumes of *Stock solution A, Stock solution B,* and the *Standard preparation* with *Mobile phase* to obtain a solution having 1 µg per mL of amitriptyline hydrochloride, 0.5 µg per mL of amitriptyline related compound A, and 1.5 µg per mL each of amitriptyline related compound B, cyclobenzaprine hydrochloride, and nortriptyline hydrochloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 45°. Chromatograph the *System suitability preparation,* and record the peak areas as directed for *Procedure:* the approximate relative retention times for related compounds are given in *Table 1;* and the resolution, *R,* between amitriptyline related compound B and nortriptyline is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the relative standard deviation for amitriptyline replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for about 40 minutes, and measure the responses for the major peaks. Calculate the percentage of $C_{20}H_{23}N \cdot HCl$ in the portion of Amitriptyline Hydrochloride taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of the *Standard preparation* and the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Calcium Lactate, *USP 28* page 329. It is proposed to replace *Identification* test *B* with a test for *Identification* based on infrared spectroscopy. The new test will require the use of a new USP Reference Standard that is also being proposed.

(DSN: L. Evans) RTS—42823-1

Add the following:

▲**USP Reference standards** ⟨11⟩—*USP Calcium Lactate RS.*▲*USP30*

Change to read:

Identification—

A: A solution (1 in 20) responds to the tests for *Calcium* ⟨191⟩.

B: ~~To 10 mg add 1 mL of sulfuric acid, and heat for 2 minutes in a water bath maintained at a temperature of 85°. Cool the solution to room temperature, add about 10 mg of 4-phenylphenol crystals, swirl, and allow to stand for about 20 minutes: a violet color develops that deepens with the passage of time.~~

▲*Infrared Absorption* ⟨197K⟩.▲*USP30*

In-Process Revision

BRIEFING

Calcium Lactate Tablets, *USP 28* page 329 and page 81 of *PF* 30(1) [Jan.–Feb. 2004]. Editorial changes have been made to *Identification* test *B* to remove the reference to the monograph for *Calcium Lactate.*

(DSN: L. Evans) RTS—42823-2

Change to read:

Identification—

A: A filtered solution of Tablets, equivalent to calcium lactate solution (1 in 20), responds to the tests for *Calcium* ⟨191⟩.

B: A filtered solution of Tablets, equivalent to calcium lactate solution (1 in 20), responds to ~~*Identification* test *B* under *Calcium Lactate*, 1 drop of the solution being used.~~

▲the tests for *Lactate* ⟨191⟩.▲*USP30*

Change to read:

Dissolution ~~*Procedure for a Pooled Sample*~~

■■1S (*USP29*)
⟨711⟩—
Medium: water; 500 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—

■Proceed as directed for *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.■1S (*USP29*)
Determine the amount of $C_6H_{10}CaO_6 \cdot 5H_2O$ dissolved, employing the procedure set forth in the *Assay,* making any necessary modifications.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_6H_{10}CaO_6 \cdot 5H_2O$ is dissolved in 45 minutes:

■the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample.* Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

■1S (*USP29*)

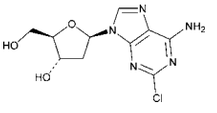
BRIEFING

Cladribine, page 395 of *PF* 31(2) [Mar.–Apr. 2005]. On the basis of comments received, it is proposed to revise the specification in the test for *Specific rotation* by adding a significant figure to both the upper and the lower limits. It is also proposed to revise the test for *Related compounds* by adding a significant figure to each of the limits shown in *Table 1.* In the *Limit of residual solvents* test, it is proposed to revise the limit of methanol to reflect the limits of Class 2 solvents as given in the general chapter *Organic Volatile Impurities* ⟨467⟩.

(MD-OOD: L. Evans) RTS—43097-1

Add the following:

■Cladribine



$C_{10}H_{12}ClN_5O_3$ 285.69

Adenosine, 2-chloro-2′-deoxy-.

2-Chloro-2′-deoxyadenosine [*4291-63-8*].

In-Process Revision

» Cladribine contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}ClN_5O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and protect from light. Store between 2° and 8°.

USP Reference standards ⟨11⟩—*USP Cladribine RS. USP Cladribine Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Limit of residual solvents—

Standard solution—Transfer 15 µL of methanol and 24 µL of alcohol to a 100-mL volumetric flask containing 80 mL of water, dilute with water to volume, and mix. Transfer 3 mL of the solution to a 20-mL headspace vial. The concentrations of methanol and alcohol are 119 µg per mL and 198 µg per mL, respectively.

Test solution—In a 20-mL headspace vial, dissolve 200 mg of Cladribine, accurately weighed, in 5 mL of water.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame-ionization detector and contains a 0.53-mm × 30-m column coated with a 5-µm film of liquid phase G16. The carrier gas is nitrogen, flowing at a rate of 4 mL per minute. The split ratio is 5 : 1. Vials containing the *Standard solution* and the *Test solution* are equilibrated for 10 minutes at 80° in the headspace sampler. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 80° for 6 minutes, then it is increased at a rate of 25° per minute to 240° and held at 240° for 20 minutes. The injection port temperature is maintained at 250°, and the detector temperature is maintained at 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between alcohol and methanol is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10.0% for each of the two solvents.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspaces of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration, in ppm, of each residual solvent in the portion of Cladribine taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the respective individual solvent in the *Standard solution; W* is the quantity, in mg, of Cladribine taken to prepare the *Test solution;* and r_U and r_S are the peak responses of the relevant solvent obtained from the *Test solution* and the *Standard solution,* respectively: not more than 5000 ppm of alcohol is found, and not more than ~~450~~ ▲3000▲*USP30* ppm of methanol is found.

Assay—

Buffer—Dissolve 9.96 g of triethylamine phosphate, accurately weighed, in 500 mL of water, and add an additional 500 mL of water. Adjust with potassium hydroxide to a pH of 6.1.

Diluent—Prepare a mixture of water and methanol (90 : 10).

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and methanol (78 : 22). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Cladribine RS and USP Cladribine Related Compound A RS in *Diluent* to obtain known concentrations of about 2.0 mg per mL each.

Standard preparation—Dissolve an accurately weighed quantity of USP Cladribine RS in *Diluent* to obtain a concentration of 0.5 mg per mL.

Assay preparation—Transfer about 25 mg of Cladribine, accurately weighed, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm × 15-cm column that contains packing

L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cladribine and cladribine related compound A is not less than 1.5; the tailing factor for the cladribine peak in the *System suitability solution* is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{12}ClN_5O_3$ in the portion of Cladribine taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cladribine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S *(USP29)*

BRIEFING

Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution, *USP 28* page 670, and page 3481 of the *Second Supplement*; **Diphenoxylate Hydrochloride and Atropine Sulfate Tablets**, *USP 28* page 671. A single HPLC *Assay* method, which allows determination of both components, is proposed for inclusion into these dosage form monographs. It will replace two separate HPLC assay methods in the monograph for Tablets, and a potentiometric titration and a tedious GC procedure in the monograph for Oral Solution. The liquid chromatographic procedure is based on analyses performed with the Spherisorb CN brand of L10 column. The typical retention times for atropine and diphenoxylate are about 5.5 and 15 minutes, respectively. It is also proposed to replace the *Identification* test for these monographs with HPLC retention time agreement of the major peaks in the *Assay preparation* and the *Standard preparation*.

(MD-GRE: E. Gonikberg) RTS—42094-1

Change to read:

Identification—~~Transfer a volume of Oral Solution, equivalent to about 100 mg of diphenoxylate hydrochloride, to a separator, add 1 mL of 3 N hydrochloric acid and sufficient water to make about 100 mL, and extract with five 25-mL portions of a mixture of chloroform and isopropyl alcohol (9 : 1). After each extraction transfer the bottom chloroform layer to a second separator, passing each portion through a sintered glass filter. Wash the combined chloroform solutions with two 25-mL portions of water, discard the washings, and evaporate the chloroform on a steam bath to dryness. To the residue add 10 mL of ether previously saturated with hydrochloric acid, carefully evaporate to dryness, then add a second portion of the acid-saturated ether, and again evaporate to dryness. Make a slurry of the residue with *n*-hexane, allow the solids to settle, and carefully decant the supernatant. Dry the solids at 105° for 1 hour: the diphenoxylate hydrochloride so obtained meets the requirements for *Identification* tests *A* and *B* under *Diphenoxylate Hydrochloride.*~~

▲The retention times of two major peaks in the chromatogram of the *Assay preparation* correspond to the atropine and diphenoxylate peaks in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*▲*USP30*

Delete the following:

▲~~**Assay for diphenoxylate hydrochloride**—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg of diphenoxylate hydrochloride, to a separator, add 4 mL of 3 N hydrochloric acid, and extract with six 30-mL portions of chloroform. Wash the combined chloroform extracts with 25 mL of water, and discard the washing. Transfer the chloroform to a beaker, and evaporate nearly to dryness. Add 100 mL of glacial acetic acid and 4 mL of mercuric acetate TS to the beaker, and titrate with 0.05 N perchloric acid in dioxane VS, determining the endpoint potentiometrically. Each mL of 0.05 N perchloric acid is equivalent to 24.45 mg of diphenoxylate hydrochloride ($C_{30}H_{32}N_2O_5 \cdot HCl$).~~▲*USP30*

Delete the following:

▲~~**Assay for atropine sulfate**—~~

~~*pH 2.8 Buffer*—Dissolve 1.9 g of aminoacetic acid and 1.5 g of sodium chloride in 250 mL of water. Adjust by the gradual addition of about 85 mL of 0.1 N hydrochloric acid to a pH of 2.8.~~

~~*Internal standard solution*—Transfer about 20 mg of homatropine hydrobromide to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

~~*Standard preparation*—Transfer about 25 mg of USP Atropine Sulfate RS, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Pipet 2 mL of the resulting solution into a 125-mL separator containing about 50 mL of water. Add 2.0 mL of *Internal standard solution,* 10.0 mL of *pH 2.8 Buffer,* and 25 mL of water-saturated methylene chloride. Insert the stopper, shake for 2 minutes, and allow the layers to sep-~~

~~arate. Discard the lower, organic layer. Repeat the extraction four times, using 25-mL portions of water-saturated methylene chloride each time, allowing the layers to separate and discarding the organic layer each time. To the remaining aqueous layer add 3 mL of 0.1 N sodium hydroxide, and shake briefly. Using a pH meter, adjust the solution to a pH of 9.0 ± 0.3. Immediately add 10 mL of water-saturated methylene chloride, insert the stopper, and shake. Transfer the lower, organic layer to a 50-mL container. Repeat the extraction twice more with 10-mL portions of water-saturated methylene chloride, combining the organic extracts. Under a stream of nitrogen, evaporate the organic extracts to dryness. Dissolve the residue in 0.1 mL of methylene chloride.~~

~~*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 250 µg of atropine sulfate, to a 125-mL separator. Proceed as directed for *Standard preparation,* beginning with "Add 2.0 mL of *Internal standard solution*."~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.2-m glass column that contains 3% phase G3 on support S1. The column is maintained at a temperature of 230°, and the injection port and detector temperatures are maintained at 250°. Helium is used as the carrier gas at a rate of 40 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between atropine and the internal standard is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.5%.~~

~~*Procedure*—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of atropine sulfate $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$ in each mL of the Oral Solution taken by the formula:~~

~~$$2(694.85/676.83)(C/V)(R_U/R_S),$$~~

~~in which 694.85 and 676.83 are the molecular weights of atropine sulfate monohydrate and anhydrous atropine sulfate, respectively; *C* is the concentration, in µg per mL, of USP Atropine Sulfate RS (corrected to the monohydrate) in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and R_U and R_S are the peak response ratios of atropine to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~ ▲*USP30*

Add the following:

▲Assay—

Solution A—Transfer 192 mg of sodium 1-pentanesulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of water and 1.0 mL of phosphoric acid, and mix.

Solution B—Transfer 192 mg of sodium 1-pentanesulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of acetonitrile, 1.0 mL of phosphoric acid, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Solution B* and *Solution A* (66 : 34). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Atropine stock preparation—Dissolve an accurately weighed quantity of USP Atropine Sulfate RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 0.04 mg per mL.

Standard preparation—Transfer about 20 mg of USP Diphenoxylate Hydrochloride RS to a 200-mL volumetric flask, add about 100 mL of dehydrated alcohol, and sonicate to dissolve. Accurately add 5.0 mL of *Atropine stock preparation* and 34 mL of water, and mix. Allow the solution to reach room temperature, and then dilute with dehydrated alcohol to volume. This solution contains about 0.1 mg of diphenoxylate hydrochloride and about 0.001 mg of atropine sulfate per mL.

Assay preparation—Transfer an accurately measured volume of the Oral Solution, equivalent to about 2.5 mg of diphenoxylate hydrochloride, based on the label claim, to a 25-mL volumetric flask, wash inside of the pipet with small portions of dehydrated alcohol, add the washings to the flask, dilute with dehydrated alcohol to volume, and mix. Pass a portion of the solution obtained through a 0.45-µm PTFE filter, discarding the first few mL, and use the clear filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.35 for atropine and 1.0 for diphenoxylate; the resolution, *R,* between atropine and diphenoxylate

In-Process Revision

is not less than 5.0; the tailing factor is not more than 2.5 for diphenoxylate and not more than 1.5 for atropine; and the relative standard deviation for replicate injections is not more than 2.0% for diphenoxylate and not more than 5.0% for atropine.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diphenoxylate hydrochloride ($C_{30}H_{32}N_2O_2 \cdot HCl$) in the portion of Oral Solution taken by the formula:

$$25C_D(r_U/r_S)$$

in which 25 is the volume, in mL, of the *Assay preparation;* C_D is the concentration, in mg per mL, of USP Diphenoxylate Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the diphenoxylate peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Calculate the quantity, in mg, of atropine sulfate $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$ in the portion of Oral Solution taken by the formula:

$$(694.83/676.83)(25)C_A(r_U/r_S)$$

in which 694.83 and 676.83 are the molecular weights of atropine sulfate monohydrate and anhydrous atropine sulfate, respectively; 25 is the volume, in mL, of the *Assay preparation;* C_A is the concentration, in mg per mL, of USP Atropine Sulfate RS in the *Standard preparation;* and r_U and r_S are the atropine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

Assay—Transfer about 1200 mg of Ensulizole, accurately weighed, to a 300-mL iodine flask, and dissolve by stirring in 25 mL of 0.5 N sodium hydroxide. Add phenolphthalein TS, and titrate the excess with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sodium hydroxide is equivalent to 137.15 mg of $C_{13}H_{10}N_2O_3S$. ■Calculate the percentage of $C_{13}H_{10}N_2O_3S$ in the portion of Ensulizole taken by the formula:

~~$$\frac{[(V_{NaOH} \times T_{NaOH}) - (V_{HCl} \times T_{HCl})] \times 0.5 \times 274.30 \times 100}{W \times LOD \times 10}$$~~

▲$$\frac{[(V_{NaOH} \times T_{NaOH}) - (V_{HCl} \times T_{HCl})] \times 0.5 \times 274.30 \times 100}{W \times (1 - LOD) \times 10}$$ ▲*USP30*

in which V_{NaOH} is the volume, in mL, of 0.5 N sodium hydroxide added; T_{NaOH} is the titer of the 0.5 N sodium hydroxide; V_{HCl} is the volume, in mL, of 0.5 N hydrochloric acid used; T_{HCl} is the titer of 0.5 N hydrochloric acid; W is the weight, in g, of Ensulizole taken; ▲100 is the percentage conversion factor;▲*USP30* and *LOD* is the percentage of loss on drying expressed as a weight fraction, as determined in the test for *Loss on drying.*■1S (*USP28*)

BRIEFING

Estradiol Vaginal Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Symmetry brand of L1 column. The typical retention time for estradiol is about 4.1 minutes.

(PA1: C. Anthony) RTS— 39955-1

Add the following:

▲Estradiol Vaginal Tablets

» Estradiol Vaginal Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol ($C_{18}H_{24}O_2$).

Packaging and storage—Each Tablet is contained in a single-unit HG-polyethylene/polyethylene applicator. Each applicator with the inset tablet is packed separately in a laminated blister consisting of aluminum and polyvinylchloride foil. Preserve in a tight container, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Estradiol RS. USP Estradiol Related Compound A RS. USP Estradiol Related Compound B RS. USP Estrone RS.*

In-Process Revision

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Place 30 Tablets in a vessel, add 500 mL of water, and allow to disintegrate by shaking overnight. Add 50.0 mL of ether, and shake for 2 minutes. Filter the ether layer through cotton wool and anhydrous sodium phosphate, shake with three 50-mL aliquots of ether, and evaporate to dryness. Dissolve the residue in 5 mL of ether, and quantitatively transfer to a fresh vessel. Evaporate to dryness, and reconstitute with 150 µL of absolute alcohol.

Standard solution—Dissolve suitable quantities of USP Estradiol RS, USP Estradiol Related Compound A RS, and USP Estrone RS, accurately weighed, in absolute alcohol to obtain a solution having known concentrations of 5 mg per mL, 0.25 mg per mL, and 0.25 mg per mL, respectively.

Application volume: 5 µL.

Developing solvent system: a mixture of chloroform and acetone (9 : 1).

Procedure—Proceed as directed in the chapter using the *Developing solvent system* described above. Develop the chromatogram three times over a path of about 8 cm, allowing the chromatogram to dry for 1 minute between each run. After the third run, allow the plate to air-dry. After removal of the plate, marking of the solvent front, and allowing solvent evaporation as described in the chapter, heat at 100° for about 15 minutes. Allow the plate to cool, and then immerse it in a mixture of absolute alcohol and concentrated sulfuric acid (95 : 5). Remove it immediately, place the plate on absorbing paper, and allow it to air-dry. Heat the plate at 100° until it is developed. Examine under UV light at $\lambda = 365$ nm. The principal spot obtained from the *Test solution* and the *Standard solution* has the same color and R_F value.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g. Tablets meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Dissolution ⟨711⟩—[To come.]

Loss on drying ⟨731⟩—Dry about 1200 mg of finely powdered Tablets in a tared evaporating dish at a pressure not exceeding 25 mm of mercury at 60° for 3 hours: it loses not more than 7.0% of its weight.

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (5 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Estradiol RS and USP Estradiol Related Compound B RS to obtain a solution having a known concentration of about 100 µg per mL and about 0.525 µg per mL, respectively.

Test solution—Place 12 Tablets, equivalent to about 300 µg of estradiol, in a 50-mL volumetric flask. Add 50 mL of absolute alcohol, stir for 16 hours with a magnetic stirrer, and shake thoroughly. Centrifuge the suspension, and evaporate 10.0 mL of the supernatant to dryness. Dissolve the residue in 1.0 mL of water and 7.0 mL of a mixture of toluene and acetone (5 : 2), mix on a whirl mixer, allow to stand for 1 hour, and evaporate 5 mL of the organic phase to dryness. The residue is reconstituted in 450 µL of absolute alcohol, to obtain a solution containing about 0.08 µg of estradiol per mL, and centrifuged.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.96 for estradiol related compound B and 1.0 for estradiol; and the resolution, *R,* between estradiol related compound B and estradiol is not less than 2.0.

Procedure—Inject a volume (about 25 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each estradiol related impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 3.0% of total impurities is found. The impurities meet the requirements specified in the table below.

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
6α-Hydroxy estradiol	0.54	1.0	1.0
6β-Hydroxy estradiol	0.60	1.0	1.0
6-Keto estradiol	0.71	1.0	1.0
16-Keto estradiol	0.74	1.0	1.0
6-Keto estrone	0.85	1.0	1.0
β-Equilenol	0.91	1.0	1.0
Estradiol related compound B (6-Dehydro-estradiol)	0.96	1.0	1.0
Estradiol	1.0	1.0	—
Estradiol related compound A (α-Estradiol)	1.05	1.0	1.0
Estrone	1.13	1.0	1.0
4-Methyl estradiol	1.17	1.0	1.0
Total impurities	—	—	1.0

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (5 : 1).

Solvent solution—Prepare a mixture of water and absolute alcohol (1 : 1).

Estrone standard stock solution—Prepare a solution of USP Estrone RS in absolute alcohol having a known concentration of 0.4 mg per mL.

Estradiol standard stock solution—Prepare a solution of USP Estradiol RS in absolute alcohol having a known concentration of 0.5 mg per mL.

System suitability preparation—Transfer 400 µL of *Estradiol standard stock solution* and 200 µL of *Estrone standard stock solution* to a 100-mL volumetric flask, and dilute to the mark with *Solvent solution*.

Standard solution—Pipet 500 µL of *Estradiol standard stock solution* into a 250-mL flask, and dilute with *Solvent solution* to the mark to obtain a solution having a known concentration of about 1.0 µg per mL.

In-Process Revision

Assay preparation—Add 10 Tablets into a measured amount of *Solvent solution*, to obtain a solution having an estradiol concentration of about 2.5 µg per mL. Stir the mixture overnight with a magnetic stirrer, shake thoroughly, and centrifuge if necessary.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between estradiol and estrone is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatographs, and measure the peak responses. Calculate the quantity, in mg, of estradiol ($C_{18}H_{24}O_2$) in the portion of Tablets taken by the formula:

$$100(C/)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Estradiol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively.▲*USP30*

BRIEFING

Synthetic Conjugated Estrogens. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed.

(PA1: C. Anthony) RTS—42243-1

Add the following:

▲Synthetic Conjugated Estrogens

» Synthetic Conjugated Estrogens is a mixture of sodium estrone sulfate and sodium equilin sulfate, derived synthetically from Estrone and Equilin. It contains other conjugated estrogenic substances of the type excreted by pregnant mares. It is a dispersion of the estrogenic substances in a suitable diluent.

Synthetic Conjugated Estrogens contains not less than 52.5 percent and not more than 61.5 percent of sodium estrone sulfate; not less than 22.5 percent and not more than 30.5 percent of sodium equilin sulfate; and not less than 13.5 percent and not more than 19.5 percent of sodium 17α-dihydroequilin sulfate. The total of sodium estrone sulfate, sodium equilin sulfate, and sodium17α-dihydroequilin sulfate is not less than 90.0 percent

In-Process Revision

and not more than 110.0 percent of the labeled content of Synthetic Conjugated Estrogens. Synthetic Conjugated Estrogens contains not less than 2.5 percent and not more than 9.5 percent of sodium 17α-estradiol sulfate; and not less than 0.5 percent and not more than 4.0 percent of sodium 17β-dihydroequilin sulfate, of the labeled content of Synthetic Conjugated Estrogens. Synthetic Conjugated Estrogens A meets the requirements of Synthetic Conjugated Estrogens and contains not less than 0.1 percent and not more than 3.0 percent of sodium 17α-dihydroequilenin sulfate; not less than 0.1 percent and not more than 1.5 percent of sodium 17 β-dihydroequilenin sulfate; not less than 0.1 percent and not more than 4.0 percent of sodium equilenin sulfate; and not less than 0.1 percent and not more than 2.5 percent of sodium 17β-estradiol sulfate. Synthetic Conjugated Estrogens B meets the requirements of Synthetic Conjugated Estrogens A and contains not less than 1.0 percent and not more than 7.0 percent of sodium $\Delta^{8,9}$-dehydroestrone sulfate.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to state the content of Synthetic Conjugated Estrogens on a weight-to-weight basis.

USP Reference standards ⟨11⟩**—***USP 17α-Dihydroequilin RS. USP Equilin RS. USP Estradiol RS. USP Estrone RS.*

Identification—The following results are obtained with respect to the *Assay preparation,* treated as directed for *Procedure* in the *Assay.*

A: The relative retention times of the major peaks for 17α-dihydroequilin, estrone, and equilin in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: The chromatogram of the *Assay preparation* exhibits additional peaks or shoulders, corresponding to 17α-estradiol and 17β-dihydroequilin at retention times of about 0.24 and 0.35, respectively, relative to that of 3-*O*-methylestrone.

Limit of estrone, equilin, and 17α-dihydroequilin (free steroids)—

Internal standard solution, pH 5.2 Acetate buffer, and *System suitability solution*—Proceed as directed in the *Assay.*

Standard stock solution—Prepare as directed for the *Standard stock preparation* in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Free steroids standard solution—Dilute the *Standard stock solution* tenfold. Pipet 1.0 mL of the resulting solution and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard preparation* in the *Assay,* beginning with "Evaporate the mixture."

Test solution—Proceed as directed for *Assay preparation* in the *Assay* with the following exceptions: do not add the sulfatase enzyme preparation, and transfer 6.0 mL of the filtrate instead of 3.0 mL in the preparation of the test specimen.

Blank solution—Prepare as directed for the *Test solution,* without addition of the Synthetic Conjugated Estrogens.

Chromatographic system—Proceed as directed in the *Assay* with the additional requirement that for not less than two replicate injections the relative standard deviation for the ra-

tio of the peak response of estrone to that of the internal standard in the *Free steroids standard solution* is not greater than 5.5%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Free steroids standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the ratio, R_U, of the combined peak areas of estrone, equilin, and 17α-dihydroequilin relative to the area of the internal standard in the *Test solution,* correcting for peaks obtained from the *Blank solution.* The ratio, R_U / R_S, where R_S is the peak response ratio of estrone to that of the internal standard obtained from the *Free steroids standard solution,* is not more than 0.65 (1.3% of free steroids).

Limit of chromatographic impurities—

Internal standard solution, pH 5.2 Acetate buffer, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Blank solution—Prepare as directed for the *Assay preparation* without addition of the Synthetic Conjugated Estrogens.

Procedure—Separately inject equal volumes (about 1 µL) of the *Test solution* and the *Blank solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Identify any peaks obtained from the *Blank solution* that are not due to the identified estrogenic components and are not due to the reagents in the *Blank solution.* For each peak response calculate the area percent using the formula:

$$100(A_R / A_T)$$

in which A_R is the sum of the unidentified area responses obtained from the *Blank solution,* and A_T is the sum of the area responses of the identified estrogenic components obtained from the *Test solution.* Calculate the area percentage of the chromatographic impurities by summing the area percentage determined for each response identified. The total area percentage of the responses is less than or equal to 1%.

Residual solvents ⟨467⟩**:** meets the requirements.

Solvent—Use dimethyl sulfoxide.

Content of 17α-dihydroequilin, 17β-dihydroequilin, and 17α-estradiol—

Internal standard solution, pH 5.2 Acetate buffer, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Prepare as directed for *Assay preparation* in the *Assay.*

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the peaks due to 17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin in the chromatogram of the *Test solution.* The relative retention times of 17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin are about 0.82, 1.00, and 1.11, respectively. Separately calculate the quantities, in mg, of

In-Process Revision

17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin as their sodium sulfate salts in the portion of Synthetic Conjugated Estrogens taken by the formula:

$$0.005(1.381C_S)(R_U/R_S)$$

in which C_S is the concentration, in µg per mL, of USP 17α-Dihydroequilin RS in the *Standard stock solution;* R_U is the ratio of the peak response of the appropriate analyte to that of the internal standard obtained from the *Test solution;* and R_S is the ratio of the peak response of 17α-dihydroequilin to that of the internal standard obtained from the *Standard solution.*

Content of 17α-dihydroequilenin, 17β-dihydroequilenin, and equilenin—

Internal standard solution, Stock solution, pH 5.2 Acetate buffer, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Prepare as directed for *Assay preparation* in the *Assay.*

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify any peaks due to17α-dihydroequilenin, 17β-dihydroequilenin, 3-*O*-methylestrone, and equilenin in the chromatogram of the *Test solution.* The relative retention times for 17α-dihydroequilenin, 17β-dihydroequilenin, 3-*O*-methylestrone, and equilenin are about 0.56, 0.64, 1.0, and 1.3 respectively. Separately calculate the quantities, in mg, of 17α-dihydroequilenin, 17β-dihydroequilenin, and equilenin as their sodium sulfate salts in the portion of Synthetic Conjugated Estrogens taken by the formula:

$$0.005(1.381C_S)(R_U/R_S)$$

in which C_S is the concentration, in µg per mL, of USP Estrone RS in the *Standard stock solution;* R_U is the ratio of the peak response of the appropriate analyte to that of the internal standard obtained from the *Test solution;* and R_S is the ratio of the peak response of estrone to that of the internal standard obtained from the *Standard solution.*

Content of 17β-estradiol and $\Delta^{8,9}$-dehydroestrone—

Internal standard solution, Stock solution, pH 5.2 Acetate buffer, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Prepare as directed for *Assay preparation* in the *Assay.*

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify any peaks due to 17β-estradiol, 3-*O*-methylestrone, and $\Delta^{8,9}$-dehydroestrone in the chromatogram of the *Test solution.* The relative retention times of 17β-estradiol, 3-*O*-methylestrone, and $\Delta^{8,9}$-dehydroestrone are about 0.29, 1.0, and 0.9, respectively. Separately calculate the quantities, in mg, of 17β-estradiol and $^{\Delta 8,9}$-dehydroestrone as their sodium sulfate salts in the portion of Synthetic Conjugated Estrogens taken by the formula:

$$0.005(1.381C_S)(R_U/R_S)$$

In-Process Revision

in which C_S is the concentration, in µg per mL, of USP Estrone RS in the *Standard stock solution;* R_U is the ratio of the peak response of the appropriate analyte to that of the internal standard obtained from the *Test solution;* and R_S is the ratio of the peak response of estrone to that of the internal standard obtained from the *Standard solution.*

Assay—

Internal standard solution—Prepare a solution of 3-*O*-methylestrone in methanol containing about 150 µg per mL.

Standard stock preparation—Using accurately weighed quantities of USP Estrone RS, USP Equilin RS, and USP 17α-Dihydroequilin RS, prepare, by quantitative and stepwise dilution, a solution in alcohol having known concentrations of about 160 µg per mL, 70 µg per mL, and 50 µg per mL, respectively.

pH 5.2 Acetate buffer—Mix 79 mL of sodium acetate TS with 21 mL of 1 N acetic acid, dilute with water to 500 mL, and mix. Adjust to a pH of 5.2 ± 0.1 by the addition of 1 N acetic acid or sodium acetate TS, if necessary.

System suitability solution—Dissolve a quantity of USP Estradiol RS (17β-estradiol) in alcohol to obtain a solution containing about 2 µg per mL. Pipet 1.0 mL of this solution, 1.0 mL of *Standard stock preparation,* and 1.0 mL of *Internal standard solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard preparation,* beginning with "Evaporate the mixture."

Standard preparation—Pipet 1.0 mL of the *Standard stock preparation* and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue add 15 µL of dried pyridine and 65 µL of bis(trimethylsilyl)trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, mix, and allow to stand for 15 minutes. Add 0.5 mL of toluene, and mix.

Assay preparation—Transfer an accurately weighed quantity of Synthetic Conjugated Estrogens, equivalent to about 2 mg of total synthetic conjugated estrogens, to a 100-mL square bottle, fitted with a polytef-lined screw cap, containing 15 mL of *pH 5.2 Acetate buffer* and 1 g of barium chloride (1 : 3 aqueous solution). Cap the tube tightly, and shake by mechanical means for 30 minutes. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of 5.0 ± 0.5. Place in a sonic bath for 30 seconds, then shake for an additional 30 minutes. Add a suitable sulfatase enzyme preparation equivalent to 2500 Units, and shake for 20 minutes in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake for 15 minutes. Centrifuge for 10 minutes or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by passing rapidly through a filter consisting of a pledget of dry glass wool and about 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss due to evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution.* Proceed as directed for *Standard preparation,* beginning with "Evaporate the mixture."

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector maintained at a temperature of 260°, a 0.25-mm × 15-m fused silica capillary column bonded with a 0.25-µm layer of phase G19, and a split injection system. The column temperature is maintained at 220° and the injection port is maintained at 260°. The carrier gas is hydrogen flowing at the rate of 2 mL per minute, and the split flow rate is 40 to 60 mL per minute. Inject about 1 µL of the *System suitability*

solution into the gas chromatograph, adjust the operating conditions as necessary to maintain the elution time of the 3-*O*-methylestrone peak at between 17 and 25 minutes, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.29, 0.30, 0.80, 0.87, and 1.00 for 17β-estradiol, 17α-dihydroequilin, estrone, equilin, and 3-*O*-methylestrone, respectively; the resolution, *R,* between estrone and equilin is not less than 1.2; and the tailing factor for the estrone peak is not more than 1.3. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation of the estrone peak ratios for not fewer than four injections is not greater than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Separately calculate the quantities, in mg, of sodium estrone sulfate and sodium equilin sulfate in the portion of Synthetic Conjugated Estrogens taken by the formula:

$$0.005(1.381C_S)(R_U/R_S)$$

in which 1.381 is the factor converting free estrogen to the conjugate sodium salt; C_S is the concentration, in µg per mL, of USP Estrone RS or USP Equilin RS in the *Standard stock preparation;* and R_U and R_S are the ratios of the peak response of the appropriate analyte to that of the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Etidronate Disodium, *USP 28* page 798, and page 3485 of the *Second Supplement*. It is proposed to allow the use of a suitable chemical suppressor in the test for *Limit of phosphite,* in addition to a self-regenerating suppressor. A *Note* has been added to clarify that the *Suppressor regenerant solution* is needed only when the chemical suppression option is used.

(MD-GRE: E. Gonikberg) RTS—43210-1

Change to read:

Limit of phosphite—

■*Solution A*—Prepare an aqueous solution containing 0.65 mg per mL of anhydrous sodium carbonate and 0.40 mg per mL of sodium bicarbonate.

Solution B—Prepare an aqueous solution containing 4.68 mg per mL of anhydrous sodium carbonate and 2.89 mg per mL of sodium bicarbonate.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve suitable quantities of USP Etidronate Disodium Related Compound A RS and dibasic sodium phosphate in *Solution A* to obtain a solution having a known concentration of 0.027 mg of sodium phosphite dibasic pentahydrate and 0.015 mg of dibasic sodium phosphate in each mL. [NOTE—Etidronate disodium related compound A is sodium phosphite dibasic pentahydrate.]

Suppressor regenerant solution—Use 12.5 mM sulfuric acid.

▲[NOTE—This solution is needed only if the chemical suppression option is used.]▲*USP30*

Test solution—Transfer approximately 50 mg of Etidronate Disodium, accurately weighed, to a suitable flask. Dissolve in 10.0 mL of *Solution A*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector, a 4-mm × 25-cm column and a 4-mm × 50-mm guard column ~~that contain packing L61, and a 4-mm anion self-regenerating suppressor~~ ▲both containing packing L61, and either a 4-mm anion self-regenerating suppressor or a suitable chemical suppressor.▲*USP30*

The flow rate is about 1.0 mL per minute for the *Mobile phase*. ~~and 3 to 5 mL per minute for the *Suppressor regenerant solution.*~~ ▲When a chemical suppressor is used, the flow rate is 3 to 5 mL per minute for the *Suppressor regenerant solution.*▲*USP30*

The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6.0	100	0	isocratic
6.0–6.1	100→0	0→100	linear gradient
6.1–8.0	0	100	isocratic
8.0–8.1	0→100	100→0	linear gradient
8.1–15	100	0	isocratic

In-Process Revision

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the elution order is phosphite, followed by phosphate; the resolution, *R,* between phosphite and phosphate is not less than 2.5; and the relative standard deviation for replicate injections is not more than 10% for each peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the phosphite peaks. Calculate the percentage of phosphite, determined as monobasic sodium phosphite, in the portion of Etidronate Disodium taken by the formula:

$$1000(103.98/216.06)(C/W)(r_U/r_S)$$

in which 103.98 and 216.06 are the molecular weights of sodium phosphite monobasic and sodium phosphite dibasic pentahydrate, respectively; C is the concentration, in mg per mL, of USP Etidronate Disodium Related Compound A RS in the *Standard solution;* W is the weight, in mg, of Etidronate Disodium taken to prepare the *Test solution;* and r_U and r_S are the phosphite peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.0% of phosphite, determined as monobasic sodium phosphite, is found. ■2S (*USP28*)

BRIEFING

Fentanyl. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a Microsorb C18 brand of L1 column. The typical retention time for fentanyl is about 2.7 minutes.

(PA2: C. Anthony) RTS—42140-1

Add the following:

▲Fentanyl

$C_{22}H_{28}N_2O$ 336.47

Propanamide, *N*-phenyl-*N*-[1-(2-phenylethyl)-4-piperidinyl].

N-(1-Phenethyl-4-piperidyl)propionanilide. [*437-38-7*].

» Fentanyl contains not less than 98.0 percent and not more than 102.0 percent of the labeled amount of $C_{22}H_{28}N_2O$, calculated on the dried basis.

Caution—Great care should be taken to prevent inhaling particles of Fentanyl and exposing the skin to it.

Packaging and storage—Preserve in tightly closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Fentanyl RS. USP Fentanyl Related Compound A RS. USP Fentanyl Related Compound B RS. USP Fentanyl Related Compound C RS. USP Fentanyl Related Compound D RS. USP Fentanyl Related Compound E RS. USP Fentanyl Related Compound F RS. USP Fentanyl Related Compound G RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩**—**Dry it in vacuum at 60° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.5%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Standard stock solution—Dissolve an accurately weighed quantity of USP Fentanyl Related Compound A RS, USP Fentanyl Related Compound B RS, USP Fentanyl Related Compound C RS, USP Fentanyl Related Compound D RS, USP Fentanyl Related Compound E RS, USP Fentanyl Related Compound F RS, and USP Fentanyl Related Compound G RS in methanol to obtain a solution having a known concentration of each related compound of about 0.13 mg per mL.

Standard solution—Prepare a 1 : 5 dilution of *Standard stock solution* in methanol.

In-Process Revision

Test solution—Transfer 250 mg of Fentanyl, accurately weighed, to a 10-mL volumetric flask, and dissolve in methanol.

Spiked test solution—Transfer 250 mg of Fentanyl, accurately weighed, to a 10-mL volumetric flask, and dissolve in *Standard stock solution.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame ionization detector and a 0.32-mm × 30-m column containing a 0.5-µm layer of phase G3. The carrier gas is helium, flowing at a rate of about 2.4 mL per minute, and the split ratio is about 30 : 1. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at about 220° for 2.5 minutes, then the temperature is increased at a rate of 8° per minute to 275°, and maintained at 275° for 26 minutes. The equilibration time is 2 minutes. The injector and detector port temperatures are maintained at 280°. Chromatograph the *Spiked test solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not more than 5% for each impurity.

Procedure—Separately inject equal volumes (about 3 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. Impurity peak responses are normalized to adjust for different drug weights. Determine the concentration, in µg per mL, of each impurity obtained from the chromatogram of the *Test solution* . Then calculate the content of each related compound in % (w/w) by using the following equations:

$$(n)A_S = A_S \times C_T / C_S$$

$$X_i = A_T \times C_i / [(n)A_S - A_T]$$

$$\% (w/w) = X_i \times 100 / C_T$$

in which $(n)A_S$ is the normalized peak area of the related compound obtained from the chromatogram of the *Spiked test solution,* A_S is the peak area of of the related compound obtained from the *Spiked test solution,* and A_T is the peak area of the related compound obtained from the *Test solution;* C_T and C_S are the concentrations of fentanyl, in µg per mL, in the *Test solution* and the *Spiked test solution,* respectively; C_i is the concentration, in µg per mL, of the related compound in the *Standard stock solution*; X_i is the calculated concentration, in µg per mL, of each related compound in the *Test solution.*

Calculate impurity content in % (w/w) by using the following equations:

$$(n)A_{ki} = A_{ki} \times C_T / C_S$$

$$EC_{uk} = A_{uk} \times C_{ki} / [(n)A_{ki} - A_{ki}]$$

$$\text{Unknown Impurity } \% = EC_{uk} \times 100 / C_T$$

in which $(n)A_{ki}$ is the normalized peak area of a known impurity obtained from the chromatogram of the *Spiked test solution,* A_{ki} is half the peak area of the nearest known impurity in the chromatogram of the *Spiked test solution,* and A_{uk} is the peak area of an unknown impurity obtained from the chromatogram of the *Test solution;* C_T and C_S are the concentrations, in µg per mL, of fentanyl in the *Test solution* and the *Spiked test solution,* respectively; EC_{uk} is the estimated concentration of an unknown impurity in the *Test solution;* and C_{ki} is the concentration, in µg per mL, of a known impurity in the *Test solution:* the impurities meet the requirements specified in the table below.

Name	Relative Retention Times	Limits (%)
USP Fentanyl Related Compound A	0.17	0.25
USP Fentanyl Related Compound B	0.44	0.25
USP Fentanyl Related Compound C	0.59	0.25
USP Fentanyl Related Compound D	0.72	0.25
USP Fentanyl Related Compound E	0.78	0.25
USP Fentanyl Related Compound F	0.89	0.25
USP Fentanyl Related Compound G	0.96	0.25
Individual unknown impurities	NA	0.1
Total impurities	NA	0.5

Residual solvents ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, triethylamine, phosphoric acid, and octanesulfonic acid (500 : 500 : 1 : 1 : 0.5)

Diluent—Prepare a 0.02 N sulfuric acid solution.

Standard preparation—Dissolve an accurately weighed quantity of USP Fentanyl RS in *Diluent* to obtain a solution having a known concentration of about 15 µg per mL.

System suitability solution—Dissolve accurately weighed quantities of Fentanyl and USP Fentanyl Related Compound G RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a concentration of 10 µg per mL of fentanyl base and 1 µg per mL of USP Fentanyl Related Compound G RS.

Assay preparation—Dissolve an accurately weighed quantity of Fentanyl in *Diluent* to obtain a solution having a known concentration of about 15 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the fentanyl peak is not greater than 2.0. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fentanyl and fentanyl related compound G is not less than 1.5; and the relative standard deviation for replicate injections is not greater than 2.0% for fentanyl.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in percent, of $C_{22}H_{28}N_2O$ in the portion of Fentanyl taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL of USP Fentanyl RS in the *Standard preparation;* C_U is the concentration of Fentanyl in the *Assay preparation;* and r_U and r_S are the peak responses of fentanyl in the *Assay preparation* and *Standard preparation,* respectively.▲*USP30*

BRIEFING

Flumazenil, page 3230 of the *First Supplement.* It is proposed to replace Chlordiazepoxide, a Class IV controlled substance, with USP Flumazenil Related Compound B, for use in preparation of the *System suitability solution* in the *Assay.* In addition, it is proposed to revise the preparation of the *Standard solution* in *Related compounds Test 2* by using a diluted solution of the *Standard preparation* from the *Assay* instead of weighing out an additional quantity of USP Flumazenil RS. In *Related compounds Test 2,* it is further proposed to simplify preparation of the *Test solution* by using the *Assay preparation* and also to clarify the definition of the relative response factors specified in the *Procedure.* Finally, in *Re-*

In-Process Revision

lated compounds Test 2 and in the *Assay,* it is proposed to revise the formula to reflect the use of the drug substance concentration rather than its weight.

Related compounds—

TEST 1—

Ninhydrin solution—Dissolve 0.5 g of ninhydrin in 90 mL of alcohol, and add 10 mL of glacial acetic acid.

Diluent—Prepare a mixture of alcohol and chloroform (1 : 1).

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* ⟨621⟩).

Test solution—Transfer about 250 mg of Flumazenil, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Standard solution 1—Prepare a solution of USP Flumazenil RS and *N,N*-dimethylformamide diethyl acetal in *Diluent* having known concentrations of about 0.5 mg per mL and about 0.6 µL per mL, respectively.

Standard solution 2—Dilute 2.0 mL of *Standard solution 1* with *Diluent* to 10.0 mL.

Application volume: 10 µL.

Developing solvent system: a mixture of chloroform, glacial acetic acid, alcohol, and water (75 : 15 : 7.5 : 2.5).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate for 10 minutes in a current of cold air, and view under short-wavelength UV light. Spray the plate with *Ninhydrin solution,* and heat at 105° for 15 minutes. The R_F values of analytes are as follows.

Compound	R_F	Detection
Flumazenil	about 0.8	UV
N,N-Dimethylformamide diethyl acetal	about 0.04	Ninhydrin

Any spot at an R_F value corresponding to *N,N*-dimethylformamide diethyl acetal in the chromatogram obtained from the *Test solution* is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 2:* not more than 0.2% is found.

TEST 2—

Diluted phosphoric acid, pH 2.0, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—~~Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase,* and dilute quantitatively,~~

▲Dilute the *Standard preparation* quantitatively,▲*USP30* and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL of flumazenil.

Chromatographic purity—

Mobile phase, System suitability solution, Standard solution, and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* for *Gemcitabine Hydrochloride*.

Test solution—Reconstitute the vial with an appropriate amount of water to achieve a solution of 2 mg per mL, based on the labeled content of gemcitabine.

In-Process Revision

Procedure—Proceed as directed in *Chromatographic purity* for *Gemcitabine Hydrochloride*. Calculate the amount of cytosine, expressed as a percentage of gemcitabine hydrochloride, by the formula:

$$0.1(263.20/299.66)(C_C V/L)(r_t / r_S)$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively; C_C is the concentration of USP Cytosine RS in the *Standard solution,* in µg per mL; V is the volume, in mL, of water used to reconstitute the vial; L is the labeled amount of gemcitabine in the vial, in mg; r_t is the peak response for cytosine in the *Test solution;* and r_S is the response for cytosine in the *Standard solution:* not more than 0.1% of cytosine is found. Similarly, calculate the amount of each impurity other than cytosine, expressed as a percentage of gemcitabine hydrochloride, by the formula:

$$0.1(263.20/299.66)(C_S V/L)(r_i / r_S)$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively; C_S is the concentration of USP Gemcitabine Hydrochloride RS in the *Standard solution,* in µg per mL; V is the volume, in mL, of water used to reconstitute the vial; L is the labeled amount of gemcitabine in the vial, in mg; r_i is the response for gemcitabine α-anomer or any other individual impurity

▲in the *Test solution;* ▲*USP30*
and r_S is the peak response for gemcitabine in the ~~*Test solution.*~~

▲*Standard solution.* ▲*USP30*
Not more than 0.1% of gemcitabine α-anomer is found; not more than 0.2% each of any other impurity is found; and the sum of all impurities is not more than 0.3%. Exclude from the sum of all impurities any peaks that are below the limit of quantitation (0.02%).

BRIEFING

Glipizide and Metformin Hydrochloride Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the tests for *Assay for glipizide* and *Related compounds (Glipizide)* is based on analyses performed with the Phenomenex Luna C8 brand of L7 column. The typical retention time for glipizide peak is about 14 minutes. The liquid chromatographic procedure in the tests for *Assay for metformin hydrochloride* and *Chromatographic purity (Metformin Hydrochloride)* is based on analyses performed with the Zorbax SB-Phenyl brand of L11 column. The typical retention time for metformin peak is about 7.5 minutes.

(PA4: E. Gonikberg; NL: W. Paul) RTS—42796-1

Add the following:

▲Glipizide and Metformin Hydrochloride Tablets

» Glipizide and Metformin Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of glipizide ($C_{21}H_{27}N_5O_4S$) and metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Glipizide RS. USP Glipizide Related Compound A RS. USP Metformin Hydrochloride RS. USP Metformin Related Compound A RS.*

Identification—

A: GLIPIZIDE—

Infrared Absorption ⟨197A⟩—Prepare the test specimen as follows. Transfer not fewer than 10 Tablets to a suitable container, add 10 mL of methanol, and shake to remove any tablet coating. Drain the methanol, add 20 mL of water, and stir until the Tablets dissolve (about 1 hour). Transfer the solution to a separatory funnel, and extract twice with 10-mL portions of chloroform, shaking for approximately 5 minutes. Transfer the lower organic layer into a beaker containing 3 to 4 g of anhydrous magnesium sulfate. Repeat the extraction of the solution in the separatory funnel two more times, each time using 20-mL portions of chloroform. Swirl the mixture in the beaker for about 1 minute. Filter, and collect the filtrate. Evaporate the solvent under vacuum, and dry the residue under vacuum for 4 hours at 105°. Mound

the residue onto a diamond cell: the IR spectrum so obtained exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Glipizide RS.

B: GLIPIZIDE—

The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for glipizide.*

C: METFORMIN HYDROCHLORIDE—

The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for metformin hydrochloride.*

Dissolution ⟨711⟩—[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

GLIPIZIDE—

Solution A, Solution B, and *Chromatographic system*—Prepare as directed in the *Assay for glipizide*.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for glipizide*.

Procedure—Inject about 50 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of glipizide related compound A (approximate relative retention time 0.92) and other individual impurities in the portion of Tablets taken by the formula:

$$100(1/F)(r_i / r_s)$$

in which F is the relative response factor for each impurity and is equal to 1.4 for glipizide related compound A and 1.0 for all other peaks; r_i is the peak response of each impurity; and r_s is the sum of the responses of all the peaks: not more than 2.0% of glipizide related compound A is found; not more than 0.5% of any other individual glipizide related impurity (eluting after approximately 8 minutes) is found; and not more than 1.0% total impurities, excluding glipizide related compound A, is found. [NOTE—Disregard the broad peak due to metformin that elutes before 8 minutes. Disregard any peak observed in the blank, and disregard any peak less than 0.05%.]

Chromatographic purity—

METFORMIN HYDROCHLORIDE—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay for metformin hydrochloride*.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for metformin hydrochloride.*

Procedure—Inject about 25 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Disregard any peak less than 0.05%, and disregard any peak observed in the blank.]

Assay for glipizide—

Ammonium phosphate buffer pH 8.0—Dissolve 2.6 g of dibasic ammonium phosphate in water, and dilute with water to 1000 mL. Adjust with ammonium hydroxide to a pH of 8.0.

Solution A—Prepare a degassed mixture of water, *Ammonium phosphate buffer pH 8.0,* and acetonitrile (14 : 5 : 1).

In-Process Revision

Solution B—Prepare a degassed mixture of acetonitrile, *Ammonium phosphate buffer pH 8.0,* and water (2 : 1 : 1).

Diluent—Use a mixture of acetonitrile and water (60 : 40).

Standard stock preparation—Transfer an accurately weighed quantity of USP Glipizide RS to a suitable low-actinic volumetric flask. Dissolve first in acetonitrile, using 60% of the final volume, by sonicating for about 20 minutes, then dilute with water to volume to obtain a solution having a known concentration of about 0.1 mg of glipizide per mL. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

Standard preparation—Transfer 25.0 mL of *Standard stock preparation* to a 200-mL low-actinic volumetric flask. Dilute first with 75 mL of *Diluent,* and bring to volume with water to obtain a solution having a known glipizide concentration of approximately 0.0125 mg per mL. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

System suitability preparation—Transfer approximately 5 mg of USP Glipizide Related Compound A RS to a 500-mL volumetric flask, and fill halfway with acetonitrile. Sonicate for about 30 minutes to dissolve, and dilute with acetonitrile to volume. Transfer 1 mL of this solution to a 50-mL low-actinic volumetric flask, and dilute with *Standard preparation* to volume.

Assay preparation—Transfer not fewer than 5 Tablets to a suitable volumetric flask, and fill halfway with *Diluent*. Sonicate for 30 minutes, and shake vigorously for another 30 minutes to dissolve. Dilute with water to volume, and mix to obtain a solution with a final glipizide concentration of about 0.0125 mg per mL. Pass a portion of this solution through a nylon or PVDF filter having a 0.2-µm porosity, and use the filtrate. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 223-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–3	100	0	isocratic
3–18	100→0	0→100	linear gradient
18–20	0	100	isocratic
20–22	0→100	100→0	linear gradient
22–30	100	0	re-equilibration

Chromatograph the *System suitability preparation* and the *Standard preparation,* and record the peak responses as directed for *Procedure*. For the *System suitability preparation,* the relative retention times are about 0.92 for glipizide related compound A and 1.0 for glipizide; the resolution, *R,* between glipizide related compound A and glipizide is greater than 1.2. For the *Standard preparation,* the relative standard deviation for replicate injections is less than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the glipizide peaks. Calculate the quantity, in mg per Tablet, of glipizide ($C_{21}H_{27}N_5O_4S$) by the formula:

$$CV(r_U / r_S) / N$$

in which C is the concentration, in mg per mL, of USP Glipizide RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation;* r_U and r_S are the glipizide

In-Process Revision

peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and *N* is the number of Tablets taken to prepare the *Assay preparation.*

Assay for metformin hydrochloride—

Solution A—Prepare a 50 mM hexanesulfonic acid solution by dissolving 9.41 g of sodium 1-hexanesulfonate in 1000 mL of water, and adjusting with trifluoroacetic acid to a pH of 2.0.

Solution B—Prepare a solution of water and acetonitrile (60 : 40).

Mobile phase—Prepare a degassed mixture of water, *Solution A,* and *Solution B* (50 : 30 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent pH 2.0—Prepare a mixture of water, *Solution A*, and acetonitrile (63 : 30 : 7).

Standard preparation—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Diluent pH 2.0* to obtain a solution having a known concentration of about 0.1 mg per mL.

System suitability preparation—Dissolve a suitable quantity of USP Metformin Related Compound A RS in water to obtain a solution containing about 5 µg per mL. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with the *Standard preparation* to volume.

Assay preparation—Quantitatively dilute a portion of the *Assay preparation,* obtained as directed for *Assay for glipizide,* with *Diluent pH 2.0,* to obtain a solution having an expected concentration of about 0.1 mg of metformin hydrochloride per mL, based on the label claim. Pass a portion of this solution through a nylon or PVDF filter having a 0.2-µm porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.26 for metformin related compound A and 1.0 for metformin; the resolution, *R,* between the two peaks is not less than 3.0; and the relative standard deviation for replicate injections, determined from the metformin peak, is less than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) by the formula:

$$CVD(r_U / r_S)/N$$

in which *C* is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation*, as prepared under the *Assay for glipizide; D* is the dilution factor of the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and *N* is the number of Tablets used to prepare the *Assay preparation.* ▲*USP30*

In-Process Revision

BRIEFING

Glucagon, *USP 28* page 905 and page 3491 of the *Second Supplement.* Several changes in the *Assay* are proposed. Because of variability in this bioassay, it is proposed to allow for changes in concentrations of the *Standard preparations* and the *Assay preparations* to allow the *Assay* to be performed in a more linear portion of the response when needed. It is also proposed, on the basis of data and analysis received, to allow full curve analysis using validated nonlinear statistical methods. Finally, on the basis of analysis of data received from several laboratories, it is also proposed to change the criterion for the determination of linearity. It is proposed to implement these revisions via the *Second Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2006.

(BB PP: L. Callahan) RTS—43267-1; 43280-1

Change to read:

Assay—[NOTE—All buffers have a final pH of 7.4, unless otherwise indicated.

•The concentration range of the *Standard preparations* and the *Assay preparations* may be modified to fall within the linear range of the *Assay.* The calculations should be adjusted accordingly. Alternatively, full curve analysis using validated nonlinear statistical methods can be used, provided that parallelism is demonstrated when comparing the responses of the *Standard preparations* and the *Assay preparations*.]•2

HEPATOCYTE PREPARATION—

Calcium-free perfusion buffer with dextrose—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 1.80 g of dextrose, 0.19 g of edetic acid, and 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid. Oxygenate prior to circulation.

Collagenase buffer—Prepare a solution containing, in each L, 3.62 g of sodium chloride, 23.83 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.35 g of potassium chloride, 0.52 g of calcium chloride, and 1.8 g of dextrose. Adjust to a pH of 7.6, and oxygenate. Immediately before perfusion, dissolve a quantity of collagenase in this solution to obtain a concentration of 0.02% to 0.05%.

Wash buffer—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 0.19 g of edetic acid, 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.22 g of calcium chloride, and 0.12 g of magnesium sulfate.

Incubation buffer—Prepare a solution containing, in each L, 6.19 g of sodium chloride, 0.35 g of potassium chloride, 0.22 g of calcium chloride, 0.12 g of magnesium sulfate, 0.16 g of monobasic potassium phosphate, 11.915 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, and 1% bovine serum albumin (BSA). Adjust to a pH of 7.5.

Test animals—Male Sprague-Dawley rats are maintained on a standard rat chow diet and freely given water. On the morning of the test, select a healthy rat weighing approximately 300 g, and administer 100 Units of Heparin Sodium subcutaneously.

Procedure—[NOTE—Conduct this procedure in the morning to ensure that the rat has optimal glycogen in its liver.] Anesthetize the rat with an appropriate anesthetic. Open the abdominal cavity, and isolate the portal vein. Insert an angiocatheter connected to a perfusion pump, and tie into the portal vein at the general location of the lienal branch. Start the perfusion (25 mL per minute) in situ with *Calcium-free perfusion buffer with dextrose,* equilibrated with oxygen, at a temperature of 37°. As the liver enlarges, cut the inferior vena cava to allow pressure equilibrium. [NOTE—About 300 mL of the perfusate is needed to clear the liver of red blood cells at a flow rate of 30 to 60 mL per minute.] Then circulate *Collagenase buffer* at a flow rate of 30 to 60 mL per minute for about 10 minutes. The exact concentration of collagenase (within the range of 0.02% to 0.05%) is determined empirically for each lot of enzyme. The concentration of collagenase is that necessary to consistently cause a breakdown of the liver about 10 minutes after initial entry of the *Collagenase buffer* into the liver. When the liver significantly increases in size, changes color and consistency, and starts to leak perfusate out of the lobes, change the system to the oxygenated prewarmed *Wash buffer.* About 100 mL of *Wash buffer* is needed to wash the liver of collagenase at a flow rate of 25 mL per minute. Surgically remove the liver from the animal and place in a prewarmed tray containing oxygenated *Wash buffer* (37°). Gently comb the liver with a stainless steel, fine-toothed comb to free the hepatocytes. Wash the hepatocytes with *Wash buffer,* and filter through cheesecloth (or a 150-µm mesh polyethylene net) into a plastic beaker. Centrifuge the cell suspension for about 2 minutes at about 25 × *g* to form a loosely packed pellet. Discard the supernatant, and resuspend the pellet in *Wash buffer.* Repeat the washing procedure twice for a total of three washes. Resuspend the final pellet in 100 to 200 mL of *Incubation buffer,* depending on cell yield. [NOTE—If the *Assay* procedure is interrupted, cool the cells by collecting the cells in a beaker placed in ice. The cells are washed with ice-cold *Wash buffer,* and stored on ice until ready for use. At that point the cells are pelleted once more, and resuspended in ice-cold *Incubation buffer.*]

Suitability—The concentrations of cells may vary due to the collagenase activity and the viability of the hepatocytes. To check cell viability and to determine viable cell concentration, dilute duplicate 100-µL aliquots of cell suspension with 400 µL of *Wash buffer* and 500 µL of isotonic 0.4% trypan blue. The aliquots are counted in a hemocytometer. The cells are suspended in *Incubation buffer* to obtain a viable cell concentration of not less than 3×10^6 per mL. Count several distinct fields. [NOTE—Viable cells are those cells that exclude the trypan blue.]

NEGATIVE CONTROL SOLUTION—Prepare a solution containing 0.5% BSA in sterile water.

INCUBATION FLASKS—Use 25-mL conical flasks, the bottoms of which have been heated and pushed inward to form a conically raised center.

STANDARD PREPARATIONS—In duplicate, dissolve a suitable quantity of USP Glucagon RS, accurately measured, in 0.01 N hydrochloric acid or other suitable diluent to obtain a solution containing 1.0 USP Glucagon Unit per mL. All dilutions thereafter are made using 0.5% BSA (w/v) in water. Accurately dilute measured volumes of each solution with *Negative control solution* to obtain five concentrations—200, 100, 50, 25, and 12.5 micro-Units per

mL—of each solution *(Standard preparations).* Pipet 0.2 mL of each *Standard preparation* into separate *Incubation flasks.* Pipet 0.2 mL of *Negative control solution* into each of two flasks *(Negative control solutions 1* and *2).* Then add the hepatocytes into each of the 12 flasks.

ASSAY PREPARATIONS—Using accurately weighed quantities of Glucagon, proceed as directed for *Standard preparations.*

D-GLUCOSE DETERMINATION—

Standard stock solution—Transfer 2.0 g of USP Dextrose RS, accurately weighed, to a 200-mL volumetric flask, and dissolve in and dilute with saturated benzoic ■acid■2S *(USP28)* solution to volume.

Standard solutions—Transfer suitable quantities of *Standard stock solution* to three flasks, and dilute with saturated benzoic acid solution to obtain solutions having known concentrations of 0.5, 1.0, and 1.5 times the typical sample glucose concentration.

Potassium ferrocyanide solution—Dissolve 1.25 g of trihydrate potassium ferrocyanide in 125 mL of *Sterile Water for Injection*.

System suitability—Analyze the *Potassium ferrocyanide solution,* the *Standard solutions,* and five replicates of the middle *Standard solution.* Prepare a standard curve using the *Standard solutions* as directed for *Procedure:* the relative standard deviation of the standard curve is not more than 2.0%; the response of the *Potassium ferrocyanide solution* is not more than 30 mg per L; and the relative standard deviation is not more than 2.0% for the replicate analyses of the middle *Standard solution.*

PROCEDURE—Dispense 5 mL of *Hepatocyte preparation* into the special incubation flasks in sequence from high glucagon concentration to low glucagon concentration, alternating the *Standard preparations* with the *Assay preparations.* The flasks are swirled in an orbiting water bath at 125 rpm at 30° for approximately 30 to 60 minutes. [NOTE—The exact incubation time must be determined to optimize the signal-to-noise ratio.] Following incubation, place 0.5- to 1.0-mL aliquots, in duplicate, from each incubation flask into labeled tubes, and centrifuge at 12,500 × *g.* Determine the percentage of glucose concentration in each flask's supernatant.

To conform to the linear range of the instrument being used, it may be necessary to adjust by dilution each of the preparations. Use a glucose analyzer that has demonstrated appropriate specificity, accuracy, precision, and linear response over the range of concentrations being determined. [NOTE—A suitable analyzer may use an immobilized, oxidase-enzyme membrane or jacket-generating hydrogen peroxide, which is then detected at the electrode.] Perform the glucose analysis in the following sequence: *Negative control solution 1, Standard preparations, Assay preparations,* and *Negative control solution 2.* Determine the percentage of glucose against the *Negative control solution* for each preparation.

CALCULATIONS—

Linearity test—Use an analysis of variance (ANOVA) with one sample assayed against a standard, and using two replicates each, construct a table (see *Table 1*). Compare the value of the ratio $MSNL/MSRES_1$ to a critical value obtained from a table for an *F* distribution with $m-2$ and $3m-3$ degrees of freedom, where m is the number of dose levels for each preparation. If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity (ratio value is lower than the critical value), then proceed to the test for parallelism. If the ratio exceeds the critical value (significance level of ~~0.05),~~

•0.025),•2

the nonlinearity is statistically significant and the test is repeated, discarding the results from either the highest or lowest dose of both the *Standard preparations* and the *Assay preparations* (four dose levels). If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity, then proceed to the test for parallelism.

Table 1. ANOVA for the Rat Hepatocyte Assay for Glucagon

Source	Degrees of Freedom	SS (Sum of Squares)	MS (Mean Square)
Preparations	1	SSPREP	MSPREP
Replicates	1	SSREP	MSREP
Linear Slope	1	SSLIN	MSLIN
$Residual_3$	$4m-4$	$SSRES_3$	$MSRES_3$
Nonparallelism	1	SSNP	MSNP
$Residual_2$	$4m-5$	$SSRES_2$	$MSRES_2$
Nonlinearity	$m-2$	SSNL	MSNL
$Residual_1$	$3m-3$	$SSRES_1$	$MSRES_1$
TOTAL	$4m-1$	SST	

Parallelism test—Compare the ratio $MSNP/MSRES_2$ to a critical value obtained from an *F* distribution having 1 and $4m-5$ degrees of freedom. If the ratio $MSNP/MSRES_2$ does not indicate the presence of significant nonparallelism, then the assay is considered valid. Use the appropriate dose levels for the estimation of the relative potency.

Relative potency—Calculate the relative potency, *R,* of the *Assay preparations* as compared with the *Standard preparations* as follows.

(1) X_j is defined as the $\log_{10}$ of the j^{th} dose of the *Standard preparations* or the *Assay preparations.* The glucagon dose varies from 12.5 to 200 × 10^{-6} USP Glucagon Units per mL. For ease in the subsequent calculations, these doses are respectively represented by 1 through 5, as shown in the table below.

j	1	2	3	4	5
Dose	12.5	25	50	100	200
X_j	1.10	1.40	1.70	2.00	2.30

(2) To differentiate between the *Standard preparations* and the *Assay preparations* in the calculations, the subscript *i* will be used, with $i = 1$ to designate the *Standard preparations* and $i = 2$ to designate the *Assay preparations.* Y_{ijk} will denote the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the i^{th} preparation. For example, Y_{1jk} is the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the appropriate *Standard preparation;* Y_{11k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Standard preparation;* and Y_{21k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Assay preparation.* Dose 1 represents a glucose dose of 12.5 × 10^{-6} USP Glucagon Units per mL. Finally, Y_{132} represents the glucose concentration associated with the 2nd replicate of dose 3 for the *Standard preparation.*

(3) Y_S and Y_t denote the average glucose concentrations for the *Standard preparations* and the *Assay preparations,* respectively.

(4) Calculate the least-squares slope estimate, *b,* for a linear regression relating the Y_{ijk}'s to the X_j's as follows: $b = S_{xy}/S_{xx}$, with S_{xy} and S_{xx} calculated using the equations in *Table 2*.

(5) The log potency, *M,* is calculated using $M = -1[(Y_S - Y_t)/b]$.

(6) R = antilog *(M).*

(7) Calculate the confidence limits (upper and lower) for the relative potency, *R,* using the value $s^2 = MSRES_3$ (see *Table 1* and *Table 2*) as follows. Obtain *t* from a table for a *t* distribution having $4m-4$ degrees of freedom. For the 95% limits, the *t* values can be obtained from *Table 9* under *Design and Analysis of Biological Assays* ⟨111⟩.

In-Process Revision

Table 2. Equations for Calculating the Sums of Squares in the Analysis of Variance*

$$Y_{i..} = \sum_{jk}\sum y_{ijk}$$

$$Y_{.j.} = \sum_{ik}\sum y_{ijk}$$

$$Y_{..k} = \sum_{ij}\sum y_{ijk}$$

$$CF = \frac{\left(\sum_{ijk}\sum\sum y_{ijk}\right)^2}{4m}$$

$$S^S_{xy} = \sum_{jk}\sum x_j y_{ijk} - \frac{\left(\sum_j x_j\right)(Y_{1..})}{m}$$

$$S^T_{xy} = \sum_{jk}\sum x_j y_{2jk} - \frac{\left(\sum_j x_j\right)(Y_{2..})}{m}$$

$$S_{xy} = S^S_{xy} + S^T_{xy}$$

$$S^S_{xx} = 2\sum_j x_j^2 - \frac{2\left(\sum_j x_j\right)^2}{m}$$

$$S^T_{xx} = S^S_{xx}$$

$$S_{xx} = S^S_{xx} + S^T_{xx}$$

$$SSPREP = \frac{\sum_i Y^2_{i..}}{2m} - CF$$

$$SSREP = \frac{\sum_k Y^2_{..k}}{2m} - CF$$

$$SSLIN = \frac{\left(S_{xy}\right)^2}{S_{xx}}$$

$$SST = \sum_{ijk}\sum\sum y^2_{ijk} - CF$$

$$SSRES_3 = SST - SSPREP - SSREP - SSLIN$$

$$SSNP = \frac{\left(S^S_{xy}\right)^2}{S^S_{xx}} + \frac{\left(S^T_{xy}\right)^2}{S^T_{xx}} - SSLIN$$

$$SSRES_2 = SSRES_3 - SSNP$$

$$SSNL = \frac{\sum_j Y^2_{.j.}}{4} - SSLIN - CF$$

$$SSRES_1 = SSRES_2 - SSNL$$

* Refer to the *Calculations* for section on *Relative Potency* for the definitions of x_j and y_{ijk}.

NOTE—For confidence limits having other probability levels (i.e., $100(1 - a)$ %), the right tail t critical value having $a/2$ area to its right is used.

Calculate $g = t^2S^2 / b^2S_{xx}$

and $F = (ts / b)\sqrt{(1/m)(1-g) + (M^2 / S_{xx})}$,

and calculate

$$M_L = (M - F)/(1 - g),$$

and

$$M_U = (M + F)/(1 - g),$$

where M is the log potency and M_L and M_U are the log potency lower and upper confidence limits. The lower and upper confidence limits for the relative potency, R, are given by

$$RL = \text{antilog}\,(M_L)$$

$$RU = \text{antilog}\,(M_U)$$

It meets the requirements if the potency is between 0.8 and 1.25 USP Glucagon Units per mg, and the confidence interval width at $P = 0.95$ does not exceed 45% of the computed potency. ■Repeat the assay if the confidence interval width exceeds 45% of the computed potency.■2S *(USP28)*

NOTES—This analysis pertains to one sample assayed against a standard, using two replicates each.

The number of dose levels for each preparation is denoted by *m*. *Table 2* gives the equations for calculating the SS terms.

In each row of the ANOVA table, the MS is obtained by dividing the SS term by the degrees of freedom.

BRIEFING

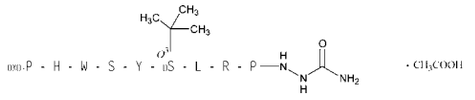
Goserelin Acetate, page 410 of *PF* 31(2) [Mar.–Apr. 2005]. On the basis of comments received, it is proposed to change the name of the test for *Identification* to *Amino acid content.* The requirements of the test have also been changed to require integration of the ^{13}C NMR signals to allow quantitation of the individual amino acids present in goserelin acetate.

(BB PP: L. Callahan) RTS—43328-1

In-Process Revision

Add the following:

▲Goserelin Acetate



$C_{59}H_{84}N_{18}O_{14} \cdot xC_2H_4O_2$

Luteinizing hormone-releasing factor (pig), 6-[*O*-(1,1-dimethylethyl)-D-serine]-10-deglycinamide-, 2-(aminocarbonyl)hydrazide, acetate (salt) [*145781-92-6*].

1-(5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-*tert*-butyl-D-seryl-L-leucyl-L-arginyl-L-prolyl)-semicarbazide (Goserelin) 1269.41 [*65807-02-5*].

» Goserelin Acetate is a synthetic nonapeptide analog of the hypothalmic decapeptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate salt. It contains not less than 94.5 percent and not more than 103.0 percent of goserelin ($C_{59}H_{84}N_{18}O_{14}$), calculated on the anhydrous and acetic acid-free basis.

Packaging and storage—Preserve in a tight, light-resistant container, and store in a refrigerator.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Goserelin Acetate RS. USP Goserelin Related Compound A RS. USP Goserelin Validation Mixture RS.*

~~**Identification—**~~

~~**A:** *Nuclear Magnetic Resonance* ⟨761⟩—~~

~~*Standard solution*—Prepare a 10% w/v solution of USP Goserelin Acetate RS in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.~~

~~*Test solution*—Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.~~

~~*Procedure*—Obtain a ^{13}C, proton-decoupled NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions should be qualitatively similar, and all the resonances from the spectrum of the *Standard solution* should be present in the spectrum of the *Test solution* and have the same chemical shift values; any other resonances in the spectrum of the *Test solution* should be identified.~~

~~**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*~~

Specific rotation ⟨781S⟩**:** between –52° and –56°.

Test solution: 2 mg per mL, in water, calculated on the anhydrous and acetic acid-free basis.

Bacterial endotoxins ⟨85⟩—It contains not more than 16 USP Endotoxin Units per mg of goserelin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

Water, *Method I* ⟨921⟩**:** not more than 10.0%.

Limit of acetic acid—

Mobile phase—Transfer 49.04 g of sulfuric acid to a 1000-mL volumetric flask, dilute with water to volume, and mix. Accurately transfer 20 mL of this solution to a 2000-mL volumetric flask, dilute with water to volume, mix, filter, and degas.

Test solution—Dissolve about 20 mg of Goserelin Acetate, accurately weighed, in 2 to 3 mL of *Mobile phase*. Connect a 1-mL cartridge containing L44 packing to a 1-mL cartridge containing L2 packing, which is then attached to a suitable vacuum apparatus. With the vacuum applied,

In-Process Revision

wash the cartridge combination with 2 mL of methanol followed by 15 mL of *Mobile phase,* and discard the washings. Quantitatively apply the solution containing Goserelin Acetate to the cartridge combination, and wash through the cartridge system with several small volumes of *Mobile phase*. Collect the solution and washings in a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Standard solution—Transfer 2.0 mL of glacial acetic acid to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a standard stock solution. Transfer 5.0 mL of the standard stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—[NOTE—Condition the column for about 24 hours until a stable baseline is obtained.] The liquid chromatograph is equipped with a 206-nm detector and a 7.8-mm × 30-cm column that contains packing L17. The column temperature is maintained at 65°, and the flow rate is about 0.8 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time is about 11 minutes for acetic acid; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.1%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of acetic acid in the portion of Goserelin Acetate taken by the formula:

$$(1.049/5)(r_U / r_S)(1/W)$$

in which 1.049 is the weight per mL, in g, of glacial acetic acid; W is the sample weight of Goserelin Acetate, in g, taken to prepare the *Test solution* and corrected (for purposes of the calculation) to eliminate the water content, which is determined immediately prior to the test; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The content of acetic acid is between 4.5% and 15.0%.

Related compounds—

Mobile phase, Standard preparation, Diluted standard preparation, Resolution solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Diluted test solution—Transfer 1 mL of the *Test solution* into a 100-mL volumetric flask, and dilute with water to volume.

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution, Diluted test solution, Resolution solution,* and *System suitability solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of goserelin-related impurities in the portion of Goserelin Acetate taken by the formula:

$$r_i / r_S$$

in which r_i is the peak area response for any individual impurity in the *Test solution;* and r_S is the peak area response of the main goserelin peak in the *Diluted test solution:* not more than 1.0% of decarbamoylgoserelin is found, not more than 0.5% of any other impurity is found, and not more than 2.5% of total impurities is found.

Amino acid content, *Nuclear Magnetic Resonance* ⟨761⟩—[NOTE—Concentrations of Goserelin in both the *Standard solution* and the *Test solution* must be the same (within 5% of each other) but can be adjusted based on the quality of the ^{13}C spectrum obtained. The spectra must be acquired under the same conditions for both the *Standard solution* and the *Test solution*. The spectra obtained are of

sufficient quality to allow quantification of the integrals of the resonances specified below to be obtained. Integrals and spectra of both the *Standard solution* and the *Test solution* can be repeated and averaged.]

Standard solution—Dissolve USP Goserelin Acetate RS in deuterium oxide to obtain a known concentration of about 10% w/v, and adjust with deuterated acetic acid-d4 to a pH of 4.

Test solution—Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.

Procedure—Obtain a ^{13}C, proton-decoupled NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions are qualitatively similar, and all the resonances from the spectrum of the *Standard solution* are present in the spectrum of the *Test solution* and have the same chemical shift values; identify any other resonances in the spectrum of the *Test solution.* The relative amino acid ratio between the *Standard solution* and the *Test solution* can be calculated as follows. Integrate the resonances at the approximate ppm corresponding to each amino acid in the following table.

Amino Acids	Resonances (ppm)
Azo-glycine	162.2
Histidine	118.4
Tyrosine	116.7
tert-Butyl serine	62.5
Serine	62.2
Tryptophan	55.7
Arginine	41.8
Pyroglutamic acid	26.3
Proline	26.0
Leucine	23.5

Calculate the ratio of each of the amino acids from the integrals of the *Standard solution* and the *Test solution* by the formula:

$$r_U / r_S$$

in which r_U and r_S are the integrals of the resonances of a designated amino acid obtained from the *Test solution* and the *Standard solution,* respectively. The resulting ratios fall within the following limits: histidine, tyrosine, *tert*-butyl serine, serine, tryptophan, arginine, pyroglutamic acid, proline, and leucine 0.9 to 1.1; azo-glycine 0.8 to 1.2.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (1600 : 400 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Goserelin Acetate RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Diluted standard preparation—Transfer 1 mL of the *Standard preparation* to a 10–mL volumetric flask, and dilute with water to volume.

Assay preparation—Transfer about 25 mg of Goserelin Acetate, accurately weighed, to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Resolution solution—Dissolve the contents of a vial of USP Goserelin Related Compound A RS in water to obtain a concentration of 0.1 mg per mL, and mix with an equal volume of *Diluted standard preparation.*

System suitability solution—Dissolve the contents of a vial of USP Goserelin Validation Mixture RS with 1 mL of water.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6–mm × 15–cm column that contains 3.5-µm packing L1. The column temperature is maintained between 50° and 55°, and the flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the retention time for goserelin is between 40 and 50 minutes, the relative retention times are about 0.67 for 4-D-ser-goserelin, 0.89 for decarbamoylgoserelin, 0.92 for 5-D-tyr-goserelin, 0.94 for 2-D-his-goserelin, and 1.0 for goserelin; and the resolution, *R,* between 4-D-ser-goserelin and goserelin is not less than 7.0. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* two peaks, corresponding to decarbamoylgoserelin and 2-D-his-goserelin and eluting prior to the principal peak, are visible; three peaks eluting after the principal peak are visible; the column efficiency for the principal peak is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of goserelin ($C_{59}H_{84}N_{18}O_{14}$) in the portion of Goserelin Acetate taken (where sample weight has been corrected for water and acetic acid content, both determined immediately prior to the assay) by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Goserelin Acetate RS in the *Standard preparation;* and r_U and r_S are the goserelin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

BRIEFING

Hepatitis B Virus Vaccine Inactivated, *USP 28* page 943—See briefing under *Diphtheria Toxin for Schick Test*.

(BB VV: T. Morris) RTS—42382-2

Delete the following:

▲~~Hepatitis B Virus Vaccine Inactivated~~

~~» Hepatitis B Virus Vaccine Inactivated is a sterile preparation consisting of a suspension of particles of Hepatitis B surface antigen (HBsAg) isolated from the plasma of HBsAg carriers; treated with pepsin at pH 2, 8 M urea, and 1 : 4,000 formalin so as to inactivate any hepatitis B virus and any representative viruses from all known virus groups that may be present; purified by ultracentrifugation and biochemical procedures and standardized to a concentration of 35 µg to 55 µg of Lowry (HBsAg) protein per mL. The preparation is adsorbed on aluminum hydroxide and diluted to a concentration of 20 µg Lowry protein per mL or other appropriate concentration, depending on the intended use. The Vaccine meets the requirements for potency in animal tests using mice and by a quantitative parallel line radioimmunoassay. It contains not more than 0.62 mg of aluminum per mL and not more than 0.02 percent of residual free formaldehyde. It contains thimerosal as a preservative. It meets the requirements of the tests for pyrogen and for general safety (see *Safety Tests—General* under *Biological Reactivity Tests, In Vivo* ⟨88⟩).~~

~~**Packaging and storage**—Preserve at a temperature between 2° and 8°.~~

~~**Expiration date**—The expiration date is 3 years from the date of manufacture, the date of manufacture being the date on which the last valid potency test was initiated.~~

In-Process Revision

~~**Labeling**—Label it to state the content of HBsAg protein per recommended dose. Label it also to state that it is to be shaken before use and that it is not to be frozen.~~ ▲*USP30*

BRIEFING

Sodium Iodide I 123 Capsules, *USP 28* page 1033. It is proposed to include in the Definition a new method of I 123 generation, proton irradiation of enriched xenon 124.

BRIEFING

Diluted Isosorbide Mononitrate, page 3495 of the *Second Supplement,* and page 1060 of *PF* 31(4) [July–Aug. 2005]. It is proposed to delete the tests for *pH,Water*, and *Residue on ignition* as formulation-specific, and to make changes in the tests for *Identification, Related compounds,* and the *Assay* to accommodate different formulations.

In addition, it is proposed to revise the *USP Reference standards* section to change the name of USP Isosorbide Mononitrate RS to USP Diluted Isosorbide Mononitrate RS. Also, a *Note* is being added to identify the Reference Standards that are dry mixtures of an active component with a suitable excipient.

In the absence of any significant adverse comments, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 29-NF 24,* with an official date of April 1, 2006.

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of absolute alcohol and toluene (8 : 2).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 0.5% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1 : 1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Isosorbide mononitrate related compound A standard solution—Prepare as directed for *Isosorbide mononitrate related compound A standard preparation* in the *Assay.*

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate, and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL.

Standard solution—Transfer a quantity of USP

•Diluted•2
Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard solution* and a volume of *Isosorbide dinitrate standard stock solution,* and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of ~~USP Isosorbide Mononitrate RS~~

•isosorbide mononitrate•2
per mL, 0.005 mg of isosorbide mononitrate related compound A per mL, and 0.005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

~~$5556(C/W)(r_U/r_S)$~~

•$100(CV/W)(r_U/r_S)$•2

in which C is the concentration, in mg per mL, of ~~the appropriate Reference Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS,~~

•isosorbide mononitrate related compound A or isosorbide dinitrate, as appropriate,•2
in the *Standard solution; W* is the ~~weight, in mg,~~

•amount, in mg, of isosorbide mononitrate in the portion•2
of Diluted Isosorbide Mononitrate used to prepare the *Test solution*,

•based on the label claim; V is the volume, in mL, of the *Test solution;*•2
and r_U and r_S are the peak areas of the corresponding components obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak area for each other impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks: not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than 0.5% of total impurities is found, the results for *Test 1* and *Test 2* being considered.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP

•Diluted•2

In-Process Revision

Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg

•of isosorbide mononitrate•2
per mL.

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

Resolution solution—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* 1.0 mL of *Standard preparation,* and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation—Transfer ~~about 110 mg of Diluted Isosorbide Mononitrate, accurately weighed,~~

•an accurately weighed amount of Diluted Isosorbide Mononitrate, equivalent to 100 mg of isosorbide mononitrate,•2
to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

~~$50C(r_U / r_S)$~~

•$CV(r_U / r_S)$•2

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;*

•V is the volume, in mL, of the *Assay preparation;*•2
and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ivermectin, *USP 28* page 1093 and page 3250 of the *First Supplement.* On the basis of comments received, it is proposed to change the test conditions and the *Test solution* in the test for *Specific rotation.* In the test for *Limit of alcohol and formamide,* it is proposed to change the preparation of *Standard solutions 1, 3,* and *4* and the preparation of the *Test solution;* and to make changes in the *Chromatographic system* and the *Procedure.*

in which *C* is the concentration, in mL per mL, of alcohol or formamide, as appropriate, in the *Test solution; D* is the density of alcohol (0.79 g per mL) or formamide (1.13 g per mL); and *W* is the weight, in g, of Ivermectin taken: not more than 5.0% of alcohol and 3.0% of formamide are found.▲*USP30*

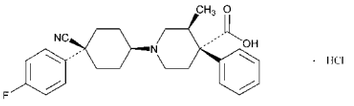
BRIEFING

Levocabastine Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on the *Levocabastine Hydrochloride* monograph in the *European Pharmacopoeia 5.0,* is being proposed.

(PA1: K. Russo) RTS—43014-1

Add the following:

▲Levocabastine Hydrochloride



$C_{26}H_{29}FN_2O_2 \cdot HCl$ 456.98

4-Piperidinecarboxylic acid, 1-[4-cyano-4-(4-fluorophenyl)cyclohexyl]-3-methyl-4-phenyl-, monohydrochloride, (–)-[1(*cis*),3α,4β]-.

(–)-*trans*-1-[*cis*-4-Cyano-4-(*p*-fluorophenyl)cyclohexyl]-3-methyl-4-phenylisonipecotic acid monohydrochloride [*79547-78-7*].

» Levocabastine Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of $C_{26}H_{29}FN_2O_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Protect from light.

USP Reference standards ⟨11⟩—*USP Levocabastine Hydrochloride RS. USP Levocabastine Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements of the tests for *Chloride* ⟨191⟩.

C: It meets the requirement for *Specific rotation* ⟨781S⟩.

Specific rotation ⟨781S⟩**:** between –102° and –106° at 20°.

Test solution: 10 mg per mL, in methanol.

Loss on drying ⟨731⟩—Dry about 1.000 g of sample at 105° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%, based on a sample weight of about 1.000 g.

Related compounds—[NOTE—Prepare solutions immediately before use.]

Diluent—Prepare an aqueous solution containing about 2 mg per mL of sodium hydroxide.

pH 9.0 Buffer—Dissolve about 1.39 g of boric acid in water, and adjust with 1 N sodium hydroxide to a pH of 9.0. Dilute with water to 100 mL.

Run buffer—Dissolve about 1.08 g of sodium dodecyl sulfate and about 650 mg of hydroxypropyl-β-cyclodextrin in 5 mL of isopropyl alcohol, then dilute with *pH 9.0 Buffer* to 50 mL.

In-Process Revision

System suitability solution—Dissolve suitable quantities of USP Levocabastine Hydrochloride RS and USP Levocabastine Related Compound A RS in *Diluent* to obtain a solution containing about 0.0125 mg per mL of each compound.

Standard solution—Dilute 5.0 mL of the *Test solution* with *Diluent* to 100 mL. Dilute 1.0 mL of this solution with *Diluent* to 10 mL to obtain a solution containing about 0.0125 mg of levocabastine hydrochloride per mL.

Test solution—Transfer about 25 mg of Levocabastine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

System setup (see *Capillary Electrophoresis* ⟨727⟩)—The capillary electrophoresis system is equipped with a 214-nm detector and a 75-µm × 50-cm uncoated fused-silica capillary column. The temperature is maintained at 50°. The current is programmed as follows.

Time (minutes)	Current (µA)
0–0.17	0→75
0.17–15	75→130
15–40	130
40–60	130→200

Equilibrate the capillary column with the *Diluent* for 2 minutes, then equilibrate with the *Run buffer* for at least 5 minutes. Inject the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative migration times are approximately 1.07 for levocabastine related compound A and 1.0 for levocabastine; the resolution, *R*, between levocabastine and levocabastine related compound A is not less than 4. If necessary, adjust the current gradient to achieve the required resolution.

Procedure—Separately inject equal volumes (pressure of 3450 Pa for 5 seconds) of the *Diluent* (as the blank), the *Standard solution,* and the *Test solution,* and record the peak responses: the area for any peak in the *Test solution,* other than the major peak, is not greater than the major peak area obtained from the *Standard solution* (0.5%); and the sum of all peak areas in the *Test solution,* except for the major peak, is not greater than twice the major peak area obtained from the *Standard solution* (1.0%). Disregard any peak originating from the *Diluent*. Disregard any peak with an area of less than 0.1 times the major peak area obtained from the *Standard solution* (0.05%).

Assay—Dissolve about 175 mg of Levocabastine Hydrochloride, accurately weighed, in 50 mL of alcohol, and add 5.0 mL of 0.01 N hydrochloric acid. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. The volume of titrant required to titrate Levocabastine Hydrochloride is the difference between the first and third endpoints. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide VS is equivalent to 22.85 mg of $C_{26}H_{29}FN_2O_2 \cdot HCl$. ▲*USP30*

BRIEFING

Lindane, *USP 28* page 1136. It is proposed to replace the nonspecific titration method in the *Assay* with a more selective gas chromatographic method. The analysis is performed with a J&W Scientific fused-silica column coated with a 1-µm phase G46.

(PA7b: B. Davani) RTS—43022-1

In-Process Revision

Change to read:

» Lindane is the gamma isomer of hexachlorocyclohexane. It contains not less than 99.0 percent and not more than ~~100.5~~

▲101.0▲*USP30*
percent of lindane (γ-$C_6H_6Cl_6$).

Change to read:

Assay— ~~Transfer about 400 mg of Lindane, accurately weighed, to a wide-mouth, glass-stoppered, 250-mL conical flask, add 20 mL of alcohol, and warm on a steam bath until solution is complete. Cool, add 20 mL of a 1 in 20 solution of potassium hydroxide in alcohol, swirl gently, and allow to stand for 10 minutes. Dilute with water to about 100 mL, neutralize with 2 N nitric acid, and add 5 mL in excess. Pipet into the solution 50 mL of 0.1 N silver nitrate VS, then add 5 mL of nitrobenzene, and shake vigorously. Add ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 0.1 N silver nitrate is equivalent to 9.694 mg of $C_6H_6Cl_6$.~~

▲*Internal standard solution*—Dissolve *n*-octadecane in methylene chloride to obtain a solution having a concentration of about 0.5 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Lindane RS in *Internal standard solution* to obtain a solution having a known concentration of about 2 mg per mL.

System suitability solution—Prepare solutions of α-benzene hexachlorides (BHC) at 1000 µg per mL of methanol, *β*-BHC at 1000 µg per mL of acetone, and *δ*-BHC at 1000 µg per mL of methanol. Transfer 100 µL each of α- BHC, *β*-BHC and *δ*-BHC solutions to a 4-mL conical vial, and evaporate under a stream of nitrogen to dryness. Add to the vial a 100-µL aliquot of the *Standard preparation*. Insert the stopper, and shake vigorously to dissolve the residue.

Assay preparation—Transfer about 10 mg of Lindane, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with methylene chloride to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused-silica column coated with a 1-µm phase G46. The chromatograph is programmed as follows. The initial column temperature is maintained at 120° for 1 minute. Then, the temperature is increased at a rate of 20° per minute to 150°, and then ramped at a rate of 10° per minute to 280° and maintained at that temperature for 4 minutes. The injection port and detector temperatures are maintained at 300°. The injection split ratio is 50 : 1. Chromatograph the *Standard preparation* and the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times for *n*-octadecane and lindane are about 0.85 and 1.0, respectively. [NOTE—Typical retention times for α-BHC, *β*-BHC, γ-BHC, *δ*-BHC, and *n*-octadecane are 15.7, 17.8, 16.5, 18.8, and 13.9 minutes, respectively.] The resolution, *R,* between *n*-octadecane and α-BHC is not less than 21, between lindane (γ-BHC) and α-BHC is not less than 9, between *β*-BHC and lindane is not less than 14, and between *δ*-BHC and *β*-BHC is not less than 8; the tailing factors for *n*-octadecane and lindane are less than 1.5 and 1.2, respectively; and the relative standard deviation of the ratios of peak area responses of lindane to *n*-octadecane for replicate injections of *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of γ-$C_6H_6Cl_6$ in the portion of Lindane taken by the formula:

$$5C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Lindane RS in the *Standard preparation;* and R_U and R_S are the ratios of the peak responses of lindane to *n*-octadecane, obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Mangafodipir Trisodium, *USP 28* page 1178 and page 3502 of the *Second Supplement.* On the basis of comments received, it is proposed to specify the *Standard solution* used to determine the relative standard deviation for replicate injections in the test for *Limit of residual solvents.*

(RMI: A. Wilk) RTS—43133-1

Change to read:

Limit of residual solvents—

Internal standard solution—Transfer 600 µL of methyl ethyl ketone to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a concentration of about 5 mg per mL. Transfer 2 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.1 mg per mL.

Standard stock solution—Transfer about 1 g of dehydrated alcohol and 1 g of acetone, both accurately weighed, to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 1 mg each of alcohol and acetone per mL.

Standard solutions—Transfer 10.0 mL of *Internal standard solution* to each of four 100-mL volumetric flasks. Separately add 0 mL, 1.0 mL, 5.0 mL, and 10.0 mL of *Standard stock solution* to the volumetric flasks, and dilute each with water to volume to obtain solutions having known concentrations of 0.0 µg per mL and about 10 µg per mL, 50 µg per mL, and 100 µg per mL each of alcohol and acetone, respectively. Add 7.0 mL of each *Standard solution* to separate headspace sample vials, and cap.

Test solution—Transfer about 1 g of Mangafodipir Trisodium, accurately weighed, to a sample vial, add 7.0 mL of the *Standard solution* having a concentration of 0.0 µg per mL, cap, and swirl to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused silica column coated with 1.8-µm G43 stationary phase. The carrier gas is helium, flowing at a rate of 1.5 mL per minute. The temperatures of the injection port and the oven are maintained at 150° and 50°, respectively. The bath temperature for the headspace sample vials is maintained at 90°, the valve/loop temperature is maintained at 130°, and the sample thermostating time is 15 minutes. Chromatograph the *Standard solutions,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between alcohol and acetone is not less than 5; and the relative standard deviation for replicate injections

▲of the *Standard solution* having a concentration of 100 µg per mL,▲*USP30*
determined from the peak response ratios of the analyte to the internal standard, is not more than 2.0%. Calculate the peak response ratios of the analyte to the internal standard, and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient. A suitable system is one that yields a line having a correlation coefficient of not less than 0.990.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentages (w/w) of alcohol and acetone in the portion of Mangafodipir Trisodium taken by the formula:

$$(7/10{,}000)(C/W)$$

in which C is the concentration, in µg per mL, of alcohol or acetone in the *Test solution,* as determined from the relevant standard response line; and W is the weight, in g, of Mangafodipir Trisodium taken: not more than 0.1% of alcohol is found; and not more than 0.01% of acetone is found, both calculated on the anhydrous basis.

BRIEFING

Mirtazapine, page 3257 of the *First Supplement.* On the basis of data received, it is proposed to change the currently required *Method I* in the test for *Heavy metals* to *Method II.*

(MD-PP: R. Ravichandran) RTS—42658-1

Change to read:

Heavy metals, ~~*Method I*~~

▲*Method II*▲*USP30*
⟨231⟩: 0.001%

~~*Diluent:* a mixture of methanol and water (85 : 15).~~

~~*Test preparation*—Dissolve 4.8 g of mirtazapine in 51 mL of methanol. Add 9 mL of water. Adjust 25 mL of this solution with 1 N acetic acid to a pH of between 3.0 and 4.0, using a short range pH indicator paper as the internal indicator. Dilute with *Diluent* to 40 mL, and mix.~~

~~NOTE—Use *Diluent* instead of water to prepare the *Standard Preparation* and *Monitor Preparation.* Prepare a blank of *Diluent,* and use *Diluent* instead of water in the *Procedure.*~~

▲*Test preparation*—Use a weighed quantity, approximately 4.0 g, of Mirtazapine.▲*USP30*

In-Process Revision

BRIEFING

Ondansetron Injection, *USP 28* page 1420. It is proposed to specify that the total impurity acceptance criteria include the results from the test for *Limit of ondansetron related compound D* and the results from the test for *Chromatographic purity.* Also, the redundant section for *Standard solution* preparation in the test for *Chromatographic purity* has been deleted since it is not required for the test.

(MD-PP: R. Ravichandran) RTS—43204-1

Change to read:

Chromatographic purity—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

~~*Standard solution*—Proceed as directed for *Standard preparation* in the *Assay.*~~

▲▲*USP30*

Test solution—Use the *Assay preparation*.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the volume of Injection taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all of the peaks: not more than 0.2% of any individual impurity is found, and the total of all impurities

▲including ondansetron related compound D from the test for *Limit of ondansetron related compound D*▲*USP30* is not more than 0.5%.

BRIEFING

Orphenadrine Citrate Injection, *USP 28* page 1423. On the basis of comments received regarding the stability of the *Assay preparation* dissolved in *Mobile phase,* in the *Assay* it is proposed to change the diluent used to prepare the *Standard preparation,* the *System sensitivity solution,* and the *Assay preparation* from *Mobile phase* to water to improve the stability of the preparations.

(MD-PP: R. Ravichandran) RTS—42433-1

Change to read:

Assay—

0.05 M Ammonium phosphate buffer—Dissolve 5.8 g of monobasic ammonium phosphate in 1000 mL of water, and adjust with ammonium hydroxide or phosphoric acid to a pH of 7.9 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of methanol, *0.05 M Ammonium phosphate buffer,* and acetonitrile (9 : 8 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Orphenadrine Citrate RS in ~~*Mobile phase,*~~

▲water,▲*USP30*
and dilute quantitatively, and stepwise if necessary, with ~~*Mobile phase*~~

▲water▲*USP30*
to obtain a solution having a known concentration of about 0.9 mg per mL.

System sensitivity solution—Dilute a volume of the *Standard preparation* quantitatively, and stepwise if necessary, with ~~*Mobile phase*~~

▲water▲*USP30*
to obtain a solution having a known concentration of about 0.00045 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 90 mg of orphenadrine citrate, to a 100-mL volumetric flask, dilute with ~~*Mobile phase*~~

▲water▲*USP30*
to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the column efficiency is not less than 4500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *System sensitivity solution*, and record the peak areas as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for orphenadrine citrate. Calculate the quantity, in mg, of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in each mL of the Injection taken by the formula:

$$(100C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Orphenadrine Citrate RS in the *Standard preparation; V* is the volume, in mL, of Injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Oxybutynin Chloride Extended-Release Tablets, page 1276 of *PF* 30(4) [July–Aug. 2004]. It is proposed to modify the system suitability requirements in the test for *Related compounds* and in the *Assay.* It is also proposed to change the *Tolerances* in the *Drug release* test to conform to those approved by the FDA for this product. In addition, it is proposed to modify the *Packaging and storage* statement to indicate storage at controlled room temperature.

(BPC: M. Marques; PA4: E. Gonikberg) RTS—43085-1; 43226-1

Add the following:

▲Oxybutynin Chloride Extended-Release Tablets

» Oxybutynin Chloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store at ~~25°, excursions permitted between 15° and 30°.~~ controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Oxybutynin Chloride RS. USP Oxybutynin Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197⟩—

Test specimen—Add a quantity of finely powdered Tablets, equivalent to about 15 mg of oxybutynin chloride, to 5 mL of water per Tablet. Mix for 1 minute. Adjust with 0.1 N sodium hydroxide to a pH between 7 and 8. Extract the solution twice with 10 mL of ether. Combine the extracts, evaporate the ether, and dry under vacuum over silica gel for at least 30 minutes. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.

Standard specimen—Dissolve 15 mg of USP Oxybutynin Chloride RS in 5 mL of water. Proceed as directed for the *Test specimen,* beginning with "Adjust with".

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Drug release ⟨724⟩**—**

Medium: simulated gastric fluid without enzymes; 50 mL.

Apparatus 7: 30 cycles per minute; 2- to 3-cm amplitude.

Times: 4, 10, and 24 hours.

Determine the amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved by employing the following method.

0.035 M Phosphate buffer, pH 2.2—Dissolve about 4.83 g of monobasic sodium phosphate in 1000 mL of water, add 2.3 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.2 ± 0.2.

Acidified water—To 1 L of water add phosphoric acid dropwise to a pH of 3.5, and mix well.

Standard stock solutions—Dissolve accurately weighed quantities of USP Oxybutynin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain solutions having known concentrations of about 250, 300, and 350 µg per mL.

Standard solutions—Prepare a series of dilutions of the *Standard stock solutions* in acidified water having final concentrations similar to those expected in the *Test solution.*

Test solution—Use portions of the solution under test. If the solution is cloudy, centrifuge at 2000 rpm for 10 minutes, and use the supernatant.

In-Process Revision

Mobile phase—Prepare a suitable filtered and degassed mixture of *0.035 M Phosphate buffer, pH 2.2* and acetonitrile (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Use a medium range *Standard solution* of USP Oxybutynin Chloride RS.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 5-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. The column temperature is maintained at about 35°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.5 and less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions.* A weighing factor, $1/x$, is applied to the regression line of the calibration curve to enhance the accuracy of the low standard concentrations. Determine the amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved in each interval from a linear regression analysis of the calibration curve.

Tolerances—The percentages of the labeled amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1.*

FOR TABLETS LABELED TO CONTAIN 5 MG OR 10 MG OF OXYBUTYNIN CHLORIDE:

Time (hours)	Amount dissolved
4	not more than 20%
10	between 34.5% and 59.5%
24	not less than 80%

FOR TABLETS LABELED TO CONTAIN 15 MG OF OXYBUTYNIN CHLORIDE:

Time (hours)	Amount dissolved
4	not more than 20%
10	between 34.5% and 59.5%
24	not less than 75%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Mobile phase, Diluent, Preparation medium, Impurity stock solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Impurity standard solution—Dilute the *Impurity stock solution* with *Diluent* to obtain a solution having a known concentration of about 1 µg of oxybutynin related compound A per mL. [NOTE—Oxybutynin related compound A is phenylcyclohexylglycolic acid.]

Test solution—Use the *Assay preparation*.

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Impurity standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.75 and not more than 2.5 for the phenylcyclohexylglycolic acid peak. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, *R,* between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5; and the relative standard deviation of peak area responses for six replicate injections of *System suitability solution* is not more than 3% for each compound.~~

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of oxybutynin related compound A in the *Impurity standard solution;* and r_U and r_S are the peak responses for each impurity obtained from the *Test solution* and the *Impurity standard solution,* respectively. Disregard any peak less than 0.1%: not more than 1% of oxybutynin related compound A is found, and not more than 2% of total impurities is found.

Assay—

Mobile phase—Prepare a mixture of water, acetonitrile, and triethylamine (65 : 35 : 0.15). Adjust with phosphoric acid to a pH of 3.9, degas, and filter.

Diluent—Use water adjusted with phosphoric acid to a pH of 3.5.

Preparation medium—Prepare a solution of methanol and acetonitrile (1 : 1).

Impurity stock solution—Dissolve an accurately weighed quantity of USP Oxybutynin Related Compound A RS in acetonitrile to obtain a solution having a known concentration of about 0.11 mg per mL.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in acetonitrile to obtain a solution having a known concentration of about 0.37 mg per mL.

System suitability solution—Transfer 10 mL of the *Standard stock preparation* and 1 mL of the *Impurity stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard preparation—Dilute the *Standard stock preparation* with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—

FOR TABLETS THAT CONTAIN 5 MG OF OXYBUTYNIN CHLORIDE—Place 10 Tablets in a 500-mL volumetric flask, add 150 mL of *Preparation medium,* and stir ~~overnight~~ for at least 4 hours or until dissolved. Dilute with *Diluent* to volume. Mix thoroughly, centrifuge, and use the clear supernatant.

FOR TABLETS THAT CONTAIN 10 MG OF OXYBUTYNIN CHLORIDE OR MORE—Place 10 Tablets in a 1000-mL volumetric flask, add 300 mL of *Preparation medium,* and stir ~~overnight~~ for at least 4 hours or until dissolved. Dilute with *Diluent* to volume. If necessary, make a further dilution with *Diluent* to obtain a solution having a final concentration equivalent to 0.1 mg per mL of oxybutynin chloride. Mix thoroughly, centrifuge, and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. ~~Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.75 and not more than 2.5.~~ Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for oxybutynin and about 1.6 for oxybutynin related compound A; the resolution, *R,* between oxybutynin and oxybutynin related compound A is not less than 1.5; the tailing factor is greater than 0.75 and not more than 2.5 for each peak; and the relative standard deviation of peak area responses for six replicate injections is not more than 3% for each compound.

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) in the portion of Tablets taken by the formula:

$$CVD(r_U / r_S)$$

in which C is the concentration, in mg per mL, of oxybutynin chloride in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation; D* is the dilution factor; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Prednicarbate Cream; Prednicarbate Ointment. Because there are no existing *USP* monographs for these drug products, new monographs are being proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the Symmetry brand of L1 column. The typical retention time is about 38.2 minutes for prednicarbate.

(PA1: C. Anthony) RTS—42987-1

Add the following:

▲Prednicarbate Cream

» Prednicarbate Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednicarbate ($C_{27}H_{36}O_8$). It may contain a suitable preservative.

Packaging and storage—Preserve in tight, light-resistant containers at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Prednicarbate RS.*

Identification—The retention time of the prednicarbate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩**:** between 3.5 and 5.0, in a solution prepared in the following manner. Add 15 mL of boiling water to 3.5 g of cream in a 50-mL centrifuge tube, and shake vigorously until an emulsion is formed. Loosen the cap, and place in a steam bath for 5 minutes. Centrifuge the hot solution. After cooling to room temperature, collect the lower aqueous solution in a glass tube, and determine the pH.

Consistency—At room temperature, a cream string having a length of 2 cm retains its shape on a glass plate for at least 10 minutes. It can easily be spread and has no visible lumps.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic bacterial count does not exceed 100 cfu per g.

Minimum fill ⟨755⟩**:** meets the requirements.

In-Process Revision

Related compounds—

Solution A, Solution B, Mobile phase, Standard stock solution, Resolution solution, Solution 1, and *Solution 2*—Prepare as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

System sensitivity solution—Dilute 1.0 mL of the *Standard solution* with dehydrated alcohol to 50.0 mL. Dilute 1.0 mL of the solution thus obtained with *Solution A* to 20.0 mL.

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *System sensitivity solution:* the signal-to-noise ratio is not less than 3. Chromatograph the *Test solution,* and record the responses of all the peaks other than the prednicarbate peak, as directed for *Procedure:* the relative retention times are about 0.57 for prednisolone-17-ethylcarbonate, 0.64 for prednisolone-21-propionate, 1.0 for prednicarbate, and 1.04 for 1,2-dihydroprednicarbate.

Procedure—Inject a volume (about 60 µL) of *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound and unknown impurity in the portion of Cream taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each individual impurity obtained from the *Test solution,* and r_s is the sum of all peak responses obtained from the *Test solution:* not more than 2.0% of prednisolone-17-ethylcarbonate and prednisolone-21-propionate is found; not more than 0.1% of any individual related compound is found; and not more than 5.0% of total related compounds is found.

Assay—

Solution A—Prepare a 0.01 M solution of potassium dihydrogen phosphate in water.

Solution B—Prepare a mixture of acetonitrile and dehydrated alcohol (2 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Prednicarbate RS in dehydrated alcohol, and dilute quantitatively and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of 0.3 mg per mL.

Standard preparation—Transfer 10.0 mL of *Standard stock preparation* to a 100-mL volumetric flask, add 15 mL of tetrahydrofuran and 30 mL of *Solution B,* and dilute with *Solution A* to volume.

Assay preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 3.0 mg of prednicarbate to a 100-mL volumetric flask. Add 15 mL of tetrahydrofuran, shake vigorously, and allow to stand in an ultrasonic bath until the sample has dissolved. Add 20 mL of dehydrated alcohol, and shake vigorously. Add 20 mL of acetonitrile, and shake vigorously. Immediately dilute with *Solution A* to volume, and shake vigorously. Allow to stand in an ice bath for at least 15 minutes. Shake the samples vigorously, and pass through a folded paper filter. Pass the filtrate through a 0.45-µm membrane filter.

Solution 1—Transfer about 15 mg each of prednisolone-17-ethylcarbonate and prednisolone-21-propionate, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with dehydrated alcohol to volume.

Solution 2—Transfer about 15 mg of 1,2-dihydroprednicarbate, accurately weighed, to a 50-mL volumetric flask, add 1.0 mL of *Solution 1,* and dilute with dehydrated alcohol to volume.

Resolution solution—Transfer 10.0 mL of the *Standard preparation* to a volumetric flask, add 1.0 mL of *Solution 2,* 1 mL of tetrahydrofuran, and 2 mL of acetonitrile, and dilute with *Solution A* to 20.0 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 243-nm detector and a 4.0-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	67	33	equilibration
5–45	67→40	33→60	linear gradient
45–50	40	60	isocratic
50–55	40→20	60→80	linear gradient
55–70	20	80	isocratic
70–75	20→67	80→33	linear gradient
75–85	67	33	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between prednicarbate and 1,2-dihydroprednicarbate is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the prednicarbate peak is between 0.7 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 60 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of prednicarbate ($C_{27}H_{36}O_8$) in each g of Cream taken by the formula:

$$100(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Prednicarbate RS in the *Standard preparation; W* is the weight, in g, of Cream taken; and r_U and r_S are the prednicarbate peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Prednicarbate Ointment—See briefing under *Prednicarbate Cream*.

(PA1: C. Anthony) RTS—43000-1

Add the following:

▲Prednicarbate Ointment

» Prednicarbate Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednicarbate ($C_{27}H_{36}O_8$), in a suitable ointment base.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Prednicarbate RS.*

Identification—It meets the requirements of the *Identification* test under *Prednicarbate Cream*.

Consistency—At room temperature, an ointment string having a length of 2 cm retains its shape on a glass plate for at least 10 minutes. It can easily be spread and has no visible lumps.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic bacterial count does not exceed 100 cfu per g.

Minimum fill ⟨755⟩**:** meets the requirements.

Related compounds—

Solution A, Solution B, Mobile phase, Standard stock solution, Resolution solution, Solution 1, and *Solution 2*—Prepare as directed in the *Assay* under *Prednicarbate Cream.*

System sensitivity solution—Prepare as directed for *Related compounds* under *Prednicarbate Cream*.

Test solution—Prepare as directed for the *Assay preparation* under *Prednicarbate Cream*.

Chromatographic system—Prepare as directed in the *Assay* under *Prednicarbate Cream*. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 3. Chromatograph the *Test solution,* and record the responses of all the peaks other than the prednicarbate peak, as directed for *Procedure:* the relative retention times are about 0.57 for prednisolone-17-ethylcarbonate, 0.64 for prednisolone-21-propionate, 1.0 for prednicarbate, and 1.04 for 1,2-dihydroprednicarbate.

Procedure—Inject a volume (about 60 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound and unknown impurity in the portion of Ointment taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity obtained from the *Test solution,* and r_s is the sum of all the peak responses obtained from the *Test solution:* not more than 2.0% of prednisolone-17-ethylcarbonate and prednisolone-21-propionate is found; not more than 0.1% of any individual related compound is found; and not more than 5.0% of total related compounds is found.

Assay—

Solution A, Solution B, Mobile phase, Standard stock preparation, Standard preparation, Assay preparation, Solution 1, Solution 2, and *Resolution solution*—Prepare as directed in the *Assay* under *Prednicarbate Cream*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 243-nm detector and a 4.0-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

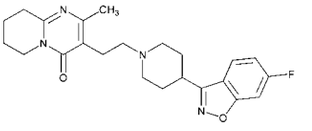
BRIEFING

Risperidone. Because there is no existing *USP* monograph for this active drug substance, a new monograph is being proposed. The proposed liquid chromatographic tests for *Related compounds* and the *Assay* are based on analyses performed with the Hypersil BDS C18 (L1) column. The typical retention time for risperidone is about 9.5 minutes. The test for *Residual solvents* reflects the change in general chapter ⟨467⟩ title from *Organic Volatile Impurities* to *Residual Solvents* and the adoption of the ICH guidelines in the chapter, as proposed in *PF* 31(5) [Sept.–Oct. 2005].

(MD-PP: R. Ravichandran) RTS—42740-1

Add the following:

▲Risperidone



$C_{23}H_{27}FN_4O_2$ 410.48

4*H*-Pyrido[1,2-*a*]pyrimidin-4-one, 3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-.

3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidino]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one [*106266-06-2*].

» Risperidone contains not less than 98.0 percent and not more than 102.0 percent of $C_{23}H_{27}FN_4O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

USP Reference standards ⟨11⟩**—***USP Risperidone RS. USP Risperidone System Suitability Mixture RS.* [NOTE—This mixture contains risperidone, *Z*-oxime, 9-hydroxyrisperidone, and 6-methylrisperidone.]

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩—Dry in vacuum at 80° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%, a 2.0-g test specimen being used.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—

Buffer solution, Solution A, Solution B, Mobile phase, Diluent, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use *Assay preparation*.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatogram. Identify the impurities based on the relative retention times given in *Table 1,* and measure the peak responses. Calculate the percentage of each risperidone related compound in the portion of Risperidone taken by the formula:

$$100(C_S/C_U)(r_U/r_S)(1/F)$$

in which C_S and C_U are the concentrations, in mg per mL, of risperidone in the *Standard solution* and the *Test solution* respectively; r_U is the peak area of each impurity obtained from the *Test solution;* r_S is the peak area of risperidone obtained from the *Standard solution;* and F is the relative response factor for each impurity relative to risperidone. In addition to not exceeding the limits in *Table 1,* not more than 0.10% of any unknown impurity (use F value of 1.0) is found and not more than 0.30% of the total impurities is found. Disregard the impurity peaks that are less than 0.05%.

Table 1

Related Compound	Relative Retention Time (RRT)	Relative Response Factor (*F*)	Limit (%)
E-oxime[1]	0.60	1.0	NMT 0.20
Z-oxime[2]	0.67	0.63	NMT 0.20
9-hydroxyrisperidone[3]	0.76	0.92	NMT 0.20
5-fluororisperidone[4]	0.94	1.0	NMT 0.20
Risperidone	1.0	1.0	—
6-methylrisperidone[5]	1.2	0.95	NMT 0.20

[1] 3-[2-[4-[*(E)*-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one
[2] 3-[2-[4-[*(Z)*-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one
[3] (9*RS*)-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-9-hydroxy-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one
[4] 3-[2-[4-(5-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one
[5] (6*RS*)-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2,6-dimethyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one

Residual solvents ⟨467⟩**:** meets the requirements.

Assay—

Buffer solution—Dissolve 15.4 g of ammonium acetate in 1 L of water. Adjust with 10% acetic acid to a pH of 6.5, and mix.

In-Process Revision

Solution A—Mix 100 mL of *Buffer solution* with 150 mL of methanol in a 1000-mL volumetric flask, and dilute with water to volume.

Solution B—Mix 100 mL of *Buffer solution* with 850 mL of methanol in a 1000-mL volumetric flask, and dilute with water to volume.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Mix 100 mL of *Buffer solution* with 900 mL of water and 1000 mL of methanol.

System suitability solution—Prepare a 1 mg per mL solution of USP Risperidone System Suitability Mixture RS in *Diluent*.

Standard preparation—Dissolve an accurately weighed quantity of USP Risperidone RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Risperidone in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a concentration of about 1.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–1	70	30	isocratic
1–20	70→5	30→95	linear gradient
20–25	5	95	isocratic
25–27	5→70	95→30	linear gradient
27–35	70	30	re-equilbration

Inject the *System suitability solution*. Record the peak responses as directed for *Procedure,* and identify the peaks due to *Z*-oxime, 9-hydroxyrisperidone, 6-methylrisperidone, and risperidone using the relative retention times (RRT) from *Table 1*; the resolution, *R,* between *Z*-oxime and 9-hydroxyrisperidone is not less than 2.8; the tailing factor for risperidone is not less than 1.5; and the relative standard deviation for replicate injections is not less than 2.0% for the risperidone peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the risperidone peak. Calculate the quantity, in percent of $C_{23}H_{27}FN_4O_2$, in the portion of Risperidone taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations of risperione, in mg per mL, of *Standard preparation* and the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Rubella and Mumps Virus Vaccine Live, *USP 28* page 1743—See briefing under *Diphtheria Toxin for Schick Test*.

(BBVV: T. Morris) RTS—42382-4

Delete the following:

▲~~Rubella and Mumps Virus Vaccine Live~~

~~» Rubella and Mumps Virus Vaccine Live conforms to the regulations of the FDA concerning biologics (see *Biologics* ⟨1041⟩). It is a bacterially sterile preparation of a combination of live rubella virus and live mumps virus such that each component is prepared in conformity with and meets the requirements for Rubella Virus Vaccine Live, and for Mumps Virus Vaccine Live, whichever is applicable. It may contain suitable antimicrobial agents.~~

~~**Packaging and storage**—Preserve in single-dose containers, or in light-resistant, multiple-dose containers, at a temperature between 2° and 8°. Multiple-dose containers for 50 doses are adapted for use only in jet injectors, and those for 10 doses for use by jet or syringe injection.~~

~~**Expiration date**—The expiration date is 1 to 2 years, depending on the manufacturer's data, after date of issue from manufacturer's cold storage (−20°, 1 year).~~

~~**Labeling**—Label the Vaccine in multiple-dose containers to indicate that the contents are intended solely for use by jet injector or for use by either jet or syringe injection, whichever is applicable. Label the Vaccine in single-dose containers, if such containers are not light-resistant, to state that it should be protected from sunlight. Label it also to state that constituted Vaccine should be discarded if not used within 8 hours.~~ ▲*USP30*

BRIEFING

Schick Test Control, *USP 28* page 1756—See briefing under *Diphtheria Toxin for Schick Test*.

(BBVV: T. Morris) RTS—42382-5

Delete the following:

▲~~Schick Test Control~~

~~» Schick Test Control conforms to the regulations of the FDA concerning biologics (see *Biologics* ⟨1041⟩). It is Diphtheria Toxin for Schick Test that has been inactivated by heat for use as control for the Schick Test. It meets the requirements of the specific guinea pig test for detoxification by injection of not less than 2.0 mL into each of at least four guinea pigs. The animals are observed daily for 30 days and during this period show no evidence of diphtheria toxin poisoning (extensive necrosis, paralysis, or specific lethality).~~

~~**Packaging and storage**—Preserve at a temperature between 2° and 8°.~~

~~**Expiration date**—The expiration date is not later than 1 year after date of issue from manufacturer's cold storage (5°, 1 year).~~ ▲*USP30*

BRIEFING

Talc, *USP 28* page 1846, and page 3538 of the *Second Supplement*. In order to align the monograph with the text presented in the *Pharmacopeial Discussion Group,* Stage 6 harmonization draft, it is proposed to omit the use of *Cesium chloride solution* in the preparation of the *Test stock solution* in the test for *Limit of calcium*. This change also affects the test for *Limit of aluminum* and, by cross reference, the test for *Content of magnesium*. It is also proposed to add *Cesium chloride solution* to the test for *Limit of aluminum* where it is used in the preparation of the *Standard aluminum solutions*. In addition, the preparation of the *Standard*

In-Process Revision

iron stock solution in the test for *Limit of iron* is revised to comply with the Stage 6 harmonization draft. A *Packaging and storage* section is also included in this proposal.

(EM1: C. Sheehan) RTS—43212-1

Add the following:

▲**Packaging and storage**—Preserve in well-closed containers. No storage requirements specified.▲*USP30*

Change to read:

Limit of iron—

Test stock solution—Weigh 10.0 g of Talc into a conical flask fitted with a reflux condenser, gradually add 50 mL of 0.5 N hydrochloric acid while stirring, and heat on a water bath for 30 minutes. Allow to cool. Transfer the mixture to a beaker, and allow the undissolved material to settle. Filter the supernatant into a 100-mL volumetric flask, retaining as much as possible of the insoluble material in the beaker. Wash the residue and the beaker with three 10-mL portions of hot water. Wash the filter with 15 mL of hot water, allow the filtrate to cool, and dilute with water to 100.0 mL.

Test solution—Transfer 2.5 mL of the *Test stock solution* to a 100-mL volumetric flask, add 50.0 mL of 0.5 N hydrochloric acid, and dilute with water to volume.

Standard iron stock solution—~~Transfer 863.4 mg of ferric ammonium sulfate to a 100-mL volumetric flask, dissolve in water, add 10 mL of 2 N sulfuric acid, and dilute with water to volume. Pipet 25 mL of this solution into a 100-mL volumetric flask, add 10 mL of 2 N sulfuric acid, dilute with water to volume, and mix. This solution contains the equivalent of 250 µg of iron per mL.~~

▲Prepare a solution containing 4.840 g of ferric chloride in a 150 g per L solution of hydrochloric acid in water to obtain a concentration equivalent to 250 µg of iron per mL. Prepare immediately before use.▲*USP30*

Standard iron solutions—Into four 100-mL volumetric flasks, each containing 50.0 mL of 0.5 N hydrochloric acid, transfer respectively 2.0, 2.5, 3.0, and 4.0 mL of the *Standard iron stock solution,* and dilute each flask with water to volume.

Procedure—Concomitantly determine the absorbance of the *Test solution* and the *Standard iron solutions* at the iron emission line of 248.3 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with an iron hollow-cathode lamp and an air–acetylene flame. Make any correction using a deuterium lamp: not more than 0.25% of iron is found.

Change to read:

Limit of calcium—

~~*Cesium chloride solution*—Dissolve 2.53 g of cesium chloride in 100 mL of water, and mix.~~

▲▲*USP30*

Lanthanum chloride solution—To 5.9 g of lanthanum oxide slowly add 10 mL of hydrochloric acid, and heat to boiling. Allow to cool, and dilute with water to 100 mL.

Test stock solution—[Caution—Perchlorates mixed with heavy metals are known to be explosive. Take proper precautions while performing this procedure.] Weigh 500 mg of Talc in a 100-mL polytetrafluoroethylene dish, add 5 mL of hydrochloric acid, 5 mL of lead-free nitric acid, and 5 mL of perchloric acid. Stir gently, then add 35 mL of hydrofluoric acid, and evaporate slowly on a hot plate to moist dryness (until about 0.5 mL remains). To the residue, add 5 mL of hydrochloric acid, cover with a watch glass, heat to boiling, and allow to cool. Rinse the watch glass and the dish with water, and transfer into a 50-mL volumetric flask, ~~containing 5 mL of the *Cesium chloride solution*. Rinse the dish again with water,~~

▲▲*USP30*
and dilute with water to volume.

Test solution—Transfer 5.0 mL of the *Test stock solution* to a 100-mL volumetric flask, add 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution,* and dilute with water to volume.

Calcium standard stock solution—Dissolve 3.67 g of calcium chloride dihydrate in diluted hydrochloric acid, and dilute with the same solvent to 1000 mL. Immediately before use, pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 100 µg of calcium per mL.

Standard calcium solutions—Into four identical 100-mL volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of *Lanthanum chloride solution,* transfer respectively 1.0, 2.0, 3.0, and 4.0 mL of *Calcium standard stock solution,* and dilute each flask with water to volume.

Procedure—Concomitantly determine the absorbance of the *Test solution* and the *Standard calcium solutions* at the calcium emission line of 422.7 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a calcium hollow-cathode lamp and a nitrous oxide–acetylene flame: not more than 0.9% of calcium is found.

Change to read:

Limit of aluminum—

~~*Cesium chloride solution* and *Test stock solution*—Proceed as directed in the test for *Limit of calcium.*~~

▲*Cesium chloride solution*—Dissolve 2.53 g of cesium chloride in 100 mL of water, and mix.

Test stock solution—Proceed as directed in the test for *Limit of calcium.* Transfer 5 mL of the *Cesium chloride solution* to the 50-mL volumetric flask, prior to transfer of residue, and dilute with water to volume.▲*USP30*

Test solution—Transfer 5.0 mL of the *Test stock solution* to a 100-mL volumetric flask, add 10 mL of the *Cesium chloride solution* and 10.0 mL of hydrochloric acid, and dilute with water to volume.

Aluminum standard stock solution—Dissolve 8.947 g of aluminum chloride in water, and dilute with water to 1000 mL. Immediately before use, pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 100 µg of aluminum per mL.

Standard aluminum solutions—Into four identical 100-mL volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of *Cesium chloride solution,* transfer respectively 5.0, 10.0, 15.0, and 20.0 mL of *Aluminum standard stock solution,* and dilute with water to volume.

Procedure—Concomitantly determine the absorbance of the *Test solution* and the *Standard aluminum solutions* at the aluminum emission line of 309.3 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with an aluminum hollow-cathode lamp and a nitrous oxide–acetylene flame: not more than 2.0% of aluminum is found.

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 23* page 2941, page 3647 of the *Second Supplement,* and page 1414 of *PF* 31(5) [Sept.–Oct. 2005]. It is proposed to add *Canola Oil* to the *Solvent* and *Vehicle (Oleaginous)* categories and *Oleyl Oleate* to the *Emollient* and *Emulsifying and/or Solubilizing Agent* categories to complement the proposed new monographs for *Canola Oil* and *Oleyl Oleate,* respectively, which appear elsewhere in this issue of *PF.*

MONOGRAPHS (NF)

BRIEFING

Canola Oil. Because there is no existing *NF* monograph for this product, it is proposed to add a new monograph based on the Canola Oil monograph in the *Food Chemicals Codex, Fifth Edition,* page 86 and also on the *Cottonseed Oil* monograph in *NF 23,* page 2991.

(EMC: D. Bempong; NL: W. Paul) RTS—43026-1

Add the following:

▲Canola Oil

Low erucic acid rapeseed oil

LEAR oil

» Canola Oil is the refined fixed oil obtained from the seeds of *Brassica napus* or *Brassica campestris* (Fam. Cruciferae). A suitable antioxidant may be added.

Packaging and storage—Preserve in tight containers, and avoid contact with metals. Fill to the top or flush partially filled containers with nitrogen. No storage requirements specified.

Labeling—Label it to indicate the name and concentration of any added antioxidant.

In-Process Revision

Identification—It meets the requirements of the test for *Fatty acid composition*.

Specific gravity ⟨841⟩**:** between 0.906 and 0.920.

Acid value ⟨401⟩**:** not more than 6.0.

Iodine value ⟨401⟩**:** between 110 and 126.

Peroxide value ⟨401⟩**:** not more than 10.0.

Saponification value ⟨401⟩**:** between 178 and 193.

Unsaponifiable matter ⟨401⟩**:** not more than 1.5%.

Fatty acid composition—Canola Oil exhibits the following composition profile of fatty acids, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	—	<0.1
14	0	<0.2
16	0	<6.0
16	1	<1.0
18	0	<2.5
18	1	>50
18	2	<40
18	3	<14
20	0	<1.0
20	1	<2.0
22	0	<0.5
22[1]	1	≤2.0
24	0	<0.2
24	1	<0.2

[1] Erucic acid

Refractive index ⟨831⟩**:** between 1.465 and 1.467 at 40°.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of erucic acid: not more than 2.0%, as determined in the test for *Fatty acid composition.*▲*NF25*

BRIEFING

Ethylcellulose Aqueous Dispersion, *NF 23* page 3004 and page 811 of *PF* 31(3) [May–June 2005]. It is proposed to revise the labeling statement to state that the names and quantities of any added antifoaming and antimicrobial agents should be indicated. Editorial changes have been made to *Identification* test *A*.

(EMC: C. Sheehan) RTS—42994-2

Change to read:

Labeling—The labeling states the ethoxy content of the Ethylcellulose and the percentage of Ethylcellulose.

▲The labeling also indicates the names and quantities of any added antifoaming and antimicrobial agents.▲*NF25*

Change to read:

Identification—

A: ~~Transfer a small quantity to a silver chloride plate, and allow the water to evaporate:~~

▲Separately dissolve a small quantity of sample and about 250 mg of USP Ethylcellulose RS in 5 mL of a mixture of toluene and alcohol (80 : 20), transfer a few mL of each solution to a silver chloride plate, and evaporate the solution on each plate:▲*NF25*
the IR absorption spectrum of the residue in the 3600 to 2600 cm^{-1} and 1500 to 800 cm^{-1} regions exhibits maxima only at the same wave numbers as that of a film of USP Ethylcellulose RS prepared ~~as directed in the test for *Identification* under *Ethylcellulose*~~.

▲by dissolving about 250 mg of USP Ethylcellulose RS in 5 mL of a mixture of toluene and alcohol (80 : 20) and evaporating a few mL on a silver chloride plate.▲*NF25*

B: Transfer about 2 mL to a 100-mm diameter petri dish so that the bottom of the dish is covered uniformly. Place the dish in an oven or on a hot plate to evaporate the water: a transparent film results.

C: Dissolve the film formed in *Identification* test *B* in 20 mL of chloroform. Inject 2 µL of this solution into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a 2-mm × 1.8-m column that contains 10% liquid phase G1 on support

In-Process Revision

S1A maintained at a temperature of 220° and a flame-ionization detector. The temperatures of the injection port and the detector are maintained at about 250° and 275°, respectively. The retention time of the major peak following the solvent peak in the resulting chromatogram corresponds to that obtained from a similar solution of USP Cetyl Alcohol RS.

D: *Methylene blue solution*—To a 150-mL graduated beaker containing 0.7 mL of sulfuric acid and 5 g of anhydrous sodium sulfate slowly add water to the 90-mL mark. Add methylene blue solution (3 in 1000) to the 100-mL mark, and mix.

Procedure—To 1 mL of Aqueous Dispersion in a 100-mL graduated mixing cylinder add 9 mL of water followed by 25 mL of *Methylene blue solution*, and mix. Add 15 mL of chloroform, and shake vigorously. Allow the two phases to separate: the lower phase is blue, indicating the presence of sodium lauryl sulfate.

BRIEFING

Glyceryl Monostearate, *NF 23* page 3015, page 3357 of the *First Supplement,* and page 495 of *PF* 31(2) [Mar.–Apr. 2005]. On the basis of comments received, it is proposed to add a labeling statement to indicate the name and quantity of any added antioxidant.

(EMC: C. Sheehan) RTS—42994-1

Add the following:

▲**Labeling**—Label it to indicate the name and quantity of any added antioxidant.▲*NF25*

Delete the following:

▲~~**USP Reference standards** ⟨11⟩ *USP Monoglycerides RS.*~~▲*NF24*

Change to read:

Assay for monoglycerides—

~~*Propionating reagent*—Mix 10 mL of pyridine and 20 mL of propionic anhydride.~~

~~*Internal standard solution*—Transfer about 400 mg of hexadecyl hexadecanoate, accurately weighed, to a 100-mL volumetric flask, dissolve in chloroform, dilute with chloroform to volume, and mix.~~

~~*Standard preparation*—Transfer about 50 mg of USP Monoglycerides RS, accurately weighed, to a 25-mL conical flask, add by pipet 5 mL of *Internal standard solution,* and mix. When solution is complete, immerse the flask in a water bath maintained at a temperature between 45° and 50°, and volatilize the chloroform with the aid of a stream of nitrogen. Add 3.0 mL of *Propionating reagent,* and heat on a hot plate at 75° for 30 minutes. Evaporate the reagents with the aid of a stream of nitrogen and gentle steam heat. Add 15 mL of chloroform, and swirl to dissolve the residue.~~

~~*Assay preparation*—Transfer about 50 mg of Glyceryl Monostearate, accurately weighed, to a 25-mL conical flask, and proceed as directed for *Standard preparation,* beginning with "add by pipet 5 mL of *Internal standard solution*."~~

~~*Chromatographic system*—Under typical conditions the instrument is equipped with a flame-ionization detector, and contains a 4-mm × 2.4-m borosilicate glass column packed with 2% liquid phase G27 on 80- to 100-mesh support S1A. The column is maintained isothermally at a temperature between 270° and 280°, the injection port and detector block temperature are maintained at about 310°, and helium is used as the carrier gas at a flow rate of about 70 mL per minute.~~

~~*System suitability*—Chromatograph six to ten injections of the *Standard preparation* as directed for *Procedure:* the resolution factor, *R,* between the peaks for the derivatized glyceryl hexadecanoate and glyceryl octadecanoate is not less than 2.0, and the relative standard deviation of the ratio of the peak area of the derivatized glyceryl octadecanoate to that of the hexadecyl hexadecanoate is not more than 2.0%.~~

~~*Procedure*—Inject a suitable portion of the *Standard preparation* into a suitable gas chromatograph, and record the chromatogram. Measure the areas under the peaks, and record the values of the sum of the areas under the derivatized monoglyceride peaks and of the area under the hexadecyl hexadecanoate peak as A_u and A_s, respectively. Calculate the response factor, F, by the formula:~~

$$~~(A_u/A_s)(W_s/W_u),~~$$

~~in which W_u and W_s are the weights, in mg, of hexadecyl hexadecanoate and USP Monoglycerides RS, respectively, in the *Standard preparation.* Similarly inject a suitable portion of the *Assay preparation,* and record the chromatogram. Measure the areas under the peaks, and record the values of the sum of the areas under the derivatized monoglyceride peaks and of the area under the hexadecyl hexadecanoate peak as a_u and a_s, respectively. Calculate the quantity, in mg, of monoglycerides in the amount of Glyceryl Monostearate taken by the formula:~~

$$~~(W_s/F)(a_u/a_s),~~$$

~~in which the terms are as defined therein.~~

▲*Mobile phase*—Use tetrahydrofuran.

Assay preparation—Transfer about 40 mg of Glyceryl Monostearate, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with tetrahydrofuran to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.5-mm × 60-cm column containing 5-µm 100-Å packing L21. The column and the detector temperatures are maintained at 40°. [NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of the one 60-cm column, provided that system suitability requirements are met; and the column temperature may be lowered to ambient temperature, although working at 40° provides stable separation conditions and ensures better sample solu-

In-Process Revision

bility.] The flow rate is about 1 mL per minute. Chromatograph the *Assay preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for glycerin, 0.86 for monoglycerides, 0.81 for diglycerides, and 0.77 for triglycerides; and the relative standard deviation for replicate injections determined from the monoglycerides peak is not more than 2.0%.

Procedure—Inject a volume (about 40 µL) of the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of monoglycerides in the portion of Glyceryl Monostearate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for the monoglycerides; and r_s is the sum of the responses for all the glyceride peaks.▲*NF24*

BRIEFING

Oleyl Oleate. Because there is no existing *NF* monograph for this excipient, a new monograph is being proposed, based on the *Oleyl Oleate* monograph in the *Japanese Pharmaceutical Excipients Directory 1996,* page 346, and the *Ethyl Oleate* monograph in *USP 28–NF 23,* page 3003.

(EMC: D. Bempong) RTS—42982-1

Add the following:

▲Oleyl Oleate

$C_{36}H_{68}O_2$ 532.94

9-Octadecenoic acid, *(Z)-,* oleyl ester.

Oleyl oleate [*3687-45-4*].

» Oleyl Oleate consists of esters of oleyl alcohol and high molecular weight fatty acids, principally oleic acid.

Packaging and storage—Preserve in tight containers. No storage conditions specified.

USP Reference standards ⟨11⟩—*USP Oleyl Oleate RS.*

Clarity of solution—Dissolve 2.0 g in 10 mL of ether: the resulting solution is clear.

Identification, *Infrared Absorption* ⟨197F⟩.

Specific gravity ⟨841⟩**:** between 0.860 and 0.884 at 20°.

Acid value ⟨401⟩**:** not more than 3.0.

Hydroxyl value ⟨401⟩**:** not more than 10.

Iodine value ⟨401⟩**:** between 70 and 120.

Saponification value ⟨401⟩**:** between 90 and 125.

Refractive index ⟨831⟩**:** between 1.464 and 1.468 at 20°.

Residue on ignition ⟨281⟩**:** not more than 0.1%, a 2-g specimen being used.

Arsenic, *Method II* ⟨211⟩**:** 2 µg per g.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.▲*NF25*

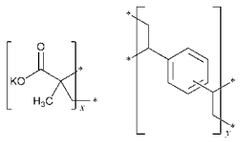
In-Process Revision

BRIEFING

Polacrilin Potassium, *NF 23* page 3050. It is proposed to correct the CAS number and to revise the chemical name of the material.

(EM2: H. Wang) RTS—43173-1

Change to read:



~~2-Propenoic acid, 2-methyl-, polymer with divinylbenzene, potassium salt.~~

▲2-Propenoic acid, 2-methyl-, potassium salt, polymer with diethenylbenzene.▲*NF25*

~~Methacrylic acid polymer with divinylbenzene, potassium salt~~

▲Potassium methacrylate-divinylbenzene copolymer▲*NF25* [~~*39394-76-5*~~

BRIEFING

Polyoxyl 35 Caster Oil, *NF 23* page 3060 and page 3656 of the *Second Supplement*. On the basis of comments received, it is proposed to revise the lower limit in the test for *Viscosity* from 650 centipoises to 600 centipoises.

(EM2: H. Wang) RTS—43001-2

Change to read:

Viscosity ⟨911⟩: between ~~650~~

▲600▲*NF25*
and 850 centipoises at 25°, a capillary viscosimeter being used.

BRIEFING

Sorbitol Sorbitan Solution, page 3656 of the *Second Supplement*. It is proposed to revise the statement appearing directly below the Title to provide further clarification on Title change and labeling of this excipient. In the absence of any adverse comments, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2006.

(EM1: C. Sheehan; NOM: W. Paul) RTS—43172-1

Sorbitol Sorbitan Solution

Change to read:

(Title for this monograph—to become official August 1, 2010)
~~(Prior to August 1, 2010, it is expected that the current practice of labeling the article of commerce with the name Anhydrized Liquid Sorbitol will be continued.)~~

•***(Prior to August 1, 2010, the current practice of labeling the article of commerce with the name Anhydrized Liquid Sorbitol may be continued. Use of the name Sorbitol Sorbitan Solution will be permitted as of August 1, 2005, but the use of this name will not be mandatory until August 1, 2010. The 60-month extension will provide the time needed by the manufacturers and users to make necessary changes.)***•2

In-Process Revision

BRIEFING

Tetrafluoroethane. Because there is no existing *NF* monograph for this excipient, a new monograph, based on submitted data, is being proposed. In *Chromatographic purity Test 1* and *Test 2,* the typical retention times for tetrafluoroethane are about 13 minutes and 9 minutes, respectively; for a description of the phases and supports for the columns used in *Test 1,* please see *Chromatographic Reagents* under the general chapter *Chromatography* ⟨621⟩, which appears elsewhere in this issue.

(AER: K. Zaidi) RTS—34836-2

Add the following:

▲Tetrafluoroethane

$C_2H_2F_4$ 102.03

1,1,1,2-Tetrafluoroethane [*811-97-2*].

»Tetrafluoroethane contains not less than 99.9 percent and not more than 100.0 percent of $C_2H_2F_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in contamination-free tight containers, reserved for pharmaceutical propellants, and specifically designed for transport and storage of liquefied refrigerant gases. Protect from excessive heat.

USP Reference standards ⟨11⟩**—***USP Tetrafluoroethane RS. USP Tetrafluoroethane Related Compound Mixture 1 RS. USP Tetrafluoroethane Related Compound Mixture 2 RS.*

Identification—The IR absorption spectrum of 1,1,1,2-tetrafluoroethane determined in a 10-cm gas cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths, in µm: 3.4(m), 4.4(m), 7.0(m), 7.7(vs), 8.4(vs), 9.1(s), 10.3(s), 11.9(m), and 15.0(s). The stronger maxima are best obtained at pressures less than 19 mm of mercury.

Water—Determine the water content by using an instrument designed specifically for measuring moisture in refrigerants.* Follow the instrument manufacturer's instructions, and connect the instrument directly to the bulk propellant container. Enter the molecular weight of the gas (102 Da for 1,1,1,2-tetrafluoroethane) to convert volumetric flow rate to mass flow rate. Set the vapor flow rate to 1100 cc per minute. When a stable reading on the digital display is achieved (about 15 minutes), record the mass of water present, in ppm. Not more than 10 ppm is found.

High-boiling residues—Proceed as directed for *General Sampling Procedure* in *Propellants* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩ to collect a sample of propellant. *[Caution—Contact with liquid propellant can cause severe frostbite.]* Attach a clean Teflon tube (20-cm length × about 6-mm OD) to the cylinder valve. Weigh the cylinder (with tubing) to the nearest 0.1 g. Prepare a vessel in which the propellant can be collected and then evaporated in a fume hood and weighed with precision and accuracy. Typically, an empty, clean, dry aluminum beverage can from which the top has been removed is suitable. [NOTE—The top may easily be removed by trimming 1 or 2 mm off the bead around the top of the beverage can with tin snips.] Handle the vessel with clean,

* An instrument such as the IceMan, manufactured by MEECO, Inc., Warrington, PA, is suitable.

In-Process Revision

dry cotton gloves or appropriate tongs. Tare the vessel to the nearest 0.0001 g. Set the vessel on a clean paper towel in a fume hood. With the sample cylinder inverted to deliver liquid propellant from the attached tube, open the valve carefully to discharge propellant into the vessel tangentially, to cause swirling of the fluid against the vessel wall, until the vessel is about half full. [NOTE—Cooling created by the propellant gas impinging on the wall of the vesssel will liquefy the gas.] Dry any condensed water off the sample cylinder tube, and set the cylinder aside with the tube still attached. Allow the propellant to evaporate from the sample vessel. After the propellant has evaporated, dry the outside of the vessel by gently wiping the condensed moisture from the outside of the vessel with a lint-free towel. Place the vessel on a hot plate, and set to 80 ± 5° (monitored with a surface thermometer) for 5 minutes. Allow the vessel to cool to room temperature. Weigh the vessel to the nearest 0.0001 g, and weigh the sample cylinder to the nearest 0.1 g. From the sample size (weight lost from the sample cylinder and tubing) and the weight gained by the vessel, calculate the concentration, in percentage, of high-boiling residue in the propellant by the formula:

$$\text{Percentage residue} = 100(W_R / W_S)$$

in which W_R is the weight of residue, and W_S is the weight of the propellant sample: not more than 0.01% (w/w) is found.

Ionic contaminants—[NOTE—Use a suitable conductivity meter equipped with a dip cell that has a cell constant of 0.1 cm^{-1}. Convert all conductivity measurements to specific conductivity by multiplying the meter reading by the cell constant. Record the specific conductivity.]

Conductivity, C_1, of the deionized water—Proceed as directed for *General Sampling Procedure* in *Propellants* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩ to collect at least 100 g of propellant (100 to 120 g). Attach a clean, dry heavy-walled Teflon tubing (25-cm length × 3-mm OD) to the valve of the sample cylinder. Weigh the cylinder tubing assembly to the nearest 0.5 g, and record the weight as S_1. Reserve a 250-mL narrow-mouth polyethylene bottle with a polyethylene screw cap for this test. Calibrate this bottle with 100 mL of water (mark the level on the outside of the bottle). Copiously rinse the bottle and cap with deionized water having a specific conductivity not greater than 0.5 microSiemens (μS). Discard the water, then air-dry the bottle and cap. Weigh the bottle and cap to the nearest 0.5 g, and record as the tare weight, W_1. Fill the bottle to the 100-mL mark with deionized water (specific conductivity not greater than 0.5 μS), and cap. Weigh and record the weight of the bottle containing the water to the nearest 0.5 g, W_2. Vigorously shake the bottle for about 20 seconds to equilibrate the water with any carbon dioxide present in the headspace air in the bottle. Clamp the bottle in a 25° water bath; the water level in the bottle should be slightly below that of the water in the bath to allow the water in the bottle to equilibrate to 25 ± 0.5°. Carefully measure the conductivity, in μS, of the water in the polyethylene bottle. Record this conductivity as C_1.

Conductivity, C_2, of the aqueous extractant—Position the cylinder containing the sample on a ring stand so that liquid sample can be discharged through the Teflon tubing into the deionized water extractant. The discharge end of the tubing should be positioned in the extractant to within about 6 mm

from the bottom of the polyethylene bottle. Open the valve on the sample cylinder slowly, to allow the sample to bubble through the water (extractant) at a moderate rate. (It will require approximately 40 to 50 minutes to deliver 80 to 100 g of sample.) When the required sample has been delivered, close the valve on the sample cylinder; then, raise the sample cylinder so that the end of the Teflon tubing is clear of the polyethylene bottle. Cap the bottle. Allow the water in the bottle to re-equilibrate to 25 ± 0.5°. Carefully remove the cap of the bottle (some propellant gas may escape as a result of temperature change), and measure the conductivity of the aqueous extractant. Record this specific conductivity, in µS, as C_2.

Total ionic contamination—Wipe dry the Teflon tubing; then, weigh the sample cylinder with the tubing to the nearest 0.5 g. Record this weight as sample weight S_2. Calculate the total ionic contamination, as HCl, in parts per billion (ppb) by weight, by the following formula:

$$HCl_{ppb} = 85.5CE/0.997P$$

in which 85.5 is the factor used to convert specific conductivity, in µS, to nanograms of HCl; C is the change in specific conductivity, in µS, due to acidity extracted from the propellant that is collected in the aqueous extract ($C_2 - C_1$); E is the weight in g, of the aqueous extract ($W_2 - W_1$); 0.997 is the density of water, in g per cm³, at 25°; and P is the propellant sample weight ($S_1 - S_2$). Total acidity as HCl, as determined above, must not exceed 100 ppb. [NOTE—The factor used above for converting specific conductivity to weight of HCl in the extractant, 85.5 nanograms of HCl per µS, is based on standard formulas, using the literature standard value for equivalent conductivity of HCl, at near infinite dilution at 25°, of 426 Siemens cm²/equivalent. Conductivity measurements are made at 25° to avoid temperature compensation problems often present in conductivity meters.]

Chromatographic purity—

TEST 1—

Standard solution—Use USP Tetrafluoroethane Related Compound Mixture 1 RS.

Test solution—Proceed as directed for *General Sampling Procedure* in *Propellants* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩ to collect a sample of tetrafluoroethane from the bulk container.

Chromatographic system (see *Chromatography* ⟨621⟩)—Connect the four packed columns in series, in the order listed in *Table 1*.

Table 1*

Phase	Support	Length
G##	100/120 mesh S1A	6 ft (nominal 1.83 m)
G##	60/80 mesh S12	6 m
G25 or G35	60/80 mesh S12	16 ft (nominal 4.88 m)
	S##	1 ft (nominal 30.5 cm)

* The 1/8-inch (nominal 3.2-mm) OD stainless steel packed columns must be connected in series in the order listed.

In-Process Revision

Column 1 must be connected directly to the injection port. The chromatograph settings are shown in *Table 2.*

Table 2. Chromatograph Settings for *Test 1* (Packed Column)*

Columns: four packed columns (listed in *Table 1*) connected in series, with column 1 connected directly to the injection port
Maximum safe column temperature: 180°
Column compensation: none
Injection port: liquid valve; sample size: 0.2 µL
Injector temperature: 200°
Detector: flame ionization; gas settings: hydrogen—30 mL per minute, air—300 mL per minute
Detector temperature: 200°
Carrier gas: helium at 20 mL per minute
Programming:
Initial column temperature: 40°
Initial hold: 6 minutes
Temperature rise: 10° per minute
Final temperature: 165°; hold: 26.0 minutes
Total run time: 45 minutes

* Possible impurities detected are listed in *Table 3.*

Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the retention time for tetrafluoroethane is about 13 minutes.

Procedure—Pressurize the cylinders containing the *Standard solution* and the *Test solution* to 150 ± 10 PSIG (1 mPa ± 70 kPa gauge) with nitrogen. Invert the cylinders to ensure liquid delivery. Attach the inverted cylinders to the injection valve of the chromatograph with a short but convenient length of 3-mm OD translucent Teflon tubing. Open the cylinder valve. Flush the tubing and the injection valve by intermittently opening and closing the exit valve, which is attached to the exit side of the injection valve with a short piece of tubing, to ensure that the injection valve is full of liquid and bubble free. Separately inject about 0.2 µL of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the ppm of each impurity in the sample of Tetrafluoroethane taken by the formula:

$$C = C_S r_i / r_S$$

in which C is the concentration, in ppm, of impurities in the *Test solution;* C_S is the concentration, in ppm, of impurities in the *Standard solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_S is the peak area of each impurity obtained from the *Standard solution.* In addition to not exceeding the limits for each impurity shown in *Table 3* and *Table 5*, not more than 5 ppm of other identified saturated impurities are found; not more than 5 ppm of any individual unidentified impurity is found; and not more than 10 ppm of total unidentified impurities is found.

Table 3. Impurities Listing for Packed Column *(Test 1)*

Impurity Number	Chemical Name	Maximum Allowed (ppm)	Retention Time Relative to HFC-134a
HFC-1123[c] (unsaturated halocarbon)	1,2,2-Trifluoroethene	5[a]	0.881
HFC-143a[c] (saturated hydrofluorocarbon)	2,2,2-Trifluoroethane	20	0.916
HFC-161[c] (saturated hydrofluorocarbon)	Fluoroethane	30	0.976[b]
HFC-125 (saturated hydrofluorocarbon)	1,1,2,2,2-Pentafluoroethane	5	0.976 [b]
HFC-134a[c] (saturated hydrofluorocarbon)	1,1,1,2-Tetrafluoroethane	—	1

CFC-113 (saturated chlorofluorocarbon)	1,1,2-Trichloro-1,2,2-trifluoroethane	5	2.767

[a] The maximum allowable concentration of the unsaturated compounds listed here, along with those determined with the capillary column method (*Test 2*) described below, in aggregate, must not exceed 5 ppm by weight of tetrafluoroethane.
[b] HFC-125 and HFC-161 coelute. Determine composition by gas chromatography/mass spectroscopy. HFC-1243zf, HFC-1132, and HFC-245cb coelute. Determine composition by gas chromatography/mass spectroscopy.
[c] These impurities are present in USP Tetrafluoroethane Related Compound Mixture 1 RS.

TEST 2—

Standard solution—Use USP Tetrafluoroethane Related Compound Mixture 2 RS.

Test solution—Proceed as directed for the *General Sampling Procedure* in *Propellants* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩ to collect a sample of Tetrafluoroethane from the bulk container.

Chromatographic system (see *Chromatography* ⟨621⟩—See *Table 4* for the chromatographic system settings.

Table 4. Chromatograph Settings for *Test 2* (Capillary Column Method)*

Columns: Supelco fused silica capillary, 0.25 mm × 60 m, 1-µm film substrate, DB-1301 (USP G43)
Maximum safe column temperature: 250°
Column compensation: nitrogen makeup gas, 18 mL per minute
Injection port and sample size: gas valve, 0.5 µL, split ratio 150 : 1
Injector temperature: 200°
Detector: flame ionization; gas settings: hydrogen—30 mL per minute, air—300 mL per minute
Detector temperature: 250°
Carrier gas: helium at 0.7 mL per minute
Programming:
Initial column temperature: –20°
Initial hold: 12 minutes
Temperature rise: 10° per minute
Final temperature: 50°; hold: 5.00 minutes
Total run time: 24 minutes

* Possible impurities detected are listed in *Table 5.*

Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the retention time for tetrafluoroethane is about 9 minutes.

Procedure—Attach the cylinder containing the USP Tetrafluoroethane Related Compound Mixture 2 RS upright to the injection valve of the chromatograph by means of a short but convenient length of 3-mm OD translucent Teflon tubing. The cylinder must be held upright to ensure vapor delivery. Open the cylinder valve. Flush the tubing and the injection valve by intermittently opening and closing the exit valve, which is attached to the exit side of the injection valve by means of a short piece of tubing, to ensure that the injection valve is bubble free. Separately inject about 0.5 µL of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the ppm of each impurity in the sample of Tetrafluoroethane taken by the formula:

$$C = C_S r_i / r_S$$

in which C is the concentration, in ppm, of impurities in the *Test solution;* C_S is the concentration, in ppm, of impurities in the *Standard solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_S is the peak area of each impurity obtained from the *Standard solution.* In addition to not exceeding the limits for each impurity shown in *Table 3* and *Table 5*, not more than 5 ppm of other identified saturated impurities is found; not more than 5 ppm of any individual unidentified impurity is found; and not more than 10 ppm of total unidentified impurities is found.

Table 5. Impurities Listing for Capillary Column Method (*Test 2*)

Impurity Number	Chemical Name	Maximum Allowed (ppm)	Retention Time Relative to HFC-134a
HFC-1225zc[a] (unsaturated halocarbon)	1,1,1,3,3-Pentafluoropropene	[b]	0.987
HFC-134a[a] (saturated hydrofluorocarbon	1,1,1,2-Tetrafluoroethane	—	1.000
HFC-152a[a] (saturated hydrofluorocarbon)	1,1-Difluoroethane	300	1.110
HFC-134[a] (saturated hydrofluorocarbon)	1,1,2,2-Tetrafluoroethane	1000	1.183
HCFC-22[a] (saturated hydrochlorofluorocarbon)	Chlorodifluoromethane	50	1.288
HCC-40[a] (saturated chlorocarbon)	Chloromethane	5	1.578
HCC-1140[a] (unsaturated chlorocarbon)	1-Chloroethene (vinyl chloride)	[b]	1.793
HCFC-31[a] (saturated hydrochlorofluorocarbon)	Chlorofluoromethane	5	1.809

[a] These impurities are present in USP Tetrafluoroethane Related Compound Mixture 2 RS.
[b] The maximum allowable concentration of the unsaturated compounds listed here, along with those determined with the packed column method described above, in aggregate, must not exceed 5 ppm by weight of Tetrafluoroethane.

Assay—Using the results of the tests for *High-boiling residues* and *Chromatographic purity,* calculate the percentage of tetrafluoroethane ($C_2H_2F_4$) in the sample of Tetrafluoroethane taken by subtracting from 100.0% the total percentages of all the impurities found.▲*NF25*

Physical Tests and Determinations

BRIEFING

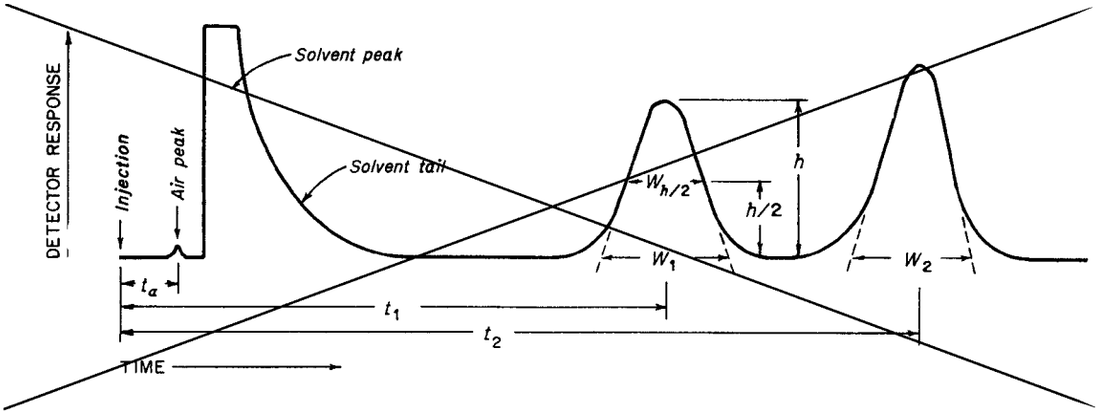
⟨**621**⟩ **Chromatography,** *USP 28* page 2380, page 3566 of the *Second Supplement,* and page 825 of *PF* 31(3) [May–June 2005]. In the *Chromatographic Reagents* section it is proposed to expand the particle size ranges for the designations L1, L7, and L11. Also, some new column designations are being added.

(BPC: M. Marques) RTS—43214-1

Change to read:

INTERPRETATION OF CHROMATOGRAMS

Figure 1 represents a typical chromatographic separation of two substances, 1 and 2, where t_1 and t_2 are the respective retention times; and h, $h/2$, and $W_{h/2}$ are the height, the half-height, and the width at half-height, respectively, for peak 1. W_1 and W_2 are the respective widths of peaks 1 and 2 at the baseline. Air peaks are a feature of gas chromatograms and correspond to the solvent front in liquid chromatography.



In-Process Revision

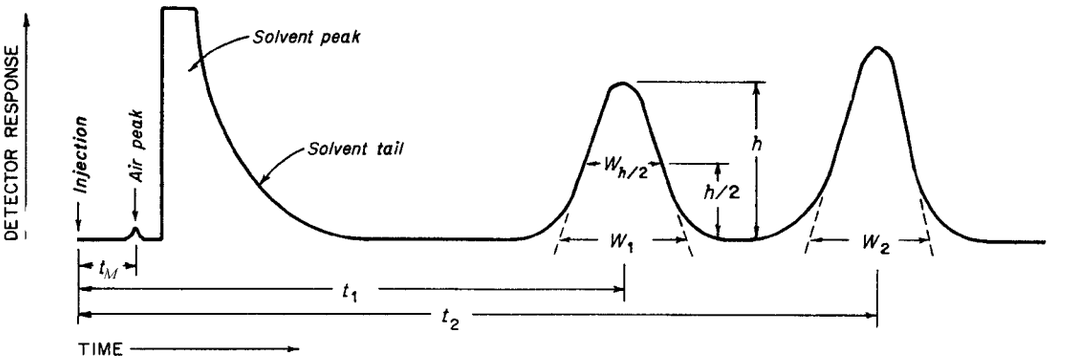


Fig. 1. Chromatographic separation of two substances

Chromatographic retention times are characteristic of the compounds they represent but are not unique. Coincidence of retention times of a test and a reference substance can be used as a feature in construction of an identity profile but is insufficient on its own to establish identity. Absolute retention times of a given compound vary from one chromatogram to the next. ~~Comparisons are normally made in terms of relative retention, α,~~

~~r,~~
~~which is calculated by the equation:~~

$$\alpha = \frac{t_2 - t_a}{t_1 - t_a},$$

$$r = \frac{t_2 - t_a}{t_1 - t_a}$$

~~where t_2 and t_1 are the retention times, measured from the point of injection, of the test and reference substances, respectively, determined under identical experimental conditions on the same column, and t_a is the retention time of a nonretained substance, such as methane in the case of gas chromatography.~~

~~In this and the following expressions, the corresponding retention volumes or linear separations on the chromatogram, both of which are directly proportional to retention time, may be substituted in the equations. Where the value of t_a is small, R_r may be estimated from the retention times measured from the point of injection (t_2/t_1).~~

~~R_r:~~

■Because in most procedures there is no need to identify an unretained peak, comparisons are normally made in terms of relative retention times, R_r:

$$R_r = \frac{t_2}{t_1}$$

where t_2 and t_1 are the retention times, measured from the point of injection, of the test and the reference substances, respectively, determined under identical experimental conditions on the same column.

Other procedures may identify the peak position using the relative retention, r:

$$r = \frac{t_2 - t_M}{t_1 - t_M}$$

where t_M is the retention time of a non-retained marker, which needs to be defined in the procedure.■1S (*USP29*)

The number of theoretical plates, N, is a measure of column efficiency. For Gaussian peaks, it is calculated by the equation:

$$N = 16\left(\frac{t}{W}\right)^2 \text{ or } N = 5.54\left(\frac{t}{W_{h/2}}\right)^2,$$

■$N = 16\left(\frac{t}{W}\right)^2$ ■1S (*USP29*)

where t is the retention time of the substance and W is the width of the peak at its base, obtained by extrapolating the relatively straight sides of the peak to the baseline. ~~$W_{h/2}$ is the peak width at half-height, obtained directly by electronic integrators.~~

■■1S (*USP29*)

In-Process Revision

The value of N depends upon the substance being chromatographed as well as the operating conditions such as mobile phase or carrier gas flow rates and temperature, the quality of the packing, the uniformity of the packing within the column and, for capillary columns, the thickness of the stationary phase film, and the internal diameter and length of the column.

The separation of two components in a mixture, the resolution, R, is determined by the equation:

$$R = \frac{2(t_2 - t_1)}{W_2 + W_1}$$

in which t_2 and t_1 are the retention times of the two components, and W_2 and W_1 are the corresponding widths at the bases of the peaks obtained by extrapolating the relatively straight sides of the peaks to the baseline.

Where electronic integrators are used, it may be convenient to determine the resolution, R, by the equation:

$$R = \frac{2(t_2 - t_1)}{1.70(W_{1,h/2} + W_{2,h/2})}$$

and to determine the number of theoretical plates, N, by the equation:

$$N = 5.54(t/W_{h/2})^2$$

■where $W_{h/2}$ is the peak width at half-height, obtained directly by electronic integrators.■1S *(USP29)*
However, in the event of dispute, only equations based on peak width at baseline are to be used.

Peak areas and peak heights are usually proportional to the quantity of compound eluting. These are commonly measured by electronic integrators but may be determined by more classical approaches. Peak areas are generally used but may be less accurate if peak interference occurs. For manual measurements, the chart should be run faster than usual, or a comparator should be used to measure the width at half-height and the width at the base of the peak, to minimize error in these measurements. For accurate quantitative work, the components to be measured should be separated from any interfering components. Peak tailing and fronting and the measurement of peaks on solvent tails are to be avoided.

Chromatographic purity tests for drug raw materials are sometimes based on the determination of peaks due to impurities, expressed as a percentage of the area due to the drug peak. It is preferable, however, to compare impurity peaks with those in the chromatogram of a standard at a similar concentration. The standard may be the drug itself at a level corresponding to, for example, 0.5% impurity, or in the case of toxic or signal impurities, a standard of the impurity itself.

SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the

▲detection sensitivity,▲*USP29*
(Official June 1, 2006)

resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

▲The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the *Chromatographic purity* or *Related compounds* tests by injecting a volume of a quantitation limit solution equal to that of the *Test solution*. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the *Test solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test solution* in the case of drug substances, and at a 0.1% level relative to the amount of drug substance in the *Test solution* for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.▲*USP29*
(Official June 1, 2006)

The resolution, R, [NOTE—All terms and symbols are defined in the *Glossary of Symbols*] is a function of the column efficiency, N, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, S_R, if the requirement is 2.0% or less; data from six replicate injections are used if the relative standard deviation requirement is more than 2.0%.

The tailing factor, *T,* a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see *Figure 2*). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

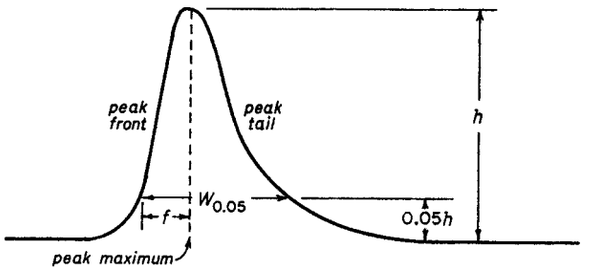

Fig. 2. Asymmetrical chromatographic peak

These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see *Procedures* under *Tests and Assays* in the *General Notices*). ~~Adjustments of operating conditions to meet system suitability requirements may be necessary.~~

■If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum ~~specification~~ variation that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when ~~Reference Standards~~ suitable standards (including Reference Standards) are available for all ~~analytes~~ compounds used in the suitability test and only when those standards are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. ~~The changes described below may require additional validation data unless the user can verify the suitability of the method under the new conditions. This verification consists of assessing the analytical performance characteristics that can be affected by the change (e.g., specificity, linearity, precision, accuracy) to ensure the adequacy of the method. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.~~ The changes described below may require additional validation data. The user should verify the suitability of the method under the new conditions by assessing the relevant analytical performance characteristics potentially affected by the change. *Tables 1* and *2* in the general information chapter *Verification of Compendial Procedures* ⟨1226⟩ provide lists of analytical performance validation characteristics that may require assessment. Multiple adjustments can have a cumulative effect in the performance of the system and should be considered carefully before implementation.

pH of Mobile Phase (HPLC)—The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within ~~0.2~~ ± 0.2 units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within ± 10%, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC)—~~The amount of the minor~~ The following adjustment limits apply to minor components of the mobile phase (specified at 50% or less). The amount(s) of these component(s) can be adjusted by ± 30% relative. ~~or ± 2% absolute (i.e., in relation to the total mobile phase), whichever is larger.~~ However, the change in any component cannot exceed ± 10% absolute (i.e., in relation to the total mobile phase), nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

In-Process Revision

Binary Mixtures—

SPECIFIED RATIO OF 50 : 50—Thirty percent of 50 is 15% absolute, but this exceeds the maximum permitted change of ±10% absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40 : 60 to 60 : 40.

~~SPECIFIED RATIO OF 95 : 5 Thirty percent of 5 is 1.5% absolute. However, because adjustments up to ±2% absolute are allowed, the ratio may be adjusted within the range of 93 : 7 to 97 : 3.~~

SPECIFIED RATIO OF 2 : 98—Thirty percent of 2 is 0.6% absolute. ~~In this case an absolute adjustment of ±2% is not allowed because it would reduce the amount of the first component to zero.~~ Therefore the maximum allowed adjustment is within the range of 1.4 : 98.6 to 2.6 : 97.4.

Ternary Mixtures—

SPECIFIED RATIO OF 60 : 35 : 5—For the second component, 30% of 35 is 10.5% absolute, which exceeds the maximum permitted change of ±10% absolute in any component. Therefore the second component may be adjusted only within the range of 25% to 45% absolute. For the third component, 30% of 5 is 1.5% absolute. ~~Since ±2% absolute is permitted and provides more flexibility, the third component may be adjusted within the range of 3% to 7% absolute.~~ In all cases, a sufficient quantity of the first component is used to give a total of 100%. Therefore, mixture ranges of 50 : 45 : 5 to 70 : 25 : 5 or ~~58 : 35 : 7 to 62 : 35 : 3~~ 58.5 : 35 : 6.5 to 61.5 : 35 : 3.5 would meet the requirement.

~~Detector~~ Wavelength of UV-Visible Detector (HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, ±3 nm.

Column Length (GC, HPLC): can be adjusted by as much as ~~70%.~~ ±70%.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as ~~±25% 50%.~~ ±25% for HPLC and ±50% for GC.

Film Thickness (Capillary GC): can be adjusted by as much as –50% to 100%.

Particle Size (HPLC): can be reduced by as much as 50%.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as ±50%.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. ~~It may be increased to as much as twice the volume specified, provided there are no adverse effects on factors such as baseline, peak shapes, resolution, linearity, and retention times.~~

Column Temperature (HPLC): can be adjusted by as much as ~~±20°.~~ ±10°. Column thermostating is recommended to improve control and reproducibility of retention time.

~~Column~~ Oven Temperature (GC): can be adjusted by as much as ~~±2%, in terms of absolute temperature.~~ ±10%.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to ±20% is permitted.

~~**Gradient Elution (HPLC)**—The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column.~~ ■1S (*USP29*)

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

■Relative retention times may be provided in monographs for informational purposes only, to aid in peak identification. There are no acceptance criteria applied to relative retention times.■1S (*USP29*)

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.

The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails

■system suitability■1S (*USP29*) requirements are unacceptable.

GLOSSARY OF SYMBOLS

To promote uniformity of interpretation, the following symbols and definitions are employed where applicable in presenting formulas in the individual monographs.

■Where a different symbol or definition is used in an individual monograph, the monograph text takes precedence (see *General Notices*).■1S (*USP29*)

[NOTE—Where the terms W and t both appear in the same equation they must be expressed in the same units.]

~~α relative retention,~~

$$\alpha = \frac{t_2 - t_a}{t_1 - t_a}.$$

~~c_s, c_t, c_u concentrations of Reference Standard, internal standard, and analyte in a particular solution.~~

~~C_u concentration ratio of analyte and internal standard in test solution or *Assay preparation*,~~

$$C_A = \frac{C_u}{C_t}.$$

~~C_s concentration ratio of Reference Standard and internal standard in Standard solution,~~

$$C_S = \frac{C_t}{C_t}.$$

■■1S (*USP29*)

f distance from the peak maximum to the leading edge of the peak, the distance being measured at a point 5% of the peak height from the baseline.

k' capacity factor,

$$k' = \frac{\text{amount of substance in stationary phase}}{\text{amount of substance in mobile phase}}$$

$$k' = \frac{\text{time spent by substance in stationary phase}}{\text{time spent by substance in mobile phase}} = \frac{t}{t_u} - 1.$$

■$$k' = \frac{\text{time spent by substance in stationary phase}}{\text{time spent by substance in mobile phase}} = \frac{t}{t_{ur}} - 1$$■1S (*USP29*)

N number of theoretical plates in a chromatographic column,

$$N = 16\left(\frac{t}{W}\right)^2.$$

■$$N = 16\left(\frac{t}{W}\right)^2 \text{ or } N = 5.54\left(\frac{t}{W_{h/2}}\right)^2$$■1S (*USP29*)

~~q_s, q_t, q_u total quantities (weights) of Reference Standard, internal standard, and analyte in a particular solution.~~

In-Process Revision

~~Q_A~~ ~~quantity ratio of analyte and internal standard in test solution or *Assay preparation*,~~

~~$Q_A = \frac{q_u}{q_i}$.~~

~~Q_S~~ ~~quantity ratio of Reference Standard and internal standard in Standard solution,~~

~~$Q_S = \frac{q_r}{q_i}$.~~

r relative retention,

~~$r = \frac{t_2 - t_a}{t_1 - t_a}$~~

$$r = \frac{t_2 - t_M}{t_1 - t_M}$$

r_i peak response of an impurity obtained from a chromatogram.

~~r_i~~, r_{IS} peak response of the internal standard obtained from a chromatogram. ■1S (*USP29*)

r_S peak response of the Reference Standard obtained from a chromatogram.

r_U peak response of the analyte obtained from a chromatogram.

R resolution between two chromatographic peaks,

$$R = \frac{2(t_2 - t_1)}{W_1 + W_2}$$

■ or $R = \frac{2(t_2 - t_1)}{1.70(W_{1,h/2} + W_{2,h/2})}$ ■1S (*USP29*)

R_F chromatographic retardation factor equal to the ratio of the distance from the origin to the center of a zone divided by the distance from the origin to the solvent front.

~~R_r~~ ~~relative retention~~

~~$R_r = \frac{\text{distance traveled by test substance}}{\text{distance traveled by standard}}$.~~

■■1S (*USP29*)

~~R_r~~ relative retention time

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, ~~3~~

▲1.7▲*USP30*
to 10 µm in diameter,

■or a monolithic silica rod.■1S *(USP29)*

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, ~~3~~

▲1.7▲*USP30*
to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, ■3 to■1S *(USP28)* 10 µm in diameter.

L9—~~10 µm~~

■■1S *(USP29)*
Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating,

■3 to 10 µm in diameter.■1S *(USP29)*

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, ~~5~~

▲1.7▲*USP30*
to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel ■■1S *(USP28)* having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating, ■5 to 10 µm in diameter.■1S *(USP28)*

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.~~5~~

■[NOTE—Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd. and distributed by Waters Corp. (www.waters.com).]■1S *(USP29)*

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, ~~5~~

■3■1S *(USP29)*
to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

~~5 Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■ and distributed by Waters Corp. (www.waters.com).■1S *(USP29)*~~

In-Process Revision

L31—A

■hydroxide-selective,■1S (*USP29*)
strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate dextrans by molecular size over a range of 4000 to 500,000 Da. It is spherical, silica-based, and processed to provide pH stability.[6]

■[NOTE—Available as TSKgel G4000 SWXL from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, 5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, ■about■1S (*USP28*) 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.[7]

■[NOTE—Available as CarboPac MA1 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.[8]

■[NOTE—Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.]■1S (*USP29*)

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.[9]

■[NOTE—Available as OmniPac PAX-500 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.[10]

■[NOTE—Available as Chiralpak AD from Chiral Technologies, Inc., ■(www.chiraltech.com).■1S (*USP28*)]■1S (*USP29*)

L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.[11]

■[NOTE—Available as TSK IC SW Cation from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column. [12]

■[NOTE—Available as IonPac CS14 distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.[13]

■[NOTE—Available as Superdex Peptide HR 10/30 from Amersham Pharmacia Biotech (www.amershambiosciences.com).]■1S (*USP29*)

■L## (Dalteparin Sodium, anion-exchange Dowex 1X8)—[To come.]

L## (Dalteparin Sodium, cation-exchange Dowex 50WX2)—[To come.]■1S (*USP29*)

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00 : 0.90 : 0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17—75% Phenyl-25% methylpolysiloxane.
G18—Polyalkylene glycol.
G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.
G20—Polyethylene glycol (av. mol. wt. of 380 to 420).
G21—Neopentyl glycol succinate.
G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. ~~Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.~~

■[NOTE—Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.]■1S (*USP29*)

G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.
G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.
G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36—1% Vinyl-5% phenylmethylpolysiloxane.
G37—Polyimide.
G38—Phase G1 containing a small percentage of a tailing inhibitor.[19]

■[NOTE—A suitable grade is available commercially as ''SP2100/0.1% Carbowax 1500'' from Supelco, Inc. (www.sigma-aldrich.com/supelco).]■1S (*USP29*)

G39—Polyethylene glycol (av. mol. wt. about 1500).
G40—Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).

[16] ~~Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143) (www.bio-rad.com).~~

[17] ~~Available as TSKgel G3000SW Column (analytical column) and TSKgel Guard (guard column) from Tosoh Biosep (part numbers 05789 and 05371, respectively). (www.tosohbiosep.com).~~

[18] ~~Available as Supelcosil ABZ from Supelco. (www.sigma-aldrich.com/supelco).~~

[19] ~~A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc., ■~~(www.sigma-aldrich.com/supelco).■1S *(USP28)*

In-Process Revision

G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).
G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).
G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.
G45—Divinylbenzene-ethylene glycol-dimethylacrylate.
G46—14% Cyanopropylphenyl-86% methylpolysiloxane.
G47—Polyethylene glycol (av. mol. wt. of about 8000).
G48—Highly polar, partially cross-linked cyanopolysiloxane.
~~G49—Proprietary derivatized phenyl groups on a polysiloxane backbone.[20]~~

■■1S (*USP29*)

▲G## (Docosahexaenoic acid, Famewax)—Polyethylene glycol, cross-linked (average molecular weight of not more than 20,000).

G## (Tetrafluoroethane, Bentone 34/SP-1200)—Aluminosilicate montmorrillonite that has been treated with dimethyloctadecylammonium salts plus a low polarity ester phase.

G## (Tetrafluoroethane, Krytox)—A perfluorinated polyether fluid.▲*USP30*

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.
S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane[21]

■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)
to mask surface silanol groups.
S1AB—The siliceous earth as described above is both acid- and base-washed.[21]

■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)
S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.
S1NS—The siliceous earth is untreated.
S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 µm.
S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 µm.
S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 µm.
S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.
S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 µm.
S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.
S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.
S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.
S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.
S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.[22]

■[NOTE—Commercially available as SP1500 on Carbopack B from Supelco (www.sigma-aldrich.com/supelco).]■1S (*USP29*)
S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

▲S## (Tetrafluoroethene, Porapak T)—Polymer based on highly polar ethylene glycol dimethacrylate monomer, with a surface area of 225–350 m^2 per g.▲*USP30*

BRIEFING

〈**711**〉 **Dissolution,** *USP 28* page 2412 and page 3572 of the *Second Supplement.* In the introductory paragraph, it is proposed to remove the statement on interchangeability. Although this chapter is harmonized by agreement among the European Pharmacopoeia, the Japanese Pharmacopoeia, and the United States Pharmacopeia, regulatory interchangeability is currently under consideration by the working group Q4B of the International Conference on Harmonization. It is further proposed, in *Apparatus 1 and Apparatus 2* in the *Procedure* section, to add the subsection *Procedure for a Pooled Sample for Immediate-Release Dosage Forms.* Finally, it is proposed to include, in the *Interpretation* section, the procedure and acceptance table for a pooled sample of immediate-release dosage forms in the USP-specific text of this harmonized general test chapter. Concern has been expressed by stakeholders that the pre-

In-Process Revision

[20] ~~A suitable grade is available commercially as "Optima Delta-3" from Machery-Nagel, Inc., 215 River Vale Road, River Vale, NJ 07675.~~
[21] ~~Unless otherwise specified in the individual monograph, silanized support is intended.~~
[22] ~~Commercially available as SP1500 on Carbopack B from Supelco (www.sigma-aldrich.com/supelco).~~

viously proposed removal of this text from the chapter, and inclusion separately in each affected drug product monograph, will cause an unnecessary burden on their resources. Therefore the Biopharmaceutics Expert Committee has proposed this revision. At this time, the committee does not envision an expansion of the number of monographs for which pooled sampling is specified. The monographs in which pooled sampling appears represent well-characterized dosage forms with long product histories. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2006, the same date as the date of implementation of the harmonized chapter.

(BPC: W. Brown) RTS—42348-1; 42761-1

Change to read:

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* ~~The texts of these pharmacopeias are therefore interchangeable, and the methods of the European Pharmacopoeia or the Japanese Pharmacopoeia may be used for demonstration of compliance instead of the present general chapter.~~

•.[2]

These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national USP text, and therefore not part of the harmonized text, are marked with symbols (◆◆) to specify this fact.

This test is provided to determine compliance with the dissolution requirements ◆where stated in the individual monograph◆ for dosage forms administered orally. In this general chapter, a dosage unit is defined as 1 tablet or 1 capsule or the amount specified. ◆Of the types of apparatus described herein, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and where a dissolution or disintegration test that does not specifically state that it is to be applied to delayed-release articles is included in the individual monograph, the procedure and interpretation given for *Delayed-Release Dosage Forms* is applied unless otherwise specified in the individual monograph. For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the *Dissolution* specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

USP Reference Standards ⟨11⟩—*USP Chlorpheniramine Maleate Extended-Release Tablets RS (Drug Release Calibrator, Single Unit). USP Prednisone Tablets RS (Dissolution Calibrator, Disintegrating). USP Salicylic Acid Tablets RS (Dissolution Calibrator, Nondisintegrating).*◆

PROCEDURE

Apparatus 1 and Apparatus 2

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* (±1%) in the vessel of the specified apparatus ◆given in the individual monograph,◆ assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage unit in the apparatus, taking care to exclude air bubbles from the surface of the dosage unit, and immediately operate the apparatus at the specified rate ◆given in the individual monograph.◆ Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating basket or blade, not less than 1 cm from the vessel wall. [NOTE—Where multiple sampling times are specified, replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37° or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.] Perform the analysis ◆as directed in the individual monograph◆ using a suitable assay method.[3] Repeat the test with additional dosage form units.

If automated equipment is used for sampling or the apparatus is otherwise modified, verification that the modified apparatus will produce results equivalent to those obtained with the standard apparatus described in this general chapter is necessary.

Dissolution Medium—A suitable dissolution medium is used. Use the solvent specified ◆in the individual monograph.◆ The volume specified refers to measurements made between 20° and 25°. If the *Dissolution Medium* is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the specified pH ◆given in the individual monograph.◆ [NOTE—Dissolved gases can cause bubbles to form, which may change the results of the test. If dissolved gases influence the dissolution results, dissolved gases should be removed prior to testing.[4]]

Time—Where a single time specification is given, the test may be concluded in a shorter period if the requirement for minimum amount dissolved is met. Specimens are to be withdrawn only at the stated times within a tolerance of ±2%.

•◆Procedure for a Pooled Sample for Immediate-Release Dosage Forms—Use this procedure where *Procedure for a Pooled Sample* is specified in the individual monograph. Proceed as directed in *Procedure* for *Apparatus 1 and Apparatus 2* in *Immediate-Release Dosage Forms.* Combine equal volumes of the filtered solutions of the six or twelve individual specimens withdrawn, and use the

[3] Test specimens are filtered immediately upon sampling unless filtration is demonstrated to be unnecessary. Use an inert filter that does not cause adsorption of the active ingredient or contain extractable substances that would interfere with the analysis.

[4] One method of deaeration is as follows: Heat the medium, while stirring gently, to about 41°, immediately filter under vacuum using a filter having a porosity of 0.45 µm or less, with vigorous stirring, and continue stirring under vacuum for about 5 minutes. Other validated deaeration techniques for removal of dissolved gases may be used.

In-Process Revision

pooled sample as the test specimen. Determine the average amount of the active ingredient dissolved in the pooled sample.◆●[2]

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms.*

Time—The test-time points, generally three, are expressed in hours.

DELAYED-RELEASE DOSAGE FORMS

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

Use *Method A* or *Method B* and the apparatus specified ◆in the individual monograph.◆ All test times stated are to be observed within a tolerance of ±2%, unless otherwise specified.

Method A—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 750 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the specified rate ◆given in the monograph.◆

After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—Complete the operations of adding the buffer and adjusting the pH within 5 minutes.]

With the apparatus operating at the rate specified ◆in the monograph,◆ add to the fluid in the vessel 250 mL of 0.20 M tribasic sodium phosphate that has been equilibrated to 37 ± 0.5°. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph.◆ At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for the minimum amount dissolved is met at an earlier time.◆

Method B—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 1000 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the rate specified ◆in the monograph.◆ After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—For this stage of the procedure, use buffer that previously has been equilibrated to a temperature of 37 ± 0.5°.] Drain the acid from the vessel, and add to the vessel 1000 mL of pH 6.8 phosphate buffer, prepared by mixing 0.1 N hydrochloric acid with 0.20 M tribasic sodium phosphate (3 : 1) and adjusting, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. [NOTE—This may also be accomplished by removing from the apparatus the vessel containing the acid and replacing it with another vessel containing the buffer and transferring the dosage unit to the vessel containing the buffer.]

Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph.◆ At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.◆

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage-form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage unit, and immediately operate the apparatus as specified ◆in the individual monograph.◆ During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed ◆in the individual monograph.◆ If necessary, repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 3*.

Dissolution Medium—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

DELAYED-RELEASE DOSAGE FORMS

Proceed as described for *Delayed-Release Dosage Forms, Method B* under *Apparatus 1 and Apparatus 2* using one row of vessels for the acid stage media and the following row of vessels for the buffer stage media and using the volume of medium specified (usually 300 mL).

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

In-Process Revision

Apparatus 4 (Flow-Through Cell)

IMMEDIATE-RELEASE DOSAGE FORMS

Place the glass beads into the cell specified ◆in the monograph.◆ Place 1 dosage unit on top of the beads or, if specified ◆in the monograph,◆ on a wire carrier. Assemble the filter head, and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified ◆in the individual monograph◆ and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed ◆in the individual monograph.◆ Repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4*.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

DELAYED-RELEASE DOSAGE FORMS

Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2,* using the specified media.

Time—Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Change to read:

INTERPRETATION

Immediate-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph,◆ the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 1*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient ◆specified in the individual monograph,◆ expressed as a percentage of the labeled content of the dosage unit; the 5%, 15%, and 25% values in *Acceptance Table 1* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 1

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is not less than Q + 5%.
S_2	6	Average of 12 units (S_1 + S_2) is equal to or greater than Q, and no unit is less than Q – 15%.
S_3	12	Average of 24 units (S_1 + S_2 + S_3) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

◆●Immediate-Release Dosage Forms Pooled Sample—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample.* Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient specified in the individual monograph, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

◆●[2]

Extended-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph,◆ the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 2*. Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q_i, the amount dissolved at each spec-

In-Process Revision

ified fractional dosing interval. Where more than one range is specified ◆in the individual monograph,◆ the acceptance criteria apply individually to each range.

Acceptance Table 2

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units (L_1 + L_2) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units (L_1 + L_2 + L_3) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Delayed-Release Dosage Forms

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA.

Acid Stage—Unless otherwise specified ◆in the individual monograph,◆ the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 3*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Acceptance Table 3

Level	Number Tested	Criteria
A_1	6	No individual value exceeds 10% dissolved.
A_2	6	Average of the 12 units (A_1 + A_2) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.
A_3	12	Average of the 24 units (A_1 + A_2 + A_3) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.

Buffer Stage—Unless otherwise specified ◆in the individual monograph,◆ the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 4*. Continue testing through the three levels unless the results of both stages conform at an earlier level. The value of Q in *Acceptance Table 4* is 75% dissolved unless otherwise specified ◆in the individual monograph.◆ The quantity, Q, ◆specified in the individual monograph◆ is the total amount of active ingredient dissolved in both the *Acid* and *Buffer Stages*, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in *Acceptance Table 4* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 4

Level	Number Tested	Criteria
B_1	6	Each unit is not less than Q + 5%.
B_2	6	Average of 12 units (B_1 + B_2) is equal to or greater than Q, and no unit is less than Q – 15%.
B_3	12	Average of 24 units (B_1 + B_2 + B_3) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1217**⟩ **Tablet Breaking Force.** This proposed new general information chapter considers tablet friability, hardness, crushing strength, breaking force, and issues that must be considered in the analytical determination of tablet breaking force. The use of breaking force to compute the tensile strength of flat-faced, round tablets is also discussed.

(PDF: W. Brown) RTS—42837-1

Add the following:

▲⟨1217⟩ TABLET BREAKING FORCE

INTRODUCTION

There are a variety of presentations for tablets as delivery systems for pharmaceutical agents, such as rapidly disintegrating, slowly disintegrating, eroding, chewable, and lozenge. Each of these presentations places a certain demand on the bonding, structure, and integrity of the compressed matrix. Tablets must be able to withstand the rigors of handling and transportation experienced in the manufacturing plant, in the drug distribution system, and in the field at the hands of the end users (patients/consumers). Manufacturing processes such as coating, packaging, and printing can involve considerable stresses, which the tablets must be able to withstand. For these reasons, the mechanical strength of tablets is of considerable importance and is routinely measured. Tablet strength serves both as a criterion by which to guide product development and as a quality control specification.

One commonly employed test of the ability of tablets to withstand mechanical stresses determines their resistance to chipping and surface abrasion by tumbling them in a rotating cylinder. The percentage weight loss after tumbling is referred to as the *friability* of the tablets. Standardized methods and equipment for testing friability have been provided in general chapter *Tablet Friability* ⟨1216⟩.

Another measure of the mechanical integrity of tablets is their *breaking force,* which is the force required to cause them to fail (i.e., break) in a specific plane. The tablets are generally placed between two platens, one of which moves to apply sufficient force to the tablet to cause fracture. For conventional, round (circular cross-section) tablets, loading occurs across their diameter (sometimes referred to as diametral loading), and fracture occurs in that plane.

The breaking force of tablets is commonly called *hardness* in the pharmaceutical literature; however, the use of this term is misleading. In material science, the term *hardness* refers to the resistance of a surface to penetration or indentation by a small probe. The term *crushing strength* is also frequently used to describe the resistance of tablets to the application of a compressive load. Although this term describes the true nature of the test more accurately than does *hardness,* it implies that tablets are actually crushed during the test, which often is not the case. Moreover, the term *strength* in this application can be questioned, because in the physical sciences that term is often used to describe a stress (e.g., tensile strength). Thus, the term *breaking force* is preferred and will be used in the present discussion.

TABLET BREAKING FORCE DETERMINATIONS

Early measuring devices were typically hand operated. For example, the Monsanto (or Stokes) hardness tester was based on compressing tablets between two jaws via a spring gauge and screw. In the Pfizer hardness tester, the vertically mounted tablet was squeezed in a device that resembled a pair of pliers. In the Strong Cobb hardness tester, the breaking load was applied through the action of a small hydraulic pump that was first operated manually but was later motorized. Problems associated with these devices were related to operator variability in rates of loading and difficulties in proper setup and calibration. Modern testers employ mechanical drives, strain gauge–based load cells for force measurements, and electronic signal processing, and therefore are preferred. However, several important issues must be considered when using them for the analytical determination of breaking force; these are discussed below.

Platens

The platens should be parallel. Their faces should be polished smooth and precision-ground perpendicularly to the direction of movement. Perpendicularity must be preserved during platen movement, and the mechanism should be free of any bending or torsion displacements as the load is applied. The contact faces must be larger than the area of contact with the tablet.

Rate and Uniformity of Loading

Either the rate of platen movement or the rate at which the compressive force is applied (i.e., the loading rate) should be constant. Maintaining a constant loading rate avoids the rapid buildup of compressive loads, which may lead to uncontrolled crushing or shear failure and greater variability in the measured breaking force. However, constant loading rate measurements may be too slow for real time monitoring of tablet production.

The rate at which the compressive load is applied can significantly affect results, because time-dependent processes may be involved in tablet failure (*1*). How a tablet matrix responds to differences in the loading rate depends on the mechanism of failure. At low strain rates, some materials may fail in a ductile manner, but brittle failure is more likely at faster strain rates. The transition from ductile to brittle failure is accompanied by an increase in the breaking force. Devices that simply crush tablets may produce deceptively reproducible data because they lack sensitivity.

A constant loading rate of 20 newtons (N) or less per second or a constant platen movement of 3 mm or less per second encourages controlled breaking in a consistent manner. To ensure comparability of results, testing must occur under identical conditions of loading rate or platen movement rate. Since there are certain advantages to each system of load application, both are found in practice. Because the particular testing situation and the type of tablet matrix being evaluated will pose different constraints, there is also no basis to declare an absolute preference for one system over the other. This general chapter proposes consideration of both approaches.

Method A: Constant rate of load application. The breaking force (at point of matrix failure) determined with a uniform rate of force application at a rate of 20 N or less per second.

Method B: Constant rate of displacement. The breaking force (at point of matrix failure) determined with force application coming from a uniform platen movement at a rate of 3 mm or less per second.

The different methods may lead to numerically different results for a particular tablet sample, requiring that the rate of load application or displacement must be specified along with the determined breaking force.

Dependence of Breaking Force on Tablet Geometry and Mass

Measurements of breaking force do not take into account the dimensions or shape of the tablet. Thicker tablets of the same material compressed under conditions identical to those of thinner tablets, with the same tooling shape and to the same peak force, will require greater breaking forces. For direct comparisons (i.e., without any normalizations of the data), breaking force measurements should be performed on tablets having the same dimensions and geometry.

Tablet Orientation

Tablet orientation in diametral compression of round tablets without any scoring is unequivocal. That is, the tablet is placed between the platens so that compression occurs across a diameter. However, tablets with a unique or complex shape may have no obvious orientation for breaking force determination. Because the breaking force may depend on the tablet's orientation in the tester, to ensure comparability of results, it is best to settle on a standard orientation, preferably one that is most readily and easily reproduced by operators. In general, tablets are tested either across the diameter or at 90° to the longest axis. Scored tablets have two orientation possibilities. When they are oriented with their scores perpendicular to the platen faces, the likelihood that tensile failure will occur along the scored line increases. This provides information about the strength of the matrix at the weakest point in the structure. When scored tablets are oriented with their scores parallel to the platen faces, more general information about the strength of the matrix is derived.

Capsule-shaped tablets or scored tablets may best be broken in a three-point flexure test (*2*). A fitting, which is either installed on the platens or substituted for the platens, supports the tablet at its ends and permits the breaking load to be applied to the opposite face at the unsupported midpoint of the tablet. The fittings are often available from the same source that supplies the hardness tester.

Units, Resolution, and Calibration

Modern breaking force testers are usually calibrated in kiloponds or newtons. The relationship between these units of force (*3*) is 1 kilopond (kp) = 1 kilogram-force (kgf) = 9.80 N. Some breaking force testers also will provide a scale in Strong Cobb units (SCU), a carryover from the days when Strong Cobb hardness testers were in common usage. The conversion between SCU and N or kp must be viewed with caution, because the SCU is derived from a hydraulic device and is a pressure.

Generally, contemporary breaking force testers use modern electronic designs with digital readouts. Some units also have an integral printer or may be interfaced with a printer. Breaking forces should be readable to within 1 N.

Breaking force testers should be calibrated periodically. The force sensor as well as the mechanics of the apparatus needs to be considered. For the force sensor, the complete measuring range (or, at a minimum, the range used for measuring the test sample) should be calibrated to a precision of 1 N, using either the static or dynamic method. Static calibration generally employs traceable counterweights; at least three different points are checked to assess linearity. Dynamic calibration makes use of a traceable reference-load cell that is compressed between the platens. The functional calibration of a breaking force test apparatus should also confirm that the velocity and the constancy of velocity for load application or displacement are within prescribed tolerances throughout the range of platen movement.

Sample Size

In order to achieve sufficient statistical precision for the determination of average breaking force, a minimum of 6 tablet samples should be tested. The average breaking force alone may be adequate to fulfill the purpose of process or product quality control. In cases where breaking force may be particularly critical, the average plus individual breaking force values should be accessible.

TENSILE STRENGTH

The measurement of tensile strengths provides a more fundamental measure of the mechanical strength of the compacted material and takes into account the geometry of the tablet. If tablets fail in tension, the breaking force can be used to calculate the tensile strength. Unfortunately, this is practical only for simple shapes. If flat-faced round tablets (right circular cylinders) fail in tension, as indicated by a clean split into halves under diametral compression, the breaking force may be used to compute the tensile strength from the following equation (*4*), which applies only to cylindrical tablets:

$$\sigma_X = \frac{2F}{\pi DH}$$

in which σ_X is the tensile strength, F is the breaking force, D is the tablet diameter, and H is the tablet thickness. Because only tablets that fail in tension are counted, the data are based on tablets that fail in a consistent way. Thus, reproducibility of data should be enhanced when compared to conventional breaking-strength testing. Moreover, the data will be normalized with respect to tablet dimensions, because both diameter and thickness are included in the equation. The derivation of this equation may be found in standard texts (*5, 6*); it is based on elastic theory and the following assumptions:

1. The tablet is an isotropic body
2. Hooke's law is obeyed
3. The modulus of elasticity in compression and in tension is the same
4. Ideal point loading occurs

The derivation has been extended to convex-faced tablets (*7, 8*):

$$\sigma_X = \frac{10F}{\pi D^2}\left[\frac{2.84H}{D} - \frac{0.126H}{W} + \frac{3.15W}{D} + 0.01\right]^{-1}$$

where σ_X is the tensile strength, F is the breaking force, D is the tablet diameter, H is the tablet thickness, and W is the central cylinder thickness (tablet wall height).

The slow and constant loading rate of modern motorized break force testers encourages tensile failure. However, ideal point loading may not occur, because of crushing and the induction of shear failure at the interface with the surface of the platens. The addition of padding to the platens helps prevent shear at contact points and promotes true tensile failure. On that basis, padding is strongly recommended when highly precise measurements are needed. Padding should be relatively thin so that any deviation from the assumption of true point-source force application will not be large. The padding should also collapse very easily so that its deformation does not become part of the force measured by the test apparatus. In more routine settings involving measurements on a large number of samples, the addition of padding could contribute to inaccuracies in measurement as powder from previously tested samples becomes embedded in the collapsible matrix and thereby alters its properties. Unless provisions for frequent and routine replacement of the padding are made, it can be considered acceptable to ignore the use of padding material to maintain constancy of the test conditions.

Bending or flexure of tablets is another option for determining the tensile strength of tablets. Under ideal loading conditions, a breaking load applied to the unsupported midpoint of one face will result in the generation of pure tensile

stress in the opposite face. If the tablets are right circular cylinders and are subjected to three-point flexure, the tensile strength may be estimated using the following equation (*9*):

$$\sigma_X = \frac{3FL}{2H^2D}$$

in which L is the distance between supports, and the other terms are as defined above. The assumptions are the same as those for calculating tensile strength from diametral compression. However, tensile strengths determined by flexure and diametral compression may not agree, because of likely nonideal loading and the induction of shear failure during testing.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Geneticin. This new reagent is used in the test for *Bioidentity* in the monograph for *Glucagon,* proposed elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—43070-2

Add the following:

▲**Geneticin** *(G418; O-2-Amino-2,7-dideoxy-D-glycero-alpha-D-glucoheptopyranosyl-(1-4)-O-(3-deoxy-4-C-methyl-3-(methylamino)-beta-L-arabinopyranosyl-(1-6)-D-streptamine),* $C_{20}H_{40}N_4O_{10}$—**496.55** [*49863-47-0*]—Use a suitable grade, cell culture tested.▲*USP30*

In-Process Revision

BRIEFING

Hydroxypropyl-β-cyclodextrin. It is proposed to add this new reagent used in the *Related compounds* test in the monograph for *Levocabastine Hydrochloride* published elsewhere in this issue of *PF*.

(HDQ: M. Marques) RTS—43014-2

Add the following:

▲**Hydroxypropyl-β-cyclodextrin,** (*Hydroxypropylbetadex*), $C_{42}H_{70}O_{35}(C_3H_6O)_x$ with x = 7 molar substitution—[*94035-02-6]*—Use a suitable grade with a molar substitution not less than 0.40 and not more than 1.50.▲*USP30*

BRIEFING

Isopropyl Iodide *(2-Iodopropane), USP 28* page 2823. It is proposed to update the information about this compound.

(HDQ: M. Marques) RTS—43120-2

Change to read:

Isopropyl Iodide (*2-Iodopropane*), C_3H_7I—**169.99**~~—Colorless liquid, discoloring upon exposure to air and light. Sparingly soluble in water; miscible with alcohol, with benzene, with chloroform, and with ether.~~

~~*Density:* between 1.696 and 1.704.~~

~~*Refractive index* ⟨831⟩: between 1.4987 and 1.4997 at 20°.~~

▲[*75-30-9*]—Use a suitable grade.▲*USP30*

BRIEFING

Sodium Carbonate, Monohydrate. It is proposed to add this new reagent.

(HDQ: M. Marques) RTS—43228-1

Add the following:

▲**Sodium Carbonate, Monohydrate,** $Na_2CO_3.H_2O$—**124.00** [*5968-11-6*]—Use ACS reagent grade.▲*USP30*

BRIEFING

1-Vinyl-2-pyrrolidone, *USP 28* page 2850 and page 108 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to update the information about possible suppliers of this compound.

(HDQ: M. Marques) RTS—42795-2

Change to read:

~~**1-Vinyl-2-pyrrolidone**~~

▲**Vinylpyrrolidinone** (*1-Vinyl-2-pyrrolidinone, 1-Vinyl-2-pyrrolidone, N-Vinylpyrrolidinone, N-Vinylpyrrolidone*).▲*USP30*

C_6H_9NO—**111.14**

▲[*88-12-0*]▲*USP30*

—Colorless liquid.

Assay—Inject an appropriate volume into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°; and the column temperature is maintained at 100° and programmed to rise 10° per minute to 250°. The area of the C_6H_9NO peak is not less than 99.0% of the total peak area.

Water, Method I ⟨921⟩: not more than 0.1%, determined on 2.5 g, using a mixture of 50 mL of methanol and 10 mL of butyrolactone as the solvent.

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 28* page 2869, page 3639 of the *Second Supplement,* and page 1490 of *PF* 31(5) [Sept.–Oct. 2005].

(HDQ) RTS—39955-1; 42796-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 28* page 2875, page 3640 of the *Second Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], and page 1491 of *PF* 31(5) [Sept.–Oct. 2005].

(HDQ) RTS—42243-1; 42382-1; 42382-4; 42382-5; 42740-1; 42982-1; 43026-1

Add the following:

▲**Canola Oil:** Clear, pale yellow, slightly viscous liquid. Practically insoluble in water and in alcohol; miscible with light petroleum (bp: 40° to 60°). *NF category:* Solvent; vehicle (oleaginous).▲*NF25*

Add the following:

▲**Synthetic Conjugated Estrogens:** A white to light buff, crystalline or amorphous powder that is odorless or has a slight odor.▲*USP30*

In-Process Revision

Delete the following:

▲~~**Diphtheria Toxin for Schick Test:** Transparent liquid.~~▲*USP30*

Add the following:

▲**Oleyl Oleate:** Clear, colorless to light yellow liquid. Has a faint characteristic odor. Slightly soluble in alcohol; miscible with chloroform and with ether. *NF category:* Emollient; emulsifying and/or solubilizing agent.▲*NF25*

Add the following:

▲**Risperidone:** White or almost white powder. Soluble in methylene chloride; sparingly soluble in ethanol; practically insoluble in water.▲*USP30*

Delete the following:

▲~~**Rubella and Mumps Virus Vaccine Live:** Solid having the characteristic appearance of substances dried from the frozen state. The Vaccine is to be constituted with a suitable diluent just prior to use. Constituted vaccine undergoes loss of potency on exposure to sunlight.~~▲*USP30*

Delete the following:

▲~~**Schick Test Control:** Transparent liquid.~~▲*USP30*

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 31(1) through 31(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF*.

Dibucaine Ointment—*Identification*	31	2	400
Dibucaine Hydrochloride—*Labeling* (add), *USP Reference standards, Identification B, Other requirements* (add)	31	2	400
Dibucaine Hydrochloride Injection—*Identification A*	31	2	401
Diclofenac Potassium (new)	31	5	1350
Diclofenac Potassium Tablets (new)	31	5	1352
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Didanosine (new)	31	5	1355
Didanosine for Oral Solution (new)	31	5	1357
Didanosine Tablets (new)	31	5	1359
Diethylcarbamazine Citrate Tablets—*Dissolution*	30	1	97
Digoxin Oral Solution—*Assay*	31	5	1361
Dihydroergotamine Mesylate—*Identification C, Related alkaloids* (delete), *Chromatographic purity* (add), *Assay*	29	6	1870
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diphenhydramine Hydrochloride Capsules—*Dissolution*	30	1	97
Diphenhydramine and Pseudoephedrine Capsules—*Dissolution*	30	1	98
Divalproex Sodium (new)	31	5	1362
Docusate Calcium—*Limit of bis(2-ethylhexyl)maleate*	31	3	752
Docusate Potassium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Docusate Sodium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Dorzolamide Hydrochloride—*Limit of dorzolamide hydrochloride related compound A, Assay*	31	2	401
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Drospirenone (new)	31	3	754
Dyclonine Hydrochloride—*Identification B*	31	1	42
Dyphylline and Guaifenesin Tablets—*Dissolution*	30	1	100
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Ensulizole—*USP Reference standards*	31	5	1363
Epinephrine Injection—*Identification A, B*	31	1	43
Estradiol and Norethindrone Acetate Tablets (new)	31	5	1364
Estradiol Transdermal System (new)	31	4	1063
Conjugated Estrogens—*Definition*	30	3	840
Ethinyl Estradiol Tablets—*Disintegration* (delete), *Dissolution* (add), *Related compounds*	31	4	1067
Ethosuximide Capsules—*Dissolution*	30	1	102
Ethyl Chloride—*Alcohol* (delete)	31	5	1368
Fenofibrate (new)	31	3	763
Fexofenadine Hydrochloride (postponed indefinitely)	31	3	703
Fexofenadine Hydrochloride Capsules (postponed indefinitely)	31	3	705
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Fluconazole—*Definition, Labeling* (add), *USP Reference standards, Melting range* (delete), *Related compounds*	31	5	1368
Fluorometholone Acetate (new)	31	5	1371
Fluoxetine Delayed-Release Capsules (new)	30	3	849
Flurazepam Hydrochloride—*Identification*	31	3	766
Flurbiprofen—*Identification*	31	4	1069
Fluticasone Propianate—*Chemical information, Definition, Content of acetone, Assay*	31	4	1070
Fluticasone Propianate Nasal Spray (new)	31	4	1071
Fluvoxamine Maleate Tablets (new)	30	5	1622
Fosinopril Sodium (new)	30	6	2001
Fosinopril Sodium Tablets (new)	30	6	2004

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Gabapentin Capsules (new)	28	7	298
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Dissolution*	29	2	418
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Glycopyrrolate Tablets—*Identification, Dissolution*	31	4	1077
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	31	2	410
Guaifenesin Capsules—*Dissolution*	30	1	106
Guaifenesin Tablets—*Dissolution*	30	1	107
Helium—*USP Reference standards* and *Assay* (postponed indefinitely)	31	4	1014
Helium—*Definition, Packaging and storage*	31	4	1077
Hydrocodone Bitartrate—*USP Reference standards [USP Hydrocodone Bitartrate Related Compound A RS], Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Acetaminophen Tablets—*Dissolution*	30	1	109
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hyoscyamine Sulfate—*USP Reference standards, Identification, Melting temperature* (delete), *Loss on drying* (delete), *Water* (add), *Residue on ignition, Other alkaloids* (delete), *Readily carbonizable substances* (delete), *Chromatographic purity* (add), *Assay*	31	4	1078
Hyoscyamine Sulfate Elixir—*Identification*	31	5	1372
Hyoscyamine Sulfate Injection—*Identification*	31	5	1373
Hyoscyamine Sulfate Oral Solution—*Identification*	31	5	1373
Hyoscyamine Sulfate Tablets—*Identification*	31	5	1374
Hypromellose Ophthalmic Solution—*Identification*	31	3	771
Ibuprofen—*Assay*	31	5	1374
Indocyanine Green—*Definition, Assay*	29	6	1905
Insulin—*USP Reference standards*	31	5	1375
Insulin Human—*USP Reference standards*	31	5	1375
Iodixanol—*Labeling* (add), *USP Reference standards, Limit of calcium, Other requirements* (add)	31	1	54
Irbesartan Tablets (new)	31	4	1080
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isopropyl Alcohol—*USP Reference standards* (add), *Identification*	31	5	1375
Isosorbide Dinitrate Tablets—*Dissolution, Assay*	31	5	1375
Isosorbide Dinitrate Chewable Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Extended-Release Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Sublingual Tablets—*Dissolution, Assay*	31	5	1377
Diluted Isosorbide Mononitrate—*pH*	31	4	1060
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Kanamycin Sulfate Capsules—*Dissolution*	30	1	120
Ketoprofen—*Assay*	31	3	772
Ketoprofen Extended-Release Capsules (new)	31	5	1378
Leflunomide (new)	31	5	1380
Leflunomide Tablets (new)	31	5	1383
Leuprolide Acetate (new)	30	3	882
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lidocaine Hydrochloride—*Assay*	31	2	415
Lidocaine Hydrochloride and Epinephrine Injection—*Assay for lidocaine hydrochloride, Assay for epinephrine*	31	2	415
Lipid Injectable Emulsion (new)	31	2	416
Lisinopril Tablets—*Dissolution*	31	4	1090
Lithium Carbonate Extended-Release Tablets—*Dissolution*	31	5	1385
Loratadine Oral Solution—*Antimicrobial effectiveness test* (delete)	31	1	56
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	419
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	31	5	1386
Magnesium Chloride—*Identification, Insoluble matter*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	421
Magnesium Oxide—*Labeling, Bulk density* (add)	31	4	1091
Mannitol Injection—*Labeling*	28	1	73
Meclizine Hydrochloride Tablets—*Dissolution*	30	1	127
Mefloquine Hydrochloride—*Related compounds*	31	4	1091
Megestrol Acetate Oral Suspension—*Dissolution*	31	5	1387
Meloxicam (new)	31	1	57
Meperidine Hydrochloride—*Packaging and storage, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	62
Meprobamate Tablets—*Dissolution*	30	1	129
Mesalamine—*Related compounds*	31	2	424
Metformin Hydrochloride—*Packaging and storage* (add), *Related compounds*	31	4	1092
Metformin Hydrochloride Tablets—*Identification, Related compounds*	31	4	1093
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methenamine Tablets—*Dissolution*	30	1	130
Methenamine Hippurate Tablets—*Labeling* (add), *Dissolution*	31	1	63
Methocarbamol Tablets—*Dissolution*	30	1	130
Methoxyflurane—*Foreign odor* (delete)	31	5	1388
Methscopolamine Bromide (new)	31	2	425
Methscopolamine Bromide Tablets (new)	31	2	427
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methylphenidate Hydrochloride Tablets—*Dissolution*	30	1	131
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Miconazole Nitrate Vaginal Suppositories—*Assay*	31	5	1389
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Nabumetone—*Related compounds*	31	1	63
Nadolol and Bendroflumethiazide Tablets—*Dissolution*	30	1	132
Nalidixic Acid—*Assay*	30	1	132
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage*	30	4	1264
Nefazodone Hydrochloride (new)	31	4	1094
Nefazodone Hydrochloride Tablets (new)	31	4	1096
Neostigmine Bromide Tablets—*Dissolution*	30	1	133
Niacinamide Tablets—*Dissolution*	30	1	139
Nitrous Oxide—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	4	1014
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Limit of residual solvents, Chromatographic purity, Assay*	31	5	1390
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals*

Oxaprozin Tablets—*Packaging and storage*	29	4	1061
Oxybutynin Chloride Extended-Release Tablets (new)	30	4	1276
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxycodone and Acetaminophen Capsules—*Dissolution*	30	1	151
Oxycodone and Acetaminophen Tablets—*Dissolution*	30	1	151
Oxycodone and Aspirin Tablets—*Dissolution*	30	1	152
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Paroxetine Tablets—*Identification A, C*	31	2	435
Paroxetine Hydrochloride—*USP Reference standards, Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, Chromatographic purity*	31	4	1112
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	72
Pentobarbital Sodium—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phentermine Hydrochloride Capsules—*Dissolution*	30	1	159
Phentermine Hydrochloride Tablets—*Dissolution*	30	1	160
Phenylpropanolamine Hydrochloride Capsules—*Dissolution*	30	1	161
Phenylpropanolamine Hydrochloride Tablets—*Dissolution*	30	1	162
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Pimozide Tablets—*Dissolution*	30	1	164
Pindolol Tablets—*Dissolution*	30	1	165
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piperazine Citrate Tablets—*Dissolution*	30	1	165
PEG 3350 and Electrolytes for Oral Solution—*Title* (name change—*delayed implementation to February 1, 2009*), *Definition, Assay for potassium and sodium*	31	5	1393
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Bromide (new)	31	2	441
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	31	5	1394
Prednicarbate (new)	31	5	1398
Procyclidine Hydrochloride Tablets—*Dissolution*	30	1	169
Propantheline Bromide Tablets—*Dissolution*	30	1	170
Propoxyphene Hydrochloride and Acetaminophen Tablets—*Dissolution*	30	1	170

Pending Proposals (*continued*)

Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	172
Pyridoxine Hydrochloride Tablets—*Dissolution*	30	1	177
Pyrilamine Maleate Tablets—*Dissolution*	30	1	177
Quinapril Tablets—*Packaging and storage*	29	4	1071
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards [USP Ranitidine Resolution Mixture RS], Chromatographic purity, Assay*	30	6	2033
Ranitidine Oral Solution—*USP Reference standards, Identification, Chromatographic purity, Assay*	30	6	2036
Oral Rehydration Salts—*USP Reference standards* (add), *Identification F* (delete), *Assay for citrate*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Ritonavir (new)	31	3	788
Saccharin Calcium (new)—*Harmonization*	31	2	607
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Saquinavir Mesylate—*Identification*	31	5	1400
Scopolamine Hydrobromide—*Identification A*	31	1	73
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	31	3	792
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bicarbonate Injection—*Packaging and storage*	31	5	1401
Sodium Bromide (new)	31	2	446
Sodium Chloride—*Identification, Loss on drying, Limit of phosphates, Limit of potassium*	31	5	1401
Sodium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for sodium citrate (delayed implementation to April 1, 2009)*	31	3	797
Sodium Lactate Injection—*Identification B* (delete)	31	5	1402
Sodium Phosphates Rectal Solution—*Assay*	31	5	1403
Sodium Salicylate Tablets—*USP Reference standards* (add)	31	4	1116
Sorbitol Solution—*Microbial limits* (add)	29	4	1078
Spironolactone Oral Suspension (new)	30	3	929
Spironolactone Tablets—*Assay*	31	1	74
Spironolactone and Hydrochlorothiazide Oral Suspension (new)	30	3	930
Stavudine Capsules—*Assay*	31	5	1403
Succinylcholine Chloride—*Limit of ammonium salts* (delete), *Chromatographic purity*	31	5	1404
Sulfamethazine Granulated—*Assay*	31	3	797
Tazobactam (new)	31	4	1116
Technetium Tc 99m Fanolesomab Injection (new)—*Packaging and storage* (add)	31	5	1405
Terbutaline Sulfate—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	75
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Terbutaline Sulfate Tablets—*USP Reference standards, Dissolution*	31	1	76
Tetracaine Hydrochloride—*Identification A*	31	2	451
Thalidomide—*Chromatographic purity*	31	2	452
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets—*Dissolution*	30	1	189
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thiamine Hydrochloride Tablets—*Dissolution*	30	1	190
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Chromatographic purity*	30	5	1649
Tiamulin (new)	31	1	77
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Timolol Maleate Tablets—*Dissolution*	30	1	191

Pending Proposals (*continued*)

Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate*	31	2	465
Triclosan—*USP Reference standards; Limit of monochlorophenols and 2,4-dichlorophenol; Limit of 1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran; Assay*	31	5	1408
Trimethoprim—*Packaging and storage*	31	5	1409
Triprolidine and Pseudoephedrine Hydrochlorides Tablets—*Dissolution*	30	1	192
Tryptophan—*Chloride, Sulfate*	31	5	1410
Tylosin Tartrate (new)	31	5	1410
Ursodiol Capsules—*Dissolution*	31	3	800
Valsartan (new)	29	6	1996
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2007)*	31	5	1412
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127
Purified Water—*Definition*	31	2	467
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins, Oxidizable substances*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Zinc Oxide—*Iron and other heavy metals*	31	1	80
Zinc Oxide Neutral (new)	31	1	80
Zinc Sulfate Oral Solution (new)	31	2	468
Zinc Sulfate Tablets (new)	31	1	82
<u>*Dietary Supplements Monographs*</u>			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Choline Chloride—*Limit of total amines*	31	1	84
Black Cohosh (new)	28	5	1455
Powdered Black Cohosh (new)	28	5	1460
Powdered Black Cohosh Extract (new)	28	5	1461
Black Cohosh Tablets (new)	28	5	1462
Ethylcellulose Aqueous Dispersion—*Identification*	31	3	811
Ethylparaben—*Identification*	31	3	812
Gamma Cyclodextrin (new)	31	3	812
Powdered Ginkgo Extract (new)	27	2	2233
Ginkgo Capsules (new)	27	2	2238
Ginkgo Tablets (new)	27	2	2240
American Ginseng Capsules (new)	30	2	565
American Ginseng Tablets—*Dissolution [to come]*	30	2	567
Asian Ginseng Capsules (new)	30	2	571
Lutein—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1133
Lutein Preparation—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1134
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Fish Oil Containing Omega-3 Acids (new)	31	2	474
Fish Oil Containing Omega-3 Acids Capsules (new)	31	2	481
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Psyllium Husk—*Definition, Light extraneous matter, Heavy extraneous matter* (delete)	30	6	2077
Pygeum Extract—*Packaging and storage*	30	3	956
Selenomethionine—*USP Reference standards, Assay*	31	2	482
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Ubidecarenone Capsules—*USP Reference standards, Assay*	31	1	86
Valerian Capsules (new)	27	1	1825
Xanthan Gum—*Assay*	31	3	821
USP General Test Chapters			
⟨1⟩ Injections—*Labels and Labeling, Packaging, Foreign Matter and Particulates*	31	5	1428
⟨1⟩ Injections *(Harmonization)—Packaging*	31	1	192

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Methacrylic Acid Copolymer—*Limit of monomers*	31	1	93
Monoethanolamine—*USP Reference standards* (add), *Identification* (add)	31	5	1425
Neotame (new)	31	2	497
Nitrogen—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	4	1015
Nitrogen—*Definition, Packaging and storage, Assay*	31	4	1145
Nitrogen 97 Percent —*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	4	1015
Nitrogen 97 Percent—*Definition, Packaging and storage, Assay*	31	4	1146
Paraffin—*Readily carbonizable substances*	31	5	1426
Phenolsulfonphthalein—*Labeling* (add), *USP Reference standards* (add), *Bacterial endotoxins* (add)	31	1	94
Polyethylene Glycol—*Harmonization*	31	3	897
Polyethylene Oxide—*Organic volatile impurities*	31	1	95
Potassium Alginate (new)	31	5	1426
Propylene Glycol Dilaurate (new)	31	2	500
Propylene Glycol Monolaurate (new)	31	2	501
Saccharin	31	2	616
Saccharin (new)—*Harmonization*	31	2	618
Sesame Oil—*USP Reference standards* (add), *Triglyceride composition*	30	5	1668
Silicon Dioxide (new)—*Harmonization*	31	4	1229
Colloidal Silicon Dioxide (new)—*Harmonization*	31	4	1233
Sodium Caprylate—*Packaging and storage*	30	3	990
Sodium Starch Glycolate—*Harmonization*	31	5	1523
Sodium Sulfite—*Identification*	31	4	1146
Sodium Tartrate—*Packaging and storage*	31	1	95
Rice Starch (new)—*Harmonization*	30	2	721
Stearic Acid—*Microbial limits* (add)	29	2	480
Purified Stearic Acid—*Other requirements, Microbial limits*	29	3	706
Succinic Acid—*Packaging and storage*	31	1	95
Sucralose—*Limit of hydrolysis products*	31	4	1146
Sucrose—*Harmonization*	31	3	902
Compressible Sugar—*Loss on drying*	31	4	1147
Confectioner's Sugar—*Identification*	31	4	1147
Sunflower Oil (new)	31	1	95
Tagatose (new)	30	5	1672
Medium-Chain Triglycerides—*Definition*	31	1	98
Trolamine—*USP Reference standards* (add), *Identification*	31	5	1427
Xylitol—*USP Reference standards, Limit of other polyols, Assay*	31	4	1147

Proposed Revisions and New Text Previously Presented in *PF* but Now Canceled
(Canceled proposals may be republished at any time in a future number of *Pharmacopeial Forum*.)
[*PF* 31(1)–*PF* 31(6)]

Title and Proposal	*PF Volume, Issue, and Page Numbers of Canceled Proposals* *Vol.*	*No.*	*Page(s)*
USP Monographs			
Acepromazine Maleate—*Labeling, Other requirements*	29	6	1832
Acyclovir—*Labeling, USP Reference standards, Other requirements*	30	5	1580
Adenosine—*Labeling, USP Reference standards, Other requirements*	29	6	1834
Medical Air—*Assay*	28	4	1065
Albendazole Oral Suspension—*Labeling*	29	4	991
Albuterol Tablets—*Assay*	31	1	40
Alcohol—*Harmonization*	30	2	670
Dehydrated Alcohol—*Harmonization*	30	2	673
Alfentanil Hydrochloride—*Labeling, USP Reference standards, Other requirements*	29	6	1834
Alprostadil—*Labeling, USP Reference standards, Other requirements*	29	5	1412
Alteplase—*Labeling, Other requirements*	29	6	1835
Amifostine—*Labeling, USP Reference standards, Other requirements, Assay*	30	6	1974
Aminocaproic Acid—*Labeling, USP Reference standards, Other requirements*	29	5	1414
Aminopentamide Sulfate—*Labeling, USP Reference standards, Other requirements*	30	4	1163
Aminophylline—*Labeling, USP Reference standards, Other requirements*	29	5	1414
Amitriptyline Hydrochloride—*Labeling, Other requirements*	29	6	1844
Ammonium Chloride—*Labeling, USP Reference standards, Other requirements*	29	5	1415
Ammonium Molybdate—*Labeling, Other requirements*	29	5	1416
Amphotericin B Lotion—*Title*	30	2	444
Amphotericin B Topical Emulsion (entire submission)	30	2	445
Anileridine—*Labeling, USP Reference standards, Other requirements*	29	6	1846
Atenolol—*Labeling, USP Reference standards, Other requirements*	29	5	1416
Atracurium Besylate—*Labeling, USP Reference standards, Other requirements*	29	6	1846
Atropine Sulfate—*Labeling, USP Reference standards, Other requirements*	29	6	1847
Aurothioglucose—*Labeling, Other requirements*	29	6	1847
Azaperone—*Labeling, Other requirements*	29	6	1847
Benzoyl Peroxide Lotion—*Title*	30	2	456
Benzoyl Peroxide Topical Emulsion (entire submission)	30	2	456
Benztropine Mesylate—*Labeling, USP Reference standards, Other requirements*	29	6	1848
Benzyl Benzoate Lotion—*Title*	30	2	457
Benzyl Benzoate Topical Emulsion (entire submission)	30	2	457
Betamethasone Tablets—*Identification, Thin-layer chromatographic identification test*	30	1	62
Betamethasone Dipropionate Lotion—*Title*	30	2	458
Betamethasone Dipropionate Topical Emulsion (entire submission)	30	2	459
Betamethasone Valerate Lotion—*Title*	30	2	461
Betamethasone Valerate Topical Emulsion (entire submission)	30	2	461
Bethanechol Chloride—*Labeling, USP Reference standards, Other requirements*	30	5	1586
Biperiden—*Labeling, USP Reference standards, Other requirements*	29	6	1851
Bretylium Tosylate—*Labeling, USP Reference standards, Other requirements*	29	5	1431

Proposed Revisions and New Text Previously Presented in *PF* but Now Canceled
(Canceled proposals may be republished at any time in a future number of *Pharmacopeial Forum*.)

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

GENERAL CHAPTERS

General Information

BRIEFING

〈**1216**〉 **Tablet Friability,** *USP 28* page 2745 and page 3608 of the *Second Supplement.* The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the specifications provided in this general information chapter. The regional **Adoption Stage 6A** text was published in the *Second Supplement* to *USP 28–NF 23.* Revisions presented herein include the addition of a new opening paragraph to indicate that this chapter has now been harmonized and implemented by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia. Other revisions clarify portions of the text. In the absence of any significant adverse comment, it is proposed to implement these revisions via the *Second Interim Revision Announcement* pertaining to *USP 29–NF 24,* with a delayed implementation date of **1 August 2006**.

(PDF: W. Paul) RTS—43195-1

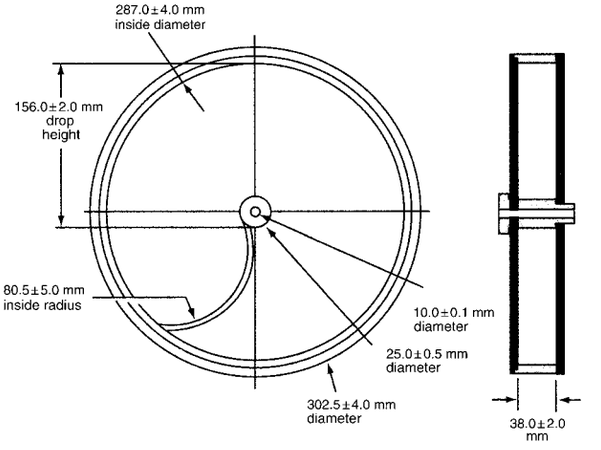
Change to read:

•This general information chapter has been harmonized with the corresponding texts of the *European Pharmacopoeia* and the *Japanese Pharmacopoeia*. The harmonized texts of these three pharmacopeias are therefore interchangeable, and the methods of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* may be used for demonstration of compliance instead of the present *United States Pharmacopeia* general information chapter method. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.•2

This chapter provides guidelines for the friability determination of compressed, uncoated tablets. The test procedure presented in this chapter is generally applicable to most compressed tablets. Measurement of tablet friability supplements other physical strength measurements, such as tablet ~~crushing strength~~ •breaking force.•2

Use a drum,* with an internal diameter between 283 and 291 mm and a depth between 36 and 40 mm, of transparent synthetic polymer with polished internal surfaces, and ~~not~~ ••2 subject to •minimum.•2 static build-up (see figure for a typical apparatus). One side of the drum is removable. The tablets are tumbled at each turn of the drum by a curved projection with an inside radius between 75.5 and 85.5 mm that extends from the middle of the drum to the outer wall.

•The outer diameter of the central ring is between 24.5 and 25.5 mm.•2 The drum is attached to the horizontal axis of a device that rotates at 25 ± 1 rpm. Thus, at each turn the tablets roll or slide and fall onto the drum wall or onto each other.



Tablet Friability Apparatus

For tablets with a unit ~~mass~~ •weight•2 equal to or less than 650 mg, take a sample of whole tablets corresponding •as near as possible•2 to 6.5 g. For tablets with a unit ~~mass~~ •weight•2 of more than 650 mg, take a sample of 10 whole tablets. The tablets should be carefully dedusted prior to testing. Accurately weigh the tablet sample, and place the tablets in the drum. Rotate the drum 100 times, and remove the tablets. Remove any loose dust from the tablets as before, and accurately weigh.

Generally, the test is run once. If obviously cracked, cleaved, or broken tablets are present in the tablet sample after tumbling, the sample fails the test. If the results are ~~doubtful~~ •difficult to interpret•2

* The apparatus meeting these specifications is available from laboratory supply houses such as VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513, or from Erweka Instruments, Inc., 56 Quirk Road, Milford, CT 06460.

or if the weight loss is greater than the targeted value, the test should be repeated twice and the mean of the three tests determined. A maximum ■mean■2S (*USP28*) weight loss ■from the three samples■2S (*USP28*) of not more than ■1.0%■2S (*USP28*) is considered acceptable for most products. ■■2S (*USP28*)

If tablet size or shape causes irregular tumbling, adjust the drum base so that the base forms an angle of about 10° with the ~~bench top~~ •horizontal•2 and the tablets no longer bind together when lying next to each other, which prevents them from falling freely.

Effervescent tablets and chewable tablets may have different specifications as far as friability is concerned. ■■2S (*USP28*) In the case of hygroscopic tablets, ■an appropriate■2S (*USP28*) humidity-controlled environment ■■2S (*USP28*) is required for testing.

■Drums with dual scooping projections, or an apparatus with more than one drum, for the running of multiple samples at one time, are also permitted.■2S (*USP28*)

•(Official August 1, 2006)•2

Harmonization

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 31(6) [Nov.–Dec. 2005]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

USP Advisory Panels on the USP Performance Test

L. Shargel, *Chair, Advisory Committee on Performance Tests (Injections),* and T. Foster, *Chair, Biopharmaceutics Expert Committee*

ABSTRACT USP's mission is to promote public health and benefit practitioners and patients by disseminating authoritative standards and information developed by its volunteers for medicines, other health care technologies, and related practices used to maintain and improve health and promote optimal health care delivery. USP publishes the *United States Pharmacopeia (USP)* and *National Formulary (NF),* which contain monographs and associated information for more than 3,800 medicines, dietary supplements, and other health care products. Standards in a pharmacopeial monograph include introductory statements (definition, description, and packaging and storage statements), followed by a specification (tests, procedures, and acceptance criteria). A key test in the drug product monograph is the USP Performance test, which is a specific (not universal) test in ICH terminology (*1*).

INTRODUCTION

This and a following *Stimuli* article ("Critical Quality and Performance Parameters for Modified-Release Parenteral Dosage Forms") provide information about ongoing activities that are intended to improve and expand upon the USP Performance test. The activities are proceeding in Advisory Panels that were formed in connection with the Council of Experts Biopharmaceutics Expert Committee in the 2000–2005 cycle. With adjustments in membership, these Advisory Panels will continue in the current cycle (membership is shown in Appendix 1).

BACKGROUND

Following regulatory documentation of bioavailability (BA) and bioequivalence (BE), if required, and market access, if approved, the USP Performance test becomes the sole means of directly monitoring the ongoing performance of a dosage form or dietary supplement product that may be marketed perhaps for many years. For this reason, the work of the Advisory Panels and that of the Biopharmaceutics Expert Committee is especially important to the public health.

USP publishes monographs for both ingredients and products, including pharmaceutical dosage forms (drug products) and dietary supplement products. A key test in the product monograph for nonsolution dosage forms is the USP Performance test, which assesses release of the drug or dietary supplement in vitro. Under appropriate circumstances, the USP Performance test links to BA and BE studies, which are subject to regulatory review. Without this linkage, the USP Performance test should be viewed solely as a quality control test. For orally administered drug products, procedures and acceptance criteria for the USP Performance test appear in General Chapters ⟨701⟩ *Disintegration,* ⟨711⟩ *Dissolution,* and ⟨724⟩ *Drug Release*. Individual product monographs may then refer to these General Chapters with suitable Drug Release adjustments in the procedure to account for a specified dosage form or dietary supplement product.

In November 2002, USP formed an Ad Hoc Committee composed of members with expertise in pharmaceutical dosage forms, biopharmaceutics, and nomenclature, who worked with the Pharmaceutical Dosage Forms Expert Committee to develop a pharmaceutical dosage forms taxonomy scheme and related glossary. This taxonomy scheme and glossary were published as a *Stimuli* article in the September–October 2003 issue of *Pharmacopeial Forum* (*2*). The taxonomy scheme is tiered: The first grouping arranges dosage forms according to five routes of administration; the second grouping aligns them by dosage form type and physical properties (e.g., solid, semisolid, liquid, gas, or aerosol; and the third groups them according to the release pattern of the active pharmaceutic ingredient and performance characteristics of the dosage form. According to this scheme, any dosage form for any drug substance can be unambiguously identified by a combination of taxonomic terms from each tier, taking the form:

[drug substance] [route of administration] [physical state] [release pattern].

Following the publication of this taxonomy *Stimuli* article, it became possible for USP to better consider dosage form specifications and to focus on improving and/or expanding the USP Performance test for dosage forms grouped by route of administration and other factors. This consideration began in the 2000–2005 cycle with creation of four Advisory Panels in connection with the USP Council of Experts Biopharmaceutics Experts Committee:

- Parenteral
- Inhalation/Aerosol

* Correspondence should be addressed to Horacio Pappa, Scientist and Latin American Specialist, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8319; e-mail hp@usp.org.

- Topical/Dermal
- Mucosal.

Deliberations on the oral route of administration were reserved for the Biopharmaceutics Expert Committee itself. The current membership of each Panel and chair appear in the Appendix to this *Stimuli* article. According to USP's rules and procedures, the chair must be a member of the Biopharmaceutics Expert Committee.

DISCUSSSION

USP recognizes that the task of the Advisory Panels and of the Biopharmaceutics Expert Committee in improving and expanding on the USP Performance test for drug products by route of administration is not a simple one. Although this performance test, in both its public and private presentations, has been of considerable value in ensuring the quality and performance of dosage forms/products in the U.S. and other markets, the general approach requires continued careful scientific study, deliberation, and adjustment as needed (*3*). Further, it must be viewed in the context of national and international advances in regulatory control, not only in terms of development information in support of a regulatory filing (e.g., the product development report and quality-by-design approaches), but also in terms of post-approval change and ongoing adherence to current Good Manufacturing Practices (e.g., process analytical technology) even in the absence of change.

Even when the approach has been widely applied, as in the case of orally administered dosage forms, new advances and a stronger scientific understanding are possible (*4*). For other routes of administration, for which the number and types of dosage forms are rapidly evolving, the task of developing a valid specification to include a USP Performance test in applicable private or public approaches becomes even more daunting. Although the outcome of the deliberations of the Advisory Panels and Biopharmaceutics Expert Committee remains to be fully defined, USP envisions perhaps one or more General Chapters for each route of administration, just as there are now three General Chapters (cited above) for orally administered dosage forms (and, if applicable, this work may include dietary supplement products). Manufacturers submitting a Request for Revision (*5*) for either a new monograph or to update an existing monograph may then refer to these General Chapters in establishing a public standard for a particular dosage form/product and route of administration. Thus, the approach would follow the one that is now well-established for orally administered dosage forms.

USP ADVISORY PANEL ON INJECTABLE DOSAGE FORM PERFORMANCE

An accompanying *Stimuli* article has been prepared by the USP Advisory Panel on Parenteral/Injectable Dosage Form Performance,* which held its first meeting on 27 September 2004 at the time of USP's First Annual Scientific Meeting. This meeting included a track on regulatory and compendial goals in setting specifications for the performance of drug products. In this track, reports of the prior two workshops were summarized. The first was an AAPS-, FDA-, and USP-sponsored workshop report, ''Assuring Quality and Performance of Sustained- and Controlled-Release Parenterals'' (*6*), held in the Washington, DC, area. The second was held in Basel, Switzerland (*7*). At this initial meeting of the Advisory Panel in September 2004, key recommendations were to:

- Define essential product characteristics that are critical to product performance;
- Provide nomenclature for sustained- and controlled-release parenterals, including stents, nanosystems, liposomes, implants, etc., that is consistent with the tiered nomenclature structure proposed in the taxonomic scheme outlined in the *Pharmacopeial Forum Stimuli* article (*2*);
- Review preexisting information, including reports from the workshops on sustained- and controlled-release parenterals;
- Investigate apparatus, media, and calibrators for use in drug release studies in vitro;
- Investigate the linking of in vitro drug release studies to in vivo drug performance (i.e., BA).

The Advisory Panel envisioned continued research to substantiate the value and applicability of performance tests for the specified group of dosage forms with the goal of assisting regulatory and compendial authorities in understanding how to develop the needed procedures and acceptance criteria. In the current cycle, the Advisory Panel has prepared the following *Stimuli* article as a means of gaining public input to and assuring transparency about its deliberations. Through work of the Prescription/Nonprescription Stakeholder Forum, USP plans to form a Project Team that will monitor the work of the Biopharmaceutics Expert Committee and the four Advisory Panels to gain specific advice about the complex set of issues that will require consideration. This new Project Team will continue the deliberations of Project Teams 5 and 6 in the prior cycle.

SUMMARY

The USP Performance test is an important tool among the list of tests, procedures, and acceptance criteria that form the dosage form/product specification. USP has created Advisory Panels to study application of the USP Performance test to dosage forms grouped by four specified routes of ad-

* For membership list, see Appendix 1.

ministration. All Advisory Panels will work under the direction of the Biopharmaceutics Expert Committee. Consideration of issues for the USP Performance for a fifth route (oral) will be considered by the Biopharmaceutics Expert Committee itself. The following *Stimuli* article is one of several planned to ensure that USP maintains the highest scientific and public health approaches to compendial tests to assure the safety, quality, and efficacy of compendial articles.

APPENDIX 1: MEMBERSHIP OF THE 2005–2010 ADVISORY PANELS

Members of the USP Advisory Panel for Injectable Dosage Forms Performance are the following: Leon Shargel, Ph.D. (Chair); Jim Boylan, Ph.D. (Vice chair); Diane J. Burgess, Ph.D.; Brian Clark; Mary Jo Hampson-Carlin, B.S., M.B.A.; Pankaj Shah, Ph.D.; Mary Stickelmeyer, Ph.D.; David Young, Ph.D.; and Horacio Pappa, Ph.D. (USP Liaison).

The USP Advisory Panel for Gastro-Intestinal Dosage forms comprises the entire Biopharmaceutics Expert Committee, which includes the following members: Thomas S. Foster, Pharm.D. (Chair); Diane J. Burgess, Ph.D.; G. Bryan Crist, B.S.; Mario A. Gonzalez, Ph.D.; Vivian A. Gray, B.S.; Johannes Kraemer, Ph.D.; Lewis J. Leeson, Ph.D.; Alan F. Parr, Pharm.D., Ph.D.; James E. Polli, Ph.D.; Leon Shargel, Ph.D.; Eli Shefter, Ph.D.; William C. Simon, Ph.D.; Clarence T. Ueda, Pharm.D., Ph.D.; David Young, Pharm.D., Ph.D.; William E. Brown (USP Liaison); and Margareth R.C. Marques, Ph.D. (USP Liaison).

Members of the USP Advisory Panel for Topicals are the following: Clarence T. Ueda, Ph.D. (Co-chair); Vinod P. Shah, Ph.D. (Co-chair); Kris Derdzinski, Ph.D.; Gary Ewing, Ph.D.; Gordon Flynn, Ph.D.; Howard Maibach, Ph.D.; Steve Shaw, Ph.D.; Kailas Thakker, Ph.D.; Avi Yacobi, Ph.D.; and Margareth R.C. Marques, Ph.D. (USP Liaison).

Members of the USP Advisory Panel for Inhalation Products will be recruited because this Advisory Panel is currently in development.

Members of the USP Advisory Panel for Mucosal Products are the following: Eli Shefter, Ph.D. (Chair); Tom Foster, Pharm.D. (Chair, Biopharmaceutics Expert Committee); Lisbeth Ankersen; Bruce Aungst, Ph.D.; Stuart Bates; Sarath Chandar, M.B.A.; Munir Hussain, Ph.D.; Johannes Kraemer, Ph.D.; and William E. Brown (USP Liaison).

Critical Quality and Performance Parameters for Modified-Release Parenteral Dosage Forms

Diane J. Burgess, *University of Connecticut;* Brian C. Clark, *AstraZeneca, Macclesfield, UK;* Mary Joan Hampson-Carlin, *Laureate Pharma;* and Pankaj Shah, *Bristol-Myers Squib*[*]

ABSTRACT This *Stimuli* article addresses the use of performance tests and the setting of specifications for controlled-release parenteral products. Although each product must be regarded on a case-by-case basis, a set of general guidelines may facilitate product development and marketing approval to ensure drug product safety and efficacy. Controlled-release parenterals encompass a range of products with commonalities and also unique properties. Therefore, different categories of specifications can be considered, including those that are standard among all products and those that are product specific. This article defines controlled-release parenterals and discusses factors that affect bioavailability from intramuscular (IM) and subcutaneous (SC) sites. A list describes the necessary critical quality parameters common to all controlled-release dosage forms as well as those that are specific to certain dosage forms or drug products. In addition, the *Stimuli* article attempts to categorize controlled-release parenteral dosage forms on the basis of specifications that are necessary for product development purposes and those that are necessary for quality control.

INTRODUCTION

In 2004 USP created Advisory Panels to address critical quality and performance parameters for injectable, oral, aerosol, topical, and mucosal products (*1*). The information generated by the Advisory Panels could lead to companion General Chapters in *USP–NF* to complement the existing General Chapters on the quality control of various drug products. Specifications for product performance may also be generated and would be included in individual monographs. This article is the result of the efforts of the USP Advisory Panel on Performance Tests—Injections. Panel members are listed at the end of the article.

CONTROLLED-RELEASE PARENTERAL DOSAGE FORMS

Controlled-release drug delivery systems are defined in *USP* as: "dosage forms that allow for the uniform release or targeted delivery of drugs to the body." These dosage forms are used to improve therapeutic responses by providing blood levels that are more consistent and stable compared to those of multiple doses of immediate-release dosage forms. Controlled-release parenteral products can result in a reduction in adverse reactions due to less fluctuation in plasma or tissue drug concentrations, and for targeted-delivery products high systemic levels are avoided. As a consequence of targeted and controlled release, patient compliance may be improved due to lower dosing frequencies and simpler dosing regimes. Controlled-release parenteral drug delivery systems include the following: suspensions, liposomes, microspheres, gels, and implants. Tiny microspheres and larger implantable devices, such as stents, can be used to achieve extended release during periods ranging from months to years. Suspensions, liposomes, and gels may not achieve quite as long a duration of action; however they can be localized at the site in vivo, and liposomes may achieve targeted delivery both by passive and active means following intravenous administration. These delivery systems are becoming increasingly utilized by the pharmaceutical industry to deliver drugs for treatment or prevention of a variety of diseases.

Not all drugs are candidates for controlled parenteral delivery. The drug should be potent with known toxicity and pharmacokinetic profiles. The drug should not have a narrow therapeutic index. A controlled-release parenteral dosage form usually is selected when there are problems associated with oral delivery (e.g., gastric irritation, first-pass effects, or poor absorption) and a need for extended release or targeted delivery (e.g., rapid clearance). Both systemic and localized delivery can be achieved. In addition, the drug must be compatible with the manufacturing process, which may be fairly harsh for some of these products. Examples of disease applications for controlled-release parenteral delivery include the following: fertility treatments, hormone therapy, protein therapy, treatment of infections (e.g., antibiotics and antifungals), cancer therapy, orthopedic surgery, post-operative pain, chronic pain, vaccination/immunization, central nervous system disorders (e.g., Alzheimer's and schizophrenia), anti-seizure applications, and immunosuppression.

Routes of administration for controlled-release parenterals include intravenous (IV), intra-articular (IA), subcutaneous (SC), and intramuscular (IM). The IV and IA routes by their nature result in 100% bioavailability. However, drug absorption from the SC and IM sites can be erratic and variable as a consequence of differences in physiologi-

cal parameters, such as drainage and blood flow that result from muscle activity and inflammation, as well as physiological reactions to injection trauma. The SC route shows poor blood flow and drainage compared to the IM route. The muscle site and the injection technique may influence absorption. Different absorption profiles result from intra- and intermuscular injections (within and between the muscle fibrils, respectively).

After SC and IM administration, absorption of drugs encapsulated in carrier systems depends on release of the drug from the carrier, absorption of the free drug, and, in some cases, absorption of the carrier. Following release, the drug will behave as if administered in conventional formulations, and general biopharmaceutical principles will apply. However, if the carrier is absorbed from the injection site as an intact unit, the drug will follow the kinetics and biodistribution of the carrier. This may occur for small liposomes and other particulates with particle size of approximately 100 nm or less. Such particulates are taken up by the lymphatic capillaries, and from there they reach the general circulation. Oussoren et al. provide a comprehensive treatment of biopharmaceutical aspects of controlled-release parenterals (*2*).

DEFINITION OF SPECIFICATIONS

ICH defines a specification as a list of tests, procedures, and acceptance criteria for a substance, an excipient, a product, a package, or other component used in manufacturing. According to the AAPS workshop report, "Assuring Quality and Performance of Sustained- and Controlled-Release Parenterals," cosponsored by FDA and USP (*3*), it is important to identify critical parameters during the development process. Critical parameters include extensive physical/chemical characterization and an understanding of the impact of formulation variables on physical/chemical factors. For example, drug stability and drug release are important in vitro parameters for which specifications must be set because these influence in vivo performance. In vivo it is important to understand pharmacokinetics, safety, and efficacy. There are different categories of quality and performance attributes for controlled-release parenteral dosage forms, including the following: 1) those that are standard for parenteral systems regardless of the drug or the delivery system; 2) those that are specific to the drug; 3) those that are specific to the drug delivery system; and 4) those that are specific to the drug product. Listed immediately below are specifications in categories *1* and *2*. Those for categories *3* and *4* are listed separately for each dosage form. In addition, the specifications are further categorized as follows: general (denoted as *G*); research and development (denoted as *R&D*); and stability (denoted as *S*).

General tests are those performed throughout the product life cycle to support formulation development, clinical supply, and quality control of commercial supplies. *R&D* tests are those carried out during the R&D phase only in order to characterize the product. Stability tests are those done in addition to the general tests as part of a study to investigate degradation pathways, confirm storage conditions, and assess the effects of changes in the manufacturing process. Specifications should apply throughout the product shelf life, and therefore methods should be stability-indicating when appropriate (e.g., potency, impurities, and drug release).

Specifications Common to All Parenteral Controlled-Release Delivery Systems

1. Standard specifications for parenteral systems
   - Appearance *(G)*
   - Identity *(G)*
   - Assay *(G)*
   - pH (not for a solid or nonaqueous dosage form) *(G)*
   - Osmolarity (not for a solid or nonaqueous dosage form) *(G)*
   - Water content (for solid or nonaqueous dosage form) *(G)*
   - Residual solvent (test needed if solvents are used in the manufacturing process) *(G)*
   - Sterility *(G)*
   - Particulates (other than the delivery system itself, if a dispersed system product such as liposomes) *(G)*
   - Bacterial endotoxin or pyrogen test *(G)*
2. Drug-specific
   - Drug potency *(G)*
   - Drug-related substances *(G)*
   - Dose uniformity in the suspending agent *(G)*
   - Drug stability *(S)*

Liposomes

Formulations may contain an active pharmaceutical ingredient encapsulated in a liposome (either within the lipid bilayer or dissolved in the interior aqueous space of the liposome). Administration may be by IV, SC, or IM injection. Liposomes may be supplied as a suspension or in the dry form, with a suspending medium for constitution immediately prior to use. In the latter case, a separate specification is needed for the method of suspension and the suspending medium (one must consider pH, osmolarity, and viscosity), and a performance test is required to ensure proper reconstitution.

3. Drug delivery system–specific
   - Particle size *(G)*
   - Percent free vs. percent encapsulated *(G)*
   - pH *(G)*
   - Drug release *(G)*
   - Protein binding (including lipoprotein; determine degree of binding and nature of binding proteins) *(R&D)*
4. Product-specific
   - Lipid assay(s) *(G)*
   - Fatty acid composition *(G)*
   - Positional specificity (acyl side chains) *(R&D)*
   - Degree of fatty acid unsaturation *(R&D)*

- Phosphatidylglycerol/phosphatidyl serine (lecithin preparations) *(R)*
- Lamellarity *(R&D)*
- Peroxidation measure *(G)*
- % Lyso lipid *(G)*
- Zeta potential *(R&D)* and *(S)*
- Phase transition *(R&D)*
- Tissue reaction (IM and SC) *(R&D)*

Polymeric Microspheres and Nanoparticles

These formulations contain an active pharmaceutical ingredient entrapped in a polymeric matrix or encapsulated within a polymer wall and are defined as nanoparticles or microspheres, depending on the particle size. Administration may be IV (nanoparticles only), SC, or IM injection. Such dosage forms may be supplied as a suspension (this is unusual for microspheres) or in the dry form with a suspending medium for constitution immediately prior to use. In the latter case, one needs a separate specification for the suspending medium (covering pH, osmolarity, viscosity, and a performance test to ensure adequate suspension).

3. Drug delivery system–specific
   - Particle size and particle-size distribution, *(G)*
   - Porosity/surface area *(R&D)*
   - Percent free vs. percent encapsulated (for a suspension) *(G)*
   - pH (for an aqueous suspension) *(G)*
   - Osmolarity (for an aqueous suspension) *(G)*
   - Drug release *(G)*
   - Burst release *(G)*
   - Redispersibility *(G)*
   - Concentration and volume or weight *(G)*
   - Deliverable dose *(G)*
   - Syringability *(G)*
   - Core load (percent entrapped active) *(G)*
4. Product-specific:
   - Polymer molecular weight and polydispersity *(R&D)* and *(S)*
   - Copolymer ratio *(R&D)*
   - Glass transition point *(R&D)*
   - Morphology (surface and cross section) *(R&D)*
   - Tissue reaction *(R&D)*

Stents

Drug-eluting stents have a polymeric coating with entrapped active pharmaceutical ingredient on the surface of the metal stent. Drug is administered directly to the site of potential restenosis.

3. Drug delivery system–specific
   - Drug release test *(G)*
   - Burst release *(G)*
   - Coating thickness(es) *(G)*
   - Coating robustness and susceptibility to cracking on expansion *(R)*
   - Free drug vs. encapsulated drug *(G)*
4. Product-specific
   - Morphology (surface and cross section) *(R&D)*
   - Polymer molecular weight and polydispersity *(R&D)* and *(S)*
   - Copolymer ratio *(R&D)*
   - Glass transition point *(R&D)*
   - Coating adhesion to stent surface *(R&D)*
   - Tissue reaction *(R&D)*

Emulsions

Oil-in-water or water-in-oil emulsions typically entrap the active pharmaceutical ingredient within the dispersed phase. Administration may be by IV, SC, or IM injection. Emulsions also are used for parenteral nutrition (IV).

3. Drug delivery system–specific
   - Particle size and size distribution *(G)*
   - Percent free vs. encapsulated *(G)*
   - pH *(G)*
   - Free fatty acid *(G)*
   - Emulsifying agent *(G)*
   - Drug release rate (for a controlled-release formulation) *(G)*
   - Burst release (for a controlled-release formulation) *(G)*
4. Product-specific
   - Lipid assay(s) *(G)*
   - Zeta potential *(R&D)* and *(S)*

Suspensions

Although nanoparticles, microspheres, and liposomes are suspensions, the latter category is limited here to formulations in which an insoluble active substance is suspended in a suitable (usually aqueous) medium incorporating suspending agents, viscosity modifiers, surfactants, etc., as appropriate to avoid agglomeration and ensure suspendability of the drug. Suspensions usually are administered by IM or SC injection, although nanosuspensions may be suitable for IV administration.

3. Drug delivery system–specific
   - Particle size and size distribution *(G)*
   - Particle morphology, profile, and surface area *(G)*
   - Percent in solution vs. percent in solid form *(G)*
   - Syringability *(G)*
   - Viscosity *(G)*
   - Suspendability *(G)*
4. Product-specific
   - Crystallinity *(R&D)* and *(S)*
   - Polymorphs *(R&D)* and *(S)*
   - Tissue reaction *(R&D)* and *(S)*

Resuspendability tests (for powders, microspheres, or liposomes supplied in dry form for resuspension immediately prior to administration) involve the following:

4. Product-specific
   - Resuspendability *(G)*
   - Syringability *(G)*
   - Deliverable dose *(G)*

- Burst release *(G)*
- Particle-size distribution *(G)*

5. Suspending medium
   - pH *(G)*
   - Osmolarity *(G)*
   - Viscosity *(G)*
   - Particulate matter *(G)*
   - Color/clarity of solution *(G)*
   - Turbidity *(G)*

Monolithic Depot

A monolithic depot is a polymer-based, sustained-release formulation in which the active pharmaceutical ingredient may be dispersed (as discrete particles) in a polymer matrix or dissolved (as an ionic drug–polymer conjugate), presented as an implantable rod (or other appropriate shape) for IM or SC injection.

3. Drug delivery system–specific
   - Drug release *(G)*
   - Burst release *(G)*
   - Percent free vs. percent encapsulated active *(G)*
4. Product-specific
   - Solvent content *(G)*
   - Morphology (surface and cross section) *(R)*
   - Polymer molecular weight and polydispersity *(S)*
   - Copolymer ratio *(R&D)*
   - Glass transition point *(R&D)*

Oily Depot

An oily depot is an oil-based sustained-release formulation normally used for the delivery of water-insoluble pharmaceutical active ingredients that may include organic solvents as solubility/viscosity modifiers, presented as a clear solution for IM or SC injection.

3. Drug delivery system–specific
   - Drug release rate (for a controlled-release formulation) *(G)*
   - Burst release (for a controlled-release formulation) *(G)*
4. Product-specific
   Solvent content *(G)*
   Oil content *(G)*

Osmotic Pump Implant

Osmotic pump implants involve a formulation of pharmaceutical active ingredient in a core surrounded by semipermeable membrane that has a microdrill-produced orifice in order to release the active material at a constant rate. Within the body, fluid enters the core through the membrane and dissolves the active material. The osmotic pressure generated in the core induces release of the drug in solution at a slow but constant rate. The pump may consist of two compartments separated by a semipermeable membrane. In the latter case, one compartment contains an osmotic agent in solution form and the other, which has the outlet orifice, contains the active pharmaceutical agent.

3. Drug delivery system–specific
   - Drug release rate *(G)*
   - Semipermeable membrane thickness *(G)*
   - Active content *(G)*
   - Osmotic agent content *(R)*
   - Orifice diameter *(G)*
4. Product-specific
   - pH if the product contains a solution or suspension *(G)*
   - Osmolarity *(G)*

CONCLUSIONS

The USP Advisory Panel on Performance Tests—Injections is interested in receiving feedback on this *Stimuli* article to help in developing companion General Chapters in *USP–NF*, as well as specifications for product performance to be included in individual chapters. To this end, please send comments to Horacio Pappa, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790, tel. 301.816.8319, e-mail hp@usp.org. It should be noted that validated methods and acceptance criteria for each of the tests listed here would have to be developed to support a regulatory application, unless a compendial approach is available.

Members of the USP Advisory Panel on Performance Tests—Injections

Compendial Calculations: Improving Calculations in *USP–NF*

PhRMA Compendial Liaison Subteam on Calculations: Philip Travis,* *Pfizer Inc.*; Kerrie Heck, *PSGA (Johnson & Johnson)*; Deborah Teitz, *Bristol-Myers Squibb*; Luciano Virgili, *Bristol-Myers Squibb*; Mark Wiggins, *Merck & Co., Inc.*

ABSTRACT The objective of this article is to propose a standardized format for calculations and a new approach for presenting calculation equations in *USP* General Chapters rather than in specific monographs. Analysts recognize that the equations that can be used for an analytical procedure are all fundamentally derived from a universal calculation. The format presented in this article is one approach to achieve the end result of a standardized format. The proposal, if adopted, will simplify the USP process by removing redundancies, conserving space, and minimizing the ambiguity that is encountered in the current calculation models, which often present a challenging task in analytical laboratories. For clarity and effectiveness, the proposed standardized approach for calculations is based on the use of units of measure. Several examples of calculations used in common analytical methods are presented to support the proposed format.

BACKGROUND

There are different ways to present calculation formulas for analytical methods. In comparing USP and industry practices, the PhRMA Compendial Liaison Team (CLT) found a significant gap in the level of detail between the two calculation formats used. The proposal in this *Stimuli* article attempts to bridge the gap and find an appropriate standardized format suitable for use both in *USP* and in pharmaceutical laboratories.

Chemists, technicians, and a variety of support personnel in laboratories around the world follow *USP* to ensure the consistent analysis of pharmaceutical substances and products. Although the calculation formulas in *USP* are common to the pharmaceutical industry, they are also complex and inconsistent throughout the compendium. Thus, personnel new to the industry and new to the laboratory face a steep learning curve and require a considerable amount of training in compendial matters, including calculations.

Consistent with the USP initiative to improve the compendium, this *Stimuli* article is published to solicit input via *Pharmacopeial Forum* for further development and discussion. PhRMA CLT feels that there is great merit in having more detailed formulas for calculations and in correcting the present deficiencies in three areas: inconsistency, redundancy, and ambiguity. To this end, we propose a new system for improving calculation instructions.

CURRENT STATUS

The current USP system for providing calculations is not optimal. Some monograph procedures and General Chapters provide information about calculations, but others do not. At the same time, common calculations, such as HPLC assay results, are repeated throughout the compendium. These calculations have been reduced to their absolute minimum to save space and keep *USP* to a functional size. Unfortunately, this format challenges a scientist's ability to understand and modify the calculations where allowable revisions have been made. For example, modifying an HPLC dilution sequence can affect the dilution factor used in the calculation, but many compendial calculations have incorporated the sample dilution factor into a calculation constant. Furthermore, combined calculation constants do not address units of measure or the source of special conversion factors (e.g., molecular weight conversions). This contributes to confusion and often leads to errors in the interpretation of the formulas, which can cause delays in laboratory reports, reviews, and investigations. It even affects personnel at USP because they are often contacted to clarify the requirements. Also, with each republication of the calculation in individual monographs, there is a potential for error.

On the other hand, the pharmaceutical industry attempts to apply "fool-proof" detailed calculations that cover every possible variable for each individual test. This approach is valuable so scientists worldwide can perform the same calculation in the same manner, without question or confusion. Unfortunately, these calculations have become so specialized that they are monograph and method specific. Therefore, they may not be appropriate for public standards, such as those in *USP*, because of the significant space that would be required to incorporate them into monographs.

RECOMMENDATION

The core of this proposal is to utilize the current compendial systems to provide a new means of referencing compendial calculation information. This approach has several

* Correspondence should be addressed to: Philip Travis, Pfizer Inc., 182 Tabor Road, Building 2, 1st Floor, Morris Plains, NJ 07950; e-mail philip.travis@pfizer.com.

benefits: It limits the overall impact on *USP;* it allows *USP* to incorporate changes in a shorter time frame; and it does not require industry to adopt dramatic changes.

Three areas were evaluated to establish the proposal.

- Format: The approach needs to be appropriate for multiple applications in order to reduce redundancies while providing sufficient information for laboratory personnel to accurately generate results.
- Application: PhRMA CLT evaluated several possible ways to incorporate calculation improvements into *USP:* creating a new section in the General Notices; improving the current General Chapters; adding a new General Chapter specifically devoted to compendial calculations; and developing the calculations within individual monographs.
- Growth: The proposal needs to be able to evolve with *USP.* As new monographs are proposed, what is the best way to evaluate and incorporate the changes without consuming significant resources?

With the addition of units of measure and information about correction factors, the current *USP* format will become more user-friendly for existing calculations with great benefit to the pharmaceutical industry, as well as other *USP* subscribers.

After evaluating the different ways to incorporate compendial calculations, we focused on updating General Chapters. Several disadvantages were apparent in the alternative approaches. Creating a new section in the General Notices or adding a new General Chapter devoted to calculation formulas would require significant revisions to every section of *USP* (General Notices, Monographs, and General Chapters). Revising the calculations in current monographs would require significant space in each monograph and continue with a system that contains redundancies. Because the purpose of General Chapters is to eliminate redundancies within the monographs, we decided to apply a system that exists but is not being applied to its full extent.

Modifications to General Chapters can be performed in a more efficient manner than updating individual monographs (current system). Therefore, developing General Chapters will allow a smoother transition with future updates.

PROPOSAL FOR CALCULATIONS

To improve the current *USP* practice for applying calculations, PhRMA CLT proposes to add common calculations to the General Chapters (Attachment 1). As appropriate, calculations can be replaced in individual monographs with references to the General Chapters. This would mean that only monograph-specific calculations would remain outside of the General Chapters (e.g., Povidone, K-value). Monograph methods would then reference the General Chapters, a specific formula reference (if required), and method-specific requirements (e.g., correction factors). Attachment 2 demonstrates how this new system would appear in a monograph.

IMPLEMENTATION

We recommend a three-step plan for implementation. First, the General Chapters need to be updated with the necessary information and formulas. Second, the compendial submission guidelines should be updated to the new calculation system, with a request for public submissions to revise the current monographs. Finally, the remaining monographs should be updated as needed.

CONCLUSION

By including calculation formulas in the General Chapters, USP can resolve inconsistencies and ambiguities that currently exist with compendial calculations. Additionally, USP can remove redundancies due to repeated printing of similar calculations in the individual monographs (e.g., HPLC calculations) and reduce the potential for error in the calculations published in the monographs. This will benefit all groups involved by reducing the size of the monographs and providing more user-friendly calculations that are adaptable (e.g., to account for user-specific dilutions, formula weight corrections, units of measure, etc.) while also providing critical information that is not currently available within *USP.*

ACKNOWLEDGMENT

The authors would like to give special thanks to the other members of the PhRMA Compendial Liaison Team: Rafik Bishara, Barbara Ferguson, Ralph Gomez, Janeen Kincaid, John Landy, Scott Messner, Psyche Pease, Judy Shimek, Andy Sopirak, and Gina Trimble.

ATTACHMENT 1

Common Calculations

(NOTE: *Examples are included for the benefit of reviewers and are not intended for inclusion in* USP.)

- **Volumetric Solutions** (VS)

  Standardizing against Another VS (Formula 1):
  Calculation
  Normality of VS = N $\times$ V/V_U
  where
  N = Normality of the standardized VS (N)
  V = Volume of the standardized VS (mL)
  V_U = Volume of the unstandardized VS (mL)

  Example:
  30.0 mL of 0.1025 N silver nitrate VS is used to standardize ~0.1 N ammonium thiocyanate VS.

Experimental: 30.47 mL of ~0.1 N ammonium thiocyanate VS was used to titrate 30.0 mL of 0.1025 N silver nitrate VS.

0.1025 N × 30.0 mL/30.47 mL = 0.1009 N NH_4SCN VS

- **Volumetric Solutions (VS)**

Standardizing against a Primary Standard (Formula 2)
Calculation:
Normality of VS = N × W_S × $P_S/(V_U \times F)$
where
N = Theoretical normality
W_S = Weight of the primary standard (mg)
P_S = Purity of the primary standard (decimal)
V_U = Volume of the unstandardized VS (mL)
F = Conversion factor (mg primary standard/mL of VS as the theoretical normality)

Example:
~1 N hydrochloric acid VS standardized against 5 g tromethamine.

Experimental: 39.82 mL of ~1 N HCl was used to titrate 5.0005 g of tromethamine (99.98% pure).

121.14 mg of tromethamine is equivalent to 1 mL of 1 N hydrochloric acid.

1 N × 5000.5 mg × 0.9998 / (39.82 mL × 121.14 mg/mL) = 1.036 N HCl VS

- **Alcoholometric Table**

Extrapolation
Calculation:
Extrapolated Value = R_{U1} − [(R_{T1} − S) × (R_{U1} − R_{U2})/(R_{T1} − R_{T2})]
where
R_{T1} = Upper value of the test range
R_{T2} = Lower value of the test range
R_{U1} = Upper value of the unknown range
R_{U2} = Lower value of the unknown range
S = Experimental value

Example:
Specific Gravity (SG) for Alcohol determined at 25° converted to 15.56°

Experimental:
Sample SG = 0.7893 at 25°.

From the Alcoholometric table select the 25° and corresponding 15.56° range for your result:

25° (test range)	15.56° (unknown range)
0.7921	0.7986
0.7871	0.7936

$R_{T1} - R_{T2}$ = 0.7921– 0.7871 = 0.0050
$R_{U1} - R_{U2}$ = 0.7986 – 0.7936 = 0.0050
0.7986 – [(0.7921 – 0.7893) × 0.0050/0.0050] = 0.7958 SG at 15.56°

- **⟨281⟩ Residue on Ignition (ROI)**

Percent Residue on Ignition
Calculation:

$$\%\text{ROI} = \frac{(W_I - W_D)}{W_U} \times 100\%$$

where
W_U = Sample weight (g)
W_D = Crucible weight (g)
W_I = Weight of the ignited crucible and residue (g)

Example:
Residue on ignition ⟨281⟩: not more than 0.2%.

Experimental: 1.0293 g of sample was weighed into a 35.4688-g crucible.

The ignited sample and crucible weight was determined to be 35.4699 g.

$$\frac{(35.4699\ g - 35.4688\ g) \times 100\%}{1.0293\ \text{g}} = 0.1\%\text{ROI}$$

- **⟨541⟩ Titrimetry**

Direct titration (Formula 1)
Calculation:

$$\%\text{Assay} = \frac{(V_U - V_B) \times \text{N} \times F \times 100\%}{\text{N}_1 \times W \times (1 - A)}$$

where
V_U = Sample titration volume (mL)
V_B = Blank titration volume (mL)
N = Actual normality of the titrant (N)

F = Conversion factor (mg sample/mL of titrant as the theoretical normality)
N_T = Theoretical normality of the titrant (N)
W = Sample weight (mg)
A = Assay correction (decimal) [Loss on drying, Water, or Loss on ignition]

Example:
Dissolve about 200 mg of Sample, accurately weighed, in 10 mL of water and add 3 drops of indicator TS. Titrate with 0.1 N titrant VS to a pink endpoint. Each mL of 0.1 N titrant is equivalent to 5.844 mg of Sample (99.0% to 100.5% of Sample, calculated on the dried basis).

Experimental: 200.4 mg of Sample (0.1% LOD) was titrated with 34.25 mL of 0.1002 N titrant VS. The blank consumed 0.01 mL of 0.1002 N titrant VS.

$$\frac{(34.25\ \text{mL} - 0.01\ \text{mL}) \times 0.1002\ \text{N} \times 5.844\ \text{mg/mL} \times 100\%}{0.1\ \text{N} \times 200.4\ \text{mg} \times (1 - 0.001)} = 100.1\%\ \text{Assay}$$

- **⟨541⟩ Titrimetry**

Residual titration (Formula 2)
Note: This type of titration is identified by the addition of a primary VS to the test solution before the titration.
Calculation:

$$\%\text{Assay} = \frac{(V_B - V_U) \times \text{N} \times F \times 100\%}{N_T \times W \times (1 - A)}$$

V_B = Blank titration volume (mL)
V_U = Sample titration volume (mL)
N = Actual normality of the titrant (N)
F = Conversion factor (mg sample/mL of primary VS as the theoretical normality)
N_T = Theoretical normality of the titrant (N)
W = Sample weight (mg)
A = Assay correction (decimal) [Loss on Drying, Water, or Loss on Ignition]

Example:
Dissolve about 400 mg of Sample, accurately weighed, in 15 mL of water. Add 40.0 mL of 0.1 N primary VS. Add indicator TS, and titrate the excess with 0.1 N titrant VS. Perform a blank determination. Each mL of 0.1 N primary VS is equivalent to 18.17 mg of Sample (98.0% to 102.0% of Sample, calculated on the dried basis).

Experimental: 400.4 mg of Sample (0.1% LOD) was titrated with 18.01 mL of 0.1002 N titrant VS (40.0 mL of 0.0996 N primary VS was used in the procedure). The blank consumed 39.82 mL of 0.1002 N titrant VS.

$$\frac{(39.82\ \text{mL} - 18.01\ \text{mL}) \times 0.1002\ \text{N} \times 18.17\ \text{mg/mL} \times 100\%}{0.1\ \text{N} \times 400.4\ \text{mg} \times (1 - 0.001)} = 99.3\%\ \text{Assay}$$

- **⟨621⟩ Chromatography**

Calculations from a standard (Formula 1)

Calculation:

$$\textbf{Weight Result (mg)} = F \times C_S \times D \times (r_U / r_S)$$

or

$$\textbf{\%Result} = F \times (C_S / C_U) \times (r_U / r_S) \times 100\%$$

where
F = Correction factor equals 1 unless specified in the individual monograph
C_S = Concentration of standard solution (mg/mL) [Corrected for purity]
C_U = Concentration of test solution (mg/mL) [Corrected for Loss on Drying, Water, Loss on Ignition, Residual Solvents, etc. (as needed)]
D = Dilution for the test solution (mL)
r_U = Peak response(s) (area, height, etc.) or internal standard ratio (peak response of the analyte/peak response from the internal standard) obtained from the test solution

r_S = Peak response(s) (area, height, etc) or internal standard ratio (peak response of the analyte/peak response from the internal standard) obtained from the standard solution
Note: Correct peak responses for the blank injection as needed.

Example:
Mannitol, *NF—Assay* (96.0% to 101.5%, calculated on the dried basis).

Experimental:
Standard—120.4 mg USP Mannitol RS (100%) diluted to 25.0 mL. Assay—245.0 mg of Mannitol (0.1% LOD) diluted to 10.0 mL, further diluted 2.0 mL to 10.0 mL.
Peak Area (assay preparation)—79,221
Peak Area (standard preparation)—80,543
D = 10.0 mL × (10.0 mL/2.0 mL) = 50.0 mL
1 × 4.816 mg/mL × 50.0 mL × (79,221/80,543) = 236.8 mg

or

1 × (4.816 mg/mL/4.8951 mg/mL) × (79,221/80,543) × 100% = 96.8% Assay

• **⟨621⟩ Chromatography**

Calculations from a standard—Dosage Form (Formula 2)
Calculation:

$$\textbf{Weight Result (mg/unit)} = F \times (C_S / C_U) \times (r_U / r_S)$$

or

$$\textbf{\%Label Claim} = F \times (C_S / C_U) \times (r_U / r_S) \times (100\%/L)$$

where
F = Correction factor equals 1 unless specified in the monograph.
C_S = Concentration of standard solution (mg/mL) [Corrected for purity]
C_U = Concentration for the test solution (unit/mL) [Where unit = Tablet, Volume, Vial, etc.]
L = Label claim (mg/dosage form)
r_U = Peak response(s) (area, height, etc.) or internal standard ratio (peak response of the analyte/peak response from the internal standard) obtained from the test solution
r_S = Peak response(s) (area, height, etc.) or internal standard ratio (peak response of the analyte/peak response from the internal standard) obtained from the standard solution
Note: Correct peak responses for the blank injection as needed.

Example:
Active Tablets—Assay (90.0% to 110.0% of the labeled amount).

Experimental:
Standard—30.4 mg USP Alternative Active RS (99.5%) diluted to 100.0 mL.
Assay—20 tablets (3 mg/tablet) diluted to 200.0 mL.
Peak Area (assay preparation)—65,459
Peak Area (standard preparation)—68,534
Standard correction factor (F)—1.1

$$\frac{1.1 \times (0.304\ \text{mg/mL} \times 0.995) \times 60{,}746}{0.1\ \text{tablet/mL} \times 68{,}534} = 2.95\ \text{mg/tablet}$$

or

$$\frac{1.1 \times 0.304\ \text{mg/mL} \times 0.995 \times 60{,}746 \times 100\%}{0.1\ \text{tablet/mL} \times 68{,}534 \times 3\ \text{mg/tablet}} = 98.3\%\ \text{label claim}$$

• **⟨621⟩ Chromatography**

Area normalization (Formula 3)
Calculation:

$$\textbf{\%Impurities or \%Assay} = F \times (r_i / r_t) \times 100\%$$

where
F = Correction factor equals 1 unless specified in the monograph.
r_i = Individual peak response (area, height, etc.) obtained from the test solution
r_t = Sum of relevant peak responses (area, height, etc.) obtained from the test solution
Note: Correct peak responses for the blank as needed.

Example:
Inject a volume (about 20 µL) of the Test preparation into the chromatograph, record the chromatograms, and measure the peak responses.

Experimental:
Related substance A peak (area)—1,221
Sum of all relevant peaks (area)—180,543
1 × (1221/180,543) × 100% = 0.7% Related substance A

- **⟨731⟩ Loss on Drying (LOD)**

Percent Loss on Drying
Calculation:

$$\%\text{LOD} = \frac{[(W_D + W_U) - W_{D1}]}{W_U} \times 100\%$$

where
W_D = Weight of the bottle (g)
W_U = Weight of the sample (g)
W_{D1} = Weight of the dried sample and bottle (g)

Example:
Loss on drying ⟨731⟩: Dry it at 105° for 4 hours: it loses not more than 4.5% of its weight.

Experimental: 1.0293 g of sample was weighed into a 35.4688-g bottle. The dried sample and bottle weight after 4 hours at 105° was determined to be 36.4703 g.

$$\frac{[(35.4688\text{ g} + 1.0293\text{ g}) - 36.4703\text{ g}] \times 100\%}{1.0293\text{ g}} = 2.7\%\text{ LOD}$$

- **⟨733⟩ Loss on Ignition (LOI)**

Percent Loss on Ignition
Calculation:

$$\%\text{LOI} = \frac{[(W_D + W_U) - W_{D1}]}{W_U} \times 100\%$$

where
W_D = Weight of the crucible (g)
W_U = Weight of the sample (g)
W_{D1} = Weight of the ignited sample and crucible (g)

Example:
Loss on ignition ⟨733⟩: Transfer to a tared platinum crucible about 500 mg, weigh accurately, and ignite at 800 ± 25° to constant weight: it loses not more than 10.0% of its weight.

Experimental: 0.5023 g of sample was weighed into a 25.4688 g crucible. The ignited sample and crucible weight (at constant weight) was determined to be 25.9258 g.

$$\frac{[(25.4688\text{ g} + 0.5023\text{ g}) - 25.9258\text{ g}] \times 100\%}{0.5023\text{ g}} = 9.0\%\text{ LOI}$$

ATTACHMENT 2

Application of Calculations in General Chapters to Simplify and Clarify the Monographs

Example 1: Simplifying Monographs

USP Monograph (Active Sulfate): **Assay—**
Standard preparation—Dissolve an accurately weighed quantity of USP Active Non-sulfated RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.
Assay preparation—Transfer 60 mg of Active Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of Active Sulfate in the portion taken by the formula:

$$(115.98)C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Active Non-sulfated RS in the *Standard preparation,* and r_U and r_S are the Active Non-sulfated peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Revised *USP* Monograph (Active Sulfate): **Assay—**
Standard preparation—Dissolve an accurately weighed quantity of USP Active Non-sulfated RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.
Assay preparation—Transfer 60 mg of Active Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.
Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of Active Sulfate in the portion taken by *Formula 1,* (see *Chromatography* ⟨621⟩), where the correction factor, *F,* is equal to 1.1598 [NOTE: 1.1598 = Active Sulfate MW (711.87 g/mole)/Active Non-sulfated MW (613.80 g/mole)].

Example 2: Clarifying Monographs

Current *NF* Monograph (Aspartame): **Assay—**

Procedure—Transfer about 300 mg of Aspartame, accurately weighed, to a 150-mL beaker, dissolve in 1.5 mL of anhydrous formic acid, and add 60 mL of glacial acetic acid. Add crystal violet TS, and immediately titrate with *0.1 N Perchloric acid* to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *0.1 N Perchloric acid* is equivalent to 29.43 mg of $C_{14}H_{18}N_2O_5$. [NOTE—A blank titration exceeding 0.1 mL may be due to excessive water content, and may cause loss of visual endpoint sensitivity.]

Revised *NF* Monograph (Aspartame): **Assay—**

Procedure—Transfer about 300 mg of Aspartame, accurately weighed, to a 150-mL beaker, dissolve in 1.5 mL of anhydrous formic acid, and add 60 mL of glacial acetic acid. Add crystal violet TS, and immediately titrate with *0.1 N Perchloric acid* to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *0.1 N Perchloric acid* is equivalent to 29.43 mg of $C_{14}H_{18}N_2O_5$. Calculate the percentage of Aspartame in the portion of sample taken by *Formula 1* (see *Titrimetry* ⟨541⟩). [NOTE—A blank titration exceeding 0.1 mL may be due to excessive water content, and may cause loss of visual endpoint sensitivity.]

Comments on ''Compendial Calculations: Improving the Calculations in *USP–NF*''

USP Staff*

ABSTRACT This article briefly responds to and comments on ''Compendial Calculations: Improving the Calculations within *USP–NF*.''

USP staff shares the concerns expressed in ''Compendial Calculations: Improving the Calculations within *USP–NF*'' (*1*). In fact, USP staff published a *Stimuli* article earlier this year expressing similar concerns and additional ones and proposing some solutions (*2*). There is general agreement that the manner in which the formulas and other calculations expressed in current monographs is confusing and could potentially compromise a ''scientist's ability to understand and modify calculations where allowable revisions have been made.'' However, there are some practical issues in implementing the proposals in ''Compendial Calculations.''

1. The article primarily proposes that the formulas for techniques frequently used in *USP–NF* monographs, such as titration, chromatography, loss on drying, loss on ignition, etc., should be moved to the corresponding General Chapters with only the monograph-specific instructions and parameters included in monographs. However, the ''Current Status'' section of the article correctly recognizes that ''these calculations have become so specialized that they are monograph specific.'' This is precisely the reason why it would be inappropriate to move them to the corresponding General Chapters. It would be very confusing and unfriendly to force users to assemble an equation by combining two segments that are included in two different sections of *USP–NF*.

2. Most of the instructions and parameters included in monographs are monograph specific; therefore, this information has to be retained in each monograph. Thus, the potential space saving per monograph would be one to two lines—typically the line(s) in which the formula is presented. Given the complexity of having to look two places for a formula and the confusion that could follow the proposed change, USP staff believe it would not be appropriate to take such an approach. As mentioned in ''Compendial Calculations'' (*1*) and also in the article by Davani et al. (*2*), the current practice of combining several constants into one number is confusing. Davani et al. proposed keeping the formulas with individual monographs but breaking them down and including explanations for the constant and other terms in the formula. This is a significantly more user-friendly approach and will go a long way toward clarifying the formulas. Where appropriate, Davani et al. also proposed including critical intermediate steps in calculations rather than giving one final formula.

3. The ''Compendial Calculations'' article (*1*) indicated that because the calculations are monograph specific, they are not appropriate for a public standard. It is difficult to conceive having monographs but not having formulas or instructions for calculations in them.

4. The formulas proposed under the section *Chromatography* ⟨621⟩ depend on how the Relative Response Factor (RRF), *F,* or the Correction factor, is defined. The formulas proposed in this article are not universally accepted. Currently, *USP–NF* has several monographs in which RRF is used in the numerator, as proposed by this article, but about an equal number of monographs use RRF in the denominator. Thus, as mentioned above, such formulas are very monograph specific and should not be included in General Chapter ⟨621⟩ *Chromatography*. In addition, the proposal is not in accord with the recent effort by USP to standardize the use of this factor (*3*).

5. *USP–NF* currently has more than 4000 monographs, many of which would require revision, whichever approach is adopted. This is an extensive effort and would require significant staff and industry resources. Thus, USP proposes to take cautious steps in evaluating the proposals before committing to such an enormous task.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

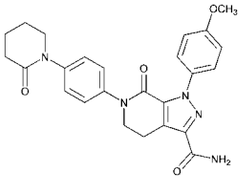
USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 4

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

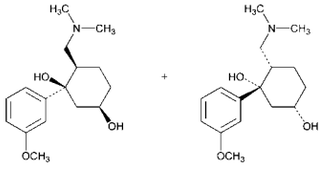
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

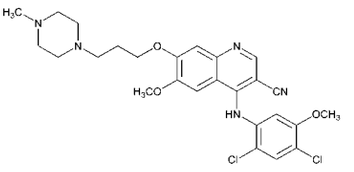
Apixaban [*2005*] (a pix′ a ban). $C_{25}H_{25}N_5O_4$. 459.50. (1) 1*H*-Pyrazolo[3,4-*c*]pyridine-3-carboxamide,4,5,6,7-tetrahydro-1-(4-methoxyphenyl)-7-oxo-6-[4-(2-oxo-1-piperidinyl)phenyl]-; (2) 1-(4-Methoxyphenyl)-7-oxo-6-[4-(2-oxopiperidin-1-yl)phenyl]-4,5,6,7-tetrahydro-1*H*-pyrazolo[3,4-*c*]pyridine-3-carboxamide. *CAS-503612-47-3*. *Anticoagulant, antithrombotic.* (Bristol-Myers Squibb) ✧*BMS-562247-01*



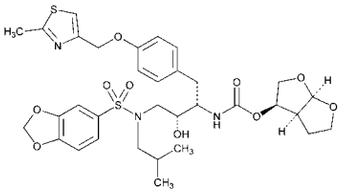
Axomadol [*2005*] (ax oh′ ma dole). $C_{16}H_{25}NO_3$. 279.40. (1) 1,3-Cyclohexanediol, 6-[(dimethylamino)methyl]-1-(3-methoxyphenyl)-, (1*R*,3*R*,6*R*)-*rel*-; (2) (1*RS*,3*RS*,6*RS*)-6-[(Dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexane-1,3-diol. *CAS-187219-99-4*. INN. *Treatment of pain, central analgesic.* (Gruñenthal GmbH, Germany) ✧*GRT151 base; BN110 base*



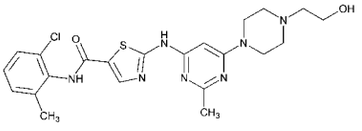
Bosutinib [*2005*] (boe sue′ ti nib). $C_{26}H_{29}Cl_2N_5O_3$. 530.50. (1) 3-Quinolinecarbonitrile, 4-[(2,4-dichloro-5-methoxyphenyl)amino]-6-methoxy-7-[3-(4-methyl-1-piperazinyl)propoxy]-; (2) 4-[(2,4-Dichloro-5-methoxyphenyl)amino]-6-methoxy-7-[3-(4-methylpiperazin-1-yl)propoxy]quinoline-3-carbonitrile. *CAS-380843-75-4*. *Antineoplastic* (*Src kinase inhibitor*). (Wyeth) ✧*SKI-606*



Brecanavir [*2005*] (bre kan′ a veer). $C_{33}H_{41}N_3O_{10}S_2$. 703.80. (1) Carbamic acid, [(1*S*,2*R*)-3-[(1,3-benzodioxol-5-ylsulfonyl)(2-methylpropyl)amino]-2-hydroxy-1-[[4-[(2-methyl-4-thiazolyl)methoxy]phenyl]methyl]propyl]-, (3*R*,3a*S*,6a*R*)-hexahydrofuro[2,3-*b*]furan-3-yl ester; (2) (3*R*,3a*S*,6a*R*)-Hexahydrofuro[2,3-*b*]furan-3-yl [(1*S*,2*R*)-3-[(1,3-benzodioxol-5-ylsulfonyl)(2-methylpropyl)amino]-2-hydroxy-1-[4-[(2-methylthiazol-4-yl)methoxy]benzyl]propyl]carbamate.*CAS-313682-08-5*. *Treatment of HIV infection in combination with other antiretroviral agents.* (GlaxoSmithKline) ✧*GW64085X*

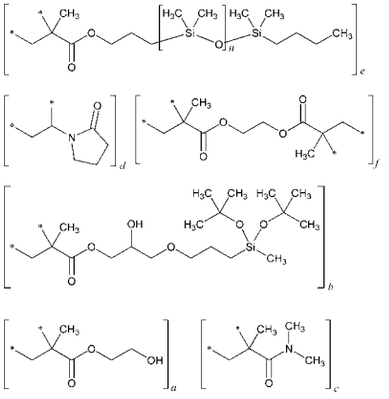


Dasatinib [*2005*] (da sa′ ti nib). $C_{22}H_{26}ClN_7O_2S$. 488.00. (1) 5-Thiazolecarboxamide-*N*-(2-chloro-6-methylphenyl)-2-[[6-[4-(2-hydroxyethyl)-1-piperazinyl]-2-methyl-4-pyrimidinyl]amino]-; (2) *N*-(2-Chloro-6-methylphenyl)-2-[[6-[4-(2-hydroxyethyl)piperazin-1-yl]-2-methylpyrimidin-4-yl]amino]thiazole-5-carboxamide.*CAS-302962-49-8*. *Antineoplastic.* (Bristol-Myers Squibb) ✧*BMS-354825*



Denosumab [*2005*] (den oh sue′ mab). $C_{6404}H_{9912}N_{1724}O_{2004}S_{50}$. (1) Immunoglobulin G2, anti-(human osteoclast differentiation factor) (human monoclonal AMG162 heavy chain), disulfide with human monoclonal AMG162 light chain, dimer; (2) Immunoglobulin G2, anti-(human RANK ligand) (human monoclonal AMG162 heavy chain), disulfide with human monoclonal AMG162 light chain, dimer. Molecular weight is approximately 144,700 daltons. *CAS-615258-40-7. Prevention and treatment of all forms of osteoporosis or bone loss.* (Amgen) ✧*AMG 162*

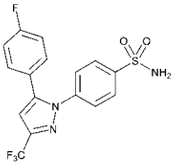
Galyfilcon A [*2002*] (gal ee fil′ kon). $(C_6H_{10}O_3)_a(C_{17}H_{38}O_6Si_3)_b(C_5H_9NO)_c(C_6H_9NO)_d(C_{35}H_{92}O_{13}Si_{12})_e(C_{10}H_{14}O_4)_f$. (1) Siloxanes and Silicones, di-Me, Bu group- and 3-[(2-methyl-1-oxo-2-propenyl)oxy]propyl group-terminated (n=11), polymers with *N,N*-dimethyl-2-propenamide, ethylene dimethacrylate, 2-hydroxyethyl methacrylate, 2-hydroxy-3-[3-[1,3,3,3-tetramethyl-1-[(trimethylsilyl)oxy]disiloxanyl]propoxy]propyl methacrylate and vinylpyrrolidone; (2) Copolymer of 3-(23-butyltetracosamethyldodecasiloxanyl)propyl 2-methylprop-2-enoate (n=11), *N,N*-dimethylprop-2-enamide, 1-ethenylpyrrolidin-2-one, ethylene bis(2-methylprop-2-enoate), 2-hydroxyethyl 2-methylprop-2-enoate and (2*RS*)-2-hydroxy-3-[3-[1,3,3,3-tetramethyl-1-[(trimethylsilyl)oxy]disiloxanyl]propoxy]propyl 2-methylprop-2-enoate. *CAS-446264-97-7. Contact lens material* (*hydrophilic*). (Vistakon) *[Note—The water content of the contact lens material is 47% at ambient temperature* ($23 \pm 2°C$)*, the purity of 2-hydroxyethyl methacrylate* (*HEMA*) *is 99%, and the oxygen permeability is* $60 \pm 2 \times 10^{-11}$ (cm^2/sec)($mL\ O_2/mL \times mm\ Hg$) *at 35°C* (*Dk value*)*.]*



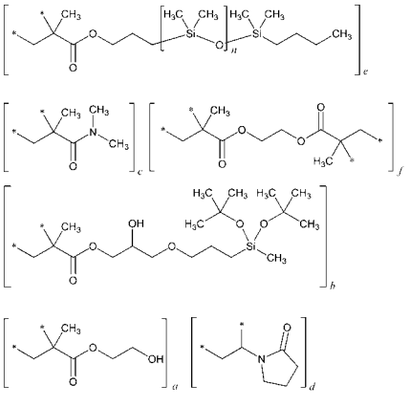
Hemoglobin Glutamer-200 (Bovine) [*1997*] (hee′ moe gloe bin glue ta mer). Hemoglobin-based oxygen carrier 301 is a solution of purified, glutaraldehyde-polymerized, bovine hemoglobin. The average polymer weight is 200,000 daltons. *CAS-192230-37-8. Oxygen carrier for veterinary use.* Oxyglobin Solution (Biopure) ✧*HBOC-301*

Hemoglobin Glutamer-250 (Bovine) [*1997*] (hee′ moe gloe bin glue ta mer). [Hemoglobin glutamer is INN.] Hemoglobin-based oxygen carrier 201 is a solution of purified, glutaraldehyde-polymerized, bovine hemoglobin. The average polymer weight is 250,000 daltons. *CAS-192230-36-7. Oxygen carrier and blood substitute for human use.* Hemopure (Biopure) ✧*HBOC-201*

Mavacoxib [*2005*] (may″ va kox′ ib). $C_{16}H_{11}F_4N_3O_2S$. 385.30. (1) Benzenesulfonamide, 4-[5-(4-fluorophenyl)-3-(trifluoromethyl)-1*H*-pyrazol-1-yl]-; (2) 4-[5-(4-Fluorophenyl)-3-(trifluoromethyl)-1*H*-pyrazol-1-yl]benzenesulfonamide. *CAS-170569-88-7. Treatment of pain, inflammation, and fever.* (Pfizer) ✧*PHA 739,521*

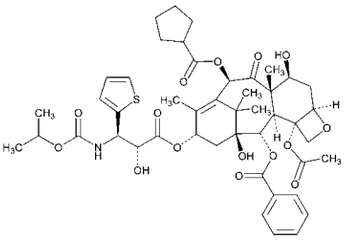


Senofilcon A [*2003*] (sen oh fil′ kon). $(C_6H_{10}O_3)_u(C_{17}H_{38}O_6Si_3)_v(C_5H_9NO)_w(C_6H_9NO)_x(C_{35}H_{92}O_{13}Si_{12})_y(C_{16}H_{26}O_7)_z$. (1) Siloxanes and silicones, di-Me, Bu group- and 3-[(2-methyl-1-oxo-2-propenyl)oxy]propyl group-terminated, polymers with *N,N*-dimethyl-2-propenamide, 2-hydroxyethyl methacrylate, 2-hydroxy-3-[3-[1,3,3,3-tetramethyl-1-[(trimethylsilyl)oxy]disiloxanyl]propoxy]propyl methacrylate, tetraethylene glycol dimethacrylate and vinylpyrrolidone; (2) Copolymer of 3-(23-butyltetracosamethyldodecasiloxanyl)propyl 2-methylprop-2-enoate (n=11), *N,N*-dimethylprop-2-enamide, 1-ethenylpyrrolidin-2-one, 2-hydroxyethyl 2-methylprop-2-enoate, (2*RS*)-2-hydroxy-3-[3-[1,3,3,3-tetramethyl-1-[(trimethylsilyl)oxy]disiloxanyl]propoxy]propyl 2-methylprop-2-enoate and oxybis(ethyleneoxyethylene) bis(2-methylprop-2-enoate). *CAS-478799-92-7. Contact lens material* (*hydrophilic*). (Vistakon) *[Note—The water content of the contact lens material is 38% at ambient temperature* ($23 \pm 2°C$)*, and the oxygen permeability is* 103×10^{-11} (cm^2/sec)($mL\ O_2/mL \times$ mm Hg) *at 35°C* (*Dk value*)*.]*



Simotaxel [*2005*] (sim″ oh tax′ el). $C_{46}H_{57}NO_{15}S$. 896.00. (1) 2-Thiophenepropanoic acid, α-hydroxy-β-[[(1-methylethoxy)-carbonyl]amino]-, (2a*R*,4*S*,4a*S*,6*R*,9*S*,11*S*,12*S*,12a*R*,12b*S*)-12b-(acetyloxy)-12-(benzoyloxy)-6-[(cyclopentylcarbonyl)oxy]-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,11-dihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1*H*-cyclodeca[3,4]benz[1,2-*b*]oxet-9-yl ester, (α*R*,β*R*)-; (2) (2a*R*,4*S*,4a*S*,6*R*,9*S*,11*S*,12*S*,12a*R*,12b*S*)-4,11-Dihydroxy-4a,8,13,13-tetramethyl-5-oxo-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-7,11-methano-1*H*-cyclodeca[3,4]benz[1,2-*b*]oxete-6,9,12,12b-tetrayl 12b-acetate 12-benzoate 6-cyclopentanecarboxylate 9-[(2*R*,3*R*)-2-hydroxy-3-[[(1-methylethoxy)carbonyl]amino]-3-(thiophen-2-yl)propanoate].

CAS-791635-59-1. *Second-line treatment of NSCLC and metastatic breast cancer.* (Wyeth) ✧*MST-997*



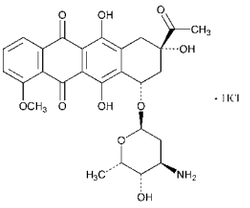
Nomenclature

Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

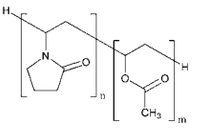
Epirubicin Hydrochloride

Change the chemical structure to read:



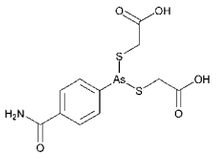
Copovidone

Change the chemical structure to read:



Thiacetarsamide

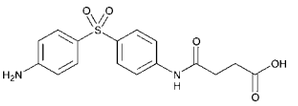
Change the chemical structure to read:



Succisulfone

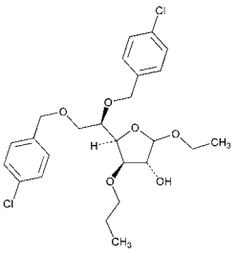
Change the molecular formula and chemical structure to read:

$C_{16}H_{16}N_2O_5S$



Clobenoside

Change the chemical structure to read:



Proposed International Nonproprietary Names

The following 53 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 19, No. 2, 2005.

Any comments or formal objections to the proposed names should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Antithrombin Alfa	*Anticoagulant*
Apixaban	*Anticoagulant*
Apratastat	*Antirheumatic (inhibition of TNF-α converting enzyme)*
Arasertaconazole	*Antifungal*
Avosentan	*Endothelin receptor antagonist*
Bapineuzumab	*Immunomodulator (amyloid β-peptide clearance enhancer)*
Belatacept	*Immunosuppressant*
Brivaracetam	*Nootropic agent*
Caricotamide	*Pharmaceutical adjuvant*
Catumaxomab	*Antineoplastic*
Dapiclermin	*Appetite suppressant*
Dexlansoprazole	*Anti-ulcer*
Dianicline	*Nicotinic acetylcholine receptor partial agonist*
Ecallantide	*Kallicrein inhibitor*
Ertumaxomab	*Antineoplastic*
Esmirtazapine	*Serotonin receptor antagonist*
Fosfluridine Tidoxil	*Antineoplastic*
Ispronicline	*Nicotinic acetylcholine receptor agonist*
Istaroxime	*Inotropic agent*
Lecozotan	*Serotonin 5-HT1a receptor antagonist*
Levolansoprazole	*Anti-ulcer*
Manitimus	*Immunosuppressant*
Mapatumumab	*Antineoplastic*
Nebicapone	*Antiparkinsonian*
Nerispirdine	*Na^+/K^+ channel blocker*
Ofatumumab	*Antineoplastic*
Olmesartan	*Angiotensine II receptor antagonist*
Padoporfin	*Photosensitizing agent*
Pagibaximab	*Immunomodulator*
Paliroden	*Nootropic agent*
Peforelin	*GnRH analogue with preferential FSH action*
Plerixafor	Blockade of chemokine (CXCR4) receptor
Plitidepsin	*Antineoplastic*
Pradefovir	*Antiviral*
Rimacalib	*Nonsteroidal anti-inflammatory*
Rivanicline	*Nicotinic acetylcholine receptor agonist*
Rivenprost	*Prostaglandin receptor agonist*
Satavaptan	*Vasopressin V_2 receptor antagonist*
Seletracetam	*Nootropic agent*
Sipoglitazar	*Antidiabetic*
Sunitinib	*Antineoplastic*
Surinabant	*CB1 cannabinoid receptor antagonist*
Tasidotin	*Antineoplastic*
Tasquinimod	*Immunomodulator*
Terutroban	*Tromboxane A_2 antagonist*
Tesetaxel	*Antineoplastic*
Tretazicar	*Antineoplastic*
Udenafil	*Vasodilator*
Valategrast	*Nonsteroidal anti-inflammatory*
Valopicitabine	*Antiviral*
Voloximab	*Antineoplastic*
Zabofloxacin	*Antibacterial*
Zalutumumab	*Antineoplastic*

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

[*Note—This index covers Vol. 31 No. 1, pp. 1–288, Vol. 31, No. 2, pp. 289–669, Vol. 31, No. 3, pp. 671–980, Vol. 31, No. 4, pp. 981–1287, Vol. 31, No. 5, pp. 1289–1556, Vol. 31, No. 6, pp. 1557-1773*]
